integrating medical documents from various health information systems [10]. It is important to note that multiagent systems are currently developed as prototypes and not deployed in real environments [10]. A major challenge in using multiagent systems is their communication problems, leading to system failure. Thus, their security and maintainability should be considered more strictly in the future [10]. The use of context-aware hospital information systems using multiagent based middleware can respond to patient conditions and needs in real-time, aiding in quality care delivery [10]. Furthermore, multiagent based decision support systems aid in organ and tissues distribution for transplantation and procedure allocation through negotiation and coordination between agents [10]. Integrating web service standards and technologies with multi-agent systems provides a promising computing environment for managing complex distributed issues efficiently [10]. Multi-agent based middleware helps to automate the prehospital process and can be beneficial in complex prehospital emergency environments [10]. Multiagent systems can create a society of interacting agents for distributed decision making, providing autonomy, flexibility, collaboration, and negotiation capabilities [10]. Using autonomous agents in MAS provides intelligent decision-making capabilities, providing a useful tool for efficient resource utilization for managing prehospital emergency patients [10]. The ambulance agent takes care of patients and provides consultation if necessary, while the quality of care monitoring agent monitors the EMS center agent, ambulance agent, and healthcare providers [10]. The electronic health record agent provides a repository of patient's medical history, improving the quality of care [10]. Lastly, the EMS center agent acts as a decision support module and selects suitable treatment protocols based on the patient's medical history [10]. Multiagent based middleware enables efficient delivery of patient calls to patient agents, while the consultation agent provides remote consultation to ambulance agents and healthcare providers, enhancing patient care [10].

Future Directions and limitations for Multiagent Based Middleware

Despite the advantages of multi-agent based middleware, current solutions have several limitations that restrict their applicability in complex and dynamic Machine-to-Machine (M2M) environments. One of the primary limitations is that current multi-agent based middleware solutions are not designed to address the heterogeneity of M2M systems, which limits their interoperability and integration with other systems [6]. In addition, most existing solutions are focused on Wireless Sensor Networks (WSNs) or lightweight mobile devices, and do not scale well to larger and more complex M2M systems [6]. Extensibility and operational management are also challenging due to the low level of resource abstraction in multi-agent based middleware solutions. Furthermore, these solutions lack support for semantic and syntactical interoperability, which is essential for seamless integration of different systems [6]. Despite several notable attempts to address these issues, there is still no standard ontology design principle for scalable, complex, and dynamic M2M environments [6]. Finally, most current work lacks support for semantic service enablement and resource constraint in multi-agent based middleware. Predefined and deterministic composition mechanisms in current work will not scale well in dynamic M2M applications, where the number of devices and services may change rapidly over time [6]. These limitations highlight the need for further research and development to overcome the challenges posed by multi-agent based middleware solutions in M2M environments.

To address the limitations of existing frameworks and contribute to the evolution of multiagent systems, there are several potential solutions that can be explored. Firstly, the agent community should work together to provide solutions that can enhance existing platforms and overcome their limitations [8]. Additionally, designers can consider coupling existing simulations instead of creating new simulation platforms, as there are already numerous simulation platforms available for use [7]. It is recommended that designers carefully consider creating a new mobility simulation and verify if a composition of existing platforms can meet their requirements. This approach can save time and resources while still meeting the needs of the project [7]. Furthermore, a proposed middleware model can limit or even eliminate incoherence between two simulations, providing a more seamless integration of different components [7]. Lastly, depending on the execution time requirements, designers can choose to use bidirectional or unidirectional corrections to optimize performance and ensure accurate results [12]. By exploring these solutions, the limitations of current frameworks can be addressed, leading to more effective and efficient multiagent systems. Middleware is becoming more common in multiagent systems, especially in the context of simulations with large behavioral differences [7]. The future of multiagent based middleware will be shaped by emerging trends such

as the exponential increase of devices in the upcoming years [6]. Machine-to-Machine (M2M) technology is expected to play a significant role in managing billions of devices, resources, data, and actuators and supporting the new era of smart cities [6]. However, the limitations of middleware on the behavior of simulations are restricted to the definitions of graphs and travelers [7]. Virtual urban fire fighting simulations can be used to test the feasibility and efficiency of new designs [6]. In order to address the challenge of selecting appropriate services or service combinations for upper layer applications, an agent-based middleware can be built to support semantic service enablement based on a semantic service representation model with four key properties: Capability, Deployment, Resource, and IOData. An efficient semantic service discovery and matching approach can be used for a service combination process that calculates the semantic similarity between services and a heuristic algorithm to search for service candidates for a specific service request [6]. This approach allows composing the scales of involved simulations and iteratively executing $S_{dm} \rightarrow S_a \rightarrow S_{dm}$ to compose processes. S_a provides the right valuations of the transportation graph, and the middleware re-executes the same time step of S_{dm} with a different graph (G_{Sa}) using Algorithm 2 called A-DM for Assign-Demand and Move [7]. The described approach is an emerging trend in multiagent based middleware that will shape its future development [7].

CONCLUSION

The survey on multiagent-based middleware provides valuable insights into the development and implementation of multi-agent systems for various applications, including wireless sensor networks and resource-constrained devices. The study highlights the importance of middleware services in the development of multi-agent systems and emphasizes the need for standardized approaches to facilitate interoperability and scalability. The research demonstrates that existing middleware services, such as RMI and CORBA, are limited in their ability to provide domain-specific services, which can be difficult to integrate with other services for multi-agent systems. The study proposes multiagent-based middleware as a potential solution to address these limitations and facilitate the visualization of emergent agent behavior and entity agents. The study highlights different types of multiagent-based middleware, such as JADE and ActorNet, which offer diverse functionalities and capabilities for service creation, enablement, and discovery. However, the study also acknowledges potential weaknesses and challenges related to the extensibility and operation management of multiagent-based middleware, as well as the lack of support for semantic and syntactical interoperability. Overall, the survey on multiagent-based middleware provides valuable insights into the development and implementation of multi-agent systems and highlights the potential of this technology to enhance the efficiency and effectiveness of various applications. Future research can focus on addressing the limitations and challenges identified in the study and exploring the potential of new and emerging technologies for multiagent-based middleware.

ABSTRACT

Cloud computing is a decentralised repository of resources available to consumers. It offers users virtually limitless pay-per-use computing services without the obligation for the underlying infrastructure. The objective of cloud service providers is to facilitate efficient resource utilisation and maximise advantages. This renders work planning in cloud computing a pivotal and formidable issue. Cloud job scheduling is an NP-hard optimisation problem that has been proposed for resolution by various meta-heuristic techniques. An effective task manager must adjust their planning strategy to changing circumstances and work methodologies. This work presents an enhanced Ant Colony Optimisation algorithm that incorporates observer ants to facilitate the adaptation and diversity of reinforcement schemes.

Keywords: Cloud Computing, Task Scheduling, Optimization technique, Ant Colony Optimization, Multi-Objective

INTRODUCTION

The cloud end user will utilise the entire spectrum of computational resources, encompassing both hardware and software. Cloud storage systems operate on a pay-as-you-go model. The cloud service user may adjust the available resources based on application requirements. One of the principal advantages of cloud computing is that the associated costs must be borne by the service customers. The cloud service customer can get and relinquish resources at any moment. Any solution predicated on application criteria is complimentary for the cloud service client. The entitlement to choose a service for users has generated complications; it does not pertain to the subsequent user

**Vaaheedha Kfatheen**

request. Consequently, job planning and resource allocation are essential elements of cloud science. The efficiency of resource utilisation relies more on planning and load balancing approaches than on random resource allocation. Cloud-based computers are often utilised to address intricate tasks (user requests). The implementation of the programming approach is advised for addressing intricate task challenges. The tools are utilised in these planning algorithms. A primary issue in cloud computing is task scheduling. The efficient use of resources might result in proper job scheduling. The fundamental advantage of cloud computing lies in the optimal use of resources [3]. Project preparation and resource allocation are inherently interconnected. Each exerts an influence on the other. Internet users can presently access content from any location without regard for the hosting infrastructure. This hosting infrastructure comprises numerous computers owned and managed by the service provider. Cloud computing enhances the capacity of these infrastructures, facilitating Internet connectivity. The delivery of cloud-based services to cloud-based users generates profit.

Related Works

Kiruthiga, G., and S. Mary Vennila [5] proposed that Chaotic Darwinian Swarm Optimisation (CDCSO) is an innovative multi-objective approach for enhancing energy-efficient quality control and load balancing in task scheduling. The CDCSO Multi-Objective method integrates Chicken Swarm Optimisation with chaotic dynamics and Darwinian theory to enhance global exploration and optimise convergence rate. This performance-enhanced CDCSO algorithm models the cloud task planning problem as NP-hard and use optimisation principles to address it based on multiple objectives. CDCSO formulates the multi-objective fitness function utilising objective parameters including resources, costs, mission completion time, reaction time, and load balancing index. Utilising this multi-objective characteristic, CDCSO effectively assigns jobs to the energy-efficient, cost-effective, and time-reduced, optimally load-balanced virtual machines (VMs).

Yazdanbakhsh, Mina, Reihaneh Khorsand Motlagh Isfahani, and Mohammadreza Ramezanpour [6] put forth A multi-target method for elastic cloud resources (MODE) involves dynamic task planning, wherein an algorithm is presented to generate independent, non-dominated jobs. The non-dominated sets are organised into various tiers based on a novel crowding gap. An Elastic Resource Building is proposed for the dynamic allocation of resources depending on the maximum available virtual machine load. Abualigah, Laith, and Ali Diabat [7] introduced A novel hybrid antlion optimisation algorithm for addressing multi-target task planning issues in cloud computing environments, emphasising elite differential evolution. The problem's multi-target nature arises from the necessity to concurrently minimise makeup and optimise resource utilisation in the proposed process, referred to as MALO. The antlion optimised algorithm was enhanced by employing elite-based differential generation as a local research strategy to augment operational capabilities and prevent stagnation in local optima. The CloudSim toolset was utilised to conduct two experimental series on both synthetic and real trace datasets. The findings indicated that MALO outperformed other established optimisation techniques. MALO converged more swiftly and was more appropriate for extensive planning problems compared to other approaches in broader search spaces.

Sardaraz, Muhammad, and Muhammad Tahir [8] introduced a multi-target planning algorithm for the orchestration of scientific operations in cloud computing. The method employs a genetic algorithm that emphasises financial expenditures and load balancing. Initially, the suggested approach identifies the optimal solution for each parameter. The algorithm identifies the optimal solution for all parameters based on these outcomes. The suggested technique is evaluated against the conventional genetic algorithm, particle swarm optimisation, and sophisticated schedulers utilising benchmark datasets for comparative performance analysis. Devaraj, A. Francis Saviour, et al. [9] introduced a contemporary firefly hybrid and Improved Multi-Objective Particle Swarm Optimisation (IMPSO) technique, referred to as the FIMPSO load balancing algorithm. This method employs the Firefly (FF) algorithm to reduce the search space, while the improved responsiveness is achieved by the IMPSO methodology. The IMPSO algorithm identifies the optimal global particle (gbest) with a minimal point-to-line distance. The optimal particle candidates may be selected by applying the minimal distance from a point to a side. The suggested FIMPSO algorithm

Vaaheedha Kfatheen

effectively enhanced fundamental metrics, including resource utilisation and job reaction time, under average load conditions.

Proposed Enhanced Ant Colony Optimization Based Task Scheduling Technique

Upon submission of several cloud tasks by a user, the task manager can process these tasks utilising the task programmer. The task manager, upon which the suggested algorithm is predicated, determines the distribution of tasks to resources. The task planner collaborates with the resource manager, who oversees the physical and intellectual resources of the task planner and the allocation of tasks. The resource manager periodically monitors resources (both physical and virtual computers) and records data on CPU and memory utilisation. The retained data can then be utilised by the task planner. The task scheduler thus preserves current resource information through the system's compilation and updates from the resource manager. The primary directives for cloud operations are: (1) it collects data from the resource management regarding cloud tasks and resources; (2) it ensures that Ra aligns with the Ja mission. Observe that the necessity is contingent upon the scheduling method, and, with the assistance of resource management, the scheduler allocates task Ja to resource Ra.

In Ant Colony Optimisation, state transitions and pheromone updates are regulated. The probability of an ant transitioning from node a to node b is determined by Equation 1, according to the state transition rule.

$$v_{a,b} = T_{a,b}^x \cdot \eta_{a,b}^y / \sum_k T_{a,b}^x \cdot \eta_{a,k}^y \quad (1)$$

x and y represent parameters for pheromone and its enhancement. We employ a diversification strategy with viewers to enhance the efficacy of the job programmer in cloud computing environments. The core principle of the diversification technique is to establish varying probability factors for viewers to address the optimisation issue. Equation 2 delineates the likelihood parameter for observing ants.

$$v_m = u_0 \times m/c \quad (2)$$

$$\forall m \in \{1, 2, 3, \dots, c\}, v_m \leq u_0 \text{ and } 0 < u_0 < 1$$

According to Eq. 2, the likelihood parameter and the degree of dependence on other ants vary for each onlooker ant within the colony system. An effective Pheromone enhancement program is crucial for minimising the makespan of cloud tasks. The acceleration parameter for local pheromone evaporation is utilised in reinforcement schemes. The local pheromone updating rule of our algorithm is founded on Equation 3.

$$T_{a,b} = (1 - q - g)T_{a,b} + qT_0 \quad (3)$$

Where q represents the local pheromone evaporation coefficient and T₀ denotes the initial pheromone value. The suggested global pheromone update rules can be executed using Equation 4, grounded in the local pheromone update principle.

$$T_{a,b} = (1 - v)T_{a,b} + \Delta T_{a,b}^{best} \quad (4)$$

Algorithm 1 illustrates the proposed methodology for job planning of observer ants utilising Ant Colony Optimisation (ACO). The algorithm's input consists of the optimal mapping data between tasks and resources, as well as cloud tasks and resources (VM). It liberates all the ants from the colony system to address the issue at the first phase of the cycle.

Assigning a task to a resource based on the likelihood parameter defined by Eq1. The makespan information for an ant group, comprising a standard ant and its accompanying spectator ants, is updated. With revised makespan data, one of the ants will transform into a standard ant whose makespan is optimal for the collective. Another axe, yet the

**Vaaheedha Kfatheen**

ordinary ant serves as a bystander, while one of the bystander axes with the most inadequate area is a feeble axe. The upgrading process is thereafter executed at the local pheromone.

The make span data is recorded once all the ants in the colony system have completed their journey. The individual possessing the most superior mapping information between cloud tasks and resources will be selected as the Queen Ant among ordinary ants. The initial component is the global system for pheromone updates. If the queen ant's makespan is superior to the current map $\left(J_{a,S,b}\right)_{bt}$, the queen ant's mapping will be designated to map $\left(J_{a,S,b}\right)_{bt}$. The procedure ultimately returns the map $\left(J_{a,S,b}\right)_{bt}$. Should the stipulated criterion remain unfulfilled, the subsequent cycle would be repeated. Alternatively, the cloud scheduler utilises the provided mapping information to allocate cloud jobs to resources.

RESULT AND DISCUSSION

The evaluation metrics like Throughput (in mbps), Resource Utilization (in %), Latency (in mS), End-to-End Delay (in mS), Average Waiting Time (in mS) are used to evaluate the proposed E-ACO task scheduling algorithm with existing task scheduling algorithms like PSO, GA, and ACO based on the time (in minutes). The cloudSim tool is used for implementing the task scheduling algorithms. Table 1 depicts the Throughput (in mbps) obtained by the existing and proposed task scheduling techniques based on Time (in minutes). Figure 1 presents the graphical representation of the Throughput (in mbps) obtained by Proposed E-ACO, ACO, PSO and GA task scheduling algorithms. From the table 1 and figure 1, it is clear that the proposed E-ACO gives higher throughput when it is compared with the existing optimization techniques for task scheduling algorithms.

Table 2 gives the resource utilization (in %) by the existing and proposed task scheduling techniques based on Time (in minutes). Figure 2 depicts the graphical representation of the resource utilization by Proposed E-ACO, ACO, PSO and GA task scheduling algorithms. From the table 2 and figure 2, it is clear that the proposed E-ACO gives higher resource utilization when it is compared with the existing optimization techniques for task scheduling algorithms. Table 3 gives the Latency (in mS) by the existing and proposed task scheduling techniques based on Time (in minutes). Figure 3 depicts the graphical representation of the Latency (in mS) by Proposed E-ACO, ACO, PSO and GA task scheduling algorithms. From the table 3 and figure 3, it is clear that the proposed E-ACO gives less latency when it is compared with the existing optimization techniques for task scheduling algorithms.

Table 4 gives the End-to-End Delay (in mS) by the existing and proposed task scheduling techniques based on Time (in minutes). Figure 4 depicts the graphical representation of the End-to-End Delay (in mS) by Proposed E-ACO, ACO, PSO and GA task scheduling algorithms. From the table 4 and figure 4, it is clear that the proposed E-ACO gives less End-to-End Delay (in mS) when it is compared with the existing optimization techniques for task scheduling algorithms. Table 5 gives the Average Waiting time (in mS) by the existing and proposed task scheduling techniques based on Time (in minutes). Figure 5 depicts the graphical representation of the Average Waiting time (in mS) by Proposed E-ACO, ACO, PSO and GA task scheduling algorithms. From the table 5 and figure 5, it is clear that the proposed E-ACO gives less Average Waiting time (in mS) when it is compared with the existing optimization techniques for task scheduling algorithms.

CONCLUSION

The main goal of planning algorithms is to assign a mission or a job to the right resource. Since the most important means in the execution of tasks are computer resources, this is the first element in a high-level computing model, such as cloud computing. An improved ACO task planning for planning tasks in cloud computing environments is proposed with Onlooker ants in this article. This proposal EACO adapted diversifying and strengthening strategies with onlooker ants to avoid long pathways where leading ants wrongly collect pheromones. In contrast to current

Vaaheedha Kfatheen

optimization algorithms such as PSO, AC O and GA, this proposed EACO performs at a minimal average time, latency and end-to-end delays, and higher resource utilization and throughput.

ABSTRACT

Internet of Things (IoT) is transforming traditional classrooms by enabling the integration of digital and internet-based smart devices, which benefit both students and teachers. In traditional classrooms, IoT is being used for content management, including content creation and lesson delivery, as well as classroom management, such as optimizing classwork and keeping track of crucial resources. IoT provides a platform for creating a smart learning environment that enhances the learning experience of students. This paper surveys the applications of IoT in education, focusing on the benefits of using IoT, the different types of devices and sensors, and their potential impact on traditional classroom settings and teaching methodologies. Additionally, this paper examines the challenges associated with implementing IoT in education and proposes potential solutions to address them. By exploring the role of IoT in enhancing the learning experience and its potential impact on education, this paper seeks to provide a comprehensive understanding of the emerging trends in education technology.

Keywords: Internet of Things, sensors, internet-based smart devices

INTRODUCTION

The Internet of Things has revolutionized various industries, including education[1].IoT devices give students better access to learning materials and communication channels in the classroom, while also allowing teachers to measure student learning progress in real-time [2]. Additionally, IoT technology is being used to help teachers connect better

96509

**Dhanasekar and Sujith**

with their peers and students, as well as to boost the learning capability of students through interactive and engaging learning experiences [1][3]. The IoT enables education to be connected with digital infrastructure, facilitating the shift in teaching approaches from traditional to digital [3][4]. Furthermore, IoT solutions are expanding education beyond classrooms, providing technical assistance to teachers and students alike. With the help of IoT devices, students can learn all subjects from languages to medical sciences through graphics and animation [4][1]. Overall, IoT can significantly improve teaching standards and learning capabilities in traditional classrooms, enhancing education as a whole.

IoT-based systems are designed to store and distribute data in specially designed applications, with registered students issued IDs and passwords to access the content in IoT-based distance learning programs [4]. IoT developers have designed tools that are worth investing in for the benefit of both students and teachers alike, with institutions able to employ a certified Internet of Things developer to create online portals for students [4]. The use of IoT features can make learning more accessible, affordable, and convenient for students, and will significantly improve the quality of teaching in the education sector [4]. While the text does not provide specific examples of IoT being used in distance learning or online education, there are exciting examples of IoT in education that enhance the interactive component of learning, increase student accessibility, improve teacher efficiency, and bolster the educational experience. These less ambitious but still significant examples highlight the potential of IoT devices and applications in online education.

IoT has brought many benefits to the education sector, and its implementation can supplement traditional classroom methods with cutting-edge technology, making learning easy for everyone [4][5][4]. Implementing IoT in education can introduce innovative digital technologies into learning activities, simplifying and streamlining the learning process, making it more efficient and productive [6]. Teachers can utilize IoT to monitor student progress and track their attendance and progress in education [4][6]. This personalized approach to teaching can be achieved through IoT technology in education, allowing for a more individualized and tailored learning experience for each student [6]. Furthermore, the use of smart HVAC systems enabled by IoT can aid in climate control in schools, while smart cameras can improve security on campus, providing a safe learning environment for students [2]. Energy and water consumption can also be optimized through the use of IoT, helping institutions minimize costs and take a step towards environmental conservation [7]. Organized data can be used to take insights and shape decisions in education, enabling institutions to perform management tasks faster and risk-free [7]. It is clear that the benefits of IoT in education must be understood by management and officials, as educational institutions that implement IoT in education are likely to become top market leaders [6][7]. Therefore, encouraging stakeholders to use technology in educational environments like classrooms is necessary for successful implementation of IoT in education, as it is changing how learning is delivered from kindergarten to 12th grade [7][5].

Devices and Sensors in enhancing the learning experience

The use of IoT in education is a significant move towards embracing technology in the classroom. IoT has the potential to have a significant impact on education, offering various benefits to the education sector. It offers technical assistance to teachers and students, enabling them to tap into their full potential and enhance their learning capabilities [1]. IoT enables remote learning and access to educational resources from anywhere, supplementing e-learning and SMART board infrastructure in educational institutions [1][2]. It can also improve the efficiency of educational institutions by automating administrative tasks and providing real-time data analysis, increasing student engagement and personalized learning experiences [2]. IoT technologies can be used for content creation, lesson delivery, content management, and classroom management in educational institutions [2]. Moreover, IoT devices allow teachers to measure student learning progress in real-time and give students better access to learning materials and communication channels [3]. The benefits of using IoT in education can include increased efficiency and effectiveness in teaching and learning, improving the way learning is imparted, and leading to a structural shift in the learning process [1][2].

**Dhanasekar and Sujith**

IoT-based devices and sensors have the potential to revolutionize the field of education. These smart devices and sensors can collect valuable data on student engagement levels, attendance rates, academic performance, and even monitor the learning environment itself. The data collected by these IoT devices can then be used to improve the overall learning experience. For instance, IoT sensors can track how long a student spends on a particular task or how often they ask for help, allowing teachers to provide targeted assistance to those who need it most [8]. In addition, IoT sensors can be used to track the movement and behavior of students in the classroom [8]. IoT-enabled devices such as smart boards can also be used in education, providing an interactive and engaging learning experience [8]. Furthermore, IoT-powered attendance systems can be used in education to streamline attendance tracking and cut down on administrative tasks [8]. IoT devices can also be used to monitor the temperature, air quality, and humidity in the learning environment, which can have a significant impact on student productivity and health [8]. Additionally, IoT sensors can monitor equipment such as computers and printers, ensuring that they are functioning correctly and reducing maintenance costs [8]. The assets that can be tracked and managed through IoT sensors include textbooks, laptops, projectors, equipment, and supplies. IoT sensors can be used for asset tracking in schools, making it easier to locate missing items and manage inventory [8]. Moreover, electronic bracelets can be used as one of the devices/sensors in IoT-based education. These bracelets can track student movements and behavior within the learning environment, providing valuable data on student engagement levels and areas of improvement [16]. This data can then be used by teachers to adjust lesson plans and provide targeted support to individual students [5]. As technology continues to advance, it is clear that IoT devices and sensors have the potential to transform the field of education and improve student outcomes.

IoT has the potential to revolutionize student engagement and interaction in the education sector. By using gamified applications on IoT devices, lessons can be made more interesting and engaging for students [6]. Interactive tables are an example of IoT devices that can facilitate engagement by allowing students to interact with different subjects, such as history and science, in a tactile way [6]. IoT devices can provide interactive learning content, where students can make choices and solve tasks during their learning experience [6]. Accessing class and homework through IoT technology outside the building can also improve student engagement by making learning more accessible and convenient [7]. Moreover, IoT can break down barriers and enable remote learning, enhancing student engagement and interaction. Custom technology enabled by IoT can make learning easier for students with disabilities, further enhancing engagement [7]. IoT provides platforms for students to communicate with their peers, which drives interest and collaboration [7]. IoT can also be used to publish student work on a certain platform and connect students with people worldwide who share educational interests [7].

IoT can enhance student engagement by allowing them to connect with people worldwide, enabling virtual field trips, such as visiting the bus that Rosa Parks protested on at the Henry Ford Museum, and providing access to information and experiences they wouldn't have had otherwise [7]. The use of IoT is changing the game in education by enhancing student engagement and interaction, transforming traditional lessons into interactive and engaging learning experiences [6]. However, it is important to note that too much connectivity through IoT may distract students from their education [7]. Schools should make the most of IoT technology to enhance student interaction but should also ensure that it is mainly controlled by educators or limited to showing only educational material to maintain student interest in education [7]. IoT has the potential to increase student engagement and interaction in numerous ways and should be integrated into education systems in a way that supports learning and enhances student outcomes.

Impact of IoT on traditional classroom settings and teaching methodologies

The impact of IoT on traditional classroom settings and teaching methodologies cannot be underestimated, as it has the potential to revolutionize the way education is delivered. One potential benefit of IoT technology is that it can help teachers keep track of crucial resources in traditional classroom settings, such as textbooks, equipment, and other materials [1]. Additionally, IoT technology can optimize classwork and boost students' learning capability by providing interactive and engaging learning experiences [1]. Furthermore, IoT can enhance the effectiveness of teaching in traditional classroom settings, offering real-time access to course resources such as videos and textbooks

**Dhanasekar and Sujith**

and facilitating the development of learning communities and a culture of professionalism in schools [1]. Another advantage of IoT is that it can reduce the time spent by instructors on other standard activities, such as grading exams, allowing them to focus on more creative work and constantly improve their skills [1][16]. Moreover, the introduction of IoT in education has already brought significant transformation in the teaching and learning process in developed countries.

One of the notable transformations is the emergence of virtual learning systems, online systems, and technology-supported smart classrooms through IoT interventions [17]. Additionally, IoT devices can provide real-time access to course resources and automated tasks such as grading, note-taking, schedule checking, and research tasks. This can enable teachers to provide targeted help and support to students based on their progress in real-time and improve connectivity in classrooms [18][1][16]. Furthermore, IoT has the potential to extend a smart environment for reasoning, learning, and predicting in traditional classroom settings. The use of robots and artificial intelligence through IoT projects has already replaced human efforts in teaching methodologies [18][17]. Finally, IoT can create interactive and inclusive learning environments for both students and teachers, bringing a more appealing, engaging, flexible, and quantifiable education system to traditional classrooms [18].

Challenges in implementing IoT in education

The implementation of IoT in education is expected to face challenges, and education professionals need to acknowledge these issues before fully introducing IoT in pre-schools, classrooms, and lecture halls [9][10]. Despite the fact that the text does not provide specific information about what those challenges are, efforts should be put in place to overcome these challenges [9][2]. The successful implementation of IoT in education will depend on three crucial elements: connectivity and network infrastructure, security and privacy concerns, and strict policies and decisions for successful implementation [1]. Security threats can cause unpredictable spendings, data loss, and reputational damage [9]. Moreover, there are multiple security threats associated with implementing IoT in education, such as ransomware, smurfing, rogue devices, and hardware attacks [9]. The another concern is the reliability of IoT devices, which can experience technical issues that disrupt learning and teaching in the classroom. This can lead to frustration among teachers and students, causing them to lose confidence in the technology's effectiveness [11]. Connectivity and network infrastructure are important for successful implementation. However, the integration of IoT devices into existing systems can be complex [11]. Therefore, training and support for teachers and staff on IoT technology is necessary [11]. Educational institutions also face several major challenges when adopting IoT solutions, such as incompatibility of devices, absence of financial resources, and scalability issues [9]. Additionally, the cost of implementing and maintaining IoT devices can be a barrier for some educational institutions, preventing widespread adoption of the technology [11]. To overcome these challenges, management and officials must understand the challenges and encourage stakeholders to use technology in educational environments [2]. In conclusion, implementing IoT in education faces many challenges, but with proper training and support for teachers and staff, strict policies and decisions for successful implementation, and addressing security concerns, it is possible to overcome these challenges and reap the benefits of IoT in education.

The challenges of IoT integration can be daunting, but they can be overcome with effective strategies and timely detection of the challenges and their implications [12]. When implementing IoT, organizations may face several challenges, including security, scalability, interoperability, cost, data management, and organizational change. These challenges can be addressed by designing a multi-level solution that involves stakeholders early in the process, provides adequate training and support, and leverages existing infrastructure to reduce costs [12][13][14]. One way to address the challenge of security is by implementing encryption, user authentication, and secure data storage [13]. To address scalability challenges, organizations can use cloud-based solutions and distributed computing. Open standards and APIs can help address interoperability challenges [13]. Effective data analytics strategies can be implemented to overcome the challenge of data management. In addition to these strategies, organizations can also consider hiring a small team of experts either in-house or on a contractual basis to reduce the costs of IoT implementation [2]. Furthermore, organizations can explore new and improved ways to make IoT-enabled systems more affordable and easier to implement [2]. Experienced IoT teams can help overcome integration challenges by

**Dhanasekar and Sujith**

leveraging their vast experience in making software communicate with different types of connected devices [12]. To address the challenges of increasing social distancing and reducing personal interaction brought about by the COVID-19 pandemic, the education sector can consider implementing measures to ensure that the use of IoT services does not completely replace in-person interaction and socialization opportunities [11]. Furthermore, existing data sources can be brought together to create a foundation for new data-driven approaches [15]. Even a slight improvement in metrics like uptime, security risks, and overall equipment effectiveness can lead to a significant return on investment [15]. However, it is important to note that there is no one solution that can ensure high security and prevent malicious attacks. A strategic security approach can be helpful in addressing these challenges [9]. To overcome these challenges, it is recommended to start with known, specific, well-documented problems, and gain experience before pursuing more challenging IoT opportunities.

Future Possibilities of IoT in Education

The future of IoT in education is expected to bring a significant transformation in the educational environment and learning experience of students. IoT holds a promising future in the education sector with its huge potential and is expected to continue its implementation in education institutions [15]. Educators, parents, and students must change their perception and start supporting the changes in educational policies to make the most of IoT in education [15]. Making these technologies accessible and easy to use is the most important factor to focus on, as it will take some time for IoT to become a part of mainstream education [15]. However, the use of advanced technology in classrooms is likely to increase, and IoT provides educators with greater power to personalize their students' learning experience and makes it easier than ever before for students to learn through play [15][10]. IoT solutions help make educational plans up-to-date and engaging for students and make the most of the resources available, improving school management and administration processes [14]. Schools and universities are taking confident steps towards smart education IoT solutions that can provide a number of benefits for education businesses in terms of holding market share and competition, increasing financial return on investment, and becoming a growing point for education businesses. However, there are also a number of challenges and considerations that need to be taken into account in the future of IoT in education [8][14]. Therefore, educational institutions must encourage stakeholders to use technology in education, as IoT in education is changing how learning is delivered and has the potential to significantly impact education [7][8][10]. Students who use mobile IoT devices in the classroom can automate tasks such as note-taking, schedule checking, and research, thus making it more interactive and immersive [5]. In conclusion, the IoT has many potential applications in education and implementing IoT-based solutions can help educational startups and classical institutions gain a competitive advantage and take the technological lead, shaping and defining the future of education. [14][5].

DISCUSSION

The integration of Internet of Things (IoT) into education has the potential to transform the traditional mode of learning and teaching [17]. To start with, IoT can supplement the existing e-learning and SMART board infrastructure by expanding smart board functionalities to improve interactivity [1][8]. Additionally, IoT can be used to create a more personalized learning experience for students by tracking their progress and providing real-time feedback [1]. This will enable teachers to measure student learning progress in real-time and provide technical assistance to tap into their full potential [2][1]. Furthermore, IoT can enhance the overall efficiency and effectiveness of educational institutions by automating attendance-keeping [17], enabling predictive maintenance for school infrastructure and equipment, monitoring a student's whereabouts on campus, and keeping parents updated on things like test results [8]. The integration of IoT can also enhance both traditional and virtual classrooms, making education more practical and interactive [9][10]. In order to maximize the benefits of IoT in education, it is necessary to determine how well it is implemented in an educational establishment [1]. Education policy should support the use of technology to strengthen the case for deploying IoT in educational institutions, as IoT has the potential to have a significant impact on education by improving teaching standards and learning capabilities, surpassing the

boundaries of the institutes, creating communication channels for students, and providing better access to learning materials [1][2].

CONCLUSION

The emergence of Internet of Things (IoT) technology has brought significant benefits to the education sector, as evidenced by the findings of this survey. IoT devices can be used for content creation, lesson delivery, content management, and classroom management, and can supplement e-learning and SMART board infrastructure in educational institutions. The use of IoT in education can improve the efficiency of educational institutions by automating administrative tasks and providing real-time data analysis, ultimately increasing student engagement and personalized learning experiences. Furthermore, IoT can provide technical assistance to teachers and students, enabling them to tap into their full potential and enhance their learning capabilities. The use of cloud-based solutions and distributed computing can address scalability challenges in the implementation of IoT technology. In addition, IoT devices can provide interactive learning content, where students can make choices and solve tasks during their learning experience, ultimately revolutionizing student engagement and interaction in the education sector. The emergence of virtual learning systems, online systems, and technology-supported smart classrooms through IoT interventions is a notable transformation in the education sector. Moreover, IoT technology can optimize classwork and boost students' learning capability by providing interactive and engaging learning experiences. However, the implementation of IoT technology in education also has potential weaknesses and biases that must be acknowledged and addressed. Future research should focus on identifying and addressing these limitations and gaps to ensure that the benefits of IoT technology in education are fully realized.

ABSTRACT

The purpose of this study was to investigate the effects of women's prenatal health and lifestyle on the menstrual cycle. This study investigated the health of 320 women aged 13-53. Data analysis was performed using R software version 4.3.2 and MS-Excel. Out of 320 women 21% have irregular periods due to hormonal changes, 38% have menstrual disorder of Dysmenorrhea (painful periods), 47% say that their schedules affect their daily lives. Age was associated with menstrual cycle length, menstrual cycle duration, diet was associated with menstrual cycle length, regularity of menstrual cycle, menstrual flow was associated with body weight and working hours ($p < 0.05$). Moreover, cycle irregularity depends on diet, working hours, and occupation. Young women are more likely to have irregular menstruation and therefore they need to eat healthy, meditate and consult a gynecologist.

Keywords: Menstrual health, menstrual disorders, dysmenorrhea, irregular periods, menstrual bleeding, menstrual flow

INTRODUCTION

Menstrual cycle is a natural process having blood discharge from uterus through the vagina in the reproductive age of women[1]. In a world, about 52% of the female population is of reproductive age. And these females menstruate each month for 2 to 7 days.[2] Menstrual health is not a disease, it is a physical, mental and social improvement phase.[3] Women menstrual cycle affected by different menstrual disorders. It includes dysmenorrhea, menorrhagia, oligomenorrhea, PCOS.[4] Dysmenorrhea is the most frequent menstrual disorder in which menstrual cramps occurred during a cycle.[5,6] In menorrhagia heavy bleeding is occurred and it is about 80 ml per cycle.[7]

Oligomenorrhea refers to irregular or delayed menstrual cycles which may be influenced by hormonal imbalance, improper dietary.[8] PCOS affects women during their reproductive age. About 2.2% to 26.7% of women faces PCOS problem.[9] Irregular cycles effect on physical, mental and reproductive problems due to which pregnancy problems are raised.[10] Irregularity of periods are due to puberty, vaginal infections, stress, diet and hormonal changes.[11] Meditation practice can help to reduce physical as well as mental stress to regulate periods. It also reduces cramps during periods.[12]

MATERIALS AND METHODS

Research Design: A cross-sectional study conducted in Phaltan Tehsil to collect sample of 320 women aged between 13-53 years.

Data collection: According to the Census India 2011, Phaltan Tehsil has about 166417 female population.[13] Out of these population a sample of 320 women aged between 13-58 years were selected by simple random sampling method which were considered as representative of all regions of tehsil.[14] This sample were collected through Google form questionnaire. It has questions on demographic factors as well as characteristic related to menstrual health condition.

Statistical Methods:

The data was analyzed by descriptive statistics, Chi-Square test of independency, test for proportionality and multivariate logistic regression using R-software, version 4.3.2 and MS-Excel. Descriptive statistics was used to find count, percentage and proportion. Chi-square test was used to check independency between categorical variables.[14] Test for proportionality was used to check proportion of women of different age groups, diet type and their regularity condition. A multivariate logistic regression was applied to find the more significant factors associated with menstrual health condition.

RESULTS

Table 1. Demographic Information

The following table shows demographic information of 320 women aged between 13-53 years.

Characteristics	Groups / Categories	Women Count (n)	Percentage (%)
Age (in years)	13-18	41	12.8125
	18-23	65	20.3125
	23-28	29	9.0625
	28-33	50	15.625
	33-38	47	14.6875
	38-43	34	10.625
	43-48	32	10
	48-53	22	6.875
Weight(in kg)	25-40	33	10.3125
	40-55	93	29.0625
	55-70	141	44.0625
	70-85	53	16.5625
Marital Status	Married	170	53.125
	Unmarried	150	46.875

Total 320 females were participated in the survey in the age group 13 - 23 years with mean age 31 years. Distribution of women according to their weight was 25-40(10.31%), 40-55(29.06%), 55-70(44.06%) and 70-85 (16.56%). About 53.13% were married and 46.87% were unmarried women in the study.

Bhosale and Katkar

Table 2.Cause of Irregular Periods

The following table represents the distribution of women based on the causes of their irregular period

Cause	Women Count (n)	Percentage (%)
Stress	51	15.9375
Diet	28	8.75
Hormonal Change	67	20.9375
Other	174	54.375

Out of all the respondents, around 15.93% reported stress, 8.75% said diet, 20.93% mentioned hormonal change as a cause of irregular periods and 54.37% gave other reason for irregularity of periods.

Table 3.Menstrual Disorders

The following table gives the distribution of menstrual disorders among women.

Disorders	Women Count (n)	Percentage (%)
Dysmenorrhea (painful period)	122	38.125
Menorrhagia (heavy bleeding)	44	13.75
Oligomenorrhea (infrequently period)	48	15
Polycystic ovary syndrome (PCOS)	14	4.375
None of these	92	28.75

Majority of 38.12% participants had Dysmenorrhea, 13.75% had menorrhagia, 15% had oligomenorrhea, 4.37% had PCOS disorder and remaining 28.75% had no any disorder.

Table 4.Menstrual Symptoms Interfere With Daily Routine

The following table presents percentage of women who reported that menstruation interferes with their daily routine.

	Women Count (n)	Percentage (%)
Mildly	151	47.1875
Moderately	93	29.0625
Severely	21	6.5625
Not at all	55	17.1875

Most of the 47.18% respondents said mild, 29.06% said moderate, 6.56% said severe and 17.18% said no interference of menstruation in their daily routine.

Table 5.Chi-square Test For Independency

The following tables illustrate association between different categorical factors.

Variable	Association with			
	Length of Cycle(Gap Between Two Period)		Duration of Menstrual Bleeding(In Days)	
	χ^2	p - value	χ^2	p - value
Age(in years)	53.897	0.0001022	96.408	1.239e-11
	Length of Cycle (Gap Between Two Period)		Regularity of Cycle	
	χ^2	p - value	χ^2	p - value
Diet	59.966	2.948e-12	17.1666	0.0006532
	Weight		Woking Hours	
	χ^2	p - value	χ^2	p - value
Menstrual	40.9951	1.151e-05	23.	0.0006488

Flow		487

The study was also discovered that age was significantly associated with length of cycle (gap between two periods), duration of menstrual bleeding (in days) ($p < 0.05$). There was also dependency between diet and length of cycle (gap between two periods), regularity of a cycle ($p < 0.05$). Association of menstrual flow with weight and working hours was found ($p < 0.05$).

Table 6. Chi-square Test For Independence

Variable	Association with					
	Duration of bleeding in days		Regularity of Cycle		Menstrual Flow	
	χ^2	p-value	χ^2	p-value	χ^2	p-value
Meditation	9.4008	0.0244	7.8489	0.00508	16.31	0.000286

The study also revealed that meditation was significantly associated with duration of bleeding in days, regularity of cycle and menstrual flow ($p < 0.05$).

Table 7. Test For Proportionality

The following table displays the analysis of the proportionality testing.

Hypotheses		Z Statistic	p value
$H_0: P1=P2$ (The proportion of women with irregular menstrual cycle in age group 13-33 is equal to the proportion of women with irregular menstrual cycle in age group 33-53)	$H_1: P1>P2$ (The proportion of women with irregular menstrual cycle in age group 13-33 is greater than proportion of women with irregular menstrual cycle in age group 33-53)	4.0505	0.999974
$H_0: P1 = P2$ (There is no significance difference between the proportion of diet type and regularity of period)	$H_1: P1 \neq P2$ (There is significance difference between the proportion of diet type and regularity of period)	2.1925	0.985828

From the test of proportionality, it was observed that the proportion of women with regular cycle in age group 13 - 33 is higher than age group 33 - 53 ($p < 0.05$). The significant difference between proportion of diet type and regularity of period was also observed ($p < 0.05$) in this study.

Table 8. Logistics Regression Model For Regularity Of Periods

The following table outlines the findings from the logistic regression models.

	Model-1			Model-2		
	Independent Variable			Independent Variable		
	Tirednes (β_1)	Occupation (β_2)	Diet (β_3)	Working Hours (β_1)	Occupation (β_2)	Diet (β_3)
Slopes	-0.4627	-0.2036	-0.2716	-0.4310	2.7479	-0.3463
p-values	0.1192 ($>\alpha$)	0.0946 ($>\alpha$)	0.267 ($>\alpha$)	0.0387 ($<\alpha$)	0.00371 ($<\alpha$)	0.1675 ($>\alpha$)
Intercept (β_0)	2.5044 (p-Value= 0.0004695)			2.987 (p-value = 0.00281)		
AIC	418.85			413.78		

The analysis of Model-1 and Model-2 highlights key factors influencing the regularity of periods. Model-2 is a better fit than Model-1, as indicated by its lower AIC (413.78 vs. 418.85). The results show that increased working hours

Bhosale and Katkar

causes irregularity in periods ($p = 0.03878$), whereas certain occupation positively impacts regularity ($p = 0.00371$). Since the maximum number of women in the study are housewives. Housewives may experience less work-related stress and have regular sleep pattern. Although diet shows a negative effect (-0.3463), it is not statistically significant, indicating that other factors might affect on regularity of periods. In Model-1, tiredness was also tested and shows a negative impact, suggesting that exertion may contribute to irregular cycles, even though it was not statistically significant.

DISCUSSION

Overall, both physical and mental health factors influence menstrual regularity. Poor dietary habits and irregular work schedules may disrupt hormonal balance, while stress from jobs and long working hours can lead irregular periods.

ACKNOWLEDGEMENT

We would like to acknowledge all the respondents who took part in the study. We are grateful to Prof. Dr. P. H. Kadam, Principal, Mudhoji College, Phaltan who inspire us for writing our paper.

ABSTRACT

In the realm of modern cryptography and data security, the quest for stronger, more resilient encryption methods is a perpetual endeavor. This abstract introduces a pioneering approach that marries the power of Harris Hawks Optimization (HHO) [1] with Elliptical Curve Cryptography (ECC) [2] to generate security keys through fragmentation, enhancing both the strength and efficiency of cryptographic key generation. The fragmented key generation approach, driven by HHO and ECC, represents a remarkable fusion of nature-inspired optimization and advanced mathematical principles. HHO, inspired by the cooperative hunting behavior of Harris's Hawks, optimizes the key generation process by adapting and fine-tuning the parameters to maximize security while minimizing computational overhead [3]. Complementing HHO's optimization prowess, ECC, renowned for its robustness in modern cryptography, forms the foundation for creating fragmented security keys. Leveraging the inherent complexity of elliptical curves, ECC generates keys that are exceptionally resilient against brute-force attacks, offering a level of security crucial in safeguarding sensitive data.

Keywords: HHO, inspired by the cooperative hunting behavior of Harris's Hawks, optimizes the key generation process by adapting and fine-tuning

INTRODUCTION

In today's digital age, Electronic Health Records (EHRs) have become the cornerstone of modern healthcare. They enable healthcare providers to efficiently manage patient information, streamline clinical workflows, and improve patient care. The migration of EHR systems to the cloud has introduced numerous benefits, including enhanced

Ambika

accessibility, scalability, and cost-efficiency [4]. However, this digital transformation has also heightened security concerns surrounding the protection of sensitive patient data. To address these challenges, healthcare organizations must employ advanced security measures, with cryptography algorithms and optimization techniques playing a pivotal role in safeguarding cloud-hosted EHR data. The importance of securing EHR data in the cloud cannot be overstated. Healthcare providers and organizations are entrusted with a wealth of sensitive patient information, including medical records, treatment plans, billing details, and more. The loss, theft, or unauthorized access to this data can lead to severe consequences, including patient privacy breaches, legal penalties, and reputational damage. Furthermore, regulatory frameworks such as the Health Insurance Portability and Accountability Act (HIPAA) in the United States and the General Data Protection Regulation (GDPR) in the European Union mandate strict data protection measures. Cryptography, with its ability to convert data into an unreadable format that can only be deciphered with the appropriate keys, provides an effective means of achieving compliance and ensuring the confidentiality, integrity, and availability of cloud EHR data [5].

The Role of Cryptography in EHR Data Security

Data Encryption at Rest

One of the foundational principles of securing EHR data in the cloud is data encryption at rest. This involves encrypting data when it is stored on physical or virtual storage devices, ensuring that even if an unauthorized party gains access to the storage media, the data remains inaccessible without the appropriate decryption keys. Full Disk Encryption (FDE) and Transparent Data Encryption (TDE) are common methods used to secure data at rest. FDE encrypts the entire storage device, while TDE focuses on encrypting specific data fields or files.

- **Full Disk Encryption (FDE):** FDE encrypts the entire storage device, ensuring that all data on it is protected. This includes not only EHR data but also system files and other information. Disk encryption is often performed using symmetric key algorithms like the Advanced Encryption Standard (AES). FDE ensures that all data on the disk is automatically encrypted as it is written and decrypted when it is read.
- **Transparent Data Encryption (TDE):** TDE focuses on encrypting specific data fields or files within a database. It is commonly used in database management systems for securing EHR databases. TDE provides granular control over which data is encrypted, making it a suitable choice for protecting sensitive patient records.

Data Encryption at Transit

Securing data as it traverses networks or is transmitted between different cloud services is equally critical. Encryption protocols like Transport Layer Security (TLS) and Secure Sockets Layer (SSL) are employed to protect data during transmission. These protocols use cryptographic algorithms to establish secure communication channels, preventing eavesdropping and man-in-the-middle attacks. This ensures that EHR data remains confidential while in transit. Data encryption in transit ensures that EHR data remains secure while it is transmitted between different cloud services or when accessed by authorized users. This is essential to protect against eavesdropping and man-in-the-middle attacks.

End-to-End Encryption

To provide the highest level of confidentiality, end-to-end encryption is employed. This approach ensures that data is encrypted at the source (e.g., the healthcare provider's system) and remains encrypted until it reaches the authorized recipient. Only the recipient possesses the decryption keys, ensuring that not even service providers or cloud administrators can access the data in its unencrypted form. End-to-end encryption is the gold standard for securing cloud EHR data, as it provides an airtight layer of protection. End-to-end encryption provides the highest level of data security. It ensures that EHR data is encrypted at the source (e.g., a healthcare provider's system) and remains encrypted until it reaches the authorized recipient. Only the recipient possesses the decryption keys, making it virtually impossible for anyone else to access the data in its unencrypted form.

**Ambika****Public Key Infrastructure (PKI)**

PKI is often used to implement end-to-end encryption. It involves the use of asymmetric cryptography, where each user has a public key for encryption and a private key for decryption. When one user wants to send EHR data to another, they encrypt it using the recipient's public key. Only the recipient, who possesses the corresponding private key, can decrypt and access the data [6].

Homomorphic Encryption

Homomorphic encryption is an advanced cryptographic technique that allows computations to be performed on encrypted data without the need for decryption. This groundbreaking approach opens the door to secure data analytics and research on sensitive medical information without exposing it. Healthcare organizations can perform calculations, derive insights, and extract valuable information from encrypted EHR data while preserving its privacy. This not only enhances data security but also facilitates data-driven decision-making in healthcare. Homomorphic encryption is an advanced cryptographic technique that allows computations to be performed on encrypted data without the need for decryption. This approach offers a unique way to process EHR data in the cloud while maintaining its privacy [7].

Computation on Encrypted Data

With homomorphic encryption, mathematical operations can be performed on encrypted data directly, preserving the confidentiality of the data. For example, computations like addition and multiplication can be done on encrypted numbers without revealing the actual values. This is particularly useful for performing analytics and research on sensitive medical information without exposing it.

Key Management

Effective key management is integral to the success of cryptographic security measures. Encryption keys, which are used to encrypt and decrypt data, must be generated securely, stored in a protected environment, regularly rotated to prevent vulnerabilities, and revoked when necessary [8]. A robust key management system ensures that encryption keys are safeguarded against unauthorized access and loss, thereby enhancing the overall security of cloud EHR data. Effective key management is integral to the success of cryptographic security measures. Encryption keys, which are used to encrypt and decrypt data, must be managed securely throughout their lifecycle.

- **Key Generation:** Keys should be generated using strong cryptographic algorithms and secure random number generators.
- **Key Storage:** Keys should be stored in a secure and tamper-resistant manner, such as hardware security modules (HSMs) or secure key vaults.
- **Key Rotation:** Regularly rotating encryption keys helps mitigate the risk of key compromise. New keys should be generated, and data should be re-encrypted with the new keys.
- **Key Revocation:** In cases of key compromise or personnel changes, keys should be promptly revoked to prevent unauthorized access to EHR data.

Optimization Techniques for Efficient Cryptographic Security

While the use of cryptographic algorithms is essential for securing cloud EHR data, it can introduce computational overhead and potential performance bottlenecks. To address these challenges, optimization techniques are employed to streamline cryptographic processes and enhance overall system efficiency [9].

Optimized Encryption Libraries

The use of optimized encryption libraries and algorithms is critical to minimizing the computational burden associated with encryption and decryption operations. These libraries are designed to maximize performance while minimizing latency, ensuring that data remains secure without compromising system responsiveness. By leveraging these optimized libraries, healthcare organizations can achieve a balance between data security and system performance.

Ambika

Multi-Factor Authentication (MFA)

Complementing cryptographic encryption with Multi-Factor Authentication (MFA) adds an additional layer of security. MFA requires users to provide multiple forms of authentication, such as a password, a fingerprint scan, or a one-time code, before gaining access to EHR data. This robust authentication process enhances access control and mitigates the risk of unauthorized access, even if encryption measures were to be compromised [10].

Data Access Optimization

Optimization techniques can also enhance data access and retrieval speed, addressing concerns about latency in cloud-hosted EHR systems. Caching mechanisms, distributed databases, and intelligent data indexing can reduce data retrieval times, ensuring that authorized users can access patient information quickly. These optimizations are essential for maintaining the usability and responsiveness of EHR systems while upholding data security.

Quantum-Resistant Cryptography

Looking to the future, healthcare organizations must consider the potential threat posed by quantum computing to conventional cryptographic algorithms. Quantum computers have the potential to break many existing encryption methods, making it imperative to adopt quantum-resistant cryptography. These cryptographic techniques are designed to withstand quantum-enabled attacks, ensuring the long-term security of cloud EHR data.

ELLIPTICAL CURVE CRYPTOGRAPHY (ECC) ALGORITHM

Elliptic Curve Cryptography (ECC) [11] [12] is a powerful encryption algorithm that can be used to secure Electronic Health Records (EHRs).

Key Pair Generation

ECC key pair generation involves the creation of a public key and a private key. These keys are essential for encryption and decryption of EHR data. The elliptic curve equation is defined as $y^2 = x^3 + ax + b$. The base point (G) on the curve is a fixed point with coordinates (x, y).

Encryption and Decryption

ECC can be used for encrypting and decrypting EHR data, with the Elliptic Curve Integrated Encryption Scheme (ECIES) being a common choice.

Algorithm for Encryption:

- Select a recipient's public key (Q_R) from their certificate.
- Generate an ephemeral key pair (d_E, Q_E) for one-time user.
- Derive a shared secret (S) by multiplying the recipient's public key with the ephemeral private key: $S = d_E \cdot Q_R$
- Use a key derivation function to expand (S) into encryption keys for symmetric encryption (e.g., AES).
- Encrypt the EHR data using the symmetric encryption keys.
- Send the encrypted data along with the ephemeral public key (Q_E)

Algorithm for Decryption:

- Receive the encrypted data and the ephemeral public key (Q_E).
- Compute the shared secret (S) by multiplying your private key (d_R) with the ephemeral public key: $S = d_R \cdot Q_E$
- Use the key derivation function to derive the same encryption keys used for encryption.
- Decrypt the EHR data using the symmetric decryption keys.

Digital Signatures

ECC can also be used for creating and verifying digital signatures to ensure the integrity and authenticity of EHR data.

Ambika

Algorithm for Signing:

- Compute the hash of the EHR data: $h = \text{Hash}(\text{EHR\_data})$.
- Sign the hash using your private key (d_R): $\text{Signature} = d_R \cdot h$

Algorithm for verification:

- Receive the EHR data, the digital signature, and the sender's public key (Q_s).
- Compute the hash of the EHR data: $h = \text{Hash}(\text{EHR\_data})$
- Verify the signature by checking if $d_R \cdot h$ is equal to the received signature.
- If the equality holds, the signature is valid, and the data has not been tampered with.

Security Aspects of ECC

The security of ECC relies on the difficulty of solving the elliptic curve discrete logarithm problem, which is considered computationally infeasible.

- **Key Size Efficiency:** ECC provides strong security with smaller key sizes, making it computationally efficient.
- **Quantum Resistance:** ECC is believed to be more resistant to quantum attacks compared to other encryption algorithms.
- **Efficiency:** ECC's efficiency is essential, particularly in resource-constrained environments.

Key Management

Effective key management is crucial for ECC. It includes secure key generation, storage, rotation, and revocation.

Challenges and Considerations

- **Key Management:** Protecting the private key is paramount.
- **Standardization:** Use well-vetted and standardized elliptic curves.
- **Implementation Security:** Proper ECC implementation is crucial.
- **Quantum Threats:** Address potential quantum threats through post-quantum cryptography research.

Harris Hawks Optimization (HHO) Algorithm

Harris Hawks Optimization (HHO) [13] [14] is a nature-inspired optimization algorithm that takes its inspiration from the cooperative hunting behavior of Harris's Hawks, a species of raptors found in the Americas. Introduced by Heidari et al. in 2019, HHO has gained recognition as an efficient and effective optimization method for solving complex real-world problems.

The Cooperative Nature of Harris's Hawks

Harris's Hawks are known for their collaborative hunting techniques. They work together in groups, with some hawks taking on leadership roles to improve their hunting efficiency. HHO emulates these behaviors in the optimization process.

Key Components and Steps in Harris Hawks Optimization

Stage 1: Initialization

- The algorithm starts by initializing a population of hawks, where each hawk represents a potential solution to the optimization problem. These solutions are typically randomly generated.
- The fitness of each hawk's solution is evaluated using the objective function, which provides a measure of how good each solution is.
- Among the initial population, the best solution is identified and designated as the leader solution. This leader solution will guide the exploration process.

Ambika

Stage 2: Leadership and Exploration

- HHO introduces parameters that govern the balance between exploration and exploitation. These parameters control how the leader subpopulation influences the rest of the hawks.
- The leader solution guides the movement of other hawks. In the algorithm, this is accomplished by computing the relative position of each hawk to the leader and updating their positions accordingly.
- This dynamic positioning of the hawks mimics the collaborative hunting behavior observed in nature, where the group follows a leader to locate prey more effectively.

Stage 3: Updating the Leader

- During the optimization process, the fitness of each hawk's current solution is calculated. A higher fitness corresponds to a better solution.
- If a hawk discovers a solution that surpasses the fitness of the leader's solution, the leader is updated with the improved solution. This mechanism allows the algorithm to adapt and discover better solutions during the search.

Stage 4: Exploration and Exploitation

- Throughout the optimization process, the exploration and exploitation parameters are adjusted to balance the exploration of new solution areas with the exploitation of promising regions.
- This adaptive mechanism allows HHO to efficiently explore the solution space and gradually refine solutions as the search progresses.

Stage 5: Termination Criteria

- The algorithm defines stopping criteria, such as a maximum number of iterations or reaching a predefined convergence threshold.
- When these criteria are met, the algorithm terminates, concluding the search for the optimal solution.

Stage 6: Final Solution

- The best solution encountered during the algorithm's execution represents the optimal or near-optimal solution to the optimization problem.

Hunting Strategies of HHO

HHO has four main hunting strategies:

Soft besiege

The hawks surround the prey and gradually move closer to it. This forces the prey to stay in a confined area, making it easier for the hawks to attack. The mathematical equation for the soft besiege strategy is as follows:

$$y = X_{prey} - E * |J * (X_{prey} - X_{hawk})|$$

Hard besiege

The hawks form a tight circle around the prey and attack all together. This is the most aggressive hunting strategy and is used to capture prey that is difficult to catch. The mathematical equation for the hard besiege strategy is as follows:

$$Y = X_{prey} - P * |\Delta X|$$

Soft besiege with progressive rapid dives

The hawks use the soft besiege strategy to surround the prey and then they swoop down and attack from different angles. This is a very effective hunting strategy for catching prey that is trying to escape. The mathematical equation for the soft besiege with progressive rapid dives strategy is as follows:

$$Y = X_{prey} - E * |J * (X_{prey} - X_{hawk})| - L * Levy(D)$$

Ambika

Hard besiege with progressive rapid dives

The hawks use the hard besiege strategy to form a tight circle around the prey and then they swoop down and attack from different angles. This is the most effective hunting strategy, but it is also the most energy-consuming. The mathematical equation for the hard besiege with progressive rapid dives strategy is as follows:

$$Y = X_{prey} - P * |\Delta X| - L * Levy(D)$$

Where Y is the new position of the hawk, X_{prey} is the position of the prey, X_{hawk} is the current position of the hawk, E is the exploration phase, and J is a random vector. The random vector J is used to ensure that the hawks move around the prey in a random fashion. P is the exploitation phase, ΔX is the difference between the current position of the hawk and the position of the prey. L is the scaling factor. $Levy(D)$ is the levy flight functions. The Lévy flight function is used to simulate the random search patterns of the hawks.

Advantages of Harris Hawks Optimization

- **Global Search Capability:** HHO is adept at exploring the entire solution space, making it suitable for a wide range of optimization problems.
- **Biological Inspiration:** The algorithm's inspiration from the natural behavior of birds provides an intuitive connection between nature and optimization.
- **Ease of Implementation:** HHO is relatively straightforward to understand and implement when compared to some other complex optimization techniques.

Procedure of HHO

Step 1: Initialize a population of hawks: The number of hawks in the population is a parameter that can be tuned depending on the specific optimization problem. Each hawk represents a candidate solution to the optimization problem.

Step 2: Set the parameters of the algorithm: The HHO algorithm has three main parameters:

- **Exploration rate (E):** This parameter controls the exploratory behavior of the hawks. A higher exploration rate will allow the hawks to explore more of the solution space, but it may also make them more likely to get lost.
- **Exploitation rate (S):** This parameter controls the exploitative behavior of the hawks. A higher exploitation rate will allow the hawks to focus more on the regions of the solution space that have been identified as promising, but it may also make them more likely to get stuck in local optima.
- **Maximum number of iterations (N):** This parameter controls the number of times the algorithm will be repeated.

Step 3: Enter the exploration Phase: In the exploration phase, the hawks search for new and promising regions of the solution space. This is done using the following equation:

$$X_{new} = X_{hawk} + E * R * (X_{prey} - X_{hawk})$$

Where X_{new} is the new position of the hawk. X_{hawk} is the current position of the hawk. E is the exploration rate, R is a random vector, X_{prey} is the position of the prey (best solution). The random vector R is used to ensure that the hawks explore different regions of the solution space.

Step 4: Update the position of the prey: After each hawk has updated its position, the position of the prey is updated to the best solution in the population.

Step 5: Share the knowledge of the best solution among the hawks: Each hawk shares its knowledge of the best solution with the other hawks. This helps the hawks to learn from each other and improve their search performance.

Ambika

Step 6: If the termination criterion is met, then stop the algorithm and return the best solution. Otherwise, go to step 3: The termination criterion can be any condition, such as reaching the maximum number of iterations or finding a solution that is good enough.

Step 7: Enter the exploitation phase: In the exploitation phase, the hawks focus on finding the best solution in the regions of the solution space that have been identified as promising during the exploration phase. This is done using the following equation:

$$X_{new} = X_{hawk} + S * (X_{prey} - X_{hawk})$$

Where S is the exploitation rate. The exploitation rate S is used to control how quickly the hawks converge to the best solution. A higher exploitation rate will allow the hawks to converge more quickly, but it may also make them more likely to get stuck in local optima.

Step 8: Update the position of the prey: After each hawk has updated its position, the position of the prey is updated to the best solution in the population.

Step 9: Share the knowledge of the best solution among the hawks: Each hawk shares its knowledge of the best solution with the other hawks. This helps the hawks to learn from each other and improve their search performance.

Step 10: If the termination criterion is met, then stop the algorithm and return the best solution. Otherwise, go to step 7. The termination criterion is the same as the one used in the exploration phase.

Optimization Fragmented Key based Encryption Based Privacy Preserving (OFKE-PP) Approach for Securing the EHR

Cloud HER security should be guaranteed for all users. Therefore, security is a major concern when exposing information to networks. In today's world, the information is never enough protected the way it should be. Cryptography is one of the most effective and efficient components of network security. Cryptography is a technique to apply ensure the secure and reliable transaction between the sender and the receiver when transferring unintelligible information. Moreover, only the authorized receiver can have the right to decrypt the information that was sent and encrypted by the sender. The cryptography plays an essential role in order to provide security to these networks. In this contribution, an authentication mechanism is improved by utilizing the Elliptical Curve Cryptography (ECC) based encryption algorithm with the optimal key generation by using Harris Hawks Optimization (HHO) and fragment the private key. The optimal private and public key are obtained by using HHO, and the fragmented private key is used for the decryption of the text. This encryption and decryption will help to improve the authentication security by providing the secure encryption and decryption approach. Elliptical curve cryptography is a public key encryption technique which is based on the theory of elliptical curves. This encryption technique uses the properties of elliptic curve in order to generate keys instead of using the traditional methodology of generation of keys using the product of two very large prime numbers. The most important advantage of elliptical curve cryptography is the use of smaller keys providing the same level of security. ECC can provide the same security with 164-bit key that other systems provide with 1024- bit key. ECC is a public key cryptosystem which is used to generate the public key and the private key in order to encrypt and decrypt the data. Harris Hawks Optimization (HHO) is a novel optimization algorithm developed by Heidari and Mirjalili et al. in 2019. The algorithm simulates the collaborative behavior and hunting technique of Harris Hawks in nature named surprise pounce. In this smart strategy, the Hawks collaboratively attack from many directions to surprise the prey. Harris Hawks exposes several chase styles based on the nature of the plots and the escaping patterns of the victim. The standard HHO algorithm proposes the exploration and exploitation strategies, motivated by exploring prey, surprise pounce, and the unique attacking technique of Harris Hawks. The HHO algorithm is a population-based and slope optimization method. Therefore, it was utilized to many optimization problems subject to an appropriate formulation. The following are the stages of HHO: Elliptic curve cryptography (ECC) is a public-key cryptography algorithm that is well-suited for securing EHRs. ECC is based on elliptic curves, which are mathematical objects that are difficult to compute over. This makes ECC very secure and resistant to attack. Harris Hawks Optimization (HHO)

Ambika

is a metaheuristic optimization algorithm inspired by the cooperative hunting behavior of Harris hawks. HHO is a simple and efficient algorithm that has been shown to be effective in solving a wide range of optimization problems. HHO can be used to generate secure ECC parameters for EHR security. The following steps describe how to use HHO to generate secure ECC parameters:

Step 1: Initialize the HHO algorithm

Set the parameters of the HHO algorithm, including the population size, exploration rate, exploitation rate, and maximum number of iterations.

hawks = initialize HHO Algorithm (population Size, exploration Rate, exploitation Rate)

Step 2: Generate initial ECC parameters

Generate a random elliptic curve and a random base point on the curve. These parameters will be used as the initial solution for the HHO algorithm.

Ec Curve = generate Random Elliptic Curve ()

base Point = generate Random Base Point (ecCurve)

Step 3: Evaluate the fitness of the ECC parameters

The fitness of the ECC parameters is evaluated by measuring their security. This can be done by measuring the difficulty of solving the elliptic curve discrete logarithm problem (ECDLP) for the given curve and base point.

fitness = evaluate Fitness(ecCurve, base Point)

Step 4: Update the ECC parameters using HHO

The HHO algorithm is used to update the ECC parameters in order to improve their fitness. This is done by using the exploration and exploitation phases of the HHO algorithm.

for i in range(maxIterations):

hawks = updateHawks(hawks, fitness)

fitness = evaluateFitness(hawks)

Step 5: Repeat steps 3 and 4 until the termination criterion is met.

The termination criterion can be any condition, such as reaching the maximum number of iterations or finding ECC parameters that are secure enough.

Step 6: Return the secure ECC Parameters *return hawks*

Algorithm for OFKE-PP

def generate Secure ECC Parameters (population Size, exploration Rate, exploitation Rate, max Iterations):

Initialize the HHO algorithm.

hawks = initialize HHO Algorithm (population Size, exploration Rate, exploitation Rate)

Generate initial ECC parameters.

Ec Curve = generate Random Elliptic Curve()

base Point = generate Random Base Point (ecCurve)

Evaluate the fitness of the ECC parameters.

fitness = evaluate Fitness(ecCurve, base Point)

Update the ECC parameters using HHO.

for i in range(max Iterations):

hawks = update Hawks(hawks, fitness)

fitness = evaluate Fitness (hawks)

```
# Return the secure ECC parameters.  
return hawks
```

RESULT AND DISCUSSION

Dataset and Performance Metrics

The sample Electronic Health Record dataset [15] from the Kaggle repository. The metrics like Encryption time (in Milliseconds), decryption time (in Milliseconds), total time taken (in Milliseconds), and Key Generation time (in Milliseconds) are considered to evaluate the performance of the Proposed OFKE-PP and existing ECC algorithm. The performance of the proposed Optimization Fragmented Key based Encryption Privacy Preserving (OFKE-PP) Approach is evaluated with the existing encryption techniques like ECC for the given dataset varying from 150 MB to 1000 MB. Table 1 depicts the Encryption time (in ms) obtained by the Proposed OFKE-PP approach and ECC for varying size of the dataset. Figure 1 gives the graphical representation of the Encryption time (in ms) obtained by the Proposed OFKE-PP approach and ECC. From the table 1 and figure 1, it is clear that the proposed OFKE-PP approach reduces the encryption time for the varying size of the dataset than ECC. As the dataset size increases, both encryption methods (Proposed OFKE-PP and ECC) exhibit an increase in encryption time. This is a common trend, as larger datasets require more computational resources and time for encryption. ECC consistently demonstrates higher encryption times compared to Proposed OFKE-PP for all dataset sizes. This suggests that, in terms of encryption speed, Proposed OFKE-PP outperforms ECC. For a 150 MB dataset, Proposed OFKE-PP takes 58 milliseconds for encryption, while ECC takes 72 milliseconds. As the dataset size increases to 1050 MB, Proposed OFKE-PP's encryption time increases to 836 milliseconds, and ECC's encryption time increases to 1274 milliseconds. The difference in encryption times between the two methods remains relatively consistent, with Proposed OFKE-PP being faster. The data shows that both methods are scalable to some extent, as they can handle datasets ranging from 150 MB to 1050 MB. However, ECC appears to be less efficient in terms of encryption time, especially with larger dataset sizes. Table 2 depicts the decryption time (in ms) obtained by the Proposed OFKE-PP approach and ECC for varying size of the dataset. Figure 2 gives the graphical representation of the decryption time (in ms) obtained by the Proposed OFKE-PP approach and ECC. From the table 2 and figure 2, it is clear that the proposed OFKE-PP approach reduces the encryption time for the varying size of the dataset than ECC.

ECC consistently exhibits higher decryption times compared to Proposed OFKE-PP for all dataset sizes. This suggests that, in terms of decryption speed, Proposed OFKE-PP outperforms ECC. For a 150 MB dataset, Proposed OFKE-PP takes 69 milliseconds, while ECC takes 93 milliseconds. As the dataset size increases to 1050 MB, Proposed OFKE-PP decryption time increases to 974 milliseconds, and ECC decryption time increases to 1363 milliseconds. The difference in decryption times between the two methods remains relatively consistent, with Proposed OFKE-PP being faster. However, ECC appears to be less efficient in terms of decryption time, especially as the dataset size grows. Table 3 depicts the total time taken for encryption and decryption (in ms) obtained by the Proposed OFKE-PP approach and ECC for varying size of the dataset. Figure 3 gives the graphical representation of the total time taken for encryption and decryption time (in ms) obtained by the Proposed OFKE-PP approach and ECC. From the table 3 and figure 3, it is clear that the proposed OFKE-PP approach reduces the total time taken for encryption and decryption for the varying size of the dataset than ECC. ECC consistently exhibits higher total times compared to Proposed OFKE-PP for all dataset sizes. This implies that, in terms of the combined speed of encryption and decryption, Proposed OFKE-PP outperforms ECC. For a 150 MB dataset, Proposed OFKE-PP takes 127 milliseconds for the total process, while ECC takes 165 milliseconds. As the dataset size increases to 1050 MB, Proposed OFKE-PP's total time taken increases to 1,810 milliseconds, and ECC's total time taken increases to 2,637 milliseconds. The difference in total time between the two methods remains consistent, with Proposed OFKE-PP being faster. However, ECC exhibits a less efficient performance in terms of the combined encryption and decryption time, particularly with larger dataset sizes. Table 4 depicts the Key generation time (in ms) obtained by the Proposed OFKE-PP approach and ECC for varying size of the dataset. Figure 4 gives the graphical representation of the Key generation time (in ms) obtained by the Proposed OFKE-PP approach and ECC. From the table 4 and figure 4, it is clear that the

Ambika

proposed OFKE-PP approach reduces the key generation time for the varying size of the dataset than ECC. Key generation time is a critical factor in the overall performance of encryption methods, as it contributes to the time required for setting up secure communication. Key generation time is relatively independent of the dataset size. For key generation time, Proposed OFKE-PP consistently shows shorter times compared to ECC across all dataset sizes. This indicates that Proposed OFKE-PP is more efficient in generating encryption keys. For a 150 MB dataset, Proposed OFKE-PP takes 68 milliseconds for key generation, while ECC takes 75 milliseconds. As the dataset size increases to 1050 MB, Proposed OFKE-PP's key generation time increases to 1018 milliseconds, and ECC's key generation time increases to 1358 milliseconds. The difference in key generation times between the two methods remains relatively consistent, with Proposed OFKE-PP being faster.

CONCLUSION

In this section, Harris Hawks Optimization algorithm is utilized to update the ECC parameters using HHO. The performance of the proposed OFKE-PP approach and ECC is evaluated with the various performance metrics like encryption time, decryption time, key generation time and total time taken for encryption and decryption. From the results obtained, it is clear that the proposed OFKE-PP approach consumes less encryption, decryption, key generation and total time than the ECC.

ABSTRACT

A lot of people have depression, which is a mental health problem. Recent statistics show that about 3.8% of the population, including 5% of adults, suffers from depression. Face-to-face interviews and other traditional approaches of finding out if someone is depressed have their limits and don't always work. But social media sentiment analysis could help find people who are likely to get depressed. This essay will talk about how common depression is in society, the problems with traditional ways of finding depression, the possible uses of social media for finding depression, the difficulties of using social media sentiment analysis to find depression, and how well social media sentiment analysis works for finding depression.

Keywords: Face-to-face interviews, social media for finding depression, sentiment analysis to find depression.

INTRODUCTION

Depression is a common mental illness that affects a lot of people. A survey found that about 3.8% of the population suffers from depression, including 5% of adults. More women than men suffer from depression: 6% of women and

**Dhanasekar and Sujith**

4% of men do. Depression may make life a lot worse for a person and cause a lot of physical and mental health concerns. [1]. Face-to-face interviews and other traditional approaches of finding depression have problems and don't always work. Only approximately half of those with mental illnesses, like depression, are found in primary care settings. Also, traditional methods require a lot of money and time, which makes them too expensive for many individuals. So, we need more ways to find folks who are depressed early on. [2] [3] [4]. Social networking could help find those who are at danger of getting depressed. Negative remarks or posts on social media can make it possible for people to be hurt. Using machine learning algorithms on social media data to automatically find signs of sadness could be a way to find those who are at risk of getting depressed. Researchers can get behavioural data from social media that is related to how a person thinks, feels, talks, and does things. [5] [4] [6]. There are a number of problems with using social media sentiment to find depression. For example, social media data is unstructured and noisy, which makes it hard to find relevant information in it. Also, social networking sites have diverse languages and features, which makes it hard to come up with a single way to find depression. Researchers have looked into using natural language processing to look at social media posts for signs of sadness, though. They used machine learning techniques to find patterns and traits that are linked to depression. [7] [8] [3]. It has been shown that social media sentiment analysis can help find persons who are likely to get depressed. Researchers have built a text categorisation system that can quickly and easily find signs of early sadness in social media streams. This framework uses machine learning algorithms to look at social media data and find patterns and attributes that are linked to depression. Machine learning algorithms applied to social media data can automatically find signs of depression. This could help find those who are at risk of depression early on. [3] [6] [4]. Social media sentiment analysis can help find people who are at risk of depression, but it's crucial to include human knowledge in the process. Sentiment analysis is a way to automatically look at how people feel, what they think, and what they write. But it isn't always right and can miss key details that only human specialists can see. So, we can make a reliable and accurate way to find out if someone is depressed by using both natural language processing and human validation methodologies. [9] [10]. Also, research has shown that people with mental illness are interested in getting mental health assistance through social media. This shows how important it is to add human expertise to social media sentiment analysis. [5]

Social media sentiment analysis could have a big effect on mental health care. Studies have shown that people with mental illness are interested in getting mental health assistance through social media. This suggests that social media sentiment analysis could be a useful way to find and help people who need it. There have also been early attempts to use social media as a place to offer mental health treatments. [5] There are both pros and cons to using social media sentiment analysis to find out if someone is depressed. Recent research have shown that using social media can be bad for young people's mental health, including making them feel pressured to compare themselves to others with unattainable expectations. So, it's crucial to employ social media sentiment analysis along with other screening tools to find those who are at risk of depression. [17] [8] [5] Public health policy can be very helpful in encouraging the use of social media to find people who are depressed. The Substance addiction and Mental Health Services Administration (SAMHSA), for instance, has made resources available for family members of people with substance addiction or mental health issues. These resources include information on how to spot people who are at risk of depression and how to help them. In the same way, public health policies can be made to encourage the use of social media sentiment analysis to find and help people with depression. [3] [5] It looks good that social media sentiment analysis might be applied with standard screening methods. For mental disease to be found and treated properly, assessment and outcome monitoring are very important. Traditional ways of collecting social, emotional, and behavioural data don't work well for tracking changes in a person's mental health in real time. Social media sentiment analysis, on the other hand, can give you real-time information on how someone is feeling and acting. So, you may utilise social media sentiment analysis along with standard screening methods to get a better and more accurate picture of someone's mental health. [12] [5] [13]. There are several ways that social media sentiment analysis could be employed in various areas of mental health. Research has demonstrated that social media can be a useful way to promote and support mental health. In a poll of people with mental illness who use social media, those who answered said that talking about their own experiences with mental illness can help eliminate stigma and raise awareness. You can use machine learning and deep learning to sort things, and you can use social media sentiment analysis to keep an eye on or look at levels of sentiment. There hasn't been much research on how to promote mental

**Dhanasekar and Sujith**

health in young adults, but what there has been shows that social media is seen as a good resource. So, social media sentiment analysis could be used in different areas of mental health to help people and raise awareness. [11] [14] [19]

METHODOLOGY**Data Collection**

A dataset of social media posts from Indian patients who had COVID-19 is used to do this investigation. The dataset has posts, real feelings (good, bad, or neutral), the users' age, gender, and location. Before doing sentiment analysis, the postings are cleaned up to get rid of noise and material that isn't useful.

- CSV labels: name, place, tweet, created_at, user_id, username
- To find signs of sadness, you may look at the tweets' content (in the "tweet" column) and other user information (such "created_at," "user_id," "username," "name," and "place") to see if there are any patterns or clues that point to depression.

Performance Evaluation

The performance metrics for this studies are Prevalence of Depression and Linguistic Cues:

Prevalence of Depression: The percentage of posts with cues indicative of depression among post-COVID patients.

- The prevalence of depression is calculated by determining the percentage of posts that exhibit depression cues among the total number of posts from post-COVID patients. The calculation is as follows:
- $\text{Prevalence of Depression} = (\text{Number of Posts with Depression Cues}) / (\text{Total Number of Posts}) * 100$
- Prevalence of Depression:
- Number of Posts with Depression Cues: 1366
- Total Number of Posts: 9655
- Prevalence: 0.14

Linguistic Cues: The percentage of posts containing specific linguistic cues associated with depression.

List of Linguistic Cues and Their Counts:

- sad: 48
- depressed: 1
- unhappy: 2
- lonely: 0
- down: 1035
- low: 339

Data Analysis and Interpretation

The study looks at how well each sentiment analysis method works using metrics and other parameters. It looks into the link between sentiment scores and depression, which answers Research Question 1. It also finds language and sentiment clues that point to depression, which answers Research Question 2. Then, the data are looked at to learn more about how post-COVID patients use language and express their feelings on social media. Researchers can learn more about mental health issues like depression and look into whether sentiment analysis can be used to find depression in post-COVID patients early on.

Findings

The case study shows how sentiment analysis on social media can help find indicators of depression in people who have had COVID. The link between feelings and sadness, as well as linguistic clues and mood signals, can help us understand mental health issues and come up with possible screening methods to help people get help and treatment when they need it.

DISCUSSION

It can also utilise social media sentiment analysis in other parts of public health. Social media is a new medium with a lot of potential for use in public health. Researchers found that social media has both good and bad effects on public health issues. Researchers have shown that social media can be a useful way to encourage people to improve their health behaviours. It might also be utilised for public health campaigns and interventions. So, social media sentiment analysis can be used in different areas of public health to help people and raise awareness. [15] [16] There is a lot of hope for the future of using social media sentiment analysis to find depression. Using social media sentiment analysis to find people who are likely to be depressed early on could make a big difference in mental health care. Using machine learning algorithms on social media data to automatically find signs of depression could help find people who are at risk of depression and provide them help. Adding human knowledge to the process can help build a method for finding depression that is more accurate and trustworthy. Combining social media sentiment analysis with established screening methods can give a more complete and accurate picture of a person's mental health. So, the future of using social media to find out how people are feeling about depression looks good. [18] [3].

CONCLUSION

In conclusion, a lot of people have depression, which is a common mental health problem. It's hard to find people who are at risk of depression early on because traditional ways of finding it are restricted and expensive. Social media sentiment analysis could help find those who are at risk of depression and give them support. But there are a number of problems with using social media sentiment to find people who are depressed. Adding human knowledge to the process can make it possible to find depression in a way that is both accurate and dependable. You can also use social media sentiment analysis in other areas of mental health and public health to help people and raise awareness. The future of using social media sentiment analysis to find people with depression is bright, and it might have a big effect on mental health care.

ABSTRACT

Cloud computing is a novel way to employ computing resources that are provided across a network as services. It makes the best use of IT resources including the CPU, storage, and network. Many cloud computing services are popular with regular people, and they are growing more significant these days. There are a lot of smart phones, smart pads, and other mobile devices. Users can access the cloud computing environment through these mobile devices. So, people can use their physical gadgets to access sophisticated computational resources. There are two types of devices: a physical device that exists in the actual world and a virtual device that exists on the cloud. Service providers should employ strong cryptographic methods to make sure that a physical device and a virtual device may talk to each other safely. But the strong cryptographic methods take too long to finish each task, which slows down the network. When a physical device is processing too many data packets, the network gets congested. It also can't be sure of the quality of service on its network. This paper looks at the literature on encryption techniques used for authentication and access control to keep the Mobile Cloud Computing environment safe.

Keywords: Mobile Cloud Computing, Cryptographic Techniques, Encryption algorithms, Authentication, Access Control

INTRODUCTION

The smartphone has become a new way of using computers in the last few years. It has a wide range of uses, sophisticated operating systems, and sensors that can do many things. The fact that smartphones can run a wide range of apps for different purposes, such teaching, entertainment, business, and health care, has made them very popular. Because of this, the smartphone is becoming the most significant computing platform for people who are on the go [1] [2]. As demand for computational power and energy grows, so do the features and complexity of smartphone apps [3]. To meet consumer needs, manufacturers create new and improved authentic basic mobile device models. But the size of mobile devices is limited, thus improvements to smartphone technology can't meet the needs of users and apps [4]. Many apps that require a lot of resources don't work well on smartphones since they have limited memory, processing power, battery life, and the ability to move about. A lot of different fields use cloud computing. Cloud computing is clearly a good way to meet the smartphone's needs for processing power, memory, and battery life [5] [6]. Mobile cloud computing (MCC) is an emerging field that studies how cloud computing works on mobile devices. MCC makes mobile devices more powerful and energy-efficient by letting apps access cloud computing capacity to do resource-intensive activities. Navigation systems for mobile devices, voice search, Google Maps, Gmail, and a number of Android apps, such as MotoBlur from Motorola and MobileMe from Apple, have all gotten different apps based on MCC and made them available to consumers. Recently, both academics and industry have become quite interested in mobile cloud computing. A recent study of heavy reading found that the mobile cloud market's direct revenue will reach over \$68 billion by 2017 [7]. In the larger mobile cloud industry, it is predicted to reach \$1 trillion. ABI Research has made a similar prediction, saying that the number of mobile cloud computing subscribers (mobile users and mobile app providers) around the world will quickly rise over the next five years, from 42.8 million in 2008 (about 1.1% of all mobile subscribers) to over 998 million in 2014 (about 19%) [8]. ABI also predicts that mobile cloud will soon become a disruptive force in the mobile market and will finally become the most important location for mobile apps to work [9].

Security Challenges in the MCC

Mobile Terminal

In general, a mobile terminal has the following features: it has an open operating system, it can run third-party applications, it can be "personalised," and it can connect to the Internet wirelessly from anywhere and at any time. Because of this, security problems on mobile devices are particularly important.

Mobile Network Security

Because mobile networks are portable, they add more nodes and access points to the traditional network. The network node now includes mobile devices like smartphones, tablet PCs, and others. These devices can connect to the network in many ways. For example, 3G networks let smartphone users make phone calls, send text messages, and use other internet services. Also, most smart phones can connect to the internet through Wi-Fi and Bluetooth. So, additional means to get to things will make them less safe, like leaking private information or becoming attacked. For instance, various kinds of public place (such as Cafe, restaurant and airport, etc.) can provide free Wi-Fi, and many people will open a laptop and access Internet through free Wi-Fi. In this instance, there is a chance that information will leak. Even private Wi-Fi is at risk of security problems, in addition to this type of public Wi-Fi, because Wi-Fi's encryption is inadequate. Also, mobile devices and mobile cloud service providers often talk to each other through various interfaces. This will also make things less safe.

Mobile Cloud

- **Platform Reliability:** Because it has so much user information, the cloud platform is easy to attack. One goal of the malicious attacker is to steal important information or service. These attacks could originate from a malevolent outside user of the cloud, a lawful cloud computing user, or even employees of the cloud computing companies themselves. The goal of the malicious attacker, on the other hand, is to shut down the cloud service.

**Karthikeyan**

- **Data and Privacy Protection:** Data security and privacy are very crucial in the mobile cloud. First of all, users' data is owned and managed separately on the cloud. This makes users worry about their own information, which is a big reason why mobile cloud computing isn't more popular [9]. Also, the users' data is stored in random places all over the world in the shared infrastructure, and users don't know exactly where their data is stored. This means that users' private information is more likely to be seen. The only way to protect the sensitive data is not enough. It needs a full security solution to keep users' data safe and private [10].

Cryptographic Algorithms

Cryptographic algorithms are used to create authentication mechanisms. Encryption is the process of changing the contents of a message so that people who aren't supposed to see it can't. Cypher text is what you term an encrypted message. Decryption is the process of getting the plain text back from the cypher text. A key is normally needed for both encryption and decryption, and the way the data is coded means that only the right key can decrypt it. Many encryption techniques are easy to find and use for information security. They can be divided into two groups: symmetric (private) keys encryption and asymmetric (public) keys encryption. In secret key encryption or symmetric keys encryption, only one key is utilised to encode and decrypt information. In a symmetric cryptosystem, the same key is used for both encryption and decryption. In an asymmetric cryptosystem, two separate keys are used: an encryption key and a decryption key. The encryption key is public, and the decryption key is a private key in an asymmetric cryptosystem. To tackle the problem of key distribution, asymmetric key encryption uses two keys: a private key and a public key. Encryption uses a public key, and decryption uses a private key (for example, RSA and ECC). Mathematical functions are used in asymmetric key encryption, although it's not very good for small mobile devices. Asymmetric encryption methods are almost 1000 times slower than symmetric methods because they need more computing resources. The strength of symmetric key encryption relies on how big the key is. A cryptosystem is made up of two parts: one has an encryption algorithm and the other has a decryption algorithm..

Literature Survey

Zou, Qin, *et al* [11] used new encryption search methods for content-based image retrieval that use similar encryption and order-preserving encryption technology. Because it doesn't require homomorphic encryption, the suggested structure considerably cuts down on the amount of work that needs to be done on the client side and makes fuzzy search more accurate than earlier solutions. Sookhak, Mehdi, *et al* [12] gave a full overview of attribute-based access control methods and compared the features and functions of each one. This article also showed a thematic taxonomy of attribute-based techniques based on important factors like access control mode, architecture, revocation mode, revocation method, revocation issue, and revocation controller. Arvind, K. S., and R. Manimegalai [13] suggested a better naive classifier for safely sorting data in agent-based mobile cloud computing. The agent puts the user's data into three groups: low, medium, and high. After that, the Advanced Encryption Standards (AES) are used to encrypt the data. The broker gets the encrypted data so they can choose the right service agent. But the broker has a lot of service agents who work for him. After then, the cloud service provider gets the data and stores it. Then, the stored data is encrypted in a way that lets the cloud provider and cloud user work with it without having to decrypt it. Odelu, Vanga, *et al* [14] looked at the Tsai-Lo system and found that it is vulnerable to server impersonation attacks. Because of this, their scheme does not accomplish safe mutual authentication. They then devised a provably secure authentication scheme for distributed mobile cloud computing applications. Sajjad, Muhammad, *et al* [15] the issue of sending a medical image to the cloud for selective encryption by devices with limited resources, such smartphones, is solved without showing the cover image to the cloud via steganography. The suggested approach starts by finding the area of interest in the medical image using a visual saliency model. Banerjee, Amit, *et al* [16] suggested a lightweight, fast protocol for mobile devices named CLOAK. CLOAK uses a stream cypher and an outside server to make and send out cryptographically secure pseudo random numbers (CSPRN). Khan, Abdul Nasir, *et al* [17] suggested a workload distribution model for re-encryption methods that moves heavy tasks like encryption and decryption to a trusted entity. Also, the suggested workload allocation model is compared to existing re-encryption strategies that use resources on a trusted entity and a mobile device. David, Shubin, Basil Xavier, and Jasper W. Kathrine [18] talked about the numerous encryption methods and their variations that are already in use, as well as some ideas for future improvements that could lead to better encryption methods that protect privacy and security.

**Karthikeyan**

Yan, Zheng, Xueyun Li, and Raimo Kantola [19] adopted trust and reputation management and looked into three ways to protect cloud data access based on trust and reputation that may be used in a variety of situations. Roy, Sandip, *et al* [20] suggested a new mobile cloud computing user authentication technique that is both secure and lightweight. It uses cryptographic hash, bitwise XOR, and fuzzy extractor functions. It has been shown that the suggested technique is safe against well-known passive and active attacks and also keeps users anonymous through both informal and formal security analysis utilising the random oracle model. Son, Junggab, *et al.* [21] offer a new conditional proxy re-encryption (CPRE) system called the CPRE for mobile cloud. This scheme uses the back-end cloud to its fullest potential, which greatly reduces the load on terminals. Shivanna, K., S. Prabhu Deva, and M. Santoshkumar [22] came up with a twofold encryption mechanism that makes it safer to store and access resources on a cloud platform. The suggested technique gives the data owner, cloud service providers, and cloud users authentication and privacy. features. Kaur, Hasveen, and P. S. Mann [23] employed the Diffie Hellman symmetric key agreement technique to make the cloud manager-based approach better. A one-time password (OTP) is made, which makes things safer. The main goal of the article was to make the cloud manager-based scheme better so that security and integrity could be improved. Mohsin, J. K., *et al.* [24] talked about how authentication in MCC is split into two groups and how one group is better than the other in terms of security. They were trying to find the best secure authentication strategy. Li, Ping, and others [25] came up with two ways to fix the difficulties listed above. The authors first show a simple technique based on multi-key completely homomorphic encryption (MK-FHE). Then they suggest an enhanced scheme that combines the double decryption process and fully homomorphic encryption (FHE) into a hybrid structure. Zhang, Yinghui, Axin Wu, and Dong Zheng [26] came up with a privacy-friendly and efficient attribute-based data sharing system that can generate keys and encrypt data when not connected to the internet. In the suggested system, sensitive attribute values that are part of an access structure are not delivered with a ciphertext. Li, Dazhi, Minglu Li, and Jianhua Liu [27] came up with a certificate-aware framework for online access control systems in mobile computing. In this system, users are paid for their privacy certificate and operation disclosure, which encourages them to provide more certificate information. Liu, Yi, and others [28] came up with a fine-grained Electronic Health Record (HER) access control approach. In this scheme, an EHR owner can make offline ciphertexts before they know the EHR data and access regulations.

The suggested EHR access control approach lets access policies be encoded in linear secret sharing schemes. To limit access to data, Agrawal, Neha, and Shashikala Tapaswi [29] used dynamic factors such spatial or temporal parameters, application usage, unlock failures, and the location and vicinity of mobile devices. The work deals with the limitations of mobile devices and offers a useful solution by using pairs of mobile agents. The proposed plan can tell if the data owner is real and keep the user's identity secret. Guo, Yeting, and others [30] suggest ENSURE (Efficient and Secure), a mobile cloud storage architecture that allows for fast and safe encrypted screened search. Edge computing is what inspired ENSURE. It lets mobile devices send the heavy computing work to the edge server, which makes everything run more smoothly. Also, to keep data safe, it hides the connection between the query term and search results from the cloud, which makes it harder for untrusted clouds to get information. Meng, Tianhui, and others [31] came up with a hybrid Continuous-time Markov chain (CTMC) and queueing model. They also looked at the trade-off between security and performance. The authors came up with security metrics that system builders need to use to make smart tradeoff choices about system security. Alonso-Monsalve, Saúl, Félix García-Carballeira, and Alejandro Calderón [32] came up with a novel model for mobile cloud computing. In this model, platforms of volunteer devices offer some of the cloud's resources. This model is based on both volunteer computing and mobile edge computing. These platforms might be hierarchical, depending on what the volunteer devices can do and what the clouds need to do to supply their services. Sukumaran, Sreeja Cherillath, and Misbahuddin Mohammed [33] talked about the security problems in the MCC and suggested biocomputing solutions to fix them. A solution is suggested that uses the main ideas of polymerase chain reaction and primer production to make sure that data stays private and safe. Yang, Li, and others [34] came up with a novel plan dubbed FREDP, which stands for File Remotely keyed Encryption and Data Protection. In this plan, a mobile terminal, private clouds, and public clouds all work together. The private clouds send the ciphertext file to the public clouds until the mobile device and the private clouds, which are a trusted third party, finish encrypting the plaintext file using an encryption algorithm that can be accessed from anywhere. Babu, V. Suresh, and M. M. Kumar [35] came up with a way to safely share sensitive

**Karthikeyan**

information in the cloud, including safe data storage, usage, and destruction in a semi-trusted cloud environment. The authors showed how the Kerberos protocol works over the system and a client procedure protection method based on a virtual machine screen, which helps with the recognition of system functions. Nagamani, S., and D. R. Nagaraju [36] said that healthcare records kept in the cloud are more sensitive than other types of information that need a lot of supervision. Different mobile devices can access the data stored in the cloud, but all of those transactions happen over the network Zhang, Yu, Yin Li, and Yifan Wang [37] came up with a way to change keywords into a vector space model. This method can change both the query and the index keywords. The authors came up with a new public key encryption approach that lets you search for keywords that are both and not. Pavithra, P., and K. Balamurugan [38] came up with a full mobile cloud design that lets people use cloud computing services on their phones in a safe and productive way. This proposed system uses a fuzzy authorisation method to make sure that the login and password are correct.

Chen, Wenqi, *et al.* [39] came up with a new public auditing protocol based on the adjacency-hash table. This protocol is better at dynamic auditing and data updating than the best ones that are currently available. Also, this kind of authentication structure can help lower the costs of computing and communication. Patel, Swachil J., and Ronak R. Patel [40] looked at cipher-text data that was saved in a database using a modified homomorphic encryption method. The database has data that is short and has a complicated structure, making it hard for any analysts to figure out what it means. Somula, Ramasubbareddy, and others [41] looked at healthcare applications that the new cloudlet model can handle. This model cuts down on processing time and keeps users' data safe. At first, the user connects to the cloudlet that is available. If the cloudlet doesn't have the resources or services the user needs, they will be sent to a faraway cloud. We use the cloudlet in our model to look at patient medical records. Ajay, D. M., and E. Umamaheswari [42] came up with a packet encryption strategy that uses a packet key just once throughout a session. This scheme has low latency and high security for real-time mobile cloud applications. Gao, Chong-zhi, and others [43] came up with a new cloud-based profile-matching approach that protects privacy and works with multiple keys. It is based on a proxy re-encryption scheme with additive homomorphism. Under the honest-but-curious (HBC) model, the suggested technique is safe as long as there are two cloud servers that do not work together. Mo, Jiaqing, and others [44] came up with a fast and provably safe way for mobile cloud computing users to authenticate themselves without revealing their identity. The suggested system not only lets mobile devices and cloud computing authenticate each other, but it also meets all the existing security evaluation requirements.

Mo, Jiaqing, and others [45] suggested that the security method be put into action using the random oracle model and the protocol validation model of the well-known automated tool ProVerif. For systems this big and complicated, three-factor biometrics-based authentication approaches are thought to be safer. Seth, Bijeta, Surjeet Dalal, and Raman Kumar [46] wanted to learn about certain important parts of cloud computing, such as its features, delivery models, deployment models, and cloud computing platforms. The proposed system for multi-clouds shows a general flow of data and the tasks that need to be done. The authors came up with a way to change the Paillier Homomorphic algorithm without putting the security of the current method at risk. The method suggested by Agrawal, Neha, and Shashikala Tapaswi [47] uses dynamic characteristics encryption to protect data and regulate who can access it. The pairs of mobile agents are in charge of fixing the problem with the network connection. The anonymous key-issuing protocol is used to send out the secret key. This keeps the user's identity secret. Koe, Arthur Sandor Voundi, and Yaping Lin [48] talked about how the data owner is constantly online in proxy reencryption methods for giving out re-encryption keys. The authors built our solution by expanding and adapting multi-authority ciphertext policy attribute-based encryption methods to type-based proxy re-encryption. Wang, Yuan, *et al.* [49] came up with a new, efficient way to search for encrypted images that uses K-means and secure modular hashing. This method can keep the privacy of picture searches while yet being as accurate as searches for plaintext images. Bhatia, Tarunpreet, A. K. Verma, and Gaurav Sharma [50] came up with a pairing-free incremental proxy re-encryption system that doesn't need certificates. It would run in proportion to the number of changes made over time, rather than the length of the document, to make file modification jobs easier. The proposed technique makes the file modification mechanism far better in terms of energy use and the time it takes to turn around. For smart city applications in mobile cloud computing, Jegadeesan, Subramani, and others [51] came up with a good way to do anonymous mutual

Karthikeyan

authentication. This method requires both the mobile user (Ui) and the service provider (Sj) to show that they are who they say they are. This way, the legitimate Ui can access all of the cloud computing services in a safe and efficient way. Merlin, S. Sengole, and A. Chandrasekar [52] suggest an excellent approach called multi-cross template matching using fast dynamic time warping (MuCFdTW). This algorithm is employed in mobile cloud services for authentication and data protection through gait-based encryption. MuCFdTW makes it easier to verify a user's identity in less time and with an accuracy of above 99%. Lo'ai, A. Tawalbeh, and GokaySaldamli [53] were the first to come up with a way to store huge data. Second, we looked into how to leverage the P2P Cloud System (P2PCS) to handle and analyse huge data. Third, they suggested a good hybrid mobile cloud computing model based on the idea of cloudlets. Irshad, Azeem, and others [54] came up with a bilinear pairing-based multi-server authentication (MSA) protocol that lets you skip the TTP, at least for mutual authentication. As far as getting rid of TTP involvement in authentication goes, the scheme structure works perfectly. Sandor, Voundi Koe Arthur, and others [55] came up with a good decentralised multi-authority attribute-based approach for storing data in the cloud on mobile devices. The proposed scheme gets rid of the central authority and doesn't employ any global user identification to solve the key escrow problem.

Research Direction

This survey study gives us the following information: sensitive data needs encryption technology to stay safe from storage to transmission. The data should be stored in cypher text in the cloud to keep sensitive information from getting out. But encryption will make the data less useful, thus the attention shifts to quickly analysing and processing the cypher text. To lower the danger of fraud in the mobile cloud, an authentication and access control system will be used.

CONCLUSION

Mobile cloud computing is becoming a popular new technology these days. And researchers are now focussing on finding a security solution for it. As mobile cloud computing grows, new security problems will arise that require greater security measures. The main problems with MCC are the possibility of data theft, the privacy of data, the infringement of privacy rights, the loss of physical security, the handling of encryption and decryption keys, and the security and auditing of virtual machines. This study briefly looks at other papers that deal with authentication and access control mechanisms that can make the MCC environment safer. This paper shows that improving the encryption methods can make the MCC work better and more effectively against security threats.

ABSTRACT

This study analyzes participant preferences for UN Sustainable Development Goals (SDGs) 4 (Quality Education) and 9 (Scientific Research and Innovation) through digital literacy initiatives based on a survey of 269 respondents. It examines areas such as cybersecurity, AI, digital wellness, extended reality, blockchain, digital accessibility, green digital literacy, and personal branding. Findings highlight cybersecurity as a top priority, followed by AI literacy and digital wellness, reflecting evolving learner interests. The research offers actionable insights for educators, policymakers, and organizations to design digital literacy programs that address diverse needs, bridge the digital divide, and support sustainable development goals.

Keywords: Digital Literacy, Sustainable Development Goals, Quality Education, Scientific Research and Innovation, Library Programs, Technology Adoption

INTRODUCTION

In an era of rapid technological progress and an expanding digital landscape, libraries are transforming from traditional knowledge repositories into dynamic centers that foster sustainable development. This study explores the potential of digital literacy initiatives within libraries to drive significant advancements, emphasizing their critical role in promoting two key UN Sustainable Development Goals (SDGs): Quality Education (Goal 4) and Scientific Research & Innovation (Goal 9).

**Rajesh****Statement of the Problem**

In the rapidly evolving digital age, access to and engagement with digital literacy have become critical for personal and professional growth. Libraries, as pivotal knowledge centers, play an essential role in equipping individuals with the digital skills needed to navigate the complexities of the modern world. However, despite the increasing emphasis on digital literacy, there remains a gap in understanding the extent of its impact and the level of engagement among library users. This study investigates the effectiveness of library-led digital literacy initiatives in addressing this gap. It aims to uncover how these programs contribute to achieving key United Nations Sustainable Development Goals (SDGs), specifically Goal 4 (Quality Education) and Goal 9 (Scientific Research and Innovation). By examining participant preferences, utilization patterns, and program outcomes, this research seeks to identify challenges, opportunities, and actionable strategies for enhancing digital literacy efforts within libraries. Ultimately, the study aspires to provide valuable insights that can guide educators, policymakers, and library professionals in fostering a digitally empowered community that bridges knowledge gaps, promotes innovation, and supports sustainable development.

Objectives of the Study

- To evaluate the level and extent of participation in library-led digital literacy initiatives.
- To assess the effectiveness of the library's digital literacy programs.
- To analyze library users' engagement with digital educational resources.
- To investigate the use of digital tools in scientific research and innovation.

METHODOLOGY

Data for the study was collected using a Google Forms questionnaire featuring varied response formats, including short answers, paragraphs, multiple-choice options, checkboxes, dropdowns, and linear scales. The survey, conducted over ten days, targeted a diverse group of participants, including graduate and postgraduate students, PhD-level faculty, and library professionals. A total of 269 responses were obtained, providing robust data for analysis. Statistical methods were employed to derive meaningful insights, ensuring the findings' reliability and validity. This methodical approach offers a comprehensive understanding of participant preferences and engagement with digital literacy initiatives.

REVIEW OF LITERATURE

Bushra and Devi (2023) investigated the intersection of digital learning and sustainability in higher education, prompted by the global shift to e-learning during COVID-19. Their study, conducted at the University of the Mascareignes in Mauritius, developed and tested a model based on the Technology Acceptance Model (TAM). The findings highlighted the positive impact of online platforms and identified key factors essential for sustainable learning. This research addresses a gap in the literature and provides a framework for educators and policymakers to enhance digital learning strategies. Bangani and Dube (2023) explored how South African academic libraries contribute to global goals such as ending hunger, improving health, and combating climate change through Community Engagement (CE) initiatives. Their findings demonstrate that libraries extend beyond academic support by actively engaging in community activities to promote sustainability. The study encourages libraries to strengthen their involvement in community efforts and align their initiatives with global sustainable development goals. Manna and De Sarkar (2022) examined how libraries worldwide support sustainable development using a web-based approach. The research focused on eco-friendly practices adopted by school and public libraries, highlighting the factors driving sustainability commitments, current green strategies, and the challenges libraries face in implementing these practices. The study provides valuable insights for librarians and information professionals to enhance and adopt sustainable practices effectively. Cyr and Connaway (2020) discussed the role of libraries in achieving the United Nations Sustainable Development Goals (SDGs), tracing the goals' history and the influence of librarians. The research emphasized libraries' contributions to building a sustainable future through information

**Rajesh**

access and skill development. It also highlighted the OCLC Global Council's focus on SDGs, showcasing research and advocacy efforts by libraries worldwide.

RESULTS OF THE STUDY**Demographics**

The demographic analysis of the participants provides a comprehensive understanding of their profiles, focusing on age, gender, and educational backgrounds. This detailed breakdown highlights the diversity of the respondent pool and provides a foundation for analyzing the study's findings in relation to participant characteristics.

Age Distribution

The largest age group among the participants was the 18–24 years category, accounting for 53.90% (145 respondents). This indicates that the study primarily attracted younger individuals, who are likely students or early-career professionals. Their prominence reflects the increasing engagement of younger generations with digital literacy initiatives and their natural inclination toward adopting technology in education. The next largest group was the 25–34 years category, comprising 28.99% (78 respondents). This group likely represents individuals in higher education, postgraduate studies, or early professional stages. Their active participation indicates a growing awareness of the importance of digital skills for career advancement and professional development. The 35–44 years group, making up 9.66% (26 respondents), suggests mid-career professionals who may be pursuing continued education or upskilling through digital platforms. The relatively smaller representation from the 45–54 years group (4.08%, 11 respondents) and those aged 55 and above (3.34%, 9 respondents) highlights a potential gap in engagement among older individuals. This could be attributed to barriers like less familiarity with technology or a lack of tailored initiatives for these age groups.

Gender Distribution

In terms of gender, the study observed near parity between male and female participants, with 52.78% (142 respondents) identifying as female and 46.84% (126 respondents) as male. This relatively balanced representation highlights the inclusivity of the study and suggests that digital literacy initiatives are appealing to both genders almost equally. Notably, the inclusion of one transgender participant (0.33%) is significant, as it reflects the study's efforts to consider diverse identities. This inclusion underscores the importance of creating digital literacy programs that are accessible and welcoming to all, regardless of gender identity.

Educational Backgrounds

The educational qualifications of the participants reveal a diverse and academically inclined pool. A significant portion of respondents, 50.92% (137 individuals), held undergraduate degrees. This group likely includes current students and early-career professionals who form a substantial base for digital literacy initiatives. Participants with postgraduate degrees accounted for 36.05% (97 respondents), indicating a strong presence of individuals seeking advanced education and professional upskilling. The 4.83% (13 respondents) with PhDs reflect a smaller yet important demographic of highly educated individuals, possibly involved in research or academia, who are leveraging digital tools for specialized purposes. The category labeled "Others" included 8.17% (22 respondents), suggesting a mix of vocational qualifications, certifications, or unconventional educational backgrounds. This diversity emphasizes the importance of tailoring digital literacy programs to cater to varied academic and professional needs.

Insights and Implications

The demographic distribution offers several key insights:

**Rajesh**

Young Dominance: The significant representation of younger age groups highlights their openness to digital learning and their crucial role in driving digital transformation. However, the lower participation from older age groups suggests the need for targeted strategies to engage and empower these individuals.

1. **Balanced Gender Participation:** The nearly equal representation of male and female participants reflects a healthy gender balance, indicating that digital literacy programs are resonating across genders. This balance can serve as a model for promoting gender inclusivity in other educational initiatives.
2. **Diverse Educational Backgrounds:** The wide range of educational qualifications indicates that digital literacy initiatives appeal to individuals across different stages of their academic and professional journeys. This diversity underscores the importance of designing programs that cater to both foundational learners and advanced professionals. By understanding these demographic patterns, stakeholders can better design and implement digital literacy initiatives that are inclusive, equitable, and impactful for a broad range of participants.

Utilization of Digital Educational Resources: An In-Depth Analysis

The study highlights the diverse range of digital educational resources employed by participants to enhance their learning experience, showcasing a rich landscape of preferences. Among the tools and platforms utilized, online courses emerged as the most popular, with 49.81% (134 respondents) engaging with platforms like Coursera, edX, Udacity, Khan Academy, and Swayam. These platforms are widely recognized for their high-quality, flexible, and accessible learning opportunities, catering to various academic and professional needs. Their popularity underscores a growing trend toward self-paced, on-demand education that aligns with individual learning goals. E-books and digital texts were used by 44.98% (121 respondents), reflecting the enduring appeal of digital reading materials for academic and research purposes. Similarly, video lectures and tutorials on platforms such as YouTube, TED-Ed, and Swayam Prabha were accessed by 44.23% (119 respondents), indicating the value of visual and auditory content for engaging and interactive learning. These tools are especially useful for individuals seeking subject-specific guidance or skill-based learning. Educational apps, used by 47.95% (129 respondents), demonstrated their versatility in addressing various learning objectives, from general knowledge acquisition to skill development. Their widespread usage highlights the increasing reliance on mobile-friendly solutions that integrate seamlessly into daily life. Less utilized but still significant, interactive simulations were employed by 15.98% (43 respondents). These tools, often used in STEM fields, provide hands-on, experiential learning opportunities. While their lower adoption could indicate limited awareness or access, their potential for fostering deep understanding remains invaluable. The study also sheds light on the adoption of open educational resources (OER), such as OpenStax and OER Commons, with 32.34% (87 respondents) reporting usage. These resources are pivotal in democratizing education by offering free and openly licensed materials, particularly beneficial for underserved communities. Learning management systems (LMS) like Moodle, Canvas, and Blackboard were utilized by 34.57% (93 respondents), demonstrating their role in formal education settings, where they streamline course delivery, assessments, and collaborative activities. Similarly, webinars and virtual workshops, accessed by 36.05% (97 respondents), have become a staple for real-time, interactive learning experiences, especially in a post-pandemic world.

Other notable tools include online assessments and quizzes such as Quizlet and Kahoot, used by 37.54% (101 respondents), which highlight the importance of self-assessment in the learning process. Additionally, coding and programming platforms like Codecademy, FreeCodeCamp, and Scratch (utilized by 39.40%, 106 respondents) reflect the increasing interest in technical and computational skills. Language learning platforms, including Duolingo, Rosetta Stone, and Babbel, were employed by 40.14% (108 respondents), showcasing their effectiveness in promoting multilingual capabilities. Meanwhile, innovative technologies like virtual reality (VR) and augmented reality (AR) had a moderate adoption rate of 20.07% (54 respondents), indicating their emerging role in immersive and interactive education. Other resources, such as podcasts and audio books (22.67%, 61 respondents), educational games (35.31%, 95 respondents), and cloud-based learning platforms, underline the growing trend of integrating diverse digital tools into education. The relatively lower usage of some advanced tools, such as VR/AR, interactive simulations, and open science platforms, suggests opportunities to increase awareness and accessibility for these resources. In summary, the findings reveal a multifaceted approach to digital education, with participants leveraging a wide array of tools and

**Rajesh**

platforms tailored to their specific needs. This diversity reflects the dynamic nature of modern learning environments, where digital resources play a crucial role in enriching educational experiences, enhancing engagement, and promoting lifelong learning.

Utilization of Digital Tools for Research and Innovation: An In-Depth Analysis

The study provides valuable insights into the digital tools and technologies that participants leverage for research, innovation, and academic advancement. The results reveal a diverse set of tools, reflecting the growing integration of technology in the research process. Research databases, such as PubMed and JSTOR, are widely used by 47.95% (129 respondents), underlining their importance in providing access to vast repositories of scholarly articles, research papers, and journals. These databases are integral to evidence-based research and serve as foundational resources for academics and researchers across disciplines. Reference management tools, such as Zotero and EndNote, were used by 32.71% (88 respondents). These tools facilitate efficient management of citations, references, and bibliographies, crucial for researchers who are dealing with extensive sources. Their adoption is indicative of a well-organized approach to managing academic work and ensuring accurate referencing in scholarly outputs. In the realm of data analysis, platforms like Python and SPSS were reported by 46.84% (126 respondents). These tools are central to processing large datasets, conducting statistical analysis, and generating insights for research. The widespread use of data analysis tools emphasizes the increasing importance of quantitative and computational methods in modern research. Collaboration platforms, such as Microsoft Teams and Zoom, were reported by 46.09% (124 respondents), highlighting the central role of digital tools in facilitating communication and collaboration among researchers, particularly in remote or hybrid environments. The use of these platforms reflects the shift toward virtual teamwork, especially in light of the ongoing global transition to digital communication in academia.

Cloud computing services like AWS and Azure were utilized by 39.77% (107 respondents). These platforms enable researchers to access computing resources and store large datasets online, thus supporting scalability, flexibility, and efficiency in research workflows. The growing use of cloud computing shows how researchers are embracing decentralized, on-demand computing power for their projects. The study also highlights the significant role of online learning platforms, such as Coursera and edX, with 49.07% (132 respondents) reporting usage. These platforms not only offer courses for skill enhancement but also contribute to lifelong learning, enabling researchers to stay updated with the latest advancements in their respective fields. Simulation tools, like COMSOL, were used by 12.26% (33 respondents). While this tool had a relatively lower adoption rate, its value in modeling and simulating complex systems in areas such as engineering and physics cannot be understated. Its specialized nature might explain the smaller user base. The study also points to the emerging influence of open science platforms such as OSF and Zenodo, which were used by 20.81% (56 respondents). These platforms encourage collaboration, data sharing, and transparency in research, thereby promoting open science practices. The adoption of such platforms signifies a growing trend towards making research more accessible and reproducible. Furthermore, citizen science platforms, such as Zooniverse, were reported by 11.52% (31 respondents). These platforms allow public participation in scientific research, emphasizing the democratization of science and fostering greater public engagement with research initiatives. An additional 11.15% (30 respondents) reported using various other digital tools, reflecting the diverse and customized approaches to research and innovation. This category encompasses a range of specialized platforms and tools, reflecting the participants' adaptability in selecting the best resources for their specific research needs. In summary, the results of this section highlight the wide variety of digital tools utilized by participants for research and innovation. The diverse set of tools—ranging from databases and reference management to collaboration platforms and cloud computing—illustrates the increasing digitalization of academic research and innovation. These tools are integral to modern research practices, enhancing productivity, collaboration, and the overall research experience.

Key Findings

- **Demographic Distribution:** The study participants reflect a diverse demographic profile. A majority of the respondents were female (52.78%), with the largest age group being 18-24 years (53.90%). In terms of education,

Rajesh

nearly half (50.92%) of the participants held undergraduate degrees, showcasing a range of academic backgrounds.

- **Utilization of Digital Educational Resources:** Online courses were the most frequently utilized digital educational resource (49.81%), followed by e-books and digital texts (44.98%) and educational apps (47.95%). Additionally, participants reported engagement with a wide array of other resources, including interactive simulations, video lectures, open educational resources (OER), and learning management systems (LMS), reflecting the diverse ways in which digital tools are integrated into their educational practices.
- **Utilization of Digital Tools for Scientific Research and Innovation:** Key digital tools for scientific research and innovation included research databases (47.95%), data analysis and visualization tools (46.84%), collaboration platforms (46.09%), and cloud computing services (39.77%). Moreover, online learning platforms (49.07%) were extensively used for skill development, reflecting the participants' commitment to continuous learning and the integration of digital technologies in research processes.

CONCLUSION

The study highlights the importance of digital literacy in libraries, emphasizing their role in engaging diverse users and enhancing digital skills. The positive feedback on the effectiveness of library programs suggests they significantly contribute to educational outcomes. The broad use of digital educational resources and tools for research reflects the growing integration of technology in education and innovation. Libraries should continue to innovate and expand digital literacy initiatives, focusing on program effectiveness, accessibility, and the use of diverse digital tools to improve learning and research quality. Collaboration with educational and industry partners can also ensure the relevance and sustainability of these programs in the evolving digital landscape.

ABSTRACT

Medicinal plants are a valuable source of pharmacological effects, offering new possibilities for anti-infections, antioxidants, and anti-cancer agents. These plants contain bioactive constituents such as steroids, terpenoids, carotenoids, flavonoids, alkaloids, tannins, and glycosides, which serve as important starting materials for drug development. While traditional medicines and medicinal plants have long been used in developing countries for health maintenance, modern pharmacopoeia now includes at least 25% drugs derived from plants, as well as synthetic analogs based on plant-derived chemical substances. The use of medicinal plants has gained momentum due to the high costs of prescription drugs and the search for new plant-based drugs. In India, the ayurvedic system features numerous medicinal remedies derived from plants, and studying their morphological, pharmacological, and pharmacognostical characteristics can enhance our understanding of their active principles and modes of action. However, many tropical plants have not been thoroughly studied for their chemical constituents. Therefore, our focus is on the phytochemical aspects of selected indigenous plants of India, such as *Crossandra infundibuliformis*. We aim to investigate the preliminary phytochemical screening, quantify phytochemicals, analyze phyto compounds using GC-MS, assess DPPH-radical scavenging activities, and conduct in vitro cytotoxicity analysis through MTT-assay.

Keywords: *Crossandra infundibuliformis*; Antioxidants; Phytochemicals; Medicinal plants, Cervical cancer.

Selvakumar

INTRODUCTION

Plants are the source of medication for preventive, curative, protective or promotive purposes [1]. Plant-derived foods help in the prevention of lifestyle-associated diseases. Several groups of constituents in plants have been identified as potentially health-promoting in animal studies, including cholesterol-lowering factors, antioxidants, enzyme inducers, and others. A thousand years ago an extensive use of plants as medicines was reported and was initially taken in the form of crude drugs and other herbal formulations. Hence it is of interest to investigate the phytochemical and pharmacological efficacy of the plant is of paramount importance it may provide many emerging insights [2]. *Crossandra infundibuliformis* belongs to the family of Acanthaceae. It is a plant that is important in the South Indian horticulture industry. This plant is found abundantly in tropical areas such as India and Sri Lanka. It grows 2m in height and can withstand high temperature which makes it to survive in very high humidity. Due to its medicinal value, various parts of this plant are used for many types of treatment. The leaf extract shows significant hepatoprotective effects. It is also found that *C. infundibuliformis* shows very good anti-corrosive properties. Its antibacterial, and antioxidant activity was reported and very less work has been done regarding *C. infundibuliformis* phytochemical values. Hence, it is of interest to investigate the preliminary phytochemical analysis of n-hexane, petroleum ether and butyl alcohol extracts of whole plant of *C. infundibuliformis*.

MATERIALS AND METHODS

Collection of Samples

For this study, the aerial parts of the plant *Crossandra infundibuliformis* were utilized as the medicinal plants.

Preparation of Extracts

To extract the samples, 500 grams of dried powder from the aerial parts of the plant material were separately packed in round bottom flasks. Different solvents, namely ethanol, methanol, chloroform, ethyl acetate, and water, were used for sample extraction. Each solvent (750 ml) was used for a 24-hour extraction period. After the extraction, the solvents were concentrated under reduced pressure, and the resulting crude extracts were stored in a refrigerator.

Phytochemical Analysis

The prepared extracts were subjected to analysis to determine the presence of alkaloids, saponin, tannins, steroids, flavonoids, anthraquinone, cardiac glycosides, and reducing sugars. The analysis was conducted based on established protocols found in the literature [3-8].

Test for Alkaloids

To test for alkaloids, the crude dry powder extract from each solvent was evaporated to dryness using a boiling water bath. The residues were then dissolved in 2 N Hydrochloric acid. The resulting mixture was filtered and divided into three equal portions. Mayer's reagent, Dragendorff's reagent, and Wagner's reagent were added to each portion respectively. The formation of a creamish precipitate, orange precipitate, or brown precipitate indicated the presence of the respective alkaloids.

Test for Saponins

To test for saponins, approximately 0.5 g of the plant extract was shaken with water in a test tube and heated to a boil. The observation of frothing was considered as preliminary evidence for the presence of saponins.

Test for tannins

To test for tannins, approximately 0.5 g of the extract was added to 10 ml of water in a test tube and filtered. A few drops of 0.1% ferric chloride were then added, and the mixture was observed for the development of a brownish-green or blue-black coloration.

**Selvakumar****Steroid Test**

The methanol extract of each sample was mixed with acetic anhydride and sulphuric acid. In some samples, the color changed from violet to blue or green, indicating the presence of steroids.

Flavonoid Test

The extract solution was treated with a methanol solution and warmed. Metal magnesium was added, followed by a few drops of concentrated hydrochloric acid. The presence of flavonoids was indicated by a red color, while orange color indicated the presence of flavonols.

Anthraquinone Test

The extract was mixed with chloroform and shaken. After filtration, the filtrate was shaken with ammonia solution. The presence of anthraquinones was indicated by a pink, violet, or red color in the ammoniacal layer.

Cardiac Glycoside Test

The extract was dissolved in glacial acetic acid containing ferric chloride solution. Concentrated sulphuric acid was then added. The presence of a deoxy sugar characteristic of cardiac glycosides was indicated by a brown ring at the interface.

Protein Test

The protein solution was mixed with NaOH solution and drops of CuSO₄ solution. The presence of peptide linkage was indicated by a violet color.

Test for Amino Acids

2ml of the sample was added to 2ml of Ninhydrin reagent and kept in a water bath for 20 minutes. The appearance of purple color indicated the presence of amino acids in the sample.

Test for Tri-Terpenoids

5ml of each extract was added to 2ml of chloroform and 3ml of con. H₂SO₄ to form a monolayer of reddish brown coloration of the interface was shown to form positive results for the terpenoids.

Test for Triple Sugars

To 2 ml of extract 2 drops of Molisch's reagent were added and shaken well. 2ml of concH₂SO₄ was added to the sides of the test tube. A reddish-violet ring appeared at the junction of two layers immediately indicating the presence of carbohydrates.

Test for Polyphenols

2ml of the sample was added to 2ml of ferric chloride solution and kept in room temperature. The appearance of violet color indicated the presence of phenolic compounds in the sample.

Quantification of Phytochemicals

The analysis included determining the total phenolic content, total tannin content, total alkaloid content, and total flavonoid content [9-21].

Determination of Total Alkaloid Content

To determine the total alkaloid content, a plant extract weighing 1mg was dissolved in dimethyl sulphoxide (DMSO) and mixed with 1 ml of 2N hydrochloric acid. The solution was then filtered and transferred to a separating funnel. Bromocresol green solution (5 ml) and phosphate buffer (5 ml) were added to the mixture. The resulting solution was vigorously shaken with chloroform (1, 2, 3, and 4 ml) and collected in a 10-ml volumetric flask. The volume was then adjusted with chloroform. Reference standard solutions of atropine (20, 40, 60, 80, and 100 µg/ml) were prepared using the same method as described earlier. The absorbance of the test and standard solutions was measured at 470

**Selvakumar**

nm using a UV/Visible spectrophotometer, against the reagent blank. The total alkaloid content was expressed as mg of AE/g of extract.

Measurement of Total Flavonoid Content

The total flavonoid content was determined using the colorimetric assay with aluminum chloride. In a 10 ml volumetric flask, 1 ml of the extract and 4 ml of distilled water were combined. Then, 0.30 ml of 5% sodium nitrite was added to the flask, followed by the addition of 0.3 ml of 10% aluminum chloride after 5 minutes. After another 5 minutes, 2 ml of 1M sodium hydroxide was introduced, and the mixture was diluted to 10 ml with distilled water. Reference standard solutions of quercetin (20, 40, 60, 80, and 100 µg/ml) were prepared in the same manner. The absorbance of the test and standard solutions was measured at 510 nm using a UV/Visible spectrophotometer, against the reagent blank. The total flavonoid content was expressed as mg of QE/g of extract.

Determination of Total Tannin Content

The tannin content was determined using the Folin-Ciocalteu method. A volumetric flask (10 ml) containing 7.5 ml of distilled water and 0.5 ml of Folin-Ciocalteu phenol reagent, 1 ml of 35% Na₂CO₃ solution, and 0.1 ml of the sample extract was prepared. The flask was then diluted to 10 ml with distilled water. The mixture was thoroughly shaken and left at room temperature for 30 minutes. Reference standard solutions of gallic acid (20, 40, 60, 80, and 100 µg/ml) were prepared in the same manner. The absorbance of the test and standard solutions was measured at 725 nm using a UV/Visible spectrophotometer, against the blank. The tannin content was expressed as mg of GAE/g of extract.

The Spectrophotometric Method was Utilized to Determine The Concentration of Phenolics In Plant Extracts.

For the determination of the total phenol content, the Folin Ciocalteu assay method was employed. In a volumetric flask (25 ml), a mixture of 1 ml of extract and 9 ml of distilled water was prepared. The mixture was then treated with 1 ml of Folin-Ciocalteu phenol reagent and thoroughly shaken. After 5 minutes, 10 ml of a 7% Sodium carbonate (Na₂CO₃) solution was added to the mixture. The volume was adjusted to 25 ml. Standard solutions of gallic acid (20, 40, 60, 80, and 100 µg/ml) were also prepared in the same manner. The test and standard solutions were incubated for 90 minutes at room temperature, and their absorbance was measured against the reagent blank at 550 nm using an Ultraviolet (UV)/Visible spectrophotometer. The total phenol content was expressed as mg of GAE/gm of extract.

GC-MS analysis of chloroformic extract of *Crossandra infundibuliformis*.

Preparation of plant extract 25gm of the powdered material of *Crossandra infundibuliformis* was soaked in 95% chloroform for 12hrs. The extract was then filtered through Whatman filter No.41 along with 2gm sodium sulfate to remove the sediments and traces of water in the filtrate. Before filtering, the filter paper was made wet with 95% ethanol along with sodium sulfate. The filtrate was then concentrated by bubbling nitrogen gas into the solution. The extract contained both polar and non-polar phyto-components in the plant material. 2µl of this solution was employed for GC-MS analysis. The herbal powder was extracted with chloroform and analyzed using a GC-M (GC Clarius 500 Perkin Elmer) analyzer. The data were obtained on an Elite-1(100% Dimethyl poly siloxane) column (30 0.25mm 1µmdf). Helium (99.999%) was used as the carrier gas with a flow rate of 1ml/min in the split mode (10:1). An aliquot of 2µl of ethanol solution of the sample was injected into the column with the injector temperature at 250°C. GC oven temperature started at 110°C and held for 2min and it was raised to 200°C at the rate of 10°C/min, without holding. Holding was allowed at 280°C for 9 min with a program rate of 5°C/min. The injector and detector temperatures were set at 250°C and 280°C respectively. The source temperature was maintained at 200°C. The mass spectrum of compounds in samples was obtained by electron ionization at 70 eV and the detector was operated in scan mode from 45-450amu (atomic mass units). A scan interval of 0.5 seconds and fragments from 45 to 450 Da was maintained. The total running time was 36 minutes [22].

Identification of Components

Identification was based on the molecular structure, molecular mass and calculated fragments. Interpretation on mass spectrum GC-MS was conducted using the database of the National Institute Standard and Technology (NIST) having more than 62,000 patterns. The name, molecular weight and structure of the test materials' components were

**Selvakumar**

determined, and the percentage of each component was calculated by comparing its average peak area to the total areas. The spectrum of the unknown component was compared to the spectrum of the component stored in the NIST library version (2005), using Turbomas 5.2 software.

Antioxidant Activity

The determination of antioxidant activity, specifically the DPPH free radical scavenging activity, was conducted in this study. The plant extracts were evaluated based on their ability to scavenge the stable DPPH free radicals. A solution of DPPH in ethanol was prepared and added to the extract solutions with varying concentrations. The mixture was vigorously shaken and allowed to stand for 5 minutes. The absorbance was then measured at 517 nm using a spectrophotometer, with ethanol used as a reference to set the absorbance to zero. A blank sample containing ethanol and DPPH was also prepared. All measurements were performed in triplicate. The percentage of inhibition of DPPH activity was calculated using the formula: $[(AB - AA) / AB] \times 100$, where AA and AB represent the absorbance values of the test and blank samples, respectively [23].

In vitro Assay for Cytotoxicity Activity (3-[4,5-dimethylthiazol-2-yl] -2,5-diphenyltetrazolium bromide assay) (MTT Assay).

The MTT assay, also known as the in vitro assay for cytotoxicity activity, was used to determine the anticancer activity of the samples on PA-1 and Vero cell lines. In this assay, cells were plated in 96-well plates at a density of 1×10^5 cells per well and incubated in a 5% CO₂ incubator for 72 hours. After that, the samples were added at various concentrations in 0.1% DMSO and incubated for 24 hours in the same CO₂ incubator. Following the removal of the sample solution and washing with phosphate-buffered saline (pH 7.4), 20 µl of 0.5% MTT in phosphate-buffered saline solution (5 mg/ml) was added to each well. After a 4-hour incubation, 1 ml of DMSO was added. The absorbance at 540 nm was measured to determine the viability of the cells. The concentration required for a 50% inhibition of viability (IC₅₀) was determined graphically. The effect of the samples on the proliferation of PA-1 and Vero cells was expressed as the percentage of cell viability using the formula: % cell viability = A₅₄₀ of treated cells / A₅₄₀ of control cells $\times 100\%$ [24].

Determination of IC₅₀

The IC₅₀ value, which indicates the concentration of a compound needed to inhibit 50 percent cell growth, was determined by creating a graph of Log (concentration of plant extract) versus % cell inhibition. By drawing a line from the 50% value on the Y axis to intersect the curve and then interpolating to the X axis, the Log value representing the concentration of the compound can be obtained. Taking the antilog of this value gives the IC₅₀ value. The percentage inhibition of novel compounds against all cell lines was calculated using the formula: $(At - Ab) / At \times 100$, where At represents the absorbance of the test, Ab represents the absorbance of the blank media, and Ac represents the absorbance of the control cells. % of cell inhibition = 100 – % cell survival.

RESULTS AND DISCUSSION

Table 1 presents the results of the phytochemical analysis conducted on the n-hexane, butyl alcohol, and petroleum ether extracts of the entire *C. infundibuliformis*. The hexane extract contains alkaloids, flavonoids, saponins, triple sugars, anthraquinones, and cardiac glycosides, while the other secondary metabolites were not detected. On the other hand, the butyl alcohol extract of the plant contains alkaloids, flavonoids, saponins, tannins, triple sugars, anthraquinones, and cardiac glycosides. The petroleum ether extract, on the other hand, contains alkaloids, flavonoids, saponins, tannins, and cardiac glycosides as secondary metabolites. Medicinal plants are known for their inherent active ingredients that have been utilized for treating diseases and alleviating pain [25]. The use of traditional medicines and medicinal plants as therapeutic agents for maintaining health has been widely observed in developing countries [26]. It is worth noting that modern pharmacopeia includes at least 25% of drugs derived from plants, as well as synthetic analogues based on chemical compounds originally isolated from plants. The interest in medicinal plants as a promising healthcare aid has been fueled by the escalating costs of prescription drugs in the

Selvakumar

pursuit of personalized health and well-being, as well as the exploration of new plant-derived drugs through bioprospecting [27]. The objective of this study was to analyze the levels of various compounds in the chloroform extract of *C.infundibuliformis*. Figure 1 and Table 2 present the total content of Phenolic compounds, Flavanoids, Alkaloids, and Tannins. The total content of phenolic compounds in the extract, expressed as Gallic acid equivalent, was determined to be $Y=0.001x + 1.993$ and $R^2=0.011$. The range of phenolic compounds in the extract was found to be 2.09 ± 0.48 . Figure 2 and Table 2 display the total content of flavanoids, expressed as Quercetin equivalent, with a concentration of $2.21 \pm 0.91 \mu\text{g/ml}$. Figure 3 and Table 2 show the total content of alkaloids, expressed as Atropine equivalent, with a range of 1.50 ± 0.58 . Figure 4 and Table 2 present the total content of tannins, expressed as gallic acid equivalents, with a variation of 1.95 ± 0.67 . Further research will be conducted in our laboratory to explore the biological and pharmacological effects of the chloroform extract of *C.infundibuliformis*. These findings provide promising prospects for the development of plant-based drugs for various human diseases, including cancer [28]. The antioxidant activity of the chloroform extract from the herbal medicinal plant *C.infundibuliformis* was observed to be dose-dependent. As the concentration of the extract increased, so did the inhibition of radical scavenging activity. In the control group, BHT exhibited inhibition percentages of 38.9, 54.2, 71.1, 74.5, and 99.8 at concentrations of 100, 200, 300, 400, and 500 $\mu\text{g/ml}$ respectively. Similarly, the plant extract showed inhibition percentages of 33.8, 38.9, 49.1, 54.2, and 59.3 at the same concentrations. These findings suggest that the chloroform extract of *C.infundibuliformis* possesses free radical scavenging activity, which can be attributed to the presence of various Phytochemical components including flavonoids, alkaloids, tannins, reducing sugars, cardiac glycosides, and anthraquinones.

The chloroform extract of *Crossandra infundibuliformis* contains 7 phytochemicals such as 1-Hexadecanol, 2-methyl-, E-14-Hexadecenal, Phenol, 2,4-bis(1,1-dimethylethyl)-, E-15-Heptadecenal, Ethanol, 2-(9-octadecenyloxy)-, (Z)-, 9,12,15-Octadecatrienoic acid, 2-[(trimethylsilyl)oxy]-1-[[[(trimethylsilyl)oxy]methyl]ethyl ester, (Z,Z,Z)-, Octasiloxane, 1,1,3,3,5,5,7,7,9,9,11,11,13,13,15,15-hexadecamethyl [29]. Medicinal plants continue to offer humanity new remedies. Therefore, it is crucial to investigate medicinal plants for their safety, quality, toxicity, appropriate dosage of plant materials, and effectiveness. Plants' natural products possess various biological activities, including antioxidant and anti-inflammatory properties. Medicinal plants are abundant in active phytochemical compounds with diverse biological activities. Researchers are highly interested in studying plants to discover novel active drugs that can replace synthetic drugs currently available in the market. The presence of these plant constituents serves as a natural source for modern medicine. Consequently, the cytotoxic levels of medicinal plants must also be assessed against host cells. The safety of plants as potential therapeutic agents must be confirmed, and any side effects should be acceptable to the host. Bioactive compounds that have little to no toxic effects on the host are ideal candidates for drug formulation [30]. Figure 8-10 illustrates the percentage viability of a chloroform extract of *C.infundibuliformis* on Vero and human prostate cancer cell lines. The MTT assay was utilized to analyze cytotoxicity and measure cell proliferation in response to various factors. This assay is also useful for evaluating the effects of cytotoxic and cytostatic compounds, including anticancer drugs. Safety is a crucial consideration in the development of new drugs derived from bioactive compounds found in plants, as some of these compounds can be toxic to our normal system [31-32]. In this particular study, the cytotoxic effect of the chloroform extract of *C.infundibuliformis* was investigated on Vero and human prostate cancer cell lines at concentrations ranging from 100–500 $\mu\text{g/mL}$. The results, depicted in figure 9 and 10 demonstrated that the chloroform extract had a toxic effect on both cell lines at the higher concentration of 500 $\mu\text{g/mL}$. The cells' morphology also changed from a fibroblast shape to an oval shape due to the extract's toxicity. However, at lower concentrations (100 $\mu\text{g/mL}$), the chloroform extract exhibited more than 90% cell viability after 24 and 48 hours of exposure.

ABSTRACT

Facial expression-based emotion recognition is a significant domain within affective computing. Contemporary emotion detection systems may exhibit two deficiencies: translation in face imagery may impair recognition efficacy, and the classifier lacks robustness. Affective computing is presently a highly active research area, garnering escalating attention. This significant interest is propelled by a diverse range of intriguing applications across various domains, including virtual reality, intelligent surveillance, and perceptual interfaces. Affective computing encompasses a diverse knowledge base, including psychology, cognitive science, physiology, and computer science. This report emphasises a literature assessment on facial emotion recognition utilising image processing approaches by diverse academics from 2013 to 2017. Diverse methodologies are analysed to assess the current state of the art. Ultimately, several research obstacles and prospective directions are also examined.

Keywords: Affective Computing, Facial Expression, Image Processing, Emotion Recognition,

INTRODUCTION

Affective computing empowers computers with human-like abilities for the observation, interpretation, and creation of emotional characteristics. This topic is crucial for fostering harmonious human-computer interaction by enhancing the quality of communication between humans and computers, as well as the intelligence of the machine. Research on affect or emotion has been ongoing since the 19th century [1]. Traditionally, "affect" was infrequently associated with inanimate machinery and was mostly examined by psychologists. In recent years, affective qualities have been recorded and processed by computers. Affective computing constructs a "affect model" with data acquired by various sensors, so creating a personalised computing system capable of seeing and interpreting human emotions,

**Agilan**

while providing intelligent, sensitive, and amiable replies. This paper provides a concise overview of significant technologies in affective computing research during the past several years, including facial expression analysis and emotion recognition through image processing techniques. The remainder of the paper is structured as follows. The section presents the studies on facial expressions. Section 3 presents the recognition of emotions through body language and movement. The literature review is located in section 4. Section 5 presents the survey results, while Section 6 outlines the subsequent study approach. The paper concludes at the final portion.

Facial Expression based Emotion Recognition

Facial expressions and gestures, such as smiling or nodding, serve either to convey emotional meaning or to provide communication signals. Analogous to speech processing, the study of facial expressions include coding, recognition, and production, and has been conducted for an extended period. For example, Etcoff [2] delineated the configuration of the primary features of the human face using 37 lines, facilitating the assessment of emotional states; Ekman [3] developed the facial action coding system. They categorised human face emotions into several action components. This approach delineates facial expressions corresponding to six fundamental emotions: joy, anger, surprise, disgust, fear, and sadness. At present, the majority of facial traits are delineated in the MPEG-4 specification. MPEG-4 enables users to design and construct systems for diverse applications by offering flexibility in system settings and varying levels of interactivity with audio-visual content [4][5]. This standard employs both the mesh model and the muscle model to generate three-dimensional facial representations. The study of facial expressions predominantly utilised optical flow or the active appearance model to collect facial features. Lyons [7] employed supervised Fisher Linear Discriminant Analysis (FDA) to derive an appropriate linear subspace from class-specific training samples, enabling optimal separation of the projected samples within this subspace. Principal Component Analysis (PCA) and Independent Component Analysis (ICA) have been employed for expression classification. Numerous approaches exist for face expression identification, including Gabor wavelets, neural networks, Hidden Markov Models (HMM), Point Distribution Models (PDM), optical flow, geometrical tracking systems, and the EGM method, among others. The Gabor representation has been preferred by numerous researchers owing to its effective performance and sensitivity to facial posture and lighting conditions. Numerous studies employed techniques utilising pictures [11][12], visemes [13], facial animation parameters (FAPs) [14], principal components (PCs) [15][16], three-dimensional coordinates [13], three-dimensional distance measurements [5][15], or optical flows [17] to produce facial expressions.

Body Gesture and Movement based Emotion Recognition

Body gestures and movements are determined by the positions of joint articulations and their temporal variations. The current emphasis in gesture processing is predominantly on hand tracking. Hand gestures can convey a multitude of messages, enhancing mood or functioning as a form of sign language. Traditionally, there are two methods: apparentness [18] and three-dimensional modelling [19]. The apparentness-based method constructs the model by examining visible aspects of hand gestures from 2-D photographs, whereas the 3-D methods do tracking in a real-time 3-D environment. In comparison to 3-D methods, the apparentness techniques are less complex and more suitable for real-time computing; yet, they necessitate greater effort to adapt to high noise backgrounds and real-time applications. Efforts have been undertaken to implement mixed modelling techniques to characterise static hand gestures using various aspects, including local profile attributes and comprehensive picture matrix characteristics [20]. It demonstrates superior and more reliable tracking outcomes. To interpret body gestures and movements from image sequences, the crucial aspect is determining the locations of body joints based on the provided image data. The current methodologies typically exhibit several limitations [19], including varying garment colours corresponding to different body arthroses, simplistic movement trajectories, basic backgrounds, and the necessity for hand starting markings. Initially, the target body's profile is acquired using these approaches, followed by the extraction of a virtual framework analogous to the actual body framework through an energy function. The placements of arthroses are established according to the virtual framework utilising knowledge of anthropotomy. The energy function can mitigate certain background sounds and has minimal requirements for the accuracy of the obtained body profile. Furthermore, certain individuals utilise supplementary devices such as electromagnetic inductors [21] and optical reflection markers [22] to enhance the precision of computers in capturing data related to quick facial and bodily

**Agilan**

movements. Recently, the task remains a challenging topic in the field of computer vision, particularly in practical applications. Regarding the acquisition of bodily gestures and movements, alongside enhancing the accuracy and efficiency of parameter capture, the quest for more resilient and nuanced body language remains a pressing challenge for affective computing.

Literature Survey

Liu, Mengyi, *et al.* [23] have introduced a technique for video-based human emotion identification. Each video clip is represented as a set of images, which can be modelled as a linear subspace embedded in a Grassmannian manifold. Class-specific One-to-Rest Partial Least Squares (PLS) is utilised to analyse video and audio data to differentiate each class from the other similar classes. Ghimire *et al.* [24] have proposed a system for fully automated recognition of face expressions in sequences of facial images. The standard expression sequence for each category of facial expression is generated by calculating the median of the landmark tracking outcomes from the training facial expression sequences. Multi-class AdaBoost employs dynamic time warping similarity distance between the feature vector of the input facial expression and the prototype facial expression as a weak classifier to identify a subset of discriminative feature vectors. Two approaches for facial emotion identification are ultimately presented: one use multi-class AdaBoost with dynamic time warping, while the other utilises Support Vector Machine (SVM) on the enhanced feature vectors. Kahou, Samira Ebrahimi, *et al.* [25] delineated the methodologies employed by the University of Montreal's team for the 2013 Emotion Recognition in the Wild Challenge entries. The proposed methodology integrates various deep neural networks tailored for distinct data modalities: a deep convolutional neural network for analysing facial expressions in video frames, a deep belief network for capturing audio data, a deep autoencoder for modelling the spatio-temporal information generated by human actions in the scene, and a shallow network architecture concentrating on the extracted features of the primary subject's mouth. Zavaschi, Thiago HH, *et al.* [26] introduced an innovative method for facial expression recognition utilising an ensemble approach that integrates two distinct feature sets. A collection of foundational support vector machine classifiers is established utilising Gabor filters and Local Binary Patterns. A multi-objective evolutionary algorithm is employed to identify the optimal ensemble, with the objective functions being the minimisation of both the error rate and the ensemble size.

Danisman, Taner, *et al.* [27] have introduced an automated method for identifying pixels in a facial image that enhances the accuracy of facial emotion identification outcomes. The suggested method conducts a comprehensive search for the optimal and suboptimal feature window positions from a collection of face photos across all potential combinations utilising a Multi-Layer Perceptron (MLP). Kalita, Jeemoni, and Karen Das [28] have introduced an Eigenvector-based method designed to recognise face expressions from digital facial photographs. The photos were initially captured and segmented into five distinct sections. The graphic illustrates the extraction and storage of Eigenvectors pertinent to the expressions. Wagner, Jennifer B., *et al.* [29] investigated the neurological, behavioural, and autonomic components of emotional face processing in adolescents with Autism Spectrum Disorder (ASD) and normal development (TD) utilising eye-tracking and event-related potentials (ERPs) across two distinct paradigms. The initial task revealed comparable facial scanning across groups, however the subsequent task indicated that face-sensitive ERPs differed with emotional expressions alone in the typically developing group. Zhang, Li, *et al.* [30] have proposed a study focussing on intelligent neural network-based face expression identification and Latent Semantic Analysis-based topic detection for a humanoid robot. The project has primarily integrated the Facial Action Coding System (FACS) delineates physical indicators and anatomical understanding of face activity for the identification of neutrality and six fundamental emotions from real-time simulated facial expressions. Feedforward Neural Networks (NN) are employed to create analysers for both upper and lower face Action Units (AU), recognising six upper and eleven lower facial actions, including Inner and Outer Brow Raiser, Lid Tightener, Lip Corner Puller, Upper Lip Raiser, Nose Wrinkler, and Mouth Stretch, among others. Rivera *et al.* [31] introduced a novel local feature descriptor, the Local Directional Number Pattern (LDN), for facial analysis, namely in face and expression recognition. LDN encodes the directional information of facial textures (i.e., the structure of the texture) succinctly, resulting in a more discriminative code than existing techniques. Sikka, Karan, *et al.* [32] introduced a technique for the automatic detection of emotions in unconstrained environments during the 2013 Emotion Recognition in the Wild Challenge.

**Agilan**

The method integrates various visual descriptors with paralinguistic audio information for the multimodal classification of video clips. Extracted features are integrated by Multiple Kernel Learning, and the clips are categorised using an SVM into one of seven emotional classifications: Anger, Disgust, Fear, Happiness, Neutral, Sadness, and Surprise. Ahsan, Tanveer, *et al.* [33] have suggested a method for recognising facial expressions, whereby face features are represented by a mix of Gabor wavelet transform and local binary pattern coding of an image. Expression photos are categorised into prototype expressions using a support vector machine with various kernels. Sadeghi *et al.* [34] have proposed a method that eradicates geometric variability in emotional expression, hence enabling the precise utilisation of appearance parameters for facial expression recognition. A static geometric model is employed for the geometric normalisation of facial pictures. This approach is defined as a form of emotional expression. Furthermore, Local Binary Patterns are employed to depict facial appearance characteristics. Cid, Felipe, *et al.* [35] have introduced a real-time system for the recognition and replication of facial emotions within the framework of affective Human-Robot Interaction. The suggested method facilitates rapid and resilient face feature extraction through the sequential application of filters to the gradient image. The Gabor filter is employed in conjunction with a series of morphological and convolutional filters to mitigate noise and light dependency in the images captured by the robot. A collection of invariant edge-based characteristics is retrieved and utilised as input for a Dynamic Bayesian Network classifier to assess human emotion. The classifier's output modifies a geometric robotic head model, serving as a conduit between human expressiveness and the robotic head. Young *et al.* [36] have proposed a method to assess the long-term effects of child maltreatment on emotional processing capabilities in adulthood, as well as the mediating roles of IQ, psychopathology, and psychopathy in the link between childhood maltreatment and adult emotional processing. Majumder *et al.* [37] have introduced an innovative emotion recognition model utilising the system identification methodology. A thorough data-driven model utilising an extended Kohonen self-organising map (KSOM) has been created, with input derived from a 26-dimensional facial geometric feature vector that includes eye, lip, and eyebrow feature points.

Owusu, Ebenezer, Yongzhao Zhan, and Qi Rong Mao [38] have enhanced the recognition accuracy and execution speed of the face expression recognition system to be utilised. The face detection component is executed through the utilisation of the Viola-Jones descriptor. The identified face is down-sampled using Bessel transform to minimise the feature extraction space, hence enhancing processing time. Gabor feature extraction methods were utilised to derive hundreds of facial characteristics that signify diverse facial deformation patterns. A hypothesis based on AdaBoost is developed to choose several hundred from the multitude of extracted features to expedite classification. Zhang, Ligang, Dian Tjondronegoro, and Vinod Chandran [39] introduced a rigorous methodology utilising a Monte Carlo algorithm to derive a collection of Gabor-based part-face templates from gallery photos, then transforming these templates into template match distance features. The resultant feature vectors exhibit resilience to occlusion, as obscured sections are concealed by certain, though not all, of the random templates. Bejani, Mahdi, Davood Gharavian, and Nasrollah Moghaddam Charkari [40] have replicated human emotional perception by integrating emotion-related data from facial expressions and voice. The speech emotion recognition system relies on prosodic features, mel-frequency cepstral coefficients (a representation of the short-term power spectrum of sound), and facial expression recognition utilising integrated time motion images and quantised image matrices, effectively serving as an extension of temporal templates. Ebenezer Owusu, Yonzhao Zhan, and Qi Rong Mao [41] have concentrated on enhancing the recognition accuracy and processing speed of facial recognition systems. Pixel-based techniques identify the skin to minimise the search space for the Maximum Rejection Classifier (MRC) in face detection. The identified face is standardised using a Discrete Cosine Transform (DCT) and down-sampled via Bessel transform. Gabor feature extraction methods were employed to get hundreds of facial features indicative of facial deformation patterns. A hypothesis based on AdaBoost is developed to identify several hundred Gabor features that are suitable candidates for expression recognition. Vitale, Jonathan, *et al.* [42] employed Simulation Theory and neuroscientific insights into Mirror-Neuron Systems to develop an innovative computational model for processing emotive facial expressions. The approach relies on a probabilistic mapping of observations from various identities to a singular fixed identity ('internal transcoding of external stimuli'), thereafter mapping to a latent space ('phenomenological reaction'). Ali, Hasimah, and colleagues [43] have introduced a novel approach utilising the empirical mode decomposition (EMD) technique for facial emotion identification. The EMD algorithm may deconstruct any

**Agilan**

nonlinear, non-stationary signal into several intrinsic mode functions (IMFs). This method involves decomposing the facial signal derived from the sequential projection of the Radon transform of a 2-D image into oscillatory components known as intrinsic mode functions (IMFs) using empirical mode decomposition (EMD). The initial IMF (IMF1) was retrieved and utilised as characteristics for facial emotion recognition. Three dimensionality reduction algorithms—Principal Component Analysis (PCA) combined with Linear Discriminant Analysis (LDA), PCA with Local Fisher Discriminant Analysis (LFDA), and Kernel LFDA (KLFDA)—were separately employed on EMD-based features for dimensionality reduction. The dimensionality-reduced features were input into the k-Nearest Neighbour (k-NN), Support Vector Machine (SVM), and Extreme Learning Machines with Radial Basis Function (ELM-RBF) classifiers for the classification of seven universal face emotions. Rice, Linda Marie, *et al.* [44] investigated the correlation between the computer-based social skills intervention FaceSay™ and enhancements in affect recognition, mentalizing, and social skills among school-aged children with Autism Spectrum Disorder (ASD). Hossain, M. Shamim, and Ghulam Muhammad [45] have introduced a cloud-assisted framework for speech and facial recognition aimed at monitoring the health of the elderly, wherein handheld devices or video cameras capture speech and facial pictures, thereafter transmitting them to a cloud server for analysis and categorisation. The framework identifies a patient's condition, including pain and tension, from their speech and facial images.

Ming, Yue [46] suggested a robust regional bounding spherical descriptor (RBSR) to enhance 3D face recognition and emotion analysis. In the suggested architecture, the authors initially delineate a set of regions on each 3D facial point cloud using form indices and spherical bands on the human visage. The relevant face regions are mapped to regional bounding spheres to derive our regional descriptor. Ultimately, a regional and global regression mapping (RGRM) technique is utilised on the weighted regional descriptor to enhance classification accuracy. Palo, H. K., Mihir Narayana Mohanty, and Mahesh Chandra [47] illustrated an effort to identify two categories of speech emotions: high arousal, such as anger and surprise, and low arousal, such as sadness and boredom. Linear prediction coefficients (LPC), linear prediction cepstral coefficients (LPCC), Mel frequency cepstral coefficients (MFCC), and perceptual linear prediction (PLP) features are employed for emotion recognition utilising multilayer perceptron (MLP). Diverse emotional speech features are extracted from the audio channel using the aforementioned features for training and testing purposes. Barros, Pablo, *et al.* [48] employed a hierarchical feature representation to address spontaneous emotions and developed a method for integrating different modalities for non-verbal emotion recognition, rendering it appropriate for Human-Robot Interaction (HRI) contexts. Zhang, Li, *et al.* [49] have presented an unsupervised automatic facial point identification method coupled with regression-based intensity estimate for facial action units (AUs) and emotion clustering to address these problems. The suggested facial point detector can identify 54 facial points in images exhibiting occlusions, position fluctuations, and scaling discrepancies through the utilisation of Gabor filtering, BRISK (Binary Robust Invariant Scalable Keypoints), an Iterative Closest Point (ICP) algorithm, and fuzzy c-means (FCM) clustering.

Neoh, Siew Chin, *et al.* [50] have introduced a face expression recognition system utilising a layered encoding cascade optimisation methodology. Generating an effective facial representation is crucial for successful facial emotion recognition. A modified Local Gabor Binary Pattern operator is initially utilised to obtain a refined initial face representation. Subsequently, we propose two evolutionary algorithms for feature optimisation: (i) direct similarity and (ii) Pareto-based feature selection, within the layered cascade model. Mlakar, Uroš, and Božidar Potočnik [51] have introduced an effective automated technique for face expression recognition utilising the histogram of orientated gradient (HOG) descriptor. This approach, independent of topic matter, was developed for the recognition of six prototypical emotions. It identifies emotions by assessing the variances in feature descriptors between a neutral expression and a peak expression of the observed individual. The parameters for the HOG descriptor were established utilising a genetic method. Support vector machines (SVM) were utilised in the recognition phase, wherein a single SVM classifier was developed for each emotion. Liu, Mengyi, *et al.* [52] proposed the development of a deep architecture known as AU inspired Deep Networks (AUDN), which is based on the psychological hypothesis that expressions may be deconstructed into various facial Action Units (AUs). To fully leverage this inspiration while circumventing the detection of AUs, it is proposed to autonomously learn: (1) informative local appearance variations; (2) the ideal method for merging local variations; and (3) a high-level representation for final

**Agilan**

expression recognition. Boughrara, Hayet, *et al.* [53] have introduced a systematic training algorithm for Multi-Layer Perceptron (MLP) utilised in face emotion detection applications. The created technique consists of a single hidden layer utilising a certain number of neurones and a limited quantity of training patterns. The proposed MLP constructive training algorithm aims to determine synthesis parameters, including the initial number of patterns for each class subset presented during training, the initial count of hidden neurones, the number of training iterations, and the predefined MSE value. Kahou, Samira Ebrahimi, *et al.* [54] have introduced a methodology for developing many specialised models utilising deep learning techniques, with each model concentrating on a specific modality. Included are a convolutional neural network that captures visual information in detected faces, a deep belief network that represents the audio stream, a K-Means-based "bag-of-mouths" model that extracts visual features from the mouth region, and a relational autoencoder that addresses spatio-temporal aspects of videos. Mano, Leandro Y., *et al.* [55] have examined the application of patient imagery and emotional recognition to support patients and the elderly in a home healthcare setting. Moreover, there are limited studies that consider the patient's mental state, which is essential for their recovery from illness. Alhussein and Musaed [56] have presented a facial expression recognition system for an e-Healthcare framework. Weber local descriptors (WLD) are employed for features. The suggested approach divides a static facial image into several chunks. A multiscale WLD is utilised for each block to generate a WLD histogram for the image. The prominent bins of the histogram are identified through the application of the Fisher discrimination ratio. These bin values represent the characteristics of the face. The facial characteristics are subsequently entered into a support vector machine-based classifier to recognise the emotion.

Kim, Bo-Kyeong, *et al.* [57] have delineated the proposed methodology for resilient facial expression recognition (FER) in the context of the third Emotion Recognition in the Wild challenge. The authors trained several deep convolutional neural networks (deep CNNs) as committee members and aggregated their decisions. To enhance this committee of deep CNNs, the authors proposed two strategies: (1) to achieve diverse decisions from deep CNNs, one may alter network architecture, input normalisation, and random weight initialisation during the training of these models, and (2) to establish a superior committee in both structural and decisional dimensions, a hierarchical architecture of the committee is constructed utilising exponentially-weighted decision fusion. Sun, Bo, *et al.* [58] developed two temporal-spatial dense scale-invariant feature transform (SIFT) features and integrated multimodal features to identify expressions from image sequences. For static facial emotion recognition utilising video frames, we extract dense SIFT and several deep convolutional neural network (CNN) features, including the suggested CNN architecture. Calvo, Manuel G., and Lauri Nummenmaa [59] identified three key results about the visual and emotional determinants in expression recognition. Initially, behavioural, neurophysiological, and computational metrics demonstrate that fundamental expressions are consistently identified and differentiated, but the effect may be exaggerated by the employment of prototypical expression stimuli and forced-choice responses. Secondly, affective content regarding valence and arousal is rapidly derived from facial expressions; nevertheless, this rudimentary affective representation has a negligible impact on the categorical identification of distinct expressions. The physical arrangement and visual prominence of face features play a crucial role in expression detection, as "emotionless" computational models can replicate some fundamental phenomena observed in humans.

Zhang, Li, *et al.* [60] suggested a face expression recognition system utilising a variation of the evolving firefly method for feature optimisation. A modified Local Binary Pattern descriptor is introduced to generate an initial discriminative facial representation. A modified version of the firefly method is introduced for feature optimisation. The suggested evolutionary firefly algorithm utilises the spiral search activity of moths and the attraction search actions of fireflies to alleviate premature convergence in the Levy-flight firefly algorithm (LFA) and the moth-flame optimisation (MFO) algorithm. Zhang, Xiao, and Mohammad H. Mahoor [61] introduced a unique approach, task-dependent multi-task multiple kernel learning (TD-MTMKL), for the simultaneous detection of the absence and presence of multiple action units (AUs). TD-MTMKL seeks to derive an optimal kernel combination from a specified set of foundation kernels for each relevant AU, hence achieving a more nuanced representation of AU relationships through the weights of the kernel combinations. Altamura, Mario, *et al.* [62] have indicated that emotional facial recognition is compromised in bipolar disorder; however, it remains uncertain if this impairment is exclusive to the condition. The authors examined the effects of ageing and bipolar disease on dynamic emotional face recognition.

**Agilan**

Twenty elderly individuals, 16 patients with bipolar disorder, and 20 control subjects engaged in a dynamic affective facial recognition challenge followed by a rating task. Kar, Nikunja Bihari, Korra Sathya Babu, and Sanjay Kumar Jena [63] have introduced a novel hybrid system for the automatic identification of facial expressions. The suggested method employs histograms of orientated gradients (HOG) descriptors to extract features from expressive facial photos. Feature reduction techniques, including principal component analysis (PCA) and linear discriminant analysis (LDA), are employed to identify the most significant discriminant features. The discriminant features are subsequently input into the back-propagation neural network (BPNN) classifier to ascertain the underlying emotions from expressive face images. Liu, Zhentao, *et al.* [64] suggested a facial expression emotion recognition-based human-robot interaction (FEER-HRI) system, for which a four-layer architecture has been built. The FEERHRI technology allows robots to both recognise human emotions and produce facial expressions to align with those emotions. A method for face emotion detection utilising 2D-Gabor, uniform local binary pattern (LBP) operator, and multiclass extreme learning machine (ELM) classifier is introduced, aimed at real-time facial expression recognition for robots. Lopes, André Teixeira, *et al.* [65] have suggested a straightforward approach for facial expression recognition utilising a combination of Convolutional Neural Networks and targeted picture pre-processing techniques. Convolutional Neural Networks attain superior accuracy with extensive datasets.

Fan, Xijian, and Tardi Tjahjadi [66] have concentrated on fundamental emotion recognition and suggest a spatiotemporal characteristic derived from local Zernike moments in the spatial domain, utilising motion change frequency. The authors additionally create a dynamic feature that includes a motion history image and entropy. A weighting method utilising the latter feature and image frame subdivision is employed to increase the dynamic information of facial expressions, followed by the implementation of a traditional support vector machine. Datta, Samyak, Debashis Sen, and R. Balasubramanian [67] has introduced a rapid face emotion categorisation system that utilises the amalgamation of geometric and texture-based features. The authors proposed utilising the binary classification capabilities of a support vector machine classifier within a hierarchical graph-based framework to facilitate multi-class classification. Wen, Guihua, *et al.* [68] introduced an ensemble method utilising convolutional neural networks with probability-based fusion for facial expression recognition, wherein the CNN architecture was modified by employing a convolutional rectified linear layer as the initial layer and several hidden maxout layers. The construction involved systematically altering parameters and architecture around the optimal values for CNN, with each CNN serving as the basis classifier trained to yield a probability for each class. Ashir, Abubakar M., and Alaa Eleyan [69] have introduced a novel methodology for enhanced face emotion recognition. The novel methodology is derived from the principles of compressive sensing theory and the multi-resolution approach to facial expression challenges.

Ghimire, Deepak *et al.* [70] have introduced a novel approach for recognising facial expressions from a single visual frame, utilising a combination of appearance and geometry information alongside support vector machine classification. The authors derived region-specific appearance features by partitioning the entire facial area into domain-specific local sections. Geometric characteristics are also derived from relevant domain-specific areas. Qayyum, Huma, *et al.* [71] employed stationary wavelet transform to extract features for facial emotion identification, owing to its superior localisation properties in both spectral and spatial domains. A combination of horizontal and vertical subbands from the stationary wavelet transform is employed, as these subbands encapsulate muscle movement information for most face emotions. The discrete cosine transform is applied to these subbands to further reduce feature dimensionality. The chosen features are subsequently input into a feedforward neural network, which is trained using the backpropagation technique. Mlakar, Uroš, *et al.* [72] have suggested an efficient feature selection technique for a Facial Expression Recognition (FER) system. This system, which can identify seven basic emotions, including neutral expression, is founded on a histogram of orientated gradient descriptor (HOG) and differential feature vectors.

Agilan

Survey Findings

- Facial Recognition and Emotion Recognition are two primary issues in pattern recognition and computer vision.
- Facial appearance can exhibit significant variances due to differences in facial expressions, lighting conditions, occlusion, head orientation, and ageing.
- Most feature extraction methods have been developed and assessed concerning differences in facial look and illumination; nonetheless, they have achieved satisfactory recognition results only with a greater number of training samples.

Research Direction

In recent years, the examination of human emotional behaviour has captivated numerous researchers. This automatic analysis is beneficial in multiple disciplines, including psychology, computer science, linguistics, and neuroscience. Affective computing is responsible for creating standardised systems and technologies that facilitate the recognition and interpretation of diverse human expressions and gestures. The emotions are classified as anger, disgust, fear, happiness, sadness, and surprise. The emotion recognition system has three primary steps: face detection, feature extraction, and facial expression categorisation. Therefore, a necessity exists for standardised methodologies that address the issue of machines comprehending human affective behaviour. Machine learning methodologies should be implemented to identify human emotional behaviour.

CONCLUSION

Facial recognition is a routine activity for humans, typically performed effortlessly and with minimal focus; nonetheless, it continues to provide a significant challenge for machine learning in the field of biometrics. After over 30 years of research in this field, beneficial answers and products are finally emerging. In biometrics research, automated facial detection possesses several beneficial attributes that facilitate the translation of research findings into practical applications. This literature survey discussed the diverse perspectives of researchers in the domain of Facial Emotion Recognition utilising Image Processing techniques.

ABSTRACT

The increasing volume and complexity of academic research publications have made the efficient analysis of research abstracts a crucial task in academic and scholarly work. Traditional text classification techniques often struggle to capture the nuanced, interdisciplinary nature of research abstracts, where each document may span multiple categories or research domains. In this study, we propose a novel approach to enhancing research abstract analysis through multi-label classification, incorporating a Hybrid Text Preprocessing Framework. This methodology integrates advanced preprocessing techniques to improve the semantic representation of research abstracts, thereby increasing the accuracy and robustness of multi-label classification models. The preprocessing pipeline begins with text cleaning, where noise such as URLs, special characters, numbers, and excessive spaces are removed, and all text is standardized to lowercase. Contractions are expanded to preserve the full semantic meaning. Tokenization is performed using a hybrid of Byte Pair Encoding (BPE) and Word Piece methods, which effectively handle out-of-vocabulary words and fragmented expressions common in academic text. Stop word removal and lemmatization are applied using NLTK and spaCy libraries to reduce redundancy and bring words to their base forms. Additionally, the methodology includes the normalization of discipline-specific jargon and abbreviations, ensuring consistency in terms across various academic fields. To address the inherent class imbalance in research datasets, the Synthetic Minority Over-sampling Technique (SMOTE) is utilized to synthetically augment underrepresented categories, ensuring a balanced dataset for training. This multi-label preprocessing approach significantly enhances the effectiveness of research abstract classification, allowing models to more accurately predict multiple

relevant categories simultaneously. The proposed framework not only improves the quality of research abstract analysis but also demonstrates the critical role of integrated preprocessing techniques in advancing multi-label classification tasks in academic research.

Keywords: Multi-label classification, Predictive modeling, Research abstract analysis, Machine learning algorithms, Natural language processing (NLP), Text classification, Hybrid models, Neural networks, Academic content categorization, Deep learning models

INTRODUCTION

The vast growth in academic publications across a multitude of disciplines has led to an overwhelming amount of research material being generated each year. Research abstracts, as concise summaries of scholarly articles, play a crucial role in the academic ecosystem by offering a snapshot of the research's goals, methodologies, results, and conclusions [1]. However, the sheer volume of academic content, coupled with the increasing diversity and interdisciplinarity of research topics, has made it increasingly difficult to efficiently manage, categorize, and retrieve relevant scholarly information. Traditional text classification systems, which typically assign a single label or category to a document, often fall short in capturing the complexity of modern research abstracts, as these abstracts frequently span multiple topics or research areas [2] [3]. The problem of assigning multiple labels to a single instance, referred to as multi-label classification, is crucial in the context of research abstract analysis. Unlike traditional single-label classification, multi-label classification allows for a document to belong to more than one category simultaneously [4]. For example, a research abstract on "machine learning applications in healthcare" may belong to both "Artificial Intelligence" and "Healthcare" categories. The ability to handle multi-label classification effectively in research abstracts enables more precise content categorization, making it easier for researchers to find relevant studies across different domains. As a result, multi-label classification has become an essential tool in areas like literature review automation, content-based recommendation systems, and scholarly search engines [5]. One of the significant challenges in multi-label classification of research abstracts is the quality of the input data. Research abstracts are often written in a highly specialized, domain-specific language that may contain jargon, abbreviations, and varied terminologies that can hinder accurate classification [6].

In addition, the informal and fragmented nature of some research abstracts, especially those from interdisciplinary or emerging fields, can complicate the model's ability to capture relevant information. Text preprocessing, which involves cleaning and preparing the raw text data before feeding it into machine learning models, plays a critical role in improving the quality of the data used for multi-label classification [7] [8]. Effective preprocessing ensures that the text is standardized, redundant information is removed, and domain-specific terms are consistently represented, thereby enhancing the model's ability to classify the abstract accurately. In this study, we propose a Hybrid Text Preprocessing Methodology designed to enhance research abstract analysis through multi-label classification. The goal of our methodology is to improve the overall quality and effectiveness of multi-label classification models by applying a series of advanced preprocessing techniques [8] [9]. These techniques aim to address common challenges such as noisy data, inconsistent grammatical structures, out-of-vocabulary terms, and domain-specific jargon. Our approach incorporates text cleaning, tokenization using a hybrid of Byte Pair Encoding (BPE) and Word Piece methods, stop word removal, lemmatization, and normalization of discipline-specific terminology, among other steps. Additionally, we address the issue of class imbalance—an inherent challenge in multi-label classification tasks—by utilizing the Synthetic Minority Over-sampling Technique (SMOTE) to ensure that underrepresented categories are adequately represented during model training. By enhancing the preprocessing pipeline, we aim to improve the semantic representation of research abstracts, which in turn boosts the accuracy and performance of multi-label classification models [8]. The proposed framework not only enhances the effectiveness of categorizing research abstracts across multiple disciplines but also contributes to the broader field of automatic literature review,

**Anbarasi and Prabakaran**

where research abstracts play a central role in identifying and classifying relevant academic studies [9] [10]. The significance of this research lies in its potential to streamline the process of research discovery, enabling more efficient and accurate retrieval of information for scholars, researchers, and academic institutions. Ultimately, this approach demonstrates the importance of integrated preprocessing techniques in improving multi-label classification tasks in the context of academic content analysis.

Tokenization Approaches in the Text Preprocessing

Tokenization is a fundamental preprocessing step in natural language processing (NLP) that involves breaking down text into smaller, manageable components, such as words, phrases, or even characters [11]. In the context of research abstract analysis, tokenization plays a crucial role in preparing the text for further processing, such as classification, information extraction, and keyword analysis. Each type of tokenization serves a specific purpose depending on the nature of the task and the structure of the text.

Word Tokenization

Word tokenization involves splitting a given text into individual words. This technique is essential in research abstract analysis as it enables the extraction and analysis of distinct terms or concepts within the abstract [12]. Word tokenization is commonly used for tasks such as keyword extraction, classification, and semantic analysis. For instance, a research abstract sentence like "The study explores the effects of climate change" would be tokenized into ["The", "study", "explores", "the", "effects", "of", "climate", "change"]. Word tokenization is simple and effective but may struggle with punctuation marks and contractions, which could lead to errors or loss of meaning in specific cases.

Sentence Tokenization

Sentence tokenization is a process where the text is divided into individual sentences. This approach is beneficial when the structure of the text needs to be preserved, such as when performing sentence-level sentiment analysis, syntactic parsing, or topic segmentation [13]. In research abstract analysis, sentence tokenization can be particularly useful when analyzing the flow and structure of an abstract. For example, the sentence "This paper investigates renewable energy sources. The findings suggest significant potential" would be tokenized into ["This paper investigates renewable energy sources.", "The findings suggest significant potential."] While sentence tokenization works well in many contexts, challenges arise when punctuation marks, like abbreviations (e.g., "Dr."), interfere with sentence boundaries, leading to incorrect segmentation.

Subword Tokenization

Subword tokenization is a technique that divides words into smaller units or subwords, making it particularly useful for handling complex words, rare terms, or unseen words in research abstracts [14]. For instance, a word like "unprecedented" might be tokenized into ["un", "precedented"]. This method is popular in advanced NLP tasks such as neural machine translation and speech recognition, as it helps in reducing vocabulary size and managing out-of-vocabulary (OOV) words. In the context of research abstract analysis, subword tokenization helps maintain semantic integrity while reducing the number of unique tokens. However, it can be computationally intensive and may require advanced techniques like Byte Pair Encoding (BPE), WordPiece, or Sentence Piece to implement effectively.

Character Tokenization

Character tokenization splits text into individual characters instead of words, which can be particularly beneficial for languages with complex morphology or for handling non-standard spellings and typographical errors common in research abstracts. For example, the word "methodology" would be tokenized as ["m", "e", "t", "h", "o", "d", "o", "l", "o", "g", "y"]. This method allows for deep analysis of word structure and is particularly useful when examining variants of words or identifying spelling mistakes in user-generated content or research abstracts. However, character tokenization does not capture word-level meaning as effectively as word tokenization and may result in longer sequences that could complicate downstream processing tasks.

**Anbarasi and Prabakaran****N-gram Tokenization**

N-gram tokenization divides text into sequences of N consecutive words or characters, where N represents the number of words or characters in each token. This method is useful for capturing contextual relationships between adjacent words and maintaining the sequence of terms in research abstracts [15]. For instance, a bigram (2-gram) model applied to the sentence "The study focuses on AI" would tokenize it as ["The study", "study focuses", "focuses on", "on AI"]. N-gram tokenization helps in tasks like language modeling and text classification by preserving the sequential nature of language. However, as the value of N increases, the number of possible combinations grows exponentially, which can lead to sparse data and overfitting in machine learning models. In research abstract analysis, selecting the appropriate N-gram size is crucial for balancing context capture and computational efficiency.

Lemmatization Approaches in the Text Preprocessing

Lemmatization is a crucial text preprocessing technique that involves reducing words to their base or root form [16]. In the context of research abstract analysis, lemmatization helps to normalize words and eliminate variations due to tense, plurality, or other grammatical changes, making it easier to analyze and categorize research content effectively. For instance, lemmatization enables the model to recognize that "running," "ran," and "runs" all correspond to the base word "run," ensuring consistent feature representation for analysis and classification tasks.

Rule-based Lemmatization

Rule-based lemmatization uses predefined linguistic rules to reduce words to their base forms. These rules are based on grammatical structures, such as suffix stripping or identifying verb conjugations [17]. For example, the word "running" would be reduced to "run," and "better" would be mapped to "good." This approach is fast and efficient for regular cases and is particularly useful in languages with consistent morphological patterns. However, rule-based methods may struggle with irregular forms or exceptions, making them less reliable in more complex or ambiguous linguistic contexts, such as those found in multi-disciplinary research abstracts.

Part-of-Speech (POS) Tagging Lemmatization

POS-based lemmatization improves accuracy by taking into account the part of speech of each word to determine its correct base form [18]. For example, "saw" would be lemmatized to "see" if used as a verb, but would remain "saw" if used as a noun. In research abstract analysis, this approach ensures that words are lemmatized in a context-sensitive manner, preserving their intended meaning. However, POS tagging requires an additional computational step, where each word must be tagged with its part of speech, which can increase processing time and complexity. The accuracy of POS tagging directly impacts the quality of lemmatization.

Dictionary-based Lemmatization

Dictionary-based lemmatization relies on predefined lexicons or word databases, such as **WordNet**, to map words to their base forms [19]. For instance, the word "running" would be mapped to "run." This method is efficient and straightforward but limited by the scope of the dictionary used. In research abstract analysis, this approach is useful for handling common words but may fail to lemmatize words that are not included in the dictionary or complex, inflected terms that do not follow standard patterns. Thus, it may not be as comprehensive in handling specialized or domain-specific terminology.

Statistical Lemmatization

Statistical lemmatization uses machine learning techniques to predict the lemma of a word based on statistical patterns learned from large corpora of text [20]. This data-driven approach can handle rare and irregular forms better than rule-based or dictionary-based methods, as it learns patterns from context. For example, statistical lemmatization could better handle domain-specific terminology in research abstracts. However, this approach requires a large annotated corpus for training, making it computationally intensive and more suited for applications with abundant labeled data.

**Anbarasi and Prabakaran****Morphological Analysis Lemmatization**

Morphological lemmatization focuses on breaking down words into their smallest meaningful units, known as morphemes [21]. By analyzing the root and affixes (such as prefixes and suffixes), this method reduces complex words to their base forms. For example, "unhappiness" would be lemmatized to "happy." This approach is particularly useful for languages with rich morphology and compound words, making it beneficial for analyzing research abstracts in languages with complex word structures. However, morphological lemmatization may not generalize well across languages or handle highly irregular words, which can be a limitation in cross-lingual research abstract analysis.

Machine Learning-based Lemmatization

Machine learning-based lemmatization involves training models to predict the base form of a word based on its context within a sentence [22]. Advanced algorithms, such as deep learning models, are leveraged to learn complex patterns in text and perform accurate lemmatization. This method can outperform traditional rule-based and dictionary-based approaches, especially when dealing with irregular words or complicated sentence structures in research abstracts. However, machine learning-based lemmatization requires large labeled datasets for training, making it computationally expensive and less feasible for small-scale applications or situations with limited data.

Proposed Hybrid Text Preprocessing Methodology

In this study, we propose a Hybrid Text Preprocessing Approach (HTP) to enhance the quality of research abstract data before feature extraction and classification tasks. This approach integrates multiple preprocessing techniques to effectively clean, normalize, and transform textual data, ensuring improved classification accuracy and better contextual understanding. The methodology consists of several key preprocessing steps:

Text Cleaning

The preprocessing pipeline begins with text cleaning to remove unnecessary elements that can introduce noise into the analysis. This step involves eliminating URLs, special characters, numbers, and extra spaces from the text. Conversions are made to lowercase to maintain consistency across the dataset. Additionally, contractions are expanded to their full forms (e.g., "don't" becomes "do not") to preserve the semantic meaning and ensure uniformity in the text.

Tokenization

Tokenization is a crucial step in the preprocessing process, as it splits the text into smaller components (tokens), such as words or subwords. For better handling of complex research terminology, slang, and abbreviations, we use WordPiece Tokenization (BERT-based) and Byte Pair Encoding (BPE), which are powerful methods to tokenize subword units effectively. These tokenization techniques ensure the model retains meaningful subword representations, especially when dealing with fragmented or context-rich terms found in research abstracts.

Stopword Removal and Lemmatization

Following tokenization, stopwords removal is performed using the NLTK stopwords list to eliminate common words that do not contribute much to the text's meaning. Lemmatization, utilizing spaCy, is applied to reduce words to their base forms (e.g., "running" becomes "run"), helping to standardize the vocabulary and reduce variations in the text. This step is essential for improving the model's ability to generalize across diverse terms in research abstracts.

Emoji and Slang Handling

Given that research abstracts may include emojis or informal language (especially in social sciences or interdisciplinary fields), the proposed methodology also incorporates emoji and slang normalization. Emojis are converted into their corresponding textual meanings using an emoji dictionary, while slang terms are standardized using a custom-built slang dictionary. This ensures that informal expressions and symbols do not distort the model's interpretation of the text.

Anbarasi and Prabakaran

Handling Class Imbalance

To address the class imbalance issue commonly found in research datasets, especially when certain research topics or categories are underrepresented, we apply the Synthetic Minority Over-sampling Technique (SMOTE). SMOTE generates synthetic samples for minority classes, balancing the dataset and improving the model's ability to detect underrepresented research themes. This step is crucial for ensuring that the model performs accurately across all categories, including less frequent research domains.

Step-by-Step Procedure for the Proposed Hybrid Text Preprocessing (HTP) Approach

Input: Raw text dataset containing various research abstracts across multiple domains.

Output: Tokenized and preprocessed text data suitable for feature extraction and classification.

1. **Step 1: Text Cleaning**
 - 1.1: Remove URLs, special characters, numbers, and extra spaces.
 - 1.2: Convert all text to lowercase for consistency.
 - 1.3: Expand contractions (e.g., "don't" → "do not").
2. **Step 2: Apply Byte Pair Encoding (BPE)**
 - 2.1: Initialize the vocabulary with all individual characters in the dataset.
 - 2.2: Compute the frequency of character pairs across the text corpus.
 - 2.3: Iteratively merge the most frequent character pairs to form subwords using the following formula:
3. $V \leftarrow V \cup \{xy\} \text{ where } (x,y) = \arg \max_{xy} f(x,y)$
 - Where V = vocabulary, w is the word to tokenize, $p=(x,y)$ is the most frequent symbol pair, $f(p)$ is the frequency of pair.
 - 2.4: Continue merging until a predefined vocabulary size (e.g., 30,000 tokens) is reached.
 - 2.5: Store the BPE-tokenized vocabulary for further processing.
4. **Step 3: Apply WordPiece Tokenization**
 - 3.1: Take the BPE-tokenized words as input.
 - 3.2: If a word exists in the WordPiece vocabulary, retain it as a single token.
 - 3.3: If the word is not in the vocabulary, apply WordPiece subword segmentation by performing greedy matching and appending ## before fragments in the middle or end of a word.
5. **Step 4: Stopword Removal and Lemmatization**
 - 4.1: Remove stopwords using the NLTK stopwords list.
 - 4.2: Apply spaCy-based lemmatization to convert words to their base forms.
6. **Step 5: Handling Emojis & Slang**
 - 5.1: Convert emojis to textual representations using a predefined emoji dictionary.
 - 5.2: Normalize slang words through a custom slang dictionary.
7. **Step 6: Handling Class Imbalance**
 - 6.1: Identify class distribution within the dataset.
 - 6.2: Apply SMOTE (Synthetic Minority Over-sampling Technique) to generate synthetic samples for underrepresented classes.
8. **Step 7: Store the Final Processed Text**
 - 7.1: Store the fully preprocessed text in a structured format for feature extraction and further analysis.

RESULT AND DISCUSSION

The Education Research Articles or Research Abstracts dataset can be considered from the Kaggle Repository [R]. The performance metrics like Accuracy, Recall, Precision, F1-Score, Miss Rate and False Discovery Rate can be used to evaluate the performance of the Proposed approach with the existing pre-processing techniques. In this section, the performance of the Proposed Hybrid Text Pre-Processing approach can be evaluated with the different

**Anbarasi and Prabakaran**

tokenization techniques. To evaluate the impact of different tokenization strategies, we compare the Proposed Hybrid BPE + WordPiece Tokenization with BPE, WordPiece, and Sentence Piece Tokenization across different classification models used in the cybers talking detection task. The traditional ML models like: Support Vector Machine (SVM), Random Forest (RF), Naïve Bayes (NB) and the Deep Learning Models: Long Short-Term Memory (LSTM), Bidirectional LSTM (BiLSTM), Bidirectional Encoder Representations from Transformers (BERT). Table 6.1 depicts the Classification Accuracy (in %) obtained by the Proposed Hybrid Text Pre-processing (HTP), BPE, WordPiece and Sentence Piece Tokenization using SVM, RF, NB, LSTM, BiLSTM, and BERT. The classification accuracy results from Table 1, which compares different tokenization strategies (BPE, Word Piece, Sentence Piece, and Proposed Hybrid Text Pre-processing or HTP) across various machine learning (SVM, RF, NB) and deep learning (LSTM, BiLSTM, BERT) models. BPE Tokenization: The best accuracy was achieved with BiLSTM (93.2%) and BERT (88.2%). SVM, RF, and NB performed relatively well, with accuracy ranging from 78.1% to 83.5%. WordPiece Tokenization: BiLSTM (94.3%) and BERT (89.8%) showed the highest accuracy, continuing the trend of deep learning models performing better. The accuracies for SVM, RF, and NB improved slightly compared to BPE, ranging from 79.6% to 84.1%. SentencePiece Tokenization: BiLSTM (94.9%) and BERT (91%) performed the best among all tokenization strategies. SVM, RF, and NB saw slight improvements over the Word Piece strategy, with accuracies between 80.5% and 85%. Proposed HTP Tokenization: The Proposed HTP tokenization yielded the highest classification accuracy across all models, with BiLSTM achieving 95.4% and BERT achieving 92.3%. This tokenization strategy provided noticeable improvement for all models, with SVM, RF, and NB reaching accuracies between 81.2% and 85.7%. Table 2 depicts the Precision (in %) obtained by the Proposed Hybrid Text Pre-processing (HTP), BPE, WordPiece and Sentence Piece Tokenization using SVM, RF, NB, LSTM, BiLSTM, and BERT. The precision results from Table 2, comparing different tokenization strategies (BPE, Word Piece, Sentence Piece, and Proposed Hybrid Text Pre-processing or HTP) across various machine learning (SVM, RF, NB) and deep learning (LSTM, BiLSTM, BERT) models. BPE Tokenization: BiLSTM achieved the highest precision (91%). BERT performed well (85.6%), followed by LSTM (83.2%). SVM, RF, and NB had precision values ranging from 75.4% to 81%.

WordPiece Tokenization: BiLSTM again led with the highest precision (92.1%). BERT achieved 87.2%, showing an improvement from BPE. SVM, RF, and NB had precision values between 76.8% and 82%. SentencePiece Tokenization: BiLSTM achieved the highest precision (93%). BERT performed well at 88.5%, and LSTM had a precision of 86.4%. SVM, RF, and NB also showed an improvement over the BPE strategy, with precision ranging from 77.6% to 82.8%. Proposed HTP Tokenization: BiLSTM reached the highest precision (93.7%). BERT showed the highest improvement (90.1%), followed by LSTM (87.5%). SVM, RF, and NB performed best with the Proposed HTP strategy, with precision values between 78.4% and 83.1%. Table 3 depicts the Recall (in %) obtained by the Proposed Hybrid Text Pre-processing (HTP), BPE, WordPiece and Sentence Piece Tokenization using SVM, RF, NB, LSTM, BiLSTM, and BERT. The recall results from Table 3, comparing different tokenization strategies (BPE, WordPiece, SentencePiece, and Proposed Hybrid Text Pre-processing or HTP) across various machine learning (SVM, RF, NB) and deep learning (LSTM, BiLSTM, BERT) models. BPE Tokenization: BiLSTM achieved the highest recall (86.7%). BERT followed with a recall of 81.3%, while LSTM showed a recall of 78.5%. SVM, RF, and NB had recall values ranging from 68.3% to 74.2%. WordPiece Tokenization: BiLSTM led again with the highest recall (88.2%). BERT achieved 82.7%, showing an improvement over BPE. Recall values for SVM, RF, and NB ranged from 69.7% to 74.9%. SentencePiece Tokenization: BiLSTM performed best with a recall of 89%. BERT showed good improvement (84%), and LSTM had a recall of 81.5%. SVM, RF, and NB had recall values between 71.4% and 75.2%. Proposed HTP Tokenization: BiLSTM achieved the highest recall (89.8%). BERT showed the highest improvement with a recall of 85.4%, followed by LSTM (82.6%). SVM, RF, and NB performed best with the Proposed HTP strategy, with recall values ranging from 72.5% to 75.8%. Table 4 depicts the F1-Score (in %) obtained by the Proposed Hybrid Text Pre-processing (HTP), BPE, WordPiece and Sentence Piece Tokenization using SVM, RF, NB, LSTM, BiLSTM, and BERT. The F1-Score results from Table 4, comparing different tokenization strategies (BPE, WordPiece, SentencePiece, and Proposed Hybrid Text Pre-processing or HTP) across various machine learning (SVM, RF, NB) and deep learning (LSTM, BiLSTM, BERT) models. BPE Tokenization: BiLSTM achieved the highest F1-Score (88.8%). BERT followed with a score of 83.4%, while LSTM scored 80.8%. SVM, RF, and NB had F1-Scores ranging from 71.7% to 77.5%. WordPiece Tokenization: BiLSTM again achieved the highest F1-Score (90.1%). BERT showed an improvement

**Anbarasi and Prabakaran**

to 84.9%, and LSTM had an F1-Score of 82.5%. SVM, RF, and NB had scores between 73.1% and 78.1%. SentencePiece Tokenization: BiLSTM achieved the highest F1-Score (91%). BERT showed a further improvement with an F1-Score of 86.2%, and LSTM had 83.9%. SVM, RF, and NB had F1-Scores ranging from 74.4% to 78.6%. Proposed HTP Tokenization: BiLSTM achieved the highest F1-Score (91.7%). BERT reached 87.7%, followed by LSTM with a score of 85%. The Proposed HTP strategy provided the best performance for all models, with SVM, RF, and NB achieving scores ranging from 75.3% to 79.3%. Table 5 depicts the AUC-ROC Score obtained by the Proposed Hybrid Text Pre-processing (HTP), BPE, WordPiece and SentencePiece Tokenization using SVM, RF, NB, LSTM, BiLSTM, and BERT. The AUC-ROC score results from Table 5, comparing different tokenization strategies (BPE, WordPiece, SentencePiece, and Proposed Hybrid Text Pre-processing or HTP) across various machine learning (SVM, RF, NB) and deep learning (LSTM, BiLSTM, BERT) models. BPE Tokenization: BiLSTM achieved the highest AUC-ROC score (0.95). BERT followed closely with a score of 0.92, and LSTM had a score of 0.90. SVM, RF, and NB had AUC-ROC scores between 0.82 and 0.88. WordPiece Tokenization: BiLSTM again achieved the highest AUC-ROC score (0.96). BERT reached 0.93, and LSTM showed a score of 0.91. SVM, RF, and NB had scores between 0.84 and 0.89. SentencePiece Tokenization: BiLSTM performed best with a score of 0.96. BERT achieved 0.94, and LSTM had 0.92. SVM, RF, and NB had AUC-ROC scores between 0.85 and 0.89. Proposed HTP Tokenization: BiLSTM achieved the highest AUC-ROC score (0.97). BERT showed a score of 0.95, and LSTM achieved 0.93. The Proposed HTP strategy consistently provided higher AUC-ROC scores for all models, with SVM, RF, and NB ranging from 0.86 to 0.90.

Table 6 depicts the Miss Rate (in %) obtained by the Proposed Hybrid Text Pre-processing (HTP), BPE, WordPiece and SentencePiece Tokenization using SVM, RF, NB, LSTM, BiLSTM, and BERT. The miss rate results from Table 6 comparing different tokenization strategies (BPE, WordPiece, SentencePiece, and Proposed Hybrid Text Pre-processing or HTP) across various machine learning (SVM, RF, NB) and deep learning (LSTM, BiLSTM, BERT) models. BPE Tokenization: BiLSTM achieved the lowest miss rate (13.3%). BERT had a miss rate of 18.7%, while LSTM performed at 21.5%. SVM, RF, and NB had miss rates between 25.8% and 31.7%. WordPiece Tokenization: BiLSTM again showed the best performance with a miss rate of 11.8%. BERT had a miss rate of 17.3%, and LSTM had 19.8%. SVM, RF, and NB had miss rates ranging from 25.1% to 30.3%. SentencePiece Tokenization: BiLSTM performed best with a miss rate of 11%. BERT had a miss rate of 16%, and LSTM had 18.5%. SVM, RF, and NB had miss rates between 24.8% and 28.6%. Proposed HTP Tokenization: BiLSTM achieved the lowest miss rate (10.2%). BERT showed a miss rate of 14.6%, while LSTM had 17.4%. The Proposed HTP strategy consistently improved the miss rate across all models, with SVM, RF, and NB showing miss rates between 24.2% and 27.5%. Table 6.7 depicts the False Discovery Rate (in %) obtained by the Proposed Hybrid Text Pre-processing (HTP), BPE, WordPiece and SentencePiece Tokenization using SVM, RF, NB, LSTM, BiLSTM, and BERT. The False Discovery Rate (FDR) results from Table 7, comparing different tokenization strategies (BPE, WordPiece, SentencePiece, and Proposed Hybrid Text Pre-processing or HTP) across various machine learning (SVM, RF, NB) and deep learning (LSTM, BiLSTM, BERT) models. BPE Tokenization: BiLSTM achieved the lowest FDR (9%). BERT performed well with a score of 14.4%, and LSTM had an FDR of 16.8%. SVM, RF, and NB had FDR values ranging from 19% to 24.6%. WordPiece Tokenization: BiLSTM continued to show the lowest FDR (7.9%). BERT had an FDR of 12.8%, and LSTM showed 15%. SVM, RF, and NB had FDR values between 18% and 23.2%. SentencePiece Tokenization: BiLSTM had the best performance with an FDR of 7%. BERT showed an FDR of 11.5%, and LSTM had 13.6%. SVM, RF, and NB had FDR values ranging from 17.2% to 22.4%. Proposed HTP Tokenization: BiLSTM again achieved the lowest FDR (6.3%). BERT showed an FDR of 9.9%, and LSTM had 12.5%. The Proposed HTP strategy consistently reduced the FDR across all models, with SVM, RF, and NB showing values between 16.9% and 21.6%.

CONCLUSION

The Hybrid Text Preprocessing (HTP) Approach presented in this study offers a comprehensive solution for enhancing the quality of research abstract analysis, specifically in the domain of educational research. By integrating a range of advanced preprocessing techniques, including text cleaning, tokenization, stopword removal, lemmatization, and handling informal language, the HTP approach ensures that the textual data is refined,

Anbarasi and Prabakaran

normalized, and contextually enriched for better model performance. In the context of educational research abstracts, where language can vary greatly across disciplines and contain specialized terminology, the use of BPE and WordPiece tokenization effectively handles complex words and academic jargon. This ensures that even fragmented expressions or domain-specific terms are captured accurately, improving the model's ability to classify research across multiple relevant categories. Additionally, the inclusion of slang normalization and emoji handling ensures that informal language, commonly found in interdisciplinary educational research, does not hinder the classification process. The application of SMOTE further addresses the critical issue of class imbalance, which is prevalent in research datasets, particularly in niche areas of education. By generating synthetic samples for underrepresented categories, this technique ensures a balanced dataset, enhancing the model's ability to detect and classify all relevant research areas, regardless of their frequency in the dataset. Overall, the proposed HTP approach significantly improves the classification accuracy and efficiency of educational research abstract analysis. The integrated preprocessing techniques help in refining the dataset, ensuring that it is ready for accurate and effective feature extraction and classification. This methodology contributes to more precise content categorization, enabling educators, researchers, and policymakers to access relevant and comprehensive academic materials more efficiently. Future work could expand on this framework by incorporating more domain-specific preprocessing methods and applying it to large-scale educational datasets to further enhance its applicability and scalability in real-world settings.

ABSTRACT

The exponential growth of e-commerce has transformed how consumers shop, and the need for personalized product recommendations has become a crucial aspect of modern online retail. Traditional recommendation systems, relying on collaborative filtering or content-based methods, often fall short in capturing the richness of user preferences and the nuances of customer behavior. With the rapid advancement in Natural Language Processing (NLP) and Deep Learning (DL) techniques, there is a growing trend towards leveraging these technologies to improve the accuracy and relevance of product recommendations in e-commerce platforms. This literature review explores the state-of-the-art techniques in recommendation systems for the e-commerce domain, focusing specifically on the integration of NLP and DL approaches. NLP has proven to be particularly useful in extracting valuable insights from unstructured data, such as product descriptions, user reviews, and other textual content. Techniques such as sentiment analysis, aspect-based opinion mining, and topic modeling are commonly employed to identify user preferences and product features that influence purchasing decisions. By analyzing customer feedback, NLP tools can extract meaningful sentiments, opinions, and attributes that go beyond simple keywords, enabling a deeper understanding of user needs and behaviors.

Keywords: Product Recommendations, Opinion Mining, Sentiment Analysis, Customer Reviews, Natural Language Processing (NLP), Deep Learning, Personalized Recommendations, E-Commerce, Aspect-Based Sentiment Analysis, Text Mining.

INTRODUCTION

In the modern digital marketplace, customer reviews have become a pivotal source of information for both consumers and businesses [1]. As e-commerce continues to expand, understanding and leveraging customer feedback effectively has never been more important. Consumer purchasing decisions are significantly influenced by the opinions and experiences shared in customer reviews. According to various studies, a substantial proportion of online buyers consider product reviews to be a critical factor when deciding on a purchase, making it essential for businesses to tap into this valuable resource. However, the vast volume of unstructured textual data available in the form of customer reviews presents challenges in extracting meaningful insights that can be used for enhancing product recommendations [2]. Product recommendation systems have evolved to become an essential feature of e-commerce platforms, helping customers navigate through the overwhelming number of choices by suggesting products that match their preferences [3]. Traditional recommendation algorithms, such as collaborative filtering and content-based filtering, rely on historical data, purchase patterns, or metadata. While these methods have demonstrated effectiveness, they often fall short in capturing the full complexity of user preferences, especially when users have unique or nuanced needs. Additionally, these systems primarily rely on explicit feedback, such as ratings and purchases, which do not always reflect the full range of user interests [4].

This is where opinion mining or sentiment analysis comes into play. Opinion mining, a subdivision of natural language processing (NLP), entails the extraction of subjective information from textual data [5]. By analyzing customer reviews, opinion mining aims to uncover the sentiments, opinions, and preferences expressed by users regarding specific products. Traditional sentiment analysis can detect whether a review is positive, negative, or neutral, but advanced opinion mining goes further by identifying specific aspects or features that customers appreciate or criticize. For example, a review may express satisfaction with the "ease of use" of a product but dissatisfaction with its "battery life." Such insights are invaluable for fine-tuning product recommendations based on individual aspects that matter most to users [6]. In recent years, the integration of advanced Deep Learning (DL) techniques with opinion mining has enhanced the ability to analyze large volumes of complex textual data [7]. Deep learning models, such as Recurrent Neural Networks (RNNs), Convolutional Neural Networks (CNNs), and Transformer-based models (like BERT), can better understand the context, emotions, and sentiments expressed in customer reviews, even when the language is informal, contains slang, or includes emojis [8]. These models excel in capturing semantic relationships and contextual meaning, improving the system's ability to offer personalized and context-aware recommendations [9].

The proposed approach, which combines advanced opinion mining with product recommendation systems, represents a shift towards more intelligent and nuanced recommendations. By extracting specific aspects of products that customers care about (e.g., quality, price, customer service), businesses can provide hyper-personalized recommendations. This approach enhances the relevance and quality of suggestions, making them more aligned with individual customer needs and improving overall satisfaction [10]. Moreover, opinion mining can help solve the problem of cold start in recommendation systems, where there is insufficient historical data about a new product or user. By analyzing reviews and feedback from early adopters, opinion mining can generate valuable insights about the product's appeal and performance, facilitating quicker and more accurate recommendations for new users or products. This study aims to explore how advanced opinion mining can enhance product recommendations in the e-commerce domain. Specifically, we focus on how aspect-based sentiment analysis, emotion detection, and contextual word embeddings can be leveraged to extract meaningful insights from customer reviews. By integrating these insights into the recommendation pipeline, we aim to provide personalized, dynamic, and context-aware recommendations that align with the real needs and preferences of users.

Background Study on the Advanced Opinion Mining

Opinion mining, also known as sentiment analysis, is a rapidly growing subfield of Natural Language Processing (NLP) that focuses on identifying and extracting subjective information from text. It aims to determine the sentiments, opinions, and emotions expressed by individuals in a given piece of text [11]. Opinion mining has found extensive applications across various domains, including social media monitoring, customer feedback analysis, product review classification, and political sentiment analysis [12]. With the explosion of online content, especially user-generated data such as reviews, comments, and forum discussions, opinion mining has become a critical tool for businesses, researchers, and decision-makers in understanding public opinion and improving services or products based on user feedback [13]. In the context of e-commerce, opinion mining has proven to be essential in analyzing customer reviews. E-commerce platforms, including Amazon, eBay, and Alibaba, rely heavily on customer reviews to provide other customers with insights into the quality and features of products [14]. These reviews, while incredibly valuable, are often unstructured and noisy, making it difficult to extract meaningful insights without the aid of advanced opinion mining techniques [15].

Early Approaches to Opinion Mining

Traditional opinion mining models primarily relied on lexicon-based approaches, where predefined dictionaries of positive and negative words were used to classify text based on word polarity. In such models, each word in the text was classified as positive, negative, or neutral, and the overall sentiment of the text was determined by aggregating the sentiment of individual words. While this approach was simple, it often struggled with context and sentence structures, leading to inaccurate sentiment classification, especially when dealing with complex or contradictory sentences. Over time, researchers moved towards more sophisticated approaches that combined statistical techniques and machine learning models to improve the accuracy of opinion mining. These models were trained on large datasets of labeled text, allowing them to learn the relationships between words and sentiments. However, early machine learning models, such as Support Vector Machines (SVMs) or Naive Bayes, still faced limitations in understanding nuanced opinions and domain-specific language.

The Emergence of Advanced Opinion Mining Techniques

The introduction of deep learning and neural networks revolutionized opinion mining by allowing models to capture intricate patterns in text, including the relationships between words, phrases, and even entire sentences. Techniques such as Recurrent Neural Networks (RNNs), Long Short-Term Memory (LSTM) networks, and Convolutional Neural Networks (CNNs) were applied to sentiment analysis tasks, enabling models to better understand context and handle complex sentences with varying sentiments. Deep learning models, especially Transformer-based architectures such as BERT (Bidirectional Encoder Representations from Transformers) and GPT (Generative Pre-trained Transformers), have set new standards for opinion mining. These models are designed to process text in parallel and capture long-range dependencies, making them particularly effective for understanding complex opinions, sarcasm, and mixed sentiments. The bidirectional nature of BERT, in particular, enables it to understand the meaning of words based on their surrounding context, improving the accuracy of sentiment classification tasks.

Aspect-based Opinion Mining

One of the key advancements in opinion mining has been the development of aspect-based opinion mining (ABOM), which focuses on extracting opinions about specific aspects or features of a product or service. Instead of simply classifying the overall sentiment of a text, aspect-based mining breaks down the text into smaller components, each associated with a specific feature, and identifies the sentiment expressed about each aspect. This approach is particularly valuable in applications such as product review analysis, where customers often express opinions about various attributes of a product, such as quality, price, design, and functionality. For example, in a review of a smartphone, a customer might express positive sentiment about its "camera quality" but negative sentiment about its "battery life." Aspect-based opinion mining allows businesses to capture these nuanced opinions, which is critical for making informed decisions about product improvements or targeted marketing strategies.

**Gobinath and Prabakaran****Emotion and Sentiment Analysis**

While traditional opinion mining mainly focused on classifying text as positive, negative, or neutral, recent advancements have introduced more granular sentiment analysis techniques that include emotion detection. Emotion detection aims to identify specific emotional responses in text, such as joy, anger, sadness, or surprise. By using specialized models, such as emotion-aware deep learning architectures, opinion mining has become more sophisticated, providing a deeper understanding of user sentiment and emotional reactions. Emotion-based analysis is particularly useful for understanding the psychological impact of customer feedback and tailoring product recommendations or marketing campaigns to resonate with users' emotional states. In e-commerce, for example, analyzing the emotion behind a review can help businesses identify critical pain points or moments of delight for customers.

Background Study on the Enhancing Recommendation Systems

The e-commerce industry has witnessed rapid growth over the past decade, fundamentally changing the way people shop, interact with brands, and make purchasing decisions [16][17]. As a result, the need for effective product recommendation systems has become more critical than ever. Recommendation systems are essential tools for e-commerce platforms, helping to enhance the shopping experience by suggesting products that are tailored to the preferences and needs of individual customers [18]. These systems not only drive sales and customer engagement but also contribute to the overall user experience, ensuring that customers find relevant products amidst the overwhelming amount of available options [19] [20].

Traditional Recommendation Systems in E-Commerce

Traditional recommendation systems typically rely on one of three main methods: collaborative filtering, content-based filtering, and hybrid models that combine the two. Collaborative filtering uses historical user behavior, such as past purchases or ratings, to recommend products based on the preferences of similar users. Content-based filtering, on the other hand, recommends products based on their features, such as category, brand, price, or user-provided descriptions. These methods have been successful to some extent, but they are also limited by a number of challenges. For instance, collaborative filtering suffers from the cold start problem, where it cannot make good recommendations for new users or new items without sufficient historical data. Content-based methods, while better at handling new items, often fail to capture the diversity of user preferences and ignore the richness of user-generated content like reviews or feedback. As a result, the e-commerce industry has seen a shift towards more sophisticated methods that combine Natural Language Processing (NLP) and Deep Learning (DL) techniques to improve recommendation systems, providing a more holistic and accurate approach.

The Role of NLP in Enhancing Recommendation Systems

Natural Language Processing (NLP), a subdivision of artificial intelligence (AI), concentrates on the interface between computers and human language. NLP approaches are utilised in e-commerce recommendation systems to analyse and interpret unstructured textual data, including customer reviews, product descriptions, and search queries. By leveraging NLP, recommendation systems can go beyond simple metadata matching (like product categories or tags) to gain deeper insights into the sentiment, preferences, and needs expressed by users. One of the primary applications of NLP in recommendation systems is sentiment analysis. By analyzing the sentiments expressed in customer reviews, NLP algorithms can help determine whether users are happy or dissatisfied with certain product features. For example, if a customer frequently expresses satisfaction with the “battery life” of smartphones in their reviews, the system can recommend products with similar features. This enables the recommendation engine to suggest products based not only on objective features but also on subjective sentiments.

Another important NLP technique is topic modeling, which allows recommendation systems to identify hidden themes or topics in large volumes of text data. For example, a review may mention multiple aspects, such as price, durability, and design. Using topic modeling, the system can break down the review into these different topics and match users with products that meet their specific preferences.

**Gobinath and Prabakaran**

Named entity recognition (NER) is another NLP method that can be used in e-commerce recommendation systems. NER identifies and classifies proper names in text, such as brands, locations, and product names. By extracting this information from reviews or product descriptions, recommendation systems can match users with products from their preferred brands or associated with specific entities.

Deep Learning for Recommendation Systems

Deep learning, a subset of machine learning, has revolutionized the field of recommendation systems. Deep learning models, particularly neural networks, excel at capturing complex patterns and relationships within large datasets. These models can learn directly from data without the need for manual feature engineering, making them highly effective in e-commerce settings where data can be vast and varied. One of the most successful deep learning architectures for recommendation systems is the Recurrent Neural Network (RNN) and its variant, the Long Short-Term Memory (LSTM) network. RNNs are particularly suited for sequential data, making them useful for analyzing user behavior over time, such as tracking a customer's browsing history or purchase patterns. By capturing the temporal dynamics of a customer's interactions, RNNs can offer personalized recommendations that adapt to shifting preferences. More recently, Transformer-based models, such as BERT (Bidirectional Encoder Representations from Transformers), have gained significant popularity for their ability to capture long-range dependencies and contextual information.

BERT has been successfully applied to NLP tasks like sentiment analysis, and it can also be used in recommendation systems to process text data from product descriptions and reviews. By better understanding the relationships between words and the context in which they appear, BERT can improve the system's ability to make accurate recommendations based on the content of user reviews or search queries. Another important deep learning technique for recommendation systems is Autoencoders, which are used for collaborative filtering. Autoencoders work by encoding user-item interactions into a compressed representation and then decoding them to predict ratings or preferences. These models are particularly effective at learning user preferences from sparse data, allowing them to make recommendations even when there is little user interaction history.

Hybrid Models: Combining NLP and Deep Learning

While both NLP and deep learning techniques offer significant improvements in recommendation systems, their true potential is realized when they are integrated into hybrid models. Hybrid models combine the strengths of multiple methods, such as collaborative filtering, content-based filtering, and NLP-DL techniques, to overcome the weaknesses inherent in each approach. For instance, hybrid models can combine the predictive power of collaborative filtering (based on user-item interactions) with the insight-rich capabilities of NLP (based on customer reviews or product descriptions). By doing so, the model can recommend products that match a user's historical preferences while also incorporating textual insights from product reviews or descriptions that align with the user's tastes. Multi-modal recommendation systems also combine structured and unstructured data, such as incorporating both product metadata (e.g., category, price) and customer feedback (e.g., reviews, ratings). By integrating diverse types of data, these models can provide richer and more diverse recommendations.

LITERATURE REVIEW

Loukili, Manal, and Fayçal Messaoudi [21] This study comprised the subsequent steps. Initially, the data is collected and preprocessed using keyword manipulation, subsequently analysed using the K-means clustering method, and finally, the optimal number of clusters is determined via the elbow approach. Subsequently, automated language processing was employed as a metric of similarity utilising the K-means clustering technique to identify analogous articles based on sections, keywords, and titles. A deep neural network was constructed to forecast the temporal probabilistic distribution of the queried keywords. The clustering results indicated the existence of twenty-three distinct segments of newspaper stories within this publication. Subsequently, following the training of the neural network on the data, the temporal probability distributions of the queried phrases were visualised. Omar, Hoger K.,

**Gobinath and Prabakaran**

MondherFrikha, and Alaa Khalil Jumaa [22] introduced a prototype cloud-based recommendation system for the analysis of massive data. The suggested study employs the matrix factorisation method using three distinct approaches. The initial method employs singular value decomposition (SVD), a conventional and established recommendation technique. The secondary recommendation method is optimised utilising the alternating least squares (ALS) algorithm in conjunction with Apache Spark. The deep neural network (DNN) algorithm is employed using TensorFlow. This study addresses the difficulty of managing extensive datasets in the collaborative filtering (CF) technique by optimising algorithms by parameter adjustments in the second approach, which employs machine learning, and in the third approach, which utilises deep learning. Moreover, the outcomes of these two methodologies surpassed traditional strategies and attained a satisfactory computational duration. The collection is around 1.5 GB and was obtained from the Goodreads website API. Furthermore, the Hadoop Distributed File System (HDFS) is utilised as cloud storage rather than the local disc of the computer for managing larger datasets in the future. Zheng, Haotian, et al. [23] The foundational ideas of natural language processing encompass numerous domains, including linguistics, computer science, and statistics. It encompasses the examination of linguistic structure, semantics, grammar, and pragmatics, alongside the statistical analysis and modelling of extensive corpora. During the implementation of tangible, it is essential to process natural language at many levels. This article integrates deep learning and natural language processing technologies to perform sentiment analysis on patient remarks, facilitating the recommendation of more suited medications and so attaining precise drug prescribing and personalised recommendations.

Likith, V. P., M. Farida Begam, and Magadum Neeraj Shashikant [24] tackled the issue using a cohesive methodology that integrates machine learning and Natural Language Processing techniques to retrieve data and correlations potentially overlooked by other approaches. The image corpus and handwritten notes will collectively enhance insights and augment the model's accuracy. Our methodology intends to alleviate the confusion experienced by beginner doctors and address patient enquiries, so enabling these medical professionals to make more informed decisions in their diagnostic and prognostic processes. The chatbot will utilise Bidirectional Encoder Representations from Transformers (BERT), which has exhibited exceptional performance in natural language understanding tasks, such as sentiment analysis, semantic role labelling, sentence classification, and polysemy disambiguation. The authors sought to accurately diagnose and prognosticate cancer while also assessing the likelihood of remission.

Mishra, Kamta Nath, et al [25] endeavored to mitigate the cold start problem by harnessing the capabilities of natural language processing (NLP) applied to user-generated reviews. A novel methodology is presented, combining supervised and unsupervised NLP techniques enabled by scikit-learn, employing benchmark datasets from several areas. This study provides scientific contributions via its innovative methodology, guaranteeing rigour, precision, scalability, and practical applicability. It addresses the cold start issue in recommendation systems by integrating natural language processing (NLP) with machine learning and collaborative filtering methods, successfully mitigating data sparsity. This study underscores reproducibility and precision while presenting an enhanced solution that augments personalisation in recommendation models. The suggested NLP-driven approach improves the quality of user-generated content, hence enhancing the precision of Collaborative Filtering-Based Recommender Systems (CFBRSs). The authors executed experiments to evaluate the efficacy of the proposed methodology on benchmark datasets including MovieLens, Jester, Book-Crossing, Last.fm, Amazon Product Reviews, Yelp, Netflix Prize, Goodreads, IMDb, CiteULike, Epinions, and Etsy, in order to assess global accuracy, global loss, F-1 Score, and AUC (area under the curve) metrics. Evaluation using many techniques, including random forest, Naïve Bayes, and Logistic Regression on varied benchmark datasets, demonstrates that random forest is the most efficacious strategy, attaining an accuracy rate surpassing 90%. The suggested method achieved a worldwide accuracy of 95%, a global loss of 1.50%, an F-1 Score of 0.78, and an AUC value of 92%. Moreover, the tests performed on distributed and global differential privacy (GDP) enhance the system's effectiveness.

Campos Macias, Nathalie, et al. [26] examined the applicability of technical ideas, including web crawling and natural language processing, for knowledge discovery from unstructured information and the creation of a technology recommender system by constructing a prototype of this system. It also evaluates the prototype's

**Gobinath and Prabakaran**

performance in terms of effectiveness and efficiency. The research strategy grounded in design science research comprises four stages: (1) generation of awareness; (2) proposal of a solution pertaining to the information retrieval process; (3) creation of an artefact as a Python computer program; and (4) assessment of the prototype through a comparative experiment. The assessment indicates that the prototype is exceptionally effective at obtaining fundamental and somewhat arbitrary extractive text summaries from websites containing the specified search phrases. Nevertheless, the efficacy, assessed by the quality of outcomes, is inadequate owing to the previously described arbitrary organisation of extracted sentences within the resultant summaries. Natural language processing and web crawling are appropriate technologies for this software, but the incorporation of new technologies or concepts would greatly enhance its usefulness for potential users. Multiple opportunities for incremental enhancement of the prototype have been discovered.

Salman, Israa Bint Rahman, and G. Varaprasad [27] There are several Websites today that compare products. Nonetheless, the bulk utilise solely textual data. The development of content-based image retrieval (CBIR) enables the visual software for product images introduced in this study to offer an innovative method for visually identifying products. The purchase strategy of consumers is affected by product value, intricacy, and durability. Price comparison is often utilised to characterise contrastive searches in general. Contrast searching is evolving beyond only locating the most economical and environmentally friendly products online. Currently, a wide array of items is accessible online. Customers might obtain diverse records regarding the products of interest through manufacturing advisory frameworks. The essence of this issue, from a computational and technological standpoint, is to extract information from the objects for the purpose of aligning similar products. This paper presents a method for consolidating records of things in a database, thereby generating a comprehensive summary of the products in textual format. The application of the CNN approach facilitates the integration of product definitions. A basic weighting method is employed to amalgamate photographic and textual content information. The cosine similarity metric is employed to perform the matching. Information was provided by online sellers. The product reviews have been processed with NLP. Android application for comparing product costs utilising reviews and pricing information as assistance.

Gündoğan, Esra, Mehmet Kaya, and Ali Daud [28] present a method for recommending a journal based on the article's title, abstract, keywords, and reference information, without requiring user information. In contrast to other research, the scope information of journals is essential for identifying suitable journals for the paper, typically derived from previously published publications in the relevant journals. The journal's scope has been assessed based on publications from the past three years. This study presents a complete recommendation system that encompasses journals from several publishers, in contrast to the existing publishers' journal recommendation systems. This method using SBERT to assess the similarity between the scope of journals and articles. Comparing the results with Word2vec, GloVe, and FastText—commonly favoured techniques for document similarity—it was noted that sentence-level similarity recommendations utilising SBERT are more effective. The experimental findings demonstrate the efficacy of our methodology.

Darraz, Nossayba, et al. [29] sought to improve recommendation systems by the incorporation of a hybrid sentiment analysis methodology. The methodology integrates lexicon-based strategies and deep learning approaches, employing TextBlob alongside Bag of Words and a Multilayer Perceptron (MLP) algorithm to assess the sentiment of textual information. The hybrid sentiment analysis method demonstrates an accuracy rate of 88.63%, indicating its efficacy in extracting sentiment from customer evaluations. This integration allows recommendation algorithms to more effectively comprehend and integrate client attitudes, resulting in more personalised recommendations. Additionally, we integrate this hybrid sentiment analysis with DeepMF for collaborative hotel suggestions, resulting in an impressive Root Mean Square Error (RMSE) of 0.1. Integrating sentiment analysis into the recommendation system provides significant insights into client preferences, enhancing recommendation quality and personalisation. This study underscores the efficacy of sentiment analysis in refining customer experience management in the hotel sector, offering a significant instrument for improving visitor satisfaction and engagement.

**Gobinath and Prabakaran**

Siet, Sophort, et al. [30] suggested a ranking and enhancement sequence movie recommendation system that use a hybrid deep learning model to address existing challenges. To address these problems, we develop a recommendation system model that employs user data (age, gender, occupation) to evaluate new users and align them with others with analogous tastes. We first create sequences of user behaviour to accurately forecast the users' likely next target movie. Subsequently, we integrate user data and movie sequence embeddings as input features to diminish dimensionality, prior to inputting them into a transformer architecture and multilayer perceptron (MLP). The proposed model incorporates a transformer layer with positional encoding for user behaviour sequences and multi-head attention methods to improve prediction accuracy. The method employs KMeans clustering on movie genre embeddings to categorise comparable films and incorporates this clustering data with expected ratings to guarantee diversity in personalised suggestions for target viewers.

Li, Caiwen, et al. [31] presented a systematic review paper that comprehensively analyzes the literature on deep learning techniques in recommendation systems, specifically using term classification. We analyzed relevant studies published between 2018 and February 2023, examining the techniques, datasets, domains, and measurement metrics used in these studies, utilizing a thorough SLR strategy. The analysis indicates that deep learning methodologies, including graph neural networks, convolutional neural networks, and recurrent neural networks, have been extensively employed in recommendation systems. Moreover, our study emphasises the burgeoning field of research in domain classification, which has demonstrated encouraging outcomes in the application of deep learning methodologies to sectors such as social networks, e-commerce, and e-learning. The review paper presents insights into deep learning methodologies employed in various recommendation systems and proposes directions for further research. Our review addresses a significant research need and provides a valuable resource for scholars and practitioners focused on deep learning methodologies for recommendation systems.

Xu, Xiaonan, et al [32] delved into the current landscape of deep learning applications in NLP, specifically in three core areas: text representation, sequence modeling, and knowledge representation. Additionally, it examines the progress and synergies enabled by natural language processing in text classification, while simultaneously confronting obstacles introduced by adversarial methods in text production, categorisation, and semantic parsing. An empirical study on text classification problems reveals the effectiveness of interactive integration training, especially when combined with TextCNN, highlighting the crucial importance of these innovations in enhancing text classification techniques.

Alatrash, Rawaa, et al. [33] proposed a new methodology of e-learning hybrid Recommendation System Based on Sentiment Analysis (RSBSA) by leveraging tailored Natural Language Processing (NLP) and Convolutional Neural Network (CNN) techniques, to recommend appropriate e-learning materials based on learner's preferences. Integration is performed using fine-grained sentiment analysis models to categorise text reviews of e-content published on an e-learning platform. Two advanced language models utilising 'Continuous Bag of Words' and 'Skip-Gram' methodologies are shown. Additionally, three robust language models utilising hybrid linguistic methodologies have been built to generate an enhanced vocabulary representation. These models were developed utilising multiple CNN architectures to forecast ratings of resources based on online reviews submitted by learners. A customisable dataset, 'ABHR-1', is utilised for this purpose, derived from e-content reviews with matching scores labelled [1–5]. The proposed models are evaluated and tested using ABHR-1 and two public datasets. According to the simulation results, Multiplication-Several-Channels-CNN model outperformed other models with an accuracy of 90.37 % for fine-grained sentiment classification on 5 discrete classes and the empirical results are compared.

Patil, Shreya, et al [34] introduced an innovative approach to enhance movie recommendation systems by integrating BERT. The approach employs BERT's advanced text processing to improve the understanding of movie description. Experiments comparing regular algorithms with BERT-enhanced ones indicate substantial enhancements in recommendation accuracy. The proposed model combines BERT to identify similar movies and TF-IDF for additional suggestions, creating an efficient recommendation system. A comparative study of Word2Vec, BoW, and BERT strengthens the research foundation, highlighting BERT's superior performance by 11% and 8%, respectively.

**Gobinath and Prabakaran**

Chakraoui, Mohamed, AbderrafaaElkalay, and NaoualMouhni [35] developed an optimised interface for bibliographic information retrieval, enabling various researchers to fulfil their requirements based on pertinent criteria through natural language comprehension. Publications indexed in Web of Science and Scopus are highly sought after. Natural language, encompassing text and linguistic techniques such as tokenisation, named entity identification, and syntactic and semantic analysis, is employed to articulate natural language questions. Our Interface use association criteria to identify other pertinent papers for recommendation. Spanning trees aim to enhance the efficiency of the system's search process.

Chinnasamy, P., et al. [36] proposed an advanced intelligent Health Recommendation System (HRS) utilising a deep learning framework comprising the Restricted Boltzmann Machine (RBM) and Coevolutionary Neural Network (CNN). This work elucidates the application of data mining methodologies in developing a proficient and effective health recommendation system engine, while underscoring the pharmaceutical sector's capacity to transition from traditional paradigms to a more personalised approach. The authors constructed the proposed system utilising TensorFlow and Python. We assess the proposed method's efficacy by comparing several error metrics to alternative approaches utilising the healthcare dataset. Additionally, the accuracy, precision, recall, and F-measure of the proposed method were compared with existing techniques.

Khilji, Abdullah Faiz Ur Rahman, et al. [37] developed a recipe recommendation system utilising deep learning and a rule-based methodology. Its objective is to suggest recipes based on provided components or food photos. To evaluate the efficacy of the developed recommendation system, we have assembled a dataset comprising recipes, primarily featuring culinary items and their corresponding photographs. The developed recommendation system enables users to seek the needed information using text and image searches.

Paul, Pretty, and Rimjhim Padam Singh [38] The purpose of this study is to examine a weighted hybrid recommendation approach by utilizing the user reviews and the rating data. We provide an experimental evaluation using the Amazon Reviews dataset. The most well-known application of recommendation systems is on e-commerce Web sites, where they leverage information about a customer's preferences to build a list of suggested items. Sentiment analysis can aid in gaining a better understanding of user's emotions, attitudes and opinions. Collaborative filtering, which emphasises the interaction between users and items, determines the similarity of two items based on the congruence of their ratings by users, and is advantageous for enhancing the dependability of recommendations in recommender systems. The sentiment rating for each user review was predicted using the Vader lexicon method to compute the polarity score, which was subsequently assessed by many machine learning methods, including K Nearest Neighbour, Random Forest, Extra Tree, SGD, Decision Tree, and Naive Bayes. The user's rating was utilised to do collaborative filtering. These predictions are combined with static weights, and a rating inference technique utilising collaborative filtering and textual user reviews is executed.

Mu, Yongheng, and Yun Wu [39] presented a customised multimodal film recommendation system utilising multimodal data analysis and deep learning techniques. The authentic MovieLens datasets were chosen to evaluate the efficacy of our novel recommendation algorithm. Utilising the provided data, latent properties of both movies and users were extracted through deep learning to develop a deep learning network algorithm model for training, aimed at predicting movie ratings. Utilising a learning rate of 0.001, the root mean squared error (RMSE) scores attained were 0.9908 and 0.9096 for the MovieLens 100K and 1M test sets, respectively. The scoring prediction outcomes demonstrate enhanced accuracy following the integration of prospective characteristics and relationships within multimodal data utilising deep learning technology. In contrast to conventional collaborative filtering algorithms, including user-based collaborative filtering (User-CF), item-based collaborative filtering (Item-CF), and singular-value decomposition (SVD) methods, the multimodal movie recommendation system leveraging deep learning can yield superior personalised recommendation outcomes. Simultaneously, the issue of scant data was mitigated to some extent. We propose that the recommendation system can be enhanced by integrating deep learning technology with multimodal data analysis.

**Gobinath and Prabakaran**

Chakravarthi, GKalyan, Raghvendra Kumar, and Ssvr Kumar Addagarla [40] Recommender Systems (RS) act as efficient tools for filtering vast amounts of online data, shaping the behaviors of smartphone users, personalization trends, and the evolution of internet access. Recommendation systems are typically categorised into three main types: Hybrid Filtering, Content-Based Filtering (CBF), and Collaborative Filtering (CF). These systems are extensively utilised in diverse domains such as online education, e-commerce, marketing, tourism, food service, film, and business, among others. Despite the modern recommendation systems being recognised for their important suggestions, they are hindered by several constraints and obstacles, including scalability, sparsity, and cold-start issues, among others. The existence of numerous methodologies complicates the selection of these methods during the creation of application-based recommendation systems. Furthermore, each strategy possesses distinct features, benefits, and limitations that must be considered. This survey examines the research tendencies that incorporate the advanced technical features of the RS. The objective of this survey is to conduct a thorough analysis of current advancements in the RS sector, focussing on many applications including education, food, and products. This overview offers an extensive examination of various categories of RS, recent scholarly works, and applications of visual RS.

Research Problem Statement

The growing volume of customer reviews and feedback in the e-commerce sector presents both an opportunity and a challenge for businesses looking to enhance their product recommendation systems. Conventional recommendation algorithms, which predominantly depend on user behaviours like previous purchases or ratings, do not properly leverage the extensive, unstructured data available from customer evaluations. While sentiment analysis and opinion mining have been used to extract insights from customer feedback, existing methods often struggle to capture the complexity of nuanced opinions, domain-specific terminology, and mixed sentiments that are frequently expressed in reviews.

This research aims to address the limitations of current product recommendation systems by integrating advanced opinion mining techniques into the recommendation process. Specifically, the challenge lies in extracting fine-grained sentiments, understanding context-dependent expressions, and effectively handling unstructured textual data (such as slang, emojis, and complex sentences) that are often present in customer reviews. Additionally, personalized recommendations must go beyond generic sentiment analysis to incorporate aspect-based insights, which can more accurately represent user preferences on specific product attributes like quality, design, functionality, and price.

The core research problem is to design a more effective opinion mining framework that can handle the complexity of customer feedback and seamlessly integrate these insights into product recommendation systems. This requires overcoming several obstacles, such as improving the accuracy of aspect-based sentiment analysis, addressing the cold start problem for new products, and incorporating contextual understanding from deep learning models to enhance recommendation relevance.

Future Research Direction**Aspect-Based Sentiment Analysis Improvement:**

Future research could focus on enhancing aspect-based sentiment analysis (ABSA) to better handle multi-aspect feedback in reviews. While current models can identify general sentiments, there is a need to develop more accurate models that can dissect user feedback into more granular aspects (e.g., battery longevity, customer support, user-friendliness) and comprehend how these factors influence total product satisfaction.

Handling Informal Language and Contextual Variations

As customer reviews often contain informal language, slang, or even sarcasm, further work can be done to enhance the robustness of Natural Language Processing (NLP) tools in understanding these forms of communication. This

**Gobinath and Prabakaran**

may involve developing more sophisticated contextual word embeddings or adapting transformer-based models (like BERT) to handle domain-specific terminology and informal expressions found in reviews.

Leveraging Hybrid Models for Enhanced Personalization

Integrating traditional collaborative filtering techniques with advanced NLP and opinion mining could improve recommendation accuracy. Research could explore how hybrid models—which combine collaborative filtering, content-based filtering, and sentiment analysis—can offer more personalized and context-aware recommendations by analyzing both user behavior and textual reviews.

Real-Time Sentiment Analysis for Dynamic Recommendations

Current recommendation systems typically rely on historical data, but there is increasing demand for real-time personalized suggestions. Research could explore the use of real-time sentiment analysis and dynamic feedback loops to update product recommendations based on the most recent reviews or changes in customer preferences.

ABSTRACT

Recommender systems assist people in a community find information they like more easily by using the opinions of other people in that group. In a virtual classroom, the teacher gives an online course that includes the resources for learning, a self-quiz, and a path to follow to learn. Most students read the course material and take a self-quiz to see how much they know. The quality of the learning materials is the most crucial thing for successful learners. This depends not only on what the teacher gives them, but also on what other students recommend. Recommender systems have been helpful in many online systems, such as e-learning, for suggesting things. But there hasn't been much research on how well learners do when they use e-learning with a recommender system. Instead, most of the researchers were more interested in how well the recommender system could guess the advice than in how much the learners learnt. This survey article shows the complete literature review done by different researchers in the Recommender System for the Smart E-Learning environment.

Keywords: E- Learning, Education, Recommender System, Big Data Analytics, Machine Learning

INTRODUCTION

Big data technologies are a new set of tools and systems that can get meaningful information from massive amounts of data and let you collect and analyse it in real time [1]. In the past, schools have used Big Data to create several programs that let them look at huge amounts of educational data. In the past few years, both basic and higher education groups have employed Big Data for education data mining. This is the process of looking at the data generated in education or by people around it in order to find solutions to educational research challenges [2]. The

96604

**Kasthuri**

question is how to use all the data we have on students (including their work and activity on educational platforms) to both assess the strengths and weaknesses of educational resources and find out what each student needs to work on. These huge amounts of data and its analysis clearly raise a lot of issues with protecting personal information and much more with how these data could be used. Learning analytics [3] combines different methods from artificial intelligence, like machine learning and social network analysis, to use them in education [4]. The automated analysis adds traces of action to events, which make up the system. An event can be a connection, downloading files or movies, posting in a forum, or filing an exercise. Collecting this information allows for reflection on both individual and group action. Big Data analytics in education is a difficult field that helps us figure out how collaborative exchange affects learning. This field is built on data mining, predictive analysis, social network analysis, and adaptive algorithms [2]. It supports the concept of data-driven education, which makes the choice based on performance and the adaptation of teaching materials. It is also an economic opportunity, and in this way, the future of education systems, these methods give researchers a chance to improve existing e-learning platforms so that they can better fit their educational content. This survey paper will talk about how we might use Big Data applications in education systems to assist us solve problems in education.

Big Data

Big Data [5] is a collection of data that is more or less structured and gets so big that it is hard to use standard database management techniques. The "3V" rule defines Big Data: Volume (data means very large amounts of raw data), Variety (data set is usually made up of different types of data, structured or not), and Velocity (data is created at "high speed" or even continuously, which also means processing it quickly or even in real time). Some definitions include two more V's. The first is Veracity, which means that data is not always flawless. In short, data can have "noise," which is extra information, missing information, or two copies of the same information that don't make sense. The second is the worth, which means being able to focus on the data that has genuine worth and can be acted on. Hadoop is the leading platform for Big Data right now. Many e-learning platforms employ this framework and its parts for their Big Data projects since they can store and handle a lot of data. Hadoop's primary parts are its storage part, HDFS (Hadoop Distributed File System) [6], and its processing part, MapReduce.

Smart E-Learning Recommender System

The recommender system is a piece of software that collects rating data from all users and uses it to suggest or forecast the best items for each user. There are two common ways to build recommender systems. a clever e-learning web app that lets all learners share their knowledge to figure out which learning resources will work best for each person.

Literature Review

Udupi, Prakash Kumar, Puttaswamy Malali, and Herald Noronha [7] suggests a way to find and analyse the most important parts of the e-learning paradigm and suggests the idea of making a new framework for integrating big data. Looks into more possible study on an integrated system and suggests a new way to combine smart technologies and big data within the e-learning framework. This will help people learn smarter. Researchers are still looking into new ways to learn, such as adaptive learning, skill-based learning, project-based learning, assignment-based learning, and flipped learning, in order to find better ways to learn. But none of these can recognise patterns in a learner's information or group learning patterns, which is one of the most important things that next-generation augmented learning needs. Smart learning systems combine different parts of the learning framework, like big data integration, which is needed for the next generation of learning. Chaffai, Abdelmajid, Larbi Hassouni, and Houda Anoun [8] The main goal is to design and build modern and hybrid real-time data pipeline architecture that uses Apache Flume to collect data, Apache Spark as a unified engine for running analytics on students' activity data, and Apache Hive as a data warehouse for storing the processed data and making it available to different reporting tools. It has dealt with the problem of putting an event-driven system around a web-based learning platform. Anshari, Muhammad, *et al.*, [9] looked at recent Internet use and literacy in Brunei Darussalam (Brunei) to discover about how people in the country use the Internet and study online. It has brought attention to important events, problems, and trends in recent Internet activity, with a focus on online learning and its promise in the age of big data. We did a big

**Kasthuri**

survey across the country to make sure the data was accurate. The survey showed that individuals in Brunei want and expect better learning services and experiences from an online learning system. It gave us critical information about Brunei's online learning and Internet-based activities. Birjali, Marouane, Abderrahim Beni-Hssane, and Mohammed Erritali [10] shown how Big Data technology may be used in schools to assist solve problems in education. The technical architecture needs to be a useful paradigm for schools and universities that work with Big Data technologies. After that, one of the most important benefits of this work is that it finds Big Data sources from or made in the educational environment. Also talked on how Big Data may help with education problems by helping people accomplish their learning goals. They talk about various ways that Big Data analytics can help kids learn better and keep more of what they learn. Huda, Miftachul, *et al.*, [11] used thematic analysis to build a model that higher education institutions can use to control how they use big data. The results show that it can help people make better decisions, gain new knowledge, and make learning more effective. Higher education institutions can use big data analytics to improve their teaching and learning by giving students new ways to learn and giving them chances to do so with big data analytics. Using big data in new ways of teaching has been a good experience for students, teachers, schools, and the community as a whole. Khan, Samiya, Kashish A. Shakil, and Mansaf Alam [12] looked at how cloud-based big data analytics can be used in Indian research and education and talks about the problems that need to be solved before the full benefits of this technology can be realised. It also gives a statistical look into the Indian education system and looks into whether cloud-based big data analytics tools could be used to improve education at all levels and make research in the country better. We have found and dealt with the technical and non-technical problems that make it hard for India to widely use big data technologies for research and education.

Santos, Olga C. [13] talked about problems that still need to be solved with affective computing in education. In addition to those unresolved issues, more work needs to be done in this area to enhance naturalistic learning experiences in the wild by making sure they are real, useful, and can be applied to other situations. Huba, Mikuláš, and Štefan Kozák [14] illustrated the newest trend in the Industry 4.0 project and how it will affect Mechatronics education. It also talked about a lot of things that are the same as the flexible learning movement that started in the second part of the last century and the rise of e-learning. A quick look at the best universities in the world shows that Slovakia's higher education system has not been able to establish flexible learning in a way that will last. Jin, Sung-Hee, and Y. Kim. [15] depicted a learning activity, and learning behaviours in e-learning environments were used as a starting point for research in learning analytics. Modelling behaviour helps find learning data, and learning analytics gives learners and teachers useful information about the learning process. The goal is to help people learn and help teachers do their jobs. So, by modelling learning behaviour data, both learners and teachers should get learning information. Gudivada, Venkat N., *et al.* [16] suggested a reference architecture for cognitive analytics, talked about how to put it into action, introduced different sorts of learning, and talked about different types of machine learning algorithms. There are a few examples of cognitive analytics applications. There are two main fields of study that work together to study cognitive analytics: computer science and cognitive and neurosciences. Ducange, Pietro, *et al.* [17] looked at the main parts of modern e-learning systems, including where they get their data and how much information can be found in them. It also looked at the idea of instructional Big Data and came up with a layered approach that makes sense and works well in real life. It sheds light on the numerous levels where Big Data mining can happen and the benefits of each.

Mahboob, Tahira, Sadaf Irfan, and Aysha Karamat [18] There has also been a proposal for a methodology for fair and open student evaluation and performance. We have set specific parameters that we then evaluate successfully using machine learning methods. This study uses classifiers like Decision Trees-J48, Naive Bayes, and Random Forest to improve the quality of student data by first getting rid of noisy data and then achieving better predictions. The paper's focus is on undergraduate programs. It looked into the possibilities of employing machine learning algorithms to predict how well students in a course will do. Murugananthan, V., and B. L. ShivaKumar [19] The suggested data model uses an improved classifier to create a novel agent-based intelligent system that builds the data model as 3D cubes for each categorisation. A good way to mine the data models has been suggested. The proposed hypothesis with a 3D cube perspective can be used at any time. Authors Umbleja, Kadri, and Manabu Ichino. [20] came up with a way to make a prediction model for a student's final grade and when they would finish based on

**Kasthuri**

how they had acted in the past. We used data mining using regression analysis, principle component analysis, and hierarchical clustering of symbolic histogram valued data to construct a prediction model. Dwivedi, Surabhi, and VS Kumari Roshni [21] suggested a Recommendation system that employed collaborative filtering and item-based recommendations to help a student choose elective courses. These suggestions are based on his grade and might aid students a lot when they choose their elective courses. The school can make its syllabus more flexible so that students can choose subjects that are more in line with their talents and interests. Handling big data is a problem in and of itself, but if it is done correctly, it can help make the current education system and process better. The suggestions that these kinds of systems come up with can help schools, teachers, and students do better. Appalla, Padmaja, Venu Madhav Kuthadi, and Tshilidzi Marwala [22] offered an effective way to mine educational data to help e-learning. The suggested method has two parts: the server module and the client module. The server module reads the documents from the database and makes the knowledge representation that goes with them. The client module gets the information based on what the user needs. We look at a number of factors, including as precision, recall, and the F-measure, to see how well this method works. By changing the keywords, the number of documents, and the K-size, we get the whole results. Vyas, Madhav S., and Reshma Gulwani [23] suggested using the C4.5 Decision Tree approach in Big Data's Map-Reduce framework for E-learning Systems to make better predictions about how well students will do. It has looked at numerous data mining techniques that can be used to guess how well students will do in an E Learning System. When predicting how well kids will do, the Decision Tree Algorithm was proven to be better with all types of data mining approaches, input values, and accuracy. The C4.5 Decision Tree Algorithm was shown to be useful for looking at a lot of student data. It is suggested that it be combined with the Map-Reduce Framework instead of the usual way of using a decision tree. So, it will make predictive analytics of students' performance more useful. It will help us find the students who are most likely to fail or drop out of the class.

Tashtoush, Yahya M., *et al.* [24] came up with a novel adaptive e-learning system. The technology combines a well-known intelligent web-based English E-learning teacher with data mining methods. Also, data mining methods are utilised to group students' learning styles based on Jackson's learning styles. The main purpose of the suggested system is to find the optimal way to teach each student. The web Everywhere as well as Every Time (EWET) can make the proposed system available. It also has adaptive features like quizzes, instructional videos, and presentations that change based on the student's needs. El Fouki, Mohammed, Noura Aknin, and K. Ed El. Kadiri. [25] studied how deep principal component analysis and reinforcement learning could make classification models better and even make a deep neural network algorithm's predictions better by reducing the number of variables in data sets, without losing the accuracy and reliability of the classifier. Dividing the learning phase into several agents will reduce the amount of related information that comes from overlapping input instances. This will speed up network training and make DNN systems work better, especially when they have to solve hard problems with a lot of input data. But we still need to undertake more research on how to use Deep Learning algorithms to solve Big Data problems, such as high dimensionality, making Deep Learning models more scalable, figuring out how to get excellent data representations, and adapting to new domains. Rao, NV Krishna, N. Mangathayaru, and M. Sreenivasa Rao [26] suggested to look at how well students are doing in order to figure out how well they are doing now and how well they will do in the future. A learning algorithm is put into action by letting student data be stored in clustered memory so that it can be queried again and again. Clustering is used to get important student information from large amounts of data and process it very quickly. We use the decision tree approach to classify students' performance.

Tian, Feng, Qinghua Zheng, and Kuo-Ming Chao [27] looked into the history of the evolution of e-learning and found that it can be broken down into three stages: digitalised, networked, and intelligent. The authors came to the conclusion that it is still in the intelligence stage, which they name "smart e-learning." This stage shows tendencies that are intelligent, everywhere, personalised, open, and collaborative, and it calls for a close integration of artificial intelligence and big data. Cerezo, Rebeca, *et al.* [28] suggested a new educational algorithm dubbed Inductive Miner based on the interaction traces of 101 university students who took a course on the Moodle 2.0 platform over the course of one semester. We looked at the platform's event logs, which had 21,629 traces, to find out how students regulate themselves, which helps make the teaching process better. The Inductive Miner method found the best

Kasthuri

models for both Pass and Fail students in this dataset. It also found models at a particular degree of detail that can be understood in educational terms, which is the most important thing to do when finding models. The authors came to the conclusion that students who passed didn't follow the teachers' advice exactly, but they did follow the logic of a successful self-regulated learning process, which was not the case for their failed classmates. Moubayed, Abdallah, *et al.* [29] suggested using the k-means algorithm to group students based on 12 engagement measures that were split into two groups: those that had to do with interaction and those that had to do with effort. The goal of the model was to find out how predictive data mining algorithms can be used to find poor pupils early on in order to help them do better. Razzaque, Anjum, and Allam Hamdan [30] looked at research to find out how the Internet of Things (IoT) and students' Learning Style (LS) affect what students expect from their learning, as shown by the Learning Outcomes (LOs) of higher education students.

FUTURE RESEARCH DIRECTION AND CONCLUSION

As a route for future research, we wanted to suggest an e-learning recommender system that can suggest items that are comparable to the one being seen and also those that good learners have rated highly. We will make accuracy the goal of the research because we have thoroughly tested the system's effect on student performance. There are a number of things we can do in the future to make our work even better and more useful. First, the system was tested on Software Engineering students, who are considered to be very good with computers. The kids can quickly learn how to use ratings as a recommendation tool. It would be a good idea to test the system with various groups of students who have different levels of computer skills (like sociology students) or other levels of education (like primary and secondary school students). You should know that there must be exams after the learning process (post-tests to group the pupils, with the scores of the best learners being used as recommendations). The course speaker also chose a set of learning materials and a single type of learning material (lecture slides) for the tests. It would be fascinating to examine how well the system works and how well the learner does with different sets and kinds of learning materials.

ABSTRACT

Virtual Machines (VMs) and containers are pivotal technologies in cloud computing, each offering distinct benefits in terms of resource isolation, performance, and scalability. VMs provide stronger isolation by emulating entire operating systems, which results in higher resource overhead. Containers, in contrast, are lightweight and share the host OS kernel, leading to more efficient resource utilization. Traditional methods for comparing these technologies, such as empirical benchmarking and queuing models, are time-consuming and often limited to specific workloads. This research proposes a machine learning-based approach to enhance the comparative analysis of VMs and containers. Supervised models, including regression and neural networks, are employed to predict performance metrics like response time, throughput, and server utilization. Unsupervised clustering techniques are applied to identify optimal configurations for different workloads. The results indicate that containers outperform VMs in terms of response time and scalability, particularly in cloud-native environments. Machine learning models not only improve prediction accuracy but also reduce the time required for performance evaluations, offering a scalable solution for real-time resource optimization in dynamic cloud environments.

Keywords: Virtual Machines, Containers, Machine Learning, Cloud Computing, Performance Comparison, Resource Optimization.

INTRODUCTION

The increasing adoption of cloud computing has heightened the demand for efficient virtualization technologies, which play a crucial role in optimizing resource allocation and management. Among the most widely used virtualization methods are Virtual Machines (VMs) and containers, each offering distinct benefits in terms of isolation, performance, and scalability. VMs provide full operating system virtualization, delivering robust isolation and security but at the cost of increased resource overhead due to the need for duplicating the OS kernel in each instance [1]. Containers, on the other hand, employ OS-level virtualization, sharing the host kernel and enabling lighter, more efficient resource usage, making them ideal for cloud-native applications requiring rapid deployment and scalability [2]. The popularity of containers has grown significantly due to platforms like Docker, which offer lower overhead and faster startup times compared to VMs [11]. However, VMs are still widely used in cases where strong isolation is necessary, such as when running applications that require independent OS environments or when compatibility with legacy systems is critical [10]. Both technologies have their own merits, and the choice between them depends heavily on the specific requirements of the environment, such as security, performance, or resource efficiency [9]. Traditional approaches for comparing the performance of VMs and containers rely heavily on empirical benchmarking, where performance metrics such as CPU utilization, memory consumption, and response times are directly measured under specific workloads [6]. While this method provides valuable insights, it is time-consuming and often limited to particular configurations, making it less applicable for dynamic cloud environments [8]. Analytical models, such as queuing theory, have been used as alternative methods to predict system behavior and performance [5]. These models are more scalable than empirical testing but often oversimplify complex real-world scenarios, which can lead to less accurate predictions [4]. In light of these challenges, machine learning (ML) has emerged as a promising tool for enhancing performance comparisons between VMs and containers. By using supervised learning models, such as regression and neural networks, ML can predict performance metrics like response time and resource utilization based on historical data [3]. Additionally, unsupervised methods, such as clustering, can help identify patterns in resource usage and suggest optimal configurations for different workloads [9]. This ML-based approach offers several advantages over traditional methods, including faster evaluations, reduced manual setup, and the ability to generalize across different environments and workloads [11].

Background

The virtualization landscape has seen substantial advancements, driven by the need for scalable and flexible resource management in cloud environments. Both Virtual Machines (VMs) and containers have emerged as pivotal technologies, each offering unique advantages and limitations. In this section, we review the current literature concerning the performance, migration strategies, and comparative analysis of VMs and containers.

Virtual Machines and Containers: an Overview

VMs have been a dominant virtualization technology for years, providing complete OS virtualization. This approach offers excellent isolation and security, which is crucial for environments where multiple tenants or applications need to be isolated from one another. However, the resource overhead associated with full OS virtualization can lead to inefficiencies, particularly in terms of memory and CPU usage [1]. In contrast, containers have gained popularity for their lightweight nature, sharing the host OS kernel, which allows for quicker startup times and more efficient resource usage [2]. Containers, through platforms like Docker, are increasingly favored for cloud-native applications due to their ability to provide rapid scalability and lower resource consumption compared to VMs [11]. However, despite these benefits, containers are often seen as less secure due to their shared kernel model, which can present security risks if not managed properly [10]. Various studies have sought to compare the performance of VMs and containers under different workloads, emphasizing the need to choose between them based on specific use cases [3].

VM and Container Performance Comparison

Several empirical studies have evaluated the performance of VMs and containers in various contexts. Containers are widely recognized for their superior performance in resource-constrained environments, particularly for cloud-

**Anand and Nisha Jebaseeli**

native applications that demand fast scaling and high resource efficiency [4]. A comparative study by Zeng *et al.* highlighted that Docker containers could offer performance close to that of native hardware, especially in networking scenarios where latency and throughput are critical [8]. In contrast, VMs tend to suffer from higher resource overheads due to the need to emulate hardware and run separate OS instances [9]. Performance evaluations conducted in highly consolidated server environments further confirm the efficiency of containerized solutions. Tachibana *et al.* found that Docker containers consistently outperformed VMs when deploying web applications, particularly when scaling the number of containers in high-density environments [9]. However, for workloads requiring stringent security and isolation, VMs remain the preferred option due to their full OS isolation capabilities [10].

Migration and Resource Allocation Strategies

Migration of VMs and containers is another area of intense research. Live migration of VMs is a well-established technique used to transfer running virtual instances between physical hosts without downtime. However, this process often incurs high overhead due to the need to transfer the entire OS state, which can impact performance during migration [5]. Recent advancements, such as the use of eBPF-based paravirtualization in QEMU, have attempted to improve the efficiency of VM migration by reducing overhead [2]. Container migration, on the other hand, is more lightweight and faster, given that containers do not need to transfer an entire OS. This makes them highly suitable for environments that demand fast, seamless scaling and migration of applications [4]. Lohumi *et al.* explored container migration strategies, emphasizing that while containers are more efficient in terms of speed and resource usage, they still face challenges regarding network configurations and maintaining persistent states across migrations [1].

Machine Learning in Virtualization Performance Analysis

Machine learning (ML) has recently been applied to enhance performance comparison and optimization between VMs and containers. Supervised learning techniques, such as regression models, are increasingly used to predict performance metrics, including response time and resource utilization [3]. Additionally, unsupervised learning approaches, like clustering, have been used to identify optimal resource configurations for VMs and containers under varying workloads [9]. Toutov *et al.* proposed resource allocation algorithms that leverage machine learning to dynamically optimize VM and container performance based on workload characteristics, demonstrating that ML models can significantly reduce the time required for performance tuning [5]. This approach offers a more scalable and adaptive solution compared to traditional empirical benchmarking and queuing models, which are time-consuming and often limited in scope [4].

Comparative Studies and Emerging Trends

Several comparative studies have investigated the trade-offs between using VMs and containers in different environments. Gopalasingham *et al.* conducted an extensive performance analysis of virtualized radio access networks, demonstrating that containers, particularly Docker, offer better performance in terms of deployment time and resource efficiency when compared to VMs [10]. Similarly, Morabito *et al.* emphasized the growing role of containers in network function virtualization (NFV), where their lightweight nature makes them ideal for dynamic and resource-intensive applications [6]. However, containers are not without limitations. For workloads requiring high security, such as multi-tenant environments or regulatory-compliant systems, VMs are still the preferred choice due to their strong isolation capabilities [3]. These studies collectively highlight that the decision to use VMs or containers should be based on the specific requirements of the application, including performance, security, and scalability [9].

Problem Formulation

Cloud computing relies heavily on virtualization technologies, such as Virtual Machines (VMs) and containers, for efficient resource management. VMs offer strong isolation by emulating entire operating systems, making them suitable for applications that require high security. However, this approach incurs significant resource overhead, particularly due to the duplication of OS instances. Containers, on the other hand, provide lightweight virtualization

**Anand and Nisha Jebaseeli**

by sharing the host OS kernel, resulting in faster startup times and more efficient resource usage. Despite these advantages, containers are often seen as less secure because of the shared kernel architecture. Traditionally, comparing the performance of VMs and containers has been done through empirical benchmarking and queuing models. While these methods provide valuable insights, they are limited in scope, time-consuming, and often tied to specific workloads, making them unsuitable for dynamic and rapidly evolving cloud environments. As cloud infrastructures become more complex, the need for more scalable, real-time performance evaluation methods has become evident. Machine Learning (ML) has emerged as a promising tool in this context. ML algorithms can predict key performance metrics such as response time, throughput, and resource utilization by analyzing historical data, thus eliminating the need for repeated manual benchmarking. Additionally, ML can handle the complexity of dynamic environments by continuously learning and adjusting predictions based on new data, enabling real-time optimization of resource allocations. This capability is essential in cloud environments, where workloads fluctuate rapidly and optimal resource configurations need to be adjusted in real time. Thus, the core problem addressed in this research is how machine learning algorithms can be utilized to provide scalable, accurate, and real-time comparative analysis of VMs and containers, with the aim of improving performance and resource optimization in cloud environments.

Research Objective

The primary objective of this research is to develop a machine learning-based framework for the efficient comparison and optimization of Virtual Machines (VMs) and containers in cloud environments. This framework will leverage machine learning techniques to address the limitations of traditional benchmarking approaches, providing real-time performance predictions and dynamic resource optimization. Specifically, the research aims to develop supervised learning models—such as regression and neural networks—that can predict key performance metrics, including response time, throughput, CPU, and memory utilization for both VMs and containers under varying workloads. In addition to supervised models, unsupervised learning techniques like clustering will be applied to identify optimal configurations for VMs and containers based on resource utilization and workload characteristics. This approach will allow for more granular and adaptive optimizations, particularly in cloud-native environments, where workload demands can change rapidly. Furthermore, the research will evaluate the performance trade-offs between VMs and containers in different workload scenarios, such as CPU-intensive, memory-bound, and I/O-bound tasks, to provide a more comprehensive understanding of their performance under varying conditions. The integration of machine learning in this comparative analysis will enable real-time resource optimization, allowing cloud infrastructures to dynamically adjust resource allocations based on the predicted workload demands. The machine learning-based framework will be validated against traditional benchmarking and queuing models to demonstrate its accuracy, scalability, and applicability in real-world cloud systems. By achieving these objectives, this research seeks to provide a robust solution for optimizing cloud resource management through machine learning, with potential future applications in hybrid virtualization environments and the integration of more advanced machine learning models for even greater precision in performance optimization.

METHODOLOGY

This section outlines the methodology employed to perform a comparative analysis between Virtual Machines (VMs) and containers using machine learning algorithms. The approach is divided into four main stages: data collection, feature engineering, machine learning model development, and performance evaluation. By leveraging both supervised and unsupervised machine learning techniques, the aim is to predict and optimize key performance metrics such as response time, throughput, and resource utilization.

Experimental Setup and Data Collection

The performance data for both VMs and containers is collected from cloud-based virtualized environments. Two experimental environments are created: one using KVM-based VMs and the other using Docker containers. Both environments host the same web applications and perform identical workloads under varying conditions. The

**Anand and Nisha Jebaseeli**

workloads are designed to simulate typical cloud-native applications, including CPU-intensive, memory-bound, and I/O-bound tasks [1]. To generate workloads, we use benchmarking tools such as Apache Bench (ab) and Sysbench, which generate concurrent requests and measure the performance of applications deployed in both VMs and containers. Each workload varies in terms of the number of requests, data size, and number of active instances, simulating both high-load and low-load scenarios [9].

Key performance metrics are collected during the experiments, including

Response Time (latency) – the time taken for a request to be processed and responded to.

Throughput – the number of requests processed per second.

CPU and Memory Utilization – the percentage of CPU and memory resources consumed.

Disk I/O Operations – the number of read and write operations per second.

Network Latency – the time taken for network requests to be transmitted and received [9][8].

The performance data from the experiments is logged and used for further analysis.

Feature Engineering

Feature engineering involves transforming the raw data collected from the experiments into meaningful input features for machine learning models. The following features are extracted:

Workload characteristics: This includes CPU load, memory usage, disk I/O operations, and network latency.

VM/container configurations: The number of CPU cores, memory allocated, and the number of instances running.

Resource utilization metrics: CPU, memory, and I/O utilization collected during various workload scenarios [8][4].

The features are then normalized to ensure that the input data is on a consistent scale. This normalization helps improve the performance of machine learning models and reduces the impact of large differences in feature magnitude [10].

Machine Learning Model Development

Two types of machine learning techniques are applied in this analysis: supervised learning for predicting performance metrics and unsupervised learning for identifying optimal configurations.

Supervised Learning

Regression Models: We use regression algorithms such as linear regression, decision trees, and random forests to predict performance metrics like response time, throughput, and resource utilization based on workload characteristics and resource configurations [5]. Neural Networks: A feed-forward neural network is also employed to capture more complex, non-linear relationships between the input features and the output performance metrics [3]. The models are trained on 70% of the collected data, with the remaining 30% used for validation. Hyperparameter tuning is conducted to optimize the performance of the models, and cross-validation is used to ensure generalizability [2].

Unsupervised Learning

K-Means Clustering: Unsupervised learning techniques like K-Means clustering are used to group similar performance profiles based on resource utilization and workload patterns. This helps identify optimal configurations for both VMs and containers based on the specific workload types [9][10].

Model Evaluation

The models are evaluated based on their accuracy in predicting key performance metrics. For regression models, metrics such as Mean Squared Error (MSE) and R-squared are used to evaluate the accuracy of the predictions. For clustering, the silhouette score is used to assess the quality of the clusters formed. In addition, the training time and inference time of the models are compared to traditional benchmarking and queuing model-based methods. The goal is to demonstrate that machine learning models provide faster and more accurate performance predictions [5][6].

Real-Time Resource Optimization

The final step in the methodology involves applying the trained models for real-time resource optimization. Based on the predictions of response time and resource utilization, cloud infrastructure can dynamically allocate resources to VMs or containers to optimize performance under varying workloads. This approach ensures that cloud environments are not over-provisioned, reducing costs while maintaining performance [7][4].

Validation

To validate the effectiveness of the machine learning-based approach, the predictions are compared with actual empirical performance data from the VMs and containers. Furthermore, the model's ability to generalize across different workload types is tested by applying it to new workloads not included in the training set [10].

EXPERIMENTS AND RESULTS

Experimental Setup

To evaluate the performance of Virtual Machines (VMs) and containers, two identical cloud environments were created:

VM Environment: Utilizing KVM (Kernel-based Virtual Machine) with Linux-based OS.

Container Environment: Based on Docker containers, deployed on the same hardware as the VM setup.

Both environments hosted the same applications and workloads to simulate typical CPU-intensive, I/O-bound, and memory-bound tasks. Performance metrics, such as response time, throughput, CPU utilization, memory usage, and disk I/O were recorded under varying load conditions using Apache Bench (ab) and Sysbench for benchmarking [1][4].

Data Collection

Data was collected from both environments under three different workload scenarios:

- Low Load: 50 concurrent requests.
- Medium Load: 500 concurrent requests.
- High Load: 1,000+ concurrent requests.

The collected data included:

- Response time: Time taken for requests to complete.
- Throughput: Requests processed per second.
- CPU and memory usage: Utilization during the benchmarking.
- Disk I/O: Number of read/write operations per second.
- Network Latency: Delay in network communication.

This data was then used for feature engineering and machine learning model development.

Feature Engineering

Before feeding the data into the machine learning models, the following steps were taken:

Normalization: To standardize the data for features like CPU, memory, and I/O performance.

Feature Selection: Key features selected include:

- CPU usage (%)
- Memory usage (MB)
- Disk I/O operations
- Network latency (ms)
- Workload size (number of requests)
- VM/Container type (binary label: 0 for VMs, 1 for containers)

The scikit-learn library was used for normalization and splitting the data into training and test sets (70% for training and 30% for testing).

**Anand and Nisha Jebaseeli****Code Development for Machine Learning Models****Supervised Learning Models**

The scikit-learn library was employed to develop the supervised models:

- Linear Regression
- Decision Trees
- Random Forest
- Neural Networks (MLP)

Unsupervised Learning Models (K-Means Clustering)

To cluster the workloads and identify optimal configurations, K-Means was applied using the scikit-learn library

Virtual Machine Model

The virtual machine model can be mathematically represented by the following components:

$VM_i = (CPU_i, Mem_i, Disk_i, Net_i, OS_i)$

Where:

Results and Outputs**Supervised Learning Results**

- Random Forest performed best for predicting response time with an MSE of 0.015 for containers and 0.028 for VMs.
- Neural Networks provided the most accurate predictions for throughput, with an MSE of 0.018 for containers and 0.039 for VMs.

The supervised learning models, including Linear Regression, Random Forest, Decision Tree, and Neural Network (MLP), were applied to predict key performance metrics such as response time and throughput for both Virtual Machines (VMs) and containers. The results demonstrated that Random Forest provided the most accurate predictions for response time, with a Mean Squared Error (MSE) of 0.015 for containers and 0.028 for VMs. In contrast, Neural Networks (MLP) outperformed other models in predicting throughput, achieving an MSE of 0.018 for containers and 0.039 for VMs. These findings highlight the effectiveness of machine learning models in capturing complex patterns in system performance, with containers consistently exhibiting lower MSE values than VMs, indicating superior scalability and efficiency under high-load conditions. The accurate predictions from these models significantly reduce the time required for performance

evaluations, enabling faster and more reliable optimization of resource allocation in dynamic cloud environments.

The ability of supervised learning models to accurately predict performance metrics directly contributes to improving cloud resource management. By leveraging these predictions, real-time adjustments to resource allocations can be made, ensuring that systems are neither over-provisioned nor under-provisioned. This approach enhances the operational efficiency of cloud infrastructures and reduces costs, addressing one of the primary objectives of the research.

Clustering Results

The K-Means clustering model grouped workloads into three distinct clusters, revealing patterns in resource utilization:

- Cluster 1: Low CPU and memory utilization, typical of I/O-bound tasks.
- Cluster 2: Medium utilization, ideal for mixed workloads.
- Cluster 3: High CPU and memory usage, common in CPU-intensive tasks.

The silhouette score for clustering was 0.81, indicating strong clustering performance, especially for container-based workloads. Clustering techniques, particularly K-Means, were employed to identify patterns in resource utilization across various workloads. The clustering analysis revealed three distinct clusters corresponding to low, medium, and high CPU and memory utilization. For example, Cluster 1 comprised I/O-bound tasks with minimal CPU and memory usage, while Cluster 3 represented CPU-intensive workloads with high resource demands. The silhouette score of 0.81 indicates strong clustering performance, particularly for container-based workloads. This grouping of similar workload profiles allows for more targeted optimization, as each cluster represents an optimal configuration

**Anand and Nisha Jebaseeli**

for specific types of workloads. Clustering results play a crucial role in identifying optimal resource configurations for both VMs and containers. By categorizing workloads into distinct clusters based on their resource usage patterns, cloud environments can be tuned for efficiency. This approach enables the research to recommend specific configurations for varying workload types, ensuring that resources are allocated effectively, which is key to enhancing the scalability and performance of cloud-native applications. This methodology adds a layer of adaptability to the system, allowing it to handle the dynamic nature of real-world cloud environments.

Performance Comparison**Response Time**

Containers consistently showed lower response times than VMs. The average response time for containers was 20-25% lower across all workload scenarios.

Throughput

Containers handled 15-20% more requests per second than VMs, especially in high-load scenarios. This confirms their suitability for environments demanding fast scaling and high concurrency [9].

CPU and Memory Utilization

Containers exhibited better resource efficiency, using 30% less CPU and 25% less memory compared to VMs under the same workload [4][5]. Traditional empirical benchmarking involves directly running performance tests in real-time, executing workloads in both VM and container environments, and measuring metrics like response time and throughput over a period. This process is time-consuming as it requires setting up the environment, running tests under different conditions, and waiting for the tests to complete, especially when dealing with high-load scenarios. Each time a new workload or configuration is tested, the benchmarking process must be repeated, adding to the overall time. In contrast, machine learning-based predictions are much faster. Once trained on historical data, machine learning models can instantly predict performance metrics for new configurations or workloads without rerunning the entire benchmark process. The models have already learned the relationships between input features and performance metrics, allowing them to provide nearly instantaneous predictions. This rapid computation, combined with the elimination of the need for extensive testing setups, significantly reduces the time required to generate results. The 65% faster inference time comes from this efficiency, as machine learning models can make predictions in seconds or milliseconds, while empirical benchmarking requires more time-intensive processes to produce similar results. This scalability and speed make machine learning a more time-efficient approach for performance analysis and optimization.

The machine learning-based approach outperforms traditional queuing models in accuracy, flexibility, and scalability. Queuing models often oversimplify dynamic cloud environments with assumptions like steady workloads, leading to less accurate predictions. In contrast, ML models, trained on real-world data, capture complex relationships between system parameters, providing more precise predictions. ML models are also more flexible, easily generalizing across varied workloads without recalibration, unlike queuing models that need constant adjustments. Additionally, ML models offer near-instant predictions, making them faster and more suitable for real-time performance optimization, while queuing models involve time-consuming calculations. ML models also scale better, adapting to dynamic workloads and large, distributed systems, and they enable automatic resource optimization in real-time, which queuing models cannot achieve efficiently. The Time Efficiency Comparison highlights the differences in how various methods perform when predicting system performance. Traditional approaches like Empirical Benchmarking and Queuing Models take significantly longer. Empirical benchmarking, which requires setting up real-world workloads and running tests, is the most time-consuming, taking around 180 seconds. Queuing models, which use theoretical predictions based on system parameters, are faster but still take around 120 seconds due to recalculations and adjustments for different scenarios. In contrast, Machine Learning (ML) models, once trained on historical data, offer nearly instantaneous predictions, taking just 30 seconds. This drastic reduction in time demonstrates the advantage of using ML for real-time performance optimization in dynamic cloud

**Anand and Nisha Jebaseeli**

environments. By leveraging ML, resource allocation decisions can be made much faster, improving operational efficiency.

CONCLUSION

This research demonstrates that machine learning-based methods offer a significant advantage in comparing the performance of virtual machines (VMs) and containers in cloud environments. Through the application of supervised and unsupervised machine learning techniques, this study has shown that ML models can accurately predict key performance metrics such as response time, throughput, and resource utilization. Compared to traditional approaches like empirical benchmarking and queuing models, the ML-based approach is faster, more adaptable, and better suited for dynamic, cloud-native environments. Containers consistently outperformed VMs in terms of response time, scalability, and resource efficiency, making them ideal for high-demand cloud applications. Furthermore, machine learning models enable real-time performance predictions and automatic resource optimization, significantly reducing the time required for evaluations and improving operational efficiency. Overall, this research highlights the potential of machine learning as a scalable and effective solution for optimizing virtualization technologies in modern cloud infrastructures. Future work can explore the integration of more advanced algorithms, such as deep learning models or reinforcement learning, to dynamically adjust resources in real-time with greater precision. Additionally, incorporating more diverse datasets from different cloud platforms and infrastructures could enhance model generalization, making the approach applicable across a wider range of cloud environments. Another area for future exploration is improving security and isolation mechanisms within containers. Given the increasing adoption of containers in cloud-native applications, research into combining the lightweight nature of containers with the robust isolation of VMs could offer hybrid solutions. Furthermore, the application of machine learning techniques to improve migration strategies between VMs and containers, or to optimize the deployment of multi-cloud and edge computing architectures, presents another valuable opportunity. Finally, the integration of AI-driven resource management with emerging cloud technologies like serverless computing and microservices can be explored. As cloud environments become more decentralized and distributed, leveraging machine learning for predictive analytics, resource scaling, and fault tolerance will be crucial for maintaining efficient, scalable, and secure systems. This continued evolution will position machine learning as a key tool in the optimization of cloud infrastructure performance.

ABSTRACT

The CatBoost algorithm, a gradient boosting-based machine learning technique, is employed to analyze the efficacy of Indian medical herbal plants for chronic diseases. The algorithm handles categorical data efficiently, making it suitable for datasets with diverse herbal plant attributes. It uses ordered boosting and oblivious trees to reduce overfitting and improve generalization. The steps include data preprocessing, dividing the dataset into both training and testing, training the CatBoost model with hyperparameter tuning, and evaluating its performance using metrics like accuracy, precision, recall and F1-score. The model identifies key chemical compounds and their mechanisms of action, linking them to specific chronic diseases. The combination of data-balancing skills and understandable results makes GLM useful for this research project.

Keywords: Indian Medical, Herbal Plants, Chronic Disease, CatBoost, Machine Learning, Traditional Medicine.

INTRODUCTION

Chronic diseases, such as diabetes, cardiovascular diseases, and arthritis, are major contributors to global morbidity and mortality, accounting for approximately 71% of deaths worldwide, as reported by the World Health Organization (WHO). Managing these diseases often requires long-term treatment, which can be costly and

**Pavithra and Mohan Kumar**

associated with adverse side effects [1]-[3]. This has led to a growing interest in alternative and complementary therapies, including herbal medicine. Indian medical herbal plants, deeply rooted in traditional systems like Ayurveda, Siddha, and Unani, have been used for centuries to treat various chronic conditions. Herbs are renowned for their anti-inflammatory, antioxidant, and immunomodulatory properties [4]-[6]. However, despite their widespread use, the efficacy of these herbal plants in modern medical contexts is often questioned due to a lack of rigorous scientific validation. One of the primary challenges in evaluating the efficacy of herbal plants is the complexity of their chemical compositions and the variability in their biological effects. Traditional methods of assessment often rely on anecdotal evidence or small-scale studies, which may not provide a comprehensive understanding of their therapeutic potential[7]-[9]. Additionally, the lack of standardized datasets and the need for interdisciplinary collaboration between traditional medicine practitioners and data scientists further complicate the process. Machine learning, particularly gradient boosting algorithms like CatBoost, offers a promising solution to these challenges. The CatBoost framework demonstrates efficiency in categorical data processing while avoiding overfitting and permits interpretation of results which matches its suitability to analyze complex herbal medicine datasets[10]-[12]. The novelty of this research lies in its application of the CatBoost algorithm to systematically evaluate the efficacy of Indian medical herbal plants for chronic diseases. Unlike traditional methods, this approach leverages large datasets, advanced computational techniques, and modern machine learning algorithms to identify patterns and insights that may not be apparent through conventional approaches[13]. The main objective of this study focuses on understanding how the CatBoost algorithm assesses the effectiveness of Indian medical herbal plants in chronic disease treatment while establishing which herbs perform best and studying their chemical compositions along with algorithm forecast reliability assessment. The contribution of this research is multifaceted. The scientific methodology enables traditional herbal plant use to connect with contemporary medical standards through sound evidence. Second, it demonstrates the potential of machine learning in herbal medicine research, offering a scalable and data-driven approach to identifying effective treatments. Third, it highlights the importance of interdisciplinary collaboration, combining insights from traditional medicine, pharmacology, and data science. By addressing the limitations of existing methods and leveraging the strengths of the CatBoost algorithm, this research paves the way for the development of evidence-based herbal therapies for chronic diseases[15].

LITERATURE REVIEW

Existing methods for evaluating the efficacy of Indian medical herbal plants often rely on traditional knowledge, anecdotal evidence, or small-scale clinical studies. While these approaches provide valuable insights, they are limited by their lack of scalability, reproducibility, and scientific rigor [7]. For example, traditional methods may not account for the variability in herbal plant compositions or the complexity of their biological effects [8]. Small-scale studies, on the other hand, may lack the statistical power to draw definitive conclusions. Additionally, the absence of standardized datasets and the reliance on subjective assessments further limit the reliability of these methods [9]. However, these methods have their own limitations. Random Forest, while robust, may struggle with imbalanced datasets and categorical data. Logistic Regression, while simple and fast, may not capture the non-linear relationships inherent in complex datasets [16]-[17].

PROPOSED METHODOLOGY

The proposed methodology for analyzing the efficacy of Indian medical herbal plants for chronic diseases using the CatBoost algorithm is a comprehensive, data-driven approach that integrates traditional knowledge with modern machine learning techniques. Each stage is designed to ensure the robustness, scalability, and reliability of the analysis, ultimately providing a scientific basis for the traditional use of herbal plants in treating chronic diseases.

CatBoost Algorithm Formulation

CatBoost is a gradient boosting algorithm that optimizes decision trees while handling categorical features efficiently. The key mathematical components include:

Pavithra and Mohan Kumar

Objective Function (Loss Minimization)

The model minimizes the loss function LL during training:

$$L(\theta) = \sum_{i=1}^N L(y_i, F(x_i; \theta)) + \Omega(\theta) \quad L(\theta) = \sum_{i=1}^N L(y_i, F(x_i; \theta)) + \Omega(\theta)$$

where:

- y_i = True label (efficacy of herbal plant)
- $F(x_i; \theta)$ = Predicted output (CatBoost model)
- $\Omega(\theta)$ = Regularization term to prevent overfitting
- N = Number of training samples

Gradient Boosting with Ordered Boosting

CatBoost uses **ordered boosting** to reduce bias in gradient estimation:

$$F_t(x) = F_{t-1}(x) + \eta \cdot h_t(x) \quad F_t(x) = F_{t-1}(x) + \eta \cdot h_t(x)$$

where:

- $F_t(x)$ = Model prediction at iteration t
- η = Learning rate (typically 0.01–0.30.01–0.3)
- $h_t(x)$ = Weak learner (decision tree) at step t

Handling Categorical Features

CatBoost uses **target-based encoding** for categorical variables (e.g., plant species, disease type):

$$x_{\text{encoded}} = \sum_{j=1}^k (y_j \cdot I(x_j = x_i)) + \alpha \cdot p \quad x_{\text{encoded}} = \sum_{j=1}^k I(x_j = x_i) + \alpha \sum_{j=1}^k (y_j \cdot I(x_j = x_i)) + \alpha \cdot p$$

where:

- $I(\cdot)$ = Indicator function
- α = Smoothing parameter
- p = Prior mean (for regularization)

Chemical Compound-Disease Association

To link herbal compounds (CC) to chronic diseases (DD), we use **Jaccard Similarity**:

$$J(C, D) = \frac{|TC \cap TD|}{|TC \cup TD|} \quad J(C, D) = \frac{|TC \cap TD|}{|TC \cup TD|}$$

where:

- TC = Set of biological targets of compound CC
- TD = Set of genes/proteins associated with disease DD

A threshold $J(C, D) \geq 0.5$ suggests a **significant association**.

Feature Importance Analysis

CatBoost computes **feature importance** using **PredictionValuesChange**:

$$\text{Importance}_j = \frac{1}{N} \sum_{i=1}^N |F(x_i) - F(x_i(j))| \quad \text{Importance}_j = \frac{1}{N} \sum_{i=1}^N |F(x_i) - F(x_i(j))|$$

where:

- $x_i(j)$ = Feature j with permuted values
- Higher values indicate stronger influence on efficacy prediction

Pseudocode

```
# Step 1: Collect the input Data
def collect_data(sources):
    data = []
    for source in sources:
        if source == "Ayurvedic_DB":
            data += fetch_ayurvedic_data()
        elif source == "PubChem":
            data += fetch_pubchem_data()
```

**Pavithra and Mohan Kumar**

```
elif source == "Scientific_Literature":
    data += fetch_literature_data()
return data
# Step 2: Pre-processing of input Data
def preprocess_data(data):
    # Standardize formats (e.g., chemical compound names, disease classifications)
    data = standardize_formats(data)
    # Set categorical features
    data = encode_categorical_features(data)
    # Extract relevant features (e.g., chemical compounds, biological pathways)
    features = extract_features(data)
    return features
# Step 3: Feature Selection
def select_features(features, target):
    # Use correlation analysis or feature importance ranking
    selected_features = correlation_analysis(features, target)
    return selected_features
# Step 4: Chemical Compound Analysis
def analyze_chemical_compounds(effective_herbs):
    compounds = identify_compounds(effective_herbs)
    pathways = map_pathways(compounds, tool="KEGG")
    disease_associations = link_pathways_to_diseases(pathways)
    return compounds, pathways, disease_associations
# Step 5: Interpretation of Results
def interpret_results(effective_herbs, compounds, pathways, disease_associations):
    # Compare with traditional knowledge
    traditional_knowledge = fetch_traditional_knowledge(effective_herbs)
    comparison = compare_with_traditional_knowledge(effective_herbs, traditional_knowledge)
    # Assess biological relevance
    biological_relevance = assess_biological_relevance(compounds, pathways)
    return comparison, biological_relevance
# Step 6: Output Results
def generate_report(effective_herbs, compounds, pathways, disease_associations, performance_metrics):
    report = {
        "Effective_Herbs": effective_herbs,
        "Chemical_Compounds": compounds,

    data = collect_data(sources)
    # Step 2: Data Preprocessing
    features = preprocess_data(data)
    # Step 3: Feature Selection
```

**Pavithra and Mohan Kumar**

```
target = "Efficacy" # Target variable (efficacy of herbal plants)
selected_features = select_features(features, target)
# Step 4: Model Development
X_train, X_test, y_train, y_test = split_dataset(selected_features, test_size=0.2)
# Step 5: Chemical Compound Analysis
effective_herbs = model.get_effective_herbs() # Hypothetical function to get effective herbs
compounds, pathways, disease_associations = analyze_chemical_compounds(effective_herbs)
# Step 6: Interpretation of Results
comparison, biological_relevance = interpret_results(effective_herbs, compounds, pathways,
disease_associations)
# Step 7: Output Results
report = generate_report(effective_herbs, compounds, pathways, disease_associations,
performance_metrics)
return report
# Execute the workflow
if __name__ == "__main__":
    report = main()
    print(report)
```

The first stage of the methodology involves data collection, where data on Indian medical herbal plants, their chemical compositions, and their associated biological activities are gathered from multiple sources. These sources include traditional medicine databases such as the Ayurvedic Pharmacopoeia of India, scientific literature from peer-reviewed journals, and chemical databases like PubChem and ChEMBL[18]. The collected data encompasses information on the traditional uses of herbal plants, their pharmacological properties, and the chemical compounds responsible for their therapeutic effects. This multi-source approach ensures a comprehensive dataset that captures the diversity and complexity of herbal medicine. This includes removing duplicate entries, handling missing values through imputation or removal, and standardizing data formats such as chemical compound names and disease classifications. Additionally, categorical features, such as the names of herbal plants and their traditional uses, are encoded to facilitate their use in the CatBoost algorithm. Feature extraction processes distinguish applicable attributes in the dataset that include particular chemical compounds and biological pathways and disease associations. The third stage is feature selection, where the most relevant features for predicting the efficacy of herbal plants are identified. For example, chemical compounds with known anti-inflammatory or antioxidant properties are prioritized as features.

The fourth stage focuses on model development, where the CatBoost algorithm is employed. CatBoost is chosen for its ability to handle categorical data efficiently, reduce overfitting, and provide interpretable results. The fifth phase of model building includes checking the trained CatBoost model through cross-validation processes to verify its universal applicability. The sixth stage is chemical compound analysis, where the key chemical compounds in the most effective herbal plants are identified and analyzed. This involves using tools such as the KEGG Pathway Database and Reactome to map the chemical compounds to their associated biological pathways. The pathways are then linked to specific chronic diseases, such as diabetes, cardiovascular diseases, and arthritis, to understand the mechanisms of action of the herbal compounds. The chemical compound interaction data during this stage enables scientists to connect ancient medicinal wisdom with contemporary biological sciences for scientific study[16]. The seventh stage focuses on interpretation of results, where the findings of the machine learning analysis are interpreted in the context of traditional knowledge and scientific literature. This involves comparing the predictions of the CatBoost model with the traditional uses of herbal plants to identify consistencies and discrepancies. For example, if the model identifies Ashwagandha as effective for managing stress-related disorders, this result is compared with its traditional use in Ayurveda[19]. The biological relevance of the identified chemical compounds is also assessed to determine their potential therapeutic effects. This stage ensures that the results are not only statistically significant

**Pavithra and Mohan Kumar**

but also biologically meaningful. The final stage is output and reporting, where the results of the analysis are compiled into a comprehensive report. This includes a list of the most effective herbal plants for specific chronic diseases, along with their key chemical compounds and mechanisms of action. The report provides actionable insights for researchers, healthcare practitioners, and policymakers, highlighting the potential of herbal medicine as a complementary treatment for chronic diseases. The proposed methodology addresses several challenges in herbal medicine research, including the complexity of herbal compounds, the lack of standardized datasets, and the need for interdisciplinary collaboration. By leveraging the strengths of the CatBoost algorithm, this approach provides a scalable and data-driven solution for evaluating the efficacy of Indian medical herbal plants. The methodology also emphasizes the importance of integrating traditional knowledge with modern scientific techniques, ensuring that the results are both culturally relevant and scientifically valid[20].

RESULTS AND DISCUSSION

The proposed CatBoost model was compared with three widely—to evaluate its performance in analyzing the efficacy of Indian medical herbal plants for chronic diseases. The results are summarized in the table below:

Algorithm	Accuracy (%)	F1-Score (%)	Recall (%)	Precision (%)
CatBoost (Proposed)	85.2	82.1	83.5	81.8
Random Forest	82.4	79.3	80.7	78.9
Support Vector Machine (SVM)	78.6	75.4	76.8	74.9
Logistic Regression	75.3	72.1	73.5	71.8

The CatBoost model demonstrated superior performance than all other algorithms and Random Forest showed slightly worse results with accuracy at 82.4% and F1-score at 79.3% because of its incapability to tackle imbalanced datasets. SVM, despite its effectiveness in high-dimensional spaces, struggled with accuracy (78.6%) and recall (76.8%), possibly due to its sensitivity to hyperparameter tuning and computational complexity. The basic nature of Logistic Regression resulted in its poor performance which yielded 75.3% accuracy while achieving 72.1% F1-score since it lacked the capacity to detect nonlinear patterns in the collected data[7]. The precision and recall metrics of CatBoost show effective identification of beneficial herbal plants with minimal incorrect outputs which well suites this research. Future work could explore further optimization of the algorithm and validation with larger datasets to enhance its applicability in herbal medicine research[11].

CONCLUSION AND FUTURE WORK

In conclusion, this research demonstrates the effectiveness of the CatBoost algorithm in analyzing the efficacy of Indian medical herbal plants for chronic diseases. Future work could focus on expanding the dataset to include clinical trial data, exploring other advanced algorithms like deep learning, and conducting experimental studies to validate the biological mechanisms of identified compounds. Additionally, interdisciplinary collaboration between traditional medicine practitioners, pharmacologists, and data scientists could further enhance the reliability and applicability of the findings. This research covers the way for evidence-based herbal therapies, offering a holistic and scalable solution for managing chronic diseases.

ABSTRACT

Type 2 Diabetes Mellitus (T2DM) is a chronic condition characterized by high blood sugar levels due to insulin resistance and inadequate insulin secretion. Early prediction and accurate classification of T2DM are crucial for effective management and prevention. The vast amount of medical data available from various sources, including clinical measurements, genetic information, and lifestyle data, presents both opportunities and challenges for predictive modeling. Feature selection plays a pivotal role in improving the performance of machine learning algorithms by identifying the most relevant and informative features while reducing the dimensionality of the data. This study proposes the InfoGrav Hybrid Optimization Algorithm (InfoGrav-HOA), a novel feature selection method that combines Information Gain (IG) and Gravitational Search Optimization (GSO) to enhance the prediction of T2DM. The InfoGrav-HOA integrates the strength of Information Gain, which measures the relevance of each feature based on the entropy of the data, with the Gravitational Search Optimization algorithm, which is inspired by the law of gravity and aims to find the optimal set of features by simulating the gravitational attraction between masses (representing potential solutions). The InfoGrav-HOA algorithm aims to exploit the benefits of both methods: IG for feature relevance ranking and GSO for global search and optimization. The hybrid approach addresses the problem of selecting the most relevant features from a large pool of potential features, leading to more accurate, efficient, and interpretable predictive models.

Keywords: Type 2 Diabetes Mellitus (T2DM), Feature Selection, Information Gain (IG), Gravitational Search Optimization (GSO), Machine Learning, Predictive Modeling.

INTRODUCTION

Type 2 Diabetes Mellitus (T2DM) is a prevalent and increasingly common chronic metabolic disorder characterized by insulin resistance and impaired insulin secretion. Unlike Type 1 diabetes, which is an autoimmune condition where the body attacks its insulin-producing cells, T2DM primarily results from the body's inability to effectively use insulin (insulin resistance) and/or an insufficient insulin response from pancreatic cells [1]. As a result, individuals with T2DM have elevated blood glucose levels (hyperglycemia), which can lead to severe complications, such as cardiovascular disease, renal failure, neuropathy, retinopathy, and even premature death if not properly managed [2]. The global incidence of T2DM has risen dramatically over the past few decades, largely due to increasing rates of obesity, physical inactivity, unhealthy diets, and aging populations. According to the World Health Organization (WHO), more than 400 million people worldwide are living with diabetes, with T2DM comprising about 90-95% of all cases [3]. This alarming rise presents a significant public health challenge, placing enormous strain on healthcare systems and economies globally. The primary factors contributing to the development of T2DM include genetic predisposition, lifestyle factors (e.g., poor diet and lack of physical activity), and environmental influences. While lifestyle modifications, including weight loss, physical activity, and dietary changes, can help manage and even prevent T2DM, early detection is crucial to reduce the risk of complications [4]. Identifying individuals at high risk of developing T2DM and predicting the onset of the disease is of paramount importance for improving clinical outcomes and implementing preventive interventions [5]. Advances in medical data collection, particularly through electronic health records, genetic research, and wearable devices, have made it possible to gather a wealth of information on various factors that influence the development of T2DM. These data sets are often high-dimensional, meaning they contain a large number of variables that could potentially contribute to the prediction of the disease [6] [7]. However, the presence of irrelevant, redundant, or noisy features in these data sets can reduce the accuracy and interpretability of machine learning models used for prediction. Thus, feature selection has emerged as a critical step in developing effective predictive models. Feature selection aims to identify and retain the most important variables while eliminating irrelevant or redundant ones, thereby improving model accuracy, efficiency, and interpretability [8]. In recent years, machine learning techniques, such as Long Short Term Memory (LSTM), Artificial Neural Network (ANN), and random forests (RF), have shown great promise in predicting the onset of T2DM. However, the success of these models heavily depends on the quality and relevance of the features used for training. Many traditional feature selection methods, though effective, have limitations in terms of computational efficiency and the ability to handle complex, high-dimensional data [9]. This has led to a growing interest in the development of hybrid optimization algorithms that combine the strengths of multiple techniques to improve feature selection and predictive modeling [10]. This study aims to address the challenge of selecting the most relevant features for predicting T2DM by proposing the InfoGrav Hybrid Optimization Algorithm (InfoGrav-HOA), which combines Information Gain (IG), a well-established measure for evaluating feature relevance, with Gravitational Search Optimization (GSO), a powerful optimization technique inspired by the laws of gravity. By leveraging the advantages of both methods, the InfoGrav-HOA seeks to enhance the prediction of T2DM, offering a more accurate, efficient, and interpretable approach to feature selection in high-dimensional medical data.

Information Gain based Feature Selection Method

Information Gain (IG) [11] is a widely used criterion in machine learning and data mining, particularly for feature selection. It is derived from the concept of entropy, a measure of uncertainty or disorder in a dataset. Information Gain quantifies how much information a particular feature provides in reducing the uncertainty (or entropy) about the target variable. The more a feature can help reduce the uncertainty in predicting the target, the higher its Information Gain [12]. The main goal of Information Gain-based feature selection is to select features that provide the most information about the target variable while discarding irrelevant or redundant features. This approach is especially useful in high-dimensional data sets, where many features may not contribute significantly to the prediction task [13]. In the context of a classification problem, Information Gain measures the effectiveness of a feature in classifying the dataset. The process of Information Gain-based feature selection is grounded in Shannon's entropy theory, which is used to quantify uncertainty or impurity in the data.

Babu and Prakash Kumar

Entropy

The entropy of a dataset D with respect to a target class Y is calculated as:

$$H(D) = - \sum_{i=1}^n p(y_i) \log_2 p(y_i)$$

Where n is the number of classes in the target variable, $p(y_i)$ is the probability of the i -th class in the target variable. The entropy function measures the uncertainty or impurity in a dataset. A dataset with a uniform distribution of classes (equal probability for each class) has high entropy, while a dataset with a single class (no uncertainty) has zero entropy.

Conditional Entropy

The conditional entropy of a dataset D given a feature X is the expected entropy after the dataset is split based on the values of feature X . It is computed as:

$$H(D|X) = \sum_{v \in \text{Values}(X)} p(v) H(D_v)$$

Where $\text{Values}(X)$ is the set of possible values for the feature X , $p(v)$ is the probability of the dataset being split into subset D_v based on the value v of feature X , $H(D_v)$ is the entropy of the subset D_v . The conditional entropy tells us how much uncertainty remains in the target variable after splitting the data based on feature X .

Information Gain (IG)

Information Gain is the reduction in entropy achieved by knowing the value of a particular feature. It is computed as the difference between the entropy of the dataset before the feature is introduced and the weighted sum of the entropies after the feature is used to split the data. Mathematically:

$$IG(D, X) = H(D) - H(D|X)$$

Where $H(D)$ is the entropy of the dataset before the feature split, $H(D|X)$ is the conditional entropy of the dataset after the feature split. The feature with the highest Information Gain is considered the most informative in predicting the target variable.

Steps Involved in Information Gain-Based Feature Selection:

- Calculate the Entropy of the Entire Dataset: First, calculate the entropy of the target variable (class) in the entire dataset. This gives the baseline uncertainty in the target variable.
- Compute the Conditional Entropy for Each Feature: For each feature, calculate how the dataset is split based on the feature's values and compute the conditional entropy of the resulting subsets. This step gives the uncertainty in the target variable after the feature is introduced.
- Calculate Information Gain: For each feature, calculate the Information Gain by subtracting the conditional entropy from the total entropy. The feature with the highest Information Gain is considered the most valuable in reducing uncertainty about the target variable.
- Rank and Select Features: Rank the features based on their Information Gain values. The features with the highest Information Gain are selected for further analysis, while the features with the lowest Information Gain are discarded as they provide little to no useful information for classification.

Gravitational Search Optimization

Gravitational Search Optimization (GSO) [14] is a novel metaheuristic optimization algorithm inspired by the principles of gravity and the laws of physics. It was first proposed by Rashedi et al. in 2009 and is based on the analogy of particles (representing solutions) attracting each other due to gravitational forces. The fundamental idea behind GSO is that each particle's position represents a potential solution, and the gravitational attraction between particles determines how particles move toward better solutions over time. The algorithm simulates the gravitational interaction between particles to guide the search process in the problem's solution space [15]. In GSO, particles are treated as masses in a multi-dimensional space, and the force of attraction between them depends on their mass and the distance between them. The gravitational force between two particles increases as the mass of the particles

Babu and Prakash Kumar

increases and as the distance between them decreases. In the context of optimization, the “mass” of a particle corresponds to the quality of the solution it represents, with higher-quality solutions (better fitness values) having larger masses [16].

Components of GSO

Mass

In GSO, the mass of a particle represents the quality of the solution it represents. A particle with a higher fitness value will have a larger mass and will exert a greater gravitational pull on other particles.

Gravitational Force

The gravitational force between two particles is proportional to their masses and inversely proportional to the square of the distance between them. The formula for the gravitational force F between two particles is given by:

$$F = G \cdot \frac{m_1 \cdot m_2}{r^2}$$

Where: G is the gravitational constant, m_1 and m_2 are the masses of the two particles, r is the Euclidean distance between the particles.

Movement of Particles: The position of each particle is updated based on the gravitational forces acting on it. The particle moves toward better solutions (higher mass) by adjusting its position in the search space according to the forces exerted by the other particles. The position update formula is:

$$\vec{x}(t+1) = \vec{x}(t) + \vec{v}(t)$$

Where: $\vec{x}(t)$ is the position of the particle at time t , $\vec{v}(t)$ is the velocity of the particle at time t , which is influenced by the gravitational forces.

Exploration and Exploitation

The movement of particles in GSO allows for both exploration and exploitation. Exploration is achieved by the gravitational pull between distant particles, which helps the algorithm explore different regions of the search space. Exploitation occurs when particles with higher masses (better solutions) attract neighboring particles, guiding them to optimal solutions.

Convergence

Over time, the particles converge toward the optimal solution. As the algorithm progresses, the gravitational force between particles decreases, and particles move more precisely toward the best solutions.

Steps Involved in GSO-Based Feature Selection

In the context of feature selection, the objective is to identify a subset of the most relevant features from a large set of candidate features to improve the performance of a machine learning model. Feature selection is a crucial step, especially in high-dimensional datasets, where irrelevant or redundant features can degrade model accuracy and increase computational cost. The GSO algorithm can be effectively applied to feature selection by treating each particle as a candidate feature subset and using the fitness function to evaluate the quality of each subset.

Steps Involved in GSO-Based Feature Selection

1. Initialization

- Each particle in the GSO represents a potential solution to the feature selection problem. The solution is a binary vector where each element represents whether a feature is selected (1) or not selected (0).
- The mass of each particle is initially assigned based on the fitness value of the selected feature subset. The fitness of a particle is evaluated using a machine learning model, such as a classification algorithm, trained on the subset of features represented by the particle.
- The gravitational constant G is typically initialized to a high value at the beginning and decreased over time to allow the algorithm to focus on fine-tuning the solution as it converges.

**2. Fitness Evaluation:**

- The fitness of each particle is calculated based on the performance of the machine learning model using the feature subset selected by the particle. Common performance measures for evaluating feature subsets include classification accuracy, F1-score, or other relevant metrics depending on the problem.
- Particles with higher fitness (better model performance) will have larger masses, which will exert stronger gravitational forces on other particles.

3. Gravitational Force Calculation:

- The gravitational force between two particles is computed based on their masses and the distance between them in the feature space. Particles with better solutions (higher fitness) will have larger masses and will pull weaker solutions (lower fitness) toward them, leading to the exploration of better feature subsets.

4. Particle Movement:

- Each particle moves in the search space based on the gravitational forces acting on it. The movement is influenced by the mass of the particle (its fitness) and the masses of other particles. The velocity and position of each particle are updated iteratively to move toward better feature subsets.
- The position of the particle represents a feature subset, and the velocity determines how the subset changes over time (i.e., which features are added or removed).

5. Convergence:

- As the algorithm progresses, the gravitational forces between particles become weaker, and the particles converge toward the best feature subset. At this point, the algorithm should have found an optimal or near-optimal set of features that maximizes the performance of the machine learning model.

6. Stopping Criteria:

- The algorithm stops when a predefined stopping condition is met, such as a maximum number of iterations, convergence to a solution, or when the performance of the model no longer improves significantly.

Proposed Infograv Hybrid Optimization Algorithm: A Novel Feature Selection Method Combining Information Gain and Gravitational Search Optimization For Enhanced Prediction of Type 2 Diabetes Mellitus

The proposed hybrid feature selection technique begins with thorough data preprocessing, which involves collecting and cleaning the dataset by handling missing values, removing duplicates, and normalizing or standardizing features to ensure consistency. Categorical variables are encoded appropriately, and the dataset is split into training and testing sets for effective evaluation. Next, the process employs Information Gain (IG) as an initial filter to evaluate the relevance of each feature with respect to the target variable. IG scores are calculated for all features, and features are ranked accordingly. To reduce the dimensionality and focus the search, features with low IG scores are discarded, or only the top-ranked features are selected to create a candidate feature pool, which helps to narrow down the search space for the optimization algorithm. Following this, the Gravitational Search Optimization (GSO) algorithm is initialized with carefully defined parameters including the number of agents (candidate solutions), maximum iterations, initial gravitational constant, decay rate, and velocity limits. Each agent is represented by a binary vector that encodes a candidate feature subset, where each bit indicates whether a feature is selected or not. To enhance the search efficiency, the initialization of agents is biased by IG scores, meaning that features with higher IG values have a higher probability of being included in the initial subsets. This fusion of filter and metaheuristic methods provides a strong starting point for the optimization. A fitness function is then defined to evaluate the quality of each agent's feature subset. Typically, this fitness is measured by the classification accuracy of a chosen predictive model (such as SVM or Random Forest) on validation data, sometimes combined with a penalty term to encourage smaller feature subsets. The GSO algorithm uses a physics-inspired approach where agents' masses are assigned proportionally to their fitness values, allowing better-performing agents to exert stronger gravitational forces. The gravitational forces between agents are computed, influencing their accelerations and velocities, which in turn update their positions in the solution space. These position updates represent modifications to the selected feature subsets. To translate velocity values into binary feature selections, a transfer function such as a sigmoid is applied, determining whether each feature should be included or excluded at each iteration. Importantly, IG scores

**Babu and Prakash Kumar**

continue to guide the search during these updates by biasing the probability of selecting features with higher information gain, effectively steering the exploration towards more promising regions in the feature space. This iterative process continues for a set number of iterations or until convergence criteria are met, such as stabilization of fitness values over several cycles. Upon completion of the optimization, the algorithm selects the agent with the highest fitness score, representing the optimal or near-optimal subset of features. This subset balances relevance and parsimony by combining the initial IG-based filtering with the global search capability of GSO. The selected features are then used to train the final predictive model, which is validated on unseen test data to assess improvements in accuracy, precision, recall, and other performance metrics. Finally, the chosen features are analyzed for domain relevance, providing interpretability crucial for applications such as diabetes risk prediction, where understanding the contributing factors is essential. Overall, this hybrid approach synergizes the strengths of Information Gain's quick and effective filtering with Gravitational Search Optimization's powerful global search to enhance the feature selection process, thereby improving the predictive accuracy and robustness of machine learning models in complex, high-dimensional medical datasets.

Step 1: Data Preprocessing

Before applying any feature selection techniques, the dataset must be prepared and cleaned:

1. **Data Collection:** Collect the relevant dataset for T2DM prediction, which could include clinical measurements, genetic information, lifestyle factors, and other health metrics.
2. **Data Cleaning:**
 - Handle missing values through imputation or removal, depending on the extent and nature of missing data.
 - Normalize or standardize numerical features, especially if they have different units or scales, to ensure that no feature dominates the others.
 - Encode categorical variables into numerical values (e.g., one-hot encoding).
3. **Data Splitting:** Split the dataset into training and testing sets, typically in an 80:20 ratio, to evaluate the model's generalization performance after feature selection.

Step 2: Feature Ranking using Information Gain (IG)

Before starting the GSO-based optimization, the first step is to use Information Gain (IG) for initial ranking of the features based on their relevance to the target variable (T2DM classification):

1. **Calculate Entropy:** Compute the entropy of the target variable (T2DM class) using Shannon's entropy formula to quantify the uncertainty in the dataset.
2. **Feature Evaluation Using IG:**
 - For each feature, calculate the **conditional entropy** based on its values, which measures the uncertainty in the target variable given the feature. The Information Gain for each feature.
3. **Rank Features by IG:** Sort the features in descending order based on their Information Gain values. Features with higher IG values are more relevant to the target variable and will be prioritized during the feature selection process.

Step 3: Initialize Gravitational Search Optimization (GSO)

With the initial ranking of features done using IG, proceed to the GSO-based feature selection algorithm to further refine the selection of the most relevant features:

1. **Particle Initialization:**
 - Each particle in the GSO represents a binary feature subset. A binary vector is used where 1 indicates the selection of a feature and 0 indicates its exclusion.
 - Initialize the particle population, with each particle corresponding to a random feature subset. The size of the population can be set based on the problem's complexity (e.g., 30-50 particles).

2. Mass Initialization:

- The mass of each particle is initialized based on the fitness value of the selected feature subset. The fitness function is determined by evaluating the performance of a machine learning model (e.g., SVM, Random Forest, or Decision Tree) on the feature subset.
- Higher mass is assigned to particles corresponding to better-performing feature subsets.

3. Gravitational Constant:

- Set an initial gravitational constant G , which controls the strength of gravitational interactions. The constant G is typically set high at the start to allow exploration and gradually reduced to enhance exploitation.

4. Distance Calculation:

- Compute the Euclidean distance between each particle and every other particle in the population, which will be used to calculate the gravitational force between them.

Step 4: Fitness Evaluation Using Machine Learning Model

The fitness of each particle (feature subset) is evaluated using a machine learning classifier, typically using cross-validation on the training data:

1. **Train Classifier:** For each particle's feature subset, train a classifier (e.g., decision tree, random forest, or support vector machine) on the training set using only the selected features.
2. **Evaluate Performance:** Evaluate the performance of the classifier using a suitable performance metric such as **accuracy**, **F1-score**, **ROC-AUC**, or **precision/recall**.
 - The fitness of the particle is determined by the classifier's performance on the training data. Particles corresponding to better-performing feature subsets (higher fitness) will have larger masses.
3. **Assign Fitness to Particles:** Assign a fitness value to each particle based on the performance of the model. Particles with better performance will be assigned a higher mass.

Step 5: Calculate Gravitational Forces and Update Positions

Once the initial population and masses are established, the GSO algorithm proceeds with calculating the gravitational forces between particles and updating their positions:

1. **Calculate Gravitational Force:** The gravitational force between two particles is calculated using the formula: The gravitational force determines how much influence one particle has on the movement of another. Particles with larger masses (better fitness) exert a greater force on other particles, guiding them toward better feature subsets.
2. **Update Velocities and Positions:** Based on the calculated forces, update the velocities and positions of the particles. The velocity update is determined by the sum of the gravitational forces acting on a particle, which will move it toward better solutions (feature subsets). The movement of particles towards high-mass particles ensures convergence toward optimal or near-optimal feature subsets.

Step 6: Termination and Convergence Check

After a set number of iterations or when the particles converge, the algorithm stops:

1. **Check Convergence:** Monitor the progress of the particles. If the changes in the positions (feature subsets) are minimal over several iterations, or if the performance of the selected subset stabilizes, the algorithm may be terminated.
2. **Final Feature Subset:** The best-performing feature subset (corresponding to the particle with the highest fitness) is selected as the final feature subset for predicting T2DM. This subset is expected to have a high predictive power, reducing dimensionality while maintaining or enhancing model accuracy.

RESULT AND DISCUSSION

Performance Metrics

The dataset considered for the Type 2 Diabetes Mellitus from the Kaggle Repository [17]. The following table 1 depicts the performance metrics used in this research work to evaluate the performance of the proposed methodologies.

Contribution – 1 Result and Analysis

The performance of the Proposed InfoGrav Hybrid Optimization algorithm (IG-GSO) is evaluated with the existing feature selection techniques like Information Gain (IG), Chi-Square (CS), Gravitational Search Optimization (GSO), and Particle Swarm Optimization (PSO) using classification techniques like Long-Short Term Memory (LSTM), Artificial Neural Network (ANN) and Random Forest (RF). Table 1 gives the number of features obtained by the existing and proposed feature selection methods. Table 2 depicts the Classification Accuracy (in %) obtained by the existing and Proposed Feature Selection methods using LSTM, ANN and RF classification techniques. Table 3 depicts the True Positive Rate (in %) obtained by the existing and Proposed Feature Selection methods using LSTM, ANN and RF classification techniques. Table 4 depicts the False Positive Rate (in %) obtained by the existing and Proposed Feature Selection methods using LSTM, ANN and RF classification techniques. Table 5 depicts the Precision (in %) obtained by the existing and Proposed Feature Selection methods using LSTM, ANN and RF classification techniques. Table 6 depicts the Specificity (in %) obtained by the existing and Proposed Feature Selection methods using LSTM, ANN and RF classification techniques. Table 7 depicts the Miss Rate (in %) obtained by the existing and Proposed Feature Selection methods using LSTM, ANN and RF classification techniques. Table 8 depicts the False Discovery Rate (in %) obtained by the existing and Proposed Feature Selection methods using LSTM, ANN and RF classification techniques.

CONCLUSION

The first major contribution is the design of a hybrid feature selection methodology that combines Information Gain (IG) with Gravitational Search Optimization (GSO). The proposed hybrid feature selection methodology, which combines Information Gain (IG) with Gravitational Search Optimization (GSO), has demonstrated significant effectiveness in improving the predictive modeling of Type 2 Diabetes Mellitus (T2DM). By leveraging the strengths of both filter-based and metaheuristic approaches, this hybrid strategy addresses the common challenges posed by high-dimensional and complex clinical datasets. The initial filtering step using Information Gain efficiently ranks features based on their statistical relevance to the target variable, providing a rapid reduction of the feature space by removing irrelevant or weakly correlated attributes. Subsequently, Gravitational Search Optimization refines the feature subset through a global search process that explores multiple candidate solutions to identify the optimal combination of features. This two-stage approach not only minimizes computational overhead but also mitigates the risk of excluding potentially significant features, which can occur with purely filter-based methods. Results from the classification tasks using multiple classifiers—LSTM, ANN, and Random Forest—clearly highlight the superiority of the proposed hybrid method over using the original dataset or single-method feature selection techniques. The hybrid feature selection enabled the classifiers to achieve considerably higher accuracy rates, with LSTM achieving up to 88.1% accuracy compared to only 63.2% when using the original unfiltered dataset. Similar improvements were observed in True Positive Rate (TPR), Precision, and Specificity, underscoring the enhanced ability of models to correctly identify diabetic patients while reducing false positives. Furthermore, the reduction in dimensionality achieved through the hybrid feature selection contributed to more stable and generalizable models, as evidenced by the reduced Miss Rate and False Discovery Rate (FDR) across classifiers. This indicates that the selected features were not only relevant but also sufficient for accurate discrimination between risk classes, avoiding overfitting and enhancing robustness against noisy data.

ABSTRACT

Task scheduling continues a critical and difficult research challenge in cloud computing, directly impacting service quality, energy consumption, and task completion times. Inefficient scheduling strategies often lead to prolonged wait times and excessive energy usage, degrading overall system performance. Meta-heuristic algorithms, particularly those leveraging swarm intelligence, have demonstrated significant promise in optimizing task scheduling algorithms in cloud environments. This paper introduces a novel hybrid Mean-Min Particle Swarm Optimization (HMMPSO) algorithm tailored for efficient task scheduling. The algorithm integrates the Mean-Min scheduling approach to establish an initial task allocation, followed by an improved Particle Swarm Optimization (PSO) phase for optimal task distribution. The proposed HMMPSO algorithm ensures balanced scheduling, effectively addressing key performance metrics such as Makespan, degree of imbalance, and energy consumption. Extensive simulations and comparative analyses against contemporary scheduling techniques reveal that the HMMPSO algorithm consistently outperforms traditional PSO and other recent methods, offering a robust and energy-efficient solution for cloud task scheduling.

Keywords: Task Scheduling, Cloud, optimization, mean-min, PSO, meta-heuristic

INTRODUCTION

Cloud computing has developed as a widely adopted platform, offering individuals and enterprises an efficient and scalable solution for executing and storing large-scale applications [1]. The pay-per-use pattern of cloud computing

**VaaheedhaKfatheen**

enables the dynamic fulfillment of user demands, ensuring cost efficiency and scalability [2]. The operational framework of these models is structured around three critical components: the data center, cloud users, and cloud service providers [3]. A cloud service provider procures computing resources and allocates them to users based on their specific requirements. Cloud data centers consist of extensive networks of host computers, each capable of supporting one or more Virtual Machines (VMs). Scheduling task is a critical process in cloud, requiring the allocation of user-submitted tasks to the most appropriate resources to minimize execution time and costs. Effective task scheduling techniques not only optimize processing time but also enhance resource utilization [4]. Scheduling can be categorised into two types: static and dynamic. Static scheduling assigns tasks to resources at the outset and does not permit task migration during execution. In contrast, dynamic scheduling allows for the migration of tasks between resources during runtime, offering greater flexibility [5]. Task scheduling methodologies are broadly categorized into heuristics, meta-heuristics, hybrids of meta-heuristics, and emerging techniques such as machine learning-based approaches. Heuristic algorithms provide near-optimal solutions tailored to specific problems, with examples including Min-Min, Max-Min, and Sufferage algorithms [6]. Conversely, meta-heuristic algorithms are developed to achieve generalized optimal results and include methods such as Particle Swarm Optimization (PSO), Ant Colony Optimization (ACO), and Genetic Algorithms [7]. Hybrid approaches that combine heuristics and metaheuristics have been introduced as effective strategies for optimizing load-balanced task scheduling in cloud computing environments [8]. This study introduces a static independent task scheduling approach that influences the complementary powers of heuristic and meta-heuristic techniques. The proposed model, illustrated in Figure 1, outlines the scheduling framework within a cloud computing environment. This approach aims to optimize resource allocation and minimize execution overhead, addressing key challenges in task scheduling. This paper introduces a novel hybrid methodology that integrates the Mean-Min algorithm [9] with an enhanced Particle Swarm Optimization (PSO) algorithm to optimize task scheduling efficiency in cloud computing environments. Initially, the Mean-Min algorithm is employed to determine the preliminary task allocation. Subsequently, a modified PSO algorithm, incorporating a randomized simulated annealing inertia weight strategy, is utilized to optimize task scheduling further. This proposed algorithm ensures balanced scheduling, thereby enhancing resource utilization and minimizing execution overhead.

The primary contributions of this research are as follows:

- A hybrid Mean-Min Particle Swarm Optimization (HMMP SO) algorithm is proposed to improve task scheduling, focusing on reducing Makespan and energy consumption.
- The Mean-Min algorithm is designed to determine the initial task allocation, and its results are utilized as the initial population for the PSO algorithm.
- An enhanced PSO algorithm is developed to achieve efficient and optimal task scheduling.
- To enhance the performance of the Particle Swarm Optimization (PSO) algorithm, a randomized simulated annealing inertia weight strategy is designed and implemented.
- The proposed HMMP SO algorithm is assessed and analyzed against conventional and recent task scheduling techniques using three objective metrics: Makespan, degree of imbalance, and energy consumption.

Related Work

Zhou et al. [10] developed a hybrid algorithm that integrates a modified Genetic Algorithm (GA) with a greedy method to improve task scheduling efficiency. Their approach requires fewer iterations to identify optimal solutions, thereby reducing average response time and overall execution time. Additionally, it ensures load balancing across cloud resources at minimal cost. Kruekaew *et al.* [11] introduced a multi-objective task optimization technique by combining a Q-learning algorithm with the Artificial Bee Colony Algorithm (ABC). This study aims to enhance virtual machine (VM) throughput, optimize scheduling and resource allocation, and achieve efficient load balancing across VMs, with a focus on performance metrics such as Makespan, cost, and resource utilization. Pirozmand *et al.* [12] presented a two-phase hybrid strategy for task scheduling, emphasizing time and energy efficiency. The first phase prioritizes tasks, while the second assigns tasks to processors. Their Energy-Conscious Scheduling Heuristic model prioritizes tasks and assigns them to processors based on primary chromosome formation, leveraging

VaaheedhaKfatheen

heuristic techniques to enhance efficiency. Alsaidy *et al.* [13] proposed an improved initialization method for Particle Swarm Optimization (PSO) using heuristic approaches. The suggested model integrates the Minimum Completion Time (MCT) and Longest Job to Fastest Processor (LJFP) methodologies to initialise the Particle Swarm Optimisation (PSO) algorithm, thereby improving task scheduling efficiency and optimising resource allocation. Nabi *et al.* [14] introduced a approach aimed at minimizing Makespan while enhancing resource utilization and throughput. Their method utilizes an inertia weight mechanism to balance the local and global search processes, combining Adaptive Inertia Weight and Linearly Descending Weight within the Particle Swarm Optimization (PSO) framework to achieve efficient task scheduling. Abualigah *et al.* [15] proposed a hybrid optimization technique for task scheduling that integrates the Multi-Verse Optimizer with a Genetic Algorithm. This approach optimizes task transfer performance over the cloud network, considering the workload of cloud resources. It ensures efficient task rearrangement by leveraging the efficiency weight of accumulated functions in the cloud. Mangalampalli *et al.* [16] utilized the Whale Optimization Algorithm (WOA) for task scheduling on virtual servers in cloud environments, targeting reductions in Makespan and energy consumption. Tasks are assigned to appropriate Virtual Machines (VMs) based on task and VM priorities, facilitating cost-effective power usage in data centers. Krishnadoss *et al.* [17] suggested a hybrid scheduling method using the Cuckoo Crow Search algorithm, inspired by the crow's foraging behavior and the cuckoo's parasitic tendencies. This approach efficiently selects suitable VMs for task scheduling, achieving reductions in both Makespan and operational costs. Chandrashekar *et al.* [18] introduced a hybrid Ant Colony Optimization (ACO) approach for efficient task scheduling. The proposed method enhances conventional ACO by exploring the search space more effectively and mitigating premature convergence through the assignment of appropriate weights to the ants. This approach aims to minimize both execution costs and completion time concurrently. Abdullahi *et al.* [19] developed a task scheduling framework based on the Symbiotic Organism Search (SOS) algorithm, utilizing adaptive benefit factors. To achieve faster convergence, the framework dynamically adjusts the search control parameters of symbiotic organisms, ensuring a balanced trade-off between local and global search strategies. Furthermore, the algorithm incorporates an adaptive constrained handling mechanism that fine-tunes penalty function values, thereby preventing infeasible solutions and mitigating the risk of premature convergence. Table 1 provides a outline of related work.

PROPOSED METHODOLOGY

This section explains the developed HMMPSTO task scheduling algorithm. In cloud computing, task scheduling is employed to improve the performance of specific QoS measures. The task scheduling challenge is determining how to allocate multiple tasks among a certain number of virtual machines most efficiently. Consider the task set $T = \{T_1, T_2, T_3, \dots, T_n\}$ contains n number of tasks and set of resources Virtual Machine $VM = \{VM_1, VM_2, VM_3, \dots, VM_m\}$ contains m number of VMs. The outcome of the scheduling process is an allocation matrix of size $T_c * VM_c$, that specifies which VM should perform which task. The allocation matrix of mapping relation among Task and VM is denoted as,

$$A = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1m} \\ \vdots & \vdots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nm} \end{pmatrix} \quad (1)$$

Where 'n' is the number of Tasks, 'm' is the number of VMs and $a_{ij} = 1$ if Task T_i is assigned to the VM_j ; otherwise, $a_{ij} = 0$; Initially, the allocation matrix is generated using the Mean-Min scheduling algorithm. Algorithm 1 explains the Mean-min algorithm.

Algorithm-1 Mean-Min Algorithm

Input: $T = \{T_1, T_2, T_3, \dots, T_n\}$, $VM = \{VM_1, VM_2, VM_3, \dots, VM_m\}$, T_c = Task Count, VM_c = VM Count

Output: Allocation Matrix of Tasks to VMs

Step01: Sort tasks based on MI

Step02: Sort and group (High and Low) VMs based on MIPS

Step03: Compute Expected Completion Time (ECT) Matrix using Eq. (2)

Step04: Create an allocation matrix of size $T_c * VM_c$ and fill it with zeros

Step05: Compute Minimum Execution Time (MET) using Eq. (3)

VaaheedhaKfatheen

```

Step06: Sort task based on MET
Step07: Compute MeanMET using Eq. (4)
Step08: For i = 1 to Tc
Step09:  If MET (Ti) > MeanMET then
Step10:   Allocate task Ti to VM with minimum execution time and high-speed resource
Step11:  Else
Step12:   Allocate task Ti to VM with minimum execution time and low-speed resource
Step13:  EndIf
Step14: Endfor

```

The expected completion time matrix is generated for all tasks. The ECT of i^{th} task on j^{th} VM is computed by,

$$ECT_{ij} = \frac{TMI_i}{VMIPS_j} \quad (2)$$

The task allocation matrix (A) of size $T_c * VM_c$ is created and assigned $\forall a_{ij} = 0$. After being sorted according to the minimal ETC in ascending order, the tasks are arranged in a task queue. The virtual machines are categorised into two groups: high-speed and low-speed resources, and organised based on their speed. The minimum execution time of the task is calculated using the following equation.

$$MET(T_i) = \min_{j \in VM_c} (ECT_{ij}) \quad (3)$$

The mean value of MET is computed using the following eq.

$$Mean_{MET} = \sum_{i=1}^{T_c} \frac{MET(T_i)}{T_c} \quad (4)$$

Where T_c is the number of tasks, the tasks with METs larger than or equal to the $Mean_{MET}$ will be allocated in high-speed resource sets; tasks with METs less than or equal to the $Mean_{MET}$ are scheduled in low-speed resource sets. Algorithm 1 produces the task allocation matrix, which is used as the initial population for the modified PSO algorithm. The PSO algorithm is an adaptable optimal method based on global search [20]. This method is a population-based scheduling mechanism that depends on the particle's behaviour in social settings. This strategy is based on swarm intelligence and is modelled after the social dynamics found in groups of birds and fish schools. Particles and generations comprise the population of the swarm. Generation denotes the quantity of repetitions required to attain an ideal solution. Each generation consists of several particles, with each particle symbolising a distinct solution. The quantity of generations and particles is dynamically modified according to the specific circumstances to attain more optimal outcomes. Each particle possesses four defining attributes: position, velocity, global best, and local best. A random initialization process is one of the main components of PSO in dispersing the particles throughout the search space. However, the algorithm's performance might be enhanced if a suitable starting search point could be chosen. Therefore, the recommended strategy is to initiate the PSO search process employing heuristic scheduling methodologies.

Algorithm 2 explains the proposed HMMP SO task scheduling algorithm.

Algorithm-2 HMMP SO Algorithm
Input: $T = \{T_1, T_2, T_3, \dots, T_n\}$, $VM = \{VM_1, VM_2, VM_3, \dots, VM_m\}$, T_c = Task Count, VM_c = VM Count
Output: Allocation Matrix of Tasks to VMs, Makespan, Degree of Imbalance, Energy Consumption
Step 01: Establish PSO parameters MaxIter = 100, Number_of_Particles = 70, $c_1 = 2$, $c_2 = 1.5$, $w_1 = 0.9$, $w_2 = 0.3$, $iw = 0$
Step02: Create an allocation matrix of size $T_c * VM_c$ and fill it with zeros
Step03: Initialize Particle P_1 using Mean-Min algorithm
Step04: Generate remaining Particles randomly
Step05: For iter = 1 to MaxIter
Step06: Find Inertia weight using Eq. (5)

VaaheedhaKfatheen

```

Step07: For i = 1 to No_of_Particles
Step08:   Compute fitness value using Eq. (6)
Step09:   Find the local best particle
Step10:   Compute the new velocity
Step11:   Update particles
Step12: End For
Step13: Find the global best particle
Step14: End For
Step15: Set global best particle to allocation matrix

```

The initial particle is generated using the Mean-min algorithm, and the remaining particles are generated randomly. The efficacy of the PSO algorithm is contingent upon the inertia weight and the optimal parameter configuration. The inertia weights balance exploration and exploitation while searching for the best solution inside the search zone [21]. This paper introduced a random simulated annealing inertia weight, which can be computed using the following equation:

$$iw = \frac{rand()}{2} + w2 + (w1 - w2)(5)$$

Here, rand() indicates the random function that returns a value between 0 and 1. Local search gradually reduces the search space, improving performance and accelerating convergence.

The fitness value of each particle can be computed using,

$$fitness = \frac{1}{makespan} + \frac{Degree\ of\ Imbalance}{Energy\ Consumption} \quad (6)$$

Here, the Makespan can be computed using Eq. (7),

$$Makespan = \max_{j \in VM_c} \left(\sum_{i=0}^{T_c} a_{ij} * ECT_{ij} \right) \quad (7)$$

The degree of imbalance is calculated using Eq. (8)

$$Degree\ of\ Imbalance = VM_c * \left[\frac{Makespan - VM_{minET}}{\sum_{j=1}^{VM_c} \sum_{i=1}^{T_c} a_{ij} * ECT_{ij}} \right] \quad (8)$$

Where VM_{minET} demonstrated the minimal execution time among all virtual machines.

The energy consumption is computed using Eq. (9)

$$Energy\ Consumption = \sum_{j=1}^{VM_c} ((VM_{ETj} * active_j + (Makespan - VM_{ETj}) * idle_j) * MIPS_j) \quad (9)$$

Here, the active_j and idle_j indicate the active and idle state of jth VM. VM_{ETj} represent the execution time of jth VM, and it can be computed using Eq. (10)

$$VM_{ETj} = \sum_{i=0}^{T_c} a_{ij} * ECT_{ij} \quad (10)$$

The metrics Makespan, Degree of Imbalance and Energy Consumption are used to optimize the scheduling algorithms' task allocation.

SIMULATION RESULTS

This section evaluates the performance of the proposed task scheduling algorithm against standard PSO and MCT-PSO [14] algorithms. The proposed HMMPSO scheduling technique employs the Java-based NetBeans IDE 8.2 and the CloudSim 4.0 simulation tool. Table 2 shows the simulation parameters. Three primary metrics, Makespan, Degree of Imbalance, and Energy Consumption compare the performance. Initially, a Java application creates arbitrary task lengths, and various virtual machine execution speeds within the ranges of (1000–4000) in MI and

**VaaheedhaKfatheen**

(1000–5000) in MIPS, respectively, for a certain number of tasks and VM. Additionally, each virtual machine's power consumption is randomly adjusted between 200 and 1000 watts. A VM's execution rate is correlated with its random power consumption values; the higher the VM's execution rate, the higher its power consumption. A virtual machine (VM) can be in any of the simulation's two states of power consumption: idle or active. A virtual machine uses all of its power when it is active. In idle mode, a virtual machine uses 60–70%. Two sets of simulation scenarios—a variable quantity of tasks with a constant number of VMs and a constant number of tasks with a variable quantity of VMs—are employed to obtain the performance evaluation findings.

Case-1 Variable number of tasks with a fixed number of VMs

The number of tasks, in this case, varies from 200 to 1000, and the VM count is set to 100. Table 3 shows the makespan comparison. Figure 2 shows the comparison of Makespan. The outcome shows that, for all algorithms, Makespan increases as the number of tasks increases and that, for every task count, the suggested HMMP SO obtained minimum Makespan. Table 4 and Figure 3 illustrate the performance in relation to the degree of imbalance comparison. Noticeably, there is a significant variation in the recorded DI values for a limited number of tasks. The variation gets smaller as the number of tasks increases, almost reaching the comparable degree of imbalance values when there are 1000 tasks. Across all task counts, the HMMP SO got the optimal VM balance. In contrast, the load balance of the traditional PSO is the worst in every scenario. Table 5 and Figure 4 illustrate the comparative performance of energy usage.. It is noticeable that when the number of tasks increases, energy usage also increases. HMMP SO scheduling uses the least energy across all scenarios compared to other algorithms.

Case-2 Fixed number of tasks with a variable number of VMs

The number of tasks in this scenario remains fixed at 500. The VMs are varied from 40 to 200. Table 6 and Figure 5 present a comparison of makespan. The Makespan is expected to diminish with an increase in the number of machines. In every scenario, the HMMP SO outperforms other algorithms. Table 7 and Figure 6 illustrate the performance of the imbalance degree comparison.. The traditional PSO algorithm increases the degree of imbalance, and the proposed HMMP SO decreases when the number of VMs increases. Table 8 and Figure 7 show the performance of energy consumption comparison. From the results, the proposed HMMP SO reduces the energy for all cases.

CONCLUSION

Cost-effective task scheduling is critical for both customers and service providers in cloud computing environments. This study introduces a hybrid Mean-Min Particle Swarm Optimization (HMMP SO) method for optimizing task scheduling. The Mean-Min technique is utilized to heuristically initialize the particles in the PSO algorithm, significantly enhancing the performance and convergence speed of the search process by starting with solutions derived from the Mean-Min strategy. A key element in PSO, the inertia weight, performs a vital role in balancing the exploration of global and local search spaces. To further improve the algorithm's performance, this work incorporates a randomized simulated annealing inertia weight technique. The proposed HMMP SO algorithm has been assessed using performance metrics such as Makespan, degree of imbalance, and energy consumption, and its results are compared against conventional PSO and MCT-PSO methods. The analysis demonstrates that the proposed strategy consistently outperforms existing approaches, achieving superior efficiency and effectiveness.

ABSTRACT

This scientometric evaluation explores global research trends and outputs related to fossil fuels over a 30-year period (1994–2024). A total of 13,436 records were analyzed, reflecting contributions from 36,553 authors across 141 countries and 8,217 institutions (expanding to 19,996 when sub-divisions are considered). The research is distributed among 2,272 journals, spanning 19 document types and 23 languages, highlighting the multidisciplinary and international scope of fossil fuel-related studies. The dataset includes 12,403 unique words, 706,233 cited references, and received a cumulative 475,627 global citations and 18,415 local citations, indicating significant academic influence. This comprehensive analysis provides insights into the evolution of fossil fuel research, major contributing entities, and the overall impact within the scientific community.

Keywords: Scientometric analysis. Fossil fuels, Research productivity, Trends, Historical research.

INTRODUCTION

Coal, oil, and natural gas are primary examples of fossil fuels that have historically served as the dominant sources of global energy, driving both industrial and economic growth. Despite increasing environmental concerns and a growing shift toward renewable energy alternatives, fossil fuels continue to occupy a significant share of many

**Kanagasundari et al.,**

countries' energy portfolios. As a result, research related to their extraction, utilization, environmental impact, and associated policies remains highly active and continuously evolving. In this context, scientometric analysis has emerged as an effective approach for systematically assessing the development and structure of academic research within a specific field. By examining publication trends, citation patterns, leading authors, institutions, and contributing countries, scientometric studies offer valuable insights into the intellectual framework and emerging areas of focus within the research landscape. This study employs scientometric methods to analyze the global research output related to fossil fuels. By examining bibliometric data from reputable academic sources, the aim is to identify key contributors, emerging research themes, collaborative networks, and potential future directions in fossil fuel studies. This comprehensive analysis provides valuable insights for policymakers, researchers, and stakeholders, supporting informed decision-making in the pursuit of sustainable energy strategies.

Objectives

The objectives of this study entitled “A SCIENTOMETRIC EVALUATION OF RESEARCH TRENDS AND OUTPUTS RELATED TO FOSSIL FUELS” are given below

- To analyze the growth rate of research productivity related to fossil fuels.
- To examine the annual distribution of publications in the field of fossil fuels research.
- To assess the distribution of publications based on document types.
- To study the authorship patterns and the extent of research collaboration.
- To identify the distribution of fossil fuels research across various journals.
- To apply and test relevant scientometric laws in the context of fossil fuels research output.

Statement of the Problem

The present study aims to analyze the research performance related to fossil fuels. Research publications serve as a primary medium through which scientists gain professional recognition, esteem, career advancement, and access to funding opportunities for future research. Publication is central to research productivity, as a study attains formal recognition only when it takes a tangible, published form that can be reviewed, evaluated, and acknowledged by the scientific community. From this perspective, bibliometric analysis emerges as a valuable tool for examining research output across various disciplines, including both science and social science. With this understanding, the researcher proposes to undertake the study titled “A Scientometric Evaluation of Research Trends and Outputs Related to Fossil Fuels.”

METHODOLOGY

The research literature on fossil fuels was sourced from the Web of Science database, maintained by Clarivate Analytics. This study focuses on analyzing the research output in the field of fossil fuels, highlighting aspects such as growth trends, doubling time, authorship patterns, publication languages, document types, country-wise contributions, and core journals. Web of Science, being a comprehensive and reliable source, effectively supports the literature research process. Statistical tools like trend analysis, correlation analysis, and time series analysis were applied to forecast future research output. A total of 13,436 records were downloaded and analyzed using HistCite software. The findings were tabulated in line with the study's objectives, aiming to explore research intensity and journal preferences in fossil fuels research.

Data Collection

For collecting the publication metadata, the renowned Web of Science (WoS) database was used which covers journals, conferences and other sources. The data was collected for the period 1994-2024.

Tools and Techniques

The research output on Fossil Fuels is the data used for the present study. A total of 13436 records were published in Fossil Fuels Research output at global level. The research output was analyzed using various bibliometric indicators.

**Kanagasundari et al.,**

Histcite software is designed to assist a user in analyzing bibliographic data, or any data of a textual nature formatted in a similar manner.

Scope and Limitations of the Study

- The results are based on the assumption that citations reflect meaningful connections between citing and cited documents.
- Limitations may arise due to technical issues in the citation indexes and bibliographic data used.
- The study focuses only on journals published during the 31-year period from 1994 to 2024.
- Analysis is based solely on publication data retrieved from the Web of Science database.

Data Analysis and Interpretation

This study analyzed 13,436 publications on fossil fuels research indexed in the Web of Science database over a 31-year period (1994–2024) at the global level. The highest number of publications occurred in 2024 (1,667), followed by 2023 (1,491). A total of 36,553 authors contributed to 2,272 journal articles from 8,217 institutions across 141 countries. The study also examined journal contributions, author rankings, publication preferences, and keyword frequencies. Table 1 summarizes the research output. The records received 475,627 global citations, 18,415 local citations, and 706,233 cited references. Publications appeared in 23 languages and 19 document types, supported by 1,365 institutions worldwide. To assess the year-wise distribution of fossil fuels research output, data is presented in Table 2. Between 1994 and 2024, a total of 13,436 publications were recorded globally. The peak output was in 2024 with 1,667 publications, followed by 1,491 in 2023, and 1,241 in 2022. Other notable years include 2021 (1,175), 2020 (976), 2019 (860), 2018 (780), 2017 (714), and 2016 (646). The lowest output was in 1989, with just 13 publications. Table 2 also includes the average citations per paper, which was 35.4 overall. The highest average was 89.49 for 383 papers in 2008, followed by 88.10 for 200 papers in 2005. The lowest average was 3.87 for 1,667 papers in 2024. Additionally, the highest number of global citations—37,699—was recorded in 2015 for 540 papers, followed by 34,274 in 2013 (383 papers), 33,479 in 2016 (646 papers), and 31,167 in 2017 (714 papers). Table 3 presents the growth pattern of fossil fuels research output, calculated using standard methods outlined in the study's methodology. The year-wise growth trend shows alternating increases and decreases, eventually rising steadily to 33.125 during 2015–2016. The moving average method, based on arithmetic mean, is used to smooth out fluctuations and reveal the overall trend. Unlike a single average, moving averages use overlapping time intervals, placing the average at the center of the time span to reflect the normal value. This method helps reduce short-term variations and simplifies analysis. However, if the moving average period doesn't align with the cycle length, cyclical fluctuations may not be fully eliminated due to their irregular duration. Therefore, selecting an appropriate period is essential for accurate results. Relative Growth Rate (RGR) measures the increase in the number of articles over a specific period, while Doubling Time (DT) indicates the time required for the output to double. Table 4 presents the year-wise research output, cumulative growth, RGR, and DT for fossil fuels research from 1989 to 2019. A total of 13,436 publications were recorded globally during the period. The highest number of publications was 1,667 in 2019, followed by 1,491 in 2018, 1,241 in 2017, 1,175 in 2016, and 976 in 2015. The trend continued with 860 in 2014, 780 in 2013, 714 in 2012, and 646 in 2011. The growth pattern and doubling time were calculated using standard methods. The mean RGR was 5.65, and the average doubling time was 98.69 years, indicating the rate at which fossil fuels research output doubled over the study period.

The formulas used are:

- Average Authors per Paper (AAPP) = Number of Authors / Number of Papers
- Productivity per Author = Number of Papers / Number of Authors

Table 5 presents data on author productivity and AAPP. The average number of authors per article during 1989–2019 is 3.74 for 13,436 papers. The highest AAPP is 4.31 in 2019 (7,194 authors for 1,667 papers), followed by 4.25 in 2018, 4.20 in 2017, 4.09 in 2016, and 3.95 in 2015. The average productivity per author over the period is 0.27. Notably, the years 1989 to 1992 recorded higher productivity rates of 0.48, 0.46, 0.47, and 0.44 respectively.

Table 6 presents the document-wise distribution of fossil fuels research publications from 1994 to 2024. Articles account for the majority at 74.4% (10,001 records), followed by Reviews at 16.1% (2,164), Article; Proceedings Papers

Kanagasundari et al.,

at 6.4% (859), and Editorial Materials at 1.2% (161). Document types such as Bibliography, Reprint, and Review; Retracted Publication have only one record each. In terms of global citations, Articles received the highest (260,235), followed by Reviews (180,442), Article; Proceedings Papers (27,290), and Editorial Materials (3,056). Rare document types had minimal citations, possibly due to limited referencing despite being accessed. The figure 1 shows that more than three fourth portions are covered by the document type Article, followed by review covering one fourth portion or area and the rest as documents of the other types. The analysis indicates that Lotka's Law is not applicable to author productivity in fossil fuels research, as publications are widely distributed among numerous authors. Masjuki HH leads with the highest global citations (3,447) from 34 publications, followed by Wang Y with 3,123 citations (24 publications) and Saidur R with 2,573 citations (24 publications). Among the top 25 authors, Masjuki HH also has the highest citation references (185), followed by Gustavsson L with 103 references (28 publications) and Kalam MA with 101 references (18 publications). Overall, only two authors have over 3,000 citations, one author exceeds 2,000, seven authors have over 1,000, and another seven have more than 500 citations, while the remaining authors follow. The Figure 2 shows the Author wise distribution of the publications. The X axis in the figure denotes the Name of the authors and the Y axis denotes the number of records. The figure clearly depicts the highest to lowest number of publications or rank wise published articles in author wise distribution of the publications. Table 8 highlights author-wise self-citations and H-index distribution. Gustavsson L recorded the highest number of self-citations (77 out of 204), followed by Masjuki HH with 69 out of 284, and Valero A with 62 out of 101, indicating strong and consistent research in their fields. In terms of H-index, Masjuki HH leads with a value of 24 from 54 publications. He is followed by Gustavsson L and Saidur R, both with an H-index of 20 from 28 and 24 publications respectively. Li Y and Dincer I have an H-index of 17, while Veziroglu TN and Kumar A have 16 and 15, respectively. Among the top 25 authors, Masjuki HH has 215 non-self-cited citations from 34 papers, followed by Saidur R with 138. Only one author, Masjuki HH, has over 200 self-cited papers, and two others exceed 100. Table 9 reveals a decline in the Co-Authorship Index (CAI) for single authors—from 35% in 1995 to 34% in 1996, 30% in 1997 and 1998, and 29% in 1999. Conversely, the CAI for multiple authors shows a steady increase, reaching 11% in 2024, indicating a growing trend of collaborative research in journal publications. Author productivity is typically measured by the number of papers contributed by individual authors in a specific field. This study examines the applicability of Lotka's Law to Fossil Fuels Research output. Table 10 presents the frequency distribution of author productivity based on Lotka's Law. An effort has been made to assess its relevance, and the values of 'n', 'C', and the critical value for the dataset are calculated and shown in Table 17.

$$n = \frac{N \sum XY - \sum X \sum Y}{N \sum X^2 - (\sum X)^2}$$

$$n = ((36 * 33.768) - (43.554 * 42.446)) / ((36 * 59.503 - (43.554^2)))$$

$$n = -2.58$$

$$c = \frac{1}{\sum_{i=1}^{p-1} \frac{1}{x^i} + 1 / ((n-1)(p^{n-1}) + 1/2 * p^n + n/24 * (p-1)^{n+1})}$$

$$C = (1 / ((0.005568 + 0.00022 + 0.000003)))$$

$$C = 172.68$$

In this context, p represents the number of observed or fixed values. According to Pao (1985), the residual error is not significant when p equals 20. Lotka's Law can be tested using the Kolmogorov-Smirnov (K-S) test, which evaluates the goodness of fit between observed and expected author productivity distributions. The maximum deviation (Dmax) is calculated based on these distributions, as shown in Table 12. The K-S test at the 5% significance level (0.565) shows a maximum deviation (Dmax) of 23%, which is slightly less than the critical value (C.V. = 23.269). Since Dmax < C.V., the results indicate that Lotka's Law is not applicable to the author productivity pattern in Fossil Fuels Research output. Out of 2272 journals contributing to 13,436 fossil fuel-related publications, the top five are:

- Renewable & Sustainable Energy Reviews ranks first with 734 articles (5.5%) and 45,685 global citations.
- Energy Policy is second with 134 articles (3.2%) and 14,953 citations.
- Energy ranks third with 336 articles (2.5%) and 12,255 citations.

**Kanagasundari et al.,**

- International Journal of Hydrogen Energy holds fourth with 335 articles (2.5%) and 13,786 citations.
- Applied Energy is fifth with 331 articles (2.5%) and 12,946 citations.

Ranking of Journals

Journals play a key role in disseminating current research and tracking knowledge growth. Table 14 tests Bradford's Law using ranked journal citations in descending order. The 2272 cited journals were divided into three zones to test the algebraic form of the law. Bradford's multiplier, calculated by dividing the number of journals in a zone by those in the preceding one, was used to analyse distribution. The dataset shows that 21 journals account for 4583 citations, 111 journals for 4517, and 1040 journals for 4336 citations—each zone contributing approximately one-third of total citations. Ideally, Bradford's law follows a geometric series ($1:n:n^2$), but the current ratio (21:111:1040) deviates, with $n = 5.29$. This results in an expected distribution of 21:111.09:587.67, yielding a 32.52% error. Since the deviation is significant, the data doesn't fully conform to Bradford's Law, though the relatively lower error suggests a partial fit. Therefore, Bradford's Law can be moderately applied to this dataset. Figure 4 illustrates the rise in Fossil Fuels research output in India and globally between 1994 and 2024. The Activity Index for India shows a significant increase starting around 2024 (violet line). The sky-blue line represents India's projected publication growth, while the yellow line shows global growth for comparison. The Activity Index equation is calculated as $Y = 44.92x - 285.1$, and the Karl Pearson correlation coefficient is 0.778, indicating a strong positive relationship.

CONCLUSION

The study reveals that no prior scientometric analysis has been conducted on fossil fuel research output. This research identifies 13,436 publications indexed in the Web of Science from 1994 to 2024, published across 2,272 journals by 36,553 authors from 8,217 institutions in 141 countries, accumulating 475,627 global citations. Bibliometric analysis proves to be a reliable method to assess scientific output. The findings highlight significant growth in fossil fuel research during the study period, with a core group of journals contributing prominently. Academics tend to publish in broad-scope, high-impact journals over niche ones. Journal distribution follows Bradford's Law of Scattering, while Lotka's Law shows a closer fit using the chi-square method than the maximum likelihood method. The high number of collaborative works indicates strong team-based research in this domain. Fossil fuels remain central to modern life, powering electricity, transportation, and more, despite their environmental and health drawbacks. The study provides valuable insights for future researchers, helping identify existing gaps and guiding further exploration to improve fossil fuel research productivity.

ABSTRACT

The quick growth of Internet of Things (IoT) sensor networks has changed several sectors by making it possible to collect and monitor data in real time. However, the fact that IoT devices have limited resources and need high-quality service (QoS) and strong security procedures makes it very hard to develop routing protocols. This literature study looks at energy-efficient and QoS-aware routing methods in IoT-based sensor networks in great detail. It looks at current trends, important design rules, and how to include strong security mechanisms to protect against attacks that change over time. The review talks about important trade-offs between security, network performance, and energy efficiency. It also talks about new ideas like machine learning-based optimisation, blockchain-based trust mechanisms, and cross-layer protocol designs. This study also finds holes in the research, like how to balance dynamic network scalability with strict QoS requirements and make sure encryption methods are energy-efficient. This review's goal is to help academics and practitioners create IoT sensor network solutions that are sustainable, safe, and high-performing by combining recent developments and pointing out future paths.

Keywords: Energy-efficient routing, QoS-aware protocols, IoT sensor networks, Routing protocols

INTRODUCTION

The Internet of Things (IoT) is a new way of doing things that lets linked objects talk to one other and share data in real time. Sensor networks based on the Internet of Things (IoT) are an important part of this ecosystem. They are used in many applications, such as smart cities, healthcare, environmental monitoring, industrial automation, and

**Kayalvizhi and Dheepak**

agriculture. Wireless sensor nodes are what these networks use to gather, process, and send data quickly. However, the limited battery life, computing power, and memory of these devices make it very hard to build routing protocols. To make sure that these networks run well and reliably over time, it is important to make sure that they use as little energy as possible, keep the Quality of Service (QoS), and include strong security measures. One of the most important issues in IoT sensor networks is energy efficiency because sensor nodes have limited energy resources. To keep the network running for longer, routing methods need to use less energy while yet sending data quickly. Clustering, data aggregation, and adaptive duty cycling are some of the most frequent ways to reach this goal. But these methods often come with trade-offs, such as higher latency or lower network throughput, therefore protocol design needs to be done carefully. Maintaining QoS is also important for IoT apps that need dependable and timely data transmission, in addition to being energy-efficient. Latency, packet delivery ratio, bandwidth utilisation, and fault tolerance are just a few of the factors that make up QoS. Routing protocols for IoT sensor networks need to find a balance between these factors so that they can function with a wide range of applications, from real-time healthcare monitoring to automating industrial processes. It gets harder to find this equilibrium in dynamic contexts when the network's layout and traffic patterns change often. Another important issue with IoT sensor networks is security. Because these networks are wireless and spread out, they are open to a number of assaults, including eavesdropping, data tampering, denial of service, and node compromise. To protect the integrity, confidentiality, and availability of data, it is important to add strong security features to routing protocols. But typical cryptographic approaches frequently require a lot of processing power, which isn't good for sensor nodes that don't have a lot of energy. Because of this, lightweight security solutions and trust-based methods are becoming more important in the design of IoT routing protocols. The goal of this literature study is to look into how energy efficiency, quality of service (QoS), and security all come together in IoT-based sensor network routing methods. By looking at current developments, it finds important patterns, problems, and trade-offs that come with establishing these kinds of protocols. The review also goes into new ideas, such as using machine learning and AI to improve dynamic routing, blockchain technology for safe communication, and cross-layer designs to make better use of resources. It also points out holes in current research, like the need for scalable protocols that can handle the differences across IoT devices and networks.

Background Study on Internet of Things Sensor Networks

The Internet of Things (IoT) is a game-changing idea that lets physical devices, networks, and digital systems work together without any problems. IoT sensor networks are an important part of this model. They are made up of sensor nodes that are connected to one other and gather, process, and send data about their surroundings. These networks are very important for many things, such as smart cities, healthcare, industrial automation, environmental monitoring, and precision agriculture. Researchers and innovators are very interested in IoT sensor networks since they are so different and have so many problems to solve.

Overview of IoT Sensor Networks

IoT sensor networks are made up of sensor nodes that are spread out and talk to each other wirelessly to gather and share data. These nodes have sensors, processing units, and communication modules that let them detect things like temperature, humidity, motion, and pressure in the environment. The data that was captured is either processed on the spot or sent to a central gateway for more analysis and decision-making. IoT sensor networks are usually set up in places where it's hard to get to the nodes physically, thus they need to be reliable and energy-efficient. These networks generally work in changing and resource-limited environments, where optimising communication protocols is essential for the network to run well over time.

Key Features of IoT Sensor Networks

- Heterogeneity: IoT sensor networks are generally made up of different devices that can do different things, such as process power, memory, and energy.
- Scalability: The networks need to be able to add new nodes and manage more data traffic as the number of devices grows.

**Kayalvizhi and Dheepak**

- **Dynamic Topology:** Nodes can join or leave the network, and their positions can alter because of movement or the environment.
- **Resource Constraints:** Sensor nodes often have short battery lives, poor processing power, and limited memory.
- **Data-Centric Operation:** The main purpose is to collect and send useful data, not to keep communication going between nodes all the time.

Background Study on Routing Protocols

The Internet of Things (IoT) has changed the way objects talk to and work with each other. It has made a network of connected systems that can be used for many things, like smart cities, healthcare, agriculture, and industrial automation. IoT sensor networks, which are a key part of this model, depend on efficient routing protocols to make sure that data is sent reliably between sensor nodes that don't have a lot of resources and destination points like gateways or cloud platforms. Routing protocols serve a key role in optimizing network performance, conserving energy, maintaining Quality of Service (QoS), and assuring security. This background study looks at the main ideas, types, problems, and progress that have been made in routing protocols for IoT sensor networks.

IoT Sensor Networks and Routing Protocols

IoT sensor networks have sensor nodes that are spread out across a large area and monitor environmental conditions. They send data over wireless communication channels. Most of the time, these nodes are limited by how long their batteries last, how much computing power they have, how much memory they have, and how far they can communicate. As a result, routing protocols are made to handle these limits in the best way possible while still making sure the network lasts and works well. Routing in IoT sensor networks is figuring out the best way for data packets to get from the source node to the destination. This procedure needs to find a balance between many goals, such as security, energy efficiency, scalability, and quality of service (QoS). IoT sensor networks generally work in changing conditions with limited resources, which means they need routing protocols that can adapt and are lightweight.

Classification of Routing Protocols**Based on Network Structure**

Routing protocols can be categorized based on the underlying network architecture:

- **Flat Routing Protocols:** All sensor nodes in the network do the same thing. Flooding and Gossiping are examples of protocols that fit into this group. These protocols are easy to use, but they often use a lot of energy and send the same data over and over again.
- **Hierarchical Routing Protocols:** Nodes are grouped into clusters, and cluster heads collect and send data. Many people utilise protocols like LEACH (Low-Energy Adaptive Clustering Hierarchy) and TEEN (Threshold-sensitive Energy Efficient Network). These protocols make communication less expensive, which saves energy.
- **Location-Based Routing Protocols:** These protocols decide how to route data based on where nodes are physically located. Some examples include GPSR (Greedy Perimeter Stateless Routing) and GAF (Geographic Adaptive Fidelity).

Based on Communication Model

Routing protocols can also be classified based on the data delivery model:

- **Proactive Protocols:** Keep routing tables with the most recent pathways for all nodes, such as DSDV (Destination-Sequenced Distance Vector). These protocols use a lot of energy yet keep latency low.
- **Reactive Protocols:** Find routes only when you need them, which saves energy. AODV (Ad hoc On-Demand Distance Vector) and DSR (Dynamic Source Routing) are two examples.
- **Hybrid protocols,** like ZRP (Zone Routing Protocol), use both proactive and reactive methods to find a balance between energy efficiency and latency.

**Kayalvizhi and Dheepak****Based on QoS Parameters**

Routing protocols in IoT sensor networks often consider QoS requirements such as latency, bandwidth, and packet delivery ratio:

- Protocols that are sensitive to delays: These are made for apps that need real-time data, such monitoring health.
- Energy-Aware Protocols: Try to keep the network running longer by using less energy.
- Load-Balanced Protocols: Evenly spread out traffic to avoid bottlenecks and lower the chance of node failure.

Based on Security Mechanisms

Secure routing methods include ways to keep data and nodes safe from possible assaults. These are protocols that use encryption, trust-based systems, and systems that look for unusual behaviour.

LITERATURE REVIEW

Matheen, M. A., and S. Sundar [16] looked into all of these kinds of methods. First, we learn about the basic structure of a multimedia sensor node, and then we learn about the features and uses of WMSNs. After that, we looked at a lot of different methods and put them into three groups. We have looked at several elements and separated them into three groups: Data Security, QoS Aware approaches, and Energy Aware ways. Karunkuzhali, D., B. Meenakshi, and Keerthi Lingam [17] added a routing method that takes Quality of Service (QoS) into account. During the data collection phase, the authors used Chaotic Bird Swarm Optimisation (CBSO) to build IoT sensor clusters and Improved Differential Search (IDS) to check the dependability of each sensor node. They then chose the most reliable node to be the Cluster Head (CH). We use lightweight signcryption to make IoT sensor data more secure throughout the data transfer phase. The authors also used an Optimal Data Routing (ODM) method to find the best ways to send data between source and destination nodes in the IoT network. Finally, we use NS2 to run network simulations to test how well our QoS-aware routing strategy works and compare it to other methods. This gives us useful information about how well it works and how well it fits smart city IoT applications. The major results of the study show that the suggested QoS-aware routing strategy (QOS-AWARE ROUTING) consistently beats conventional routing algorithms in terms of energy efficiency, network lifetime, and latency, no matter how many sensor nodes there are or how many cycles there are. Srinivasulu, M., G. Shivamurthy, and B. Venkataramana [18] The major goal of this study is to make the IoT more resilient by fixing problems with routing, energy optimisation, and other things to make the network last longer.

The authors of this study came up with a QoS-aware, energy-efficient multipath routing (QEMR) protocol that uses an IoT hybrid optimisation method. The first stage is to use a modified teaching-learning-based optimisation (MTLO) strategy to get the best clustering. Using the nonlinear regression-based pigeon optimisation (NR-PO) method, we find the cluster head (CH) next. The authors employed the Deep Kronecker Neural Network (DKNN) to find the best path and route. We use the NS-3 simulation tool to create a model of our suggested routing QEMR system and see how well it works. We compare the simulation results of the proposed QEMR system with those of the REER, Rumour, and EOMR strategies in terms of how node density, node speed, and network traffic affect them. Samadi, Raheleh, Amin Nazari, and Jochen Seitz [19] The Intelligent Energy-aware Routing Protocol in Mobile IoT Networks based on SDN (IERMioT) is a novel way to route that tries to deal with the changes in topology that happen as mobile nodes move around. This will make the network last longer and stop energy from being wasted. To do this, it groups nodes into clusters and utilises an intelligent evolutionary algorithm to figure out how many clusters the network needs and how to evenly spread them out in the changing environment. This method also looks at a way to cut down on the extra work that control packets and routing packets cause, which has a big impact on how much energy nodes use. Nazari, Amin, *et al*[20] suggested EQRSRL as a good way to route different kinds of IoMT apps. The goal of EQRSRL is to give IoMT traffic a good degree of Quality of Service (QoS). In order to reach this goal, it divides the network traffic into three groups and handles them differently based on their QoS needs. EQRSRL also splits the network into several zones to cut down on the number of messages that nodes have to send to each other. It uses a reinforcement learning approach to find the best pathways between the nodes by taking into account QoS and

**Kayalvizhi and Dheepak**

energy metrics. Dilek, Selma, *et al.* [21] Gave a full and current overview of how QoS is supported in IoT networks and communication technologies. This paper looks at the QoS-aware IoT architectures, layer-dependent QoS measurements, and network resource optimisation approaches used in IoT systems. We talk about the problems with the best available studies for efficiently delivering QoS measurements. The study ends with ideas for future research on how to provide end-to-end QoS in the Internet of Things. Siraj, Mohammad, Majid Altamimi, and Zeeshan Abbasi [22] supplied services that were aware of quality and a way for imbalanced IoT networks to work together. By looking at how devices move around, it can send huge amounts of data across established connections and reduce communication errors for a wide range of services. Also, the routes are made better by taking into account energy and resource limits. Mobile devices use lightweight processing algorithms to communicate with intelligence in dynamic networks, which makes them more reliable. Second, different performance indicators are used to check how strong the security is for new IoT apps. Gurram, Girija Vani, Noorullah C. Shariff, and Rajkumar L. Biradar [23] suggested the SEAMHR (Secure Energy-Aware Meta-Heuristic Routing) protocol for WSNs in order to make the network safer and work better. The suggested methodology starts by using Meta-Heuristic analysis based on MEHO (Mutation Elephant Herding Optimisation) to make learning safe and smart. The protocol learns how to route by looking at hop counts, connection integrity characteristics, and total residual energy. The protocol also uses the Counter Mode Cryptography approach, which uses AEs (Auto encoders) named CTR-AEDL to encrypt data and verify inter-routing to make the process even more secure. CTR-AEDL makes data transfers better and safer by creating keys from five important parts: secret keys, counter bits, data packets, classifier's weights, and biases. It makes four-factor unique patterns for counter blocks and cypher texts by doing softmax operations between data packets and counter blocks. Using the same key to decode the data packets gives you the real data packets. Traffic explorations also help keep links from failing and networks from disconnecting as part of route repair plans. Subramani, Neelakandan, *et al.* [24] Explained the Energy Aware Clustering and Multihop Routing Protocol with mobile sink (EACMRP-MS) method for WSNs that use IoT. The goal of the EACMRP-MS method is to lower the energy use of IoT sensor nodes in a way that makes the IoT system's network more efficient. The Tunicate Swarm Algorithm (TSA) is used at first by the suggested EACMRP-MS technique to choose the cluster head (CH) and put the clusters together. Also, the type-II fuzzy logic (T2FL) method is utilised to choose the best multi-hop routes, using a number of input factors to do so. Lastly, a mobile sink with a route modification method is shown to make the IoT system even more energy-efficient. This plan lets you change the routes based on the path of the mobile washbasin, which makes the system even more energy efficient.

Nagaraju, Regonda, *et al* [25] showed a safe routing strategy that optimises energy use for IoT applications in heterogeneous WSNs. The multipath link routing protocol (MLRP) is used in our plan to set up secure routing for IoT data that needs to stay private. This is done by using sensor nodes with different amounts of energy. The hybrid-based TEEN (H-TEEN) protocol, which also offers load balancing capabilities, improves the energy and network lifetime after secure routing has been set up. The ubiquitous data storage protocol (U-DSP) also makes the data storage capacity better. This routing protocol has been put into use and compared to two other routing protocols that already exist. It demonstrates better performance in terms of throughput, energy efficiency, end-to-end delay, network longevity, and data storage capacity. Mahamat, Michaël, Ghada Jaber, and Abdelmadjid Bouabdallah [26] suggested a way to sort recent solutions that cut down on energy use while keeping IoT networks safe. The authors think that context-aware security for IoT networks is a good way to keep IoT networks safe and use less energy at the same time. The authors also talk about new technologies and ideas, such artificial intelligence and Software-Defined Networking (SDN), and how they can be leveraged to make IoT security solutions that are stronger and consume less energy. Lastly, the authors gave a basic paradigm for creating energy-efficient IoT security solutions that strikes a solid balance between keeping IoT applications safe and using less energy. Yin, Huaying, Hongmei Yang, and Saeid Shahmoradi [27] To make WSNs safer, we suggest using an Energy-Aware Trust method based on the AODV protocol and the Multi-path Routing technique (EATMR). There are two primary parts to EATMR. The first part uses the Open-Source Development Model Algorithm (ODMA) to group the nodes into clusters. The second part uses clustering-based routing. This paper talks about how the routing process works using the AODV protocol and the multi-path routes method, taking into account trust that is mindful of energy. Here, the best and safest route is found by looking at different factors, such as energy, trust, hop count, and distance. In this case, we want to stress the

**Kayalvizhi and Dheepak**

importance of employing direct trust, indirect trust, and a multi-objective function to evaluate node trust. The simulation took place in MATLAB software while a Denial of Service (DoS) assault was going on.

Dutta, Ashit Kumar, *et al* [28] showed an Ensemble of Metaheuristic Optimisation based QoS Aware Clustering with Multihop Routing (EMO-QoSCMR) Protocol for IoT-assisted WSN. The suggested EMO-QoSCMR protocol intends to meet QoS goals including energy, throughput, latency, and lifetime. The suggested model has two steps: clustering and routing. Firstly, the EMO-QoSCMR protocol involves cross-entropy rain optimization algorithm based clustering (CEROAC) technique to select an optimal set of cluster heads (CH) and construct clusters. The oppositional chaos game optimisation based routing (OCGOR) method is also used to find the best set of routes in the IoT-assisted WSN. Dogra, Roopali, *et al* [29] offered an improved smart-energy-efficient routing protocol (ESEERP) method that fixes the problems listed above by making the network last longer and making its connection better. It chooses the Cluster Head (CH) based on an effective optimisation strategy that comes from a number of goals. It helps drowsy sensor nodes wake up and use less energy. A Sail Fish Optimizer (SFO) is used to find an appropriate route to the sink node for data transfer following CH selection. We did some math on the proposed method to see how it affects energy use, bandwidth, packet delivery ratio, and network longevity. We then compared the results to those of other methods that are currently in use, like Genetic Algorithm (GA), Ant Lion Optimisation (ALO), and Particle Swarm Optimisation (PSO). Sakib, Aan Nazmus, *et al* [30] This article suggested an energy-aware QoS MAC protocol called EQPD-MAC, which stands for "Prioritised Data and Multi-hop Routing." The EQPD-MAC protocol is a basic yet useful way to communicate between layers. It delivers packets with multiple priorities on time, employs an adjustable active time to cut down on idle listening, and has a strong routing system built in. Finally, we looked at how well the EQPD-MAC protocol worked and compared it to three other well-known QoS MAC systems.

Muneeswari, G., *et al* [31] suggested a new Trust and Energy Aware Routing Protocol (TEARP) for wireless sensor networks. It uses blockchain technology to keep track of the Sensor Nodes (SNs) and Aggregator Nodes (ANs) identities. The suggested TEARP method gives nodes a full trust value based on their direct trust values, and the filtering methods make the indirect trust values. Additionally, an improved threshold method is used to find the best clustering heads based on how the networks' trust levels and leftover energy evolve over time. Finally, a Sand Cat Swarm Optimisation Algorithm (SCSOA) should be used to route cluster heads in a safe way. Lakshmana, Kuruva, *et al* [32] developed an enhanced metaheuristic-driven energy-aware cluster-based routing (IMD-EACBR) strategy for IoT-assisted WSN. The goal of the proposed IMD-EACBR model is to get the most out of the network's energy and lifetime. To do this, the IMD-EACBR model mostly creates an improved Archimedes optimisation algorithm-based clustering (IAOAC) method for choosing cluster heads (CHs) and organising clusters. The IAOAC algorithm also calculates a suitable purpose that links several structures for energy efficiency, detachment, node degree, and distance between clusters. Also, the teaching-learning-based optimisation (TLBO) method is used to find the best routes to destinations using the multi-hop routing (TLBO-MHR) technique. The TLBO-MHR approach also creates a suitable purpose based on distance and energy parameters. There have been a number of tests on how well the IMD-EACBR model works. Li, Chaoqun, *et al* [33] suggested a new QoS-secure routing method called MCEAACO-QSRP, which stands for "multiobjective chaotic elite adaptive ant colony optimisation." A chaotic optimisation technique is used to start the population, which makes it more diverse and SPE and helps the algorithm get out of the local optimal. The adaptive optimisation technique also aims to change the algorithm trend on the fly, which speeds up the algorithm's convergence. We test how well the proposed method works in different situations.

Saleh, Alaa, *et al* [34] added a trust-aware routing mechanism (TARM) that uses an edge node with mobility to gather data from nodes that are working properly. The edge node uses a way of evaluating trust to separate the malfunctioning and unusual nodes from the typical ones. A modified grey wolf optimisation (GWO) is utilised in TARM to group the sensor nodes that have already been deployed into clusters. After the clusters are created, the trust values for each cluster are figured out. The edge node then starts getting data exclusively from nodes that are trusted through the cluster heads. The artificial bee colony optimisation algorithm finds the best way to get from the trusted nodes to the mobile edge node. Ahmad, Naveed, *et al* [35] focused on WBAN routing protocols. The biggest concerns with routing protocols are using too much energy, losing too much of the path, not delivering packets on

**Kayalvizhi and Dheepak**

time, and keeping the signal-to-noise ratio steady. HMS needs real-time analysis to help doctors, carers, and hospital systems support patients. Existing wireless communication systems send collected data to the access point for further processing and retransmission. This study suggests the use of an Improved Quality of Service aware Routing Protocol (IM-QRP) for WBAN-based HMS to keep an eye on elderly persons or patients with chronic illnesses in hospitals and homes. Han, Youjia, Huangshui Hu, and Yuxin Guo [36] proposed TAGA, an adaptive genetic algorithm-based routing protocol for wireless sensor networks that is both energy-aware and trust-based. It can not only protect against typical routing assaults and particular trust attacks, but it can also reduce the amount of energy consumed to send data. To do this, TAGA builds the nodes' full trust values based on their direct trust values, which take into account the volatility and adaptive penalty factors, and their indirect trust values, which are based on filtering processes. Also, a new threshold function is shown that takes into account the changing comprehensive trust values and residual energy of the nodes to choose the best cluster heads. Finally, a genetic algorithm with changing mutation and crossover probabilities is used to identify the most secure routing for the cluster heads. Verma, Vanita, and Vijay Kumar Jha [37] presented a Mutation-based Multi-Layer Perceptron (MUMLP), which uses energy- and security-aware optimum routing to send data safely and quickly. The Boltzmann Selection Probability-centric Gravitational Search Algorithm (BSP-GSA) is used to find the best Cluster Heads (CHs) for Data Aggregation (DA). After the network's nodes are set up, these things happen. After then, the non-cluster members are put together with a nearby CH to make a cluster. The CHs collect data from people who are not in a cluster, and the data they collect is encrypted using the Improved Elliptical Curve Cryptography (IECC) method to keep it safe.

Dass, Ruby, *et al* [38] suggested a novel cluster-based secure routing system termed the Secure Optimal Path-Routing (SOPR) protocol. This suggested approach makes WBANs safer by finding and stopping black-hole attacks on one side and sending data packets in encrypted form on the other side. Chiwariro, Ronald, and Thangadurai . N. [39] Gave a summary of new studies on multipath routing protocols and multi-channel media access methods that guarantee quality of service while dealing with multimedia data. The survey demonstrates that current routing systems still have problems when used with wireless multimedia sensor networks because of the type of traffic they handle and the limitations, needs, and features that come with them. Jalili Marandi, Shabnam, *et al.* [40] talked about routing strategies in WBANs that know about temperature. There are different types of routing protocols in WBANs, including thermal (temperature)-aware, QoS-aware, security-aware, cluster-based, cross-layered, postured-based, cost-effect, link-aware, and opportunistic ones. In a WBAN, a rise in temperature in implant nodes might hurt bodily tissues, which is bad for the patient. So, in this case, we looked at the algorithms that are shown in thermal (temperature)-aware protocols. This paper starts by talking about IoT-based WBANs, how they route data, and the problems they face. Then it goes into detail about thermal (temperature)-aware algorithms. Lastly, the pros and cons of these algorithms are shown. Velmurugadass, P., *et al* [41] suggested effective IoT authentication and energy-aware safe DT models for improving QoS and security while using less energy (EC) in WSNs. At first, the network randomly deploys the sensor nodes (SNs) and registers them with the base station (BS). Second, the Entropy-based Jaccard similarity induced fuzzy C-means clustering (EJS-FCM) model groups the SNs based on their inherent characteristics. Then, the enhanced grasshopper optimisation algorithm (BGOA) picks the best cluster heads (CHs) based on important fitness factors such communication distance, energy, and distance centroid. After that, an Adler-32 hashing-based authentication system checks the identity of each IoT node in the network to make DT safer.

Shahid, Misbah, *et al* [42] established the connection-Quality based Energy-Efficient routing (LQEER) protocol, which improves the reliability of connections by estimating the quality of the links. Also, LQEER uses energy and link information to create routes and a cost to choose the best nodes for sending packets, which lowers packet loss in the end. Because of this, it increases the packet delivery ratio and cuts down on latency. Kirubasri, G., *et al* [43] The major point of the research is to use the optimal forward node selection approach to find the most energy-efficient and reliable path for sending data. This work proposes a connection Quality based Energy and Trust Aware Routing Protocol (LQETA-RP) for WMSNs. Its goal is to choose the best forwarding node based on connection quality, energy, and trust. Link Quality Indicator, Received Signal Strength Indicator, Expected Transmission Count, and Trust Based Link Cost Function (TLCF) are examples of hardware and software-based link performance indicators used in LQETA-RP to find the most reliable and energy-efficient route. Pathak, Aditya, Irfan Al-Anbagi, and Howard

**Kayalvizhi and Dheepak**

J. Hamilton [44] proposed a Mult objective WSN optimisation problem and offer a novel technique called as lightweight secure routing (LSR) to manage WSNs that directly addresses the Mult objective WSN optimisation problem. To solve the Mult objective WSN optimisation problem, our LSR algorithm uses ant colony optimisation (ACO), an adaptive security model that takes into account both direct and indirect trust, an adaptive QoS model, a hybrid deployment model that uses 2-D Gaussian and uniform distributions, and an adaptive connectivity model that uses the right communicational radius to make sure that sensor nodes can connect to each other easily. Alateeq, Abdulla, *et al* [45] The goal of this study is to look at the most recent research on safe routing protocols in Wireless Sensor Networks (WSNs) and suggest a new method that can provide a higher level of security than the ones that are already in use. The security of routing protocols is one of the biggest problems with WSNs. A typical WSN has a lot of small, low-power, and low-cost sensor devices. These devices don't have a lot of resources, and they normally talk to each other in an ad hoc way using cheap short-range radios. Because of this, it's very hard to keep these networks secure, and there is a lot of room for research in this area.

Research GAP

The proliferation of Internet of Things (IoT)-enabled sensor networks has significantly transformed industries by offering real-time data collection and monitoring capabilities. Despite their wide range of applications, such as in smart cities, healthcare, and agriculture, IoT sensor networks face several critical challenges. The resource-constrained nature of IoT devices, which are limited by factors such as battery life, processing power, and memory, complicates the development of efficient routing protocols. Furthermore, the increasing demand for high-quality service (QoS) and secure data transmission exacerbates these challenges, requiring the integration of energy-efficient, QoS-aware, and secure routing mechanisms. Current research indicates a tension between optimizing energy consumption, maintaining network performance, and ensuring robust security. Techniques such as clustering, data aggregation, and adaptive duty cycling aim to improve energy efficiency, but often result in trade-offs like increased latency or reduced throughput. Similarly, QoS requirements, such as low latency, high reliability, and fault tolerance, must be balanced against the dynamic nature of IoT networks, where topology and traffic patterns are constantly changing. In addition, IoT sensor networks are susceptible to various security threats due to their wireless and distributed nature, necessitating the incorporation of lightweight security mechanisms that do not compromise energy efficiency. Although advancements in machine learning, blockchain, and cross-layer design have shown promise in addressing these issues, existing protocols often struggle to effectively balance energy efficiency, QoS, and security. Furthermore, there is a lack of scalable solutions that can adapt to the heterogeneity of IoT devices and accommodate the growing size of these networks. This research aims to address these gaps by exploring the design of routing protocols that seamlessly integrate energy-efficient, QoS-aware, and secure features to optimize IoT sensor networks, with a particular focus on ensuring network scalability, reliability, and robust security in dynamic environments.

Future Research Direction

- **Scalable and Adaptive Routing Protocols:** Future research should focus on developing scalable routing protocols that can efficiently handle the increasing number of IoT devices and the dynamic nature of these networks. These protocols should be able to adapt to changes in network topology, device mobility, and fluctuating traffic patterns while maintaining energy efficiency and QoS.
- **Energy-Efficient Security Mechanisms:** The integration of energy-efficient security mechanisms remains a critical challenge. Future studies should explore lightweight cryptographic techniques, such as homomorphic encryption or lightweight authentication protocols, that provide robust security without significantly impacting the energy consumption of resource-constrained sensor nodes. Additionally, the use of machine learning-based security solutions could offer more dynamic and adaptive security features.
- **Machine Learning and Artificial Intelligence for Routing Optimization:** Leveraging machine learning and artificial intelligence (AI) for dynamic routing optimization holds great potential. Future research can explore how AI algorithms can be used to predict traffic patterns, optimize routing paths, and make real-time decisions about

Kayalvizhi and Dheepak

energy consumption, network load balancing, and security threats. Reinforcement learning, in particular, could be used to develop protocols that learn and adapt based on network conditions.

- **Trust-Based Routing and Fault Tolerance:** As IoT sensor networks become more complex, the need for trust-based routing protocols that can identify and avoid malicious or faulty nodes becomes crucial. Future work could investigate the use of trust models that incorporate direct and indirect trust measures, and explore how these models can be integrated into routing protocols to improve fault tolerance and network resilience.

ABSTRACT

In the context of e-commerce product recommendation systems, effective feature selection is crucial for improving the accuracy of recommendations while reducing computational overhead. This study introduces a novel hybrid feature selection approach that integrates statistical, contextual, and optimization techniques to enhance recommendation performance. Initially, Term Frequency-Inverse Document Frequency (TF-IDF) is used to extract frequency-based features from product descriptions and user reviews, capturing the most relevant terms. To capture deeper contextual insights, Bidirectional Encoder Representations from Transformers (BERT) embeddings are utilized for vectorizing the text, enabling the model to understand nuanced relationships and sentiments. The features are then refined through the Chi-Square test to eliminate statistically insignificant terms, ensuring that only the most meaningful features are retained. Finally, Particle Swarm Optimization (PSO) is applied to optimize the feature selection process, identifying the most relevant and non-redundant features that contribute to more accurate and personalized product recommendations.

Keywords: Product Recommendations, Opinion Mining, Sentiment Analysis, Customer Reviews, Natural Language Processing (NLP), Deep Learning, Personalized Recommendations, E-Commerce, Aspect-Based Sentiment Analysis, Text Mining.

INTRODUCTION

In the realm of e-commerce, product recommendation systems are pivotal in enhancing the customer shopping experience by suggesting relevant products based on individual preferences [1]. With the growing volume of online transactions, the need for effective and efficient recommendation algorithms has become crucial. These systems rely on the ability to accurately understand and predict user preferences, often requiring robust feature extraction and selection methods to optimize their performance [2]. Feature extraction involves transforming raw data, such as product descriptions, customer reviews, and user interactions, into a set of relevant features that can be processed by machine learning algorithms [3]. In the context of product recommendations, this step entails identifying key patterns and attributes, such as product categories, user ratings, and purchase history, which help to characterize customer preferences and behavior. These features are used to represent the underlying interests of customers, providing a foundation for making personalized suggestions [4]. Once features are extracted, feature selection becomes critical. Feature selection identifies the most relevant and informative features for improving the recommendation model's accuracy and efficiency [5]. This process reduces overfitting, minimizes computational complexity, and ensures that the system focuses only on the most impactful data. For product recommendation systems, feature selection helps pinpoint the essential indicators of a customer's interests, such as preferences for specific product attributes or brand loyalty, while eliminating irrelevant or redundant data that could compromise the model's performance [6]. The combination of feature extraction and selection is fundamental in developing effective product recommendation models [7]. By identifying and utilizing the most relevant features, these systems can make better recommendations and deliver personalized shopping experiences [8]. Moreover, this approach allows models to handle large datasets, which is particularly important in e-commerce environments with millions of products and users [9]. Focusing on the most significant features ensures that recommendation systems can process data efficiently and accurately, enhancing their ability to predict customer needs. As the e-commerce landscape continues to evolve, advancements in feature extraction and selection techniques are vital [10]. This includes exploring new data sources, such as social media or browsing behaviors, leveraging deep learning models for automated feature extraction, and adapting to emerging trends in customer behavior to further improve the personalization of product recommendations.

Term Frequency-Inverse Document Frequency (TF-IDF) Technique

In the realm of e-commerce, the Term Frequency-Inverse Document Frequency (TF-IDF) [11] technique is widely used for feature extraction, particularly for processing textual data such as product descriptions, customer reviews, and search queries. TF-IDF is instrumental in transforming raw text data into numerical features, making it suitable for machine learning models [12]. It helps capture the significance of terms within a given document, ensuring that words with higher relevance are given more weight while minimizing the influence of overly frequent terms that are common across many products or reviews [13].

Term Frequency (TF)

Term Frequency measures the occurrence of a specific term within a document. In the context of is that terms appearing more often in a document are likely to be important for describing the product or user preference. Mathematically, TF is calculated as:

$$TF(t, d) = \frac{\text{Number of times term } t \text{ appears in the document } d}{\text{Total Number of terms in document } d}$$

For instance, if the term "laptop" appears 6 times in a product description of 200 words, the term frequency for "laptop" would be:

$$TF = \frac{6}{200} = 0.03$$

This frequency helps highlight the relevance of a product's core features, like "battery life" or "screen size," which are often mentioned in user reviews.

Gobinath and Prabakaran

Inverse Document Frequency (IDF)

Inverse Document Frequency measures the importance of a term across the entire corpus of documents [14]. In e-commerce, this relates to how often a word appears across all products or reviews in the dataset. Terms that appear frequently across many products, such as "quality," "price," or "service," have lower IDF values because they are considered less informative. Conversely, terms that appear in fewer products, such as specific product features or brand names, receive higher IDF values, emphasizing their relevance to particular products. IDF is computed as:

$$IDF(t, D) = \log\left(\frac{N}{df(t)}\right)$$

here N is the number of documents in the corpus, and $df(t)$ is the number of documents containing the term t . If a word appears in most of the documents in the corpus, its IDF value will be low (since $df(t)$ is large). Conversely, if the word appears in only a few documents, its IDF value will be higher.

TF-IDF Score

The TF-IDF score combines both Term Frequency and Inverse Document Frequency to evaluate the significance of a term within a document while accounting for its importance across the entire dataset [15]. This dual focus ensures that frequently occurring but generic terms are not overemphasized, and instead, more distinctive and product-specific terms are highlighted. The TF-IDF score is calculated as:

$$TF-IDF(t, d, D) = TF(t, d) \times IDF(t, D)$$

Where t is the term, d is the document and D is the entire corpus. This score helps capture the uniqueness of terms in product descriptions or customer reviews, making them more relevant for the recommendation system.

Why Use TF-IDF in E-Commerce Product Recommendations?

TF-IDF is particularly valuable for e-commerce product recommendation systems for several reasons:

- **Importance of Rare Terms:** By assigning higher weights to terms with high IDF values, TF-IDF highlights product features or attributes that are more specific and informative. For example, terms like "waterproof" in a product review or "wireless" in a product description are more important in distinguishing products compared to general words like "price" or "quality."
- **Reduction of Noise:** Common words like "and," "the," and "is" appear across most products and customer reviews but carry little meaning in identifying relevant products. TF-IDF reduces the influence of these common terms by assigning them low IDF scores, thus preventing them from cluttering the recommendation system's ability to focus on the more meaningful attributes.
- **Improved Text Representation:** TF-IDF transforms text into a numerical representation, enabling machine learning algorithms, such as decision trees, support vector machines, and neural networks, to classify and recommend products more accurately. This vectorized representation of product descriptions and reviews allows the system to effectively understand the relative importance of various features, leading to better product recommendations.
- **Scalability:** TF-IDF is computationally efficient, making it an ideal choice for processing large datasets typically found in e-commerce platforms. With millions of products and reviews, TF-IDF helps analyze vast amounts of unstructured text, such as product descriptions and customer feedback, at scale. It ensures that even with growing datasets, the recommendation system can maintain high accuracy without overwhelming computational resources.

Bert Embedding Technique

BERT (Bidirectional Encoder Representations from Transformers) [16] is a deep learning model developed by Google in 2018 that has significantly advanced the field of Natural Language Processing (NLP). BERT represents a breakthrough in how machine learning models understand and generate contextualized word representations. Unlike traditional models like Word2Vec or GloVe, which generate fixed embeddings for words, BERT creates dynamic word embeddings that change based on the surrounding context [17]. This makes BERT highly effective for a variety of NLP tasks, including sentiment analysis, question answering, and named entity recognition. In the context of e-commerce product recommendation systems, BERT's ability to understand the nuanced meaning of

**Gobinath and Prabakaran**

words in relation to their context is extremely beneficial for interpreting customer reviews, product descriptions, and search queries [18].

Key Components of BERT

BERT is based on the Transformer architecture, which uses self-attention mechanisms to model relationships between words in a sentence, regardless of their position [19]. The key components that make BERT powerful for NLP tasks in e-commerce product recommendations include:

- **Bidirectional Contextualization:** Unlike traditional models that process text in a left-to-right or right-to-left fashion, BERT processes text bidirectionally. This means it takes into account the full context surrounding each word, enabling it to better understand words based on both what comes before and after them. For example, the word "discount" in the phrase "I am looking for discounts on electronic gadgets" is interpreted differently from the phrase "The discount is only valid for a limited time." This allows BERT to capture the nuanced meaning of product descriptions and reviews, improving product recommendation accuracy.
- **Transformer Encoder:** BERT utilizes the encoder component of the Transformer architecture, which applies multiple layers of attention mechanisms to understand the context and relationships between tokens (words or subwords) in the input. These encoded features allow BERT to generate highly informative embeddings for each token, which can be used to understand user preferences and suggest relevant products.
- **Pre-training and Fine-tuning:** BERT is pre-trained on vast text corpora, including Wikipedia and BookCorpus, to understand general language patterns and relationships. After pre-training, BERT can be fine-tuned for specific tasks, such as product recommendation, by training it on a domain-specific dataset. Fine-tuning adjusts the pre-trained model to the particular context of e-commerce, allowing it to understand consumer preferences and behaviors more effectively.
- **Subword Tokenization:** BERT uses **Word Piece** tokenization to break down words into smaller subword units. This technique is particularly helpful in handling rare or out-of-vocabulary words, which are common in e-commerce when new products or brand names emerge. For example, the word "smartphone" might be broken down into "smart" and "##phone," allowing BERT to effectively handle a wide range of product-related terms, even if they haven't been seen during pre-training.

Working of BERT

BERT's ability to generate highly contextualized word embeddings makes it ideal for tasks like product recommendation, where understanding the nuances of user preferences and product attributes is crucial. Here is how BERT works for e-commerce applications:

- **Input Representation:** When a user submits a search query or a product review, BERT tokenizes the input into subword units. Each token is then mapped to an embedding vector. These embeddings consist of:
 - **Token Embeddings:** Represent the actual words or subwords in the text.
 - **Segment Embeddings:** Used to differentiate between different segments of text, such as distinguishing between the query and the product description.
 - **Position Embeddings:** Encode the position of each token in the sequence, which helps BERT maintain the order of words in a sentence.
- **Contextualized Embeddings:** BERT's Transformer layers process the token embeddings through a self-attention mechanism, allowing each token to be updated based on its relationships with all other tokens in the sentence. This bidirectional attention allows BERT to understand the context of each word fully. For instance, if a customer review mentions "durability" in relation to a "laptop," BERT understands that the word "durability" is specific to the laptop and not just a general comment.
- **Fine-Tuning:** Once BERT has been pre-trained on large datasets, it can be fine-tuned for specific tasks such as product recommendation. During fine-tuning, a task-specific layer is added to BERT's architecture. For example, in a product recommendation system, this layer could be trained to classify or predict the likelihood that a customer will purchase a given product based on their previous reviews, search queries, and preferences. Fine-tuning makes the model adaptable to the specific nuances of e-commerce data.

Gobinath and Prabakaran

- **Output:** After fine-tuning, BERT generates high-dimensional vectors (typically 768-dimensional for the base model) for each token in the input. These vectors encapsulate the contextual meaning of each word in relation to the entire sentence, which can then be used by the recommendation system to better understand customer preferences and make more personalized recommendations.

Chi-Square Feature Selection Technique

The Chi-Square (χ^2) test is a statistical method used to evaluate the independence of two categorical variables [20]. It is commonly used for feature selection in machine learning, particularly in classification tasks, where the goal is to identify the most relevant features for prediction based on their relationship with the target variable [21]. In the context of feature selection, the Chi-Square test assesses whether a particular feature (or attribute) is independent of the target variable [22]. If the feature and target are highly related, the Chi-Square score will be high, indicating that the feature should be retained. If the relationship is weak or absent, the feature is deemed irrelevant and can be discarded [23].

Key Concepts of Chi-Square Feature Selection

To understand how the Chi-Square feature selection method works, it's important to first grasp some fundamental statistical concepts:

Observed Frequencies (O)

These are the actual frequencies or counts of occurrences of different combinations of feature values and target classes in the dataset.

Expected Frequencies (E)

These are the expected frequencies under the assumption that the feature and the target are independent of each other. The expected frequency for a given cell in a contingency table is calculated as:

$$E = \frac{(\text{Row Total} \times \text{Column Total})}{\text{Grand Total}}$$

Chi-Square Statistic (χ^2)

The Chi-Square statistic is used to measure the deviation of the observed frequencies from the expected frequencies. It is calculated using the following formula: Where O is the observed frequency, and E is the expected frequency.

$$\chi^2 = \sum \frac{(O - E)^2}{E}$$

The summation is taken over all the cells in the contingency table. A high Chi-Square value indicates a large discrepancy between observed and expected values, suggesting that the feature is related to the target variable.

Degrees of Freedom (DF)

The degrees of freedom in a Chi-Square test are calculated as:

$$df = (C - 1)(R - 1)$$

where: C is the number of columns (possible values of the feature), R is the number of rows (possible values of the target variable).

p-value

Once the Chi-Square statistic is calculated, it is compared against a threshold value (usually 0.05) to determine whether the feature is statistically significant. The p-value is used to determine the significance of the Chi-Square statistic, and a smaller p-value indicates a stronger relationship between the feature and the target.

The Chi-Square Feature Selection Process

The process of applying the Chi-Square test for feature selection [24] can be broken down into the following steps:

Gobinath and Prabakaran

Create a Contingency Table

- The first step is to create a **contingency table** (cross-tabulation) for each feature against the target variable. The table summarizes the frequency distribution of the values of a feature with respect to the target classes.

Calculate Chi-Square Statistic

- For each feature, the observed and expected frequencies are computed based on the contingency table. Then, the Chi-Square statistic is calculated using the formula mentioned earlier.

Compute the p-value

- The Chi-Square statistic is compared with the critical value from the Chi-Square distribution table based on the degrees of freedom and significance level (typically $\alpha=0.05$ \alpha = 0.05 $\alpha=0.05$) to calculate the p-value.

Feature Ranking

- Features with a high Chi-Square statistic (indicating strong dependence with the target variable) are considered more relevant for the classification task. Features with low Chi-Square values are deemed less significant and can be discarded.

Select Top Features

- Features that have a p-value below the threshold (e.g., 0.05) are retained. The features are ranked based on their Chi-Square values, and the top features are selected for use in the model.

Particle Swarm Optimization

Particle Swarm Optimization (PSO) is a computational optimization technique inspired by the social behavior of birds flocking or fish schooling [25]. It was introduced by James Kennedy and Russell Eberhart in 1995 as a population-based, stochastic global optimization method. PSO is part of the family of swarm intelligence algorithms, which are based on the collective behavior of decentralized systems, and is primarily used for optimizing complex, multidimensional problems in various domains such as machine learning, robotics, engineering, and economics [26]. PSO is particularly well-suited for solving problems where the search space is large and poorly understood, making it a popular choice for continuous optimization tasks, feature selection, neural network training, and many others [27].

Key Concepts of Particle Swarm Optimization

The basic idea behind PSO is to simulate the social behavior of a swarm of particles that move through a multidimensional search space [28]. Each particle represents a potential solution to the optimization problem, and it moves by adjusting its position based on two main factors:

- The best solution found by the particle itself (personal best): Each particle has a memory of the best position it has encountered so far, which is referred to as its personal best position (pbest).
- The best solution found by the entire swarm (global best): The swarm as a whole also remembers the best position found by any particle, known as the global best position (gbest). The particles update their positions based on both their own experiences and the experiences of other particles in the swarm, allowing them to converge toward optimal solutions [29].

Mathematical Formulation of PSO

At each iteration of the PSO algorithm, the particles update their positions and velocities based on the following equations:

Velocity Update

The velocity of each particle is updated using a combination of three components:

$$v_i(t+1) = w \cdot v_i(t) + c_1 \cdot r_1 \cdot (pbest_i - x_i(t)) + c_2 \cdot r_2 \cdot (gbest - x_i(t))$$

Where $v_i(t)$ is the velocity of the particle i at time step t , $x_i(t)$ is the position of particle i at time step t , w is the inertia weight (controls the impact of the previous velocity), c_1 and c_2 are cognitive and social coefficients (determines the influence of personal and global bests), r_1 and r_2 are random numbers between 0 and 1, used to introduce randomness

Gobinath and Prabakaran

into the velocity update. Position Update: The position of each particle is then updated based on the updated velocity:

$$x_i(t+1) = x_i(t) + v_i(t+1)$$

Where $x_i(t+1)$ is the new position of particle i at time step $t+1$.

Key Parameters of PSO

- **Inertia Weight (w):** Controls the momentum of the particle and its exploration of the search space. A higher inertia weight encourages exploration, while a lower value encourages exploitation of the current best solutions.
- **Cognitive Coefficient (c_1):** Determines the attraction of the particle towards its own best position (personal best). This encourages the particle to exploit its own experiences.
- **Social Coefficient (c_2):** Determines the attraction of the particle towards the best position found by the entire swarm (global best). This encourages the particle to explore the global search space and share information with other particles.
- **Randomization (r_1, r_2):** The random factors are introduced to add stochastic elements to the movement of particles, allowing the swarm to explore the search space more effectively and avoid getting stuck in local optima.

PSO Algorithm Steps

- **Initialize Particles:** Randomly initialize the position and velocity of each particle within the problem's search space. Each particle has a personal best position and fitness value, and the best position found by the entire swarm is also initialized.
- **Evaluate Fitness:** For each particle, calculate the fitness value based on the problem's objective function. The fitness value determines how good the current solution is.
- **Update Personal Best (pbest):** If the current particle's fitness is better than its previous best, update its personal best position and fitness.
- **Update Global Best (gbest):** Identify the particle with the best fitness value among all particles in the swarm, and update the global best position and fitness.
- **Update Velocity and Position:** Using the velocity and position update equations, adjust the position and velocity of each particle based on its personal best and the global best position.
- **Termination Condition:** The algorithm continues iterating through the above steps until a termination condition is met. This condition could be a maximum number of iterations, a threshold fitness value, or convergence of the swarm.
- **Output the Best Solution:** Once the termination condition is met, the algorithm outputs the global best solution, which is considered the optimal or near-optimal solution.

Proposed Hybrid Feature Selection Approach (TF-IDF + Bert Embeddings + PSO Selection)

This methodology integrates TF-IDF, BERT embeddings, and PSO-based selection to enhance classification accuracy by selecting optimal features.

Step-by-Step Procedure

Feature Extraction Phase

- **Step 1.1: Extract TF-IDF Features**
 - Compute Term Frequency-Inverse Document Frequency (TF-IDF) values for all words in the dataset.
 - TF-IDF captures the importance of a term in a document relative to the entire corpus.
 - Use unigram, bigram, or trigram representations based on dataset requirements.
- **Step 1.2: Generate BERT Word Embeddings**
 - Use a pre-trained BERT (Bidirectional Encoder Representations from Transformers) model to extract contextualized word embeddings.

Gobinath and Prabakaran

- Utilize the [CLS] token representation from BERT for each sentence, as it captures a holistic sentence-level embedding.
- Ensure embeddings are of consistent dimensionality (e.g., 768-dim for BERT-base).
- **Step 1.3: Concatenate Features**
 - Combine TF-IDF vector representations with BERT embeddings to form a hybrid feature vector for each document.
 - Normalize or scale feature values to ensure compatibility between both representations.

Feature Selection Phase

- **Step 2.1: Apply Chi-Square Test for Initial Feature Filtering**
 - Compute the Chi-Square statistic for each feature to determine its statistical significance in relation to the class labels.
 - Select a subset of features based on a predefined p-value threshold (e.g., $p < 0.05$).
- **Step 2.2: Optimize Feature Selection Using PSO (Particle Swarm Optimization)**
 - Initialize a population of feature subsets (particles), each representing a selection of features.
 - Define fitness function: Use classification accuracy (or F1-score) of a machine learning model (e.g., SVM, Random Forest) as the fitness score.
 - **Iterate and update:**
 - Particles update their positions based on global best (gbest) and personal best (pbest) positions.
 - Balance between exploration (diversity) and exploitation (optimal selection).
 - Converge to an optimal feature subset with minimal redundancy and maximum relevance.

Classification and Evaluation Phase

- **Step 3.1: Train Machine Learning Classifiers**
 - Train classifiers such as SVM, Random Forest, or Deep Neural Networks using the optimized feature set.
- **Step 3.2: Evaluate Model Performance**
 - Measure accuracy, precision, recall, F1-score, and ROC-AUC to assess classification effectiveness.
 - Compare performance with baseline models (without feature selection) to validate improvement.

The proposed hybrid feature selection approach combines traditional statistical feature extraction, deep learning-based embeddings, and optimization-based selection techniques to enhance text classification performance. The methodology consists of three main stages: Feature Extraction, Feature Selection, and Feature Optimization. Feature Extraction: Initially, TF-IDF (Term Frequency-Inverse Document Frequency) is applied to represent textual data by capturing the importance of words within a document while reducing the impact of commonly occurring words. This statistical method generates a sparse matrix representing the frequency-based significance of terms. Next, BERT-based embeddings are extracted using the CLS token representation, which encodes contextual meaning from the entire input sequence. The BERT embeddings transform the text into dense numerical vectors that capture semantic relationships among words, unlike traditional frequency-based approaches. Feature Selection: Once the feature vectors are obtained, an initial filtering process is performed using the Chi-Square Test to identify statistically significant features that have a strong relationship with the target class. The Chi-Square method helps in removing irrelevant and less informative features, thereby reducing the feature space and computational cost. Feature Optimization Using PSO: After the preliminary selection, Particle Swarm Optimization (PSO) is employed to further refine the selected feature subset. PSO, a nature-inspired metaheuristic algorithm, optimizes feature selection by balancing exploration and exploitation. It initializes a population (swarm) of candidate solutions (particles), each representing a subset of features. These particles iteratively adjust their positions based on their own best performance and the best solution found by the swarm. The fitness function used in PSO evaluates feature subsets based on classification performance metrics, such as accuracy, precision, recall, and F1-score. This process reduces redundancy, enhances discriminative capability, and ensures that only the most relevant features are retained. Final Feature Set for Classification: The optimized feature subset obtained after PSO selection is then used as input for

**Gobinath and Prabakaran**

machine learning and deep learning classification models such as Support Vector Machine (SVM), Random Forest (RF), Naïve Bayes (NB), LSTM, BiLSTM, and BERT-based classifiers. The integration of TF-IDF, BERT embeddings, and PSO-driven selection ensures that both frequency-based and contextual features contribute effectively to classification, leading to improved model performance.

RESULT AND DISCUSSION

The performance of the Proposed The performance of the Proposed Hybrid Feature Selection (TF-IDF + BERT + PSO) (HFS) approach is evaluated with the other existing feature selection and feature extraction techniques like Chi-Square (CS), Mutual Information (MI), Principal Component Analysis (PCA), Genetic Algorithm (GA), and Particle Swarm Optimization (PSO) using Random Forest, Long-Short Term Memory (LSTM) and Bidirectional Encoder Representations from Transformers(BERT) classification models for the using the metrics like Classification Accuracy, Precision, Recall, F1-Score, AUC-ROC score, Miss Rate, and False Discovery Rate. Table 1 depicts the Classification Accuracy (in %) obtained by the Proposed Hybrid Feature Selection (HFS) and existing feature extraction, feature selection approach. CS technique yields classification accuracies ranging from 81.2% for RF to 83.1% for BERT, showing moderate performance across the models. The MI method shows slight improvements over Chi-Square, with classification accuracy ranging from 81.5% for RF to 83.5% for BERT. The PCA technique results in the lowest classification accuracies among the methods tested, ranging from 78.9% for RF to 81.2% for BERT. The GA demonstrates a significant improvement in classification accuracy, with 84.5% for RF, 86.5% for LSTM, and 87.3% for BERT, but it still falls short of the proposed HFS approach. The PSO method further improves performance, yielding 85.3% for RF, 87.2% for LSTM, and 88.1% for BERT. Finally, the Proposed HFS approach achieves the highest classification accuracy, with 89.7% for RF, 91.2% for LSTM, and 92% for BERT, indicating its superior effectiveness in feature selection and extraction across all models. Table 2 depicts the Precision (in %) obtained by the Proposed Hybrid Feature Selection (HFS) and existing feature extraction, feature selection approach.

The Chi-Square technique provides precision values ranging from 79.1% for RF to 82.3% for BERT, demonstrating moderate precision performance. The MI method slightly outperforms Chi-Square, with precision values from 80.3% for RF to 83% for BERT. The PCA technique shows the lowest precision across all methods, ranging from 77.2% for RF to 80.1% for BERT. GA technique provides a notable improvement in precision, with 83.4% for RF, 85.6% for LSTM, and 86.4% for BERT, but it still falls short of the proposed HFS approach. PSO method shows further improvements in precision, with 84.6% for RF, 86.4% for LSTM, and 87.3% for BERT. The Proposed HFS approach achieves the highest precision across all models, with 88.6% for RF, 90.3% for LSTM, and 91.5% for BERT, demonstrating its superior performance in enhancing precision in product recommendation tasks. Table 3 depicts the Recall (in %) obtained by the Proposed Hybrid Feature Selection (HFS) and existing feature extraction, feature selection approach. The Chi-Square technique yields recall values ranging from 78.6% for RF to 82.4% for BERT, showing moderate performance in terms of recall. MI method offers a slight improvement over Chi-Square, with recall values from 79.7% for RF to 83.3% for BERT. PCA technique shows the lowest recall performance across all methods, ranging from 76.1% for RF to 80.7% for BERT. GA shows a significant increase in recall, with 83.7% for RF, 85.4% for LSTM, and 86.7% for BERT, but it still does not match the performance of the proposed HFS approach. PSO method further improves recall, with 84.9% for RF, 86.3% for LSTM, and 87.5% for BERT. The Proposed HFS approach achieves the highest recall across all models, with 88.3% for RF, 90.4% for LSTM, and 91.5% for BERT, indicating its superior ability to identify relevant instances and improve model performance. Table 4 depicts the F1-Score(in %) obtained by the Proposed Hybrid Feature Selection (HFS) and existing feature extraction, feature selection approach. Chi-Square achieves F1-scores ranging from 78.8% for RF to 82.4% for BERT, demonstrating consistent but relatively lower performance in balancing precision and recall. MI shows slight improvements over Chi-Square, with F1-scores ranging from 80.0% for RF to 83.2% for BERT, indicating better performance in combining precision and recall. PCA produces the lowest F1-scores, ranging from 76.6% for RF to 80.4% for BERT, reflecting its limited effectiveness in maintaining a balance between precision and recall. GA yields a significant improvement in F1-score, achieving 83.5% for RF, 85.5% for LSTM, and 86.5% for BERT, although still not matching the performance

**Gobinath and Prabakaran**

of the proposed HFS approach. PSO further improves the F1-score, with values of 84.7% for RF, 86.3% for LSTM, and 87.4% for BERT, indicating its effectiveness in improving both precision and recall. The Proposed HFS approach consistently achieves the highest F1-scores, with 88.4% for RF, 90.3% for LSTM, and 91.5% for BERT, showcasing its superior performance in balancing precision and recall across all models. Table 5 depicts the AUC-ROC score(in %) obtained by the Proposed Hybrid Feature Selection (HFS) and existing feature extraction, feature selection approach. Chi-Square achieves AUC-ROC scores ranging from 0.83 for RF to 0.88 for BERT, indicating moderate performance in distinguishing between relevant and non-relevant product recommendations. MI shows slightly improved AUC-ROC scores, ranging from 0.84 for RF to 0.89 for BERT, providing better classification ability compared to Chi-Square. PCA delivers the lowest AUC-ROC scores, ranging from 0.8 for RF to 0.86 for BERT, showing limited ability in identifying the true positive rates. GA demonstrates a significant improvement in AUC-ROC scores, with 0.89 for RF, 0.92 for LSTM, and 0.94 for BERT, but still falls short when compared to the proposed HFS approach. PSO shows further gains in AUC-ROC scores, with 0.9 for RF, 0.93 for LSTM, and 0.95 for BERT, reflecting its increased effectiveness in improving classification performance. The Proposed HFS approach consistently achieves the highest AUC-ROC scores, with 0.95 for RF, 0.97 for LSTM, and 0.98 for BERT, demonstrating its superior performance in distinguishing relevant products from irrelevant ones.

CONCLUSION

The proposed Hybrid Feature Selection (HFS) Approach for e-commerce product recommendation systems represents a significant advancement in enhancing recommendation accuracy and system performance. By integrating multiple feature selection methods—including filter, wrapper, embedded, and hybrid techniques—the HFS approach ensures that only the most relevant and non-redundant features are selected, ultimately leading to more personalized and context-aware product suggestions. This comprehensive approach addresses key challenges in e-commerce, such as handling large datasets with complex and diverse features, improving computational efficiency, and reducing the risk of overfitting. The use of advanced techniques like Term Frequency-Inverse Document Frequency (TF-IDF) and BERT embeddings further enhances the capability of the HFS approach by effectively capturing the importance of product-related terms and understanding the contextual meaning of user preferences. As a result, the system is better equipped to interpret user reviews, product descriptions, and search queries, providing more accurate and tailored recommendations. By leveraging a combination of statistical, machine learning, and deep learning techniques, the HFS approach offers a robust solution for e-commerce platforms, ensuring that the recommendation system not only performs efficiently but also delivers recommendations that align with the users' specific needs and interests. In doing so, it enhances user satisfaction, promotes higher engagement, and drives better sales outcomes for e-commerce businesses.

ABSTRACT

Mobile Ad Hoc Networks (MANETs) are dynamic, decentralised wireless networks that facilitate communication between nodes without dependence on permanent infrastructure. Although MANETs offer flexibility and scalability, they are susceptible to numerous security vulnerabilities, including black hole attacks. In a black hole attack, malicious nodes mislead the network by advertising false optimal routes, allowing them to intercept and discard data packets, leading to data loss and network performance degradation. This paper proposes a novel Collaborative Trust Model (CTM) for the detection and mitigation of black hole attacks in MANETs. The model dynamically computes trust thresholds using Particle Swarm Optimization (PSO), allowing for efficient identification of malicious nodes. Through collaboration among network nodes, the CTM enhances the robustness and reliability of MANETs by providing an adaptive, trust-based approach to detecting and isolating black hole attackers. The simulation results illustrate the efficacy of the suggested methodology in enhancing network performance and security.

Keywords: Mobile Ad Hoc Network (MANET), Denial of Service Attacks, Black Hole Attack, Optimization Algorithm, Malicious Node

INTRODUCTION

Mobile Ad Hoc Networks (MANETs) are wireless, decentralized networks that enable devices (or nodes) to communicate with each other without relying on a fixed infrastructure, such as routers or base stations [1] [2]. The key characteristic of MANETs is their ability to form networks on-the-fly, making them highly flexible and scalable for a wide range of applications, including military communications, emergency response systems, and personal area networks. However, this decentralized nature, coupled with the mobility of nodes, introduces significant challenges in ensuring the security, reliability, and efficiency of communication within the network [3]. One of the primary security threats to MANETs is the black hole attack [4]. In this type of attack, a malicious node deliberately advertises itself as having the shortest or most optimal route to a destination node, while actually intending to intercept and drop the packets that pass through it. This can lead to a significant degradation of network performance, as data packets are lost, and communication between legitimate nodes is disrupted [5]. Moreover, detecting and mitigating black hole attacks is especially challenging in MANETs due to their highly dynamic topology, where nodes frequently join, leave, or move within the network [6]. Given the gravity of the problem, several approaches have been proposed to defend against black hole attacks in MANETs [7]. However, many of these solutions fail to provide effective and real-time detection, especially as the network scales in size and complexity. In addition, traditional approaches often rely on static trust models or simplistic detection techniques that fail to adapt to changing network conditions and the dynamic behaviors of malicious nodes [8]. Thus, there is a pressing need for more advanced, adaptable, and collaborative solutions that can effectively identify black hole attackers and mitigate their impact on the network [9] [10]. In this paper, we propose an innovative solution to address the black hole attack problem in MANETs through a Collaborative Trust Model (CTM) that dynamically adjusts trust thresholds using Particle Swarm Optimization (PSO). The primary goal of our model is to enhance the detection and isolation of black hole nodes by enabling nodes to collaboratively share and evaluate trust information. By employing PSO, the model can adaptively compute optimal trust thresholds, which allows for the identification of malicious nodes with greater accuracy and responsiveness. This dynamic and collaborative approach to trust management is key to mitigating the adverse effects of black hole attacks in real-time and ensuring the robustness of communication within the network. By introducing an adaptive and collaborative trust-based solution, this work aims to contribute to the development of more secure and efficient MANETs, especially in environments where security threats like black hole attacks are a persistent concern.

Background Study on Collaborative Trust Model

The Collaborative Trust Model (CTM) is designed to mitigate the impact of black hole attacks in Mobile Ad Hoc Networks (MANETs) by leveraging dynamic trust management and collaborative information sharing among network nodes [11]. In a MANET, nodes are typically mobile, decentralized, and have limited resources (such as energy and bandwidth). This makes it difficult to use traditional security mechanisms such as centralized monitoring and control. The CTM addresses these challenges by enabling nodes to evaluate and share trust information in a distributed manner, allowing for the detection and isolation of malicious nodes like black holes [12]. A black hole attack occurs when a malicious node in a MANET advertises itself as having the shortest or best route to the destination node, despite being a harmful entity. Once it attracts the data packets from neighboring nodes, it either drops or misroutes them, leading to loss of communication and network congestion. The deceptive nature of black hole attacks makes them difficult to detect, especially in dynamic environments where nodes frequently join and leave the network [13]. In the context of MANETs, "trust" refers to the reliability or reputation of a node in carrying out its intended functions, particularly in forwarding data packets. Trust models in MANETs aim to establish a basis for decision-making, helping nodes distinguish between trustworthy and untrustworthy entities [14]. Trust can be computed based on various factors, such as the history of node behavior (i.e., whether it successfully forwards packets or drops them), its reliability in routing, or the perceived stability of the routes it offers. Traditional trust models may rely on either static or fixed trust thresholds, but these may fail to adapt to changing conditions, especially in the presence of sophisticated attacks like black holes. The Collaborative Trust Model (CTM) proposed here adapts dynamically to real-time conditions by adjusting trust thresholds based on the behavior of network

**Saratha and Shanmuga Sundaram**

nodes [15]. The collaborative aspect of CTM refers to the process by which nodes share their trust information with neighboring nodes in the network. Instead of relying on isolated, individual trust evaluations, nodes collaborate by exchanging feedback and observations about each other's performance in packet forwarding. This collective sharing of information allows the network to collectively identify malicious behavior and build a more comprehensive understanding of each node's trustworthiness [16]. Nodes in the network periodically communicate their trust assessments to their neighbors, which helps in refining their own evaluations and improving the overall reliability of the network's routing decisions. This collaboration helps counter black hole attacks, as it becomes harder for a malicious node to maintain the illusion of a trustworthy node when other nodes in the network are actively sharing and updating trust information [17]. To address the challenge of adapting trust thresholds in real time, the CTM uses Particle Swarm Optimization (PSO) to dynamically compute optimal trust levels. PSO is a bio-inspired optimization technique that mimics the social behavior of birds flocking or fish schooling. In this context, PSO is used to find the optimal threshold for trust evaluation, balancing sensitivity to detecting black hole attacks while avoiding false positives. PSO works by iteratively refining the trust threshold based on the behavior of nodes and their interactions within the network. Each node (or particle) in the PSO algorithm represents a potential solution (in this case, a trust threshold), and the swarm of particles collaborates to find the optimal threshold for detecting black hole attacks. The fitness function of PSO assesses the threshold's efficacy in identifying malicious nodes while ensuring effective communication within the network. As the PSO algorithm converges, the trust threshold becomes more accurate and adaptive to the ever-changing conditions in the MANET.

Once the trust thresholds are computed and updated dynamically using PSO, the CTM uses these thresholds to evaluate the trustworthiness of the nodes. If a node's trust score falls below a certain threshold, it is flagged as potentially malicious. In the case of a black hole attack, the malicious node would be detected due to its failure to forward packets and its consistent presence in the route advertisements, which is an indication that it is dropping or misdirecting data packets. The detection process is enhanced through collaboration between nodes. Each node can cross-check its observations with others, and this collective intelligence helps reduce the chances of misidentifying a non-malicious node as a black hole. This collaborative approach makes the detection of black hole attacks more robust and accurate, as it considers the behavior of the entire network rather than relying solely on individual node observations. Once a black hole node is detected, the CTM facilitates its isolation from the network. This can be done by updating the trust information shared among the nodes, excluding the malicious node from the routing tables, and rerouting traffic through alternative, trusted paths. The collaboration between nodes ensures that once an attack is detected, the entire network can quickly adapt and bypass the malicious node, restoring normal communication without relying on centralized control. The dynamic nature of the CTM ensures that the network continues to operate efficiently, even as nodes join, leave, or move within the network. As the network topology changes, the model continuously recalculates trust thresholds using PSO, ensuring that the detection and mitigation processes remain effective and up-to-date.

Particle Swarm Optimization (PSO)

Particle Swarm Optimization (PSO) is a powerful optimization technique inspired by the social behavior observed in nature, such as the flocking of birds, schooling of fish, and the foraging behavior of insects. Introduced by James Kennedy and Russell Eberhart in 1995, PSO is a population-based, metaheuristic optimization algorithm [18]. It belongs to the class of evolutionary algorithms (EAs) and is widely used for solving complex optimization problems, including those where traditional optimization methods may struggle due to nonlinearity, high dimensionality, or multiple optima [19]. In Particle Swarm Optimisation (PSO), a population of potential solutions, known as particles, traverses the search space to identify the global optimum. Each particle modifies its position and velocity according to its individual experience and the experiences of its neighbours or the entire swarm. The objective is to enhance the solutions by analysing both the behaviour of individual particles and the collective dynamics of the swarm [20].

Particles and Swarm

- In Particle Swarm Optimisation (PSO), the answer to a problem is depicted as a particle. Each particle constitutes a point within the search space and signifies a potential solution to the optimisation problem.

Saratha and Shanmuga Sundaram

- A swarm is a group of particles, and they collectively search the problem space to find the best solution. Each particle possesses a position (indicative of a candidate solution) and a velocity (dictating the particle's movement within the search space).

Position and Velocity

- Each particle has a position in the search space, represented as a vector, which corresponds to a potential solution.
- The velocity determines the rate and direction of movement of a particle. The velocity is also a vector, and it is used to update the position of the particle during the optimization process.

Personal Best (pbest):

- Each particle maintains a record of its personal best position (pbest), which is the position where the particle achieved its best fitness value (objective function evaluation).
- The personal best represents the best solution that a particle has encountered up to that point in time.

Global Best (gbest):

- The global best position (gbest) is the best solution found by any particle in the entire swarm. This value is shared across the swarm and represents the collective knowledge of the particles about the optimal solution.

Fitness Function

- The fitness function (objective function) evaluates the quality of a particle's position. A superior answer correlates with an enhanced fitness value.
- Each particle evaluates its position using this fitness function and compares it with the particle's personal best and the global best.

Basic Working Principle of PSO

The PSO algorithm mimics the social behavior of birds or fish looking for food. Each particle symbolises a bird or fish within the swarm, navigating the search space to identify the ideal solution. The particle mobility is influenced by two factors:

- **Cognitive component:** The particle's previous best position (personal best).
- The optimal position identified by any particle inside the swarm on a global scale.

Throughout the optimisation process, the position of each particle is iteratively updated with the following equations: Equation for Position Update:

$$\mathbf{x}_i(t+1) = \mathbf{x}_i(t) + \mathbf{v}_i(t+1)$$

Where $\mathbf{x}_i(t)$ is the position of particle i at time step t . $\mathbf{v}_i(t+1)$ is the velocity of particle i at time step $t+1$.

Velocity Update Equation:

$$\mathbf{v}_i(t+1) = w \cdot \mathbf{v}_i(t) + c_1 \cdot r_1 \cdot (\mathbf{pbest}_i - \mathbf{x}_i(t)) + c_2 \cdot r_2 \cdot (\mathbf{gbest} - \mathbf{x}_i(t))$$

Where $\mathbf{v}_i(t)$ denotes the velocity of particle i at time step t , and w represents the inertia weight, which regulates the influence of prior velocities on the particle's current velocity. c_1 and c_2 are cognitive and social scaling variables, respectively, that dictate the impact of the personal best and the global best on the particle's trajectory. r_1 and r_2 are random numbers between 0 and 1, introducing stochasticity into the algorithm and ensuring diversity in the particle's search. $\mathbf{pbest}_i$ is the personal best position of particle i . $\mathbf{gbest}$ is the global best position found by the swarm.

Steps in the PSO Algorithm

The basic steps of the PSO algorithm are as follows:

**Initialization**

- Randomly initialise a swarm of particles within the search space. Assign random velocities to each particle.
- Set each particle's personal best (pbest) to its initial position.
- Establish the global best (gbest) as the optimal place identified by any particle inside the swarm..

Iterative Updates:

- For each iteration:
 1. Assess the efficacy of each particle at its present location..
 2. If a particle's fitness is better than its personal best (pbest), update its personal best.
 3. If a particle's fitness surpasses the global best (gbest), update the global best..
 4. Update the particle's velocity based on the position of its personal best and the global best using the velocity update equation.
 5. Revise the particle's location via the position update equation..

Termination

- The algorithm terminates when a stopping criterion is met, which can be based on a maximum number of iterations or a satisfactory fitness value.
- The global best (gbest) at termination represents the optimal solution identified by the swarm..

Proposed Optimization Based Collaborative Trust Model**Step 1: Network Initialization**

- **Step 1.1: Establish the MANET:** Configure a network of mobile nodes capable of wireless communication among themselves without reliance on fixed infrastructure. Each node in the network acts as both a router and a host, meaning they can send, receive, and forward data packets.
- **Step 1.2: Define Initial Parameters:** Initialize the trust metrics that will be used to evaluate the behavior of nodes, such as how well they forward packets and how consistent they are in providing routing information. Set up the parameters for the Particle Swarm Optimization (PSO) algorithm, including the number of particles (possible solutions), their movement speed, and how they will explore potential solutions.

Step 2: Trust Calculation

- **Step 2.1: Direct Trust Calculation:** Each node observes its neighbors' behavior by checking how reliably they forward data packets and how consistently they provide routing information. Consequent to these observations, the node computes a direct trust value for each of its neighbours.
- **Step 2.2: Indirect Trust Calculation:** Nodes also collect feedback from other nodes about the trustworthiness of their neighbors. This helps them form a more comprehensive view. The indirect trust is calculated by averaging the feedback received from other nodes about a particular neighbor.
- **Step 2.3: Aggregated Trust Computation:** The node amalgamates direct trust, derived from its own observations, and indirect trust, obtained from feedback, to compute an overall or aggregate trust value for each neighbour. This aggregate trust helps the node decide whether a neighbor is trustworthy or potentially malicious.

Step 3: PSO-Based Dynamic Trust Threshold Optimization

- **Step 3.1: Initialise the PSO Population:** In the PSO algorithm, each particle signifies a potential trust threshold, which serves as a criterion for determining the trustworthiness of a node.. Particles are randomly assigned initial positions (trust thresholds) and are ready to explore the search space to find the best possible threshold.
- **Step 3.2: Evaluate Fitness Function:** Each particle's position (trust threshold) is evaluated to see how well it distinguishes between trustworthy and malicious nodes. The PSO algorithm seeks to identify a trust threshold that reduces erroneous decisions (false positives and false negatives) while enhancing the accuracy of black hole detection.
- **Step 3.3: Update Particle Positions and Velocities:** As the PSO algorithm iterates, each particle updates its position (trust threshold) based on its previous best position and the best position found by the swarm. This process

**Saratha and Shanmuga Sundaram**

continues until the algorithm finds the optimal trust threshold for each node, which balances the need for accurate detection with minimizing mistakes.

- **Step 3.4: Convergence check:** The PSO process is repeated until the algorithm converges, meaning it finds an optimal or sufficiently good trust threshold for each node. The best threshold found during this process is selected for use in detecting black hole attacks.

Step 4: Trust Threshold Application and Black Hole Detection

- **Step 4.1: Apply Optimized Trust Threshold:** Once the optimal trust threshold is determined, each node applies it to the aggregate trust values of its neighbors. If a neighbor's trust value falls below this threshold, the node flags that neighbor as suspicious.
- **Step 4.2: Collaborative Trust Sharing:** Nodes share their trust assessments and optimized thresholds with their neighbors, helping the entire network maintain an updated view of trustworthiness. This collaborative sharing allows nodes to refine their trust calculations based on new information from the network.
- **Step 4.3: Black Hole Detection:** Nodes that are consistently flagged as suspicious (falling below the trust threshold) are monitored more closely. If these nodes continue to exhibit malicious behavior, such as dropping packets, they are identified as black holes. The network then takes action to isolate these black hole nodes, preventing them from participating in routing or data forwarding.

RESULT AND DISCUSSION

This section evaluates the performance of the Proposed OCT Model against known optimisation strategies, including Genetic Algorithm (GA), Artificial Bee Colony (ABC), and Ant Colony Optimisation (ACO), for detecting black hole nodes in the network. The evaluation metrics like Packet Loss (in %), Packet Delivery Ratio (in %), End-to-End Delay (in %), Average Energy Consumption (in Joules), Throughput (in mbps) with varying number of nodes for 10% and 15% of the Black Hole Nodes in the network.

Performance analysis with 10% Black Hole Nodes in the Network

Table 1 depicts the Packet Loss (in %) obtained by the Proposed OCT Model, GA, ABC and ACO with 10% of Black Hole Nodes in the network. Table 2 depicts the Packet Delivery Ratio (in %) obtained by the Proposed OCT Model, GA, ABC and ACO with 10% of Black Hole Nodes in the network. Table 3 depicts the Average Energy Consumption (in Joules) obtained by the Proposed OCT Model, GA, ABC and ACO with 10% of Black Hole Nodes in the network. Table 4 depicts the End-to-End Delay (in %) obtained by the Proposed OCT Model, GA, ABC and ACO with 10% of Black Hole Nodes in the network. Table 5 depicts the Throughput (in mbps) obtained by the Proposed OCT Model, GA, ABC and ACO with 10% of Black Hole Nodes in the network.

Performance analysis with 15% Black Hole Nodes in the Network

Table 6 depicts the Packet Loss (in %) obtained by the Proposed OCT Model, GA, ABC and ACO with 15% of Black Hole Nodes in the network. Table 7 depicts the Packet Delivery Ratio (in %) obtained by the Proposed OCT Model, GA, ABC and ACO with 15% of Black Hole Nodes in the network. Table 8 depicts the Average Energy Consumption (in Joules) obtained by the Proposed OCT Model, GA, ABC and ACO with 15% of Black Hole Nodes in the network. Table 9 depicts the End-to-End Delay (in %) obtained by the Proposed OCT Model, GA, ABC and ACO with 15% of Black Hole Nodes in the network. Table 10 depicts the Throughput (in mbps) obtained by the Proposed OCT Model, GA, ABC and ACO with 15% of Black Hole Nodes in the network.

Summary

The proposed methodology for detecting black hole attacks in Mobile Ad Hoc Networks (MANETs) leverages a Collaborative Trust Model with a Dynamic Trust Threshold optimized using Particle Swarm Optimization (PSO). By dynamically adapting the trust threshold based on real-time network conditions, the methodology provides an effective and scalable solution for enhancing network security in the face of malicious attacks. The combination of

direct and indirect trust evaluations ensures a comprehensive assessment of node behavior, while the collaborative sharing of trust values across nodes enhances the accuracy of detection. The incorporation of PSO for threshold optimization not only adapts to the dynamic and decentralized nature of MANETs but also minimizes false positives and false negatives, leading to more reliable detection of black hole attacks.

ABSTRACT

The drastic development of cloud computing (CC) has resulted in a large amount of energy utilization and carbon emission from several servers. Task scheduling plays a vital role in the CC environment which aims to allocate the task requests of the users to the servers. The process of reducing energy utilization with the assurance of client QoS needs is essential in accomplishing enhanced profit for the cloud service providers and ensuring the user's service level agreement (SLA). Besides, the cloud data centre needs to fulfill the distinct condition of utilizing cloud resources with the consideration of the needs of multiple clients. The task scheduling problem can be considered as an NP hard problem and can be resolved by the use of metaheuristic optimization algorithms. In this aspect, this paper presents a chaotic pigeon inspired algorithm with dragonfly algorithm-based task scheduling (CPIADA-TS) technique for CC environment. The proposed CPIADA-TS technique aims to allot resources based on the requirement of many users in an effectual way. The CPIA technique is initially derived by integrating the concepts of chaotic maps to the PIA technique to improve its performance. Moreover, for enhancing the searching possibility and remove the local optima issue, the CPIA technique undergoes hybridization with the DA. A brief simulation analysis takes place and the experimental outcomes ensured the goodness of the CPIADA-TS technique.

Keywords: Task scheduling, Load balancing, Cloud computing, Metaheuristics, Hybrid algorithms

INTRODUCTION

Cloud computing has gained more interest in several communities for its reliability, cost-cutting solutions, accessibility, and scalability [1]. The importance of CC creates the resource available around the Internet [2]. Hence, various scientific organizations and businesses have adopted cloud for commercial benefit [3]. The CC provides QoS guaranteed, customized, and scalable computing environment for the user with pervasive and easy access [4]. The

**Karthikeyan**

users should utilize the cloud without creating administering the network, databases, and systems or cost of maintaining or investing in computing resources. Hence, the cloud user pays only for the computing services and resources they have utilized. This advantage makes CC a compelling model for computing service requirements for the user [5]. Furthermore, the huge resources provided and the flexibility related to the size variation of the Cloud brought major advantages. But it brought novel problems, where resources allocation and task scheduling are key challenges. The virtualization technologies and wide placement and usage of cloud lead to the development of large-scale data centers which provide cloud service. This could lead to a significant rise in the number of energies expended. For providing service, cloud provider deploys a number of servers in their data centres that result in bulk usage of energy and increase the levels of carbon footprint in the environment [6, 7]. As United States data centres use up around 91 billion kWh of energy by 2013 and it is estimated to rise around 140 billion kWh in 2020 based on natural resource defense council report. Hence, efforts have been taken for reducing carbon emission and power usage by effective management and resource utilization. Therefore, the present study on cloud is how to schedule tasks for resources utilization could be maximized and simultaneously, the power usage is also minimized. But, it is essential to notice that high resource utilization might create high power usage. Thus, task scheduling needs to be executed so that there should be appropriate utilization of resources [8-10] and concurrently, power usage needs to be moderate [11, 12]. Mainly, it is a significant problem in the environment of heterogeneous cloud where the capacity of resources differs. The open and dynamic features of CC environments are easier to create problems such as user priority management, excessive energy consumption, low utilization of resources, allocation and availability of physical resources, etc. Therefore, they have developed this method for tackling the issues, and also considered the dynamic features of CC to make this solution more practical, robust, and flexible in real time deployment. Therefore, the primary goal of this research is to present a novel optimization approach i.e., deadline aware and energy efficient.

Thus, the solution needs to be sufficient for considerably improving the system efficiency and makes it aware of the major optimization aspects like perspective of Cloud providers and users, flexible or dynamic scheduling, the necessities among Cloud service components. Therefore, the solution goals at minimizing the energy consumption and makespan when meeting users' deadlines and attaining effective resource utilization with higher efficiency computing and maximal profit. In [13], an enhanced initialization of PSO utilizing heuristic algorithm is projected. The LJFP and minimal MCT approaches are utilized for initializing the PSO. The efficiency of the presented MCT-PSO and LJFP-PSO methods are estimated in minimizing overall implementation time, makespan, overall energy consumption matrices, and degree of imbalance. In [14], a novel CC task scheduling approach presents max-min and min-min algorithm for load balancing as double FF, generating initialization population and select task completion time, and improve the algorithm search ability, convergence speed, and quality of initialization population, has been projected. [15] aim is to decrease the makespan time of the scheduling in CC platform. The work presents a method for efficient scheduling tasks of the various machines utilized in cloud for minimizing the makespan time. The presented method has been tested with the Braun standard dataset. This paper presents a chaotic pigeon inspired algorithm with dragonfly algorithm-based task scheduling (CPIADA-TS) technique for CC environment. The proposed CPIADA-TS technique aims to allot resources based on the requirement of many users in an effectual way. The CPIA technique is initially derived by integrating the concepts of chaotic maps to the PIA technique to improve its performance. Moreover, for enhancing the searching possibility and remove the local optima issue, the CPIA technique undergoes hybridization with the DA. A brief simulation analysis takes place and the experimental outcomes ensured the goodness of the CPIADA-TS technique.

The Proposed CPIADA -TS Technique

Fig. 1 demonstrates the overall process of CPIADA-TS approach. The main goal of proposed method is to assign all tasks to VM based on the VM load. The LB approach is employed for eliminating the event from overloaded VM and allocate to VM which has minimal load. The recently placed method has huge datacenters so-called PM and it is made up of VM for preceding the user's task. A user of a cloud contains several numbers of tasks to process VM. Now, the event is assigned to VM in the application of LB method. The proposed LB approach often validates the load of VM in cloud platform. The VM's load is depending upon the computation time of all the tasks. Now, load is an important parameter to schedule, i.e., a task of allocation a load on different nodes of shared system for enhancing

Karthikeyan

the resource consumption and task respond time during removing a deeply loaded VM while nodes are idle with minimal event. Such issues are solved by multiobjective based LB method using ADA. DA is a nature inspired method established using dynamic and static swarming hierarchies of dragonflies. For enhancing the searching possibility and remove a local optimal, in which CPIA is hybridized by DA. The population of dragonflies is initialized in an arbitrary approach. The solution length indicates the amount of tasks and dragonflies refer the access node. As, the validation of each dragonfly can be 1, 2, 3, 4, 5. The instance solution encoding is shown as follows

$$P_i = \{2,4,3,1,5,2,5,3,2,1\} \quad (1)$$

As above mentioned, it is learned task 1 will be assigned to VM₂, task 2 is stated to VM₄ and task10 is stated to VM₁. With respect to the solution encoding, the population matrix (SM) was created in which components should be zero/one. The method is based on the relation between a VM & task. on off chance in which a task j is related inside VM_i show $PM(i, j) = 1$, or $PM(i, j) = 0$. Thus, all columns have individual elements for one, remaining zero. When the solution is made, it estimates the fitness of each solution. The FF is shown below

$$MOF = \min [\alpha_1(ET) + \alpha_2(EC) + \alpha_3(1 - Load)] \quad (2)$$

For upgrading the solution, 5 main factors are employed namely distraction from enemy alignment, separation, cohesion, and attraction of food. When the step vector is calculated, the location vectors are evaluated by:

$$X_{k+1} = X_k + \Delta X_{k+1} \quad (3)$$

whereas k denotes the current iteration. The PIA method is established from pigeon homing behaviors based SI optimization technique i.e., made up of several advantages. Pigeon is appropriate for predicting the earth fields by a magneto reception for building the map in brain. It assumes the height of sun as a compass for modifying the direction. A novel position X_i and velocity V_i of pigeon i in t -th iterations are evaluated in the application by:

$$V_i(t) = V_i(t-1) \cdot e^{-Rt} + rand. (X_g - X_i(t-1)) \quad (4)$$

$$X_i(t) = X_i(t-1) + V_i(t) \quad (5)$$

whereas R refer to the map and compass factor, $rand$ implies arbitrary value, and X_g illustrates a present global optimal position, achieved than pigeon position. Considers $X_c(t)$ denotes a middle part of pigeon position in t -th iteration, while each pigeon could fly in direct movement. The position increasing for pigeon i at t -th iteration is given below:

$$N_p(t) = \frac{N_p(t-1)}{2} \quad (6)$$

$$X_c(t) = \frac{\sum X_i(t).fitness(X_i(t))}{N_p \sum fitness(X_i(t))} \quad (7)$$

$$X_i(t) = X_i(t-1) + rand. (X_c(t) - X_i(t-1)) \quad (8)$$

whereas $fitness()$ refers to the quality of pigeon. For constrained optimization problem, it is selected by $fitness(X_i(t)) = \frac{1}{f_{min}(X_i(t)) + \epsilon}$. Compared to DA & PIA, DA optimal fitness value (DA_{best}) is lesser compared to PIA fitness value (PIA_{best}), the optimum place of DA is substituted by PIA. The implementation gets ended when the best solution is attained. The end solutions are provided to the CC environment. The key objective of chaos optimization, modern search technique, is for transforming the variables from chaos to solution space. The main goal to utilize chaos optimization technique in this study consists of convergence rate and local minimum avoidance. A significant and efficient way to faces the challenge is to employ chaos concept. In Meta heuristic method, chaotic mapping is utilized rather than arbitrary number for increasing convergence. In CPIA used in this technique, arbitrary parameter is replaced with chaotic one. The feature of chaos optimization significantly enhances the efficacy of this model and makes this model powerful. The benefit of the chaotic Meta heuristic optimization methods such as

**Karthikeyan**

decrease of computational time, scalability, and simplicity, have been taken into account when using CPIA. Chaos is defined as semi arbitrariness behavior made by an arithmetical nonlinear deterministic scheme which has three substantial dynamic characteristics such as ergodicity, sensitivity, and quasi stochastic to new conditions. The ability to substitute arbitrary parameters with the value of chaotic map is defined as quasi-stochastic. The ability of chaotic parameters to study non-recurrent whole conditions in a specific range is defined as ergodicity. The sensitivity to new conditions is called minimum change in the earlier condition can result in different behaviours.

Performance Validation

The CPIADA-TS technique is simulated using CloudSim tool. The results are investigated in two aspects namely execution time and execution cost. Table 1 depicts the execution time analysis of CPIADA-TS methodology under different iterations with recent approaches. Fig. 2 showcases the execution time analysis of the CPIADA-TS technique under different iterations on PM: 5, VM:15, and Task:50. The figure reported that the CPIADA-TS technique has attained least execution time under all iterations. For instance, with 10 iterations, the CPIADA-TS technique has offered a lower execution time of 0.33 whereas the FA, DA, ADA, and PIADA-TS techniques have accomplished a higher execution time of 0.63, 0.42, 0.38, and 0.34 respectively. Moreover, with 50 iterations, the CPIADA-TS algorithm has obtainable a minimum execution time of 0.38 whereas the FA, DA, ADA, and PIADA-TS methodologies have accomplished a maximum execution time of 0.69, 0.48, 0.42, and 0.39 correspondingly. Fig. 3 illustrates the execution time analysis of the CPIADA-TS method under varying iterations on PM: 10, VM:30, and Task:75. The figure described that the CPIADA-TS manner has reached worse execution times under all iterations. For sample, with 10 iterations, the CPIADA-TS manner has obtainable a lower execution time of 0.65 whereas the FA, DA, ADA, and PIADA-TS methods have accomplished a superior execution time of 0.93, 0.86, 0.73, and 0.66 correspondingly. Furthermore, with 50 iterations, the CPIADA-TS technique has presented a minimal execution time of 0.71 whereas the FA, DA, ADA, and PIADA-TS methods have accomplished an improved execution time of 0.95, 0.89, 0.78, and 0.72 correspondingly. Fig. 4 demonstrates the execution time analysis of the CPIADA-TS approach under different iterations on PM: 20, VM:50 and Task:100. The figure stated that the CPIADA-TS technique has gained minimum execution time under all iterations. For instance, with 10 iterations, the CPIADA-TS algorithm has accessible a lesser execution time of 0.72 whereas the FA, DA, ADA, and PIADA-TS methods have accomplished an increased execution time of 0.95, 0.90, 0.78, and 0.73 correspondingly. Also, with 50 iterations, the CPIADA-TS approach has accessible a lesser execution time of 0.78 whereas the FA, DA, ADA, and PIADA-TS methodologies have accomplished an improved execution time of 0.99, 0.96, 0.81, and 0.79 correspondingly. Table 2 demonstrates the execution cost analysis of CPIADA-TS model under varying iterations with existing techniques. Fig. 5 depicts the execution cost analysis of the CPIADA-TS system under distinct iterations on PM: 5, VM:15 and Task:50. The figure reported that the CPIADA-TS technique has attained least execution cost under all iterations. For sample, with 10 iterations, the CPIADA-TS technique has to exist a lower execution cost of 0.69 whereas the FA, DA, ADA, and PIADA-TS methods have accomplished a higher execution cost of 0.80, 0.76, 0.75, and 0.70 correspondingly. Besides, with 50 iterations, the CPIADA-TS approach has obtainable a lower execution cost of 0.68 whereas the FA, DA, ADA, and PIADA-TS techniques have accomplished a higher execution cost of 0.80, 0.77, 0.76, and 0.70 correspondingly. Fig. 6 portrays the execution cost analysis of the CPIADA-TS manner under varying iterations on PM: 10, VM:30 and Task:75. The figure described that the CPIADA-TS algorithm has reached worse execution cost under all iterations. For instance, with 10 iterations, the CPIADA-TS method has offered a lesser execution cost of 0.06 whereas the FA, DA, ADA, and PIADA-TS methodologies have accomplished an increased execution cost of 0.19, 0.12, 0.08, and 0.06 correspondingly. Followed by, with 50 iterations, the CPIADA-TS technique has offered a minimal execution cost of 0.09 whereas the FA, DA, ADA, and PIADA-TS techniques have accomplished a superior execution cost of 0.28 0.16, 0.13, and 0.10 correspondingly. Fig. 7 exhibits the execution cost analysis of the CPIADA-TS approach under different iterations on PM: 20, VM:50 and Task:100. The figure stated that the CPIADA-TS method achieved minimal execution cost under all iterations. For sample, with 10 iterations, the CPIADA-TS manner has obtainable a lesser execution cost of 0.08 whereas the FA, DA, ADA, and PIADA-TS methods have accomplished an improved execution cost of 0.25, 0.15, 0.11, and 0.08 correspondingly. Furthermore, with 50 iterations, the CPIADA-TS algorithm has existed a lower execution cost of 0.10 whereas the FA, DA, ADA, and PIADA-TS techniques have accomplished a maximum execution cost of 0.33, 0.19, 0.14, and 0.11 correspondingly.

CONCLUSION

This paper has presented a new CPIADA-TS technique for CC environment. The proposed CPIADA-TS technique aims to allot resources based on the requirement of many users in an effectual way. The CPIA technique is initially derived by integrating the concepts of chaotic maps to the PIA technique to improve its performance. Moreover, for enhancing the searching possibility and remove the local optima issue, the CPIA technique undergoes hybridization with the DA. The implementation gets ended when the best solution is attained and the final solution is provided to the cloud environment. A brief simulation analysis takes place and the experimental outcomes ensured the goodness of the CPIADA-TS technique. In future, the performance can be boosted by the design of context aware route planning approaches in the CC environment.

ABSTRACT

Mathematical modelling for agricultural quality seed germination using robust fuzzy regression optimization is an effective way to resolve uncertainties caused by environmental conditions, seed variety, and agricultural methods in biological systems. In this case, trials with various seed kinds should be conducted under both controlled and field situations. Additionally, correlate the model predictions with the actual germination data.. Solve the mathematical goal function with restrictions on soil moisture, temperature, and seed viability. Agricultural grade seed germination is focused on simulating natural growth circumstances, such as sowing seeds in field soil and monitoring emergence. A new hybrid mathematical modelling for agricultural quality seed germination has begun.

Keywords: Germination, soil, regression, hybrid, moisture, temperature, fuzzy and viability.

INTRODUCTION

Seed germination is a crucial phase in plant development that influences agricultural productivity. Understanding and forecasting the germination process is critical for increasing crop yields, better using resources, and maintaining food security. However, germination is regulated by a complex interaction of factors, including seed quality, environmental conditions, and farming techniques, all of which are variable and unknown. The use of robust fuzzy regression optimization in seed germination modelling is a particularly interesting strategy. The inherent uncertainties and imprecisions in seed quality, measurement errors, and climatic factors are considered by the fuzzy regression optimization. Fuzzy systems, in contrast to typical deterministic models, express ambiguous information

96707

**Sundhari and Shunmugapriya**

using linguistic variables and membership functions. This makes them ideal for agricultural systems, where exact control is frequently impossible. The goal of this project is to create a mathematical model for seed germination that uses fuzzy optimization approaches. The model considers crucial parameters like as temperature, moisture, and seed viability to assess germination rates and seedling vigour under different conditions. By addressing uncertainty and unpredictability, the suggested model provides a strong decision-making tool for improving agricultural operations and assuring high-quality seed germination results. Through this technique, we want to bridge the gap between theoretical modelling and real agricultural applications, opening the path for more sustainable and efficient crop production systems.

Preliminary

In order to produce seedlings, germination is essential. It is an ongoing, irreversible process that starts with many physiological functions in seeds and concludes with the growth or demise of a germ. Nonetheless, the definition of germination is occasionally employed informally and inaccurately, leading to confusion with seedling growth, which commences after the completion of the germination process (Bewley and Black, 1994). Identifying the initiation and conclusion of each stage in molecular and cellular processes inside multicellular and complex tissues is problematic because to the slow nature of process reactivation, as exemplified by imperfect germination (Ranal and Santana, 2006; Fenner and Thompson, 2005). Identifying the source of germination events in nature remains a key research priority (Baskin and Baskin, 1998). However, germination seldom happens right away. Every seed in a population has a distinct genotype, which might affect how the seed reacts to outside stimuli. In recent years, methodologies for analysing the dynamics of seed germination have progressed rapidly (Garcia-Huidobro *et al.*, 1982; Ellis *et al.*, 1986; Bradford, 1995). Numerous approaches or mathematical formulas for quantifying the germination process have been put forth or investigated throughout the past 200 years. It is beneficial on the one hand, but comparison is challenging due to the variety of wording. Several of these expressions evaluate diverse aspects of the germination process under a common nomenclature; others quantify the same characteristics using varied mathematical terminology; furthermore, some convey identical meanings despite being represented by different symbols (Ranal and Santana, 2006). The dynamics of the process are significantly influenced by time, speed, uniformity, and synchronization. Because they enable one to predict the level of species success based on the seeds' ability to grow and develop throughout time, these characteristics are important not only for physiologists and seed technologists but also for ecologists.

An atmosphere that encourages germination is necessary for a seed (Craufurd *et al.* 1996). Certain seeds require light, a suitable temperature range, and a suitable water supply (Collis-George and Williams 1968, Levitt 1980, Long and Woodward 1998). The number of seeds that germinated (the final germination percentage achieved) and the duration of the germination process are utilised to quantify the outcome. Nonetheless, from an agronomic, planning, or physiological standpoint, many elements frequently exert a considerable influence (Jones and Sanders 1987, Esechie 1994, Kader *et al.* 1998, Kader *et al.* 1999, Kader, 2005). A number of cultural operations, including crop fertilization, harvesting, and field maturity, are influenced by the time interval between the first and last seeds to germinate, the variation in germination speed, and the timing at which the majority of seeds germinate (Roberts 1981, Washitani and Saeki 1986, Kader and Jutzi 2001). According to Kader *et al.* (1998), germination events classified as "high" (when many seeds germinate) or "low" (when just a small percentage of seeds germinate) are also important markers of seed vigor and stress tolerance. Statistical analyses are significantly impacted by this experimental data (Bland and Altman 1995, Legendre and Legendre 1998, Johnson 1999). It is challenging to understand and analyze a significant number of experiments that link seed germination to time and rate estimates (Finch-Savage *et al.* 1998; Trudgill *et al.* 2000; Grundy *et al.* 2000). Although germination data varies greatly from other data frequently collected in plant research, analytical or graphical methods are used to assess seed germination and emergence (Scott *et al.* 1984). Despite some seeds within a treatment exhibiting asynchronous responses, germination is recognised as a qualitative developmental response of an individual seed occurring at a specific moment (Harper and Benton 1966, Orchard 1977, Scott *et al.* 1984, Kader 1998).. Because two sets of data cannot be compared, this leads to a scenario where the final germination % by itself is insufficient for reporting findings. Several germination measurement techniques have been developed as a result of this limitation in earlier research relating seed treatments to seed lot germination

Sundhari and Shunmugapriya

patterns (Timson 1965, Todd and Webster 1965, Harris and Wilson 1970, Thompson 1974). (Heydecker 1966, Scott *et al.* 1984, Carberry and Campbell 1989). The literature on seed germination uses both analytical models (Glaser, 1975; Gładyszewska, 1998; Pabis, 1985) and simulation models (Monte Carlo Method) (Gładyszewska, 1998; Gładyszewska and Koper 2002a; Jazwiński *et al.*, 1975; Roe, 1982). Analytical models can help researchers gain a full mathematical knowledge of seed germination. In their study of germination kinetics, Gładyszewska *et al.* (2001) emphasize the need of considering external influences. However, if all we have are flawed lab models, how can we predict when and how many seeds will sprout in the real world? Many contemporary attempts to anticipate seed germination rely on hydrothermal models. A crucial assumption of these models is that each seed accumulates hydrothermal time proportional to temperature and water potential, also known as the base temperature and water potential at which seeds may develop. Because the equations in hydrothermal models apply to the entire seed population, it is possible to examine both germination speed and seed interest at the same time (Alvarado and Bradford, 2002). The link between experimental data collected in controlled contexts and the changing field environment is sometimes confusing. Under field conditions, simulation modeling guarantees that seeds and seedlings combine their expected water potential and heat history in a predictable manner. Though it has received little attention in seedling occurrence models (Finch-Savage *et al.*, 1998; Roman *et al.*, 1999), this idea was shown using hydrothermal time concepts for the cessation of hibernation in *Bromus tectorum* seeds (Bauer *et al.*, 1998). The development of hydrothermal threshold models that more accurately predict seed behavior in the real world has advanced significantly as a result of papers on germination modeling under field conditions that incorporate improvements to hydrothermal modeling proposed by Rowse and Finch-Savage (2003) (Allen, 2003).

MATERIALS AND METHODS

In the experiment, a seed germination analysis method was applied, which indicated the primary parameters used in germination research, as shown in Table 1. These germination calculating techniques are essentially classified into three types. The various techniques were tested for accuracy and representation using germination data from Kader *et al.* (1998, 1999) and Kader and Jutzi (2001, 2002), as well as hypothetical germination data (see details below), demonstrating time-based variations in the three areas listed below.

Let, S_n is denote the number of seeds.

P_q^* is denote the plants in a generation of n .

S_p^1 is denote number of seeds that are 1 year old.

S_p^2 is denote number of seeds that is 1.5 Years old.

S_p^3 is denote number of seeds that are 2 Years old.

S_q^1 is denote number of seeds remaining 1 year old.

S_q^2 is denote number of seeds remaining is 1.5 Year old.

S_q^3 is denote number of seeds remaining are 2 Years old.

S_{pq} is denote the new seed germination.

The robust fuzzy regression is defined as,

$$P_n^* = (p * 1 \text{ year}) + (p * 1.5 \text{ year}) + (p * 2 \text{ years}) + e$$

$$P_n^* = \beta_1 S_p^1 + \beta_2 S_p^2 + \beta_3 S_p^3 + \beta_4 S_p^4 + \gamma_1 S_p^1 + \gamma_2 S_p^2 + \gamma_3 S_p^3 + \gamma_4 S_p^4$$

$$P_n^* = \beta \{S_p^1 + S_p^2 + S_p^3 + S_p^4\} + \gamma \{S_p^1 + S_p^2 + S_p^3 + S_p^4\}$$

$$P_n^* = \beta \{S_p^*\} + \gamma \{S_p^*\}$$

$$P_n^* = S_p^* \{\beta + \gamma\}$$

$$P_n^* = S_p^*$$

where $\beta + \gamma = 1$ (Probability of success & failure) and $e = 0.001$ is the error.

Similarly

$$\overline{P_n^*} = S_q^* \{\beta + \gamma\}$$

$$\overline{P_n^*} = S_q^*$$

The average total germination seed production (TGSP)

Sundhari and Shunmugapriya

$$G_{AI} = \frac{P_n^* + \overline{P_n^*}}{N}$$

The annual integrated total germination seed production (IIGSP)

$$G_{GSP} = G_{AI} * M * V$$

where,

Soil moisture 30% < M < 70%,

Temperature, 15°C < T < 30°C and

Seed Viability, V > 80%.

Specifically, within our framework, we may encounter many types of outliers concerning

- One or more non-fuzzy explanatory variables
- The centers and/or the spreads of the fuzzy dependent variable $\hat{x}$ of MGT.
- The robust fuzzy regression models P_n^* and $\overline{P_n^*}$.

Final Germination Percentage (Scott *et al.* 1984)

$$FGP = \{\text{Final no. of seeds germinated in a seed lot} / \text{Total Seeds}\} \times 100$$

Mean Germination Time (Orchard 1977)

MGT = total of Seeds germinated on day * x / Seeds germinated on day

$$MGT = \frac{\sum_{i=1}^n f_i x_i}{\sum f_i}$$

Mathematical Modelling for Agriculture Quality Seed Germination Biological factors include seed viability, dormancy, and age. Environmental factors include temperature, moisture, light, soil type, and nutrient availability.

External Interventions: Use of fertilizers, pesticides, or growth promoters.

Modelling Approaches: Logistic Growth robust fuzzy Regression Model

Outputs:

- (i). Optimal environmental conditions for germination.
- (ii). Predictions of germination rates over time.
- (iii). Recommendations for seed treatment and storage.

RESULT AND DISCUSSION

The findings of Tables 2-4 demonstrate a large difference in germination data based on the temporal spread of germination and its final percentage. FGP solely represents the final percentage of germination obtained and offers no image of the speed or uniformity of germination. This table shows that the variation in a plant for per season with respective days. Experiment was conducted in 3 aspects 2 years, 1.5 years and 1 years and tested with new seeds. In the above figure the x array represents the generations. The y array represents the plant. The number of plants decreases with respect. In the above figure the x array represents the generations. The y array represents the plant. The number of plants decreases with respect. The table demonstrates that all the tested lots achieved a FGP of 95% but had varied germination time ranges. MGT is a precise indicator of the duration required for a lot to germinate; however, it does not correlate effectively with the temporal dispersion or uniformity of germination. It focuses on the day when most germination events happened. In the graph above, the x array indicates the generations. The y-array symbolizes the plant. The quantity of plants diminishes with respect to α , β , and γ . If this trend continues, the plant species may go extinct within a few generations. This might be the explanation for the extinction of certain plant species.

Sundhari and Shunmugapriya

CONCLUSION AND SUGGESTIONS

This suggested model sheds light on the salinity-mediated modification of seed germination percentages and can assist forecast overall germination indices. Given academics' increasing interest in modelling seed germination, the equations produced in the current work may be useful in this field. In general, a botanist wants to determine if one cultivar of a species outperforms another in harsh environments such as salinity. The cultivars might be an effective alternative technique for reducing production concerns in salty arable soils. Even though biological research requires more precise statistics that cover most of the changing germination process, the FGP is typically a strong adequate indicator. Understanding and modelling the behavior of germinating seeds is important from both basic and applied scientific perspectives. We believe that our message will serve as a starting point for future study into identifying salt reactions in germinating seeds using mathematical models. We also feel that progressive study using mathematical modelling might bring new insights into plant stress responses. Seed germination models are still being developed due to mechanical integration of environment and factors affecting germination speed and seedling elongation.

ABSTRACT

Financial fraud is a problem that affects a lot of people, including businesses, the government, and regular people. The problem has gotten worse in recent years as people have become more reliant on new technology like mobile and cloud computing. In the age of big data, traditional methods that rely on manual detection are not only time-consuming, expensive, and inaccurate, but they are also not practicable. It's hardly unexpected that banks and other financial organisations have started utilising automated systems that use statistical and computational methodologies. This article focusses on the hybrid Artificial Neural Network Classification approach for finding fraud in the financial sector. The Harris Hawks Optimisation (HHO) algorithm is an optimisation method that is used to find the best weights for the NN in fraud detection.

Keywords: Fraud Detection, Classification, Finance, Neural Network, Optimization, Harris Hawks Optimization

INTRODUCTION

Fraud in the financial world has effects that go beyond the world of finance and into everyday life. Fraud can make people less trusting of businesses, hurt economies, and raise people's cost of living. Auditing and other manual methods were used in the past, but they are not very effective or dependable since the problem is too hard. Researchers have found that data mining-based methods are helpful because they can find small problems in huge data sets [1]. There are many kinds of fraud and many ways to mine data. Researchers are always looking for the best way to handle each situation. Financial fraud is a broad term that can encompass a lot of different things. For our

**Ambika**

purposes, it is using illegal methods or activities on purpose to make money [2]. Fraud hurts businesses and society in a big way. For example, credit card fraud costs businesses billions of dollars in lost sales every year [3]. Some estimates say that the total cost to the U.S. could be more than \$400 billion a year [4]. A third study shows that UK insurers lose 1.6 billion pounds a year because of false claims [1]. Financial fraud also has bigger effects on the industry, like giving money to illegal operations like drug trafficking and organised crime [3]. When credit card fraud happens, the merchants usually have to pay for the shipping, chargebacks, and administrative charges, as well as lose customers' trust after being the victim of a fake transaction [5], [6]. This shows us how far-reaching the effects of fraud may be and how important it is to reduce it. In the last few years, financial fraud has gone up because of new technology like the internet and mobile computers [7]. Social variables, such the fact that more people have credit cards, have led to more spending but also more fraud [6]. Because fraudsters are always coming up with new ways to trick people, detection technologies need to be able to change with them [3]. Data mining has already proven helpful in areas including predicting bankruptcy, approving credit cards, and looking at share markets [8]. Fraud detection is a similar classification challenge, but there is a big difference in the number of fraudulent transactions compared to normal ones, and it costs a lot more to misclassify them [9]. Data mining methods can also be used to find fraud because they can handle enormous amounts of data quickly and don't need to know what the input variables are [10].

Related Works

Lai, Yingxu, Jingwen Zhang, and Zenghui Liu [11] suggested a way to use deep learning to find unusual patterns in industrial traffic and classify attacks. We employ a deep learning representation model based on a convolutional neural network as the detection model. To make the initial one-dimensional data usable for model processing, the feature mapping method maps them. The deep learning technology can automatically find important traits and correctly classify attacks. We used real network assault data from a supervisory control and data acquisition (SCADA) system to test our model. The test results demonstrated that the proposed method could find anomalies and sort attacks in a SCADA system. The suggested strategy also encourages the use of deep learning algorithms to find anomalies in industry. Asha, R. B., and Suresh Kumar KR [12] The goal was to use different machine learning methods, like support vector machine (SVM), k-nearest neighbour (Knn), and artificial neural network (ANN), to guess when fraud would happen. We also use several supervised machine learning and deep learning algorithms to tell the difference between fraud and non-fraud transactions. Sahu, Aanchal, G. M. Harshvardhan, and Mahendra Kumar Gourisaria [13] Used five classifiers to develop models that can identify the best match for the situation when trying to find fake credit card transactions. The writers employed two alternative methods to deal with the problem of data imbalance. The first method uses a data resampling strategy to add more samples to the minority class. The second method is a cost-based approach, where the error function takes into account the weights of each class. The weights can make the samples of fraudulent transactions more important than the usual ones. Zou, Junyi, Jinliang Zhang, and Ping Jiang [14] suggested a denoising autoencoder neural network (DAE) approach that can both oversample a minority class sample by using misclassification cost and clean up and classify the sampled dataset. Compared to the denoising autoencoder neural network (DAE) with oversampling procedure and typical fully connected neural networks, the results of the trials demonstrated that the proposed approach makes it easier to classify the minority class of imbalanced datasets. Chen, Joy Long-Zong, and Kong-Long Lai [15] suggested a financial fraud detection technique based on the Deep Convolution Neural Network (DCNN) scheme and the deep learning algorithm. This method can improve the accuracy of detection when there is a lot of data to work with. We use a real-time credit card fraud dataset to compare the proposed model to existing machine learning models, such as the auto-encoder model and other deep learning models, to see how well it works. The experimental findings show that the suggested model can identify with 99% accuracy over a period of 45 seconds. Georgieva, Sevdalina, Maya Markova, and Velizar Pavlov [16] showed how a neural network model might find fake transactions. If you train an artificial neural network (ANN) the right way, it can work like a human brain. Like people, they learn by example and are known as a highly good classifier. One of the key things that makes credit card traffic so bad is that there are a lot more real transactions than fake ones. At the same time, it's challenging to get public data because of privacy concerns. We employ resampling methods to fix the dataset that isn't balanced. We used the Neural Network Toolbox in Matlab to make sure the model was built correctly by training a pattern recognition network with a scaled

Ambika

conjugate gradient backpropagation technique. Dubey, Saurabh C., Ketan S. Mundhe, and Aditya A. Kadam [17] Using the ANN (Artificial Neural Network) algorithm and Backpropagation, a model is made. It works like a human brain and offers accurate and quick answers when compared to other algorithms. First, the customer's credit card information is gathered. This includes their name, time, last transaction, transaction history, and other details. After that, eighty percent of the data is used to train the model, while the other twenty percent is split into test and validation data, which is processed without giving a result. So, it works better than other algorithms. This will be incredibly helpful in the future because our model can find and anticipate customer transactions in real time. Mehbodniya, Abolfazl, *et al* [18] There are many machine learning and deep learning methods that can find credit card fraud. For example, Naive Bayes, Logistic Regression, K-Nearest Neighbour (KNN), Random Forest, and the Sequential Convolutional Neural Network are all used to train the other normal and abnormal features of transactions to find credit card fraud. We use data that is available to the public to check how accurate the model is. The accuracy of the different algorithms was shown to be 96.1%, 94.8%, 95.89%, 97.58%, and 92.3%, which corresponded to the Naive Bayes, Logistic Regression, K-Nearest Neighbour (KNN), Random Forest, and Sequential Convolutional Neural Network methods, respectively. The comparison showed that the KNN algorithm gives better outcomes than other methods. Trivedi, Naresh Kumar, *et al* [19] added a working credit card fraud detection system that uses machine learning and a feedback system. Its feedback method helps the classifier find more things and do so at a lower cost. After that, we looked at how well several methods worked on a credit card fraud data set that was a little bit off. These methods included random forest, tree classifiers, artificial neural networks, support vector machines, Naïve Baiyes, logistic regression, and gradient boosting classifiers. These data sets comprise transaction data from 284,807 trades made by European account holders with credit cards. The same methods work for both raw and pre-processed content.

Artificial Neural Network Classification

Artificial Neural Network (ANN) is a mathematical model that mimics how neurones behave in the brain by copying the brain's pattern and creating outputs based on what it has learnt from a set of training data. A multi-layer feedforward network with a back-propagation learning process is one of the most prevalent types of neural networks. A lot of study has been done on it, and it has been used in many different areas. There are usually three layers in a neural network: an input layer, an output layer, and an intermediate or hidden layer. The input vector is $\in R^n$ and $D = (X_1, X_2, \dots, X_n)^T$; the output of q neurons in the hidden layer are $Z = (Z_1, Z_2, \dots, Z_n)^T$; and the outputs of the output layer are $Y \in R^n, Y = (Y_1, Y_2, \dots, Y_n)^T$ the output of q neurons in the hidden layer are $Z = (Z_1, Z_2, \dots, Z_n)^T$; and the outputs of the output layer are $Y \in R^n, Y = (Y_1, Y_2, \dots, Y_n)^T$. If the weight and threshold between the input layer and the hidden layer are w_{ij} and y_{-j} , and the weight and threshold between the hidden layer and the output layer are w_{jk} and y_{-k} , then the outputs of each neurone in the hidden layer and output layer are:

$$Z_j = f \left(\sum_{i=1}^n w_{ij} X_i - \theta_j \right)$$

$$Y_j = f \left(\sum_{j=1}^q w_{kj} Z_j - \theta_k \right)$$

$f()$ is a transfer function that tells the neurones how to send their summed input to their output. By making the right decision, you can add non-linearity to the network architecture. The sigmoid function is one of the most common functions. It is always increasing and goes from 0 to 1. To test how well the suggested model worked, a typical feed forward neural network with three inputs, one hidden layer with seven neurones, and one output layer was used.

Harris Hawks Optimization (Hho)

Heidari *et al.* came up with HHO, a new meta-heuristic optimisation technique, in 2019 [20]. HHO works like the way Harris Hawks hunt in the wild. Researchers looked at how Harris hawks behave and found that they use a number of clever ways to attack and hunt their food, which is primarily rabbits. The first publication of HHO showed that

Ambika

this technique works well for solving a wide range of optimisation problems. HHO works like any other population-based meta-heuristic optimiser by creating a group of search agents and changing them during exploration and exploitation phases. There are two phases to exploring this method and four stages to using it.

Initialization Phase

At this point, the search space and the objective function are set. Also, the first Genetic Algorithm based on a population is started. Also, all of the parameter values are set.

Exploration Phase

At this point, all Harris hawks are seen as possible answers. For each iteration, the fitness value for all of these feasible solutions is depending on the targeted prey. There are two ways to copy the exploring behaviour of Harris Hawks in the search space described in (1):

$$X(t+1) = \begin{cases} X_{rand}(t) - r_1 |X_{rand}(t) - 2r_2 X(t)| & q \geq 0.5 \\ (X_{rabbit}(t) - X_m(t)) - r_3(LB + r_4(UB - LB)) & q < 0.5, \end{cases} \quad (1)$$

$X(t+1)$ is the position of Hawks in the second iteration t . $X_{rabbit}(t)$ represents the position of the prey, and $X_{rand}(t)$ is the random solution that was chosen from the current population. $X(t)$ is the position vector of Hawks in the current iteration t . r_1, r_2, r_3, r_4 , and q are random scaled factors between 0 and 1 that are updated in each iteration. LB and UB are the upper and lower bounds of the variables, and X_m is the average number of solutions. This planned method finds the placements of Hawks inside $(UB - LB)$ limits by following two rules: 1) make the solutions based on a randomly chosen hawk from the present population and the other hawks. 2) Make the answers based on where the prey is, where the Hawks are on average, and some random scaled elements. r_3 is a scaling factor, but when r_4 is close to 1, it will assist make the rule more random. This rule adds a randomly scaled movement length to LB . A random scaled component is thought to offer more ways to diversify and look into different parts of the feature space. (2) shows how to find the average position of hawks (solutions).

$$X_m(t) = \frac{1}{N} \sum_{i=1}^N X_i(t) \quad (2)$$

In this case, $X_m(t)$ represents the average number of solutions in the current iteration. N stands for all possible answers. $X_i(t)$ shows where each solution is in iteration t , which is based on chaos theory. When the hawk uses information from random hawks to catch its prey, rule one is usually used in Eq. (1). Rule two is used when all the hawks share the best solution and the best hawk is used.

Transition from Exploration to Exploitation

This step shows how HHO moves from exploration to exploitation, depending on the energy of the prey (E). HHO thinks that the energy of prey slowly goes down as they try to escape. E_0 is the starting energy that goes down from $[1, -1]$, as seen in (3).

$$E = 2E_0 \left(1 - \frac{t}{T} \right), \quad E_0 \in [-1, 1] \quad (3)$$

where T indicates the maximum number of iterations, and t is the current iteration.

Exploitation Phase

At this stage, four different parameter sets are used to complete the exploitation phase. The position found in the exploration phase is what these approaches are founded on. The prey, on the other hand, often tries to get away, and

Ambika

the hawks follow it and try to catch it. HHO exploitation is like the Hawks' attack plan in that it can use four different methods. The soft besiege, hard besiege, soft besiege with progressive rapid dives, and hard besiege with progressive fast dives are some of these methods. These methods are based on two variables, r and $|E|$, which determine the method that was used. In this case, $|E|$ is the prey's escaping energy and r is the chance of fleeing. If r is less than 0.5, the prey has a better chance of escaping successfully, and if r is more than or equal to 0.5, the prey has a better chance of escaping unsuccessfully. Here is a summary of these methods: In the soft besiege strategy, when $r \geq 0.5$ and $|E| \geq 0.5$, the rabbit still has some energy to get away. The hawks are softly surrounding the prey, making it lose more energy before they pounce. Soft besiege is mathematically defined in (4), (5), and (6).

$$X(t+1) = \Delta X(t) - E |JX_{rabbit} - X(t)| \quad (4)$$

$$\Delta X(t) = X_{rabbit} - X(t) \quad (5)$$

$$J = 2(1 - r_5), \quad r_5 \in [0, 1] \quad (6)$$

$\Delta x(t)$ is the difference between the prey's position vector and the current location in iteration t , J is the prey's jump strength, and r_5 is a random variable. When r is more than or equal to 0.5 and $|E|$ is less than 0.5, the prey is exhausted and has a low chance of escape. In this situation, the hawk hardly gets around the prey to make the final surprise attack. So, (7) is used to update the solution.

$$X(t+1) = X_{rabbit}(t) - E |\Delta X(t)| \quad (7)$$

Eq. (8) depicts the soft besiege with the progressive quick dives method. If $r < 0.5$ and $|E| \geq 0.5$ the prey still has enough energy to get away. The hawk glides quickly around the prey and waits calmly to plunge before pouncing. This move is called "intelligent soft besiege," and it changes the position of the hawks in two stages. The first step is for the hawks to approach towards the prey by guessing what the prey will do next using formula (8):

$$Y = X_{rabbit}(t) - E |JX_{rabbit}(t) - X(t)| \quad (8)$$

In the second step, the hawk had to evaluate whether or not to dive based on how the last dive went and how it would go this time. If it isn't, the hawks will dive in a way that isn't regular, based on the Levy Flight (LF) idea in (9):

$$Z = Y + S \times LF(Dim) \quad (9)$$

In the second stage, the hawk had to decide whether or not to dive based on how the prior dive went and how this one would proceed. If it isn't, the hawks will dive in a method that isn't normal, like the Levy Flight (LF) proposal in (9):

$$LF(x) = 0.01 \times \frac{u \times \sigma}{|v|^{\frac{1}{\beta}}}, \quad \sigma = \left(\frac{\Gamma(1+\beta) \times \sin(\frac{\pi\beta}{2})}{\Gamma(\frac{1+\beta}{2}) \times \beta \times 2^{(\frac{\beta-1}{2})}} \right)^{\frac{1}{\beta}} \quad (10)$$

Where β is a default constant that is set to 1.5 by default, and u and v are random numbers between 0 and 1. So, we can write (11) to show how to update the positions of the Harris hawks with quick, progressive dives:

$$X(t+1) = \begin{cases} Y & \text{if } F(Y) < F(X(t)) \\ Z & \text{if } F(Z) < F(X(t)) \end{cases} \quad (11)$$

where (8) and (9) are used to do Y and Z , and both point to the next location in the current iteration. When $r < 0.5$ and $|E| < 0.5$, the last method is called hard besiege with progressive quick dives. In this case, the prey doesn't have the

Ambika

energy to get away, so the Harris hawks try to get to it by diving quickly and then surprising it with a pounce to catch it. The way the hawks move in this situation is described in (12):

$$X(t+1) = \begin{cases} Y & \text{if } F(Y) < F(X(t)) \\ Z & \text{if } F(Z) < F(X(t)) \end{cases} \quad (12)$$

where Y is set as in (13), and Z is updated as in (14).

$$Y = X_{rabbit}(t) - E |JX_{rabbit}(t) - X_m(t)| \quad (13)$$

$$Z = Y + S \times LF(Dim) \quad (14)$$

Proposed Harris Hawks Neural Network Classification Method

The Back Propagation Neural Network (BPNN) is simple and contains three layers: an input layer, a hidden layer, and an output layer. The training and testing processes are done using its back-propagation function. The interconnection weight (w_{ij}) between the levels changes the input data in each layer. This shows how the i th node of the current layer is related to the j th node of the following layer. The hidden layer's main job is to handle the information from the input layer. A sigmoid transfer function is used to find the overall activation. The FF algorithm is used to optimise the weights of the BPNN in this suggested FFNN classification approach. The HHO algorithm is used to get the best weights for the BPNN in this suggested FFNN classification approach. The transfer function tells the neurones how to send their summed input to their output. It also lets you introduce non-linearity to the network architecture by making the right choice. The sigmoid function, which grows steadily and ranges from 0 to 1. There is one Input Layer, one hidden layer with 7 neurones, and one output layer in this suggested NN design.

Step by Step Procedure

Initialize Inputs and Outputs

- Allocate all the inputs and outputs for the neural network.
- Initialize weights randomly between -1 and 1.

Repeat the Process

- For every input in the training set, follow these steps:

Layer-wise Iteration

- For each layer in the neural network:
 - For each node in the layer, repeat the following:

Population Initialization

- Initialize the population of hawks (X_i) for each node in the layer, where i ranges from 1 to N .

Fitness Evaluation and Update Loop

- While the fitness value does not meet the stopping criteria, do the following:
 - Compute the fitness values of hawks.
 - Set the location of the best hawk (X_{rabbit}) as the "rabbit" location.
 - For each hawk (X_i), repeat the following:
 - Update the initial energy (E_o) and jump strength (J).
 - Calculate the new values for E_o and J using random factors.

Exploration Phase

- If the absolute value of the energy ($|E|$) is greater than or equal to 1, perform the exploration phase:
 - Update the location vector based on the exploration formula.

Ambika

Exploitation Phase

- If the absolute value of the energy ($|E|$) is less than 1, perform the exploitation phase:
 - If $r \geq 0.5$ and $|E| \geq 0.5$:
 - Perform a soft besiege and update the location vector.
 - Else if $r \geq 0.5$ and $|E| < 0.5$:
 - Perform a hard besiege and update the location vector.
 - Else if $r < 0.5$ and $|E| \geq 0.5$:
 - Perform a soft besiege with progressive rapid dives and update the location vector.
 - Else if $r < 0.5$ and $|E| < 0.5$:
 - Perform a hard besiege with progressive rapid dives and update the location vector.

Summation and Activation Function

- Calculate the summation of inputs, including weights and thresholds.
- Apply the activation function to compute the node's output.

Output Node Error Calculation

- For every output node, calculate the error function.

Hidden Layer Error Calculation

- For each hidden layer, repeat the following:
 - For every node in the hidden layer, calculate the error function.
 - Update the weights in the network using the Harris Hawks optimization location vector.
 - Evaluate the new solution and update the location vector, energy, and jump strength.

Recalculate Error Function

- After updating weights, recalculate the error function.

Iterate

- Repeat the process until one of the following conditions is met:
 - The maximum number of iterations is reached.
 - The error function is less than the specified criteria.

RESULT AND DISCUSSION

The performance of the Proposed Harris Hawk based Neural Network (HHNN) method is evaluated with the existing classification methods like ANN, RF and Gradient Boosting Machine (GBT) using original and feature selection methods like Proposed GWOFS method, WOA and GA processed datasets. Table 1 shows the Classification Accuracy (in %) for the original dataset, the Proposed GWOFS, WOA, and GA processed datasets, and the Proposed HHNN, ANN, RF, and GBT. Figure 1 shows the Classification Accuracy (in %) for the original dataset, the Proposed GWOFS, WOA, and GA processed datasets, and the Proposed HHNN, ANN, RF, and GBT. Table 1 and Figure 1 show that the suggested HHNN classification method works better with the proposed GWOFS processed dataset than the other classification methods. Table 2 shows the True Positive Rate (in %) for the original dataset, as well as the Proposed GWOFS, WOA, and GA processed datasets, using the Proposed HHNN, ANN, RF, and GBT. Figure 2 shows the True Positive Rate (in %) for the original dataset, the Proposed GWOFS, WOA, and GA processed datasets, and the Proposed HHNN, ANN, RF, and GBT. The suggested HHNN classification method is more accurate than the other classification methods when used on the proposed GWOFS processed dataset, as seen in table 2 and figure 2. Table 3 shows the False Positive Rate (in %) for the original dataset and the Proposed GWOFS, WOA, and GA processed datasets using the Proposed HHNN, ANN, RF, and GBT. Figure 3 shows the False Positive Rate (in %) for the original dataset, the Proposed GWOFS, WOA, and GA processed datasets, and the Proposed HHNN, ANN, RF, and GBT. Table 3 and Figure 3 show that the proposed HHNN classification technique has a lower FPR when used

Ambika

with the suggested GWOFS processed dataset than other classification methods. Table 4 shows the Precision (in %) that the Proposed HHNN, ANN, RF, and GBT got for the original dataset, the Proposed GWOFS, WOA, and GA processed datasets. Figure 4 shows the Precision (in %) that the Proposed HHNN, ANN, RF, and GBT got for the original dataset and the Proposed GWOFS, WOA, and GA processed datasets. The table and figure 4 show that the suggested HHNN classification method works better with the proposed GWOFS processed dataset than the other classification methods.

Table 5 shows the Specificity (in %) that the Proposed HHNN, ANN, RF, and GBT got for the original dataset, as well as for the datasets that were processed by the Proposed GWOFS, WOA, and GA. Figure 5 shows the Specificity (in %) for the original dataset, the Proposed GWOFS, WOA, and GA processed datasets, and the Proposed HHNN, ANN, RF, and GBT. Table 5 and Figure 5 show that the suggested HHNN classification method works better with the proposed GWOFS processed dataset than the other classification methods. Table 6 shows the Miss Rate (in %) for the original dataset and the Proposed GWOFS, WOA, and GA processed datasets using the Proposed HHNN, ANN, RF, and GBT. Figure 6 shows the Miss Rate (in %) for the original dataset, the Proposed GWOFS, WOA, and GA processed datasets, and the Proposed HHNN, ANN, RF, and GBT. Table 6 and Figure 6 show that the proposed HHNN classification technique has a lower miss rate with the proposed GWOFS processed dataset than the other classification methods. Table 7 shows the False Discovery Rate (in %) for the original dataset, the Proposed GWOFS, WOA, and GA processed datasets, and the Proposed HHNN, ANN, RF, and GBT. Figure 7 shows the False Discovery Rate (in %) that the Proposed HHNN, ANN, RF, and GBT got for the original dataset, the Proposed GWOFS, WOA, and GA processed datasets. Table 7 and Figure 7 show that the suggested HHNN classification technique has a lower FDR with the proposed GWOFS processed dataset than the other classification methods.

CONCLUSION

This paper talked about the proposed Harris Hawks Neural Network classification approach, which uses the Harris Hawks Optimisation algorithm and the Artificial Neural Network. We utilise this optimisation approach to make the ANN's parameters better. The results suggest that the proposed HHNN classification method works better with the Proposed GWOFS method processed dataset than the other classification methods.

ABSTRACT

The purpose of this study is to conduct a systematic analysis of research articles in order to evaluate the contributions and critiques of scientific publications pertaining to Tamil Nadu's agricultural institutions. The goal of the study is to draw attention to how these colleges support agricultural education and awareness in the face of social and environmental issues. 5,501 publications published during a 31-year period were subjected to a bibliometric study. These articles were divided into 1,502 research papers and were written by 14,509 researchers. The study evaluates author contributions, publication trends, and the overall influence of agricultural research using scientific data analysis tools. The findings highlight important patterns in agricultural research publications, highlighting the difficulties and endeavors of agricultural colleges. While these institutions strive to sustain and promote agricultural education, external factors, such as climate change and societal perceptions, pose significant hurdles. The findings also shed light on the evolving focus areas within agricultural research. This study provides a comprehensive long-term analysis of agricultural research output in Tamil Nadu, offering insights into publication patterns, institutional contributions, and critical discussions surrounding agricultural education. By systematically evaluating the impact of agricultural universities, this research adds to the discourse on sustaining agricultural knowledge and its relevance in modern society.

Keywords: Agricultural, Scientometric study, Research Output, Bibliometric, Scientific data.

INTRODUCTION

In locations like Tamil Nadu, which has one of India's largest agricultural regions, agricultural universities play a crucial role in advancing agricultural research and innovation. These 28 specialized colleges act as centers for scientific research and technological development in addition to offering thorough agriculture education. Their impact goes beyond conventional education since they promote capacity building, policy support, and agricultural sustainability. Precision farming, data-driven decision-making, and AI-based analytics have all emerged as a result of the digital transformation of agriculture in recent years. The use of smart technologies in agriculture has been the subject of numerous research. For instance, IoT-based precision farming methods for soil monitoring and production prediction were offered by [Kumar et al., 2023]. In a similar vein, [Sharma & Patel, 2022] created a machine learning framework to maximize irrigation and crop scheduling. [Rao et al., 2023] emphasized how GIS and remote sensing may improve land-use planning and agricultural forecasts. Notwithstanding these developments, the majority of current research concentrates on the application of discrete technical solutions without conducting a thorough assessment of academic contributions, institutional preparedness, or systemic integration at agricultural colleges.

By assessing the strategic role of agricultural institutions, particularly in Tamil Nadu, in fostering innovation, information sharing, and technological adoption in agriculture, this study fills a significant vacuum in the literature. It seeks to evaluate their institutional capacities, pinpoint technology transfer barriers, and offer a comprehensive plan for enhancing their position in the field of agricultural innovation. With the growing importance of agricultural research, it becomes imperative to assess the productivity of agricultural universities in Tamil Nadu. Scientific quantitative analysis serves as a valuable tool for quantitatively evaluating research output, collaboration patterns, and impact in the agricultural domain. By analyzing bibliographic indicators such as publication count, citation rates and faculty affiliations, this study aims to provide a comprehensive overview of the research productivity of agricultural universities in Tamil Nadu.

LITERATURE REVIEW

Kanagasundari, Dr. S., Kohila, G. T., and Prasannakumari, N. (2019) conducted a bibliometric analysis of 718 publications related to the social aspects of the blogosphere, published between 2002 and 2018 and indexed in the Web of Science online database. The study revealed that the highest number of publications occurred in the years 2010 and 2013, each with 76 records. This was followed by 72 publications in 2009, 69 in 2015, and 67 in 2011. The lowest publication output was recorded in the early years of 2002, 2003, and 2004, with only one publication each year, likely due to the nascent stage of web development during that period. In total, 1,368 authors contributed to 520 journal publications, while institutions contributed 668 records in the form of articles. The study also analyzed various bibliometric indicators such as journal contributions, author rankings, publication preferences, and keyword frequency.

Research design

This chapter deals with contents and meaning of undertaking the study in terms of objectives, methodology, data collection, statistical tools and techniques used, operational definition of key concepts and limitations of the study.

Objectives

The main objective of this study was to use Research on Productivity in Agricultural Universities of Tamil Nadu: Scientometric Analysis with special reference to research activities at global level:

- To identify and analyze the rate of growth of research productivity;
- To examine the Year wise distribution of publications;
- To note the Document wise distribution of publications;

Kanagasundari *et al.*,

- To analyze the authorship pattern and examine the extent of research collaboration

Statement of the Problem

The present study aims to analyze the research performance of agricultural universities in Tamil Nadu. Agricultural research plays a vital role in monitoring agricultural progress, improving livelihoods, and contributing to national development. This study seeks to understand how such research is received and justified by experts, the challenges they face—particularly in the context of climate change—and how they respond to these issues. It also aims to explore the efforts of individuals working against these challenges, gather their demands, and examine the beliefs that drive their actions. Bibliometric analysis serves as an important tool in this research. Accordingly, the researcher proposes to undertake a study titled “Research on Productivity in Agricultural Universities of Tamil Nadu: A Scientometric Analysis.” This study seeks to examine the patterns, trends, and impact of research output within these institutions using scientometric methods.

METHODOLOGY

This scientometric/bibliometric study analyzes the research productivity of agricultural universities in Tamil Nadu using data from the Web of Science (WoS) database. The study examines publication trends, authorship patterns, language, formats, country affiliations, and journal preferences. Statistical tools such as trend analysis, correlation analysis, and time series analysis are applied to assess relative growth, doubling time, and to predict future research trends. The data were processed and visualized using HistCite software, which supports quantitative scientific analysis. The choice of WoS over other databases was due to its comprehensive coverage and citation indexing capabilities.

Data Collection

For collecting the publication metadata, the renowned Web of Science (WoS) was used which covers a selected group of journals, conferences and other sources. The data was collected for the period 1993-2023. The 31 years period is a good period for detailed analytical purpose.

Tools and Techniques

Agricultural Universities in Tamil Nadu is used in the present study. The total of 5501 records was published in Agricultural Universities in Tamil Nadu at global level. The research output was analyzed using various scientometric indicators. Histcite software is designed to assist a user in analyzing bibliographic data, or any data of a textual nature formatted in a similar manner. The present study examines a total of 5,501 records published by agricultural universities in Tamil Nadu over a 31-year period from 1993 to 2023, as indexed by the Web of Science online database. This extensive dataset offers a comprehensive view of the research landscape in this field, revealing patterns in publication output at the global level.

Peak Publication Years

The highest number of publications occurred in 2021, with 504 records, followed closely by 2020, which saw 394 records. This surge in publication output may reflect increased research funding, collaboration efforts, and a growing emphasis on addressing agricultural challenges through scientific inquiry.

Author Contributions

The analysis indicates that 14,997 authors contributed to the publications across 1,502 journals. This reflects a robust collaborative environment within the agricultural research community, highlighting the active engagement of researchers in disseminating their findings.

Kanagasundari *et al.*,

Institutional Contributions

The publications emerged from 3,602 institutions located in 131 countries, illustrating the global nature of agricultural research and the diverse international collaboration involved in addressing agricultural issues.

Table shows that the year wise and H-Index distribution of the publications. It also shows that in the year 2009, 2010 and 2012 has got highest 27 H-Index against 106, 139 and 228 publications, followed in the year 2013 with 26 H-index against 252 publications and third highest h type index is 24 with 105 and 290 publications in the year 2009 and 2014. It also shows that the in the year 1993 has got lowest 3 H-index against 20 publications and the following year 1994 has got 4 H-index against 15 publications and rest as well as follows. The mean Global citation is 29.83 (2009) with 106 publications. Figure 1 shows that the Year wise distribution of the publications. It's divided into two categories. One is X category (year wise distribution of the publications) and another one is Y category (Record of the publications). The highest number of the publications in the year 207 with 504 records and second level of the distribution of the publications in the year 2016 with 394 records and rest as well as follow in the figure dot mark. This figure followed in the cone methods of the distribution of the publications.

Figure 2 shows that the exponential growth rate of the distribution of the publications. X axis cover the record of the publications and Y axis cover the yearly wise distribution of the publications. Blue line segments in year wise distribution of the publications, Red curve is followed by the records and Dark blue curve is followed by the Exponential growth rate is also perpendicular to x axis. Table shows that the distribution of the publications from Tamil Nadu is in 7 formats. Of which the research Articles in Journals is the most preferred format of publication in Agricultural Universities research as it forms 91.18% of the total output. The other preferred forms by the Tamil Nadu researcher as article: Proceedings paper (4.13%), Reviews (2.19%), Editorial Material (1.39%), Biographical-Item (0.31%), Meeting abstract (0.16%) and others (0.65%). Overall the most of coverage document area in articles and the least product of publications by others or miscellaneous document with 52 records of the publications respectively.

Research Articles in Journals

- The overwhelming majority of publications, constituting **91.18%**, are research articles published in peer-reviewed journals. This preference highlights the importance placed on rigorous academic standards and the desire for broad dissemination of research findings within the scientific community.

Proceedings Papers

- The second most common format is proceedings papers, accounting for **4.13%** of the total output. This reflects the engagement of researchers in conferences and workshops, contributing their findings to collective scholarly discussions.

Reviews

- Review articles represent **2.19%** of the publications, indicating an effort to synthesize existing research and provide comprehensive insights into specific agricultural topics.

Editorial Material

- Editorials make up **1.39%** of the publications, suggesting that researchers are also involved in discussing broader issues and trends in agricultural science.

Biographical Items and Meeting Abstracts

- These formats, with **0.31%** and **0.16%** respectively, indicate limited use, possibly reflecting their more specialized nature within the context of agricultural research.

Others (Miscellaneous)

- This category includes a variety of formats and constitutes **0.65%** of the publications, with a total of **52 records**. This low percentage highlights the predominant focus on the more established formats of research articles and proceedings.

This figure shows that the Author wise distributions of the publications is divided into two parts, one is x axis mention the Name of the authors and another one is Y axis mention the number of records. It also clear and mention the different size of the cones. Author Zhang TY published highest number of articles for the study period with 40 records; next author Li H published next highest number of articles for the study period with 33 records, Jin Y published 32 records, Kumar A 28 records, Chen XM published 25 records, Amanullah and Arif M published 24 records, Singh S, Wang SZ and Wu YM published 22 records, Zhang XG published 21 records, Khan NU published 20 records and as well as follows.

Collaborative Index in Agricultural Universities in Tamil Nadu Research

It can be observed that the result of highest value to lowest in the year 2016 had index value 4.59, for 2022 the index value is 4.50, 2016 has an index value of 4.44; 2014 the index value is 4.40, 2020 had index value 4.29, 2021 and 2017 had index value is 4.14, 2019 has an index value of 4.11, 2015 has an index value of 4.05, 2012 had index value is 3.91, 2013 has an index value of 3.90, 2008 had index value is 3.52, 2011 has an index value of 3.50, 2003 has an index value of 3.47, 2005 had index value is 3.41, 2007 had index value of 3.38, 2010 had index value is 3.32, 2007 had index value is 3.18, 2012 has an index value of 3.07, 2002 had index value is 3.03, 2004 the index value is 2.87, 2001 the index value is 2.72 and 2000 has an index value of 2.65. Results from the table shows, the trend in authorship pattern and collaborative measures. The 'Collaborative Index' for universal level is 3.90 which show the popularity towards collaborative research pattern than single author research in chosen field of Agricultural Universities in Tamil Nadu research output. The Figure 4 shows that year wise distribution of publications and citations. Calculation of the h-index is based on a list of publications ranked in descending order by the Times Cited. The value of h is equal to the number of papers (N) in the list that have N or more citations. The calculated in the h-index as follows in the formula. An h-index of 79 means this author has published at least 79 papers that have each received at least 79 citations.

Total No of Publications: 5501

Sum of the Times Cited: 46269

Times Cited without self-citations: 45199

Citing Articles: 42845

Average Citations per Item: 9.05

H-index: 79

Summary of Findings and Conclusions

This study extracts data from a set of scientific publications on Agricultural University of Tamil Nadu and presents an overview of their conclusions and recommendations. It includes a total of 5501 articles. That means selecting a 30-year period and specifically covering data from 1993 to 2023.

Release Results

- 5501 articles were published in 31 years.
- More publications have been published in recent years in terms of number of publications. This means that every year the number of publications is increasing.
- Publications in 2017 included 504 articles, followed by 394 in 2016 and 375 in 2018.

Authorship and collaboration

- The average number of authors per article is 3.90.
- The average productivity per author is 0.26 publications.
- Collaborative work is widespread, with both faculty groups highly productive, exemplifying a trend toward increased collaboration.

Output Formats

- Most of the publications are in article form, with 4660 articles accounting for more than half of the total publications. Other forms account for the remaining outputs.

Kanagasundari et al.,

Best Authors and Quotes

- Among the top 25 authors, Jin Y leads with 100 references for 32 publications.
- Other notable authors include Kolmer JA with 85 cited references for 22 publications, Chen XM with 60 cited references for 25 publications, and Chen MS with 57 cited references for 19 publications.
- There are only two authors with more than 200 global citations, five with 150 citations, seven with more than 100 citations and eight with 50 citations.
- Open Access Publications:
- There are 1018 open access records, which contribute to the visibility and accessibility of research publications.

CONCLUSION

The region's increasing emphasis on agricultural research is highlighted by the scientometric examination of research output from Tamil Nadu's agricultural universities, which shows a consistent and notable rise in scholarly publications over time. With a doubling duration of roughly 31 years, the study found a noteworthy research articles in journal of 91.18% (insert real data) in publications during the past ten years, suggesting a rising momentum in research. With more than 22% of the articles co-authored, collaborative authorship became a prominent trend, indicating that team-based research has become essential to scientific production in this area. With 18.51% of papers publicly accessible online, the data also shows a shift towards open access publishing, which improves visibility, citation impact, and societal significance. The study's main conclusion is the concentration of high-impact publications in recent years, which is backed by an increase in the frequency of citations and the presence of multiple highly referenced authors. These findings demonstrate the growing caliber and effect of research coming from these institutions.

Suggestions and Opportunities

- To further improve research quality and worldwide reach, Tamil Nadu's agricultural institutions should fortify their international and inter-institutional partnerships.
- To increase the visibility and impact of scientific work, there is a compelling argument for maintaining support for open access platforms.
- To increase citation performance, institutions should think about strategically publishing in high-impact journals that were found in this study.
- To further understand the dynamics of agricultural research in the state, future studies can examine financing trends, subject-specific growth, and the social use of research output. This study establishes a standard for academic planning, policy-making, and institutional development while offering fresh perspectives on the research environment of Tamil Nadu's agricultural universities.

ABSTRACT

This study aimed to conceptualize and develop an assessment tool in the form of the yogasana scale to assess the well-being of adolescents through the practice of yogasanas. For this purpose yogasana concept was designed and developed from astanga yoga of Indian yoga philosophy text books. Though yoga philosophy provides a rich theoretical base but the major disconnect is its use as a tool for health and well-being remains unexplored. In this paper, we made an attempt to develop a questionnaire tool for yogasana. To test the tool, we collected the data from 599 participants with ages between 13 to 18 years. The data were analysed using SPSS-AMOS version 25's exploratory and confirmatory factor analysis methods. Fifteen factors were extracted and confirmed from the analysis. The KMO and Bartlett's significance test value found to be 0.95, $p < 0.0001$. Further, three different fitness categories of indexes comprising Absolute, Incremental and Parsimonious fits were also analysed and found to be acceptable within the limits. The composite reliability value from confirmatory factor analysis was 0.95 and the R^2 correlations were found to be 0.7 - 0.77, $p < 0.001$ and for other scales were found to be 0.46 and 0.48 values. The yogasana scale was found to be beneficial for the health and well-being of adolescents.

Keywords: Yogasana, Health, Wellness, Adolescent, School, Scale development

Ananya Gupta et al.,

INTRODUCTION

Yoga as an integral part of lifestyle helps in improving health and well-being. In the pre-Vedic period (2700 B. C.), yoga started its journey as an ancient Indian philosophy of holistic health care system and proposed numerous practical techniques such as yogasana or postures for proper physical and mental well-being [1]. Modern science affirms the effectiveness of yogasanas on human physiology which is helpful in the physical growth, maintaining body structure, body perimeter and weight under control, increases vitality and psycho-physical parameters such as wellness, self-confidence, emotional control, quality of life and social health among adolescents [2-11]. Therefore, the aim of the present study is to develop a psychometric tool to measure the health effects of daily yoga practice in adolescents so that the benefits of practicing yoga by each adolescent individually can be assessed by self-reporting. So that every adolescent, while evaluating his health, understands the importance of the effect of yogasanas with interest and full heart, includes yogasanas practice in his daily routine and can always be healthy. In this context, a fitness mantra has been given by the World Health Organization that; "Let's be active everyone, everywhere, every day", because regular physical activity is an essential aspect of our life to have good health and well-being [12]. For good health of adolescents, WHO recommends the minimum duration of 60 minutes of moderate to vigorous-intensity physical activity as part of their daily routine, including yogasanas and sports [12]. Unfortunately, a decline in physical activity have been observed as only 1 in 3 adolescents are estimated to meet these WHO (2018) guidelines [13,14], possibly due to increasing sedentary ways of life of using overtime Internet, facebook and mobile games. In support, the range of physically inactivity has grown in Indian population varies from 10 percent to 90 percent [15,16] with gender variations. In addition, WHO (2018) reported around 23 percent of adults and more than 80 percent of adolescents were insufficiently engaged in physical activity [12]. As Consequences physical inactivity has been found to be the fourth leading risk factor for global mortality [17]. Moreover, the physical inactivity is estimated to be the main cause for breast and colon cancers (21 to 25 percent) and diabetes (27 percent) [18], ischaemic heart disease burden (about 30 percent) [19] and lifestyle-associated risk factors [20]. Most of the risk factors are behaviourally acquired and are due to change in lifestyle during adolescent age group. All these studies show the need for alternative yoga lifestyle for good health and well-being.

Conceptual Frame

The concept of yogasana is developed based on four major Indian text books of yoga viz; (i) *Patanjali Yog-Darshana*, (ii) *Gheranda Samhita*, (iii) *Hatha Yoga Pradipika*, and (iv) *Asana Pranayama Mudra Bandha* [21,22,23]. In *Patanjali Yog-Darshana*, the asana is explained in the form of a verse "*Sthirasukhamasanam*" and may be translated as a physical body posture in a steady, stable and comfortable position [21]. Sage *Gheranda* in his *samhita* treatise explains asana as a body position in a particular way for maintenance of final position without any type of physical stress [22]. Sage *Swatmarama's* *hath yoga pradipika* elucidates the concept of yogasanas body postures that steadily gains a stable posture resulting into a feeling of light body weight [23]. Swami *Satyananda* views yogasana as a technique of bending the body in a position where one can relax, concentrate and meditate for mental well-being and not a form of physical exercise. It may be interesting to note that all four authors at different periods of time have arrived more or less at the same definition that asana stands for a steady and comfortable position without any distress. All these yoga text books form the foundation in forming the conceptual frame (Figure 1). Based on the conceptualization diagram (Figure1), constructs may be evolved for item generation. As seen from the conceptual frame there multiple benefits mentioned and its relation to yogasana frame. The major disconnect is data supplement to the concept. So, we proposed a hypothesis to relate the independent variable yoga to the dependent variable health and well-being. The hypothesis may be stated for the scale development.

MATERIALS AND METHODS

The study methodology was conducted in three stages- the 1st stage involves item development and refinement of the constructs developed from the conceptual frame. The second stage is to test the refined items with a sample size population of adolescents and carry out the exploratory and confirmatory factor analysis using SPSS-AMOS (Version

**Ananya Gupta et al.,**

25.0) and finally, the scale is tested which is obtained from the preceding two phases. The details of these phases were

Stage I: Items development

As explained in the conceptual frame (Figure 1), we developed 20 constructs from the four text books of yoga i.e. (i) *Patanjali Yog-Darshana*, (ii) *Gheranda Samhita*, (iii) *Hatha Yoga Pradipika*, and (iv) *Asana Pranayama Mudra Bandha* [21,22,23]. In this research work method of inductive approach is used [24]. The inductive approach is a strong theory-based hypothesis testing that explains the causal relation between yogasana and well-being. The stated hypothesis in this thesis is well-being relation to yogasana. A 5-point Likert scale was used to quantify the questionnaire.

- **Item refinement, modification and review by experts**

The face validity of the items was carried out with the members of our research scholars group at the university. The feedback given by these scholars were used in simplifying the question statements and modified suitably for better understanding. Five subject matter experts from were considered to evaluate the content validity of the items [25]. All these experts were from different fields of social sciences- statistics, philosophy, yoga, psychology, and medical sciences. A 4-point scale (1 = not relevant, 2 = some-what relevant, 3 = quite relevant, 4 = highly relevant)) was given to determine the content validity index (CVI). These experts sent their answers by email to evaluate the original 20-items and exclude any theoretically or practically irrelevant questions or any ambiguous items that apparently repeated the essential content of other items. Therefore, 02 items on the draft yogasana scale (YS) were deemed to be invalid because they yielded CVIs of $1/4=0.25$ to $2/4=0.50$ and were removed from the questionnaire with CVI lower than 0.75 [25,26]. All the remaining items were valid with CVIs ranging from 0.75 (3/4) to 1 (4/4). In addition, the experts also gave suggestions for the new items that could be generated. Based on these suggestions and refinement, even after rejection and were retained with an 18-items scale.

Stage II: Sample size

For the purpose of the development of questionnaire initially, DeVellis (2016) recommends a ratio of 1:15 or 1:20, up to approximately 300 participants as an ideal sample size [27]. Learning from the literature, a sample size of a ratio of 1:15 was decided to ensure the sample adequacy. The present study on scale validation was conducted with sample of 599 Indian adolescents (age range between 13 to 18 years; average age: 15.5 years) who were selected based on convenient sampling. The detailed demographic information of the participants is provided in Table 1.

Inclusion criteria: Yogasana practitioner and age of the individuals was considered as the criterion for inclusion and adolescents aged above 13 years to below 18 years were included in the study.

Exclusion criteria: We have excluded the students who are non-yoga practitioners, physically disabled, suffering from chronic ailments and un-healthy participants.

Stage III: Final items

The scale was further subjected to item analysis using the exploratory analysis (EFA) and confirmatory analysis (CFA) dimension reduction method of factor analysis. In these items found below 0.4 correlation value were deleted and final item scale left with 15 item yogasana scale.

RESULTS

The exploratory analysis (EFA) and confirmatory analysis (CFA) uses after further dropping down of three items from 18 items yogasana scale (15 items), a factor structure that is replicated for confirmatory analysis using SPSS-AMOS version 25. The KMO and Bartlett's tests of sphericity were conducted for knowing the sample adequacy. The value is found to be excellent 0.95 which is more than the accepted value of 0.5 and above [28,29]. It is significant at $p<0.0001$. The values of KMO values and Bartlett's tests of sphericity are provided in Table 2. The scale was subjected

**Ananya Gupta et al.,**

to varimax rotation and found to have correlation values with a single loading factor itself. A variance of 59.05% was observed and had the Eigen value of 8.7. Finally, the scale had 15 items. The loading factors of various items were shown in Table 3. Only factor loadings greater than .40 are reported, in order to aid interpretation of the factor structure. The various structure equation fitness indices are given in Table 4. All three different fit indices minimum level was achieved with 35 iterations. Figure 2 represents the CFA with path coefficients, associated errors and the latent variable as “wellbeing through asana” (WBtA). With the above procedures completed for the structural equations model, further one need to compute important measures which indicate the validity and reliability of the SEM constructs. As has been said that uni-dimensionality, validity and reliability for the measurement model are required [30,31].

DISCUSSION AND CONCLUSION

The purpose of this study was to develop the constructs based on the Indian Yoga philosophy text books on yogasanas, a limb of astanga yoga using a theoretical model. In this study, the item scales explain an excellent KMO value of 0.95 and the item had a single iteration factor loading. Earlier studies have shown the KMO value of 0.71 in the sub domain scale of astanga yoga [32-35]. The results of this present study indicate the better sample accuracy measure. The philosophical and psychological significance of yoga techniques were explored a complex Indian model of health and well-being. The scientific interpretation of the yoga verses was given a greater meaning through yogasana scale development. Most of the studies focus on clinical and therapeutic aspects of yoga while the sedentary life style of adolescents without much of physical activity, yogasana helps in maintaining good health and well-being. No self-report measure exists in this conceptual frame of development. The present study addresses not only this gap but also uses confirmatory factor analysis where it predicts good path regression coefficients that fit the structure equation measurement model. This will be a useful asana tool for further research in the other limbs of astanga yoga separately. This yogasana scale has good psychometric properties with excellent composite reliability value of 0.95 and the overall scale shows a fair degree of correlations above 0.70. The reliability value shows a good number of items in the main yogasana scale while researcher Raina's sub scale asana had only 3 items with poor reliability [32].

Literally major traditional yoga texts provide support for the specific ways in which regular practice of yoga asanas actually improves health [36,37]. For example in *Hathapradipika*; Sage *Swatmaram* talks about fifteen asanas but he only mentioned the benefits of seven asanas out of which *Siddhasana*, *Padmasana*, *Simhasana* and *Bhadrasana* are considered as more helpful in spiritual growth rather than some physical benefits maybe because they comes under meditative postures but the researchers have showed many more physical benefits of these asanas because spiritual dimension is a subtler level and it is not possible to check yet, through the instruments which are available. It is clearly mentioned in these major yoga literature that practice of various yogasanas provides many types of health benefits. In this context, many scholars have presented the scientific basis that regular practice of yoga actually benefits the practitioners by providing many health benefits. Many research studies currently being conducted on a large scale show a high percentage of psychophysical benefits obtained from the practice of asanas. Apart from this, many such researches were also seen which provide information about the mental, physical as well as emotional and spiritual benefits of yogasana.

In this context, as a result of a yoga survey conducted as part of a research study by researcher Penman and other colleagues in 2012, only 19% of participants reported spiritual benefits derived from yoga [36]. Whereas according to a study conducted by researcher Park and other colleagues in the year 2016, practicing yoga for a long time is a helpful technique in developing spirituality [37]. They also presented the result that while starting the practice of yoga, the practitioner does not have much desire for spiritual benefits, but with prolonged practice, a change was seen in their outlook and the attitude of most yoga practitioners towards spiritual progress [38]. However, this present scale also has its own limitations. The first limitation is the complexity of the yoga concept with different interpretations of yoga in different philosophical text books. It was a tough measure to comprehend. In addition, own

Ananya Gupta et al.,

formulation of the items scale may not resonate with others in testing the scale. Next limitation is its variance, 59% which is little above the accepted limit of >50% which requires further refinement.

ABSTRACT

Performance of Machine Learning Models struggles when the data floods into the stream in a diversified manner. Any discipline, whether it is the stock market, or medical diagnosis, or business-oriented systems, expects instant solutions in this digital era, with less computation time. Researchers have developed Deep Learning Models that mimic the human brain, compute with the data and constraints given, and provide accurate results, even when the data is in various formats and volumes. This study analyses the widely used RNNs, CNNs, and Hybrid Models that increase the accuracy of prediction. The fusion of RNNs with CNNs outperforms all other models taken for this study. These models, however,

used a bit of additional resources to compute, yet proved their power to predict in terms of accuracy and high throughput. To conclude, to reduce the resource intensity and carbon footprints, researchers' direction will move towards green AI models in the near future.

Keywords: Forecasting, Machine Learning, RNN, CNN, Hybrid Models, Green AI Models.

INTRODUCTION

The first-generation machine learning and deep learning models are considered to be classic models today, due to their performance with respect to computational time, gets degraded when working with big data, but their accuracy of prediction exists [1-2]. For any kind of real-time scenario, people expect instant results. Hence, these models must be trained with past data and must be able to predict the future. The second-generation deep learning models paved the way for forecasting. These models have started to perform exceptionally with complex datasets having data in varieties and huge in volume [1-2]. These models were able to find the patterns and relationships that the classic models could not find. Recurrent Neural Networks (RNN), such as Long-Short Term Memory (LSTM) models, were used to forecast the results based on sequential data [3]. On the other side, Convolutional Neural Network (CNN) has been designed, developed, and launched exclusively for the purpose of image recognition [4], classification [5], and pattern analysis [6] on images, showing potential impact on forecasting. [7-9] There are scenarios where one particular model cannot provide good results due to its limitations. Hence, researchers started developing hybrid models where a fusion of one or more models was together to provide accurate results. The need for these kinds of fused models helps their end-users to overcome issues such as overfitting, underfitting, poor feature selection, etc. Hence, hybrid models paved the way to forecast accurately. [10-15] This paper discusses issues such as data preprocessing and computational complexity by evaluating the AI Models and how the model works effectively when compared to the conventional approaches. The study presents a systematic framework to integrate AI systems in forecasters' workflows to deliver actionable insights for researchers and practitioners.

Novelty and Contribution

This research is novel because of its holistic integration of AI-based forecasting techniques while considering practical issues for real-world applications. While previous studies have explored individual AI models or specific domains, this study emphasizes:

- **Comprehensive Model Evaluation:** Comparison between RNNs, CNNs, and hybrid models over various datasets, where the relative strengths and weaknesses of the RNNs, CNNs, and hybrid models are systematically highlighted.
- **Domain-Agnostic Framework:** A flexible forecasting framework to be customized for industries such as finance, healthcare, and logistics.
- **Scalability Insights:** Computational efficiency exploration, to show how GPU-based architectures and cloud platforms can aid in scalability.
- **Addressing Interpretability:** We propose methods to enhance the explain ability of AI models by addressing the accuracy-untrustworthiness gap.

Related Works

Over the years, data-driven decision-making has relied on the powerhouse of forecasting, moving from standard statistical models to complex AI-based techniques. The traditional methods like Autoregressive Integrated Moving Average (ARIMA), Exponential Smoothing (ES), Moving Average (MA), and Seasonal Autoregressive Integrated Moving Average with Exogenous Regressors (SARIMAX) have been extensively used because of their simplicity and interpretability. Nevertheless, these models tend to be inappropriate for application to complex, non-linear data sets and are relatively inflexible when dealing with varying data patterns as well as huge amounts of unstructured data. This has led to the recent adoption of machine learning and deep learning methods since traditional approaches

Priya et al.,

recently faced the limitations thereof [16]. Chen, J. et. al, in 2025 [17] pinpointing the inefficiency of the classic models like ARMA and ARIMA to deal with nonlinear and high frequency data, suggested a Bi-LSTM model with AutoML techniques and achieved a Mean Absolute Percentage Error (MAPE) of 18.7% success in predicting 6 waste categories. The data is collected using IoT, and it has been forwarded to the AI model Bi-LSTM. Frimpong, A. T., et. al, in 2025 [18] used 3 Machine Learning Models such as Linear Regression (LR), Random Forest (RF), and LSTM for forecasting the Municipal Solid Waste Generation (MSWG), by integrating socioeconomic and geospatial variables. The conclusion was that the feature “built area” plays a key role in generating solid waste. Thereby, proper planning in government policy and urbanization becomes important. Thus, the model supported the authors for their strong suggestion. Kumar, N. et. al, in 2024 [19] created a lightweight Graph Former model that uses the LSTM for preprocessing the raw data and a graph-based Transformer with Light weight Multi-Layer Perceptron to forecast the MSWG. The author concludes that this hybrid model had shown 98% accuracy. Li, N., & Chen, Y. in 2023 [20] suggested CNN-LSTM based solid waste collection system to segregate 6 different objects on a conveyor belt, achieving 97.5% accuracy. Ihsanullah, I. et. al, in 2022 [21] suggest that AI Techniques are powerful tools in predicting the MSWG. In the near future, the AI tools can be converted into applications for optimal control of generation, transportation, and disposal of waste. Establishing a trend toward research on hybrid models incorporates the best of multiple techniques. Relying on the sequential data processing power of RNNs [22] and the spatial feature extraction capabilities of CNNs, these models exploit more advantages [23]. For instance, hybrid CNN-LSTM models were successfully employed in energy demand forecasting [24], stock market analysis [25], and climate forecasting [26]. Such combinations often outperform single models by their accuracy as well as robustness. To enhance the performance of Neural Network Models, Evolutionary algorithms have been successfully integrated for feature selection, to identify relevant variables, and to decrease computational overhead. Admittedly, such algorithms, including genetic algorithms and particle swarm optimization, are ensemble with deep learning models to augment input quality as well as to optimize hyper-parameters [27].

PROPOSED METHODOLOGY

Using advanced artificial intelligence (AI) models, a proposed methodology provides an effective forecasting system with the ability to independently handle complex, nonlinear, and high-dimensional datasets. In this approach, data preprocessing, feature selection, and model training are done using deep learning structures and hybrid models. This paper focuses on creating a model that is robust, scalable, and efficiently forecasts the results. As the model was executed under GPUs, its computational time was recorded.

Data Preprocessing

Data preprocessing provides the quality and importance of data being processed. This involves:

- Normalization: Efficient data scaling from either 0 to 1 or from your min/max data. The normalization equation is:

$$X_{norm} = \frac{X - X_{min}}{X_{max} - X_{min}}$$

where X_{norm} is the normalized value, X_{min} and X_{max} are the minimum and maximum values of the feature, respectively.

- Outlier Detection: It has been found that the anomalies can be removed via the use of statistical techniques.
- Data Augmentation: When we encounter class imbalance in our dataset, it's crucial to consider effective methods for generating synthetic samples.

Feature Selection

Feature selection by genetic algorithms (GA) is employed to optimize input quality. The GA operates as follows:

- Initialization: Generate randomly an initial population of feature subsets.
- Fitness Evaluation: Run a defined fitness function, e.g. accuracy, or mean squared error (MSE) to measure the performance of each subset.

Priya et al.,

- Selection, Crossover, and Mutation: Let the best subsets remain, then combine them together, and add random variations.

The fitness function is given by:

$$F(S) = \frac{1}{N} \sum_{i=1}^N (Y_i - \hat{Y}_i)^2$$

Where S is the feature subset, Y_i is the true value, $\hat{Y}_i$ is the predicted value, and N is the total number of observations.

Model Selection and Training

The methodology uses hybrid AI models combining recurrent neural networks (RNNs) and convolutional neural networks (CNNs):

- CNN Layer: It extracts spatial patterns in the data.
- RNN/LSTM Layer: We use temporal dependencies on time series data.
- The hybrid model architecture is trained using the backpropagation algorithm, minimizing the following loss function:

$$L = \frac{1}{N} \sum_{i=1}^N (Y_i - \hat{Y}_i)^2$$

Where L is the loss, N is the batch size, Y_i is the ground truth, and $\hat{Y}_i$ is the model prediction.

Scalability and Optimization

To handle large datasets, the methodology employs:

- GPU Acceleration: Reduction of computational time by training the models onto GPUs.
- Distributed Learning: Framework-based parallelization for tasks like Tensor-Flow, and PyTorch.

Validation and Testing

The model is validated using metrics such as Mean Absolute Error (MAE) and Root Mean Square Error (RMSE).

Mean Absolute Error (MAE)

$$MAE = \frac{1}{N} \sum_{i=1}^N |Y_i - \hat{Y}_i|$$

Root Mean Square Error (RMSE)

$$RMSE = \sqrt{\frac{1}{N} \sum_{i=1}^N (Y_i - \hat{Y}_i)^2}$$

The Proposed Methodology Below is the flowchart representing the proposed methodology:

RESULTS AND DISCUSSIONS

Benchmark datasets were used to implement the proposed forecasting methodology and evaluate its performance before providing some practical insights for the system. Results show the usefulness of the AI-based hybrid approach to capture complex patterns and make accurate forecasts. Comparison of the hybrid model performance to traditional and standalone AI techniques was a critical aspect of this evaluation. The training and validation loss across epochs for the hybrid model is illustrated in Figure 2. It is seen that there is a rapid convergence with the validation loss stabilizing around 20 epochs also meaning little overfitting. This result corroborates how the hybrid model in generalization to unseen data. In Table 1, we compare the hybrid model with standalone RNN and CNN models and find that it has a lower mean absolute error (MAE) and root mean square error (RMSE) than either of the

**Priya et al.,**

two individual architectures. [28-31] It is due to the hybrid model's capacity to simultaneously extract spatial and temporal dependencies in the data which yielded better performance than the other models. The dual focus increases its predictive accuracy in datasets with large sequential patterns, including financial and energy consumption data. In Figure 3 you will find a picture of the predicted versus the actual values for a test dataset. These curves are very close to each other and this allows you to know how accurate the model is [32]. We also test our hybrid model on datasets of different sizes, for a further analysis on scalability. In Figure 4, the model was shown to scale linearly, that is processing time increased proportionally with dataset size. The enormity of this scalability is a critical factor for real-world applications where such huge datasets exist. It was also evaluated how interpretable the forecasting model is. A feature importance analysis showed that variables such as temporal trends and sudden spikes in the data were the most important when making predictions. The methodology represented by this work effectively reduced data dimensionality using evolutionary algorithms, maintaining computational efficiency without sacrificing accuracy [33]. The proposed hybrid methodology results are validated as a robust and scalable solution to forecasting. By means of advanced preprocessing and optimization techniques applied with CNN and RNN architectures, the combination of CNN and RNN architectures shows excellent improvements comparatively to traditional and standalone AI methods. Tables and diagrams showing visualizations and comparisons show the model's ability to achieve accurate, reliable forecasts across all different datasets.

CONCLUSION

This research shows that deep learning models have the power to transform the way of prediction. AI-based forecasting stands as a powerful tool in modern analytics because its performance outweighs the complications from interpretation and processing requirements. Future research directions can focus on constructing green AI models that reduce the resources used and carbon footprint.

ABSTRACT

This article examines a clear explanation about the various properties of Intuitionistic $(gg)^*$ - closed sets with the use of $i(gg)^*$ - closure and $i(gg)^*$ - interior. As such, this research informs understandings of basic results of $i(gg)^*$ -closed sets. Introduction to $i(gg)^*$ - continuous function has played a major role with its unique properties and equivalent conditions. Ultimately this study aims to cultivate a more profound comprehension of $i(gg)^*$ - continuous function.

Keywords: $i(gg)^*$ -closed, $i(gg)^*$ - open, $i(gg)^*$ - closure, $i(gg)^*$ - interior

INTRODUCTION

Topology in mathematics is the study of spaces and characteristics that are maintained under constant deformations, such as stretching, crumpling, and bending, but not tearing or adhering. This field 'Topology' developed as a study out of geometry and set theory, through analysis of concepts such as space, dimension and transformation. The study of generalized closed sets was introduced by Levine in 1970 [1] "Intuitionistic set" is a concept in topological space was came into existence because of Coker [2] in 1996. Further he developed the concept with the use of intuitionistic point [3] and investigated some fundamental properties of closed sets in intuitionistic topological space. In 2009, it was further investigated and J.Younis Yaseen and G.Asmat Raouf [4] has given some results in intuitionistic

Hari Siva Annam and Pavithra

generalized closed sets in topological spaces. In 2019,[5] several new generalization of nano open sets has been introduced and discovered many results by Nethaji, Ochanan. Further G.Hari siva annam and S.Pavithra [6] has introduced intuitionistic generalization of generalized star closed sets in intuitionistic topological space in a proceeding where the igg^* is compared with various intuitionistic sets.

Continuity is a important concept in mathematics and many forms of continuous functions have been introduced over the years. The generalized continuity (briefly g - continuity) was studied by Balachandran, et.al,(1991). With the aid of g -open sets many topologist have introduced and investigated various continuous functions which are the core concept of topology. In this regard, many topologists have enriched the field of generalized closed sets to a considerable extend through their detailed study. J.G.LEE, P.K.Lim, J.H.Kim,K.Hur [7] introduced intuitionistic continuous, closed and open mapping, where many results were discovered and gave identity to many more new theorems. The concept of contra continuity via soft lattice topological spaces [8] was introduced in 2024 by G.Hari Siva Annam and T.Abinaya where these results gives a pathway for contra continuity. Further it was developed in this paper as intuitionistic generalization of generalized star (shortly $i(gg)^*$)continuous and discussed many ideas which evolved as a new discovery.

PRELIMINARIES

Definition 2.1 Let X be an non-void set. An intuitionistic set (IS for short) A is an object having the form $A = \langle X, A_1, A_2 \rangle$ where A_1 and A_2 are subsets of X satisfying $A_1 \cap A_2 = \emptyset$. The set A_1 is called the set of members of A , while A_2 is called the set of non members of A .

Definition 2.2 Let X be a non-void set and let A, B are intuitionistic sets in the form $A = \langle X, A_1, A_2 \rangle, B = \langle X, B_1, B_2 \rangle$ respectively. Then

- (a) $A \subseteq B$ iff $A_1 \subseteq B_1$ and $A_2 \supseteq B_2$.
- (b) $A = B$ iff $A \subseteq B$ and $B \subseteq A$.
- (c) $A^c = \langle X, A_2, A_1 \rangle$
- (d) $[] A = \langle X, A_1, A_1^c \rangle$
- (e) $A - B = A \cap \bar{B}$
- (f) $\emptyset_\sim = \langle X, \emptyset, X \rangle, X_\sim = \langle X, X, \emptyset \rangle$
- (g) $A \cup B = \langle X, A_1 \cup B_1, A_2 \cap B_2 \rangle$
- (h) $A \cap B = \langle X, A_1 \cap B_1, A_2 \cup B_2 \rangle$.

Definition 2.3 An intuitionistic topology (for short IT) on a non empty set X is a family I_τ of IS in X satisfying the following axioms.

- (1) $\emptyset_\sim, X_\sim \in I_\tau$
- (2) $G_1 \cap G_2 \in I_\tau$, for any $G_1, G_2 \in I_\tau$
- (3) $\cup G_\alpha \in I_\tau$ for any arbitrary family $\{G_i: G_\alpha/\alpha \in J\} \subseteq I_\tau$ where (X, I_τ) is called an intuitionistic topological space (for short ITS(X)) and any intuitionistic set in I_τ is called an intuitionistic open set (for short IOS) in X . The complement A^c of an IOS A is called an intuitionistic closed set (for short ICS) in X .

Definition 2.4 Let (X, I_τ) be an intuitionistic topological space (for short ITS(X)) and $A = \langle X, A_1, A_2 \rangle$ be an IS in X . Then the interior and closure of A are defined by

- (1) $Icl(A) = \cap \{K : K \text{ is an ICS in } X \text{ and } A \subseteq K\}$
- (2) $Iint(A) = \cup \{G : G \text{ is an IOS in } X \text{ and } G \subseteq A\}$.

It can be shown that $Icl(A)$ is an ICS and $Iint(A)$ is an IOS in X and A is an ICS in X iff $Icl(A) = A$ and is an IOS in X iff $Iint(A) = A$.

Definition 2.5 Consider an intuitionistic set A of a non -void set X and $a \in X$.

$a_I = (\{a\}, \{a\}^c)$ is an intuitionistic point (IP) and $a_{IV} = (\emptyset, \{a\}^c)$ is a vanishing point of X .
IP(X) is a set of all intuitionistic points or intuitionistic vanishing point in X .

Definition 2.6 Let (X, I_τ) be an ITS(X). An intuitionistic set A of X is said to be

- (1) Intuitionistic semi-open if $A \subseteq Icl(I\,int(A))$.
- (2) Intuitionistic pre-open if $A \subseteq Iint(Icl(A))$.

- (3) Intuitionistic regular-open if $A = Iint(Icl(A))$.

The family of all intuitionistic (semi-open, pre-open, regular-open) of (X, I_τ) are denoted by ISOS, IPOS, IROS respectively.

Definition 2.7 [4] Let a subset A of an intuitionistic topological spaces (X, I_τ) is called an intuitionistic generalized closed set (briefly $i\,g$ -closed) if $i\,cl(A) \subseteq U$ whenever $A \subseteq U$ and U is an intuitionistic open in (X, I_τ) .

Definition 2.8 [9] Let a subset A of an intuitionistic topological spaces (X, I_τ) is called an intuitionistic regular generalized closed set (briefly $i\,rg$ -closed) if $i\,cl(A) \subseteq U$ whenever $A \subseteq U$ and U is an intuitionistic regular open in (X, I_τ) .

Definition 2.9 [6] A intuitionistic subset A of an intuitionistic topological space (X, I_τ) is called an intuitionistic generalization of generalized star closed sets ($i\,(gg)^*$ -closed) if $ircl(A) \subseteq U$ whenever $A \subseteq U$ and U is $i\,(gg)$ open in (X, I_τ) . The collection of all $i\,(gg)^*$ -closed sets in (X, I_τ) is denoted by $i\,(gg)^*C(X)$.

Definition 2.10 [6] i) Every intuitionistic regular closed set is $i\,(gg)^*$ -closed.
ii) Every $i\,(gg)^*$ closed set is $i\,g$ -closed (resp. $i\,g^{**}$ -closed, $i\,gr$ -closed, $i\,gr^*$ -closed, $i\,rg$ -closed).

Definition 2.11 [6] The arbitrary union of two $i\,(gg)^*$ -closed sets of (X, I_τ) is $i\,(gg)^*$ -closed.

Definition 2.12 For an ITS (X, τ) and A is a subset of X . The class $\tau_A = \{(G_T \cap A, G_F \cap A) : G = (G_T, G_F) \text{ and } \{G \in \tau\} \text{ is an IT on } A\}$ is called the relative IT on A or the relativization of τ to A and the ITS (A, τ_A) is called an intuitionistic topological subspace of (X, τ) .

Intuitionistic $(gg)^*$ Closure

Definition 3.1 Let A be an intuitionistic subset of an ITS of (X, I_τ) . Then $i\,(gg)^*$ closure of A is defined as the intersection of all $i\,(gg)^*$ -closed set of (X, I_τ) containing A . It is denoted by $I\,(gg)^*cl(A)$.

Theorem 3.2 If A and B are $i\,(gg)^*$ -closed, then $A \cap B$ is $i\,(gg)^*$ -closed.

Proof: Let A and B are $i\,(gg)^*$ -closed sets and $A \cap B \subseteq U$, U is $i\,gg$ -open. Suppose $ircl(A \cap B) \not\subseteq U$ then $ircl(A) \not\subseteq U$ and $ircl(B) \not\subseteq U$. This implies $A \cap B \not\subseteq U$. Hence $ircl(A \cap B) \subseteq U$.

Theorem 3.3 If A and B are an intuitionistic subsets of an ITS of (X, I_τ) then

- i) $i\,(gg)^*cl(X_\sim) = X_\sim$, $i\,(gg)^*cl(\emptyset_\sim) = \emptyset_\sim$
- ii) $A \subseteq i\,(gg)^*cl(A)$
- iii) If B is any $i\,(gg)^*$ -closed set containing A then $i\,(gg)^*cl(A) \subseteq B$
- iv) If $A \subseteq B$ then $i\,(gg)^*cl(A) \subseteq i\,(gg)^*cl(B)$
- v) $i\,(gg)^*cl(A) = i\,(gg)^*cl(i\,(gg)^*cl(A))$
- vi) $i\,(gg)^*cl(A \cup B) = (i\,(gg)^*cl(A) \cup i\,(gg)^*cl(B))$

Proof i), ii), iii), iv), v) are straightforward.

vi) Let A and B be subsets of (X, I_τ) . Clearly $A \subseteq A \cup B$ and $B \subseteq A \cup B$. From iv) $(i\,(gg)^*cl(A) \cup i\,(gg)^*cl(B)) \subseteq i\,(gg)^*cl(A \cup B)$. Now we have to prove that $i\,(gg)^*cl(A \cup B) \subseteq (i\,(gg)^*cl(A) \cup i\,(gg)^*cl(B))$. Suppose $x \notin i\,(gg)^*cl(A) \cup i\,(gg)^*cl(B)$ then there exists a $i\,(gg)^*$ -closed sets A_1 and B_1 such that $A \subseteq A_1$, $B \subseteq B_1$ such that $x \notin A_1$ and $x \notin B_1$. Therefore $x \notin A_1 \cup B_1$ such that $A \cup B \subseteq A_1 \cup B_1$. Hence $x \notin i\,(gg)^*cl(A \cup B)$. Hence $i\,(gg)^*cl(A \cup B) \subseteq (i\,(gg)^*cl(A) \cup i\,(gg)^*cl(B))$.

Theorem 3.4 A intuitionistic subset A of (X, I_τ) is $i\,(gg)^*$ -closed set in (X, I_τ) iff $ircl(A) - A$ contains no non empty $i\,gg$ -closed set.

Hari Siva Annam and Pavithra

Proof: Let A be an $i(gg)^*$ -closed set in (X, I_τ) . Suppose F is a non empty $i(gg)$ -closed set in (X, I_τ) such that $F \subseteq ircl(A) - A$ which implies $F \subseteq ircl(A) \cap (X - A)$. Then $F \subseteq ircl(A)$ and $F \subseteq (X - A)$. Since A is an $i(gg)^*$ -closed set, $ircl(A) \subseteq X - F \Rightarrow F \subseteq X - ircl(A)$. Hence we get $F \cap F \subseteq ircl(A) \cap (X - ircl(A)) = \emptyset$. Which is a contradiction. Therefore $ircl(A) - A$ does not contain any non empty $i(gg)$ -closed set.

Conversely, suppose that $ircl(A) - A$ contains no non empty $i(gg)$ -closed set. Let U be a $i(gg)$ -open set such that $A \subseteq U$. Suppose $ircl(A)$ is not contained in U . Then $ircl(A) \subseteq X - U$ Where $(X - U)$ is $i(gg)$ -closed set in (X, I_τ) and contained in $ircl(A) - A$. Which is a contradiction. Hence A is $i(gg)^*$ -closed.

Theorem 3.5 Let $A \subseteq B \subseteq ircl(A)$ and A is $i(gg)^*$ -closed set in (X, I_τ) , then B is also $i(gg)^*$ -closed.

Proof: Let U be an $i(gg)$ -open set in (X, I_τ) such that $B \subseteq U$. Now if $A \subseteq B \subseteq ircl(A)$, then $ircl(A) \subseteq ircl(B) \subseteq ircl(A)$. Therefore $ircl(A) = ircl(B)$. Since A is $i(gg)^*$ -closed, $ircl(A) \subseteq U$. Therefore $ircl(B) = ircl(A) \subseteq U$. Hence B is $i(gg)^*$ -closed.

Theorem 3.6 If A is $i(gg)$ -open subset of X and $i(gg)^*$ -closed set in X . Then A is i -regular closed set.

Proof: Since A is $i(gg)$ -open subset of X and $i(gg)^*$ -closed, $ircl(A) \subseteq A$. But $A \subseteq ircl(A)$. Therefore $A = ircl(A)$. Hence A is i -regular closed.

Theorem 3.7 Let $A \subseteq B \subseteq X$, Where B is $i(gg)$ -open and $i(gg)^*$ -closed in X . If A is $i(gg)^*$ -closed in B . Then A is $i(gg)^*$ -closed in X .

Proof: Let U be a $i(gg)$ -open set in X such that $A \subseteq U$. Since $A \subseteq U \cap B$, $U \cap B$ is $i(gg)$ -open in B and A is $i(gg)^*$ -closed in B , $ircl(A) \cap B \subseteq U \cap B$. Since $A \subseteq B$, $ircl(A) \subseteq ircl(B)$. Since B is $i(gg)$ -open and $i(gg)^*$ -closed in (X, I_τ) . By theorem(3.5), B is i -regular closed. Therefore $ircl(B) = B$. This implies $ircl(A) \subseteq B$. Thus $ircl(A) \subseteq U \cap B \subseteq U$. Hence A is $i(gg)^*$ -closed in (X, I_τ) .

Theorem 3.8 For every point $x \in X$, $\{x\}$, $\{x\}^c$ of the space (X, I_τ) the set $X - \{x\}$, $\{x\}$, $\{x\}^c$ is either $i(gg)^*$ -closed or $i(gg)$ -open.

Proof: Suppose that $X - \{x\}$, $\{x\}$, $\{x\}^c$ is not $i(gg)$ -open. Then (X, I_τ) is the only $i(gg)$ -open set containing $X - \{x\}$, $\{x\}$, $\{x\}^c$. That is $X - \{x\}$, $\{x\}$, $\{x\}^c \subseteq X$. This implies $ircl(X - \{x\}, \{x\}, \{x\}^c) \subseteq X$. Therefore $X - \{x\}$, $\{x\}$, $\{x\}^c$ is $i(gg)^*$ -closed set in (X, I_τ) .

Theorem 3.9 Let A be a subset of an intuitionistic topological space (X, I_τ) . Then $a_1 \in i(gg)^*cl(A)$ [resp $a_1 \in i(gg)^*int(A)$] iff for any $i(gg)^*$ -open set U containing a_1 , $A \cap U \neq \emptyset$.

Proof: Let $a_1 \in X$, $\{a_1\}$, $\{a_1\}^c \in i(gg)^*cl(A)$ [resp $a_1 \in i(gg)^*int(A)$] and suppose that there is a $i(gg)^*$ -open set U in X such that $a_1 \in U$ and $A \cap U = \emptyset \Rightarrow A \subseteq U^c$. Which is $i(gg)^*$ -closed in (X, I_τ) . Then $i(gg)^*cl(A) \subseteq i(gg)^*cl(U^c) = U^c$. Therefore $a_1 \in U \Rightarrow a_1 \notin U^c \Rightarrow a_1 \notin i(gg)^*cl(A)$. Which is a contradiction. Conversely, suppose for any $i(gg)^*$ -open set U containing a_1 , $A \cap U \neq \emptyset$. To prove $a_1 \in i(gg)^*cl(A)$. Suppose that $a_1 \notin i(gg)^*cl(A)$, then there is a $i(gg)^*$ -closed set F in X such that $a_1 \notin F$ and $A \subseteq F$. Therefore $a_1 \notin F \Rightarrow a_1 \in F^c$ which is $i(gg)^*$ -open in (X, I_τ) . Hence $A \subseteq F \Rightarrow A \cap F^c = \emptyset$, which is a contradiction. Thus $a_1 \in i(gg)^*cl(A)$.

Intuitionistic $(gg)^*$ - Interior

Definition 4.1 A intuitionistic subset of an ITS of (X, I_τ) is called $i(gg)^*$ -open set ($I(gg)^*OS$) if $X - A$ is $i(gg)^*$ -closed. The equivalent definition for $i(gg)^*$ -open set is that a set A is said to be $i(gg)^*$ -open iff $U \subseteq ig\ int(A)$ whenever $U \subseteq A$, U is $i(gg)$ -closed.

Definition 4.2 Let A be an intuitionistic subset of an ITS of (X, I_τ) . Then $i(gg)^*$ interior of A is defined as the union of all $i(gg)^*$ -open set of (X, I_τ) contained in A . It is denoted by $I(gg)^*int(A)$.

Theorem 4.3 If A and B are an intuitionistic subsets of an ITS of (X, I_τ) then

- i) $i(gg)^*int(X_\sim) = X_\sim$, $i(gg)^*int(\emptyset_\sim) = \emptyset_\sim$
- ii) $i(gg)^*int(A) \subseteq A$

Hari Siva Annam and Pavithra

iii) If B is any $i(gg)^*$ -open set contained in A then $B \subseteq i(gg)^* \text{int}(A)$

iv) If $A \subseteq B$ then $i(gg)^* \text{int}(A) \subseteq i(gg)^* \text{int}(B)$

v) $i(gg)^* \text{int}(A) = i(gg)^* \text{int}(i(gg)^* \text{int}(A))$

vi) $i(gg)^* \text{int}(A \cap B) = (i(gg)^* \text{int}(A) \cap i(gg)^* \text{int}(B))$

Theorem 4.4 If $i\text{rint}(A) \subseteq B \subseteq A$ and A is $i(gg)^*$ -open set then B is $i(gg)^*$ -open set.

Proof: Given $i\text{rint}(A) \subseteq B \subseteq A$ which implies $A^c \subseteq B^c \subseteq i\text{rcl}(A^c)$ where A^c is $i(gg)^*$ -closed set. By theorem (3.5) B^c is $i(gg)^*$ -closed set. Hence B is $i(gg)^*$ -open set.

Theorem 4.5 The arbitrary intersection of two $i(gg)^*$ -open sets of (X, I_τ) is $i(gg)^*$ -open.

Proof: Let A and B be the $i(gg)^*$ -open sets in (X, I_τ) . Then A^c and B^c are $i(gg)^*$ -closed sets in (X, I_τ) . By (3.2), Therefore $(A \cap B)$ is $i(gg)^*$ -open set in (X, I_τ) .

Theorem 4.6 If $A \subseteq X$ is $i(gg)^*$ -closed set then $i\text{rcl}(A) - A$ is $i(gg)^*$ -open set.

Proof: Let $A \subseteq X$ be a $i(gg)^*$ -closed set. Let U be $i(gg)$ -closed in (X, I_τ) such that $U \subseteq i\text{rcl}(A) - A$. By theorem (3.4), $\emptyset = U \subseteq i\text{rint}(i\text{rcl}(A) - A)$. Hence $i\text{rcl}(A) - A$ is $i(gg)^*$ -open set.

Theorem 4.7 Let A and B be subsets of a topological space (X, I_τ) . If A is $i(gg)^*$ -open and $i\text{rint}(B) \subseteq A$ then $A \cap B$ is $i(gg)^*$ -open.

Proof: Let A and B be $i(gg)^*$ -open in (X, I_τ) and $i\text{rint}(B) \subseteq (A \cap B) \subseteq B$ then by theorem (4.3) $A \cap B$ is $i(gg)^*$ -open set in (X, I_τ) .

Intuitionistic $(gg)^*$ -Continuous

Definition 5.1 The function $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ is said to be intuitionistic $(gg)^*$ -continuous, if $f^{-1}(V)$ is $i(gg)^*$ -open in (X, I_τ) for every intuitionistic open set V of (Y, I_σ) .

Example 5.2 Let $X = \{a, b, c\}$ with $I_\tau = \{< X, \emptyset, X >, < X, X, \emptyset >, < X, \{a\}, \emptyset >, < X, \{a\}, \{b\} >, < X, \{a\}, \{c\} >, < X, \{a\}, \{b, c\} >\}$ and $Y = \{r, s, t\}$ with $I_\sigma = \{< X, \emptyset, X >, < X, X, \emptyset >, < X, \{s, r\}, \emptyset >, < X, \{s\}, \emptyset >, < X, \{s, t\}, \emptyset >\}$. Then $I(gg)^* - C(X, I_\tau) = \{< X, \emptyset, X >, < X, X, \emptyset >, < X, \{a\}, \emptyset >, < X, \{a, b\}, \emptyset >, < X, \{a, c\}, \emptyset >\}$. Define $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ as $f(a) = s, f(b) = t, f(c) = r$. The inverse image of every i -closed sets in (Y, I_σ) is $I(gg)^*$ -closed in (X, I_τ) , f is $I(gg)^*$ -continuous.

Theorem 5.3 Let $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ be a function from an intuitionistic topological space X into the intuitionistic topological space Y . Then the following statements are equivalent.

- 1) The function f is $i(gg)^*$ -continuous.
- 2) The inverse image of intuitionistic closed set of Y is $i(gg)^*$ -closed set in (X, I_τ) .
- 3) $f(i(gg)^* \text{cl}(A)) \subseteq i \text{cl } f(A)$ for every subset A of (X, I_τ) .
- 4) $i(gg)^* \text{cl}(f^{-1}(B)) \subseteq f^{-1}(i \text{cl}(B))$ for each intuitionistic set B of Y .

Proof : (1) $\Leftrightarrow$ (2) is obvious.

(3) $\Rightarrow$ (2) let $F \subseteq Y$ be a intuitionistic closed set. Then $f^{-1}(F) = f^{-1}(i \text{cl } (F))$. Hence by (3), $f(i(gg)^* \text{cl } (f^{-1}(F))) \subseteq i \text{cl } (f(f^{-1}(F))) \subseteq i \text{cl } (F) = F$. Thus $i(gg)^* \text{cl } (f^{-1}(F)) \subseteq f^{-1}(F) \Rightarrow i(gg)^* \text{cl } (f^{-1}(F)) = f^{-1}(F)$. Therefore $f^{-1}(F) \in i(gg)^* C(X)$.

(3) $\Rightarrow$ (4) Let B be any intuitionistic subset of Y . From (3) $f(i(gg)^* \text{cl } (f^{-1}(B))) \subseteq i \text{cl } (f(f^{-1}(B))) \subseteq i \text{cl } (B)$. Hence $i(gg)^* \text{cl } (f^{-1}(B)) \subseteq f^{-1} i \text{cl } (B)$ for each intuitionistic set B of Y .

(4) $\Rightarrow$ (3) Let A be an subset of X . Then there exists a subset B of Y such that $A = f^{-1}(B)$.

From (4) $i(gg)^* \text{cl } (A) = i(gg)^* \text{cl } (f^{-1}(B)) \subseteq f^{-1}(i \text{cl } (B))$. Therefore $f(i(gg)^* \text{cl } (A)) \subseteq i \text{cl } (B) = i \text{cl } (f(A))$. Hence $f(i(gg)^* \text{cl } (A)) \subseteq i \text{cl } (f(A))$ for every subset A of X .

Hari Siva Annam and Pavithra

(1) $\Rightarrow$ (4) Let f be $i(\text{gg})^*$ -continuous and B be any intuitionistic set of Y . Then $f^{-1}(i \text{ cl}(B))$ is an $i(\text{gg})^*$ -closed set in X . For any intuitionistic set $B, f^{-1}(i \text{ cl}(B)) = i(\text{gg})^* \text{ cl}(f^{-1}(\text{cl}(B))) \supseteq i(\text{gg})^* \text{ cl}(f^{-1}(B))$. Therefore $f^{-1}(i \text{ cl}(B)) \supseteq i(\text{gg})^* \text{ cl}(f^{-1}(B))$.

Theorem 5.4 Let $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ be a function from an intuitionistic topological space X into the intuitionistic topological space Y . Then the following statements are equivalent.

- 1) The function f is $i(\text{gg})^*$ -continuous.
- 2) For each subset A of $Y, f^{-1}(i \text{ int}(A)) \subseteq i(\text{gg})^* \text{ int}(f^{-1}(A))$.

Proof: (1) $\Rightarrow$ (2) Let A be any intuitionistic subset of Y . Then $i \text{ int}(A)$ is a open set in Y and $f^{-1}(i \text{ int}(A))$ is $i(\text{gg})^*$ -open set in X . $f^{-1}(i \text{ int}(A)) = i(\text{gg})^* \text{ int}(f^{-1}(\text{int}(A))) \subseteq i(\text{gg})^* \text{ int}(f^{-1}(A))$. Therefore $f^{-1}(i \text{ int}(A)) \subseteq i(\text{gg})^* \text{ int}(f^{-1}(A))$.

(2) $\Rightarrow$ (1) Let A be any intuitionistic open set of Y , so that $i \text{ int}(A) = A \Rightarrow f^{-1}(i \text{ int}(A)) = f^{-1}(A)$. By (2) $f^{-1}(i \text{ int}(A)) \subseteq i(\text{gg})^* \text{ int}(f^{-1}(A))$. Hence $f^{-1}(A)$ is an $i(\text{gg})^*$ -open, when A is intuitionistic open in Y . Therefore f is $i(\text{gg})^*$ -continuous.

Theorem 5.5 Every $i(\text{gg})^*$ -continuous is i g-continuous.

Proof: Let $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ be a $i(\text{gg})^*$ -continuous. Let V be an intuitionistic closed set of (Y, I_σ) . Then $f^{-1}(V)$ is $i(\text{gg})^*$ -closed in (X, I_τ) . since every $i(\text{gg})^*$ -closed is i g-closed. Therefore $f^{-1}(V)$ is i g-closed in (X, I_τ) . Hence f is i g-continuous.

Theorem 5.6 Every $i(\text{gg})^*$ -continuous is i rg-continuous.

The proof is forthright.

Remark 5.7 The converse of the above theorems need not be true.

Example 5.8 Let $X = \{a, b, c\}$ with $I_\tau^c = \{ \langle X, \emptyset, X \rangle, \langle X, X, \emptyset \rangle, \langle X, \{a\}, \emptyset \rangle, \langle X, \{a\}, \{b\} \rangle, \langle X, \{a\}, \{c\} \rangle, \langle X, \{a\}, \{b, c\} \rangle \}$ and $Y = \{a, b, c\}$ with $I_\sigma^c = \{ \langle X, \emptyset, X \rangle, \langle X, X, \emptyset \rangle, \langle X, \{a\}, \{c\} \rangle, \langle X, \{a\}, \{b, c\} \rangle, \langle X, \{a, c\}, \{b\} \rangle, \langle X, \{a, c\}, \emptyset \rangle \}$.

$i(\text{gg})^* - C(X, I_\tau) = \{ \langle X, \emptyset, X \rangle, \langle X, X, \emptyset \rangle, \langle X, \{a\}, \emptyset \rangle, \langle X, \{a, b\}, \emptyset \rangle, \langle X, \{a, c\}, \emptyset \rangle \}$ and $i \text{ g} - C(X, I_\tau) = \{ \langle X, \emptyset, X \rangle, \langle X, X, \emptyset \rangle, \langle X, \emptyset, \{b\} \rangle, \langle X, \emptyset, \{c\} \rangle, \langle X, \emptyset, \{b, c\} \rangle, \langle X, \{a\}, \emptyset \rangle, \langle X, \{a\}, \{b\} \rangle, \langle X, \{a\}, \{c\} \rangle, \langle X, \{a\}, \{b, c\} \rangle, \langle X, \{b\}, \emptyset \rangle, \langle X, \{b\}, \{c\} \rangle, \langle X, \{c\}, \emptyset \rangle, \langle X, \{c\}, \{b\} \rangle, \langle X, \{a, b\}, \emptyset \rangle, \langle X, \{a, b\}, \{c\} \rangle, \langle X, \{b, c\}, \emptyset \rangle, \langle X, \{a, c\}, \emptyset \rangle, \langle X, \{a, c\}, \{b\} \rangle, \langle X, \emptyset, \emptyset \rangle \}$. Define $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ as $f(a) = a, f(b) = c, f(c) = b$. Clearly f is

i g-continuous but $f^{-1}(\langle X, \{a\}, \{b, c\} \rangle) = \langle X, \{a\}, \{b, c\} \rangle$ is not an $i(\text{gg})^*$ -closed in (X, I_τ) . Hence f is not $i(\text{gg})^*$ -continuous.

Example 5.9 From example (5.8) $i \text{ rg} - C(X, I_\tau) = \{ \langle X, \emptyset, X \rangle,$

$\langle X, X, \emptyset \rangle, \langle X, \emptyset, \{b\} \rangle, \langle X, \emptyset, \{c\} \rangle, \langle X, \emptyset, \{b, c\} \rangle, \langle X, \{a\}, \emptyset \rangle, \langle X, \{a\}, \{b\} \rangle, \langle X, \{a\}, \{c\} \rangle, \langle X, \{a\}, \{b, c\} \rangle, \langle X, \{b\}, \emptyset \rangle, \langle X, \{b\}, \{a\} \rangle, \langle X, \{b\}, \{c\} \rangle, \langle X, \{b\}, \{a, c\} \rangle, \langle X, \{c\}, \emptyset \rangle, \langle X, \{c\}, \{a\} \rangle, \langle X, \{c\}, \{b\} \rangle, \langle X, \{c\}, \{a, b\} \rangle,$

$\langle X, \{a, b\}, \emptyset \rangle, \langle X, \{a, b\}, \{c\} \rangle, \langle X, \{b, c\}, \{a\} \rangle, \langle X, \{b, c\}, \emptyset \rangle, \langle X, \{a, c\}, \emptyset \rangle, \langle X, \{a, c\}, \{b\} \rangle, \langle X, \emptyset, \emptyset \rangle \}$. Define $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ as $f(a) = a, f(b) = c, f(c) = b$. Clearly f is $i \text{ rg}$ -continuous but $f^{-1}(\langle X, \{a\}, \{b, c\} \rangle) = \langle X, \{a\}, \{b, c\} \rangle$ is not an $i(\text{gg})^*$ -closed in (X, I_τ) . Hence f is not $i(\text{gg})^*$ -continuous.

Theorem 5.10 If $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ is a $i(\text{gg})^*$ -continuous and $g: (Y, I_\sigma) \rightarrow (Z, I_\eta)$ is a intuitionistic continuous then their composition $g \circ f: (X, I_\tau) \rightarrow (Z, I_\eta)$ is $i(\text{gg})^*$ -continuous.

Proof: Let O be any intuitionistic closed set in (Z, I_η) . Since g is intuitionistic continuous, then $g^{-1}(O)$ is intuitionistic closed in (Y, I_σ) . Since f is $i(\text{gg})^*$ -continuous, then $f^{-1}(g^{-1}(O))$ is $i(\text{gg})^*$ -closed in (X, I_τ) . Therefore $g \circ f$ is $i(\text{gg})^*$ -continuous.

Hari Siva Annam and Pavithra

Definition 5.11 The function $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ is said to be strongly $i(\text{gg})^*$ - continuous, if $f^{-1}(V)$ is intuitionistic closed in (X, I_τ) for every set $i(\text{gg})^*$ - closed set V of (Y, I_σ) .

Theorem 5.12 If $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ is a strongly $i(\text{gg})^*$ - continuous and $g: (Y, I_\sigma) \rightarrow (Z, I_\eta)$ is a $i(\text{gg})^*$ - continuous then their composition $gof: (X, I_\tau) \rightarrow (Z, I_\eta)$ is a intuitionistic continuous.

Proof: Let O be any intuitionistic closed set in (Z, I_η) . Since g is $i(\text{gg})^*$ - continuous, then $g^{-1}(O)$ is $i(\text{gg})^*$ - closed in (Y, I_σ) . Since f is strongly $i(\text{gg})^*$ - continuous, then $f^{-1}(g^{-1}(O))$ is intuitionistic closed in (X, I_τ) . Therefore gof is intuitionistic continuous.

Theorem 5.13 If $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ is a $i(\text{gg})^*$ - continuous and $g: (Y, I_\sigma) \rightarrow (Z, I_\eta)$ is a intuitionistic continuous then their composition $gof: (X, I_\tau) \rightarrow (Z, I_\eta)$ is a i g- continuous.

Proof: Let O be any intuitionistic closed set in (Z, I_η) . Since g is intuitionistic continuous, then $g^{-1}(O)$ is intuitionistic closed in (Y, I_σ) . Since f is $i(\text{gg})^*$ - continuous, then $f^{-1}(g^{-1}(O))$ is $i(\text{gg})^*$ - closed in (X, I_τ) . By theorem (2.10) (ii)) we have $f^{-1}(g^{-1}(O))$ is i g- closed in (X, I_τ) . Therefore gof is i g- continuous.

CONCLUSIONS

This class of $i(\text{gg})^*$ - closed in intuitionistic topological spaces is defined using regular closure and igg - open sets. We have studied the relation of this set with some other closed sets and investigated some of their properties and discovered various results. Further we have made some compositions in continuous function and analyzed various results. Further it will be developed in connectednes.

ABSTRACT

In cloud computing, resource allocation for video streaming refers to deliberate distribution of computing resources. Key is a Content Distribution Network (CDN), setting edge servers all around for effective content delivery. Calculate resources including Virtual Machines (VMs) and containers, host video streaming apps with auto-scaling to dynamically change capacity depending on demand. In systems of scalable object storage, storage calls for allocation depending on content volume and access patterns. Low latency and high-quality streaming are ensured by use of allotted network resources including bandwidth and Quality of Service (QoS). Database resources, which demand careful allocation depending on workload expectations, provide services including user authentication and analytics. Video formats are converted by content transcoding servers; transcoding complexity determines resource allocation depending on concurrent stream count. While security resources prevent unwanted access, monitoring tools and analytics systems track performance. Cost control is vital and requires ongoing monitoring and optimisation to guarantee economy. Allocating resources holistically guarantees a dependable, scalable, and reasonably priced video streaming infrastructure in the cloud.

Keywords: Cloud Computing, Resource Allocation, Quality of Service, Virtual Machine, Network Resources

INTRODUCTION

A crucial issue in cloud computing for video streaming is the strategic distribution and management of several computer resources to guarantee best performance, scalability, and cost-effectiveness [1] [2]. With changing user

**Karthikeyan**

expectations and content delivery difficulties, the dynamic character of video streaming calls for a complete approach to resource allocation and use in the cloud [3]. Content Delivery Network (CDN) is fundamental in nature for allocation of video streaming resources. By using edge servers at several geographical sites, CDNs lower latency and expedite content delivery. In this sense, resource allocation is the process of estimating edge server capacity and number depending on user distribution and demand patterns. The intention is to guarantee low latency and high-quality streaming independent of user location [4]. Hosting video streaming applications mostly depends on computation of resources. Virtual machines (VMs) or containers allowing for hosting of these applications are provided by cloud providers. Based on expected workload and performance criteria, choices on resource allocation include choosing the suitable VM type, size, and number of instances. Often used to dynamically change the number of virtual machine instances or containers depending on changing demand, auto-scaling rules help to maximise resource use both in peak and off-peak times. Another vital component of resource allocation for video streaming is storage. Object storage technologies for scalable and robust storage of video files abound. In this sense, resource allocation is the process of choosing the suitable storage classes depending on content access patterns and cost constraints by means of the necessary storage capacity. Effective storage management guarantees that, during streaming, the video content is easily accessible and can be grabbed fast [5]. Smooth video streaming depends critically on network resources including bandwidth and Quality of Service (QoS). The volume of flowing data calls for enough bandwidth to handle. Here, choices on resource allocation include choosing suitable network setups and tracking bandwidth utilisation to avoid congestion. Implementing QoS rules helps to give video streaming traffic first priority therefore guaranteeing a constant and high-quality user experience.

For purposes including analytics, content metadata storage, and user authentication, database resources are put to work. In this field of resource allocation, expected workloads and performance criteria help one to decide the number and capacity of database instances. Support of the flawless running of video streaming services depends on effective database administration [6]. A resource-intensive procedure in video streaming is content transcoding. Transcoding servers allocate resources to translate video files into several formats and bitrates to support diverse devices and network situations. Determining the number of transcoding servers depending on the volume of concurrent streams and the complexity of transcoding activities forms part of resource allocation considerations. Resource allocation for cloud-based video streaming depends critically on monitoring and analytics. Dynamic resource allocation is achieved by tracking resource use using monitoring technologies that also identify performance problems. By means of insights into user behaviour, content popularity, and system performance, analytics systems guide resource allocation decisions and thereby maximise the whole streaming infrastructure [7]. Firewalls and security groups among other security tools are set aside to guard against illegal access and possible assaults. Decisions on resource allocation include putting security policies into effect to protect video streaming services and guarantee data integrity and user privacy. Resource allocation always takes cost management under constant thought. Users of clouds have to track resource expenses and maximise allocation to cut costs. Using cloud provider tools and services helps one to examine cost trends, spot areas for savings, and guarantee effective use of resources.

Overview of Optimization based Resource Allocation for Video Streaming in Cloud Computing

A complex task, optimising resource allocation for video streaming in cloud computing calls for thorough evaluation of many elements to guarantee a flawless user experience, effective resource use, and economy of cost. High data quantities and real-time demands define video streaming, which calls for a customised strategy of resource allocation [8] [9] [10].

- **Content Delivery Network (CDN) Optimization:** In video streaming, content delivery takes front stage. Using a global CDN enables the distribution of video material across edge servers placed strategically. By caching content closer to end users, CDNs lower latency and improve streaming performance. Choosing a CDN with a broad geographic reach, effective caching systems, and quick content retrieval powers helps to optimise. Dynamic CDN setups guarantee flexibility to fit evolving user dispersion and content popularity.
- **Dynamic Scaling and Auto-Scaling:** Adapting to changing demand calls for dynamic scalability. Based on real-time use patterns, auto-scaling systems automatically change resource count. For video streaming, this entails

**Karthikeyan**

dynamically adding or deleting virtual machines or containers to manage different concurrent stream counts. Peak hours maximise scalability; lesser demand results in scaled-down resources that help to minimise expenses.

- **Load Balancing for Video Servers:** Equally distributing video streaming requests over several servers depends on load balancing. Load balancing techniques with optimisation take into account elements including server condition and resource availability. This guarantees good use of resources, helps to avoid server overloads, and improves fault tolerance. Dynamic load balancing methods change the distribution of demands, therefore maximising the general system performance.
- **Transcoding Optimization:** Transcoding involves bitrate and format conversion of video files, hence requiring resources. Dynamic bitrate modification and effective transcoding techniques help to balance bandwidth use with video quality. Using GPU acceleration or specialised hardware improves transcoding speed and efficiency, hence besting resource use for this important video processing chore.
- **Quality of Service (QoS) Implementation:** Maintaining a high-quality streaming experience calls for QoS policies' application. These rules give video streaming traffic first priority over the network, therefore assigning enough bandwidth to preserve video quality and lower buffering. Dynamic changes of QoS settings depending on user needs and real-time network conditions maximise the streaming experience.
- **Storage Optimization:** Optimising storage solutions is choosing suitable storage classes and layouts depending on access patterns. Scalable object storage systems handle video files, and caching techniques help to lower data retrieval times. This guarantees fast and consistent access to video content while besting storage expenses. Handling the enormous amounts of data related with video streaming depends on effective storage management.
- **Adaptive Bitrate Streaming (ABR):** ABR methods dynamically change real-time video quality according to the network situation of the observer. This ensures a seamless viewing experience by changing the bitrate and resolution of the video stream, therefore optimising bandwidth use. To fit various network circumstances and viewer devices, ABR is an essential optimisation technique that increases the adaptability of video streaming services.
- **Edge Computing for Video Processing:** Using edge computing for video processing chores pushes computational capability right up to end users. By offloading some processing chores, such content distribution or transcoding, edge servers lower latency and enhance general streaming performance. Edge computing maximises responsiveness and real-time video processing.
- **Cost-Aware Resource Allocation:** Making wise decisions on the efficient distribution of resources depends on constant observation and analysis of their use. Tools and services provided by cloud providers help companies to monitor expenses related to certain parts of the video streaming system. Optimisation is the process of allocating resources where they are most needed, therefore balancing performance with cost economy.

Particle Swarm Optimization

Inspired by social behaviour of birds and fish, particle swarm optimisation (PSO) [11] [12] is a computational optimisation method. Russell Eberhart and James Kennedy debuted it in 1995. Designed to simulate the social behaviour of people inside a swarm, PSO is a population-based, heuristic optimisation method meant to identify the best solution to a problem. Inspired by the group behaviour of swarms in nature—such as bird flocks or fish schools—PSO is a strong metaheuristic optimisation method. It can be used to address many optimisation issues, including allocation of resources in video streaming. Every particle in the swarm stands for a possible answer to your optimisation challenge. Affected by their own experiences as well as those of their neighbours, these particles traverse the search area. Every particle has a position—that of its current solution—and a velocity—that of its movement's direction and speed. Particles change their places and velocities according on two main considerations as the swarm iteratively: Each particle recalls its best position thus far, therefore reflecting the best solution it has come across. Global Best: The swarm guides all towards better solutions by tracking the best place discovered by any particle [13]. Particle Swarm Optimisation (PSO) for cloud resource allocation is the method of optimising the distribution of resources in a cloud environment to satisfy performance criteria, maximise efficiency, and minimise cost.

Karthikeyan

Basic Concepts of PSO

- **Swarm Representation:** A population of possible solutions known as "particles" probes the solution space. Every particle stands for a possible resolution to the optimisation challenge.
- **Fitness Function:** To assess the quality of every particle's solution, a fitness function is defined. Depending on the type of the optimisation problem, the aim is to either maximise or minimise the fitness function.
- **Initialization:** Particles are randomly started inside the solution space. Every particle has a position and a velocity vector that reflect a possible solution and the direction it is travelling in the solution space.

Step by Step Procedure for PSO based Resource Allocation

Step 1: Initialization: Particle Initialization

- Create a swarm of particles where every particle stands for a possible cloud environment resource allocation or solution.
- Each particle has a position vector (X_i) representing the allocation of resources such as virtual machines (VMs) or containers.

Step 2: Define Fitness Function – Objective Function (Fitness)

- Define the fitness function $f((X_i))$ that evaluates the quality of a resource allocation strategy.
- The goal is to optimize the allocation of resources based on criteria such as performance, cost, and resource utilization.

Step 3: Set Initial Best Positions

- **Personal Best ($pBest$):** For each particle, set the initial personal best solution ($pBest_i$) to its current position (X_i).
- **Global Best ($gBest$):** Identify the particle with the best fitness in the entire population and set it as the initial global best position ($gBest$).

Step 4: Update Particle Positions and Velocities:

Update the position of each particle based on its current position, velocity, personal best, and global best using the following equations:

$$V_i(t+1) = w \cdot V_i(t) + C_1 \cdot r_1 \cdot (pBest_i - X_i) + C_2 \cdot r_2 \cdot (gBest_i - X_i) \quad (4.1)$$

$$X_i(t+1) = X_i(t) + V_i(t+1) \quad (4.2)$$

Where $V_i(t)$ is the velocity vector of particle i at time t . $X_i(t)$ is the position vector of particle i at time t . w is the inertia weight, controlling the impact of the previous velocity on the new velocity. C_1 and C_2 are acceleration coefficients representing the cognitive and social components. r_1 and r_2 are random numbers between 0 and 1.

Step 5: Evaluate Fitness and Update Best Positions:

- **Evaluate Fitness:** Evaluate the fitness of each particle using the objective function that incorporates cloud resource allocation parameters.
- **Update Personal Best ($pBest$):** Update the personal best position ($pBest_i$) for each particle if the current position yields a better fitness value.
- **Update Global Best ($gBest$):** Identify the particle with the best fitness in the entire population and update the global best position ($gBest$).

Step 6: Termination Criteria:

- **Termination Conditions:** Determine the termination criteria, such as a predefined number of iterations, reaching a satisfactory fitness value, or other criteria specific to cloud resource allocation.

Step 7: Repeat or Terminate:

- **Loop:** If the termination conditions are not met, repeat steps 4 to 6.

Karthikeyan

- **Termination:** If the termination conditions are met, the algorithm terminates, and the best solution found ($gBest$) represents the optimized resource allocation strategy.

Key Parameters

- **Inertia Weight w :** Balances exploration and exploitation in the optimization process.
- **Acceleration Coefficient (C_1 and C_2):** Control the influence of personal and global knowledge in the movement of particles.
- **Random Factors (r_1 and r_2):** Introduce stochasticity to the algorithm.

Cloud Resource Allocation Parameters to Optimize

- **VM or Container Allocation:** Adjusting the number and type of virtual machines or containers allocated to different tasks or applications.
- **Resource Utilization:** Optimizing the utilization of CPU, memory, and storage resources to ensure efficient performance.
- **Cost Optimization:** Balancing resource allocation to minimize costs, considering factors such as on-demand pricing and reserved instances.
- **Performance Metrics:** Incorporating performance metrics such as response time, throughput, and latency into the fitness function.

Cultural Algorithm

A population-based optimisation method with cultural knowledge incorporated to direct the search for ideal solutions is called Cultural Algorithm (CA). Its two fundamental components are the belief space expressing cultural knowledge [14] [15] and the population of solutions.

Basic Concepts of Cultural Algorithm

- **Population:** Operating on a population of possible solutions to the optimisation problem, cultural algorithms are like other evolutionary algorithms. Every member of the population stands for a candidate solution, generally defined by a set of criteria.
- **Belief Space:** One important component special to Cultural Algorithms is the Belief Space. It provides a storehouse of cultural knowledge. This area provides details on effective strategies, past solutions, or heuristics directing the optimisation process. The Belief Space is changed and applied during the iterations of optimisation.
- **Assimilation:** Assimilation is the process by which individual performance in the population updates the Belief Space. Effective solutions or knowledge acquired during the optimisation process finds place in the Belief Space. This lets the method adapt to new situations and learn from prior events.
- **Knowledge Transfer:** Knowledge Transfer is the interaction between the Population and the Belief Space concerning information. Cultural algorithms guide the search process and try to provide useful knowledge from the Belief Space to people in the population, therefore impacting their behaviour. This knowledge transfer improves population diversity and adaptation.
- **Selection:** Selection is the process of selecting from the population people depending on their degree of fitness. Usually in Cultural Algorithms, the objective function reflecting the quality of a solution determines the fitness. Higher fitness values translate into more likely selection for reproduction.
- **Evolution:** Evolution is the genetic activities carried out on the chosen individuals that produce children, a new population. Among common evolutionary operators are crossover and mutation. Evolution probes the solution space and brings variety into the population.
- **Objective Function (Fitness):** The objective function, which measures how effectively a solution solves the optimisation issue, assesses the quality of that solution. This function defines an individual's degree of fitness and directs the choosing and development processes.

Karthikeyan

- **Termination Criteria:** Termination criteria specify the circumstances in which the process of optimising pauses. This can cover various requirements particular to the optimisation problem, attaining a certain fitness value, or reaching a given number of iterations.
- **Adaptability:** Cultural algorithms dynamically change the Belief Space and integrate fresh knowledge, therefore displaying adaptability. This versatility lets the method react to changes in the terrain of optimisation.
- **Exploration and Exploitation:** Cultural Algorithms provide a special method of optimisation by including cultural information, therefore enabling the algorithm to profit from successful tactics found throughout time. The interaction of the population with the Belief Space helps to enable a more intelligent and flexible search for best answers.

Step by Step Procedure

Step 1: Initialization

- **Population Initialization:** Initialize a population of solutions, where each solution represents a potential allocation of cloud resources (e.g., virtual machines or containers). Each solution has a set of parameters defining the allocation strategy.
- **Belief Space Initialization:** Initialize the belief space, representing cultural knowledge. This can include historical successful solutions, heuristics, or any knowledge that guides the optimization process.

Step 2: Define Fitness Function

- **Objective Function (Fitness):** Define the fitness function ($f(X_i)$) that evaluates the quality of a resource allocation strategy. The goal is to optimize the allocation of resources based on criteria such as performance, cost, and resource utilization.

Step 3: Update Belief Space

- **Assimilation:** Periodically update the belief space with information from the population of solutions. This can involve incorporating the best solutions or adapting the belief space based on the success of certain strategies.

Step 4: Evaluate Fitness

- **Evaluate Fitness:** Evaluate the fitness of each solution in the population using the defined fitness function.

Step 5: Knowledge Transfer

Knowledge Transfer: Transfer knowledge between the belief space and the population. This can involve incorporating cultural knowledge into the solutions or updating the belief space with successful solutions.

Step 6: Selection and Evolution:

- **Selection:** Select solutions from the population based on their fitness values. Solutions with higher fitness are more likely to be selected.
- **Evolution:** Apply evolutionary operators (e.g., crossover and mutation) to create new solutions. This step introduces diversity into the population.

Step 7: Termination Criteria:

- **Termination Conditions:** Determine the termination criteria, such as a predefined number of iterations, reaching a satisfactory fitness value, or other criteria specific to cloud resource allocation.

Step 8: Repeat or Terminate:

- **Loop:** If the termination conditions are not met, repeat steps 3 to 7.
- **Termination:** If the termination conditions are met, the algorithm terminates, and the best solution found represents the optimized resource allocation strategy.

Key Components of CA

- **Belief Space:** The belief space (BS) is a repository of cultural knowledge, including successful solutions, heuristics, or patterns. It is updated periodically based on the performance of solutions in the population.

Karthikeyan

- **Assimilation Equation:** The assimilation equation updates the belief space based on the success of solutions in the population.

$$BS(t + 1) = \text{Assimilation}(BS(t), \text{population}(t))$$
- **Knowledge Transfer:** The knowledge transfer involves updating the solutions in the population based on the cultural knowledge stored in the belief space.

$$\text{Population}(t + 1) = \text{KnowledgeTransfer}(\text{Population}(t), BS(t))$$
- **Selection and Evolution:** The selection process chooses solutions from the population based on their fitness, and the evolution process applies operators to create new solutions.

$$\text{SelectedSolutions} = \text{Selection}(\text{Population}(t)) \text{ offspring} = \text{Evolution}(\text{SelectedSolutions})$$

Proposed Optimization based Resource Allocation (ORA) Method

A hybrid optimisation model combining Particle Swarm Optimisation (PSO) and Cultural Algorithm (CA) for cloud resource allocation offers a strong method to address the complexity and dynamic character of cloud settings. This model combines PSO's global search capacity with CA's adaptive and knowledge-guided properties.

- **Initialization Phase:** The method starts with cloud initialising a population of possible resource allocation options. Every solution, seen as a particle, determines how virtual machines or containers are allocated. A belief space is also created and acts as a store for learnt cultural knowledge during the optimisation process.
- **PSO Phase:** Guiding by their personal best (pBest) and global best (gBest), particles move around the solution space during the PSO phase according to their velocities. PSO stresses exploration and exploitation to effectively hunt for best use of resources. Examining performance criteria and cost, the fitness function assesses the quality of every solution.
- **CA Phase: Assimilation and Knowledge Transfer:** Periodically using assimilation, the CA phase changes the belief space. The belief space incorporates data from the present population including effective methods of resource allocation. This assimilation process makes the algorithm more flexible and lets it learn from past performance. Knowledge transfer updates the population with information from the belief space. This entails leading the populace towards prior successful areas of the solution space. The incorporation of cultural knowledge is a useful means of improving the search engine performance.
- **Selection and Evolution:** Population members are chosen according on their fitness values; evolutionary operators like crossover and mutation are then used to produce fresh ideas. This stage brings variety into the population and investigates different approaches of resource distribution.
- **Termination and Results:** Until termination criteria—such as reaching a preset number of iterations or attaining a suitable fitness value—are satisfied, the algorithm runs these phases repeatedly. The best answer discovered strikes a compromise between cost and performance by means of an optimal resource allocation method in the clouds. Leveraging the complimentary qualities of both methods, this hybrid (PSO + CA) model for cloud resource allocation provides an adaptive and effective means of negotiating the complexity of cloud settings.

Step by Step Procedure

Especially for video streaming systems, the hybrid Particle Swarm Optimisation (PSO) + Cultural Algorithm (CA) model presents a strong method for effective resource allocation in cloud computing.

Step 1: Initialization

- Start a population of possible solutions, each reflecting a cloud-based resource allocation technique. Specify the allocation's characteristics and conditions, including job assignment, virtual machine count, and limited resource use.
- Create the repository of cultural knowledge—the belief space. Historical successful solutions, heuristics, or patterns guiding the optimisation process abound in this arena.

Step 2: PSO Iteration

- Analyse every particle: Determine its fitness value applying the specified function.
- • Update personal best: Examine the current fitness of every particle against its personal best. Update the personal best position should the present level of fitness be superior.
- • Update global best: Find the particle in the population with the best fitness value worldwide.

Karthikeyan

- Calculate a fresh velocity vector for every particle depending on three components:
 - Term of inertia: Affects the particle's inclination to keep its current speed and direction.
 - Cognitive term: Motives the particle towards its personal optimum location.
 - Social term: pulls the particle towards the world best position.
- Update particle positions: Move every particle according to its revised speed to guarantee respect to resource limitations..

Step 3: CA Phase

- Update the belief space sometimes by assimilation. Include current demographic data into the belief space. This stage enables the algorithm to learn from effective answers and change with the times.
- Bring ideas from the belief space into the population. This entails arming the particles with cultural awareness to direct their quest..

Step 4: Selection and Evolution

- Sort members of the population according to their degree of fitness. Higher fit solutions are more likely to be selected for the following generation.
- Use evolutionary operators—such as crossover and mutation—to produce fresh ideas. This brings variety into the population and investigates different approaches of resource distribution.

Step 5: Termination

- Specify termination criteria, such a predefined iteration count or reaching a suitable fitness value.
- Should termination criteria fall short, go back to Steps 2 through 4. Proceed to the next stage otherwise.

Step 6: Results

- The algorithm terminates, and the best solution found represents an optimized resource allocation strategy in the cloud.

Step 1:Initialize a population of solutions: X_i , where $i = 1$ to N (N is the population size).

Step 2:Initialize the belief space: BeliefSpace.

Step 3:Set PSO parameters: w (inertia weight), C_1 and C_2 (acceleration coefficients), $\max\_iter$ (maximum iterations).

Step 4:For $iter = 1$ to $\max\_iter$:

For each particle i :

Update velocity and position using PSO equations 4.1, and equation 4.2

Evaluate fitness: $fitness_i = fitness(X_i)$

Update $pBest_i$ if $fitness_i$ is better than the previous $pBest_i$.

Update $gBest_i$ if $fitness_i$ is better than the previous $gBest$.

Step 5:Periodically update the belief space through assimilation:

Step 6:BeliefSpace($t+1$) = Assimilation(BeliefSpace(t), Population(t))

Step 7:Transfer knowledge from the belief space to the population:

Step 8:Population($t+1$) = KnowledgeTransfer(Population(t), BeliefSpace(t))

Step 9:Select individuals from the population based on their fitness values.

Step 10:Apply evolutionary operators (crossover, mutation) to create new solutions:

SelectedSolutions = Selection(Population)

Offspring = Evolution(SelectedSolutions)

Step 11:Set termination conditions (e.g., maximum iterations, satisfactory fitness).

Step 12:If termination conditions are not met, go to Step 2. Otherwise, proceed to the next step.

Step 13:The algorithm terminates, and the best solution found represents an optimized resource allocation strategy in the cloud.

EXPERIMENTAL RESULTS AND DISCUSSION

Simulation Parameters

Table 1 depicts the simulation parameters used in this contribution.

**Karthikeyan**

The performance of the Proposed Optimized Resource Allocation (ORA) method with the existing Cultural Algorithm based Resource Allocation (CA-RA) in this chapter with various performance metrics like Average Execution time (in seconds), Utilization Rate (in %), average makes pan (in Seconds), and average response time (in Seconds). Table 2 depicts the average execution time (in seconds) by the Proposed ORA method and CA for varying number of file size. Figure 4.1 depicts the graphical representation of the average execution time (in seconds) by the Proposed ORA method and CA for varying number of file size. Table 2 and figure 1 presents the average execution times (in seconds) for the Proposed ORA method and the CA-RA method across varying file sizes. The results indicate the performance of both methods in handling different file sizes. As the file size increases, the Proposed ORA method consistently demonstrates faster execution times compared to the CA-RA method. For a file size of 150 MB, the Proposed ORA method exhibits an execution time of 28 seconds, significantly outperforming the CA-RA method, which takes 75 seconds. This trend continues across all file sizes, with the execution time gap widening as the file size grows. At a file size of 1050 MB, the Proposed ORA method achieves an execution time of 800 seconds, while the CA-RA method lags behind with a time of 900 seconds. These results suggest that the Proposed ORA method offers improved efficiency and speed in processing larger file sizes compared to the CA-RA method. Table 2 and figure 1 demonstrates that the Proposed ORA method consistently outperforms the CA-RA method in terms of average execution time across a range of file sizes, showcasing its effectiveness in handling varying workloads.

Table 3 depicts the Utilization Rate (in %) by the Proposed ORA method and CA for varying number of file size. Figure 2 depicts the graphical representation of the Utilization Rate (in %) by the Proposed ORA method and CA for varying number of file size. Table 3 and figure 2 displays the Utilization Rates (in %) for both the Proposed ORA method and the CA-RA method across different file sizes. The Utilization Rate provides insights into the efficiency of resource utilization by each method, with higher percentages indicating more effective use of available resources. As observed in the results, the Proposed ORA method consistently achieves higher Utilization Rates compared to the CA-RA method across all file sizes. At the smallest file size (150 MB), the Proposed ORA method demonstrates a Utilization Rate of 8%, while the CA-RA method lags behind at 11%. This trend continues as the file size increases. As the file size grows, the Utilization Rate gap widens between the two methods. At the largest file size (1050 MB), the Proposed ORA method reaches a Utilization Rate of 55%, surpassing the CA-RA method, which achieves 58%. These results suggest that the Proposed ORA method is more efficient in utilizing resources, leading to higher Utilization Rates compared to the CA-RA method. Table 3 and figure 2 indicates that the Proposed ORA method consistently outperforms the CA-RA method in terms of Utilization Rates across varying file sizes. The higher Utilization Rates for the Proposed ORA method suggests its ability to optimize resource usage, showcasing its efficiency in resource management. Table 4 depicts the Average Makespan (in seconds) by the Proposed ORA method and CA for varying number of file size. Figure 3 depicts the graphical representation of the Average Makespan (in seconds) by the Proposed ORA method and CA for varying number of file size. Table 4 and figure 3 presents the Average Makespan (in seconds) for both the Proposed ORA method and the CA-RA method across different file sizes. The Average Makespan is a key metric that represents the total time taken to complete a set of tasks or processes, and lower values indicate faster completion times. In this context, the data reveals that the Proposed ORA method consistently achieves lower Average Makespan values compared to the CA-RA method across various file sizes. At the smallest file size (150 MB), the Proposed ORA method demonstrates a Makespan of 45 seconds, while the CA-RA method has a longer Makespan of 67 seconds. This trend continues as the file size increases. As the file size grows, the gap in Average Makespan widens between the two methods. At the largest file size (1050 MB), the Proposed ORA method achieves a Makespan of 145 seconds, outperforming the CA-RA method, which has a Makespan of 341 seconds. These results indicate that the Proposed ORA method is more efficient in completing tasks within a shorter time frame compared to the CA-RA method. Table 4 and figure 3 suggests that the Proposed ORA method consistently exhibits a shorter Average Makespan across varying file sizes, highlighting its superior performance in task completion efficiency compared to the CA-RA method. This indicates the effectiveness of the Proposed ORA method in optimizing workflow and minimizing the time required to complete tasks. Table 5 depicts the Average response time (in seconds) by the Proposed ORA method and CA for varying number of file size. Figure 4 depicts the graphical representation of the Average response time (in seconds) by the Proposed ORA method and CA for varying number of file size. Table 5 and figure 4 presents the Average Response Time (in seconds) for the Proposed

Karthikeyan

ORA method and the CA-RA method across different file sizes. The Average Response Time reflects the time taken for a system or method to respond to a given input or request, and lower values indicate quicker response times. The data reveals that the Proposed ORA method consistently achieves lower Average Response Time values compared to the CA-RA method across various file sizes. At the smallest file size (150 MB), the Proposed ORA method demonstrates a response time of 30 seconds, while the CA-RA method has a longer response time of 68 seconds. This trend continues as the file size increases. As the file size grows, the gap in Average Response Time widens between the two methods. At the largest file size (1050 MB), the Proposed ORA method achieves a response time of 785 seconds, outperforming the CA-RA method, which has a response time of 900 seconds. These results indicate that the Proposed ORA method is more efficient in responding to inputs or requests within a shorter time frame compared to the CA-RA method. Table 5 and figure 4 suggests that the Proposed ORA method consistently exhibits shorter Average Response Times across varying file sizes, highlighting its superior performance in responsiveness compared to the CA-RA method. This indicates the effectiveness of the Proposed ORA method in efficiently handling and responding to tasks or inputs in a timely manner.

CONCLUSION

In this section, the Optimization algorithms-based Resource Allocation in cloud for video streaming is proposed. Particle Swarm Optimization and Cultural Algorithm is hybridized to improve the resource allocation for video streaming. From the results obtained, the proposed ORA method performs better than the existing CA based RA method in terms of Average Execution time, Average Makespan, Average response time, and utilization rate.

ABSTRACT

This study investigates the rural healthcare challenges faced by women in Neigunam Village, Tiruchirappalli District, Tamil Nadu, focusing on their access to and utilization of healthcare services. Despite India's economic growth, rural healthcare remains inadequate, with significant disparities between urban and rural areas. Women in Neigunam Village face barriers including limited access to healthcare facilities, a shortage of female healthcare professionals, and low health literacy. The study employs primary data from 50 women through structured interviews and secondary data from academic and official sources. Findings reveal that most women prefer government hospitals for common ailments due to cost and accessibility, whereas private hospitals are chosen for severe conditions like chest pain. Economic factors, including low income and financial constraints, significantly impact healthcare access and decisions. Many women avoid treatment due to the cost, lack of time, or minor nature of their ailments. Despite some positive outcomes from government initiatives, such as mobile health units and health camps, consistent and widespread efforts are needed. Recommendations include increasing healthcare infrastructure, recruiting female healthcare professionals, implementing health education programs, and providing financial assistance to improve healthcare access for rural women. This study aims to contribute to improving rural healthcare policies and interventions, ensuring better health outcomes for women in rural India.

Keywords: Rural Healthcare, Access to Healthcare, Health Barriers, Healthcare Utilization, Rural Health Disparities.

INTRODUCTION

Economic and social developments are interdependent. Historical studies have demonstrated that prioritizing economic growth while neglecting social progress leads to asymmetrical development and ultimately decelerates overall economic advancement. When economic sectors are prioritized and social sectors such as education and health receive insufficient attention, it results in economic prosperity coexisting with social impoverishment. This social impoverishment, particularly in education and health, can eclipse economic growth and ultimately degrade the quality of life. Therefore, a balanced strategy for resource allocation between economic and social sectors is imperative for a developing country like India. Healthcare, as a vital social infrastructure, is a fundamental right for everyone. However, many in India lack access to quality healthcare due to poor infrastructure, a shortage of qualified medical professionals, and limited availability of basic medicines and medical facilities. About 60 percent of India's population faces these challenges. The situation is particularly dire in rural areas, where around 700 million people live with inadequate medical facilities. Given these dismal facts, new practices and procedures are needed to ensure quality and timely healthcare reaches the underserved corners of Indian villages. Despite numerous government policies and programs, their success and effectiveness remain questionable due to implementation gaps. India has one of the highest numbers of maternal deaths, most of which occur in rural areas due to poor maternal healthcare. Even private sector healthcare is often limited to family planning and antenatal care, neglecting critical services like labour and delivery, where proper medical care can save lives in case of complications. In India, 92 percent of healthcare visits are to private providers, and 70 percent of these visits are by urban residents. However, private healthcare is expensive, often unregulated, and varies in quality. It is unreliable for the illiterate and unaffordable for low-income rural people. To control disease spread and reduce mortality rates due to inadequate health facilities, special attention must be given to rural healthcare. Rural residents often face barriers to healthcare that limit their ability to receive necessary care. To ensure they have sufficient healthcare access, appropriate services must be available and accessible in a timely manner. In addition to an adequate supply of healthcare services in the community, other factors play a significant role in healthcare access. For example, rural residents need financial means to pay for services, such as health insurance coverage accepted by providers. They also need means to reach and use services, such as transportation to distant services and the ability to take paid time off work. Moreover, they need confidence in their ability to communicate with healthcare providers, especially if they are not fluent in English or have poor health literacy.

This study explores barriers to healthcare access, including workforce shortages, health insurance status, distance and transportation issues, and poor health literacy. People in rural areas face different health issues compared to those living in towns and cities. Accessing healthcare can be challenging in remote areas. In emergencies, they may not reach hospitals quickly, and they might avoid traveling long distances for routine check-ups and screenings. Rural areas often have fewer doctors and dentists, and certain specialists may not be available at all. This study aims to understand rural healthcare for people in India, with a specific focus on women in Neigunam Village, Tiruchirappalli District, Tamil Nadu. The investigation included exploring the healthcare challenges faced by women in this village, analyzing the effectiveness of existing healthcare facilities, and identifying areas needing improvement to ensure better healthcare access for rural women. Through this study, we hope to provide insights into the current state of rural healthcare for women in Neigunam Village and suggest actionable steps for policymakers and healthcare providers to improve the situation. In the past, women in Neigunam Village faced numerous healthcare challenges. These included limited access to healthcare facilities, a shortage of female healthcare professionals, and a lack of awareness about health issues. Many women had to travel long distances to reach healthcare centers, which often resulted in delayed treatment. Additionally, cultural and social barriers prevented women from seeking timely medical help. The study found that many women were reluctant to discuss their health problems openly, which further exacerbated their health issues. The study also highlighted the impact of economic factors on women's healthcare in Neigunam Village. Many women belonged to low-income families and could not afford healthcare services. The lack of health insurance and financial resources forced them to rely on inadequate and unqualified local practitioners, leading to poor health outcomes. Furthermore, the study revealed that women's health literacy levels

**Adaikkala Mary et al.,**

were low, contributing to a lack of understanding about preventive healthcare measures and the importance of regular health check-ups. Despite these challenges, there have been efforts to improve women's healthcare in Neigunam Village. Government initiatives aimed at enhancing rural healthcare infrastructure and increasing awareness about women's health issues have shown some positive results. Mobile healthcare units and health camps have provided basic medical services to women in remote areas. However, the study found that these initiatives need to be more consistent and widespread to have a lasting impact. The study recommends several measures to improve women's healthcare in Neigunam Village. Firstly, increasing the number of healthcare facilities and ensuring they are well-equipped with essential medical supplies is crucial. Secondly, recruiting and training more female healthcare professionals can help address cultural barriers and encourage women to seek medical help. Thirdly, implementing comprehensive health education programs can raise awareness about women's health issues and the importance of preventive care. Lastly, providing financial assistance and health insurance coverage to low-income families can make healthcare services more accessible and affordable for women in rural areas. Now, the study underscores the importance of addressing the healthcare challenges faced by women in Neigunam Village. By improving healthcare infrastructure, increasing awareness, and providing financial support, we can ensure that women in rural areas receive the quality healthcare they deserve. This study hopes to contribute to the ongoing efforts to improve rural healthcare in India and serve as a basis for future research and policy-making in this field.

REVIEW OF LITERATURE

Baru, R., Acharya, A., Acharya, S., Shiva Kumar, A. K., and Nagaraj, K. (2010) highlighted that despite India's notable economic growth post-1990s economic reforms, advancements in public health have been sluggish and disparate. Significant disparities in health and healthcare access remain and have even expanded across states, between rural and urban locales, and within communities. Three primary inequities plague India's health sector: historical inequities rooted in British colonial policies that persisted post-independence; socio-economic disparities evident in caste, class, and gender differences; and inequities in the availability, utilization, and affordability of healthcare services. Addressing these inequities in healthcare provision and ensuring quality care is paramount for achieving universal health coverage in the near future. Rao, M. G., and Choudhury, M. (2012) scrutinized the quantum and nature of public health expenditure in India. They examined how public spending impacts health infrastructure and the population's health status. Their analysis revealed that recent reforms aimed at increasing health expenditure through targeted transfers to states, highlighting the health expenditure needs at the state level. They discussed the fiscal space available for healthcare spending at the state level and the effects of central transfers on state health expenditures. They noted that India's healthcare system is marked by low public spending, poor quality services, and a heavy reliance on private providers, leading to high out-of-pocket (OOP) expenses and financial distress, especially among the poor. Wang, S. (2011) observed that while the rural health systems in China and India function relatively well, both exhibit significant flaws. In China, he suggested that instead of standardized premiums and reimbursements, varying amounts should be considered based on income levels, particularly for the extremely poor and wealthy. In India, he identified the financial challenge of the government's inability to fund extensive free healthcare services. He proposed that the Indian government should develop a financing mechanism that involves pooling risks and reimbursement for payments within the rural health system, rather than offering universal free healthcare services in rural areas.

Statement of the Problem

A significant portion of the population migrates from rural to urban areas in search of employment opportunities, medical treatment, and improved lifestyles. However, many individuals continue to reside in rural regions where environmental conditions are suboptimal, and various health issues persist. Women in these rural areas often bear a disproportionate burden, managing both household and external work responsibilities more extensively than men. This study seeks to investigate the healthcare and personal hygiene of women in rural settings, focusing on their unique challenges and needs. The research aims to shed light on the health disparities faced by rural women, who often lack access to essential medical services and hygienic living conditions. By understanding these issues, the

study endeavors to contribute to the development of targeted interventions that can improve the quality of life for rural women and promote equitable health outcomes.

Scope of the Study

This study represents a concerted effort to highlight the state of rural healthcare for women in Neigunam Village, located in Tiruchirappalli District. As an independent investigation, it meticulously gathers relevant information based on the proposed objectives. The scope of the study encompasses an in-depth analysis of the economic, social, and living conditions of the village's residents, with a particular focus on women's health. By examining these aspects, the study aims to provide a comprehensive overview of the standard of living and the healthcare challenges faced by women in this rural community. The findings will not only illuminate the current state of rural women's health but also serve as a foundation for future research and policy-making, aiming to address the identified gaps and improve the overall well-being of rural women.

Research Objectives

- 1.To analyze the health status and health profile of Tamil Nadu state.
- 2.To examine the socio-economic conditions of women in the study area.
- 3.To assess the health conditions of women in Neigunam village of Tiruchirappalli district, Tamil Nadu.

Research Hypotheses

- 1.There is no significant difference in the proportion of respondents preferring private hospitals against government hospitals for different ailments.
- 2.There is no significant difference in the reasons for refusal to seek medical treatment across different income groups.

METHODOLOGY

The methodology of this study integrates both primary and secondary data to provide a holistic view of the healthcare situation for women in Neigunam Village. In view of this research design, the study use primary data method and the data collected through a well-structured questionnaire module, administered via personal interviews. With regard to sampling design, the study using convenience sampling method and covered 50 women respondents from the village. This approach ensured that a diverse range of perspectives was captured, reflecting the real-life experiences of rural women. Further, the secondary data collected from various academic books, peer-reviewed journals, and official websites to complement and contextualize the primary findings. This mixed-methods approach allowed for a robust analysis of the data, ensuring that the study's conclusions are well-founded and comprehensive. By combining first-hand accounts with established literature, the research aims to present a nuanced understanding of the healthcare challenges and needs of women in rural Tamil Nadu, paving the way for effective interventions and policy recommendations. With regard to tools of analysis, the study used percentages; t-test and ANOVA model are applied.

RESULTS AND DISCUSSIONS

In the current scenario, the development of social infrastructure is essential for the comprehensive advancement for an economy. In this context, rural health emerges as a critical metric for rural development. This chapter endeavours to examine the trends in health status and health profiles in Tamil Nadu and to evaluate the socio-economic conditions, living standards, and health conditions of 50 women respondents selected from Neigunam, a village in Tiruchirappalli District.

Adaikkala Mary *et al.*,**Health Care Institutions in Tamil Nadu**

Health services are crucial for understanding the mechanisms and provisions of healthcare delivery within the State, categorized into primary, secondary, and tertiary care systems. The Primary Healthcare System encompasses Primary Health Centres (PHCs) and Health Sub-Centres (HSCs). The Secondary Healthcare System includes District Headquarters Hospitals, Taluk Hospitals, Women and Children Hospitals, Dispensaries, Mobile Medical Units, Police Hospitals, and Non-Taluk Hospitals. The Tertiary Healthcare System comprises multi-specialty hospitals. Besides governmental efforts, the private sector also contributes to healthcare services. However, in the absence of comprehensive data on private sector health services, this analysis focuses solely on evaluating the efficacy of the government healthcare system.

Primary Healthcare Services

Primary Health Centres (PHCs) and Health Sub-Centres (HSCs) provide preventive, curative, and rehabilitative healthcare services to rural populations. The rural healthcare infrastructure has been enhanced and optimized under the National Rural Health Mission (NRHM) to achieve the objective of universal health coverage. Over the past four years, the number of operational PHCs in the State increased from 1,539 in 2010-11 to 1,751 in 2013-14. All PHCs operate continuously on a 24x7 basis. The extensive network of 1,751 PHCs and 8,706 Health Sub-Centres is dedicated to delivering universal healthcare to the rural population through a mission-driven and holistic approach. Table 1 examines the key indicators for the Primary Healthcare System over three fiscal years, showing a slight increase in the total number of beds from 12,873 in 2019-20 to 12,979 in 2021-22. However, the bed-to-population ratio deteriorated from 1:3,924 to 1:3,970, indicating a reduced availability of beds relative to the growing population. In contrast, the number of doctors increased significantly from 4,386 to 4,864 during the same period, improving the doctor-to-population ratio from 1:11,518 to 1:10,596. Despite these improvements in medical staffing, overall bed availability has decreased. This situation underscores the broader issue that, despite extensive efforts by Central and State Governments, urban-rural health disparities remain largely unaddressed. Urban populations generally enjoy longer lifespans and healthier outcomes, except for HIV/AIDS, while significant health inequities continue to persist between urban and rural areas, despite past focus on equitable distribution in development planning. Table 2 compares vital rates between rural and urban India for 2021. Rural areas exhibit higher rates across all indicators: Crude Birth Rate is 23.7 compared to 18.0 in urban areas; Crude Death Rate is 7.7 versus 5.8; Infant Mortality Rate stands at 54.7, while urban areas report 33.7; and Under Five Mortality Rate is 66.0, compared to 38.0 in urban regions. Additionally, only 29.7% of deaths in rural areas involved medical attention before death, compared to 48.9% in urban areas. These figures highlight significant disparities in health outcomes and access to medical care between rural and urban areas.

Table 3 presents the occupational status of respondents in Neigunam Village, Tiruchirappalli District. The majority of respondents, 66.0 percent, are engaged in daily wage labour, indicating a predominant reliance on informal and temporary employment. Weekly wage earners constitute 8.0 percent, while 20.0 percent are employed on a monthly wage basis. Only 6.0 percent of respondents hold salaried positions. This distribution reflects a heavy reliance on low-paying, insecure jobs among rural women, which likely impacts their access to consistent healthcare and overall well-being. The predominance of daily wage laborers suggests that financial instability may contribute to challenges in accessing quality healthcare services and maintaining health in Neigunam Village. Table 4 outlines the educational status of respondents in Neigunam Village, Tiruchirappalli District. A minority, 6.0 percent, are illiterate, while 14.0 percent have completed primary school. The majority, 62.0 percent, have achieved secondary school education, indicating a significant level of basic education among the respondents. Another 14.0 percent have attained higher secondary education, and only 4.0 percent hold collegiate or diploma qualifications. This distribution highlights that while a substantial proportion of women have secondary education, higher levels of education are relatively rare. The educational background of these women likely influences their health literacy and access to healthcare resources, affecting their overall health outcomes and the effectiveness of rural health interventions. Table 5 details the income distribution of respondents in Neigunam Village, Tiruchirappalli District. A substantial majority, 74.0 percent, earn between Rs. 1,000 and Rs. 5,000, reflecting low-income levels prevalent among the rural population. In contrast, 14.0 percent of respondents have incomes ranging from Rs. 6,000 to Rs. 10,000, while 8.0 percent earn between Rs. 11,000

and Rs. 15,000. Only 4.0 percent of respondents have incomes between Rs. 16,000 and Rs. 20,000. This income distribution underscores the financial constraints faced by the majority of women in the village, which may affect their ability to access healthcare services and impact their overall health and well-being. The limited higher income brackets suggest that economic hardships could be a significant barrier to improving health outcomes.

Table 6 compares the preference for private and government hospitals for health check-up by women in Neigunam Village for various ailments. For headaches, 76.0 percent of respondents preferred government hospitals over 24.0 percent who chose private hospitals. In cases of body pain and back pain, 68.0 percent and 60.0 percent respectively, opted for government hospitals, while 32.0 percent and 40.0 percent preferred private facilities. Chest pain saw a stark contrast, with 90.0 percent choosing private hospitals and only 10.0 percent selecting government hospitals. For stomach pain and diarrhea, government hospitals were favored by 84.0 percent and 54.0 percent, compared to 16.0 percent and 46.0 percent for private hospitals. Cough and cold treatments also showed a preference for government hospitals, with 82.0 percent and 66.0 percent respectively. Toothache treatment saw a majority, 70.0 percent, opting for private hospitals. This indicates a general preference for government hospitals for most common ailments, while private hospitals are preferred for more severe conditions like chest pain and toothache. Table 7 reveals reasons for refusing medical treatment among respondents. A significant 40.0 percent cited being too busy with work as the main reason, while 24.0 percent considered their ailments too minor for treatment. Cost of medical aid was a concern for 18.0 percent, and 10.0 percent feared losing wages. Only 8.0 percent felt knowledgeable about medications. Table 8 shows dissatisfaction with hospital services. In private hospitals, 38.0 percent of respondents expressed dissatisfaction, while 46.0 percent were dissatisfied with government hospitals. Conversely, 62.0 percent were satisfied with private hospital services, compared to 54.0 percent for government hospitals. This indicates a higher level of dissatisfaction with government hospitals despite overall satisfaction with both types of facilities.

Hypothesis:1

There is no significant difference in the proportion of respondents preferring private hospitals against government hospitals for different ailments. Table 9 presents the results of the t-test for hospital preference and satisfaction results based on occupation. The tests reveal significant differences for ailments such as headache, body pain, back pain, stomach pain, cough, and cold, with p-values below 0.05, indicating a statistically significant preference for one type of hospital over the other. However, chest pain, diarrhea, and toothache show p-values greater than 0.05, suggesting no significant preference. The results support the alternative hypothesis that there is a significant difference in the proportion of respondents preferring private hospital against government hospitals with satisfaction results based on occupation for most ailments in the study region.

Hypothesis2

“There is no significant difference in the reasons for refusal to seek medical treatment across different income groups”. Table 10 presents the ANOVA results for reasons for refusing medical treatment across different income groups. The F-statistic of 3.54 with a p-value of 0.027 indicates a significant difference in refusal reasons among the income groups at the 5% significance level. This result suggests that income influences the reasons individuals choose not to seek medical treatment. Consequently, the null hypothesis, which states that there is no significant difference in refusal reasons across income groups, is rejected. Since to accept alternative hypothesis, i.e., “There is a significant difference in the reasons for refusing to seek medical treatment across different income groups”.

Major Findings

- ✓With regard to healthcare preferences and access issues, the preference for government hospitals over private hospitals is notable for most common ailments such as headaches, body pain, and coughs. However, for severe conditions like chest pain and toothaches, private hospitals are preferred. This indicates that while government hospitals are more accessible for routine issues, private hospitals are chosen for critical conditions due to perceived better care or facilities.
- ✓Regarding dissatisfaction with services, a significant proportion of respondents expressed dissatisfaction with both private (38%) and government hospitals (46%). Despite this, a majority of respondents (62%) were satisfied with

**Adaikkala Mary et al.,**

private hospitals, compared to 54% for government hospitals. This suggests that while dissatisfaction exists, the quality of service in private hospitals is relatively better perceived.

- ✓ In the reasons for refusal to seek medical treatment, the main reasons for not seeking medical treatment include being too busy with work (40%) and considering the ailments too minor (24%). Cost and fear of lost wages also contribute to treatment refusal, indicating financial constraints and work commitments as key barriers to accessing healthcare.
- ✓ With regard to income and healthcare access, a substantial portion of respondents (74%) has a low income between Rs. 1,000 and Rs. 5,000, reflecting significant financial constraints. This income level likely impacts their ability to afford healthcare services and highlights the economic barriers faced by rural women in accessing quality care.
- ✓ Among educational impact on health literacy, most respondents have achieved secondary education (62%), which influences their health literacy. However, higher levels of education are less common, suggesting that limited education may affect awareness and understanding of healthcare needs and preventive measures.

CONCLUSION

The study on rural healthcare for women in Neigunam Village, Tiruchirappalli District, highlights several critical issues impacting women's health. Despite improvements in healthcare infrastructure, significant gaps remain in access and quality of care. Rural women face considerable barriers such as financial constraints, inadequate medical facilities, and educational limitations that affect their health literacy. While government hospitals are preferred for routine care, private hospitals are chosen for more severe health issues, indicating discrepancies in service quality and accessibility. The dissatisfaction with both types of hospitals points to the need for better healthcare delivery systems. Addressing these issues requires a comprehensive approach involving increased funding, improved healthcare facilities, and targeted educational programs to enhance health literacy. These findings emphasize the urgent need for effective interventions to ensure equitable healthcare access and improve the overall well-being of rural women.

Policy Suggestions

1. To invest in expanding and upgrading healthcare facilities in rural areas, including the establishment of more well-equipped primary health centers and specialized care units. This will improve accessibility and quality of care for rural women.
2. To implement financial assistance programs and expand health insurance coverage for low-income families. This will reduce out-of-pocket expenses and make healthcare services more affordable and accessible for rural residents.
3. To develop and implement comprehensive health education programs focusing on preventive care, health literacy, and the importance of regular check-ups. Target these programs towards women to empower them with knowledge and encourage proactive health management.

ABSTRACT

The symptoms of Epilepsy, a common nervous system illness, include a high incidence, sudden start, and recurrence. Therefore, early seizure prediction and intervention therapy can protect patients' lives and health by significantly reducing the risk of unintentional injury. To better use the temporal and spatial aspects of epileptic EEG signals, existing deep learning approaches often ignore their spatial properties. The temporal and spatial evolution leads to epileptic seizures. We propose a seizure prediction model for epilepsy based on CAM-3DCNN. First, we apply the Short-Time Fourier Transform (STFT) to preprocess the EEG signals. Second, the 3DCNN model extracted the pre and postictal stages' characteristics. Interictal signals that have been preprocessed. To evaluate the efficiency of the proposed technique, tests are conducted for each preictal length of 5, 10, and 15 min using the CHB-MIT scalp EEG dataset.

Keywords: Seizure Prediction; Electroencephalogram (EEG), Discrete Wavelet Transform (DWT), Dense Convolutional Network (DenseNet), Long Short-Term Memory (LSTM), Hybrid model.

INTRODUCTION

EPILEPSY is a chronic neurological disorder characterized by sudden, abnormal neuronal discharges that cause transient brain dysfunction due to the different origins and modes of transmission of the abnormal discharge. Epilepsy can present as paroxysmal movement, sensory, autonomic nerve, awareness, and mental abnormalities, among other intricate and varied clinical signs. Currently, epilepsy is the second most prevalent neurological condition after headaches. Data indicates that they are in the vicinity. Currently, 70 million people worldwide have

**Mary Monica and Selvan**

epilepsy, and that number is increasing by about 2 million per year. About thirty per cent of people with intractable epilepsy do not receive the necessary care, even though over seventy per cent of epilepsy patients can control their seizures with regular antiepileptic medication, surgery, and nerve stimulation therapy. These people with epilepsy not only face serious challenges to their safety but also to their lifestyles and mental well-being. It is critical to determine the onset of epilepsy in order to treat patients with medication or nerve stimulation at that time to prevent injury. An EEG is a graph created from the scalp using advanced electronic equipment to record and increases the biological potential of the brain. Brain cell networks' regular and unrestricted electrical activity has been recorded using electrodes. EEG testing is accurate in diagnosing epilepsy because it can accurately record abnormal spikes, dispersed slow waves, or spikes during seizures. EEG can be broadly divided into two types based on the acquisition method: scalp EEG and intracranial EEG. The EEG signals of people with epilepsy are usually divided into four periods by medical professionals—the beginning to end of an epileptic episode, which usually lasts a few minutes or seconds. The preictal interval is the period several minutes before seizures start. The time between an epileptic patient's convulsions ending and their normalcy returning is known as the postictal phase. The period during which the patient's state remains unchanged between the late onset and the subsequent pre-seizure is known as the interictal interval. Studies show that epilepsy evolves from a normal state to the onset of the preictal period, a transitional time, but that it does not occur suddenly. To predict epilepsy, it is crucial to identify pre-seizures accurately. Table 1 represent the study related on EEG Signal frequency band and functioning of Human Brain [44].

As seen in Figure 1, the seizure prediction method typically comprises gathering data[1], preprocessing the EEG signal, extracting features, classifying the data, and assessing the outcomes. The preictal and interictal EEG signal characteristics are employed to classify epileptic seizure prediction. Early in the 1870s, Viglione et al. employed patients' EEGs to forecast epilepsy, which is when seizure prediction originated [1]. The physical-mathematical theory of nonlinear systems was introduced in the 1980s by Rogowski et al. [2] and Salant et al. [3], who proposed an autoregressive model to assess the parameter change information provided within 6 seconds before the onset. This is a novel approach to seizure prediction. The popularity of seizure prediction has increased recently due to the developments in deep learning and machine learning. Fei and colleagues employed the refined Lyapunov exponent approach to more effectively capture the fractional Fourier transform domain's delicate chaotic dynamics of epileptic signals. The model's accuracy is higher than the Traditional Lyapunov exponent technique [4]. After demonstrating that the successive decomposition index (SDI) increased dramatically during seizures, Raghu et al. developed a characteristic of the SDI that uses changes in the SDI prior to the commencement of seizures to predict the occurrence of seizures [5]. Bandarabadi et al. utilised the amplitude distribution feature selection approach. Features from the epileptic EEG sample were ranked according to their amplitude distribution histograms (ADHs), and the features with the biggest ADHs difference were chosen [6]. To choose the best feature set, Wang and Lyu suggested feature selection based on elimination and paired it with SVM [7]. Yuan and Wei proposed a Bayesian linear discriminant analysis (BLDA) algorithm used as a classifier to identify the sample features. BLDA utilizes the regularization technique instead of the traditional Fisher's linear method. To directly input epileptic EEG signals into the CNN model, Xu et al. proposed an end-to-end one-dimensional convolutional neural network (CNN) architecture [9]. Zhang et al. computed the Pearson correlation coefficient of the EEG signals to obtain the correlation matrix, which they then integrated into the CNN model for classification [10]. Ozcan and Erturk introduced a 3D CNN model that leverages the temporal and spatial correlations of EEG data [11]. To extract optimal spatial features from EEG signals, Abdelhameed and Bayoumi employed a deep convolutional auto-encoder, whereas a BiLSTM was utilised for classifying temporal information [12].

Shahbazi and Aghajan proposed a CNN-LSTM model for epileptic seizure prediction, which extracts the temporal and spatial properties of multichannel EEG signals [13]. Daoud and Bayoumi [14] offer a semi-supervised approach based on transfer learning techniques to enhance optimization issues and employ recurrent neural networks to predict seizures. Convolutional neural networks extract relevant spatial data from various scalp locations. This work aims to automatically extract the features of epileptic EEG using deep learning to forecast epileptic seizures reliably. In order to more effectively utilize the spatial and temporal properties of epileptic EEG recordings. We suggest a

**Mary Monica and Selvan**

CNN model called CAM-3D to forecast seizures. First, we use STFT to preprocess the EEG signals. Second, the preprocessed signals' interictal and preictal stage properties were abstracted using the 3DCNN model. Thirdly, for classification, Bi-LSTM is linked to 3DCNN. In order to obtain the important information from the data and enable the model to extract interictal and pre-ictal features accurately, CAM is finally added to the model. This improves the model's learning capacity and resilience. Our suggested method produced a 0.010 h⁻¹ false alarm rate, 98.65 sensitivity, and 98.09% accuracy on 11 patients using the public CHB-MIT scalp EEG dataset.

Related Work

One of the most prevalent neurological conditions, epilepsy, is typified by abrupt brain malfunctions that result in seizures. Worldwide, epilepsy affects 50 million individuals [15]. Epilepsy seizures are typically detected and treated by EEG. The time between R-waves in the ECG (RRI) data acquired from patients was converted into HRV features and then monitored by Multivariate Statistical Process Control (MSPC) in a Heart-Rate Variability (HRV) based epileptic seizure technique [16] that predicts monitoring. The Common Average Reference (CAR) filter [17], Independent Component Analysis (ICA) [18], Sparse optimization [19], 10-fold cross-validation [20], and Butterworth (IIR) filter [21] were used for the preprocessing of the data. Techniques in mathematics and statistics, including cross-correlation, FFT, Butterworth bandpass filter, and HRV [22]. The sets of linear model coefficients constructed for every EEG channel comprise the features. These characteristics served as criteria for categorization. SVM [15], [23], CNN [24], LSTM [25], Multi-layer Perceptron (MLP) [26], K-nearest neighbour, and naïve bays [27] were the most often used classifiers in earlier research projects. SVM classifiers were employed in the majority of earlier research. Deep learning techniques were widely used as classifiers.

The ICA approach was used to preprocess the EEG signals, and the Fuzzy Multichannel EEG Classifier (FMCEC) was employed for feature extraction and classification [28]. Similarly, in [24], CNN identified normal, pre-ictal, and seizure classes based on preprocessing the data using Computer-Aided Design (CAD). The Amplitude and Frequency Modulated (AM-FM) model was utilized to extract the features from the EEG data. The frequency-dominant signal and frequency-dominant signal ident amplitude-dominantSeizure prediction have been the subject of extensive research in [15][24][25]. It is possible to forecast how different features will be combined to create the epileptic seizure feature vector. The EMD approach was used to preprocess the EEG data of brain activity, and the time-frequency domain was used to extract features. The SVM classifier was used to classify the retrieved features [27]. A great deal of information is extracted from the EEG signal through processing. The transformation employed in [24] can be utilized to achieve this. The wavelet transform was extensively employed in earlier studies. A technique using the DWT preprocessing method to assess the EEG and ECG data was proposed in [29]. K-nearest neighbour or Linear Bayes was used as the classifier, and Sequential Forward Selection (SFS) was used for feature selection [27]. It may be possible to forecast the epileptic seizure using the ECG signal. A Short-Time Fourier Transform (STFT) was employed in [30] to convert EEG data from Children's Hospital of Boston—Massachusetts Institute of Technology (CHB-MIT)—into a matrix format. The CNN received the STFT output and extracted features from the modified data. The employed classifier was a discrete Kalman filter. The prediction of epileptic seizures was provided by K of the n-filter. A phase space representation technique was employed in [31] to extract characteristics from EEG signals. The EMD approach preprocessed the EEG signal. The EEG signal's characteristics were retrieved using Propeller Shaft Rate (PSR). The classifier that uses EEG signals to predict an epileptic seizure is called LS-SVM. The experiment employed a dataset that was made available to the public.

Data Set

We used CHB-MIT scalp EEG dataset in our investigation. Every data sample was captured through the examination of epileptic patients at Bonn University's Department of Epileptology [32]. There are five segments in the data (A - E). There are 100 text lines in each section. Four thousand ninety-six samples of a single EEG time series encoded in ASCII code make up each text le. The identical 128-channel amplifier device recorded the EEG time series signals. Five sets (A, B, C, D, and E) of the EEG time series representation are illustrated in FIGURE-2 [32].

**Mary Monica and Selvan**

The five recorded sets of signals are included in this dataset. The data was converted into a digital representation using an analog-to-digital converter (ADC). The data was subsequently recorded on the disc at a sampling frequency of 173.61 Hz. The filter used in the data collection process typically has a range of 0.53 to 40 Hz. Each of the 100 signal channels in sets A through E contained an EEG segment that lasted for 23.6 seconds. Five segments were extracted from the continuous multichannel EEG data following the visual evaluation of five pollutants, including muscle activity. Segments A and B of the EEG recording surface were eliminated. Data on healthy persons were included in both sections. Segment B featured a healthy volunteer's closed eye, while segment A featured the volunteer's open eyes. The remaining three segments (C, D, and E) were associated with the seizure condition of the brain activity. Five patients with epileptic seizures were selected for the group [32]. Sets C and D contained only the seizure-free brain activity interval. Only the ictal activity was present in some areas of the E section, where the seizure activity was located.

METHODOLOGY

The evolution of the EEG signal is correlated with time and place. Typically, the CNN model—the 2DCNN model—that is employed in the epilepsy prediction method overlooks the temporal characteristics of EEG signals in favor of obtaining spatial features. This model has several advantages. The epileptic EEG signal has a distinct correlation between temporal and spatial dimensions, as it varies over time. The CNN model used in the epilepsy prediction method is frequently the 2DCNN model, which has some advantages in extracting spatial properties but ignores the temporal components of EEG signals. The LSTM model is more appropriate for timing information. The temporal and spatial correlation of epileptic EEG signals is not efficiently utilized by either model. The collected data is initially preprocessed and annotated. The processed data set is then extracted by the 3D CNN model, and CAM is added to the model to improve its resilience and learning ability. Lastly, BiLSTM was used to classify the interictal and preictal phases.

Preprocessing

Identifying ES activity in the brain predominantly entails the analysis of EEG recordings. An EEG recording is a crucial clinical instrument for distinguishing ES from non-ES. The characteristics of EEG signals recorded prior to and during an epileptic seizure can differentiate between the pre- and post-seizure stages of the event [41].

- (a) (a) Pre-ictal State: This transpires within a defined interval preceding the commencement of a seizure and is not observed during other phases. It may not always be apparent externally. It will, however, forecast seizures within a specific range of values and will indicate alterations in the underlying signals. Pre-ictal states must be promptly identified within a warning system to minimise the duration of false alarms, hence enhancing their therapeutic utility [42].
- (b) Pro-Ictal State: This condition increases the likelihood of seizures, although it does not ensure them.
- (c) Ictal and Interictal States: An alteration in EEG signals during a seizure is known as the ictal state, while the interval between two seizure onsets is known as the interictal state. The cortical area, seizure duration, and number of epileptogenic neurons can all vary in the same individual.
- (d) Post-Ictal State: This is the condition that follows a seizure.

The wave pattern might contain important insights about brain activity. Skilled neurologists can visually observe the EEG signals to identify abnormalities. However, because of the high temporal and spatial characteristics of the dynamic non-linear EEG data, this approach takes a long time and is prone to inaccurate identification. Consequently, automated methods, the extraction and analysis of EEG signal parameters, might be quite helpful in the diagnostic process [43].

**Mary Monica and Selvan**

We used a publicly accessible scalp EEG dataset with 24 participants. The signals were recorded using 23 electrodes and were digitalized at 256 Hz. First, these signals are transformed into mat files by use of the "edf-read" function. EEG signals are subjected to a Butterworth bandpass filter [44] in order to eliminate baseline noise [44] and power line [44]. Following the reduction of noise, the signals are converted from the time domain to the frequency domain and the signal to noise ratio is further increased by applying the Short Time Fourier Transform (STFT) [8] by choosing a non-overlapping window of 30 seconds.

Feature Extraction

Features are derived from EEG signals after preprocessing in order to categorize various seizure states. There are two approaches for extracting features: one is by hand, and the other is automatically through the use of deep learning techniques. Handcrafted features are multivariate features [61] and univariate features [60] in the frequency and temporal domains. Temporal aspects encompass the Lyapunov exponent, principal component analysis (PCA), Hjorth parameters, entropy, estimated entropy, skewness, kurtosis, and statistical moments such as mean and variance. Power spectral density and spectral moments exemplify spectral properties. Recent research have employed handcrafted features, including zero-crossing intervals, bags of waves, spectral features in the frequency domain, common spatial pattern filtering, and phase-locking values, in various seizure prediction algorithms.

a) Time domain methods: The temporal functions of EEG recordings exhibit non-linearity and non-stationarity. A time-domain technique called linear prediction computes the result based on the input and previous outcomes. Unsupervised time-domain techniques that are frequently used to summarize EEG data include principal component analysis (PCA), linear discriminant analysis (LDA), and independent component analysis (ICA). Whereas ICA breaks down high-dimensional data into linear statistically independent components, PCA converts high-dimensional data—or, in the case of high-dimensional feature vectors associated with epilepsy, high-dimensional data—to low-dimensional data. The most popular application of ICA in EEG data processing is artifact removal. On the other hand, LDA finds linear combinations of feature vectors to minimize the size of feature sets.

b) Frequency domain methods: The abrupt shift in EEG signal frequency that occurs during an epileptic seizure can be measured using frequency-domain techniques, such as the Fourier transform (FT). FT can be used to estimate the power spectrum using parametric or non-parametric approaches. The widely used periodogram approach is modified to create the non-parametric Welch method, which is typically used to estimate PSD. However, spectral leakage is a drawback that can be addressed by using parametric techniques. Better frequency resolution is achieved with parametric approaches, which treat the EEG signal as a stationary random process. Commonly used parametric techniques include moving average (MA), auto-regression (AR), and auto-regressive moving average (ARMA).

c) Time-frequency domain approaches: While the frequency-domain and time-domain methods discussed above can provide information about a specific time moment, they are limited in their ability to provide the precise frequencies involved at that instant. Wavelet transform (WT), a time-frequency based analytic method, is frequently used to create multi-resolution deconstructed sub-band signals by running the EEG signal through filter banks in order to get over these restrictions.

d) Non-linear techniques: To find the coupling between harmonics in a signal's spectrum, non-linear analytic techniques are used. Widely used non-linear parameters for EEG analysis include higher order spectra (HOS), several measures of entropy (e.g., approximate entropy (ApEn), Kolmogorov entropy, sample entropy (SampEn), Hurst exponent (H), and largest Lyapunov exponent (LLE). LLE and entropy are frequently employed as characteristics for categorizing epilepsy. Entropy evaluates the uncertainty or unpredictability in the patterns of the data and offers hints about information that may be stored in the probability distribution of a signal. Data patterns exhibiting a greater entropy value are more stochastic. LLE gives information on the system's reliance on starting conditions [45].

Mary Monica and Selvan

Proposed Method

This section presents the suggested CAM-3DCNN model for epileptic seizure prediction. The raw EEG signal data requires preprocessing prior to the implementation of CAM-3DCNN and LSTM models. The CAM-3DCNN model is subsequently built and utilised to detect epileptic seizures.

CAM-3D CNN Model

A feed forward neural network characterised by a deep architecture and convolutional processing is termed a convolutional neural network [33]. This is a fundamental deep-learning technique with extensive applications in image classification, speech recognition, machine vision, and various other fields. A CNN, or "translation invariant artificial neural network," can illustrate learning by utilising the hierarchical structure of input data [34]. The primary components of a CNN are the convolutional layer, pooling layer, and fully connected layer. Typically, features are extracted from the input data, and the feature map is created using the convolution layer. The feature is then down-sampled using the pooling layer to reduce the computational complexity and minimize its dimension. Finally, the output data from the preceding layer is applied to the linked layer to create a one-dimensional feature vector [35]. It is crucial to make better use of the temporal and spatial characteristics of epileptic EEG signals since the chronological and spatial progression of an epileptic seizure precedes its occurrence. We propose a CAM-CNN model for feature extraction. The model consists of one fully connected layer, three max pooling layers, and three convolutional layers. In the first convolution stack, the pooling layer size is approximately $1 * 2 * 2$, and the convolution kernel size is approximately $22 * 3 * 3$. In the last two convolution stacks, the sizes of the pooling layer and convolution layer are $1 * 1 * 1$. All convolutional layers use the RELU activation function, and batch normalization is applied to increase the model's capacity for generalization, decrease overfitting, and expedite training.

Training and Testing Methods

We evaluated each patient's response to our suggested model using the leave-one-out cross-validation method [36] to prevent over-fitting and preserve model robustness. Put another way, we use the remaining $N - 1$ seizures to train the model after selecting one seizure ($N - 1$) from a patient's total number of seizures ($N - 1$). Thus, N times will pass before this operation is finished. Twenty-five percent of the pre- and interictal sample data were randomly selected for the test set of this study, while the remaining seventy-five percent constituted the training set. We select more iteration to increase training accuracy; nevertheless, this might quickly result in over-fitting. In order to overcome this problem, we use the early-stop strategy, which ends training as soon as the validation set accuracy reaches 98.6% or the validation set loss function begins to increase.

RESULTS

The Google Colab environment was used for all performance tests, taking advantage of its GPU support for effective model testing and training. When processing large-scale EEG datasets like CHB-MIT, Google Colab's cloud-based computational infrastructure makes it easier to conduct scalable and repeatable studies. This study also included three metrics as the assessment indices of the epileptic seizure prediction model: accuracy, sensitivity, and false prediction rate (FPR). Researchers are particularly interested in two important evaluation markers: sensitivity and FPR. Sensitivity is the prediction model's ability to identify the EEG's pre-epileptic phase accurately. Moreover, FPR gauges the number of inaccurate forecasts the model generates every hour [37]. This is how it is expressed mathematically.

Accuracy =	TP + TN
	TP + TN + FP + FN

The percentage of correctly predicted instances over all instances is used to calculate accuracy. The accuracy of the current CNN[38], 3DCNN[39], 3DCNN BiGRU[40], 3DCNN BiLSTM[40], and CBAM 3DCNN[40] is compared to

Mary Monica and Selvan

that of our suggested CAM 3DCNN approach, which is 98.09%. The results are 81.2%, 80.5%, 93.21%, 94.86%, and 97.95%. It proves that the classification provided by our proposed method is accurate.

Sensitivity	=	TP
		TP+FN

A classifier's sensitivity can be defined as the ratio of correctly identified positive data to real positive data. Accuracy comparisons show that our suggested CAM 3DCNN approach achieves 98.65%, while that of the current CNN[38], 3DCNN[39], 3DCNN BiGRU[40], 3DCNN BiLSTM [40], and CBAM 3DCNN[40] are 75%, 85.7%, 90.11%, 91.87%, and 98.40%.

FPR	=	FP
		Time

The false positive rate (FPR) measures the proportion of positive instances that the model erroneously classifies as positive. The accuracy of the current CNN[38], 3DCNN[39], 3DCNN BiGRU[40], 3DCNN BiLSTM [40], and CBAM 3DCNN[40] is compared to that of our suggested CAM 3DCNN technique, which is 0.010%.

Where,

- True positive (TP) is the number of correctly predicted ES.
- False Negative (FN) refers to the quantity of events that are erroneously classified as non-seizures.
- True negative (TN) is the number of correctly predicted no-seizure.
- False Negative (FP) is the number of non-ES that are incorrectly predicted as seizures.

The CHB-MIT dataset shows that the suggested model performs on average with 98.09 per cent accuracy, 98.65 per cent sensitivity, and 0.010 h⁻¹ FPR. The model integrating 3DCNN surpasses the model that incorporates 3DCNN with BiGRU for accuracy, sensitivity, and false positive rate (FPR). We utilise the CAM-3DCNN model to predict seizures. We also add CAM into 3DCNN at the same time. Table 2 shows that the CAM-3DCNN model outperforms the other models' performance. Figures 6 show the accuracy and loss curves that were produced using the recommended proposed models. Figures 7 show the accuracy versus loss graphs for each upgraded model. In this case, the x-axes show the number of epochs, and the y-axes accuracy/loss. The graphs above show how the models are trained and validated. The best results are produced by the proposed model. The confusion matrix that was created for the suggested model is shown in Figure 8. One of the main factors assisting in controlling the seizure outbreak is the conspicuous absence of FN relative to FP.

CONCLUSION

A CAM-3DCNN model for seizure prediction was proposed in this work. The STFT technique converts EEG impulses into three-dimensional feature vectors. Utilizing 3DCNN, features are extracted based on time, frequency, and channel data. CAM is incorporated into the model to filter essential node information, mitigate feature redundancy, and augment the model's learning capacity and robustness. This approach achieves 0.010 h⁻¹ FPR, 98.65 % sensitivity, and 98.09 % accuracy. The experimental results demonstrate that the suggested method has a low mistake prediction rate, high accuracy, and sensitivity compared to earlier research. This study's epileptic seizure prediction system outperforms alternative approaches. Future work must test more participants in diverse age groups, clinical situations, and illness characteristics due to the patient-specific nature of epileptic EEG data. Only then can we be sure that the procedure can be pushed. In addition, by using current technology, epilepsy sufferers' lives and health are protected, the possible risk to them is decreased, and their forecast accuracy is continuously improved.

Table 1: EEG Frequency Band and related study of Human Brain functioning [44].

Frequency Bands	Frequency Range (Hz)	Relation to human behavior
Delta	1-4	Mostly observed in newborns and in deep sleep periods in healthy adults
Theta	4-8	Adults who are awake and have high theta rhyme values have aberrant cognitive activity.
Alpha	8-12	Usually present in posterior region of the brain and in normal relaxed adults
Beta	12-26	Existent in the frontal lobe of the brain and in conscious, fearful individuals
Gamma	26-1000	Mostly present in those who are anxious, joyful, or conscious

Table 2: The Comparison results of the CAM 3DCNN model with other model.

Model	Accuracy (%)	Sensitivity (%)	FPR (%)
CNN[38]	81.2	75	0.16
3DCNN[39]	80.5	85.7	0.096
3DCNN BIGRU[40]	93.21	90.11	0.09
3DCNN BiLSTM[40]	94.86	91.87	0.06

ABSTRACT

The personalized workout recommendations are created by the privacy-preserving personalized fitness recommender system while user privacy is protected by advanced security methods. However, difficulties still exist in achieving a balance between data personalization and privacy protection, as well as in improving algorithm efficiency for precise recommendations. This paper presents a novel hybrid model, combining a Self-Attention based Graph Convolutional Network (SAGCN) with an Optimized Radial Basis Network (ORBN). Data preprocessing is a foundational step in our approach, refining raw fitness data collected from wearable IoT devices. Crucially, user privacy is prioritized through RSA-based data encryption and the innovative Competitive Championship Algorithm (CCA) -Based Private Key Selection algorithm, guaranteeing secure cloud storage and seamless decryption using the appropriate private key (PK). Feature extraction is pivotal, achieved via SAGCN, facilitating the extraction of essential features from the preprocessed data. Feature selection and personalization optimize system efficiency by reducing feature space dimensionality. The CCA aware Information Gain technique identifies pertinent features for each recommendation type, enhancing personalized fitness guidance. Personalization is at the core of our system, with the Optimized Radial Distribution Function (ORDF) model predicting personalized exercise distances, speed sequences, and heart rate recommendations based on learned features. CCA is used to fine-tune the Optimized Radial Basis Network (O-RBN) weights, effectively addressing accuracy, novelty, and diversity objectives. The proposed model is implemented using Python.

Keywords: Privacy Preserving; SAGCN; CCA; ORDF; ORBN; Information Gain.

INTRODUCTION

In today's digital age, personalized recommendation systems have become integral to various aspects of our lives, from suggesting movies to watch on streaming platforms to tailoring news articles to our interests. Beyond the province of entertainment and information, the power of recommendation systems extends into more specialized domains, including health and fitness [1]. The application of personalized recommendation systems is explored to predict routes and heart rates, a fusion of technology and fitness that holds immense potential for enhancing our well-being [2]. Physical fitness and outdoor activities have gained renewed importance in contemporary society, as individuals seek to maintain a healthy lifestyle while escaping the confines of sedentary routines [3,4]. Whether it's running, cycling, or hiking, these activities not only provide opportunities for physical exercise but also serve as mental rejuvenation, allowing individuals to connect with nature and relieve stress [5,6]. As technology continues to advance, the integration of smart wearables, GPS-enabled devices, and heart rate monitors has brought about a revolution in how approaching fitness [7,8]. One of the key challenges faced by fitness enthusiasts, whether novice or seasoned, is deciding on the most suitable routes for their workouts and optimizing their exercise intensity to achieve their health and fitness goals [9,10]. Here is where personalized recommendation systems step in, leveraging data analytics and machine learning to provide tailored suggestions for both routes and heart rate targets [11]. The concept of personalized route recommendation involves taking into account an individual's fitness level, preferences, and objectives [12]. By analyzing past workout data and considering factors such as terrain, elevation, and distance, these systems can suggest routes that align with the user's goals. Whether someone is aiming for a leisurely jog in a nearby park or a challenging mountain bike trail, the recommendation system can guide them towards an ideal path [13]. Fitness recommendation exercises using deep learning represent an innovative approach to personalized fitness guidance. Deep learning, a subset of machine learning, leverages artificial neural networks to process complex data and make predictions [14,15]. When applied to fitness recommendations, deep learning algorithms can analyze a wide range of user-specific data to offer tailored exercise plans and routines.

The motivation behind this work stems from the growing demand for personalized fitness recommendations and importance of user privacy in the field of wearable IoT devices and fitness tracking. Traditional fitness recommendation systems often rely on collecting and processing users' sensitive biometric and identity information, which raises significant privacy concerns. To address this challenge, the proposed methodology introduces a privacy-aware personalized fitness recommender system that utilizes advanced techniques. The primary motivation is to provide users with highly tailored exercise recommendations without compromising their privacy. The use of deep learning, specifically SAGC-NN, enables the system to learn user and workout route embeddings from real workout data while preserving user anonymity. The hybrid optimization model incorporating quantum-inspired CCA, aims to fine-tune recommendation parameters while optimizing multiple objectives like accuracy, novelty, and diversity. In summary, the motivation for this work is twofold: to deliver highly accurate and personalized fitness recommendations and to safeguard user privacy by eliminating the need for sensitive data collection. It addresses a critical need in the fitness recommendation domain by striking a balance between personalization and privacy, ultimately enhancing user satisfaction and trust in fitness recommendation systems.

The primary contribution of this research work is:

- ✓ To enhance the quality of the fitness dataset collected from wearable IoT devices, this study employs data pre-processing. It commences with noise removal to eliminate unwanted signals. Standardization follows, ensuring uniform feature scaling. Normalization aligns data ranges, facilitating accurate analysis and equitable comparisons.
- ✓ To prioritize user privacy, a robust RSA-based Data Encryption method is employed, coupled with a novel hybrid metaheuristic algorithm known as CCA Based Private Key Selection. This ensures that user data remains encrypted and secure when stored in the cloud, with the ability to be decrypted only using the appropriate private key (PK). CCA is the combination of Soccer League Competition (SLC) Algorithm and the League Championship Algorithm (LCA).

**Balamurugan and Bharathiraja**

- ✓To capture relevant patterns in the pre-processed data, features are extracted using a SAGCN, contributing to improved recommendation accuracy.
- ✓To optimize the recommendation process and reduce dimensionality, a feature selection technique based on metaheuristic-aware Information Gain is applied, identifying crucial features tailored to each recommendation type.
- ✓To provide personalized fitness recommendations, an ORDF model is developed. This model predicts personalized exercise distance recommendations, personalized speed sequence recommendations, and personalized heart rate sequence recommendations based on learned features, minimizing the need for explicit user identity or biometric information.
- ✓To ensure efficient optimization of the recommendation model, the weights of the O-RBN are fine-tuned using a hybrid optimization model, CCA.

The following is the arrangement of the remaining sections: The research and literature reviews that are relevant to the topic are covered in Section 2. The suggested framework is talked about in Section 3. Section 5 concludes this study, while Section 4 describes the outcomes that were recorded.

LITERATURE REVIEW

Arunkumar and Bhaskar [16] introduced a novel algorithm to improve heart rate estimation from wearable devices using photoplethysmography (PPG). It combines recursive least square, normalized least mean square, and least mean square adaptive filters to reduce motion artifacts in PPG signals. The filtered signals are then processed using the softmax activation function, Fast Fourier Transform, and phase vocoder to enhance heart rate accuracy. The method achieves a low error rate of 1.86 beats per minute when tested on 22 datasets, outperforming existing techniques. Smyth *et al.* [17] investigated the potential of using recommender systems and machine learning to aid people in their marathon training. It highlights the abundance of real-time activity data made available by wearable sensors, smartwatches, and fitness applications. The study provides examples of how such data might be used to improve training, competition, and recovery for marathon runners, regardless of whether their goals are to finish the race or set personal best times. With regard to issues with motion artefact compensation, Reiss *et al.* [18] concentrated on continuous heart rate monitoring using PPG. It adds a sizable dataset (PPG-DaLiA) gathered under real-world circumstances, improves a cutting-edge algorithm, and applies deep learning methods. To estimate heart rate, the deep learning method uses the time-frequency spectra of synchronized PPG and accelerometer signals. The efficiency of the deep learning approach in this field has been shown through comparative evaluations on four open datasets. Temko [19] discussed the difficult challenge of estimating heart rate (HR) using (PPG) signals during strenuous physical activity. It also incorporates a phase vocoder for HR refining and user-adaptive post-processing in addition to the Wiener filter-based WFPV method, which reduces motion artefacts. Also included is an offline version with Viterbi decoding (WFPV+VD). In comparison to other PPG-based HR estimation methods, the dataset of 23 PPG recordings' comparative result shows a considerable reduction in errors, making it appropriate for wearable health monitoring and fitness tracking applications.

Thomas and Gopi [20] employed a condensed method to concentrate on precise HR monitoring from PPG signals during physical activity. The procedure entails two crucial steps: 1) employing sparse methods to extract PPG signals from observed data, and 2) predicting HR using phase data produced from the polar representation of PPG signals. This method reduces complexity by not requiring accelerometer readings and relying on more than two PPG signals. In comparison to existing methods, the suggested method shows good results with an average absolute error of 1.00 BPM and an average relative error of 0.85 BPM. To get over the limitations of conventional contact-type devices, Chou *et al.* [21] developed a non-contact approach for HR measurement during physical activity. The suggested method uses unique frequency-domain pulse rate measurement techniques and adaptive skin color detection to increase measurement accuracy. A multichannel PPG sensor was introduced by Lee *et al.* [22] for accurate HR assessment during high-intensity exercise. The sensor uses truncated singular value decomposition (SVD) to reduce noise and can simultaneously acquire nine-channel PPG signals. The suggested method provides precise HR

**Balamurugan and Bharathiraja**

estimation throughout a variety of exercises, including high-intensity jogging, outperforming single-channel and other multichannel methods. The system performs better when acceleration signals and an HR tracking algorithm are added, proving its usefulness for HR estimation during strenuous exercise. The RR interval signal quality of a Holter device (medilog® AR12plus) and a chest belt heart rate monitor (Polar H10) were compared by Gilgen-Ammann *et al.* [23] during rest and exercise. Based on their precision in detecting RR intervals, both methods were evaluated. According to the study, both devices maintained great signal quality during a variety of activities, with the Polar H10 continuing to perform better, especially during intense workouts. The Polar H10 is advised for strenuous activities with noticeable body movements because of the strong correlation between both systems, which confirms their validity for RR interval evaluations in various activity levels. Mekruksavanich and Jitpattanakul [24] concentrated on using PPG signals, which are frequently utilized for daily heart rate monitoring in wearable devices, to improve the identification of human activities. The researchers present SE-DeepConvNet, a unique deep learning model for successfully identifying various physical activity patterns. Using the PPG dataset as a benchmark, they assessed the model's performance. In terms of accuracy (99.32%) and F1-score (99.32%), the results demonstrated that SE-DeepConvNet outperformed traditional CNN (convolutional neural network) models. This demonstrates the opportunity for deep learning methods to enhance the precision of identifying human activity patterns from PPG signals. Xiao *et al.* [25] proposal addressed the drawbacks of conventional health monitoring devices, which are frequently heavy and cumbersome to transport. The suggested solution uses Internet of Things (IoT) technology and consists of a wearable intelligent sports wristband with built-in heart rate monitoring capabilities. It tracks changes in users' heart rates while they engage in physical activity and transmits data to personal devices like PCs or mobile phones for real-time monitoring, archiving, and analysis via communication technologies like ZigBee and Bluetooth. Data is transmitted to a monitoring terminal platform using the IoT communication network, where it is processed and analyzed. Individuals' heart rate health while physical activity is continuously monitored as any aberrant data prompts prompt alerts.

Problem Statement

In the field of digital health and fitness, the fusion of technology with personalized fitness recommendations has revolutionized how individuals manage their physical well-being. However, this progress raises a fundamental concern related to the privacy and security of personal health data. While privacy-focused systems aim to safeguard user data, they introduce several challenges. Balancing privacy with personalized recommendations may restrict access to comprehensive user data, potentially affecting the accuracy of fitness advice [5]. Incorporating robust privacy measures can increase system complexity and slow down real-time interactions, potentially impacting user engagement. Stringent privacy measures may deter users from sharing their data, which can, in turn, diminish the quality of recommendations. Moreover, the resource-intensive nature of implementing stringent privacy protocols can result in higher operational costs [12]. Finding the delicate equilibrium between privacy and functionality is an intricate task, further complicated by the need to educate users and comply with evolving privacy regulations. Achieving a harmonious coexistence between data privacy and personalized fitness recommendations remains an ongoing challenge in the digital health landscape.

PROPOSED METHODOLOGY

Fitness recommendation systems are designed to offer specific exercise recommendations and predict heart rate during different activities. They employ diverse methods and technologies to customize workout plans and provide accurate heart rate estimations. This paper presents a privacy-conscious personalized fitness recommendation system that employs a SAGC-NN with an ORDF. The system utilizes real workout data from Fitbit devices, incorporating various parameters like gender, sport type, calorie expenditure, duration, distance, speed, heart rate, and geographical route data. Additionally, to enhance privacy, it utilizes the RSA algorithm with a key optimized through a novel hybrid metaheuristic algorithm CCA. Fig.1 shows the overall proposed architecture.

**Balamurugan and Bharathiraja****Pre-Processing**

In this study, data pre-processing is used to improve the quality of the initial fitness dataset that was collected through wearable IoT devices. In order to remove any unnecessary or undesired signals that can affect the dataset, noise removal is first applied. The use of standardization is then used to make sure that all the features are scaled uniformly, hence preventing bias brought on by different measurement units. The data is then transformed via normalization to bring it into a similar range, allowing for fair comparisons and accurate analysis across many aspects.

Median Filter - Noise Removal

Median filtering is a nonlinear technique for noise reduction in time series data. Each data point is replaced with the median value of its neighbours' points within a predetermined window. With this method, random noise, or "salt and pepper" noise, is successfully eliminated while the underlying patterns are kept. Data quality is improved by efficiently reducing noise through sorting data points and choosing the median. Median filtering, a popular technique, is used to perform early processing on raw time series data. When the noise distribution contains extended tails and periodic behaviours, this approach is highly effective at reducing random noise. The procedure comprises moving a window across the data, where the window's median value replaces the window's centre value, as shown in Eq. (1).

$$\text{Median}[C(t) + D(t)] \neq \text{Median} C(t) + \text{Median} D(t) \quad (1)$$

Two operations on time series data are represented in this case by $C(t)$ and $D(t)$. For particular channels, precise statistics are accessible, providing granular insights. All adjacent data points are averaged to provide the median value. The noise-free data is then extended using min-max contrast for improved analysis and visibility.

Standardization

Standardization is a crucial preprocessing method for time series data. The data must be transformed to have a mean of 0 and a standard deviation of 1. By putting data on a standard scale, this procedure makes it simpler to compare and analyse patterns across many time series. Standardization makes the data more acceptable for various analytical procedures that presume standardised distributions by ensuring that each data point's value accurately reflects its departure from the mean. Time series analysis, this method encourages precise modelling, lessens the impact of outliers, and facilitates the interpretation of data trends.

Normalization

For time series data, normalization is an essential preprocessing step. To maintain consistency and comparability across several time series, the data must be scaled to a particular range, often between 0 and 1. Normalization removes the impact of various scales and units between separate time series by dividing each data point by the highest value in the series. The efficiency of algorithms that rely on distances between data points and relative values is improved by this practise. Additionally, normalization prevents any one feature from taking over the analysis because of its size.

Privacy Preserving

To safeguard user privacy, a Rivest, Adi Shamir and Leonard Adleman (RSA) coupled with a CCA algorithm is employed for key generation. This encryption technique ensures that user data remains encrypted and secure on the Cloud. When needed, decryption with the corresponding private key (PK) is used to convert the cipher-text back to its original form, maintaining the confidentiality of user information. A hybrid optimization model, CCA, is developed by combining SLC and LCA.

Balamurugan and Bharathiraja

RSA-CCA

RSA Based Data Encryption

The RSA algorithm, widely employed in internet security, relies on prime numbers and modular arithmetic to create a pair of cryptographic keys: a public key and a private key. This system is fundamental to public key cryptography, supporting secure internet communication, digital signatures, and data protection. The public key, openly shared, serves to encrypt messages or data, rendering them indecipherable to unauthorized parties. Conversely, the private key, kept confidential, allows the recipient to decrypt these messages, ensuring the privacy and authenticity of information exchanged over the internet. The sender creates a message of the document, encrypts it with their private key to form a digital signature, and sends both the document and signature to the receiver. On the receiver's end, the digital signature is separated, decrypted to obtain the message, and compared with the document's message. This process ensures integrity, as any tampering with the document would alter the digests, authentication as the sender's private key is used, and non-repudiation, as the sender cannot deny authorship due to the unique signature.

Step 1: Consider the input file

Step 2: Now add the public key generated by RSA to the key pair.

Step 2: Add the RSA -generated optimal keyp.

Step 3: The input file is encrypted using RSA and uploaded in the server.

Step 4: After the file is uploaded, it is downloaded from the server and translated using the public key provided by RSA in order to decrypt the original file.

Step 6: The generated same public key ' p ' is used at the receiving end to decode the encrypted data and recover the original data U^i .

CCA Based Private Key Selection

To derive an optimal private key, a hybrid metaheuristic algorithm known as CCA is introduced. For the purpose of resolving optimisation issues, competitions between football teams for league success and between players for being a Star Player (SP) or Super Star Player (SSP) can be replicated. The same as football players want to be the best, optimisation looks for world-wide answers. Whether a SP, a team player, or an SSP, each league participant represents a solution vector that resembles local and global optimum. This league structure with M teams that have fixed players and substitutes, which is similar to the SLC algorithm's solution vectors. The power of a player is measured by objective functions that, like the fitness functions used in optimisation, are generated using Eq. (2). This strategy uses soccer's spirit of competition to address optimisation problems.

$$pp(i, j) = c(i, j) \text{ if team, } j \in \text{player, } c = \text{objective function} \quad (2)$$

The average power value of a team's fixed players is considered to be its overall power. The calculation of a Team's Power (tp) is demonstrated by Eq. (3).

$$tp(i) = \left(\frac{1}{nfp} \right) \sum_{j=1}^{nfp} pp(i, j) \quad (3)$$

The total number of fixed players on the i th team is represented as nfp . The team with more power in each match has a better chance of winning. Each team's chance of winning a game is determined by Eq. (4) and Eq. (5).

$$pvic(k) = \frac{tp(k)}{(tp(i) + tp(k))} \quad (4)$$

$$pvic(i) = \frac{tp(i)}{(tp(i) + tp(k))} \quad (5)$$

In the SLC algorithm, " $pvic$ " represents the probability of victory, ensuring that the sum of $pvic(k)$ and $pvic(i)$ equals 1, reflecting the probability of one player/team winning over the other. After each match, changes are introduced to improve player and team performance. These changes are simulated through operators like the imitation operator and provocation operator. The algorithm proceeds with steps including problem and parameter initialization, sample

Balamurugan and Bharathiraja

generation, team assessment, league initiation, updates, relegation and promotion, and a stopping criterion check, effectively optimizing solutions akin to managing a soccer league.

Step 1: Initialization - The process starts by creating a population of solutions. These solutions are generated randomly and form the basis for the subsequent optimization procedure. Each solution is represented as a vector x , where $x = \{x_1, x_2, \dots, x_n\}$, and X defines the set of possible values for each variable in the vector. The key objective is to minimize the function $f(x)$, and this is quantified through the fitness function $F(x)$. This function assigns a score or measure of fitness to each solution, indicating how well it performs with respect to the optimization goal. By initializing the population and calculating their fitness, the algorithm lays the foundation for the subsequent steps of the optimization process, where solutions will be refined and improved iteratively.

Step 2 : Samples generation -The total number of players in the league is determined using Eq. (6), which considers the number of teams (ntx), fixed players per team (nfp), and substitute players per team (ns). The outcome, denoted as $nPlay$, represents the total players in the league.

$$nPlay = ntx(nfp + ns) \quad (6)$$

Then, random solution vectors are generated, equal to the number of players in the league. Each solution vector corresponds to a specific player and is organized within the matrix *team*. This matrix comprises entries for fixed players (fp) and substitute players (sp), where xf represents fixed players and xr represents substitutes as given by Eq. (7).

$$team = \begin{bmatrix} fp_1 \\ fp_2 \\ \vdots \\ fp_{nfp} \\ rp_1 \\ rp_2 \\ \vdots \\ rp_{ns} \end{bmatrix} = \begin{bmatrix} xf_1^1 & xf_2^1 & \dots & xf_n^1 \\ xf_1^2 & xf_2^2 & \dots & xf_n^2 \\ \vdots & \vdots & \ddots & \vdots \\ xf_1^{nfp} & xf_2^{nfp} & \dots & xf_n^{nfp} \\ xr_1^1 & xr_2^1 & \dots & xr_n^1 \\ xr_1^2 & xr_2^2 & \dots & xr_n^2 \\ \vdots & \vdots & \ddots & \vdots \\ xr_1^{ns} & xr_2^{ns} & \dots & xr_n^{ns} \end{bmatrix} \quad (7)$$

In the optimization process, an objective function representing profit is calculated. This objective function incorporates a penalty cost associated with each solution vector, reflecting the player's power. To handle infeasible solutions, a penalty function is employed, ensuring effective exploration within the feasible solution space. The objective function, denoted as $Max f(x)$, can be expressed as the sum of the products of vk (representing some evaluation criterion for each solution component xk) and $wkxk$, where xk is an element of the solution vector. A penalty coefficient λ is introduced to apply penalties on infeasible solution vectors, ensuring optimization within the feasible region. λ is a significant constant ensuring that the fitness value of the best infeasible solution remains weaker than that of the worst feasible solution. This approach allows the optimization algorithm to effectively navigate the solution space while penalizing infeasible solutions as per Eq. (8).

$$max f(x) = \sum_{k=1}^n vkxk - \lambda \times max \left(\frac{\sum_{k=1}^n wkxk}{w} \right) \quad (8)$$

Step3: Teams assessment - All participants are grouped into teams and placed according to their calculated power in this step. The average power of a team's fixed players determines the power of each squad. In this step, players are assigned to the team's fixed and substitute positions based on their abilities. Team power is equal to the total of the fixed player cost.

Step4: League Start - The Imitation and Provocation operators are used in this step to act on the fixed and substitute players of the winning teams, respectively. Competitions are begun between all feasible pairs of teams in the league. The complete description of operators is defined in the following section.

Balamurugan and Bharathiraja

- Imitation Operator: In the SLC algorithm, the fixed players (fp) on the winning team adopt a strategy of imitation to enhance their future performance. They imitate both their own Star Player (sp) and the Super Star Player (ssp) in the league, aiming to improve their future activities. This proposed imitation process is described by the following formulas:

$$fp(i, j) = fp(i, j) + \tau_1(ssp - rp1(i)) * a_i^t \quad (9)$$

$$fp(i, j) = fp(i, j) + \tau_1(sp - rp1(i)) * a_i^t \quad (10)$$

$$fp(i, j) = fp(i, j) + \tau_1(rp2 - rp1(i)) * a_i^t \quad (11)$$

Here, $\tau_1 \sim u(0.2, 0.8)$ is the random number with uniform distribution. The i th team's star player is designated as $sp(i)$, whereas $rp1$ and $rp2$ are arbitrary random players. $fp(i, j)$ defines the i th team's j th fixed player. First, the victorious team's solution vector of fixed players (fp) moves in the direction of the outcome vector of ssp Eq. (9).

The previous solution vector is substituted with the new solution vector Eq. (9) if the newly created solution vector at this new position was superior. If not, the solution vector shifts in the direction of the SP resultant vector Eq. (10). If this solution was superior to the previous one, new solution vector (10) is used. If not, the solution vector shifts towards the outcome vector of a team member chosen at random Eq. (11). The player's location remains unchanged if none of the suggested movements resulted in a superior solution vector. To achieve this, a truncated geometric probability distribution is used to simulate the number of changes dynamically. The formula provided calculates a_i^t based on several parameters:

$$a_i^t = \left\lceil \frac{\ln(1 - (1 - c_p)^{n - a_0 + 1})r}{\ln(1 - c_p)} \right\rceil + a_0 - 1: a_i^t \in \{a_0, a_0 + 1, \dots, n\} \quad (12)$$

In Eq. (12), r represents a random number in the range $[0, 1]$, c_p is a control parameter, with $c_p < 1$ (and $c_p \neq 0$). A smaller c_p places more emphasis on fewer changes, while a more negative c_p emphasizes greater changes. a_0 is the minimum number of changes expected during the artificial match analysis, assumed to be at least one ($a_0 = 1$). n is a variable that helps define the range of possible values for a_i^t . The formula calculates a_i^t as a discrete value within the range $\{a_0, a_0 + 1, \dots, n\}$, taking into account the random number r and the control parameter c_p . The value of c_p influences the likelihood of fewer or greater changes, with a higher c_p resulting in fewer recommended changes in the team formation process. The formula for a_i^t representing the number of changes in team formation, is adjusted using the imitation operator during the league start phase in LCA. This modification prevents the algorithm from converging prematurely to local optima. By incorporating strategies from top-performing teams or players, the imitation operator introduces diversity, enhancing the exploration of the solution space and increasing the likelihood of finding globally optimal solutions, rather than being trapped in suboptimal local ones.

- Provocation operator: In order to qualify as a fixed player, a substitute of a winning side (s) must demonstrate performance on par with the average performance level value of the fixed players on their team. The provocative operator in the SLC algorithm executes this procedure, which is explained by Eq. (13) and Eq. (14).

$$s(i, j) = g(i) + \chi_1(g(i) - s(i, j)) \quad (13)$$

$$s(i, j) = g(i) + \chi_2(s(i, j) - g(i)) \quad (14)$$

where $g(i)$ is the average value of the fixed player's solution vectors in the i th team, and $\chi_1 \sim u(0.9, 1)$, $\chi_2 \sim u(0.4, 0.6)$ are random values with uniform distribution. The j th substitute for the i th team is $s(i, j)$. First, the solution vector of the winning team's weakest substitute player moves in the direction of the fixed players' gravity centre Eq. (13). It is replaced with new solution vector, if the newly created solution vector for this new point was superior than the previous one. If not, the player in question will travel backwards towards the gravitational centre Eq. (14). If this movement provided a solution that was stronger than the least effective one, it would take its place. When none of the moves suggested could improve the weakest solution vector, a new vector is produced at random and utilised in place of the previous one. Provocation operators operate on the weakest winners' replacements overall. They remain

Balamurugan and Bharathiraja

on the team if their performance showed signs of improvement. If not, they are kicked off the team and replaced in subsequent games with fresh random players (solution vectors). Two previously discussed operators are applied to the players (solution vectors) after each game, and the team's powers are revised in accordance with the new solutions. Naturally, strong teams have a higher chance of winning their upcoming games. The SSP of the league produces the global optimum (best solution) for the optimisation problem as this process proceeds through the end of the season.

Step 5: League update - In this step, following each season, players are reorganized based on their newly assessed abilities. As a new league begins, the top-performing players are assigned to the best teams, players with average performance join teams of similar standing, and the least proficient players are transferred to the lower-ranked teams in the league.

Step 6: Relegation and promotion - In this step, inspired by real sports leagues, the SLC algorithm introduces a system of relegation and promotion to prevent getting stuck in local minimums or plateaus. Unlike real leagues where the worst team is removed, here, the algorithm eliminates the weakest teams from the first-level league. Simultaneously, new teams, designated as promotion spots, are introduced into the league. This step is triggered when the best costs remain equal for three consecutive seasons.

Step 7: Check the stopping criterion - The optimization process continues by repeating steps 3 to 5 iteratively. This repetition persists until the specified termination criterion, typically denoted as n Season, is met, signifying that the algorithm has completed the desired number of seasons or iterations, and the optimization process can be concluded.

Feature Extraction

In this research, the process of feature extraction relies on SAGC-NN. This technique employs neural networks with self-attention mechanisms and graph convolutional layers to capture and distill meaningful patterns and attributes from complex data structures.

SAGCN

SAGCN is a powerful framework for processing graph-structured data. It starts with an input consisting of a graph structure represented by an adjacency matrix A and node features in a matrix X . The convolutional layer aggregates information from neighboring nodes to enhance node representations. This operation is performed as per Eq. (15).

$$h^{l+1} = \sigma(d^{-\frac{1}{2}} a d^{-\frac{1}{2}} h^l w^l) \quad (15)$$

Where h^l represents the node features at layer l , σ is an activation function (e.g., ReLU), a defines the adjacency matrix with added self-loops, d represents the a 's degree matrix, w^l is the learnable weight matrix. Common pooling methods include mean pooling or max pooling, which aggregates information from all nodes to create a single representation for the entire graph. In self-attention-based GCNs, the attention mechanism helps nodes focus on more relevant neighbors. The attention coefficients α_{ij} are calculated as per Eq. (16) using a function that measures the compatibility between node i and its neighbors j .

$$\alpha_{ij} = \frac{\exp(e_{ij})}{\sum_{k \in n_i} \exp(e_{ik})} \quad (16)$$

Where n_i represents the neighbors of node i , e_{ij} represents the compatibility score computed for node pairs (i, j) . This score depends on node features and learnable parameters. After applying the attention mechanism and aggregating information, a fully connected layer is often used to further process node representations. This layer applies a linear transformation followed by an activation function. The output layer produces the final predictions. For classification tasks, it typically consists of a softmax activation function. The loss function is an essential component for training the model. For classification tasks, a common choice is the categorical cross-entropy loss. Given a set of labeled nodes in the graph, denoted as n_{train} , and their true class labels Y , the loss function can be formulated as per Eq. (17),

Balamurugan and Bharathiraja

$$\text{loss} = \sum_{i \in n_{\text{train}}} \sum_{c=1}^C \mathbb{I}(y_i = c) \log(p_{i,c}) \quad (17)$$

Where C is the number of classes, y_i represents the true class label for node i , and $p_{i,c}$ is the predicted probability that node i belongs to class c . the indicator function $\mathbb{I}(y_i = c)$ evaluates to 1 when $y_i = c$ and 0 otherwise. In order to properly train the model to correctly predict classes for the provided graph-based data, this loss function must be minimized during training in order for the predicted probabilities $p_{i,c}$ to coincide with the true class labels. In order to improve the model's ability to capture significant patterns in the graph structure and node attributes for the specific classification job, this loss is back propagated through the layers of the network.

Feature Selection and Personalization

In this process, features are initially extracted from pre-processed data using SAGCN. To streamline the data, a feature selection method is applied, specifically the Information Gain method, which identifies key features for each recommendation type. Then, the ORDF model leverages these learned features to provide personalized exercise distance, speed sequence, and heart rate recommendations based on users' fitness characteristics inferred from sensory data, without requiring explicit user identity or biometric information.

CCA based Information Gain

The statistical distribution of feature weights in information gain is based on correlations between features and classifications. Assume that $A(a_1, a_2, \dots, a_p)$ is a collection of p features, $F(f_1, f_2, \dots, f_n)$ is a group of n data points, and $B(b_1, b_2, \dots, b_m)$ is a group of m type labels. The proportion of classes in F with the label " P_i " is shown by the number $P(Cl_i)$ (where $i = 1, 2, \dots, m$). Entropy is given as per Eq. (18).

$$H(B) = -\sum_{i=1}^m P(Cl_i) \log_2 P(Cl_i) \quad (18)$$

There is an information gain for each characteristic in the data categorization system (IG). Where I_j is the dataset feature for the p^{th} ($p = 1, 2, \dots, n$). In relation to the property $I_j(I_j^1, I_j^2, \dots, I_j^p)$, the relevant conditional entropy is shown in Eq. (19).

$$H(B|I_j) = -\sum_{p=1}^k P(I_j^p) \sum_{i=1}^m P(Cl_i|I_j^p) \log_2 P(Cl_i|I_j^p) \quad (19)$$

The value of the attribute I_j , which has k distinct sorts of values, is I_j^p , and $P(I_j^p)$ stands for the category variable Cl 's prior probability. Following the fixation of the attribute I_j , the conditional probability of the variable Cl is represented by the $P(Cl_i|I_j^p)$. Since the difference between $H(B)$, $H(B|I_j)$, which is determined by Eq. (4), is what determines the value of the information obtained from the attribute I_j , it can be inferred from the formula shown in Eq. (20).

$$IG(I_j) = H(B) - H(B|I) \quad (20)$$

Enhancements to SAGCN involve incorporating metaheuristic-aware Information Gain for improved feature learning. Additionally, Information Gain is employed with CCA-based feature extraction to enhance feature selection, ultimately leading to enhanced classification performance. These techniques collectively optimize feature extraction and selection in the SAGCN model.

ORDF

The ORDF model is used to create a personalized recommendation system. It predicts individualized exercise distances, speed sequences, and heart rate sequences by analyzing learned features from sensory data. This approach minimizes the necessity for explicitly gathering user identity or biometric information, as the model infers users' fitness characteristics. It offers exercise recommendations, enhancing user experiences and health outcomes in route planning and heart rate management. ORDF model calculates exercise recommendations, speed sequences, and heart rate sequences that are finely tuned to an individual's unique fitness characteristics. The model starts by learning

Balamurugan and Bharathiraja

essential features from user data and historical exercise patterns. These features could include exercise preferences, past performance, age, and more. ORDF examines the relationships between different exercise parameters. The ORDF, denoted as $g(r)$, is calculated as per Eq. (21).

$$g(r) = \frac{n(r)}{2\pi r^2 \rho} \quad (21)$$

$n(r)$ is the number of exercises that should be performed within a radius of r , and ρ denotes the user's fitness density. The model utilizes sensory data from wearables, such as heart rate monitors and accelerometers, to track real-time fitness metrics during exercise sessions. By combining learned features and real-time sensory data, the ORDF model tailors exercise recommendations, speed sequences, and heart rate targets on the fly. This personalized guidance optimizes workout effectiveness and safety. Crucially, the RDF model operates without explicitly collecting user identity or biometric information, ensuring privacy and data security.

Classification

The O-RBN fine-tunes its weights through a hybrid optimization approach CCA. This approach blends the SLC and LCA. CCA's primary role is to optimize the parameters of the RBN, which enhances the classification performance.

ORBN

The input layer, the hidden layer, and the output layer are the three layers that make up RBFN. It is a feed-forward network, and the hidden layer's functionality—which uses radial basis functions (RBF) as activation functions—is what makes it unique. The neurons in the buried layer have local receptive fields that show a response that monotonically decreases or increases with distance from a centre point. The input is transformed nonlinearly by the RBFN hidden layer, and the output layer applies linear regression to get the desired outputs. According to Equations (22) and (26), the Gaussian and Multiquadric RBFs are frequently used in the hidden layer. The Multiquadric RBF has a monotonically growing response with distance from the centre, compared to the Gaussian RBF's monotonically decreasing response.

$$gaus \phi = \exp\left(-\frac{(\gamma-b)^2}{a}\right) \quad (22)$$

$$multiqua \phi = \frac{\sqrt{a^2 + (x-b)^2}}{a} \quad (23)$$

$$\phi_i = \phi(\|\gamma - C_j\|) = \exp\left(-\frac{\|\gamma - b_i\|^2}{2\sigma_i^2}\right) \quad (24)$$

$$\delta = \frac{D_{max}}{\sqrt{h}} \quad (25)$$

$$Out = \sum_{i=1}^n w_i \cdot \phi(\|\gamma - b_i\|) \quad (26)$$

Each input vector is fed into a hidden unit that is connected to a radial centre represented by $b_1, b_2, \dots, b_n$ in accordance with Eq. (26). The output of the i -th hidden unit is defined by the RBF function, which measures the Euclidean distance between the input and the i -th center, δ_i is the standard deviation of i th gaussian function. The weight, w_i , that is given to each hidden unit is learned during network training using the CCA algorithm. The goal of this optimisation process is to fine-tune the RBFN's parameters and improve its detecting capabilities. According to Eq. (25), D_{max} denotes the greatest separation between the centres of the radial basis functions (RBF) contained in the hidden layer. The weighted contributions of each RBF in the hidden layer are added up to get the network's output Out, which is indicated in Eq. (26). The O-RBFN's parameters are improved using the CCA algorithm to increase the accuracy with which it can identify and categorise patterns in the input data. The CCA algorithm is a metaheuristic method that incrementally modifies the network's RBF weights and centre. The O-RBFN is able to modify its parameters to more closely match the training data through this iterative optimisation process, improving detection performance. This strategy intends to outperform existing approaches in classification by integrating the radial basis function design of O-RBFN with the parameter adjusting capabilities of CCA algorithm. With its optimised parameters, the O-RBFN can more accurately complete classification jobs and handle complicated patterns, which improves the system's overall prediction performance. To sum up, the privacy-aware personalized fitness

recommender system, employing a three-tier deep learning architecture featuring SAGC-NN and an ORBN fine-tuned via a hybrid optimization model CCA, represents an efficient and privacy-conscious approach to delivering personalized fitness recommendations. This system ensures that users receive fitness guidance while safeguarding their sensitive information, striking a valuable balance between personalization and privacy protection. In conclusion, our system offers valuable solutions in the field of workout route recommendation and short-term heart rate prediction. By accommodating users' workout expectations and providing route suggestions, it promotes workout consistency and adaptability, even during travel. Additionally, the real-time heart rate prediction serves as a personalized assistant, enhancing the safety and effectiveness of users' exercise routines.

RESULT AND DISCUSSION

Experimental Setup

The proposed model is implemented using Python. The proposed model is compared with the existing models namely, League Championship Algorithm (LCA) [28] and Soccer League Competition (SLC) [29], Whale Optimization Algorithm (WOA) [30], and Particle Swarm Optimization (PSO) [27]. The performance metrics like Mean Squared Error (MSE), Mean Absolute Error (MAE), Normalized Mean Squared Error (NMSE), Root Mean Squared Error (RMSE), and Mean Absolute Percentage Error (MAPE) are used to evaluate the proposed model.

Dataset Description

The FitRec project databases [26] include user sport records from Endomondo and provide a thorough collection of sequential sensor data including heart rate, speed, GPS coordinates, and extra information like sport kind, gender, and weather conditions. The datasets are only made accessible for academic usage, with a focus on non-commercial and non-redistributive use. There are three different dataset variants offered: unfiltered, filtered, and resampled. Metadata and meteorological conditions are among the unprocessed data in the raw dataset. The filtered version of the data uses heuristics to exclude workout examples that are aberrant and derive characteristics like speed and distance. The data is interpolated to ensure regular sampling intervals in the resampled version, enabling efficient analysis. While maintaining user privacy concerns, these datasets provide significant resources for studies into personalised fitness advice, heart rate forecasts, and activity analytics.

Performance Metrics

The performance metrics and their calculation formulas are given below.

MSE: MSE is a measure of the average squared difference between the predicted values and the actual values. It is commonly used in regression analysis to evaluate the quality of a model's predictions. The formula for MSE is given as per Eq. (31).

$$MSE = 1/n * \sum (y_i - \hat{y}_i)^2 \quad (31)$$

where y_i is the actual value, $\hat{y}_i$ is the predicted value, n is the total number of observations.

MAE: MAE is a measure of the average absolute difference between the predicted values and the actual values. It calculates the average of the absolute differences between each prediction and its corresponding actual value. The formula for MAE is given as per Eq. (32).

$$MAE = 1/n * \sum y_i - \hat{y}_i \quad (32)$$

NMSE: NMSE is a measure of the average squared difference between the predicted values and the actual values, normalized by the variance of the actual values. It is commonly used in signal processing and image analysis to evaluate the quality of a model's predictions. The formula for NMSE is given as per Eq. (33).

$$NMSE = 1/n * \sum (y_i - \hat{y}_i)^2 / var(y_i) \quad (33)$$

where $var(y_i)$ is the variance of the actual values.

Balamurugan and Bharathiraja

MAPE: MAPE is a measure of the average percentage difference between the predicted values and the actual values. It is commonly used in forecasting to evaluate the quality of a model's predictions. The formula for MAPE is given as per Eq. (34).

$$MAPE = 1/n * \sum |y_i - \hat{y}_i| / y_i * 100\% \quad (34)$$

RMSE: RMSE is a measure of the square root of the average squared difference between the predicted values and the actual values. It is commonly used in regression analysis and time series analysis to evaluate the quality of a model's predictions. The formula for RMSE is given as per Eq. (35).

$$RMSE = \sqrt{1/n * \sum (y_i - \hat{y}_i)^2} \quad (35)$$

where *sqr*t is the square root function.

Overall performance of the proposed model

In Table 1, the overall performance metrics for various optimization methods, including the proposed model, LCA, SLC, WOA, and PSO, are presented. These metrics are essential for evaluating the effectiveness of these methods in solving the specific problem under consideration. The proposed model outperforms the other methods with an MSE of 0.9708, indicating that its predictions, on average, are closer to the actual values than those of LCA, SLC, WOA, and PSO. This lower MSE suggests that the proposed model provides more accurate predictions. The proposed model yields the lowest MAE of 0.0348 among all methods, demonstrating that the proposed model has the smallest absolute errors on average. This metric emphasizes the precision of the proposed model's predictions. The proposed model achieves the lowest NMSE of 0.0001, indicating that its predictions are not only accurate but also consistent concerning the variability in the actual data. This highlights the robustness of the proposed model. The proposed model again excels with an RMSE of 0.9852, implying that its errors are relatively smaller in magnitude compared to the other methods. The proposed achieves the lowest MAPE of 0.0005, indicating that, on average, its predictions deviate by the smallest percentage from the actual values among all methods. privacy-conscious personalized fitness recommendation system that employs a SAGC-NN with an ORDF. The system utilizes real workout data from Fitbit devices, incorporating various parameters like gender, sport type, calorie expenditure, duration, distance, speed, heart rate, and geographical route data. Additionally, to enhance privacy, it utilizes the RSA algorithm with a key optimized through a novel hybrid metaheuristic algorithm CCA. Fig.1 shows the overall proposed architecture.

Overall graphical representation

Figure 2 provides visual representations of critical performance metrics: (a) MSE, (b) MAE, (c) NMSE, (d) RMSE, and (e) MAPE. These graphs offer a comprehensive view of how different evaluation criteria vary across the considered models or methods, aiding in the assessment of their predictive accuracy and consistency

CONCLUSION

Advanced security techniques were used to preserve user privacy when the personalized fitness recommender system generated the personalized workout recommendations. Achieving a balance between data personalization and privacy protection, as well as increasing algorithm efficiency for exact recommendations, remained challenging, though. This study proposed a brand-new hybrid model that combines an ORBN and a SAGCN. In our methodology, data preparation functioned as a fundamental step that improved the raw fitness data gathered from wearable IoT devices. Importantly, user privacy was given top priority through RSA-based data encryption and the ground-breaking CCA-Based Private Key Selection algorithm, ensuring secure cloud storage and simple decryption using the right PK. By using SAGCN to extract key features from the preprocessed data, feature extraction played a crucial role in this study. By decreasing the dimensionality of the feature space, feature selection and personalization increased system efficiency. By identifying relevant characteristics for each sort of recommendation, the CCA aware Information Gain technique improved personalized exercise advice. The ORDF model predicted personalized workout lengths, speed sequences, and heart rate recommendations based on learning attributes, which was at the

Balamurugan and Bharathiraja

heart of our system. The O-RBN weights were refined using CCA, successfully addressing the accuracy, novelty, and diversity objectives. Python was used to put the proposed model into practice.

ABSTRACT

In the fields of healthcare and finance, medical insurance is unavoidable. According to the terms of the policyholder-insurer agreement, the insurance company offers this form of insurance. It covers medical costs related to emergency treatment, unanticipated hospital stays, and healthcare services. The client must pay a premium regularly to obtain medical insurance from the insurer. This study aims to anticipate policyholders' medical insurance rates in advance by considering several variables and risk factors. To achieve this goal, we took a dataset that belongs to an Indian Insurance Company, which has disclosed data for approximately 1000 clients. Effective machine learning techniques such as Decision Tree Regression, XG Boost Regression, Bayesian Ridge Regression, Principal Component Regression, and Partial Least Square Regression will be used to build a machine learning model. An Exploratory Data Analysis (EDA) will examine various policyholder characteristics. With the help of this forecast, the insurance provider may improve their financial performance and set suitable premium prices. Based on the cost of their premiums, policyholders may make informed choices.

Keywords: Medical Insurance, Machine Learning, Health Insurance, Premium Prediction, Cost Prediction

INTRODUCTION

The insurance sector includes firms that utilize insurance contracts to manage risks. One party, the party being insured, promises payment in the case of an unforeseen future disaster. This is the basic principle of insurance. If this

**Sabarish and Abarnaa**

protection leads to an uncertain incidence, the insured or the insurer will pay the insured a reduced decoration. These programs are intended to offer policyholders who have decorations recreated with information or compensation. Then, with a focus on health insurance, we look at some of the different insurance options. Insurance products come in a wide variety of forms, such as health, life, liability, and property and casualty insurance. Whereas one type of insurance, known as health insurance or health insurance, covers all or part of the risks associated with a person needing medical care. Since this decision is influenced by several circumstances, each person's health insurance cost is unique. Like other insurances, the danger includes many parties. Calculating the health risks and medical costs for the whole barrier fund. Health insurance covers a wide range of medical services, such as hospital stays, operations, prescription drugs, vaccinations, checkups, and specialized therapies.

Apart from guaranteeing that people may get the care they need without worrying about running out of plutocrats, it also guards against the exorbitant cost of medical care. Large danger populations and actuarial calculations are sometimes used in older health insurance premium calculation systems, which might result in strange and inaccurate forecasts. The rising cost of health care has policyholders looking for more affordable and transparent insurance options. By more precisely defining the threat profiles of certain visitors, insurance companies may benefit from more accurate payment estimations. This might lead to a more equitable distribution of possible risks, fewer losses from underpricing, and a stronger position in the request. The "Medical Insurance Premium Forecast" aims to fundamentally change the difficulties and complications the insurance sector is now facing. Displaying insurance decorations that guests have paid insurance companies is the primary purpose of our design. creating a transparent insurance system that benefits both insurance companies and tourists. To achieve this, we use several machine literacy techniques in combination with a fundamental machine learning model and a dataset of the policyholders' varied clinical characteristics.

REVIEW OF LITERATURE

As defined by Greenlaw and Shapiro (2011), insurance is a financial safeguard against significant adverse events, while Outreville (1998) emphasizes its legal context as a contract for risk-based compensation. These studies underline the potential of machine learning in enhancing accuracy and scalability in insurance premium predictions. Identical to S. Angel Latha Mary et al. (2023) achieved 99% accuracy using Linear Support Vector Machines (LSVM) trained and evaluated on eleven criteria, showcasing its robustness. Vijayalakshmi and Selvakumar (2023) compared multiple regression techniques, identifying Random Forest Regression (RFR) as the best-performing model with an R^2 score of 0.9533, emphasizing the strength of ensemble methods. RM Jesus et al. (2023) analyzed the role of Machine Learning Operations (MLOps) in improving forecasting outcomes and operational scalability in the insurance sector. AD Kafuria (2022) assessed the predictive performance of models like RFR, XGBoost, and LASSO on demographic and behavioral data, demonstrating the effectiveness of ensemble methods for complex data patterns.

METHODOLOGY

The methodology examines the various medical aspects of policyholders and includes several steps to predict the premium of customers who have purchased medical insurance from an insurance company. These steps include data collection, exploratory data analysis, model building, testing, evaluation, and visualization of the expected results. Each approach will be discussed in depth.

Data Collection

To generate our estimate, we utilized a Kaggle.com dataset that contained health data for 1000 clients with insurance-covered medical expenses. The dataset included 10 characteristics: height, weight, known allergies, family history of cancer, diabetes, blood pressure problems, age, number of major operations, transplants, and chronic illnesses.

**Sabarish and Abarnaa****Exploratory Data Analysis**

Exploratory data analysis (EDA) enables us to better understand our data, detect trends, and choose the best features, pre-processing, and modeling options. It provides the framework for developing accurate prediction algorithms for estimating the cost of health insurance. Our EDA in this instance takes advantage of bivariate analysis.

- **Bivariate Analysis** In our study, we favour stacked bar plots to comprehend the link between two variables. A statistical analysis technique called bivariate analysis involves simultaneously examining and assessing correlations between two variables.
- **Scatter Plot** scatter plots depict the associations between two continuous data, displaying trends, clusters, and outliers. They are excellent for detecting correlations and adding multivariate insights via colour or size changes.
- **Boxplot** : Boxplots display the distribution and distribution of data using a five-number summary (minimum, Q1, median, Q3, maximum). They make it possible to compare categories quickly to find trends and group differences, and they aid in the detection of outliers, which are shown as points outside the whiskers.
- **Heatmap** : Heatmaps use colour intensity to illustrate value differences to examine data patterns, particularly for correlations and interactions. Grouped heatmaps display distribution patterns for categorical combinations, whereas correlation heatmaps illustrate correlations between continuous variables, supporting feature selection and multicollinearity tests. Heatmaps offer a clear summary of big datasets, directing additional research.

Feature Selection : A crucial phase in machine learning (ML) and data analysis is feature selection, which enhances interpretability, reduces overfitting, and boosts model performance. A larger pool of possible features, it comprises choosing a subset of relevant features (variables or attributes). Feature selection may be particularly important when working with high-dimensional data because adding redundant or superfluous features might slow down computation and lower model accuracy.

Splitting Training and Testing Set In this case, we divide our dataset into 80% training data and 20% testing data to develop a model.

Algorithms Used The mentioned ML algorithms are used to fit a model for the data, as well as preprocessing techniques such as the Standard Scaler to compare model performance with and without preprocessing. Additionally, we fitted a polynomial feature regression model.

- **Decision Tree Regression** Decision tree regression predicts continuous values by splitting data into subsets based on feature values. Each leaf represents the predicted value, often the mean of the target in that subset. While effective for capturing complex patterns, decision trees can overfit, requiring techniques like pruning or ensemble methods for better performance.
- **XG Boost Regression** XGBoost Regression is a fast and powerful algorithm that builds an ensemble of decision trees to predict continuous values. It improves model accuracy by correcting errors in each successive tree and includes regularization to prevent overfitting.
- **Bayesian Ridge Regression** Bayesian Ridge Regression is a linear regression technique that adds regularization to avoid overfitting and estimates model parameters using Bayesian inference. It works well with multicollinearity or high-dimensional data and assumes Gaussian distributions for the coefficients.
- **Principal Component Regression** Principal Component Regression (PCR) is a technique that combines principal component analysis (PCA) with linear regression. It first reduces the dimensionality of the data by transforming it

**Sabarish and Abarnaa**

into principal components and then performs linear regression on the most significant components. PCR helps address multicollinearity and overfitting, especially when there are many correlated features.

- **Partial Least Squares Regression** Partial Least Squares (PLS) Regression is a dimensionality reduction technique used when predictors are numerous and highly correlated. It creates latent variables by combining predictors in a way that maximizes their covariance with the response, addressing multicollinearity while ensuring prediction accuracy. PLS is widely applied in fields like chemometrics and bioinformatics and is particularly useful when predictors outnumber observations.

Model Evaluation Evaluating a trained machine learning model's performance and efficacy is known as model evaluation in machine learning. It entails evaluating the model's effectiveness in achieving its goals related to classification, regression, clustering, or any other machine learning issue. We will test our model with Root mean squared and mean squared errors.

- **Distribution Plot** A distribution plot, sometimes referred to as a distribution comparison plot or distribution visualization, is a graphical tool used in data analysis and machine learning to compare the distributions of anticipated (fitted) and actual (observed) values. It is a helpful tool for determining how well the predictions of a model match the distribution of the data.
- **Root Mean Squared Error (RMSE)** A more comprehensible measure of error in the same units as the target variable is provided by the ROOT MEAN SQUARED ERROR (RMSE), which is the square root of the MSE.
- **Mean Squared Error (MSE)** One often used statistic for assessing how well regression models work is the Mean Squared Error (MSE). It calculates the mean square of the errors, or the discrepancies between the actual and anticipated values. A model that fits the data better is indicated by a lower MSE.

Viewing The Predicted Premium To view projected output data as a CSV file in Jupyter Notebook, initially generate your predictions. Next, arrange these predictions in a table fashion using the pandas package. Use pandas to save this table as a CSV file with a custom name. To view and manipulate the data, you may simply open the CSV file in your notebook or other spreadsheet program.

Analysis

To uncover how our medical insurance premium prediction system works with a step-by-step process, we used to turn data into useful predictions. So, get ready to peek under the hood of our medical insurance prediction machine through our methodologies like Data collection, Exploratory Data Analysis (EDA), Building the model by five ML algorithms to find the best model that fits our data, and visualizing the predicted output of our best model.

Importing Data

In the first step, we imported data named medical insurance.csv with the features Age, diabetes, issues with blood pressure, Any chronic illnesses, transplantation, Size, weight, any known allergies cancer in the family history, number of big operations, Premium Cost.

Exploratory Data Analysis

EDA is performed to understand the data on how the cost of our premiums changes based on the policyholders' medical conditions and when forecasting models by using bivariate analysis. Figure 1, appears that premium prices tend to be higher for people in various age ranges, particularly around the ages of 30 and 60, where premiums often reach levels around 35,000 to 40,000. However, there is considerable variation in premium prices across all age groups, indicating that factors other than age likely influence premium pricing. There is no clear linear trend, suggesting that age may have a complex or limited direct impact on premium price levels.

**Sabarish and Abarnaa**

Figure 2, Individuals with chronic diseases (1) tend to have higher median premium prices compared to those without (0), as seen by the upward shift in the central line within the box for group '1'. Additionally, the range of premium prices is wider for those without chronic diseases, indicating greater variability in premiums for this group. In contrast, the distribution for individuals with chronic diseases is more concentrated around the median, with slightly fewer outliers and a tighter interquartile range. This suggests that having chronic conditions is associated with more consistent but generally higher insurance premiums. Figure 3 displays Any Transplants is 0 (no transplants), the median premium price is lower, with a tighter range of values and fewer outliers, compared to when Any Transplants is 1 (at least one transplant). For patients with transplants, the median premium price is significantly higher, and the range of prices is more spread out, indicating greater variability. This suggests that having a transplant is associated with a higher and more variable premium price

Figure 4, Exhibitions For individuals without blood pressure issues (represented by 0), the median premium price is around 20,000, with a fairly wide interquartile range (IQR) extending from about 17,500 to 30,000. The spread of the data is large, with several high outliers reaching up to 40,000, indicating significant variability in premium prices within this group. In contrast, for individuals with blood pressure problems (represented by 1), the median premium is slightly higher, close to 25,000, with a narrower IQR from approximately 20,000 to 30,000. Although this group also has fewer outliers, they lie within a narrower range compared to the group without blood pressure problems. Overall, while premiums are somewhat higher for those with blood pressure issues, there is more consistency in pricing for this group. In contrast, premiums for those without blood pressure problems display greater variability and include some notably high values. This distribution may reflect the influence of additional risk factors or underwriting considerations in determining premium prices for individuals without blood pressure issues.

Figure 5, displays that Individuals without diabetes (indicated by "0") generally have a wider range of premium prices, with the interquartile range (IQR) extending from about 20,000 to 30,000. Their premiums also include some higher values reaching nearly 40,000, though they contain no extreme outliers. In contrast, individuals with diabetes (indicated by "1") have a narrower IQR, indicating a more consistent range in premium prices, but they exhibit several outliers above 35,000. While the median premium is slightly lower for diabetic individuals, the presence of outliers suggests that some individuals with diabetes are paying significantly higher premiums. Figure 6, illustrates the correlation coefficients between several characteristics, including height, weight, allergies, family history of cancer, diabetes, blood pressure issues, transplants, chronic diseases, age, and insurance-related metrics. Dark blue denotes a strong negative correlation, whereas dark red denotes a strong positive connection. The colors' intensity, which ranges from dark blue to dark red, reveals the direction and strength of the relationships. Finding patterns and connections in the data with the help of this heatmap may help guide future research or decision-making procedures.

Feature Selection

The following attributes were employed in our premium prediction: Age, diabetes, hypertension, organ transplants, long-term illnesses, Weight, height, known allergies, and The number of major operations and a family history of cancer are independent variables for input features. We then determined that the goal-dependent variable would be the premium price.

Training and Testing Set

Post feature selection, we divided our dataset into 1000 distinct observations for testing and training. Eighty percent of our data will be separated into X train using the input features we chose, and another eighty percent will be split into Y train using just the target variable. 20% of the training set's data with input features will be split for the X test, and the premium will be predicted for the Y test.

Fitting the Model

We going to build the model using five machine learning algorithms they are Decision Tree Regression, XG Boost Regression, Bayesian Ridge Regression, Principal Component Regression, and Partial Least Squares Regression, We also perform these algorithms with scaling, and polynomial features.

Sabarish and Abarnaa

Model Evaluation

We are going to evaluate our models using distribution plots, mean squared error, and Random mean squared error. By comparing all the Random mean squared errors (RMSE) for each model, we get a minimum value for the model XG BOOST REGRESSION that fits best into our data

Viewing the Predicted Premium

To view the expected output in machine learning, a trained model is used to generate predictions, which are then analyzed or saved. Once the model has been trained on a dataset, it may be applied to new data to provide predictions, which can be either categories for classification or numerical values for regression tasks. You can do statistical analysis, make visualizations, or print these predictions to the console to see them. To make it simple to access and deal with the model's output in an organized way, you can also save them in a CSV file in a designated folder for later use or sharing. Based on each policyholder's medical characteristics, we developed a model to forecast the target variable premium for our medical insurance premium prediction.

Here we are viewing our predicted premium by saving it as a CSV file.

	A
1	PREDICTED PREMIUM
2	31216
3	26261
4	29037
5	15823
6	25238
7	28060
8	24337
9	23006
10	27532
11	28505
12	22435
13	27470
14	15614
15	15315
16	32989
17	28249
18	28161
19	29241
20	28365

CONCLUSION

This study successfully used machine learning to predict medical insurance premiums based on policyholders' medical and demographic factors, with XGBoost Regression achieving the highest accuracy. The results highlight the potential of data-driven approaches to refine premium pricing, support insurers' financial strategies and assist customers in making informed choices. Future research could enhance model accuracy by incorporating additional variables like lifestyle and socio-economic factors or exploring advanced methods like neural networks. Developing explainable AI models could also offer greater transparency, enabling both insurers and policyholders to understand the factors influencing premium predictions.

ABSTRACT

Municipal Solid Waste Generation Management has become a global threat, and the developed countries have started implementing various strategies to reach 100 percent zero waste. Achieving 100 per cent zero waste may be considered as a holistic policy, but reducing the landfill by less than 10 per cent, moving towards the circular economy by 2035, has become the benchmark suggested by the European Union Directive (EUD) is possible if every developing country follows these strategies discussed in this article. The countries are determined as developed and developing based on their Economic Indicators

96824

Priya et al.,

such as Gross Domestic Product (GDP) per capita, their Industrialization, Economic structure, Technological advancement, and Social Indicators such as Human Development Index (HDI), Education indicators, and Poverty rate. This paper consolidates the best practices around the world and discusses the business opportunities, Technologies, Infrastructures, and Entrepreneurial growth in developed countries, and finally, their impact on the global environment. Household waste has been taken as the primary focus in this study. During this study, it has been identified that there is a huge quantity of employability available, starting from professionals such as Engineers specialized in Chemical, Mechanical, Electrical, and Civil engineering, to school dropouts. Hence, the overall poverty ratio will also be greatly reduced if the developing countries implement the ideas on a pilot basis. This paper concludes that a strong policy to reduce the landfill and the collaboration of the public-private-government is mandatory to achieve the EUD by the next ten years.

Keywords: Municipal Solid Waste Generation Management (MSWGM), Zero Waste, European Union Directive for solid waste, Entrepreneurial Development, Employability in MSWM, Solid Waste Recycling and Recovery.

INTRODUCTION

“Refuse, Rethink, and Reduce” is the future motto to prevent household waste. Unfortunately, the generation of solid waste from individual homes grows day by day all around the world. It is estimated by the World Bank that around 3.40 billion tons of solid waste will be generated by the year 2050 [1]. Countries having vast landscapes can allot acres of land for the landfill of solid waste. But, countries that do not have sufficient space are moving towards incineration, which has led to severe air pollution and environmental changes. Changes that happens in the environment and air pollution leads to severe health issues that damages the respiratory system of humans around the incineration areas. Developed countries have started making use of advanced technologies like IoT, Mobile applications to monitor remotely [2] [3]. Hence, landfill, incineration without proper segregation can never be good choices to control the Municipal Solid Waste Generation (MSWG). Even countries that are very good at segregation the waste can come out with a percentage of waste that can neither be recycled nor be valorised, thereby using incineration and landfill strategies. To achieve 100% zero waste, developed countries use various strategies by creating new business opportunities in Municipal Solid Waste Management (MSWM), more employment and adapting new technologies to combat the MSWG. Waste such as household waste, industrial waste, mall waste, food waste, electronic waste, plastic waste, and bio waste from hospitals are the widely classified wastes around the world. In this article, the primary focus will be on household solid waste, its generation, and how the world reacts to it have been taken. This article has the following sections for easy understanding:

1. MSWG management strategies
2. Policies framed by the countries
3. Technologies successfully implemented
4. Employment opportunities in MSWM
5. Entrepreneurial Development in MSWM
6. Future goals of developed countries to achieve zero waste

MSWG Management Strategies

Table 1 displays the list of developed countries, their Landscape (in Sq.Km), and their percentage of landfill areas they use. As we notice from Table 1, the landfill residue percentage varies depending on the country's recycling, refurbishing, reusing, repurposing, and valorizing strategies, as these dimensions depend on the country's geographical position. A “One size fits all” approach is not a feasible solution. It is up to the country's government to choose which model can be adapted to their nation. Recycling plants for Plastic, Metal, Glass, Paper, and Electronic

**Priya et al.,**

waste are all actively installed in all developed countries, to move towards Sustainable Development Goal (SDG) 12.5: By 2030, substantially reduce waste generation through prevention, reduction, recycling and reuse. general, household waste is normally classified into organic waste, plastic waste, paper waste, cardboard waste, sanitary waste, electronic waste, etc. Developed countries are collecting waste after it gets segregated from the source itself [19]. It greatly reduces the workload of the collector and reduces the landfill. But, segregation from the source is a challenging task, where people never find time to properly split the waste. Therefore, these countries follow strategies like gamification [20], activities for youngsters [21], offers for the house that best reduce the waste [19][22], penalties for not segregation [23], and collecting charges for the waste thrown [24]. All these ideas were suggested by the researchers for the welfare of the society, but unfortunately, these ideas were tested as a prototype and never turned out to be a habit in both developed and developing countries. There is always a lack of interest among people to follow these ideas as habits, and governments also must frame strong policies to bring these models alive. Proper awareness about the MSWG as a future threat to youngsters at the school level [20] [21], campaigns to create awareness in the public are the alternate ideas taken as steps by the governments to encourage people. The reason behind this is that people think handling waste effectively is the duty of the government and not ours. On the other hand, governments used to say that sufficient funds are not available to create proper infrastructure to handle the waste. Most countries have handed over this process to the private sector, and it is agreed that most private sectors are flooded with millions of dollars in handling the MSW. Some of these sectors register themselves as Non-Governmental Organisations (NGOs), which get so many relaxations in policies and rules framed by the government. As a final note for this section, there are thousands of job opportunities, entrepreneurship development, and millions of dollars of money will be generated from this sector. If this MSWG is properly managed, any developing country can successfully transform into a developed one. The next section discusses the policies that are used by the countries to attain zero waste.

Policies framed by the countries

Based on the policies, countries were grouped, and some countries follow a combination of different policies to reduce the landfill at a greater level. If the household waste has not been segregated, a penalty will be collected in the following countries [23] [25]. “Pay as you throw” is the kind of motto implemented in [24] [25], based on the garbage weight, money will be collected. [22] Countries that provide offers for their people to encourage segregation at the source. Awareness creation at the school level can be given through an ambient intelligence learning environment [20] [26-29], activity-based segregation are happening in [21]. There are countries where handling the waste segregation has been taught in school level [20] [21]. The policies that were discussed are very well accepted by the public, private, and government sectors, at least to attain zero waste one day. It is clear that not only by these policies help a country attain zero waste. Policies are textual contents, but to give life to them, countries must rely on tools and technologies that make the attainment easier. The next section discusses the various tools, technologies adapted by the countries to achieve zero landfill.

Technologies successfully implemented

Table 2 consists of the tools and technologies that developed countries have implemented to handle various waste after segregation. These infrastructures may belong to the governments or to the private sectors or can be partnered with banks on shared basis. Very few countries are ready to invest initially in these technologies. Since the cost is too high and they need proof-of-concept the success of the infrastructure. Despite the initial amount to be invested on these technologies, the cost of maintenance also plays a crucial role. Table 2 consists of the technologies, the budget approximately needed for the implementation in USDs. These infrastructures are not only meant for household recycling, but for all types of waste collected in the city, except bio and hazardous waste [30]. The details enclosed in Table 3 portray the technologies and infrastructures of dominant sites constructed for recycling, and the residuals are dumped in landfill areas. Apart from the listed, there are so many other plants that were also constructed by those countries to reduce waste to the maximum. Once these hardware, software, and embedded systems were kept ready for the segregation process, it is time to identify the correct human resources to work in these sectors according to their educational qualification and knowledge levels. The next section deals with the various business opportunities that were identified and in live were discussed.

Priya et al.,

Employment opportunities in MSWM

100 per cent employability cannot be attained by any government without the support of the private sector. In fact, for some developing countries, these private sectors are the driving force, and in some developed countries, these sectors suggest what the government should do to reduce the ratio of unemployment. As far as MSWM is concerned, there are so many direct and indirect jobs that are available. Table 3 portrays the various roles, designations, and qualifications needed to work in those industries has been consolidated and listed. This information is a sample collected from various countries. Each developed country is focussing on reducing the waste by having many plants, which will create an entire book for a special edition. To construct the infrastructure, these private sectors get initial funding from banks as loans, and once the plant becomes active, they will generate revenue, and it will be repaid to the banks. To have the best workforce, they recruit engineers and administrators from diverse streams. Upon successful implementation, the government and the banks may also join as partners in the firm.

Entrepreneurial Development in MSWM

Table 3 has given a brief knowledge of how developed countries are utilizing qualified engineers to reduce landfill waste, using various technologies and infrastructures to handle the MSWM. Some of these countries have predicted the MSW that will be generated by the next decade and how it can be brought under control using advanced technologies. Highly skilled labours are in demand in this sector shortly. In addition to this, some engineers either as a group or individual might have their own ideas of handling the waste and they would like to create start-up with minimum fund. Normally, these ideas would be cost-effective and might be a break-through in technology arena. Their ground-breaking ideas will not only create revenue but will create more employability. Such kind of Entrepreneurs are also encouraged in developed countries to combat the MSWM. Table 4 lists the various low-investment, high-profit start-ups that are in operation, working directly or indirectly on Solid waste handling techniques. Only few best start-ups were displayed as samples from various countries.

Future goals of developed countries to achieve zero waste

The future goal of all the developed nations is to attain zero waste by adopting more eco-friendly tools and methodologies. If it gets successful implementation, all the developing countries will be ready to adapt those technologies and finally whether be the methodologies being identified, it is up to the active participation of each individual with the policies of the governments and each private sector must create more job opportunities to attract the youngsters to neutralise the raising MSWG.

Table 1: Landfill coverage by developed countries

Country	Landscape (in sq. km) [4]	Landfill Area Used	Ref.
Germany	357,580	< 1%	[5]
Denmark	42920	< 0.9%	[6]
Sweden	447,430	< 1%	[7]
France	549,087	< 18.1%	[8]
Switzerland	41,290.40	< 0.54%	[9]
Japan	377,975	< 0.01%	[10]
South Korea	100,339	< 0.6%	[11]
Australia	7,741,220	< 0.01%	[12]
Canada	9,984,670	< 0.4%	[13]
USA	9,525,067	< 0.08%	[14][15]
United Arab Emirates	83,600	< 0.05%	[16] [17]
Russia	17,098,250	< 0.31%	[18]

Table 2: Infrastructure under practice for segregation of waste

Country	Tools or Technologies implemented	Approximate budget (in USD) to construct	Ref.
Sweden	Svensk Plaståtervinning's "Site Zero" plant in Motala Optical Sorter Machinery	104,905,375.35 million USD	[31]
Denmark	Amager Resource Center (ARC) / CopenHill - A WtE plant to produce electricity out of waste	670 million USD	[32]
South Korea	Sudokwon Landfill Site (SLS) - Recycling & Energy Recovery Facilities	Approximately 32.5 million USD	[33]
UAE	Dubai Centre for Waste Processing (Warsan Waste-to-Energy Plant)	Approximately 1.1 billion USD	[34]
USA	Republic Services Southern Nevada Recycling Center (MRF)	30 million - 35 million USD	[35]
France	TotalEnergies Advanced Plastic Recycling Unit (Grandpuits Refinery Conversion) A former oil refinery converted into a bio-refinery Unit	Approx. 535 million USD	[36]
Moscow, Russia Waste Sorting Complexes (e.g., in various districts)	A group of complexes was constructed with an approximate budget to segregate mixed municipal solid waste and reduce landfill.	4.4 billion USD	[37]

Priya et al.,

Living Earth Composting Facilities (Owned by WM New Zealand)	New Zealand's largest organic waste to composting operation, which converts green waste and food waste into nutrient-rich compost.	New Zealand has invested around 1.1 billion linked loan on these plants	[38]

Table 3: Roles, Designations, and Qualifications to work in sites

MSWM Plants	Jobs or Roles	Expected Qualification	Ref.
Svensk Plaståtervinning's "Site Zero" plant in Motala, Sweden Optical Sorter Machinery	Industrial Automation, Robotics control Engineer, Electrical, Mechanical, Chemical Engineers, and Sensor Process control engineers.	Advanced skills in Robotics, Process Control, Electrical, Mechanical, and Chemical Engineers.	[31]
Amager Resource Center (ARC) / CopenHill - A WtE plant to produce electricity out of waste, Denmark	Technicians, Machinery Maintenance Experts, Power plant Operations specialists, Administrative officers	Bachelor's or Master's Degrees in Mechanical, Chemical, Environmental Science, and Standard office qualifications	[32]
Sudokwon Landfill Site (SLS) - Recycling & Energy Recovery Facilities, South Korea	Operational staff, Mechanical, Chemical, Environmental Technology Engineers, Civil engineers, and Heavy equipment operators	Bachelor's or Master's Degree in Mechanical, Civil, Chemical, Environmental Science	[33]
Dubai Centre for Waste Processing (Warsan Waste-to-Energy Plant), UAE	Technician to work in power plants, Mechanical, Chemical, and Electrical Maintenance, Safety certifications are optional.	Bachelor's or Master's Degree in Mechanical, Civil, Chemical, and Environmental Science. Experience in industrial management, energy sector	[34]
Republic Services Southern Nevada Recycling Center, Material Recovery Facility (MRF), USA	Operational staff, Technician in Mechanics, Electronics, Automation. Logistics Operators.	High School diploma, Degree in Mechanics, Electrical and Industry automation.	[35]
TotalEnergies Advanced Plastic Recycling Unit (Grandpuits Refinery Conversion) A plastic Recycling Unit, France	Chemical Engineers, Mechanical Engineers, Administrative Officers, and Technicians.	Degree or Diploma in Industrial Mechanics, Chemical Engineering and Pollution control certifications.	[36]
Waste Sorting Complexes, Moscow, Russia	Heavy Machine operators, Logistics operators, Sorters, and collectors.	Degree in industry maintenance, Mechanical and Electrical Engineers	[37]
Living Earth Composting Facilities, New Zealand	Heavy Machines operators, Quality control Engineers for compost production, Organic waste separators.	Degree or Diploma in soil science, Chemical, and Environmental Engineering	[38]

Table 4: Country-wise start-ups and their unique ideas

Country	Start-up company	Unique Idea	Ref.
Germany	Zaak Technologies	Industrial by-products converted into building materials	[39]
Denmark	Too good to go	A digital app to reduce food waste	[40]

Priya et al.,

Sweden	Stena Recycling (cannot be called a start-up), but provides solutions to the Circular Economy	Waste recycling solutions	[41]
France	Back Market	An online market to buy refurbished electronic products by extending their life to reduce e-waste	[42]
Switzerland	DePloy SA	Used plastics recycled into raw materials	[43]
Japan	BIOTECHWORKS-H2	Using advanced gasification techniques, organic wastes are converted into pure hydrogen	[44]
South Korea	Black Smith	Efficient Recycling machines to convert waste to raw materials and reduce energy consumption	[45]
Australia	Wastefuel	Using Advanced technologies to convert hard materials to Energy	[46]
Canada	Enerkem	Converts waste into low-carbon fuels and chemicals	[47]
USA	PureCycle Technologies	Recycles polypropylene plastics into new-like plastic	[48]
UAE	MOBA Mobile Automation UAE	Using Advanced technologies in a single platform for smart waste collection	[49]

Trends in Research Productivity: A Scientometric Analysis of Bharathidasan University from 2014 To 2024

ABSTRACT

This study conducts a scientometric analysis of the publication productivity of Bharathidasan University, Tiruchirappalli, from 2014 to 2024, aiming to evaluate its research output, citation impact, and the evolution of its academic focus. The analysis draws on data from the Scopus and Web of Science databases to assess total publications, citation trends, and subject-wise distribution. The total number of publications showed consistent growth over the decade, with notable increases in fields such as Natural Sciences, Engineering, and Social Sciences. The university's research output expanded steadily from 120 publications in 2014 to 400 in 2024, reflecting a robust growth trajectory. Citations per publication also demonstrated an upward trend, signaling an improvement in the impact of the research. In particular, the number of highly cited papers increased significantly, with the top 10% of publications growing from 12 in 2014 to 55 in 2024. This trend highlights the growing global recognition of Bharathidasan University's research contributions. Citation analysis revealed a notable increase in total citations, from 500 in 2014 to 2200 in 2024, emphasizing the increasing academic influence of the institution. The subject-wise analysis showed that Natural Sciences and Engineering remained dominant research domains, with other areas such as Life Sciences and Social Sciences also witnessing significant growth. The subject-specific trends reveal that the university's academic focus has diversified over time, adapting to emerging research fields and global academic trends. Notably, the university has increasingly fostered research in interdisciplinary areas, particularly in environmental sciences, engineering, and health-related disciplines. This study provides valuable insights into the publication and citation trends of Bharathidasan University, helping to identify its strengths and areas of growth. The findings offer a

**Meenambigai and Selvam**

comprehensive understanding of the university's academic standing and contribute to enhancing future research strategies, fostering international collaborations, and improving the university's global academic visibility.

Keywords: Bharathidasan University, scientometric analysis, publication productivity, citation impact, research trends, subject-wise distribution, highly cited papers, academic influence.

INTRODUCTION

The role of academic institutions in fostering research and development is pivotal to advancing knowledge and addressing societal challenges [1] [2]. In this context, the publication productivity of universities serves as a critical indicator of their research output, academic standing, and contributions to global knowledge dissemination [3] [4]. Bharathidasan University, Tiruchirappalli, a prominent educational institution located in the southern part of India, has been a significant contributor to the academic and research landscape since its establishment. The university's impact can be gauged by evaluating its research publications, citation patterns, and collaborative initiatives within the global academic network [5]. Scientometrics, the study of quantitative measures related to academic publications, citations, and other scholarly outputs, provides a robust methodology to assess research productivity and performance [6] [7]. This approach is essential for understanding the effectiveness of a university's research strategy, identifying areas of excellence, and recognizing the challenges faced by researchers within the institution [8]. In the case of Bharathidasan University, scientometric analysis can offer valuable insights into the growth of its research output, the subjects that dominate its academic portfolio, and the extent of its collaboration with national and international institutions [9]. Over the years, Bharathidasan University has witnessed a steady increase in research publications across various disciplines, contributing significantly to fields like environmental sciences, chemistry, engineering, and social sciences [10]. However, a systematic and comprehensive analysis of its research performance, such as the examination of citation indices, h-index, and collaborative trends, is required to fully appreciate the university's academic stature and global visibility [11] [12].

The primary objective of this study is to conduct a scientometric analysis of the publication productivity of Bharathidasan University, focusing on its research output from its inception to the present day. By analyzing a wide range of scientometric indicators, this study seeks to uncover patterns of publication productivity, citation impact, and the extent of interdisciplinary research across different departments. The analysis also explores the university's collaborative efforts, both at the national and international levels, to understand how global networks have influenced its academic profile. Furthermore, this study aims to highlight the areas where Bharathidasan University has excelled in research and where there may be opportunities for further growth. By examining the university's publication productivity, this study provides essential insights for academic administrators, researchers, and policymakers to enhance research strategies, foster interdisciplinary collaboration, and boost the overall research ecosystem of the institution. In sum, the introduction of this scientometric analysis sets the stage for a detailed exploration of Bharathidasan University's publication productivity, aiming to provide a comprehensive understanding of its research output, collaborative efforts, and impact on the academic community. The results of this analysis will contribute to enhancing the university's reputation and aligning its future research endeavors with global academic trends.

Aim of the Study

The aim of this study is to conduct a scientometric analysis of the publication productivity and citation impact of Bharathidasan University, Tiruchirappalli, from 2014 to 2024. The study aims to evaluate the trends in research output, subject-wise distribution, and global recognition of the university's academic contributions, providing insights into its research strengths and areas for improvement.

Objective of the Study

- To assess the total number of research publications produced by Bharathidasan University between 2014 and 2024, analyzing the growth in publication output over the decade.
- To evaluate citation trends by calculating the total number of citations and examining citation patterns to understand the academic impact and global visibility of the university's research.
- To calculate citations per publication to determine the overall impact and quality of the university's research outputs in comparison to the total number of publications.
- To identify highly cited papers by tracking the top 10% of publications, highlighting the most influential works and their contribution to the academic community.
- To analyze the subject-wise distribution of publications, tracking the growth in research output across various domains such as Natural Sciences, Engineering, Social Sciences, Life Sciences, and Physical Sciences.
- To examine the growth in research output over the years and identify emerging research trends within the university, focusing on shifting academic priorities and interdisciplinary research.
- To assess the evolution of research focus within Bharathidasan University, identifying areas of academic strength and emerging fields of research that have contributed to the university's growing academic profile.
- To explore national and international collaborations in research, evaluating the university's engagement in global academic partnerships and their influence on research visibility and citation impact.
- To compare the university's publication productivity and citation impact with other peer institutions, benchmarking its academic standing in the global research landscape.
- To provide recommendations for enhancing the university's research strategies, fostering interdisciplinary collaboration, and improving its global academic standing based on the analysis.

METHODOLOGY

This section outlines the methodology used for conducting the scientometric analysis of the publication productivity of Bharathidasan University, Tiruchirappalli, from 2014 to 2024. The methodology focuses on data collection, processing, and analysis to meet the study objectives.

Data Collection

Source of Data

- The primary data for this study was obtained from the two major academic databases: Scopus and Web of Science. These databases are widely regarded for their comprehensive coverage of scholarly articles, citation data, and author information, making them reliable sources for scientometric analysis.
- Data was collected for all publications affiliated with Bharathidasan University between 2014 and 2024.

Search Criteria

- Publications were retrieved by searching for the name Bharathidasan University in the author affiliation field. To ensure comprehensive data collection, variations of the university's name were also considered, including abbreviations and official titles.
- Only peer-reviewed journal articles, conference papers, reviews, and book chapters were considered for inclusion in the analysis.
- Publications were filtered by the time period of 2014 to 2024, ensuring the analysis captures the recent decade of research productivity.

Data Variables

- The dataset includes variables such as:
 - **Number of Publications** (Total count of papers)
 - **Citations** (Total citations received by the publications)
 - **H-index** (A measure of the productivity and citation impact of an author or publication)
 - **Impact Factor of Journals** (Where applicable, the impact factor of journals in which articles were published)

**Meenambigai and Selvam**

- **Research Areas** (Subject areas or keywords associated with the publications)
- **Author Information** (Prolific authors, co-authors, affiliations)
- **Collaboration Networks** (National and international co-authorship patterns)
- **Citation Counts by Year** (Tracking citation growth over time)

Data Extraction Process:

- Data was extracted for each publication, including publication year, title, journal name, number of citations, and the authors' affiliations.
- Citation data for each publication was recorded to analyze the overall citation impact.

Data Processing and Cleaning

- After extraction, data cleaning was performed to remove duplicates and ensure the accuracy of the bibliographic details.
- Papers from non-peer-reviewed sources (e.g., editorials, short communications, etc.) were excluded.
- Incomplete or erroneous metadata (such as missing author affiliations or incorrect journal details) was rectified to the extent possible.

Analysis of the Data

The analysis was conducted using a combination of descriptive and inferential scientometric techniques to meet the study's objectives. The data was analyzed in the following steps:

Descriptive Analysis

- **Total Publications:** The total number of publications produced by Bharathidasan University from 2014 to 2024 was calculated and categorized by year to determine trends in publication growth.
- **Subject-wise Distribution:** The publications were categorized based on the subject area or research domain (e.g., Natural Sciences, Engineering, Social Sciences, etc.), providing a breakdown of research focus.

Citation Analysis

- **Total Citations:** The total number of citations received by all publications was calculated, and citation trends over the years were analyzed to understand the university's growing academic influence.
- **Citations per Publication:** The average number of citations per publication was computed to determine the impact of the research output.
- **Highly Cited Papers:** The top 10% of the most highly cited papers were identified to assess the quality and global recognition of the university's publications.

Trend Analysis

- **Growth in Research Output:** Publication growth trends were analyzed over the decade to examine the university's increasing or decreasing output of research papers.
- **Subject-wise Trends:** The evolution of research in different domains over the period was tracked to identify areas of focus or emerging research fields within the university.

Data Analysis**Publication by Year**

Table 1 and figure 1 illustrates the publication growth at Bharathidasan University from 2014 to 2024. The data reveals a steady and consistent increase in the number of research publications over the decade, with the total number of publications growing from 120 in 2014 to 400 in 2024. This indicates a robust growth trajectory, highlighting the university's expanding research output year after year. From 2014 to 2017, the number of publications increased steadily each year, with a rise of 30 to 40 publications per year. In 2018, the university experienced a more substantial increase, with an additional 40 publications, reflecting a potentially stronger research

**Meenambigai and Selvam**

output during this year. After 2018, there was an even greater acceleration in publication numbers, particularly from 2020 to 2024, with an increase of 30 to 50 publications per year. This suggests that the university's research activities gained momentum in recent years, possibly due to more focused academic strategies, funding, or collaborations. The data shows no significant fluctuations in publication numbers, indicating a stable and consistent approach to research production over the decade.

Subject-wise Distribution of Publications

Table 2 and figure 2 presents the distribution of Bharathidasan University's publications across various subject areas. The data highlights the university's research focus and the areas that have seen the most academic output in terms of publications. The largest share of publications is in Natural Sciences, with 500 publications. This indicates that the university has a significant research focus on disciplines such as physics, chemistry, and environmental science, which are likely central to its academic and research agenda. Engineering follows closely with 400 publications, underscoring the university's emphasis on applied sciences and technology. This suggests that the university is playing a crucial role in advancing research related to engineering fields, possibly including civil, mechanical, and electrical engineering. Social Sciences ranks third with 300 publications, reflecting a substantial commitment to research in areas like sociology, psychology, economics, and political science. Humanities follows with 250 publications, showing the university's balanced focus on literature, philosophy, history, and other humanities disciplines. Life Sciences accounts for 200 publications, indicating an increasing interest in health-related research, biology, and medicine. While not as large as the Natural Sciences or Engineering fields, the growing output in Life Sciences is noteworthy and may reflect emerging trends in health and biotechnology research. The Physical Sciences domain, with 100 publications, represents the smallest portion of research output. This indicates that while the university does conduct research in physical sciences, it is relatively less emphasized compared to other domains such as Natural Sciences and Engineering.

Citation Analysis

Table 3 and figure 3 provides an overview of the citation trends for Bharathidasan University's publications from 2014 to 2024. It includes the total number of citations, citations per publication, and the number of highly cited papers (top 10%) for each year. The data provides insights into the growing academic influence and impact of the university's research output over the years. There is a consistent and significant increase in the total number of citations, rising from 500 citations in 2014 to 2200 citations in 2024. This indicates a steady rise in the visibility and academic impact of the university's research in global scholarly circles. The increase in citations reflects the growing recognition and relevance of the university's publications in the academic community. The citations per publication metric has generally increased over the years, from 4.17 citations per publication in 2014 to 5.50 citations per publication in 2024. This trend suggests that, over time, Bharathidasan University's research has garnered more attention and recognition, leading to a higher average citation rate. While there is a slight dip in 2016 and 2017 (3.89 and 3.81 citations per publication), the overall trend shows that the research is becoming more influential and widely cited. The number of highly cited papers (top 10%) has shown a consistent upward trajectory, increasing from 12 papers in 2014 to 55 papers in 2024. This highlights that not only is the total research output growing, but a larger proportion of the university's publications are being recognized as influential and significant in the academic field. The consistent growth in highly cited papers indicates that Bharathidasan University is producing more groundbreaking research that is having a strong impact on the broader academic community. The data suggests that the university's research is gaining global visibility and academic recognition. As the total number of citations, citations per publication, and highly cited papers all show positive growth, it can be concluded that the university's research is increasingly contributing to the global knowledge pool. The growth in highly cited papers further reinforces the notion that Bharathidasan University's research is producing high-impact work, which is being widely acknowledged in the academic community.

Trend Analysis

The table 4 and figure 4 illustrates the growth of publications at Bharathidasan University from 2014 to 2024, broken down into overall publications and subject-specific growth across five major disciplines: Natural Sciences,

**Meenambigai and Selvam**

Engineering, Social Sciences, Life Sciences, and Physical Sciences. The total number of publications has consistently increased each year, growing from 120 in 2014 to 400 in 2024, indicating a steady upward trajectory in the university's research output. The average annual growth in publications is approximately 30-40 publications per year, reflecting the university's increasing commitment to research production and its growing academic presence.

Subject-wise Growth**Natural Sciences**

- Natural Sciences shows the highest growth, starting with 50 publications in 2014 and reaching 190 by 2024. This consistent growth in this field reflects the university's strong emphasis on disciplines such as chemistry, physics, and environmental sciences.
- The annual growth rate in Natural Sciences fluctuates between 10-20 publications per year, demonstrating the expanding research activities in this area.

Engineering:

- Engineering also shows significant growth, increasing from 30 publications in 2014 to 120 in 2024. This growth reflects the university's continued focus on applied research in fields like civil, mechanical, and electrical engineering.
- Like Natural Sciences, Engineering publications grow steadily each year, with an average annual increase of around 10-20 publications.

Social Sciences

- Social Sciences shows a steady increase, growing from 20 publications in 2014 to 85 in 2024. This indicates an ongoing commitment to areas such as sociology, psychology, economics, and political science, reflecting the university's diverse research interests.
- The growth in this field, while notable, is more moderate compared to Natural Sciences and Engineering, averaging an increase of around 5-10 publications per year.

Life Sciences

- Life Sciences has also witnessed strong growth, rising from 15 publications in 2014 to 100 in 2024, highlighting the university's growing focus on health-related research, biology, and medicine.
- The steady rise in Life Sciences publications, with an average growth rate of 5-10 publications per year, shows the expanding importance of research in health, biotechnology, and related fields.

Physical Sciences

- Physical Sciences remains the smallest research area in terms of publication output, starting with 5 publications in 2014 and growing to 60 by 2024. While it shows consistent growth, it lags behind the other disciplines, suggesting that it may be a lower priority for the university compared to Natural Sciences and Engineering.
- Physical Sciences shows moderate growth, averaging 5-10 publications per year, but its relative output remains smaller compared to the other disciplines.

CONCLUSION

The scientometric analysis of Bharathidasan University's publication productivity from 2014 to 2024 reveals significant growth in both the total number of publications and citation impact, indicating a robust academic development over the past decade. The university has shown consistent and sustained growth in research output, with publications increasing from 120 in 2014 to 400 in 2024. This growth reflects the institution's expanding research capacity and its increasing prominence in global academic circles. The subject-wise distribution of publications demonstrates a strong emphasis on Natural Sciences and Engineering, which remain the university's dominant research domains. The notable growth in these areas reflects a strategic focus on applied and interdisciplinary research, particularly in fields like chemistry, physics, and engineering. Additionally, Social Sciences, Life Sciences,

Meenambigai and Selvam

and Physical Sciences have also shown consistent growth, signaling a broader academic focus that aligns with global research trends and societal needs. Citations per publication and the number of highly cited papers have steadily increased, further reinforcing the growing impact of the university's research. The rise in highly cited papers, from 12 in 2014 to 55 in 2024, demonstrates that Bharathidasan University is producing increasingly influential work that resonates within the global academic community. Overall, the findings of this study highlight Bharathidasan University's strong and expanding research footprint across multiple disciplines, with a particular emphasis on Natural Sciences and Engineering. The increasing citation impact and the growth in highly cited papers reflect the university's growing academic visibility and its rising global recognition. Moving forward, the university can leverage its strengths in these areas while continuing to diversify and enhance research in Life Sciences, Social Sciences, and Physical Sciences to maintain its academic momentum and global standing.

ABSTRACT

The increasing complexity of drug selection in clinical settings poses significant challenges for healthcare professionals, requiring the integration of vast amounts of medical data and expertise. A Clinical Decision Support System (CDSS) powered by deep learning techniques offers promising solutions to optimize drug selection, enhance patient safety, and improve therapeutic outcomes. This literature review explores the advancements in deep learning methods applied to drug selection in CDSS. We examine the various models, including convolutional neural networks (CNNs), recurrent neural networks (RNNs), and hybrid approaches, highlighting their efficacy in predicting drug interactions, optimizing drug regimens, and personalizing treatments. Additionally, the review delves into data sources, such as electronic health records (EHRs), drug databases, and genomic information, which are crucial for training deep learning models. Key challenges, including data quality, model interpretability, and clinical integration, are also discussed. Finally, the review identifies future directions for the development of more robust, reliable, and user-friendly CDSS tools, emphasizing the need for interdisciplinary collaboration to harness the full potential of deep learning in clinical decision-making.

Keywords: CDSS, decision-making, Clinical Decision, interpretability, databases.

INTRODUCTION

The process of drug selection is one of the most critical and complex aspects of clinical practice. It involves identifying the most appropriate pharmaceutical intervention for a patient based on their specific condition, medical history, and individual characteristics. Effective drug selection requires a comprehensive understanding of

**India Solai and Srinaganya**

pharmacology, drug interactions, patient-specific factors (such as age, weight, genetic makeup, and comorbidities), as well as the ability to analyze and synthesize large volumes of clinical data. Despite significant advances in medical knowledge and technology, drug selection remains prone to errors, which can lead to adverse drug reactions (ADRs), ineffective treatments, and ultimately, poorer patient outcomes. Clinical Decision Support Systems (CDSS) have emerged as an important tool to assist healthcare providers in making informed, evidence-based decisions regarding drug selection. These systems leverage vast amounts of clinical data, medical guidelines, and predictive algorithms to provide real-time support to clinicians at the point of care. Traditionally, CDSS have relied on rule-based systems, which apply predefined criteria to recommend drugs based on patient information. However, these systems often fall short in handling the dynamic and complex nature of medical decision-making, as they are limited by their reliance on rigid rules and lack the capacity to learn from new data.

In recent years, deep learning techniques, a subset of artificial intelligence (AI), have shown great promise in transforming CDSS by providing more advanced and flexible approaches to drug selection. Deep learning methods, particularly those based on neural networks, excel at processing large, unstructured datasets such as medical records, genomic data, and drug interaction databases. These techniques can identify patterns and relationships within the data that are often too complex for traditional rule-based systems to detect, allowing for more personalized and accurate drug recommendations. The integration of deep learning in CDSS for drug selection brings several potential benefits. First, it enhances the ability to predict drug efficacy and safety by considering a wide range of patient-specific factors. Second, it facilitates the detection of potential drug interactions, minimizing the risk of adverse effects. Third, deep learning can help optimize drug regimens, improving therapeutic outcomes for patients with complex or rare conditions. Finally, it supports personalized medicine by tailoring drug choices to the genetic, metabolic, and phenotypic characteristics of individual patients.

However, despite its potential, the application of deep learning in drug selection within CDSS is not without challenges. The success of these systems depends heavily on the quality and completeness of the data used to train the models. Issues such as data incompleteness, bias, and the need for large, labeled datasets remain significant hurdles. Furthermore, the interpretability of deep learning models is often a concern, as clinicians need to understand the rationale behind the system's recommendations to ensure trust and clinical adoption. Lastly, integrating deep learning-based CDSS into existing clinical workflows requires careful consideration of user experience and technological infrastructure. This review aims to explore the evolving role of deep learning in drug selection for Clinical Decision Support Systems. By examining the current state of research, methodologies, data sources, challenges, and future directions, we provide an overview of how deep learning can enhance drug selection processes in clinical settings. Through this discussion, we hope to contribute to the ongoing efforts to improve patient care through the effective use of AI in medicine.

Importance of Drug Selection In The Healthcare Domain

Drug selection is a cornerstone of clinical decision-making, directly impacting patient health outcomes. The process of choosing the most appropriate medication is not only pivotal for treating the patient's condition but also for preventing adverse effects, optimizing therapeutic efficacy, and ensuring cost-effective care. In the context of Clinical Decision Support Systems (CDSS), the accuracy and reliability of drug selection are critical in enhancing the overall quality of healthcare. The importance of drug selection in CDSS can be understood through several key dimensions:

Improved Patient Safety

One of the most crucial roles of CDSS in drug selection is its potential to reduce the risk of adverse drug reactions (ADRs) and medication errors. Given the complex nature of drug interactions and patient-specific factors, human clinicians may struggle to identify all potential risks associated with drug prescriptions. CDSS can help by integrating patient data (e.g., age, medical history, lab results, and genetic information) and cross-referencing this with vast databases of drug interactions, contraindications, and adverse effects. By providing real-time warnings about potential drug interactions, allergies, or dosage issues, CDSS helps safeguard patients from preventable harm.

**India Solai and Srinaganya****Personalized Medicine and Tailored Treatment**

The effectiveness of a drug is not uniform across all patients due to variability in genetic makeup, disease progression, and coexisting health conditions. Personalized drug selection, enabled by CDSS, allows healthcare providers to tailor treatments to individual patients, optimizing therapeutic outcomes. Deep learning algorithms in CDSS can analyze complex patient data and recommend drugs that are likely to be the most effective based on genetic markers, metabolic profiles, and other unique characteristics. This personalized approach is especially important in the management of chronic diseases, cancer, and rare conditions, where the right drug choice can make a significant difference in prognosis.

Enhanced Clinical Decision-Making

CDSS offers real-time assistance to clinicians by providing evidence-based recommendations for drug selection. Clinicians are often required to choose from a vast array of medications, each with specific indications, side effects, and dosing requirements. The complexity of this decision-making process, especially in high-pressure, fast-paced environments, can lead to errors or suboptimal choices. CDSS assists clinicians by synthesizing available medical literature, treatment guidelines, and historical patient data to suggest the most appropriate medication for each case. This decision support empowers healthcare providers to make more informed, accurate choices, ultimately leading to improved patient care.

Detection of Drug Interactions and Contraindications

One of the persistent challenges in drug selection is identifying potential drug-drug interactions (DDIs) that could lead to harmful effects or reduced efficacy. With the growing number of available medications, the likelihood of drug interactions increases, making it increasingly difficult for clinicians to track all possible combinations. CDSS integrated with deep learning algorithms can predict and identify these interactions by cross-referencing patient-specific information and medical literature on known drug interactions. This feature is vital for preventing medication-related complications and ensuring safe drug regimens for patients.

Cost-Effectiveness

The selection of the right drug not only impacts patient outcomes but also has significant financial implications. The cost of treatment can escalate quickly, especially when patients are prescribed medications that are ineffective, unnecessary, or cause adverse side effects, leading to hospitalizations and prolonged treatments. CDSS can optimize drug selection by recommending the most cost-effective medications that align with the patient's condition, considering factors like generic alternatives, formulary restrictions, and insurance coverage. By reducing inappropriate drug prescriptions and unnecessary treatments, CDSS helps lower healthcare costs for both patients and providers.

Improved Clinical Workflow and Efficiency

The process of selecting an appropriate drug is time-consuming and requires a great deal of cognitive load on clinicians. In a busy healthcare setting, this can lead to delays in treatment or clinical decision fatigue, which can affect patient outcomes. CDSS helps streamline the drug selection process by automating parts of the decision-making, providing quick access to relevant information, and reducing the time spent on administrative tasks. This enhanced efficiency allows clinicians to focus more on patient care, improving overall workflow in the clinical setting.

Supporting Evidence-Based Medicine

Evidence-based medicine (EBM) relies on the integration of the best available research evidence with clinical expertise and patient values. CDSS supports EBM by providing clinicians with up-to-date research, clinical trial results, and treatment guidelines relevant to a patient's condition. This ensures that drug selection is based on the most current and scientifically validated information, leading to more effective treatments and improved patient outcomes. By incorporating deep learning techniques, CDSS can continuously learn from new data and clinical trends, ensuring that drug recommendations remain at the forefront of medical advancements.

**India Solai and Srinaganya****Compliance with Guidelines and Regulatory Requirements**

Drug selection in clinical practice is often guided by established clinical protocols and regulatory standards that ensure patient safety and therapeutic efficacy. CDSS aids in ensuring that drug prescriptions comply with these guidelines, reducing the risk of non-compliance or malpractice. By offering clinicians decision-making tools that are aligned with the latest treatment guidelines, CDSS helps promote adherence to best practices, reducing the likelihood of legal and regulatory issues.

Application of Deep Learning in the CDSS

The integration of deep learning in Clinical Decision Support Systems (CDSS) for drug selection represents a transformative shift in how healthcare providers make treatment decisions. Deep learning, a subset of artificial intelligence (AI), is particularly adept at processing complex, high-dimensional data, and can uncover patterns that traditional rule-based systems cannot detect. The application of deep learning in drug selection within CDSS is rapidly evolving, offering new opportunities for optimizing patient care, reducing errors, and personalizing treatments. This section explores the various ways deep learning is applied to drug selection in CDSS, highlighting the methodologies, key use cases, and challenges.

Prediction of Drug Efficacy and Patient Response

One of the primary applications of deep learning in drug selection is predicting the efficacy of drugs for individual patients. Traditional drug selection often relies on population-based guidelines that may not fully account for individual variability, such as genetic differences, comorbidities, or other personal health factors. Deep learning algorithms, particularly convolutional neural networks (CNNs) and recurrent neural networks (RNNs), can analyze large-scale, complex datasets, including genomic data, electronic health records (EHRs), and clinical histories. By processing this data, deep learning models can predict how a specific patient will respond to a particular drug. For example, deep learning models can predict drug response based on genetic markers, such as single nucleotide polymorphisms (SNPs) or gene expression profiles. These models can identify patterns in genetic data that correlate with drug efficacy or toxicity, allowing for more personalized drug prescriptions. This approach is particularly useful in oncology, where treatments like chemotherapy and targeted therapies need to be tailored based on genetic mutations.

Drug-Drug Interaction Prediction

Another critical application of deep learning in drug selection is the prediction of drug-drug interactions (DDIs). Drug interactions can cause severe adverse reactions, reduce drug efficacy, or result in harmful side effects, making their detection essential in the drug selection process. Traditional methods for detecting DDIs rely on manually curated databases and expert knowledge, but these methods are often limited by their ability to capture the complex and dynamic nature of drug interactions. Deep learning models can improve the prediction of DDIs by automatically learning from large datasets, including drug properties (e.g., pharmacodynamics, pharmacokinetics), clinical outcomes, and patient data. Graph neural networks (GNNs) are particularly well-suited for this task as they can represent drugs and their interactions as nodes and edges in a graph, respectively. These models can predict potential interactions by learning from known interactions and identifying new, previously unknown combinations of drugs that might interact negatively. By detecting potential DDIs early, deep learning-powered CDSS can help clinicians avoid harmful drug combinations and ensure safer prescribing practices.

Personalized Medicine and Precision Drug Selection

Deep learning plays a pivotal role in the growing field of personalized medicine, where treatments are tailored to the specific characteristics of individual patients. Personalized drug selection aims to optimize therapeutic outcomes by considering factors such as genetic makeup, medical history, lifestyle, and other unique characteristics. Deep learning models, particularly neural networks, can integrate various data sources (genomic, proteomic, clinical, and environmental) to recommend drugs that are most likely to be effective for a particular patient. These systems can also adjust drug dosages based on an individual's response to the drug, which is influenced by factors like age, weight, metabolic rate, and coexisting diseases. This approach is especially important in chronic conditions like

**India Solai and Srinaganya**

diabetes, hypertension, and cancer, where drug effectiveness can vary significantly across different patients. For instance, in cancer treatment, deep learning can help identify the most effective chemotherapy agents based on the genetic mutations of a patient's tumor, thus improving survival rates and minimizing unnecessary side effects.

Drug Repurposing

Drug repurposing, or finding new uses for existing drugs, is a time- and cost-effective strategy in drug development. Deep learning has shown promise in accelerating the process of drug repurposing by identifying novel indications for approved drugs. This is particularly important in cases where new treatments are urgently needed, such as in the response to emerging infectious diseases or rare conditions. Deep learning models can analyze vast datasets, including chemical properties of drugs, biological data, and existing clinical outcomes, to find potential new applications for old drugs. For example, deep learning techniques have been used to identify potential antiviral or anti-inflammatory effects of drugs initially developed for other purposes. By learning from past drug failures and successes, deep learning can predict which drugs might be effective in treating new diseases, reducing the time required to bring a treatment to market.

Optimization of Drug Dosage and Treatment Regimen

Optimizing drug dosage and treatment regimens is essential to achieving the best therapeutic outcomes while minimizing side effects. Deep learning models can assist in determining the optimal dose for a patient based on factors such as age, weight, renal and liver function, and genetic predisposition. For example, reinforcement learning, a branch of deep learning, can be used to model and predict how different doses of a drug will affect a patient's condition over time. These models can learn from both real-world clinical data and controlled trials to suggest the most effective and safe dosage regimen. In chronic diseases such as epilepsy or hypertension, where ongoing adjustments to drug dosage are often needed, deep learning models can continuously update recommendations based on the patient's evolving condition.

Clinical Workflow Integration and Decision Support

Deep learning models can be seamlessly integrated into CDSS to provide real-time decision support for clinicians. By incorporating deep learning into CDSS, healthcare providers are presented with drug recommendations based on the most up-to-date, personalized data available. This integration not only helps streamline the decision-making process but also reduces the cognitive load on clinicians, allowing them to focus on more complex aspects of patient care. For instance, when a doctor enters a patient's medical history and symptoms into the system, the CDSS can use deep learning algorithms to generate drug recommendations, predict potential drug interactions, and suggest adjustments to existing treatment regimens. This system can also continuously learn and adapt from new data, improving its accuracy and reliability over time.

LITERATURE REVIEW

Lufyagila, Beston, and Francis A. Rua [16] explored the application of deep learning in healthcare, highlighting its significant role in areas such as medical imaging, digital consultation, electronic medical records, and genomics. It reviews 16 articles from various scholarly databases published between April 2014 and April 2024, emphasizing the potential of deep learning to enhance precision, data-driven approaches, and personalized medicine in healthcare. The study also addresses challenges associated with deep learning in healthcare, including the inability to replicate the human touch and emotional connection that patients seek, as well as concerns regarding data privacy. It suggests new perspectives for overcoming these challenges by leveraging emerging technologies like Augmented Reality (AR), Virtual Reality (VR), and federated learning to improve patient outcomes and create a more efficient healthcare system. Nikam, Deepa [17] offers a comprehensive review of machine learning and deep learning applications in healthcare, highlighting their effectiveness in analyzing complex medical data as the sector transitions to digital records and data-driven decision-making. It discusses the benefits and challenges of these advanced computational techniques, emphasizing the growing need for AI and ML models in healthcare and their potential for

**India Solai and Srinaganya**

future research in the field. Patra, Ramesh Chandra, et al. [18] discussed the integration of Deep Learning (DL) in healthcare, highlighting its significant advancements in medical diagnosis and treatment, particularly through the use of Convolutional Neural Networks for image-based disease detection. It emphasizes the transformative potential of DL in refining diagnostics and enabling personalized treatment strategies. It also addresses the challenges associated with DL in healthcare, such as data privacy concerns and the need for model interpretability, while showcasing its applications in optimizing healthcare management through resource allocation and digitized records. Nivodhini, M. K., et al. [19] discussed the applications of deep learning in healthcare, particularly focusing on electronic health records (EHR) and predictive analytics, which help in identifying patterns in large datasets to facilitate personalized healthcare strategies and predict disease progression. It also explored the theoretical aspects of natural language processing (NLP) in healthcare, highlighting improvements in clinical documentation, voice recognition, and patient interaction, while addressing challenges such as data privacy, algorithmic bias, and interpretability in the context of medical decision-making.

Rajasekaran, Umamaheswari, et al [20] discussed the rise of deep learning (DL) in healthcare, highlighting its effectiveness and potential to replace traditional machine learning (ML) methods. It emphasizes the ability of DL to analyze and diagnose various biomedical and healthcare issues, particularly in the treatment and prediction of critical illnesses, as well as in detecting fraud in the medical field. It also addresses the necessity of large data sets for DL operations and the importance of effective organization and utilization of this data. The collaboration between medical professionals and DL technologies is presented as a pathway to achieving more advanced and effective treatments for both curable and incurable diseases.

Andi, Hari Krishnan [21] reviewed the integration of deep learning algorithms in embedded healthcare applications, highlighting their potential to transform medical diagnostics, monitoring, and treatment processes. It discusses various deep learning algorithms such as Convolutional Neural Networks (CNN), Recurrent Neural Networks (RNN), Long Short-Term Memory (LSTM), and Transformer Networks, emphasizing their performance and suitability for enhancing embedded healthcare systems to support timely and accurate medical responses. Gayathiri, P [22] discussed the impact of deep learning advancements on healthcare applications, particularly in response to the rise of diseases like COVID-19, highlighting how improvements in chip processing power, data size, and deep learning research have led to the development of solutions that support diagnosis, forecasting, and treatment of patients using various data types such as images, video, audio, and text. It provides an overview of commonly used deep learning algorithms in the medical field, including back propagation, convolutional neural networks, and generative adversarial networks, while also examining their benefits, drawbacks, and the current state of real-world applications in healthcare, as well as future directions for the field.

Selvakumar, R., et al [23] discussed the transformative impact of deep learning in medical applications, highlighting its ability to enhance disease diagnosis and treatment through improved accuracy, efficiency, and personalized care. It focuses on significant contributions in diagnosing cancers, neurological disorders, and cardiovascular diseases, as well as predicting patient outcomes and customizing treatments. It also addresses the methodologies employed, such as recurrent neural networks (RNNs) for sequential data and convolutional neural networks (CNNs) for image analysis, while acknowledging challenges like data privacy, the necessity for large annotated datasets, and model interpretability. The future of deep learning in medicine is explored, emphasizing the integration of multi-modal data and the development of explainable AI to build trust among healthcare professionals.

Shastri, K. Aditya, et al [24] discussed the intersection of technology and healthcare through medical informatics (MI), which enhances patient outcomes by integrating medical and computer sciences, ultimately improving patient care in research and clinical settings. It highlighted the growing application of deep learning (DL) in MI and public health (PH), showcasing its potential benefits such as aiding in disease diagnosis, cancer detection, personalized medicine effects, understanding genetic associations, discovering new phenotypes, and accurately forecasting infectious disease outbreaks.

**India Solai and Srinaganya**

Bhat, Raghavendra, Sandya Mannarswamy, and Shreyas NC [25] discussed the advancements and applications of Machine Learning (ML) and Deep Learning (DL) in healthcare, highlighting the use of these technologies in areas such as medical imaging, clinical decision making, and processing electronic healthcare records. It emphasizes the significance of Federated Learning (FL) as a method to train ML/DL algorithms without centralizing data, which is crucial in a data siloed healthcare environment. The tutorial aimed to provide an overview of DL/FL techniques in healthcare, addressing the challenges of applying probabilistic methods in a field that often demands deterministic correctness, interpretability, and verifiability. It also outlines future research directions and the importance of fostering collaboration between the data science community and the healthcare sector.

Fateh, Sana, et al [26] emphasized the significance of deep learning in healthcare risk assessment, highlighting its role in early detection of potential risks and weaknesses to ensure the safety of patients and staff. It discusses how the integration of artificial intelligence, machine learning, and deep learning is transforming traditional approaches to healthcare challenges. It noted that deep learning techniques, although still in their early stages, have a wide range of applications in healthcare, including the management of universal health records and the development of emerging technologies that are expected to significantly alter the healthcare landscape in the near future. Abdel-Jaber, Hussein, et al [27] reviewed various deep learning algorithms, highlighting their architectures, advantages, disadvantages, and applications, particularly in the healthcare sector. It emphasizes the ability of deep learning to analyze big data and discusses the challenges faced in the field, such as AutoML-Zero and neural architecture search. It serves as a resource for new researchers by providing detailed insights into the practical applications of deep learning algorithms, including their use in addressing issues related to the COVID-19 pandemic, while also motivating further innovation and solutions to the challenges identified in deep learning.

Pujahari, Rakesh Mohan, Rijwan Khan, and Satya Praksh Yadav [28] discussed the rapid advancements in medicine and healthcare driven by the accumulation of large volumes of health data, emphasizing the need for technological and analytical methods to process this data effectively. It highlights the role of artificial intelligence (AI) and deep learning, particularly in optimizing machine learning algorithms, to enhance predictive performance in biomedicine. It outlined the broad applications of deep learning in health informatics and biomedicine, including molecular diagnostics, biomedical imaging, drug discovery, and more. The chapter aimed to showcase how deep learning algorithms improve pattern recognition and feature extraction from complex datasets, ultimately advancing healthcare and medicine in contemporary society. Deshmukh, A [29] discussed the transformative role of artificial intelligence (AI) and deep learning, particularly convolutional neural networks (CNNs), in enhancing disease detection and diagnosis through medical imaging. It highlights the fundamentals of deep learning and its significance in analyzing medical images. Various applications of deep learning in medical imaging are explored, including automated disease detection and classification, image segmentation for anatomical localization, quantitative analysis for predictive modeling, personalized medicine, and workflow optimization, supported by case studies from specialties like oncology, cardiology, and neurology.

Abdulwahhab, Ali H., et al [30] highlighted the transformative impact of deep learning techniques, particularly Convolutional Neural Networks (CNNs) and Generative Adversarial Networks (GANs), on medical image analysis, emphasizing their applications in tasks such as segmentation, classification, and enhancement, with specific focus on brain tumor segmentation and COVID-19 diagnosis using high-quality datasets like the NIH Clinical Center's Chest X-ray dataset and BraTS dataset. It underscores the importance of data quality in medical imaging and the need for collaborative partnerships between medical practitioners and data scientists, pointing out the managerial implications for healthcare organizations and the expansive potential of deep learning in advancing healthcare diagnostics and treatments. Chen, Yen-Wei, and Lakhmi C. Jain [31] discusses the application of deep learning in healthcare, particularly focusing on the detection of various types of cancer, including lung, liver, breast, and brain cancer, while highlighting state-of-the-art research in these areas. It also addresses the limitations of deep learning as a standard diagnostic tool in healthcare and emphasizes the importance of understanding deep learning methods for data science practitioners and healthcare workers to enhance their application for the benefit of life on Earth. Tripathi, Padmesh, et al [32] discussed the emergence and applicability of deep learning (DL) in healthcare,

**India Solai and Srinaganya**

highlighting the challenges researchers face in managing large amounts of medical data. It emphasizes the role of various neural network architectures, such as convolutional neural networks (CNN) and recurrent neural networks (RNN), in enhancing the capabilities of deep learning in this field. It outlines the successful applications of deep learning techniques in healthcare, particularly in image processing, which aids physicians in accurately diagnosing patients through various imaging modalities like CT scans, MRIs, and ultrasounds, ultimately concluding that deep learning is a highly effective tool in the healthcare sector. Gezimati, Mavis, and Ghanshyam Singh [33] discusses the rapid expansion of deep learning algorithms in healthcare, emphasizing their potential to enhance clinical decision support systems and improve diagnostic accuracy through computer-aided diagnostics, particularly in the context of multimodal image and acoustic data fusion for lung cancer classification and prediction tasks. It proposed a framework for multimodal deep learning models that integrates various data sources, identifies existing challenges in multisource information processing, and highlights the importance of these advancements in supporting practitioners and health centers in delivering precise, evidence-based medicine.

Al-Asmari, Abdulrhman Samman [34] presented a systematic review of 47 research papers focused on the applications of Deep Learning (DL) in healthcare and biomedicine, highlighting its effectiveness in improving healthcare outcomes, particularly in cancer and medical imaging, while also noting a significant lack of research in chronic and lifestyle-related illnesses such as diabetes. The findings suggested that there is a wealth of accessible research on DL applications for cancer and medical imaging that health practitioners can utilize, while also indicating a pressing need for intensified research in areas with a deficit of literature, particularly concerning acute health problems and diseases caused by immunodeficiency. Hassouna, Mohammed, et al [35] reviewed the applications of deep learning in various medical imaging fields, including neuro, retinal, pulmonary, digital pathology, breast, and cardiac systems, highlighting its role in image classification, object detection, and segmentation, which addresses many challenges in healthcare. It notes that while deep learning has improved the analysis of medical images in areas such as cancer detection and chest radiography normalization, the use of small-scale medical datasets poses a significant challenge to the generalization and performance of deep learning algorithms.

Shaik, Farooq, et al [36] Deep learning, particularly through convolutional neural networks (CNN), is a powerful method in machine learning that excels in image classification and object detection by extracting spatial features from images. The advancements in computational power and data availability have enabled the effective training of deep CNN models. The application of deep CNN in healthcare has transformed various areas, including disease diagnosis, supporting clinical decision-making for physicians, continuous patient monitoring, and the creation of personalized treatment strategies, while also raising important ethical considerations. Shekhar, Raj, et al [37] discussed the evolution of smart healthcare, emphasizing the integration of advanced technologies such as artificial intelligence and the Internet of Things (IoT) to enhance the reliability, efficiency, and personalization of medical systems. It presented the application of various Deep Learning techniques, including convolutional neural networks (CNN), CNN-LSTM, Multi Headed CNN-LSTM, and Multi Headed CNN-BiLSTM, for recognizing human physical activity using wearable sensors, with the Multi-Headed CNN-BiLSTM model demonstrating superior performance on the UCI HAR dataset in terms of accuracy, precision, recall, and F1 score.

Viswanathan, Janani, N. Saranya, and Abinaya Inbamani [38] discussed the rise of deep learning (DL) and artificial intelligence (AI) as significant tools in healthcare, particularly for medical diagnostics, highlighting the popularity of computational techniques like deep learning and machine learning (ML) in medical image processing. It reviewed fundamental concepts of DL algorithms, their necessity in healthcare, various applications, and challenges faced in medical image processing, while also addressing the tools and technology needed for DL, specifically in the context of cancer detection. Juyal, Prachi [39] discussed the transformative impact of deep learning in predictive analytics within healthcare, highlighting its ability to improve treatment methods and facilitate earlier disease detection through precise predictive models derived from complex datasets, including medical records and genetic data. It proposed a hybrid deep learning model that combines Convolutional Neural Networks (CNNs) with Recurrent Neural Networks (RNN), achieving an accuracy of 88% compared to traditional CNN models, and emphasizes the potential for enhanced, patient-focused treatment outcomes as this technology evolves.

**India Solai and Srinaganya**

Khanna, Tejaswi, and Sonali Mathur [40] focused on the performance assessment of a cloud-based Totally Deep system in intelligent healthcare management, emphasizing its ability to predict patient outcomes based on clinical history and records, as well as its diagnostic accuracy for individual conditions. Key performance metrics for the model include accuracy, time efficiency, and scalability, with the ultimate goal of enhancing predictive healthcare analytics to improve patient outcomes in real-world applications.

Research Problem Statement

The drug selection process in clinical settings is complex, involving numerous factors such as patient-specific characteristics (e.g., genetic profile, comorbidities, age, gender), drug efficacy, potential side effects, and drug interactions. Traditional methods of drug selection, though based on clinical guidelines and expert knowledge, often fail to fully account for the vast amount of data and the variability across individual patients. Furthermore, drug-drug interactions, patient-specific responses, and the need for personalized treatment strategies make drug selection a critical area requiring more advanced decision support tools. The integration of deep learning into Clinical Decision Support Systems (CDSS) offers significant promise for improving drug selection, enabling more accurate, personalized, and efficient recommendations. However, challenges such as data quality, model interpretability, integration into clinical workflows, and scalability remain, limiting the effectiveness of these systems in real-world applications. The central research problem is: How can deep learning models be effectively utilized to optimize drug selection in clinical settings, considering the diverse patient characteristics and minimizing risks associated with drug interactions and adverse effects?

Future Research Direction**Data Quality and Integration**

A significant challenge in applying deep learning for drug selection in CDSS is the availability and quality of data. Future research should focus on improving the collection, integration, and standardization of various data sources, including electronic health records (EHRs), genomic data, proteomic data, clinical trial results, and patient-reported outcomes. Ensuring the completeness, accuracy, and diversity of data is essential for training robust models that can generalize across different patient populations.

Explainability and Interpretability of Deep Learning Models

One of the major barriers to the widespread adoption of deep learning in clinical decision support is the "black-box" nature of many models. Clinicians need to trust the system's recommendations, and a lack of transparency regarding how deep learning models arrive at their conclusions can hinder this trust. Research should focus on developing interpretable deep learning models, such as attention mechanisms or explainable AI techniques, to provide insights into how decisions are made. This will enhance the clinical utility of these systems and promote their integration into daily practice.

Personalized Medicine and Precision Drug Selection

Future studies should explore the application of deep learning in precision medicine, where drug selection is tailored to the genetic, molecular, and environmental factors of individual patients. Investigating the potential of multi-modal deep learning models that incorporate genomic data, imaging data, clinical history, and lifestyle factors could significantly improve personalized treatment strategies. Additionally, the development of models that predict individual responses to drugs based on patient-specific characteristics should be prioritized.

Real-Time Decision Support and Continuous Learning

Clinical decision-making is dynamic, with patients' conditions and responses to treatment evolving over time. Future research should focus on the integration of continuous learning systems within CDSS, where deep learning models can update in real-time based on new patient data, clinical guidelines, and emerging research. Such models would be capable of adapting to new drug formulations, updated clinical practices, and evolving disease characteristics, ensuring that drug recommendations remain current and relevant.

**Drug-Drug Interaction (DDI) Prediction and Drug Repurposing**

The prediction of drug-drug interactions remains a critical application of deep learning in drug selection. Future research should explore more advanced methods, such as graph neural networks (GNNs), to better model and predict complex drug interactions. Additionally, deep learning can aid in drug repurposing, identifying new therapeutic indications for existing drugs. Research in this area could significantly reduce the time and cost associated with developing new drugs, particularly for rare or emerging diseases.

Scalability and Deployment in Real-World Clinical Environments

While deep learning-based CDSS shows great promise in controlled research environments, translating these models into real-world clinical settings remains a challenge. Future research should focus on the scalability of deep learning models, addressing issues such as computational efficiency, model generalization to diverse populations, and seamless integration with existing clinical workflows and EHR systems. This research should also explore the cost-effectiveness of deploying deep learning-powered CDSS across different healthcare settings, from hospitals to primary care.

Ethical and Regulatory Considerations

The widespread use of deep learning in clinical decision support brings ethical concerns, particularly regarding patient privacy, data security, and algorithmic bias. Future research should address these concerns by developing frameworks for ensuring the ethical use of AI in healthcare. This includes creating regulatory guidelines for the safe deployment of deep learning models, as well as establishing standards for data privacy and fairness to ensure that these systems are equitable and do not exacerbate existing healthcare disparities.

Collaborative Human-AI Decision Making

Deep learning models should not replace clinicians but rather complement their expertise. Research should investigate how to design CDSS that facilitate collaborative decision-making between clinicians and AI systems, ensuring that healthcare providers can interpret and validate AI-generated recommendations. This collaboration could improve clinicians' decision-making process, enabling them to make better-informed choices with the aid of deep learning insights, rather than relying solely on the system.

ABSTRACT

Using the Possibility and Necessity Relation, we suggest a new way to rank Type -2 Trapezoidal Fuzzy Numbers (T2TFN) in this study. A Type-2 fuzzy set (T2FS) possesses a membership function, indicating that the membership value for each element within this set is itself a fuzzy set within the interval $[0,1]$. Zadeh came up with this idea as a way to build on fuzzy sets. Type-2 fuzzy sets are more expressive and interesting in terms of ideas. Using this suggested strategy, decision-makers can choose the best option with varied levels of pleasure. The suggested method has been shown using numbers.

Keywords: Type-2 Fuzzy Numbers, Type-2 Trapezoidal Fuzzy Numbers, Possibility, Necessity.

INTRODUCTION

Zadeh [1] proposed the concept of a type-2 fuzzy set as an extension of the traditional fuzzy set notion. The distinctive feature of the type-2 fuzzy set is its fuzzy membership function. The membership value for each element of this set constitutes a fuzzy set inside the interval $[0,1]$. In a regular fuzzy set, the membership value is a clear number between 0 and 1.

Preliminaries

Zadeh [1] was the first to come up with the idea of fuzzy set theory. Let X be a group. A fuzzy set is defined by a function called the membership function, which is the $f_X: X \rightarrow [0,1]$ that links each element of X to a real number in the range $[0,1]$. A fuzzy number A is a fuzzy subset of a real line $\mathbb{R}$ with the membership function μ_A . This function is normal, fuzzy convex, upper semi-continuous, and $\text{supp } A$ is bound. The support of A , which is denoted by $\text{supp } A$, is the closure of the set $\{x \in X: \mu_A(x) > 0\}$. You can write any fuzzy number in this way.

$$\mu_A(x) = \begin{cases} g(x), & \text{when } x \in [a, b] \\ 1, & \text{when } x \in [b, c] \\ h(x), & \text{when } x \in (c, d] \\ 0, & \text{otherwise,} \end{cases} \quad \text{Where } a, d, c, b \in \mathbb{R} \text{ such that } a < b \leq c < d, \text{ } g \text{ is a real } h \text{ is a real-valued function that is}$$

declining and lower semi-continuous, while v is a valued function that is increasing and upper semi-continuous.

We will call the set of fuzzy numbers $F(\mathbb{R})$. The basic groups of fuzzy numbers are shown in [3], which starts with a generic description of fuzzy numbers. There are Exponential fuzzy numbers, Gaussian fuzzy numbers, L–R fuzzy numbers, Quasi–exponential fuzzy numbers, Quasi–gaussian fuzzy numbers, Quasi–quadratic fuzzy numbers, Single–ton fuzzy numbers, Trapezoidal fuzzy numbers, Triangular fuzzy numbers.

Type-2 Fuzzy Set

This section reviews fundamental principles of type-2 fuzzy sets and their operations.

A type - 2 fuzzy set (T2FS) [4],[5] [6]) denoted $\tilde{A}$, is characterized by a Type - 2 membership function $\mu_{\tilde{A}}(x, u)$ where $x \in X$ and $u \in J_x \subseteq [0,1]$. i.e., $\tilde{A} = \{(x, u), \mu_{\tilde{A}}(x, u) / \forall x \in X, u \in J_x \subseteq [0,1]\}$ in which $0 \leq \mu_{\tilde{A}}(x, u) \leq 1$. $\tilde{A}$ Can be expressed as

$$\tilde{A} = \int_{\forall x \in X} \int_{\forall u \in J_x \subseteq [0,1]} \mu_{\tilde{A}}(x, u) / (x, u) \# \quad (1)$$

where $\int$ signifies the union across all permissible domain values x and secondary domain value u . In a discrete world of discourse, the integral is substituted by the summation. The Vertical Slice (VS) of a T2FS $\tilde{A}$ [7] represents the T2FS membership at a specific value x . The VS constitutes a fuzzy set (T1FS), where $A_x \in F(U)$.

The Vertical Slice Representation Theorem (VSRT) of a T2FS [8], $\tilde{A} \in \tilde{F}(X)$, is the union of all its vertical Slices, i.e.,

$$\tilde{A} = \bigcup_{\forall x \in X} (x, \tilde{A}_x) \# \quad (2)$$

A Primary Grade (PG) u_x in a T2FS, $\tilde{A} \in \tilde{F}(X)$, is a single domain value of the VS, $\tilde{A}_x$, at element $x \in X$. A Secondary Grade (SG) $\tilde{u}_x$ in a T2FS, $\tilde{A} \in \tilde{F}(X)$, is the membership grade of a single PG $\tilde{u}_x$ of VS, $\tilde{A}_x$, i.e., $\tilde{u}_x = \tilde{A}_x(u_x)$. The Footprint of Uncertainty (FOU) is derived from the union of all primary memberships

$$\text{FOU}(\tilde{A}) = \bigcup_{\forall x} (x, J_x) = \int_{x \in X} J_x \# \quad (3)$$

The FOU can be described in terms of its upper and lower membership function.

$$\text{FOU}(\tilde{A}) = \int_{x \in X} [\underline{\mu}_{\tilde{A}}(x), \overline{\mu}_{\tilde{A}}(x)] \# \quad (4)$$

i.e., $\text{FOU}(\tilde{A})$ is upper and lower bounded by $\underline{\text{FOU}}(\tilde{A})$ and $\overline{\text{FOU}}(\tilde{A})$, respectively. $\underline{\text{FOU}}(\tilde{A})$ is called an lower MF(LMF) for $\text{FOU}(\tilde{A})$, i.e., $\text{LMF}_{\text{FOU}(\tilde{A})}(x)$, and $\overline{\text{FOU}}(\tilde{A})$ is called an upper MF(UMF) for $\text{FOU}(\tilde{A})$, i.e., $\text{UMF}_{\text{FOU}(\tilde{A})}(x) (\forall x \in X)$. [9] The important notation is *Principal Membership* (PrMF) defined as the union of all the primary memberships having secondary grades equal to 1.

$$\text{Pr}(\tilde{A}) = \int_{x \in X} u/x \mid f_x(u) = 1 \# \quad (5)$$

Alpha - cut of IT2FSs

In this section novel of IT2FSs are discussed. These α – cut are defined by crisp sets and the IT1FS α – EP extends operation directly from crisp set to IT1FSs. This fact is in Section 3.2 α -planes are shown to be IT1FS, and the α – plane EP is defined in order to enable the extension of operation IT1FSs to T2Fs. Combining these two theorems leads to the definition of α -cuts for T2FSs. First, the UMF and LMF of α -planes are generalized. Let, $\tilde{A} \in \tilde{F}(X)$, be a T2FS and, $\tilde{A}_\alpha \in \tilde{F}(X)$, be a IT2FS representing its α -plane at level $\tilde{\alpha}$, such that

Kavitha et al.,

Type - 2 Fuzzy Number

Coupland *et. al.* [10.] define a type - 2 fuzzy number as a type - 2 fuzzy set having a numerical domain. No assumption of normality has been established for this T2FN; however, the instances provided presuppose normality. From another perspective within the framework of interval valued fuzzy set [11], which are equal to IT2FS [12.], interval valued fuzzy numbers are defined to be a host convex and normal [13.]. Here it is desired to define a host of cases that may be conceived to qualify as T2FN. First normally is defined, recalling its definition within the context of T1FN.

A T1FS, A , is considered normal if its height $h(A)$ equals 1, i.e., $\sup \mu_A(x) = 1$, whenever a T1FS is not normal it is called subnormal. A normal Type - 2 Trapezoidal Fuzzy Number [14] $\tilde{A}$ on R is given by $\tilde{A} = \left[\left(x, (\mu_A^L(x), \mu_A^M(x), \mu_A^N(x), \mu_A^U(x)) \right) \right], x \in R$ and $\mu_A^L(x) \leq \mu_A^M(x) \leq \mu_A^N(x) \leq \mu_A^U(x)$, for all $x \in R$. Let A be the set $\{AL, AM, AN, AU\}$, where A comprises the elements $a1L, a2L, a3L, a4L, a1M, a2M, a3M, a4M, a1N, a2N, a3N, a4N$. If $\mu_{A^L}(x) \leq \mu_{A^M}(x) \leq \mu_{A^N}(x) \leq \mu_{A^U}(x)$ for every $x \in R$, then A is classified as a lawful type-2 fuzzy number. A is referred to as an illegal type-2 fuzzy number. Interval Type - 2 fuzzy number (IT2FN) is a special case of general T2FN, however, it is enough to characterize the uncertainty of real word applications. In addition, the computation complexity is greatly reduced. Here, we give the basic definition for the IT2FN. Furthermore, we will give some definitions about the arithmetic operations of trapezoidal IT2FNs.

Let $FOU(\tilde{A}) = [\underline{FOU}(\tilde{A}), \overline{FOU}(\tilde{A})]$ be an interval type - 2 fuzzy subset on real numbers (IT2FN) [15]. Let $FOU(A)$ be defined as a totally normal interval type-2 fuzzy number if both $FOU(A)$ and $\overline{FOU}(A)$ are classified as normal T1FNs.

Let $FOU(\tilde{A}) = [\underline{FOU}(\tilde{A}), \overline{FOU}(\tilde{A})]$ be an interval type - 2 fuzzy subset on real numbers. Then $FOU(\tilde{A})$ is called a normal interval type-2 fuzzy number if $\underline{FOU}(\tilde{A})$ is a generalized T1FN and $\overline{FOU}(\tilde{A})$ is a normal T1FN.

An IT2FS is completely described by its FOU, but a general T2FS is not described by just its FOU. [16]

The α -Cut of IT2FS [17] $FOU(\tilde{A}) = [\underline{FOU}(\tilde{A}), \overline{FOU}(\tilde{A})]$ to represent a perfectly normal IT2FS defined by its lower and upper membership functions respectively. Then, using $A = \bigcup_{\alpha} \alpha \cdot [\alpha_1^\alpha, \alpha_2^\alpha]$ individually for lower and upper membership, it follows that $\underline{FOU}(\tilde{A}) = \bigcup_{\alpha} \alpha \cdot [\underline{\alpha}_1^\alpha, \underline{\alpha}_2^\alpha]; \overline{FOU}(\tilde{A}) = \bigcup_{\alpha} \alpha \cdot [\overline{\alpha}_1^\alpha, \overline{\alpha}_2^\alpha]$ computing the LMF and UMF under the same α -levels result α -cut representation of interval valued fuzzy set in the $FOU(\tilde{A}) = \bigcup_{\alpha} \alpha \cdot \left[[\underline{\alpha}_1^\alpha, \underline{\alpha}_2^\alpha], [\overline{\alpha}_1^\alpha, \overline{\alpha}_2^\alpha] \right]$ for a normal IT2FS.

An interval type - 2 fuzzy sub - number (IT2FsN) [18] when both the upper and lower membership functions are T1FNs, then

$$\begin{aligned} \tilde{A} &= \bigcup_{\alpha} \tilde{\alpha} FOU(\tilde{A}_{\alpha}) \\ &= \bigcup_{\alpha} \tilde{\alpha} \cdot \left(\bigcup_{\alpha} \alpha \cdot \left[[\underline{\alpha}_1^\alpha, \underline{\alpha}_2^\alpha], [\overline{\alpha}_1^\alpha, \overline{\alpha}_2^\alpha] \right] \right) \end{aligned} \quad (6)$$

Let $\tilde{A} = \bigcup_{\alpha} \tilde{\alpha} FOU(\tilde{A}_{\alpha})$ be a type -2 fuzzy subset of real numbers [19]. A is designated as a perfectly normal type-2 fuzzy number if $FOU A_{\alpha=0}$ qualifies as a perfectly normal IT2FN, and $FOU A_{\alpha=1} = Pr(A)$ is classified as normal (specifically, either a normal T1FN or a normal IT2FN). $\tilde{A}$ is called a normal type -2 fuzzy number if $FOU(\tilde{A}_{\alpha=0})$ is a normal IT2FN, and $FOU(\tilde{A}_{\alpha=1}) = Pr(\tilde{A})$ exist. $\tilde{A}$ is called a partially normal type -2 fuzzy number if $FOU(\tilde{A}_{\alpha=0})$ is a normal IT2FN. J.M. Mendel et al. defined that if A is an IT2FS, then A can be represented by an upper membership function (UMF) and a lower membership function (LMF), denoted as A^L and A^U :

$$\tilde{A} = [A^L, A^U] \# \quad (7)$$

D.StephenDinagar and A.Anbalagan defined [21.] if $\mu_A^L(x) \leq \mu_A^M(x) \leq \mu_A^N(x) \leq \mu_A^U(x)$, for all $x \in R$ then $\tilde{A}$ is called legal type -2 fuzzy number. Otherwise $\tilde{A}$ is called illegal type -2 fuzzy number.

If $\lambda_A=1$, then $A=AL, AM, AN, AU, a1L, a2L, a3L, a4L, a1M, a2M, a3M, a4M, a1N, a2N, a3N, a4N$ is a totally typical type-2 fuzzy number. If $A^L = A^M$ and $A^N = A^U$, then $A = A^L, A^U =$

Kavitha et al.,

$a_1^L, a_2^L, a_3^L, a_4^L, a_1^U, a_2^U, a_3^U, a_4^U$ is a normal type-2 fuzzy number. If $\lambda_A=1$, then $A=AL, AU=a_1L, a_2L, a_3L, a_4L, a_1U, a_2U, a_3U, a_4U$ constitutes a fully typical type-2 fuzzy number. If $A^N=A^N$, then $A=AL, AM, AU$ is designated as a Type-2 triangular fuzzy number. Let $\tilde{A}$ be an interval type - 2 trapezoidal fuzzy number (IT2TrFN) [22] and $\tilde{A} = (A^L, A^U) = ((a_1^L, a_2^L, a_3^L, a_4^L), (a_1^U, a_2^U, a_3^U, a_4^U))$. Then an IT2TrFN can be depicted in Fig.2.1. In Fig. 2.1, UMF is determined by $(a_1^L, a_2^L, a_3^L, a_4^L, h^L)$, LMF is represented by $(a_1^U, a_2^U, a_3^U, a_4^U, h^U)$. Obviously, if $a_1^U = a_1^L, a_2^U = a_2^L, a_3^U = a_3^L, a_4^U = a_4^L, h^U = h^L$, then the IT2TrFN is reduced to a T1TFN.

A New Representation For Interval Type-2 Fuzzy Number

In this section, we provide a new representation for an Interval type-2 trapezoidal fuzzy numbers (IT2TrFN) is a fuzzy number that is fully determined by core and supports of IT1TN and its operations are provide.

The core, core($\tilde{A}$) of T2FS $\tilde{A}$.

Let $A \in F(X)$; then the core, core(A), is the precise set that includes the elements of the domain that achieve both SGs and PGs at unity, i.e.,

$$\text{core}(\tilde{A}) = \{x \mid u_x = 1 \text{ and } \tilde{u}_x = 1\} \# \quad (8)$$

The core of T2FSs can be achieved by assigning unity to the height of T2FSs, and taking all the elements of the domain that attain a membership grade equal to this height. The α -cut RT of the T2FS can serve as an alternate definition, namely,

$$\text{core}(\tilde{A}) = \tilde{A}_{1,1} \# \quad (9)$$

In other words, the core of a T2FS is a crisp set that is represented by the α – cut of T2FS at levels $\tilde{\alpha}$ and $\alpha = 1$. Another description of this equation can be that the core of a T2FS is equal to the core of it's principal set, i.e.,

$$\begin{aligned} \text{core}(\tilde{A}) &= \text{core}(PS(\tilde{A})) \\ &= \text{core}(\tilde{A}_1) = \tilde{A}_{1,1} \end{aligned} \quad (10)$$

Let, $\tilde{A} \in \tilde{F}(X)$. Then, the Support, Supp($\tilde{A}$) is the crisp set that contain the elements of the domain that attain both SGs and PGs greater than zero, i.e.,

$$\text{Supp}(\tilde{A}) = \left\{ \frac{x}{u_x} > 0 \text{ and } \tilde{u}_x > 0 \right\} \# \quad (11)$$

In other words, the support of a T2FS is a crisp set that is represented by the strong α – cut of the FOU of the T2FS. It is evident since the FOU is an interval fuzzy set represented by and α - plane at level $\alpha = 0$, then the support of this interval fuzzy set is the support of it's UMF.

$$\begin{aligned} \text{Supp}(\tilde{A}) &= \text{Supp}(\text{FOU}(\tilde{A})) \\ &= \text{Supp}(\tilde{A}_0) \\ &= \tilde{A}_{0,0+} \end{aligned} \quad (12)$$

The interval type - 2 trapezoidal fuzzy number is a fuzzy number that is fully determined by quadruples of LMF and quadruples of UMF. i.e., $\tilde{A} = \cup_{\alpha} \tilde{\alpha} \text{FOU}(\tilde{A}_\alpha) = (A^L, A^U) = ((a_2^L, a_3^L, \alpha_L, \beta_L), (a_2^U, a_3^U, \alpha^U, \beta^U))$ of crisp numbers such that $a_2^L \leq a_3^L, a_2^U \leq a_3^U, \alpha_L, \alpha^U \geq 0$ and $\beta_L, \beta^U \geq 0$. $[a_2^L, a_3^L]$ is the core of $\text{FOU}(\tilde{A})$, and $\alpha_L \geq 0, \beta_L \geq 0$ are the left-hand and right-hand spreads and $[a_2^U, a_3^U]$ is the core of $\text{FOU}(\tilde{A})$, and $\alpha^U \geq 0, \beta^U \geq 0$ are the left-hand and right-hand spreads.

$$\text{Nec}(\tilde{A}_1 \leq \tilde{A}_2) = 1 - \min \left\{ \max \left(\frac{M^*(\tilde{A}_1) - M_*(\tilde{A}_2)}{M^*(\tilde{A}_1) - M_*(\tilde{A}_1) + M^*(\tilde{A}_2) - M_*(\tilde{A}_2)}, 0 \right), 1 \right\}$$

are called possibility and necessity indices respectively.

The Core of IT2TrFN [24.]

$$\text{core}(\tilde{A}) = ([a_2^L, a_3^L] \cap [a_2^U, a_3^U]) \# \quad (13)$$

where $[a_2^L, a_3^L]$ is the core of $\text{FOU}(\tilde{A})$ and $[a_2^U, a_3^U]$ is the core of $\text{FOU}(\tilde{A})$

**Definition 3.1**

A interval type-2 trapezoidal fuzzy numbers (IT2TrFN) is a fuzzy number that is fully determined by core and supports of $\underline{\text{FOU}}(\tilde{A})$ and $\overline{\text{FOU}}(\tilde{A})$ of crisp number such that $a_2^L \leq a_3^L$, $\alpha^L \geq 0$ and $\beta^L \geq 0$, whose membership function can be denoted by

$$\mu_{\tilde{A}}(x) = \begin{cases} (x - a_2^L + \alpha_1 + \alpha_2 + \alpha_3)/\alpha_3, & a_2^L - \alpha_1 - \alpha_2 - \alpha_3 \leq x \leq a_2^L - \alpha_1 - \alpha_2 \\ (x - a_2^L + \alpha_1 + \alpha_2)/\alpha_2, & a_2^L - \alpha_1 - \alpha_2 \leq x \leq a_2^L - \alpha_1 \\ (x - a_2^L + \alpha_1)/\alpha_1, & a_2^L - \alpha_1 \leq x \leq a_2^L \\ 1, & a_2^L \leq x \leq a_3^L \\ -(x - a_3^L - \beta_1)/\beta_1, & a_3^L \leq x \leq a_3^L + \beta_1 \\ -(x - a_3^L - \beta_1 - \beta_2)/\beta_2, & a_3^L + \beta_1 \leq x \leq a_3^L + \beta_1 + \beta_2 \\ -(x - a_3^L - \beta_1 - \beta_2 - \beta_3)/\beta_3, & a_3^L + \beta_1 + \beta_2 \leq x \leq a_3^L + \beta_1 + \beta_2 + \beta_3 \\ 0, & \text{otherwise} \end{cases}$$

where $\alpha_L = \alpha_1 + \alpha_2 \geq 0$, $\beta_L = \beta_1 + \beta_2 \geq 0$ are the left-hand and right-hand spreads $\underline{\text{FOU}}(\tilde{A})$ and $\alpha^U = \alpha_2 + \alpha_3 \geq 0$, $\beta^U = \beta_2 + \beta_3 \geq 0$ are the left-hand and right-hand spreads $\overline{\text{FOU}}(\tilde{A})$

Arithmetic Operation on IT2FN

Let $\tilde{A} = ((a_2^L, a_3^L, \alpha_L, \beta_L), (a_2^U, a_3^U, \alpha^U, \beta^U))$ and $\tilde{B} = ((b_2^L, b_3^L, \gamma_L, \theta_L), (b_2^U, b_3^U, \gamma_U, \theta_U))$ both be interval type-2 trapezoidal fuzzy numbers. Some of the results of applying fuzzy arithmetic on the interval type-2 trapezoidal fuzzy numbers $\tilde{A}$ and $\tilde{B}$ follow:

- $\lambda \cdot \tilde{A} = ((\lambda a_2^L, \lambda a_3^L, \lambda \alpha_L, \lambda \beta_L), (\lambda a_2^U, \lambda a_3^U, \lambda \alpha^U, \lambda \beta^U))$, $\lambda > 0$
- $\lambda \cdot \tilde{A} = ((\lambda a_2^L, \lambda a_3^L, -\lambda \beta_L, -\lambda \alpha_L), (\lambda a_2^U, \lambda a_3^U, -\lambda \beta^U, -\lambda \alpha^U))$, $\lambda < 0$
- $\tilde{A} + \tilde{B} = ((a_2^L + b_2^L, a_3^L + b_3^L, \alpha_L + \gamma_L, \beta_L + \theta_L), (a_2^U + b_2^U, a_3^U + b_3^U, \alpha^U + \gamma_U, \beta^U + \theta_U))$
- $\tilde{A} - \tilde{B} = ((a_2^L - b_2^L, a_3^L - b_3^L, \alpha_L + \theta_L, \beta_L + \gamma_L), (a_2^U - b_2^U, a_3^U - b_3^U, \alpha^U + \theta^U, \beta^U + \gamma^U))$

Ranking of Fuzzy number**Definition 4.1**

Let $\tilde{A} = ((a_2^L, a_3^L, \alpha_L, \beta_L), (a_2^U, a_3^U, \alpha^U, \beta^U))$ and $\tilde{B} = ((b_2^L, b_3^L, \gamma_L, \theta_L), (b_2^U, b_3^U, \gamma_U, \theta_U))$ both be interval type-2 trapezoidal fuzzy numbers,

$$\text{Pos}(\tilde{A} \leq \tilde{B}) = \sup_{x \leq y} \min\{\mu_{\tilde{A}}(x), \mu_{\tilde{B}}(y)\},$$

$$\text{Nec}(\tilde{A} < \tilde{B}) = \inf_{x \geq y} \max\{1 - \mu_{\tilde{A}}(x), 1 - \mu_{\tilde{B}}(y)\} = 1 - \sup_{x \geq y} \min\{\mu_{\tilde{A}}(x), \mu_{\tilde{B}}(y)\}$$

are called possibility and necessity indices respectively.

Proposition 4.1

If $\tilde{A} = ((a_2^L, a_3^L, \alpha_L, \beta_L), (a_2^U, a_3^U, \alpha^U, \beta^U))$ and $\tilde{B} = ((b_2^L, b_3^L, \gamma_L, \theta_L), (b_2^U, b_3^U, \gamma_U, \theta_U))$ both be interval type-2 trapezoidal fuzzy numbers, then we have

$$\text{Pos}(\tilde{A} \leq \tilde{B}) \geq \alpha \text{ iff } \tilde{A}_{\alpha}^L \leq \tilde{B}_{\alpha}^U;$$

$$\text{Nec}(\tilde{A} < \tilde{B}) \geq \alpha \text{ iff } \tilde{A}_{1-\alpha}^U \leq \tilde{B}_{1-\alpha}^L;$$

We write also alternatively

$$\text{Pos}(\tilde{A} \leq \tilde{B}) = \mu_{\text{Pos}}(\tilde{A}, \tilde{B}) = (\tilde{A} \leq^{\text{pos}} \tilde{B}),$$

$$\text{Nec}(\tilde{A} < \tilde{B}) = \mu_{\text{Nec}}(\tilde{A}, \tilde{B}) = (\tilde{A} <^{\text{nec}} \tilde{B}).$$

An clarification of the α -relation associated to 'Pos' and 'Nec' when comparing fuzzy numbers $\tilde{A}$ and $\tilde{B}$ is as follows: for a given level of fulfillment $\alpha \in [0,1]$, a fuzzy number $\tilde{A}$ is not better than $\tilde{B}$ with respect to fuzzy relation Pos if the smallest value of $\tilde{A}$ with the degree of fulfillment being greater or equal to α is less or equal to the largest value of $\tilde{B}$ with the degree of fulfillment greater or equal to α . On the other hand, a fuzzy number $\tilde{A}$ is not better than $\tilde{B}$ with

Kavitha et al.,

respect to fuzzy relation $<^{Nec}$ if the largest value of $\tilde{A}$ with the degree of fulfillment at least $1 - \alpha$ is less or equal to the smallest value of $\tilde{B}$ with the degree of satisfaction at least $1 - \alpha$.

Theorem 4.1

Let $\tilde{A} = ((a_2^L, a_3^L, \alpha_L, \beta_L), (a_2^U, a_3^U, \alpha^U, \beta^U))$ and $\tilde{B} = ((b_2^L, b_3^L, \gamma_L, \theta_L), (b_2^U, b_3^U, \gamma_U, \theta_U))$ both be interval type-2 trapezoidal fuzzy numbers, then

$$\text{Pos}(\tilde{A} \leq \tilde{B}) = \begin{cases} 1, & b_3^U \geq a_2^L \\ \frac{b_3^U - a_2^L + \alpha + \theta}{\alpha + \theta}, & 0 < a_2^L - b_3^U \leq \alpha + \theta \\ 0, & a_2^L - b_3^U > \alpha + \theta \end{cases}$$

$$\text{Nec}(\tilde{A} < \tilde{B}) = \begin{cases} 1, & b_2^L - a_3^U \geq \gamma + \beta, \\ \frac{b_2^L - a_3^U}{\gamma + \beta}, & 0 \leq b_2^L - a_3^U < \gamma + \beta, \\ 0, & b_2^L < a_3^U, \end{cases}$$

Theorem 4.2

Let $\tilde{A} = ((a_2^L, a_3^L, \alpha_L, \beta_L), (a_2^U, a_3^U, \alpha^U, \beta^U))$ and $\tilde{B} = ((b_2^L, b_3^L, \gamma_L, \theta_L), (b_2^U, b_3^U, \gamma_U, \theta_U))$ both be interval type-2 trapezoidal fuzzy numbers, $p \in (0, 1]$, $\text{Pos}(\tilde{A} \leq \tilde{B}) \geq p$, if and only if $b_3^U - a_2^L \geq (p - 1)(\alpha + \theta)$.

Proof If $p = 1$, then from $\text{Pos}(\tilde{A} \leq \tilde{B}) \geq 1$ one can get that $b_3^U \geq a_2^L$, and vice versa. If $0 < p < 1$, then $b_3^U \geq a_2^L$ and $b_3^U + \theta > a_2^L - \alpha$, $\text{Pos}(\tilde{A} \leq \tilde{B}) \geq p$ if and only if $\frac{b_3^U - a_2^L + \theta + \alpha}{\theta + \alpha} \geq p$, that is $b_3^U - a_2^L \geq (p - 1)(\theta + \alpha)$.

Theorem 4.3

Let $\tilde{A} = (a_2^L, a_3^L, \alpha, \beta)$ and $\tilde{B} = (b_2^L, b_3^L, \gamma, \theta)$ be two reduced interval type - 2 trapezoidal fuzzy numbers, $p \in (0, 1]$, $\text{Nec}(\tilde{A} < \tilde{B}) \geq p$, if and only if $b_2^L - a_3^L \geq p(\gamma + \beta)$.

Proof If $p = 1$, then from $\text{Nec}(\tilde{A} < \tilde{B}) \geq 1$ one can get that $b_2^L - \gamma \geq a_3^L + \beta$, and vice versa. If $0 < p < 1$, then $b_2^L > a_3^L$ and $b_2^L - \gamma < a_3^L + \beta$, $\text{Nec}(\tilde{A} < \tilde{B}) \geq p$ if and only if $\frac{b_2^L - a_3^L}{\gamma + \beta} \geq p$, that is $b_2^L - a_3^L \geq p(\gamma + \beta)$.

Numerical illustration

Consider the following pair of type -2 fuzzy numbers

$$\tilde{A} = ((1.9, 2.0, 2.5, 2.6), (1.5, 2.0, 2.5, 2.8), (1.2, 1.9, 2.6, 3.0), (1.0, 1.9, 2.6, 3.1))$$

$$\tilde{B} = ((1.3, 1.4, 1.5, 1.6), (1.2, 1.4, 1.5, 1.7), (1.1, 1.3, 1.6, 1.8), (1.0, 1.3, 1.6, 1.9))$$

From Definition 4.3 (New representation of IT2TrFN)

$$\tilde{A} = \bigcup_{\forall \alpha} \tilde{\alpha} \text{FOU}(\tilde{A}_{\alpha}) = (A^L, A^U) = ((1.9, 2.0, 2.5, 2.6), (1.0, 1.9, 2.6, 3.1))$$

$$\tilde{B} = \bigcup_{\forall \alpha} \tilde{\alpha} \text{FOU}(\tilde{B}_{\alpha}) = (B^L, B^U) = ((1.3, 1.4, 1.5, 1.6), (1.0, 1.3, 1.6, 1.9))$$

From Definition 4.4 (New representation of RIT2TrFN)

$$\tilde{A} = \bigcup_{\forall \alpha} \tilde{\alpha} \text{FOU}(\tilde{A}_{\alpha}) = \begin{cases} (x - 2.0 + \alpha)/\alpha & 2.0 - \alpha \leq x \leq 2.0 \\ 1 & 2.0 \leq x \leq 2.5 \\ -(x - 2.5 + \beta)/\beta & 2.5 \leq x \leq 2.5 + \beta \\ 0 & \text{Otherwise} \end{cases}$$

$$\tilde{B} = \bigcup_{\forall \alpha} \tilde{\alpha} \text{FOU}(\tilde{B}_{\alpha}) = \begin{cases} (x - 1.4 + \alpha)/\alpha & 1.4 - \alpha \leq x \leq 1.4 \\ 1 & 1.4 \leq x \leq 1.5 \\ -(x - 1.5 + \beta)/\beta & 1.5 \leq x \leq 1.5 + \beta \\ 0 & \text{Otherwise} \end{cases}$$

ABSTRACT

Internet has increased dramatically with the development of 3G and 4G technologies in the recent years. The usage of mobile broadband internet on the devices like laptop, tablets and cellular mobiles has become very popular. Video streaming is the most popular multimedia application in mobile environment. The big challenge in this is without compromising the quality, these services should be provided to users in a cost-effective manner. The above challenge is achieved by the development of the LTE (Long Term Evolution) technology in the mobile world. With low latency and high data rates, the effective multimedia services are provided to user by means of the features of LTE technology over cloud in the multimedia application. In this research paper, variable bit rate based Dynamic Headlight Prefetching model is proposed to improve the quality of service on the video streaming over the cloud environment using LTE network.

Keywords: Video Streaming, Long Term Evolution, Constant Bit Rate, Variable Bit Rate, Adaptive Video Prefetching model

INTRODUCTION

In live media streaming, the bit rate are used in the sound or video encoding, and the term variable bit rate (VBR) that relates the bit rate are used in telecommunications and computing fields. For the segment per time, there will be the change in the capacity of output data for variable bit rate files when compared to constant bit rate (CBR) [1] [2]. More complicated portions of media files require greater storage space, whereas less complex segments necessitate

**Vaaheedha Kfatheen**

less space; hence, VBR allows for a higher bit rate. The average bit rate for the file can be determined by calculating the mean of these rates [3] [4]. For the past years, many hardware and software players are not able to decode the variable bit rate files properly because the using VBR encoders were not well developed. For the interest of compatibility, because of this result there will be the common use of CBR over VBR. In the huge majority VBR encoded files are supported by the modern portable music devices and software and in the year of 2006 December the largely disused files are CBR encoded files that are supported by devices. In most digital audio players released by the companies like SanDisk, Creative Technology, Apple and Microsoft supports for VBR in AAC and MP3 files is founded. In some cases like audio books and acoustic music, when encoding monotone or minimal tones an audible artifacts were introduced occasionally in early VBR algorithms. During the silence portions of the song or when there was only speaking, a “digital chirp” is mimed by these artifacts. The subsequent iterations of the VBR standard have addressed these issues by enhancements in the VBR encoding algorithms [5][6][7][22][23][24][25].

Media streaming in mobile environments has been attracting much attention lately. A real-time continuous media streaming protocol with special emphasis on dynamic transmission capacity allocation and pre-fetching is proposed. Nonstop middleware with partition prediction and service replication for continuous media streaming in mobile and ad hoc networks is developed. Video streaming methodologies on 3G mobile networks are executed inside a three-tier architecture [18] [19] [20] [21]. These are only focused on the coordination of media servers for smooth handover and the rate adaptation technique when a base station becomes overloaded. There is no coordination at the base station level or the user level. Data management challenges, particularly pre-fetching, are predominantly overlooked. Group mobility to predict the future availability of wireless links for increasing total streaming capacity is proposed. An iterative algorithm to predict continuous link availability between mobile users is proposed. The proposed V3 architecture for live video streaming is fundamentally a collaborative streaming framework for mobile vehicles.

The AO2P algorithm proposed for privacy routing uses a mechanism such that a receiver geographically closer to the destination is assigned to a class with a higher priority for contending the channel to be the next hop. The routing request in AO2P is disseminated to all adjacent nodes [8][9][10]. The work on moving objects databases is needed to maintain dynamic data items. For representing and processing dynamic attributes such as locations and trajectories, spatial and temporal indexing methods are devised. Headlight pre-fetching is proposed for media streaming in mobile contexts [11]. It features a headlight pre-fetching zone, a virtual fan-shaped area aligned with the user's movement, like to a vehicle's headlight. All service access points (SAP) of the cells that intersect with the zone are designated as the prefetching SAPs.

BIT RATE

In telecommunications and computing, bit rate is the number of bits that are conveyed or processed per unit of time [12].

Variable Bit Rate (VBR)

It a term used in telecommunications and computing, that relates to the bit rate used in sound or video encoding. Unlike constant bit rate (CBR), variable bit rate (VBR) files fluctuate the quantity of output data each time interval [13]. For the more complex segments of media files, a higher bit rate (more storage space is required) is allowed by VBR, whereas for less complex segments less space is apportioned. To produce an average bit rate for the file is to be calculated by the average of these rates.

Advantage

When compared to the same data of CBR file, VBR produces a better quality-to-space ratio. To encode the sound or video data more accurately by using the available bits in flexible manner, more bits are used in difficult-to-encode passages whereas in less demanding passages the fewer bits are used.

**Vaaheedha Kfatheen****Disadvantage**

Certain hardware may lack compatibility with VBR files due to the intricate encoding procedure, which requires more time. When the instantaneous bit rate exceeds the data rate of the communication link during streaming, issues may arise in variable bit rate (VBR) transmission. Encoding, or at the expense of increased latency, or by refining the playback buffer, mitigates these issues by restricting the immediate bit rate [14].

Proposed Adaptive Video Prefetching model

Headlight prefetching is proposed for media streaming in mobile contexts. It features a headlight prefetching zone, a virtual fan-shaped area aligned with the user's movement direction, analogous to a vehicle's headlight, as illustrated in figure 1. All service access pointers (SAP) of the cells that intersected with the zone are designated as the prefetching SAPs [13].

The Headlight Zone and the Computation of Virtual Illuminance

The challenge lies in ascertaining the cell area encompassed by the headlight zone, as the intersecting region may assume various shapes. To circumvent the expensive calculation of the covered area, we employ a more straightforward method to estimate the virtual illuminance. We divide the headlight zone into smaller grids and pre-calculate the virtual illuminance and the centre of each grid. Given that each grid possesses a regular shape, the virtual illuminance can be readily calculated using the subsequent formula. To ascertain the segment assignment of a certain cell, we aggregate the illuminance of all grids whose centres are located within the cell. The granularity of the grids can be easily adjusted, allowing for enhanced precision through finer partitioning at any time [15][16].

Prefetching Segment Assignments

To ascertain the segment assignment, we must evaluate both user mobility and media playback velocity. Consequently, the quantity of segments to be managed by the current cell is tP , as illustrated in figure 3.2. If the media segment now playing is S_i , then SAPC must prefetch the segments S_{i+1} , S_{i+2} , ..., S_{i+tP} . The initial segment requiring prefetching by SAPC₃ is $S_{i+tP} + 1$. The anticipated quantity of segments to be managed is t_3P . The initial segment and the overall quantity of segments to prefetch for all additional SAPs within the headlamp zone can be ascertained in a comparable manner. Given that it is evidently not economically viable for all such SAPs to prefetch the complete range of segments, we employ virtual illuminance as a weighting factor to ascertain the precise amount of segments to prefetch. The precise segment assignment for SAPC to prefetch is defined by parameters that determine the segment allocation.

Headlight Shifting

Headlight prefetching is highly effective for predominantly stable mobile users. Nonetheless, if the user executes a quick turn, the majority or entirety of the prefetching conducted in the preceding headlight zone may become entirely ineffective, since the user is no longer progressing towards the anticipated direction. We can initiate a new round of headlight prefetching for the updated circumstances. Nonetheless, this will result in a twofold increase in the prefetching expense. Due to the continuous playback of the media stream, the segments required for the next headlight zone substantially overlap with those of the previous zone. Consequently, the optimal approach is to relocate these segments to the new zone [17].

Headlight Sharing

Headlight shifting only takes the headlight zone of one user into consideration. Segments not yet pre-fetched by any SAP of the old zone can only be retrieved from the remote source. Given that identical media can be accessed concurrently by multiple users, particularly for popular media, the headlamp zones of various users may share numerous portions. If they intersect, it is quite probable that we can locate the required segments from alternative areas, with or without adjustment. This concept is termed headlight sharing, as segments pre-fetched for a certain zone by a SAP are disseminated to adjacent SAPs with overlapping headlight zones. Upon locating a requested segment within the vicinity, the expenses associated with prefetching from the remote server can be mitigated.

**Vaaheedha Kfatheen****Proposed Model**

This suggested architecture incorporates multi-level cooperation for effective data streaming management strategies, including Variable Bit Rate (VBR), dynamic headlight prefetching (shown in Figure 3.3), multi-user resource allocation, and mashed video sense chaining (depicted in Figure 3.4). A suggested iterative technique predicts continuous link availability among mobile users. The V3 architecture suggested for live video streaming is fundamentally a collaborative streaming framework for mobile vehicles. And belongs to our proposed levels, we overcome the propagation delay this is our major contribution of this work.

Multi-User Resource Allocation and Mashed Video Sense Chaining

Using the possibilities of mashed sensing in Wireless Multimedia Sensor Network Environment for rate control, error correction and mashing of video, it presents a network system is designed. By a cross-layer system its transmission rate, channel coding rate and encoding rate to maximize the quality of received video and this is the actual objective of our research. First, for transmission over wireless multimedia sensor networks (WMSNs) the encoding of video which is on the mashed sensing is examined. It is expressed that mashed sensing can defeat many of the present issues of video over WMSNs, for the channel errors the encoder complexity and low resiliency. It is shown that the rate of mashed sensed video can be predictably controlled by varying only the mashed sensing sampling rate. The above problem is defeated by the technique called Mashed Sensing (MS) concerning to video over WMSNs. By altering the sampling rate of mashed sensing that governs the frequency of Mashed Sensed Video (MSV). The MS encoder serves as an alternative to conventional video encoders, providing minimal computing complexity by allowing imaging systems to simultaneously sense and process data. To store or transmit for processing, a substantial volume of raw data is presumed and recorded in traditional digital image or video capture. The two main disadvantages are there in this process [19].

First, in some cases CMOS/CCD technology is limited and for particular wavelength assuming the large amount of raw image or video data can be expensive.

Second, in the case of video the computational complex one is mashing the raw data. Mashed Sensing (MS) is a method that retains essential information while discarding the extraneous data during the sampling process. Using conventional methods there will be a difficulty to encode or capture many signals but it is possible in Mash Sensing (MS) method. A high-dimensional signal can be retrieved by the random measurements in small number. A mashing algorithm can be utilised for each frame to identify a complete set of samples required by ordinary video capture devices. Acquiring those raw samples is challenging or significant in applications such as imaging at non-visible wavelengths (e.g., infrared), as illustrated in Figure 4. In other situations, such as multi-image capture in camera networks, creating a mashing method will pose a hurdle. In mash imaging technology, such as single-pixel systems, random measurements are individually obtained from each frame, thereby alleviating the associated burdens and eliminating the necessity for a mashing process.

Rate Change based on Video Quality

The transmission rate is contingent upon the received video quality, and the system is predicated on this MS design. The information regarding the estimated received video quality utilised by the rate controller and its significance in the rate control decision. The transmitted video quality is exceptionally high, as determined by the transmitting node, and to improve the rate, it will be reduced. To improve video quality, its data rate is reduced by transmitting a node of inferior-quality video.

Video Transmission using Mashing Samples

The video encoder can be developing based on mashed sensing. At low complexity based on the temporal correlation the frames can be captured and mashed by the difference of two frames of the MS samples.

EXPERIMENTAL RESULTS AND DISCUSSION

Simulation Parameters

Table 1 illustrates the simulation parameters employed in this work..

Evaluation Metrics

- **Packet Loss** The total number of data packets lost legitimately or through malicious action without any notification.
- **Packet Delivery Ratio (PDR)** The ratio of total number of data packets delivered to the total number of data packets sent.
- **End-to-End Delay** The latency encountered by the data packet during its transmission from source to destination, encompassing processing, queuing, and propagation delays.
- **Throughput** It measures the amount of data that can be transmitted through a network or processed by a system in a given time period. Throughput is a crucial metric as it indicates the efficiency and capacity of a network or system to handle data.

The performance of the Proposed Dynamic Headlight Prefetching (DHP) model with the existing multipath routing protocols like Temporally ordered routing algorithm (TORA) in this chapter.

Table 2 gives the Packet Delivery Ratio (in %) by the Proposed DHP model and TORA with varying number of nodes for streaming data. Figure 6 depicts the graphical representation of the Packet Delivery Ratio (in %) by the Proposed DHP model and TORA with varying number of nodes.

The Table 2 and figure 6 compares the Packet Delivery Ratio (PDR) percentages, measured in %, for the Proposed DHP model and TORA protocol across varying numbers of nodes in a network. Proposed DHP:PDR ranges from 87.64% to 92.85%.Demonstrates consistently higher PDR compared to TORA at all node counts. TORA:PDR ranges from 63.64% to 69.71%.Shows lower PDR compared to the Proposed DHP at all node counts.

Table 3 gives the End-to-End Delay (in %) by the Proposed DHP model and TORA with varying number of nodes for streaming data. Figure 7 depicts the graphical representation of the End-to-End Delay (in %) by the Proposed DHP model and TORA with varying number of nodes.

The Table 3 and figure 7 presents the End-to-End Delay percentages, measured in %, for the Proposed DHP model and TORA protocol across varying numbers of nodes in a network. Proposed DHP: End-to-End Delay ranges from 11.47% to 17.22%.Demonstrates a generally increasing trend with the number of nodes. TORA:End-to-End Delay ranges from 32.14% to 38.63%.Shows a generally increasing trend with the number of nodes, and consistently higher values compared to the Proposed DHP. In summary, the Proposed DHP model tends to exhibit lower End-to-End Delay percentages compared to TORA across the range of nodes tested.

Table 4 gives the Packet Loss (in %) by the Proposed DHP model and TORA with varying number of nodes for streaming data. Figure 8 depicts the graphical representation of the Packet Loss (in %) by the Proposed DHP model and TORA with varying number of nodes.

The table 4 and figure 8 displays the Packet Loss percentages, measured in %, for the Proposed DHP model and TORA protocol across varying numbers of nodes in a network. Proposed DHP: Packet Loss ranges from 12.14% to 18.44%.Demonstrates an increasing trend with the number of nodes. TORA:Packet Loss ranges from 34.25% to 40.42%.Exhibits an increasing trend with the number of nodes and consistently higher values compared to the

Vaaheedha Kfatheen

Proposed DHP. In summary, the Proposed DHP model generally shows lower Packet Loss percentages compared to TORA across the range of nodes tested. Both protocols experience an increase in Packet Loss as the number of nodes in the network increases, with TORA consistently exhibiting higher Packet Loss values.

Table 5 gives the Throughput (in kbps) by the Proposed DHP model and TORA with varying number of nodes for streaming data. Figure 9 depicts the graphical representation of the Throughput (in kbps) by the Proposed DHP model and TORA with varying number of nodes.

The table 5 and figure 9 represents the Throughput percentages, measured in kbps, for the Proposed DHP model and TORA protocol across varying numbers of nodes in a network. Proposed DHP: Throughput ranges from 684 to 1047kbps. Demonstrates a generally decreasing trend with the number of nodes. TORA: Throughput ranges from 563 to 884kbps. Exhibits a generally decreasing trend with the number of nodes, and consistently lower values compared to the Proposed DHP. In summary, the Proposed DHP model generally shows higher Throughput percentages compared to TORA across the range of nodes tested. Both protocols demonstrate a decline in Throughput as the number of nodes in the network escalates, with TORA constantly displaying inferior Throughput figures.

CONCLUSION

In this chapter, the Dynamic Headlight Prefetching model is proposed to improve the QoS in video streaming over cloud environment. The performance of the proposed DHP model is evaluated with the existing routing TORA protocol with various metrics. From the results obtained in this chapter, the proposed DHP model performing better in terms of Throughput, End-to-End delay, packet delivery ratio and packet loss.

ABSTRACT

Herbaceous plants in the Kolli Hills ecosystem of the Eastern Ghats exhibit remarkable adaptive plasticity in response to environmental variations. This study investigated the role of phenotypic plasticity in survival, growth, and reproductive success of dominant herbaceous species across varying altitudinal gradients. This study employed a descriptive and analytical research design to systematically document, analyze, and interpret the distribution, growth characteristics, and ecological adaptations of 259 herbaceous species from 54 angiospermic families. The altitude zones were classified as I (260m–300m), II (301m–680m), or III (681m–1009m). Statistical analyses were performed to examine the correlation between altitude range, growth forms, and patterns of occurrence. This study revealed significant variations in species dominance across different ecological zones, highlighting the influence of altitude on species composition and distribution. Herbaceous species exhibit diverse sub - forms, including prostrate, ascending, slender, procumbent, creeping, diffuse, spreading, stout, and succulent, each adapted to specific environmental conditions. Statistical analyses demonstrated significant correlations between the altitude range, growth sub - forms, and patterns of occurrence. Karl Pearson's co - efficient correlation and One-way analysis of variance confirmed significant variances among the altitude ranges for various growth sub - forms and occurrence patterns. This study offers valuable insights into the adaptive strategies of herbaceous flora in the Kolli Hills and contributes to biodiversity conservation and sustainable habitat management in this ecologically important region. These findings underscore the importance of phenotypic plasticity in enabling herbaceous species to thrive under diverse environmental conditions and maintain ecosystem balance. Understanding the adaptive mechanisms of these plants can inform conservation efforts and support the development of strategies to mitigate the impacts of anthropogenic pressures and climate change on a region's biodiversity.

Keywords: Adaptive phenotypic plasticity, herbaceous species, Kolli Hills, Eastern Ghats, altitudinal gradients, growth sub - forms, occurrence patterns, biodiversity conservation.

INTRODUCTION

Evolutionary changes in plant morphology and ecological strategies have occurred repeatedly across distantly related lineages, with herbaceous plants exhibiting significant diversification from woody ancestral forms in response to various environmental pressures (Folk *et al.*, 2020). This diversification, central to the adaptive radiation of angiosperms, operates at multiple levels, encompassing both macro-evolutionary trends and micro evolutionary changes. Climatic conditions, soil composition, and ecological interactions have profoundly influenced the evolution of herbaceous taxa, enabling them to demonstrate exceptional plasticity in growth forms and occupy a wide range of ecological niches (Klimeš *et al.*, 2021). Herbaceous plants are vital components of forest ecosystems, contributing significantly to biodiversity, regulating ecosystem processes, and supporting the conservation of entire plant communities under specific ecological conditions. Habitat-filtering processes associated with herbaceous plants play a critical role in facilitating the germination and establishment of tree species across different ecological zones (Ulrich *et al.*, 2017). Furthermore, the mineral environment and overall ecosystem functionality are largely governed by the population dynamics of herbaceous flora. Herbaceous plants represent a substantial proportion of vascular plant diversity, accounting for approximately 80% of vascular plants in temperate forests and 45% in tropical forests (Spicer *et al.*, 2021). These plants are integral to nutrient cycling, soil stabilization, and interactions with microbial communities, collectively sustaining the health of forest ecosystems. Recent research has highlighted their essential role in carbon sequestration and enhancement of forest resilience to climatic variations (Koutika *et al.*, 2022). Phylogenetic research has supported the notion that herbaceous growth forms are derived from woody plants. The transition from woody to herbaceous forms is considered an important evolutionary strategy that enables plants to exploit diverse habitats (Eames, 1911; Sinnott & Bailey, 2018). Consequently, understanding the evolutionary and ecological roles of herbaceous plants is crucial for biodiversity conservation. Herbs, with their diverse forms and ecological significance, play vital roles in maintaining ecosystem structure and function (Guo *et al.*, 2023).

This diversity exemplifies the dynamic nature of plant evolution, wherein the interaction between genetic composition and environmental factors drives morphological transformation. On a more detailed level, herbaceous plants display a variety of growth forms, such as succulent, creeping, perennial, erect, prostrate (Klimeš *et al.*, 2022). Herbaceous plants have evolved to occupy a diverse array of habitats, ranging from aquatic environments to epiphytic niches within forests, and have even included mycoheterotrophic forms found in rare orchid species with primitive evolutionary characteristics and slender habits, each adapted to specific ecological contexts (Graça *et al.*, 2015). Herbaceous plants exhibit significant taxonomic diversity and specialization. For example, features such as pubescence, glabrescence, and pilosity serve as defence mechanisms, regulate water loss, and facilitate nutrient absorption (Liesenfeld *et al.*, 2019). Certain herbaceous species, such as holoparasitic and insectivorous herbs, exhibit mimicry, imitating fungi or animals and illustrating the complex interactions between plants and their environments (Barthlott *et al.*, 2017). These morphological and physiological adaptations highlight the survival and radiation strategies of herbaceous plants, which enables them to thrive in increasingly variable and challenging environments (Xi *et al.*, 2023). Given the ongoing evolutionary changes, herbaceous plants remain a critical area of study to understand the broader processes of plant adaptation, evolution, and speciation (Li *et al.*, 2020). Recent research has elucidated how genetic diversity, environmental changes, and ecological interactions contribute to the vast array of growth forms and survival strategies observed in this groups. Recent intensive research on biodiversity has opened new avenues to understand the processes of diversification among biological organisms (Beheregaray *et al.*, 2015). Adaptive radiation is one of the key mechanisms driving this diversification. This process results from complex interactions between abiotic (environmental) factors and biotic (organism) elements within ecologically distinct areas. Adaptive radiation leads to rapid evolution of phenotypic diversity in response to ecological challenges, with lineages multiplying quickly to occupy particular ecological niches. Although adaptive radiation is well documented in numerous animal groups, its role in plants remains relatively underexplored (Santos *et al.*, 2022). The evolution of plant growth forms has been proposed as a significant adaptive strategy that facilitates the establishment and colonization of diverse habitats and contributes to plant diversification (Box, 2019). As more than 50% of angiosperms are herbaceous, their ecological dominance across a wide range of habitats is associated with their

Sivaramakrishnan *et al.*,

capacity to rapidly adapt to varying environmental conditions. Hence, the present study focuses on the adaptive phenotypic plasticity and population dynamics of herbaceous species of the Kolli Hills ecosystem in Tamil Nadu (Ogburn & Edwards, 2015).

MATERIALS AND METHODS

Study Area

This study was conducted in the Kolli Hills, a segment of the Eastern Ghats located in Tamil Nadu, India. The study area is situated within the Namakkal district, geographically positioned between 11°10'54" and 11°30'00" N latitude and 78°15'00" and 78°30'00" E longitude (Prabakaran & Kumar, 2021). This region encompasses approximately 490 square kilometers of forested land. Kolli Hills is characterized by altitudinal variation, ranging from 200 to 1,400 meters above mean sea level (MSL), and exhibits diverse ecological features. The area is renowned for its persistent and relatively undisturbed forest formations, which are officially categorized and protected by the Tamil Nadu Forest Department. The predominant forest types in the region include semi-evergreen and deciduous forests, scrub jungles, and grassland patches (SHARMILA *et al.*, 2019). The dominant soil type was loamy, which supports a rich diversity of herbaceous and woody plant species. To capture the ecological variation across different habitats, line transect surveys were conducted over a four-year period (2019–2022) across multiple elevations and topographic zones, including the forest floor, foothills, slopes, and upper hill ranges (Rahman *et al.*, 2021). Both wet and dry seasons were included in the sampling schedule to account for seasonal differences in the presence and abundance of species. Each transect was 100 m in length, and herbaceous species were recorded at 10-meter intervals along the transect. Plant identification was performed in the field using standard botanical keys, regional flora guides, and expert consultation (Tarmi & Hyvönen, 2012). GPS devices were employed to geo-reference transect locations to ensure precise spatial mapping of the species distribution. All herbaceous species were classified according to family, growth form, and ecological role. Information such as common and scientific names, habitat preferences, and elevation ranges were documented. Taxonomic verification was supported by herbarium specimens and the relevant literature. Voucher specimens of the representative species were collected and preserved for future studies (Harker *et al.*, 2021).

Mapping work

The primary and secondary data were collected from various sources and compiled using GIS software in digital format available for the Kolli Hills, obtained from reliable sources of Remote Sensing (RS) and geographical information systems (GIS). The GIS database of the structural boundaries of elevation ranges was superimposed with the primary data collected through a specific application on geotagged study sites. Spatial analyses were performed using spatial queries and overlay analysis conducted using the ArcGIS software platform to derive reliable insights into the study area (Guo *et al.*, X *et al.*, 2017).

Field survey and sampling methods

The field survey was conducted over three years from 2017 to 2019. A periodical visit was performed every 2 months. Tree diversity was noticed without disturbing any vegetation to capture the necessary photographs using a canon DSLR camera. A line transect was made on the possible predetermined route randomly based on environmental criteria to support tree diversity. The transect can vary in length, other ranges 50 m to 500 m distance variation type which broadly included on 7 categories for the present above (Kral-O'Brien *et al.*, 2021).

Photography

Photomicrographs were obtained using an Olympus binocular research microscope equipped with a Nikon COOLPIX P 610 camera. Images were captured using a standard memory card and subsequently transferred. Photo-plates were prepared using conventional photographic editing methods. Additional photographs were obtained using a standard field camera.

Sivaramakrishnan *et al.*,

Statistical Analysis

The present study utilized a descriptive and analytical research design to evaluate phenotypic plasticity and population dynamics guided by seven research hypotheses. Pearson's correlation coefficient was employed to ascertain correlations, and significant variations were assessed using one-way analysis of variance. This investigation systematically explored altitude variation, sub-growth forms, family representation, and patterns of occurrence within the Kolli Hills ecosystem. Statistical analysis was conducted using SPSS version 25 (Cordeiro & Neri, 2018).

RESULTS AND DISCUSSION

Herbs, as a diverse group of plants, exhibit considerable flexibility in their vegetative structures because of evolutionary pressures that shape their adaptations to specific environments (Guo *et al.*, 2023). Herbaceous species in Kolli Hills ecosystems demonstrate remarkable adaptive plasticity in response to environmental variations, including changes in temperature, soil composition, and moisture availability (Carrell *et al.*, 2023). This study investigated the role of phenotypic plasticity in the survival, growth, and reproductive success of dominant herbaceous plant species in this biodiverse region. Field observations and experimental studies have indicated that species with high plasticity exhibit greater resilience to environmental stressors, such as seasonal fluctuations and anthropogenic disturbances. Furthermore, analyses of population dynamics underscore the interplay between ecological factors and species distribution patterns, highlighting the importance of adaptive strategies for maintaining biodiversity (Whipple *et al.*, 2022). The Kolli Hills, part of the Eastern Ghats, host a diverse range of herbaceous species, demonstrating significant adaptive plasticity across varying altitudinal gradients. This study documents 259 herbaceous species from 54 angiospermic families, analyzing their growth forms, altitude preferences, and patterns of occurrence. The altitude zones are classified as I (260m–300m: Karavalli to Tamil Nadu check post area), II (301m–680m: Tamil Nadu check post forest area to viewpoint), and III (681m–1009m: Viewpoint to Shri Kalliamman Temple, Karainkadu) (Bhat *et al.*, 2018). In the statistical analysis, the list of plants was categorized into groups, with plants exclusively identified in zones I, II, and III as Groups 1, 2, and 3, respectively. Additionally, plant species available in zones I and II, I and III, and II and III were categorized as groups 4, 5, and 6, with another special category designated as group 7 for plants variably found in zones I, II, and III (Table 1 and Figures 2 and 3) (Yusuf *et al.*, 2020).

Column no 5 Zone I (Foot hills) – Below 200 MSL, Zone II (Sloop) - 200 – 800 MSL, Zone III (Top hills) – 800 – 1400 MSL. Column no 6: Individual species (Rare) IR, Individual species (Mixed) IM, Population in (Dominant) : PD, Population in (Rare) :PR, Population of (Planted) :PP. Herbaceous plants have a relatively simple structure and complete their life cycle within a short duration, ranging from ephemeral to perennial forms. These growth forms are further subdivided and classified based on their ecological habits, nutritional modes, growth patterns, and specialized structures within the vegetation (Bora *et al.*, 2020). Categories include aquatic, mesophytic, xerophytic, arid, and semi-arid environments, and epiphytic and mycoheterotrophic forms. Insectivorous, holoparasitic, and semi-parasitic herbs represent special groups based on their nutritional value. Typically, the term "herb" refers to plants with small, weak, erect stems (Huang *et al.*, 2021). Specific growth patterns are observed in prostrate herbs (Pr h), ascending herbs (As h), slender herbs (Sl h), procumbent herbs (Pb h), creeping herbs (Cr h), diffuse herbs (Di h), spreading herbs (Sp h), stout herbs (St h), and succulent herbs (Su h). Additionally, pubescent herbs (Ps h), glabrescent herbs (Gl h), and pilose herbs (Pl h) were distinguished by their unique structures. This study examined 259 species from 54 plant families, focusing on their occurrence patterns, population distributions, and adaptive traits. The study titled "The Adaptive Plasticity and Population Dynamics of Herbaceous Species in Kolli Hills Ecosystems" examined the influence of altitude on species composition and distribution, highlighting significant variations in floral dominance across different ecological zones (Shah *et al.*, 2019). This study offers valuable insights into the adaptive strategies of herbaceous flora in the Kolli Hills, thereby contributing to

**Sivaramakrishnan et al.,**

biodiversity conservation and sustainable habitat management in this ecologically important region (Rahman *et al.*, 2021). Employing a descriptive and analytical research design, this study systematically documents, analyzes, and interprets the distribution, growth characteristics, and ecological adaptations of the herbaceous flora across various altitudinal gradients (Argenti *et al.*, 2020). This study investigated the correlation of hypotheses concerning seven parameters: i) a significant correlation between altitude range and various forms of herbs, ii) a significant correlation between altitude range and pattern of occurrence, iii) a significant correlation between family and various forms of herbs, iv) a significant correlation between family and pattern of occurrence, v) a significant variance among altitude ranges concerning various forms of herbs, vi) a significant variance among altitude ranges concerning pattern of occurrence, and vii) a significant variance among patterns of occurrence concerning various forms of herbs.

The statistical analyses of the herbaceous forms in the Kolli Hills clearly demonstrated the significance of the seven tested hypotheses concerning the comparison of altitude with various sub-forms of herbs, as evidenced by the Karl Pearson's coefficient of correlation (Table 1) and the pattern of occurrence (Table 2). Additionally, a one-way analysis was conducted on families with various subforms and patterns of occurrence (Tables 3 and 4). Indeed, the one-way analysis of variance further revealed strong significance across all levels of comparison (Tables 5, 6, and 7). Adaptation and phenotypic plasticity are essential for plant survival under extreme and adverse ecological conditions. An investigation of herbaceous species provides valuable insights into drought-induced plant adaptation, emphasizing the diverse mechanisms of drought adaptation observable within a single species. Naturally occurring genotypes or ecotypes of herbaceous taxa have been observed to complete their life cycle rapidly, whereas other growth forms, such as shrubs, climbers, and trees, exhibit extended lifespans, primarily due to the mechanical support chemically provided by the cell wall component lignin. (Thonglim *et al.* 2023). propose that stem lignification may be more pronounced in longer-lived stems, which is consistent with the idea that longer-lived genotypes, being more likely to encounter stress, may have a greater need to invest in strategies for drought resistance. Enhanced lignification has also been linked to reduced stomatal conductance, leading to decreased water loss, and consequently, an increased capacity to endure drought conditions.

Plant growth forms, particularly among angiosperms, exhibit remarkable diversity, which reflects adaptations to a wide range of environmental conditions. Herbaceous growth forms, which dominate nearly half of flowering plant taxa, have evolved under the influence of both biotic and abiotic factors (Taylor *et al.*, 2023). These factors, driven by natural selection, play critical roles in determining the life cycle, growth rate, and survival strategy of herbaceous plants. Herbaceous plants represent a highly adapted group of flora characterized by their non-woody structures and rapid growth cycles (Moreno & Bertiller, 2015). Their structural and physiological traits are fine-tuned to meet the demands of various environmental conditions, making them vital components of ecosystems worldwide. This essay explores the significance of these adaptations, focusing on stem diversity, water storage mechanisms, and photosynthetic flexibility, and highlights their ecological and evolutionary roles (Ekwealor *et al.*, 2020). Herbaceous plants exhibit a remarkable diversity in stem morphology, reflecting their evolutionary adaptability. Morphological forms, such as creeping, erect, prostrate, ascending, slender, and procumbent stems, are specialized to optimize light capture and spatial resource utilization. Creeping and prostrate stems spread horizontally, enabling the plant to stabilize the soil, reduce erosion, and rapidly occupy open spaces (Klimešová *et al.*, 2018). In contrast, erect and ascending stems facilitate vertical growth, allowing plants to access sunlight more effectively in competitive environments. Slender and procumbent stems balance energy efficiency with effective expansion, ensuring survival, even in resource-scarce or unstable habitats. These structural traits collectively enable herbaceous plants to thrive in diverse ecological niches ranging from dense forests to open grasslands (Harris *et al.*, 2023). Herbaceous plants also exhibit various morphological adaptations that enhance their ability to survive and thrive in challenging environments. Among these, pubescent, glabrescent, and pilose structures are particularly significant, as they serve as natural defenses against physical and environmental stressors, including harmful UV radiation, while also aiding in trapping moisture on the plant surface (Hauser, 2014). This feature is especially advantageous for reducing water loss under dry or windy conditions, thereby enhancing the overall drought tolerance of plants (Ekwealor *et al.*, 2020). In arid and semi-arid regions, herbaceous plants often exhibit succulent forms, an adaptation that allows them to store water in specialized tissues. This water reservoir ensures survival during prolonged dry periods, thereby

**Sivaramakrishnan *et al.*,**

reducing the dependence on external water sources (Fang & Xiong, 2014). The ability to conserve water while maintaining metabolic function is a hallmark of resilience. By minimizing water loss, these plants contribute to the sustainability of arid ecosystems, often serving as keystone species that supports other forms of life within their habitats (Rascio & Rocca, 2005). One of the most remarkable physiological traits of certain herbaceous plants is their ability to transition from the standard C3 photosynthetic pathway to Crassulacean Acid Metabolism (CAM). This adaptation, common in water-stressed environments, involves the nocturnal opening of stomata to capture carbon dioxide, thereby minimizing water loss during daylight (Zahedi *et al.*, 2019). The CAM pathway serves not only as a survival mechanism but also as an efficient strategy for maintaining productivity under extreme conditions.

This photosynthetic flexibility underscores the dynamic responses of herbaceous plants to environmental challenges. The adaptation of herbaceous plants plays a crucial role in maintaining ecosystem balance (Yan *et al.*, 2016). Their rapid growth and reproduction enable them to act as pioneers in disturbed areas, stabilize soils, and initiate ecological successions. By efficiently capturing sunlight and contributing to energy flow, they form the foundation of food webs, thus supporting higher trophic levels. Additionally, their roles in nutrient cycling and water conservation enhance the overall health and sustainability of ecosystems (Poorter *et al.*, 2024). Ephemeral herbs exhibit a remarkable ability to grow rapidly and complete their life cycles within a short period, often as little as 4-5 days under optimal conditions. These plants are well suited to environments with unpredictable or seasonal rainfall, where they germinate, flower, and set seeds within a brief span, ensuring the survival of the species. This strategy is particularly advantageous in arid and semi-arid regions where moisture availability is transient and sporadic (Akhalkatsi, 2017). Aquatic herbs represent a retrogressively evolved category of plants adapted to thrive in aquatic environments through simplified plant forms and specialized adaptive structures. These herbs exhibit significant differences in vegetative structure compared to their terrestrial counterparts (Klimeš *et al.*, 2022). Notably, they often lack lignified cells or have reduced lignified cells within their tissues. Lignin, a complex polymer that imparts rigidity and structural support, is minimized or absent in aquatic herbs, facilitating greater flexibility and buoyancy—traits essential for survival in water (Melro *et al.*, 2021). Instead of lignified tissues, aquatic herbs typically comprise loosely arranged parenchymal cells. Arun (2000) documented 916 taxa, including 854 angiosperms, underscoring the rich flora of the region. However, anthropogenic pressures such as agriculture and deforestation have led to habitat degradation, adversely affecting the diversity and distribution of herbaceous species (Uddin & Hassan, 2012). Changes in land use significantly affect soil quality, thereby influencing herbaceous plant communities. A study assessing soil quality across various ecosystems in the Kolli Hills revealed that conversion to agriculture and horticulture increased sand content and bulk density, whereas forested areas maintained a higher clay content and soil moisture. These alterations can negatively affect herbaceous species that depend on specific soil conditions (K & R, 2015). Furthermore, climate change poses a substantial threat to plant species in the Eastern Ghats. Simulations predict that by 2050, the region will experience increased temperatures and altered precipitation patterns, resulting in a reduction in habitats for endemic and rare species by approximately 60% and 40%, respectively. This highlights the vulnerability of the herbaceous species to climatic shifts (Kumari *et al.*, 2022).

CONCLUSION

In this paper highlights the critical role of adaptive phenotypic plasticity in shaping the survival, growth, and reproductive strategies of herbaceous plant species within the Kolli Hills ecosystem in the Eastern Ghats. By analyzing 259 species across various altitudinal gradients, we established a clear correlation between elevation, growth subforms, and species occurrence patterns. The observed variation in dominant growth forms, such as prostrate, creeping, and succulent, suggests that herbaceous species have evolved diverse adaptive strategies to navigate environmental heterogeneity. Statistical analyses, including Karl Pearson's correlation coefficient and one-way ANOVA, confirmed significant differences in species distribution and morphological adaptations across altitude zones. These findings underscore the ecological importance of phenotypic plasticity as a crucial mechanism that enables plant species to respond effectively to changing environmental conditions. This study provides valuable insights into biodiversity conservation and sustainable habitat management, particularly in ecologically sensitive

Sivaramakrishnan *et al.*,

regions, such as the Kolli Hills. Understanding these adaptive strategies is essential not only for preserving native flora but also for informing policy decisions aimed at mitigating the impacts of anthropogenic pressures and climate change on mountain ecosystems.

ABSTRACT

Chronic diseases are a significant burden on global health systems, and the search for effective treatments is ongoing. Different chronic diseases are treated effectively with traditional herbal medicine plants which have been utilised for generations in Indian medicinal practices. This research paper aims to analyze the efficacy of Indian medical herbal plants for chronic diseases using a machine learning gradient boosting algorithm. The study focuses on identifying the most effective herbal plants for specific chronic diseases, such as diabetes, cardiovascular diseases, and arthritis, to analyze large datasets of plant compounds and their effects on chronic diseases. The results of this study could provide valuable insights into the potential of herbal medicine as a complementary treatment for chronic diseases.

Keywords: Indian Medical, Herbal Plants, Chronic Disease, Gradient Boosting, Machine Learning

INTRODUCTION

Indian medical herbal plants have stored traditional medical knowledge in Ayurveda as well as Siddha and Unani systems for many years [1]-[2]. These systems have extensively documented the use of various herbs, such as Ashwagandha, Turmeric, and Neem, for treating chronic conditions. However, the efficacy of these herbal plants in modern medical contexts is often debated due to insufficient scientific validation. These systems have documented the use of various herbs for the treatment of chronic diseases. However, the efficacy of these herbal plants in modern

**Pavithra and Mohan Kumar**

medical contexts is often questioned due to a lack of rigorous scientific validation [3]. Despite the widespread use of Indian medical herbal plants for chronic diseases, there is a need for systematic analysis to determine their efficacy. Traditional methods of evaluating herbal medicine often rely on anecdotal evidence or small-scale studies, which may not provide a comprehensive understanding of their effectiveness [4].

The primary objective of this research is to analyze the efficacy of Indian medical herbal plants for chronic diseases using a machine learning gradient boosting algorithm [5]. Specific objectives include:

- Identifying the most effective Indian medical herbal plants for specific chronic diseases.
- Analyzing the chemical compounds present in these herbal plants and their potential mechanisms of action.
- Evaluating the predictive performance of the gradient boosting algorithm in identifying effective herbal treatments for chronic diseases.

LITERATURE REVIEW

Traditional Use of Indian Medical Herbal Plants

The traditional medical system of Ayurveda uses Indian medical herbal plants as its core therapeutic components in practice for extended periods of time. Through Ayurvedic principles the therapeutic properties of plants Ashwagandha (*Withania somnifera*) and Turmeric (*Curcuma longa*) and Neem (*Azadirachta indica*) help manage long-term health conditions. Indian medical herbal plants have gained fame due to their anti-inflammatory and antioxidant abilities as well as their capacity to modify immune responses which helps treat arthritis alongside diabetes and cardiovascular diseases[7]-[8]. Ashwagandha has established itself as an adaptogenic plant that reduces stress. Neem is widely recognized for its anti-diabetic and antimicrobial benefits. These herbs have been extensively studied for their ability to modulate biological pathways associated. Their longstanding use in traditional medicine, supported by modern scientific research, underscores their potential as complementary treatments for chronic conditions [19].

Machine Learning in Herbal Medicine Research

Machine learning has emerged as a powerful tool in drug discovery and medical research. Gradient boosting algorithms, such as XGBoost and Light GBM, are particularly effective. These algorithms have been used in various applications, including predicting drug-target interactions and identifying potential therapeutic compounds from natural products [10]-[11].

Scientific Validation of Herbal Medicine

While traditional knowledge provides a foundation for the use of herbal plants, scientific validation is essential to establish their efficacy and safety. Several studies have investigated the pharmacological properties of Indian medical herbal plants [12].

Challenges in Herbal Medicine Research

Despite the potential of machine learning in herbal medicine research, there are several challenges. These include the complexity of herbal compounds, the lack of standardized datasets, and the need for interdisciplinary collaboration between traditional medicine practitioners and data scientists [13]. Additionally, the interpretation of machine learning models in the context of herbal medicine requires careful consideration of the biological and pharmacological context [14].

PROPOSED METHODOLOGY

The proposed methodology for analyzing the efficacy of Indian medical herbal plants for chronic diseases using a machine learning gradient boosting algorithm involves a systematic approach that integrates data collection, preprocessing, model development, and analysis [15]. The process starts with the data collection from traditional medicine databases, scientific literature, and chemical databases to compile a comprehensive dataset of Indian

**Pavithra and Mohan Kumar**

medical herbal plants, their chemical compounds, and their associated biological activities[16]-[17]. A gradient boosting algorithm, such as XGBoost or LightGBM, is employed to develop a predictive model. The model is trained on the preprocessed dataset, and its performance is validated using cross-validation techniques. Key chemical compounds in the most effective herbal plants are analyzed to understand their mechanisms of action, and the results are interpreted in the context of traditional knowledge and scientific literature. The methodology ensures a robust and data-driven approach to evaluating the efficacy of herbal plants for chronic diseases[18].

```

Identification of Effective Herbal Plants

The gradient boosting algorithm identified several Indian medical herbal plants as potentially effective for treating specific chronic diseases. For example:

1. **Ashwagandha (*Withania somnifera*):** The plant shows promise to treat both stress-related disorders alongside arthritis conditions because of its anti-inflammatory response and adaptogenic properties.
2. **Turmeric (*Curcuma longa*):** The high curcumin composition makes turmeric-effective for treating inflammatory conditions such as arthritis and cardiovascular diseases.
3. **Neem (*Azadirachta indica*):** Predicted to be effective for managing diabetes and skin disorders due to its antioxidant and anti-diabetic properties.

RESULTS AND DISCUSSION

The proposed gradient boosting algorithm (XGBoost) was compared with three other widely used ML algorithms. The results are presented in the table 1 below.

DISCUSSION OF RESULTS

The proposed XGBoost algorithm achieved the highest accuracy of 85.2%, outperforming Random Forest (82.4%), SVM (78.6%), and Logistic Regression (75.3%). This indicates that the gradient boosting algorithm is better at correctly classifying the efficacy of herbal plants for chronic diseases. The F1-score, which balances precision and recall, was highest for XGBoost at 82.1%. XGBoost achieved a recall of 83.5%, indicating its ability to correctly identify a higher proportion of effective herbal plants. This is superior to Random Forest (80.7%), SVM (76.8%), and Logistic Regression (73.5%). The precision of XGBoost was 81.8%, demonstrating its ability to minimize false positives. While Random Forest (78.9%) performed comparably, SVM (74.9%) and Logistic Regression (71.8%) lagged behind.

CONCLUSION AND FUTURE WORK

This research paper analyzed the efficacy of Indian medical herbal plants for chronic diseases using a machine learning gradient boosting algorithm. The study identified several herbal plants, such as Ashwagandha, Turmeric, and Neem, as potentially effective for treating specific chronic diseases. The analysis of chemical compounds revealed that these plants contain bioactive compounds with known pharmacological properties, providing a scientific basis for their traditional use. The gradient boosting algorithm demonstrated high predictive performance, highlighting the potential of machine learning in herbal medicine research. Future research should focus on expanding the dataset, exploring other machine learning algorithms, and validating the biological relevance of the identified chemical compounds through experimental studies.

ABSTRACT

An $\langle S \rangle$ is a union of a connected Random graph (non isolated Random graph) with some (at least one) isolated vertices. An isolated connected dominating set of a connected Random graph $G(n,p)$ is a dominating $S \subseteq V(G_{n,p})$ set in this way. The smallest cardinality of an isolated connected dominating set of G is represented by an isolated connected domination number of $G(n,p)$, denoted by $\gamma_{ic}(G(n,p))$. We examine a few characteristics and provide an isolated connected dominance number for a few families of random graphs in this research.

Keywords: Random Graph($G_{n,p}$), Connected Random Graph $G_c(n,p)$, Domination number in $G_{n,p}$, connected domination number in $G_{n,p}$, Isolated Connected domination $G_{n,p}$.

Mathematics Subject Classification (2010): 05C69, 05C80

INTRODUCTION

In the 1960s Erdos and Renyi, two great Mathematicians, established the Random graph theory and initiated the systematic study of it [1]. Random Graph($G_{n,p}$) lies in the intersection of Graph theory and Probability theory, has always been the basic theory for studying complex networks. Domination is a central topic in graph theory, with a number of application in computer science and engineering. A dominating set S in a graph G has that each node not in S is joined to some node of S . The minimum order of a dominating set is the domination number of G denoted $\gamma(G)$. The book [8][9] supply a introduction to theoretical and applied results of domination in graphs.

Sirajunisha and Krishnan

Relatively little work has been done on domination in Random graph models. The domination number of ER Random Graph $(G_{n,p})$ was determined by Wieland and Godbole in [7]. Dreyer[17] analyse some basic results of proves with $q=1/(1-p)$ (p fixed) and set of cardinality $(1+\varepsilon)\log_q n$ is a dominating set with probability tends to 1 as n tends to infinity. And sets of order $(1-\varepsilon)\log_q n$ dominate with probability approaching zero as n tends to infinity. May instead take $\varepsilon = \varepsilon_n$ tends to zero so that $\varepsilon_n \log_q n$ tends to infinity. we analyse the some properties of Isolated connected domination of $(G_{n,p})$.

PREMILIARIES

Definition:2.1: $(G_{n,p})$

When we are given a graph G is a random graph, this is wrong. Already Existing graph is fixed, there is nothing random to it. What we mean though through this term abuse is that this graph was sampled out of a set of graphs according to a probability distribution. An Random Graph $G_{n,p}$ has two parameters, the number of vertices n and a probability parameter $0 \leq p \leq 1$. Let $\mathcal{G}$ be the family of all possible labelled graphs on the vertex set $[n]$. Note that $|\mathcal{G}| = 2^{\binom{n}{2}}$. The $G_{n,p}$ Model assign to a graph $G \in \mathcal{G}$ satisfy the probability

$$\text{Probability}[G] = P^{|E(G)|} (1 - P)^{\binom{n}{2} - |E(G)|}$$

Definition: 2.2: $(G_{n,m})$

An Uniform Random graph $(G_{n,m})$ has two parameters, the number of vertices n and the number of edges m , where $0 \leq m \leq \binom{n}{2}$. This model assigns to all labelled (named) graphs on the vertex set $[n]$ with exactly m edges equal probability. Therefore,

$$\text{Probability}[G] = \begin{cases} \frac{1}{\binom{\binom{n}{2}}{m}} & \text{if } |E(G)| = m \\ 0 & \text{otherwise} \end{cases}$$

Definition: 2.3: $G_c(n, p)$

An Connected Random Graph $G_c(n, p)$, a pair of u and v is chosen from the vertex set $V(G)$ of the graph G . Here each pair of vertices $\{v_i, v_j\}$, where $v_i, v_j \in V(G)$. There exist an edge between v_i and v_j in a graph iff the random number generated for the pair v_i and v_j is at most the edge probability p of the graph G . Its is denoted by $G_c(n, p)$.

Definition:2.4: $\gamma(G(n, p))$

An Random Graph $G(n, p)$ with fixed parameter $p_n = p > 0$ and the number vertices n tending to infinity. Then a.a.s the domination number of $G(n, p)$ satisfies,

$$\gamma(G(n, p)) = (1 + o(1)) \log_q n$$

Where $q = \frac{1}{1-p}$.

Definition:2.5 $\gamma_c(G(n, p))$

An Connected Domination Random Graph $\gamma_c(G(n, p))$ with fixed parameter $p_n = p > 0$ and the number vertices n tending to infinity. Then a.a.s the connected domination number of $\gamma_c(G(n, p))$ satisfies,

$$\gamma_c(G(n, p)) = \lceil \log_q n + a_n \rceil$$

Where a_n be any sequence of $G_c(n, p)$.

An Isolated Connected Domination in Random Graphs:**Definition:3.1 $\gamma_{ic}(G(n, p))$**

An Isolated connected dominating set S of a $G(n, p)$ is a dominating set

$S \subset V(G(n, p))$ such that $\langle S \rangle$ is union of a connected $G(n, p)$ and some (at least one) isolated vertices. An Isolated connected dominating number of $G_c(n, p)$ is denoted by $\gamma_{ic}(G(n, p))$.

**Propositions:3.2**

A Connected Random Graph $\gamma_c(G(n, p))$ with m (fixed) edges is equally likely to be any of the $\binom{n}{2}$ graphs with m edges.

Proof:

Let any graph with m edges(fixed), its G .

Probability $[G_c(n, p)] = G[|E(G_c(n, p))| = m]$

$$\begin{aligned} &= \frac{\text{Pro}[G_c(n, p) = G]}{\text{Pro}[|E(G_c(n, p))| = m]} \\ &= \frac{p^{|E(G)|} (1-p)^{\binom{n}{2} - |E(G)|}}{\binom{n}{2} p^{|E(G)|} (1-p)^{\binom{n}{2} - |E(G)|}} \\ &= \frac{p^m (1-p)^{\binom{n}{2} - m}}{\binom{n}{2} p^m (1-p)^{\binom{n}{2} - m}} \end{aligned}$$

$$\text{Probability } [G_c(n, p)] = \frac{1}{\binom{n}{2}}$$

Example:3.2.1

A Connected Random Graph $G_c(n, p)$ on 3 vertices with 2 edges (fixed)

Is given by

Above $G(n, p)$ figure having same Probability $\frac{1}{3}$.

Theorem:3.3

In connected Random Graph $G_c(n, p)$, consider P is a monotone increasing property and $0 \leq p_1 < p_2 \leq 1$, $G \sim G_c(n, p_i)$, $i=1, 2$.

Propability $[G_1 \in p_1] \leq \text{Propability } [G_2 \in p_2]$

Propositions:3.4

If a Random Graph $G(n, p)$ admits isolated connected vertex set, then $\text{diam}(G(n, p)) \geq 2$. (a.a.s)

Proof

Let X be the eccentricity of vertex v .

$\Pr(x = 1) = p^{n-1}$, which goes to 0 as $n \rightarrow \infty$

$\Pr(X > 2)$ indicates that there is a vertex u such that u is not connected (isolated vertex) to v or any of the vertices that is directly connected to v .

So, $\Pr(X > 2) = (n-1)(1-p)^{|S|+1}$

Where S is the set of vertices connected to v . Since $|S| = np + o(1)$ when n is sufficiently large, $\Pr(X > 2)$ also goes to zero as n goes to infinity.

Just an approximation $|S| = (n-2)p$, the probability that a given pair of vertices is not connected by a path of length 2 is $(1-p^2)^{(n-2)}$. Since all edges forming these potential paths are distinct.

Thus the expected number of pair not thus connected is $\binom{n}{2}(1-p^2)^{(n-2)}$, which goes to zero as $n \rightarrow \infty$ at fixed $p > 0$.

The probability for the diameter to exceed 2 is less than this expected number and thus also goes to 0.

Example:3.4.1

If $G_c \sim G_{ic}(n, n^{-\frac{1}{3}})$ prove that $G_{ic}(n, n^{-\frac{1}{3}})$ has diameter 2 almost surely.

Solution

Let X_{uv} be the indicator for the event A_{uv} that no other vertex in $G(n, p)$ is adjacent to u or v .

Show that $E[X] \rightarrow 0$ as $n \rightarrow \infty$ (ie) (it has diameter 2 almost surely)

$$E[X] = E[\sum_{(u,v) \in \binom{V}{2}} X_{uv}]$$

$$= \sum_{(u,v) \in \binom{V}{2}} E[X_{uv}]$$

$$= \sum_{(u,v) \in \binom{V}{2}} P[A_{uv}]$$

$$= \binom{n}{2} (1-p)(1-p^2)^{(n-2)}$$

In this situation given above problem $p = n^{-\frac{1}{3}}$

$$\binom{n}{2} (1-p)(1-p^2)^{(n-2)} = \binom{n}{2} (1-n^{-\frac{1}{3}})(1-n^{-\frac{2}{3}})^{(n-2)} \cong \binom{n}{2} (1-n^{-\frac{1}{3}}) \exp(-n \cdot n^{-\frac{2}{3}}) n \rightarrow \infty = \binom{n}{2} (1-n^{-\frac{1}{3}}) \exp(-n^{\frac{1}{3}}) \rightarrow 0.$$

Propositions:3.5

If a Random Graph $G(n, p)$ admits Isolated connected set then

$$\gamma(G(n, p)) \leq \gamma_{ic}(G(n, p)) \rightarrow 1 \text{ as } n \rightarrow \infty$$

Proof

There is no relationship between $(G(n, p))$ and $\gamma_{ic}(G(n, p))$.

The domination number of $G(n, p) = (1 + o(1)) \log_q n$ where $q = \frac{1}{1-p}$.

Case(i)

$\gamma(G(n, p))$ is no larger than $\lceil \log_q n + a_n \rceil$ with probability approaching unity.

$$P(D \leq \lceil \log_q n + a_n \rceil) = P(\exists \text{ a dominating set of size } r: \lceil \log_q n + a_n \rceil)$$

$$\geq P(\{1, 2, \dots, r\} \text{ is a dominating set}) [\because p = p^{n-r+r}]$$

$$= (1 - (1-p)^r)^{n-r} = (p^r)^{n-r}$$

$$\geq 1 - (n-r)(1-p)^r = (1 - (1-p)^r)^{n-r}$$

$$= 1 - n(1-p)^r + n(1-p)^r \geq 1 - n(1-p)^{\log_q n + a_n}$$

$$= 1 - n(1-p)^{\log_q n} \cdot (1-p)^{a_n} = 1 - n \cdot (q)^{\log_q n} (1-p)^{a_n}$$

$$= 1 - (1-p)^{a_n} = 1 - p^{a_n} \rightarrow 1$$

Case(ii)

$$p(\gamma_{ic}(G(n, p))) \leq \lceil \log_q n + a_n \rceil \rightarrow 1 \text{ as } n \rightarrow \infty.$$

Let a_n be any sequence approaching infinity then,

$$p(\gamma_{ic}(G(n, p))) \leq \lceil \log_q n + a_n \rceil = P(\exists \text{ a dominating set of size } r: \lceil \log_q n + a_n \rceil) \geq P(\text{vertices } \{1, 2, \dots, r\} \text{ form a dominating set})$$

Now a set consisting of r vertices which we will call M_r . Let N_r be the set with the remaining $(n-r)$ vertices and some (at least one) isolated vertices. It becomes the vertices $\{1, 2, \dots, r\}$ forming a dominating set is connected to every vertex in N_r having at least one neighbour in M_r (i.e) $M_r \cup N_r = V(G(n, p))$.

$$p(\gamma_{ic}(G(n, p))) \leq \lceil \log_q n + a_n \rceil \geq p(\text{vertex } v \text{ in } M_r \text{ is adjacent to } u \text{ in } N_r)^{n-r}$$

Now use that the probability of vertices forming an edge is independent. Then probability if a vertex v in N_r not having any neighbour in M_r .

$$p(\gamma_{ic}(G(n, p))) \leq \lceil \log_q n + a_n \rceil \geq (1 - p(\text{vertex } v \text{ in } N_r \text{ has no neighbour in } M_r))^{n-r} = (1 - (1-p)^r)^{n-r}$$

Where to the fact that edge from a vertex v in N_r to a vertex u in M_r with probability $1-p$ and having r possibilities for vertices u in M_r . then,

$$\geq 1 - (n-r)(1-p)^r = 1 - n(1-p)^r + n(1-p)^r \geq 1 - n(1-p)^r \geq 1 - n(1-p)^{\log_q n + a_n}$$

Sirajunisha and Krishnan

$$\begin{aligned}
 &= 1 - n(1-p)^{\frac{\log n}{\log(1-p)} + a_n} \\
 &= 1 - n.(e)^{\frac{\log(1-p)}{\log(1-p)} + a_n} \\
 &= 1 - (1-p)^{a_n} \\
 &= 1 - 1 + p^{a_n} \\
 &= p^{a_n} \rightarrow 1
 \end{aligned}$$

We assumed that $a_n \rightarrow \infty$ as $n \rightarrow \infty$ and since $p > 0$ we have that $1-p < 1$.

This results in $(1-p) \rightarrow 0$ as $n \rightarrow \infty$.

$$p(\gamma_{ic}(G(n, p))) \leq \lceil \log_q n + a_n \rceil \geq 1 - (1-p)^{a_n} \rightarrow 1-0=1.$$

From the case(i) & (ii), $\gamma(G(n, p)) \leq \gamma_{ic}(G(n, p)) \rightarrow 1$ as $n \rightarrow \infty$.

Example:3.2.1

Here $n=3$, $p=1/3$, $\gamma(G(n, p)) = (1 + o(1))\log_q n$

$$\gamma(G(3, 1/3)) = \lceil (1 + 2)\log_{1.5} 3 \rceil = \lceil 1.43136 \rceil = 1.$$

Here $n=3$, $p=1/2$, $\gamma_{ic}(G(n, p)) = (1 + o(1))\log_q n$

$$\gamma_{ic}(G(3, 1/2)) = \lceil (1 + 1)\log_2 3 \rceil = \lceil 0.954 \rceil = 1.$$

ABSTRACT

This study aims to provide the analysis of COVID-19 pandemic in India and address economic impact, diagnosis approaches, and vaccine acceptance and hesitation. The investigation of this development factor is crucial since it informs the appropriate individuals or organisations on how to handle the impending widespread epidemic. The goal of the current study was to determine how the daily increase in confirmed COVID-19 instances related to cases that were curing and dying based on the model that fit them the best and was helpful in forecasting growth, cure, and death.

Keywords: COVID-19 in India, COVID-19 testing, Coronavirus Vaccine, COVID-19 statistics of India.

INTRODUCTION

The COVID-19 pandemic is the worldwide pandemic of coronavirus disease in 2019. It evolved rapidly. This rapid spread has already made a catastrophic mark this century [1]. The World Health Organisation (WHO) has announced and intimated that the worst of COVID-19 is yet to come, while the United Nations has tailed that since World War II, this coronavirus pandemic is the most global crisis [2-3]. The goal of each nation is to bring the rising indicator of COVID-19 cases to zero. Some countries were successful in bending the curve of new cases. However, the majority of countries are far from the goal, as the number of worldwide confirmed cases is increasing very fast. India is also experiencing the same. It is the worst situation that, in relation to this COVID-19 pandemic, everybody knows the exact number of actual cases. Only the confirmed cases, which are a fraction of the real number, are

**Shilpa S. Shinde and Kakade**

known. It is observed that India's rate of case progression is slower as compared to some countries, viz., Japan, South Africa, the U.K., the U.S., South Korea, Australia, and Italy. This is because the rate of testing is poor as compared to these countries [4-5]. India is one of the five most affected countries. India reported the first case on January 30, 2020, which crossed the counter of 10 lakh in the second fortnight of July 2020 while crossing the counter of 25 lakh on August 15. Every Indian, including laymen and all-level authorities, is in the dark, unable to guess what the scenario the scenario will be tomorrow, day after tomorrow, and so on, if the current situation of growth remains as usual! Under these circumstances, it is essential to understand the growth rate, which will help in the planning and preparation of further management to rescue the affected. The statistical indicator 'Growth Factor', which implies alteration in a quantity over time, plays an important role in such an assessment. The base considered to quantify the growth is the ratio of cases from the current day to the cases from the previous day. If the value of this indicator is <1 , it is an indication of decline, while ≥ 1 implies exponential growth. It is needed to know the growth in relation to all facets, i.e., the daily increment in new cases, as well as the velocity of cure and death. The study of such growth factor is very important as it aware the responsible personnel or agencies to cope up with the arriving large scale pandemic. Thus, the present study was planned to understand the daily augmentation in confirmed COVID-19 cases with cases that are curing and dying on the basis of the model, which is most appropriately useful in predicting growth, cure, and death.

METHODOLOGY

Data regarding confirmed daily cumulative cases of COVID-19, with cases curing and dying worldwide, in India and Maharashtra, was retrieved with the aid of a Google search engine that was published by media and government agencies. The daily rate of change in the number of cases confirming, curing, and dying was evaluated. Growth factors as well as regression analysis with the aid of linear, quadratic, compound, logarithmic, growth, cubic, and exponential approaches were exposed to assess the data trend. The prediction ability of the model was assessed. The reference data utilized to serve the study objectives was that published for a period of more than four months from April 1, 2020.

RESULTS

Various regression models tried to assess its fitting over data available for a period of around 131 days. Missing or non-availed data, during period of was estimated by using best fitted regression model on data prior to that missed day data. Introducing this missed data at its appropriate day, the next missed data, if any, for day $x+i$ was estimated from previous $x+i-1$ observations and the complete data was made ready for final analysis. Using this completed data set the final regression model was derived. Every time, for estimation of missed data as well as for future prediction, the best regression model was selected on the basis of following criteria.

- i) high R^2 value of the regression model,
- ii) significance of factors as per ANOVA (more than one non-significant factor produces over or under estimation for day ' x ' in comparison to the next day ' $x+1$ ') in case of missing data,
- iii) lesser residual values (smaller Minimum to Maximum range of residual values for all observed values used in model development),
- iv) lesser range of lower limit of 95% confidence intervals (LCL),
- v) lesser range of upper limit of 95% confidence intervals (UCL), and
- vi) narrower 95% confidence intervals of the estimate (Range of differences between UCL and LCL). However, the cubic regression followed by quadratic regression revealed the best fit, every time. Thus, the cubic regression model was employed for estimating the cases in all ways; confirming, curing and dying; in future. The model satisfying as maximum criteria as possible was utilized to estimate the missing as well as to predict for any day. Data for 131 days regarding affected and died cases while for 117 days of cured cases of Maharashtra, was used to study the trend. Data search for affected, cured and deaths revealed that cured started to observe after 15th day since affected.

**Shilpa S. Shinde and Kakade****Maharashtra**

Growth rate of cases, i.e. the ratio of cases of current day to the cases of previous day, ranged from 0% to 44.6% (Fig 1). In the initial period it found to be very high, however this rate found declining as time passed. It was about 2% in the last week of July.

Cure rate, i.e. ratio of cumulative total cured to cumulative total affected on current day, ranged from 6% to 59.3% (Fig 2). Since beginning it showed gradual rise in this rate.

In the initial period for 25 days death rate, i.e. ratio of cumulative total deaths to cumulative total affected, found increased. 26th day onward it declined and it stabilized around 3.6%.

DISCUSSION

The number of corona berths found increased rapidly not only in metropolitan cities but also in towns and villages worldwide. Although only 5% of battles were serious, the number of beds for them was very low. Science was intimating that the cases of CIVID would continue to increase. However, the crisis was exacerbated by the fact that privatization has not led to an adequate increase in the number of government hospitals. This is one of the major causes of death for people affected by the COVID-19 virus. It was also observed that the epidemic slowed down in areas where the administration paid special attention and used adequate health personnel and other equipment properly. However, there was a dire need that it should be slowed down so that there would be no havoc. But according to some experts, after acquiring corona by 60–65 crore people in India, the herd immunity develops biologically, leading to the permanent downfall of this epidemic permanently [6]. The declining growth rate of cases in Maharashtra indicated slow progress in new cases. But this small amount of addition in the present big quantity results in a big number, i.e., 2% of 100 is 102, while of 1000 it is 1020, which reflects like havoc! The rising trend of the cure rate and the stabilisation of the death rate implied an overall improvement in health care services as well as facilities.

CONCLUSION

Maharashtra went through one of the biggest sufferings during the COVID-19 pandemic. The pandemic posed extensive health and socioeconomic challenges and also became the largest disruption in the Indian economy. In summary, we observe the major reasons behind the COVID-19 pandemic in the Indian context, to identify the pitfalls in the public healthcare system and economic preparedness to tackle a pandemic situation. We further highlight the role of citizens in aiding the fight against this kind of national or global disaster by obeying the government advisories of social distancing and containment. The increasing trend in the cure rate and the stability of the death rate suggested that medical facilities and services had generally improved.

ABSTRACT

Consumption of tender coconut water is very common in South East Asian countries and the Pacific which invariably led to the generation of tender coconut shell causing pollution. To augment the wastage and to make better use of the tender coconut shell, it has been evaluated for the availability of polyphenols by extracting it in distilled water at different intervals of time. The maximum extraction of polyphenols took place at 48 hours and it was 1.17mg/ml. The extracted polyphenols were also evaluated for its antifungal and antibiofilm activity and it was found that there was no antifungal activity whereas, at a concentration 1000µg/ml there was a weak antibiofilm activity and the MIC is greater than 1000µg/ml.

Keywords: Polyphenols, Tender Coconut Shell, Extraction, Antifungal, Antibiofilm

INTRODUCTION

Coconut trees *Cocos nucifera*. (L) commonly called coconut palm is a member of the Arecaceae family and is also the only living member of the genus *Cocos*. It is cultivated mainly in the tropical and sub-tropical areas which have high humidity, sandy soil and regular rainfall. The coconut tree provides food, fuel, cosmetics, folk medicine and building materials, among many other uses[1]. Botanically the coconut fruit is a drupe, not a true nut. Like other fruits, it has three layers: the exocarp, mesocarp and endocarp. The exocarp is the glossy outer skin, usually yellow-green to yellow-brown in colour. The mesocarp is composed of a fibre, called coir, which has many traditional and commercial uses. Both the exocarp and the mesocarp make up the "husk" of the coconut, while the endocarp makes up the hard coconut "shell". The endocarp is around 4 mm thick and has three distinctive germination pores (micropyles) on the distal end. Two of the pores are plugged (the "eyes"), while one is functional. The interior of the

**Anie T. Uthup and T R Satyakeerthy**

endocarp is hollow and is lined with a thin brown seed coat around 0.2 mm thick. The endocarp is initially filled with a multinucleate liquid endosperm (the coconut water). As development continues, cellular layers of endosperm deposit along the walls of the endocarp up to 11 mm thick, starting at the distal end. They eventually form the edible solid endosperm (the "coconut meat" or "coconut flesh") which hardens over time.

The clear liquid within young coconuts (tender coconuts), typically those aged around 5–7 months, is commonly known as tender coconut water and this liquid is unique to coconuts during their tender phase of development [2]. The immense nutritional and health benefits of tender coconut water have paved its way for its consumption across several countries alike. Extensive consumption of tender coconut water has led to the generation of tender coconut shell which is usually discarded as a solid waste across beaches and streets causing serious environmental pollution. These tender coconut shells though biodegradable takes a very long time to degrade on its own. At present, in addition to edible coconut water as a beverage and the kernel as the source food or oil, small amounts of the meso- carp and endocarp are used to produce activated carbon, carpets, ropes and agricultural fertilizers, etc. [3]. There are findings and research studies which reveal the presence of large amounts of polyphenols in coconut husk and its pericarp [4,5]. Most of these studies were done on the exocarp, mesocarp and the pericarp but no research was done on the tender coconut shell. Thus, to abate environmental pollution due to the wasted tender coconut shell and to explore the availability of polyphenols in tender coconut shell for its applications the present study has been carried out.

MATERIALS AND METHODS

Plant Material and Preparation of Extract

Two fresh tender coconuts of 4-5 months maturity were collected from the farms at Thiruvananthapuram, Kerala, cleaned, de-husked and dewatered to obtain the tender coconut shell. These tender coconut shells were cleaned properly with water, broken into small pieces, and are immersed in 750 ml distilled water in a 1L glass beaker. The total polyphenol content in the extract was measured following Folin-Ciocalteu method at intervals of 24 hours, 48 hours, 72 hours, 96 hours, and 120 hours respectively.

Determination of Total Polyphenols

Aliquot of 1ml extract was mixed with 1.25 mL Folin–Ciocalteu reagent (0.2 N diluted in MeOH). A reagent blank using MeOH without the extract was prepared. After 5 min incubation at room temperature, 1 ml sodium carbonate solution (75 g/L) was added. Samples were incubated at room temperature for 2 hours and the absorbance was measured at 765 nm. All tests were carried out in triplicate and total polyphenol content was expressed as mg of gallic acid equivalents (GAE) per g of extract.

Determination of Antifungal Activity

Agar well diffusion method was used to evaluate the antifungal activity of the polyphenol extract. For this, Mueller–Hinton agar and Potato Dextrose agar in the ratio of 1:1 was poured on petri dishes and allowed to solidify. Standard inoculums of the test organisms like *Candida albicans* (MTCC No.227), *Aspergillus niger* (MTCC No.872), *Mucor mucedo* (MTCC No.3169), *Penicillium chrysogenum* (MTCC No.5108), *Rhizopus stolonifera* (MTCC No.958) and *Fusarium oxysporum* (MTCC No.9913) were uniformly spread on the surface of the plates using sterile cotton swab. Four wells with a diameter of 8mm (20mm apart from one another) were punched aseptically with a sterile cork borer in each plate. The extract (50 and 100 µL) was added into the wells directly. Clotrimazole (40 µL from 300 mcg/ml stock) and distilled water was added as positive and negative control respectively. The plates were incubated for 48 hours at 27°C ±1°C, under aerobic conditions. After incubation, the plates were observed and the zone of bacterial growth inhibition around the wells was measured in mm.

**Anie T. Uthup and T R Satyakeerthy****Determination of Antibiofilm Activity**

The quantitative test was performed for determination of biofilm production using microtiter plate (48well) method (MtP). The experiment was set according to Manukumar et al. [2017] with slight modifications. Bacterial suspension (final OD₆₀₀ = 0.01), prepared by diluting an overnight *Bacillus subtilis* culture in Trypticase Soy broth (TSB) supplemented with glucose (10 g/100 mL) was prepared added to the interior wells of a 96-well polystyrene microtitre plate containing 10 µL of the sample (1mg/ml) or 10 µL of vehicle control. The plates were incubated overnight at 37 °C under static conditions to allow bacterial growth and biofilm maturation. The following day, bacterial growth was quantified by recording OD₆₀₀ of each well using an Epoch Microplate Spectrophotometer (Thermoscientific Multiscan skyhigh). The planktonic cells and the spent medium were discarded, and the adhered biomass was rinsed three times with sterile distilled water. The biomass was stained with 0.1% CV solution for 20 min and then rinsed three times with distilled water to remove unbound dye. The bound CV dye was resuspended in 70% ethanol with gentle mixing and the A₅₉₅ was recorded in the same sample plate. The amount of biofilm inhibition was calculated relative to the amount of biofilm that was grown in the absence of sample (defined as 100% biofilm) and the media sterility control (defined as 0% biofilm). To quantify the intensity of biofilm, the mean OD was compared to the OD of negative control (only TSB medium; No drug or test sample). As standard drug gentamycin was used. Medium without bacterial cells was used as blank. Results from at least three separate biological replicates were averaged.

RESULTS AND DISCUSSION

The polyphenols extracted at different time intervals are depicted in Fig 1 and it has been found that the maximum extraction of polyphenols of 1.17mg/ml took place at 48 hours, after which there was decline in the concentration of the polyphenols extracted. It is important that the extraction procedure is standardized so that the maximum amount of the required compound is obtained for further isolation, purification and for examining its applications [6]. Anti-fungal activity of the extracted polyphenols on fungal cultures are given in Table 1 and it has been found that the polyphenols do not show any antifungal activity on the fungal cultures tested. The antifungal activity is thus limited to the fungal cultures that are tested in this present study and to the concentration of the polyphenol extract used. However, there can be antifungal activity if the polyphenols are tested over other fungal cultures and at a higher concentration of the polyphenol extract. It is also essential to consider the source of the polyphenols, the quantity, and the extraction methods as well as the cultures used while investigating the antimicrobial properties [7].

The biofilm inhibition was rated between 0 and 100%. Values below and at 0% were categorized as biofilm growth enhancement; between 0–50% indicated weak anti-biofilm activity, and above 50% represented good biofilm inhibition. From the results indicated in Table 2 at a concentration of 1000µg/ml of polyphenols there is a weak anti-biofilm activity and thus the minimum inhibitory concentration of the polyphenol extract is found to be greater than 1000µg/ml. Therefore, if the concentration of the polyphenols is further increased above 1000µg/ml there could be a good biofilm inhibition. Bacteria adopt biofilm as a lifestyle to circumvent environmental stresses and biofilm formation is a multistep process, which involves (i) bacterial attachment, (ii) maturation, and (iii) bacterial release [8]. Among infectious diseases, the contribution of biofilm-forming bacteria has gained attention. Biofilm-forming bacteria cause around 65–80% of infectious diseases [9]. Such biofilm-related infectious diseases are typically chronic [10]. Despite enormous research efforts to treat infectious diseases, there are no assured treatment options. Antibiofilm agents that target their formation and stability have been evaluated, and very few products have been tested in clinical trials [11]. In this context, as the present study shows some amount of antibiofilm activity it is suggested that similar evaluation of antibiofilm activity can be performed on several other bacterial cultures which form biofilms.

Anie T. Uthup and T R Satyakeerthy

CONCLUSION

Tender coconut shell which normally goes as a waste has now been found to contain a good amount of polyphenols and these crude polyphenols were evaluated for its efficiency as a antifungal agent and antibiofilm formers. The study was limited to certain fungal cultures and it could be analysed on other fungal cultures also with higher concentrations of polyphenols. As far as the antibiofilm activity is concerned, targeting the biofilm formation process is more desirable than targeting fully formed biofilms for the treatment of infectious diseases.

ABSTRACT

The *Cow* was revered as a sacred animal in ancient India because of her maternal qualities, which led to its treatment as a mother. *Cows* and the products they produce are also very helpful to humans because they are used in agriculture, the painting and cosmetics industries, and medicine for a variety of ailments since ancient times. Because of its antibacterial qualities, *Cow* dung is utilized by many villagers to paint their hut walls and clean the surrounding area. It also keeps the temperature of the room cool in the summer. As a result of this property, organic *Cow* dung paint is being produced with a high business potential. Due to the agnihotra, the two families were spared the damaging effects of the methyl isocyanide gas that was discharged from the Union Carbide Plant in Bhopal on the evening of December 3, 1984. The panchagavya therapy uses five *Cow* products to treat a variety of illnesses and ailments, including the flu, allergies, colds, cough, arthritis, leukoderma, leucorrhoea, alopecia, and asthma. These products can be taken alone or in combination with other medications of herbal, animal, or mineral origin. Amith Vaidhya, a person, was able to survive cancer by include *Cow* products in his diet, demonstrating the potential of *Cow* products to combat cancer. This is evidence that *Cow* products have anticancer properties. A type of animal-assisted therapy known as "*Cow* cuddling or hugging" includes brushing, caressing, or simply just talking with your new, reliable psychologists which was believed to reduce anxiety and stress.

Keywords: Panchagavya, Bhopal gas tragedy, *Cow* cuddling therapy, *Cow* dung paint.

Trinadha Rao et al.,

INTRODUCTION

The *Cow* was revered as a sacred animal in ancient India because of her maternal qualities, which led to its treatment as a mother. The name "gaumata" or "kamdhenu" refers to a sacred *Cow* in India that is thought to grant wishes. Our Indian economy is built on *Cows*. The sacredness of *Cow* s Hinduism holds that *Cows* are products of nature and divine beneficence, and as such, they should be worshipped[1]. When we think of *Cows* as a source of milk, dung, urine, ghee, and curd, we see more benefits than when we think of killing them for meat. *Cows* and the products they produce are also very helpful to humans because they are used in agriculture, the painting and cosmetics industries, and medicine for a variety of ailments since ancient times. Numerous studies have been conducted on products derived from *Cows*, and the results have shown that these products are beneficial in a variety of fields, including agriculture, paper manufacturing, and pollution management due to their natural and environmentally favorable nature. They can be used for a variety of medical purposes as well Panchagavya treatment is the name given to the practise of using *Cow* products—milk, curd, ghee, dung, and urine to treat various diseases and problems. Another animal-assisted therapy that uses *Cows* as a key character to help patients with anxiety and depression is called " *Cow* hugging" or " *Cow* cuddling" therapy.

COW PRODUCTS

COW MILK: The component found in *Cow* 's milk that is comparable to mothers' milk *Cow* milk's low calorie, low cholesterol, and high content of protein, calcium, and vitamins make it a healthy food. It has complex C, vitamin A, and carotenoids. It is readily absorbed, making it highly nourishing for both adults and children[2]. Among other dairy products, *Cow* milk is special because it contains enough nutrients in a concentrated enough way to suit human demands for both physical and cognitive development[3]. *Cow* milk has a PH of 6.6 to 6.7. While other breeds produce milk of the A1 kind, Indian breed *Cows* produce milk of the A2-type. India's *Cow* milk has a high content of nutrients and only 4.6% lactose. 0.59% minerals and 4.65% fat 3.4% of proteins 86% water. 27 % beta casein, 9 % k-casein, 36% alpha casein, and 27 % peptides are found in *Cow* milk protein[4]. The constituents of *Cow* milk and colostrums was described in table.1.

BENEFITS OF COW MILK

Strengthening of bones and teeth

The calcium and phosphorus found in *Cow*'s milk helps to strengthen large teeth and bones.

Healthy heart

potassium, calcium, and phosphorus keep the heartbeat stable.

Low cholesterol

fat content in milk is essential for both mental and physical development.

Energy

It is provided by lactose and vitamins, riboflavin, and keeps the immune system, brain, and digestive systems functioning.

Boost your vision

It Improve vision because it has 250 milliliters of *Cow* milk and vitamin A-carotene. Due to the presence of vitamin K, it controls the blood clotting process. Breastfeeding is one way to treat baby anemia. It encourages the growth of healthy gut flora and inhibits the growth of dangerous gut bacteria, milk-based enzymes

**Trinadha Rao et al.,****Bovine milk and the corona virus**

when substantial quantities of the virus coated in mucous discharge are consumed, the BIM inactivates the virus. The ingested antibodies attach to some shared antigenic structure of SARS-COV2, which is duplicated and distributed into the GIT[5].

COW GHEE

Cow ghee has been used for religious rituals and as a therapeutic substance in Ayurveda from ancient times in India. Traditional methods of preparing *Cow* ghee are said to be helpful in healing and in promoting health. Compared to ghee made from the milk of other exotic *Cow* species, it has greater health benefits.

BENEFITS OF COW GHEE

It has long been believed that ghee improves speech, memory, vision, IQ, and the body's ability to fight off illnesses. Ayurvedic practitioners think that ghee and *Cow*'s milk improve memory. It enhances digestion and is beneficial for those with impaired vision[6].

Ghee-based formulations

which are designed to improve the bioavailability and targeted delivery of hydrophobic botanicals. As an illustration, consider Brahmi Ghrita for mental clarity, Vasa Ghrita for the respiratory system, Shaptadhatu Ghrita for skin conditions, Bhallatakadi Ghrita for wound healing, and Kaamdev Ghrita for sexual dysfunctions, among others. A combination of *Cow* ghee, honey, vitamins, and the non-fat portion of *Cow* milk were tried as micronutrients[7].

Anti cancer activity

A study comparing the effects of *Cow* ghee vs soya bean oil on rats' mammary glands showed that *Cow* ghee has anticancer potential. The study also found that *Cow* ghee produced mammary carcinogenesis and that the expression of cox-2 and peroxisome proliferators activated receptors- γ (PPAR- γ) in the rats' mammary glands. *Cow* ghee composition & medicinal properties were described in figure.1.

COW CURD

It's sometimes referred to as "yogurt" or "Dahi" is consumed all over the world because of its great nutritional content and health advantages. Probiotics, or good live microorganisms, are abundant in curd and provide a variety of health benefits when taken orally. Lactic acid-producing bacteria in curd produce metabolites like cyclic dipeptides. Phenyl Lactate's antifungal properties[8]. Composition and calories of *Cow* products is described in table.2.

BENEFITS

It is an excellent probiotic that includes beneficial bacteria that are known to enhance intestinal activity, which in turn helps with digestion and soothes upset stomachs.

Boost immunity

Curd contains living bacteria that can combat pathogenic microorganisms and safeguard the gut and intestinal health. There is evidence to support the notion that curd, a probiotic has a strong immune-boosting effect.

For skin that is healthy

curd helps to support gut health, which results in skin that is vibrant and healthy. It is an excellent ingredient since it contains a lot of lactic acid, which acts as fantastic exfoliant that removes all imperfections and dead cells.

Strengthen bones and joints

The minerals calcium, magnesium and phosphorous found in curd help to strengthen teeth and bones. A tiny amount of curd in our diet strengthens our connective tissues and lowers our risk of developing weakening diseases like osteoporosis and arthritis.

**Trinadha Rao et al.,****Reduces hypertension**

Potassium helps the body eliminate extra salt, which eases the strain on the heart muscle and lowers high blood pressure. Regularly eating a specific amount of non-fat yogurt with meals reduces the symptoms of hypertension and promotes heart health[9].

Regarding vaginal infections

Curd's multitude of beneficial microorganisms not only improve digestion by guaranteeing ideal gut flora, but also treat female vaginal yeast infections. By producing hydrogen peroxide, a specific microbe called *Lactobacillus acidophilus*, which is found in large amounts in yogurt, kills the dangerous yeast growth that is close to the vagina. This relieves pain and discomfort while suppressing the contagious bacteria in the vagina. Cow curd benefits and composition was described in figure.2.

COW DUNG

In India's natural regions, dried Cow dung cakes are used as a cooking fuel, which reduces reliance on external energy sources, is completely environmentally benign, and ensures air purification by eliminating airborne bacteria. Cow dung is better than other dung because it contains preventive and antibacterial qualities. The amount of curd fiber (90%) and carbohydrates(20%), ash (10.5%), crude protein (7%), crude fat (4%), and moisture (18.5%) in dung are all dependent on the grain and forage that Cows are given during domestication. Cow dung has a pH between 6.5 and 7.1.

BENEFITS OF COW DUNG**Soil fertility enhancer**

Cow dung, used as a bio fertilizer, can replenish the mineral states of the soil, giving plants resistance against pests and immune system development, as well as sulphoxidation and phosphorus solubilization. Cow manure was used to make African deserts fertile. With 1 kg of manure, 15–16 kg of biomass, and soil of comparable grade, we can create 3 kg of high-quality compost. Out of every kilogram of excrement, a healthy Cow yields about ten kilograms. It yields 33 kg of manure, also referred to as organic manure. This has also been accepted by the "NATIONAL BANK OF AGRICULTURE AND RURAL DEVELOPMENT (NABARD)" this. It has been demonstrated that manure from dung provides the cultivation soil with 18 micronutrients, including calcium, iron, cobalt, manganese, phosphate, and potassium[10].

Fuel

Dung as fuel is well known in rural kitchen. Cow dung patties [gootte] are used for cooking. Cooking foods using dung cakes is traditional practice followed in village of our country. It has advantage, when food is cooked by using dung patties, the temperature never rises beyond a certain point that prevents overheating and doesn't destroy nutrient in food[11].

Seed protector

Covering seeds in dung before planting, protect the seed against pest so it is an excellent conditioner for soil.

Gobar gas

Dung is best valuable source of energy as it produces biogas [methane] and also generate electricity. Biogas is a form of renewable energy for cooking, lighting of homes and street light. The self-combustion engines can be driven by using this biogas. Example: Running generator to produce electricity.

Petrol making

According to Japanese scientist 'sukae shibusawa' at Tokyo university of agriculture and technology, cattle dung is new source of petrol [gasolin], extracted from dung by application of high pressure and heat.

**Trinadha Rao et al.,****Floor coating**

Mixed with mud and water serves to coat the walls of mud houses. it has antiseptic property.

Mud brick additive

It is proven that mud huts plastered with dung keep insects and reptiles away.

Mosquito repellent

Smoldering of Cow patties keeps away mosquitoes from the houses.

Pot cleaner

Pots can be cleaned by dung. So, it is good cleaning agent for utensils.

As a container

By using containers made of Cow dung, the grains can be stored for long time.

PH balancer

As dung neutralize acid content in water when thrown into ponds.

Resistant to radiation

Several scientific studies have been proved that the Cow dung is resistant to solar radiation by applying thick layer of Cow dung on walls houses prevent incidence of gamma rays as it absorbs rays emitted from solar emission.

Dhoop sticks preparation

By mixing fine powder of nagarmutha, ral, lalchandhan, jatamachi, Kapoor kajuri & ghee in Cow dung produces oxygen when burnt.

Environmental protection

Dung from single Cow in its life span can produce 4,500litres of biogas which is equal to burning 6,80,00,000 tons of wood. This will help us to have 14 crore trees from cutting and burning& thus gives protection to environment. 1 spoon of ghee on burning Cow dung evolves 1 ton of oxygen[12].

BHOPAL GAS TRAGEDY

On the evening of December 3, 1984, a deadly gas known as methyl isocyanide (MIC) spilled from the Union Carbide plant in Bhopal. This catastrophe demonstrated the potency and significance of ghee. Two families, the families of Shri Sohan Lal S. Khushwaha and Shri M.L. Rathore, who lived around one mile away from the facility, escaped unharmed although hundreds of people died and thousands were hospitalized. These families practiced Agnihotra (Havan) on a regular basis. Despite being in the region most severely impacted by the deadly gas leak, none the members of these families passed away or were even admitted to the hospital. The published article of newspaper was depicted in figure.3. This suggests that agnihotra is a well-established remedy for pollution. On that fatal night, the intense smoke emitted by these Cow dung cakes served as an effective antidote to the hazardous Methyl Isocyanate (MIC) gas. Ghee, being one of Agnihotra's key ingredients, played an important role in detoxifying the noxious vapors surrounding it. Havan made with elements such as dry Cow dung, wood, ghee, rice grains, etc., when lit in fire, eliminates microorganisms and purifies the region.

COMMERCIAL PRODUCT OF COW DUNG

Cow dung paint is a commercial product also known as "khadi prakritik paint" or "vedic paint." Because of its antibacterial qualities, Cow dung is utilized by many villagers to paint their hut walls and clean the surrounding area. It also keeps the temperature of the room cool in the summer. As a result of this property, organic Cow dung paint is being produced with a high business potential. The paint is free of metals such as lead, mercury, chromium, arsenic, cadmium, and others. Khadi pratikrit distemper and emulsion paints were evaluated at three reputable laboratories,

**Trinadha Rao et al.,**

including the National Test House in Mumbai, Shri Ram Institute of Industrial Research, New Delhi, National Test House, Ghaziabad. Khadi pratikrit emulsion paint meets BIS 15489:2013 specifications, and khadi Pratikrit distemper paint meets the BIS 428:2013 standards[13].

Why is Cow dung used in the paint?

Boost air quality by as much as 50% qualities that are antiseptic, resistant to heat, economical (7–10/-per dung cake), Dried manure has no smell. It serves as an insulator, keeping heat inside during the winter and preventing it from escaping in the summer. It eradicates bacteria efficiently, It is extremely valuable and used to purify the air. Radium, which shields against UV radiation, is present in it. use of Cow dung has an inverse relationship with paint costs. serves as a coolant, removing the need for application[14]. HVAC up to 40,000/-in savings, reduces the requirement for heating by providing insulation, it produces a uniform, smooth surface after drying in less than 4 hours. Paint can be used on walls that are indoors or outdoors. The picture of vedic and pratikrit paint was given in figure.4.

COW URINE

Cow urine has various helpful effects, particularly in the fields of agriculture and healthcare. Cow pee is typically considered as safe since 95% is water, 2.5% is urea, and the remaining 2.5% is a mixture of the aforementioned minerals, hormones, and salts[15]. The composition of cow urine and their functions are given in table.3.

Benefits of COW urine: Agriculture

Distillation waste and Cow dung can be used to produce vermin compost. The use of vermin compost in pots increases the yield of "Medicago sativa". Cow urine acts as a disinfectant, purifies the environment, and improves land fertility[16].

Bio pesticides

2kg of neem leaves are soaked in 10kgs of urine and mixed with other vegetable waste [1:50] before spraying. Cow urine combined with neem leaves acts as a pest repellent due to its insecticidal, fungicidal, and pesticidal characteristics. Urine utility can generate modest amounts of power to power electronic clocks and kitchen appliances.

Medicinal uses include

Analgesia: it was discovered that the animals given Cow urine had comparable analgesic effects to the standard drug group given Diclofenac Sodium, reinforcing the recommendations of Ayurvedic texts to use Cow urine as a reasonably safe, easily available, and cost-effective natural analgesic.

Anti-diabetic activity

Streptozotocin (50 mg/kg) diluted in citrate buffer (0.1 M, pH 4.5) was administered to diabetic rats in a study on the utilization of Cow urine distillate. Compared to the diabetic control group, the increased levels of blood glucose, serum cholesterol, and serum triglycerides were significantly ($P < 0.05$) reduced by the Cow urine distillate. The diabetic rats given Cow urine distillate also had a notable increase in body weight and HDL levels[17].

Anti hemorrhoids activity

In both Grade I and Grade II hemorrhoids, a clinical evaluation of the efficacy of Cow urine demonstrated a significant reduction in pain during defecation, bleeding, and itching. This indicates that oral supplementation with Cow urine can prevent the time-consuming, painful, and costly complications associated with hemorrhoids of Grade I and Grade II.

Antimicrobial & fungal activity

Analyzed against pathogenic microbes, the antibacterial activity of Cow Urine Distillate (5, 10 and 15µl) was found to be maximal against *Pseudomonas aeruginosa* and *Salmonella typhi*. An analysis was conducted on the antifungal activity of Cow urine distillate against *Aspergillus niger* and *Aspergillus flavus*.

Trinadha Rao *et al.*,

Immunomodulatory activity

It has been discovered that *Cow* urine distillate has an immune modulatory impact since it promotes T and B lymphocyte proliferation, blastogenesis, and elevated IgG levels in mice and chicks (avian species)[18].

As a bioenhancer

Rifampicin, a first-line treatment for tuberculosis, exhibits bio-enhancing activity for pharmaceuticals or medicines in *Cow* urine. Increase its effectiveness against *Escherichia coli* by seven times and against Gram-positive bacteria by eleven times as an Anti-tubercular medication. Additionally, it improves the transfer of antibiotics by a factor of two to seven-For instance: ampicillin, tetracycline, and rifampicin through artificial membranes and the gut wall.

The patents granted on cow products were described in table.4[19].

ECONIMICS OF COW PRODUCTS

COW URINE

The average healthy *Cow* yields three liters of gaumutra. Now let's discuss gau mutra, or *Cow* dung. A *Cow* can yield two to two and a quarter liters of pee daily. Approximately 48 different ailments can be treated with urine, including diabetes, arthritis, bronchitis, bronchial asthma, TB, osteomyelitis and more! One liter of urine sells for approximately 500/- in the market; this may also be the case for the Indian market. However, a liter of urine can fetch more in international markets. The American government imports *Cow* urine from India each year to manufacture medications for diabetes, cancer, and other conditions. Therefore, if we base our calculations on the American market, a liter of *Cow* urine can fetch between 1,200 and 1,300/-. That implies just out. A healthy *Cow* may live for approximately 20 years, thus if we assume we can make \$10,95,000/-a year, we can make \$219,00,000/-millions from selling urine in 20 years.

COW DUNG

In the global market, a kilogram of organic manure sells for roughly six rupees. Thus, 10 kg of *Cow* dung sells for between 1800 and 2000 rupees each day [330 kg of manure for every 10 kg of dung, which is worth 6 rupees]. Thus, we can earn 657000/-year of *Cow* dung in 365 days of the year. *Cows* are 20 years old on average, and they excrete manure every day till the end. We could so make millions of dollars, or 1,31,40,000/-. Because *Cow* dung is high in nitrogen, it is the most effective crop nutrient. Additionally, using *Cow* dung and pee, scientists created specialized bio fertilizers that, when sprayed on crops, increased plant growth and productivity. It yielded nutrient-dense fruits that promote long life

COW MILK

A *Cow* can yield 28 liters of milk a day, with each liter valued at roughly 50 cents. It can therefore make 1400/-per day, 42000/-per month, 511000/-per year, 1400×365 /-per year, and 10,220,000/-(511000×20) during the course of its 20-year life span for 28 liters of milk. Over the course of their 20-year existence, we can make a total of 6,700/-per day, 2,01,000/-per month, 24,45,500/-per year, and 48,910,000/- from *Cow* products, which also include *Cow* manure, urine, and milk. The economics of cow products was given in table.5.

PANCHAGAVYA

The Sanskrit terms "gavya-means *Cow* derivatives" and "panch-means five" are the roots of the word "panchagavya." A mixture of five *Cow* products, including milk, dung, urine, curd, and ghee (two indirect and three direct products, respectively), is called panchagavya. Scriptures on vruksh ayurvedha (plants and health system) and the vedas honor the panvchagavy [20].*Cow* pathy, also known as Panchagavya chikitsa or therapy, is the term used to describe the panchagavya treatment. The panchagvyva therapy uses five *Cow* products to treat a variety of illnesses and ailments, including the flu, allergies, colds, cough, arthritis, leuco-derma, leucorrhoea, alopecia, and asthma. These products can be taken alone or in combination with other medications of herbal, animal, or mineral origin [21].

**Trinadha Rao et al.,****BENEFITS**

When Panchagavya is sprayed on plants, they always develop more leaves and a denser canopy. For optimal biological efficiency, the photosynthetic system is active, allowing for the synthesis of photosynthates and metabolites. It is possible for the Panchagavya to raise agricultural yield levels again. For every crop, the harvest is advanced by fifteen days. It extends the shelf life of fruits, vegetables, and cereals while also enhancing their flavor. Through the replacement or reduction of expensive chemical inputs, Panchagavya guarantees greater profit margins and releases organic farmers from debt. The plants' large, deep roots enable them to endure protracted dry spells. and so ensuring harsh hardiness while lowering the irrigation water consumption by thirty percent[22]. Panchagavya is the living essence of numerous microorganisms, including bacteria, fungus, protein, carbohydrates, vitamins, and enzymes, as well as known and unknown growth-promoting agents, micronutrients, trace elements, antioxidants, and immunity-enhancing agents[23]. The living microorganisms in Panchagavya, when consumed orally by humans or animals, stimulate the immune system and generate a large amount of antibodies against the eaten bacteria. It functions similarly to a vaccination. This physiological reaction boosts immunity in both humans and animals, assisting in the prevention and treatment of disease [24].

THE LIVING PROOF

Amit vaithya, a US-born individual, holds a Ph.D. in economics and works in the entertainment industry's business department in the US. His father passed away from cancer at the age of 27. For around two years, he had been receiving various treatments, but they had been ineffective. His mother also passed away from cancer two months after the death of his father. Subsequently, his health records were examined prior to the death of his parents, and it was revealed in 2011 that he was also afflicted with cancer that had spread to his liver and lungs. Then, before he passed away, he made the decision to visit India. A few days later, he recalled his friend's recommendation to have an ayurvedic therapy. Afterwards, he began doing yoga, meditation, and consuming Cow's milk, curd, and ghee in addition to using Cow urine as a medicinal combination. His scan data showed that his body had conquered cancer after a few days. Afterwards, he kept consuming foods associated with Cows, built a cattle shed, and tamed the Cows. He also works with the nonprofit organization "HEALING VAIDHYA" to offer free services to cancer sufferers.

The book "HOLY CANCER-HOW A COW SAVED MY LIFE" was also written by Amit Vaidhya. This served as evidence for the products made from Cows having a miraculous ability to treat cancer. Amith Vaidhya served as a living example of how Cow's milk products might prevent cancer. The image of amith vaidhya was given in figure.5.

COW HUGGING THERAPY

The Dutch word "koeknufflen" translates to "Cow cuddling." It's customary in the Netherlands to take a trip from the city to the countryside and spend time with farm animals as a way to unwind and rebalance one's emotions. This practice is known as animal-aided interaction, or AAI, and it falls under the category of bovine assisted therapy [25]. Research from a wide range of studies has shown that interactions between animals and people improve social support and overall well-being while lowering anxiety, depression, and loneliness [26]. A type of animal-assisted therapy known as "Cow cuddling or hugging" includes brushing, caressing or simply just talking with your new, reliable psychologists. It's a custom that dates back to the Dutch village of Reuver[26]. The image of cow cuddling is given in figure.6.

Amazing advantages of giving Cow hugs

Provide instantaneous respite from mental strain; Disseminate good energy wherever Feel good hormones are released; hyper-vigilance and social isolation are eliminated; high blood pressure is avoided; spinal pain is effectively treated; a sense of calm and serenity is experienced; depression is effectively managed; and respiratory disorders are effectively treated. February 14 is designated as "Cow Hugging Day," as proclaimed by the Animal Welfare Board of India. A "Horse& Cow experience" at a mountain horse farm in upstate New York aims to provide participants with the opportunity to "bring relaxation, healing, and awareness About body language" through Cow snuggling. Additionally, it encourages ease, mindfulness, assertiveness, confidence building, fear-reduction, playfulness, and boundary-setting. It continued by saying that the people hugging the Cows had slower heart rates and shown outward manifestations of relaxation[27].

Trinadha Rao *et al.*,

CONCLUSION

According to the study's findings, cows are an extremely useful natural resource for a sustainable way of life because of the high quality of the items they provide. This study has shown a number of facts about cows and their products that are advantageous to agriculture since they increase soil fertility and serve as fertilizers and pesticides. Several studies and experiments have confirmed it. The cow adds to our riches as well since, when its products are exploited appropriately, it yields 4,89,10,000. Many individuals don't know this knowledge or how much cows are worth. Cow ghee creates oxygen, which is good for cleaning the atmosphere, as the Bhopal gas tragedy shows. It also treats a wide range of illnesses, including epilepsy, TB, cancer, and cow huggings in anxiety. Additionally, there is living evidence of cow products' anticancer effects. The aforementioned information led to the conclusion that cows are an invaluable resource for human well-being and success. Therefore, we believe that this evaluation will increase people's awareness of the advantages of cows.

Table 1: Constituents of milk and colostrums

Milk and colostrum constituents	Protein	Caseins (α S1, α S2, β & α) (β -LG, α -LA, BSA & LF)
	Fat	Triacyl glycerol, diacyl glycerol, phospholipids, free fatty acid.
	Vitamins	Vit A, Vit B1, B2, B3, B6, B12, folate, Vit D
	Enzymes	Lacto peroxidase, thiocyanate, Xanthine oxidase, lysozyme & peroxidase
	Minerals	Calcium, phosphorous, magnesium, potassium
	Immuno-globulins	IgG1, IgG2, IgA, IgM, IgE and IgD
	Cytokines	IL- β , IL-8, IL-10, IL-12, IL-18, IFN- γ , TGF- β .
	Immune & other factors	PRP, G-CSF, M-CSF AND GM-CSF.

Table 2: Composition and calories of the Cow products

Name of the Cow product	Composition in %	Calories per 100 ml
Milk	Carbohydrates-4.75, fats-3.7, proteins-3.2, minerals-0.7	68
Ghee	Fats-98, cholesterol-30, kerotene-3.2, free fatty acids-2.8	900
Curd	Fat-4.2, protein 11.75, carbohydrates-3.4, vitamin A-42.	98
Paneer	Proteins-23, fat-25, minerals-2	265-323
Butter	Fat-82, minerals-2, vitamins-8.6	717
Cheese	Fat-29	272
Dung	Nitrogen 0.6, carbon-10	3500

Trinadha Rao et al.,

Table 3: Cow urine composition and benefits

Bio-component of Cow urine	Functions
Nitrogen, N ₂ NH ₂	Remove blood abnormalities & toxins, stimulant of UT & kidney.
Sulphur	Support motion in large intestine, cleanses blood
Ammonia	Stabilize bile, mucus and air of body, stabilizes blood
Iron	Maintain balance and help in production of R.B.C, and hemoglobin
Urea	Affects urine formation and removal, has germicidal properties
Uric acid	Remove swelling or inflammation it is diuretic so destroys the toxin
Sodium, potassium	Purifies blood, increase appetite, removes muscular weakness
Calcium	Blood purifier, bone strengthen, germicidal
Copper	Control unwanted fat, iron help to produce hemoglobin.

Table 4: Patents Granted on Cow Products[19]

1.US patent no.6410059	For the antibiotic, antifungal, bio-enhancer effect of Cow urine by USFDA to CSIR, India.
2.US patent no.6896907	For the anti-allergic, anti-infective, nutrient, anticancer activity of gomutra.
3.US patent no.7718360	For antioxidant and apoptosis properties on May 18, 2010.
4.US patent no.7235262	Cow urine distillate as a bio-enhancer of anti-infective, anticancer agents and nutrients.
5.US patent no.7297659	For synergistic fermented plant growth promoting & bio-control composition.
6. US patent no.6602537	For its enhanced nutritive and health value
7.Chinese patent no. 10047522 1	For Cow urine as DNA protector on April 8, 2009.

Table 5: Economics of Cow Products

Cow products	Per day income	Per month income	Per annum income	Throughout its life span income
330 kilos of Cow dung manure(10 kilos of dung)	1800/-	54,000/- (1800x 30)	6,57,000/- (1800x365)	1,31,40,000/- (6,57,000x20)
Cow urine liter	in India 500/- in America 3000/-	15,000/- (500x30) 90,000/- (3000x30)	1,82,500/- (500x365) 10,95,000/- (3000x365)	3,650,000/- (182,500x20) 2,19,00,000/- (10,95,000x20)
Cow milk 1 liter	1400/-	42000/- (1400x30)	511000/- (1400x365)	10,220,000/- (511000x20)
Total income	6700/-	2,01,000/-	24,45,500/-	48,910,000/-

ABSTRACT

Depression detection is a critical challenge in mental health research due to the increasing prevalence of mental disorders and the limitations of traditional diagnostic methods. Conventional approaches, such as interviews and PHQ scores, often suffer from low accuracy and delayed diagnoses. In this study, we propose a hybrid deep learning framework for depression detection, leveraging the power of transformer models and ensemble learning techniques. Specifically, we utilize the RoBERTa transformer model to extract high-quality textual features from patient responses and integrate these with an XGBoost classifier to improve detection performance. The proposed method is evaluated using a publicly available depression dataset from Hugging Face, achieving an accuracy of 92.8%, significantly outperforming traditional methods. The findings demonstrate the potential of combining transformer-based architectures with ensemble learning for efficient and accurate depression detection, paving the way for early intervention and improved mental health outcomes.

Keywords: Depression Detection, Deep Learning, Roberta, XGBoost Classifier, Hugging Face, Transformer, Ensemble learning, accuracy

INTRODUCTION

Mental health issues, including depression, affect a significant portion of the global population, with over 264 million people suffering from this condition worldwide [1]. Depression can stem from various factors such as sudden environmental changes, imbalances in neurotransmitter levels, or even genetic predispositions [2]. Effective treatment options include therapy sessions and medication. However, many individuals remain undiagnosed due to

**Roshani R. Borase et al.,**

a lack of awareness about depression, leading to adverse outcomes such as social withdrawal, erratic behavior, suicidal thoughts, or dependence on antidepressants. Left untreated, depression can severely impact daily activities, reducing focus and interest, and eventually causing harm to both the mind and body. With technological advancements, social media usage has surged, with approximately 3.8 billion active users worldwide [3]. Social media platforms have become spaces for individuals to express emotions, thoughts, and opinions, often providing relief by sharing unsettling feelings. These platforms enable users to post textual content that offers valuable insights for various real-world applications, including healthcare, politics, and entertainment [4]. Researchers can analyze this data to gain an understanding of users' mental health, offering opportunities for timely intervention [5].

Twitter, a popular micro-blogging platform, allows users to post concise updates, known as tweets, limited to 140 characters [16]. Its simplicity and accessibility make it a widely used platform for sharing emotions and opinions. Most tweets are publicly accessible and can be retrieved using Twitter's API, which supports complex queries, such as retrieving tweets on specific topics [6]. Additionally, Twitter supports more than 35 languages, broadening its global reach. The data shared on Twitter provides researchers with a valuable resource for analyzing mental health conditions and identifying opportunities for support and recovery [21]. Social media, while offering a platform for self-expression and connection, can also pose significant risks in certain circumstances [8]. For example, users may send, post, or share harmful content targeting others, leading to cyber bullying or harassment. Additionally, social media activity can reflect offline risks; for instance, adolescents experiencing depression might begin posting suicidal thoughts online, signaling potential dangers [11].

In recent years, natural language processing (NLP) and deep learning have emerged as powerful tools for analyzing textual data and identifying mental health concerns [13]. These technologies have been successfully applied to detect depression, anxiety, and suicidal ideation from user-generated content [15]. By leveraging computational methods, researchers can develop automated and scalable tools to identify individuals experiencing mental health issues or at risk of harm [8]. This approach holds great promise for timely intervention and support, making social media a valuable resource for addressing mental health challenges.

In recent years, the emergence of social media has opened new avenues for monitoring mental health. The proliferation of user-generated content on platforms like Twitter and Facebook offers rich data for analysis, enabling the identification of emotional imbalances and depressive tendencies. Artificial intelligence (AI) and machine learning (ML) techniques have evolved significantly, providing tools that can enhance emotional intelligence in machines. These technologies facilitate text-based emotion recognition [6], which can analyze posts and tweets to gauge users' moods and potentially predict suicidal thoughts. Such early detection can lead to timely interventions, significantly impacting user well-being. Recent advancements in transformer-based models [15], such as RoBERTa, have demonstrated remarkable performance in natural language understanding tasks, making them invaluable for sentiment analysis in textual data related to mental health. RoBERTa's ability to capture nuanced emotional expressions enhances the detection of depressive signals in social media content. Additionally, tree-based algorithms like XGBoost offer robust solutions for classification problems, allowing for efficient processing of large datasets and improving prediction accuracy [16]. These algorithms can be evaluated through metrics such as precision scores and confusion matrices to determine their effectiveness in sentiment prediction [9].

Beyond textual analysis, emotions can also be inferred from facial expressions, gestures, and vocal tones, further enriching the potential for accurate detection of depression. [13]. For instance, AI applications can monitor drivers for signs of drowsiness, potentially preventing accidents. Similarly, emotion detection systems can enhance user interactions with chatbots, allowing for personalized responses that aim to improve mood and mitigate distress [23].

Furthermore, the application of emotion detection technologies can play a pivotal role in educational settings [20]. For example, identifying signs of depression in students through their interactions in online learning environments can help educators provide timely support [17]. By analysing engagement levels, communication patterns, and emotional cues, AI systems can alert educators to students who may be struggling, facilitating early intervention and promoting mental well-being in academic contexts [11]. As these technologies continue to develop, they hold promise not only for individual mental health monitoring but also for fostering supportive environments in various sectors [15]

Literature Review

Depression has become a serious problem in this current generation and the number of people affected by depression is increasing day by day. However, some of them manage to acknowledge that they are facing depression while some of them do not know it. On the other hand, the vast progress of social media is becoming their “diary” to share their state of mind. Several kinds of research had been conducted to detect depression through the user post on social media using machine learning algorithms [1]. Through the data available on social media, the researcher can able to know whether the users are facing depression or not. Machine learning algorithm enables to classify the data into correct groups and identify the depressive and non-depressive data.

Research work aims to detect the depression of the user by their data, which is shared on social media. The Twitter data is then fed into two different types of classifiers, which are Naïve Bayes and a hybrid model, NBTtree. The results will be compared based on the highest accuracy value to determine the best algorithm to detect depression. The results show both algorithm perform equally by proving same accuracy level. [2] proposed method consists of three components; first, a textual CNN model in which a CNN model is trained with only text features, second, an audio CNN model in which CNN model is trained with only audio features and third, a combination of audio and textual model named as hybrid model in which LSTM algorithms are applied. An improved version of LSTM model named as Bi-LSTM model is also used in the proposed work. In results, training accuracy, training loss, validation accuracy and validation loss is calculated for all the mentioned models [2]. The results shows that deep learning is a better solution for depression detection in which accuracy of textual CNN model is 89% whereas accuracy of audio CNN model is 91% and loss of textual CNN is 0.2 whereas loss of audio CNN is 0.1. These results show that audio CNN is a good model for depression detection [2]. It performs better as compared to textual CNN model. It is also observed that Bi-LSTM has better learning rate as compared to other models with accuracy 88% and validation accuracy 78%. There are some parameters such as precision, F1-score, recall and support are found for evaluation of models. In results, graphs for training loss, validation loss, training accuracy and validation accuracy are plotted. At last, by using confusion matrix depression can be detected for textual CNN Model, audio CNN model, LSTM model and Bi-LSTM against true label and predicted label. [3] proposes depression detection among individuals we have conducted a survey with 21 questions based on Hamilton tool and advice of psychiatrist. With the use of Python's scientific programming principles and machine learning methods like Decision Tree, KNN, and Naive Bayes, survey results were analyzed. Further a comparison of these techniques is done [3]. Study concludes that KNN has given better results than other techniques based on the accuracy and decision tree has given better results in the terms of latency to detect the depression of a person. At the conclusion, a machine learning-based model is suggested to replace the conventional method of detecting sadness by asking people encouraging questions and getting regular feedback from them [3]. [4] Propose a depression detection model that utilizes both audio and video features extracted from the vlogs (video logs) on YouTube. We first collected vlogs from YouTube and annotated them into depression and non-depression. We then analyze the statistical differences between depression and non-depression vlogs. Based on the lessons learned, we build a depression detection model that learns both audio and visual features, achieving high accuracy [4]. We believe our model helps detect depressed individuals on social media at an early stage so that individuals who may need appropriate treatment can get help. [5] proposes the early screening of depression is highly beneficial for patients to obtain better diagnosis and treatment. While the effectiveness of utilizing voice data for depression detection has been demonstrated, the issue of insufficient dataset size remains unresolved. Therefore, we propose an artificial intelligence method to effectively identify depression [5]. The wav2vec 2.0 voice-based pre-training model was used as a feature extractor to automatically extract high-quality voice features from raw audio. Additionally, a small fine-tuning network was used as a classification model to output depression classification results. Subsequently, the proposed model was fine-tuned on the DAIC-WOZ dataset and achieved excellent classification results [5]. Notably, the model demonstrated outstanding performance in binary classification, attaining an accuracy of 0.9049 and an RMSE of 0.1875 on the test set. Similarly, impressive results were obtained in multi-classification, with an accuracy of 0.7881 and an RMSE of 0.3810. The wav2vec 2.0 model was first used for depression recognition and showed strong generalization ability. The method is simple, practical, and applicable, which can assist doctors in the early screening of depression. [6] Study that trained and tested classifiers to distinguish whether a user is depressed or not using features extracted from his/her activities in the network and tweets. The results showed that the more features are used, the higher are the accuracy and F-measure scores in

**Roshani R. Borase et al.,**

detecting depressed users [6]. This method is a data-driven, predictive approach for early detection of depression or other mental illnesses. This study's main contribution is the exploration part of the features and its impact on detecting the depression level [6].

[7] Conduct Detecting depression from user-generated content on social media platforms has garnered significant attention due to its potential for the early identification and monitoring of mental health issues. This paper presents a comprehensive approach for depression detection from user tweets using machine learning techniques [7]. The study utilizes a dataset of 632,000 tweets and employs data preprocessing, feature selection, and model training with logistic regression, Bernoulli Naive Bayes, random forests, DistilBERT, SqueezeBERT, models. Evaluation metrics such as accuracy, precision, recall, and F1 score are employed to assess the models' performance [7]. The results indicate that the BERT model achieves the highest accuracy ratio of 0.87 and the highest mean accuracy of 0.77 (across 10 cross-validation folds) in detecting depression from tweets. This research demonstrates the effectiveness of machine learning and advanced transformer-based models in leveraging social media data for mental health analysis. The findings offer valuable insights into the potential for early detection and monitoring of depression using online platforms, contributing to the growing field of mental health analysis based on user-generated content.

[8] Research work, a hybrid model has been proposed that can detect depression by analyzing user's textual posts. Deep learning algorithms were trained using the training data and then performance has been evaluated on the test data of the dataset of reddit which was published for the pilot piece of work, Early Detection of Depression in CLEF eRisk 2017 [8]. In particular, Bidirectional Long Short Term Memory (BiLSTM) with different word embedding techniques and metadata features were proposed which gave good results.

Dataset

The dataset used for this study is sourced from hugging face, a platform renowned for providing diverse and high-quality datasets for research and development. This particular dataset contains user-generated content, including social media posts, tweets, and comments, focusing on mental health-related discussions. It is rich in textual data that reflects various emotional states, such as depression, anxiety, and general well-being. The dataset includes labeled examples, distinguishing between depressive and non-depressive content, which serves as the foundation for supervised learning. Preprocessing steps such as noise removal, tokenization, stop word elimination, and lemmatization will be applied to ensure the data is clean and structured. Additionally, augmentation techniques will enhance the dataset's robustness by introducing variations, helping the model generalize better to unseen data. This Hugging Face dataset provides a comprehensive and diverse resource for training and evaluating the proposed hybrid model, enabling accurate and efficient depression detection.

Proposed Methodology

The proposed methodology for depression detection involves a detailed and systematic process to ensure accurate and efficient identification of individuals at risk. The dataset will be sourced from Kaggle, comprising user-generated content such as posts, tweets, and comments related to mental health. This data will undergo preprocessing to ensure quality and consistency. Noise removal techniques will be applied to eliminate special characters, URLs, hashtags, mentions, and redundant spaces. All text will be converted to lowercase for uniformity, followed by tokenization to split the text into manageable components. Stopwords that do not add semantic value will be removed, and lemmatization will reduce words to their base forms, minimizing redundancy. To further enhance the dataset, data augmentation techniques like synonym replacement, random insertion, and back-translation will be employed, increasing diversity and robustness.

After preprocessing, RoBERTa, a transformer-based model, will extract contextual embeddings from the text. These embeddings will capture the semantic and emotional nuances, serving as input features for the XGBoost classifier. The XGBoost model will then classify the text into depressive or non-depressive categories. The model's performance will be optimized through hyperparameter tuning, adjusting factors such as learning rate, tree depth, and the number of estimators. The dataset will be split into training, validation, and test sets to ensure reliable evaluation. The training set will build the model, the validation set will guide hyperparameter adjustments, and the test set will assess the model's generalization to unseen data.

The entire process will be automated as a scalable pipeline, integrating data preprocessing, feature extraction, and classification into a unified workflow. This design will facilitate the model's deployment for real-world applications, such as monitoring social media content for early depression detection. By leveraging the contextual strength of RoBERTa and the classification efficiency of XGBoost, the proposed methodology aims to provide a robust and reliable solution for identifying individuals at risk of depression. Google Colab is used as the primary platform for implementing the proposed hybrid model for depression detection. This online, open-source platform provides a user-friendly interface for writing and executing Python code, making it ideal for developing and testing machine learning and deep learning models. In Colab it deals with the various accelerator type example CPU, GPU. GPU provides the most flexible processing with seconds of execution. Usually, neural networks deal under the GPU. It has 100x power seamless execution power. As a cloud-based tool running on Google servers, it integrates seamlessly with Google Drive, where the dataset and resources for the project are stored. This eliminates the need for additional setups, downloads, or installations, simplifying the development process.

For implementing the work Google Colab offers access to GPU and TPU accelerators, which significantly enhance the computational efficiency required for training deep learning algorithms such as RoBERTa and XGBoost. The platform also includes a variable panel, allowing real-time monitoring of variables, their values, and data types during code execution, aiding debugging and evaluation. Although it lacks a kernel menu, the runtime can be restarted effortlessly to refresh the environment.

Another key advantage of Google Colab is its ability to facilitate collaboration. Notebooks can be easily shared as it has interface like jupyter notebook, and updates can be made in real time, streamlining collaborative development. For the proposed work, which combines RoBERTa and XGBoost, Google Colab provides the computational resources and flexibility required to preprocess data, train models, and evaluate results effectively, making it an ideal platform for this research. For implementing python programming language is used. Python is a powerful and flexible programming language widely used across various domains due to its simplicity and robust ecosystem of libraries. Libraries such as NumPy, Pandas, and Matplotlib support efficient data manipulation and visualization, while machine learning frameworks like TensorFlow, PyTorch, and Scikit-learn enable the development of complex models. Python's versatility makes it a go-to language for fields ranging from web development to artificial intelligence, providing tools that streamline workflows and enhance productivity.

Evaluation Parameters and Significance

The performance of the system should be evaluated in terms of the accuracy of classification. It is worth mentioning that a comparative analysis is done based on the common and overlapping data

Accuracy (Ac): It tells us about the exactness set of the different methods. The critical parameters are:

The classification accuracy is computed as:

$$Ac = \frac{TP+TN}{TP+TN+FP+FN} \quad (1.1)$$

The precision is computed as

$$Pr = \frac{TP}{TP+FP} \quad (1.2)$$

The F-measure or F-Score is computed as:

$$F - Measure = 2 \cdot \frac{Precision \cdot Recall}{Precision + Recall} = F - Measure = \frac{TP}{TP + \frac{1}{2}(FP + FN)} \quad (1.3)$$

Here,

(TP): True Positive

(TN): True Negative

(FP): False Positive

(FN): False Negative

EXPERIMENTAL RESULTS

The evaluation of the proposed hybrid model for depression detection, which integrates RoBERTa and XGBoost, demonstrates its effectiveness in identifying depressive tendencies based on textual data. The model was assessed

using a test dataset after being trained and validated on labeled examples. The primary metric used for evaluation was accuracy, reflecting the proportion of correctly classified instances to the total instances in the dataset. The hybrid model achieved an accuracy of 92.8%, indicating a high level of reliability in distinguishing between depressive and non-depressive content. The performance of the model was observed to be consistent across both training and validation phases, showcasing its ability to generalize well to unseen data. The results highlight the superiority of the hybrid approach, as it combines RoBERTa's contextual embedding capabilities with the robust classification power of XGBoost. Furthermore, the automated pipeline ensured a streamlined process from data preprocessing to final evaluation, making the system efficient and scalable for real-world applications. Overall, the evaluation confirms the potential of the proposed methodology to serve as an effective tool for depression detection, contributing to early identification and intervention for mental health challenges.

CONCLUSION

The RoBERTa-XGBoost model for depression detection demonstrated a high classification performance, achieving an overall accuracy of 92.8%. The model effectively distinguished between depressed and non-depressed individuals, with an F1-score of 0.88 for both classes. Specifically, it attained a precision of 0.84 and recall of 0.94 for the non-depressed category, while the depressed category recorded a precision of 0.93 and recall of 0.82. These results indicate that the model is highly capable of identifying depression while maintaining a balance between precision and recall. The high recall for non-depressed individuals suggests a low false negative rate, ensuring that most non-depressed cases are correctly identified. Conversely, the high precision for depressed individuals minimizes false positives, improving the reliability of depression detection. The integration of RoBERTa's deep contextual embeddings with XGBoost's powerful classification capabilities contributed to the model's robustness and effectiveness. Overall, the findings highlight the potential of hybrid deep learning and machine learning approaches in automated mental health assessment.

Future Scope

In future enhancing model generalized by incorporating larger and complex dataset. More fine tune hyperparameters could further improve classification performance.

ABSTRACT

In this paper we introduce Soft pre g^* -open sets in soft topological space which are defined over an initial universe with a fixed set of parameters. Also we studied Soft pre g^* neighbourhood system, Soft pre g^* interior sets and Soft pre g^* exterior sets with examples.

Keywords: Soft pre open set, Soft pre g^* neighbourhood, Soft pre g^* interior sets and Soft pre g^* exterior sets.

INTRODUCTION

Soft set was introduced by Molodsov in the year 1999. Andrijevic [1] showed Semi-Preopen sets. Njastad [12] explained on some classes of nearly open sets. Veerakumar [13] defined g^* -Pre closed sets. Levine [8] examines generalized closed sets in topological spaces. In this paper we introduce soft pre g^* open set, soft pre g^* neighbourhood, soft pre g^* interior point, soft pre g^* exterior point in soft topological spaces.

PRELIMINARIES

Definition 2.1. [7] A subset A of a topological space (X, τ) is called g -closed if $cl(A) \subseteq G$ whenever $A \subseteq G$ and G is open in (X, τ) . The complement of g -closed set is called g -open.

Kalaiselvi and Anitha

Definition 2.2. [13] A subset A of a topological space (X, τ) is called g^*p -closed if $\text{pcl}(A) \subseteq G$ whenever $A \subseteq G$ and G is g -open in (X, τ) . The complement of g^*p -closed set is called g^*p -open.

Definition 2.3. [4] The union of pre open sets contained in A is called pre interior of A and is denoted by $\text{pint}(A)$.

THEOREM 2.4. [9] If U is open and A is pre open then $U \cap A$ is pre open.

Definition 2.5. [10] A map $f : X \rightarrow Y$ is called M -pre open (resp. M -pre closed) if $f(V)$ is pre open (resp. Pre closed) set in Y for every pre open (resp. Pre closed) set V of X .

Definition 2.6. [11] A map $f : X \rightarrow Y$ is called pre-irresolute if $f^{-1}(F)$ is pre-open in X for every pre-open set F in Y .

Definition 2.7. [5] Let (X, τ) be a soft topological space of non empty set X with τ . Let $A \subseteq X$ then the set A is said to be g^* Pre open set iff $A \subseteq \text{int}(\text{cl}A)$

SOFT PRE g^* -OPEN SET

Definition 3.1. A subset (S, E) of a soft topological space (X, τ, E) is called soft pre g^* -open if $(U, E) \subset \text{pint}(S, E)$ whenever $(U, E) \subset (S, E)$ and (U, E) is soft g -closed in X .

Example 3.2. Let $X = \{a, b\}$, $E = \{e_1, e_2\}$ $X = \{(e_1, \{a, b\}), (e_2, \{a, b\})\}$. Then the soft sets are written by, $(S, A)_1 = X$, $(S, A)_2 = \emptyset$, $(S, A)_3 = \{(e_1, \{a\})\}$, $(S, A)_4 = \{(e_1, \{b\})\}$, $(S, A)_5 = \{(e_1, \{a, b\})\}$, $(S, A)_6 = \{(e_2, \{a\})\}$, $(S, A)_7 = \{(e_2, \{b\})\}$, $(S, A)_8 = \{(e_2, \{a, b\})\}$, $(S, A)_9 = \{(e_1, \{a\}), (e_2, \{a\})\}$, $(S, A)_{10} = \{(e_1, \{a\}), (e_2, \{b\})\}$, $(S, A)_{11} = \{(e_1, \{a\}), (e_2, \{a, b\})\}$, $(S, A)_{12} = \{(e_1, \{b\}), (e_2, \{a\})\}$, $(S, A)_{13} = \{(e_1, \{b\}), (e_2, \{b\})\}$, $(S, A)_{14} = \{(e_1, \{b\}), (e_2, \{a, b\})\}$, $(S, A)_{15} = \{(e_1, \{a, b\}), (e_2, \{a\})\}$, $(S, A)_{16} = \{(e_1, \{a, b\}), (e_2, \{b\})\}$.

So $|S(X)| = 2^4 = 16$

Therefore we get 16 soft sets in the Universal set U .

Theorem 3.3. If (S, E) is a soft pre g^* -open set of soft topological space (X, τ, E) and $\text{pint}(S, E) \subset (T, E) \subset (S, E)$ then (T, E) is also soft pre g^* -open set of X .

Proof:

Let (S, E) be soft pre g^* -openset in soft topological space (X, τ, E) .

If (G, E) is soft g -closed set such that $(G, E) \subset (T, E)$

Since $(T, E) \subset (S, E)$ we have $(G, E) \subset (S, E)$

Since (S, E) is a soft pre g^* -openset,

$(G, E) \subset \text{pint}(S, E)$

Then $\text{pint}(\text{pint}(S, E)) \subset (T, E)$

$\Rightarrow \text{pint}(S, E) \subset \text{pint}(T, E)$

Hence $(G, E) \subset \text{pint}(S, E) \subset \text{pint}(T, E)$

$\Rightarrow (G, E) \subset \text{pint}(T, E)$

Then (T, E) is soft pre g^* -openset of X .

Example 3.4. Let us consider the soft sets of F_E that are given in example 3.2.

Let $(S, A)_9 = \{(e_1, \{a\}), (e_2, \{a\})\}$ be soft openset.

Then soft pre open sets are $(S, A)_1, (S, A)_2, (S, A)_3, (S, A)_5, (S, A)_6, (S, A)_8, (S, A)_9, (S, A)_{10}, (S, A)_{11}, (S, A)_{12}, (S, A)_{14}, (S, A)_{15}, (S, A)_{16}$.

Soft pre closed sets are $(S, A)_1, (S, A)_2, (S, A)_3^c = (S, A)_{14}, (S, A)_5^c = (S, A)_8, (S, A)_6^c = (S, A)_{16}, (S, A)_8^c = (S, A)_5, (S, A)_9^c = (S, A)_{13}, (S, A)_{10}^c = (S, A)_{12}, (S, A)_{11}^c = (S, A)_4, (S, A)_{12}^c = (S, A)_{10}, (S, A)_{14}^c =$

$$(S,A)_3, (S,A)_{15^c} = (S,A)_7, (S,A)_{16^c} = (S,A)_6.$$

Therefore soft pre closed sets are

$$(S,A)_1, (S,A)_2, (S,A)_3, (S,A)_4, (S,A)_5, (S,A)_6, (S,A)_7, (S,A)_8, (S,A)_9, (S,A)_{10}, (S,A)_{12}, (S,A)_{13}, (S,A)_{14}, (S,A)_{16}.$$

Soft g-closed sets are $(S,A)_9, (S,A)_{11}, (S,A)_{13}, (S,A)_{14}, (S,A)_{15}, (S,A)_{16}$.

Soft g-open sets are $(S,A)_{13}, (S,A)_4, (S,A)_9, (S,A)_3, (S,A)_7, (S,A)_6$.

Soft pre g^* opensets are $(S,A)_{13}$ and $(S,A)_9$.

Theorem 3.5. Every soft Pre g^* openset is soft pre open.

Proof:

Let (S,A) be soft pre g^* openset.

Then $(U,A) \subseteq \text{pint}(S,A)$ whenever $(S,A) \subseteq (U,A)$

$$\Rightarrow (U,A) \subseteq \text{int}(S,A)$$

Therefore every soft pre g^* openset is soft pre open.

Example 3.6. From example 3.4. $(S,A)_{13}$ and $(S,A)_9$ are soft pre g^* openset and the sets are soft pre opensets in X .

Remark 3.7. Converse of the above theorem is not true.

Example 3.8. From example 3.4. Every soft sets are not pre g^* open sets in X .

Theorem 3.9. Arbitrary union of soft pre g^* openset is a soft pre g^* openset.

Proof:

Let $\{(S,A)_\alpha / \alpha \in I\}$ be a collection of soft pre g^* opensets of a soft topological space (U,A,τ) .

Then for each α , $(S,A)_\alpha \subseteq \text{pint}((S,A)_\alpha)$

Claim: $\cup(S,A)_\alpha \subseteq \text{pint}(\cup(S,A)_\alpha)$

Now, $\cup(S,A)_\alpha \subseteq \cup \text{pint}((S,A)_\alpha)$

$$\subseteq \text{pint}(\cup(S,A)_\alpha)$$

Therefore, $\cup(S,A)_\alpha \subseteq \text{pint}(\cup(S,A)_\alpha)$

Theorem 3.10. Let (U,A,τ) be a soft topological space. (S_1,A) and (S_2,A) be two soft sets over U . Then $(S_1,A) \subseteq (S_2,A) \Rightarrow \text{pint}(S_1,A) \subseteq \text{pint}(S_2,A)$

Proof:

Let (U,A,τ) be a soft topological space. (S_1,A) and (S_2,A) be two soft sets over U .

Then $(S_1,A) \subseteq (U,E)$ and $(S_2,A) \subseteq (U,E)$, (U,E) is soft open in X .

Now $(S_1,A) \subseteq (S_2,A)$

By definition 3.1, $(S_1,A) \subseteq \text{pint}(S_1,A) \subseteq U$

$$(S_2,A) \subseteq \text{pint}(S_2,A) \subseteq U$$

Therefore $(S_1,A) \subseteq (S_2,A) \Rightarrow \text{pint}(S_1,A) \subseteq \text{pint}(S_2,A)$.

Theorem 3.11. Every finite union of soft pre g^* open set is soft pre g^* openset.

Proof:

Let (S,A) and (S,B) be two soft pre g^* open subset of X .

Let (U,E) be a soft g-closed set in X such that $(S,A) \cup (S,B) \subseteq (U,E)$

Then $(U,E) \subseteq \text{pint}(S,A)$ and $(U,E) \subseteq \text{pint}(S,B)$

Therefore $(U,E) \subseteq \text{pint}(S,A) \cup \text{pint}(S,B)$

$$\Rightarrow \text{pint}(U,E) \subseteq \text{pint}(S,A) \cup \text{pint}(S,B)$$

$$\Rightarrow \text{pint}((S,A) \cup (S,B)) \subseteq \text{pint}(S,A) \cup \text{pint}(S,B)$$

Therefore $\text{pint}((S,A) \cup (S,B))$ is soft pre g^* open in X .

Kalaiselvi and Anitha

Example 3.12. Consider example 3.2., $(S,A)_9 = \{(e_1, \{a\}), (e_2, \{a\})\}$,
 $(S,A)_{13} = \{(e_1, \{b\}), (e_2, \{b\})\}$, union of the sets is given by,
 $(S,A)_9 \cup (S,A)_{13} = \{(e_1, \{a\}), (e_2, \{a\})\} \cup \{(e_1, \{b\}), (e_2, \{b\})\}$
 $= \{(e_1, \{a,b\}), (e_2, \{a,b\})\}$
 $\subseteq X$

Remark 3.13. Every finite intersection of two soft pre g^* open sets need not be soft pre g^* open set.

Soft pre g^* neighbourhood system in soft topological space

Definition 4.1. Let (X, τ, E) be a soft topological space. Let $(S,A) \in S(X)$ and $p_1 \in X$. Then the soft point p_1 is said to be soft pre g^* neighbourhood of a set (S,A) if there exists a soft pre g^* open set (T,A) such that $p_1 \in (T,A) \subseteq (S,A)$

Example 4.2. Consider the soft topological space (X, τ, E) given in example 3.2., soft pre g^* open sets are $(S,A)_9$ and $(S,A)_{13}$.

- (i) The soft pre g^* neighbourhood of $(e_1, \{b\})$ is $(S,A)_{13}$.
- (ii) The soft pre g^* neighbourhood of $(e_1, \{a\})$ is $(S,A)_9$.
- (iii) The soft pre g^* neighbourhood of $(e_2, \{a\})$ is $(S,A)_9$.
- (iv) The soft pre g^* neighbourhood of $(e_2, \{b\})$ is $(S,A)_{13}$.

Proposition 4.3. Every soft pre g^* neighbourhood of (T,A) is soft pre neighbourhood in soft topological space.

Example 4.4. By example 3.2., Soft pre neighbourhood of $(e_1, \{a\})$ are $(S,A)_3, (S,A)_9, (S,A)_{10}, (S,A)_{11}, (S,A)_{15}, (S,A)_{16}$. But $(S,A)_9$ is soft pre g^* neighbourhood of $(e_1, \{a\})$.

Remark 4.5. Converse of above proposition is not true. Because every soft pre g^* neighbourhood of (T,A) is soft pre neighbourhood in soft topological space but every soft pre neighbourhood in X is not soft pre g^* neighbourhood in soft topological space.

Example 4.6. Let $X = \{a, b\}$, $E = \{e_1, e_2\}$ $X = \{(e_1, \{a, b\}), (e_2, \{a, b\})\}$. Then the soft sets are written by, $(S,A)_1 = X, (S,A)_2 = \emptyset, (S,A)_3 = \{(e_1, \{a\})\}, (S,A)_4 = \{(e_1, \{b\})\}, (S,A)_5 = \{(e_1, \{a, b\})\}, (S,A)_6 = \{(e_2, \{a\})\}, (S,A)_7 = \{(e_2, \{b\})\}, (S,A)_8 = \{(e_2, \{a, b\})\}, (S,A)_9 = \{(e_1, \{a\}), (e_2, \{a\})\}, (S,A)_{10} = \{(e_1, \{a\}), (e_2, \{b\})\}, (S,A)_{11} = \{(e_1, \{a\}), (e_2, \{a, b\})\}, (S,A)_{12} = \{(e_1, \{b\}), (e_2, \{a\})\}, (S,A)_{13} = \{(e_1, \{b\}), (e_2, \{b\})\}, (S,A)_{14} = \{(e_1, \{b\}), (e_2, \{a, b\})\}, (S,A)_{15} = \{(e_1, \{a, b\}), (e_2, \{a\})\}, (S,A)_{16} = \{(e_1, \{a, b\}), (e_2, \{b\})\}$.
 So $|S(X)| = 2^4 = 16$

Therefore we get 16 soft sets in the Universal set U .

Let $(S,A)_{15} = \{(e_1, \{a, b\}), (e_2, \{a\})\}$ be soft open set.

Then soft pre open sets are $(S,A)_1, (S,A)_2, (S,A)_3, (S,A)_4, (S,A)_5, (S,A)_6, (S,A)_8, (S,A)_9, (S,A)_{10}, (S,A)_{11}, (S,A)_{12}, (S,A)_{13}, (S,A)_{14}, (S,A)_{15}, (S,A)_{16}$.

Soft pre closed sets are $(S,A)_1, (S,A)_2, (S,A)_{14}, (S,A)_{11}, (S,A)_8, (S,A)_{16}, (S,A)_5, (S,A)_{13}, (S,A)_{12}, (S,A)_4, (S,A)_{10}, (S,A)_9, (S,A)_3, (S,A)_7, (S,A)_6$.

Soft g closed sets are $X, (S,A)_{11}, (S,A)_{16}, (S,A)_{13}, (S,A)_9, (S,A)_{14}$.

Soft g open sets are $\emptyset, (S,A)_4, (S,A)_6, (S,A)_9, (S,A)_{13}, (S,A)_3$.

Soft pre g^* open sets are $(S,A)_9, (S,A)_{13}$.

Example 4.7. Consider the Example 3.2., soft pre g^* open sets are $(S,A)_9$ and $(S,A)_{13}$. Then

- (i) Soft pre g^* neighbourhood of the soft point $(e_2, \{a\})$ is $(S,A)_9$.
- (ii) Soft pre g^* neighbourhood of the soft point $(e_2, \{b\})$ is $(S,A)_{13}$.
- (iii) Soft pre g^* neighbourhood of the soft point $(e_1, \{a\})$ is $(S,A)_9$.

Kalaiselvi and Anitha

(iv) Soft pre g^* -neighbourhood of the soft point $(e_1, \{b\})$ is $(S, A)_{13}$.

Example 4.8. Consider the example 3.2., Take the soft set $(S, A)_9 = \{(e_1, \{a\}), (e_2, \{a\})\}$. Then the collection of all soft pre g^* -neighbourhoods of $(S, A)_9 = \{(S, A)_9\}$

Example 4.9. consider the example 3.2., Take the soft set $(S, A)_{13} = \{(e_1, \{b\}), (e_2, \{b\})\}$. Then the collection of all soft pre g^* -neighbourhoods of $(S, A)_{13} = \{(S, A)_{13}\}$.

Proposition 4.10. An arbitrary soft union of soft pre g^* -neighbourhoods of a soft point $p_1 \in X$ is a soft pre g^* -neighbourhood of p_1 .

Proof:

Let $\{(T, A)_\alpha\}_{\alpha \in I}$ be an arbitrary collection of soft pre g^* -neighbourhood of p_1 .

For each $\alpha \in I$, there exists a soft pre g^* -open set $(O, A)_\alpha$ such that

$$p_1 \in (O, A)_\alpha \subseteq (T, A)_\alpha \subseteq \cup (T, A)_\alpha$$

$$\Rightarrow p_1 \in (O, A)_\alpha \subseteq \cup (T, A)_\alpha$$

Therefore, $\cup (T, A)_\alpha$ for each $\alpha \in I$ is a soft pre g^* -neighbourhood of p_1 .

Therefore, arbitrary soft union of soft pre g^* -neighbourhood of p_1 is soft pre g^* -neighbourhood of p_1 .

Remark 4.11. We conclude that the soft pre g^* -neighbourhood of $p_1 \in X$ in a soft topological space (X, τ, E) has the following facts.

- (a) Every soft super set of soft pre g^* -neighbourhood of p_1 is a soft pre g^* -neighbourhood of p_1
- (b) Every soft preopen set containing p_1 is a soft pre g^* -neighbourhood of p_1
- (c) Every $p_1 \in X$ has atleast one soft pre g^* -neighbourhood.

Theorem 4.12. A soft set (T, A) is soft pre open iff is soft pre g^* -neighbourhood of each of its soft points.

Proof:

Let $(T, A) \in X$ be a soft pre open set.

By above Remark 4.11.(b), for each soft point $p_1 \in (T, A)$, (T, A) is a soft pre g^* -neighbourhood of p_1 .

Conversely assume that (T, A) is a soft pre g^* -neighbourhood of each of its soft points.

Then for every point $p_1 \in (T, A)$ there exists a soft pre open set $(T, A)_1$ such that $p_1 \in (T, A)_1 \subseteq (T, A)$.

Therefore $(T, A) = \cup \{(T, A)_1 : p_1 \in (T, A)\}$

Since arbitrary soft union of soft pre g^* -open set is soft pre g^* -open set.

Therefore each $(T, A)_1$ is soft pre g^* -open set then (T, A) is soft pre g^* -open set.

Soft pre g^* -interior sets in soft topological space

Definition 5.1. Let (X, τ, E) be a soft topological space over X and $(S, A) \in S(X)$. Then the soft pre g^* -interior of (S, A) which is denoted by $p \text{ int}(S, A)$ is defined as the soft union of all soft pre open subsets of (S, A) . That is, $p \text{ int}(S, A) = \cup \{(T, A) : (T, A) \text{ is soft pre } g^*\text{-open and } (T, A) \subseteq (S, A)\}$

Example 5.2. Consider example 3.2.,

$$p \text{ int}(S, A)_9 = \cup \{(T, A) : (T, A) \text{ is soft pre } g^*\text{-open and } (T, A) \subseteq (S, A)_9\}$$

$$= \cup \{(S, A)_9\}$$

$$= (S, A)_9$$

$$p \text{ int}(S, A)_{13} = \cup \{(T, A) : (T, A) \text{ is soft pre } g^*\text{-open and } (T, A) \subseteq (S, A)_{13}\}$$

$$= \cup \{(S, A)_{13}\}$$

$$= (S, A)_{13}$$

Kalaiselvi and Anitha

Theorem 5.3. Let (X, τ, E) be a soft topological space and $(S, A), (T, A)$ be soft sets over X . Then (S, A) is soft pre g^* open iff $(S, A) \supseteq p \text{ int}(S, A)$

- (i) If $(S, A) \subseteq (T, A)$ then $p \text{ int}(S, A) \subseteq p \text{ int}(T, A)$
- (ii) $P \text{ int}(\phi) = \phi$ and $p \text{ int}(X) = X$
- (iii) $P \text{ int}((S, A) \cap (T, A)) \subseteq p \text{ int}(S, A) \cap p \text{ int}(T, A)$
- (iv) $P \text{ int}((S, A) \cup (T, A)) \subseteq p \text{ int}(S, A) \cup p \text{ int}(T, A)$

Proof:

- (i) Let (S, A) be soft set over X .

Let (S, A) be soft pre g^* open in X

Then the largest soft g^* pre open set contained in (S, A) is (S, A) itself.

Therefore (S, A) is soft pre g^* open set iff $p \text{ int}(S, A) \subseteq (S, A)$

- (ii) By (i), $p \text{ int}(S, A)$ is the largest soft pre g^* open set contained in (S, A)

Since $(S, A) \subseteq (T, A)$, $p \text{ int}(S, A)$ is a soft g^* pre open set contained in (T, A)

Also $p \text{ int}(T, A)$ is the soft union of all soft pre g^* open sets contained in (T, A) .

Therefore, $p \text{ int}(S, A) \subseteq p \text{ int}(T, A)$.

- (iii) Since ϕ and X are soft pre g^* open sets.

Therefore $p \text{ int}(\phi) = \phi$ and $p \text{ int}(X) = X$.

- (iv) Clearly $(S, A) \cap (T, A) \subseteq (S, A)$ and

$(S, A) \cap (T, A) \subseteq (S, A)$

Then $p \text{ int}((S, A) \cap (T, A)) \subseteq p \text{ int}(S, A)$ and

$p \text{ int}((S, A) \cap (T, A)) \subseteq p \text{ int}(T, A)$

Therefore, $p \text{ int}((S, A) \cap (T, A)) \subseteq p \text{ int}(S, A) \cap p \text{ int}(T, A)$

- (v) Using (i), $p \text{ int}(S, A) \subseteq (S, A)$ and $p \text{ int}(T, A) \subseteq (T, A)$

Then $p \text{ int}(S, A) \cup p \text{ int}(T, A) \subseteq (S, A) \cup (T, A)$

$p \text{ int}((S, A) \cup (T, A))$ is the largest soft pre g^* open set contained in $(S, A) \cup (T, A)$ and $p \text{ int}(S, A) \cup p \text{ int}(T, A)$ is soft pre g^* open set.

Hence $p \text{ int}(S, A) \cup p \text{ int}(T, A) \subseteq p \text{ int}((S, A) \cup (T, A))$

- (vi) By (i), (S, A) is soft pre g^* open set iff $(S, A) = p \text{ int}(S, A)$

Therefore $P \text{ int}(p \text{ int}(S, A)) = p \text{ int}(S, A)$

Soft pre g^* exterior set in soft topological space

Definition 6.1. Let (X, τ, E) be a soft topological space over X and $(S, A) \in S(X)$. Let $p_1 \in X$ then p_1 is called a soft pre g^* exterior point of (S, A) if there exists a soft pre g^* exterior point of (S, A) if there exists a soft pre g^* open set (T, A) such that $p_1 \in (T, A) \subseteq (S, A)^c$.

Example 6.2. Consider example 3.2., Let the soft point $(e_1, \{a\})$. Then $(e_1, \{a\}) \in (S, A)_9 \subseteq$

$(S, A)_4^c = \{(e_1, \{a\}), (e_2, \{a, b\})\}$. Therefore the soft point $(e_1, \{a\})$ is soft pre g^* exterior point of the soft set $(S, A)_4$.

Proposition 6.3. Let (X, τ, E) be a soft topological space over X and $(S, A) \in S(X)$. Then the soft exterior point of (S, A) is a soft pre g^* exterior point of (S, A) .

Kalaiselvi and Anitha

Proof:

Let (X, τ, E) be a soft topological space over X and $(S, A) \in S(X)$.

Let $p_1 \in X$ be soft exterior point of (S, A) .

Then there exists a soft open set (T, A) such that $p_1 \in (T, A) \subseteq (S, A)^c$

Since every soft open set is soft pre open set and (T, A) is soft pre g^* open set.

Therefore p_1 is a soft pre g^* exterior point of (S, A) .

Example 6.4. Consider example 3.2., Let the soft point $(e_1, \{b\})$. Then $(e_1, \{b\}) \in (S, A)_{13} \subseteq (S, A)^c = \{(e_1, \{b\}), (e_2, \{a, b\})\}$. Therefore the soft point $(e_1, \{b\})$ is soft pre g^* exterior point of the soft set $(S, A)_3$.

Proposition 6.5. Let (X, τ, E) be a soft topological space over X and $(S, A), (T, A) \in S(X)$. Then

- (a) If $(S, A) \subseteq (T, A)$ then $p \text{ ext}(T, A) \subseteq p \text{ ext}(S, A)$
- (b) $p \text{ ext}((S, A) \cup (T, A)) \subseteq p \text{ ext}(S, A) \cup p \text{ ext}(T, A)$
- (c) $p \text{ ext}((S, A) \cap (T, A)) \subseteq p \text{ ext}(S, A) \cap p \text{ ext}(T, A)$
- (d) $\text{ext}(S, A) \subseteq p \text{ ext}(S, A)$
- (e) $p \text{ ext}(X) = \phi$ and $p \text{ ext}(\phi) = X$
- (f) $p \text{ ext}(X)$ is soft pre g^* open set.

Proof:

- (a) Suppose $(S, A) \subseteq (T, A)$

Then $(T, A)^c \subseteq (S, A)^c$

$\Rightarrow p \text{ int}(T, A)^c \subseteq p \text{ int}(S, A)^c$

$\Rightarrow p \text{ ext}(T, A) \subseteq p \text{ ext}(S, A)$

- (b) Since $(S, A) \subseteq (S, A) \cup (T, A)$ and $(T, A) \subseteq (S, A) \cup (T, A)$

Using (a) we can write, $p \text{ ext}((S, A) \cup (T, A)) \subseteq p \text{ ext}(S, A)$ and $p \text{ ext}((S, A) \cup (T, A)) \subseteq p \text{ ext}(T, A)$

Therefore $p \text{ ext}((S, A) \cup (T, A)) \subseteq p \text{ ext}(S, A) \cup p \text{ ext}(T, A)$

- (c) $(S, A) \cap (T, A) \subseteq (S, A)$ and $(S, A) \cap (T, A) \subseteq (T, A)$

Using (a), we have, $p \text{ ext}(S, A) \subseteq p \text{ ext}((S, A) \cap (T, A))$ and $p \text{ ext}(T, A) \subseteq p \text{ ext}((S, A) \cap (T, A))$

Therefore $p \text{ ext}(S, A) \cap p \text{ ext}(T, A) \subseteq p \text{ ext}((S, A) \cap (T, A))$

- (d) $\text{ext}(S, A) \subseteq p \text{ ext}(S, A)$

For, Let $p_1 \in \text{ext}(S, A)$

Then $p_1 \in \text{int}(S, A)^c \subseteq p \text{ int}(S, A)^c$

$= p \text{ ext}(S, A)$

- (e) $p \text{ ext}(X) = \phi$ and $p \text{ ext}(\phi) = X$

For, $p \text{ ext}(X) = p \text{ int}(\phi)$

$= \phi$

$P \text{ ext}(\phi) = p \text{ int}(\phi^c)$

$= p \text{ int}(X)$

$= X$

- (f) Since $p \text{ ext}(X) = p \text{ int}(\phi) = \phi$

Therefore $p \text{ ext}(X)$ is soft pre g^* open set.

CONCLUSION

In this chapter we discussed Soft pre g^* open sets and their properties with examples. We have proved every soft pre g^* open set is soft pre open. But converse is not true. Every finite union of two soft pre g^* open set is soft pre g^* open set. But every finite intersection of two soft pre g^* open set is need not be soft pre g^* open set. Every soft point has at least one soft pre g^* neighbourhood. Every soft pre g^* open set containing soft pre g^* neighbourhood. Every soft pre g^* open set has soft pre g^* interior and soft pre g^* exterior points.

ABSTRACT

An $\langle S \rangle$ is a union of a connected Random graph (non isolated Random graph) with some (at least one) isolated vertices. An isolated connected dominating set of a connected Random graph $G(n,p)$ is a dominating $S \subseteq V(G_{n,p})$ set in this way. The smallest cardinality of an isolated connected dominating set of G is represented by an isolated connected domination number of $G(n,p)$, denoted by $\gamma_{ic} G(n,p)$. We examine a few characteristics and provide an isolated connected dominance number for a few families of random graphs in this research.

Keywords: Random Graph($G_{n,p}$), Connected Random Graph $G_c(n,p)$, Domination number in $G_{n,p}$, connected domination number in $G_{n,p}$, Isolated Connected domination $G_{n,p}$.

Mathematics Subject Classification (2010): 05C69, 05C80

INTRODUCTION

In the 1960s Erdos and Renyi, two great Mathematicians, established the Random graph theory and initiated the systematic study of it [1]. Random Graph($G_{n,p}$) lies in the intersection of Graph theory and Probability theory, has always been the basic theory for studying complex networks. Domination is a central topic in graph theory, with a number of application in computer science and engineering. A dominating set S in a graph G has that each node not in S is joined to some node of S . The minimum order of a dominating set is the domination number of G denoted $\gamma(G)$. The book [8][9] supply a introduction to theoretical and applied results of domination in graphs.

Sirajunisha and Krishnan

Relatively little work has been done on domination in Random graph models. The domination number of ER Random Graph $(G_{n,p})$ was determined by Wieland and Godbole in [7]. Dreyer [17] analyse some basic results of proves with $q=1/(1-p)$ (p fixed) and set of cardinality $(1+\varepsilon)\log_q n$ is a dominating set with probability tends to 1 as n tends to infinity. And sets of order $(1-\varepsilon)\log_q n$ dominate with probability approaching zero as n tends to infinity. May instead take $\varepsilon = \varepsilon_n$ tends to zero so that $\varepsilon_n \log_q n$ tends to infinity. we analyse the some properties of Isolated connected domination of $(G_{n,p})$.

PREMILIARIES

Definition:2.1: $(G_{n,p})$

When we are given a graph G is a random graph, this is wrong. Already Existing graph is fixed, there is nothing random to it. What we mean though through this term abuse is that this graph was sampled out of a set of graphs according to a probability distribution. An Random Graph $G_{n,p}$ has two parameters, the number of vertices n and a probability parameter $0 \leq p \leq 1$. Let $\mathcal{G}$ be the family of all possible labelled graphs on the vertex set $[n]$. Note that $|\mathcal{G}| = 2^{\binom{n}{2}}$. The $G_{n,p}$ Model assign to a graph $G \in \mathcal{G}$ satisfy the probability

$$\text{Probability}[G] = P^{|E(G)|} (1-P)^{\binom{n}{2}-|E(G)|}$$

Definition: 2.2: $(G_{n,m})$

An Uniform Random graph $(G_{n,m})$ has two parameters, the number of vertices n and the number of edges m , where $0 \leq m \leq \binom{n}{2}$. This model assigns to all labelled (named) graphs on the vertex set $[n]$ with exactly m edges equal probability. Therefore,

$$\text{Probability}[G] = \begin{cases} \frac{1}{\binom{\binom{n}{2}}{m}} & \text{if } |E(G)| = m \\ 0 & \text{otherwise} \end{cases}$$

Definition: 2.3: $G_c(n, p)$

An Connected Random Graph $G_c(n, p)$, a pair of u and v is chosen from the vertex set $V(G)$ of the graph G . Here each pair of vertices $\{v_i, v_j\}$, where $v_j \in V(G) - v_i$. There exist an edge between v_i and v_j in a graph iff the random number generated for the pair v_i and v_j is at most the edge probability p of the graph G . Its is denoted by $G_c(n, p)$.

Definition:2.4: $\gamma(G(n, p))$

An Random Graph $G(n, p)$ with fixed parameter $p_n = p > 0$ and the number vertices n tending to infinity. Then a.a.s the domination number of $G(n, p)$ satisfies,

$$\gamma(G(n, p)) = (1 + o(1)) \log_q n$$

Where $q = \frac{1}{1-p}$.

Definition:2.5 $\gamma_c(G(n, p))$

An Connected Domination Random Graph $\gamma_c(G(n, p))$ with fixed parameter $p_n = p > 0$ and the number vertices n tending to infinity. Then a.a.s the connected domination number of $\gamma_c(G(n, p))$ satisfies,

$$\gamma_c(G(n, p)) = \lceil \log_q n + a_n \rceil$$

Where a_n be any sequence of $G_c(n, p)$.

An Isolated Connected Domination in Random Graphs:**Definition:3.1 $\gamma_{ic}(G(n, p))$**

An Isolated connected dominating set S of a $G(n, p)$ is a dominating set

$S \subset V(G(n, p))$ such that $\langle S \rangle$ is union of a connected $G(n, p)$ and some (at least one) isolated vertices. An Isolated connected dominating number of $G_c(n, p)$ is denoted by $\gamma_{ic}(G(n, p))$.

**Propositions:3.2**

A Connected Random Graph $\gamma_c(G(n, p))$ with m (fixed) edges is equally likely to be any of the $\binom{n}{m}$ graphs with m edges.

Proof:

Let any graph with m edges(fixed), its G .

Probability $[G_c(n, p)] = G[|E(G_c(n, p))| = m]$

$$\begin{aligned} &= \frac{\text{Pro } [G_c(n, p) = G]}{\text{Pro } [|E(G_c(n, p))| = m]} \\ &= \frac{p^{|E(G)|} (1-p)^{\binom{n}{2} - |E(G)|}}{\binom{n}{m} p^{|E(G)|} (1-p)^{\binom{n}{2} - |E(G)|}} \\ &= \frac{p^m (1-p)^{\binom{n}{2} - m}}{\binom{n}{m} p^m (1-p)^{\binom{n}{2} - m}} \end{aligned}$$

$$\text{Probability } [G_c(n, p)] = \frac{1}{\binom{n}{m}}$$

Example:3.2.1

A Connected Random Graph $G_c(n, p)$ on 3 vertices with 2 edges (fixed)

Is given by

Above $G(n, p)$ figure having same Probability $\frac{1}{3}$.

Theorem:3.3

In connected Random Graph $G_c(n, p)$, consider P is a monotone increasing property and $0 \leq p_1 < p_2 \leq 1$, $G \sim G_c(n, p_i)$, $i=1,2$.

Propability $[G_1 \in p_1] \leq \text{Propability } [G_2 \in p_2]$

Propositions:3.4

If a Random Graph $G(n, p)$ admits isolated connected vertex set, then $\text{diam}(G(n, p)) \geq 2$. (a.a.s)

Proof

Let X be the eccentricity of vertex v .

$\Pr(x = 1) = p^{n-1}$, which goes to 0 as $n \rightarrow \infty$

$\Pr(X > 2)$ indicates that there is a vertex u such that u is not connected (isolated vertex) to v or any of the vertices that is directly connected to v .

So, $\Pr(X > 2) = (n-1)(1-p)^{|S|+1}$

Where S is the set of vertices connected to v . Since $|S| = np + o(1)$ when n is sufficiently large, $\Pr(X > 2)$ also goes to zero as n goes to infinity.

Sirajunisha and Krishnan

Just an approximation $|S| = (n-2)p$, the probability that a given pair of vertices is not connected by a path of length 2 is $(1-p^2)^{(n-2)}$. Since all edges forming these potential paths are distinct.

Thus the expected number of pair not thus connected is $\binom{n}{2}(1-p^2)^{(n-2)}$, which goes to zero as $n \rightarrow \infty$ at fixed $p > 0$.

The probability for the diameter to exceed 2 is less than this expected number and thus also goes to 0.

Example:3.4.1

If $G_c \sim G_{ic}(n, n^{-\frac{1}{3}})$ prove that $G_{ic}(n, n^{-\frac{1}{3}})$ has diameter 2 almost surely.

Solution

Let X_{uv} be the indicator for the event A_{uv} that no other vertex in $G(n, p)$ is adjacent to u or v .

Show that $E[X] \rightarrow 0$ as $n \rightarrow \infty$ (ie) (it has diameter 2 almost surely)

$$E[X] = E[\sum_{(u,v) \in \binom{V}{2}} X_{uv}]$$

$$= \sum_{(u,v) \in \binom{V}{2}} E[X_{uv}]$$

$$= \sum_{(u,v) \in \binom{V}{2}} P[A_{uv}]$$

$$= \binom{n}{2} (1-p)(1-p^2)^{(n-2)}$$

In this situation given above problem $p = n^{-\frac{1}{3}}$

$$\binom{n}{2} (1-p)(1-p^2)^{(n-2)} = \binom{n}{2} (1-n^{-\frac{1}{3}})(1-n^{-\frac{2}{3}})^{(n-2)} \cong \binom{n}{2} (1-n^{-\frac{1}{3}}) \exp(-n \cdot n^{-\frac{2}{3}}) n \rightarrow \infty = \binom{n}{2} (1-n^{-\frac{1}{3}}) \exp(-n^{\frac{1}{3}}) \rightarrow 0.$$

Propositions:3.5

If a Random Graph $G(n, p)$ admits Isolated connected set then

$$\gamma(G(n, p)) \leq \gamma_{ic}(G(n, p)) \rightarrow 1 \text{ as } n \rightarrow \infty$$

Proof

There is no relationship between $(G(n, p))$ and $\gamma_{ic}(G(n, p))$.

The domination number of $G(n, p) = (1 + o(1)) \log_q n$ where $q = \frac{1}{1-p}$.

Case(i)

$\gamma(G(n, p))$ is no larger than $\lceil \log_q n + a_n \rceil$ with probability approaching unity.

$$P(D \leq \lceil \log_q n + a_n \rceil) = P(\exists \text{ a dominating set of size } r := \lceil \log_q n + a_n \rceil)$$

$$\geq P(\{1, 2, \dots, r\} \text{ is a dominating set}) \therefore p = p^{n-r+r}$$

$$= (1 - (1-p)^r)^{n-r} = (p^r)^{n-r}$$

$$\geq 1 - (n-r)(1-p)^r = (1 - (1-p)^r)^{n-r}$$

$$= 1 - n(1-p)^r + n(1-p)^r \geq 1 - n(1-p)^{\log_q n + a_n}$$

$$= 1 - n(1-p)^{\log_q n} \cdot (1-p)^{a_n} = 1 - n \cdot (q)^{\log_q n} (1-p)^{a_n}$$

$$= 1 - (1-p)^{a_n} = 1 - 1 + p^{a_n} = p^{a_n} \rightarrow 1$$

Case(ii)

$$p(\gamma_{ic}(G(n, p))) \leq \lceil \log_q n + a_n \rceil \rightarrow 1 \text{ as } n \rightarrow \infty.$$

Let a_n be any sequence approaching infinity then,

$$p(\gamma_{ic}(G(n, p))) \leq \lceil \log_q n + a_n \rceil = P(\exists \text{ a dominating set of size } r := \lceil \log_q n + a_n \rceil) \geq P(\text{vertices } \{1, 2, \dots, r\} \text{ form a dominating set})$$

Now a set consisting of r vertices which we will call M_r . Let N_r be the set with the remaining $(n-r)$ vertices and some (at least one) isolated vertices. It becomes the vertices $\{1, 2, \dots, r\}$ forming a dominating set is connected to every vertex in N_r having at least one neighbour in M_r (i.e) $M_r \cup N_r = V(G(n, p))$.

$$p(\gamma_{ic}(G(n, p))) \leq \lceil \log_q n + a_n \rceil \geq p(\text{vertex } v \text{ in } M_r \text{ is adjacent to } u \text{ in } N_r)^{n-r}$$

Now use that the probability of vertices forming an edge is independent. Then probability if a vertex v in N_r not having any neighbour in M_r .

$$p(\gamma_{ic}(G(n, p))) \leq \lceil \log_q n + a_n \rceil \geq (1 - p(\text{vertex } v \text{ in } N_r \text{ has no neighbour in } M_r))^{n-r} = (1 - (1-p)^r)^{n-r}$$

Where to the fact that edge from a vertex v in N_r to a vertex u in M_r with probability $1-p$ and having r possibilities for vertices u in M_r . then,

$$\geq 1 - (n-r)(1-p)^r = 1 - n(1-p)^r + n(1-p)^r \geq 1 - n(1-p)^r \geq 1 - n(1-p)^{\log_q n + a_n}$$

Sirajunisha and Krishnan

$$\begin{aligned}
 &= 1 - n(1-p)^{\frac{\log n}{\log(1-p)} + a_n} \\
 &= 1 - n.(e)^{\frac{\log(1-p)}{\log(1-p)} + a_n} \\
 &= 1 - (1-p)^{a_n} \\
 &= 1 - 1 + p^{a_n} \\
 &= p^{a_n} \rightarrow 1
 \end{aligned}$$

We assumed that $a_n \rightarrow \infty$ as $n \rightarrow \infty$ and since $p > 0$ we have that $1-p < 1$.

This results in $(1-p) \rightarrow 0$ as $n \rightarrow \infty$.

$$p(\gamma_{ic}(G(n,p))) \leq \lceil \log_q n + a_n \rceil \geq 1 - (1-p)^{a_n} \rightarrow 1-0=1.$$

From the case(i) & (ii), $\gamma(G(n,p)) \leq \gamma_{ic}(G(n,p)) \rightarrow 1$ as $n \rightarrow \infty$.

Example:3.2.1

Here $n=3$, $p=1/3$, $\gamma(G(n,p)) = (1+o(1))\log_q n$

$$\gamma(G(3,1/3)) = \lceil (1+2)\log_{1.5} 3 \rceil = \lceil 1.43136 \rceil = 1.$$

Here $n=3$, $p=1/2$, $\gamma_{ic}(G(n,p)) = (1+o(1))\log_q n$

$$\gamma_{ic}(G(n,p)) = \lceil (1+1)\log_2 3 \rceil = \lceil 0.954 \rceil = 1.$$

ABSTRACT

This study aims to provide the analysis of COVID-19 pandemic in India and address economic impact, diagnosis approaches, and vaccine acceptance and hesitation. The investigation of this development factor is crucial since it informs the appropriate individuals or organisations on how to handle the impending widespread epidemic. The goal of the current study was to determine how the daily increase in confirmed COVID-19 instances related to cases that were curing and dying based on the model that fit them the best and was helpful in forecasting growth, cure, and death.

Keywords: COVID-19 in India, COVID-19 testing, Coronavirus Vaccine, COVID-19 statistics of India.

INTRODUCTION

The COVID-19 pandemic is the worldwide pandemic of coronavirus disease in 2019. It evolved rapidly. This rapid spread has already made a catastrophic mark this century [1]. The World Health Organisation (WHO) has announced and intimated that the worst of COVID-19 is yet to come, while the United Nations has tailed that since World War II, this coronavirus pandemic is the most global crisis [2-3]. The goal of each nation is to bring the rising indicator of COVID-19 cases to zero. Some countries were successful in bending the curve of new cases. However, the majority of countries are far from the goal, as the number of worldwide confirmed cases is increasing very fast. India is also experiencing the same. It is the worst situation that, in relation to this COVID-19 pandemic, everybody knows the exact number of actual cases. Only the confirmed cases, which are a fraction of the real number, are

**Shilpa S. Shinde and Kakade**

known. It is observed that India's rate of case progression is slower as compared to some countries, viz., Japan, South Africa, the U.K., the U.S., South Korea, Australia, and Italy. This is because the rate of testing is poor as compared to these countries [4-5]. India is one of the five most affected countries. India reported the first case on January 30, 2020, which crossed the counter of 10 lakh in the second fortnight of July 2020 while crossing the counter of 25 lakh on August 15. Every Indian, including laymen and all-level authorities, is in the dark, unable to guess what the scenario the scenario will be tomorrow, day after tomorrow, and so on, if the current situation of growth remains as usual! Under these circumstances, it is essential to understand the growth rate, which will help in the planning and preparation of further management to rescue the affected. The statistical indicator 'Growth Factor', which implies alteration in a quantity over time, plays an important role in such an assessment. The base considered to quantify the growth is the ratio of cases from the current day to the cases from the previous day. If the value of this indicator is <1 , it is an indication of decline, while ≥ 1 implies exponential growth. It is needed to know the growth in relation to all facets, i.e., the daily increment in new cases, as well as the velocity of cure and death. The study of such growth factor is very important as it aware the responsible personnel or agencies to cope up with the arriving large scale pandemic. Thus, the present study was planned to understand the daily augmentation in confirmed COVID-19 cases with cases that are curing and dying on the basis of the model, which is most appropriately useful in predicting growth, cure, and death.

METHODOLOGY

Data regarding confirmed daily cumulative cases of COVID-19, with cases curing and dying worldwide, in India and Maharashtra, was retrieved with the aid of a Google search engine that was published by media and government agencies. The daily rate of change in the number of cases confirming, curing, and dying was evaluated. Growth factors as well as regression analysis with the aid of linear, quadratic, compound, logarithmic, growth, cubic, and exponential approaches were exposed to assess the data trend. The prediction ability of the model was assessed. The reference data utilized to serve the study objectives was that published for a period of more than four months from April 1, 2020.

RESULTS

Various regression models tried to assess its fitting over data available for a period of around 131 days. Missing or non-availed data, during period of was estimated by using best fitted regression model on data prior to that missed day data. Introducing this missed data at its appropriate day, the next missed data, if any, for day $x+i$ was estimated from previous $x+i-1$ observations and the complete data was made ready for final analysis. Using this completed data set the final regression model was derived. Every time, for estimation of missed data as well as for future prediction, the best regression model was selected on the basis of following criteria.

- i) high R^2 value of the regression model,
- ii) significance of factors as per ANOVA (more than one non-significant factor produces over or under estimation for day ' x ' in comparison to the next day ' $x+1$ ') in case of missing data,
- iii) lesser residual values (smaller Minimum to Maximum range of residual values for all observed values used in model development),
- iv) lesser range of lower limit of 95% confidence intervals (LCL),
- v) lesser range of upper limit of 95% confidence intervals (UCL), and
- vi) narrower 95% confidence intervals of the estimate (Range of differences between UCL and LCL). However, the cubic regression followed by quadratic regression revealed the best fit, every time. Thus, the cubic regression model was employed for estimating the cases in all ways; confirming, curing and dying; in future. The model satisfying as maximum criteria as possible was utilized to estimate the missing as well as to predict for any day. Data for 131 days regarding affected and died cases while for 117 days of cured cases of Maharashtra, was used to study the trend. Data search for affected, cured and deaths revealed that cured started to observe after 15th day since affected.

**Shilpa S. Shinde and Kakade****Maharashtra**

Growth rate of cases, i.e. the ratio of cases of current day to the cases of previous day, ranged from 0% to 44.6% (Fig 1). In the initial period it found to be very high, however this rate found declining as time passed. It was about 2% in the last week of July.

Cure rate, i.e. ratio of cumulative total cured to cumulative total affected on current day, ranged from 6% to 59.3% (Fig 2). Since beginning it showed gradual rise in this rate.

In the initial period for 25 days death rate, i.e. ratio of cumulative total deaths to cumulative total affected, found increased. 26th day onward it declined and it stabilized around 3.6%.

DISCUSSION

The number of corona berths found increased rapidly not only in metropolitan cities but also in towns and villages worldwide. Although only 5% of battles were serious, the number of beds for them was very low. Science was intimating that the cases of CIVID would continue to increase. However, the crisis was exacerbated by the fact that privatization has not led to an adequate increase in the number of government hospitals. This is one of the major causes of death for people affected by the COVID-19 virus. It was also observed that the epidemic slowed down in areas where the administration paid special attention and used adequate health personnel and other equipment properly. However, there was a dire need that it should be slowed down so that there would be no havoc. But according to some experts, after acquiring corona by 60–65 crore people in India, the herd immunity develops biologically, leading to the permanent downfall of this epidemic permanently [6]. The declining growth rate of cases in Maharashtra indicated slow progress in new cases. But this small amount of addition in the present big quantity results in a big number, i.e., 2% of 100 is 102, while of 1000 it is 1020, which reflects like havoc! The rising trend of the cure rate and the stabilisation of the death rate implied an overall improvement in health care services as well as facilities.

CONCLUSION

Maharashtra went through one of the biggest sufferings during the COVID-19 pandemic. The pandemic posed extensive health and socioeconomic challenges and also became the largest disruption in the Indian economy. In summary, we observe the major reasons behind the COVID-19 pandemic in the Indian context, to identify the pitfalls in the public healthcare system and economic preparedness to tackle a pandemic situation. We further highlight the role of citizens in aiding the fight against this kind of national or global disaster by obeying the government advisories of social distancing and containment. The increasing trend in the cure rate and the stability of the death rate suggested that medical facilities and services had generally improved.

ABSTRACT

Consumption of tender coconut water is very common in South East Asian countries and the Pacific which invariably led to the generation of tender coconut shell causing pollution. To augment the wastage and to make better use of the tender coconut shell, it has been evaluated for the availability of polyphenols by extracting it in distilled water at different intervals of time. The maximum extraction of polyphenols took place at 48 hours and it was 1.17mg/ml. The extracted polyphenols were also evaluated for its antifungal and antibiofilm activity and it was found that there was no antifungal activity whereas, at a concentration 1000µg/ml there was a weak antibiofilm activity and the MIC is greater than 1000µg/ml.

Keywords: Polyphenols, Tender Coconut Shell, Extraction, Antifungal, Antibiofilm

INTRODUCTION

Coconut trees *Cocos nucifera*. (L) commonly called coconut palm is a member of the Arecaceae family and is also the only living member of the genus *Cocos*. It is cultivated mainly in the tropical and sub-tropical areas which have high humidity, sandy soil and regular rainfall. The coconut tree provides food, fuel, cosmetics, folk medicine and building materials, among many other uses[1]. Botanically the coconut fruit is a drupe, not a true nut. Like other fruits, it has three layers: the exocarp, mesocarp and endocarp. The exocarp is the glossy outer skin, usually yellow-green to yellow-brown in colour. The mesocarp is composed of a fibre, called coir, which has many traditional and commercial uses. Both the exocarp and the mesocarp make up the "husk" of the coconut, while the endocarp makes up the hard coconut "shell". The endocarp is around 4 mm thick and has three distinctive germination pores (micropyles) on the distal end. Two of the pores are plugged (the "eyes"), while one is functional. The interior of the

**Anie T. Uthup and T R Satyakeerthy**

endocarp is hollow and is lined with a thin brown seed coat around 0.2 mm thick. The endocarp is initially filled with a multinucleate liquid endosperm (the coconut water). As development continues, cellular layers of endosperm deposit along the walls of the endocarp up to 11 mm thick, starting at the distal end. They eventually form the edible solid endosperm (the "coconut meat" or "coconut flesh") which hardens over time.

The clear liquid within young coconuts (tender coconuts), typically those aged around 5–7 months, is commonly known as tender coconut water and this liquid is unique to coconuts during their tender phase of development [2]. The immense nutritional and health benefits of tender coconut water have paved its way for its consumption across several countries alike. Extensive consumption of tender coconut water has led to the generation of tender coconut shell which is usually discarded as a solid waste across beaches and streets causing serious environmental pollution. These tender coconut shells though biodegradable takes a very long time to degrade on its own. At present, in addition to edible coconut water as a beverage and the kernel as the source food or oil, small amounts of the meso- carp and endocarp are used to produce activated carbon, carpets, ropes and agricultural fertilizers, etc. [3]. There are findings and research studies which reveal the presence of large amounts of polyphenols in coconut husk and its pericarp [4,5]. Most of these studies were done on the exocarp, mesocarp and the pericarp but no research was done on the tender coconut shell. Thus, to abate environmental pollution due to the wasted tender coconut shell and to explore the availability of polyphenols in tender coconut shell for its applications the present study has been carried out.

MATERIALS AND METHODS

Plant Material and Preparation of Extract

Two fresh tender coconuts of 4-5 months maturity were collected from the farms at Thiruvananthapuram, Kerala, cleaned, de-husked and dewatered to obtain the tender coconut shell. These tender coconut shells were cleaned properly with water, broken into small pieces, and are immersed in 750 ml distilled water in a 1L glass beaker. The total polyphenol content in the extract was measured following Folin-Ciocalteu method at intervals of 24 hours, 48 hours, 72 hours, 96 hours, and 120 hours respectively.

Determination of Total Polyphenols

Aliquot of 1ml extract was mixed with 1.25 mL Folin–Ciocalteu reagent (0.2 N diluted in MeOH). A reagent blank using MeOH without the extract was prepared. After 5 min incubation at room temperature, 1 ml sodium carbonate solution (75 g/L) was added. Samples were incubated at room temperature for 2 hours and the absorbance was measured at 765 nm. All tests were carried out in triplicate and total polyphenol content was expressed as mg of gallic acid equivalents (GAE) per g of extract.

Determination of Antifungal Activity

Agar well diffusion method was used to evaluate the antifungal activity of the polyphenol extract. For this, Mueller–Hinton agar and Potato Dextrose agar in the ratio of 1:1 was poured on petri dishes and allowed to solidify. Standard inoculums of the test organisms like *Candida albicans* (MTCC No.227), *Aspergillus niger* (MTCC No.872), *Mucor mucedo* (MTCC No.3169), *Penicillium chrysogenum* (MTCC No.5108), *Rhizopus stolonifera* (MTCC No.958) and *Fusarium oxysporum* (MTCC No.9913) were uniformly spread on the surface of the plates using sterile cotton swab. Four wells with a diameter of 8mm (20mm apart from one another) were punched aseptically with a sterile cork borer in each plate. The extract (50 and 100 µL) was added into the wells directly. Clotrimazole (40 µL from 300 mcg/ml stock) and distilled water was added as positive and negative control respectively. The plates were incubated for 48 hours at 27°C ±1°C, under aerobic conditions. After incubation, the plates were observed and the zone of bacterial growth inhibition around the wells was measured in mm.

**Anie T. Uthup and T R Satyakeerthy****Determination of Antibiofilm Activity**

The quantitative test was performed for determination of biofilm production using microtiter plate (48well) method (MtP). The experiment was set according to Manukumar et al. [2017] with slight modifications. Bacterial suspension (final OD₆₀₀ = 0.01), prepared by diluting an overnight *Bacillus subtilis* culture in Trypticase Soy broth (TSB) supplemented with glucose (10 g/100 mL) was prepared added to the interior wells of a 96-well polystyrene microtitre plate containing 10 µL of the sample (1mg/ml) or 10 µL of vehicle control. The plates were incubated overnight at 37 °C under static conditions to allow bacterial growth and biofilm maturation. The following day, bacterial growth was quantified by recording OD₆₀₀ of each well using an Epoch Microplate Spectrophotometer (Thermoscientific Multiscan skyhigh). The planktonic cells and the spent medium were discarded, and the adhered biomass was rinsed three times with sterile distilled water. The biomass was stained with 0.1% CV solution for 20 min and then rinsed three times with distilled water to remove unbound dye. The bound CV dye was resuspended in 70% ethanol with gentle mixing and the A₅₉₅ was recorded in the same sample plate. The amount of biofilm inhibition was calculated relative to the amount of biofilm that was grown in the absence of sample (defined as 100% biofilm) and the media sterility control (defined as 0% biofilm). To quantify the intensity of biofilm, the mean OD was compared to the OD of negative control (only TSB medium; No drug or test sample). As standard drug gentamycin was used. Medium without bacterial cells was used as blank. Results from at least three separate biological replicates were averaged.

RESULTS AND DISCUSSION

The polyphenols extracted at different time intervals are depicted in Fig 1 and it has been found that the maximum extraction of polyphenols of 1.17mg/ml took place at 48 hours, after which there was decline in the concentration of the polyphenols extracted. It is important that the extraction procedure is standardized so that the maximum amount of the required compound is obtained for further isolation, purification and for examining its applications [6]. Anti-fungal activity of the extracted polyphenols on fungal cultures are given in Table 1 and it has been found that the polyphenols do not show any antifungal activity on the fungal cultures tested. The antifungal activity is thus limited to the fungal cultures that are tested in this present study and to the concentration of the polyphenol extract used. However, there can be antifungal activity if the polyphenols are tested over other fungal cultures and at a higher concentration of the polyphenol extract. It is also essential to consider the source of the polyphenols, the quantity, and the extraction methods as well as the cultures used while investigating the antimicrobial properties [7].

The biofilm inhibition was rated between 0 and 100%. Values below and at 0% were categorized as biofilm growth enhancement; between 0–50% indicated weak anti-biofilm activity, and above 50% represented good biofilm inhibition. From the results indicated in Table 2 at a concentration of 1000µg/ml of polyphenols there is a weak anti-biofilm activity and thus the minimum inhibitory concentration of the polyphenol extract is found to be greater than 1000µg/ml. Therefore, if the concentration of the polyphenols is further increased above 1000µg/ml there could be a good biofilm inhibition. Bacteria adopt biofilm as a lifestyle to circumvent environmental stresses and biofilm formation is a multistep process, which involves (i) bacterial attachment, (ii) maturation, and (iii) bacterial release [8]. Among infectious diseases, the contribution of biofilm-forming bacteria has gained attention. Biofilm-forming bacteria cause around 65–80% of infectious diseases [9]. Such biofilm-related infectious diseases are typically chronic [10]. Despite enormous research efforts to treat infectious diseases, there are no assured treatment options. Antibiofilm agents that target their formation and stability have been evaluated, and very few products have been tested in clinical trials [11]. In this context, as the present study shows some amount of antibiofilm activity it is suggested that similar evaluation of antibiofilm activity can be performed on several other bacterial cultures which form biofilms.

Anie T. Uthup and T R Satyakeerthy

CONCLUSION

Tender coconut shell which normally goes as a waste has now been found to contain a good amount of polyphenols and these crude polyphenols were evaluated for its efficiency as an antifungal agent and antibiofilm formers. The study was limited to certain fungal cultures and it could be analysed on other fungal cultures also with higher concentrations of polyphenols. As far as the antibiofilm activity is concerned, targeting the biofilm formation process is more desirable than targeting fully formed biofilms for the treatment of infectious diseases.

ABSTRACT

The *Cow* was revered as a sacred animal in ancient India because of her maternal qualities, which led to its treatment as a mother. *Cows* and the products they produce are also very helpful to humans because they are used in agriculture, the painting and cosmetics industries, and medicine for a variety of ailments since ancient times. Because of its antibacterial qualities, *Cow* dung is utilized by many villagers to paint their hut walls and clean the surrounding area. It also keeps the temperature of the room cool in the summer. As a result of this property, organic *Cow* dung paint is being produced with a high business potential. Due to the agnihotra, the two families were spared the damaging effects of the methyl isocyanide gas that was discharged from the Union Carbide Plant in Bhopal on the evening of December 3, 1984. The panchagavya therapy uses five *Cow* products to treat a variety of illnesses and ailments, including the flu, allergies, colds, cough, arthritis, leukoderma, leucorrhoea, alopecia, and asthma. These products can be taken alone or in combination with other medications of herbal, animal, or mineral origin. Amith Vaidhya, a person, was able to survive cancer by include *Cow* products in his diet, demonstrating the potential of *Cow* products to combat cancer. This is evidence that *Cow* products have anticancer properties. A type of animal-assisted therapy known as "*Cow* cuddling or hugging" includes brushing, caressing, or simply just talking with your new, reliable psychologists which was believed to reduce anxiety and stress.

Keywords: Panchagavya, Bhopal gas tragedy, *Cow* cuddling therapy, *Cow* dung paint.

Trinadha Rao et al.,

INTRODUCTION

The *Cow* was revered as a sacred animal in ancient India because of her maternal qualities, which led to its treatment as a mother. The name "gaumata" or "kamdhenu" refers to a sacred *Cow* in India that is thought to grant wishes. Our Indian economy is built on *Cows*. The sacredness of *Cow* s Hinduism holds that *Cows* are products of nature and divine beneficence, and as such, they should be worshipped[1].When we think of *Cows* as a source of milk, dung, urine, ghee, and curd, we see more benefits than when we think of killing them for meat. *Cows* and the products they produce are also very helpful to humans because they are used in agriculture, the painting and cosmetics industries, and medicine for a variety of ailments since ancient times. Numerous studies have been conducted on products derived from *Cows*, and the results have shown that these products are beneficial in a variety of fields, including agriculture, paper manufacturing, and pollution management due to their natural and environmentally favorable nature. They can be used for a variety of medical purposes as well Panchagavya treatment is the name given to the practise of using *Cow* products—milk, curd, ghee, dung, and urine to treat various diseases and problems. Another animal-assisted therapy that uses *Cows* as a key character to help patients with anxiety and depression is called " *Cow* hugging" or " *Cow* cuddling" therapy.

COW PRODUCTS

COW MILK: The component found in *Cow* 's milk that is comparable to mothers' milk *Cow* milk's low calorie, low cholesterol, and high content of protein, calcium, and vitamins make it a healthy food. It has complex C, vitamin A, and carotenoids. It is readily absorbed, making it highly nourishing for both adults and children[2]. Among other dairy products, *Cow* milk is special because it contains enough nutrients in a concentrated enough way to suit human demands for both physical and cognitive development[3]. *Cow* milk has a PH of 6.6 to 6.7.While other breeds produce milk of the A1 kind, Indian breed *Cows* produce milk of the A2-type. India's *Cow* milk has a high content of nutrients and only 4.6% lactose. 0.59% minerals and 4.65% fat 3.4% of proteins 86% water. 27 % beta casein, 9 % k-casein, 36% alpha casein, and 27 % peptides are found in *Cow* milk protein[4]. The constituents of *Cow* milk and colostrums was described in table.1.

BENEFITS OF COW MILK

Strengthening of bones and teeth

The calcium and phosphorus found in *Cow*'s milk helps to strengthen large teeth and bones.

Healthy heart

potassium, calcium, and phosphorus keep the heartbeat stable.

Low cholesterol

fat content in milk is essential for both mental and physical development.

Energy

It is provided by lactose and vitamins, riboflavin, and keeps the immune system, brain, and digestive systems functioning.

Boost your vision

It Improve vision because it has 250 milliliters of *Cow* milk and vitamin A-carotene. Due to the presence of vitamin K, it controls the blood clotting process. Breastfeeding is one way to treat baby anemia. It encourages the growth of healthy gut flora and inhibits the growth of dangerous gut bacteria, milk-based enzymes

**Trinadha Rao et al.,****Bovine milk and the corona virus**

when substantial quantities of the virus coated in mucous discharge are consumed, the BIM inactivates the virus. The ingested antibodies attach to some shared antigenic structure of SARS-COV2, which is duplicated and distributed into the GIT[5].

COW GHEE

Cow ghee has been used for religious rituals and as a therapeutic substance in Ayurveda from ancient times in India. Traditional methods of preparing *Cow* ghee are said to be helpful in healing and in promoting health. Compared to ghee made from the milk of other exotic *Cow* species, it has greater health benefits.

BENEFITS OF COW GHEE

It has long been believed that ghee improves speech, memory, vision, IQ, and the body's ability to fight off illnesses. Ayurvedic practitioners think that ghee and *Cow*'s milk improve memory. It enhances digestion and is beneficial for those with impaired vision[6].

Ghee-based formulations

which are designed to improve the bioavailability and targeted delivery of hydrophobic botanicals. As an illustration, consider Brahmi Ghrita for mental clarity, Vasa Ghrita for the respiratory system, Shaptadhatu Ghrita for skin conditions, Bhallatakadi Ghrita for wound healing, and Kaamdev Ghrita for sexual dysfunctions, among others. A combination of *Cow* ghee, honey, vitamins, and the non-fat portion of *Cow* milk were tried as micronutrients[7].

Anti cancer activity

A study comparing the effects of *Cow* ghee vs soya bean oil on rats' mammary glands showed that *Cow* ghee has anticancer potential. The study also found that *Cow* ghee produced mammary carcinogenesis and that the expression of cox-2 and peroxisome proliferators activated receptors- γ (PPAR- γ) in the rats' mammary glands. *Cow* ghee composition & medicinal properties were described in figure.1.

COW CURD

It's sometimes referred to as "yogurt" or "Dahi" is consumed all over the world because of its great nutritional content and health advantages. Probiotics, or good live microorganisms, are abundant in curd and provide a variety of health benefits when taken orally. Lactic acid-producing bacteria in curd produce metabolites like cyclic dipeptides. Phenyl Lactate's antifungal properties[8]. Composition and calories of *Cow* products is described in table.2.

BENEFITS

It is an excellent probiotic that includes beneficial bacteria that are known to enhance intestinal activity, which in turn helps with digestion and soothes upset stomachs.

Boost immunity

Curd contains living bacteria that can combat pathogenic microorganisms and safeguard the gut and intestinal health. There is evidence to support the notion that curd, a probiotic has a strong immune-boosting effect.

For skin that is healthy

curd helps to support gut health, which results in skin that is vibrant and healthy. It is an excellent ingredient since it contains a lot of lactic acid, which acts as fantastic exfoliant that removes all imperfections and dead cells.

Strengthen bones and joints

The minerals calcium, magnesium and phosphorous found in curd help to strengthen teeth and bones. A tiny amount of curd in our diet strengthens our connective tissues and lowers our risk of developing weakening diseases like osteoporosis and arthritis.

**Trinadha Rao et al.,****Reduces hypertension**

Potassium helps the body eliminate extra salt, which eases the strain on the heart muscle and lowers high blood pressure. Regularly eating a specific amount of non-fat yogurt with meals reduces the symptoms of hypertension and promotes heart health[9].

Regarding vaginal infections

Curd's multitude of beneficial microorganisms not only improve digestion by guaranteeing ideal gut flora, but also treat female vaginal yeast infections. By producing hydrogen peroxide, a specific microbe called *Lactobacillus acidophilus*, which is found in large amounts in yogurt, kills the dangerous yeast growth that is close to the vagina. This relieves pain and discomfort while suppressing the contagious bacteria in the vagina. Cow curd benefits and composition was described in figure.2.

COW DUNG

In India's natural regions, dried Cow dung cakes are used as a cooking fuel, which reduces reliance on external energy sources, is completely environmentally benign, and ensures air purification by eliminating airborne bacteria. Cow dung is better than other dung because it contains preventive and antibacterial qualities. The amount of curd fiber (90%) and carbohydrates(20%), ash (10.5%), crude protein (7%), crude fat (4%), and moisture (18.5%) in dung are all dependent on the grain and forage that Cows are given during domestication. Cow dung has a pH between 6.5 and 7.1.

BENEFITS OF COW DUNG**Soil fertility enhancer**

Cow dung, used as a bio fertilizer, can replenish the mineral states of the soil, giving plants resistance against pests and immune system development, as well as sulphoxidation and phosphorus solubilization. Cow manure was used to make African deserts fertile. With 1 kg of manure, 15–16 kg of biomass, and soil of comparable grade, we can create 3 kg of high-quality compost. Out of every kilogram of excrement, a healthy Cow yields about ten kilograms. It yields 33 kg of manure, also referred to as organic manure. This has also been accepted by the "NATIONAL BANK OF AGRICULTURE AND RURAL DEVELOPMENT (NABARD)" this. It has been demonstrated that manure from dung provides the cultivation soil with 18 micronutrients, including calcium, iron, cobalt, manganese, phosphate, and potassium[10].

Fuel

Dung as fuel is well known in rural kitchen. Cow dung patties [gootte] are used for cooking. Cooking foods using dung cakes is traditional practice followed in village of our country. It has advantage, when food is cooked by using dung patties, the temperature never rises beyond a certain point that prevents overheating and doesn't destroy nutrient in food[11].

Seed protector

Covering seeds in dung before planting, protect the seed against pest so it is an excellent conditioner for soil.

Gobar gas

Dung is best valuable source of energy as it produces biogas [methane] and also generate electricity. Biogas is a form of renewable energy for cooking, lighting of homes and street light. The self-combustion engines can be driven by using this biogas. Example: Running generator to produce electricity.

Petrol making

According to Japanese scientist 'sukae shibusawa' at Tokyo university of agriculture and technology, cattle dung is new source of petrol [gasolin], extracted from dung by application of high pressure and heat.

Trinadha Rao et al.,

Floor coating

Mixed with mud and water serves to coat the walls of mud houses. it has antiseptic property.

Mud brick additive

It is proven that mud huts plastered with dung keep insects and reptiles away.

Mosquito repellent

Smoldering of Cow patties keeps away mosquitoes from the houses.

Pot cleaner

Pots can be cleaned by dung. So, it is good cleaning agent for utensils.

As a container

By using containers made of Cow dung, the grains can be stored for long time.

PH balancer

As dung neutralize acid content in water when thrown into ponds.

Resistant to radiation

Several scientific studies have been proved that the Cow dung is resistant to solar radiation by applying thick layer of Cow dung on walls houses prevent incidence of gamma rays as it absorbs rays emitted from solar emission.

Dhoop sticks preparation

By mixing fine powder of nagarmutha, ral, lalchandhan, jatamachi, Kapoor kajuri & ghee in Cow dung produces oxygen when burnt.

Environmental protection

Dung from single Cow in its life span can produce 4,500litres of biogas which is equal to burning 6,80,00,000 tons of wood. This will help us to have 14 crore trees from cutting and burning& thus gives protection to environment. 1 spoon of ghee on burning Cow dung evolves 1 ton of oxygen[12].

BHOPAL GAS TRAGEDY

On the evening of December 3, 1984, a deadly gas known as methyl isocyanide (MIC) spilled from the Union Carbide plant in Bhopal. This catastrophe demonstrated the potency and significance of ghee. Two families, the families of Shri Sohan Lal S. Khushwaha and Shri M.L. Rathore, who lived around one mile away from the facility, escaped unharmed although hundreds of people died and thousands were hospitalized. These families practiced Agnihotra (Havan) on a regular basis. Despite being in the region most severely impacted by the deadly gas leak, none the members of these families passed away or were even admitted to the hospital. The published article of newspaper was depicted in figure.3. This suggests that agnihotra is a well-established remedy for pollution. On that fatal night, the intense smoke emitted by these Cow dung cakes served as an effective antidote to the hazardous Methyl Isocyanate (MIC) gas. Ghee, being one of Agnihotra's key ingredients, played an important role in detoxifying the noxious vapors surrounding it. Havan made with elements such as dry Cow dung, wood, ghee, rice grains, etc., when lit in fire, eliminates microorganisms and purifies the region.

COMMERCIAL PRODUCT OF COW DUNG

Cow dung paint is a commercial product also known as "khadi prakritik paint" or "vedic paint." Because of its antibacterial qualities, Cow dung is utilized by many villagers to paint their hut walls and clean the surrounding area. It also keeps the temperature of the room cool in the summer. As a result of this property, organic Cow dung paint is being produced with a high business potential. The paint is free of metals such as lead, mercury, chromium, arsenic, cadmium, and others. Khadi pratikrit distemper and emulsion paints were evaluated at three reputable laboratories,

**Trinadha Rao et al.,**

including the National Test House in Mumbai, Shri Ram Institute of Industrial Research, New Delhi, National Test House, Ghaziabad. Khadi pratikrit emulsion paint meets BIS 15489:2013 specifications, and khadi Pratikrit distemper paint meets the BIS 428:2013 standards[13].

Why is Cow dung used in the paint?

Boost air quality by as much as 50% qualities that are antiseptic, resistant to heat, economical (7–10/-per dung cake), Dried manure has no smell. It serves as an insulator, keeping heat inside during the winter and preventing it from escaping in the summer. It eradicates bacteria efficiently, It is extremely valuable and used to purify the air. Radium, which shields against UV radiation, is present in it. use of Cow dung has an inverse relationship with paint costs. serves as a coolant, removing the need for application[14]. HVAC up to 40,000/-in savings, reduces the requirement for heating by providing insulation, it produces a uniform, smooth surface after drying in less than 4 hours. Paint can be used on walls that are indoors or outdoors. The picture of vedic and pratikrit paint was given in figure.4.

COW URINE

Cow urine has various helpful effects, particularly in the fields of agriculture and healthcare. Cow pee is typically considered as safe since 95% is water, 2.5% is urea, and the remaining 2.5% is a mixture of the aforementioned minerals, hormones, and salts[15]. The composition of cow urine and their functions are given in table.3.

Benefits of COW urine: Agriculture

Distillation waste and Cow dung can be used to produce vermin compost. The use of vermin compost in pots increases the yield of "Medicago sativa". Cow urine acts as a disinfectant, purifies the environment, and improves land fertility[16].

Bio pesticides

2kg of neem leaves are soaked in 10kgs of urine and mixed with other vegetable waste [1:50] before spraying. Cow urine combined with neem leaves acts as a pest repellent due to its insecticidal, fungicidal, and pesticidal characteristics. Urine utility can generate modest amounts of power to power electronic clocks and kitchen appliances.

Medicinal uses include

Analgesia: it was discovered that the animals given Cow urine had comparable analgesic effects to the standard drug group given Diclofenac Sodium, reinforcing the recommendations of Ayurvedic texts to use Cow urine as a reasonably safe, easily available, and cost-effective natural analgesic.

Anti-diabetic activity

Streptozotocin (50 mg/kg) diluted in citrate buffer (0.1 M, pH 4.5) was administered to diabetic rats in a study on the utilization of Cow urine distillate. Compared to the diabetic control group, the increased levels of blood glucose, serum cholesterol, and serum triglycerides were significantly ($P < 0.05$) reduced by the Cow urine distillate. The diabetic rats given Cow urine distillate also had a notable increase in body weight and HDL levels[17].

Anti hemorrhoids activity

In both Grade I and Grade II hemorrhoids, a clinical evaluation of the efficacy of Cow urine demonstrated a significant reduction in pain during defecation, bleeding, and itching. This indicates that oral supplementation with Cow urine can prevent the time-consuming, painful, and costly complications associated with hemorrhoids of Grade I and Grade II.

Antimicrobial & fungal activity

Analyzed against pathogenic microbes, the antibacterial activity of Cow Urine Distillate (5, 10 and 15µl) was found to be maximal against *Pseudomonas aeruginosa* and *Salmonella typhi*. An analysis was conducted on the antifungal activity of Cow urine distillate against *Aspergillus niger* and *Aspergillus flavus*.

Trinadha Rao *et al.*,**Immunomodulatory activity**

It has been discovered that *Cow* urine distillate has an immune modulatory impact since it promotes T and B lymphocyte proliferation, blastogenesis, and elevated IgG levels in mice and chicks (avian species)[18].

As a bioenhancer

Rifampicin, a first-line treatment for tuberculosis, exhibits bio-enhancing activity for pharmaceuticals or medicines in *Cow* urine. Increase its effectiveness against *Escherichia coli* by seven times and against Gram-positive bacteria by eleven times as an Anti-tubercular medication. Additionally, it improves the transfer of antibiotics by a factor of two to seven-For instance: ampicillin, tetracycline, and rifampicin through artificial membranes and the gut wall.

The patents granted on cow products were described in table.4[19].

ECONIMICS OF COW PRODUCTS**COW URINE**

The average healthy *Cow* yields three liters of gaumutra. Now let's discuss gau mutra, or *Cow* dung. A *Cow* can yield two to two and a quarter liters of pee daily. Approximately 48 different ailments can be treated with urine, including diabetes, arthritis, bronchitis, bronchial asthma, TB, osteomyelitis and more! One liter of urine sells for approximately 500/- in the market; this may also be the case for the Indian market. However, a liter of urine can fetch more in international markets. The American government imports *Cow* urine from India each year to manufacture medications for diabetes, cancer, and other conditions. Therefore, if we base our calculations on the American market, a liter of *Cow* urine can fetch between 1,200 and 1,300/-. That implies just out. A healthy *Cow* may live for approximately 20 years, thus if we assume we can make \$10,95,000/-a year, we can make \$219,00,000/-millions from selling urine in 20 years.

COW DUNG

In the global market, a kilogram of organic manure sells for roughly six rupees. Thus, 10 kg of *Cow* dung sells for between 1800 and 2000 rupees each day [330 kg of manure for every 10 kg of dung, which is worth 6 rupees]. Thus, we can earn 657000/-year of *Cow* dung in 365 days of the year. *Cows* are 20 years old on average, and they excrete manure every day till the end. We could so make millions of dollars, or 1,31,40,000/-. Because *Cow* dung is high in nitrogen, it is the most effective crop nutrient. Additionally, using *Cow* dung and pee, scientists created specialized bio fertilizers that, when sprayed on crops, increased plant growth and productivity. It yielded nutrient-dense fruits that promote long life

COW MILK

A *Cow* can yield 28 liters of milk a day, with each liter valued at roughly 50 cents. It can therefore make 1400/-per day, 42000/-per month, 511000/-per year, 1400×365 /-per year, and 10,220,000/-(511000×20) during the course of its 20-year life span for 28 liters of milk. Over the course of their 20-year existence, we can make a total of 6,700/-per day, 2,01,000/-per month, 24,45,500/-per year, and 48,910,000/- from *Cow* products, which also include *Cow* manure, urine, and milk. The economics of cow products was given in table.5.

PANCHAGAVYA

The Sanskrit terms "gavya-means *Cow* derivatives" and "panch-means five" are the roots of the word "panchagavya." A mixture of five *Cow* products, including milk, dung, urine, curd, and ghee (two indirect and three direct products, respectively), is called panchagavya. Scriptures on vruksh ayurvedha (plants and health system) and the vedas honor the panvchagavy [20].*Cow* pathy, also known as Panchagavya chikitsa or therapy, is the term used to describe the panchagavya treatment. The panchagvyva therapy uses five *Cow* products to treat a variety of illnesses and ailments, including the flu, allergies, colds, cough, arthritis, leuco-derma, leucorrhoea, alopecia, and asthma. These products can be taken alone or in combination with other medications of herbal, animal, or mineral origin [21].

**Trinadha Rao et al.,****BENEFITS**

When Panchagavya is sprayed on plants, they always develop more leaves and a denser canopy. For optimal biological efficiency, the photosynthetic system is active, allowing for the synthesis of photosynthates and metabolites. It is possible for the Panchagavya to raise agricultural yield levels again. For every crop, the harvest is advanced by fifteen days. It extends the shelf life of fruits, vegetables, and cereals while also enhancing their flavor. Through the replacement or reduction of expensive chemical inputs, Panchagavya guarantees greater profit margins and releases organic farmers from debt. The plants' large, deep roots enable them to endure protracted dry spells, and so ensuring harsh hardiness while lowering the irrigation water consumption by thirty percent[22]. Panchagavya is the living essence of numerous microorganisms, including bacteria, fungus, protein, carbohydrates, vitamins, and enzymes, as well as known and unknown growth-promoting agents, micronutrients, trace elements, antioxidants, and immunity-enhancing agents[23]. The living microorganisms in Panchagavya, when consumed orally by humans or animals, stimulate the immune system and generate a large amount of antibodies against the eaten bacteria. It functions similarly to a vaccination. This physiological reaction boosts immunity in both humans and animals, assisting in the prevention and treatment of disease [24].

THE LIVING PROOF

Amit vaithya, a US-born individual, holds a Ph.D. in economics and works in the entertainment industry's business department in the US. His father passed away from cancer at the age of 27. For around two years, he had been receiving various treatments, but they had been ineffective. His mother also passed away from cancer two months after the death of his father. Subsequently, his health records were examined prior to the death of his parents, and it was revealed in 2011 that he was also afflicted with cancer that had spread to his liver and lungs. Then, before he passed away, he made the decision to visit India. A few days later, he recalled his friend's recommendation to have an ayurvedic therapy. Afterwards, he began doing yoga, meditation, and consuming Cow's milk, curd, and ghee in addition to using Cow urine as a medicinal combination. His scan data showed that his body had conquered cancer after a few days. Afterwards, he kept consuming foods associated with Cows, built a cattle shed, and tamed the Cows. He also works with the nonprofit organization "HEALING VAIDHYA" to offer free services to cancer sufferers.

The book "HOLY CANCER-HOW A COW SAVED MY LIFE" was also written by Amit Vaidhya. This served as evidence for the products made from Cows having a miraculous ability to treat cancer. Amith Vaidhya served as a living example of how Cow's milk products might prevent cancer. The image of amith vaidhya was given in figure.5.

COW HUGGING THERAPY

The Dutch word "koeknufflen" translates to "Cow cuddling." It's customary in the Netherlands to take a trip from the city to the countryside and spend time with farm animals as a way to unwind and rebalance one's emotions. This practice is known as animal-aided interaction, or AAI, and it falls under the category of bovine assisted therapy [25]. Research from a wide range of studies has shown that interactions between animals and people improve social support and overall well-being while lowering anxiety, depression, and loneliness [26]. A type of animal-assisted therapy known as "Cow cuddling or hugging" includes brushing, caressing or simply just talking with your new, reliable psychologists. It's a custom that dates back to the Dutch village of Reuver[26]. The image of cow cuddling is given in figure.6.

Amazing advantages of giving Cow hugs

Provide instantaneous respite from mental strain; Disseminate good energy wherever Feel good hormones are released; hyper-vigilance and social isolation are eliminated; high blood pressure is avoided; spinal pain is effectively treated; a sense of calm and serenity is experienced; depression is effectively managed; and respiratory disorders are effectively treated. February 14 is designated as "Cow Hugging Day," as proclaimed by the Animal Welfare Board of India. A "Horse& Cow experience" at a mountain horse farm in upstate New York aims to provide participants with the opportunity to "bring relaxation, healing, and awareness About body language" through Cow snuggling. Additionally, it encourages ease, mindfulness, assertiveness, confidence building, fear-reduction, playfulness, and boundary-setting. It continued by saying that the people hugging the Cows had slower heart rates and shown outward manifestations of relaxation[27].

Trinadha Rao *et al.*,

CONCLUSION

According to the study's findings, cows are an extremely useful natural resource for a sustainable way of life because of the high quality of the items they provide. This study has shown a number of facts about cows and their products that are advantageous to agriculture since they increase soil fertility and serve as fertilizers and pesticides. Several studies and experiments have confirmed it. The cow adds to our riches as well since, when its products are exploited appropriately, it yields 4,89,10,000. Many individuals don't know this knowledge or how much cows are worth. Cow ghee creates oxygen, which is good for cleaning the atmosphere, as the Bhopal gas tragedy shows. It also treats a wide range of illnesses, including epilepsy, TB, cancer, and cow huggings in anxiety. Additionally, there is living evidence of cow products' anticancer effects. The aforementioned information led to the conclusion that cows are an invaluable resource for human well-being and success. Therefore, we believe that this evaluation will increase people's awareness of the advantages of cows.

Table 1: Constituents of milk and colostrums

Milk and colostrum constituents	Protein	Caseins (α S1, α S2, β & α) (β -LG, α -LA, BSA & LF)
	Fat	Triacyl glycerol, diacyl glycerol, phospholipids, free fatty acid.
	Vitamins	Vit A, Vit B1, B2, B3, B6, B12, folate, Vit D
	Enzymes	Lacto peroxidase, thiocyanate, Xanthine oxidase, lysozyme & peroxidase
	Minerals	Calcium, phosphorous, magnesium, potassium
	Immuno-globulins	IgG1, IgG2, IgA, IgM, IgE and IgD
	Cytokines	IL- β , IL-8, IL-10, IL-12, IL-18, IFN- γ , TGF- β .
	Immune & other factors	PRP, G-CSF, M-CSF AND GM-CSF.

Table 2: Composition and calories of the Cow products

Name of the Cow product	Composition in %	Calories per 100 ml
Milk	Carbohydrates-4.75, fats-3.7, proteins-3.2, minerals-0.7	68
Ghee	Fats-98, cholesterol-30, kerotene-3.2, free fatty acids-2.8	900
Curd	Fat-4.2, protein 11.75, carbohydrates-3.4, vitamin A-42.	98
Paneer	Proteins-23, fat-25, minerals-2	265-323
Butter	Fat-82, minerals-2, vitamins-8.6	717
Cheese	Fat-29	272
Dung	Nitrogen 0.6, carbon-10	3500

Trinadha Rao et al.,

Table 3: Cow urine composition and benefits

Bio-component of Cow urine	Functions
Nitrogen, N ₂ NH ₂	Remove blood abnormalities & toxins, stimulant of UT & kidney.
Sulphur	Support motion in large intestine, cleanses blood
Ammonia	Stabilize bile, mucus and air of body, stabilizes blood
Iron	Maintain balance and help in production of R.B.C, and hemoglobin
Urea	Affects urine formation and removal, has germicidal properties
Uric acid	Remove swelling or inflammation it is diuretic so destroys the toxin
Sodium, potassium	Purifies blood, increase appetite, removes muscular weakness
Calcium	Blood purifier, bone strengthen, germicidal
Copper	Control unwanted fat, iron help to produce hemoglobin.

Table 4: Patents Granted on Cow Products[19]

1.US patent no.6410059	For the antibiotic, antifungal, bio-enhancer effect of Cow urine by USFDA to CSIR, India.
2.US patent no.6896907	For the anti-allergic, anti-infective, nutrient, anticancer activity of gomutra.
3.US patent no.7718360	For antioxidant and apoptosis properties on May 18, 2010.
4.US patent no.7235262	Cow urine distillate as a bio-enhancer of anti-infective, anticancer agents and nutrients.
5.US patent no.7297659	For synergistic fermented plant growth promoting & bio-control composition.
6. US patent no.6602537	For its enhanced nutritive and health value
7.Chinese patent no. 10047522 1	For Cow urine as DNA protector on April 8, 2009.

Table 5: Economics of Cow Products

Cow products	Per day income	Per month income	Per annum income	Throughout its life span income
330 kilos of Cow dung manure(10 kilos of dung)	1800/-	54,000/- (1800x30)	6,57,000/- (1800x365)	1,31,40,000/- (6,57,000x20)
Cow urine liter	in India 500/- in America 3000/-	15,000/- (500x30) 90,000/- (3000x30)	1,82,500/- (500x365) 10,95,000/- (3000x365)	3,650,000/- (182,500x20) 2,19,00,000/- (10,95,000x20)
Cow milk 1 liter	1400/-	42000/- (1400x30)	511000/- (1400x365)	10,220,000/- (511000x20)
Total income	6700/-	2,01,000/-	24,45,500/-	48,910,000/-

ABSTRACT

Depression detection is a critical challenge in mental health research due to the increasing prevalence of mental disorders and the limitations of traditional diagnostic methods. Conventional approaches, such as interviews and PHQ scores, often suffer from low accuracy and delayed diagnoses. In this study, we propose a hybrid deep learning framework for depression detection, leveraging the power of transformer models and ensemble learning techniques. Specifically, we utilize the RoBERTa transformer model to extract high-quality textual features from patient responses and integrate these with an XGBoost classifier to improve detection performance. The proposed method is evaluated using a publicly available depression dataset from Hugging Face, achieving an accuracy of 92.8%, significantly outperforming traditional methods. The findings demonstrate the potential of combining transformer-based architectures with ensemble learning for efficient and accurate depression detection, paving the way for early intervention and improved mental health outcomes.

Keywords: Depression Detection, Deep Learning, Roberta, XGBoost Classifier, Hugging Face, Transformer, Ensemble learning, accuracy

INTRODUCTION

Mental health issues, including depression, affect a significant portion of the global population, with over 264 million people suffering from this condition worldwide [1]. Depression can stem from various factors such as sudden environmental changes, imbalances in neurotransmitter levels, or even genetic predispositions [2]. Effective treatment options include therapy sessions and medication. However, many individuals remain undiagnosed due to

**Roshani R. Borase et al.,**

a lack of awareness about depression, leading to adverse outcomes such as social withdrawal, erratic behavior, suicidal thoughts, or dependence on antidepressants. Left untreated, depression can severely impact daily activities, reducing focus and interest, and eventually causing harm to both the mind and body. With technological advancements, social media usage has surged, with approximately 3.8 billion active users worldwide [3]. Social media platforms have become spaces for individuals to express emotions, thoughts, and opinions, often providing relief by sharing unsettling feelings. These platforms enable users to post textual content that offers valuable insights for various real-world applications, including healthcare, politics, and entertainment [4]. Researchers can analyze this data to gain an understanding of users' mental health, offering opportunities for timely intervention [5].

Twitter, a popular micro-blogging platform, allows users to post concise updates, known as tweets, limited to 140 characters [16]. Its simplicity and accessibility make it a widely used platform for sharing emotions and opinions. Most tweets are publicly accessible and can be retrieved using Twitter's API, which supports complex queries, such as retrieving tweets on specific topics [6]. Additionally, Twitter supports more than 35 languages, broadening its global reach. The data shared on Twitter provides researchers with a valuable resource for analyzing mental health conditions and identifying opportunities for support and recovery [21]. Social media, while offering a platform for self-expression and connection, can also pose significant risks in certain circumstances [8]. For example, users may send, post, or share harmful content targeting others, leading to cyber bullying or harassment. Additionally, social media activity can reflect offline risks; for instance, adolescents experiencing depression might begin posting suicidal thoughts online, signaling potential dangers [11].

In recent years, natural language processing (NLP) and deep learning have emerged as powerful tools for analyzing textual data and identifying mental health concerns [13]. These technologies have been successfully applied to detect depression, anxiety, and suicidal ideation from user-generated content [15]. By leveraging computational methods, researchers can develop automated and scalable tools to identify individuals experiencing mental health issues or at risk of harm [8]. This approach holds great promise for timely intervention and support, making social media a valuable resource for addressing mental health challenges.

In recent years, the emergence of social media has opened new avenues for monitoring mental health. The proliferation of user-generated content on platforms like Twitter and Facebook offers rich data for analysis, enabling the identification of emotional imbalances and depressive tendencies. Artificial intelligence (AI) and machine learning (ML) techniques have evolved significantly, providing tools that can enhance emotional intelligence in machines. These technologies facilitate text-based emotion recognition [6], which can analyze posts and tweets to gauge users' moods and potentially predict suicidal thoughts. Such early detection can lead to timely interventions, significantly impacting user well-being. Recent advancements in transformer-based models [15], such as RoBERTa, have demonstrated remarkable performance in natural language understanding tasks, making them invaluable for sentiment analysis in textual data related to mental health. RoBERTa's ability to capture nuanced emotional expressions enhances the detection of depressive signals in social media content. Additionally, tree-based algorithms like XGBoost offer robust solutions for classification problems, allowing for efficient processing of large datasets and improving prediction accuracy [16]. These algorithms can be evaluated through metrics such as precision scores and confusion matrices to determine their effectiveness in sentiment prediction [9].

Beyond textual analysis, emotions can also be inferred from facial expressions, gestures, and vocal tones, further enriching the potential for accurate detection of depression. [13]. For instance, AI applications can monitor drivers for signs of drowsiness, potentially preventing accidents. Similarly, emotion detection systems can enhance user interactions with chatbots, allowing for personalized responses that aim to improve mood and mitigate distress [23]. Furthermore, the application of emotion detection technologies can play a pivotal role in educational settings [20]. For example, identifying signs of depression in students through their interactions in online learning environments can help educators provide timely support [17]. By analysing engagement levels, communication patterns, and emotional cues, AI systems can alert educators to students who may be struggling, facilitating early intervention and promoting mental well-being in academic contexts [11]. As these technologies continue to develop, they hold promise not only for individual mental health monitoring but also for fostering supportive environments in various sectors [15]

Literature Review

Depression has become a serious problem in this current generation and the number of people affected by depression is increasing day by day. However, some of them manage to acknowledge that they are facing depression while some of them do not know it. On the other hand, the vast progress of social media is becoming their “diary” to share their state of mind. Several kinds of research had been conducted to detect depression through the user post on social media using machine learning algorithms [1]. Through the data available on social media, the researcher can able to know whether the users are facing depression or not. Machine learning algorithm enables to classify the data into correct groups and identify the depressive and non-depressive data.

Research work aims to detect the depression of the user by their data, which is shared on social media. The Twitter data is then fed into two different types of classifiers, which are Naïve Bayes and a hybrid model, NBTree. The results will be compared based on the highest accuracy value to determine the best algorithm to detect depression. The results show both algorithm perform equally by proving same accuracy level. [2] proposed method consists of three components; first, a textual CNN model in which a CNN model is trained with only text features, second, an audio CNN model in which CNN model is trained with only audio features and third, a combination of audio and textual model named as hybrid model in which LSTM algorithms are applied. An improved version of LSTM model named as Bi-LSTM model is also used in the proposed work. In results, training accuracy, training loss, validation accuracy and validation loss is calculated for all the mentioned models [2]. The results shows that deep learning is a better solution for depression detection in which accuracy of textual CNN model is 89% whereas accuracy of audio CNN model is 91% and loss of textual CNN is 0.2 whereas loss of audio CNN is 0.1. These results show that audio CNN is a good model for depression detection [2]. It performs better as compared to textual CNN model. It is also observed that Bi-LSTM has better learning rate as compared to other models with accuracy 88% and validation accuracy 78%. There are some parameters such as precision, F1-score, recall and support are found for evaluation of models. In results, graphs for training loss, validation loss, training accuracy and validation accuracy are plotted. At last, by using confusion matrix depression can be detected for textual CNN Model, audio CNN model, LSTM model and Bi-LSTM against true label and predicted label. [3] proposes depression detection among individuals we have conducted a survey with 21 questions based on Hamilton tool and advice of psychiatrist. With the use of Python's scientific programming principles and machine learning methods like Decision Tree, KNN, and Naive Bayes, survey results were analyzed. Further a comparison of these techniques is done [3]. Study concludes that KNN has given better results than other techniques based on the accuracy and decision tree has given better results in the terms of latency to detect the depression of a person. At the conclusion, a machine learning-based model is suggested to replace the conventional method of detecting sadness by asking people encouraging questions and getting regular feedback from them [3]. [4] Propose a depression detection model that utilizes both audio and video features extracted from the vlogs (video logs) on YouTube. We first collected vlogs from YouTube and annotated them into depression and non-depression. We then analyze the statistical differences between depression and non-depression vlogs. Based on the lessons learned, we build a depression detection model that learns both audio and visual features, achieving high accuracy [4]. We believe our model helps detect depressed individuals on social media at an early stage so that individuals who may need appropriate treatment can get help. [5] proposes the early screening of depression is highly beneficial for patients to obtain better diagnosis and treatment. While the effectiveness of utilizing voice data for depression detection has been demonstrated, the issue of insufficient dataset size remains unresolved. Therefore, we propose an artificial intelligence method to effectively identify depression [5]. The wav2vec 2.0 voice-based pre-training model was used as a feature extractor to automatically extract high-quality voice features from raw audio. Additionally, a small fine-tuning network was used as a classification model to output depression classification results. Subsequently, the proposed model was fine-tuned on the DAIC-WOZ dataset and achieved excellent classification results [5]. Notably, the model demonstrated outstanding performance in binary classification, attaining an accuracy of 0.9049 and an RMSE of 0.1875 on the test set. Similarly, impressive results were obtained in multi-classification, with an accuracy of 0.7881 and an RMSE of 0.3810. The wav2vec 2.0 model was first used for depression recognition and showed strong generalization ability. The method is simple, practical, and applicable, which can assist doctors in the early screening of depression. [6] Study that trained and tested classifiers to distinguish whether a user is depressed or not using features extracted from his/her activities in the network and tweets. The results showed that the more features are used, the higher are the accuracy and F-measure scores in

**Roshani R. Borase et al.,**

detecting depressed users [6]. This method is a data-driven, predictive approach for early detection of depression or other mental illnesses. This study's main contribution is the exploration part of the features and its impact on detecting the depression level [6].

[7] Conduct Detecting depression from user-generated content on social media platforms has garnered significant attention due to its potential for the early identification and monitoring of mental health issues. This paper presents a comprehensive approach for depression detection from user tweets using machine learning techniques [7]. The study utilizes a dataset of 632,000 tweets and employs data preprocessing, feature selection, and model training with logistic regression, Bernoulli Naive Bayes, random forests, DistilBERT, SqueezeBERT, models. Evaluation metrics such as accuracy, precision, recall, and F1 score are employed to assess the models' performance [7]. The results indicate that the BERT model achieves the highest accuracy ratio of 0.87 and the highest mean accuracy of 0.77 (across 10 cross-validation folds) in detecting depression from tweets. This research demonstrates the effectiveness of machine learning and advanced transformer-based models in leveraging social media data for mental health analysis. The findings offer valuable insights into the potential for early detection and monitoring of depression using online platforms, contributing to the growing field of mental health analysis based on user-generated content.

[8] Research work, a hybrid model has been proposed that can detect depression by analyzing user's textual posts. Deep learning algorithms were trained using the training data and then performance has been evaluated on the test data of the dataset of reddit which was published for the pilot piece of work, Early Detection of Depression in CLEF eRisk 2017 [8]. In particular, Bidirectional Long Short Term Memory (BiLSTM) with different word embedding techniques and metadata features were proposed which gave good results.

Dataset

The dataset used for this study is sourced from hugging face, a platform renowned for providing diverse and high-quality datasets for research and development. This particular dataset contains user-generated content, including social media posts, tweets, and comments, focusing on mental health-related discussions. It is rich in textual data that reflects various emotional states, such as depression, anxiety, and general well-being. The dataset includes labeled examples, distinguishing between depressive and non-depressive content, which serves as the foundation for supervised learning. Preprocessing steps such as noise removal, tokenization, stop word elimination, and lemmatization will be applied to ensure the data is clean and structured. Additionally, augmentation techniques will enhance the dataset's robustness by introducing variations, helping the model generalize better to unseen data. This Hugging Face dataset provides a comprehensive and diverse resource for training and evaluating the proposed hybrid model, enabling accurate and efficient depression detection.

Proposed Methodology

The proposed methodology for depression detection involves a detailed and systematic process to ensure accurate and efficient identification of individuals at risk. The dataset will be sourced from Kaggle, comprising user-generated content such as posts, tweets, and comments related to mental health. This data will undergo preprocessing to ensure quality and consistency. Noise removal techniques will be applied to eliminate special characters, URLs, hashtags, mentions, and redundant spaces. All text will be converted to lowercase for uniformity, followed by tokenization to split the text into manageable components. Stopwords that do not add semantic value will be removed, and lemmatization will reduce words to their base forms, minimizing redundancy. To further enhance the dataset, data augmentation techniques like synonym replacement, random insertion, and back-translation will be employed, increasing diversity and robustness.

After preprocessing, RoBERTa, a transformer-based model, will extract contextual embeddings from the text. These embeddings will capture the semantic and emotional nuances, serving as input features for the XGBoost classifier. The XGBoost model will then classify the text into depressive or non-depressive categories. The model's performance will be optimized through hyperparameter tuning, adjusting factors such as learning rate, tree depth, and the number of estimators. The dataset will be split into training, validation, and test sets to ensure reliable evaluation. The training set will build the model, the validation set will guide hyperparameter adjustments, and the test set will assess the model's generalization to unseen data.

The entire process will be automated as a scalable pipeline, integrating data preprocessing, feature extraction, and classification into a unified workflow. This design will facilitate the model's deployment for real-world applications, such as monitoring social media content for early depression detection. By leveraging the contextual strength of RoBERTa and the classification efficiency of XGBoost, the proposed methodology aims to provide a robust and reliable solution for identifying individuals at risk of depression. Google Colab is used as the primary platform for implementing the proposed hybrid model for depression detection. This online, open-source platform provides a user-friendly interface for writing and executing Python code, making it ideal for developing and testing machine learning and deep learning models. In Colab it deals with the various accelerator type example CPU, GPU. GPU provides the most flexible processing with seconds of execution. Usually, neural networks deal under the GPU. It has 100x power seamless execution power. As a cloud-based tool running on Google servers, it integrates seamlessly with Google Drive, where the dataset and resources for the project are stored. This eliminates the need for additional setups, downloads, or installations, simplifying the development process.

For implementing the work Google Colab offers access to GPU and TPU accelerators, which significantly enhance the computational efficiency required for training deep learning algorithms such as RoBERTa and XGBoost. The platform also includes a variable panel, allowing real-time monitoring of variables, their values, and data types during code execution, aiding debugging and evaluation. Although it lacks a kernel menu, the runtime can be restarted effortlessly to refresh the environment.

Another key advantage of Google Colab is its ability to facilitate collaboration. Notebooks can be easily shared as it has interface like jupyter notebook, and updates can be made in real time, streamlining collaborative development. For the proposed work, which combines RoBERTa and XGBoost, Google Colab provides the computational resources and flexibility required to preprocess data, train models, and evaluate results effectively, making it an ideal platform for this research. For implementing python programming language is used. Python is a powerful and flexible programming language widely used across various domains due to its simplicity and robust ecosystem of libraries. Libraries such as NumPy, Pandas, and Matplotlib support efficient data manipulation and visualization, while machine learning frameworks like TensorFlow, PyTorch, and Scikit-learn enable the development of complex models. Python's versatility makes it a go-to language for fields ranging from web development to artificial intelligence, providing tools that streamline workflows and enhance productivity.

Evaluation Parameters and Significance

The performance of the system should be evaluated in terms of the accuracy of classification. It is worth mentioning that a comparative analysis is done based on the common and overlapping data

Accuracy (Ac): It tells us about the exactness set of the different methods. The critical parameters are:

The classification accuracy is computed as:

$$Ac = \frac{TP+TN}{TP+TN+FP+FN} \quad (1.1)$$

The precision is computed as

$$Pr = \frac{TP}{TP+FP} \quad (1.2)$$

The F-measure or F-Score is computed as:

$$F - Measure = 2 \cdot \frac{Precision \cdot Recall}{Precision + Recall} = F - Measure = \frac{TP}{TP + \frac{1}{2}(FP + FN)} \quad (1.3)$$

Here,

(TP): True Positive

(TN): True Negative

(FP): False Positive

(FN): False Negative

EXPERIMENTAL RESULTS

The evaluation of the proposed hybrid model for depression detection, which integrates RoBERTa and XGBoost, demonstrates its effectiveness in identifying depressive tendencies based on textual data. The model was assessed

using a test dataset after being trained and validated on labeled examples. The primary metric used for evaluation was accuracy, reflecting the proportion of correctly classified instances to the total instances in the dataset. The hybrid model achieved an accuracy of 92.8%, indicating a high level of reliability in distinguishing between depressive and non-depressive content. The performance of the model was observed to be consistent across both training and validation phases, showcasing its ability to generalize well to unseen data. The results highlight the superiority of the hybrid approach, as it combines RoBERTa's contextual embedding capabilities with the robust classification power of XGBoost. Furthermore, the automated pipeline ensured a streamlined process from data preprocessing to final evaluation, making the system efficient and scalable for real-world applications. Overall, the evaluation confirms the potential of the proposed methodology to serve as an effective tool for depression detection, contributing to early identification and intervention for mental health challenges.

CONCLUSION

The RoBERTa-XGBoost model for depression detection demonstrated a high classification performance, achieving an overall accuracy of 92.8%. The model effectively distinguished between depressed and non-depressed individuals, with an F1-score of 0.88 for both classes. Specifically, it attained a precision of 0.84 and recall of 0.94 for the non-depressed category, while the depressed category recorded a precision of 0.93 and recall of 0.82. These results indicate that the model is highly capable of identifying depression while maintaining a balance between precision and recall. The high recall for non-depressed individuals suggests a low false negative rate, ensuring that most non-depressed cases are correctly identified. Conversely, the high precision for depressed individuals minimizes false positives, improving the reliability of depression detection. The integration of RoBERTa's deep contextual embeddings with XGBoost's powerful classification capabilities contributed to the model's robustness and effectiveness. Overall, the findings highlight the potential of hybrid deep learning and machine learning approaches in automated mental health assessment.

Future Scope

In future enhancing model generalized by incorporating larger and complex dataset. More fine tune hyperparameters could further improve classification performance.

ABSTRACT

In this paper we introduce Soft pre g^* -open sets in soft topological space which are defined over an initial universe with a fixed set of parameters. Also we studied Soft pre g^* neighbourhood system, Soft pre g^* interior sets and Soft pre g^* exterior sets with examples.

Keywords: Soft pre open set, Soft pre g^* neighbourhood, Soft pre g^* interior sets and Soft pre g^* exterior sets.

INTRODUCTION

Soft set was introduced by Molodsov in the year 1999. Andrijevic [1] showed Semi-Preopen sets. Njastad [12] explained on some classes of nearly open sets. Veerakumar [13] defined g^* -Pre closed sets. Levine [8] examines generalized closed sets in topological spaces. In this paper we introduce soft pre g^* open set, soft pre g^* neighbourhood, soft pre g^* interior point, soft pre g^* exterior point in soft topological spaces.

PRELIMINARIES

Definition 2.1. [7] A subset A of a topological space (X, τ) is called g -closed if $\text{cl}(A) \subseteq G$ whenever $A \subseteq G$ and G is open in (X, τ) . The complement of g -closed set is called g -open.

Kalaiselvi and Anitha

Definition 2.2. [13] A subset A of a topological space (X, τ) is called g^*p -closed if $\text{pcl}(A) \subseteq G$ whenever $A \subseteq G$ and G is g -open in (X, τ) . The complement of g^*p -closed set is called g^*p -open.

Definition 2.3. [4] The union of pre open sets contained in A is called pre interior of A and is denoted by $\text{pint}(A)$.

THEOREM 2.4. [9] If U is open and A is pre open then $U \cap A$ is pre open.

Definition 2.5. [10] A map $f: X \rightarrow Y$ is called M -pre open (resp. M -pre closed) if $f(V)$ is pre open (resp. Pre closed) set in Y for every pre open (resp. Pre closed) set V of X .

Definition 2.6. [11] A map $f: X \rightarrow Y$ is called pre-irresolute if $f^{-1}(F)$ is pre-open in X for every pre-open set F in Y .

Definition 2.7. [5] Let (X, τ) be a soft topological space of non empty set X with τ . Let $A \subseteq X$ then the set A is said to be g^* Pre open set iff $A \subseteq \text{int}(\text{cl}A)$

SOFT PRE g^* -OPEN SET

Definition 3.1. A subset (S, E) of a soft topological space (X, τ, E) is called soft pre g^* -open if $(U, E) \subset \text{pint}(S, E)$ whenever $(U, E) \subset (S, E)$ and (U, E) is soft g -closed in X .

Example 3.2. Let $X = \{a, b\}$, $E = \{e_1, e_2\}$ $X = \{(e_1, \{a, b\}), (e_2, \{a, b\})\}$. Then the soft sets are written by, $(S, A)_1 = X$, $(S, A)_2 = \emptyset$, $(S, A)_3 = \{(e_1, \{a\})\}$, $(S, A)_4 = \{(e_1, \{b\})\}$, $(S, A)_5 = \{(e_1, \{a, b\})\}$, $(S, A)_6 = \{(e_2, \{a\})\}$, $(S, A)_7 = \{(e_2, \{b\})\}$, $(S, A)_8 = \{(e_2, \{a, b\})\}$, $(S, A)_9 = \{(e_1, \{a\}), (e_2, \{a\})\}$, $(S, A)_{10} = \{(e_1, \{a\}), (e_2, \{b\})\}$, $(S, A)_{11} = \{(e_1, \{a\}), (e_2, \{a, b\})\}$, $(S, A)_{12} = \{(e_1, \{b\}), (e_2, \{a\})\}$, $(S, A)_{13} = \{(e_1, \{b\}), (e_2, \{b\})\}$, $(S, A)_{14} = \{(e_1, \{b\}), (e_2, \{a, b\})\}$, $(S, A)_{15} = \{(e_1, \{a, b\}), (e_2, \{a\})\}$, $(S, A)_{16} = \{(e_1, \{a, b\}), (e_2, \{b\})\}$.

So $|S(X)| = 2^4 = 16$

Therefore we get 16 soft sets in the Universal set U .

Theorem 3.3. If (S, E) is a soft pre g^* -open set of soft topological space (X, τ, E) and $\text{pint}(S, E) \subset (T, E) \subset (S, E)$ then (T, E) is also soft pre g^* -open set of X .

Proof:

Let (S, E) be soft pre g^* -openset in soft topological space (X, τ, E) .

If (G, E) is soft g -closed set such that $(G, E) \subset (T, E)$

Since $(T, E) \subset (S, E)$ we have $(G, E) \subset (S, E)$

Since (S, E) is a soft pre g^* -openset,

$(G, E) \subset \text{pint}(S, E)$

Then $\text{pint}(\text{pint}(S, E)) \subset (T, E)$

$\Rightarrow \text{pint}(S, E) \subset \text{pint}(T, E)$

Hence $(G, E) \subset \text{pint}(S, E) \subset \text{pint}(T, E)$

$\Rightarrow (G, E) \subset \text{pint}(T, E)$

Then (T, E) is soft pre g^* -openset of X .

Example 3.4. Let us consider the soft sets of F_E that are given in example 3.2.

Let $(S, A)_9 = \{(e_1, \{a\}), (e_2, \{a\})\}$ be soft openset.

Then soft pre open sets are $(S, A)_1, (S, A)_2, (S, A)_3, (S, A)_5, (S, A)_6, (S, A)_8, (S, A)_9, (S, A)_{10}, (S, A)_{11}, (S, A)_{12}, (S, A)_{14}, (S, A)_{15}, (S, A)_{16}$.

Soft pre closed sets are $(S, A)_1, (S, A)_2, (S, A)_3^c = (S, A)_{14}, (S, A)_5^c = (S, A)_8, (S, A)_6^c = (S, A)_{16}, (S, A)_8^c = (S, A)_5, (S, A)_9^c = (S, A)_{13},$

$(S, A)_{10}^c = (S, A)_{12}, (S, A)_{11}^c = (S, A)_4, (S, A)_{12}^c = (S, A)_{10}, (S, A)_{14}^c =$

$(S, A)_3, (S, A)_{15}^c = (S, A)_7, (S, A)_{16}^c = (S, A)_6.$

Kalaiselvi and Anitha

Therefore soft pre closed sets are

$(S,A)_1, (S,A)_2, (S,A)_3, (S,A)_4, (S,A)_5, (S,A)_6, (S,A)_7, (S,A)_8, (S,A)_9, (S,A)_{10}, (S,A)_{12}, (S,A)_{13}, (S,A)_{14}, (S,A)_{16}$.

Soft g-closed sets are $(S,A)_9, (S,A)_{11}, (S,A)_{13}, (S,A)_{14}, (S,A)_{15}, (S,A)_{16}$.

Soft g-open sets are $(S,A)_{13}, (S,A)_4, (S,A)_9, (S,A)_3, (S,A)_7, (S,A)_6$.

Soft pre g^* opensets are $(S,A)_{13}$ and $(S,A)_9$.

Theorem 3.5. Every soft Pre g^* openset is soft pre open.

Proof:

Let (S,A) be soft pre g^* openset.

Then $(U,A) \sqsubseteq \text{pint}(S,A)$ whenever $(S,A) \subset (U,A)$

$\Rightarrow (U,A) \sqsubseteq \text{int}(S,A)$

Therefore every soft pre g^* openset is soft preopen.

Example 3.6. From example 3.4. $(S,A)_{13}$ and $(S,A)_9$ are soft pre g^* openset and the sets are soft pre opensets in X .

Remark 3.7. Converse of the above theorem is not true.

Example 3.8. From example 3.4. Every soft sets are not pre g^* open sets in X .

Theorem 3.9. Arbitrary union of soft pre g^* openset is a soft pre g^* openset.

Proof:

Let $\{(S,A)_\alpha / \alpha \in I\}$ be a collection of soft pre g^* opensets of a soft topological space (U,A,τ) .

Then for each α , $(S,A)_\alpha \sqsubseteq \text{pint}((S,A)_\alpha)$

Claim: $\cup(S,A)_\alpha \sqsubseteq \text{pint}(\cup(S,A)_\alpha)$

Now, $\cup(S,A)_\alpha \sqsubseteq \cup \text{pint}((S,A)_\alpha)$

$\sqsubseteq \text{pint}(\cup(S,A)_\alpha)$

Therefore, $\cup(S,A)_\alpha \sqsubseteq \text{pint}(\cup(S,A)_\alpha)$

Theorem 3.10. Let (U,A,τ) be a soft topological space. (S_1,A) and (S_2,A) be two soft sets over U . Then $(S_1,A) \sqsubseteq (S_2,A) \Rightarrow \text{pint}(S_1,A) \sqsubseteq \text{pint}(S_2,A)$

Proof:

Let (U,A,τ) be a soft topological space. (S_1,A) and (S_2,A) be two soft sets over U .

Then $(S_1,A) \sqsubseteq (U,E)$ and $(S_2,A) \sqsubseteq (U,E)$, (U,E) is soft open in X .

Now $(S_1,A) \sqsubseteq (S_2,A)$

By definition 3.1, $(S_1,A) \sqsubseteq \text{pint}(S_1,A) \sqsubseteq U$

$(S_2,A) \sqsubseteq \text{pint}(S_2,A) \sqsubseteq U$

Therefore $(S_1,A) \sqsubseteq (S_2,A) \Rightarrow \text{pint}(S_1,A) \sqsubseteq \text{pint}(S_2,A)$.

Theorem 3.11. Every finite union of soft pre g^* open set is soft pre g^* openset.

Proof:

Let (S,A) and (S,B) be two soft pre g^* open subset of X .

Let (U,E) be a soft g-closed set in X such that $(S,A) \cup (S,B) \sqsubseteq (U,E)$

Then $(U,E) \sqsubseteq \text{pint}(S,A)$ and $(U,E) \sqsubseteq \text{pint}(S,B)$

Therefore $(U,E) \sqsubseteq \text{pint}(S,A) \cup \text{pint}(S,B)$

$\Rightarrow \text{pint}(U,E) \sqsubseteq \text{pint}(S,A) \cup \text{pint}(S,B)$

$\Rightarrow \text{pint}((S,A) \cup (S,B)) \sqsubseteq \text{pint}(S,A) \cup \text{pint}(S,B)$

Therefore $\text{pint}((S,A) \cup (S,B))$ is soft pre g^* open in X .

Kalaiselvi and Anitha

Example 3.12. Consider example 3.2., $(S,A)_9 = \{(e_1, \{a\}), (e_2, \{a\})\}$,

$(S,A)_{13} = \{(e_1, \{b\}), (e_2, \{b\})\}$, union of the sets is given by,

$$(S,A)_9 \cup (S,A)_{13} = \{(e_1, \{a\}), (e_2, \{a\})\} \cup \{(e_1, \{b\}), (e_2, \{b\})\}$$

$$= \{(e_1, \{a,b\}), (e_2, \{a,b\})\}$$

□ X

Remark 3.13. Every finite intersection of two soft pre g^* open sets need not be soft pre g^* open set.

Soft pre g^* neighbourhood system in soft topological space

Definition 4.1. Let (X, τ, E) be a soft topological space. Let $(S,A) \in S(X)$ and $p_1 \in X$. Then the soft point p_1 is said to be soft pre g^* neighbourhood of a set (S,A) if there exists a soft pre g^* open set (T,A) such that $p_1 \in (T,A) \sqsubset (S,A)$

Example 4.2. Consider the soft topological space (X, τ, E) given in example 3.2., soft pre g^* open sets are $(S,A)_9$ and $(S,A)_{13}$.

(i) The soft pre g^* neighbourhood of $(e_1, \{b\})$ is $(S,A)_{13}$.

(ii) The soft pre g^* neighbourhood of $(e_1, \{a\})$ is $(S,A)_9$.

(iii) The soft pre g^* neighbourhood of $(e_2, \{a\})$ is $(S,A)_9$.

(iv) The soft pre g^* neighbourhood of $(e_2, \{b\})$ is $(S,A)_{13}$.

Proposition 4.3. Every soft pre g^* neighbourhood of (T,A) is soft pre neighbourhood in soft topological space.

Example 4.4. By example 3.2., Soft pre neighbourhood of $(e_1, \{a\})$ are $(S,A)_3, (S,A)_9, (S,A)_{10}, (S,A)_{11}, (S,A)_{15}, (S,A)_{16}$. But $(S,A)_9$ is soft pre g^* neighbourhood of $(e_1, \{a\})$.

Remark 4.5. Converse of above proposition is not true. Because every soft pre g^* neighbourhood of (T,A) is soft pre neighbourhood in soft topological space but every soft pre neighbourhood in X is not soft pre g^* neighbourhood in soft topological space.

Example 4.6. Let $X = \{a, b\}$, $E = \{e_1, e_2\}$ $X = \{(e_1, \{a, b\}), (e_2, \{a, b\})\}$. Then the soft sets are written by, $(S,A)_1 = X, (S,A)_2 = \phi, (S,A)_3 = \{(e_1, \{a\})\}, (S,A)_4 = \{(e_1, \{b\})\}, (S,A)_5 = \{(e_1, \{a, b\})\},$

$$(S,A)_6 = \{(e_2, \{a\})\}, (S,A)_7 = \{(e_2, \{b\})\}, (S,A)_8 = \{(e_2, \{a, b\})\}, (S,A)_9 = \{(e_1, \{a\}), (e_2, \{a\})\},$$

$$(S,A)_{10} = \{(e_1, \{a\}), (e_2, \{b\})\}, (S,A)_{11} = \{(e_1, \{a\}), (e_2, \{a, b\})\}, (S,A)_{12} = \{(e_1, \{b\}), (e_2, \{a\})\},$$

$$(S,A)_{13} = \{(e_1, \{b\}), (e_2, \{b\})\}, (S,A)_{14} = \{(e_1, \{b\}), (e_2, \{a, b\})\}, (S,A)_{15} = \{(e_1, \{a, b\}), (e_2, \{a\})\},$$

$$(S,A)_{16} = \{(e_1, \{a, b\}), (e_2, \{b\})\}.$$

$$\text{So } |S(X)| = 2^4 = 16$$

Therefore we get 16 soft sets in the Universal set U .

Let $(S,A)_{15} = \{(e_1, \{a, b\}), (e_2, \{a\})\}$ be soft open set.

Then soft pre open sets are $(S,A)_1, (S,A)_2, (S,A)_3, (S,A)_4, (S,A)_5, (S,A)_6, (S,A)_8, (S,A)_9, (S,A)_{10}, (S,A)_{11}, (S,A)_{12}, (S,A)_{13}, (S,A)_{14}, (S,A)_{15}, (S,A)_{16}$.

Soft pre closed sets are $(S,A)_1, (S,A)_2, (S,A)_{14}, (S,A)_{11}, (S,A)_8, (S,A)_{16}, (S,A)_5, (S,A)_{13}, (S,A)_{12}, (S,A)_4, (S,A)_{10}, (S,A)_9, (S,A)_3, (S,A)_7, (S,A)_6$.

Soft g closed sets are $X, (S,A)_{11}, (S,A)_{16}, (S,A)_{13}, (S,A)_9, (S,A)_{14}$.

Soft g open sets are $\phi, (S,A)_4, (S,A)_6, (S,A)_9, (S,A)_{13}, (S,A)_3$.

Soft pre g^* open sets are $(S,A)_9, (S,A)_{13}$.

Example 4.7. Consider the Example 3.2., soft pre g^* open sets are $(S,A)_9$ and $(S,A)_{13}$. Then

(i) Soft pre g^* neighbourhood of the soft point $(e_2, \{a\})$ is $(S,A)_9$.

(ii) Soft pre g^* neighbourhood of the soft point $(e_2, \{b\})$ is $(S,A)_{13}$.

(iii) Soft pre g^* neighbourhood of the soft point $(e_1, \{a\})$ is $(S,A)_9$.

Kalaiselvi and Anitha

(iv) Soft pre g^* -neighbourhood of the soft point $(e_1, \{b\})$ is $(S, A)_{13}$.

Example 4.8. Consider the example 3.2., Take the soft set $(S, A)_9 = \{(e_1, \{a\}), (e_2, \{a\})\}$. Then the collection of all soft pre g^* -neighbourhoods of $(S, A)_9 = \{(S, A)_9\}$

Example 4.9. consider the example 3.2., Take the soft set $(S, A)_{13} = \{(e_1, \{b\}), (e_2, \{b\})\}$. Then the collection of all soft pre g^* -neighbourhoods of $(S, A)_{13} = \{(S, A)_{13}\}$.

Proposition 4.10. An arbitrary soft union of soft pre g^* -neighbourhoods of a soft point $p_1 \in X$ is a soft pre g^* -neighbourhood of p_1 .

Proof:

Let $\{(T, A)_\alpha\}_{\alpha \in I}$ be an arbitrary collection of soft pre g^* -neighbourhood of p_1 .

For each $\alpha \in I$, there exists a soft pre g^* -open set $(O, A)_\alpha$ such that

$$p_1 \in (O, A)_\alpha \sqsubset (T, A)_\alpha \sqsubset \cup (T, A)_\alpha$$

$$\Rightarrow p_1 \in (O, A)_\alpha \sqsubset \cup (T, A)_\alpha$$

Therefore, $\cup (T, A)_\alpha$ for each $\alpha \in I$ is a soft pre g^* -neighbourhood of p_1 .

Therefore, arbitrary soft union of soft pre g^* -neighbourhood of p_1 is soft pre g^* -neighbourhood of p_1 .

Remark 4.11. We conclude that the soft pre g^* -neighbourhood of $p_1 \in X$ in a soft topological space (X, τ, E) has the following facts.

- (a) Every soft super set of soft pre g^* -neighbourhood of p_1 is a soft pre g^* -neighbourhood of p_1
- (b) Every soft preopen set containing p_1 is a soft pre g^* -neighbourhood of p_1
- (c) Every $p_1 \in X$ has atleast one soft pre g^* -neighbourhood.

Theorem 4.12. A soft set (T, A) is soft pre open iff is soft pre g^* -neighbourhood of each of its soft points.

Proof:

Let $(T, A) \in X$ be a soft pre open set.

By above Remark 4.11.(b), for each soft point $p_1 \in (T, A)$, (T, A) is a soft pre g^* -neighbourhood of p_1 .

Conversely assume that (T, A) is a soft pre g^* -neighbourhood of each of its soft points.

Then for every point $p_1 \in (T, A)$ there exists a soft pre open set $(T, A)_1$ such that $p_1 \in (T, A)_1 \sqsubset (T, A)$.

$$\text{Therefore } (T, A) = \cup \{(T, A)_1 : p_1 \in (T, A)\}$$

Since arbitrary soft union of soft pre g^* -open set is soft pre g^* -open set.

Therefore each $(T, A)_1$ is soft pre g^* -open set then (T, A) is soft pre g^* -open set.

Soft pre g^* -interior sets in soft topological space

Definition 5.1. Let (X, τ, E) be a soft topological space over X and $(S, A) \in S(X)$. Then the soft pre g^* -interior of (S, A) which is denoted by $p \text{ int}(S, A)$ is defined as the soft union of all soft pre open subsets of (S, A) . That is, $p \text{ int}(S, A) = \cup \{(T, A) : (T, A) \text{ is soft pre } g^*\text{-open and } (T, A) \sqsubset (S, A)\}$

Example 5.2. Consider example 3.2.,

$$p \text{ int}(S, A)_9 = \cup \{(T, A) : (T, A) \text{ is soft pre } g^*\text{-open and } (T, A) \sqsubset (S, A)_9\}$$

$$= \cup \{(S, A)_9\}$$

$$= (S, A)_9$$

$$p \text{ int}(S, A)_{13} = \cup \{(T, A) : (T, A) \text{ is soft pre } g^*\text{-open and } (T, A) \sqsubset (S, A)_{13}\}$$

$$= \cup \{(S, A)_{13}\}$$

$$= (S, A)_{13}$$

Kalaiselvi and Anitha

Theorem 5.3. Let (X, τ, E) be a soft topological space and $(S, A), (T, A)$ be soft sets over X . Then (S, A) is soft pre g^* open iff $(S, A) \supseteq p \text{ int}(S, A)$

(i) If $(S, A) \sqsubseteq (T, A)$ then $p \text{ int}(S, A) \sqsubseteq p \text{ int}(T, A)$

(ii) $P \text{ int}(\phi) = \phi$ and $p \text{ int}(X) = X$

(iii) $P \text{ int}((S, A) \cap (T, A)) \sqsubseteq p \text{ int}(S, A) \cap p \text{ int}(T, A)$

(iv) $P \text{ int}((S, A) \cup (T, A)) \sqsubseteq p \text{ int}(S, A) \cup p \text{ int}(T, A)$

Proof:

(i) Let (S, A) be soft set over X .

Let (S, A) be soft pre g^* open in X

Then the largest soft g^* pre open set contained in (S, A) is (S, A) itself.

Therefore (S, A) is soft pre g^* open set iff $p \text{ int}(S, A) \sqsubseteq (S, A)$

(ii) By (i), $p \text{ int}(S, A)$ is the largest soft pre g^* open set contained in (S, A)

Since $(S, A) \sqsubseteq (T, A)$, $p \text{ int}(S, A)$ is a soft g^* pre open set contained in (T, A)

Also $p \text{ int}(T, A)$ is the soft union of all soft pre g^* open sets contained in (T, A) .

Therefore, $p \text{ int}(S, A) \sqsubseteq p \text{ int}(T, A)$.

(iii) Since ϕ and X are soft pre g^* open sets.

Therefore $p \text{ int}(\phi) = \phi$ and $p \text{ int}(X) = X$.

(iv) Clearly $(S, A) \cap (T, A) \sqsubseteq (S, A)$ and

$(S, A) \cap (T, A) \sqsubseteq (T, A)$

Then $p \text{ int}((S, A) \cap (T, A)) \sqsubseteq p \text{ int}(S, A)$ and

$p \text{ int}((S, A) \cap (T, A)) \sqsubseteq p \text{ int}(T, A)$

Therefore, $p \text{ int}((S, A) \cap (T, A)) \sqsubseteq p \text{ int}(S, A) \cap p \text{ int}(T, A)$

(v) Using (i), $p \text{ int}(S, A) \sqsubseteq (S, A)$ and $p \text{ int}(T, A) \sqsubseteq (T, A)$

Then $p \text{ int}(S, A) \cup p \text{ int}(T, A) \sqsubseteq (S, A) \cup (T, A)$

$p \text{ int}((S, A) \cup (T, A))$ is the largest soft pre g^* open set contained in $(S, A) \cup (T, A)$ and $p \text{ int}(S, A) \cup p \text{ int}(T, A)$ is soft pre g^* open set.

Hence $p \text{ int}(S, A) \cup p \text{ int}(T, A) \sqsubseteq p \text{ int}((S, A) \cup (T, A))$

(vi) By (i), (S, A) is soft pre g^* open set iff $(S, A) = p \text{ int}(S, A)$

Therefore $P \text{ int}(p \text{ int}(S, A)) = p \text{ int}(S, A)$

Soft pre g^* exterior set in soft topological space

Definition 6.1. Let (X, τ, E) be a soft topological space over X and $(S, A) \in S(X)$. Let $p_1 \in X$ then p_1 is called a soft pre g^* exterior point of (S, A) if there exists a soft pre g^* exterior point of (S, A) if there exists a soft pre g^* open set (T, A) such that $p_1 \in (T, A) \sqsubseteq (S, A)^c$.

Example 6.2. Consider example 3.2., Let the soft point $(e_1, \{a\})$. Then $(e_1, \{a\}) \in (S, A)^c \sqsubseteq$

$(S, A)^c = \{(e_1, \{a\}), (e_2, \{a, b\})\}$. Therefore the soft point $(e_1, \{a\})$ is soft pre g^* exterior point of the soft set (S, A) .

Proposition 6.3. Let (X, τ, E) be a soft topological space over X and $(S, A) \in S(X)$. Then the soft exterior point of (S, A) is a soft pre g^* exterior point of (S, A) .

Kalaiselvi and Anitha

Proof:

Let (X, τ, E) be a soft topological space over X and $(S, A) \in S(X)$.

Let $p_1 \in X$ be soft exterior point of (S, A) .

Then there exists a soft open set (T, A) such that $p_1 \in (T, A) \sqsubset (S, A)^c$

Since every soft open set is soft pre open set and (T, A) is soft pre g^* open set.

Therefore p_1 is a soft pre g^* exterior point of (S, A) .

Example 6.4. Consider example 3.2., Let the soft point $(e_1, \{b\})$. Then $(e_1, \{b\}) \in (S, A)_{13} \sqsubset$

$(S, A)^3 = \{(e_1, \{b\}), (e_2, \{a, b\})\}$. Therefore the soft point $(e_1, \{b\})$ is soft pre g^* exterior point of the soft set $(S, A)_3$.

Proposition 6.5. Let (X, τ, E) be a soft topological space over X and $(S, A), (T, A) \in S(X)$. Then

- (a) If $(S, A) \sqsubset (T, A)$ then $p \text{ ext}(T, A) \sqsubset p \text{ ext}(S, A)$
- (b) $p \text{ ext}((S, A) \cup (T, A)) \sqsubset p \text{ ext}(S, A) \cup p \text{ ext}(T, A)$
- (c) $p \text{ ext}((S, A) \cap (T, A)) \sqsubset p \text{ ext}(S, A) \cap p \text{ ext}(T, A)$
- (d) $\text{ext}(S, A) \sqsubset p \text{ ext}(S, A)$
- (e) $p \text{ ext}(X) = \phi$ and $p \text{ ext}(\phi) = X$
- (f) $p \text{ ext}(X)$ is soft pre g^* open set.

Proof:

- (a) Suppose $(S, A) \sqsubset (T, A)$
Then $(T, A)^c \sqsubset (S, A)^c$
 $\Rightarrow p \text{ int}(T, A)^c \sqsubset p \text{ int}(S, A)^c$
 $\Rightarrow p \text{ ext}(T, A) \sqsubset p \text{ ext}(S, A)$
- (b) Since $(S, A) \sqsubset (S, A) \cup (T, A)$ and
 $(T, A) \sqsubset (S, A) \cup (T, A)$
Using (a) we can write, $p \text{ ext}((S, A) \cup (T, A)) \sqsubset p \text{ ext}(S, A)$ and
 $p \text{ ext}((S, A) \cup (T, A)) \sqsubset p \text{ ext}(T, A)$
Therefore $p \text{ ext}((S, A) \cup (T, A)) \sqsubset p \text{ ext}(S, A) \cup p \text{ ext}(T, A)$
- (c) $(S, A) \cap (T, A) \sqsubset (S, A)$ and $(S, A) \cap (T, A) \sqsubset (T, A)$
Using (a), we have, $p \text{ ext}(S, A) \sqsubset p \text{ ext}((S, A) \cap (T, A))$ and
 $p \text{ ext}(T, A) \sqsubset p \text{ ext}((S, A) \cap (T, A))$
Therefore $p \text{ ext}(S, A) \cap p \text{ ext}(T, A) \sqsubset p \text{ ext}((S, A) \cap (T, A))$
- (d) $\text{ext}(S, A) \sqsubset p \text{ ext}(S, A)$
For, Let $p_1 \in \text{ext}(S, A)$
Then $p_1 \in \text{int}(S, A)^c \sqsubset p \text{ int}(S, A)^c$
 $= p \text{ ext}(S, A)$
- (e) $p \text{ ext}(X) = \phi$ and $p \text{ ext}(\phi) = X$
For, $p \text{ ext}(X) = p \text{ int}(\phi)$
 $= \phi$
 $p \text{ ext}(\phi) = p \text{ int}(\phi^c)$
 $= p \text{ int}(X)$
 $= X$
- (f) Since $p \text{ ext}(X) = p \text{ int}(\phi) = \phi$
Therefore $p \text{ ext}(X)$ is soft pre g^* open set.

Kalaiselvi and Anitha

CONCLUSION

In this chapter we discussed Soft pre g^* open sets and their properties with examples. We have proved every soft pre g^* open set is soft pre open. But converse is not true. Every finite union of two soft pre g^* open set is soft pre g^* open set. But every finite intersection of two soft pre g^* open set is need not be soft pre g^* open set. Every soft point has at least one soft pre g^* neighbourhood. Every soft pre g^* open set containing soft pre g^* neighbourhood. Every soft pre g^* open set has soft pre g^* interior and soft pre g^* exterior points.

ABSTRACT

Cholelithiasis (Gallstones) has become one of the foremost common diseases of the biliary tract worldwide. There are two subtypes of cholesterol gall stones: cholesterol stones (90-100% of cholesterol) and mixed stones (50-90 % of cholesterol). Modern medicine majorly relies on surgical management of the disease as conservative treatment is usually futile. Siddha medicine is a holistic medicine containing herbal, metal, mineral, and animal products. Among them, Pavala Veera Chunnam (PVC) is one of the Siddha preparations indicated for *Kaasam*, *Swasam*, *Kshayam*, especially Bronchial asthma, Jaundice, Gall bladder stone, Consequent Hepatic colic or Biliary colic. Most of the traditional healers use PVC for the management of Gall bladder stones. In this pilot study, 10 patients were enrolled in the study as per the inclusion and exclusion criteria. The study drug PVC was given at a dose of 200mg twice a day with milk after food continuously for 21 days. Alvarado's abdominal pain score, complete blood analysis, and USG abdomen scan were used to assess the study outcome. Symptoms like abdominal bloating, regurgitation, burning sensation in epigastric region, nausea, and vomiting reduced to 80% of the patient and 20% are Asymptomatic. Pain score reduced after treatment (80%) and patient became pain-free (20%), Stone size also reduced after treatment with the study drug indicating the drug would be effective for gallstone treatment (30%). The blood parameters show no significant difference between before and after treatment. The results of this pilot study strongly suggest that

Selvam *et al.*,

Pavalaveerachunnam may be very effective and safe in the treatment and management of Gallstones (Cholelithiasis).

Keywords: Cholelithiasis, Siddha Medicine, Pavala veera chunnam, Gall bladder stone, Pithapai kal.

INTRODUCTION

Cholelithiasis (Gallstones) has become one of the foremost common diseases of the biliary tract worldwide. The prevalence rate is too difficult because calculous disease is often asymptomatic [1]. Incidentally, gallstones can also cause right upper abdominal pain, nausea, vomiting, obstruction, cholangitis, and pancreatitis, especially after consuming greasy or spicy foods. There are two types of gallstones, among them approximately 80 percent of gallstones contain cholesterol and therefore the remaining 20 percent are pigment stones, which consist mainly of calcium bilirubin [2]. There are two subtypes of cholesterol gall stones: cholesterol stones (which contain 90-100% of cholesterol) and mixed stones (which contain 50-90 % of cholesterol) [2]. Evidence suggests that 90% of cholelithiasis patients have cholesterol stones [3]. There are multiple factors associated with an increased prevalence of gallstones like metabolic derangements such as dyslipidaemia, diabetes, obesity, insulin resistance, and diets higher in saturated fats and sugar, and lower in fiber[4]. Additional associations include lack of physical activity and conditions such as rapid weight loss or prolonged fasting that diminish gallbladder contractility and increase biliary secretion of cholesterol [5]. Gallstone risk increases for females (especially before menopause) and people near or above 40 years [6]. It has been demonstrated that bile cholesterol and a reduction in gallbladder contractility are correlated with estrogen levels. Females of reproductive age or taking estrogen-containing birth control medication have a two-fold increase in gallstone formation compared with males [7]. Even though conservative therapy is frequently used, surgery is necessary in certain circumstances. Currently, the two available therapeutic options are laparoscopic cholecystectomy and open limited-access surgery. Surgery and the adverse reactions of medication must be avoided, so natural and traditional medicinal products are being looked into as potential alternatives. Siddha medicine is one of the traditional medicines practiced in the Southern part of India. Whereasthe Siddha system of medicine contains many herbal and metallic preparations for managing cholelithiasis. Among them, Pavala Veera Chunnam (PVC) is one of the Siddha preparations indicated for *Kaasam*, *Swasam*, *Kshayam*, especially Bronchial asthma, Jaundice, Gall bladder stone, Consequent Hepatic colic or Biliary colic [8]. Most of the traditional healers use PVC for the management of Gall bladder stones, and there is no documentation on clinical trials for gall bladder stones. Hence, the main objective of the present study is to investigate PVC for the management of Cholelithiasis among patients.

MATERIAL AND METHODS

Purchase and authentication

The raw drugs were bought from the raw drug store in Chennai. Goat's bile was gathered in Chennai's Tambaram. A zoologist from NIS Tambaram Sanatorium Chennai verified the goat's bile, and a Pharmacology expert in the department of Gunapadam at NIS Tambaram Sanatorium Chennai provided the identification and authentication for mineral drugs.

Ingredients

Purified Veeram - 1/10 palam (3.5gm)
Purified kodi pavalam - 1 palam (35gm)
Goat's bile - Required amount

Selvam *et al.*,**(i). Purification of Veeram**

Veeram (Hydrargyrum perchloride) – 1/10 palam (3.5gm)

Method of purification

Make a solution of camphor and tender coconut water and put it in a pot. As per the Thula Enthiram process, burn the veeram in the pot without touching the solution for half an hour ^[9].

(ii). Purification of Pavalam:

Kodi Pavalam (coral) - 1palam (35gm)

Method of purification

Soak in lime juice for 24 hours and on the next day wash with hot water ^[9].

Preparation of the drug PVC

The above two ingredients are broken into small pieces, powdered coarsely, and placed in an earthen ware, and Goat's bile is poured in it. Then stirred well, kept for a day, and then exposed to the sunlight to be dried. Thereafter it was kept in a small earthen pot and closed with another small earthen pot, seven layers of clay cloth(*seelai*) attached to the margin of both earthen pots, dried, and subjected to *pudam* with about 250 *varatties* in a pit in an airtight compartment. On being cooled, it is taken out powdered, weighed, and stored in an airtight container.

Route of Administration: Oral route**Dose:** 200mg/ twice a day,**Adjuvant:** Cow's milk.**Duration:** 21 days [10]**Drug storage:** The prepared drug was stored in a clean and dry air-tight container.**Pilot Study Methodology**

This pilot study was conducted in Ayothidoss Pandithar Hospital OPD.NO:11/12, Dept of Gunapadam, National Institute of Siddha, Tambaram sanatorium, Chennai-47. As per standard protocol after obtaining the approval of the Institutional Ethical Committee (IEC) (NIS/IEC/11/2/03–23/06/2011). The trial has been registered in the Clinical Trial Registry India (CTRI/2013/12/004203) and also posted on the International Clinical Trials Registry Platform search portal (WHO). Before enrollment into the study, informed consent was obtained from the patients.

Selection criteria**Subject selection**

As and when patients report at OPD of Ayothidoss Pandithar Hospital, NIS with symptoms of inclusion criteria will be subjected to screening and documentation will be done by using the screening proforma.

Inclusion criteria

Patients who will be fulfilling the following criteria will be included in the study

- Age:20-60 yrs
- Sex: Male, Female, Transgender
- Patient with Asymptomatic /chronic gallstone not more than 10 years
- High cholesterol level/Normal cholesterol level
- Asymptomatic and symptoms like Abdominal bloating, Fat meal intolerance, nausea, pain in right hypochondria and epigastric.
- Murphy sign: Pain /catch in a deep breath when the fingers are pressed below the right costal cartilage.
- Stone size: not more than 10mm
- Patient willing to sign the informed consent
- Patients who are willing to take an Ultrasonography investigation (USG -Abdomen)

Selvam *et al.*,

- Patients who are willing to provide blood samples for lab investigation. (CBC, lipid profile, Liver function test)

Exclusion Criteria

A patient who will meet any of the following criteria will be excluded from participation in this study:

- Stone size > 10mm
- Pregnant women and planning to be pregnant within three months
- Lactating mother
- K\H\O Hypertension
- K\H\O Acute pancreatitis
- Carcinoma of gallbladder
- Symptoms like severe pain/fever/jaundice
- Acute (or) chronic cholecystitis
- Patient is under any steroid medication

Withdrawal criteria

- The patient turned unwilling to continue in the course of a clinical trial.
- Drug intolerance and adverse response development during the experiment.
- The patients who develop symptoms like severe abdominal pain, vomiting, Jaundice

Plan of study

15 patients were screened for the pilot study and only 10 patients fulfilled the selection criteria. So, the 10 patients were enrolled in the study as per the study protocol. (IAEC number: NIS/24/IEC/2023/S.P/30 and date:12/07/23). As per Siddha literature, before starting the treatment for Gall bladder stone, an oil bath was given with the Arakku thylam, on 2nd day onwards purgation was given with the Agasthiar Kuzhambu 200 mg od in the early morning with the ginger juice on an empty stomach for one day. Next day rest was advised to the patients, 4th day onwards the study drug *pavala veera chunnam* was given at a dose of 200mg twice a day with milk after food continuously for 21 days. [10]

Study Outcome Assessment

The study outcome was assessed based on the USG report, Blood investigations (CBC, Lipid Profile, Liver function test) improvement in reduction size before and after treatment for 21 days, and pain score (Alvarado abdominal pain score method).

Table.1: Alvarado Pain Scale

Features	Score
Right lower quadrant tenderness	2
Rebound tenderness	1
Elevated temperature (>37.3°C or >99.1°F)	1
Pain shifting to the lower right quadrant	1
Anorexia	1
Nausea or vomiting	1
Leukocytosis >10,000 white blood cells	2
Leukocytosis with a left shift of pain	1

Selvam *et al.*,

RESULT

Table No. 2: patient details before and after treatment

Sl. No	Age	Sex	Symptoms before treatment	Symptoms after treatment
1	32	Female	Pain and burning sensation present in the right upper and lower quadrant, flatulence, anorexia, nausea, and vomiting.	Pain present in the right upper quadrant, flatulence
2	34	Female	Pain and burning sensation present in the right upper, indigestion, abdominal bloating.	Pain is present in the right upper quadrant.
3	34	Male	Pain is present all over the abdomen, abdominal bloating, regurgitation, and indigestion.	Asymptomatic
4	26	Male	Pain and burning sensation present in the right upper and lower quadrant, nausea, and vomiting.	Pain and burning sensation present in the right upper and lower quadrant.
5	36	Female	Pain present in the right upper quadrant, indigestion, abdominal bloating, and nausea.	Pain present in the right upper quadrant, indigestion, abdominal bloating.
6	41	Female	Pain present in the right upper quadrant, indigestion, regurgitation, and nausea.	Pain is present in the right upper quadrant.

DISCUSSION

Gallstone (GS) disease is a very common health problem that affects millions throughout the world [12,13]. GS is generally found in the gallbladder (GB) which occupies the central part of the human biliary system. Bile is made up of phospholipids, cholesterol, bilirubin, and bile salts, all of which are essential for maintaining GB homeostasis. Various pathological conditions can disturb the regulation of these secretions. Altered secretion of biliary cholesterol, phospholipids, and bile acids disturbs the solubility of bile [14]. GS formation commences with cholesterol super saturation [15]. The Anti-hyperlipidaemic study was also done for the PVC.[16] The medicine was prepared as per the literature. The study was conducted in Ayothidoss Pandithar Hospital, Tambaram, Chennai. Totally 15 patients were screened and 10 patients enrolled in the study. On the first day oil bath will be given, on 2nd day onwards purgation will be given, the Next day rest will be advised to the patients, 4th day onwards the study drug *pavala veera chunnam* will be given at a dose of 200mg twice a day with milk after food continuously for 21 days.

Alvarado's abdominal pain score, complete blood analysis, and USG abdomen scan were used to assess the study outcome. Most of the patients had pain scores of 4 and 5, which were reduced to a pain score of 2. The third patient had a pain score of 4 before treatment, and after treatment, it was reduced to a pain score of 0. The tenth patient had a pain score of 2 before treatment, it was reduced to a pain score of 0. The pain scale is generated based on the symptoms, a massive difference between before and after treatment. Symptoms of flatulence, nausea, anorexia, and vomiting reduced well in most of the patients. Statistical analysis of pain score by paired t-test shows $P < 0.05$ significance, so the null hypothesis was rejected. Stone sizes also reduced after treatment with the study drug, indicating the drug would be effective for gallstone treatment. The first patient had a stone size of 5mm before treatment and the size was reduced to 4mm after treatment. The third patient had a stone size of 10mm, which was

Selvam et al.,

reduced to 9mm after treatment. In the seventh patient, 5mm of stone size was reduced to 4,5mm. In the other patients, there was no change in stone size before and after treatment. Statistical analysis of pain score was also done by paired t-test, showing $P < 0.05$ significance. Statistical analysis of stone size by paired t-test shows $P < 0.05$ significance, so the null hypothesis was rejected. Complete blood analysis, liver function test, and total cholesterol estimation are also done before and after treatment with the study drug. The blood parameters show no significant difference between before and after treatment. Hence, this study proves that the study drug (PVC) is very effective and safe in treating and managing gallstones. Previous literature shows that in persons with symptomatic gallstones treated by Laparoscopic cholecystectomy. The rate for subsequent pain is high, so many persons probably choose cholecystectomy to avoid pain. [17,18] In the Siddha aspect, Veeram and pavazham are both effective *kabham* and *Pitham* diseases. It reduces *kabham* and *Pitham* [19]. An increase in *Pitham* and *kabham* mainly causes cholelithiasis. So, PVC is a good choice for treating gallstones in the future.

CONCLUSION

The Results of this pilot study strongly suggest that *Pavalaveerra Chunnam* may be very effective and safe in the treatment and management of Gallstones (Cholelithiasis). Furthermore, large-scale clinical trials are needed to confirm Pavala Veera Chunnam's effectiveness in the future.

ACKNOWLEDGMENT

The authors acknowledge the support and facilities provided by the National Institute of Siddha, Tambaram sanatorium, Chennai for their support in this study.

Source of Fund

The author(s) received no financial support for the research, authorship, and/or publication of this article

Conflict of Interest

The author(s) declared no potential conflicts of interest with respect to the research, authorship, and/or publication of this article.

Ethical Approval

Before initiating the clinical study, ethical approval was granted by the Institutional Ethics Committee (IEC) of the National Institute of Siddha, Chennai. All procedures followed the guidelines and ethical principles for clinical experimentation, ensuring appropriate care and control for all participants. The IEC approval number for this study is IAEC No: NIS/24/IEC/2023/S. P/30, and the approval was granted on 12th July 2023.

ABSTRACT

Prolyl Endopeptidase (PREP) family enzymes have a major role in regulating the activity of peptides and peptide hormones, influencing processes such as learning and memory. Consequently, these enzymes are responsible for various diseases, including amnesia and depression. Prolyl peptidase (PREP; EC3.4.21.26) is a highly conserved serine protease. It cleaves peptides at the carboxyl group terminal of proline residues in small molecular weight proteins (approximately 30 amino acids). It typically does not cleave larger peptides and proteins. The peptidase domain has an α/β hydrolase fold. The catalytic triad (Ser554, His680, Asp641) is protected by a central tunnel formed by an N-terminal β propeller. This structural arrangement prevents larger peptides from entering the active site. Techniques like X-ray crystallography and enzyme kinetic analysis have provided significant insights into the structure-function relationship of these enzymes. This study employs a number of prolyl endopeptidases to develop a Multiple Linear Regression (MLR) model using QSARINS software. The model is built using molecular descriptors with minimal correlation, based on experimentally determined IC₅₀ values sourced from the ChEMBL database. A genetic algorithm is applied to select the suitable molecular descriptors for the model. The model is thoroughly validated using OECD guidelines to ensure its robustness and stability.

Keywords: QSARINS, molecular descriptors, inhibitors, Quantitative Structure-Activity Relationship, Multiple Linear Regression.

Indrani Sarkar

INTRODUCTION

Prolyl endopeptidase (PEP) is a cytosolic enzyme. It cleaves peptide bonds at the C-terminal side of prolyl residues, commonly within peptides around 30 amino acids in length. The enzyme's active site is selective, allowing only short peptide sequences to enter, which is regulated by a distinctive beta-propeller structure. In this study, we explore various inhibitors with experimentally determined IC₅₀ values sourced from the ChEMBL database (ID: ChEMBL 3202, Name: Prolyl Endopeptidase, Uniprot Accession No.: P48147, Organism: *Homo sapiens*). [1]. A dataset comprising IC₅₀ values for 697 compounds was gathered and analysed to evaluate their range and sources

MATERIALS AND METHODS

The biological activity of a molecule is related to its chemical structure. Quantitative Structure-Activity Relationship (QSAR) models are used to analyze and predict relationship between a molecule's chemical composition and its biological and physicochemical properties. A variety of molecular descriptors are used to build Multiple Linear Regression (MLR) models [2,3]. QSAR models play a crucial role in predicting new compounds with potentially improved biological activity. Three-dimensional crystal structures of 265 small compounds are taken from the PubChem database. The experimental values IC₅₀ (50% inhibition concentration) are obtained from ChEMBL (Table 1). Each molecule was subjected to 1000 steps of steepest descents energy minimization using the MMFF94 force field. RMSD of potential energy reached below 0.001. Descriptor values for these molecules are calculated using PaDEL software [4]. In this analysis, IC₅₀ was taken as the dependent variable (Y), and the molecular descriptors were considered independent variables (X). Descriptors having correlation greater than 90% were discarded, Correlation analysis was performed between each pair of descriptors. Descriptors with zero values or those exhibiting the same values for 80% of the compounds were also removed. After excluding 395 data points, 521 data entries were retained for analysis. The distribution profile of the experimental data and descriptor values are shown in Figures 1, 2, and 3. A genetic algorithm in QSARINS is used to select variables for the reduced descriptor set. A training set (70%) and a test set (30%) are then created randomly from the dataset. Multiple Linear Regression (MLR) models are constructed using Ordinary Least Squares (OLS) using the QSARINS program (QSAR-Insubria). The software is provided by the University of Insubria. This was developed by Nicola Chirico [2,3] and implemented by Gramatica *et al.* [5,6,11]. the tool explores every conceivable combination of descriptors using the all-subset approach. This approach was used to generate MLR models with 1–6 descriptors. The MLR model was used to construct a linear relationship between the molecular descriptors and the biological activity IC₅₀ (half maximum inhibitory concentration). Based on their R² values, the top models were chosen.

RESULTS AND DISCUSSION

Fitting Criteria

The evaluation of the model performance involves various criteria, including R², R²_{adj}, R² -R²_{adj}; LOF, k_{xx}, k_{xy}, δk, training data, training data (MAE, RMSE, RSS, CCC), S and F. These parameters are defined as follows:

LOF = Friedman lack of fit criterion

k_{xx} = correlation found among descriptors

k_{xy} = correlation between descriptors and responses

δk = k_{xx} - k_{xy}

R² = regression coefficient

MAE = mean absolute error in fitting

MAE (tr) = mean absolute error in the training set

RMSE (tr) = root mean square error for training set

RSS (tr) = residual sum of squares for training set

s = standard error of estimate

CCC (tr) = concordance correlation coefficient for training set

Indrani Sarkar

For a robust QSAR model, an $R^2 > 0.6$ is considered acceptable. The R^2 tends to increase with the addition of more descriptors, while R^2 (adj) improves with the inclusion of relevant variables. Importantly, R^2_{adj} will always be less than or equal to R^2 . The LOF should ideally be less than 0.4, and the F-value should be high [7]. A low value for k_{xx} is preferred, indicating weak correlation among descriptors. Additionally, the difference $k_{xy} - k_{xx}$ should be smaller than a threshold value δx [8,9]. The CCC (tr) should be high and close to 1, indicating good correlation between the expected and observed values. Moreover, RMSE values of training and validation should be similar to ensure consistency of the model.

Fitting criteria of Model MLR1 $R^2 = 0.7399$ R^2 (adj) = 0.7312 $R^2 - R^2$ (adj) = 0.0087 LOF = 0.4777 $K_{xx} = 0.2517$ Delta $K = 0.0965$ RMSE (tr) = 0.6466 MAE (tr) = 0.4916 RSS (tr) = 77.7645 CCC (tr) = 0.8505 $s = 0.6591$ $F = 84.8691$

Internal Validation

Iterated cross-validation methods are used to evaluate the model's dependability. The cross-validated correlation coefficients. Q^2 (LOO) and Q^2 (LMO), are calculated the Leave-One-Out (LOO) and Leave-Many-Out (LMO) methods. In the LOO procedure, the model is iteratively built by taking one compound out of the dataset of descriptors. After the model is trained on the remaining data, a prediction is made for the omitted compound. A model is considered good if the Q^2_{LOO} value exceeds the R^2 value. The LMO approach tests the result given by the model when multiple compounds are left out. Typically, 30% of the compounds are randomly excluded. The model is recalculated using the remaining compounds. The result is then evaluated by predicting the responses for the excluded compounds. If the averages of the R^2 and Q^2_{LOO} values fall within a specific range, the model is considered stable. For reliable model performance, both Q^2 (LOO) and Q^2 (LMO) should be greater than 0.6; MAE and RMSE (cv) (cross-validation RMSE) should both be below 0.5, RMSE (tr) (training RMSE) should be smaller than the RMSE (cv). The standard errors (s), RMSE (tr), and RMSE (cv) should be comparable. To ensure the model is not a result of random correlations, the Y-scrambling method is employed. This technique involves randomizing the experimental data or responses, breaking any link between the descriptors and the responses. If the model was constructed purely by chance, the performance of the resulting models should degrade significantly.

Internal validation criteria

Q^2 (LOO) = 0.7190 $R^2 - Q^2$ (LOO) = 0.0209 RMSE (cv) = 0.6721 MAE (cv) = 0.5112 PRESS (cv) = 84.0253 CCC (cv) = 0.8391 Q^2 (LMO) = 0.7125 $R^2 Y$ (scr) = 0.0318 $Q^2 Y$ (scr) = -0.0471 RMSE (av) Y (scr) = 1.2475

External Validation Method

The model is tested by predicting the responses for novel compounds that were not included in the training set, applying the MLR equation to these external compounds. Various performance metrics are used to evaluate the model's predictive ability, including RMSE (ext) and the Golbraikh and Tropsha approach [10]. Low multicollinearity (Table 2) among the descriptors is utilized to develop several MLR models. The average R^2 and Q^2 (LOO) values are plotted against the number of variables (Fig. 4). The addition of new descriptors led to an increase in both R^2 and Q^2_{LOO} values; however, it did not significantly improve model performance. The six-variable models share many common descriptor combinations. The best model (MLR 1) which includes six descriptors, is selected for predicting novel inhibitors. The statistical characteristics of MLR1 are shown in Table 3. According to the model statistics, $R^2 = 0.7399$ and R^2 (adj) = 0.7312, indicating that the model is capable of incorporating a new descriptor. The LOF parameter has low value (0.4777). It suggests that the minimum number of descriptors fit the data well. The low k_{xx} value (0.2517) indicates minimal correlation among the model descriptors. The δk (0.0965) value indicates that the descriptors are well correlated with the Log IC_{50} values. Additional statistical metrics (RMSE (tr) = 0.64660, MAE (tr) = 0.49160, $s = 0.6591$) indicate minimal error in the training set results. The scatter plot (Fig. 5,6) compares the predicted values from the model equation (blue points, test set) with the experimental values (yellow dots, training set). Some outliers in the data are found in the plot. The validity of the model is confirmed by internal validation. The variance observed by LOO indicates good prediction performance (Fig. 6). Q^2 (LOO) = 0.7190 is comparable to $R^2 = 0.7399$. The model demonstrates internal stability, as the prediction error is minimal (RMSE (cv) = 1.1825, MAE (cv) = 0.79180). The Leave-Many-Out (LMO) method was applied by excluding 30% of the dataset, and the values of R^2 (0.7399) and Q^2 (LMO) (0.7125) are comparable, suggesting the model's stability. The Q^2 (LOO) (0.7190) and Q^2 (LMO) (0.7125) values

Indrani Sarkar

are consistent. The $Q^2(\text{LMO})$ vs k_{xy} plot (Fig. 9) shows the performance of the LMO models, with the blue point representing the QSAR model ("model Q^2 "), and the red points indicating the LMO model's performance. The LMO model performs similarly to the original model. The model can be a correlation by chance. To rule out that possibility the Y-scrambling method is applied. The values obtained were $R^2_{Yscr}=0.0318$ and $Q^2_{Yscr}=-0.0471$. Figure 10 compares these values with those from the original model. It is evident that the R^2 and Q^2 values differ completely from those derived using Y-scrambling, suggesting that the model is not obtained by chance. For external validation, several parameters are used:[10]

External validation criteria

RMSE (ext) = 1.1825 MAE (ext)= 0.7918 PRESS (ext)= 110.4685 R^2 (ext)= 0.2554

$Q^2\text{-F1}$ = 0.0524 $Q^2\text{-F2}$ = 0.0260 $Q^2\text{-F3}$ = 0.1301 CCC (ext)= 0.4943

r^2_m (average)= 0.1304 r^2_m (delta)= 0.0501

Calculated external data regression angle from diagonal= -19.5441°

R^2 (ext) = the external validation procedure's coefficient

MAE (ext)= The Mean Absolute Error

MSE (ext) measures the Root Mean Square Error $Q^2\text{-F1}$, $Q^2\text{-F2}$ and $Q^2\text{-F3}$ measure the variances provided in external validation. [8, 9, 12, 13]

CCC (ext) = Concordance Correlation Coefficient [2,3]

$r^2_m\text{-aver}$ and $r^2_m\text{-delta}$ = Roy criteria average [14].

PRESS (ext) = for Predictive Residual Sum of Squares.

The parameters obtained are consistent with the model. Fig. 11 presents the q-q plot of experimental vs residual values from LOO. The ordinate shows the values of the residuals (from the predictions). The abscissa shows the theoretical quantiles, or Z values. The theoretical quantiles, or Z values are plotted along the abscissa. Values obtained by the model equation are shown by blue points, predicted values by LOO are represented by the yellow points (training set).

The Combined Model

The Average Combined Prediction is obtained by averaging the predictions obtained from all 9 models (ACM) (Fig.8). According to the William plot of the combined model (Fig.12,15), majority of the compounds fall within the model's applicability domain. The critical leverage value of h^* is 0.265. The predicted residuals and the HAT values are shown on the ordinate and abscissa respectively. The LOO training set is represented by the yellow spots, and the prediction set, as established by the combined model equation, is represented by the blue points. Horizontal dashed lines represent the user-specified threshold for Y-outlier detection. Outliers are defined as having HAT values exceeding the cut off value, $h^*=3p/n$ (p is the number of model variables plus one, n is the number of objects). Additionally, the applicability domain is displayed in the Insubria plot (Fig. 13,14), generated by the software QSARINS. In this graph, the ordinate shows projected data and the abscissa presents HAT diagonal values. The combined model predicts data points shown in blue (prediction set) and yellow (training set), respectively, when the experimental values are known [15,16]. Table 4 lists the chemicals tested using the model equation. The models are selected based on Principal Component Analysis (PCA) to the average performance using the combined modelling approach.

Selected Models Include

MLR1 model: (5.6059) + (-0.0125) ATSC4i + (-0.0544) VE3_Dzv+ (0.0980) VE3_Dzi + (0.3459) nBondsD + (0.4949) SsssN + (-0.3059) nHBDOn

MLR2 model: (3.2208) +(-0.0117) ATSC4i + (1.8593) GATS3c + (0.0575) VE3_Dzi + (0.3847) nBondsD + (0.4309) SsssN+ (-0.0128) VABC

MLR3 model: (3.8934) + (-0.0126) ATSC4i + (1.7166) GATS3c + (0.0662) VE3_Dzi+ (0.3390) ndssC +(0.4542) SsssN + (- 0.2544) nHBDOn

MLR4 model: (4.1440) +(- 0.0126) ATSC4i+ (1.5181) GATS3c+ (0.0679) VE3_Dzi+ (0.3832) nBondsD + (0.4638) SsssN+ (- 0.2805) nHBDOn

MLR9 model: (2.9577) + (-0.0122) ATSC4i + (2.0575) GATS3c + (0.0575) VE3_Dzi + (0.3320) ndssC + (0.4333) SsssN+ (-0.0108) VABC

Fitting criteria for the combined model

R^2 (ACM)=0.7491 R^2 (WCM)=0.7626 MAE (tr)=0.4823 RMSE (tr)=0.6353 CCC (tr)=0.8545 External validation criteria MAE (ext.)=0.6978 RMSE (ext.)=0.9101 CCC (ext.)=0.6685 Q^2 -F₁=0.4387 Q^2 -F₂=0.4231 Q^2 -F₃=0.4847 Calculated external data regression angle from diagonal (ACM)= -14.8142° Calculated external data regression angle from diagonal (WCM)= -18.1825°

DISCUSSION

The 3-D structural coordinates of human Prolyl Oligopeptidase (hydrolase) bound to the inhibitor GSK552 at a resolution of 1.56 Å (PDB DOI: <https://doi.org/10.2210/pdb3DDU/pdb>) [1] (PDB code: 3DDU) is taken from the Protein Databank. The structure of HIV-1 RT consists of two chains, A and B. Docking studies are conducted using the 560 amino acids in Chain A. Hydrogen atoms and partial charges are added to the protein. OPLS force field is used to minimize energy. Auto Dock Vina software is used to dock the chemicals ChEMBL ID: 267225, 480154, 449310, and 565813 (designated as outliers) in the binding site. [17,18] Unlike in crystals, the docked structures are not stabilized inside the active site (Fig 16,17).

CONCLUSION

Prolyl endopeptidase, is a cytosolic enzyme that has been the focus of extensive research. It plays a critical role in various physiological processes and the regulation of neuronal hormones containing proline residues. POP inhibition presents a promising strategy for treating Alzheimer's, Parkinson's, and other cognitive impairments [19,20,21,22]. The 3D structure of human POP, complexed with the inhibitor (6S)-1-chloro-3-[(4-fluorobenzyl)oxy]-6-(pyrrolidin-1-ylcarbonyl)pyrrolo[1,2-a]pyrazin-4(6H)-one is available in the Protein Data Bank. (PDB Code: 3DDU). POP cleaves peptide bonds on the carboxyl group side of proline, recognizing the sequence X-Pro-Y. Here X and Y are generally peptides/ amino acid. Y can also be amide, alcohol, or aromatic amine. The catalytic triad consists of Ser 554, Asp 641 and His 680. The enzyme's active site contains several charged residues, including Arg-128, Arg-643, Asp-642, Arg-252 and Asp-149, and. These residues create an electrostatic environment which influences substrate binding and specificity. Additionally, polar residues such as Thr481, Ser479, Tyr471, and Asn483 may create steric hindrance, further affecting binding interactions. [23,24,25,26,27]. In this study, a series of POP inhibitors, including peptide-like compounds, are utilized to develop a QSAR-MLR model through ordinary least squares regression using QSARINS. Molecular descriptors are generated using PaDEL software. The most meaningful descriptors are selected using genetic algorithm. The resulting model is at par with the regulatory principles of OECD. The robustness of the MLR model is evaluated through both internal and external validation. The model can predict novel compounds. The application domain of the model shows four potential outliers. Molecular docking studies indicate that these compounds do not fit well within the active site.

ABSTRACT

This review offers a comprehensive overview of parenteral nanosuspensions and recent advancements in technology and drug delivery. Over the past decade, nanocrystals have proven to be effective in enhancing solubility. Currently, there is a significant shift from using nano crystallization solely for solubility enhancement to exploring its more innovative and targeted applications. This article aims to offer a complete overview of nanosuspension preparation methods as well as the major technological obstacles connected with their development. It discusses suggestions for choosing stabilizers, the in vivo behaviour of intravenously delivered nanosuspensions, and ways for attaining targeted intravenous distribution. medicinal nanosuspensions are a flexible formulation approach for increasing the delivery of hydrophobic pharmaceuticals and are one of the most promising ways to improve the biopharmaceutical performance of poorly water-soluble medicinal molecules.

Keywords: Nano-suspensions, formulation techniques, manufacturing processes, stabilizer selection, administration routes.

Naziya Khan and Deepak Joshi

INTRODUCTION

Nano-suspensions (NSs) are dispersions of colloidal material that include submicron drug particles. They are generally finely dispersed, biphasic, and have drug particles smaller than 1 μm [1]. While the definition of nano-suspensions varies in the literature, and the terms small suspensions and nanocrystals are frequently used interchangeably, nano-suspensions are generally described as "pure active pharmaceutical ingredients (APIs) ranging from 10-1000 nm stabilized with surfactants or polymers.[2]" They are also classified as "particles with sizes of approximately 200-600 nm, formed from 100 percent pure active substances [3]." When nano-sized particles drug crystals are used as stabilizing agents, a nano-suspension is formed. In 1995, the first nanosuspension-based drug, Gris-Stat, was introduced. This product was a sustained-release tablet containing nanosuspensions of griseofulvin. Since then, more than 20 nanosuspension products have been launched, with administration routes categorized into oral and injectable forms. These products cover a range of indications, including analgesia, schizophrenia, antifungal treatments, anti-inflammatory applications, and other areas (Chen et al., 2022).

Parenteral nanosuspension

Intravenous (IV) administration (parenteral) is preferable because to its quick beginning of action, avoidance of hepatic metabolism, and provide tailored doses. However, creating IV formulations for medications that are poorly water-soluble presents considerable hurdles. Salt formation, co-solvents, surfactants, and complexation with cyclodextrins are used to increase solubility. Parenteral administration is crucial and demands precise control over various factors. For parenteral nanosuspensions, particle size is a critical parameter as it influences the in vivo behaviour of the nanocrystals. Studies have shown that nanocrystals larger than 200 nm dissolve more slowly and are predominantly phagocytized by liver macrophages, while those 100 nm or smaller dissolve more rapidly [4]. Although the fundamentals of solubility enhancement and preparation techniques have been extensively reviewed [5][6], this review will specifically address parenteral nanosuspensions. It will explore aspects such as the surfactants employed, preparation methods, stability challenges, strategies to overcome these challenges, in vivo behaviour following parenteral administration, and existing marketed formulations. Additionally, it will touch on pharmacokinetic strategies and provide a brief overview of general preparation methods, recent advancements, and the unique characteristics of nanocrystals.

Preparation techniques of nanosuspension

Media Milling

Media milling processing method was pioneered by Liversidge *et al.* [7][8]. This approach employs high-shear media mills or pearl mills to produce nano-suspensions. The media mills include processing chamber, processing shaft, and a distribution chamber (see Figure 3). The processing media, or beads, are typically made from sintered ceramic aluminium oxide or highly cross-linked polystyrene resin. In this method, a water-based suspension containing the drug and stabilizer is introduced into the processing chamber, where the beads rotate at high shear rates. This process can be conducted under controlled temperatures. The interactions between the drug particles and beads result in the formation of nanoparticles. Advantages of media processing include ease of scaling-up and minimal variation in batches. However, a drawback is the potential wear of the beads, which can lead to contamination of the final product and subsequent issues during administration [9].

➤ Example of a marketed formulation:

Rapamune® (sirolimus), a commercial formulation created using media milling, is a nanosuspension that improves medication bioavailability. Sirolimus is weakly soluble in water, however its solubility was greatly enhanced by formulating as a nanosuspension. The media milling procedure reduced particle size, resulting in faster solubility and absorption in the body.[11][12]

**Naziya Khan and Deepak Joshi****Benefits of media milling in nanosuspension preparation**

- Nanoparticle size reduction improves bioavailability by increasing surface area and dissolving rate, particularly for weakly water-soluble medicines.
- Media milling is scalable for industrial output.
- Cost-effective: This medication formulation technology is simple and affordable.[13]

High Pressure Homogenization

High Pressure Homogenization (HPH) is a popular process for creating nanosuspensions, notably for increasing the solubility and pharmacokinetics of medicines that are poorly water-soluble. This approach includes applying high pressure to a drug solution and pushing it through a tight gap, where extreme shear stresses and cavitation reduce size of the drug particle to nanometers.[14]

The high- pressure homogenization process begins with preparing the medication solution. The medication is initially suspended in a liquid phase, commonly water or an aqueous buffer, due to its low water solubility. Stabilizers (such as surfactants or polymers) are used to prevent aggregation and stabilize the nanosuspension.

Homogenization

The suspension is passed through a high-pressure homogenizer with pressures ranging from 500 to 2000 bars. This generates high shear forces and microjets within the suspension. The suspension goes through a thin opening in the homogenizer valve, where high pressure and shear forces reduce drug particles to nanoscale

Particle size reduction

The procedure produces particles ranging from 50 to 1000 nm, depending on the formulation and factors. To produce the appropriate particle size many rounds of homogenisation is necessary.

Stabilization

After homogenization, stabilizers such as surfactants or polymers are added to prevent particle aggregation and maintain suspension stability.[15]

Example of marketed formulation**Anakinra(Kineret®)**

Anakinra, an interleukin-1 receptor antagonist, is advertised as a protein-based medication that uses high-pressure homogenization to generate a stable and bioavailable injectable nanosuspension.

Emend® (Aprepitant)

It is an antiemetic medication produced with nanosuspension technology, including high-pressure homogenization, to improve solubility and bioavailability.

Advantages of High-Pressure Homogenisation

- Nanoparticle size reduction improves bioavailability by increasing surface area and dissolving rate, particularly for poorly soluble medicines.
- High-pressure homogenization is scalable for industrial production, making it ideal for large-scale manufacturing.
- The process is ecologically safe and ideal for pharmaceutical applications, as it does not require harmful solvents.[16]

Selection of Stabilizer

Nano suspensions (NSs), like other drug delivery methods, require stability to work properly. Because of the smaller particle size, NS preparation might provide issues such as particle aggregation or agglomeration [17]. Because these particles are tiny and high in energy, they are susceptible to recrystallization or the Ostwald ripening process, which can result in particle growth over time [18]. To avoid this instability, formulations contain stabilizers that restrict

**Naziya Khan and Deepak Joshi**

particle development [19]. Stabilizers are essential for avoiding agglomeration and increasing the stability of nano suspensions (also known as nanoparticle dispersions). They contribute to the homogeneity of nanoparticles in suspension by reducing their inclination to agglomerate or precipitate.[20] Common stabilizers used in nano suspension compositions are:

Polymeric stabilizers

- Polyvinyl Alcohol (PVA) is often employed in nano suspension formulations to stabilize nanoparticles and avoid agglomeration.
- It operates by adsorbing onto the nanoparticles' surfaces and prevents aggregation.
- Polyethylene Glycol (PEG) stabilizes nanoparticles and improves their dispersibility in aqueous solutions.
- Natural polymers such as xanthan gum and guar gum are employed.

Surfactants

Anionic surfactants, such as sodium dodecyl sulphate (SDS), help stabilize nanoparticles by lowering surface tension and promoting electrostatic repulsion between particles. Cationic surfactants, such as Cetyltrimethylammonium bromide (CTAB), stabilize nanoparticles and prevent aggregation by adsorbing to their surfaces. Non-ionic surfactants, such as Tween 80 and Polysorbate 80, are commonly utilized due to their low toxicity and ability to stabilize nanoparticles in different solvent systems.

Ionic Liquids

Ionic liquids may stabilize nano suspensions and improve dispersion quality, making them a promising option. These chemicals can provide both electrostatic and steric stabilization, which improves the suspension's long-term stability

Charge Transfer Agents (such as phospholipids):

Phospholipids stabilize nanoparticles by creating a bilayer and interacting electrostatically. These are extremely valuable in medicinal applications, particularly lipid-based nano-formulations.

Inorganic stabilizers

- Silica nanoparticles, either coated or uncoated, can serve as stabilizers in nano-suspensions. Their surface qualities allow them to provide both steric and electrostatic stability.
- Clay minerals, such as Montmorillonite, can stabilize suspensions by interacting with nanoparticle surfaces and avoiding agglomeration.

Proteins

Albumin, Casein, or Gelatine can stabilize nanoparticles by adhering to their surfaces and preventing aggregation. This is very beneficial in the creation of protein-based nanoparticles for medication delivery.[21][22]

Characterization of nanosuspension

Nanosuspensions must be characterized in order to determine their stability, size distribution, surface properties, and drug release patterns, among other attributes. Several methods are routinely used to assess the characteristics of nanosuspensions, including:

Particle size and distribution

- Dynamic Light Scattering (DLS) is a popular method for measuring hydrodynamic nanoparticles in suspension. It gives information on the size distribution and the polydispersity index (PDI), which determines how uniform the nanoparticles are.[23]
- Laser Diffraction: Measures the angle and intensity of light scattered by particles to determine particle size distribution. It is appropriate for bigger particle sizes but may also be used with nano-sized particles.[24]

**Naziya Khan and Deepak Joshi****Zeta Potential (Electrokinetic Potential).**

It measures the surface charge of nano-particles, which is important for understanding their stability in suspension. A strong negative or positive zeta potential often implies good stability because particles are repelled from one another, reducing aggregation.[25]

Surface Area and Porosity:

Surface Area Analysis is used to calculate the specific surface area of nanoparticles, which is critical for understanding their drug loading capacity and surface energy.[26]

Transmission Electron Micro-scopy (TEM)

- TEM imaging allows for high-resolution measurements of nanoparticle size, shape, and morphology at the nanometer scale. It can also show the interior structure of nanoparticles.
- SEM is commonly used for surface morphology study. It helps to see the surface texture and particle dispersion in a nanosuspension.[27]

X-ray diffraction (XRD)

XRD measures the crystalline structure of nanoparticles. XRD can offer information on particle stability, phase transitions, and drug release qualities by measuring their crystallinity. For example, amorphous nanosuspensions are frequently more soluble, which is advantageous for medication dissolution.[28]

Differential Scanning Calorimetry

DSC analyses the thermal behaviour of nanosuspensions, including melting point, crystallinity, and phase transitions. This approach can help us understand drug-polymer interactions and stability.

UV-Visible Spectroscopy

It is used to measure the concentration of medicines or active substances in nanosuspensions. It is also used to investigate the interaction of the medicine and the stabilizer, as well as the impact of light on the formulation.[29]

Drug Release and Dissolution Testing

In Vitro Drug Release Studies: These studies use technologies such as the USP dissolution device to examine drug release profiles from nanosuspensions. It can help you understand the formulation's bioavailability and performance.

Viscosity

Measuring the viscosity of nanosuspensions is crucial, especially for injectable or oral formulations. Increased viscosity may indicate aggregation or the presence of stabilizers.

Stability Studies

Storage Stability: Nanosuspensions are tested for long-term stability under various circumstances, including temperature, light exposure, particle size, zeta potential, and drug release are measured over time.[30]

ABSTRACT

This current study examines the antioxidant and anti-inflammatory characteristics of *Potentilla fulgens* extract (PFE) and its different fractions, specifically targeting their flavonoid and phenolic content. The phenolic content and flavonoid content were determined with the *P. fulgens* ethyl acetate fraction (PFEA) exhibiting the highest concentrations of both, i.e., 85.56±2.28 mg GAE/g and 23.79±1.07 mg QE/g, respectively. *In silico* molecular docking for major polyphenolic compounds was screened for antioxidant and anti-inflammatory activity using PyRx, and the potential 2D interaction of the most active compounds with the binding site of the receptor was visualised using Biovia Discovery Studio software. Notably, Epiafzelechin and Catechin (4α→8) epicatechin showed maximum binding scores (-7.9 kcal/mol & 7.1 kcal/mol) against PDB ID: 1N3U (Antioxidant) and 1ALU (Anti-inflammatory) target proteins, respectively. The antioxidant ability was assessed through DPPH and ABTS tests, where PFEA showed the strongest activity, with IC₅₀ values of 10.46±0.97 µg/mL (DPPH) and 26.61±1.83 µg/mL (ABTS). Anti-inflammatory effects were assessed through *in vitro* protein denaturation assays (IC₅₀ 30.44±1.52) and IL-6

Sm Abdul Aziz Barbhuiya *et al.*,

inhibition in LPS-induced THP-1 cells, with PFEA again demonstrating the most potent activity. The research indicates noted bioactivities, implying that phenolic substances are mainly accountable for the anti-inflammatory and free radical scavenging properties. Additionally, cytotoxicity testing indicated moderate activity of PFEA against THP-1 cells, supporting its therapeutic potential. These results aid in establishing *P. fulgens* as a promising treatment option for addressing inflammation linked to oxidative stress. Additional research is suggested to identify the bioactive compounds and elucidate their molecular mechanisms *in vivo*.

INTRODUCTION

Inflammation is pivotal for sustaining the body's equilibrium as it acts as a defence mechanism against illnesses and injuries. Illnesses like cancer, lung fibrosis, rheumatoid arthritis, and chronic hepatitis are commonly tied to prolonged inflammatory responses. Primarily, immune cells trigger inflammation by releasing substances like prostaglandin nitric oxide (NO), E_2 (PGE_2), and cytokines such as $TNF-\alpha$, IL-1 β , and IL-6. The extent of inflammation can be evaluated by assessing the levels of pro-inflammatory substances and cytokines, which also help in understanding how medications impact inflammatory processes. NSAIDs are often used to heal an array of disorders, like fever, reducing pain and swelling. However, they can cause adverse effects, including toxicity and increased risk of heart issues, due to their mechanism of blocking cyclooxygenase enzymes, which are involved in prostaglandin production. To address these challenges, the development of innovative medications is crucial for effectively treating both acute and chronic inflammatory conditions with reduced harm and enhanced efficacy [6]. Natural substances are being extensively used as treatment options as a result of the adverse impacts of NSAIDs. Notably, naturally occurring compounds and plants often work similarly to NSAIDs by inhibiting inflammatory pathways.

Northeast India falls in the Indo-Burma biodiversity hub and is widely acknowledged for its rich and varied flora and fauna. Traditionally, people in this region utilize various parts of plants to treat a range of health issues, leveraging the diverse medicinal properties of local flora. However, lack of documentation limits its application, and the exploration of the underlying cause is still unexplored. *P. fulgens* is a member of the family Rosaceae and is one of the herbal remedies that indigenous people, primarily from Meghalaya, routinely use. The aqueous extracts from the root peel of *Potentilla fulgens* are used to treat parasitic infections in the intestine. The taproot of this plant is chewed by locals of Meghalaya, India, mixed with betel leaves and nut as a traditional remedy for various ailments. In mediaeval ages, the plant extracts (milk, honey, alcohol, and water) were employed for curing mouth ulcers, dysentery, hemotherapy, and wound healing. Previous investigations have demonstrated that root extracts of the plants have hypoglycemic, anti-hyperglycaemic, antihyperlipidemic, and antioxidant activity; antitumor [11]; gastroprotective; and anthelmintic. The plant's root is one of the components of "Vicco Vajradanti dental powder and toothpaste, produced by Vicco Laboratories in India [14]. The triterpenoids like fulvic acid A & B were isolated from the roots of *P. fulgens* ethyl acetate fractions. Euscaphic acid, epicatechin, corosolic acid, catechin, p-hydroxy benzaldehyde, gallic acid, and ursolic acid were additionally found as major phytoconstituents. Furthermore, two novel triterpenes, potentene A and potentene B, were obtained from shoot portions of *P. fulgens*. Also, rutin (5), epiafzelchin, and afzelchin-4 α →8"catechin were isolated from the plant [16]. According to current research, *P. fulgens* roots are a valuable source of compounds that scavenge reactive oxygen species, mitigate inflammation, and reduce pain [17]. Moreover, an additional investigation proposed that *P. fulgens* extracts could have a therapeutic impact and also shed light on the mechanism of *P. fulgens* action as a naturally produced antioxidant.

Taking this view into consideration, we have investigated the *P. fulgens* roots for their anti-inflammatory as well as antioxidant potential. To the greatest extent of our understanding, no comprehensive exploration has been conducted on the quantification of flavonoids and phenolic compounds in the root fraction of *P. fulgens*, nor have they been

**Sm Abdul Aziz Barbhuiya et al.,**

adequately explored against inflammation and its underlying mechanism. The current investigation uses established model systems to examine the flavonoids, phenolic components, radical scavenging abilities, and anti-inflammatory properties of *P. fulgens* roots.

MATERIALS AND METHODS

Plant Materials

In the month of September 2021, *P. fulgens* roots were obtained from the Khasi hills in Meghalaya, India. The roots were morphologically recognised, validated, and the original specimen was deposited (specimen number: BSI/ERC/Tech/2023-24/1049). The roots were cleaned by hand under cold running water, followed by distilled water to remove any contamination. Washed plant materials were sliced into tiny pieces, followed by drying. Prior to preparing the extracts for analysis, the dried roots were crushed into a consistent coarse powder, sieved, and preserved in sealed containers at ambient temperature until they were used.

Chemicals and reagents

Ethanol, ethyl acetate, Folin-ciocalteu reagent, phloroglucinol, aluminium nitrate, potassium acetate, quercetin, gallic acid, diclofenac sodium, wash buffer (20x), assay diluent (1x), standard (IL-6), biotin conjugated detection antibody, concentrated streptavidin: hrp conjugate, LPS (Sigma Aldrich, USA, cat no. L4130) THP-1 (procured from NCCS Pune-Human leukaemia monocytic cell), DMEM (AT149-1L), FBS (HIMEDIA-RM 10432). The reagents and chemicals were all of analytical standard.

Extraction and Fractionation

An extract of *P. fulgens* roots was made with ethanol. For the Soxhlet extraction, 100 g of crushed materials were extracted with 1000 ml of ethanol, and extraction was done for 72 hours. Obtained extracts were evaporated to dryness by using a rotary evaporator under reduced pressure (Labortechnik AG, Meierseggstrasse, Switzerland; BUCHI, R-210), and yield values were calculated (13.7% w/w) [19]. The obtained ethanol extract of *P. fulgens* roots was subjected to fractionation by solvent fractionation techniques with different polarities of solvents with an increasing order of polarity. Using a rotary evaporator, a total of four fractions—n-hexane, n-butanol, ethyl acetate, and the remaining fraction were produced and evaporated to dryness under low pressure.

Estimation of Total phenolic content (TPC)

Using a previously developed approach, the reagent Folin-Ciocalteu was utilised to determine the phenolic compounds in the ethanolic extract of *P. fulgens* roots (PFE) and its fractions [20]. Test tubes were filled with 0.5 mL of a 1.0 mg/mL sample, 2.0 mL of 2% (w/v) alkaline solution, and 2.5 mL of 10% (v/v) Folin-Ciocalteu reagent. Following a vigorous shake, incubation at 45°C for 15 minutes while being shaken periodically. At 765 nm, absorbance was estimated with a UV-Vis reader. Gallic acid served as a reference chemical, and concentrations (0-0.8 mg/mL) were employed to generate a calibration curve. Following that, the findings were converted to gallic acid equivalents per gram.

Estimation of Total flavonoid content (TFC)

The TFC of the *P. fulgens* ethanol extract (PFE) and its fractions were determined using a previously established method [20]. Test tubes were filled with 0.5 mL of a 1.0 mg/mL sample, CH₃CO₂K (0.1 mL, 1 mol/L), Al(NO₃)₃ (0.1 mL, 10%), and 80% ethanol. After thorough mixing, the chemicals were kept in room temperature for 40 minutes. At 415 nm, absorbance was estimated with a UV-Vis reader. The flavonoid content was quantified by creating a reference curve with the standard chemicals quercetin, and the findings were expressed as quercetin equivalents per gram.

**Sm Abdul Aziz Barbhuiya et al.,****Molecular Docking**

The major polyphenolic compounds reported from the root parts of *P. fulgens* include catechin (4 α →8), epicatechin, epigallocatechin, epigallocatechin gallate, epiafzelechin, and afzelechin assessed for their antioxidant and anti-inflammatory potential by employing (PDB ID: 1N3U) and (PDB ID: 1ALU), respectively. The docking protocol and assessment of the major compounds binding affinities with the aforementioned PDB IDs of the targeted protein were conducted using the PyRx software tool.

2D interaction

The software Biovia Discovery Studio was used to conduct 2D interaction of compounds with the interacting amino acid residues of the target receptors' active region, which gives a clear visual depiction of the interacting binding residues of targets with the active compounds of *P. fulgens*.

Estimation of antioxidant activity

Free radical scavenging activity with DPPH (2,2-diphenylpicrylhydrazyl)

The ability of the *P. fulgens* ethanol extract (PFE) and its fractions to scavenge free radicals generated by DPPH was assessed using a method described in earlier studies [20]. In the assay, extracts at varying concentrations (12.5-200 μ g/ml) were combined with a DPPH (0.2 mmol) solution in ethanol. Followed by incubation at ambient temperature for 30 minutes, absorbance was estimated with a UV-Vis reader at 517 nm. The reference chemical for comparison was ascorbic acid. The sample's antioxidant activity was estimated by % inhibition, and IC₅₀ was estimated through the examination of dose-response curves.

Free radical scavenging activity with ABTS (2,2'-Azinobis(3-Ethylbenzthiazolin-6-Sulfonic Acid)

A stock solution was made by mixing ABTS salt (7 mM) with potassium persulfate (2.45 mM). This combination was left to react for 14 to 16 hours until the reaction was complete. At varying concentrations (12.5-200 μ g/ml), 2.7 mL of the ABTS stock mixture was added to 0.3 mL of the test solution. Upon vigorous shaking for 45 seconds, the mixture was left to stand for approximately ten minutes. Subsequently, at 734 nm, the absorbance was measured [21]. The reference chemical for comparison was ascorbic acid. The antioxidant activity of the test solution was determined by % inhibition. The samples' IC₅₀ was estimated through the examination of dose-response curves.

Estimation of anti-inflammatory activity (protein denaturation technique)

The anti-inflammatory properties were assessed by measuring the inhibition of protein denaturation, following a previously established method [22]. For the experiment, bovine serum albumin (0.45 mL, 5%) was mixed with test solution 0.05 mL at varying concentrations (10-100 μ g/mL). The mixture's pH was adjusted down to 6.3 with 1N hydrochloric acid (HCl). The reaction mixture underwent a two-stage incubation process. Initially, it was heated to 57°C for 3 minutes, followed by a 20-minute incubation period at 37°C. Following the incubation, the reaction solution let it chill down to ambient temperature. Subsequently, PBS (2 ml) was poured into the solution. After that, a UV-Vis reader was used to measure the absorbance of the resultant solution at 416 nm. Diclofenac sodium served as the standard benchmark. The anti-inflammatory activity of the test solution was determined by % inhibition. The dosage response curves were examined to find the samples' IC₅₀ values.

Cell viability assay:

The anti-proliferative activity of the ethyl acetate fraction of *P. fulgens* (PFEA) was assessed on THP-1 cells, a human leukaemia monocytic cell line obtained from the NCCS (National Centre for Cell Science), Pune. This evaluation was conducted using the MTT assay, a method that measures cell viability [23]. The percentage inhibition of cell proliferation, indicating the samples' effect on cell proliferation, has been calculated by % inhibition. The dosage response curves were examined to find the samples' IC₅₀ values.

Sm Abdul Aziz Barbhuiya *et al.*,**Enzyme-Linked Immunosorbent (ELISA) Assay****Inhibition of inflammatory cytokines (IL-6) by PFEA was measured by ELISA assay.**

Briefly, cells were seeded onto 24-well plates and allowed to attach overnight in a CO₂ incubator. Before being stimulated with LPS, the cells were pretreated for 30 minutes with the ethyl acetate portion of *P. fulgens* (PFEA) at doses of 50, 100, and 200 µg/mL. 24 hours following activation with LPS, the levels of IL-6 in the supernatants were calculated using an ELISA assay, following the manufacturer's guidelines (GENLISATM Human IL-6 ELISA, Cat No.: ITK01156 kit).

Statistical analysis

Every parameter was assessed in triplicate for every sample (n = 3), and the findings were displayed as mean ± SD (Graph Pad Prism 8).

RESULTS AND DISCUSSION

TPC and TFC of PFE and its fractions were examined, and the results are presented in Table 1. In the present study, PFE was found to have 53.34±1.02 mg GAE/g and 12.77±1.25 mg QE/g. Among the fractions, PFEA showed the highest TPC (85.56±2.28 mg GAE/g) and TFC (23.79±1.07 mg QE/g), followed by the n-butanol fraction, which contained 74.59±2.27 mg GAE/g of TPC and 20.65±1.04 mg QE/g of TFC. The n-hexane fraction exhibited the lowest concentrations of both TPC and TFC. Earlier examinations [16] reveal that the TPC values of 33.28, 30.22, and 20.61 mg GAE/g in the n-butanol, methanolic, and aqueous fractions of *P. fulgens*, respectively. The current findings are consistent with this prior research. Furthermore, a latest report by Pandey et al. (2024) [17] reveals that aqueous methanolic extracts of *P. fulgens* had higher TPC and TFC values compared to its methanolic extracts, aligning with our findings. A molecular docking study of major components of root parts of *P. fulgens*, including catechin (4α→8) epicatechin, epigallocatechin, epigallocatechin gallate, epiafzelechin, and afzelechin, revealed that the compounds catechin (4α→8) epicatechin and epiafzelechin exhibited a very excellent binding affinity against 1N3U and 1ALU proteins, as mentioned in Table 1, which suggests a strong link in inhibiting inflammatory cytokine and radical scavenging activity of the plant.

In addition, the 2D interaction of Catechin (4α→8) epicatechin with target receptor (PDB ID:1ALU) revealed that the favorable interacting residues are GLN A:159, GLU A:106, GLN A:156, ARG A:104, PHE A:105, THR A:43, GLU A: 42, LYS A:46, ASP A:160, SER A:47, and SER A:107. whereas Epiafzelechin's interaction with the target receptor (PDB ID: 1N3U) demonstrated that the favourable interacting residues are ALA B:206, PHE B:207, ASN B:210, THR B:135, ARG B:136, ASP B:140, GLY B:139, GLY B:143, LEU B:147, GLU B:29, GLN B:38, MET B:34, and PHE B:214, respectively. The radical scavenging assays were utilised to assess the antioxidant effectiveness of test sample in addition to their phenolic and flavonoids contents. The DPPH assay, which measures hydrogen-donating capacity, revealed an IC₅₀ value of 48.32±1.29 µg/mL for PFE, while the ABTS assay yielded an IC₅₀ of 111.51±2.26 µg/mL. Among the fractions, the highest antioxidant capacity was demonstrated by PFEA, with IC₅₀ values of 10.46±0.97 µg/mL (DPPH) and 26.61±1.83 µg/mL (ABTS), then the n-butanol fraction, with IC₅₀ values of 14.70±1.31 µg/mL and 39.50±1.41 µg/mL, respectively. Previous research by Jaitak et al. (2010)[16] also reported high antioxidant activity in the n-butanol fraction of *P. fulgens*, showing values of 3.57 ± 0.05, 2.41±0.53, and 2.54± 0.69 mM Trolox equivalent/mg extract in the FRAP, DPPH, and ABTS assays, respectively. Our results corroborate these findings, demonstrating the strong correlation between antioxidant activity and TPC/TFC content, as previously reported [25-27]. A key variable in the pathophysiology of inflammation is oxidative stress, which underscores the importance of antioxidants in modulating inflammatory responses [28, 29]. In our study, the anti-inflammatory potential of PFE and its fractions was evaluated utilising an *in vitro* protein denaturation assay. PFE exhibited an IC₅₀ value of 51.29±1.94 µg/mL. Among the fractions, PFEA again showed the highest inhibition potential, with an IC₅₀ value of 30.44±1.52 µg/mL, followed by the n-butanol fraction (IC₅₀ = 32.39±1.72 µg/mL) and the remaining fractions.

Given the promising results from the antioxidant and anti-inflammatory assays, PFEA was further investigated for its inhibitory effects on cytokines in lipopolysaccharide (LPS)-activated THP-1 cells. Initially, the cytotoxicity of PFEA

**Sm Abdul Aziz Barbhuiya et al.,**

was assessed, and it exhibited an IC₅₀ value of 216.9±0.092 µg/mL against LPS-induced THP-1 cells. Although the latest studies by İpek et al. (2024) [30] showed the anti-proliferative potential of *P. fulgens* root aqueous extract against ovarian cancer (SKOV-3), human umbilical vein endothelial cells (HUVEC), and lung cancer (A549) cell lines, our findings suggest moderate cytotoxic potential of PFEA against THP-1 cells. Multiple long-term inflammatory conditions, such as autoimmune disorders like RA (rheumatoid arthritis), carcinoma, diabetes, and cardiovascular illnesses, are linked to pro-inflammatory cytokines like IL-6 [31-34]. In this study, PFEA significantly reduced IL-6 secretion in LPS-induced THP-1 cells, as evident by an ELISA assay (Figure 2B).

CONCLUSION

This study demonstrated that *P. fulgens* extract (PFE) and its fractions possess strong radical scavenging as well as inhibit proinflammatory cytokines, which are closely related to their polyphenolic compounds, as evident from *in silico* assessments. Out of all fractions, the ethyl acetate fraction (PFEA) exhibited the highest flavonoid and phenolic content, as well as the most potent free radical scavenging and anti-inflammatory activities, as evidenced by DPPH and ABTS assays, protein denaturation inhibition, and IL-6 suppression in LPS-induced THP-1 cells. These findings suggest that PFEA contains bioactive compounds with strong therapeutic potential, which is further supported by an *in silico* report due to the promising affinity for binding of the active compounds with antioxidant and anti-inflammatory proteins. However, additional studies are necessary to identify the specific phytoconstituents responsible for these effects and to further investigate their molecular mechanisms using *in vivo* models. This study provides an excellent foundation for the future development of remedies derived from *P. fulgens* to treat inflammatory diseases linked to oxidative stress.

ABSTRACT

This is the first time 3 phenyl 2- bromophenol(3P2BP) of a new organometallic nonlinear optical crystal has been reported in the literature. It was synthesized and grown at room temperature by the slow evaporation method. The cell parameters of the 3 phenyl 2-bromophenol (3P2BP) crystal are confirmed by using powder X-ray diffraction. And single X-ray analysis. This research is concerned with the nonlinear optical, fluorescence, UV, FT-IR, thermal and structural properties of organically grown 3 phenyl 2-bromophenol(3P2BP) single crystals. By employing Fourier Transform Infrared (FT-IR) spectral analysis, the functional groups and characteristic vibrations of 3 phenyl 2-bromophenol(3P2BP) crystals were determined. UV- visible NIR spectrum analysis showed the optical quality of the grown crystal. The high optical transmittance is evidence by the grown crystal in the range of 200-1100 nm.

Keywords: Crystal growth, UV-visible, FT-IR, SEM, Fluorescence

INTRODUCTION

Nonlinear optical (NLO) materials have played a significant role in advancing contemporary technology, which in essential broadens their applicability in technological and industrial processes. The past few years have witnessed an abundance of studies focused on synthesizing newer NLO materials whose properties match other NLO materials because of their extensive use for opto electronics, photonics, broad terahertz imaging and spectroscopy, laser remote sensing, optical information processing, optical switching, pharmaceuticals, color display and frequency conversion. Thus, the growth and merging of novel organic, semi-organic and inorganic NLO materials has hence become a topic of great scientific interest. Organo-metal crystals are unique here as potentially very promising due to their huge spontaneous birefringence and nonlinearities, high packing density, very good long-term stability and modifications of their chemical structures to perfection. The most attractive materials among these are organic crystals, which have high packing densities often large macroscopic nonlinearities, outstanding long-term orientation and photo chemical stabilities and tenability of the chemical structure. However, the production of large and good-quality crystals has been limited by the difficulty level of doing this. This is why bulk growth of novel nonlinear optical crystals falls under the research spotlight. Clear and defect-free single crystals of large size are important for use in optical devices and further improve the possibility of optical switching and optical limiting applications and researchers are focusing on synthesizing such crystals. In particular, organic crystals have push-pull p-conjugated bridges with electron-donor and acceptor groups on each side of the p-bond system. The increased mobility is caused by the overlap between the p-orbits and the delocalized electronic charge. Optical nonlinearity increases as the ground or excited state electron charge density distribution is improved.

Typically, well known organic materials such as aldehydes, ketones, hydrocarbons, amines, amides and amino acids possess strong electron-withdrawing characteristics and exhibit significant second and third order nonlinear optical responses. Aldehyde derivatives are considered one of the most important classes of hetero-cycles that provide chemical scaffolds to the development of synthetic drugs as they are involved in the manufacture active medicines, given that fragrances, cosmetics, dyes, flavorings, disinfectants and preservatives are just a few of the production benefits. The primary benefits of this group of compounds are leveraged in colorants, fragrances, fumigation, preservatives, medicaments and synthesis. Other than that, they are also used for manufacturing plastics, disinfectants and embalming fluids and function as medicines with anti-inflammatory, anti-cancer, anti-fungal and anti-diabetic properties. Aldehydes, especially aromatic aldehydes, have attracted interest for nonlinear optics (NLO) applications owing to their ability for nonlinear optical property. Aldehydes –based organic nonlinear optical crystals have a high thermal and environmental stability, as well as significant microscopic and macroscopic nonlinear optical susceptibility. They also generate powerful broadband THz waves when pumped at near –infrared and infrared wavelengths. Cinnamaldehyde is a one-dimensional donor- π – accept($D - \pi - A$)system used in nonlinear optics and organic electronics [1]. It consists of an electron donor group, a π -conjugated system and an electron acceptor group. This combination enables the molecule to making it useful for optoelectronics and NLO applications. These groups form a 180- degree bond with a simple aromatic benzene ring's-crystal/adduct technology develops unique solid forms of drugs with diverse physiochemical features-conjugated organic systems have become a popular choice for synthesizing efficient second and third order compounds due to their rapid reaction. In this present study, we synthesized organic and metal compound to form new organic crystals 3 Phenyl to bromo propanol has been synthesized and grew optically high quality single crystal using slow evaporation solution technique with ethanol as solvent. The grown crystals were characterized, using single crystal X-rays diffraction (XRD), Powder XRD (PXRD), Fourier transform Infra-red (FTIR), UV-Visible-NIR, thermogravimetric (TG) and Differential thermal analysis (DTA), fluorescence examination, SEM with EDAX and nonlinear optical methods.

EXPERIMENT

Material synthesis

In a 100 ml beaker, weight 10 g of potassium bromide (KBr) and dissolve it in 50 ml of pure water. Add 20 g of weighed cinnamon aldehyde to the KBr solution. Until the cinnamon aldehyde has completely dissolved, stir. Warm

Aruna et al.,

the blend to 100 °C. For twenty-four hours, the solution was constantly agitated with a magnetic stirrer. The appropriate amount of ethanol solvent was added to the calculated amount of material. Let the mixture cool gradually until it reaches room temperature [2]. It then showed up as a transparent solution with a yellowish tint. Whatman filter paper was used to filter the prepared solution, and pour the mixture into a crystallization dish or a dry, clean glass container. Allow the solution to stand at room temperature 20 to 25 degree Celsius for slow evaporation until some light yellow crystals of 3 phenyl 2-bromophenol(3P2BP) have been collected. Allow the solution to stand at room temperature (20⁰-25⁰) C for slow evaporation until some light-yellow crystal 3 phenyl 2-bromophenol(3P2BP) have been collected.

CHARACTERIZATION STUDIES

The 3 phenyl 2-bromophenol (3P2BP) cell characteristics were determined from single crystal x-ray diffraction investigations (MoK α radiation ($\lambda = 0.7170 \text{ \AA}$) the Enraf Nonius CAD4 diffractometer was employed for the measurements. This compound was studied using PXRD on the single crystal stage with an Xpert pro diffractometer and CuK α radiation ($\lambda = 1.54060 \text{ \AA}$) in the range of 10-60 degrees. Optical transmission spectra for the 3P2BP single cinnamaldehyde and potassium cinnamate were coordinated in the 4000-400 cm⁻¹ range (KBr pellet approach), using a BRUKER 66 VFT-IT spectrometer. The thermal behavior was analyzed in a nitrogen atmosphere using thermo gravimetric and differential thermal methods collected with the SDT Q 600 V8.0 thermal analyser. The melting points were taken with the crystal were recorded using a shimadzu UV-Vis spectrophotometer between 200 and 1100 nm range. FTIR analyses determined that melting point apparatus [3]. 1,3-Dibromo-1-phenylpropan-1-one and potassium hydroxide are the products of an electrophilic addition process with the bromine ions (from KBr) and cinnamaldehyde (CHO).

The mechanism of reaction

1. The bromine ions (Br⁻) from KBr) and cinnamaldehyde to form the intermediate bromonium ion.
2. The intermediate bromonium ion forms 2,3-Dibromo-1-phenylpropan-1-one a dibromo compound by the addition of an addition Br⁻ ion.
3. The hydroxyl ions(OH⁻) generated combine with each of the K⁺ ions at the end of the reaction to generate potassium hydroxide(KOH).

RESULTS AND DISCUSSION

Single Crystal X-ray diffraction

Single crystal x-ray diffraction (SXRD) analysis of the grown 3 phenyl 2-bromophenol(3P2BP) crystal was carried out using an Enraf Nonius CAD 4 X-ray diffractometer equipped with graphite monochromatic MoK radiation($\lambda=0.710 \text{ \AA}$). The grown crystal belongs to monoclinic crystal system $\alpha=90^\circ$, $\beta=96.98^\circ$ $\gamma=90^\circ$ and the crystal cell volume is $779 \text{ \AA}^3$. Which is in good agreement with the earlier reported values $a=5.64, b=17.98, c=7.74$ and it is given in Table.1. Single XRD was carried out as a confirmation of the associated monoclinic crystal structure and P space group, basic requirements for nonlinear optical applications. The produced chemical exhibits non-Centro symmetry as may be expected due to relatively good correlation between literature values and predicted lattice parameters. [4].

Powder X-ray Diffraction

With powder X-ray diffractometers, the sample type of crystallinity was determined; the peak intensity shows the level of crystalline nature of the compound. Figure demonstrates the 3P2BP crystal powder XRD pattern observed. This pattern provides additional information besides establishing that the crystalline nature of the crystal is different. Differences that may lead to patterns of crystals viewed within two hours are established through the (hkl) indices. The peaks were tried to be identified by powder XRD. A fine example of the same is the overlap of the hkl peaks and intensities for the simulated PXRD patterns and the ones that were actually obtained experimentally. The PXRD pattern diffraction peaks were tried to be indexed with the d-spacing for the corresponding (hkl) values [5]. The 3 phenyl 2-bromophenol(3P2BP) X-ray powder diffraction pattern was recorded on a Rigaku Mini Flex 600

Aruna et al.,

diffractometer. The powder sample was scanned once every minute over a time period of 10 to 40 minutes. From Table, the unit cell parameters of the crystal are $a=5.64$, $b=17.98$, $c=7.74$, $\alpha=90^\circ$, $\beta=96.98^\circ$, $\gamma=90^\circ$ and the crystal cell volume is $779\text{\AA}^3$. These values agree well with the published values. The type of crystallinity of the sample was determined with powder X-ray diffractometers; the degree of crystalline nature of the compound is reflected in the sharp peak of intensity. The triclinic nature of the crystal was also confirmed by powder X-ray diffraction and the lattice parameters were found to be quite close to the reported values. The solid diffraction peak and triclinic crystal structure of the melt-grown 3 phenyl 2-bromophenol(3P2BP) were confirmed. The value of 2θ suggests good crystalline purity and quality, which can be beneficial in NLO devices. XRD pattern for potassium bromide form 3 phenyl 2-bromophenol(3P2BP) crystal doped with cinnamon aldehyde, is shown in Table Distinct finely refined peaks at defined 2θ angles indicate a high degree of crystallinity of the 3 phenyl 2-bromophenol (3P2BP). X-ray diffraction has showed markedly increased signal intensity with sharp peaks suggest high quality and single crystal growth for 3 phenyl 2-bromophenol(3P2BP).

UV-Vis Spectral Analysis

The visible spectrum reveals the sequence pattern of molecular structure. Absorption in the UV-visible spectrum involves the transition of the electron in the π and π^* orbital from the ground state to the excited energy state. The UV-visible absorption and transmission spectra were recorded in the solid phase using Perkin Elmer Lambda 935. Transparent single crystals are suited for use in optical devices [6]. In broad terms, the transmittance properties are highly correlated with the substance atomic structure, band gap and quality. A UV-Vis-NIR spectrometer for the 200-1100 nm range is displayed in fig. Description of the optical transmission spectrum and was found to possess good optical transmittance in the visible and near-infrared ranges. The cut-off wavelength was 275.9 nm, growingly towards the surface. The optical absorption coefficient (α) is one of many important factors in choosing a material for optical applications. In the inset of figure, the crystal shows significant transmittance around 81% in the 300-1100 nm range. This also shows that the crystal has arbitrary absorbance of less than 0.12. One key features of the window of constructive transmittance is combined with devices that need to emit blue-green light [7].

Optical Band Gap Energy

The optical energy gap of the formed crystal computed using the transmittance spectrum using the equation mentioned. $\alpha h\nu = A(h\nu - E_g)^n$. Where A is a transition-dependent constant, E_g is the Energy gap of the material and n is a constant according to the type of electronic transitions $1/2$ for allowed direct transitions, $3/2$ for allowed indirect transitions, 2 for forbidden direct transitions and 3 for forbidden indirect transitions [8]. In this case, n is chosen as $1/2$ for a permitted direct transition and α is the absorption coefficient calculated using this formula, $\alpha h\nu = A(h\nu - E_g)^{1/2}$. The grain distribution and a few microcrystals on the surface of the growing crystal are clearly visible in fig. Tauc's plot can also be used to obtain an extrapolation value for direct band gap, which is 3.62 eV between $(\alpha h\nu)^2$ and $h\nu$. Due to improved optical band gap and attenuated absorption in the UV and visible regions, the material is a suitable candidate for optoelectronic applications.

FTIR Analysis

The geometry of a molecule and the interaction among its numerous functional groups is exposed by the FT-IR spectra. Molecules are made to show bands of bending and stretching due to infrared radiation. This is shown in the spectroscopic images of 3 phenyl 2-bromophenol(3P2BP) in fig .6. Olefin and aromatic C-H stretching are accountable for the sharp peak at 3065cm^{-1} and the peak at 3027.42cm^{-1} in the higher energy region.[9] The C-H aldehydic doublet stretching is represented by the peaks at about 2942.23cm^{-1} and 2749cm^{-1} , respectively. C-H aldehydic stretching appears in the band at 2942.23cm^{-1} . A maxima at 690cm^{-1} and at 750cm^{-1} are due to monostable benzene ring and aromatic C-H out of plane bending stretching vibrations, respectively. Double bonds $\text{C}=\text{O}$ are identified by bands at 1681.39cm^{-1} . The C-O stretching vibration of an un-saturated aromatic aldehyde is represented by the edge at 1125cm^{-1} . Wave numbers and corresponding assignments are tabulated. All its functional groups were determined to exist in 3 Phenyl 2-bromophenol (3P2BP). A weak absorption band may be present around 3400cm^{-1} due to water vapour or moisture. The C-O alpha, beta unsaturated aromatic stretching vibration was found to be at a frequency of 1681.39cm^{-1} . The skeletal structure of benzene vibration is exhibited by the 1504cm^{-1} peak.

Aruna et al.,

Thermal Analysis

Because of the high quality of heat generated during the cutting process, thermo gravimetric analysis (TGA) are crucial for assessing thermal stability in the fabrication technology. DTA and TGA of the prepared 3 phenyl 2-bromophenol(3P2BP) crystal were done from 30 to 987°C. The simultaneous TGA and DTA thermo grams are shown in fig. The melting temperature of the material may be found by locating the strong endothermic peak at 146°C according to the DTA curve. The narrow peak at 146 °C shows that can therefore, be made is that phase transitions have not been recorded until the melting point is reached, thus enlarging the temperature range within which this crystal will work well in NLO applications.[10] Thus, there is no weight loss almost until 250°C, which implies absence of water in the structure of the compound. The maxima were found at 270.2°C due to the compound decomposition stage. There are three phases of weight loss as seen on the TGA curve. This, coupled with a quick drop in weight over the region starting at around 200.8°C and marking the commencement of melting, corresponds to the first phase. The subsequent weight loss takes place in a region ranging from 296.7 to 557.4 °C and maintain their overlap with respect to the second stage of weight loss(stage II). Weight loss at temperatures greater than 557.4°C could be attributed to the chemical breakdown associated with the third stage of weight loss(stage III).

Micro Structure Morphology Analysis

Scanning electron microscopy photographs of 3P2BP chloride crystal are shown in figure. SEM was used to study the surface topography of the evolving 3p2bp sample. Figure shows the SEM photograph of the 3p2bp crystal. The absorb particle can take many different shapes and be composed of small crystals in aggregates. They existed in bulk form and nano scale form with the mean diameter of the bulk particle being 10 mm. Nanoparticles prepared under experimental conditions exhibit detectable early aggregation in the micrographs. The smaller particles are likely to agglomerate into larger particles as they possess more surface activity. While scanning at 20 keV, the scanning electron microscope effectively utilizes an estimated beam of 10-10 amp. Micrographs reveal a clear early aggregation of the spherical nanoparticles produced under experimental conditions. Smaller particles are more surface active and aggregate to form larger particles. Scanning electron microscope successfully employs a beam of approximately 10-10 amp at 20 keV. Produced crystals with even surfaces and well-defined planes were the only one selected for SEM study; no polishing was performed. The researchers also found that the crystals produced exhibit a very fine rod-like morphology by employing a scanning electron microscope.

EDAX Analysis

The samples of crystals that were produced and analyzed by a JEOL JSM JSM 5610 LV scanning electron microscope to analyze for energy dispersive X-rays in an effort to confirm the presence of metal ions in the 3 phenyl 2-bromophenol(3P2BP) crystal. Figure is the integration of the cinnamaldehyde into the crystalline matrix of 3 phenyl 2-bromophenol. EDAX analysis confirmed the presence of cinnamaldehyde in the doped material. The surface analysis at some points indicates that the incorporation of cinnamaldehyde was not uniform throughout the crystal surface. Figure gives the EDAX spectra of the 3 phenyl 2-bromophenol(3P2BP) crystal. Figure 10 indicates the weight percentage of each element as obtained from the EDAX spectrum. The weight percentage bar chart made it very apparent that 3 phenyl 2-bromophenol(3P2BP) was the primary component in the crystal mixture. The peak reveals that potassium and sulfur are present in the crystal. Atomic percentages of C,O,K,Br were 78.66,15.55,3.24,2.55 respectively as shown in figure.

Fluorescence

Fluorescence is typically expected in aromatic compounds or molecules with many conjugated double bonds and high resonance stability. Fluorescence is widely used in the fields of medicine and biochemistry. Fluorescent lights, light Emitting Diode (LED) lampstands other lighting devices also use it. Figure 11 displays the excitation and emission spectra for 3 phenyl 2-bromophenol(3P2BP) that were captured using the FP-6500 spectro fluorometer.[28] The measurement range of the emission spectrum was 350-600 nm. The carbonyl chromophore causes the compound 3 phenyl 2-bromophenol(3P2BP)

Aruna et al.,

NLO Studies

The optical crystals of 3 phenyl 2-bromophenol (3P2BP) subjected to this experimental analysis were tested for nonlinear optical property with a modified kurtz and perry powder technique. A Q-switched Nd-YAG laser beam operating with a repetition rate of 10 Hz and each pulse for 10 ns was employed at I.I.Sc., Bangalore, at a wavelength of 106 nm and with an input power of 1.2 mJ.[11] The powdered 3 phenyl 2-bromophenol(3P2BP) single crystals of uniform particle size are passively packed into a glass micro capillary tube. A photo-multiplier tube allows second harmonic generation (NLO-SHG) with cathode ray oscilloscope excitation. The source of the 532 nm output generated by the emission of green light was investigated to confirm the non-centrosymmetric space group of the 3 phenyl 2-bromophenol(3P2BP) grown single crystal. The nonlinear optical activity of this crystal with respect to the green light of 530nm provides evidence to an inner coordination of space group symmetry SHG. The output powder is assessed to be 10 mV for 3 phenyl 2-bromophenol(3P2BP) and 8 mV for KDP, respectively, the constant input energy being 1.2 mJ pulse for both crystals. According to older studies, SHG efficiency of crystals is comparable to that of normal KDP. While the current study indicates that the efficiency of SHG of the herein - produced crystal is 1.25 times higher than normal KDP. Bearing this in mind, it is likely that the increased efficiency value influences its NLO characteristics.

CONCLUSION

For the first time, 3 phenyl 2-bromophenol(3P2BP) single crystals with well-defined structures have been synthesized by the slow evaporation solution method. The 3P2BP crystal possesses a monoclinic crystal structure, as confirmed by SXRD studies. The FTIR was utilized to ascertain the functional group positions of the target molecule. The optical quality at the absorption edge of 282 nm is excellent, as confirmed by the UV-Vis NIR study; with transmittance exceeding 80%. It is found that the optical band gap energy is 3.62 eV. The crystals have two peaks at wavelength of 330.97 and 643.33 nm. This result does, indeed, show that the crystals give off blue and red light. In addition, it can be seen that the crystal is of extremely high crystallinity since only two are most prominent. SEM analysis of the crystal indicated that, even though it had a very strong resemblance to a rock, its surface was level. Various non-instructive techniques were employed to study the composition of the crystal. EDAX experiments on the formation of the crystal were conducted with the aim to determine its elemental composition. Also, TG and DT experiments were performed to research the thermal behavior of the 3 phenyl 2-bromophenol(3P2BP) crystal.

ABSTRACT

Children with autism spectrum disorder (ASD) frequently display distinct physical, motor, and developmental traits that may have an impact on their general well-being and capacity for daily tasks. While hand grip strength is a crucial sign of muscle strength and physical fitness, body mass index (BMI) is a commonly utilized indicator of nutritional condition. It is crucial to comprehend how children with ASD's hand grip strength and BMI relate to one another since this information may shed light on their functional development, physical health, and the need for focused therapies. To determine the correlation of hand grip strength with BMI in children with ASD. 45 children with ASD in the age group of 3 to 13 years were included in this study. BMI and hand grip strength were measured using standard procedure. Three trials of Hand grip strength were measured for right side followed by left side. Best of the three values for both sides were taken for analysis. A Pearson correlation analysis was performed to assess the relationship between Grip strength and BMI. Results showed no significant correlation for BMI and hand grip strength on right side ($r = -0.077$, $p = 0.616$) and left side ($r = 0.144$, $p = 0.344$) in children with ASD. The present study did not show statistically significant correlation for BMI with hand grip strength in children with ASD.

Keywords: Autism spectrum disorder, Hand grip strength, Body Mass Index.

INTRODUCTION

According to the American Psychiatric Association (2013)[1], Autism Spectrum Disorder (ASD) is a neurodevelopmental disorder marked by repetitive activities, limited interests, and difficulties with social communication. Children with ASD often have motor deficits, such as hypotonia, poor coordination, and decreased muscle strength, in addition to these core symptoms [2,3]. Their capacity to carry out everyday tasks, engage in physical activity, and preserve general functional health may be impacted by these motor impairments [4]. It is commonly acknowledged that hand grip strength (HGS) is a significant predictor of total muscle strength, motor function, and physical fitness in both adults and children [5]. In children who are normally developing (TD), it has been positively connected with body mass index (BMI), with higher BMI values often being linked to more muscle mass and grip strength[6]. However, this association may be influenced by the unique physical and neuromuscular traits that children with ASD frequently display, such as decreased muscle tone, decreased physical activity, and changed body composition[7,8]. However, because children with ASD have distinct neuromuscular and physical activity abnormalities, the connection between BMI and HGS in this population is still unknown. First, if BMI is not a reliable indicator of grip strength in people with ASD, further tests might be required to properly measure muscular function. Second, determining if muscle strength and BMI are related in individuals with ASD can assist direct focused therapies, such as physical therapy and strength training programs, meant to enhance motor abilities and general physical health in this population[8]. Additionally, there is limited research exploring how body composition influences strength in children with ASD. While studies have demonstrated weaker muscle strength and motor delays in this population, the extent to which BMI influences grip strength has not been well-documented [9,10]. Investigating this relationship can provide insights into physical health risk factors, helping clinicians and educators develop more effective exercise and rehabilitation strategies for children with ASD.

Thus, this study aims to bridge the gap in the literature by examining the correlation between BMI and HGS in children with ASD. The findings could contribute to the development of better assessment tools, individualized intervention programs, and overall improvements in motor function and quality of life for children with ASD. While previous studies have explored the relationship between BMI and muscle strength in typically developing children, limited research has examined this correlation in children with ASD. Given the unique neuromuscular and physical activity patterns in ASD, it remains unclear whether BMI serves as a reliable predictor of grip strength in this population. Some studies suggest that children with ASD have lower muscle strength and endurance compared to their neurotypical peers, yet the specific association between BMI and HGS has not been thoroughly investigated. Understanding this relationship is crucial for developing targeted interventions to improve motor function and overall physical health in children with ASD. Hence, the objective of the present study is to examine the correlation between BMI and hand grip strength in children with ASD. By investigating this relationship, we aim to determine whether BMI is a significant predictor of muscle strength in this population or if other factors, such as neuromuscular differences and physical activity levels, contribute more substantially to grip strength outcomes. We hypothesized that, similar to typically developing children, BMI will show a positive correlation with HGS in children with ASD.

MATERIALS AND METHODS

This correlational analytical study was conducted on 45 children with a diagnosis of ASD, age between 3 to 13 years, from pediatric physiotherapy department, Shree Bhartimaiya College of Optometry & Physiotherapy, Surat. The method used in this study for sampling was convenient sampling. Inclusion Criteria were age between 3 to 13 years, confirmed diagnosis of ASD from pediatric or child psychologist and Severity of Autism based on Gilliam Autism Rating Scale (GARS) score >75. Children who were suffering from any other neurological conditions or any genetic disorders, were excluded from this study. Outcome measures taken were Body Mass Index (BMI), which was calculated as weight in kilograms divided by the square of height in meters (kg/m^2). Participants were classified according to the CDC (Centers for Disease Control and Prevention) under the categories of Underweight: BMI < 5th percentile, Healthy weight: BMI between the 5th and 85th percentile, Over weight: BMI between the 85th and 95th

**Khushbu Naik and Saravanan**

percentile and Obesity: BMI $\geq$ 95th percentile. Hand Grip strength (HGS) was measured using a Saehan hydraulic dynamometer (ICCs 0.85 to 0.98)[11]. Participants were instructed to sit upright with their elbow at a 90-degree angle, forearm in a neutral position, and wrist in slight extension. Three trials were performed for each hand with a 30-second rest interval between trials, and the highest recorded value was used for analysis. HGS values were reported in kilograms (kg). Hand grip strength was measured for right side followed by left side.

STATISTICAL ANALYSIS AND RESULTS

Analysis was performed using SPSS 23 version software. Shapiro-Wilk test was used to determine the normality of the data, which showed that the data was normally distributed ($p > 0.05$). Pearson's correlation coefficient test was used to determine the correlation between BMI and HGS. Descriptive statistics of mean and standard deviation were used for continuous variables and frequency and percentage for categorical variables.

DISCUSSION AND CONCLUSION

The purpose of this study was to determine the relationship between body mass index (BMI) and hand grip strength (HGS) in children with autism spectrum disorders (ASD). In both hands, the results showed statistically non-significant correlation between BMI and HGS. The correlation coefficient of BMI with right side was -0.007 ($p = 0.616$), and 0.144 ($p = 0.344$) for the left side. These findings are in line with earlier research that found that children with ASD varied in their body composition and muscle strength. Although the association between BMI and strength is still unclear, research by Wentz *et al.*[12] had shown that children with ASD frequently exhibit decreased physical strength and changed body composition. Similarly, Memari *et al.*[13] found that motor impairments in children with ASD, such as decreased muscle tone and coordination issues, may impact hand grip strength regardless of body mass index. Furthermore, prior research indicates that BMI by itself might not be a reliable indicator of muscle strength because grip strength is greatly influenced by a number of variables, including neuromuscular function, degree of physical activity, and motor coordination. According to research by Bohannon [14] and Ortega *et al.* [15], hand grip strength is not only determined by body mass or BMI but also by brain control mechanisms, muscle quality, and training level. BMI alone may not be as important in determining hand grip strength as hypotonia, motor coordination deficiencies, and sensory processing difficulties, which are common in children with ASD[2]. Additionally, the present study's non-significant correlation implies that more factors, including abnormality in muscle tone, participation in physical activity, and nutritional status, ought to be investigated in connection with grip strength in people with ASD. Research by Tyler *et al.* [16] and West *et al.* [17] highlights how crucial it is to evaluate children with ASD's motor skills and degree of physical activity in order to better understand how their muscles develop.

CONCLUSION

BMI and hand grip strength in children with ASD did not significantly correlate, according to the current study. According to the results, grip strength in this cohort is not significantly influenced by BMI alone. Future studies should investigate other factors that may affect grip strength, such as muscle tone, exercise levels, and general physical health, given the intricate interactions of neuromuscular, sensory, and motor coordination aspects in children with ASD. These results emphasize the necessity of using a multifaceted strategy when evaluating children with ASD's functional strength and physical health. More significant insights into enhancing grip strength and general physical function in this population may come from interventions that emphasize motor skill development, resistance training, and physical exercise.

ABSTRACT

The current study was aimed to examine the phytoactive substances found in the leaves, bark and flowers of *Plumeria bicolor*. Thin Layer Chromatography (TLC) was the method used to identify the fractions. Column chromatography was used to isolate the Phytoactive chemicals. Methicillin Resistant *Staphylococcus aureus* was tested for antibacterial activity *in vitro* using the Well diffusion method. The inhibitory zone was noted. The plant extracts of *Plumeria bicolor* that were to be examined came in different concentrations: 15 µl, 30 µl, 45 µl, and 100 µl. All of the extracts were proven to be effective against MRSA in this experiment. The extract from the leaves of *Plumeria bicolor* had the strongest antibacterial activity against MRSA, followed by the extract from the flowers and bark.

Keywords: *Plumeria bicolor*, Methicillin Resistant *Staphylococcus aureus*, Antibacterial activity and Thin Layer Chromatography (TLC).

INTRODUCTION

For many years, nature has provided a variety of medications to treat a wide range of illnesses in both humans and animals. In India plants belonging to the genus *Plumeria*, including *Plumeria bicolor* are cultivated as attractive plants. The main sources of biologically active antimicrobial compounds are still unknown, however natural items are becoming recognized as significant sources. *Plumeria bicolor*, a tiny tree in the Apocyanaceae family, with a crooked trunk, rough bark and fragrant white blossoms. It is a beautiful plant that grows everywhere. According to every traditional medical system, a wide variety of medicinal herbs can help with skin conditions. Although these plant treatments have been utilized locally and orally since ancient times, the mechanism underlying the effects they produce has not been studied. The natural antibacterial properties of certain plants have caused these consequences. The traditional medical system makes extensive use of other species in this genus to treat a wide range of illnesses. An antibiotic found in *Plumeria bicolor* prevents MRSA from growing. The plant has been shown to support immunological and respiratory processes as well as digestion and elimination. The plant's sap is used as a laxative to treat stomachaches and bloating. The bark is used to treat venereal sores and is believed to have purgative properties. The blooms can be cooked in water or juice and added to a salad to help reduce gas and phelm, encourage bowel movements, and improve urine flow. Additionally, the blossoms are used to cure asthma. *Plumeria* flower extracts have also been utilized in cosmetics as scents [1]. In addition to its medicinal uses, extracts from various portions of *Plumeria* can be used to prevent or treat skin cancer, fungal and viral infections [2], a variety of skin defects, anti-filarial, and other ailments. It was thought that various plant parts could help with a number of illnesses, including rheumatism, leprosy, malaria, and abdominal tumors.

Nevertheless, not much research has been done to ascertain this frangipani species' antimicrobial qualities. A different perspective on a different source of treatment for bacterial infections is encouraged by the emergence of bacterial resistance to synthetic antimicrobial drugs. A study was conducted by Laila Jarin *et al.* [3] to assess the MRSA activity of an extract from *Plumeria bicolor* stem bark. Mass spectrum analysis was used to identify the extract's active anti-leishmanial chemicals, which were then isolated using bioactivity-guided fractionation. The *Plumeria* extract, its fractions, and its isolated active components were tested for their anti-proliferative properties against MRSA *in vitro* [4]. Multidrug-resistant bacteria are a major threat to world health and have been the cause of multiple infectious epidemic outbreaks [5]. Because resistant Gram positive bacteria, such as MRSA, continue to be the most problematic, research in this area is desperately needed. This is exemplified by the dearth of antimicrobial medications in the pharmaceutical pipeline to treat these illnesses and the absence of viable treatments for multidrug-resistant microbes [6]. MRSA infections are frequently seen in patients who have indwelling catheters or prosthetic devices, as well as in skin, soft tissue, bone, and joints. Compared to patients infected with Methicillin Sensitive *Staphylococcus aureus* strains, patients with MRSA typically have worse clinical outcomes. Severe MRSA infections can cause osteomyelitis, septic arthritis, and potentially fatal Infective Endocarditis (IE). In hospitals and community clinics, complications from these infections, like sepsis and septic resistance to first-line medications, are frequent. According to some estimates, people who present with MRSA infections have a 64 % higher chance of dying than those who have infections brought on by *Staphylococcus aureus* that is sensitive to Methicillin. Several plant species have also been shown to have anti-MRSA *in vitro* properties.

MATERIALS AND METHODS

Collection of Pathogenic Microorganisms

The Methicillin Resistant *Staphylococcus aureus* (MRSA) strains selected for this present investigation was collected from Sri Lakshmi Narayana Institute of Medical Science, Agaram, Pondicherry, India. The collected strain was stored in the Refrigerator at 4 °C.

**Megala et al.,****Collection of Plant Materials**

Plumeria bicolor plants were gathered in sufficient numbers in around the Cuddalore District of Tamil Nadu (Figure - 1). After being put in a paper bag, the plants were brought into the laboratory. After being carefully cleaned with tap water, healthy plant materials such as leaves, bark, and flowers were individually shade-dried for two weeks at room temperature. In order to eliminate plant fibers, the leaves, bark and flowers were then ground into powder using an electric blender and then sieved separately using a nylon sieve. Finally, the powders were collected and stored in screw-cap vials for later use.

Thin Layer Chromatography (TLC)

Using just progressively ascending procedures, Thin Layer Chromatography (TLC) was performed on all fractions using TLC precoated plates. The plates were marked with a pencil above one centimeter from the bottom after being cut with scissors. Each sample was subtly dissolved in Methanol, and the dissolved samples were evenly applied on the plates using capillary tubes before being allowed to dry. Hexane (100 %), Hexane: Ethyl acetate (9:1, 8:2 and 7:3), and other solvent systems were used to develop the plates in a Chromatographic tank. The plates were dried and examined using UV light (254 nm and 366 nm), regular daylight, and a 10 % sulfuric acid stain before being heated in an oven for 5 to 10 minutes at 105 °C. The retention factors for each active compound were calculated for each fraction using the following formula and the R_f value of the Chromatogram were recorded.

$R_f = \text{Distance moved by the Solute or Compound} / \text{Distance moved by the Solvent}$

Column Chromatography**Packing in Columns**

Hexane, a solvent, was used to properly pack Silica gel in an appropriate Column without creating air bubbles. When the combination was put on top of the Stationary phase, the chemical that was eluting with the solvent began to separate gradually as the order of polarity increased. For the biological analysis, the extracts were subjected to column chromatography. Various percentages of n-hexane and ethyl acetate, methanol, and ethylacetate were used to elute the extract (EA: Hex-25:75 % - Fraction 1; EA: Hex-50:50 % - Fraction 2; EA: Hex- 75:25 % - Fraction 3; EA: Hex- 100:0 % - Fraction 4; Me: EA- 25:75 % - Fraction 5; Me: EA- 50:50 % - Fraction 6; Me: EA- 75:25 % - Fraction 7; Me: EA- 100:0 % - Fraction 8).

Column Running

The methodology for the Column Chromatography process involved the careful addition of solvents to ensure proper separation of pigments. Hexanes were gradually added to the column using a pipette, ensuring that the solvent completely moistened the column. Excess hexanes were carefully drained until the gel reached the top of the column. At no point was the top of the column allowed to run dry after adding hexanes to the gel. Once the hexane level reached the top of the gel, the dissolved pigments were introduced into the column. For the Thin Layer Chromatography (TLC) process, the remaining sample was left in the test tube, and the eluent was collected in the same tube. To begin elution of the yellow band, hexanes were added continuously, ensuring that the yellow band moved toward the top of the column. Once the final hexanes drained to the gel's surface, acetone was added to elute the green band. Acetone was added continuously until the green band approached the bottom of the column. The process was halted when the eluent showed little to no green color. The solvents from the tubes containing the yellow pigment, green pigment, and the original pigment were evaporated using a warm water bath. Care was taken to remove the tubes from the water bath immediately after solvent evaporation to prevent pigment decomposition due to prolonged heat exposure. Finally, the tubes were securely stoppered.

Antibacterial Assay

The antibacterial activity of extracts from *Plumeria bicolor* leaves, bark, and flowers was assessed using the Well diffusion method. The Mueller Hinton agar medium was prepared and autoclaving at 121 °C at 15 lbs pressure for 15 minutes. Following sterilization, the Mueller Hinton Agar was put into sterile Petri dishes and let to set. Then, 0.1 milliliters of the test organism were extracted from the broth and the sterile cotton swab was used to swab the Mueller Hinton agar surface. The bacterial cultures were allowed to dry for 5 minutes. The test plant extracts were

96996

**Megala et al.,**

made in different concentrations (15 µl, 30 µl, 45 µl, and 60 µl). For 18 to 24 hours, the plates are incubated at 37 °C. The diameter of the zone of inhibition was measured and reported as millimeter in diameter (mm in dm).

RESULT

The outcome demonstrated that *Plumeria bicolor* plant leaves, barks and flowers were prepared by Thin Layer Chromatography (TLC) (Figure - 2). The *Plumeria bicolor* plant leaves, barks and flowers were prepared by Column chromatography separation (Figure - 3) and finally collected a pure compound (Figure - 4). The result showed that Leaf extract of *Plumeria bicolor* showed appreciable antibacterial effect against Methicillin Resistant *Staphylococcus aureus* (MRSA) and the results were presented in the Table - 1. The maximum of zone of inhibition was recorded in the Compound L4 (24 mm in dm) in 60 µl for Methanol extract. The Methanol extract of Barks (B2) exhibited more antibacterial activity against 30 µl in MRSA (13 mm) (Table - 2). The Table - 3 represent the Flowers (F1) extracts of *Plumeria bicolor* showed antibacterial effect against MRSA. The moderate inhibition was observed in (19 mm) in 60 µl for Methanol extract. The outcome of this present research demonstrated that the *Plumeria bicolor* plant leaves, barks and flower compounds were tested against MRSA to determine their antimicrobial potential. The *Plumeria bicolor* leaves extract showed maximum antibacterial activity against MRSA followed by flowers and barks extract.

DISCUSSION

The secondary metabolites found in plants are usually responsible for the positive therapeutic effects of plant materials. However, it is typically attributable to a mixture of metabolites rather than a single substance. The idea that a plant's secondary product combination is taxonomically distinct is supported by the fact that the medicinal effects of plants are specific to a given species or group of plants [7]. One of the major techniques used to choose the plant for pharmacological study is ethnobotanical screening, which typically entails many approaches. For the world's growing population, medicinal plants are a vital source of life-saving medications. The World Health Organization estimates that up to 80 % of people worldwide rely primarily on traditional medicinal plants. Many contemporary medications are also derived from plants. Plant-based compounds make up about 25 % of prescription medications. The most valuable anti-cancer medications, such as vinblastine, vincristine, and paclitaxel, are entirely produced from plant sources, starting with the most widely used painkiller, aspirin, which is derived from *Salix* species [8]. Additionally, the blossoms are used to cure asthma.

Plumeria flower extracts have also been utilized in cosmetics as perfumes. According to Syakira and Brenda [1], extracts from various portions of *Plumeria* also have medicinal qualities and can be used to prevent or treat a variety of skin conditions, including skin cancer, fungal and viral infections, various skin defects, anti-filarial, and other ailments. The disc diffusion method to extract samples from *Plumeria obtuse* leaves and reported the antimicrobial (8 bacterium) properties of various solvents (petroleum ether, ethyl acetate, chloroform, iso-butanol, and ethanol). According to the data, all microbiological species were inhibited by petroleum ether, iso-butanol, and ethyl acetate fractions, with the exception of *Klebsiella pneumonia* and *Pseudomonas aeruginosa*, respectively. *Staphylococcus aureus* was the most resistant gram-positive bacterium, whilst *Bacillus subtilis* was the most susceptible [9,10,11]. Using the disc diffusion susceptibility experiment, Rasoolsn *et al.* [12] and Vaisberg *et al.* [13] documented the antibacterial properties of ethanol, petroleum ether, chloroform, and ethyl acetate extracted from *Plumeria obtusa* leaves against *Pseudomonas aeruginosa*, *Bacillus cereus*, *Salmonella typhi*, and *Staphylococcus aureus*. Bawa Emmanuel *et al.* [14] and Nasir Ali *et al.* [15] reported to the zones of inhibition, the antibacterial activity of the plant *Plumeria rubra*'s leaves and bark that were extracted using the solvent ethyl acetate was demonstrated. The zone of inhibition for *Staphylococcus aureus* was 27 mm, with a range of 10.0 mm to 27.0 mm for dosages of 25 mg/ml to 100 mg/ml for the leaf extract. *Proteus mirabilis* and *Staphylococcus aureus* showed inhibitory zones that were equivalent to those of Gentamicin, the positive control. With a dosage range of 25 mg/ml to 100 mg/ml, the plant's bark exhibited greater antibacterial activity against *Proteus mirabilis*, with the largest zone of inhibition measuring 28.0 mm and ranging from 24 to 28 mm. remarkably, at 100 mg/ml of the extract, the zone of inhibition for *Proteus mirabilis* was larger than

**Megala et al.,**

the one for gentamicin. *Pseudomonas aeruginosa* exhibited the smallest zone of inhibition, measuring 23.0 mm for leaves and 18.0 mm for bark, at 100 mg/ml. According to Kirsty Mary Mawumenyo Mamattah [16], the essential oil of the flower outperformed the leaf essential oil as an antibacterial agent. It was comparable to what was seen in the *Pseudomonas aeruginosa* antimicrobial investigations. It has been demonstrated that *Pityriasis alba* extracts have antibiofilm properties. The ethyl acetate extracts of *Pityriasis alba* were shown to have a minimum biofilm inhibitory concentration of 60 µg/mL against *Pseudomonas aeruginosa*. According to the results of the current study, *Plumeria bicolor* leaves, bark and flowers have broad-spectrum antibacterial action. The Methicillin Resistant *Staphylococcus aureus* (MRSA) exhibited stronger antibacterial action. The leaves L4 (24 mm), barks B2 (13 mm), and flowers F1 (19 mm) showed the greatest inhibition.

CONCLUSION

The findings of this study highlight the antimicrobial potential of *Plumeria bicolor* plant extracts, specifically their efficacy against Methicillin-Resistant *Staphylococcus aureus* (MRSA). Through Thin Layer Chromatography (TLC) and Column Chromatography, pure compounds were successfully isolated from the plant's leaves, barks, and flowers. Among the extracts tested, the methanol extract of *Plumeria bicolor* leaves exhibited the highest antibacterial activity, with a maximum zone of inhibition of 24 mm (Compound L4 at 60 µL). The bark extract (Compound B2) demonstrated moderate activity, recording a 13 mm zone of inhibition at 30 µL, while the flower extract (Compound F1) exhibited an inhibition zone of 19 mm at 60 µL. The results indicate that *Plumeria bicolor* leaf extract holds the strongest antimicrobial potential, followed by the flower and bark extracts. These findings underscore the plant's promise as a natural source for antibacterial agents, particularly against drug-resistant pathogens like MRSA. Further research and development could help explore the therapeutic potential of these bioactive compounds for clinical applications.

ABSTRACT

This paper investigates the behavior of two generalized half companion sequences, composed of Diophantine and special Diophantine triplets generated using Centered Octagonal Numbers of various ranks. It also demonstrates, through several theorems, that these triplets cannot be extended into quadruples. Although no definitive method exists for generating such Diophantine triples, the paper introduces the Pellian equation as a tool to generate them. The half companion sequences are formed from Dio-triplets and special Dio-triplets based on Centered Octagonal numbers, each possessing distinct properties. The dynamics of these sequences are thoroughly examined through MATLAB analysis.

Keywords: theorems, equation, sequences, analysis

INTRODUCTION

Diophantine equations hold a prominent place among number theorists and find extensive applications in cryptography and network security. Researchers are continually solving various Diophantine equations. The idea of creating Diophantine triples and special Diophantine triples is captivating. In the context of Diophantus, we have $d_1 = \frac{1}{16}, d_2 = \frac{33}{16}, d_3 = \frac{68}{16}, d_4 = \frac{105}{16}$ which adhere to the given constraint $d_i d_j = T^2 - 1, \forall i, j \in N$ such that $i \neq j$ and $1 \leq i, j \leq 4$. where, $T \in \mathbb{Q}$.

A plethora of research has been conducted on the formation of integer sequences. According to the principal theorem proven by Cipu M, Filipin A, and Fujita Y^[1], any Diophantine triple, where the second largest element falls between the square and four times the square of the smallest element, can be uniquely expanded to a Diophantine quadruple by appending an element greater than the largest in the triple. Park J^[2] discovered the solution to the Pellian

Shanmuga Priya and Janaki

equation, developed by the D(-1) triplets, and demonstrated the extensibility of the D(-1) pair under certain constraints based on this previous result. Adzaga N, Filipin A, and JurassicA^[3] found that the set $\{2, b, c\}$ cannot be extended to irregular Dio-4 tuples for $2 < b < c$. However, they identified some families of c 's which are dependent on b 's. Additionally, Adzaga N, Dujella A, Kreso D, and Tadic P^[4] established that there are infinite families of Dio-triples that are D(n)-triples for two distinct as well as three distinct " n " with $n \neq 1$. Rihane SE, Luca F, and Togbe A.^[5] demonstrated the impossibility of forming Diophantine 4-tuples using Pell numbers. Zhang and Grossman^[6] formulated the necessary and sufficient conditions for the presence of an integer q' by analyzing the Diophantine triples $\{p_1, p_2, p_3\}$ satisfying the equation $p_k p_m + q' = \beta^2$, where $k, m=1,2,3$ and $k \neq m$. Bacic and Filipin [7] delved into the extensibility of D(4) pairings via a Pellian equation, while Earp and Lynch [8] expanded on this work to differentiate between solutions of Pellian equations corresponding to $D(l^2)$ Diophantine 3-tuples. Bonciocat NC, Cipu M, and Mignotte M.^[9] conducted a groundbreaking study on Diophantine quadruples. Additionally, they confirmed that $b_1 < b_2 < b_3$ with $b_2 = 3b_1$. Adedji KN, He B, Pinter A, and Togbe A.^[10] explored the extensibility of the Diophantine 3-tuple $\{c_1, c_2, c_3\}$ and concluded that a quadruple cannot be derived from such a set. They also established the regularity of every Diophantine triple containing the combination $\{c_1, 3c_1\}$ and found the same conclusion for $c_2 = 8c_1$. Saranya C, and Janaki G.^[11] identified the half-companion sequences of special Diophantine triplets formed using centered square numbers of ranks $n, n+1, n+2, n+3, n+1, n+2, n+3$. Sangeetha V, Anupreethi T, and Somanath M.^[12] created special Dio triples for various types of numbers of different ranks. The authors^[13] discussed centered Triacontagonal numbers. In this paper, we present the establishment of a generalized half-companion sequence for both Diophantine and special Diophantine triples. This is achieved by utilizing the Centered Octagonal number of generalized ranks, which will be elaborated upon in the subsequent sections.

METHODOLOGY

Definition 1: A centered octagonal number is a special kind of number representing an octagon, formed by placing one dot in the center and then arranging additional dots around it in layered octagonal patterns. Interestingly, these numbers also correspond to odd square numbers. The general form of centered octagonal number of rank w is given by

$$CO_w = 4w^2 + 4w + 1$$

Here, CO_w denotes the centered octagonal number of rank $w \geq 0$.

1, 9, 25, 49, 81, 121, 169, 225, 289, 361, 441, 529, 625, 729, 841, 961, 1089, 1225 are the first few centered octagonal numbers.

Definition 2: $(s_1, s_2, \dots, s_\mu)$ forms a Diophantine μ -tuple with the property $D(\gamma)$ if $s_n s_m + D(\gamma) = \alpha^2$ for each pair of $n, m \in \{1, 2, \dots, \mu\}$ and $n \neq m$.

Definition 3: $(s_1, s_2, \dots, s_\mu)$ forms a Special Diophantine μ -tuple with the property $D(\gamma)$ if $s_n s_m + s_n + s_m + D(\gamma) = \alpha^2$ for each pair of $n, m \in \{1, 2, \dots, \mu\}$ and $n \neq m$.

Here, $\gamma \in \mathbb{Z} - \{0\}$ or γ is a polynomial with integer coefficient.

A Diophantine 3-tuple (c_1, c_2, c_3) can be derived from a pair (c_1, c_2) that adheres to the property $D(\gamma)$, where $c_1, c_2, c_3 \in \mathbb{Z}_+$. By solving the equations $c_1 c_3 + \gamma = \phi_1^2$ and $c_2 c_3 + \gamma = \phi_2^2$ and applying the transformations $\phi_1 = p_1 + c_1 q_1$ and $\phi_2 = p_1 + c_2 q_1$, resulting in the Pell equation $p_1^2 - c_1 c_2 q_1^2 = \gamma - 1$. Here, $c_1 c_2$ is not a perfect square and $\gamma - 1 \neq 0$. Similarly, for special Diophantine triplet (c_1, c_2, c_3) , the Pell equation $p_1^2 - (c_1 + 1)(c_2 + 1)q_1^2 = \gamma - 1$ is formed from solving the equations $c_1 c_3 + c_1 + c_3 + \gamma = \psi_1^2$ and $c_2 c_3 + c_2 + c_3 + \gamma = \psi_2^2$ on utilizing the transformations $\psi_1 = p_1 + (c_1 + 1)q_1$ and $\psi_2 = p_1 + (c_2 + 1)q_1$, where $(c_1 + 1)(c_2 + 1)$ is not a perfect square and $\gamma \neq 1$.

Shanmuga Priya and Janaki

Formation of sequence of Diophantine triples**Case A: For the ranks $w, w + k$**

Let $v_1 = CO_w$ and $v_2 = CO_{w+k}$, where $k \in \mathbb{N}$ be the two distinct centered octagonal numbers of ranks $w, w + k$ respectively. Then

$$v_1 = 4w^2 + 4w + 1 \quad (1)$$

$$v_2 = 4w^2 + 8wk + 4k^2 + 4w + 4k + 1 \quad (2)$$

Note that $v_1 v_2 + \gamma(k) = [P(w)]^2$, where $P(w) \in \mathbb{Z}[w]$ for $\gamma(k) = 8w^2 + 8wk + 8w + 4k + 3$. Let $v_3 \in \mathbb{Z}_+$ be framed from the following set of equations

$$v_1 v_3 + \gamma(k) = \Phi_1^2 \quad (3)$$

$$v_2 v_3 + \gamma(k) = \Phi_2^2 \quad (4)$$

where $\Phi_1 = p_1 + v_1 q_1$ and $\Phi_2 = p_1 + v_2 q_1$. Solving (3) and (4) by utilizing the values of Φ_1 and Φ_2 ,

$$p_1^2 = 8w^2 + 8wk + 8w + 4k + 3 + v_1 v_2 q_1^2 \quad (5)$$

(1) and (5) give rise to the initial solution

$$p_1 = 4w^2 + 4wk + 4w + 2k + 2, \quad q_1 = 1$$

The above values of p_1, q_1 produces $\Phi_1 = 8w^2 + 8w + 4wk + 2k + 3$. On combining this value of Φ_1 along with (1) and (3) will lead to the value of v_3 as follows.

$$v_3 = 4k^2 + 8k + 16wk + 16w^2 + 16w + 6 \quad (6)$$

$$\Rightarrow v_3 = 2(CO_w + CO_{w+k}) - 4k^2 + 2$$

Thus, it is clear that the pair (CO_w, CO_{w+k}) can be extended to the Diophantine triple $(CO_w, CO_{w+k}, 2(CO_w + CO_{w+k}) - 4k^2 + 2)$.

In the similar manner, v_4 can be obtained from v_2, v_3 and v_5 from v_3, v_4 as follows.

$$v_4 = 3CO_w + 6CO_{w+k} - 8k^2 + 4$$

$$v_5 = 10CO_w + 15CO_{w+k} - 24k^2 + 12$$

Hence, $\{(CO_w, CO_{w+k}, 2(CO_w + CO_{w+k}) - 4k^2 + 2), (CO_{w+k}, 2(CO_w + CO_{w+k}) - 4k^2 + 2, 3CO_w + 6CO_{w+k} - 8k^2 + 4), (2CO_w + CO_{w+k} - 4k^2 + 2, 3CO_w + 6CO_{w+k} - 8k^2 + 4, 10CO_w + 15CO_{w+k} - 24k^2 + 12), \dots\}$ forms the half companion sequence of Diophantine triples generated by CO_w and CO_{w+k} .

Case B: For the ranks $w - k, w + k$

Consider

$$v'_1 = CO_{w-k} = 4w^2 - 8wk + 4k^2 + 4w - 4k + 1 \quad (7)$$

Now, (v'_1, v_2) forms a Diophantine pair with the property $D(8w^2 + 8w - 8k^2 + 3)$. Under the same property, this Diophantine pair can be extended to the Diophantine triple (v'_1, v_2, v'_3) in which v'_3 can be found by following the same procedure as in case A and it is represented as

$$v'_3 = 2[CO_{w-k} + CO_{w+k}] - 16k^2 + 2$$

In the same way, one can obtain v'_4 and v'_5 with the help of v_2, v'_3 and v'_3, v'_4 respectively and the values are presented as

$$v'_4 = 3CO_w + 6CO_{w+k} - 32k^2 + 4$$

$$v'_5 = 10CO_w + 15CO_{w+k} - 96k^2 + 12$$

Thus, $\{(v'_1, v_2, v'_3), (v_2, v'_3, v'_4), (v'_3, v'_4, v'_5), \dots\}$ forms the half companion sequence generated of Dio-triples by CO_{w-k} and CO_{w+k} .

Formation of sequence of Special Diophantine triples**Case C: For the ranks $w, w + k$**

Assume the values of v_1, v_2 as in (1) and (2) of case C. On computation, it is noted that $v_1 v_2 + v_1 + v_2 + \gamma'(k) = \Omega^2$, where $\gamma'(k) = 1 - 4k^2$ and $\Omega \in \mathbb{Z}[w]$. Let $v'_3 \in \mathbb{N}$ be found from v_1, v_2 satisfying the following conditions

$$v_1 v'_3 + v_1 + v'_3 + \gamma'(k) = \Psi_1^2 \quad (8)$$

$$v_2 v'_3 + v_2 + v'_3 + \gamma'(k) = \Psi_2^2 \quad (9)$$

where $\psi_1 = p'_1 + (v_1 + 1)q'_1$ and $\psi_2 = p'_1 + (v_2 + 1)q'_1$. On eradicating v'_3 from the equations (8) and (9),

$$p_1'^2 = -4k^2 + (v_1 + 1)(v_2 + 1)q_1'^2$$

Substitution of known values in the above equation will lead to initial solution

$$p_1 = 4w^2 + 4wk + 4w + 2k + 2, \quad q_1 = 1$$

With the help of this solution, one can depict the value of Ψ_1 as

$$\Psi_1 = 8w^2 + 4wk + 8w + 2k + 4 \quad (10)$$

Thus, v_3^s can be derived from (8) on using all the known values of $v_1, \Psi_1, \gamma'(k)$ as follows

$$\begin{aligned} v_3^s &= 4k^2 + 8k + 16w^2 + 16wk + 16w + 7 \\ \Rightarrow v_3^s &= 2[CO_w + CO_{w+k}] - 4k^2 + 3 \end{aligned} \quad (11)$$

Hence, it is quite easy to develop the values of $v_4^s, v_5^s \in \mathbb{N}$ from the pairs (v_2, v_3^s) and (v_3^s, v_4^s) respectively and they are represented as

$$\begin{aligned} v_4^s &= 3CO_w + 6CO_{w+k} - 8k^2 + 8 \\ v_5^s &= 10CO_w + 15CO_{w+k} - 24k^2 + 24 \end{aligned}$$

Thus, $\{(CO_w, CO_{w+k}, 2[CO_w + CO_{w+k}] - 4k^2 + 3), (CO_{w+k}, 2[CO_w + CO_{w+k}] - 4k^2 + 3, 3CO_w + 6CO_{w+k} - 8k^2 + 8), (2[CO_w + CO_{w+k}] - 4k^2 + 3, 3CO_w + 6CO_{w+k} - 8k^2 + 8, 10CO_w + 15CO_{w+k} - 24k^2 + 24), \dots\}$ represents the corresponding sequence of Special Dio-3 tuples.

Case D: For the ranks $w - k, w + k$

In order to generate the sequence of special Dio-3 tuples involving CO_{w-k}, CO_{w+k} , consider v_1', v_2 as in (2) and (7). It is determined that the special Dio-pair (v_1', v_2) can be extended to special Dio-3 tuple (v_1', v_2, u_3^s) on using the property $D(1 - 16k^2)$, where the value of u_3^s can be determined by following the similar procedure as above and represented as

$$u_3^s = 2[CO_{w-k} + CO_{w+k}] - 16k^2 + 3$$

Similarly, the values of $u_4^s, u_5^s \in \mathbb{Z}_+$ are given as

$$\begin{aligned} u_4^s &= 3CO_{w-k} + 6CO_{w+k} - 32k^2 + 8 \\ u_5^s &= 10CO_{w-k} + 15CO_{w+k} - 96k^2 + 24 \end{aligned}$$

$\therefore \{(v_1', v_2, u_3^s), (v_2, u_3^s, u_4^s), (u_3^s, u_4^s, u_5^s) \dots\}$ forms the required sequence of triplets.

Theorems of Non-Extendibility

Theorem 1:

Let (v_1, v_2, v_3) be a Diophantine triple formed by using the centered octagonal numbers CO_w, CO_{w+k} under the property $D(8w^2 + 8wk + 8w + 4k + 3)$, for all $w, k \in \mathbb{Z}_+$ and $k \geq 1$. Then, (v_1, v_2, v_3) cannot be extended to quadruples under the same property for all values of $w, k \neq 0$.

Proof:

Since (v_1, v_2, v_3) is a Diophantine triple under the property $D(8w^2 + 8wk + 8w + 4k + 3)$, in order to find $V_4 \in \mathbb{Z}_+$ satisfying the following equations,

$$v_1 V_4 + 8w^2 + 8wk + 8w + 4k + 3 = \Phi_1^2 \quad (12)$$

$$v_2 V_4 + 8w^2 + 8wk + 8w + 4k + 3 = \Phi_2^2 \quad (13)$$

$$v_3 V_4 + 8w^2 + 8wk + 8w + 4k + 3 = \Phi_3^2 \quad (14)$$

where $\Phi_i = p_i + v_i q_i$, $i = 1, 2, 3$

Elimination of V_4 from (12) and (13) provides the initial solution $p_1 = 8w^2 + 8w + 4wk + 2k + 3, q_1 = 1$. This gives $\Phi_1 = 12w^2 + 12w + 4wk + 2k + 4$. Hence from (12), the value of V_4 is resulted as

$$V_4 = 36w^2 + 36w + 24wk + 4k^2 + 12k + 13$$

On substituting the known values in LHS of (13), it is found that

$$\begin{aligned} \Phi_2^2 &= 144w^4 + 384kw^3 + 288w^3 + 352k^2w^2 + 576kw^2 + 240w^2 + 128k^3w \\ &\quad 352k^2w + 328kw + 96w + 16k^4 + 64k^3 + 104k^2 + 68k + 16 \end{aligned} \quad (15)$$

If the right hand side of Φ_2^2 in (15) is a perfect square, then (v_1, v_2, v_3) can be extended to quadruple. This can be validated by three cases.

Case (i): If $w > k$, then $w = k + 1$. The equation (15) becomes

$$\Phi_2^2 = 1024k^4 + 3840k^3 + 5408k^2 + 3372k + 784$$

Case (ii): If $w < k$, then $w = k - 1$. The equation (15) turns to

$$\Phi_2^2 = 1024k^4 - 1280k^3 + 672k^2 - 164k + 16$$

Case (iii): If $w = k$, then the equation (15) transformed to

$$\Phi_2^2 = 1024k^4 - 1280k^3 + 672k^2 - 164k + 16$$

In all the above three cases, it is analyzed that Φ_2^2 is not a perfect square. This completes the proof.

Shanmuga Priya and Janaki

Theorem 2:

Any Diophantine triple (v'_1, v_2, v'_3) generated by CO_{w-k}, CO_{w+k} cannot be extended to quadruple for all values of $w, k \in \mathbb{Z}_+$

Proof : The Proof of this theorem is same as Theorem 1.

Theorem 3:

Let (v'_1, v_2, u_3^s) be a Special Diophantine triple formed by using CO_{w-k}, CO_{w+k} under the property $D(1 - 16k^2)$, for all $w, k \in \mathbb{Z}_+$ and $k \geq 1$. Then, (v_1, v_2, v_3) cannot be expanded into quadruples while preserving the same property for any values of $w, k \in \mathbb{Z}_+$ and $k \neq 0$.

Proof :

Assume that (v'_1, v_2, u_3^s) is a Special Diophantine triple under the property $D(1 - 16k^2)$, and $\Psi_1 = p_1 + (v'_1 + 1)q_1, \Psi_2 = p_1 + v_2 + 1q_1, \Psi_3 = p_1 + u_3^s + 1q_1$.

To find $\delta \in \mathbb{Z}_+$, which satisfies the following constraints,

$$v'_1\delta + v'_1 + \delta + (1 - 16k^2) = \Psi_1^2 \quad (16)$$

$$v_2\delta + v_2 + \delta + (1 - 16k^2) = \Psi_2^2 \quad (17)$$

$$u_3^s\delta + u_3^s + \delta + (1 - 16k^2) = \Psi_3^2 \quad (18)$$

The value of δ is obtained by solving the equations (16) and (18) with the help of Ψ_i values as follows

$$\delta = 4k^2 - 24kw - 12k + 36w^2 + 36w + 17$$

Using the above value of δ and v_2 in (17),

$$\begin{aligned} \Psi_2^2 = 16k^4 + 144w^4 - 32k^3 + 288w^3 - 176k^2w^2 + 20k^2 + 324w^2 - 64wk^3 - 32wk^2 + 180w + 192kw^3 + 288kw^2 \\ + 168kw + 144w^2k^2 + 36k + 53 \end{aligned}$$

It is found that the above value of Ψ_2^2 is not a perfect square for all $w, k \in \mathbb{W}$ and $k \neq 0$.

Theorem 4:

Any Special Diophantine triple (v_1, v_2, v_3^s) generated by CO_w, CO_{w+k} cannot be extended to quadruple for all values of $w, k \in \mathbb{Z}_+$

Proof : The Proof of this theorem is same as Theorem 3

CONCLUSION

The generalized version of half companion sequence of Dio-3 tuples and special Dio-3 tuples are found by using Centered Octagonal number of distinct ranks. Also, it is verified that both the Dio-triples and Special Dio-triples are not extensible for any values of $w, k \in \mathbb{Z}_+$ and $k \geq 1$.

ABSTRACT

The dental industry, while essential to public health, contributes significantly to environmental pollution through resource-intensive practices, high energy consumption, and waste generation. As awareness of these ecological impacts grows, green dentistry has emerged as a transformative approach aimed at minimizing the industry's environmental footprint. This review examines sustainable practices and innovations in dental care, such as digital systems to reduce paper waste, biodegradable materials, energy-efficient devices, and eco-friendly waste management. It also explores the role of dental professionals in adopting and promoting green practices to align with broader sustainability goals. Through the adoption of these practices, green dentistry can help the industry move toward a more sustainable future while maintaining quality patient care.

Keywords: Dental Waste, Digital Dentistry, Eco Friendly, Green Dentistry, Sustainable Oral Healthcare

Abbreviations

SEARO, EDA, MoEFs, SUPs, HIV, LED, CBCT, CT, MRI, HER, HIPPA

INTRODUCTION

In today's world increasing environmental apprehensions regarding elevated temperatures, melting ice caps, and escalating carbon emissions have popularized the term "green" across various industries. As per the world health organization's SEARO report, the eleven South Asian nations generate approximately 35,000 tons of medical waste per year and 2000 tons per day prompting dental professionals to practice eco-friendliness and be aware of their impact on the environment.[1] Delivering oral healthcare, whether through preventive measures, therapeutic interventions, or long-term maintenance contributes to pollution and a substantial carbon footprint. Furthermore, recognizing the interconnectedness of our role as oral health care providers with the broader ecological landscape, it is essential that we proactively address and diminish the environmental ramifications of our activities. Our ethical and moral compass guides us in navigating this responsibility, urging us to adopt sustainable methodologies that not only fulfill our commitment to oral health but also contribute positively to the overall health of the environment. Through ongoing dedication to eco-conscious practices, we can ensure a lasting impact that aligns with our professional principles and environmental stewardship. Eco friendly dentistry is one such technologically advanced approach that minimizes the environmental footprint of dental practices, contributing to the shift towards an ecologically sustainable healthcare system. [2] Dr. Malden Kralj, the founder of Oral Dental Studio and innovator in the field is credited with coining the term "eco-friendly dentistry." This not only solidifies his role as a pioneer but also marks a groundbreaking moment in establishing the first green dental group in America. Eco friendly dentistry also involves a dentistry service model that promotes and sustains overall well-being. This approach aims to cater to the requirements of numerous patients while assisting dental professionals in safeguarding both planetary and community health, along with ensuring the financial stability of their practices. Launched globally in June 2009, the Eco-Friendly Dentistry Association (EDA) has played a pivotal role. In India, the Ministry of Environment and Forests (MoEFs) instituted the Hazardous Waste (Management and Handling) Rules in 1989, with subsequent amendments in 2000 and 2003. These rules are designed to ensure the effective management and proper handling of hazardous wastes throughout the country.[3]

The National Green Tribunal, a regulatory body in India, has issued a range of guidelines aimed at preserving the environment and human health.⁴ These directives advocate for:

- Embracing clean technologies
- Facilitating the recycling and reuse of waste materials
- Installing pollution control equipment

Implementing enhanced housekeeping and work practices, which incorporate waste minimization techniques. These measures collectively contribute to the protection of the environment and well-being of the community.

Going Green in Dentistry: Why?

Every year dental practices generate a considerable amount of waste, discarding millions of sterilization pouches, chair barriers, and light handle covers. The disposal of items like gloves, masks, suction tips, saliva ejectors, needle, and paper pose a persistent challenge in terms of breakdown.[5] This has far reaching environmental impacts, including the daily waste of 360 gallons of water, the production of 4.8 million lead foils, 28 millionslitres of toxic X-ray fixer, and an annual generation of 3.7 tons of mercury waste.[5]

Oral healthcare significantly contributes to CO₂ emissions through three primary avenues:

- The travel involved in patients and healthcare personnel commuting to and from care centers
- The manufacturing, distribution, and procurement processes of materials and sundries along the supply chain
- The generation and management of waste, notably the environmental challenge posed by single use plastics (SUPs). It is imperative to urgently address these aspects to effectively reduce the environmental impact associated with oral healthcare. Within the operational realm of a dental clinic, the generation of biomedical waste spans a diverse array of categories, encompassing:
 - Sharps
 - Discarded disposable items
 - Infectious waste, represented by items like blood-soaked gauze pieces and cotton

**Eshika Godara et al.,**

- Hazardous waste, inclusive of materials such as mercury and lead foils
- Chemical waste, incorporating spent film developers, fixers, cleaning solutions, and disinfectants. This comprehensive categorization underscores the varied nature of waste generated, emphasizing the need for meticulous management and environmentally conscious disposal practices within the dental healthcare setting.

Mercury Component in Silver Amalgam

During dental procedures, mercury poses a hazard to both human health and the environment. It is used during the placement, removal, and polishing of dental amalgam. The restoration and removal of dental amalgam produce potentially harmful waste, including mercury:[6]

- Vaporized elemental mercury- emanating from dental amalgam alloy
- Uncontaminated dental amalgam scrap- particles that haven't been in contact with the patient, remaining after restoration placement
- Contaminated amalgam waste- particles that have encountered patient secretions, generated during carving and restoration removal procedures
- Amalgam sludge- particles present in dental office wastewater, found in chairside traps and vacuum filters

Dentists are estimated to contribute a substantial portion, ranging from 3% to 70% of the total mercury content found in wastewater treatment facilities. Multiple ongoing efforts are focused on completely eliminating the use of mercury, with the most recent initiative coming from the United Nations Environment Programme in 2009.

In addition to mercury the presence of silver, a heavy metal, is observed in dental waste. Although it is a constituent of dental amalgam, the silver thiosulfate in radiographic fixer can infiltrate the water system due to inappropriate disposal of dental waste, resulting in a considerable environmental concern.

Lead

The lead shields present in every film packet represent a residual element from traditional radiography, and lead, being a persistent environmental toxin, poses potential risks. Even at minimal levels, the toxicity of lead is detrimental to the health of both children and adults, underscoring the importance of minimizing its presence in the environment.

Sharps

Improper management and disposal of dental waste not only increase the risk of needle injuries among healthcare personnel but also contribute to the potential spread of diseases. Those particularly vulnerable to disease transmission through contact include children, janitorial staff and garbage collectors, emphasizing the need for careful handling and disposal practices in dental settings. Accidental needle pricks can lead to the transmission of disease like HIV and hepatitis, underscoring the importance of appropriate disposal for potentially hazardous waste. In addition to metallic waste, a dental office generates various disposable items, including latex gloves, disposable patient bibs, headrest covers, syringes, and plastic suction tips. Non hazardous office waste, such as paper, cardboard, aluminium, and plastics, also contributes to the overall bulk of generated waste.

Disinfectants

Disinfectants, classified as hazardous waste, raise significant environmental considerations. The potential direct discharge of commonly used disinfectants into the sewage system poses environmental risks. It is noteworthy that straight alcohols and ethers, commonly found in disinfectants, are categorized as ignitable materials, intensifying the hazards associated with disposal. Therefore, the careful management and disposal of disinfectants are crucial to mitigate the impact on both public health and the environment.

Obstacles in Embracing Green Dentistry Approaches

The challenges in adopting green dentistry include:

- **Cost perceptions:** There may be perceived initial costs associated with transitioning to environmentally friendly practices, which could pose a barrier.

Eshika Godara *et al.*,

- **Mindset and Awareness:** Changing attitudes and fostering awareness among dental professionals and patients about the importance of eco-friendly dentistry can be challenging.
- **Implementation complexity:** The practical execution of green dentistry practices. Such as waste reduction, energy efficiency, and sustainable sourcing, may present logistical challenges.
- **Regulatory compliance:** Adhering to green standards and incorporating eco-friendly materials may require navigating complex regulatory frameworks.
- **Education and Training:** Providing sufficient education and training for dental professionals to adopt and adapt to new green technologies and practices.
- **Supply Chain Challenges:** Ensuring a consistent supply of environmentally friendly dental products and materials can be a logistical challenge.
- **Patient Preferences:** Aligning with patients who may not be fully aware of prioritizing green dentistry practices can be a hurdle.
- **Infrastructure Upgrades:** Upgrading dental facilities to incorporate sustainable technologies and infrastructure may require significant investments.
- **Waste Management:** Implementing effective waste management practices, especially reducing the use of single use plastics, can be challenging but is crucial for green dentistry

Overcoming these challenges involves a collective effort from dental professionals, regulatory bodies, suppliers, and patients to promote and adopt sustainable practices in oral healthcare. Hence, it is imperative to establish a structure for oral health care delivery that not only prioritizes optimal patient care but also integrates environmental conservation as a fundamental value. Achieving this is particularly feasible for preventable oral diseases. Through this paper, our aim is to put forward a structure that highlights the concept that effective oral health care is crucial in reducing diseases. Moreover, as an inadvertent outcome, by minimizing resource utilization, it inherently contributes to environmentally sustainable sources. This approach establishes a direct cause-and-effect relationship between delivering top-tier care and realizing tangible, environmentally sustainable practices.

Components of Sustainable Oral Healthcare

In accordance with the principles of green dentistry advocated by the Eco-Dentistry Association, the focal points include reducing waste and pollution, conserving energy, water, and financial resources. Moreover, there is an emphasis on integrating high-tech innovations and adopting a holistic approach that prioritizes wellness and integrative practices. This multifaceted approach not only aligns with environmentally conscious ideal but also promotes advancements in dental care with a holistic perspective on overall well-being.

Hence, it predominantly revolves around the principles encapsulated in the “4R” approach;

Reduce, Reuse, Recycle and Rethink: -

- Implement waste production strategies in dental practice
- Proactively prevent pollution within dental care settings
- Advocate for the conservation of water, energy, and financial resources in dental procedures
- Embrace cutting edge technologies for high dentistry practices

Ten proactive steps to actively shape dentistry’s sustainable future, concentrating on the pivotal aspects of waste reduction and pollution mitigation, providing individuals with actionable strategies for meaningful participation.²

- Embracing digital imaging as a modern alternative to traditional methods in dental practices
- Integrating the application of an efficient amalgam separator into dental procedures’
- Incorporating medical grade, sterilizable instruments and choosing plastic free patient barriers
- Minimize packaging waste through consolidating orders, thereby reducing shipping related waste
- Implement recycling and reutilization of older hand instruments
- Choose environmentally friendly options such as non-toxic, biodegradable surface disinfectants and cleaners. For instance, opt for solutions that incorporate plant-based ingredients, promoting both effective sanitation and ecological sustainability
- Consider procuring dental materials in bulk, a more cost-effective approach
- Employ reusable or compostable impression trays made from stainless steel

**Eshika Godara et al.,**

- Routinely disinfect water lines with environmentally friendly or enzymatic cleaners and completely refrain from using chlorine bleach as it may emit mercury vapors into the air
- Refrain from using harmful cold sterilization solutions, like glutaraldehyde, known for its potent irritation to the lungs and skin

Embracing conservation is the cornerstone of the evolving paradigm in green dentistry. It not only preserves our valuable resources but also proves to be prudent financial strategy. The key takeaway is to cease the unnecessary expenditure of energy for which we bear the cost but derive no benefit. Ensure that upon leaving the workplace next time, take a moment to inspect and identify any pervasive blinking lights originating from electrical devices. This may encompass computers, intraoral cameras, televisions, or lights that are left on when the office is unoccupied. Switching off these devices allows us to conserve a significant amount of energy consumed by items plugged into the grid but not actively in use. A noteworthy advancement in the future of green dentistry is the recent introduction of dental equipment designed to save both energy and water.

Enhancing Energy Efficiency

Within the ever-evolving field of dentistry, the imperative of energy conservation has assumed a central role, embodying the profession's dedication to environmental stewardship and financial prudence. Dental practitioners are increasingly attuned to the far reaching effects of their energy consumption, prompting a concerted effort to minimize their practices' ecological impact. From the conscientious deactivation of electronic equipment during periods of inactivity to the adoption of cutting edge, energy efficient dental technologies, the industry is actively reshaping its approach. This strategic commitment not only aligns with the core tenets of green dentistry but also underscores the profession's commitment to pioneering sustainable practices that concurrently contribute to cost effectiveness.

Implementing innovative strategies to conserve energy, water, and financial resources is crucial for driving dentistry towards a more sustainable and environmentally friendly future. By adopting these methods, dental practices can significantly reduce their environmental impact while saving money and promoting a greener industry:-

- Employing energy efficient appliances such as Energy Star-rated printers, computers, dishwashers, and more, aids in the conservation of energy
- Implementing the switch to LED operatory lights as a progressive enhancement in dental facility lighting
- Adoption of an in-office water distillation system
- Verify that all electrical devices are switched off during the night
- Embracing an innovative waterless vacuum system as a progressive upgrade in dental facility operations
- Integrating energy efficient LED technology for both "Exit" signs and other emergency indicators as a forward-looking approach in dental facility safety measures
- Promote awareness and educate patients about the importance of conserving water by turning it off while brushing their teeth thus contributing to substantial water savings on a daily, per-person basis
- Embracing the use of waterless hand sanitizers with an environmentally conscious perspective, contributing to sustainable and responsible hygiene practices
- Introduce motion sensors to automatically turn off lights in non-medical areas like business offices, supply closets and staff lunchrooms when not in use

Embracing Advanced Digital Technologies in Dentistry

Another aspect of sustainable dentistry involves integrating advanced technological methods. Digital dentistry represents a revolutionary shift in the dental field, leveraging cutting-edge technologies to enhance patient care and streamline dental procedures. From diagnostic imaging through digital radiography and 3D scanning to computer-aided design and manufacturing (CAD/CAM) for dental restorations, the digitalization of dentistry has significantly improved precision and efficiency. Electronic health records and digital treatment planning further contribute to comprehensive and integrated patient care. With intraoral scanners replacing traditional impressions, patients experience more comfort, and practitioners benefit from accurate and immediate data. The amalgamation of these

**Eshika Godara et al.,**

digital technologies not only transforms the way dental professionals operate but also elevates the overall dental experience for patients, marking a progressive era in oral healthcare.

Alternative approaches in dentistry that prioritize sustainability and environmental impact[7] :

Digital Imaging System

Dental imaging system is an advanced technique that utilizes computer technology in image acquisition, processing and storage and display of direct radiographic images. With the rise of cost effective intraoral and extraoral digital technology, coupled with the increasing computerization of dental practices, digital imaging has emerged as a superior alternative to conventional film imaging in various aspects.

Advancement in Digital Imaging

In the last decade, a technology that was referred to as cone beam computed tomography (CBCT) has emerged as technique that enables volumetric rendering of the oral and maxillofacial structures from any orientation. This articular imaging modality refutes the limitations of the 2-D methods, creates a lower amount of radiation than a medical CT scan, and allows clinicians to align more coherent treatment plans, which in turn heightens the chances of successful surgeries.

Advantages of Digital Radiography Immediate Observation of Radiographic Images

It is particularly valuable in assessing the fit of crowns, assessment of canal morphology prior to implant placement, checking for extrusion of posts in endodontically treated teeth, determining the presence of potential overhangs or marginal ridges in recently placed restorations, identification of radiopaque foreign bodies in soft tissues, counseling of patients and countless others.

CAD CAM

CAD, which stands for “computer aided design.” And CAM, an acronym for “computer aided manufacturing.” Are integral components in CAD/CAM systems, each comprising 3 essential elements:

- (a) Digitalization Tool/Scanner: This component transforms physical geometry into digital data that can be processed by the computer
- (b) Software: The software processes the digital data, generating a data set tailored to the specific product to be fabricated, based on the application.
- (c) Production Technology: Utilizing the data set, this component carries out the transformation process to create the desired product

Methods of data acquisition in CAD/CAM

CAD/CAM systems utilize various methods for data acquisition, including:

- (a) Intraoral scanning
- (b) Contact and non-contact digitalization
- (c) CT scan or MRI

These methods facilitate the collection of accurate digital data, ensuring precision in the fabrication of dental products through CAD/CAM technology.

Uses of CAD/CAM in Dentistry

In dentistry, CAD/CAM technology has found widespread applications across various specialities. Its impact is particularly notable in prosthodontics, where it is increasingly being employed for both removable and fixed prosthodontics procedures.

- (a) **Removable Complete Dentures:** Researchers, including a group led by Maeda et al. have proposed the utilization of CAD/CAM technology for the fabrication of removable complete dentures as early as 1994. While subsequent studies have explored this application, there is notable absence of published clinical reports or trials. However, a limited number of manufacturers claim to produce removable complete dentures using CAD/CAM processes.

**Eshika Godara et al.,**

- (b) **Removable Partial Dentures:** CAD/CAM technology allows for the production of partial denture frameworks through additive prototyping techniques, expanding the range and precision of options for dental practitioners.
- (c) **Crowns/ Bridges:** Zirconia has emerged as the predominant material for CAD/CAM fabricated crowns and bridges, with studies indicating its suitability for clinical use. Additionally, CAD/CAM processes also enable the fabrication of metal and porcelain crowns and bridges, contributing to the versatility of applications in prosthodontic procedures.
- (d) **Inlay, Onlay& Veneers:** The use of CAD/CAM technology extends to the production of inlays, onlays and veneers with research suggesting higher survival rates for restorations created through these advanced manufacturing methods. Overall, the incorporation of CAD/CAM technology in prosthodontic workflows has led to advancements and expanded treatment capabilities in the field of dentistry, contributing to improved patient care and outcomes.

Office-based sharps disposal equipment designed to render sharps insert Steam sterilizers eliminating the necessity for chemical agents

Steam sterilizers, also known as autoclaves, have become the preferred method for sterilizing medical and surgical instruments, effectively reducing the necessity for chemical sterilizing agents. These devices use pressurized steam to rapidly heat and denature proteins in microorganisms, effectively killing bacteria, viruses and spores. The efficiency and reliability of steam sterilizers make it ideal for materials that can withstand high temperatures and moisture, such as surgical instruments, linens, and certain implantable devices. Compared to chemical sterilant like ethylene oxide (ETO) and hydrogen peroxide gas plasma, steam sterilizers offer a safer and faster method. Chemical sterilant, while effective, pose significant health risks and environmental hazards, requiring stringent handling and disposal protocols. The steam sterilization process is straightforward, typically involving conditioning, exposure, and exhaust phases. This simplicity, combined with its effectiveness, has led to the widespread adoption of steam sterilizers in healthcare settings, ensuring consistent and reliable sterility. Moreover, the move away from chemical sterilant is driven by the need for safe, more sustainable practices. Steam sterilization uses water as its primary medium, which is inherently safer and more environmentally friendly compared to the toxic chemicals used in alternative methods.

Digitized patient charting, scheduling, and billing

The Electronic Health Record (EHR) is a detailed digital record that captures a patient's health information from various healthcare interactions over time. This data encompasses patient demographics, progress notes, health issues, medications, vital signs, medical history, immunization, laboratory results and radiology reports. The EHR significantly improve and streamlines the clinician's workflow by automating routine tasks and enhancing efficiency. It generates a comprehensive and detailed record of each patient's clinical encounters. Additionally, the EHR supports a wide range of care-related activities, both directly and indirectly, through integrated interfaces. These activities include providing evidence-based decision support, facilitating quality management, and enabling comprehensive outcomes reporting, all of which contribute to better patient care and more efficient healthcare delivery.

Patient Documentation

The HER must be designed to comprehensively document every detail of the face-to-face encounter between a doctor and a patient. Capturing all relevant information to ensure a complete and accurate record of the interaction (Hufford, 1999). Ensuring an efficient and rapid documentation process is crucial, given the value of a doctor's time and their typically busy schedule attending to multiple patients. The patient EHR documentation encompasses essential elements such as detailed doctor's notes, comprehensive patient medical history, accurately recorded pharmacy prescriptions, precise physician orders, thorough laboratory results, detailed X-rays and radiography reports, and documentation of various other medical interventions (Hufford, 1999). This comprehensive approach ensures a thorough and detailed record of each patient encounter, supporting effective clinical decision-making and continuity of care.

Eshika Godara et al.,

Track Patient Utilization and Healthcare Costs

Healthcare facilities invest significant effort in monitoring and managing patient statistics and utilization data, including metrics such as days of care, frequency of tests, patient visit volumes, and utilization of various hospital services. Tracking these metrics is essential for operational efficiency and optimizing the delivery of healthcare services within the facility. This data plays a pivotal role in healthcare management, encompassing the tracking of utilization trends, financial reporting, budgeting, and resource allocation within healthcare facilities. Implementing an EHR system significantly streamlines these processes by offering precise and up-to-date data. By combining utilization statistics with comprehensive financial data, healthcare providers can effectively monitor healthcare expenditures, identify opportunities for operational enhancements, and optimize overall resource management (Hufford, 1999).

Health Record Portability

At present, most health records are maintained in physical paper charts. This makes transferring a patient's medical information burdensome, especially when the patient relocates or seeks care from a different healthcare provider. Sending the patient's paper chart to a new location requires photocopying and physical transportation, which can lead to delays in accessing critical medical information and maintaining continuity of care. This process is labour-intensive and may result in incomplete records upon arrival at the new healthcare provider (Hufford, 1999). The hospital retains ownership of the original chart, which must remain in their possession. An EHR addresses this issue by enabling patient records to be securely accessed and transmitted to any location where the patient receives care.

Billing and Coding

The accurate documentation of patient encounters through proper medical coding and billing processes is critically important in the healthcare industry. Insurance companies, including Medicare, require precise documentation to ensure the integrity of healthcare claims. Inaccuracies in coding can lead to billing errors, potentially resulting in compliance issues and fines for healthcare providers. Electronic Health Records (EHR) technology plays a crucial role in facilitating proper documentation by providing built-in diagnosis databases to assist coders and billers in generating accurate healthcare claims.

A digital, paperless system for patient communication, including email-based appointments, reminders, and time saving measures for staff. These include:

- Email-Based Appointments and Reminders
- Time-Saving for Staff
- Integration with Electronic Health Records (EHR) allows quick access to patient information.
- Automated follow-ups and task management features reduce manual work and improve workflow efficiency
- Enhanced Patient Experience
- Implementation Considerations
- Ensure data security and compliance with regulations like HIPAA.
- Provide staff training for smooth adoption.
- Integrate with existing healthcare IT infrastructure by adopting these digital systems, healthcare facilities can achieve better efficiency, accuracy, and patient care outcomes.

Utilizing diode lasers as an alternative to cord packing

Use of diode lasers in dentistry presents a contemporary and effective approach in substitution to the conventional cord packing methods for tissue control and impressions. The choice of diode lasers is evident for dental practice since it offers many advantages such as accuracy, coagulation, and reduced discomfort for a patient.

Leveraging a website for promotion and as a central marketing tool

Transitioning to an electronic format for patient records

The conversion of patient records into electronic means, also called Electronic Health Record (EHR), comes with several advantages making it efficient, improving patient care, and having a secure data system. But for the transition

**Eshika Godara et al.,**

process to take place, certain factors which are important need to be considered to ensure that the change will take place properly.

Advantages of using Electronic Health Record (EHR)

- 1.Improved Efficiency and Access
- 2.Centralized Information
- 3.Streamlined Workflow
- 4.Enhanced Patient Care:
- 5.Comprehensive Patient History
- 6.Coordination of Care
- 7.Data Security and Privacy
- 8.Compliance with Regulations

Implementation of compressors without oil.**Insights from ADA's Suggestion on Embracing Green Practices**

The Council on Dental Practice, an esteemed division of the American Dental Association, has meticulously developed a comprehensive guide that details their top ten strategies for promoting environmentally conscious practices within dental offices. This insightful compilation underscores the commitment to environmentally conscious dentistry, providing practitioners with a valuable roadmap towards sustainable and responsible oral healthcare practices.[8]

- Implement the installation of an amalgam waste management system
- Power down equipment when it is not in use
- Employ paper scraps for other uses, promoting resourcefulness and minimizing waste
- Utilize waste separation bins and establish an environmental task force to transport items to recycling centers.
- Dispose of confidential patient records that have been shredded through appropriate recycling methods.
- Embrace digital technology, like adopting digital radiography
- Integrate solar or tinted shades installation
- Implement the installation of locked or programmable thermostats
- Implement the installation of high efficiency light bulbs
- Use nontoxic cleaning agents and avoid excessive use of disinfectants

CONCLUSION

The ongoing global momentum behind the "going green" movement, now recognized as an urgent international priority, is dedicated to addressing a spectrum of environmental challenges, including contamination and waste. This overarching initiative underscores the collective commitment to fostering a sustainable future by proactively confronting and mitigating critical environmental issues on a broad scale. Dentistry has the potential to reduce its cumulative environmental footprint by incorporating the core principles of the green movement, which include recycling, reducing, reusing, and rethinking, into the operations of the dental office. These principles offer practical and applicable strategies for promoting environmental sustainability within the field of dentistry. A dentist embracing eco-friendliness doesn't necessarily have to be an ardent environmentalist but rather a thoughtful reconsideration. It becomes a conscious decision for the dentist to opt for environmentally sustainable products and practices, striving to conserve resources such as paper, water, materials and energy to the greatest extent possible. This deliberate choice not only contributes to a more sustainable dental practice but also aligns with a broader commitment to environmental responsibility.

ABSTRACT

The theoretical importance of polynomial equations of second degree in three unknowns with integral coefficients is great as they are closely connected with many problems of number theory. Specifically, the second degree polynomial equations with three unknowns in connection with geometrical figures occupy a pivotal role in the region of mathematics. In this paper, the ternary quadratic equation $4x^2 - y^2 - z^2 + 2yz + 3x - 4y + 8z - 2 = 0$ geometrically exhibiting Hyperbolic Paraboloid is studied. The above equation is analyzed for obtaining its non-zero distinct solutions in integers. Varieties of solution patterns are determined through elementary algebra. Also a few fascinating relations among the solutions are presented.

Keywords: Hyperbolic Paraboloid, Ternary quadratic equation, Non- Homogeneous quadratic equation, Integer solutions.

**Notations**

$$t_{3,u} = \frac{u(u+1)}{2}$$

$$p_u^3 = \frac{u(u+1)(u+2)}{6}$$

$$p_u^5 = \frac{u^2(u+1)}{2}$$

INTRODUCTION

It is quite obvious that Diophantine equations, one of the areas of number theory, are rich in variety [1, 2]. In particular, the ternary quadratic Diophantine equations in connection with geometrical figures occupy a pivotal role in the orbit of mathematics and have a wealth of historical significance. In this context, one may refer [3-10] for second degree Diophantine equations with three unknowns representing different geometrical figures.

In this paper, the ternary quadratic Diophantine equation $4x^2 - y^2 - z^2 + 2yz + 3x - 4y + 8z - 2 = 0$ is studied for determining its integer solutions successfully through elementary algebra.

Method of analysis

The ternary quadratic Diophantine equation representing hyperbolic Paraboloid to be solved is given by

$$4x^2 - y^2 - z^2 + 2yz + 3x - 4y + 8z - 2 = 0 \quad (1)$$

The procedure for determining different sets of solutions is discussed as follows:

Technical procedure-1

Solving (1) for y , we get

$$y = [z - 2 \pm \sqrt{4x^2 + 3x + 4z + 2}] \quad (2)$$

Take

$$\alpha^2 = 4x^2 + 3x + 4z + 2 \quad (3)$$

After some algebra, (3) is written as

$$(4\alpha)^2 - (8x + 3)^2 = 64z + 23 \quad (4)$$

Employing the identity

$$(A+1)^2 - A^2 = 2A + 1 \quad (5)$$

one obtains

$$x = 4z + 1, \alpha = 8z + 3$$

In view of (2), we have

$$y = 9z + 1, -7z - 5$$

Thus, the solutions in integers to (1) are given by

$$(x, y, z) = (4k + 1, 9k + 1, k), (4k + 1, -7k - 5, k)$$

It is worth to mention that, in addition to the above solutions, there are many more choices for the variables x, z in eliminating the square-root on the R.H.S. of (2).

For simplicity and brevity, a few integer solutions to (1) are presented below:

$$(x, y, z) = (1, s^2 + 5s + 1, s^2 + 3s), (1, s^2 + s - 5, s^2 + 3s), (2, s^2 + 6s, s^2 + 4s - 2), (2, s^2 + 2s - 8, s^2 + 4s - 2), \\ (5, s^2 + 11s - 2, s^2 + 9s - 9), (5, s^2 + 7s - 20, s^2 + 9s - 9), (4s - 3, 9s - 8, s - 1), (4s - 3, -7s + 2, s - 1)$$

Technical procedure-2

Solving (1) for z , we get

$$z = [y + 4 \pm \sqrt{4x^2 + 3x + 4y + 14}] \quad (6)$$

Take

$$\alpha^2 = 4x^2 + 3x + 4y + 14 \quad (7)$$

After some algebra, (7) is written as

$$(4\alpha)^2 - (8x + 3)^2 = 64y + 215 \quad (8)$$

Employing the identity (5), one observes

$$x = 4y + 13, \alpha = 8y + 27$$

In view of (6), we have

$$z = 9y + 31, -7y - 23$$

Thus, the solutions in integers to (1) are given by

$$(x, y, z) = (4k + 13, k, 9k + 31), (4k + 13, k, -7k - 23)$$

It is worth to mention that, in addition to the above solutions, other options for the variables x, y in eliminating the square-root are available.

For simplicity and brevity, a few integer solutions to (1) are presented below:

$$(x, y, z) = (1, s^2 + 3s - 3, s^2 + 5s + 4), (1, s^2 + 3s - 3, s^2 + s - 2), (2, s^2 + 6s, s^2 + 8s + 10), (2, s^2 + 6s, s^2 + 4s - 2), \\ (5, s^2 + 11s - 2, s^2 + 9s - 9), (5, s^2 + 11s - 2, s^2 + 13s + 13), (4s - 3, s - 4, 9s - 5), (4s - 3, s - 4, -7s + 5)$$

Technical procedure-3

The substitution of the transformations

$$y = u + v, z = u - v, u \neq v \neq 0 \quad (9)$$

in (1) leads to the ternary quadratic equation

$$(8v + 12)^2 - (8x + 3)^2 = 64u + 103 \quad (10)$$

Employing the identity (5), one observes from (10)

$$x = 4u + 6 \quad (11)$$

and

$$v = 4u + 5$$

In view of (9), we have

$$y = 5u + 5, z = -3u - 5 \quad (12)$$

Thus, (11) and (12) represent the non-zero distinct integral solutions satisfying (1).

It is worth to mention that the solutions presented above lie on the straight line passing through the point (6, 5, -5) with the direction ratios (4, 5, -3). A few fascinating connections among the above solutions to (1) are exhibited below:

$$3x + 4z = -2, 5x - 4y = 10, 3y + 5z = -10, x + y + 3z = -4,$$

$$5x - y + 5z = 0, x - 2y - 2z = 6, 2x - y + z = 2, 3x - 3y - z = 8.$$

Note that, each of the above equations represents a plane surface.

Thiruniraiselvi and Gopalan

Further, varieties of nice relations between the above solutions to (1) and typical figurate numbers, are as follows.

1. $(x+z)(y+z)^2 = 8P_u^5$
2. $xz + 4y - 2z + 24t_{3,u} = 0$
3. $yz + 25x + 25z + 30t_{3,u} = 0$
4. $xyz + 120P_u^5 = 0 \pmod{10}$
5. $xyz + 360P_u^3 = 0 \pmod{10}$
6. $xy - 40t_{3,u} = 0 \pmod{10}$
7. $yz + y^2 = 20t_{3,u}$
8. $xy + xz - 16t_{3,u} \equiv 0 \pmod{4}$
9. $y^2 - xy + y = 10t_{3,u}$
10. $xyz + 150x + 150z + 120P_u^5 + 380t_{3,u} = 0$

CONCLUSION

In this paper, we have presented varieties of integer solutions satisfying the non-homogeneous ternary quadratic Diophantine equation given in title. As the choices of ternary quadratic equations are rich in variety, the readers of this paper may search for other forms of three dimensional geometrical representations to obtain patterns of integer solutions successfully.

ABSTRACT

Indoor air quality plays a crucial role in human health and well-being, necessitating effective and affordable monitoring solutions. This study investigates the application of low-cost sensors in monitoring indoor air pollutant concentrations under controlled conditions. The experiment consisted of 1-hour pre burning phase, 2-hours of post burning phase and followed by 1-hour of post burning phase. During the pre-burn phase all the four sources didn't show any variation, as they are remained in their dormant state. During the burning phase the peak emission were taken into consideration, which reveals that the concentration of PM₁ was significantly higher for incense sticks higher (466.6µg/m³). Similarly, the concentration of PM_{2.5} was highest in cow dung (3334.6µg/m³) while charcoal exhibited the highest concentration of PM₁₀ (8642µg/m³) compared to the other sources. During the post burning phase, a gradual decrease in the PM concentration was observed, primarily. The PM dispersion, settling process and ventilation are the main factors influencing the PM concentration. The study suggests that burning of indoor pollutants in an enclosed room or house can relatively produces higher concentration of PM which gets accumulated in the airways on prolonged exposure. This can be avoided by replacing biomass with clean energy and ensuring proper ventilation would be an effective strategy to improve air quality.

Keywords: Cow dung, Charcoal, Indoor air pollution, Incense stick, Low-cost sensor

Shyni Daniel *et al.*,

INTRODUCTION

Indoor air pollution has received less attention than outdoor air pollution despite indoor pollutant level is typically twice higher and Indoor air pollution is a significant public health concern, as people spend a substantial amount of time indoors [1;2]. The WHO guidelines underscore the global burden of indoor air pollution, noting its contribution to diseases such as chronic obstructive pulmonary disease (COPD) and lung cancer and it is a critical issue in developing countries[3], where the impacts on health and quality of life are often more pronounced due to a combination of socio-economic, infrastructural, and cultural factors. It is imperative to urgently seek remedies for indoor air pollutants since it can seriously harm our health and wellbeing [4]. In order to create a healthier indoor environment, it is necessary to comprehend the primary sources and the indoor air pollution concentration[5]. The use of biomass for cooking and heating, poor home ventilation, are some of the factors that contribute to indoor air pollution[6;7] in developing nations and also the usage of mosquito coil and incense sticks are two other major contributing factors of indoor air pollution [8]. These circumstances may result in higher than usual levels of indoors pollutants, which could seriously endanger the health of residents, especially women and children who spend more time at home. It is imperative to tackle these indoor air pollution sources in developing nations in order to enhance public health and lessen the prevalence of associated disorders [2]. Incense sticks, also known as agarbatti, are commonly used in Asian countries. Incense has a rich history and has been used in different cultures for religious ceremonies, rituals, and meditation for thousands of years. It is often associated with creating a sacred or spiritual atmosphere [9]. Now days, incense is burned inside homes as well as in public places including stores, shopping malls, and places of worship on daily basis [10]. In many parts of the world, burning mosquito coil is a common household activity especially in indoor environment where pollutant dispersion is limited. This process releases PM of different sizes and penetrate deep into the respiratory system leading to adverse health effects such as cancer, cardiovascular disease, and respiratory issues [11]. Monitoring the emission of PM from mosquito coil is critical for understanding their contribution to indoor air pollution and to assess the potential to cause health risk [12;13] Particularly in rural areas of India where access to modern energy sources is limited, biomass fuel sources have been a usual and common component of daily life. Indian households have been using biomass fuels like wood, cow dung, and charcoal to meet their lighting, heating, and cooking needs [14]. According to estimates, 30% of urban and 70% of rural families still rely on biomass fuels, making them the primary energy source in many houses even in the era of emerging modern energy sources [15]. Burning charcoal can emit diverse pollutants including particulate matter (PM) and carbon monoxide (CO), greenhouse gases (GHGs), hazardous trace metals (TMs), volatile organic compounds (VOCs), and polycyclic aromatic hydrocarbons (PAH). Among those diverse pollutants, PM is the most abundant, as its concentration is proportional to the amount of charcoal consumed for cooking, regardless of the source (cook-stoves, combustors, and grills) [16;17] Indoor environment may contain at least twice as much pollution as the outside environment. In fact, the air in an average-traffic metropolitan street may be cleaner than that in a living room [5]. Therefore, in the current study, the main objective is to rank the particulate matter emission from the incense stick, mosquito coil, charcoal, and cow dung in the three different phases namely before burning, during burning and after burning in an experimental chamber.

MATERIALS AND METHODS

The experimental procedures were carried out in a 10ft × 10 ft × 8 ft (length, width, height) dimension single room having 3 ft × 4ft (width and length) window area open for the dispersion of PM. The atmos PM sensors was used to monitor the concentration of PM of different sizes, and it was strategically placed above 2 feet from the burning source inside the room. The atmos PM sensors was used to monitor the concentration of PM of different sizes (model PMS7003). During this study, we focused on specific pollution sources, namely mosquito coil, incense stick, cow dung cakes and charcoal (Figure 1). The real-time data were systematically recorded and analysed using statistical methods to ensure the accuracy and reliability of the findings. Initially the PM level inside the room was monitored for one hour prior to burning phase to establish baseline concentration. The duration of burning phase for incense stick, mosquito coil, cow dung cakes and charcoal were 2h respectively. The monitoring was continued for next 1h

Shyni Daniel *et al.*,

after the completion of burning phase. Following the combustion phase, one window was deliberately left open to facilitate the dispersion of particulate matter within the room. The mean PM concentration (PM₁₀, PM_{2.5} and PM₁) was assessed in three sequential stages: before burning, during burning and after burning.

Low-cost PM Sensor

The Atmos device worked on the principle of laser-scattering technique in order to measure the real-time PM mass concentrations and apportion laser scattering of PM₁, PM_{2.5}, and PM₁₀. It is relying on a proprietary algorithm that is not accessible to others. A detailed description of the working of selected PM sensors is mentioned in a field evaluation study of PM_{2.5} [18]. The low-cost packages used in the present study (dubbed “Atmos”) shown in (Fig 1a). The dimension of the miniature PM sensors used was 48 mm × 37 mm × 12 mm, and the temperature and relative humidity ranges were -10°C to 60°C and 0% to 99%, respectively to measure PM₁, PM_{2.5}, and PM₁₀ mass concentrations. The sensor was calibrated with reference monitoring station hence maximum errors were relatively low ($\pm 10 \mu\text{g}\cdot\text{m}^{-3}$ in $<100 \mu\text{g}\cdot\text{m}^{-3}$ concentrations, and $\pm 10\%$ in the 100–500 $\mu\text{g}\cdot\text{m}^{-3}$ range) [8].

RESULTS AND DISCUSSION

The concentration of PM₁₀, PM_{2.5} and PM_{0.1} were monitored for four different indoor sources. The assessment was conducted at various stages of combustion, encompassing the periods before burning, during burning, and after burning, ensuring uniform burning across all sources. During three phases of burning PM₁₀ emerged as the predominant pollutant irrespective of the indoor sources. While showcasing the peak emission of PM, notably, charcoal (8642 $\mu\text{g}/\text{m}^3$) and incense sticks (8146.2 $\mu\text{g}/\text{m}^3$) have exhibited the highest emission of PM₁₀ among all indoor pollution sources followed by cow dung cakes (6596 $\mu\text{g}/\text{m}^3$) and mosquito coils (6393 $\mu\text{g}/\text{m}^3$). The PM_{2.5} also a dominant indoor air pollutant, with peak emissions notably stemming from the combustion of cow dung cakes (3334.6 $\mu\text{g}/\text{m}^3$). The emission of PM₁ is significant only in incense stick (466.6 $\mu\text{g}/\text{m}^3$) followed by mosquito coil (338.8 $\mu\text{g}/\text{m}^3$). Burning of incense consistently contributes to the generation of fine particles when compared to other indoor particulate matter including cooking, burning charcoal, and cow dung [18]. The incense sticks and charcoal exhibits as the primary source of the highest emission of PM₁, PM_{2.5} and PM₁₀. The highest emission point for the pollutant is reached when PM emissions no longer rise and begin a gradual decline (Figure 2). The mean concentration of PM₁₀, PM_{2.5} and PM_{0.1} across three burning phases for all indoor sources are represented in Table 1. To assess the change between two phases, the given formula has been applied for calculation. The variation in concentration provides a clear indication of whether the PM levels have increased or decreased.

Change in PM concentration = During burning – Before burning

Change in PM concentration = During burning – After burning

Pre burn phase

The control room environment provides a baseline measurement of air quality without the influence of emission source burning. This baseline helps us to differentiate between background levels of pollutants in the experimental room. Understanding the levels before combustion is essential for comprehensively assessing the potential impact of these materials on the environment. During the preburn phase the statistical analysis revealed that there are no significant differences among incense stick, mosquito coil, cow dung, and charcoal concerning to particulate matter (PM) of different sizes (Figure 3).

Burning phase

The emission of particulate matter, in indoor atmosphere the pollutant sources were burnt for 2 hours in an enclosed room. A significant change in the concentration of particulate matter of different size from the source specific is shown in the (Figure 4), during the burning phase the higher concentration of PM₁ was found in incense stick (430.82 $\pm$ 46.23 $\mu\text{g}/\text{m}^3$) followed by charcoal (257.45 $\pm$ 15.06 $\mu\text{g}/\text{m}^3$), mosquito coil (251.51 $\pm$ 35.28 $\mu\text{g}/\text{m}^3$) and cow dung (184.21 $\pm$ 8.17 $\mu\text{g}/\text{m}^3$). In comparison to the baseline or pre burn phase, there has been a noticeable increase in the concentration of PM₁ exceeding national ambient air quality standards [8;19]. The PM_{2.5} concentrations displayed

Shyni Daniel *et al.*,

minimal variation among different indoor sources, indicating relatively consistent levels across various particulate matter-emitting within enclosed environments. PM_{2.5} from cow dung is slightly elevated ($2929.4 \pm 644.12 \mu\text{g}/\text{m}^3$) when compared to other sources of particulate matter, the PM_{2.5} concentration in incense sticks recorded was ($2315.2 \pm 850.12 \mu\text{g}/\text{m}^3$), mosquito coils slightly lower at ($2276.5 \pm 730.11 \mu\text{g}/\text{m}^3$), and charcoal ($2174.3 \pm 473.49 \mu\text{g}/\text{m}^3$). The concentrations of PM_{2.5} particles tend to vary significantly between indoor sources since they are small and easily diffused [20]. PM₁₀ derived from indoor sources exhibited variability among all the specified indoor particulate matter sources. The concentration of PM₁₀ in Charcoal was much higher ($7017.4 \pm 222.3 \mu\text{g}/\text{m}^3$) followed by Incense stick ($5644.2 \pm 2507.65 \mu\text{g}/\text{m}^3$) cow dung and mosquito coils were ($4917.4 \pm 1588.65 \mu\text{g}/\text{m}^3$ and $4731.3 \pm 1743.32 \mu\text{g}/\text{m}^3$) respectively. The diverse nature of the sources which is burnt leads to variability in PM₁₀ concentrations in indoors [21].

Post burning phase:

After the burning phase of indoor pollutants for two hours, the following 1-hour duration was designated as the post-burning stage and therefore the indoor air quality was monitored to assess the dispersion of pollutant in order to improve the air quality of the experimental room. The overview of the findings observed during the monitoring period are shown in the Figure 5 and Table 2 shows that, there is difference in the concentration of PM of different sizes during the initial time of post burn to final time of post burn. The (Figure 5) gives a comprehensive comparison of the initial and final time periods during the post burn phase of various indoor pollutant sources, the initial time period may represent the immediate aftermath of burning, while the final time period could indicate a later stage of burning phase, to understand the concentrations of particulate matter (PM₁, PM_{2.5}, and PM₁₀) evolve over time after the combustion of different sources (Table 2). During the post burning phase there is a gradual decrease in the PM concentration. The PM dispersion, settling process and ventilation are the main factors for decreasing the PM concentration in an experimental room [22;23] The PM₁₀ is the major pollutant, followed by PM_{2.5} and PM₁, illustrates that during the post-burn phase the highest concentration of PM₁ was with mosquito coils. Additionally, by the end of the experiment, it is evident that PM₁ from cow dung has settled or dispersed more rapidly compared to other sources. Similarly, for PM_{2.5}, the highest concentration was recorded with incense sticks. These particles either settled or dispersed into the atmosphere more quickly than other sources, the highest concentration of PM₁₀ was observed in cow dung, while the incense stick PM notably reduced the concentration during the final time period of the burning phase.

DISCUSSION

Almost three billion people worldwide use biomass (wood, charcoal, crop residues, and animal dung) and coal as their primary source of energy for cooking, heating due to the affordability, availability and lack of infrastructure [23;24]. Not only in India, but the majority of Ethiopia's population in the rural areas rely on biomass for their cooking and heating. Biomass is mainly used for power generation and biofuel production in different part of the world and also residential use is minimal, with emphasis on sustainable practices and advanced biomass technologies [25] During the combustion of cow dung stated the particle size of between 2 and $5 \mu\text{m}$ comprised about 62% of the total PM₁₀ mass concentration at 15 kW/m² [26]. In the study conducted in Uganda stated that the average concentration of charcoal PM_{2.5} was $804 \mu\text{g}/\text{m}^3$. Higher PM_{2.5} concentrations were observed in studies conducted in rural Sierra Leone where an average of $1.686 \text{ mg}/\text{m}^3$ was observed in kitchens using charcoal fuel. This clearly indicates that the use of charcoal as a fuel source leads to increased indoor air pollution in cooking environments [27]. Through our research on biomass (cow dung and charcoal) particulate matter ensures that our results are both reliable and comparable to prevailing scientific literature. The practice of burning mosquito coils is currently used in numerous households in Asia, Africa, and South America in order to repel mosquitoes. The consumers usually use mosquito coils for at least several months every year, progressive effects from long-term exposure to the coil smoke may also be a concern. The epidemiological study conducted in Hong Kong illustrates that, long term exposure to mosquito coil smoke can induce bronchial irritation causing chronic sputum among primary school children [29]. Studies have shown that the exposure to mosquito coil particulate matter can lead to

**Shyni Daniel et al.,**

serious illness such as COPD, chest congestion and cancer. It is also noticed that high concentrations of PAHs were observed in the particulate phase of mosquito coil smoke (13). Analysis of these compounds indicates that mosquito coil smoke contains large amounts of aromatic compounds, alkenes, and furans, some of which are known to cause adverse health effects [12;30]. In our findings, the highest emission of PM_{0.1}, PM_{2.5} and PM₁₀ in mosquito coils were 338.8 µg/m³, 3156.2 µg/m³ and 6393.6 µg/m³ respectively, which indicates the health risk at higher concentration with long term exposure. The emission depends on the type and the contents of source. The incense sticks are used for the religious and aesthetic purposes. The people in Taiwan worship God using incense stick almost every day [8]. Incense sticks not only emit fragrance but also generates harmful substances such as particulate matter, volatile organic compounds, polycyclic aromatic hydrocarbons, carbon monoxide, formaldehyde, acrolein, and heavy metals are among the chemical components of incense sticks. These substances have the potential to cause respiratory issues, cancer, neurological effects, irritation of the eyes and skin, and cardiovascular issues [9]. The study conducted in USA has stated that Burning incense emits fine particulate matter in large quantities compared to other indoor sources. Indoor concentrations of PM can far exceed the 2.5 outdoor concentrations specified by the US EPA's NAAQS, so incense smoke can pose a health risk to people due to inhalation exposure of particulate matter [31]. Studies have demonstrated that exposure to incense smoke may lead to asthma, mutagenesis and cancers in the exposed individual [10].

Indoor air pollution in India is influenced by various indoor sources, each contributing to PM emissions [1]. The [11] highlights that indoor PM concentrations significantly affected by emissions from cooking fumes, fuel combustion, smoking and burning incense stick. PM_{2.5} concentrations during cooking can range from 0.14 to 24.46 mg/m³, which also depends upon method of cooking and ventilation. In a study conducted by [8] stated that, the substantial impact that burning dhoop, incense sticks and mosquito coils can have on indoor air quality. The concentration of PM₁₀, PM_{2.5} and PM₁ with incense stick, mosquito coil and dhoop remained significantly elevated throughout the post burning phase. Taking all the survey findings into account, a comprehensive conclusion can be drawn. The Indoor air quality in India is significantly impacted by biomass fuel usage, incense burning and poor ventilated spaces, leading to high levels of particulate matter (PM_{2.5} and PM₁₀) [32]. Especially the burning of mosquito coil and dhoop exacerbate indoor pollution in rural and semi-rural household [8]. This poor air quality poses serious health risks, which can be decreased by providing proper ventilation and shifting to cleaner energy [32]. In the current research, we have identified significant PM emissions from biomass, with the predominant pollutant as PM₁₀, which also aligns with the findings of existing research. The PM of all the sizes from various indoor sources have exceeded safe limits, hence posing significant risks to public health and environment. The indoor air quality can be improved by adopting a mitigative strategies such as, improving filtration system, regulation enforcement, transition to cleaner fuels, creating public awareness and urban planning improvements.

CONCLUSION

The study suggests that burning biomass such as cow dung, charcoal, Mosquito coil and incense stick produces significant amount of PM of different size which are respirable and gets accumulated on prolonged exposure and can cause threat to individual health. The elevated concentration of PM has the direct impact on indoor air quality. Indoor air pollution poses a greater health risk than outdoor air pollution due to the higher concentration of pollutants in enclosed spaces and prolonged exposure durations. Replacing biomass with clean energy fuels is recommended to improve the health of an individual by reducing exposure to harmful pollutants. Proper ventilation in households is essential in order to exchange the indoor and outdoor air, and thereby reducing the accumulation of indoor pollutants. We have thoroughly analysed the data and provided comparative and comprehensive insights into the target pollution source and outlined effective strategies to improve air quality.

Financial supports

The study was funded by ICMR Senior research fellow grant for the work.

ABSTRACT

The study focused on assessing the potentially toxic metals in the soil and effluent samples from Ranipet industrial area, Vellore district, to ascertain the presence of trivalent (Cr^{3+}) and hexavalent (Cr^{6+}) and cadmium (Cd). Analysis revealed that effluents were discharged untreated, significantly impacting soil and water quality in the radius of 5km from the chromium dumping sites. Elevated concentrations of Cr and Cd were observed in both soil and effluent samples, emphasizing the severe contamination from leachates of dumping sites. Chemical analysis of Potentially Toxic Metal (PTM) was assessed using Atomic Absorption Spectrophotometer (AAS), which indicated excessive levels of total chromium in the range 44.8 mg/L in TCCL and 38.2 mg/L in TCL and Cd in the range 6.42 mg/L and 4.89 mg/L respectively surpassing CPCB (1995) permissible limits of 2 mg/L (Cr) and 3 mg/L (Cd). In addition, Biochemical Oxygen Demand (BOD), Chemical Oxygen Demand (COD), Total dissolved solids (TDS) and Total suspended solids (TSS) exceeded regulatory standards, indicating inefficient treatment process. Soil samples collected within the radius of 2 km from the dumping site exhibited high concentrations of Cr (3178 mg/kg in TCCL and 2894 mg/kg in TCL) and Cd in the range of 24.7 mg/kg and 19.3 mg/kg respectively, emphasizing significant potentially toxic metal accumulation. Spatial distribution of Cr and Cu showed elevated concentrations within 2km of the dumping site. Deteriorated soil quality was confirmed by the detection of elevated electrical conductivity (EC), total organic carbon, levels of organic matter, and moisture content. The research has comprehensively assessed the chromium dumping site induced potentially toxic metal contamination in both soil and effluent samples emphasizing sustainable remediation strategies to mitigate the toxic metals preventing long term damage to environment.

INTRODUCTION

Industrial effluents and hazardous waste released onto land accumulate toxic metallic components leading to contamination contributing to critical and complex environmental and health hazards (Saha and Rahman, 2018). The distribution and mobility of heavy metals is attributed not alone to concentration but also to their interaction with the surrounding environment. Improper management and unscientific disposal of waste containing heavy metal residues from tanneries and chromium producing factories may cause severe environmental damage, causing detrimental effect to the water, soil, and ecosystem (Sinduja et al. 2022). Extensive stacking and disposal of chromium rich solid waste, about 5-m high above the ground level as reported by Rao et al. (2011) has caused tough water, and soil pollution and posing potential risk to the local flora and fauna in the districts, Vellore and Dindigul, Tamil Nadu, which hosted number of the chromium producing factories and tanneries (Chen et al. 2018). Cultivable land in these areas has been drastically affected and eroded by land and water pollution leading to a noticeable decline in total crop yield. The area used for agricultural has dropped by 41% in Dindigul and 10.5% in Vellore within the past 20 years. Chromium occurs in nature in its Cr^{3+} , trivalent and Cr^{6+} , hexavalent forms (Sinduja et al. 2022). It's chemical reactivity, ionic charge and toxicity has resulted in cardiovascular, renal and respiratory complications in human beings as reported by the studies of Chow et al. (2018); Chow et al. (2020); Shi et al. (2020); Salman and Elnazer (2020); Kamarudheen et al. (2020).

Due to instability in the environment Cr^{3+} is metabolized to Cr^{6+} , additionally formation of insoluble complexes due to the interaction of hydroxides and functional groups of chromium upon getting adsorbed on soil particles, Balan et al. (2012), Cr^{3+} gets immobilized in most soil environments. In contrast, anionic Cr^{6+} binds less firmly, resulting in grater mobility, Shi et al. (2020). The presence of Fe (II), Fe (O), and various organic compounds including several microorganisms contribute to a similar reduction process of Cr^{6+} to Cr^{3+} in the environment, Beukes et al. (2017). Soil contamination is reported to higher in landfill areas due to leachate from dumping site, is a major pollution source. PTM pollution due to the release of chromium rich sediments contaminate soil, surface water, and groundwater resulting in significant imbalance in the ecological system. Therefore, the present study was conducted to analyze the physicochemical parameters like moisture content, Total Organic Carbon, organic matter, Cr^{3+} , Cr^{6+} , and Cadmium being contaminated with effluents discharged by chromium processing industries around industrial sites at Ranipet, Tamil Nadu, India. Industrial waste management is a complex and challenging issue. Hence it is critical to study the pollution status of the study area to plan future research through sustainable solutions using microbiome assisted PTM bioremediation.

MATERIALS AND METHODS

Overview of the study area

As identified by the Central Pollution Control Board (CPCB) of India, Ranipet, of Vellore district, Tamil Nadu from where the soil and effluent samples were collected is located 120 km away from the Chennai-Bangalore highway and is designated as one of the areas with persistent pollution (Gowd and Govil 2008; Gowd et al. 2010). The industrial sites selected for this study were Tamil Nadu Chromates and Chemicals Limited (TCCL) and Thirumala Chemicals Limited (TCL) in Ranipet, representing metal contaminated areas associated with chromate and chemicals industries. Additionally, these sites are located within a 5 km radius of the chromium dumping site in Ranipet. The location details were located as Latitude 12.953191 N, Longitude 79.310272 E using handheld GPS (Fig. 1).

Soil sample collection and analytical procedure

Soil and effluent samples for the study were collected within a 2 and 5 km radius from chromium dumping sites of

**Chaithanya and Kumudini Belur Satyan**

TCL and TCCL. Samples of soil were collected at a depth of 15–20 cm, aseptically transferred into zip-lock polythene, labelled accordingly was further preserved at 4°C for further use (Mandal et al. 2011), the effluent sample was collected from designated study locations in a prewashed 1000 ml bottle, secured, labelled, and all the samples were transferred to the laboratory (Vijayakumar et al. 2022) and stored at 4°C.

Physico-chemical characterization of soil samples

Soil samples from the study site were identified with the Geo accumulation characteristics (Dotaniya et al. 2017; Patra 2017). The pH, temperature, electrical conductivity, cation exchange capacity, nitrogen content, stability index, moisture content, organic carbon, and heavy metal content of the soil samples were analyzed. Aqua regia was used to mineralize the air-dried soil samples as per the International Standard ISO-11466. Atomic Absorption Spectrometry (AAS) was used to analyze the elements in the soil and effluent samples (Tomczyk et al. 2023).

Determination of total chromium, trivalent (Cr^{3+}) and hexavalent chromium (Cr^{6+})

The Cr^{6+} presence in the samples were determined using 1,5- diphenylcarbazide (DPC) in line with SR ISO 11083/98 (Lace et al. 2019). To minimise the conversion of Cr^{6+} to Cr^{3+} state, the soil sample was analysed the second day following sample collection. The soil sample was extracted in aquaregia and analyzed. The complex_ion-reagent solution was formed by 1g of 1,5-diphenylcarbazide (DPC) in 100 mL acetone resulting in a red violet color complex at pH 2, read using a UV-visible spectrophotometer at 540 nm. After 15 minutes of incubation, 15 mL of NaOH (0.1 mol/L) was added. Phosphoric acid was used for pH control. Due to redox reaction, hexavalent chromium was reduced to trivalent chromium, and DPC was oxidized to 1,5-diphenylcarbazone. The total chromium, trivalent chromium, and hexavalent chromium were calculated, and all experiments were repeated in triplicates (Onchoke and Sasu 2016; Zhao et al. 2019).

Physicochemical characterization of the effluent

The effluent's physicochemical parameters, such as pH, odor, color, Total Dissolved Solids, chemical oxygen demand, Electrical conductivity, total hardness, total sulphates, chlorides, and biological oxygen demand were assessed as per the standards prescribed by the Bureau of Indian Standards (Pavitra and Kousar 2016).

RESULTS AND DISCUSSION**pH determination of soil samples**

The soil samples were analyzed to determine the pH at different sites. Within a 2 km radius, it was determined that site 1 had a pH of 9.55 and pH of 8.97 at site 2. Similarly, within a 5 km radius, site 3 had a pH of 8.17 and pH of 8.33 at site 4 in and around the chromium dumping site (Table 1). The findings indicate the alkalinity of the study areas, with the elevated pH values of the soil between 8.17 to 9.55, and average pH value of 8.86. A pH value greater than 7.4 leads to the oxidation of ammonia to produce nitrate, while the conversion of sulfur to sulfate is mediated by soil bacteria as reported by Sinduja et al. (2022). Additionally, trivalent chromium (Cr^{3+}) oxidized along with manganese dioxide (MnO_2) has been reported (Banerjee and Khan 2021). The soil samples with a pH of greater than 8.5, indicate the sodicity in the soil. Indiscriminate use of elevated concentration of dyes, sodium carbonate and sodium sulfate in the leather processing in the tanneries and untreated discharge of the effluent to the land has resulted in the increased soil pH (Mandal et al. 2011). When the acidity is low, more chromium leaches with acidic rainwater. In the acidic pH, chromium can exist in the soluble trivalent chromium (Cr^{3+}) species, generated through reduction of (Cr^{6+}). A higher value of pH value was detected in the chromium dumping site of the study area (Table 1).

Determination of temperature of soil samples

Different sites within a radius of 2 and 5km from the chromium dumping sites were selected to determine the temperature of soil samples. Within a 2 km radius, site 1 recorded a temperature of 42.3°C and site 2 with 40.9°C. Similarly, within a 5 km radius, site 3 with 37.7°C and site 4 recorded the temperature of 37.9°C (Table 1).

**Chaithanya and Kumudini Belur Satyan****Physicochemical properties of soil sample**

Physico-chemical characterization of soil samples obtained at TCCL and TCL industrial premises and the results achieved from the experiments are tabulated (Table 2). Tested soil samples had a pH, Electrical Conductivity in the range 8.68 and 8.44, and 1.28 and 1.35 Sm^{-1} with 1.315 Sm^{-1} an average respectively. The spatial distribution indicates the highest EC concentration was in the northern part of the chromium dumping site. This is attributed to the discharge of untreated chromium-rich effluent and geochemical processes. The soil test sample near the industrial sites TCCL and TCL located within the radius of 2 km from the dumping site had a higher pH of 9.55 and 8.98 respectively (Table 1) and higher 'EC' values of 1.315 Sm^{-1} (Table 2). Soil sample 1 obtained at TCCL noted to show a Moisture Content (%) of 31; Total Organic Carbon (TOC %) of 0.33; Organic Carbon content (%) of 5.37, and 76mg/kg of cadmium (Cd). Similarly, soil sample 2 obtained at TCL revealed Moisture Content (%) of 28; Total Organic Carbon (TOC %) of 0.64; Organic Carbon content (%) of 5.14, and 49 mg/kg of cadmium (Cd). It was the highest organic carbon detected at the TCCL soil sample (soil sample 1) than the soil sample (soil sample 2) obtained at TCL; other major elements like Nitrogen (N_2) ranging between 142.56 and 201.56 mg/kg; Phosphorus (P) 41.74 and 52.99 mg/kg and Potassium (K) 18.20 and 80.40 mg/kg (Arifin et al. 2022; Reddykapa et al. 2022). The remaining elements like Fe, Ni, Ca, Mg, Cu, S, Zn, Mn, B, Pb, were not detected in the soil samples of TCCL and TCL respectively (Table 2).

Determination of Chromium and hexavalent chromium (Cr^{6+})

In comparison with other trace elements the soil sample of the study area showed the gradually lowering levels in the order $\text{Cr} > \text{Fe} > \text{Ni} > \text{Pb} > \text{Mn} > \text{Cu} > \text{Zn}$, a similar analysis was recorded by Sinduja et al. (2022) and the values are tabulated (Fig. 2). Disposal of untreated sediment and effluents from the chromium producing factories and tanneries resulted in the occurrence of higher concentrations of chromium, as reported by Tarcan et al. (2010). The trivalent chromium variability (Cr^{3+}) ranged between 1193.25 ± 0.97 and 1582.21 ± 0.97 mg/kg (Tarcan et al. 2010) of 53.6 mg on an average. Soil sample in site 1 recorded the highest contamination with elevated levels of pH, EC, Cr^{3+} and Cr^{6+} in comparison to the other regions. Uddin and Ahmed, (2018) illustrated that among the various industries in the study area, tanneries and chromium producing factories produce large quantities heavy metals like chromium, nickel, lead, cadmium, manganese, and lead. Higher concentrations of chromium were ascertained within 2 km vicinity of the contaminated site, attributed to the release of untreated effluent onto the land. The increased release of high concentration of effluents has led to elevated chromium levels in soil (Prasad et al. 2021). Literature suggests, dry Cr (III) precipitates can be transformed into Cr (VI) by heating it up in the presence of oxygen. Further, Cr^{6+} can be oxidized to Cr^{3+} in the aqueous phase through interactions with manganese dioxide (MnO_2), Apte et al. (2005). Manganese oxide, commonly utilized in processing leather, Tariq et al. (2010). Cr^{3+} content in the soil was between 256.21 and 1582.21 mg/kg, and Cr^{6+} concentration ranged between 51.76 and 64.71 mg/kg. Higher Cr^{3+} and Cr^{6+} concentrations which dominated the area within 2km radius of the sample collection site were due to the disposal of untreated chromium rich tannery effluents and chromium factories. As reported by Sinduja et al. (2022), the PI (Pollution Index) a measurable parameter to evaluate the extent contamination by tannery effluents in local sediments. It acts as an indicator to relate the potential sources of heavy metal contamination in the soil from the study area. Pollution index (PI) is the quantifiable indicator for estimation of the extent of tannery effluent in the local soil sediments, Sinduja et al, (2022). The concentration of components in the soil's PI values when greater than 1.0, signifies the interference of human activity as reported by Tariq et al. (2010). The geo-accumulation index is another critical factor to consider while assessing pollutants in soils. soil sediments can be classified into five categories viz. (1) uncontaminated to slightly contaminated, (2) moderate contamination, (3) moderate to heavy contamination, (4) heavily contaminated, (5) heavy to significantly contaminated, and (6) the 'GI' value '>5', indicates extremely contaminated (Sinduja et al. 2022). An estimation of the soil contamination of the samples was made using the Geo-accumulation Index (GI). As per the classification, the trivalent chromium levels from various sites showed that at site 1 (TCCL Premise) at a distance of 2 km showed 1582.21 ± 0.97 mg/kg, site 2 (TCL Premise) within a 2 km radius showed Cr concentration of 1193.25 ± 0.97 mg/kg, Site 3 (TCCL Premise) at a distance of 5 km showed 814.64 ± 1.009 mg/kg and at site 4 (TCL Premise) at a distance of 5 km showed 256.21 ± 0.91 mg/kg. Similarly, the hexavalent chromium (Cr^{6+}) levels from various sites showed that the soil sample obtained at site 1 (TCCL Premise) at a distance of 2 km showed 64.71 ± 1.12 mg/kg of, site 2 (TCL Premise) within a 2 km radius showed Cr

**Chaithanya and Kumudini Belur Satyan**

concentration of 60.71 ± 1.43 mg/kg, Site 3 (TCCL Premise) at a distance of 5 km showed 59.20 ± 0.57 mg/kg and at site 4 (TCL Premise) at a distance of 5 km showed 51.76 ± 0.452 mg/kg of hexavalent chromium (Cr^{6+}) respectively, highlighting the industrial premise of TCCL and TCL regions affected by the discharge of heavily polluted, untreated effluents onto open ground (Table 3).

Physico-chemical characterization of the effluent

According to Muthukkappan and Parthiban (2018) physicochemical analysis, the effluent from the industrial premises in Ranipet is alkaline, containing high levels of BOD, COD, and organic particle matter, as well as an unpleasant odour and colour. Most likely, the smell comes from microbial activity or the organic materials in the effluent breaking down. The tannery effluents had a pH between 8.27 and 8.67, which is higher than the general guidelines the CPCB (1995) advised for land disposal or irrigation. The physiology of organisms in ponds, rivers, and other natural habitats can be greatly impacted by the discharge of untreated effluents with high pH levels, as this can pose a considerable threat on local flora and fauna. A water sample's electrical conductivity (EC) indicates its capacity. The current investigation discovered that the existence of salts and inorganic materials, which enhance conductivity, is the reason for the tannery effluent's high electrical conductivity (EC) (Muthukkappan and Parthiban, 2018). It is most likely the elevated concentrations of salts, bases, and acids, in the water that are causing the higher EC values. These particles can harm aquatic life and soil in a number of ways, such as altering the porosity, texture, and water holding capacity of soil and blocking fish gills and respiratory surfaces. The investigation also found that the tannery effluents had high levels of Biochemical Oxygen Demand (BOD), which was measured at 480 mg/L and indicated a sizable organic load (Muthukkappan and Parthiban, 2018). According to Goswami et al. (2020), the most effective technique for calculating the total oxygen demand by organic material in the effluent is Chemical Oxygen Demand (COD). A significant concentration of COD (3400 mg/L) was noticed in the current study. The outflow of effluent into surface water inland areas did not reach the acceptable level of 250 mg/L, as per the CPCB (1995) evaluation criteria. Water becomes harder due to ions, specifically calcium, sulphate, magnesium, and sodium. The findings showed that the ion concentration exceeded the CPCB-recommended limit of 1000 mg/L. TDS value above than 180 mg/L, indicates extreme hardness of water (Table 4) (Badrinath and Raman 1995).

CONCLUSION

The Ranipet industrial region in Vellore District was found to have primary ion pollution, as evidenced by the soil and effluent quality assessment conducted surrounding the industries. The high Cr^{3+} and Cr^{6+} concentration was noticed in the TCCL and TCL industrial premises. Along with chromium other metal species also occurred at a high concentration as it is revealed by earlier research data. The excessive concentrations of chromium in the samples collected near the chromium producing factories and tanneries in the Ranipet industrial area premises indicates the impact of disposal of untreated effluents to the open ground. Findings confirmed that the untreated effluents are discharged onto land and water bodies, degrading quality of soil and water even further. Therefore, it is essential to design and develop sustainable approach and model systems to develop the functionality of heavy metal treatment plants and incorporating suitable remediation techniques to reduce hexavalent chromium to trivalent chromium from the target regions is crucial. Such remediation techniques support sustainable agriculture by helping mitigate negative environmental consequences. A study using the Sobol sensitivity model to evaluate human health risks in a leather tanning industrial and chromium processing regions of South India revealed that children are at higher health risks compared to women and men due to environmental exposure. This emphasizes the vulnerability of younger populations to contaminants in such industrial zones (Karunanidhi et al., 2021) and thus more emphasis on Geo-accumulation studies of carcinogenic heavy metal, hexavalent chromium in the soil and effluent to design a remediation technique through an eco-friendly, cost effective and sustainable.

ABSTRACT

Amaranth and soy flour were regarded as "triple-nutrient" a gluten-free rich source of protein, vitamins, minerals, fiber, unsaturated fatty acid and anti-oxidant that also provide valuable effects to improve insulin sensitivity, malnutrition, lipid profile and bone health. Ever-growing health-conscious consumer demand for ready-to-eat nutritious food and preference for natural ingredients has led to the development of nutrient-rich milk premix to maintain a healthy life. The present study was designed to formulate a value-added milk premix using amaranth and soy flour. Amaranth flour, milk powder, soy flour, dates and cocoa powder were used to prepare three variants of milk premix like 1:1 (T1), 1:2 (T2) and 1:3 (T3) ratio of soy and amaranth flour along with control (T0) sample (without amaranth flour). The milk premix was evaluated for nutritional composition and sensory attributes. Data obtained were analyzed statistically using PSPP software for T-test. It was found that a treatment combination T2 had the highest content of calcium, protein, and low fat and was acceptable in terms of sensory attributes as compared to the control (T0). In conclusion, milk premixes with functional ingredients can be used for value addition to obtaining nutritionally rich products for children, adolescent, adult, sportspersons as well as celiac disease patients without compromising the sensory quality.

Keywords: Amaranth, Soy flour, Milk premix, Nutritional quality, Sensory attributes

INTRODUCTION

The rising number of urban population has multiplied the call for services and products related to fast moving town living, specially merchandise that's handy and time – saving, dairy products are high in demand and milk premix are one of them. Premixes are commercially manufactured custom blends in which each nutrient component is pre-scaled and precisely blended into the premix. Amaranthus, commonly known as Amaranth, belongs to the Amaranthaceae family and is a perennial plant cultivated every year. The name "Amaranth" is derived from the Sanskrit word "Amaranth" which means "King of Immortality" and the Greek word "Amaranthus" which means "not withered", and is known as "xiancai" in Chinese. Globally 60 species are divided into grain and vegetable amaranths primarily depending on its nutritional value to humans (Mlakar and others 2010). Amaranth is a widely utilised vegetable crop and possibly the most regularly consumed vegetable in the humid tropics of Asia and Africa due to its mild spinach-like flavour, it has the ability to grow in hot temperatures, and high nutritional value (Mlakar SG, et al. 2010). The seeds of amaranth are small (1–1.5 mm in diameter), lenticular in shape, and weigh 0.6–1.3 gramme per seed (Alvarez-Jubete L et al, 2010). Amaranth can be found in a variety of sizes and shapes, ranging from broad-branching (bushy) to completely lateral shoots, with creeping stems (lying) up to perfectly vertical, its stem and seed varies in different colours, including yellow, white, brown, or entirely black, as well as leaf colours ranges from red to green. Amaranth is treasure mine of macronutrients (12–22 percent proteins), dietary fibre (9–14 percent), and lipids (6–13 percent fats), as well as micronutrients (vitamins, minerals), and other phytochemical compounds (polyphenols and phytosterols) (Venskutonis and Kraujalis, 2013, Karamac et al., 2019). Amaranth has ample amount of lysine level than other cereals, as well as a large amount of protein, fat, dietary fibre, ash, and minerals, particularly calcium and salt. Beta-carotene, lactic acid, polyphenols, lutein, and anthocyanins are the bioactive substances found in it.

According to the studies amaranth have multiple health benefits such as reduction in CVD cardiovascular diseases (Caselato-Sousa et al, 2012). Tocotrienols are a kind of vitamin E present in amaranth oil that inhibits an enzyme that regulates cholesterol production. Amaranth oil has a higher concentration of squalene than other vegetable oils. Squalene enhances the immune system by carrying oxygen to numerous cells in the body and keeping LDL (low-density lipoprotein) in the blood cholesterol (Jimoh MO et al, 2018). It helps in atherosclerosis, arthritis, cataract, emphysema, and retinopathy, as well as neuro-degenerative disorders (Repo-Carrasco-Valencia et al., 2010, Thaipong et al., 2006). Amaranth leaf extract inhibits the growth of cancer cells in the liver, breast, and colon thus have anticancer property. Because its protein includes lesser amount of prolamins (seed protein), amaranth is a safe for consumption in celiac disease. Antihypertensive and anti-inflammatory properties are also found in its peptides. (Bhat A et al, 2015) Soybean (*Glycine max* L.) subfamily *Fabaceae*, was initially domesticated roughly 5000 years ago in East Asia (Carter et al., 2004). Soybean is the world's most widely produced and consumed oilseed (Wilcox 2004). Soybean is the tenth most produced crop in the world in terms of tonnes. Soy bean is a legume with proteins that are closely linked to those found in animals and a high protein content (approximately 40–45 percent of total solids) (Goyal, Sharma, & Gill, 2012) has a digestibility rating of 91.41 percent (Zhao et al., 2014), and provides enough amounts of different amino acids essential for rebuilding damaged body tissues as an excellent source of vitamins and minerals. All of the essential amino acids required for good health are found in soybean proteins. Soybean protein is four times that of wheat and six times that of rice grain, and it is high in calcium, phosphorus, and vitamins A, B, C, and D. (Serrem, Kock, & Taylor, 2011; Islam et al., 2007). Consumption of soy products can decrease the risk factors of diseases like diabetes, atherosclerosis (Ahmad et al., 2014) improves bone health, lowers cholesterol, reduces menopausal complications, avoid malignancies (F.M. Sacks, 2006).

MATERIALS AND METHODS

All the raw ingredients for research were commercially available and purchased from supermarket of Model Town, New Delhi, India which includes (amaranth seed, soy flour, dates powder, milk powder and cocoa powder). All the dry ingredients were clean to remove impurities or adulteration.

**Divya Sharma and Akanksha Yadav****Preparation of milk premix**

Amaranth seeds were taken and dry roasted them, after roasting them seeds were grinded and amaranth seed powder (amaranth flour is made), after that same process is done with soya seeds firstly they were roasted and then were grinded into flour after that peel of dry dates was removed and seeds were taken out with hands. Once the seeds and peel were separated, a peel of dates was grinded in mixer and then in mortar and pestle to make it into powder form. Once the powder was formed it was sieved through sieve and solid part was removed and then the powder was sieved through muslin cloth to make it finer. After that the dates powder is sun dried for removal of moisture. This whole process took 1-2 days.

Standardised recipe (control T0) used for development of milk premix

List of ingredients (for 100gm milk premix development)

Method of preparation

1. All the raw ingredients were processed separately which includes amaranth flour, soy flour, and dates powder. Milk powder and cocoa powder were ready made from market.
2. The desired amounts of weighed ingredients were mixed together in a bowl with spoon.

Sensory Evaluation of developed milk premix

Sensory evaluation of developed products was carried out by 20-selected trained panel member of Department of Nutrition and Dietetics and department of Microbiology including the dean of Faculty of Allied Health Sciences, SGT University, Gurugram. The panelists were served the developed milk premix mixed with milk with one control sample and different test samples. Control was prepared from ingredients used in standardised recipe and test samples were prepared by changing the amount of soy flour and amaranth flour in ratio of 1:1, 1:2 and 1:3. The panelist was asked to score the milk premix on 5 sensory attributes which includes: color and appearance, taste, flavour, consistency and overall acceptability by using score card and nine-point hedonic scale.

Nutrient estimation of developed milk premix

In this study, determination of various proximate nutrients which includes (kcal, protein carbohydrate, fat) and calcium, iron and antioxidant of control sample and test1 sample (highest rated sample in sensory evaluation) was carried out with standardised technique or procedure in NCML Labs, Udyog Vihar, Gurugram, Haryana 122016.

Different parameters were determined using different methods.**Total energy value**

Energy (kcal/100g) = (4 × Protein in %) + (4 × Carbohydrate in %) + (9 × Fat in %)

Carbohydrate Content

Carbohydrate = 100 – (Moisture + Fat + Protein + ash)

Protein Content

Protein content was determined by Kjeldahl's method (IS 7219:1973)

Fat Content

Fat content was determined using FSSAI Manual of Methods

Calcium and Iron content

Elemental analysis was performed using inductively coupled plasma mass spectrometry, (ICP-MS Model: 7800) as per AOAC 2015.01.

Estimation of antioxidant content

Antioxidant activity was determined by using DPPH radical degradation activity method. 12

Shelf life

To determine the total microbial count and to check the shelf life of the developed product the total plate count technique was used to estimate the CFU count selected media. Serial dilution method was used for both a control and the test sample of dilutions from 10^{-3} to 10^{-5} were spread onto de man rogosa sharpe agar (MRS) agar plates with for lactic acid bacteria, whereas nutrient agar media was used to determine the shelf life of the beverage. The plates were incubated at 37°C overnight. The CFU count in each media plate was checked from (day 0 to day 12) every 3rd day.

Statistical Analysis

The statistical analysis was done using PSPP software for T-test. The results were discussed as SD mean and $\pm$ standard deviation with accordance with sig and NS values.

RESULT AND DISCUSSION

The collected data for different aspect as per the methodology were analysed and represented statistically the results are also illustrated graphically. The result obtained from the analysis during the course of study presented in this chapter and discussed in detail, in the following sequence:

1. Sensory evaluation
2. Colour & appearance score of milk premix
3. Taste score of milk premix
4. Flavor score of milk premix
5. Consistency score of milk premix
6. Overall acceptability score of milk premix
7. Energy content in value added milk premix
8. Carbohydrate content in value added milk premix
9. Protein content in value added milk premix
10. Fats content in value added milk premix
11. Iron content in value added milk premix
12. Calcium content in value added milk premix
13. Antioxidant content in value added milk premix
14. Microbial analysis in value added milk premix

The analysis of the study investigated were carried out in NCML Labs, Gurugram. Dual samples of each soup premix were analyzed in triplicate form with the use of standardized techniques, and analytical grade chemicals. The statistical analysis demonstrated on dry weight foundation was done using t-test, to perceive significant variance and deviations if any. Introduction of results and discussions of the investigation are presented as follows.

Sensory evaluation of the different incorporated samples of amaranth & soy flour out of which T1 with amaranth and soy flour in equal amount is highly acceptable in all the parameters which includes color & appearance, taste, flavour & consistency as compared to the other samples. Sensory evaluation of different samples with different ratios of soy flour and amaranth out of which treatment T1 (incorporated by 30:30 soy flour & amaranth flour) was found to be mostly acceptable and scored 0 Color 7.75 ± 1.06 , Taste 7.67 ± 0.89 , Flavour 7.65 ± 0.95 , Consistency 8.12 ± 0.69 and overall acceptability 8.03 ± 0.72 as compared with control sample T0.

In this study it was analyzed that energy levels of both the samples is almost same per 100gms T0 contains 393.28 kcal whereas T1 contains 392.14 kcal. In terms of protein content it was seen that that protein content of T1 was higher i.e. 28.09gms/100gms whereas T0 contains 27.37gms/100gms. Carbohydrate content was almost same T0 contains 60.69gms/100gms and T1 contains 60.00gms/100gms. Calcium content is higher in T1 i.e. 2805.08 mg/kg whereas T0 contains 2743.768 mg/kg. Iron content is higher in T0 that is 105.35 mg/kg whereas T1 contains 88.15 mg/kg. Which suggests that overall T1 & T0 have almost same amount of nutrients but iron content was low in sample T1. The formulated sample was lower in amount of fats than that of the control, with 4.42gm/100gm and 4.56gm/100gm of test and control respectively. The antioxidant activity of the control sample was higher than that of the test with 9.43mgGae/1000gm and 6.49mgGae/1000gm respectively of the control and test.

Determination of total microbial count and shelf life

To determine the total microbial count and to check the shelf life of the developed product the total plate count technique method was used with selective media preparation. A sample of each dilution from 10^{-3} to 10^{-5} were spread onto De Man, Rogosa Sharpe agar (MRS) agar plates with selective media for both MRS, and nutrient agar media was

**Divya Sharma and Akanksha Yadav**

used to determine the shelf life of the milk premix. The plates were incubated at 37°C for 24 h. The microbial growth was calculated from (day 0 to day 12) to determine the total microbial count and shelf life of the product.

CFU/mL for each day

CFU/mL = Number of colonies/ Volume of culture plated (in mL) × DF

Where, DF = Dilution factor.

pH was determined for both T0 and T2 and the results are given below

The estimated pH value for (T0) is (6.7) And the pH value for (T2) is (6.8) respectively which indicates that both the sample with or without amaranth flour are slightly acidic in nature. Fortification with amaranth into the milk powder doesn't change the measure of pH. The microbial growth gradually decreased from day 0 to day 9 for test sample fortified with amaranth, whereas for control sample the microbial growth increased for both medias-MRS and NA. 10⁻⁴ dilution plate showed sufficient number of colonies. For MRS, the microbial count increased initially and then decreased insignificantly from day zero to day nine whereas for NA. Growth of NA was increased gradually as amaranth has antimicrobial properties. Although for MRS in test sample the microbial growth was not much at the start which increased day by day and same pattern got repeated by day 9, though with the investigation of the above results, it has been concluded that the shelf life of the formulated milk premix with amaranth is perishable for 3-4 days when it is made in unsterilised condition and no pasteurization was done during the process as it was done on the laboratory scale, not on a pilot scale

CONCLUSION

From the current study it can be concluded that milk powder developed from the value addition of amaranth had acceptable organoleptic properties and also had improved the nutritional profile in terms of macronutrients and micronutrients namely calcium and protein. Amidst the different samples of the developed milk powder T1, with the minimum quantity of amaranth content (30%) had highest amount of macronutrients and major micronutrient and in terms of overall acceptability based on the sensory attributes scored highest. The cost per 100 gm of each treatment of developed cookie ranged from Rs 23.3 for T0 to Rs 29.3 for T1 which makes it a pocket friendly purchase for the package of nutrients it provides and also makes the supplementation of amaranth in milk powder a cost effective option for preparation of enriched milk powder. Hence, amaranth can be used as potential source of desirable functional ingredient for the development of health-beverage to improve the nutrient composition of the beverage and in turn enhance the nutrient intake in the diets consumed by a person.

AVAILABILITY OF DATA AND MATERIAL

The data mentioned was thoroughly analysed and reported in this work

ABSTRACT

The disorder where stones form in the kidney, bladder, or urethra is known as urolithiasis. The most common types of stones are struvite (magnesium ammonium phosphate), calcium oxalate, urate, cystine, and silica. A number of physicochemical processes, including as supersaturation, nucleation, development, aggregation, and retention of urinary stone ingredients within tubular cells, contribute to the intricate process of stone formation. NSAIDs, alpha blockers, diuretics, narcotic analgesics are used in the management of urolithiasis to help alleviate symptoms like pain but not involved in the prevention of stone formation. Ayurveda is a historic Indian therapeutic practice that uses many different plants with anti-urolithiatic properties. A significant source of medication, plants have long been used in traditional medicine to treat a variety of illnesses. The majority of people in developing nations' rural areas receive their medical care from traditional practitioners. The primary goal of *Hemidesmus indicus* roots is to control kidney stones formation in the urinary tract. The current study is a review of the literature on medicinal plants having antiurolithiatic activity. The review includes 51 plants, their families, biological sources, chemical constituents, and plant parts used and their applications are all included in the review. The goal of this endeavor is to support scientists as they explore natural substances with potential antiurolithiatic properties.

Keywords: Anti-urolithiatic, Urinary tract, Kidney stones, Medicinal plants, Supersaturation

INTRODUCTION

LITHIASIS: The formation of stony concretions in the body (as in the urinary tract or gall bladder)

Types Of Lithiasis

Nephrolithiasis/Urolithiasis

When the high concentration of crystals oversaturates the urine and begins to build up inside the kidney's parenchyma, renal calculi are formed. [1]

Cholelithiasis

Cholelithiasis is the term for hardened deposits of digestive fluid in the gall bladder. The gallbladder holds the bile, the digestive fluid that is released into the small intestine. The components of the stones are bile, bilirubin, and cholesterol. Most of the time, the stones are found by accident and present no symptoms. Gall stones can form from bile that has not been completely emptied from the gall bladder, precipitating as sludge. Patients with symptoms include nausea, vomiting, and pain in the epigastrium that spreads to the right scapula or mid-back. [2, 3]

Hepatolithiasis

Hepatolithiasis is characterized by presence of gallstones in all bile ducts peripheral to the confluence of the left and right hepatic ducts, regardless of the existence of gall stones in other regions of the biliary system, such as the extra hepatic bile duct and the gallbladder. Hepatic abscess, liver atrophy, liver cirrhosis, biliary stricture, history of recurrent cholangitis, and a poor prognosis in intrahepatic cholangiocarcinoma are among the causes that might cause hepatolithiasis. [4, 5]

Ureterolithiasis

A major financial burden and global health concern, ureterolithiasis affects millions of individuals. Consequently, the healthcare system is heavily burdened by this disease. The prevalence and incidence of this illness are likewise rising. Ureterolithiasis can lead to a number of problems, including stenosis, ureteral scarring, infectious stones, urosepsis, and chronic kidney disease (CKD). The ureterolithiasis will be evaluated, treated, and managed, along with its genesis, epidemiology, pathophysiology, and assessment. [6, 7]

Cystolithiasis

The urine bladder is the primary location for solid calculi that are known as stones. They may consist of non-calcific material, while frequently being calcified. Bladder stones are more common in poor nations, mostly because of dietary issues; the frequency of bladder stones is comparatively low in Western countries. Middle Eastern and North African nations, as well as Thailand, Indonesia, and Myanmar, are the most severely impacted. Usually the result of urinary stasis, bladder stones can also form in healthy people who do not have any anatomical deformities, foreign bodies, strictures, infections, or benign prostatic hyperplasia or neurogenic bladder. [8, 9]

Choledocholithiasis

Choledocholithiasis occurs as a result of either the formation of stones in the common bile duct or the passage of gallstones that are formed in the gallbladder into the CBD. Some of the causes of these stones include bile stasis, chemical imbalances, increased excretion of bilirubin, pH abnormalities, and the creation of sludge. Less frequently, stones known as primary hepatolithiasis which can result in choledocholithiasis—form in the intrahepatic biliary tree. Stones in the common bile duct are the cause of choledocholithiasis (CBD). It is thought that between 1 and 15% of patients with cholelithiasis have common bile duct stones. Endoscopic retrograde cholangiopancreatography (ERCP) or, in certain situations, laparoscopic cholecystectomy with bile duct exploration is the current treatment for bile duct stones. When bile duct stones are present, laparoscopic cholecystectomy is typically performed in US hospitals after ERCP. [10, 11]

**Sialolithiasis**

Sialolithiasis is a benign condition involving the formation of stones within the ducts of the major salivary glands: parotid, submandibular, and sublingual glands. Sialolithiasis can occasionally clog the salivary ducts, causing inflammation, a bacterial infection called sialadenitis, or, in extreme circumstances, the formation of an abscess. There are a number of presenting signs, the most prevalent being reduced salivary flow and cyclical postprandial enlargement of the afflicted gland. The production of salivary stones has an unclear origin, and there has been little research done on etiologic factors because the condition is relatively uncommon and difficult to conduct in-depth investigations of. [12, 13]

Rhinolithiasis

Wealthy countries are known to see a progressive disappearance of a rare condition called rhinolithiasis, which is often ignored or misdiagnosed. It is distinguished by a solid calcification that results from the gradual accumulation of calcareous salts around a core—a foundation that may or may not be resorbable—that can take on a variety of sizes and shapes. The most common symptoms are unilateral nasal blockage and persistent unilateral purulent rhinorrhea. Nasal endoscopy and imaging are very helpful for revealing anatomical anomalies or related disorders, in addition to being valuable for validating a sound diagnosis. Endonasal rhinolith extraction is required for therapeutic management during general anesthesia. [14, 15]

Enterolithiasis

Enterolithiasis, or the formation of gastrointestinal concretions, is an uncommon medical condition that develops in the presence of intestinal diverticula, surgical enteroanastomoses, blind pouches, afferent loops, incarcerated hernias, small intestinal tumors, intestinal kinking from intra-abdominal adhesions, stenosing or structuring Crohn's disease, and intestinal tuberculosis. Acute symptoms such as nausea, distention, abdominal pain, and occasionally sudden but often fluctuating subacute vomiting might result from the enterolith rupturing into the intestinal lumen. Treatment with endoscopy or surgery requires early illness detection and action. [16, 17]

Tonsillolithiasis

Rare calcified formations known as tonsillolithiasis typically arise from long-term tonsillitis. Differences in size, form, and color are evident in concretions. Although they don't normally cause any symptoms, they can be linked to halitosis, otalgia, odynophagia, dysphagia, and neck pain. A general dentist's panoramic radiography of the patient's mandible revealed radiopaque shadows over the ascending rami of the jaw, bilaterally: two minor structures on the left side and one single formation on the upper part of the right. This led to the patient's referral. There were paroxysmal episodes of orofacial discomfort together with dysphagia and pain during swallowing on the left side, which were located in the tonsillar fossa, pharynx, and lower jaw angle. Bilateral tonsillolithiasis was seen in the computed tomography scans. [18, 19]

Phlebolithiasis

Phlebolithiasis is a condition where tiny blood clots in a vein get harder over time as a result of acidity. They often don't create any symptoms or other health issues, and they're frequently located in the bottom area of your pelvis. The condition known as phlebolithiasis, or vein stones, usually have an oval form and a diameter of less than five millimeters. They're also really frequent, particularly in those who are older than 40. A phlebolith may occur if a vein experiences pressure buildup for whatever reason. This means that varicose veins are a source of phleboliths as well as one of its symptoms. [20]

Omphalolithiasis

An infection of the umbilicus and/or surrounding tissues, known as omphelia, usually affects newborns. With an estimated mortality rate of 7 to 15%, it is a serious medical emergency that can quickly proceed to systemic infection and death. To avoid the morbidity and death linked to omphalitis, early detection and treatment are crucial. This exercise discusses the role of the interprofessional team in managing individuals with omphalitis and demonstrates how the condition is evaluated and treated. The umbilicus becomes colonized with a wide variety of germs as soon

**Dammati Nalini Devi et al.,**

as the baby is born. Within hours, gram-positive cocci are detected, and soon after, a large number of enteric bacteria are detected. These bacteria develop quickly in the devitalized tissues of the umbilical stump, and their ability to enter the bloodstream through thrombosed blood vessels raises the possibility of systemic infection.[21]

Different Types of Urinary Crystals

Naming of the stone type is based on mineral composition. The most common stones are Struvite (magnesium ammonium phosphate), calcium oxalate, urate, cystine and silica.

Calcium Oxalate Stones

Calcium stones are the most common type of stones in world wide. These typically contains calcium oxalate present either alone (or) they combine with calcium phosphate. Primarily, hyperoxaluria promotes the precipitation of oxalate crystals in urine which are combining for the development of calcium oxalate crystals. Calcium phosphate stone formation is associated with the condition called hyper para-thyroidism and renal tubular acidosis. calcium oxalate crystals microscopically they appear as 'envelops' and they also form 'dumbbells'. Calcium oxalate crystal formation is one of the toxic effect of ethylene glycol poisoning.[22, 23, 24]

Struvite Stones

10-15% of urinary calculi is composed of Struvite stones (ammonium, magnesium, phosphate, $\text{NH}_4 \text{MgPO}_4 \cdot 6\text{H}_2\text{O}$). These are also known as 'infection stones', urease (or) triple phosphate stones). These stones are formed in the infection which is caused by urea-splitting bacteria. By using the enzyme urease, these organisms metabolise the urea in to ammonia and carbon dioxide. This makes the alkaline condition of urine and it favours the formation of Struvite stones. These stones are commonly observed in the people who are having factors that predispose them to UTI, spinal cord injury and other forms of urogenic bladder, obstructive uropathies. People with metabolic disorders such as idiopathic hypercalciuria, hyper para-thyroidism and gout are attacked by these infected stones easily. Magnesium, ammonium, and phosphorus are the building blocks for the formation of Struvite stones in Urine.[25, 26]

Uric Acid Stones

Uric acid is responsible for 5–10% of stone formation. These uric acid stones are more likely to attack specific disorders such as obesity. In certain circumstances, such as hyperuricosuria with or without hyperuricemia, they can also arise. They can also develop in conjunction with acid/base metabolism problems, when the development of uric acid crystals is caused by acidic urine. Individuals with specific diseases, such as inflammatory bowel disease, are more likely to develop oxalate stones and also have a propensity to develop urate stones.(27, 28)

Cystine Stones

It is a hereditary condition brought on by cystinuria. Kidney stones occur in cysts. Excess cystine in the urine is caused by the transportation of the amino acid cystine, which can result in cystine stones. The most prevalent cystinuria deficiency is related to amino acid synthesis. While large stones stay in the kidneys (nephrolithiasis), which hinders urine flow, little stones are passed through the urine. The ureter widens and becomes squeezed as the urinary tract becomes clogged, placing pressure on the kidney and ureter. Urine builds up as a result of obstruction, which also causes infections in that specific location. Kidney disease can result from high blood pressure and urinary tract infections, among other things. Renal insufficiency and end-stage kidney disease, which call for renal dialysis or a kidney transplant, can result from the injury. [29, 30]

Signs and Symptoms

If a kidney stone becomes lodged in the ureters, it may block the flow of urine and cause the kidney to swell and the ureter to spasm, which can be very painful. At that point, you may experience these symptoms: Severe, sharp pain in the side and back, below the ribs, pain that radiates to the lower abdomen and groin, pain or burning sensation while urinating. Pain caused by a kidney stone may change — for instance, shifting to a different location or increasing in intensity — as the stone moves through your urinary tract.[31, 32]

**Dammati Nalini Devi et al.,****Treatment**

Treatment for kidney stones varies, depending on the type of stone. Most small kidney stones won't require invasive treatment and can be able to pass a small stone by: Drinking water, Pain relievers, medical therapy [33, 34]

Risk Factors

Dehydration, certain diets, family or personal history, obesity, digestive diseases and surgery, and other medical conditions, certain supplements and medications are the risk factors for urolithiasis [35, 36, 37]

Causes

Kidney stones often have no definite, single cause, although several factors may increase your risk. Kidney stones form when your urine contains more crystal-forming substances — such as calcium, oxalate and uric acid — than the fluid in your urine can dilute. At the same time, your urine may lack substances that prevent crystals from sticking together, creating an ideal environment for kidney stones to form. [38,39]

Prevention

The best way to prevent kidney stones is to make sure you drink plenty of water each day to avoid becoming dehydrated. Drink up to 3 litres (5.2 pints) of fluid throughout the day, every day and avoid drinks like tea and coffee also count. Add fresh lemon juice to your water and do not eat too much salt [40, 41, 42]

Epidemiology

The incidence of urolithiasis increased by 48.57%, from 77.78 million (ASIR) decreased. It affects 12% of the population worldwide. Urolithiasis is a common condition that affects about 1 in 11 people in the United States. It costs the health care system about \$5 billion and is responsible for about one million emergency department (ED) visits each year. Its prevalence is increasing and it mainly affects the working age population. Men occur more often than women, 10.6% versus 7.1%. Obese and overweight individuals are more common than those of normal weight, and studies have shown that obesity flattened the formation of kidney stones in both men and women. Recurrence rates of up to 50% have been observed five years after the first episodes of symptomatic urolithiasis. The incidence of urolithiasis by age presented a unimodal distribution, with the peak observed in patients aged between 50 years and 70 years [43, 44]

Pathophysiology

Renal stone formation occurs in different mechanisms and forms stones in the urinary tract. Super saturation of urine as a catalyst for crystallization. The step that starts the development of stones is urine super saturation. Super saturation of the urine in a mild state is quite common in healthy people and does not result in the formation of stones. However, the urine is in a metastable state if it beyond the threshold level, which is known as the Upper Limit of Metastability. Urine's dissolved ions initiate the nucleation process, which forms these crystals. Approximately 90% of stones are made up of several materials. Stone formation promoters and inhibitors: A few of the substances found in urine have the ability to both promote and inhibit the formation of stones. Urine contains ions that function as catalysts to create bigger compounds that cause stones. The two primary factors that encourage the production of stones are calcium and oxalate, which together produce the complex known as calcium-oxalate. [45, 46, 47]. The different kinds of chemicals are called inhibitors. Certain substances, such as magnesium and citrate, have smaller molecular weights and can interact with promoters to inhibit the synthesis of chemicals that lead to stone formation. Volume and composition of urine: an essential equilibrium. The main cause of renal stones is decreased urine concentration. The state of supersaturation of urine decreases as urine volume increases. Promoter and inhibitor dilution results from increased urine volume. [48]. At present allopathic medicines are used to treat urolithiasis symptomatically, and a lot of side effects are associated with it. WHO recommends the international community to use the traditional Ayurvedic system of medicine in management of Urolithiasis

CONCLUSION

One of the most important sources of pharmaceuticals is medicinal plants. Because of their accessibility, availability, inherited practice, economic feasibility, and perceived efficacy, plants have been utilized to cure many diseases from ancient times. The present article revealed that all of the medicinal plants presented have antiurolithiatic properties might be due to the presence of flavonoids, tannins, saponins, steroids, triterpenoids. As a result of this study, literature revealed that medicinal plants useful for the prevention and management of urolithiasis. Future research on preclinical and clinical investigation for confirm the clinical utility, efficacy and toxicity of these plants.

ACKNOWLEDGEMENT

This work would not have been possible without the services provided by Chalapathi institute of pharmaceutical sciences (Autonomous) and so I'm extremely grateful to the institution.

Table.1: Drugs Used In The Treatment Of Urolithiasis

S.No	Drugs	Mechanism of Action	Adverse Reactions
	NSAIDS		
1	Naproxen	inhibiting the activity of enzymes called cyclooxygenases (COX-1& COX-2).	Gastro intestinal issues, dizziness, headache, fluid retention, elevated blood pressure, renal effects, allergic reactions [49]
2	Ibuprofen	inhibiting the enzyme cyclooxygenase (COX)	Swelling of face, fingers, feet and lower legs, Headache, constipation, Vomiting, diarrhoea [50]
3	Meloxicam	inhibits prostaglandin synthetase	Renal damage, fluid retention, electrolyte imbalance, abdominal pain, diarrhoea, upset stomach, and nausea [51]
	Alpha Blockers		
1	Tamsulosin	Tamsulosin selectively blocks alpha-1 adrenergic receptors	Headache, Dizziness, orthostasis, chest pain, flulike symptoms, abnormal ejaculation[52]
2	Nifedipine +Tamsulosin	Tamsulosin selectively blocks alpha-1 adrenergic receptors, relaxes smooth muscle, whereas nifedipine blocking the influx of calcium ions through voltage-gated calcium channel	Headache, dizziness, and nausea, dehydration [52]
3	Doxazosin	It works by blocking the action of adrenaline and noradrenaline on alpha-1 receptors	nausea, headache, dizziness, backache, and postural hypotension [53]
	Diuretics		
1	Hydrochlorothiazide	It directly inhibits the sodium chloride cotransporter located on apical membrane of distal convoluted tubules in the kidney	Hyperglycemia, Gout, Ocular disturbances, dyslipidemia [54]
2	Chlorthalidone	It inhibits sodium reabsorption at the level of the distal convoluted tubule and thus chloride, via inhibition of NaCl symporter	Dryness of mouth, thirst, lethargy, hypotension, nausea, gastrointestinal disturbances [55]
3	Indapamide	It acts on the nephron, where it inhibits the NaCl cotransporter leading to reduced sodium reabsorption	Dark urine, fever or chills, cough, dizziness, low potassium levels, orthostatic hypotension [56]

Dammati Nalini Devi et al.,

	Narcotic Analgesics		
1	Morphine	It acts by binding to the mu-opioid receptor within the CNS and PNS, which leads to an overall reduction of the nociceptive transmission	Constipation, dysphoria, sedation, nausea, myoclonus, dry mouth [57]
2	Oxycodone	It works by binding to opioid receptors in CNS, thereby exerting its analgesic effects	Constipation, urinary retention, dehydration, tiredness, allergy [58]
3	Hydrocodone	It activates the mu-opioid receptors, results in inhibition of cyclic adenosine monophosphate formation leads to suppression of nociceptive neurotransmitters	Hypotension, diaphoresis, peripheral edema, fatigue, dizziness, abdominal pain [59]

Table.2: Medicinal Plants Used in The Treatment of Urolithiasis

Sl.No	Common Name	Plant part used	Biological Source	Chemical Constituents	Uses
1	Horse radish	Seed, root	It is obtained from dried roots of <i>Armoracia rusticana</i> . Belongs to Brassicaceae family	it contains about 0.2% to 1.0% of essential oil, mainly Sinigrin, Sinigrin-derived allyl isothiocyanate and diallyl sulphide	Used to treat inflammation by blocking or changing the parts of the immune system. (60)
2	Sarpagandha	Roots	It is obtained from dried roots of <i>Ichnocarpus frutescens</i> belongs to the family Apocynaceae.	It contains alkaloids, triterpenoids, phenolic compounds,	Used to treat anti-hypertensive, sedative, anti-oxidant, antispasmodic fever and malaria, anxiolytic effects. (61)
3	Slender Amaranth, Green Amaranth	All parts	It is obtained from all parts of the <i>Amaranthus viridis</i> belongs to the family Amaranthaceae	It contains various phytochemicals such as flavonoids, phenolic acids, saponins, and other bioactive compounds	Used to treat digestive disorders, inflammation, skin ailments and urinary tract infections. (62)
4	Wood apple, Bael	Leaves and fruit	It is obtained from fruit of <i>Feronialimonia</i> Belongs to the family Rutaceae	It contains various phytochemicals and nutrients and key chemical constituents are vitamins, minerals, phytochemicals (flavonoids, tannins, phenols, alkaloids,) organic acids, fibre, essential oils, carbohydrates, proteins and amino acids	It is used to Alleviate digestive issues such as constipation, diarrhoea and indigestion and respiratory ailments. (63)
5	Love-lies-bleeding	Leaves, Flower	It is obtained from flowering plant of <i>Amaranthus caudatus</i> Belongs to the	It contains various phytochemicals like flavonoids, phenolic compounds, saponins, tannins, alkaloids, carotenoids	It is used to treat digestive disorders, haemorrhage, skin conditions, anti-inflammatory and

Dammati Nalini Devi et al.,

			family Amaranthaceae		fever. (64)
6	Chaff- flower	Roots	It is obtained from dried roots of <i>Achyranthes aspera</i> Belongs to the family Amaranthaceae	It contains alkaloids, triterpenoids, flavonoids, saponins, phenolic compounds, polysaccharides, essential oils	It is used to treat Anti-inflammatory, wound healing, digestive disorders, respiratory conditions, anti-microbial properties. (65)
7	Khella	Whole plant	It is obtained from whole plant parts of <i>Ammi visnaga</i> Belongs to the family Apiaceae	It contains furanocoumarins, flavonoids, essential oils, coumarins, alkaloids, tannins, phenolic acids Bioactive compounds like khellin, and visnagin	It is Used to treat Respiratory conditions, cardiovascular health, kidney stones, Anti spasmodic, anti-inflammatory, anti-oxidants, digestive disorders, and urinary tract disorders. (66)
8	Rocket	Roots and leaves	It is obtained from several plant species of <i>Eruca sativa</i> Belongs to the family Brassicaceae	It contains glucosinolates, vitamins (A, C, K) and phytochemicals (Flavonoids, phenolic acids, carotenoids), minerals, fibres and essential oils	It is used to treat anti-oxidant properties, anti-inflammatory, bone health, eye health, heart health and weight management. (67)
9	Pashanbheda	Rhizomes	It is obtained from rhizomes of <i>Bergenia ligulate</i> it belongs to the family Saxifragaceae	It contains phenolic compounds, tannins, flavonoids, saponins, alkaloids, essential oils	Used as diuretic, lithoilytic, anti-inflammatory and urinary tract infections. (68)
10	Garden beet	Roots	It is obtained from dried root of the <i>Beta vulgaris</i> and belongs to the family Amaranthaceae	It contains betacyanins, betaxanthins, betaine, nitrate, fibres, vitamins and minerals, flavonoids, phenolic acids, carotenoids	Used to treat cardiovascular health, liver detoxification, anti-inflammatory, athletic performance, cognitive function anti-oxidant. (69)
11	Sugar beet	Rhizomes	It is obtained from dried root of the <i>vulgaris</i> var. <i>altissima</i> and belongs to the family Amaranthaceae	It contains sucrose, betaine, fibre, minerals, vitamins, beta Lanes and flavonoids and nitrates	Used to treat heart and liver health, anti-oxidant, blood sugar regulation, nutritional support. (70)
12	Hogweed,	Root	It is obtained	It contains furanocoumarins,	Used to treat

Dammati Nalini Devi et al.,

	Punarnava		from dried roots of the Heracleum spondylium and Heracleum mantegazzianum and belongs to the family Apiaceae	polyacetylenes, phenolic compounds, essential oils, carotenoids	rheumatism and joint pain, diuretic properties, skin conditions, digestive disorders. (71)
13	Sambong	Flowering plant	It is obtained from leaves and aerial parts of Blumea balsamifera. Belongs to the family Asteraceae	It contains flavonoids, essential oils, terpenoids, phenolic glycosides, alkaloids, triterpenes, saponins	Used to treat UTI, kidney stones, hypertension, diabetes and wound healing. (72)
14	Lobelia, Indian tobacco	Leaf, flowers, seed	It is obtained from flowering plants of Lobelia inflata. Belongs to the family Campanulaceae	It contains flavonoids, terpenoids, phenolic glycosides, alkaloids, volatile oils, resins, tannins	Used to treat Respiratory conditions, smoking Cessation, muscle relaxation, emetic nervous system support. (73)
15	Madder	Root	It is obtained from dried root of Rubia tinctorum and belongs to the family Rubiaceae	It contains Alizarin, purpurin, rubianic acid, ruberythric acid, tannins, carbohydrates, proteins, and amino acids	Used to treat anti-inflammatory, diuretic, menstrual disorders, skin conditions, GIT, respiratory conditions, liver support. (74)
16	Gravel root	Root	It is obtained from dried root of Eutrochium purpureum and Eutrochium fistulosum and belongs to the family Asteraceae	It contains phenolic compounds, tannins, flavonoids, alkaloids, coumarins, essential oils	Used to treat urinary tract health, analgesic, anti-rheumatic fever and menstrual disorders, wound healing. (75)
17	Horse chestnut	Fruit	It is obtained from fruit of Aesculus hippocastanum and belongs to the family Sapindaceae	It contains Aescin, flavonoids, triterpene glycosides, coumarins, tannins, phytosterols, minerals	Used to treat venous insufficiency, varicose veins, haemorrhoids, edema, anti-oxidant, skin conditions. (76)
18	Corn silk	Stigmata	It is obtained from silky fibres of Zea mays Linnaeus. Belongs to family Poaceae	It contains maizenic acid, alkaloids, flavonoids, saponins, vitamins and minerals, proteins and carbohydrates	Used to treat diuretic, Urinary tract and kidney health, hypoglycemic effects and skin conditions. (77)
19	Dandelion	Leaf	It is obtained from dried leaves of	It contains sesquiterpene lactones, flavonoids, phenolic	Used to treat liver support, blood sugar

Dammati Nalini Devi et al.,

			Taraxacum officinale and belongs to the family Asteraceae	compounds, triterpenes, polysaccharides, vitamins and minerals, bitter compounds, phytosterols	regulation, detoxification, diuretic, skin health. (78)
20	Goldenrod	Leaf, flower	It is obtained from flowering plants of Genus solidago and belongs to the family Asteraceae	It contains phenolic compounds, tannins, flavonoids, alkaloids, essential oils, glycosides, triterpenes	Used to treat urinary tract health, allergy relief, wound healing, anti-microbial properties. (79)
21	Hydrangea	Root	It is obtained from dried roots and rhizomes of Hydrangea macrophylla and belongs to the family Hydrangeaceae	It contains phenolic compounds, hydrangin, saponins, flavonoids, alkaloids, essential oils, glycosides, triterpenes	Used to treat urinary tract, kidney stone dissolving, anti-microbial, pain relief, anti-oxidant effect. (80)
22	Horsetail	Leaf, stems	It is obtained from stems of Equisetum arvense and belongs to the family Equisetaceae	It contains silica, flavonoids, saponins, alkaloids, minerals, terpenoids, phytosterols, phenolic compounds	Used to treat kidney support, wound healing, hair and nail health, diuretic, bone health. (81)
23	Couch grass	Root, rhizomes	It is obtained from rhizomes of Elymus repens and belongs to the family Poaceae	It contains phenolic compounds, alkaloids, volatile compounds, triterpenoids, polysaccharides, amino acids, vitamins, fatty acids	Used to treat constipation, cough, bladder swelling, kidney stones and high blood pressure. (82)
24	Saw palmetto	Fruit	It is obtained from fruits of Serenoa repens and belongs to the family Arecaceae	It contains fatty acids, steroids, flavonoids, polysaccharides, tannins, phytosterols, essential oils and enzymes	Used to treat inflammation, hair loss, urinary tract infection, pelvic pain. (83)
25	Camel's thorn	Roots	It is obtained from dried roots of Alhagi maurorum and belongs to the family Fabaceae	It contains Alkaloids, flavonoids, triterpenoids, phenolic acids, polysaccharides, tannins, volatile compounds, minerals	Used to treat wound healing, gastro intestinal disorders, respiratory conditions, fever, liver disorder. (84)
26	Lavender	Flowers	It is obtained from Flowering plants of Lavandula genus and belongs to the family Lamiaceae	It contains Linalool, linalyl acetate, camphor, 1,8-cineole, terpinen-4-ol, borneol, caryophyllene, geraniol, α -pinene and β -pinene tannins	Used to treat Relaxation and stress reduction, sleep aid, pain relief, skin care, respiratory support. (85)
27	Patharchata, Ajubu, Ghavapatta, Parndeeja	Fresh leaf juice	It is obtained from Fresh leaf juice Kalanchoe pinnata belongs to the	It contains Phenolic compounds, terpenoids, flavonoids, alkaloids, essential oils, triterpenoids, Minerals and vitamins.	Used to treat Wounds, cuts and ulcers, arresting bleeding in external

Dammati Nalini Devi et al.,

			family Crassulaceae		areas, diuretic, respiratory ailments. (86)
28	Mothers heart	Entire herb	It is obtained from entire herb of the Capsella bursa-pastoris belongs to the family Brassicaceae.	It contains Flavonoids, alkaloids, tannins, polypeptides, vitamins and minerals.	Used to treat Hemostatic properties, menstrual disorders, anti-microbial, inflammatory, digestive aid. ()
29	Papaya	Root, Fruit	It is obtained from the fresh fruit of Carica papaya belongs to the family Caricaceae	It contains Enzymes like papain, carpaine, and chymopapain and along with vitamins A, C and E.	Used for digestive support, to treat anti-inflammatory properties, skin infections, anti-oxidant. (87)
30	Plumed cockscomd	Roots	It is obtained from flowering plant of Celosia argentea belongs to the family Amaranthaceae	It contains saponins, peptides, phenols, fatty acids, amino acids and active constituents of celosia argentea	Used to treat Digestive disorders, wound healing, respiratory ailments, anti-inflammatory effects. (88)
31	Vanjeeraka, Kalijeeraka	Seeds	It is obtained from seeds of Nigella sativa belongs to the family Ranunculaceae.	It contains thymoquinone, thymohydroquinone, and other anti-oxidants	Used to treat anti-inflammatory, anti-oxidant, and antimicrobial, respiratory conditions, skin-related issues. ()
32	Bijoru	Unripened fruit	It is obtained from unripened fruit of Citrus medica belongs to the family Rutaceae	It contains Essential oils, flavonoids, and antioxidants and rich in limonene.	Used to treat anti-microbial properties, anti-inflammatory properties. (89)
33	Country borage	Leaves	It is obtained from Plectranthus amboinicus belongs to the family Lamiaceae	It contains Essential oils such as carvacrol, thymol, and eugenol.	Used for anti-inflammatory, anti-microbial, anti-oxidant and to treat digestive and respiratory problems. (90)
34	Cana-do-brejo, Cana-d-macaco	Whole plant	It is obtained from whole plant parts of Costus Spiralis Roscoe belongs to the family Costaceae	It contains alkaloids, flavonoids, terpenoids, and phenolic compounds.	Used to treat anti-inflammatory, anti-microbial, anti-oxidant, gastrointestinal disorders, wound healing. (91)

Dammati Nalini Devi et al.,

35	Barna	Bark	It is obtained from bark of Craters Magna Lour belongs to the familyCapparaceae.	It contains Alkaloids, flavonoids, triterpenoids, saponins.	Used to treat anti-inflammatory,anti-bacterial&fungal activity, anti-diabetic, gastrointestinal disorders, wound healing. (92)
36	Cucu, Cucumber	Leaves	It is obtained from Cucumis sativus belongs to the family Cucurbitaceae	It containsvitamins,minerals,phytonutrients- cucurbitacins,lignans, and flavonoids,dietary fibers.	Used to treat hydration,anti-oxidant properties,anti-inflammatory affects, digestive health, blood pressure regulations. (93)
37	Kattutumatti	Fruit	It is obtained from ridged fruit of Cucumis trigonusbelongs to the familyCucurbitaceae	It contains Alkaloids, flavonoids, saponins, vitamins, minerals,	Used to treat anti-inflammatory hydration,digestive health, skin care. ()
38	Kali musli, Golden eyegrass	Root	It is obtained from dried root of Curculigoorchioide sbelongs to the familyCucurbitaceae	It contains steroidal saponins, alkaloids, flavonoids, triterpenoids.	Used to treat Aphrodisiac, adaptogenic, immunomodulatory, Energy and vitality. (94)
39	Greater plantain	Leaves	It is obtained from leaves of Plantago major belongs to the family Plantaginaceae	It contains iridoids, triterpenoids, flavonoids, mucilage, polyphenols.	Used to treat anti-inflammatory, wound healing, respiratory health, demulcent actions, digestive aid, skin conditi(95)
40	Shatterstone	Whole plant	It is obtained from whole plant of phyllanthusnirumb elongs to the familyEuphorbiaceae	It containsphyllanthin and hypophyllanthin, flavonoids, alkaloids, tannis, phyllanthusiinD.	Used to treat kidney stones, liver health, antiviral activity, anti-oxidant activity, diuretic, immunomodulatory, antibacterial properties. (96)
41	Tezpat	Bark, Leaves	It is obtained from leaves of Cinnamomum tamalabelongs to the familyLauraceae	It contains essential oils, terpenes, phenolic compounds,	Used to treat digestive aid, respiratory health, antimicrobial, aromatherapy, menstrual health, diabetes. Wound

Dammati Nalini Devi et al.,

					healing. (97)
42	Neem	Roots	It is obtained from roots of Azadirachta indica belongs to the family Meliaceae	It contains Azadirachtin, nimbin, nimbidin, and nimbidol, Quercetin, Beta-sitosterol, Azadirone and gedunin, fatty acids	Used to treat anti-microbial, skin health, oral health, antioxidant, anti-inflammatory, immune system support, anti-diabetic. (98)
43	Carrot	Fruits	It is obtained from fruits of daucuscarota belongs to the family Apiaceae	It contains carotenoids, vitamins, minerals, dietary fiber, polyacetylenes, falcarinol	Used to treat vision health, heart health, digestive health, cancer prevention, skin health. (99)
44	Imli	Fruit	It is obtained from fruit of Tamarindus indica belongs to the family Fabaceae	It contains tartaric acid, polyphenols, vitamins, minerals, dietary fiber, tannins.	Used to treat heart health, digestive health, antioxidant, anti-inflammatory, blood sugar regulation, hydration. (100)
45	Chota gokharu	Fruit	It is obtained from fruit of Tribulus terrestris belongs to the family Zygophyllaceae	It contains saponins, flavonoids, alkaloids, sterols.	Used to treat libido and sexual health, urinary tract health, cardiovascular health, athletic performance. (101)
46	Horse gram	Seeds	It is obtained from belongs to the family Fabaceae	It contains proteins, carbohydrates, minerals, polyphenols and flavonoids	Used as kidney stones, urinary disorders, digestive health, weight and diabetes management. (102)
47	Guduchi	Stem	It is obtained from stem of Tinospora cordifolia belongs to the family Menispermaceae.	It contains alkaloids, diterpenoid lactones, polysaccharides, flavonoids, glycosides, steroids, sesquiterpenoid.	Used to treat immunomodulatory anti-pyretic, hepatoprotective, anti-arthritis, digestive health. (103)
48	Wild carrot	Rhizome	It is obtained from rhizome of Daucus carota belongs to the family Apiaceae	It contains carotenoids, volatile oils, flavonoids.	Used to treat digestive health, diuretic, menstrual issues, anti-inflammatory, anti-oxidant. (104)
49	Mountain Knotgraas	Whole plant	It is obtained from whole plant of Aerva lanata belongs to the	It contains flavonoids, tannins, alkaloids, saponins.	Used to treat diuretic anti-inflammatory, anti-oxidant, wound healing,

Dammati Nalini Devi et al.,

			familyAmaranthaceae		gastrointestinal disorders. (105)
50	African Basil	Whole plant	It is obtained from whole plant of ocimumgratissimu mbelongs to the familyLamiaceae	It contains essential oils, phenolic compounds, terpenoids, alkaloids	Used to treat anti-inflammatory,anti-bacterial&fungal activity, anti-diabetic, Febrifuge,wound healing, digestive aid, anti-malarial activity. (106)
51	Hemidesmus indicus	Roots	It is obtained from the roots of the Hemidesmus indicus plant and belongs to the family Apocynaceae	It contains alkaloids, flavonoids, saponins, tannins, steroids	Used as anti-inflammatory, antioxidant, and to treat respiratory and digestive disorders (107)

ABSTRACT

This study investigates the rural healthcare challenges faced by women in Neigunam Village, Tiruchirappalli District, Tamil Nadu, focusing on their access to and utilization of healthcare services. Despite India's economic growth, rural healthcare remains inadequate, with significant disparities between urban and rural areas. Women in Neigunam Village face barriers including limited access to healthcare facilities, a shortage of female healthcare professionals, and low health literacy. The study employs primary data from 50 women through structured interviews and secondary data from academic and official sources. Findings reveal that most women prefer government hospitals for common ailments due to cost and accessibility, whereas private hospitals are chosen for severe conditions like chest pain. Economic factors, including low income and financial constraints, significantly impact healthcare access and decisions. Many women avoid treatment due to the cost, lack of time, or minor nature of their ailments. Despite some positive outcomes from government initiatives, such as mobile health units and health camps, consistent and widespread efforts are needed. Recommendations include increasing healthcare infrastructure, recruiting female healthcare professionals, implementing health education programs, and providing financial assistance to improve healthcare access for rural women. This study aims to contribute to improving rural healthcare policies and interventions, ensuring better health outcomes for women in rural India.

Keywords: Rural Healthcare, Access to Healthcare, Health Barriers, Healthcare Utilization, Rural Health Disparities.

Adaikkala Mary *et al.*,

INTRODUCTION

Economic and social developments are interdependent. Historical studies have demonstrated that prioritizing economic growth while neglecting social progress leads to asymmetrical development and ultimately decelerates overall economic advancement. When economic sectors are prioritized and social sectors such as education and health receive insufficient attention, it results in economic prosperity coexisting with social impoverishment. This social impoverishment, particularly in education and health, can eclipse economic growth and ultimately degrade the quality of life. Therefore, a balanced strategy for resource allocation between economic and social sectors is imperative for a developing country like India. Healthcare, as a vital social infrastructure, is a fundamental right for everyone. However, many in India lack access to quality healthcare due to poor infrastructure, a shortage of qualified medical professionals, and limited availability of basic medicines and medical facilities. About 60 percent of India's population faces these challenges. The situation is particularly dire in rural areas, where around 700 million people live with inadequate medical facilities. Given these dismal facts, new practices and procedures are needed to ensure quality and timely healthcare reaches the underserved corners of Indian villages. Despite numerous government policies and programs, their success and effectiveness remain questionable due to implementation gaps. India has one of the highest numbers of maternal deaths, most of which occur in rural areas due to poor maternal healthcare. Even private sector healthcare is often limited to family planning and antenatal care, neglecting critical services like labour and delivery, where proper medical care can save lives in case of complications. In India, 92 percent of healthcare visits are to private providers, and 70 percent of these visits are by urban residents. However, private healthcare is expensive, often unregulated, and varies in quality. It is unreliable for the illiterate and unaffordable for low-income rural people. To control disease spread and reduce mortality rates due to inadequate health facilities, special attention must be given to rural healthcare. Rural residents often face barriers to healthcare that limit their ability to receive necessary care. To ensure they have sufficient healthcare access, appropriate services must be available and accessible in a timely manner. In addition to an adequate supply of healthcare services in the community, other factors play a significant role in healthcare access. For example, rural residents need financial means to pay for services, such as health insurance coverage accepted by providers. They also need means to reach and use services, such as transportation to distant services and the ability to take paid time off work. Moreover, they need confidence in their ability to communicate with healthcare providers, especially if they are not fluent in English or have poor health literacy.

This study explores barriers to healthcare access, including workforce shortages, health insurance status, distance and transportation issues, and poor health literacy. People in rural areas face different health issues compared to those living in towns and cities. Accessing healthcare can be challenging in remote areas. In emergencies, they may not reach hospitals quickly, and they might avoid traveling long distances for routine check-ups and screenings. Rural areas often have fewer doctors and dentists, and certain specialists may not be available at all. This study aims to understand rural healthcare for people in India, with a specific focus on women in Neigunam Village, Tiruchirappalli District, Tamil Nadu. The investigation included exploring the healthcare challenges faced by women in this village, analyzing the effectiveness of existing healthcare facilities, and identifying areas needing improvement to ensure better healthcare access for rural women. Through this study, we hope to provide insights into the current state of rural healthcare for women in Neigunam Village and suggest actionable steps for policymakers and healthcare providers to improve the situation. In the past, women in Neigunam Village faced numerous healthcare challenges. These included limited access to healthcare facilities, a shortage of female healthcare professionals, and a lack of awareness about health issues. Many women had to travel long distances to reach healthcare centers, which often resulted in delayed treatment. Additionally, cultural and social barriers prevented women from seeking timely medical help. The study found that many women were reluctant to discuss their health problems openly, which further exacerbated their health issues. The study also highlighted the impact of economic factors on women's healthcare in Neigunam Village. Many women belonged to low-income families and could not afford healthcare services. The lack of health insurance and financial resources forced them to rely on inadequate and unqualified local practitioners, leading to poor health outcomes. Furthermore, the study revealed that women's health literacy levels

**Adaikkala Mary et al.,**

were low, contributing to a lack of understanding about preventive healthcare measures and the importance of regular health check-ups. Despite these challenges, there have been efforts to improve women's healthcare in Neigunam Village. Government initiatives aimed at enhancing rural healthcare infrastructure and increasing awareness about women's health issues have shown some positive results. Mobile healthcare units and health camps have provided basic medical services to women in remote areas. However, the study found that these initiatives need to be more consistent and widespread to have a lasting impact. The study recommends several measures to improve women's healthcare in Neigunam Village. Firstly, increasing the number of healthcare facilities and ensuring they are well-equipped with essential medical supplies is crucial. Secondly, recruiting and training more female healthcare professionals can help address cultural barriers and encourage women to seek medical help. Thirdly, implementing comprehensive health education programs can raise awareness about women's health issues and the importance of preventive care. Lastly, providing financial assistance and health insurance coverage to low-income families can make healthcare services more accessible and affordable for women in rural areas. Now, the study underscores the importance of addressing the healthcare challenges faced by women in Neigunam Village. By improving healthcare infrastructure, increasing awareness, and providing financial support, we can ensure that women in rural areas receive the quality healthcare they deserve. This study hopes to contribute to the ongoing efforts to improve rural healthcare in India and serve as a basis for future research and policy-making in this field.

REVIEW OF LITERATURE

Baru, R., Acharya, A., Acharya, S., Shiva Kumar, A. K., and Nagaraj, K. (2010) highlighted that despite India's notable economic growth post-1990s economic reforms, advancements in public health have been sluggish and disparate. Significant disparities in health and healthcare access remain and have even expanded across states, between rural and urban locales, and within communities. Three primary inequities plague India's health sector: historical inequities rooted in British colonial policies that persisted post-independence; socio-economic disparities evident in caste, class, and gender differences; and inequities in the availability, utilization, and affordability of healthcare services. Addressing these inequities in healthcare provision and ensuring quality care is paramount for achieving universal health coverage in the near future. Rao, M. G., and Choudhury, M. (2012) scrutinized the quantum and nature of public health expenditure in India. They examined how public spending impacts health infrastructure and the population's health status. Their analysis revealed that recent reforms aimed at increasing health expenditure through targeted transfers to states, highlighting the health expenditure needs at the state level. They discussed the fiscal space available for healthcare spending at the state level and the effects of central transfers on state health expenditures. They noted that India's healthcare system is marked by low public spending, poor quality services, and a heavy reliance on private providers, leading to high out-of-pocket (OOP) expenses and financial distress, especially among the poor. Wang, S. (2011) observed that while the rural health systems in China and India function relatively well, both exhibit significant flaws. In China, he suggested that instead of standardized premiums and reimbursements, varying amounts should be considered based on income levels, particularly for the extremely poor and wealthy. In India, he identified the financial challenge of the government's inability to fund extensive free healthcare services. He proposed that the Indian government should develop a financing mechanism that involves pooling risks and reimbursement for payments within the rural health system, rather than offering universal free healthcare services in rural areas.

Statement of the Problem

A significant portion of the population migrates from rural to urban areas in search of employment opportunities, medical treatment, and improved lifestyles. However, many individuals continue to reside in rural regions where environmental conditions are suboptimal, and various health issues persist. Women in these rural areas often bear a disproportionate burden, managing both household and external work responsibilities more extensively than men. This study seeks to investigate the healthcare and personal hygiene of women in rural settings, focusing on their unique challenges and needs. The research aims to shed light on the health disparities faced by rural women, who often lack access to essential medical services and hygienic living conditions. By understanding these issues, the

study endeavors to contribute to the development of targeted interventions that can improve the quality of life for rural women and promote equitable health outcomes.

Scope of the Study

This study represents a concerted effort to highlight the state of rural healthcare for women in Neigunam Village, located in Tiruchirappalli District. As an independent investigation, it meticulously gathers relevant information based on the proposed objectives. The scope of the study encompasses an in-depth analysis of the economic, social, and living conditions of the village's residents, with a particular focus on women's health. By examining these aspects, the study aims to provide a comprehensive overview of the standard of living and the healthcare challenges faced by women in this rural community. The findings will not only illuminate the current state of rural women's health but also serve as a foundation for future research and policy-making, aiming to address the identified gaps and improve the overall well-being of rural women.

Research Objectives

- 1.To analyze the health status and health profile of Tamil Nadu state.
- 2.To examine the socio-economic conditions of women in the study area.
- 3.To assess the health conditions of women in Neigunam village of Tiruchirappalli district, Tamil Nadu.

Research Hypotheses

1. There is no significant difference in the proportion of respondents preferring private hospitals against government hospitals for different ailments.
2. There is no significant difference in the reasons for refusal to seek medical treatment across different income groups.

METHODOLOGY

The methodology of this study integrates both primary and secondary data to provide a holistic view of the healthcare situation for women in Neigunam Village. In view of this research design, the study use primary data method and the data collected through a well-structured questionnaire module, administered via personal interviews. With regard to sampling design, the study using convenience sampling method and covered 50 women respondents from the village. This approach ensured that a diverse range of perspectives was captured, reflecting the real-life experiences of rural women. Further, the secondary data collected from various academic books, peer-reviewed journals, and official websites to complement and contextualize the primary findings. This mixed-methods approach allowed for a robust analysis of the data, ensuring that the study's conclusions are well-founded and comprehensive. By combining first-hand accounts with established literature, the research aims to present a nuanced understanding of the healthcare challenges and needs of women in rural Tamil Nadu, paving the way for effective interventions and policy recommendations. With regard to tools of analysis, the study used percentages; t-test and ANOVA model are applied.

RESULTS AND DISCUSSIONS

In the current scenario, the development of social infrastructure is essential for the comprehensive advancement for an economy. In this context, rural health emerges as a critical metric for rural development. This chapter endeavours to examine the trends in health status and health profiles in Tamil Nadu and to evaluate the socio-economic conditions, living standards, and health conditions of 50 women respondents selected from Neigunam, a village in Tiruchirappalli District.

Adaikkala Mary *et al.*,**Health Care Institutions in Tamil Nadu**

Health services are crucial for understanding the mechanisms and provisions of healthcare delivery within the State, categorized into primary, secondary, and tertiary care systems. The Primary Healthcare System encompasses Primary Health Centres (PHCs) and Health Sub-Centres (HSCs). The Secondary Healthcare System includes District Headquarters Hospitals, Taluk Hospitals, Women and Children Hospitals, Dispensaries, Mobile Medical Units, Police Hospitals, and Non-Taluk Hospitals. The Tertiary Healthcare System comprises multi-specialty hospitals. Besides governmental efforts, the private sector also contributes to healthcare services. However, in the absence of comprehensive data on private sector health services, this analysis focuses solely on evaluating the efficacy of the government healthcare system.

Primary Healthcare Services

Primary Health Centres (PHCs) and Health Sub-Centres (HSCs) provide preventive, curative, and rehabilitative healthcare services to rural populations. The rural healthcare infrastructure has been enhanced and optimized under the National Rural Health Mission (NRHM) to achieve the objective of universal health coverage. Over the past four years, the number of operational PHCs in the State increased from 1,539 in 2010-11 to 1,751 in 2013-14. All PHCs operate continuously on a 24x7 basis. The extensive network of 1,751 PHCs and 8,706 Health Sub-Centres is dedicated to delivering universal healthcare to the rural population through a mission-driven and holistic approach. Table 1 examines the key indicators for the Primary Healthcare System over three fiscal years, showing a slight increase in the total number of beds from 12,873 in 2019-20 to 12,979 in 2021-22. However, the bed-to-population ratio deteriorated from 1:3,924 to 1:3,970, indicating a reduced availability of beds relative to the growing population. In contrast, the number of doctors increased significantly from 4,386 to 4,864 during the same period, improving the doctor-to-population ratio from 1:11,518 to 1:10,596. Despite these improvements in medical staffing, overall bed availability has decreased. This situation underscores the broader issue that, despite extensive efforts by Central and State Governments, urban-rural health disparities remain largely unaddressed. Urban populations generally enjoy longer lifespans and healthier outcomes, except for HIV/AIDS, while significant health inequities continue to persist between urban and rural areas, despite past focus on equitable distribution in development planning. Table 2 compares vital rates between rural and urban India for 2021. Rural areas exhibit higher rates across all indicators: Crude Birth Rate is 23.7 compared to 18.0 in urban areas; Crude Death Rate is 7.7 versus 5.8; Infant Mortality Rate stands at 54.7, while urban areas report 33.7; and Under Five Mortality Rate is 66.0, compared to 38.0 in urban regions. Additionally, only 29.7% of deaths in rural areas involved medical attention before death, compared to 48.9% in urban areas. These figures highlight significant disparities in health outcomes and access to medical care between rural and urban areas.

Table 3 presents the occupational status of respondents in Neigunam Village, Tiruchirappalli District. The majority of respondents, 66.0 percent, are engaged in daily wage labour, indicating a predominant reliance on informal and temporary employment. Weekly wage earners constitute 8.0 percent, while 20.0 percent are employed on a monthly wage basis. Only 6.0 percent of respondents hold salaried positions. This distribution reflects a heavy reliance on low-paying, insecure jobs among rural women, which likely impacts their access to consistent healthcare and overall well-being. The predominance of daily wage laborers suggests that financial instability may contribute to challenges in accessing quality healthcare services and maintaining health in Neigunam Village. Table 4 outlines the educational status of respondents in Neigunam Village, Tiruchirappalli District. A minority, 6.0 percent, are illiterate, while 14.0 percent have completed primary school. The majority, 62.0 percent, have achieved secondary school education, indicating a significant level of basic education among the respondents. Another 14.0 percent have attained higher secondary education, and only 4.0 percent hold collegiate or diploma qualifications. This distribution highlights that while a substantial proportion of women have secondary education, higher levels of education are relatively rare. The educational background of these women likely influences their health literacy and access to healthcare resources, affecting their overall health outcomes and the effectiveness of rural health interventions. Table 5 details the income distribution of respondents in Neigunam Village, Tiruchirappalli District. A substantial majority, 74.0 percent, earn between Rs. 1,000 and Rs. 5,000, reflecting low-income levels prevalent among the rural population. In contrast, 14.0 percent of respondents have incomes ranging from Rs. 6,000 to Rs. 10,000, while 8.0 percent earn between Rs. 11,000

and Rs. 15,000. Only 4.0 percent of respondents have incomes between Rs. 16,000 and Rs. 20,000. This income distribution underscores the financial constraints faced by the majority of women in the village, which may affect their ability to access healthcare services and impact their overall health and well-being. The limited higher income brackets suggest that economic hardships could be a significant barrier to improving health outcomes.

Table 6 compares the preference for private and government hospitals for health check-up by women in Neigunam Village for various ailments. For headaches, 76.0 percent of respondents preferred government hospitals over 24.0 percent who chose private hospitals. In cases of body pain and back pain, 68.0 percent and 60.0 percent respectively, opted for government hospitals, while 32.0 percent and 40.0 percent preferred private facilities. Chest pain saw a stark contrast, with 90.0 percent choosing private hospitals and only 10.0 percent selecting government hospitals. For stomach pain and diarrhea, government hospitals were favored by 84.0 percent and 54.0 percent, compared to 16.0 percent and 46.0 percent for private hospitals. Cough and cold treatments also showed a preference for government hospitals, with 82.0 percent and 66.0 percent respectively. Toothache treatment saw a majority, 70.0 percent, opting for private hospitals. This indicates a general preference for government hospitals for most common ailments, while private hospitals are preferred for more severe conditions like chest pain and toothache. Table 7 reveals reasons for refusing medical treatment among respondents. A significant 40.0 percent cited being too busy with work as the main reason, while 24.0 percent considered their ailments too minor for treatment. Cost of medical aid was a concern for 18.0 percent, and 10.0 percent feared losing wages. Only 8.0 percent felt knowledgeable about medications. Table 8 shows dissatisfaction with hospital services. In private hospitals, 38.0 percent of respondents expressed dissatisfaction, while 46.0 percent were dissatisfied with government hospitals. Conversely, 62.0 percent were satisfied with private hospital services, compared to 54.0 percent for government hospitals. This indicates a higher level of dissatisfaction with government hospitals despite overall satisfaction with both types of facilities.

Hypothesis:1

There is no significant difference in the proportion of respondents preferring private hospitals against government hospitals for different ailments. Table 9 presents the results of the t-test for hospital preference and satisfaction results based on occupation. The tests reveal significant differences for ailments such as headache, body pain, back pain, stomach pain, cough, and cold, with p-values below 0.05, indicating a statistically significant preference for one type of hospital over the other. However, chest pain, diarrhea, and toothache show p-values greater than 0.05, suggesting no significant preference. The results support the alternative hypothesis that there is a significant difference in the proportion of respondents preferring private hospital against government hospitals with satisfaction results based on occupation for most ailments in the study region.

Hypothesis2

“There is no significant difference in the reasons for refusal to seek medical treatment across different income groups”. Table 10 presents the ANOVA results for reasons for refusing medical treatment across different income groups. The F-statistic of 3.54 with a p-value of 0.027 indicates a significant difference in refusal reasons among the income groups at the 5% significance level. This result suggests that income influences the reasons individuals choose not to seek medical treatment. Consequently, the null hypothesis, which states that there is no significant difference in refusal reasons across income groups, is rejected. Since to accept alternative hypothesis, i.e., “There is a significant difference in the reasons for refusing to seek medical treatment across different income groups”.

Major Findings

- ✓ With regard to healthcare preferences and access issues, the preference for government hospitals over private hospitals is notable for most common ailments such as headaches, body pain, and coughs. However, for severe conditions like chest pain and toothaches, private hospitals are preferred. This indicates that while government hospitals are more accessible for routine issues, private hospitals are chosen for critical conditions due to perceived better care or facilities.
- ✓ Regarding dissatisfaction with services, a significant proportion of respondents expressed dissatisfaction with both private (38%) and government hospitals (46%). Despite this, a majority of respondents (62%) were

**Adaikkala Mary et al.,**

satisfied with private hospitals, compared to 54% for government hospitals. This suggests that while dissatisfaction exists, the quality of service in private hospitals is relatively better perceived.

- ✓ In the reasons for refusal to seek medical treatment, the main reasons for not seeking medical treatment include being too busy with work (40%) and considering the ailments too minor (24%). Cost and fear of lost wages also contribute to treatment refusal, indicating financial constraints and work commitments as key barriers to accessing healthcare.
- ✓ With regard to income and healthcare access, a substantial portion of respondents (74%) has a low income between Rs. 1,000 and Rs. 5,000, reflecting significant financial constraints. This income level likely impacts their ability to afford healthcare services and highlights the economic barriers faced by rural women in accessing quality care.
- ✓ Among educational impact on health literacy, most respondents have achieved secondary education (62%), which influences their health literacy. However, higher levels of education are less common, suggesting that limited education may affect awareness and understanding of healthcare needs and preventive measures.

CONCLUSION

The study on rural healthcare for women in Neigunam Village, Tiruchirappalli District, highlights several critical issues impacting women's health. Despite improvements in healthcare infrastructure, significant gaps remain in access and quality of care. Rural women face considerable barriers such as financial constraints, inadequate medical facilities, and educational limitations that affect their health literacy. While government hospitals are preferred for routine care, private hospitals are chosen for more severe health issues, indicating discrepancies in service quality and accessibility. The dissatisfaction with both types of hospitals points to the need for better healthcare delivery systems. Addressing these issues requires a comprehensive approach involving increased funding, improved healthcare facilities, and targeted educational programs to enhance health literacy. These findings emphasize the urgent need for effective interventions to ensure equitable healthcare access and improve the overall well-being of rural women.

Policy Suggestions

1. To invest in expanding and upgrading healthcare facilities in rural areas, including the establishment of more well-equipped primary health centers and specialized care units. This will improve accessibility and quality of care for rural women.
2. To implement financial assistance programs and expand health insurance coverage for low-income families. This will reduce out-of-pocket expenses and make healthcare services more affordable and accessible for rural residents.
3. To develop and implement comprehensive health education programs focusing on preventive care, health literacy, and the importance of regular check-ups. Target these programs towards women to empower them with knowledge and encourage proactive health management.

ABSTRACT

In the fields of healthcare and finance, medical insurance is unavoidable. According to the terms of the policyholder-insurer agreement, the insurance company offers this form of insurance. It covers medical costs related to emergency treatment, unanticipated hospital stays, and healthcare services. The client must pay a premium regularly to obtain medical insurance from the insurer. This study aims to anticipate policyholders' medical insurance rates in advance by considering several variables and risk factors. To achieve this goal, we took a dataset that belongs to an Indian Insurance Company, which has disclosed data for approximately 1000 clients. Effective machine learning techniques such as Decision Tree Regression, XG Boost Regression, Bayesian Ridge Regression, Principal Component Regression, and Partial Least Square Regression will be used to build a machine learning model. An Exploratory Data Analysis (EDA) will examine various policyholder characteristics. With the help of this forecast, the insurance provider may improve their financial performance and set suitable premium prices. Based on the cost of their premiums, policyholders may make informed choices.

Keywords: Medical Insurance, Machine Learning, Health Insurance, Premium Prediction, Cost Prediction

INTRODUCTION

The insurance sector includes firms that utilize insurance contracts to manage risks. One party, the party being insured, promises payment in the case of an unforeseen future disaster. This is the basic principle of insurance. If this protection leads to an uncertain incidence, the insured or the insurer will pay the insured a reduced decoration. These programs are intended to offer policyholders who have decorations recreated with information or

**Sabarish and Abamaa**

compensation. Then, with a focus on health insurance, we look at some of the different insurance options. Insurance products come in a wide variety of forms, such as health, life, liability, and property and casualty insurance. Whereas one type of insurance, known as health insurance or health insurance, covers all or part of the risks associated with a person needing medical care. Since this decision is influenced by several circumstances, each person's health insurance cost is unique. Like other insurances, the danger includes many parties. Calculating the health risks and medical costs for the whole barrier fund. Health insurance covers a wide range of medical services, such as hospital stays, operations, prescription drugs, vaccinations, checkups, and specialized therapies.

Apart from guaranteeing that people may get the care they need without worrying about running out of plutocrats, it also guards against the exorbitant cost of medical care. Large danger populations and actuarial calculations are sometimes used in older health insurance premium calculation systems, which might result in strange and inaccurate forecasts. The rising cost of health care has policyholders looking for more affordable and transparent insurance options. By more precisely defining the threat profiles of certain visitors, insurance companies may benefit from more accurate payment estimations. This might lead to a more equitable distribution of possible risks, fewer losses from underpricing, and a stronger position in the request. The "Medical Insurance Premium Forecast" aims to fundamentally change the difficulties and complications the insurance sector is now facing. Displaying insurance decorations that guests have paid insurance companies is the primary purpose of our design. creating a transparent insurance system that benefits both insurance companies and tourists. To achieve this, we use several machine literacy techniques in combination with a fundamental machine learning model and a dataset of the policyholders' varied clinical characteristics.

REVIEW OF LITERATURE

As defined by Greenlaw and Shapiro (2011), insurance is a financial safeguard against significant adverse events, while Outreville (1998) emphasizes its legal context as a contract for risk-based compensation. These studies underline the potential of machine learning in enhancing accuracy and scalability in insurance premium predictions. Identical to S. Angel Latha Mary et al. (2023) achieved 99% accuracy using Linear Support Vector Machines (LSVM) trained and evaluated on eleven criteria, showcasing its robustness. Vijayalakshmi and Selvakumar (2023) compared multiple regression techniques, identifying Random Forest Regression (RFR) as the best-performing model with an R^2 score of 0.9533, emphasizing the strength of ensemble methods. RM Jesus et al. (2023) analyzed the role of Machine Learning Operations (MLOps) in improving forecasting outcomes and operational scalability in the insurance sector. AD Kafuria (2022) assessed the predictive performance of models like RFR, XGBoost, and LASSO on demographic and behavioral data, demonstrating the effectiveness of ensemble methods for complex data patterns.

METHODOLOGY

The methodology examines the various medical aspects of policyholders and includes several steps to predict the premium of customers who have purchased medical insurance from an insurance company. These steps include data collection, exploratory data analysis, model building, testing, evaluation, and visualization of the expected results. Each approach will be discussed in depth.

Data Collection

To generate our estimate, we utilized a Kaggle.com dataset that contained health data for 1000 clients with insurance-covered medical expenses. The dataset included 10 characteristics: height, weight, known allergies, family history of cancer, diabetes, blood pressure problems, age, number of major operations, transplants, and chronic illnesses.

**Sabarish and Abarnaa****Exploratory Data Analysis**

Exploratory data analysis (EDA) enables us to better understand our data, detect trends, and choose the best features, pre-processing, and modeling options. It provides the framework for developing accurate prediction algorithms for estimating the cost of health insurance. Our EDA in this instance takes advantage of bivariate analysis.

- **Bivariate Analysis** In our study, we favour stacked bar plots to comprehend the link between two variables. A statistical analysis technique called bivariate analysis involves simultaneously examining and assessing correlations between two variables.
- **Scatter Plot** scatter plots depict the associations between two continuous data, displaying trends, clusters, and outliers. They are excellent for detecting correlations and adding multivariate insights via colour or size changes.
- **Boxplot** : Boxplots display the distribution and distribution of data using a five-number summary (minimum, Q1, median, Q3, maximum). They make it possible to compare categories quickly to find trends and group differences, and they aid in the detection of outliers, which are shown as points outside the whiskers.
- **Heatmap** : Heatmaps use colour intensity to illustrate value differences to examine data patterns, particularly for correlations and interactions. Grouped heatmaps display distribution patterns for categorical combinations, whereas correlation heatmaps illustrate correlations between continuous variables, supporting feature selection and multicollinearity tests. Heatmaps offer a clear summary of big datasets, directing additional research.

Feature Selection : A crucial phase in machine learning (ML) and data analysis is feature selection, which enhances interpretability, reduces overfitting, and boosts model performance. A larger pool of possible features, it comprises choosing a subset of relevant features (variables or attributes). Feature selection may be particularly important when working with high-dimensional data because adding redundant or superfluous features might slow down computation and lower model accuracy.

Splitting Training and Testing Set In this case, we divide our dataset into 80% training data and 20% testing data to develop a model.

Algorithms Used The mentioned ML algorithms are used to fit a model for the data, as well as preprocessing techniques such as the Standard Scaler to compare model performance with and without preprocessing. Additionally, we fitted a polynomial feature regression model.

- **Decision Tree Regression** Decision tree regression predicts continuous values by splitting data into subsets based on feature values. Each leaf represents the predicted value, often the mean of the target in that subset. While effective for capturing complex patterns, decision trees can overfit, requiring techniques like pruning or ensemble methods for better performance.
- **XG Boost Regression** XGBoost Regression is a fast and powerful algorithm that builds an ensemble of decision trees to predict continuous values. It improves model accuracy by correcting errors in each successive tree and includes regularization to prevent overfitting.
- **Bayesian Ridge Regression** Bayesian Ridge Regression is a linear regression technique that adds regularization to avoid overfitting and estimates model parameters using Bayesian inference. It works well with multicollinearity or high-dimensional data and assumes Gaussian distributions for the coefficients.
- **Principal Component Regression** Principal Component Regression (PCR) is a technique that combines principal component analysis (PCA) with linear regression. It first reduces the dimensionality of the data by transforming it into principal components and then performs linear regression on the most significant components. PCR helps address multicollinearity and overfitting, especially when there are many correlated features.
- **Partial Least Squares Regression** Partial Least Squares (PLS) Regression is a dimensionality reduction technique used when predictors are numerous and highly correlated. It creates latent variables by combining predictors in a way that maximizes their covariance with the response, addressing multicollinearity while ensuring prediction accuracy. PLS is widely applied in fields like chemometrics and bioinformatics and is particularly useful when predictors outnumber observations.

**Sabarish and Abarnaa**

Model Evaluation Evaluating a trained machine learning model's performance and efficacy is known as model evaluation in machine learning. It entails evaluating the model's effectiveness in achieving its goals related to classification, regression, clustering, or any other machine learning issue. We will test our model with Root mean squared and mean squared errors.

- **Distribution Plot** A distribution plot, sometimes referred to as a distribution comparison plot or distribution visualization, is a graphical tool used in data analysis and machine learning to compare the distributions of anticipated (fitted) and actual (observed) values. It is a helpful tool for determining how well the predictions of a model match the distribution of the data.
- **Root Mean Squared Error (RMSE)** A more comprehensible measure of error in the same units as the target variable is provided by the ROOT MEAN SQUARED ERROR (RMSE), which is the square root of the MSE.
- **Mean Squared Error (MSE)** One often used statistic for assessing how well regression models work is the Mean Squared Error (MSE). It calculates the mean square of the errors, or the discrepancies between the actual and anticipated values. A model that fits the data better is indicated by a lower MSE.

Viewing The Predicted Premium To view projected output data as a CSV file in Jupyter Notebook, initially generate your predictions. Next, arrange these predictions in a table fashion using the pandas package. Use pandas to save this table as a CSV file with a custom name. To view and manipulate the data, you may simply open the CSV file in your notebook or other spreadsheet program.

Analysis

To uncover how our medical insurance premium prediction system works with a step-by-step process, we used to turn data into useful predictions. So, get ready to peek under the hood of our medical insurance prediction machine through our methodologies like Data collection, Exploratory Data Analysis (EDA), Building the model by five ML algorithms to find the best model that fits our data, and visualizing the predicted output of our best model.

Importing Data

In the first step, we imported data named medical insurance.csv with the features Age, diabetes, issues with blood pressure, Any chronic illnesses, transplantation, Size, weight, any known allergies cancer in the family history, number of big operations, Premium Cost.

Exploratory Data Analysis

EDA is performed to understand the data on how the cost of our premiums changes based on the policyholders' medical conditions and when forecasting models by using bivariate analysis. Figure 1, appears that premium prices tend to be higher for people in various age ranges, particularly around the ages of 30 and 60, where premiums often reach levels around 35,000 to 40,000. However, there is considerable variation in premium prices across all age groups, indicating that factors other than age likely influence premium pricing. There is no clear linear trend, suggesting that age may have a complex or limited direct impact on premium price levels.

Figure 2, Individuals with chronic diseases (1) tend to have higher median premium prices compared to those without (0), as seen by the upward shift in the central line within the box for group '1'. Additionally, the range of premium prices is wider for those without chronic diseases, indicating greater variability in premiums for this group. In contrast, the distribution for individuals with chronic diseases is more concentrated around the median, with slightly fewer outliers and a tighter interquartile range. This suggests that having chronic conditions is associated with more consistent but generally higher insurance premiums. Figure 3 displays Any Transplants is 0 (no transplants), the median premium price is lower, with a tighter range of values and fewer outliers, compared to when Any Transplants is 1 (at least one transplant). For patients with transplants, the median premium price is significantly higher, and the range of prices is more spread out, indicating greater variability. This suggests that having a transplant is associated with a higher and more variable premium price

**Sabarish and Abarnaa**

Figure 4, Exhibitions For individuals without blood pressure issues (represented by 0), the median premium price is around 20,000, with a fairly wide interquartile range (IQR) extending from about 17,500 to 30,000. The spread of the data is large, with several high outliers reaching up to 40,000, indicating significant variability in premium prices within this group. In contrast, for individuals with blood pressure problems (represented by 1), the median premium is slightly higher, close to 25,000, with a narrower IQR from approximately 20,000 to 30,000. Although this group also has fewer outliers, they lie within a narrower range compared to the group without blood pressure problems. Overall, while premiums are somewhat higher for those with blood pressure issues, there is more consistency in pricing for this group. In contrast, premiums for those without blood pressure problems display greater variability and include some notably high values. This distribution may reflect the influence of additional risk factors or underwriting considerations in determining premium prices for individuals without blood pressure issues.

Figure 5, displays that Individuals without diabetes (indicated by "0") generally have a wider range of premium prices, with the interquartile range (IQR) extending from about 20,000 to 30,000. Their premiums also include some higher values reaching nearly 40,000, though they contain no extreme outliers. In contrast, individuals with diabetes (indicated by "1") have a narrower IQR, indicating a more consistent range in premium prices, but they exhibit several outliers above 35,000. While the median premium is slightly lower for diabetic individuals, the presence of outliers suggests that some individuals with diabetes are paying significantly higher premiums. Figure 6, illustrates the correlation coefficients between several characteristics, including height, weight, allergies, family history of cancer, diabetes, blood pressure issues, transplants, chronic diseases, age, and insurance-related metrics. Dark blue denotes a strong negative correlation, whereas dark red denotes a strong positive connection. The colors' intensity, which ranges from dark blue to dark red, reveals the direction and strength of the relationships. Finding patterns and connections in the data with the help of this heatmap may help guide future research or decision-making procedures.

Feature Selection

The following attributes were employed in our premium prediction: Age, diabetes, hypertension, organ transplants, long-term illnesses, Weight, height, known allergies, and The number of major operations and a family history of cancer are independent variables for input features. We then determined that the goal-dependent variable would be the premium price.

Training and Testing Set

Post feature selection, we divided our dataset into 1000 distinct observations for testing and training. Eighty percent of our data will be separated into X train using the input features we chose, and another eighty percent will be split into Y train using just the target variable. 20% of the training set's data with input features will be split for the X test, and the premium will be predicted for the Y test.

Fitting the Model

We going to build the model using five machine learning algorithms they are Decision Tree Regression, XG Boost Regression, Bayesian Ridge Regression, Principal Component Regression, and Partial Least Squares Regression, We also perform these algorithms with scaling, and polynomial features.

Model Evaluation

We are going to evaluate our models using distribution plots, mean squared error, and Random mean squared error. By comparing all the Random mean squared errors (RMSE) for each model, we get a minimum value for the model XG BOOST REGRESSION that fits best into our data

Viewing the Predicted Premium

To view the expected output in machine learning, a trained model is used to generate predictions, which are then analyzed or saved. Once the model has been trained on a dataset, it may be applied to new data to provide predictions, which can be either categories for classification or numerical values for regression tasks. You can do statistical analysis, make visualizations, or print these predictions to the console to see them. To make it simple to access and deal with the model's output in an organized way, you can also save them in a CSV file in a designated

Sabarish and Abarnaa

folder for later use or sharing. Based on each policyholder's medical characteristics, we developed a model to forecast the target variable premium for our medical insurance premium prediction. Here we are viewing our predicted premium by saving it as a CSV file.

CONCLUSION

This study successfully used machine learning to predict medical insurance premiums based on policyholders' medical and demographic factors, with XGBoost Regression achieving the highest accuracy. The results highlight the potential of data-driven approaches to refine premium pricing, support insurers' financial strategies and assist customers in making informed choices. Future research could enhance model accuracy by incorporating additional variables like lifestyle and socio-economic factors or exploring advanced methods like neural networks. Developing explainable AI models could also offer greater transparency, enabling both insurers and policyholders to understand the factors influencing premium predictions.

ABSTRACT

Many regions, including India, the U.S.A., and Egypt, face construction challenges due to clayey soil, leading to damage in light structures and pavements. Traditional soil replacement is costly, especially in developing countries. This study explores jute fiber as an eco-friendly, cost-effective soil stabilizer. Laboratory tests show that jute reinforcement significantly increases soil strength, with a 200% rise in CBR value at 0.75% fiber content. Jute-geotextile proves to be an economical, practical solution for improving weak subgrades.

Keywords: Jute geotextile, CBR, Eco-friendly, Economical, Subgrade

INTRODUCTION

The subgrade, the lowest pavement layer, bears all pavement loads and must remain stable under adverse conditions. Weak subgrades cause defects like rutting and corrugation, impacting pavement durability. Reinforcing soil with jute fiber enhances strength, bearing capacity, and durability while being cost-effective and eco-friendly. With increasing urbanization, clayey soils pose challenges due to low shear strength and high compressibility. Rather than seeking new land, improving soil properties through reinforcement methods like jute fiber offers a sustainable solution. Utilizing industrial by-products and natural fibers not only strengthens soil but also promotes environmental conservation and efficient waste management. The shrink-swell behavior of clayey soil poses significant risks to construction, leading to excessive settling at the site. Additionally, soils may be prone to collapse or liquefaction, making them challenging to manage. Searching for ideal construction sites by altering the natural environment is not advisable, as it disrupts the balance of ecosystems. The destruction of forests, agricultural land, and natural slopes can lead to imbalances in wildlife and contribute to environmental disasters such as floods and landslides. These changes pose serious threats to human life and survival.

**Sudipta Adhikary****Objectives**

- Assessing the strength properties of both untreated and jute-blended soils with varying jute fiber lengths.
- Identifying the optimal jute content and combination to achieve the highest improvement in soil strength

MATERIALS AND METHODS

The California Bearing Ratio (CBR) test, both soaked and unsoaked, was performed on soil samples reinforced with varying percentages and lengths of jute fiber. This test measures the force per unit area needed to penetrate a soil sample using a circular plunger with a 50mm diameter, at a penetration rate of 1.25mm per minute.

RESULTS AND DISCUSSION

The CBR test was performed on soil samples reinforced with 60mm long jute fibers at varying percentages of 0.25%, 0.50%, 0.75%, and 1%.

CONCLUSION

The laboratory tests revealed that the inclusion of jute fiber in soil significantly enhances its CBR value. As the fiber content increased, the CBR value showed a notable improvement, particularly at 0.75% fiber content. Additionally, the fiber length played a crucial role in further increasing the CBR value, with the most substantial rise observed when the fiber length was 90 mm. A remarkable improvement of over 200% in CBR value was noted at 0.75% fiber content. The use of jute-geotextiles for soil reinforcement proves to be a cost-effective and practical solution, offering a superior alternative to traditional methods. It is particularly beneficial for constructing low-volume roads on weak subgrades, making it a viable option in regions with limited resources.

Future Scope

- Enhancing soil properties has become a critical focus in modern construction. This study explores the effects of jute and gypsum, though numerous other materials offer potential for similar improvements. For future research, the following areas could be explored:
- Utilization of various waste materials from agricultural, municipal, or industrial sources to improve soil, contributing to sustainable urban development.
- Conducting similar studies with different moisture contents to assess their impact on soil strength. Investigating the effects of soil reinforcement with other soil types to broaden the applicability of the findings.

ABSTRACT

In this work, we assessed the effects of foliar application of ascorbic acid (AsA) on the physiological characteristics viz; relative water content, stability of the cell membrane, chlorophyll content and yield attributes of PU-19 and the UH 80-9 black gram genotypewith induced saline environment (100mM, 150 mM NaCl) under complete randomised design. Ascorbic acid (AsA) was applied by foliar spray in controlled experiment at several concentrations (0.5mM, 1.0mM, 1.5mM, and 2 mM) with and without 100 mM and 150 mM NaCl concentration. The amount of relative water content, cell membrane stability, canopy temperature depression, chlorophyll content, no of seed /pod and 1000 seed weight were reduced by the salinity whereas, enhanced using ascorbic acid. The combination of 100 mM NaCl and 2.0 mM ascorbic acid was shown to be the ideal level of ascorbic acid, leading to improved physiological and yield properties in saline circumstances. The results showed that applying ascorbic acid (AsA) topically was effective in reducing the negative effects of salinity, especially in genotypes of black gram that are more sensitive to salt stress.

Keywords: *Vigna mungo*, Black gram, salt stress, Ascorbic acid, Antioxidant

INTRODUCTION

Blackgram (*Vigna mungo* L.), is grown on 4.02 million hectares and produces 547 kg ha⁻¹ on average (Ashraf *et al.*, 2024). The issue of salinity arises when soil ion concentrations of various salts (mostly NaCl) rise above the threshold level necessary for normal plant germination, development, and physiological activity in the root zone (Porcel *et al.*, 2017, Gopalakrishnan and Kumar, 2020). A major hazard to agricultural systems, salinity stress has a substantial negative impact on crop productivity and quality, making it a major obstacle to the world's food production (Chourasia *et al.*, 2021). According to Mohanaveluet *al.* (2021), more over 25% of all land and 33% of irrigated land are thought to be affected by salinity, and this percentage is predicted to rise due to inadequate drainage systems and poor agricultural land management (Ivushkinet *al.*, 2019). Sodium chloride stress negatively impacts plant metabolism and thus reduces crop productivity worldwide (Mimouni *et al.*, 2016; Qiu *et al.*, 2017). According to Pritteshet *al.*, (2020) salinity negatively impacts the physio-chemical properties of the soil, seed germination, plant growth, physiological properties, and the uptake of ions and water by plants. Numerous investigations have demonstrated that a decrease in chlorophyll content occurs when salt levels rise. More specifically, the concentrations of chlorophyll a, chlorophyll b, and total chlorophylls decrease with increasing salinity levels (Zuo *et al.*, 2021). Furthermore, salinity can reduce seed yield by reducing the length of the seed-filling period and affecting physiological performance. (Dramaliset *al.*, 2021, Ghassemi-Golezani *et al.*, 2010). Extensive studies in controlled laboratory and greenhouse settings have examined the effects of soil salinity on unanticipated variations in canopy temperature at the plant level (Gómez-Bellot *et al.*, 2015) and barley (Grant *et al.*, 2007). According to Akhlaghi *et al.* (2018) and Sharma *et al.* (2019), it is essential in reducing oxidative stress caused by both biotic and abiotic sources. In a few important crops, including rice, tomato, okra, and maize, foliar application of ascorbic acid has been demonstrated to mitigate the detrimental effects of salt stress (Alayafi, 2020). The goal of this study was to test the theory that ascorbic acid applied topically can effectively reduce the harmful effects of salt stress on black gram physiology and yield.

MATERIALS AND METHODS

Plant material and study location

Ten seeds of the black gram cultivars PU-19 and UH 80-9 were obtained from Pulses Section, Department of Plant Breeding, CCS Haryana Agricultural University, Hisar (IND). Seeds were grown in a pot house with a complete randomized design and three replications, watered (Control-maintained pots in field conditions) and salinity was created by adding 100mM and 150mM NaCl solution during the Kharif seasons of 2021–22 and 2022–23.

Experimental design and treatment growth conditions

Pots were placed in an environment with control and salt with ascorbic acid under a complete randomised design (CRD) and pooled mean from two year was presented in the data tables. Ten numbers of treatments *viz.*, control [no NaCl or ascorbic acid (T0)], 100 mM NaCl (T1), 100mM NaCl with 0.5 mM ascorbic acid (T2), 100mM NaCl with 1.0 mM ascorbic acid (T3) and 100mM NaCl with 1.5 mM ascorbic acid (T4), 100mM NaCl with 2.0 mM ascorbic acid (T5), [no NaCl or ascorbic acid (T6)], 150 mM NaCl (T7), 150mM NaCl with 0.5 mM ascorbic acid (T8), 150mM NaCl with 1.0 mM ascorbic acid (T9) and 150mM NaCl with 1.5 mM ascorbic acid (T10) and 150mM NaCl with 2.0 mM ascorbic acid (T11), were applied. Following seed sowing, 150 mM of NaCl solution was added to the soil as a single shock to initiate the NaCl treatment. Ten days after sowing (DAS), or when new leaves started to appear, ascorbic acid was sprayed on the leaves.

Physiological data measurement

Relative Water Content (RWC), which was ascertained using the Barrs and Weatherley (1962).

A handheld infrared thermometer was used to measure the canopy temperature depression (CTD) and calculation was made using Ayeneh *et al.* (2002) approach. Whereas Hiscox and Israelstam (1962) technique was used chlorophyll extraction and calculation was done by Arnon's equations for chlorophyll 'a', chlorophyll 'b', and total chlorophyll.

Preety *et al.*,

Cell Membrane Stability was calculated from the electrolytic leakage from leaf cellular membranes using method of Ibrahim and Quick (2001).

Yield attributes

Five randomly chosen plants from each treatment had their pod counted, and the average number grain per pods was computed. The total number of harvested pods per plant was used to calculate the total number of grains produced by each plant. A precision balance was used to calculate the weight of the grains. A precision balance was used to weigh one thousand grains that were randomly selected from harvested pods (containing 8% seed moisture) to determine their weight.

RESULT AND DISCUSSION

Relative water content

Relative Water Content (%) was found almost similar under control conditions in both genotypes (92.8% to 45.5 and 86.4% to 41.1%). Application of ascorbic acid improve relative water content under 100nM and 150 mM concentration of the NaCl application. Maximum relative water content was observed in control environment and minimum was observed in the 150mM NaCl application, which is improve by the 0.5mM (50.9%), 1.0 mM (57.5%) and 1.5mM (88.2%) application in genotype UH-80-9 whereas 88.2, 57.5 and 50.9 % respectively for genotype PU-19 of ascorbic acid. Similar observations were found in previous research (Anjum *et al.*, 2011; Bangar *et al.*, 2019), which was likely due to the vegetative phase's limited capacity for water absorption. In our study we found out that salinity stress decreased relative water stress, but foliar application of ascorbic acid mitigated the negative impact of salt stress. Similar results were found by Aliniaiefard *et al.* (2016), where olive trees' water content is altered by Ascorbic acid in contrast to control plants and salt stress.

Canopy temperature depression

Under both stress and control circumstances, the Canopy Temperature Depression (CTD) values showed a rising tendency for all genotypes examined (Table 1). The control environment had the highest canopy temperature depression, while the 150 mM NaCl application had the lowest. This was improved by the ascorbic acid applications of 0.5 mM (0.30°C), 1.0 mM (0.80°C), 1.5 mM (1.5°C) and 2.0Mm (2.9°C) for genotype UH-80-9 and 0.3, 0.6, 1.5°C and 2.3°C, respectively, for genotype PU-19. Sofi *et al.* (2021) report evidence supporting the idea that genotypes with higher CTD or lower canopy temperatures tend to absorb more moisture from the soil, which mitigates excessive dehydration under drought stress and creates a cooling effect. Salt stress reduced CTD, however ascorbic acid applied topically raised CTD. Similar result was reported by Kumar *et al.* (2022) in *Triticum aestivum*. According to Kumar *et al.* (2022) findings, foliar ascorbic acid help to considerably lower the crop's canopy temperature.

Chlorophyll 'a' content

Under control settings, chl 'a' was found to be nearly same in both genotypes (0.27&0.23 mg\g fw). The results of the genotypes evaluated for the reduction of mean chlorophyll a concentration under conditions of salt stress were displayed in Figure-1. The 150 mM NaCl application showed the lowest chl 'a' concentration, while the genotype UH-80-9 showed the highest concentration at 0.5 mM (333.3%), 1.0 mM (465.2%), 1.5 mM (533.4%), and 2.0 mM (733.2%) of ascorbic acid. For the genotype PU-19, the values were 75, 200, 225, and 275%, respectively. The synthesis of photosynthetic pigments is increased and upregulated when Ascorbic acid is applied, which lessens the negative effects of salinity. (El-Hawary *et al.*, 2023).

Chlorophyll 'b' content

The data unequivocally show that, during the whole sampling process, salt stress has a great impact on chlorophyll b (Figure 2). Chlorophyll b levels in 150mM NaCl treated plants of UH 80-9 and PU-19 decreased by 91.37% and 78.75%, respectively, in comparison to the control group. Table 2 shows the genotypes that were assessed for their ability to lower the mean chlorophyll 'b' concentration when exposed to salt stress. Ascorbic acid is applied under

Preety *et al.*,

concentrations of 100 mM and 150 mM NaCl to enhance Chl 'b'. The 150 mM NaCl application showed the lowest chl 'b' concentration, while the genotype UH-80-9 showed the highest concentration at 0.5 mM (300%), 1.0 mM (350%), 1.5 mM (450%), and 2.0 mM (550%) of ascorbic acid. For the genotype PU-19, the values were 75, 200, 250, and 325%, respectively. According to Kashem *et al.* (2000), salinity stress causes a decrease in nitrogen levels within plant tissues, which in turn causes a reduction in both photosynthesis rate and chlorophyll content. Furthermore, Netondo *et al.* (2004) claim that salinity stress reduces plant growth and chlorophyll content by slowing down the rate of photosynthesis (Shimada *et al.*, 2009).

Total Chlorophyll content

Total chlorophyll content (mg g^{-1} FW) was reduced by NaCl treatment and considerably enhanced by AsA treatment (Table 3). After Control, the maximum total chlorophyll content obtained was 0.53 mg in response to 100mM NaCl +2.0 mM AsA treatment (T5) and 0.41 mg in UH -80-9 and PU-19 respectively representing an increase of 82.75% and 86.36% over the 100mM salt treatment. The 150 mM NaCl application showed the lowest Total Chl concentration, while the genotype UH-80-9 showed the highest concentration at 0.5 mM (40%), 1.0 mM (85%), 1.5 mM (110%), and 2.0 mM (130%) of ascorbic acid. For the genotype PU-19, the values were 35.29, 70.58, 88.24 and 123.52%, respectively. In our investigation, we found that in saline soil, photosynthetic pigment levels decreased (Pastenes *et al.*, 2005). Exogenous administration of Ascorbic acid is anticipated to control stomatal opening in stressful situations, hence lowering transpiration rates, preserving turgor pressure, and eventually improving plant growth and productivity (El-Beltagiet *al.*, 2022).

Cell membrane stability

Table 2 shows that, in comparison to plants grown in non-saline conditions, the cell membrane stability was significantly lower under 150mM NaCl stress. The largest concentrations of Cell membrane stability were found in the genotypes UH-80-9 at 0.5 mM (9.55%), 1.0 mM (19.43%), 1.5 mM (50.82%), and 2.0 mM (77.94%). The values for the genotype PU-19 were 14.05, 30.35, 68.29, and 110.19%, in that order. Nonetheless, the application of As A at different concentrations lessened the negative effects of salt under NaCl stress conditions, retaining the plants' cell membrane stability.

No. of seed /pod

The detrimental effects of NaCl and the positive impact of AsA on the quantity of seed per pod are clearly shown in Table 4. In comparison to the control, there were 34.96% and 39.69% fewer seeds per pod in the 100 mM NaCl group in UH 80-9 and PU-19 plants respectively. The control group (T0) had the largest number of seeds per pod at 6.12 and 5.92, while the 150 mM NaCl (T6) had the lowest number at 2.96 and 2.34. A largeno. of seed /pod was observed in the genotype UH-80-9 at 0.5 mM (5.40%), 1.0 mM (27.03%), 1.5 mM (57.780%), and 2.0 mM (106.76%) of ascorbic acid and the readings were 23.5, 43.58, 77.78, and 118.37% for the genotype PU-19, respectively. Like the control (Table 3), Induced salt reduced the total number of seeds per plant; however, ascorbic acid had a notably positive impact on this parameter.

1000-grain weight(g)

Table 3 shows that the lowest value of 1000-grain weight 1.97 ± 0.050 g and 2.03 ± 0.026 g was obtained under 150mM (T6), while the maximum value 5.12 ± 0.036 g and 5.67 ± 0.054 g was found under control conditions (T0). Increased 1000-grain weight was found in the genotype UH-80-9 at 0.5 mM (8.62%), 1.0 mM (30.45%), 1.5 mM (70.56%), and 2.0 mM (109.64%) of ascorbic acid and the readings were 26.10, 54.18, 86.20, and 142.86% for the genotype PU-19, respectively. Navarro *et al.* (2010) indicated that saline stress causes a decrease in the commercial yield of sweet peppers, which validated recent studies. Ascorbic acid's antioxidant properties, which encourage protein synthesis and delay senescence, may be responsible for the yield enhancement that has been reported after exogenous administration (Hamama and Murniati, 2010).

Preety et al.,

CONCLUSION

Based on current research, it can be said that ascorbic acid, at a threshold concentration of 2.0 mM, improves physiological and yield characteristics in black gram under salt stress. There was a significant difference was found in the applied treatment and genotype with significant interaction effect. Genotypes UH 80-9 and PU-19 showed maximum tested parameters under 100mM and 150mM salt concentration and application of ascorbic acid improve water status as compared to the salinity environment. Plant exposed with the 100mM (T1) and 150mM NaCl (T6) showed reduction in the tested physiological and yield parameters. Exogenous application of ascorbic acid (2.0mM followed by 1.5mM) in treatment, T5 and T4 with 100mM NaCl solution, as well as T10 and T9 with application of 150mM NaCl solution, not only improves physiological characteristics, but also increases the yield of the tested genotype. , Therefore, we conclude that 2.0 mm concentration of ascorbic acid can be used to reduce the harmful effects of salinity during the growth stage of the crop.

ABSTRACT

Digital technology has revolutionized music production, performance, and education by enabling advanced sound manipulation, noise reduction, and high-quality outputs. It has also introduced new ways of learning and innovation in the music industry. This study explores the historical evolution of digital technology in musical instruments, its impact on composition and performance, associated challenges, and future potential. A systematic review of academic literature, case studies, interviews with industry professionals, and comparative analysis of traditional versus digital instruments were conducted. Digital technology has transformed music creation and learning, enhancing accessibility and innovation. However, challenges such as copyright issues, reduced human creativity, and job displacement persist. This paper provides a unique perspective on the integration of IT with musical instruments, offering insights into its evolution, applications, and future possibilities.

Keywords: Technology, Music, IT, AI, Virtual Reality

INTRODUCTION

Music has been an essential part of human culture for centuries, transcending borders and languages to convey emotions, stories, and messages. The music educators and students can get benefit from the technology as a tool to support learning in the three musical processes– creating, performing, and responding to music (Bauer *et al.* 289-301). Over the time, the interplay between music and technology has brought about significant transformations, ushering in a new era of musical innovation. In the ever- evolving landscape of the music industry, the harmonious integration of technology and musical instruments has ushered in a new era of creativity and innovation. Information technology, with its rapid advancements, has become a powerful force reshaping the way musicians compose, produce, and perform. This review delves into the multifaceted relationship between digital technology and music

**Kaushik Banerjee**

instruments, exploring the profound impact it has had on the artistry, accessibility, and functionality of musical expression. The fusion of technology and traditional musical instruments has given rise to a spectrum of possibilities, enriching the musical experience for both creators and audiences alike. From the invention of electronic instruments to the incorporation of cutting-edge software in traditional setups, the synergy between music and technology has created an expansive canvas for musicians to explore and redefine their sonic landscapes. Technology allows a musical experience for all skill levels in opportunities never before available to compose manipulate, instantly listen to music electronically and even print standard Western music notation for others to play without having to know much about traditional music theory or notation (Freedman *et al.*). Additionally, the advent of smart instruments, equipped with sensors and connectivity features, has further expanded the horizon of interactive and responsive musical performance. Beyond the realm of instruments themselves, digital technology has revolutionized the way music is produced, recorded, and distributed. Digital audio workstations (DAWs), virtual instruments, and advanced recording technologies have empowered musicians to create studio-quality compositions from the comfort of their homes. Moreover, the advent of cloud-based platforms and streaming services has democratized the dissemination of music, allowing artists to reach global audiences without the constraints of traditional distribution channels. As we navigate the symphony of technology and music, this review aims to dissect the various facets of this transformative relationship. From exploring the influence of artificial intelligence in music composition to dissecting the impact of augmented reality on live performances, we will traverse the dynamic landscape where digital technology converges with musical instruments, propelling the art form into uncharted territories of creativity and expression. On this harmonious journey, we unravel the intricate notes that compose the contemporary melody of music and technology.

Relevance of Music Instrumental with IT

The evolution of music instruments, intertwined with the ever-advancing landscape of digital technology, has been a transformative journey that echoes across the annals of musical history. This review embarks on a chronological exploration of the pivotal moments and milestones in the amalgamation of music and technology. From the early experiments with electronic sound to the present day digital symphony, this historical retrospective seeks to unravel the intricate tapestry that has woven digital technology into the very fabric of musical expression. The inception of the electronic era in music instruments can be traced back to the early 20th century. Innovations such as the Theremin, developed by Léon Theremin in 1920, marked a departure from the traditional acoustic instruments by harnessing the principles of electronics to produce novel sounds. Subsequent decades witnessed the rise of the analog synthesizer, exemplified by the Moog synthesizer in the 1960s, which became a trailblazer in the integration of technology into the composition and performance of music. The advent of microprocessors in the 1970s and 1980s heralded a new era in music technology. This period witnessed the birth of digital synthesizers and drum machines, introducing a level of precision and versatility previously unattainable. The Yamaha DX7, launched in 1983, emerged as a pioneer in digital synthesis, setting the stage for a digital revolution that would reshape the landscape of music creation. As we entered the late 20th century, the rise of personal computing marked a watershed moment in the role of digital technology in music. Digital Audio Workstations (DAWs) became instrumental in music production, allowing composers and producers to manipulate and arrange sounds with unprecedented flexibility. The MIDI (Musical Instrument Digital Interface) standard, established in the early 1980s, facilitated communication between various instruments and computers, laying the foundation for seamless integration in music creation. This historical review endeavors to illuminate the key junctures in the symbiotic relationship between digital technology and music instruments. Through the lens of time, we witness the harmonious progression from analog experimentation to the digital orchestration of melodies, underscoring the profound impact that technology has had on shaping the very essence of musical expression. On this historical odyssey, we traverse the transformative epochs that have sculpted the intersection of music and digital technology into the symphony we experience today.

Transformative Impact on Composition and Performance**Digital Instruments**

Digital instruments, underpinned by DSP technology, have redefined the sonic palette available to musicians. Instruments such as synthesizers, digital pianos, and electronic drums offer unparalleled flexibility in sound generation and manipulation. Musicians can access a vast library of sounds and effects, allowing for customized

**Kaushik Banerjee**

sonic identities. Additionally, digital instruments seamlessly integrate MIDI technology, enabling precise control over composition and performance (Ellis *et al.* 1997).

Computer-Assisted Composition

IT has left an indelible mark on the composition process. Composers now wield powerful Digital Audio Workstations (DAWs), equipped with tools for composition, arrangement, recording, and production. Algorithms and machine learning have emerged as valuable aids for generating music, pushing the boundaries of traditional music genres (Ellis *et al.*)

Real-Time Performance Technologies

Live performances have undergone a paradigm shift with the integration of IT. Musicians can seamlessly incorporate electronic elements into their shows through the use of MIDI controllers, software-based instruments, and effects processors. Gesture-based control systems and sensor interfaces have enhanced live performances, allowing for interactive and expressive engagement with the audience.

AI in Music

Artificial Intelligence (AI) has disrupted conventional notions of composition and performance. AI algorithms analyze extensive music datasets, learn from them, and generate original compositions. AI-powered instruments and virtual musicians are being developed, enabling real-time collaboration between humans and AI entities. This amalgamation of human creativity and machine-generated music has ushered in a new era of musical exploration (Gioti *et al.*)

Challenges

The integration of IT in music instrumental, while transformative, brings forth several challenges:

Technological Standardization and Compatibility

As technology evolves, a significant challenge lies in maintaining standards and compatibility across diverse platforms and devices. Incompatibility issues between different hardware and software can impede the seamless integration of digital instruments and technologies, hindering collaborative efforts and limiting accessibility.

Learning Curve for Musicians

The rapid pace of technological advancement introduces a steep learning curve for musicians, particularly those accustomed to traditional instruments. Adapting to new interfaces, software, and electronic instruments can be time-consuming, potentially discouraging musicians from embracing innovative technologies in their creative process.

Affordability and Accessibility

Cutting-edge music technology often comes with a hefty price tag, making it less accessible to a broad spectrum of musicians. This financial barrier may hinder the democratization of advanced instruments and tools, creating disparities in access between established professionals and aspiring artists.

Intellectual Property and Copyright Concerns

The digital nature of music in the Information Age raises intricate issues concerning intellectual property and copyright. As musicians leverage technology for sampling, remixing, and creating, the delineation of ownership and fair use becomes a complex and contentious arena.

Overreliance on Technology in Creativity

While technology enhances musical capabilities, there is a risk of overreliance, leading to a potential dilution of authentic artistic expression. The challenge is to strike a balance where technology augments creativity without overshadowing the artist's unique voice and musical identity.

**Kaushik Banerjee****Cybersecurity Threats**

With the increasing connectivity of musical instruments to networks and the internet, the vulnerability to cyber threats rises. Ensuring the security of digital instruments and the data they generate becomes imperative, especially in live performances and studio settings.

Cultural Preservation and Evolution

The infusion of technology into music brings about a tension between preserving traditional cultural music and embracing technological evolution. Striking a balance that respects cultural roots while fostering innovation poses a nuanced challenge. This critical review aims to shine a spotlight on the challenges inherent in the intersection of digital technology and music instruments. Understanding and addressing these challenges are paramount to ensuring that the evolving symphony of technology and music remains inclusive, sustainable, and true to the artistic spirit.

Scope

The synthesis of digital technology and music instruments has ushered in an era of unprecedented creativity, innovation and transformation within the realm of musical expression. This review seeks to delineate the vast scope of this symbiotic relationship, exploring the myriad ways in which digital technology continues to reshape the landscape of music instruments and their roles in composition, production and performance.

Evolution of Digital Instruments

The scope encompasses the ongoing evolution of digital music instruments, from synthesizers and electronic drums to smart instruments equipped with advanced sensors and connectivity features (Fautley *et al.* 29-42). This evolution not only extends the possibilities for sound creation but also offers novel interfaces for musicians to interact with their instruments.

Advancements in Music Production Technologies

Information technology plays a pivotal role in revolutionizing music production processes. Digital Audio Workstations (DAWs), virtual instruments, and real-time collaborative tools have transformed the studio environment, enabling artists to produce, edit, and collaborate on music with unprecedented efficiency and creativity (Giraldo *et al.* 334).

Artificial Intelligence and Music Composition

The integration of artificial intelligence in music composition presents a vast frontier. AI algorithms are increasingly being used to generate musical compositions, pushing the boundaries of creativity and challenging conventional notions of authorship. The scope here extends to exploring the potential and ethical implications of AI in shaping musical narratives (Gioti).

Integration of Internet of Things (IoT) in Instruments

The scope encompasses the integration of the Internet of Things in musical instruments, allowing for enhanced connectivity and communication. Smart instruments, equipped with IoT capabilities, can exchange data, adapt to user preferences and even connect with other devices in a networked musical ecosystem (Tiwary *et al.* 23-27).

Education and Learning Platforms

Information Technology facilitates innovative approaches to music education. Online platforms, interactive tutorials and virtual music lessons extend the scope of learning beyond traditional boundaries, making music education more accessible and inclusive. VI. Global Collaboration and Remote Music Production The scope of digital technology in music instruments extends to global collaboration. Musicians from different parts of the world can collaborate in real-time, breaking down geographical barriers and fostering a diverse and interconnected global music community (Turchet *et al.*).

Kaushik Banerjee

Cultural Fusion and Innovation

The scope includes the exploration of how technology fosters cultural fusion in music. Digital instruments provide a platform for artists to experiment with diverse musical traditions, leading to the creation of innovative genres that reflect a globalized and interconnected world. This comprehensive review endeavors to explore the expansive scope of the role of digital technology in music instruments. From the evolution of instruments themselves to the broader impact on music creation, production, and consumption, the review aims to capture the dynamic and transformative nature of this ongoing symphony between technology and musical expression.

CONCLUSION

The fusion of Information Technology and music instrumental represents a profound transformation in the world of music. From the emergence of digital instruments to the integration of AI in composition and performance, IT has reshaped the creative landscape. While challenges like copyright and job displacement must be addressed, the scope for future advancements is immense. Augmented reality, collaborative AI music, and music education stand as testament to the boundless potential of IT in music instrumental. As we navigate this evolving terrain, musicians, composers, and technologists must collaborate to ensure that technology enhances, rather than diminishes the beauty and depth of human expression in music.

ABSTRACT

Medicinal plants are a valuable source of pharmacological effects, offering new possibilities for anti-infections, antioxidants, and anti-cancer agents. These plants contain bioactive constituents such as steroids, terpenoids, carotenoids, flavonoids, alkaloids, tannins, and glycosides, which serve as important starting materials for drug development. While traditional medicines and medicinal plants have long been used in developing countries for health maintenance, modern pharmacopoeia now includes at least 25% drugs derived from plants, as well as synthetic analogs based on plant-derived chemical substances. The use of medicinal plants has gained momentum due to the high costs of prescription drugs and the search for new plant-based drugs. In India, the ayurvedic system features numerous medicinal remedies derived from plants, and studying their morphological, pharmacological, and pharmacognostical characteristics can enhance our understanding of their active principles and modes of action. However, many tropical plants have not been thoroughly studied for their chemical constituents. Therefore, our focus is on the phytochemical aspects of selected indigenous plants of India, such as *Crossandra infundibuliformis*. We aim to investigate the preliminary phytochemical screening, quantify phytochemicals, analyze phyto compounds using GC-MS, assess DPPH-radical scavenging activities, and conduct in vitro cytotoxicity analysis through MTT-assay.

Keywords: *Crossandra infundibuliformis*; Antioxidants; Phytochemicals; Medicinal plants, Cervical cancer.

Selvakumar

INTRODUCTION

Plants are the source of medication for preventive, curative, protective or promotive purposes [1]. Plant-derived foods help in the prevention of lifestyle-associated diseases. Several groups of constituents in plants have been identified as potentially health-promoting in animal studies, including cholesterol-lowering factors, antioxidants, enzyme inducers, and others. A thousand years ago an extensive use of plants as medicines was reported and was initially taken in the form of crude drugs and other herbal formulations. Hence it is of interest to investigate the phytochemical and pharmacological efficacy of the plant is of paramount importance it may provide many emerging insights [2]. *Crossandra infundibuliformis* belongs to the family of Acanthaceae. It is a plant that is important in the South Indian horticulture industry. This plant is found abundantly in tropical areas such as India and Sri Lanka. It grows 2m in height and can withstand high temperature which makes it to survive in very high humidity. Due to its medicinal value, various parts of this plant are used for many types of treatment. The leaf extract shows significant hepatoprotective effects. It is also found that *C. infundibuliformis* shows very good anti-corrosive properties. Its antibacterial, and antioxidant activity was reported and very less work has been done regarding *C. infundibuliformis* phytochemical values. Hence, it is of interest to investigate the preliminary phytochemical analysis of n-hexane, petroleum ether and butyl alcohol extracts of whole plant of *C. infundibuliformis*.

MATERIALS AND METHODS

Collection of Samples

For this study, the aerial parts of the plant *Crossandra infundibuliformis* were utilized as the medicinal plants.

Preparation of Extracts

To extract the samples, 500 grams of dried powder from the aerial parts of the plant material were separately packed in round bottom flasks. Different solvents, namely ethanol, methanol, chloroform, ethyl acetate, and water, were used for sample extraction. Each solvent (750 ml) was used for a 24-hour extraction period. After the extraction, the solvents were concentrated under reduced pressure, and the resulting crude extracts were stored in a refrigerator.

Phytochemical Analysis

The prepared extracts were subjected to analysis to determine the presence of alkaloids, saponin, tannins, steroids, flavonoids, anthraquinone, cardiac glycosides, and reducing sugars. The analysis was conducted based on established protocols found in the literature [3-8].

Test for Alkaloids

To test for alkaloids, the crude dry powder extract from each solvent was evaporated to dryness using a boiling water bath. The residues were then dissolved in 2 N Hydrochloric acid. The resulting mixture was filtered and divided into three equal portions. Mayer's reagent, Dragendorff's reagent, and Wagner's reagent were added to each portion respectively. The formation of a creamish precipitate, orange precipitate, or brown precipitate indicated the presence of the respective alkaloids.

Test for Saponins

To test for saponins, approximately 0.5 g of the plant extract was shaken with water in a test tube and heated to a boil. The observation of frothing was considered as preliminary evidence for the presence of saponins.

Test for tannins

To test for tannins, approximately 0.5 g of the extract was added to 10 ml of water in a test tube and filtered. A few drops of 0.1% ferric chloride were then added, and the mixture was observed for the development of a brownish-green or blue-black coloration.

**Selvakumar****Steroid Test**

The methanol extract of each sample was mixed with acetic anhydride and sulphuric acid. In some samples, the color changed from violet to blue or green, indicating the presence of steroids.

Flavonoid Test

The extract solution was treated with a methanol solution and warmed. Metal magnesium was added, followed by a few drops of concentrated hydrochloric acid. The presence of flavonoids was indicated by a red color, while orange color indicated the presence of flavonols.

Anthraquinone Test

The extract was mixed with chloroform and shaken. After filtration, the filtrate was shaken with ammonia solution. The presence of anthraquinones was indicated by a pink, violet, or red color in the ammoniacal layer.

Cardiac Glycoside Test

The extract was dissolved in glacial acetic acid containing ferric chloride solution. Concentrated sulphuric acid was then added. The presence of a deoxy sugar characteristic of cardiac glycosides was indicated by a brown ring at the interface.

Protein Test

The protein solution was mixed with NaOH solution and drops of CuSO₄ solution. The presence of peptide linkage was indicated by a violet color.

Test for Amino Acids

2ml of the sample was added to 2ml of Ninhydrin reagent and kept in a water bath for 20 minutes. The appearance of purple color indicated the presence of amino acids in the sample.

Test for Tri-Terpenoids

5ml of each extract was added to 2ml of chloroform and 3ml of con. H₂SO₄ to form a monolayer of reddish brown coloration of the interface was shown to form positive results for the terpenoids.

Test for Triple Sugars

To 2 ml of extract 2 drops of Molisch's reagent were added and shaken well. 2ml of concH₂SO₄ was added to the sides of the test tube. A reddish-violet ring appeared at the junction of two layers immediately indicating the presence of carbohydrates.

Test for Polyphenols

2ml of the sample was added to 2ml of ferric chloride solution and kept in room temperature. The appearance of violet color indicated the presence of phenolic compounds in the sample.

Quantification of Phytochemicals

The analysis included determining the total phenolic content, total tannin content, total alkaloid content, and total flavonoid content [9-21].

Determination of Total Alkaloid Content

To determine the total alkaloid content, a plant extract weighing 1mg was dissolved in dimethyl sulphoxide (DMSO) and mixed with 1 ml of 2N hydrochloric acid. The solution was then filtered and transferred to a separating funnel. Bromocresol green solution (5 ml) and phosphate buffer (5 ml) were added to the mixture. The resulting solution was vigorously shaken with chloroform (1, 2, 3, and 4 ml) and collected in a 10-ml volumetric flask. The volume was then adjusted with chloroform. Reference standard solutions of atropine (20, 40, 60, 80, and 100 µg/ml) were prepared using the same method as described earlier. The absorbance of the test and standard solutions was measured at 470

**Selvakumar**

nm using a UV/Visible spectrophotometer, against the reagent blank. The total alkaloid content was expressed as mg of AE/g of extract.

Measurement of Total Flavonoid Content

The total flavonoid content was determined using the colorimetric assay with aluminum chloride. In a 10 ml volumetric flask, 1 ml of the extract and 4 ml of distilled water were combined. Then, 0.30 ml of 5% sodium nitrite was added to the flask, followed by the addition of 0.3 ml of 10% aluminum chloride after 5 minutes. After another 5 minutes, 2 ml of 1M sodium hydroxide was introduced, and the mixture was diluted to 10 ml with distilled water. Reference standard solutions of quercetin (20, 40, 60, 80, and 100 µg/ml) were prepared in the same manner. The absorbance of the test and standard solutions was measured at 510 nm using a UV/Visible spectrophotometer, against the reagent blank. The total flavonoid content was expressed as mg of QE/g of extract.

Determination of Total Tannin Content

The tannin content was determined using the Folin-Ciocalteu method. A volumetric flask (10 ml) containing 7.5 ml of distilled water and 0.5 ml of Folin-Ciocalteu phenol reagent, 1 ml of 35% Na₂CO₃ solution, and 0.1 ml of the sample extract was prepared. The flask was then diluted to 10 ml with distilled water. The mixture was thoroughly shaken and left at room temperature for 30 minutes. Reference standard solutions of gallic acid (20, 40, 60, 80, and 100 µg/ml) were prepared in the same manner. The absorbance of the test and standard solutions was measured at 725 nm using a UV/Visible spectrophotometer, against the blank. The tannin content was expressed as mg of GAE/g of extract.

The Spectrophotometric Method was Utilized to Determine The Concentration of Phenolics In Plant Extracts.

For the determination of the total phenol content, the Folin Ciocalteu assay method was employed. In a volumetric flask (25 ml), a mixture of 1 ml of extract and 9 ml of distilled water was prepared. The mixture was then treated with 1 ml of Folin-Ciocalteu phenol reagent and thoroughly shaken. After 5 minutes, 10 ml of a 7% Sodium carbonate (Na₂CO₃) solution was added to the mixture. The volume was adjusted to 25 ml. Standard solutions of gallic acid (20, 40, 60, 80, and 100 µg/ml) were also prepared in the same manner. The test and standard solutions were incubated for 90 minutes at room temperature, and their absorbance was measured against the reagent blank at 550 nm using an Ultraviolet (UV)/Visible spectrophotometer. The total phenol content was expressed as mg of GAE/gm of extract.

GC-MS analysis of chloroformic extract of *Crossandra infundibuliformis*.

Preparation of plant extract 25gm of the powdered material of *Crossandra infundibuliformis* was soaked in 95% chloroform for 12hrs. The extract was then filtered through Whatman filter No.41 along with 2gm sodium sulfate to remove the sediments and traces of water in the filtrate. Before filtering, the filter paper was made wet with 95% ethanol along with sodium sulfate. The filtrate was then concentrated by bubbling nitrogen gas into the solution. The extract contained both polar and non-polar phyto-components in the plant material. 2µl of this solution was employed for GC-MS analysis. The herbal powder was extracted with chloroform and analyzed using a GC-M (GC Clarius 500 Perkin Elmer) analyzer. The data were obtained on an Elite-1(100% Dimethyl poly siloxane) column (30 0.25mm 1µmdf). Helium (99.999%) was used as the carrier gas with a flow rate of 1ml/min in the split mode (10:1). An aliquot of 2µl of ethanol solution of the sample was injected into the column with the injector temperature at 250°C. GC oven temperature started at 110°C and held for 2min and it was raised to 200°C at the rate of 10°C/min, without holding. Holding was allowed at 280°C for 9 min with a program rate of 5°C/min. The injector and detector temperatures were set at 250°C and 280°C respectively. The source temperature was maintained at 200°C. The mass spectrum of compounds in samples was obtained by electron ionization at 70 eV and the detector was operated in scan mode from 45-450amu (atomic mass units). A scan interval of 0.5 seconds and fragments from 45 to 450 Da was maintained. The total running time was 36 minutes [22].

Identification of Components

Identification was based on the molecular structure, molecular mass and calculated fragments. Interpretation on mass spectrum GC-MS was conducted using the database of the National Institute Standard and Technology (NIST) having more than 62,000 patterns. The name, molecular weight and structure of the test materials' components were

**Selvakumar**

determined, and the percentage of each component was calculated by comparing its average peak area to the total areas. The spectrum of the unknown component was compared to the spectrum of the component stored in the NIST library version (2005), using Turbomas 5.2 software.

Antioxidant Activity

The determination of antioxidant activity, specifically the DPPH free radical scavenging activity, was conducted in this study. The plant extracts were evaluated based on their ability to scavenge the stable DPPH free radicals. A solution of DPPH in ethanol was prepared and added to the extract solutions with varying concentrations. The mixture was vigorously shaken and allowed to stand for 5 minutes. The absorbance was then measured at 517 nm using a spectrophotometer, with ethanol used as a reference to set the absorbance to zero. A blank sample containing ethanol and DPPH was also prepared. All measurements were performed in triplicate. The percentage of inhibition of DPPH activity was calculated using the formula: $[(AB - AA) / AB] \times 100$, where AA and AB represent the absorbance values of the test and blank samples, respectively [23].

In vitro Assay for Cytotoxicity Activity (3-[4,5-dimethylthiazol-2-yl] -2,5-diphenyltetrazolium bromide assay) (MTT Assay).

The MTT assay, also known as the in vitro assay for cytotoxicity activity, was used to determine the anticancer activity of the samples on PA-1 and Vero cell lines. In this assay, cells were plated in 96-well plates at a density of 1×10^5 cells per well and incubated in a 5% CO₂ incubator for 72 hours. After that, the samples were added at various concentrations in 0.1% DMSO and incubated for 24 hours in the same CO₂ incubator. Following the removal of the sample solution and washing with phosphate-buffered saline (pH 7.4), 20 µl of 0.5% MTT in phosphate-buffered saline solution (5 mg/ml) was added to each well. After a 4-hour incubation, 1 ml of DMSO was added. The absorbance at 540 nm was measured to determine the viability of the cells. The concentration required for a 50% inhibition of viability (IC₅₀) was determined graphically. The effect of the samples on the proliferation of PA-1 and Vero cells was expressed as the percentage of cell viability using the formula: % cell viability = A₅₄₀ of treated cells / A₅₄₀ of control cells $\times 100\%$ [24].

Determination of IC₅₀

The IC₅₀ value, which indicates the concentration of a compound needed to inhibit 50 percent cell growth, was determined by creating a graph of Log (concentration of plant extract) versus % cell inhibition. By drawing a line from the 50% value on the Y axis to intersect the curve and then interpolating to the X axis, the Log value representing the concentration of the compound can be obtained. Taking the antilog of this value gives the IC₅₀ value. The percentage inhibition of novel compounds against all cell lines was calculated using the formula: $(At - Ab) / At \times 100$, where At represents the absorbance of the test, Ab represents the absorbance of the blank media, and Ac represents the absorbance of the control cells. % of cell inhibition = 100 – % cell survival.

RESULTS AND DISCUSSION

Table 1 presents the results of the phytochemical analysis conducted on the n-hexane, butyl alcohol, and petroleum ether extracts of the entire *C. infundibuliformis*. The hexane extract contains alkaloids, flavonoids, saponins, triple sugars, anthraquinones, and cardiac glycosides, while the other secondary metabolites were not detected. On the other hand, the butyl alcohol extract of the plant contains alkaloids, flavonoids, saponins, tannins, triple sugars, anthraquinones, and cardiac glycosides. The petroleum ether extract, on the other hand, contains alkaloids, flavonoids, saponins, tannins, and cardiac glycosides as secondary metabolites. Medicinal plants are known for their inherent active ingredients that have been utilized for treating diseases and alleviating pain [25]. The use of traditional medicines and medicinal plants as therapeutic agents for maintaining health has been widely observed in developing countries [26]. It is worth noting that modern pharmacopeia includes at least 25% of drugs derived from plants, as well as synthetic analogues based on chemical compounds originally isolated from plants. The interest in medicinal plants as a promising healthcare aid has been fueled by the escalating costs of prescription drugs in the

**Selvakumar**

pursuit of personalized health and well-being, as well as the exploration of new plant-derived drugs through bioprospecting [27]. The objective of this study was to analyze the levels of various compounds in the chloroform extract of *C.infundibuliformis*. Figure 1 and Table 2 present the total content of Phenolic compounds, Flavanoids, Alkaloids, and Tannins. The total content of phenolic compounds in the extract, expressed as Gallic acid equivalent, was determined to be $Y=0.001x + 1.993$ and $R^2=0.011$. The range of phenolic compounds in the extract was found to be 2.09 ± 0.48 . Figure 2 and Table 2 display the total content of flavanoids, expressed as Quercetin equivalent, with a concentration of $2.21 \pm 0.91 \mu\text{g/ml}$. Figure 3 and Table 2 show the total content of alkaloids, expressed as Atropine equivalent, with a range of 1.50 ± 0.58 . Figure 4 and Table 2 present the total content of tannins, expressed as gallic acid equivalents, with a variation of 1.95 ± 0.67 . Further research will be conducted in our laboratory to explore the biological and pharmacological effects of the chloroform extract of *C.infundibuliformis*. These findings provide promising prospects for the development of plant-based drugs for various human diseases, including cancer [28]. The antioxidant activity of the chloroform extract from the herbal medicinal plant *C.infundibuliformis* was observed to be dose-dependent. As the concentration of the extract increased, so did the inhibition of radical scavenging activity. In the control group, BHT exhibited inhibition percentages of 38.9, 54.2, 71.1, 74.5, and 99.8 at concentrations of 100, 200, 300, 400, and 500 $\mu\text{g/ml}$ respectively. Similarly, the plant extract showed inhibition percentages of 33.8, 38.9, 49.1, 54.2, and 59.3 at the same concentrations. These findings suggest that the chloroform extract of *C.infundibuliformis* possesses free radical scavenging activity, which can be attributed to the presence of various Phytochemical components including flavonoids, alkaloids, tannins, reducing sugars, cardiac glycosides, and anthraquinones.

The chloroform extract of *Crossandra infundibuliformis* contains 7 phytochemicals such as 1-Hexadecanol, 2-methyl-, E-14-Hexadecenal, Phenol, 2,4-bis(1,1-dimethylethyl)-, E-15-Heptadecenal, Ethanol, 2-(9-octadecenyloxy)-, (Z)-, 9,12,15-Octadecatrienoic acid, 2-[(trimethylsilyl)oxy]-1-[[[(trimethylsilyl)oxy]methyl]ethyl ester, (Z,Z,Z)-, Octasiloxane, 1,1,3,3,5,5,7,7,9,9,11,11,13,13,15,15-hexadecamethyl [29]. Medicinal plants continue to offer humanity new remedies. Therefore, it is crucial to investigate medicinal plants for their safety, quality, toxicity, appropriate dosage of plant materials, and effectiveness. Plants' natural products possess various biological activities, including antioxidant and anti-inflammatory properties. Medicinal plants are abundant in active phytochemical compounds with diverse biological activities. Researchers are highly interested in studying plants to discover novel active drugs that can replace synthetic drugs currently available in the market. The presence of these plant constituents serves as a natural source for modern medicine. Consequently, the cytotoxic levels of medicinal plants must also be assessed against host cells. The safety of plants as potential therapeutic agents must be confirmed, and any side effects should be acceptable to the host. Bioactive compounds that have little to no toxic effects on the host are ideal candidates for drug formulation [30]. Figure 8-10 illustrates the percentage viability of a chloroform extract of *C.infundibuliformis* on Vero and human prostate cancer cell lines. The MTT assay was utilized to analyze cytotoxicity and measure cell proliferation in response to various factors. This assay is also useful for evaluating the effects of cytotoxic and cytostatic compounds, including anticancer drugs. Safety is a crucial consideration in the development of new drugs derived from bioactive compounds found in plants, as some of these compounds can be toxic to our normal system [31-32]. In this particular study, the cytotoxic effect of the chloroform extract of *C.infundibuliformis* was investigated on Vero and human prostate cancer cell lines at concentrations ranging from 100–500 $\mu\text{g/mL}$. The results, depicted in figure 9 and 10 demonstrated that the chloroform extract had a toxic effect on both cell lines at the higher concentration of 500 $\mu\text{g/mL}$. The cells' morphology also changed from a fibroblast shape to an oval shape due to the extract's toxicity. However, at lower concentrations (100 $\mu\text{g/mL}$), the chloroform extract exhibited more than 90% cell viability after 24 and 48 hours of exposure.

ABSTRACT

Reading inspirational literature enables the readers to explore new ideas and complex emotions and it also produces a kind of reality simulation that runs on the minds of the readers just as a computer simulation. Books on inspirational literature will improve the reading habit and inculcate soft skills in students at tertiary level. Graduates of today need to meet the requirements of the corporate world and sustain in their career. The study explores the main ideas of the select works to prove the prevalence of soft skills in them which help them deal with difficult situations in their lives. By highlighting the positive elements in the chosen works, otherwise called soft skills, the study helps the readers realise the fact that there is a Frederick Henry and a Santiago in every individual and the discovery of the potential in them enhances their personal qualities for an enhanced personal and professional life.

Keywords: Reading habit, inspirational literature, life skills, self-motivation and visualization.

INTRODUCTION

Reading skill is vital for any human being to function, contribute and develop in today's society. There is strong evidence that reading plays a vital role in improving one's perception about life, personal achievements, educational outcomes etc. Educational researchers have found a correlation between reading and personality development. Reading habit helps the readers to nourish and stimulate their minds and keep the mental faculties sharp and intact. It builds empathy and improves the well-being of the mind. According to a recent research, people who read regularly are on an average happier and more satisfied in life. Smith & Robinson (1980) define reading as an active attempt on the part of a reader to understand a writer's message. According to Toit (2001) reading is the process of

**Kanchana Mala**

thinking, recalling and relating concepts under the functioning of written words. Devarajan (1989) defines reading as the art of interpreting printed and written words. Irvin (1998) describes the reading process as the interaction of what is in the head with what is on the page within a particular context that causes students to comprehend what they read. The importance of regular reading is undeniable, particularly, in higher education where texts are the main sources of information. Thus, reading is the ability to recognise and examine words or sentences and understand the information within. It is a cognitive process of understanding a written linguistic message and to examine and grasp the meaning of written or printed words.

People read for different reasons and purposes, some of which include pleasure, leisure, relaxation, information and knowledge. Reyhene (1998) observes that when children read for pleasure, they involuntarily and unconsciously improve their language skills. Bignold (2003) indicates that the habit of reading improves children's reading skills. Hence, the issue of reading whether it is for learning or leisure is important since it helps broaden young people's experiences and knowledge says Green (2002). Reading habit contributes to psychological traits such as the ability to concentrate and strong self-discipline. Since reading opens a window to the world, it allows the reader to adapt easily in a variety of social situations. Reading is an important communicative process and reading skill is required for academic and professional progress. It is an important gateway to personal development, and to social, economic and civic life (Holden, 2004). It allows one to learn about other people, about history and social studies, language, arts, science, mathematics, and the other content subjects that must be mastered in school (Lyon 1997). Huey (1968) defines reading as the complicated working of the human mind. Students, who read actively and frequently, improve their comprehension of text as a consequence (Cipielewski & Stanovich 1992).

Reading often can increase sight word recognition, vocabulary, fluency, text comprehension, as well as knowledge (Morgan & Fuchs 2007). Studies show that students who like to read score better in most subjects than students who do not like to read (Krashen 2004). Students who struggle with reading, often avoid the discomfort by choosing not even to try. Several researches show that the more the students read, the better they read and the more pleasure they get out of reading for, it lowers stress levels, encourages positive thinking and strengthens relationship. Reading inspirational literature enables the readers to explore new ideas and complex emotions and it also produces a kind of reality simulation that runs on the minds of the readers just as a computer simulation. Books on inspirational literature are used for the present study to improve the reading habit and inculcate soft skills in students at tertiary level. Graduates of today need to meet the requirements of the corporate world and sustain in their career. So, in order to improve their expertise to face the job market and also enhance their personal skills, inculcating soft skills in them is the foremost objective of modern curriculum. Soft skills are a cluster of productive personality traits that characterise one's relationships in a milieu. Soft skills may include an individual's ability for leadership, his or her oral and written communication, the willingness and aptitude for team-work, aptitude for conflict resolution and problem solving, the ability and willingness to learn, and the work ethics (Case 1998; Fann & Lewis 2001; Nelson et al. 2001; Taylor 2005a). They are vital for personal well-being and also form an important part of an individual's contribution to the success of an organisation.

Soft skills are increasingly sought out by employers in addition to standard qualifications. In the workplace, soft skills are considered as complement to hard skills. Soft skills are vital for all graduates regardless of their field of study. It is necessary for them to get acquainted with the behavioural skills of the work place as Stephen Johnston and Helen McGregor (2005) view. Modern professional practice requires not only the recognized technical skills, but also high-level of generic or soft professional skills. Recent professional laxity claims suggest that technically well-qualified professionals with deficiencies in these generic skills may fail to effectively identify and satisfy client requirements. Soft skill is an abstract concept, which is, in fact, a compendium of several components like attitude, abilities, habits and practices that are combined adeptly to maximise one's work effectiveness (Ramesh Gopalasway & Ramesh Mahadevan 2010). Roselina (2009) argues that soft skills are quite different as compared to core or hard skills that tertiary students need to acquire and master. Hard skills are those that are needed to perform a particular job. These often vary depending on the type of role that will be performed or the industry will be looking for. They can usually be developed through studying and training. Compared to soft skills, hard skills are normally easy to

**Kanchana Mala**

observe and evaluate because they involve specific skill sets related to the particular job of a worker (Pool & Sewell 2007). Hard skills are very much related to the technical procedures based on the core business of an organisation and they can be administrative. Books on inspirational literature contain stories of people who overcome adversity and reach new levels of success that inspire and encourage readers to follow the lessons they carry. The genre inspirational literature is meant to uplift critical thinking as well as provide entertainment to the readers. It requires more than just a positive character; it requires encouragement and the ability to inspire others with the realisation that they can do great things and be better people. Books on inspirational literature have been read and followed by people right from their primary education to higher education periods. While reading great literature is a privilege for some, others consider it difficult, time-consuming and inherently stodgy.

But most will agree that the more effort invested in reading books on inspiration, the greater the return and it can earn high yields in one's career and personal life. Understanding the actions of the characters in these texts will open the inner resources of a person's intuition, logic and potential. In the present world of technological advancement, the study of humanities is essential since civic responsibilities from ethics to moral intelligence are lacking more than ever before. The superhighway of information overload is a crippling side-effect from the insatiable hunger for the most current news, trend, or market flinch and to "turn-off" is becoming more difficult. Be it family, workload, financial constraints, or other personal reasons, the crucial point to live life in the present for a better tomorrow makes a person free and a fuller human being. The anxiousness to be always doing something and the inability to be alone with oneself is a detriment. Business has reached extraordinary levels of competition, appropriate educational qualifications, and prolific work experience. Though reading literature does not reconcile the financial statements for an annual report, maximise a profit margin or re-align a product campaign, the values and insights that the reader glean from inspirational literature sensitise themselves to problems inherent in managing people at home or in an organisation. Reading great literature can start one's journey to enlightened mind and spirituality thereby prepares an individual to face the challenges of modern life. It provides a moral imagination with interaction. It is a supplement to elevate the worldly intuitiveness and rationality. The reflections upon the actions and consequences literary figures have on their attitudes, beliefs, and concerns will always encapsulate the desire for power, self-esteem, freedom, solidarity and virtue. It is the practicality towards the human condition that can be assimilated and aggregated into the profession and personal leisure of the reader. Books written by writers like Robin Sharma are helpful in the comparison of literary works to the everyday corporate contexts.

CONCLUSION

Though students at the tertiary level possess certain people skills due to their background and exposure, they are inadequate to impress the recruiters. The corporate sectors seek and opt for candidates who not only have the requisite academic qualifications but also soft skills to function in the competitive corporate setting where they have to deal with people of different culture. So, training in soft skills has become compulsory for today's graduates. Universities and colleges all over the world adopt many training techniques considering the industrial scenario and to cater to the needs of students. Training in soft skills is one such indispensable part of academics that helps students become dynamic in their career. An important inquiry here is whether traits like team leadership, team building, assertiveness, perseverance, strategic planning, facilitating, mentoring, learning from criticism, conflict resolution and diversity awareness can be taught. The answer is 'yes'. It is possible by choosing an appropriate mode of training depending on the level of the students. The method of teaching must show some variation from the regular pedagogical methods like delivery of lectures and demonstration of concepts and themes. A different approach is needed for creating interest among the students. Soft skills training accompanied by reading and performing activities will definitely help the students acquire the skills easier and perform better. As lecturing method continues to be the most popular method of teaching, it should also be a part of the training. One of the best ways to acquire soft skills is reading books on literature especially inspirational literature. Unlike training drives or lecture on soft skills, reading inspirational literature offers cues and invites readers to draw their own inferences. By engaging the reader in drawing inferences about what characters in the stories are feeling, inspirational literature is

Kanchana Mala

very much like a conversation and introspection into one's own self. Learning about the inner states of others through reading inspirational literature will prompt the readers to explore themselves and improve their personalities and, in the process, they become more open and aware of other people's feelings. This helps in enhancing their soft skills. Reading also gives the opportunity of exploring the subjective world of its characters and provides social expertise to the readers. The style and figurative expressions used in any work of literature put the reader through an emotional experience similar to that of the protagonist. Like dance or music, inspirational literature offers a distinct experience to the reader which is beyond comparison. Hence, reading can be considered one of the best ways to acquire people skills or soft skills. Literature, which is a mirror of human lives, can be used in classrooms to introduce and enhance the students' knowledge of soft skills. Since it distinguishes itself from other types of academic discourse, literature urges the reader to adopt an interactive approach to acquire soft skills or people skills. It can familiarise students with the formation and function of sentences, the different ways of connecting ideas and provide a good training ground for improving reading skills and soft skills. Reflecting on the central role of life experiences in shaping one's self-concept, attitudes, and behaviors, Hayakawa an educational researcher suggests that literature has the ability to produce profound changes in individuals by affording them the experience of an almost infinite number of alternative lives and personas. Hence, reading motivational literature that emphasises on the virtues of possessing soft skills will really bring a change in the attitude of the readers leading to a positive and permanent transformation in them.

ABSTRACT

This article examines a clear explanation about the various properties of Intuitionistic $(gg)^*$ - closed sets with the use of $i(gg)^*$ - closure and $i(gg)^*$ - interior. As such, this research informs understandings of basic results of $i(gg)^*$ -closed sets. Introduction to $i(gg)^*$ - continuous function has played a major role with its unique properties and equivalent conditions. Ultimately this study aims to cultivate a more profound comprehension of $i(gg)^*$ - continuous function.

Keywords: $i(gg)^*$ -closed, $i(gg)^*$ - open, $i(gg)^*$ - closure, $i(gg)^*$ - interior

INTRODUCTION

Topology in mathematics is the study of spaces and characteristics that are maintained under constant deformations, such as stretching, crumpling, and bending, but not tearing or adhering. This field 'Topology' developed as a study out of geometry and set theory, through analysis of concepts such as space, dimension and transformation. The study of generalized closed sets was introduced by Levine in 1970 [1] "Intuitionistic set" is a concept in topological space was came into existence because of Coker [2] in 1996. Further he developed the concept with the use of intuitionistic point [3] and investigated some fundamental properties of closed sets in intuitionistic topological space. In 2009, it was further investigated and J.Younis Yaseen and G.Asmat Raouf [4] has given some results in intuitionistic generalized closed sets in topological spaces. In 2019,[5] several new generalization of nano open sets has been

Hari Siva Annam and Pavithra

introduced and discovered many results by Nethaji, Ochanan. Further G.Hari siva annam and S.Pavithra [6] has introduced intuitionistic generalization of generalized star closed sets in intuitionistic topological space in a proceeding where the igg^* is compared with various intuitionistic sets.

Continuity is a important concept in mathematics and many forms of continuous functions have been introduced over the years. The generalized continuity (briefly g - continuity) was studied by Balachandran, et.al.,(1991). With the aid of g -open sets many topologist have introduced and investigated various continuous functions which are the core concept of topology. In this regard, many topologists have enriched the field of generalized closed sets to a considerable extend through their detailed study. J.G.LEE, P.K.Lim, J.H.Kim,K.Hur [7] introduced intuitionistic continuous, closed and open mapping, where many results were discovered and gave identity to many more new theorems. The concept of contra continuity via soft lattice topological spaces [8] was introduced in 2024 by G.Hari Siva Annam and T.Abinaya where these results gives a pathway for contra continuity. Further it was developed in this paper as intuitionistic generalization of generalized star (shortly $i(gg)^*$)continuous and discussed many ideas which evolved as a new discovery.

PRELIMINARIES

Definition 2.1 Let X be an non-void set. An intuitionistic set (IS for short) A is an object having the form $A = \langle X, A_1, A_2 \rangle$ where A_1 and A_2 are subsets of X satisfying $A_1 \cap A_2 = \emptyset$. The set A_1 is called the set of members of A , while A_2 is called the set of non members of A .

Definition 2.2 Let X be a non-void set and let A, B are intuitionistic sets in the form $A = \langle X, A_1, A_2 \rangle, B = \langle X, B_1, B_2 \rangle$ respectively. Then

- (a) $A \subseteq B$ iff $A_1 \subseteq B_1$ and $A_2 \supseteq B_2$.
- (b) $A = B$ iff $A \subseteq B$ and $B \subseteq A$.
- (c) $A^c = \langle X, A_2, A_1 \rangle$
- (d) $[] A = \langle X, A_1, A_1^c \rangle$
- (e) $A - B = A \cap \bar{B}$
- (f) $\emptyset_\sim = \langle X, \emptyset, X \rangle, X_\sim = \langle X, X, \emptyset \rangle$
- (g) $A \cup B = \langle X, A_1 \cup B_1, A_2 \cap B_2 \rangle$
- (h) $A \cap B = \langle X, A_1 \cap B_1, A_2 \cup B_2 \rangle$.

Definition 2.3 An intuitionistic topology (for short IT) on a non empty set X is a family I_τ of IS in X satisfying the following axioms.

- (1) $\emptyset_\sim, X_\sim \in I_\tau$
- (2) $G_1 \cap G_2 \in I_\tau$, for any $G_1, G_2 \in I_\tau$
- (3) $\cup G_\alpha \in I_\tau$ for any arbitrary family $\{G_i: G_\alpha/\alpha \in J\} \subseteq I_\tau$ where (X, I_τ) is called an intuitionistic topological space (for short ITS(X)) and any intuitionistic set in I_τ is called an intuitionistic open set (for short IOS) in X . The complement A^c of an IOS A is called an intuitionistic closed set (for short ICS) in X .

Definition 2.4 Let (X, I_τ) be an intuitionistic topological space (for short ITS(X)) and $A = \langle X, A_1, A_2 \rangle$ be an IS in X . Then the interior and closure of A are defined by

- (1) $Icl(A) = \cap \{K : K \text{ is an ICS in } X \text{ and } A \subseteq K\}$
- (2) $Iint(A) = \cup \{G : G \text{ is an IOS in } X \text{ and } G \subseteq A\}$.

It can be shown that $Icl(A)$ is an ICS and $Iint(A)$ is an IOS in X and A is an ICS in X iff $Icl(A) = A$ and is an IOS in X iff $Iint(A) = A$.

Definition 2.5 Consider an intuitionistic set A of a non -void set X and $a \in X$.

$a_I = (\{a\}, \{a\}^c)$ is an intuitionistic point (IP) and $a_{IV} = (\emptyset, \{a\}^c)$ is a vanishing point of X .
IP(X) is a set of all intuitionistic points or intuitionistic vanishing point in X .

Definition 2.6 Let (X, I_τ) be an ITS(X). An intuitionistic set A of X is said to be

- (1) Intuitionistic semi-open if $A \subseteq Icl(I\,int(A))$.
- (2) Intuitionistic pre-open if $A \subseteq Iint(Icl(A))$.

- (3) Intuitionistic regular-open if $A = Iint(Icl(A))$.

The family of all intuitionistic (semi-open, pre-open, regular-open) of (X, I_τ) are denoted by ISOS, IPOS, IROS respectively.

Definition 2.7 [4] Let a subset A of an intuitionistic topological spaces (X, I_τ) is called an intuitionistic generalized closed set (briefly $i\,g$ -closed) if $i\,cl(A) \subseteq U$ whenever $A \subseteq U$ and U is an intuitionistic open in (X, I_τ) .

Definition 2.8 [9] Let a subset A of an intuitionistic topological spaces (X, I_τ) is called an intuitionistic regular generalized closed set (briefly $i\,rg$ -closed) if $i\,cl(A) \subseteq U$ whenever $A \subseteq U$ and U is an intuitionistic regular open in (X, I_τ) .

Definition 2.9 [6] A intuitionistic subset A of an intuitionistic topological space (X, I_τ) is called an intuitionistic generalization of generalized star closed sets ($i\,(gg)^*$ -closed) if $ircl(A) \subseteq U$ whenever $A \subseteq U$ and U is $i\,(gg)$ open in (X, I_τ) . The collection of all $i\,(gg)^*$ -closed sets in (X, I_τ) is denoted by $i\,(gg)^*C(X)$.

Definition 2.10 [6] i) Every intuitionistic regular closed set is $i\,(gg)^*$ -closed.

ii) Every $i\,(gg)^*$ closed set is $i\,g$ -closed (resp. $i\,g^{**}$ -closed, $i\,gr$ -closed, $i\,gr^*$ -closed, $i\,rg$ -closed).

Definition 2.11 [6] The arbitrary union of two $i\,(gg)^*$ -closed sets of (X, I_τ) is $i\,(gg)^*$ -closed.

Definition 2.12 For an ITS (X, τ) and A is a subset of X . The class $\tau_A = \{(G_T \cap A, G_F \cap A) : G = (G_T, G_F) \text{ and } \{G \in \tau\} \text{ is an IT on } A\}$ is called the relative IT on A or the relativization of τ to A and the ITS (A, τ_A) is called an intuitionistic topological subspace of (X, τ) .

Intuitionistic $(gg)^*$ Closure

Definition 3.1 Let A be an intuitionistic subset of an ITS of (X, I_τ) . Then $i\,(gg)^*$ closure of A is defined as the intersection of all $i\,(gg)^*$ -closed set of (X, I_τ) containing A . It is denoted by $I\,(gg)^*cl(A)$.

Theorem 3.2 If A and B are $i\,(gg)^*$ -closed, then $A \cap B$ is $i\,(gg)^*$ -closed.

Proof: Let A and B are $i\,(gg)^*$ -closed sets and $A \cap B \subseteq U$, U is $i\,gg$ -open. Suppose $ircl(A \cap B) \not\subseteq U$ then $ircl(A) \not\subseteq U$ and $ircl(B) \not\subseteq U$. This implies $A \cap B \not\subseteq U$. Hence $ircl(A \cap B) \subseteq U$.

Theorem 3.3 If A and B are an intuitionistic subsets of an ITS of (X, I_τ) then

- i) $i\,(gg)^*cl(X_\sim) = X_\sim$, $i\,(gg)^*cl(\emptyset_\sim) = \emptyset_\sim$
- ii) $A \subseteq i\,(gg)^*cl(A)$
- iii) If B is any $i\,(gg)^*$ -closed set containing A then $i\,(gg)^*cl(A) \subseteq B$
- iv) If $A \subseteq B$ then $i\,(gg)^*cl(A) \subseteq i\,(gg)^*cl(B)$
- v) $i\,(gg)^*cl(A) = i\,(gg)^*cl(i\,(gg)^*cl(A))$
- vi) $i\,(gg)^*cl(A \cup B) = (i\,(gg)^*cl(A) \cup i\,(gg)^*cl(B))$

Proof i), ii), iii), iv), v) are straightforward.

vi) Let A and B be subsets of (X, I_τ) . Clearly $A \subseteq A \cup B$ and $B \subseteq A \cup B$. From iv) $(i\,(gg)^*cl(A) \cup i\,(gg)^*cl(B)) \subseteq i\,(gg)^*cl(A \cup B)$. Now we have to prove that $i\,(gg)^*cl(A \cup B) \subseteq (i\,(gg)^*cl(A) \cup i\,(gg)^*cl(B))$. Suppose $x \notin i\,(gg)^*cl(A) \cup i\,(gg)^*cl(B)$ then there exists a $i\,(gg)^*$ -closed sets A_1 and B_1 such that $A \subseteq A_1$, $B \subseteq B_1$ such that $x \notin A_1$ and $x \notin B_1$. Therefore $x \notin A_1 \cup B_1$ such that $A \cup B \subseteq A_1 \cup B_1$. Hence $x \notin i\,(gg)^*cl(A \cup B)$. Hence $i\,(gg)^*cl(A \cup B) \subseteq i\,(gg)^*cl(A) \cup i\,(gg)^*cl(B)$.

Theorem 3.4 A intuitionistic subset A of (X, I_τ) is $i\,(gg)^*$ -closed set in (X, I_τ) iff $ircl(A) - A$ contains no non empty $i\,gg$ -closed set.

Hari Siva Annam and Pavithra

Proof: Let A be an $i(gg)^*$ -closed set in (X, I_τ) . Suppose F is a non empty $i(gg)$ -closed set in (X, I_τ) such that $F \subseteq ircl(A) - A$ which implies $F \subseteq ircl(A) \cap (X - A)$. Then $F \subseteq ircl(A)$ and $F \subseteq (X - A)$. Since A is an $i(gg)^*$ -closed set, $ircl(A) \subseteq X - F \Rightarrow F \subseteq X - ircl(A)$. Hence we get $F \cap F \subseteq ircl(A) \cap (X - ircl(A)) = \emptyset$. Which is a contradiction. Therefore $ircl(A) - A$ does not contain any non empty $i(gg)$ -closed set.

Conversely, suppose that $ircl(A) - A$ contains no non empty $i(gg)$ -closed set. Let U be a $i(gg)$ -open set such that $A \subseteq U$. Suppose $ircl(A)$ is not contained in U . Then $ircl(A) \subseteq X - U$ Where $(X - U)$ is $i(gg)$ -closed set in (X, I_τ) and contained in $ircl(A) - A$. Which is a contradiction. Hence A is $i(gg)^*$ -closed.

Theorem 3.5 Let $A \subseteq B \subseteq ircl(A)$ and A is $i(gg)^*$ -closed set in (X, I_τ) , then B is also $i(gg)^*$ -closed.

Proof: Let U be an $i(gg)$ -open set in (X, I_τ) such that $B \subseteq U$. Now if $A \subseteq B \subseteq ircl(A)$, then $ircl(A) \subseteq ircl(B) \subseteq ircl(A)$. Therefore $ircl(A) = ircl(B)$. Since A is $i(gg)^*$ -closed, $ircl(A) \subseteq U$. Therefore $ircl(B) = ircl(A) \subseteq U$. Hence B is $i(gg)^*$ -closed.

Theorem 3.6 If A is $i(gg)$ -open subset of X and $i(gg)^*$ -closed set in X . Then A is i -regular closed set.

Proof: Since A is $i(gg)$ -open subset of X and $i(gg)^*$ -closed, $ircl(A) \subseteq A$. But $A \subseteq ircl(A)$. Therefore $A = ircl(A)$. Hence A is i -regular closed.

Theorem 3.7 Let $A \subseteq B \subseteq X$, Where B is $i(gg)$ -open and $i(gg)^*$ -closed in X . If A is $i(gg)^*$ -closed in B . Then A is $i(gg)^*$ -closed in X .

Proof: Let U be a $i(gg)$ -open set in X such that $A \subseteq U$. Since $A \subseteq U \cap B$, $U \cap B$ is $i(gg)$ -open in B and A is $i(gg)^*$ -closed in B , $ircl(A) \cap B \subseteq U \cap B$. Since $A \subseteq B$, $ircl(A) \subseteq ircl(B)$. Since B is $i(gg)$ -open and $i(gg)^*$ -closed in (X, I_τ) . By theorem(3.5), B is i -regular closed. Therefore $ircl(B) = B$. This implies $ircl(A) \subseteq B$. Thus $ircl(A) \subseteq U \cap B \subseteq U$. Hence A is $i(gg)^*$ -closed in (X, I_τ) .

Theorem 3.8 For every point $x \in X$, $\{x\}$, $\{x\}^c$ of the space (X, I_τ) the set $X - \{x\}$, $\{x\}$, $\{x\}^c$ is either $i(gg)^*$ -closed or $i(gg)$ -open.

Proof: Suppose that $X - \{x\}$, $\{x\}$, $\{x\}^c$ is not $i(gg)$ -open. Then (X, I_τ) is the only $i(gg)$ -open set containing $X - \{x\}$, $\{x\}$, $\{x\}^c$. That is $X - \{x\}$, $\{x\}$, $\{x\}^c \subseteq X$. This implies $ircl(X - \{x\}, \{x\}, \{x\}^c) \subseteq X$. Therefore $X - \{x\}$, $\{x\}$, $\{x\}^c$ is $i(gg)^*$ -closed set in (X, I_τ) .

Theorem 3.9 Let A be a subset of an intuitionistic topological space (X, I_τ) . Then $a_1 \in i(gg)^*cl(A)$ [resp a_{IV}] iff for any $i(gg)^*$ -open set U containing a_1 , $A \cap U \neq \emptyset$.

Proof: Let $a_1 \in i(gg)^*cl(A)$ [resp a_{IV}] and suppose that there is a $i(gg)^*$ -open set U in X such that $a_1 \in U$ and $A \cap U = \emptyset \Rightarrow A \subseteq U^c$. Which is $i(gg)^*$ -closed in (X, I_τ) . Then $i(gg)^*cl(A) \subseteq i(gg)^*cl(U^c) = U^c$. Therefore $a_1 \in U \Rightarrow a_1 \notin U^c \Rightarrow a_1 \notin i(gg)^*cl(A)$. Which is a contradiction. Conversely, suppose for any $i(gg)^*$ -open set U containing a_1 , $A \cap U \neq \emptyset$. To prove $a_1 \in i(gg)^*cl(A)$. Suppose that $a_1 \notin i(gg)^*cl(A)$, then there is a $i(gg)^*$ -closed set F in X such that $a_1 \notin F$ and $A \subseteq F$. Therefore $a_1 \notin F \Rightarrow a_1 \in F^c$ which is $i(gg)^*$ -open in (X, I_τ) . Hence $A \subseteq F \Rightarrow A \cap F^c = \emptyset$, which is a contradiction. Thus $a_1 \in i(gg)^*cl(A)$.

Intuitionistic $(gg)^*$ - Interior

Definition 4.1 A intuitionistic subset of an ITS of (X, I_τ) is called $i(gg)^*$ -open set ($I(gg)^*OS$) if $X - A$ is $i(gg)^*$ -closed. The equivalent definition for $i(gg)^*$ -open set is that a set A is said to be $i(gg)^*$ -open iff $U \subseteq ig\ int(A)$ whenever $U \subseteq A$, U is $i(gg)$ -closed.

Definition 4.2 Let A be an intuitionistic subset of an ITS of (X, I_τ) . Then $i(gg)^*$ interior of A is defined as the union of all $i(gg)^*$ -open set of (X, I_τ) contained in A . It is denoted by $I(gg)^*int(A)$.

Theorem 4.3 If A and B are an intuitionistic subsets of an ITS of (X, I_τ) then

- i) $i(gg)^*int(X_\sim) = X_\sim$, $i(gg)^*int(\emptyset_\sim) = \emptyset_\sim$
- ii) $i(gg)^*int(A) \subseteq A$

Hari Siva Annam and Pavithra

iii) If B is any $i(gg)^*$ -open set contained in A then $B \subseteq i(gg)^* \text{int}(A)$

iv) If $A \subseteq B$ then $i(gg)^* \text{int}(A) \subseteq i(gg)^* \text{int}(B)$

v) $i(gg)^* \text{int}(A) = i(gg)^* \text{int}(i(gg)^* \text{int}(A))$

vi) $i(gg)^* \text{int}(A \cap B) = (i(gg)^* \text{int}(A) \cap i(gg)^* \text{int}(B))$

Theorem 4.4 If $i \text{rint}(A) \subseteq B \subseteq A$ and A is $i(gg)^*$ -open set then B is $i(gg)^*$ -open set.

Proof: Given $i \text{rint}(A) \subseteq B \subseteq A$ which implies $A^c \subseteq B^c \subseteq i \text{rcl}(A^c)$ where A^c is $i(gg)^*$ -closed set. By theorem (3.5) B^c is $i(gg)^*$ -closed set. Hence B is $i(gg)^*$ -open set.

Theorem 4.5 The arbitrary intersection of two $i(gg)^*$ -open sets of (X, I_τ) is $i(gg)^*$ -open.

Proof: Let A and B be the $i(gg)^*$ -open sets in (X, I_τ) . Then A^c and B^c are $i(gg)^*$ -closed sets in (X, I_τ) . By (3.2), Therefore $(A \cap B)$ is $i(gg)^*$ -open set in (X, I_τ) .

Theorem 4.6 If $A \subseteq X$ is $i(gg)^*$ -closed set then $i \text{rcl}(A) - A$ is $i(gg)^*$ -open set.

Proof: Let $A \subseteq X$ be a $i(gg)^*$ -closed set. Let U be $i(gg)$ -closed in (X, I_τ) such that $U \subseteq i \text{rcl}(A) - A$. By theorem (3.4), $\emptyset = U \subseteq i \text{rint}(i \text{rcl}(A) - A)$. Hence $i \text{rcl}(A) - A$ is $i(gg)^*$ -open set.

Theorem 4.7 Let A and B be subsets of a topological space (X, I_τ) . If A is $i(gg)^*$ -open and $i \text{rint}(B) \subseteq A$ then $A \cap B$ is $i(gg)^*$ -open.

Proof: Let A and B be $i(gg)^*$ -open in (X, I_τ) and $i \text{rint}(B) \subseteq (A \cap B) \subseteq B$ then by theorem (4.3) $A \cap B$ is $i(gg)^*$ -open set in (X, I_τ) .

Intuitionistic $(gg)^*$ -Continuous

Definition 5.1 The function $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ is said to be intuitionistic $(gg)^*$ -continuous, if $f^{-1}(V)$ is $i(gg)^*$ -open in (X, I_τ) for every intuitionistic open set V of (Y, I_σ) .

Example 5.2 Let $X = \{a, b, c\}$ with $I_\tau = \{\langle X, \emptyset, X \rangle, \langle X, X, \emptyset \rangle, \langle X, \{a\}, \emptyset \rangle, \langle X, \{a\}, \{b\} \rangle, \langle X, \{a\}, \{c\} \rangle, \langle X, \{a\}, \{b, c\} \rangle\}$ and $Y = \{r, s, t\}$ with $I_\sigma = \{\langle X, \emptyset, X \rangle, \langle X, X, \emptyset \rangle, \langle X, \{s, r\}, \emptyset \rangle, \langle X, \{s\}, \emptyset \rangle, \langle X, \{s, t\}, \emptyset \rangle\}$. Then $I(gg)^* - C(X, I_\tau) = \{\langle X, \emptyset, X \rangle, \langle X, X, \emptyset \rangle, \langle X, \{a\}, \emptyset \rangle, \langle X, \{a, b\}, \emptyset \rangle, \langle X, \{a, c\}, \emptyset \rangle\}$. Define $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ as $f(a) = s, f(b) = t, f(c) = r$. The inverse image of every i -closed sets in (Y, I_σ) is $I(gg)^*$ -closed in (X, I_τ) , f is $I(gg)^*$ -continuous.

Theorem 5.3 Let $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ be a function from an intuitionistic topological space X into the intuitionistic topological space Y . Then the following statements are equivalent.

- 1) The function f is $i(gg)^*$ -continuous.
- 2) The inverse image of intuitionistic closed set of Y is $i(gg)^*$ -closed set in (X, I_τ) .
- 3) $f(i(gg)^* \text{cl}(A)) \subseteq i \text{cl}(f(A))$ for every subset A of (X, I_τ) .
- 4) $i(gg)^* \text{cl}(f^{-1}(B)) \subseteq f^{-1}(i \text{cl}(B))$ for each intuitionistic set B of Y .

Proof : (1) $\Leftrightarrow$ (2) is obvious.

(3) $\Rightarrow$ (2) let $F \subseteq Y$ be a intuitionistic closed set. Then $f^{-1}(F) = f^{-1}(i \text{cl}(F))$. Hence by (3), $f(i(gg)^* \text{cl}(f^{-1}(F))) \subseteq i \text{cl}(f(f^{-1}(F))) \subseteq i \text{cl}(F) = F$. Thus $i(gg)^* \text{cl}(f^{-1}(F)) \subseteq f^{-1}(F) \Rightarrow i(gg)^* \text{cl}(f^{-1}(F)) = f^{-1}(F)$. Therefore $f^{-1}(F) \in I(gg)^*C(X)$.

(3) $\Rightarrow$ (4) Let B be any intuitionistic subset of Y . From (3) $f(i(gg)^* \text{cl}(f^{-1}(B))) \subseteq i \text{cl}(f(f^{-1}(B))) \subseteq i \text{cl}(B)$. Hence $i(gg)^* \text{cl}(f^{-1}(B)) \subseteq f^{-1}(i \text{cl}(B))$ for each intuitionistic set B of Y .

(4) $\Rightarrow$ (3) Let A be an subset of X . Then there exists a subset B of Y such that $A = f^{-1}(B)$.

From (4) $i(gg)^* \text{cl}(A) = i(gg)^* \text{cl}(f^{-1}(B)) \subseteq f^{-1}(i \text{cl}(B))$. Therefore $f(i(gg)^* \text{cl}(A)) \subseteq i \text{cl}(B) = i \text{cl}(f(A))$. Hence $f(i(gg)^* \text{cl}(A)) \subseteq i \text{cl}(f(A))$ for every subset A of X .

Hari Siva Annam and Pavithra

(1) $\Rightarrow$ (4) Let f be $i(gg)^*$ -continuous and B be any intuitionistic set of Y . Then $f^{-1}(i\,cl(B))$ is an $i(gg)^*$ closed set in X . For any intuitionistic set $B, f^{-1}(i\,cl(B)) = i(gg)^*cl(f^{-1}(cl(B))) \supseteq i(gg)^*cl(f^{-1}(B))$. Therefore $f^{-1}(i\,cl(B)) \supseteq i(gg)^*cl(f^{-1}(B))$.

Theorem 5.4 Let $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ be a function from an intuitionistic topological space X into the intuitionistic topological space Y . Then the following statements are equivalent.

- 1) The function f is $i(gg)^*$ -continuous.
- 2) For each subset A of $Y, f^{-1}(i\,int(A)) \subseteq i(gg)^*int(f^{-1}(A))$.

Proof: (1) $\Rightarrow$ (2) Let A be any intuitionistic subset of Y . Then $i\,int(A)$ is a open set in Y and $f^{-1}(i\,int(A))$ is $i(gg)^*$ -open set in X . $f^{-1}(i\,int(A)) = i(gg)^*int(f^{-1}(int(A))) \subseteq i(gg)^*int(f^{-1}(A))$. Therefore $f^{-1}(i\,int(A)) \subseteq i(gg)^*int(f^{-1}(A))$.

(2) $\Rightarrow$ (1) Let A be any intuitionistic open set of Y , so that $i\,int(A) = A \Rightarrow f^{-1}(i\,int(A)) = f^{-1}(A)$. By (2) $f^{-1}(i\,int(A)) \subseteq i(gg)^*int(f^{-1}(A))$. Hence $f^{-1}(A)$ is an $i(gg)^*$ -open, when A is intuitionistic open in Y . Therefore f is $i(gg)^*$ -continuous.

Theorem 5.5 Every $i(gg)^*$ -continuous is $i\,g$ -continuous.

Proof: Let $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ be a $i(gg)^*$ -continuous. Let V be an intuitionistic closed set of (Y, I_σ) . Then $f^{-1}(V)$ is $i(gg)^*$ -closed in (X, I_τ) . since every $i(gg)^*$ -closed is $i\,g$ -closed. Therefore $f^{-1}(V)$ is $i\,g$ -closed in (X, I_τ) . Hence f is $i\,g$ -continuous.

Theorem 5.6 Every $i(gg)^*$ -continuous is $i\,rg$ -continuous.

The proof is forthright.

Remark 5.7 The converse of the above theorems need not be true.

Example 5.8 Let $X = \{a, b, c\}$ with $I_\tau^c = \{ \langle X, \emptyset, X \rangle, \langle X, X, \emptyset \rangle, \langle X, \{a\}, \emptyset \rangle, \langle X, \{a\}, \{b\} \rangle, \langle X, \{a\}, \{c\} \rangle, \langle X, \{a\}, \{b, c\} \rangle \}$ and $Y = \{a, b, c\}$ with $I_\sigma^c = \{ \langle X, \emptyset, X \rangle, \langle X, X, \emptyset \rangle, \langle X, \{a\}, \{c\} \rangle, \langle X, \{a\}, \{b, c\} \rangle, \langle X, \{a, c\}, \{b\} \rangle, \langle X, \{a, c\}, \emptyset \rangle \}$.

$i(gg)^*-C(X, I_\tau) = \{ \langle X, \emptyset, X \rangle, \langle X, X, \emptyset \rangle, \langle X, \{a\}, \emptyset \rangle, \langle X, \{a, b\}, \emptyset \rangle, \langle X, \{a, c\}, \emptyset \rangle \}$ and $i\,g-C(X, I_\tau) = \{ \langle X, \emptyset, X \rangle, \langle X, X, \emptyset \rangle, \langle X, \emptyset, \{b\} \rangle, \langle X, \emptyset, \{c\} \rangle, \langle X, \emptyset, \{b, c\} \rangle, \langle X, \{a\}, \emptyset \rangle, \langle X, \{a\}, \{b\} \rangle, \langle X, \{a\}, \{c\} \rangle, \langle X, \{a\}, \{b, c\} \rangle, \langle X, \{b\}, \emptyset \rangle, \langle X, \{b\}, \{c\} \rangle, \langle X, \{c\}, \emptyset \rangle, \langle X, \{c\}, \{b\} \rangle, \langle X, \{a, b\}, \emptyset \rangle, \langle X, \{a, b\}, \{c\} \rangle, \langle X, \{b, c\}, \emptyset \rangle, \langle X, \{a, c\}, \emptyset \rangle, \langle X, \{a, c\}, \{b\} \rangle, \langle X, \emptyset, \emptyset \rangle \}$. Define $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ as $f(a) = a, f(b) = c, f(c) = b$. Clearly f is

$i\,g$ -continuous but $f^{-1}(\langle X, \{a\}, \{b, c\} \rangle) = \langle X, \{a\}, \{b, c\} \rangle$ is not an $i(gg)^*$ -closed in (X, I_τ) . Hence f is not $i(gg)^*$ -continuous.

Example 5.9 From example (5.8) $i\,rg-C(X, I_\tau) = \{ \langle X, \emptyset, X \rangle,$

$\langle X, X, \emptyset \rangle, \langle X, \emptyset, \{b\} \rangle, \langle X, \emptyset, \{c\} \rangle, \langle X, \emptyset, \{b, c\} \rangle, \langle X, \{a\}, \emptyset \rangle, \langle X, \{a\}, \{b\} \rangle, \langle X, \{a\}, \{c\} \rangle, \langle X, \{a\}, \{b, c\} \rangle, \langle X, \{b\}, \emptyset \rangle, \langle X, \{b\}, \{a\} \rangle, \langle X, \{b\}, \{c\} \rangle, \langle X, \{b\}, \{a, c\} \rangle, \langle X, \{c\}, \emptyset \rangle, \langle X, \{c\}, \{a\} \rangle, \langle X, \{c\}, \{b\} \rangle, \langle X, \{c\}, \{a, b\} \rangle,$

$\langle X, \{a, b\}, \emptyset \rangle, \langle X, \{a, b\}, \{c\} \rangle, \langle X, \{b, c\}, \{a\} \rangle, \langle X, \{b, c\}, \emptyset \rangle, \langle X, \{a, c\}, \emptyset \rangle,$

$\langle X, \{a, c\}, \{b\} \rangle, \langle X, \emptyset, \emptyset \rangle \}$. Define $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ as $f(a) = a, f(b) = c, f(c) = b$. Clearly f is $i\,rg$ -continuous but

$f^{-1}(\langle X, \{a\}, \{b, c\} \rangle) = \langle X, \{a\}, \{b, c\} \rangle$ is not an $i(gg)^*$ -closed in (X, I_τ) . Hence f is not $i(gg)^*$ -continuous.

Theorem 5.10 If $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ is a $i(gg)^*$ -continuous and $g: (Y, I_\sigma) \rightarrow (Z, I_\eta)$ is a intuitionistic continuous then their composition $g \circ f: (X, I_\tau) \rightarrow (Z, I_\eta)$ is $i(gg)^*$ -continuous.

Proof: Let O be any intuitionistic closed set in (Z, I_η) . Since g is intuitionistic continuous, then $g^{-1}(O)$ is intuitionistic closed in (Y, I_σ) . Since f is $i(gg)^*$ -continuous, then $f^{-1}(g^{-1}(O))$ is $i(gg)^*$ -closed in (X, I_τ) . Therefore $g \circ f$ is $i(gg)^*$ -continuous.

Hari Siva Annam and Pavithra

Definition 5.11 The function $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ is said to be strongly $i(gg)^*$ - continuous, if $f^{-1}(V)$ is intuitionistic closed in (X, I_τ) for every set $i(gg)^*$ - closed set V of (Y, I_σ) .

Theorem 5.12 If $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ is a strongly $i(gg)^*$ - continuous and $g: (Y, I_\sigma) \rightarrow (Z, I_\eta)$ is a $i(gg)^*$ - continuous then their composition $gof: (X, I_\tau) \rightarrow (Z, I_\eta)$ is a intuitionistic continuous.

Proof: Let O be any intuitionistic closed set in (Z, I_η) . Since g is $i(gg)^*$ - continuous, then $g^{-1}(O)$ is $i(gg)^*$ - closed in (Y, I_σ) . Since f is strongly $i(gg)^*$ - continuous, then $f^{-1}(g^{-1}(O))$ is intuitionistic closed in (X, I_τ) . Therefore gof is intuitionistic continuous.

Theorem 5.13 If $f: (X, I_\tau) \rightarrow (Y, I_\sigma)$ is a $i(gg)^*$ - continuous and $g: (Y, I_\sigma) \rightarrow (Z, I_\eta)$ is a intuitionistic continuous then their composition $gof: (X, I_\tau) \rightarrow (Z, I_\eta)$ is a $i(gg)^*$ - continuous.

Proof: Let O be any intuitionistic closed set in (Z, I_η) . Since g is intuitionistic continuous, then $g^{-1}(O)$ is intuitionistic closed in (Y, I_σ) . Since f is $i(gg)^*$ - continuous, then $f^{-1}(g^{-1}(O))$ is $i(gg)^*$ - closed in (X, I_τ) . By theorem (2.10) (ii)) we have $f^{-1}(g^{-1}(O))$ is $i(gg)^*$ - closed in (X, I_τ) . Therefore gof is $i(gg)^*$ - continuous.

CONCLUSIONS

This class of $i(gg)^*$ - closed in intuitionistic topological spaces is defined using regular closure and igg - open sets. We have studied the relation of this set with some other closed sets and investigated some of their properties and discovered various results. Further we have made some compositions in continuous function and analyzed various results. Further it will be developed in connectednes.

ABSTRACT

India is the homeland of Ayurveda, martial arts and Siddha medicines. It is a multi-ethnic terrestrial, and each of its province has its own vernacular dialect, attire, gourmet, tradition and rituals. Divakaruni has incredibly projected the generic potentials of the spices and has blended it with the fictional components that complete the objective of the tale. Culinary competence, which appears to govern the perception of ideal womanhood, is meted out in varied contexts in her novels. Tilo the protagonist utilizes her magical powers to communicate with spices, which forms the primitive module of the globe, to resolve the day-to-day issues of other immigrants. This paper provides readers with a glimpse into the therapeutic standards of Indian spices accentuated for their healing qualities by Chitra Banerjee Divakaruni in her novel *The Mistress of Spices*.

Keywords: Healing, Spices, Therapeutic, Allure, Culture, Identity, Culinary

INTRODUCTION

Twentieth century has provided wide opportunities for the writers to exercise great impact on culture, society and history of the new land. At the same time, they nostalgically recall the custom, culture, gourmet, language and people of their mother land. Some of the gifted women settlers began to record the life and longings of the immigrants effectively in their writings. Immigration has given wider opportunities to the Indian writers to express their experience and anguish in a new land. Divakaruni's works are largely grounded on poignant crisis, inspiration and the extensive discord of Indian immigrant womenfolk who crave for belongingness with the aboriginal principles and morality. She distinctively plans the image of ordeal women preoccupied with their inner world, their menacing hatred and the gale in the existential impasse of women in a masculine conquered humanity. Her works exhibit Indian women as paramount characters. By exhibiting womanly- narrative all through her

Vadivu

workings, she makes a plea for a competent living of women, enduring her flexibility. She has depicted women individuals through her collective thoughts and practice. She recurrently concentrates her writing on women problems. she says,

“Women in particular respond to my work because I’m writing about them– women in love, in difficulties, women in relationships. I want people to relate me to my characters, to feel their joy and agony, because it will be harder to [be] prejudiced when they meet them in true life” (Softky).

Divakaruni after a lot of research on Ayurveda has added the information in her novel. She connotes:

“I have been absorbed in the traditional ancient Hindu system of medicine, for a long time so I did a lot of ayurvedic research as well. So, I did do a lot of Ayurvedic research. Some of it came out of, again, the folklore of There are some good luck spices. You have certain ceremonies where you would use certain spices to bring good luck and avert the evil eye—the mustard seed to avert the evil eye and the haldi, which is auspicious.” (Seshachari, Neila, 2001)

The Mistress of Spices is inscribed in a culinary genre and the narrative revolves around spices. Nearly half the spices cultivated in India is utilized by the whole world. Colleen Taylor Sen connotes:

Spices indigenous to India are ginger, turmeric, tamarind, black (also called round) pepper (Pippa nigrum), Curry Leaves (Murraya koenigi), Pippali or long pepper (P.longum), green and black cardamom and holy tulasi...Sesame seed (Sesame indicum), one of the oilseed crops, was domesticated very early. Asafoetida...originated in Afghanistan, which is still a major producer... (FAF, 23)

The Mistress of Spices (1997) is established in fashionable Oakland, California. Respectively the episodes of the novel is termed after a different spice that has deep connection with the characters. The first chapter is titled ‘Tilo’ a name derived from Til. The rest of the chapters are named after each spice. Tilo, the protagonist of this novel is the possessor of the Spice Market in Oakland, California. She is an immigrant from India who aids her clients satisfy their requirements and wishes with the aid of diverse spices. Her customers are typically primary- or subsequent-cohort immigrants who tussle to acclimatise their deep-rooted-realm thoughts in the unacquainted novel realm. “The people are compelled to leave their native land in search of a better living” (Beulah Joseline 77263)

Inbred in India Tilo is marooned on a secluded island, populated by womankind. Tilo faces gender discrimination at the very early stage in her life. She is named as ‘Nayantara’ and is discarded by her family for the scandal of being born a female. “Home gives security for everyone, but for Saru home is a place of disappointment” (Saratha Lakshmi 9749). She is gifted as the paramour of flavours and conjures the charmed supremacies of the flavours to triumph over the sufferings of the local Indian expatriate community. Her customers are typically primary or subsequent cohort immigrants who struggle to acclimatize their old world principles to the unfamiliar innovative world. “As a result of immigration to foreign countries, lonely men and women and their ethnic identity creates confusion among the young” (Shahin Banu 3547).

Tilo finds herself not only trapped in the lives of several Indian immigrants but also in the life of, Raven. Her craving to the domain of souls’ wraths the flavoring spices and she is in a dilemma, to fulfil the inhabitants or else to pursue the course of her individual contentment. Tilo gets an identity as an Indian – American and continues to render overhaul to the people with her mystical, magical and visionary powers. Divakaruni in a discussion said: “The spices are very significant in this manuscript, as characters they have peculiar traits.” (Divakaruni)

Tilo comprehends space and time to these constructions through a dialect of physicality and mentality. Owing to the displacement Tilo leads a secluded life. Her journey from the known to the unknown land leads her way to twinge and torment. This reflects her affection towards her homeland and the past world. Her expedition through water, air and ocean, is very much like walking on fire. She expresses her predicament in the foreign land: “I think I do not inflate when I say there is no other place in the globe quite like this” (MS 3). Her spice shop is a bridge between her past and the present. It also symbolizes secrecy and geographical monolithic national identity which gives space for diaspora people to rethink of them in the new nation. Divakaruni recapitulates the lost traditions and myths of her homeland through evoked memories of bygone times, place, and people. She projects the inner conflicts ranging

**Vadivu**

within a woman who has to take a resolution if she has to live for herself or for the welfare of others. Tilottama (Tilo) the raconteur of the tale is inbred in India. She is spearheaded to be a “Controller of spices” and is ultimately deployed to vanguard a flavourful spice shop in Oakland, California. Tilo, chooses America willingly and supports people open their cherished feelings and restore them back to health.

The Spice shop, for illustration, created in the novel is a setting which helps in fetching exiled inhabitants collectively and offer them consolation. Food works as reminiscence and we all have optimistic and adverse memoirs with food. The diasporic circumstances additionally strengthen this association. Seasonings from dwellings recap you to the hospitality of a blissful dwelling moreover as bygones progress by. Though daily bread and related metaphors have played a role in narratives, psychosomatic ideas have fronted to the evaluation of cuisine besides consumption for example a comprehensive understanding. (Thomas J. Schoenberg and Lawrence J. Trudeau's). Food connotes the belief systems, pious guidelines, and byzantine beliefs of a specific character, or that of an entire kinship or ethnicity. Jonathan David says: In order to begin such a framework about food in folklore, . . . we should first analyse the subject of folk cuisine itself, and folk eating habits. Together, these create the domain that scholars in the field of folklore and folklife have come to call ‘foodways.’

Divakaruni presents Tilo as a character who is undistinguishably bonded in the process of displacement. The entire notion of ‘home’ becomes exiled and is transmuted and hooked on to an indefinable form which is not centered on a particular whereabouts however quite a progress among countless locations. As Tilo’s identity is trivial and void she forges a pioneering identity as the pirate queen -Bhagyavathi. This brand new identity too for no reason accords Tilo the accomplishment she longs for. Becoming the queen of pirates she chases triumph but is deprived of a true identity. Emptiness impinges into her heart and she starts chasing death to end her imaginary life.

The sea serpents save Bhagyavathi from the typhoon. The serpents remain her Caretakers, absolutely since her infancy time. Serpents are adored in our land as Divinities and Goddesses ever since primeval eras. They resume to shield and provide her with all amenities. The serpents reveal to her concerning the entranced islet of flavors furthermore the ‘First mother’ or the ‘Older One’, who has resided there for ages. Inhabitants had viewed the First mother during the early hours when she usually ascended the utmost apex of a hilltop and guided ‘the thunder-text from corner to corner across the horizon’. Tilo perceives that her providence and outlook is in the hands of the First mother on the new island. She confronts the cautions and soliciting’s of the snakes and verves to the desert islet, as “the call of the spices coursed up her veins” (MS 24). The protagonist is drawn towards the enraptured island of flavours, nevertheless they coax her to verve with them. The serpents wanted Tilo to become ‘sarpakanya’.

Through the channel of nature and environment, Tilo acts as a concerning link between diasporas and homeland which is the accentuating feature of all living, and non-living existences in this milieu. The protagonist and the accompanying young adolescents who dwell in the land were given new name and identities, with which they would become recognizable wherever they went. New personas are being forged. Tilo is the vivid pupil of all, “swift to master every single spell and chant, ...hem a glance.” (MS 41).

The First Mother accords every Mistress an innovative designation opinionated on the flavour. But instigating the annoyance of the First Mother Tilo chooses her own name. The First Mother acquiesces to Tilo’s aspiration and bestows her with a new name ‘Tilottama’. Her name “Tilo” is shortened from “Tilottama”. The Chief Mom presents her to the myth of Tilottama, ‘the leading performer at Indira’s allure’. “The spice speaks to me” says Tilo. She is the enchantress and the enchanted. “It’s expression is like dusk, ...realm” (MS 13). The First Mother who originates Tilo discloses Tilo’s special gifts. The spices aid her to endure calmness “clean, sharp and sane” and she sanctifies even them who do not see her with “fenugreek who renders the body sweet again”. These mistresses have to obey the stern rules in their private lives as a mistress. They should keep themselves away from all carnal desires, not utilize the spices for their own sake and should linger confined in the spice shop. They have to also eschew their reflection in the mirror and not express attachment towards customers. Tilo says “The spices are my love...realm quite like

**Vadivu**

this” (MS 03). Food is a ubiquitous icon all through the narrative. Especially turmeric which can be used as an antibiotic as well as to enhance face shine.

Tilo is aware of how to use the spices, as she is able to distinguish their genesis, smell and insignia. She calls them by their factual name which was given when earth breached like a membrane and presented it till the open atmosphere. Its extracts are beneficial to many. Research is on process as it helps in treating various heart ailments including cancer. The protagonist shares Indian recipes amidst Kwesi, an African American. These simple acts of Tilo’s kindness creates friendship among people of diverse cultures and leads to her transculturation as people are willing to overlook the differences and build relationships on the common cultural aspect that they have acquired. The store where the entire community tends to relive their experiences caters to the little cravings of the Indian community. In this novel we find an outline of diaspora that pays off the price for accomplishing dislocation. Divakaruni’s novel resound this viewpoint that the notions of displacement and diaspora are, in discourse with one another. While the thought of displacement suggests the upheaval of familiar space and emphasizes the need to change, the notion of diaspora emphasizes the acquaintances between the displaced.

Tilo, significantly likes the spices she utilizes, and aids it to bestow life upon characters. For instance, Til that aids in curing diseases of liver and heart is made into an glue like consistency with sandalwood and when sautéed refurbishes brilliancy, when one has lost cognizance in life. Divakaruni has strikingly blended Indian flavours in this novel. She has globalized the effect of this ancient remedy technique of Ayurveda which is profoundly allied with Indian philosophy. Tilo offers Haroun is offered black cumin as it is presumed that it would come in handy to guard him of the malevolent. To add more to it she says that this spice is found in Sundarbans, teardrop in shape which smells like wild tigers.

Turmeric also named Halud, is highly appreciated for its therapeutic, mystical and preservation qualities. It is accepted for its devout and divine value. For more than a thousand year brides have been using this powder as it is considered to be auspicious which aids in guarding evil eyes. It is also a staple food which has the property to control inflammation. It also helps to alleviate pain and improve digestion. Turmeric, the auspicious spice... rubbed into the borders of wedding saris. (MS 13) Tilo’s allegiance towards the spices and her customers paves way for her to remember that she would chant and help in reliving sorrowness as per her learnings.

Similarly, Fennel, is an counterpoise, a flavour for Wednesdays, which can take control from one and restore it to the other. Fennel, *Mouri*, aids in digestion. -Looks typically like a tinted hedge sparrow. Tilo’s confrontation with an migrant’s grandad and his family fetches attention to flavours like saffron crocus or popularly known as Kesar. Tilo adds Badam or almond to hot milk as she understands that it would soothe anyone’s disputes and judgements and control their fury.

Cinnamon or Dalchini is a pleasingly scented drug plant which improves serum glucose, lower fasting blood glucose and reduces Triglycerides thus helping diabetics. To boost Jagjit’s confidence Tilo tucks cinnamon stick into Jagjit’s turban to help him make friends in his school and to gain strength. She wants him to be a robust self-confident character and believes cinnamom would give the valour to destroy his enemies because of its properties. In the novel, Asafoetida, a hard resinous gum spices are referred as ‘an antidote of love’ (MS 74). Healing repeatedly has been outlined as, the progression of bringing together aspects of oneself, body-mind-spirit, at profound levels of inner knowing, leading toward amalgamation and steadiness with each aspect having equal importance and value. (Egnew, 2005, p. 256)

Tilo hears her customers speaking together in all voices, Tamil, Assamese ,Hindi, Oriya, English, layered one on the other. She acts as an accordion in the new environment paving to link the breach between the two diverse beliefs. Similar is the situation of Jagjit who is forced to live the life of a marginal by the Americans. “ He lives in the world of disappointment where justice and consequence are expected but not experienced” (Shahin Banu 3467).

Vadivu

Divakaruni illuminates the agony of exile and the uncertainties of post colonialism through a ten-year-old boy, Jagjit who is traumatized at school. Racial hatred leading to racial violence can best be seen in the case of Jagjit. Tilo hurriedly offered Jeera to reinforce his cognizance and Jagjit was given Manjistha or Indian madder “to make him calm and take away his anger” (MS 119). Tilo gives peppercorn to Raven as she presumes it has the capability to extract out his enigmas.

For instance, one such dependent wife, Mrs. Ahuja (Lalita) is a regular visitor to Tilo’s Store. She marries Mr. Ahuja, because of her parents’ compulsion. He is an alcoholic and often abuses her. Taking her to be a mere machine he abuses her even at the cherished times. Mrs. Ahuja’s confronts with exploitation, mistreatment and solitude in America. Her expectations are traumatized on the day of her marriage itself as she is denied of her personal opinions. Lalita is talented to discover resolutions for her predicaments through the protagonists reassuring confrontations. “The way she fulfils the expectations of all speaks volumes about her potential” (Saratha Lakshmi 3474).

Dreaming of the island, the protagonist engrosses in a noiseless psychological treatise with the Foremost Mother athwart stretches. All the immigrant female characters-Tilo, Geeta, Lalita, Daksha and Hameeda face ‘in-betweenness’ at some juncture. Tilo too is caught amidst her duty as the paramour of flavours and her craving to help people out of the box. She violates the rules laid down for the mistress and offers her aid to the needy.

Finally, she cannot hide her feelings for Raven. Tilo challenges the mistress-ship. Her love for her work as mistress of spices and for Raven is equal. Tilo is an embodiment of Indian cultural heritage characterized by chastity and resistance to cultural infiltration. Reiterating her womanly charm Tilo adopts the tag Maya. Hence, distinctiveness neither is conventional nor preconceived in consonance with their ethnic identity, and it doesn’t inevitably come forth when immigrants abandon or embrace their ethnic identity. It is a fusion of welcoming and unleashing changes, both internal and external, just as Tilo turns into Maya, the illusion. Tilo determines to go back to Oakland, though it was overwhelmed owing to an quake. Ghanshyam remark in their article, ‘Shifting Identities: Re-invention of the Self in Chitra Banerjee Divakaruni’s The Mistress of Spices’:

Chitra Banerjee Divakaruni has very dexterously juxtaposed the world of spices with that of women, as a metaphor of her life and identity, ... (84-85)

Literature does not deal with the any precise society or a distinct commune, it is for humankind. The effects of diaspora is dexterously employed by Divakaruni. “Exotic power is empowerment, and feminism and exoticism are first demarcated and reconciled. Exotic spices enable women to become feminist subjects by using their magical and healing qualities to fight patriarchal Indian traditions” (2005:77). Inderpal Grewal

Divakaruni has utilized the “magic” of these spices, both factually and allegorically.

Since the body is accepted as a noteworthy component of distinctiveness, such illustrations clutch boundless power along with the transformations in the protagonist. Tilo enters a luminal threshold -a interplanetary amidst the historical and the forthcoming without precise knowledge of where the contemporary day is. Tilo’s journey which starts with sesame culminates in *makaradwaj*, king among spices. She says, “Make me attractive, *makaradwa*, such attractiveness as on this earth never was” (MS 262), suggests that eating practices play an intricate role in personality-identity and is influential in defining an individuality and also traditional identity in accordance to Current psychoanalytic theory. The intense incarnation of spices is promptly recognizable, showcasing their complicated immersion in the sophisticated ‘beliefs of several lives. These spices surpass their intrinsic nature and suppose roles akin to beings. Food acts as an icon to emphasize individual and communal distinctiveness. Spices serve not only for enhancing the flavour of food but also to address health-related issues. These flavours are embodied as individuals in the narration. Divakaruni has skilfully woven these elements concurrently to unveil the essence of the novel.

ABSTRACT

Sangai (Rucervus eldi), an endemic and endangered deer species gets their nutrients required for growth and development from the plant species available on the *Phumdis*, a unique floating mat of vegetation of Loktak Lake at Keibul Lamjao National Park (KLNP). A total of 25 important fodder plants belonging to 20 genera and 8 families have been studied taxonomically and their distribution status in the park based on IVI were also calculated. Of the 25 fodder plants, 16 are common, 6 are rare, and 3 belong to abundant category. The highest IVI is recorded by *Panicum sphaerocarpon* (71.9) and the lowest value is obtained by *Ludwigia adscendens* (6.69). These pattern of occurrence of fodder species is greatly influenced by climate change and in response, the grasses are becoming more abundant than the other cold climate and water loving fodder species. It indicates the risk in maintenance of variety of the fodder plants with different nutrients. The study provides an artificial key to the identification of fodder plants and their distribution status. Identification and documentation of the fodder plants would not only be helpful for further studies on *Sangai* feeding sustainability but also useful in conservation requirement criteria of the natural habitat of the *Sangai*. Plants with high IVI value indicates better adaptation to the habitat.

Keywords: Fodder species and ecology, requirement criteria, Phumdi ecosystem, fodder ecosystem.

INTRODUCTION

The survival of *Sangai* largely depends upon their unique habitat, the Phumdis i.e., the heterogenous mass of soil organic matter in different stages of decay, floating in the Loktak Lake, a well-recognized Ramsar site. About 86 species of macrophytes [1], 48 species of plants [2], 145 species [3] [4] were recorded. Meitei and Prasad [5] reported 27 wild edible and 25 medicinal plant species associated with the people residing in the periphery of the lakes. 25 plant species mostly consumed by *Sangai* were also reported [6]. The edible macrophytes are mainly herbaceous with different life forms, viz. creeping, prostrate, free-floating, or rhizomatous types. The phumdi ecosystem provides all the requirements for the survival of the endangered species *Sangai*. Thus, it is necessary to hunt the co-relationship among the phumdi species and the adaptability of *Sangai*. The present study describes the fodder plant species mainly consumed by *Sangai* that is essential not only for easy identification but also helpful for the conservation of the fodder ecosystem leading to the conservation of *Sangai* and their habitat. The study also assesses the distribution status of the fodder plants in Keibul Lamjao National Park.

MATERIALS AND METHODS

Study area

The study site, Keibul Lamjao National Park (KLNP) lies in the Southeastern corner of Loktak Lake, Bishnupur district, Manipur between 24°27' – 24°31'N latitude and 93°53' – 93° 55'E longitude covering an area of 40 km². It is the only floating National park where the endangered deer species, *Rucervus eldii eldii* exists in the world. It was recognized as a Ramsar site of International Importance in 1993. The uniqueness of the Park is the presence of floating mats of vegetation called *Phumdis* which provides the livelihood of the *Sangai*. Two-thirds to three-fourths of the total park area is formed by phumdis. The three hills viz. Pabot, Toya, and Chingjao of the park provide a refuge for the large fauna during the monsoon season. The temperature of the National Park ranges from 34.4 degrees Celsius in summer to as low as 1.7 degrees Celsius in winter. It gets enough rainfall during the rainy season and has a recorded maximum humidity of 81%. It has a rich diversity of vegetation dominated by herbs and shrubs. Mineral elements usually required for the growth of the *Sangai* are provided by the phumdis.

Plant Collection and Identification

The collection of *Sangai* fodders was done in the years 2023-24 without causing much disturbance in their natural habitat. A detailed description of every collected plant was prepared, and their photographs were taken from their habitat too. The collected specimens were identified by comparing their own descriptions with the descriptions available in various authentic literature [7] [8] [9] [10] [11] [12] [13] [14] [3] [15] [16] [17] [18] [19] and by consulting the herbarium specimens of Department of Botany, D.M. College of Science and authenticated at Assam herbarium at Shillong, Meghalaya. Herbarium specimens were prepared following the technique adopted by Jain and Rao [20] and Pinokiyo and Sharma [21]. The voucher specimens were deposited to Dhanamanjuri Herbarium (DMH), Department of Botany, D. M. College of Science, Dhanamanjuri University for future reference. Plant names were also updated with World Flora Online [22].

Calculation of Important Value Index (IVI)

The distribution status for the growth of plant species were monitored for the winter season 2023- 2024) by calculating the IVI value following Curtis [23] and Misra [24].

RESULTS

A total of 25 fodder plants belonging to 20 genera and 8 families have been identified from the study site. Out of these 8 families, Poaceae is the dominant family with 16 species followed by Amaranthaceae with 2 species, Zingiberaceae (2 species), Cyperaceae (1 species), Apiaceae (1 species), Asteraceae (1 species), Onagraceae (1 species), and Polygonaceae (1 species). Their young shoots and leaves are mostly consumed by the *Sangai*. Table 1 indicates

Tongbram Nirman Singh *et al.*,

IVI values of the 25 fodder plants ranging from 6.69-72, the lowest and highest values of IVI is contributed by *Ludwigia adscendens* (6.6) and *Panicum sphaerocarpon* (71.9). Based on IVI values all these species can be classified into three categories viz. rare category (6.6 to 10), common category (11 to 40) and abundant category (41 to 72). Of the 25 fodder species, 6 are under rare category (*Ludwigia adscendens*, *Panicum humidorum*, *Alternanthera sessilis*, *Alpinia nigra*, *Triplidium procerum* & *Triplidium arundinaceum*), 16 are under the Common category (*Saccolipsis interrupta*, *Carex setigera*, *Zizania aquatica*, *Persicaria sagittata*, *Alternanthera philoxeroides*, *Triplidium bengalense*, *Oenanthe javanica*, *Enydra fluctuans*, *Hedychium coronarium*, *Arundo plinii*, *Pogonatherum rufobarbatum*, *Eleusine indica*, *Urochloa mutica*, *Cynodon dactylon*, *Phragmites communis* & *Oryza rufipogon*) and 3 belongs to abundant category (*Leersia hexandra*, *Phragmites karka* & *Panicum sphaerocarpon*). The dominant species like *Phragmites karka* and *Panicum sphaerocarpon* belongs to Poaceae family. Therefore, with the impact of climate change and global warming, these species will spread and grow luxuriously since they are grasses, the warmer the better condition for their growth. While the species adapted to moist and water habitats like *Alpinia nigra*, *Ludwigia adscendens*, etc will have lower ecological amplitude due to global warming. These will create problems reducing the availability of the variety of fodder plants. The study provides a taxonomic synopsis and an artificial key for easy identification of all the fodder plants.

A. Key to the Families

1. Plants with two cotyledons, leaves with reticulate venation.....2
2. Plants with one cotyledon, leaves with parallel venation.....6
3. Placentation basal.....3
4. Placentation otherwise...5
5. Inflorescence a head, stamens syngenesious...Asteraceae
6. Inflorescence varied, never a head, stamens not syngenesious...4
7. *Stipules ochraceous*, fruit a nut...Polygonaceae
8. *Stipules* absent, fruit an utricle...Amaranthaceae
9. Inflorescence spike, panicle or of solitary flower...Onagraceae
10. Inflorescence umbel...Apiaceae
11. Leaves distichous, single fertile stamen, labellum present...Zingiberaceae
12. Leaves distichous or tristichous, all stamens fertile, labellum absent ...7
13. Stem triangular with solid pith throughout, fruit achene ...Cyperaceae
14. Stem circular with hollow internodes, pith often present only at nodes, fruits caryopsis...Poaceae

AMARANTHACEAE

Alternanthera Forssk.

B. Key to the Species

- 1a. Stems simple or branched, fistular, forming dense mats; inflorescence axillary or terminal, Pedunculate A. *philoxeroides*
- 1b. Stems often richly branched, more solid and thin in drier situations, very fistular when floating; inflorescence axillary and sessile.....A. *sessilis*
Alternanthera philoxeroides (Mart.) Griseb, Abh. Konigl. Ges. Wiss. Gottingen. 24:36. 1879. *Bucholzia philoxeroides* Mart., Beitr. Amarantac.: 107. 1825. *Achyranthes paludosa* Bunbury, Proc. Linn. Soc. London 1:109. 1841. Fig. 1b
Decumbent or ascending glabrate aquatic, perennial herb.

Local name: *Kabonapi*

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°29'58.66"N & 93°50'05.02"E, Elevation 761m, 27 November 2023, TNS003 (DMH).

2. *Alternanthera sessilis* (L.) DC. Cat. Pl. Horti Monsp. 77. 1813. *Gomphrena sessilis* L., Sp. Pl. 225. 1753. *Alternanthera nodiflora* R. Br., Prodr. 417. 1810. Fig. 1c Perennial herb with prostrate growth habit.

Local name: *Phakchet*

Status in the park: Rare

Tongbram Nirman Singh et al.,

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°29'58.53" N & 93°50'05.27" E, Elevation 761m, 26 November 2024, TNS005 (DMH).

APIACEAE

Oenanthe L.

Oenanthe javanica (Blume) DC., Prodr. 4:138. 1830. *Sium javanicum* Blume, Bijdr. Fl. Ned. India 881.1826. *Oenanthe benghalensis* (Roxb.) Kurz in J. Asiat. Soc. Bengal. Pt. 2, Nat. Hist. 9:115. 1877. Fig. 2d Perennial herb with fibrous roots emerged from all nodes with leaves.

Local name: *Komprek*

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°29'58.05"N & 93°50'04.84"E, Elevation 761m, 27 November 2023, TNS010 (DMH).

ASTERACEAE

Enhydra Lour.

Enhydra fluctuans Lour., Fl. Cochinch. 2:511, 1790. *Enhydra heloncha* DC., Prodr. 5:637. 1836. **Fig. 1h** Prostrate, spreading, annual; semi-aquatic herbaceous plant with serrate leaves.

Local name: *Komprektujombi*

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°28'10.37"N & 93°49'41.51"E, Elevation 765m, 26 November 2023, TNS006 (DMH).

CYPERACEAE

Carex L.

Carex setigera D. Don, Trans. Linn. Soc. London. 14:330. 1824. **Fig. 1e** Rhizomatous herb with slender, ligenous stolons.

Local name: *Humdang* **Status in the park:** Common

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°29'58.64"N & 93°50'10.46"E, Elevation 767m, 27 November 2023, TNS002 (DMH).

ONAGRACEAE

Ludwigia L.

Ludwigia adscendens (L.) H. Hara, J. Jap. Bot. 28: 291 (1953). *Jussiaea adscendens* L. Mant. Pl.:69 (1767). *Jussiaea floribunda* Griff. Not. Pl. Asiat. 4: 688 (1854). **Fig. 2c** Perennial herbs, rooting at nodes with spindle shaped pneumatophores in clusters at nodes of floating stems.

Local name: *Ishing kundo* **Status in the park:** Rare

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°29'58.51"N & 93°50'10.58"E, Elevation 767m, 27 November 2023, TNS007 (DMH).

POACEAE

C. Key to the Genera

1. Spikelets strictly with two florets; no rachilla extension ...2
2. Spikelets with one-to-many florets; if two florets, rachilla extension present ...6
3. Fertile floret awnless...3
4. Fertile floret awned ...5
5. Inflorescence open, contracted or spikelike panicle ...4
6. Inflorescence of unilateral racemes; spikelets usually single or paired...**Urochloa**
7. Panicles contracted, narrow, spiciform ...**Sacciolepis**
8. Panicles lax, not spiciform ...**Panicum**

Tongbram Nirman Singh et al.,

9. Spikelets in racemes, solitary or several, the latter digitate, inflorescence lacks an elongated central axis...**Pogonatherum**
10. Spikelets in more or less ample panicles or compound racemes arranged along a central axis...**Tripidium**
11. The spikelets with 2 or more fertile florets ...7
12. The spikelets with 1 fertile floret...9
13. Basal internodes not swollen...**Eleusine**
14. Basal internodes swollen...8
15. Ligules membranous, eciliate ...**Arundo**
16. Ligules ciliate...**Phragmites**
17. Glumes well developed, at least the upper...**Cynodon**
18. Glumes absent or very short...10
19. Spikelets with 2 narrow scales below the floret...**Oryza**
20. Spikelets without scales below the floret ...11
21. The spikelets unisexual ...**Zizania**
22. The spikelets bisexual...**Leersia**

Arundo L.

Arundo plinii Turra Farsetia: 11, 1765. Farsetia 11, 1765. *Arundo collina* Ten, Fl. Napol. 3:101. 1824. **Fig. 1d**

Perennial herb with erect, hollow, wooden, straight, glaucous green stem.

Local name: *Luwang tou* **Status in the park:** Common

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°29'58.66"N & 93°50'05.02"E, Elevation 761m, 27 November 2023, TNS009 (DMH).

Cynodon Rich.

Cynodon dactylon (L.) Pers. Syn. Pl. 1:85. 1805. *Panicum dactylon* L., Sp. Pl. 1:58. 1753. *Agrostis linearis* Retz., Observ. 4:19. 1786. **Fig. 1f** Perennial herb with stoloniferous, slender scaly rhizome.

Local name: *Tingthou*

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°28'19.92"N & 93°49'03.61"E, Elevation 767m, 26 November 2023, TNS011 (DMH).

Eleusine Gaertn.

Eleusine indica (Linnaeus) Gaertner, Fruct. Sem. Pl. 1:8. 1788. FOC 22: 482. *Cynosurus indicus* L., Sp. Pl. ed. 1:72. 1753. *Cynosurus indicus* L. Sp. Pl.:72. 1753. **Fig. 1g** Annual herbs with tufted and erect culms, geniculate base.

Local name: *Pungphai*

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°28'19.61"N & 93°49'03.68"E, Elevation 767m, 26 November 2023, TNS012 (DMH).

Leersia Brid.

Leersia hexandra Sw, Prodr. Veg. Ind. Occ.: 21. 1788. *Leersia acicularis* Griff. Not. Pl. Asiat. 3:2. 1851. **Fig. 2b** Perennial herb with rhizomes & stolon; stem-decumbent, creeping.

Local name: *Hoop*

Status in the park: Abundant

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°28'19.92"N & 93°49'03.58"E, Elevation 767m, 26 November 2023, TNS014 (DMH).

Oryza L.

Oryza rufipogon Griff. Not. Pl. Asiat. 3:5. 1851. FOC 22: 182-183. *Oryza sativa* var. *abuensis* Watt. Dict. Econ. Prod. India. 5:505. 1891. **Fig. 2e** Perennial tufted wild rice, in calm water.

Tongbram Nirman Singh *et al.*,

Local name: Wainuchara

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, KeibulLamjao National Park, Keibul, 24°28'19.92"N& 93°49'03.58"E, Elevation 767m, 26 November 2023, TNS015 (DMH).

Panicum L.

Key to the Species

Culms 30 – 150 cm high, ligule narrow and membranous...*P. humidorum*

Culms 20 – 55 cm high, ligule short or obsolete...*P. sphaerocarpon*

Panicumhumidorum Buch. Ham.ex Hook.f. Fl. Brit. India 7:53. 1896. Fl. Brit. India 7: 53, 1896. *Panicum ohwii*

Beetle, Leaf. W. Bot. 6:162. 1951. **Fig. 2f** Perennial herb, decumbent or erect; nodes glabrous.

Local name: Kang mapal

Status in the park: Rare

Specimen Examined: India: Manipur, Bishnupur, KeibulLamjao National Park, Keibul, 24°28'10.48"N & 93°49'41.64"E, Elevation 765, 04 November 2023, TNS018 (DMH).

Panicum sphaerocarpon Elliott. Sketch Bot. S. Carolina 1: 125, 1816. Fl. MO 1:218. **Fig. 2g** Perennial herbs; small tufts, erect or spreading.

Local name: Wanamanbi

Status in the park: Abundant

Specimen Examined: India: Manipur, Bishnupur, KeibulLamjao National Park, Keibul, 24°29'58.05"N & 93°50'04.84"E, Elevation 761m, 27 November 2023, TNS016 (DMH).

Phragmites Adans.

Key to the Species

Spikelets 1.2-1.8 cm long, leaf-blade smooth beneath...*P. communis*

Spikelets 0.9-1.2 cm long, leaf-blade scabrid beneath...*P. karka* 1. *Phragmites communis* (L.) Trin. Fund. Agrost. 134. 1820. Hsu, Fl. Taiwan 5: 388. *Arundo karka* Retz., Obs. Bot. 4:21. 1786. **Fig. 3a** Tall reed, cane-like shoots, perennial rhizomatous herb.

Local name: Tou agangba

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, KeibulLamjao National Park, Keibul, 24°29'58.51"N & 93°50'10.58"E, Elevation 767m, 27 November 2023, TNS020 (DMH). **2.** *Phragmites karka* (Retz) Trin. ex Steud., Nom. Bot., ed. 2, 2:324. 1841. *Arundo Karka* Retz. observ. Bot. 4:21. 1786. **Fig. 3b** Perennial herb, culms-reed-like, erect, rhizome creeping; nodes glabrous.

Local name: Tou agouba

Status in the park: Abundant

Specimen Examined: India: Manipur, Bishnupur, KeibulLamjao National Park, Keibul, 24°28'19.92"N & 93°49'03.58"E, Elevation 767m, 26 November 2023, TNS019 (DMH).

Pogonatherum P. Beauv.

Pogonatherum rufobarbatum Griff. Not. Pl. Asiat. 3:81. 1851. *Pogonatherum majus* Griseb. Nachr. Konigl. Ges. Wiss. Georg-August-Univ. 3:92. 1868). **Fig. 3c** Clump-forming grass with thin stems, narrow leaves.

Local name: Napiporom

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, KeibulLamjao National Park, Keibul, 24°28'10.38" N & 93°49'41.72" E, Elevation 765m, 04 November 2023, TNS022 (DMH).

Tongbram Nirman Singh et al.,

Sacciolepis Nash

Sacciolepis interrupta (Willd) Stapf. Fl. Trop. Afr. 9: 757. 1920. *Panicum interruptum* Willd., Sp. Pl. 1:341. 1797. *Hymenachne interrupta* Buse, Pl. Jungh. (Miquel) 3:377. 1854. Fig. 3g Rhizomatous perennial herb; culms rooting & floating in water, thick, spongy, hollow.

Local name: Choudeva

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°28'19.92"N & 93°49'03.61"E, Elevation 767, 26 November 2023, TNS026 (DMH).

Tripidium H.Scholz

Key to the Species

- 1a. Rachis internodes 5-7 mm long, glumes with 1-2 visible veins... *T. procerum*
- 1b. Rachis internodes 2.5-5 mm long, glumes with 3-5 visible veins ...2
- 2a. Panicle broad with leaf blades 1-5 cm wide ... *T. arundinaceum*
- 2b. Panicle narrow with leaf blades 0.3-1 cm wide ... *T. bengalense*1.

Tripidium arundinaceum (

Retz.) Welker, Voronts. & E.A. Kellogg, Taxon 68: 255. 2019. *Saccharum arundinaceum* Retz., Observ. Bot. 4: 14. 1786. *Saccharum exaltatum* Roxb., Fl. Ind. 1: 245. 1820. **Fig. 3d** Perennial herb with solid Culm.

Local name: Singut

Status in the park: Rare

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°28'06.34"N & 93°49'58.61"E, Elevation 766m, 04 November 2023, TNS021 (DMH).

2. *Tripidium bengalense* (Retz.) H.Scholz, Willdenowia 36: 664. 2006. *Saccharum bengalense* Retz., Observ. Bot. 5:16, 1789. *Saccharum munja* Roxb. Fl. Ind. 1: 246. 1820. **Fig. 3e** Perennial herb silky & greenish brown panicles.

Local name: Khoimom

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°28'06.34"N & 93°49'58.61"E, Elevation 766m, 04 November 2023, TNS024 (DMH). 3. *Tripidium procerum* (Roxb.) Welker, Voronts. & E.A. Kellogg, Taxon 68: 257. 2019. *Saccharum procerum* Roxb., Fl. Ind. 1: 243. 1820. *Erianthus procerus* (Roxb.) Raizada, Indian Forester 80: 41. 1954. **Fig. 3f** Perennial rhizomatous herb; Pseudostem erect & unbranched.

Local name: Singnang

Status in the park: Rare

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°28'10.38"N & 93°49'41.72"E, Elevation 765m, 04 November 2023, TNS023 (DMH).

Urochloa P.Beauv.

Urochloa mutica (Forssk.). T.Q. Nguyen, Novosti Sist. Vyssh. Rast. 3:13. 1966. *Panicum adpressum* Forssk. Fl. Aegypt. – Arab.:20. 1775. *Brachiaria mutica* (Forssk.) Stapf in Prain, Fl. Trop. Africa. 9:526. 1919. **Fig. 3h** Paragrass vigorous, semi-prostrate perennial herb with creeping stolon.

Local name: Sajik-tujombi

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, Keibul Lamjao National Park, Keibul, 24°28'06.63"N & 93°49'58.63"E, Elevation 766m, 04 November 2023, TNS008 (DMH).

Zizania L.

Zizania latifolia (Griseb). Hance ex F. Muell. Proc. Acclim. Soc. Victoria 1: 419 (1872). *Hydropyrum latifolium* Griseb. Fl. Ross, 4:466 (1853). *Zizania caduciflora* Hand.-Mazz. Symb. Sin. 7: 1278 (1936) nom. illeg. **Fig. 3i** Perennial, rhizomatous herb.

Local name: Ishing Kambong

Tongbram Nirman Singh et al.,

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, KeibulLamjao National Park, Keibul, 24°28'06.63"N& 93°49'58.63"E, Elevation: 766m, 04 November 2023, TNS027 (DMH).

POLYGONACEAE

Persicaria(L.) Mill.

Persicaria sagittata (L.) H. Gross, Beih. Bot. Centralbl. 37(2):113. 1919. *Polygonum sagittatum* L. Sp. Pl. 1: 363. 1753. *Persicariasieboldii* Ohki, Bot. Mag. (Tokyo) 40:54. 1926. **Fig. 2h** Annual herbaceous plant with ribbed, slender and weak, retrorselybarbed stems.

Local name: *Ishinglilhar*

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, KeibulLamjao National Park, Keibul, 24°28'10.48"N & 93°49'41.64"E, Elevation: 765m, 04 November 2023, TNS025 (DMH).

ZINGIBERACEAE

Key to the Genera

Lateral stamens minute or absent...Alpinia

Lateral stamens distinctly petaloid...Hedychium

AlpiniaRoxb.

Alpinia nigra (Gaertn.) B.L. Burtt, Notes Roy. Bot. Gard. Edinburgh. 35:213. 1977. *Zingiber nigrum* Gaertn., Fruct. 1:35, t.35, t.12. 1788. *Heritieraalughas* Retz., Obs. Bot. 6:17, t.1. 1791. **Fig. 1a** Biennial herbaceous plant, rhizomatous.

Local name: *Pullei*

Status in the park: Rare

Specimen Examined: India: Manipur, Bishnupur, KeibulLamjao National Park, Keibul, 24°29'58.53"N& 93°50'05.27"E, Elevation 761m, 27 November 2023, TNS004 (DMH).

Hedychium J. Koenig

Hedychium coronarium J. Koenig. Observ. Bot. (Retzius) 3. 73. (1783). *Hedychium chrysoleucum* Hook. Bot. Mag. 76:t. 4516. 1850. **Fig. 2a** Fleshy perennial rhizomatous herb.

Local name: *Loklei*

Status in the park: Common

Specimen Examined: India: Manipur, Bishnupur, KeibulLamjao National Park, Keibul, 24°28'19.92"N & 93°49' 03.61"E, Elevation 767m, 26 November 2023, TNS013 (DMH).

ACKNOWLEDGMENTS

The authors are thankful to the Head of Department of Botany, Dhanamanjuri University for providing laboratory facilities and encouragement. The authors also duly acknowledge the Principal Chief Conservator of Forests (Wildlife) & Chief Wildlife Warden, Government of Manipur for permitting us to enter in KLNP. The authors are also thankful to the Forest Guards (Zone I/II) of KLNP for guiding us during the collection tours.

CONCLUSION

Providing the taxonomic characters of fodder plants is much required not only for easy identification but also for conservation point of view. Long term monitoring of plant species distribution and growth is crucial to detect any changes in the fodder ecosystem of the park. The study also provides a basis to the young researchers for further studies. The present study also highlights the plants which are at risk of proper growth and distribution in the

present state of knowledge. The fodder taxonomy and ecology will surely be helpful in the conservation of rare and endangered species.

ABSTRACT

Mycobacterium tuberculosis (Mtb) infection is a major global public health issue, with over 10 million new cases and over 2 million deaths per year attributed to TB. Given the uncertainty in the current and future trajectory of the TB epidemic, mathematical modelling has emerged as an important analytical tool for exploring TB epidemiology and transmission dynamics. This paper reviews the key types of models that have been used to model Mycobacterium tuberculosis infection and disease transmission (compartmental, agent-based, network models) and how mathematical modelling has provided insights into key drivers and control strategies for TB epidemics at the population level. Mathematical modelling has been used to predict the impact of various interventions such as treatment, expanded case finding, and vaccination as well as provide quantitative estimates of key parameters such as reproductive number, effective transmission rate, and risk factors that propagate TB in communities. Limitations and extensions of TB modelling methodologies will also be discussed, along with challenges and opportunities for future research. Overall, mathematical modelling has served a critical role in advancing quantitative and epidemiological knowledge of TB transmission dynamics for policy development and evaluation at global, national, and local levels.

Keywords: Tuberculosis, mathematical model, transmission dynamics, policy, intervention

INTRODUCTION

Tuberculosis (TB) remains one of the deadliest infectious diseases globally, responsible for over 1.5 million deaths annually [1]. In 2020, an estimated 10 million people fell ill with TB worldwide [2]. The burden of TB morbidity and mortality disproportionately impacts developing countries, with the top 30 high TB burden countries accounting for 87% of new cases [3]. Complications in controlling TB epidemics arise from difficulties in rapid diagnosis, inadequate healthcare infrastructure in resource-limited settings, co-morbidities with HIV, and the emergence of drug-resistant TB strains [4]. Taken together, these challenges highlight the need for continued research into the epidemiology, transmission dynamics, and cost-effective control measures for TB. Mathematical models serve as useful tools for integrating existing knowledge, making inferences about latent aspects of disease natural history, predicting possible epidemic trajectories, and comparing different intervention strategies [5]. By quantifying the hypothetical effects of various biological, social and public health factors on disease spread, mathematical models can guide policy decisions in the absence of direct experimental trials at population scale. The utility of using mathematics to understand infectious disease dynamics was recognized over a century ago, beginning with foundational compartmental disease models by Ross, Kermack and McKendrick in the early 20th century [6]. Since then, mathematical epidemiology has rapidly expanded in scope, sophistication, and application to specific pathogens. Beginning in the late 1990s, spurred by advances in computational power and catalyzed by the HIV epidemic, mathematical modelling re-emerged at the forefront of infectious disease research [7, 8]. A spectrum of transmission models, ranging from simple to complex, have been developed and applied towards understanding TB dynamics at the population level. The simplest variants are based on compartmentalizing populations into broad disease states such as susceptible (S), exposed/latently infected (E), active/infectious (I) and recovered (R) classes [9]. Extensions of these SEIR-type models have provided insights into TB epidemiology by incorporating greater heterogeneity with respect to age, geography, co-infections, strain diversity, and antibiotic resistance profiles [10-13].

On the more complex end of the spectrum, agent-based models provide fine-grained simulations applied to individual people or households connected through customizable contact networks [14, 15]. While more computationally intensive, individual-based models can provide greater resolution into localized community interactions shaping TB transmission. In applying mathematical models to TB specifically, important insights have been gained into the reproduction number (R_0 , the expected secondary cases per primary case), the equilibrium prevalence levels resulting from various control strategies, optimal resource allocation, the role of imported infections or latent reservoirs in sustaining transmission, and prospective targets for interventions to curtail epidemics [16-19]. Key epidemiological features of TB that mathematical modelling has elucidated includes the important contribution of latently infected class towards prolonged infectious periods [20], the low per-contact transmission probability relative to other respiratory infections [21], age-assortative mixing driving dynamics [22], and spatial heterogeneity in high-burden settings [23,24]. Moving forward, mathematical modelling continues to have an important role in synthesizing evidence, testing assumptions, generating hypotheses and making quantitative projections to guide TB policy. In this paper, we review existing modelling methodologies applied to TB (section II), highlight key biological and epidemiological insights gained from TB modelling (section III), and discuss ways in which modelling analyses have directly informed public health planning and decision making for TB control (section IV). We conclude by addressing some current limitations as well as future opportunities for enhancing the integration of mathematical modelling into global TB elimination strategies. Overall, we demonstrate the diverse applications and benefits reaped from synergizing mathematical and public health perspectives into further unravelling the complex natural history and community dynamics propelling global TB epidemics.

Types of Mathematical Models Used for TB Simple Compartmental (SIR-type) Models

The most basic mathematical models divide the population into distinct compartments based on disease status and use a system of differential equations to describe transitions between these classes over time. The simplest structure

Rakesh Kumar *et al.*,

comprises just three classes – susceptible (S), infectious (I), and recovered (R), giving rise to so-called SIR models [25]. These models assume homogenous mixing and can be described by the following equations:

$$\frac{dS}{dt} = -\beta SI \quad (1)$$

$$\frac{dI}{dt} = \beta SI - \gamma I \quad (2)$$

$$\frac{dR}{dt} = \gamma I \quad (3)$$

Here, β describes the effective per capita disease transmission rate, and γ refers to the recovery rate. Extensions of this basic SIR structure have allowed further categorization into exposed (E) classes representing the latent period between infection acquisition and infectiousness, as shown in SEIR frameworks [26]. For TB, latently infected individuals comprise an important hidden reservoir sustaining transmission through eventual reactivation into active TB [27]. One proposed structure includes further compartmentalization of these latency classes into early and late latency stages [26]:

$$\begin{aligned} \frac{dS}{dt} &= -\beta SI \\ \frac{dE_1}{dt} &= \beta SI - k_1 E_1 \\ \frac{dE_2}{dt} &= k_1 E_1 - k_2 E_2 \\ \frac{dI}{dt} &= k_2 E_2 - \gamma I \end{aligned} \quad (4)$$

Where E_1 refers to early latent individuals that can reactivate and generate secondary infectious cases I , while E_2 refers to late latent individuals that cannot transmit further even if reactivation occurs [26]. Extensions to the basic SEIR-type model have incorporated protection from infection via vaccination (with additional protected compartments) [28], stratification by HIV status [29], and drug-resistant strains [30]. While simplifying assumptions of SIR-type models limit dynamics to population-scale behaviors, key epidemiological parameters can be derived to characterize TB transmission (e.g. the basic reproduction number R_0 scaling to transmission rate and infectious period duration). SIR-frameworks have been used to describe heterogeneity in age-specific TB infection risks in settings with historical control programs [31]. Reduced age-stratified models have also retained multi-strain capabilities and spatial connectivity between subpopulations [32, 33].

Complex Compartmental Models

Age-Structured Models *Mtb* infection risk and disease progression rates have age-dependent clinical patterns, with the highest TB incidence among young adults and greater morbidity in the extremes of age [34]. To capture this demographic heterogeneity omitting age structure from simple models compromises dynamic accuracy. Several TB modeling frameworks have subdivided population compartments into relevant age groups [35,36]. Increased age-resolution comes at the cost of added model complexity but allows customization of mixing parameters and intervention targets to specific subpopulations. Hybrid approaches balance adequately capturing age effects while retaining model tractability [37]. Multi-Strain Models Accounting for heterogeneity extends beyond host demographics to bacteriological diversity. Genomic differences between *Mtb* strains, including between the predominant lineages Lineage 2 (East Asian) and Lineage 4 (Euro-American), can influence pathogen virulence, transmissibility, and drug resistance profiles [38,39]. Similarly, models that amalgamate both drug-susceptible and increasingly prevalent multidrug resistant (MDR) types compromises the precision needed for reliable forecasts. Some TB modeling has accordingly categorized by both strain distinctions and resistance types [30,40]. While computationally challenging, multi-strain TB models provide higher resolution into genotype-specific transmission patterns and differential intervention effects. Metapopulation and Spatial Models Human mobility ties together community infection risks across geography, with important implications for containing infectious disease spread [41]. Patchy healthcare access can also drive spatial heterogeneity in control. Representing space becomes relevant for generalizing predictions to account for human travel, health infrastructure distributions, even local climates if incorporating seasonality. Some metapopulation formulations represent migratory flows between discrete city or

**Rakesh Kumar et al.,**

county subpopulations in coarse-grain fashion [42]. Fine-scale computational models simulate detailed mobility and representations of environment, but require extensive parameterization [43]. Hybrid geospatial TB models balance complexities introduced by space with retaining translational capabilities [44]. Capturing spatial dynamics, however interpretable, remains technically challenging but important for local decision making.

Individual-based Network and Agent-based Models

Rather than modeling population subgroups, individual-based simulations build models “bottom-up” from people as discrete entities with assignable characteristics that more closely mimic real-world heterogeneity and contact patterns [45]. Social connections between individuals are encoded as dynamic networks dictating possible transmission routes. Agent-based models (ABMs) couple these contact networks with simulation of people as autonomous agents with customize decision-making protocols. ABMs can embed additional spatial granularity including household, neighborhood or workplace environments shaping interactions [46]. Customizability provides flexibility adapting models to local contexts, with ability to experiment by tweaking individual behavior rules. Applied to TB, individual-based approaches have recreated infection diffusion across realistic social networks calibrated to respondent-driven sampling data [47]. Details extend to capturing household crowding effects and HIV impacts on co-infected individuals [48]. ABMs have also estimated spill over TB transmission in healthcare settings [49]. More computationally intensive than compartmental models, individual simulations better represent heterogeneous transmission but require extensive parameterization from resource-demanding field studies. Hybrid model frameworks aiming to balance detail with tractability have shown promise for capturing representative contact patterns [43]. Comparison of Different Modeling Approaches All modeling methodologies have inherent limitations accompanying simplifying assumptions, but spectrum from compartmental to individual-based models have complementary strengths balancing generalizability, precision, and feasibility [50]. Simple compartment models readily provide interpretable population-level insights but cannot capture complexities like age, spatial effects, or strain interactions driving endemic TB persistence. Individual-based network simulations offer highest resolution into transmission heterogeneities but may compromise tractability, computational efficiency, and generalizability. Investigating research questions across modeling frameworks provides a robustness check on any key predictions or policy recommendations. Multi model inference has recently been proposed for leveraging strengths across an ensemble of simulation models while mitigating limitations of any individual approach [51]. Ensemble frameworks can improve predictive performance compared to any single model by drawing consensus from divergent methodologies. Integrating multiple models does pose challenges for reconciling discordant projections and resource intensiveness. Overall a diversity of modeling approaches each provide distinct utilities based on specific research questions, with ensemble or hybrid frameworks showing promise for balancing realism with flexibility.

Key Insights Gained from Mathematical Models of TB

Understanding Disease Transmission Dynamics

Mathematical models have been instrumental in quantifying the reproduction number (R_0) for TB, which determines the expected number of secondary cases generated per infectious case when control measures are absent. This metric captures the transmission potential based on the duration of infectious period and per-contact probability of infection. Estimates of the basic reproduction number for TB typically fall in the range of 1-4 in high burden settings prior to intervention scale-up [52,53]. Customizable transmission models have allowed dissection of the relative contributions of different mixing groups (e.g. household, casual community, healthcare settings) towards propagation of infections from index cases [54]. Age-structured modeling has elucidated highest transmission potential occurring among adolescents and young adults around age 15-24 years old [55]. Capturing Latent and Reactivation Dynamics A unique challenge posed by Mycobacterium tuberculosis is the ability to cause clinical latency, where immune restraint induces a symptomless infection state that can persist for years before ultimately progressing to active TB disease [56]. This vast reservoir of latent infections sustains endemic transmission over long time horizons and complicates elimination efforts. Mathematical models accounting for these latent subpopulations have underscored their prominence, with around 90% of infected individuals entering quiescent stages after initial exposure in high prevalence settings [57]. Model calibrations to epidemiological data confirm extremely high lifetime

**Rakesh Kumar et al.,**

risks of TB reactivation around 5-10%, necessitating cost-effective targeting of preventative latently infected cohorts [58].

Predicting Intervention Impacts

Treatment Scale-Up Expanding case detection and appropriate chemotherapy forms the cornerstone of ongoing TB control efforts worldwide. Mathematical models have proven valuable for projecting the population-level impacts resulting from programs strengthening drug-susceptible TB treatment access and efficacy. Predictions suggest scaling up to global targets of detecting and treating 90% of infections could reduce TB incidence by 80% over the next century [59]. However, treatment as prevention alone will likely fall short of achieving elimination in high burden countries over feasible timeframes [60]. **Vaccination** Given unmet needs from treatment interventions alone, vaccine development remains a pivotal priority [61]. Candidate TB vaccines entering clinical trials have demonstrated safety and immunogenicity but with overall efficacy still below desirable targets [62]. Mathematical models accounting for possible transmission effects have projected the level of vaccine efficacy likely required to achieve elimination when used in conjunction with expanded case finding [63,64]. These projections crucially inform target product profiles guiding investment priorities and decision making for nascent candidates. **Synergistic Interventions** Insights from mathematical modeling also highlight opportunities for synergistically layering interventions with complimentary effects beyond standalone strategies. For example, household-targeted active case finding when combined with preventative therapy of high-risk latent groups has shown promising potential for amplifying impacts [65]. Integrating vaccination with improving treatment access is also projected to accelerate control [66]. Quantitatively evaluating combination intervention portfolios through modeling facilitates optimal allocation of finite health budgets.

Role of Model Calibration using Population-Level Data

Model parametrization leveraging available epidemiological evidence and clinical trial data represents a crucial step enabling meaningful quantitative analysis of potential TB interventions [67]. Fitting models to replicate historically observed epidemiological trends also serves to validate the structured assumptions and transmission dynamics represented. The increasing availability of age-stratified notification and mortality data has enabled calibration of age-mixing parameters [68], while molecular data help constrain understanding of strain-specific fitness and drug resistance acquisition risks [69]. Geographic information systems and contact pattern studies also facilitate quantification of transmission routes for spatially-embedded simulations [70]. Continual accrual of population-level data on demographics, mixing patterns, health-seeking behaviors, and infection biomarkers (e.g. tuberculin skin tests, IGRAs) provides an expanding evidence base for enhancing detail and local credibility of TB models intended to guide policy. Standardizing procedures for validating TB models against endemic prevalence and incidence indicators has promoted reliability in harnessing their utility for prospective health economic evaluations [71]. Overall the rigor of insights to inform public health decision-making scales directly with fidelity calibrating models to observed epidemiology from quality field data.

Applications of TB Modeling for Public Health Policy

Evaluating Control Strategies

Mathematical models provide a testbed for conducting controlled experiments comparing the potential effectiveness of new TB control strategies by simulating their impact on disease transmission under simplifying assumptions. Strategies evaluated through modeling analyses include novel diagnostics, new drug regimens or delivery mechanisms, vaccines, and non-pharmaceutical interventions modifying risk behaviors or contact patterns in communities. Representing heterogeneity and uncertainty in model projections facilitates robust comparative effectiveness analyses between intervention scenarios. One common modeling application has been cost-effectiveness evaluations weighing the trade-offs between impacts on health outcomes versus resource inputs for new tools introduced across varied epidemiological settings [73,74]. These models calibrate baseline transmission models to setting-specific TB incidence and mortality data, overlay representation of the mechanistic benefits from introducing a technology like a diagnostic or vaccine, run simulations comparing epidemiological outcomes over long time

**Rakesh Kumar et al.,**

horizons, and weigh incremental costs against health gains [75]. Customizable model designs and modularity help adapt such policy models to decision contexts ranging from high-resource to high-burden settings [76].

Cost-Effectiveness Analyses

Health economic analyses projecting the cost-effectiveness and optimal implementation strategies for emerging TB interventions have become increasingly adopted to inform technology development pipelines and global health prioritization [77]. Representing heterogeneity in transmission dynamics and linking downstream costs to epidemiological outcomes makes mathematical modeling well-suited for such appraisals. Cost-effectiveness analyses using TB modeling have evaluated target product profiles for new diagnostics, drugs, and vaccines to guide research priorities towards the most promising technical and operational characteristics [78-80]. Health policy models calibrated to representative age structure, co-infection patterns, and healthcare access constraints in a given setting provide generalizable tools for comparing interventions tailored to local infrastructure [81,82]. Portability to multiple regions also facilitates generalizable insights into equity considerations around global health resource allocation [83]. Informing Local Planning Mathematical model projections are only as credible as accurately representing endemic conditions and population demographics in the settings where policies are to be implemented. While models calibrated to one location can theoretically have parameters modified to emulate other environments, substantial biases may arise without formally integrating local evidence. Ensuring robustness therefore requires engaging directly with field data sources to build customized models tailored to capture salient characteristics of regional sub-epidemics [84]. Several collaborations between modelers and country TB programs have recently yielded hyperlocal models designed using nationally available data on age-mixing patterns, household crowding, HIV prevalence, healthcare access constraints, even spatial connectivity between communities to improve credibility of forecasts to guide sub-national planning [85-87]. Moving forward, promoting positive modeling practice including close stakeholder engagement, transparency, and validation procedures will help translate complex simulations into actionable insights for real-world decision makers [88].

Future Research Directions and Conclusions

Future Research Directions

While mathematical models have generated valuable insights into TB epidemiology and control, there remain important knowledge gaps limiting model performance. Ongoing refinement and integration of new data sources into modeling frameworks can enhance credibility and utility for decision-makers.

Model Structural Limitations

A perpetual challenge lies in balancing model complexity versus interpretability and flexibility. Although individual-based network and agent-based models capture greater realism, computational efficiency and parameterization burdens restrict application, even as increasing availability of granular data makes this more feasible. Hybrid model frameworks attempt to bridge this gap by embedding higher-resolution representations like households or age structure into accessible compartmental designs. Ensuring model structures adequately capture local transmission ecology without compromising generalizability remains an active area of investigation.

Data Limitations

All models are constrained by input data quality, relying on estimates of key epidemiological indicators, mixing patterns, health behaviors, and intervention effects that may be biased or lack precision. Expanding repositories of age-specific prevalence, centralized diagnostics databanks, contact tracing studies, and so on facilitate continuous model improvements. Particularly sparse evidence in high-burden countries most in need of tailored projections hampers progress. Advancing data science methods for synthesizing diverse multiscale data sources offers promise.

Cross-disciplinary Collaboration

Further integrating dynamic modeling with empirical epidemiology, statistical microbial genomics, health geography, and real-world policy Creating synergies between bioinformaticians, epidemiologists, clinicians, modelers and decision makers can overcome systemic blind spots and enhance collective wisdom. Formalizing best

Rakesh Kumar et al.,

practices for participatory modeling processes promoting equitable stakeholder engagement will be key. Implementation Science A key priority remains effectively translating conceptual modeling insights around optimal resource allocation into actionable guidance supporting programmatic decision-making for TB elimination. Implementation science approaches could help address persistent gaps in adoption of model-based recommendations. Studying barriers and developing capacity-building interventions around evidence-based policymaking is warranted.

CONCLUSIONS

In toto, the diverse modeling methodologies reviewed here have generated critical insights into the community dynamics of TB transmission and quantified potential gains from interventions singly and in combination over variable timescales. Although models inherently carry limitations, their utility continues to expand through steady accrual of higher quality data, increased computational power expanding model sophistication, and a broadening evidence base on intervention effects for calibration. Moving forward, even as molecular technologies and artificial intelligence transform epidemiology, dynamic modeling will likely remain essential for synthesizing evidence and guiding health policy towards accelerating the end of global TB epidemics. Realizing this potential relies on promoting best practices and building modeling literacy among decision makers to fully leverage these tools for strengthening health systems behind elimination efforts. Overall there remains tremendous untapped potential at the intersection of empirical and computational epidemiology to address critical unsolved questions, benefiting from cross-disciplinary collaboration and advancing data integration technologies.

ABSTRACT

Skin cancer is one of the most prevalent forms of cancer globally, and its early detection is critical for effective treatment and improved survival rates. This study focuses on the development of a skin cancer classification model to accurately predict three distinct categories of skin lesions: Dermatofibroma, Melanocytic nevus, and Melanoma, using input images of the skin. Leveraging the DenseNet121 deep learning architecture, this research aims to deliver a robust and efficient solution for automated skin lesion classification. The model was trained on a curated dataset of skin images and employed DenseNet121 due to its high efficiency in feature extraction and low computational overhead. DenseNet121's densely connected convolutional network allows for improved gradient flow, feature reuse, and parameter efficiency, making it an ideal choice for this task. The system preprocesses input skin images through resizing, normalization, and augmentation to ensure invariance to scale, rotation, and lighting conditions. Evaluation metrics, including accuracy, precision, recall, and F1 score, were used to assess the model's performance. The results demonstrate that the proposed DenseNet121-based classifier achieves superior performance compared to conventional models, particularly in distinguishing between closely resembling skin lesion categories. This approach not only highlights the potential of deep learning in the dermatology domain but also establishes a foundation for future advancements in skin cancer diagnostics. By providing an automated, reliable, and scalable method for skin cancer classification, this work aims to assist dermatologists in making faster and more accurate diagnoses,

**Latha Maheswari et al.,**

ultimately contributing to enhanced patient outcomes. Further optimization and integration with clinical workflows are discussed to improve the model's applicability in real-world scenarios.

Keywords: Melanocytic nevus, and Melanoma, using input images of the skin.

INTRODUCTION

Skin cancer remains one of the most common types of cancer worldwide, with millions of new cases reported annually. Early and accurate diagnosis is crucial in reducing mortality rates and improving patient outcomes. However, distinguishing between various types of skin lesions can be challenging, even for experienced dermatologists. This challenge necessitates the development of reliable, automated systems to assist in the classification of skin cancer types based on dermatoscopic images. The primary goal of this project is to create a system that can classify skin lesions into three categories:

- Dermatofibroma
- Melanocytic nevus
- Melanoma

Melanoma, in particular, is the most aggressive form of skin cancer, requiring timely intervention. Automating the classification process can aid medical professionals in making informed decisions and ensure patients receive the appropriate treatment as early as possible. This project aims to develop a skin cancer classification model using DenseNet121, a pre-trained convolutional neural network (CNN) known for its feature extraction capabilities and computational efficiency. By leveraging state-of-the-art deep learning techniques, the model will analyze skin lesion images and predict the likelihood of each lesion type. This work addresses a critical gap in automated medical diagnosis by providing a robust tool for skin cancer classification. The use of DenseNet121 ensures that the model benefits from advanced deep learning techniques, offering high accuracy with minimal computational overhead. By integrating this solution into clinical workflows, healthcare professionals can achieve:

- Improved diagnostic accuracy.
- Reduced workload for dermatologists.
- Faster identification of high-risk cases.

Problem Statement

Skin cancer is one of the most common types of cancer worldwide, with early and accurate diagnosis playing a critical role in patient outcomes. However, traditional diagnostic methods rely heavily on clinical expertise and manual evaluation, which can be time-consuming and prone to human error. This project aims to develop an automated skin cancer classification system using advanced machine learning techniques. The system will classify skin lesions into benign or malignant categories by analyzing skin images, improving diagnostic accuracy and accessibility. By leveraging computer vision and deep learning models, this solution seeks to assist dermatologists and healthcare providers in making timely, data-driven decisions.

Proposed Solution

Skin cancer classification is a critical task in dermatological diagnostics, aiming to enhance early detection and treatment. This project utilizes DenseNet121, a deep convolutional neural network renowned for its efficiency in feature extraction and gradient flow, to classify skin images into three categories: 'Dermatofibroma,' 'Melanocyticnevus,' and 'Melanoma.' DenseNet121's dense connectivity pattern mitigates the vanishing gradient problem and promotes the reuse of features, ensuring robust performance even with limited datasets. Input images undergo preprocessing, including resizing, normalization, and augmentation, to enhance generalization. The proposed method leverages transfer learning to fine-tune a pre-trained DenseNet121 model, optimizing its capability for skin lesion classification while maintaining computational efficiency. This approach promises high accuracy and scalability, making it suitable for clinical and telemedicine applications.

**Related Work**

Xia *et al.* (2023): Xia and colleagues developed a deep learning model for skin cancer detection, focusing on the classification of various skin lesions. Their approach used the InceptionV3 architecture and achieved impressive accuracy in distinguishing between melanoma, benign moles, and other types of skin lesions. Their work highlighted the potential of convolutional neural networks (CNNs) for accurate diagnosis, though they also discussed the need for high-quality labeled datasets to ensure robustness across diverse skin tones [1]. Zhou *et al.* (2022): Zhou and his team explored the use of DenseNet121 in medical image classification, specifically targeting skin lesions. They found that DenseNet121 outperformed traditional CNN architectures in terms of both feature extraction and classification accuracy. Their study also focused on optimizing the model for real-time use in clinical settings, showing promising results for early melanoma detection and providing an avenue for further improvements in skin cancer diagnosis [2]. Kang *et al.* (2024): Kang *et al.* reviewed various deep learning techniques applied to skin cancer classification, with a focus on melanoma detection. The paper noted the success of architectures such as DenseNet121, ResNet, and VGGNet in identifying malignant lesions from benign ones. They emphasized that the combination of DenseNet121's feature reuse and efficient learning algorithm made it one of the top choices for high accuracy in skin cancer classification [3]. Lee *et al.* (2021): In their study, Lee and colleagues investigated the use of deep learning methods for classifying dermatological conditions, particularly focusing on the early detection of melanoma, dermatofibroma, and melanocytic nevus. Their results suggested that multi-class classification models using CNNs could successfully differentiate between these skin conditions, achieving over 90% accuracy on large, annotated datasets. The authors noted that further research was needed to enhance model generalizability across different populations and skin types [4]. Sung *et al.* (2020): Sung and his team applied deep learning models to classify skin cancer types from dermoscopic images. Their work used DenseNet121 and other CNN architectures for multi-class classification, with the aim of identifying three major skin conditions: melanoma, benign melanocytic lesions, and dermatofibroma. Their findings indicated that DenseNet121 provided superior feature extraction capabilities compared to conventional models, particularly when trained on a diverse set of image data [5]. Kim *et al.* (2024): Kim and his team presented an advanced model for skin cancer classification, where they employed DenseNet121 and compared it to several other deep learning models. Their results indicated that DenseNet121 had a significantly higher performance in identifying melanoma and other skin lesions with fewer false positives. The study also explored the practical aspects of deploying such a model in real-world healthcare settings, emphasizing the importance of model transparency and interpretability for clinicians [6].

PROPOSED METHODOLOGY

In this section, the proposed methodology for skin cancer classification is outlined. The objective is to design a robust and efficient model capable of accurately identifying three types of skin conditions: Dermatofibroma, Melanocyticnevus, and Melanoma, using images of skin lesions. The system employs the DenseNet121 architecture, a convolutional neural network (CNN), to extract deep features from the input skin images and categorize them into one of the specified classes. The entire pipeline of image processing, feature extraction, and classification is discussed below

Data Collection and Preprocessing

The first step of the methodology involves gathering a diverse dataset of skin images. The images should ideally come from publicly available skin lesion datasets, such as the ISIC Archive, which contains annotated skin lesion images. The dataset should contain labeled images from three distinct classes: Dermatofibroma, Melanocyticnevus, and Melanoma.

Preprocessing steps are critical to ensure the quality of the data fed into the model. These steps include:

- Image Resizing: Images are resized to a consistent dimension, typically 224x224 pixels, which is the standard input size for the DenseNet121 architecture.
- Normalization: Pixel values are normalized to a range of [0, 1] by dividing the pixel values by 255.

- **Data Augmentation:** Data augmentation techniques such as rotation, flipping, and scaling are applied to increase the diversity of the training data and improve the generalization capability of the model. This helps to mitigate overfitting and enhances model performance by generating multiple variants of the same image.

Model Architecture: DenseNet121

DenseNet121, a convolutional neural network with dense connections between layers, is chosen for the classification task. The DenseNet architecture has been shown to be effective in various computer vision tasks due to its efficient use of parameters and its ability to preserve gradient flow throughout the network. The architecture of DenseNet121 consists of multiple dense blocks, where each block is composed of convolutional layers. In these blocks, each layer receives input from all previous layers, which improves feature reuse and reduces the number of parameters. The architecture of DenseNet121, specifically, has 121 layers, which makes it deep enough to capture complex patterns in images, yet efficient in terms of parameter count.

- **Input Layer:** The input to the model is a 224x224x3 image, where 224 is the height and width of the image, and 3 represents the RGB color channels.
- **Dense Blocks:** The network consists of four dense blocks. Each block contains a series of convolutional layers that progressively capture more complex features of the input image.
- **Transition Layers:** Between each dense block, transition layers perform down-sampling by applying convolution and pooling operations, reducing the spatial dimensions while retaining critical features.
- **Fully Connected Layer:** The final feature maps are flattened into a 1D vector and passed through a fully connected layer to generate the output predictions.
- **Output Layer:** The output layer uses the Softmax activation function to output probabilities for the three classes: Dermatofibroma, Melanocyticnevus, and Melanoma.

Model Training

Training the DenseNet121 model involves feeding the preprocessed images through the network and optimizing the model's weights to minimize the classification error. The following steps outline the training process:

- **Loss Function:** Categorical cross-entropy loss is used as the loss function, which is suitable for multi-class classification tasks.
- **Optimizer:** The Adam optimizer is used for weight updates, as it adapts the learning rate based on the gradient's first and second moments, ensuring faster convergence and better stability during training.
- **Learning Rate Scheduler:** A learning rate scheduler is employed to adjust the learning rate during training to prevent overfitting and ensure convergence.
- **Early Stopping:** To prevent overfitting, early stopping is implemented, which halts training if the validation accuracy does not improve after a specified number of epochs.

The model is trained for a predetermined number of epochs, typically between 20 and 50 epochs, with a batch size of 32. During training, the model learns to map input images to their corresponding labels (Dermatofibroma, Melanocyticnevus, or Melanoma).

Model Evaluation

After training, the model's performance is evaluated on a separate test set of skin images that were not seen during training. The evaluation metrics include:

- **Accuracy:** The overall percentage of correctly classified images out of the total number images.
- **Precision, Recall, F1-Score:** These metrics are calculated for each class to assess how well the model performs in detecting each type of skin condition.
- **Confusion Matrix:** A confusion matrix is used to visualize the model's performance across all classes, showing the true positives, true negatives, false positives, and false negatives.

Additionally, cross-validation is used to ensure the robustness of the model by testing it on different subsets of the data.

Latha Maheswari et al.,

Post-processing

Once the model has been trained and evaluated, the following post-processing steps are applied:

- **Class Prediction:** The model's output probabilities are used to predict the most likely class for each input image. The class with the highest probability is selected as the predicted class.
- **Result Interpretation:** The model's predictions are analyzed, and a confidence score is attached to each prediction, which provides the certainty of the classification.

Deployment

The trained model is deployed for real-time skin cancer detection in a clinical setting or as a mobile application. For deployment, the model is converted into a lightweight format compatible with the target platform, such as TensorFlow Lite or ONNX, to ensure efficient inference.

RESULT AND DISCUSSION

Model Performance

In this study, a DenseNet121 architecture was employed to classify skin lesions into three distinct categories: Dermatofibroma, Melanocytic nevus, and Melanoma. The model was evaluated on a dataset consisting of skin images, with each image representing one of the three classes. The DenseNet121 model, known for its efficient feature extraction capabilities through dense connections between layers, was trained and tested to assess its classification accuracy. The model achieved a classification accuracy of 92.4% on the test dataset, as shown in Table I. This high accuracy indicates that DenseNet121 is effective in distinguishing between the different types of skin lesions. The evaluation metrics, including precision, recall, and F1-score, were also calculated for each class, as illustrated in Table II.

Evaluation Metrics

- Dermatofibroma: Precision = 91.3%, Recall = 94.1%, F1-score = 92.7%
- Melanocytic nevus: Precision = 94.5%, Recall = 89.7%, F1-score = 92.0%
- Melanoma: Precision = 92.2%, Recall = 91.8%, F1-score = 92.0%

These metrics demonstrate a balanced performance across all three classes, with the model showing slightly higher precision for Melanocytic nevus and better recall for Dermatofibroma. The overall F1-scores reflect the model's reliability in making accurate predictions while minimizing both false positives and false negatives.

Comparison with Existing Approaches

The performance of the DenseNet121 model was compared with other state-of-the-art skin cancer classification models. Previous works in the literature typically report classification accuracies ranging from 85% to 90% using conventional convolutional neural network (CNN) architectures. Our model, with its 92.4% accuracy, surpasses many of these methods, highlighting DenseNet121's ability to capture fine-grained features that are crucial for distinguishing between similar skin lesions. Furthermore, unlike models that rely on a combination of various preprocessing and data augmentation techniques, our approach focused purely on the DenseNet121 architecture, which emphasizes efficient feature reuse through its densely connected layers, leading to improved generalization and faster convergence during training.

Visual Interpretation

To further evaluate the model's predictions, a few representative skin images from each class were analyzed. The DenseNet121 model accurately classified Dermatofibroma and Melanocytic nevus, while it correctly identified melanoma cases, which are often harder to distinguish due to their irregularities in shape and color. The high performance of the model, especially in the Melanocytic nevus and Melanoma categories, suggests that DenseNet121 is effective in handling the complexity of skin images and is capable of recognizing subtle differences that might be overlooked by simpler models.

DISCUSSIONS

The results demonstrate the strong potential of DenseNet121 in skin cancer classification, with the model achieving high accuracy and strong evaluation metrics across all three classes. Despite some variations in precision and recall, the model maintained balanced performance, minimizing the risk of misclassifications. One key factor contributing to the model's success is its architecture, which leverages densely connected layers that facilitate feature reuse and promote more efficient learning. By focusing on a single, powerful architecture, we were able to achieve competitive performance without the need for complex preprocessing pipelines or additional ensemble methods. This suggests that DenseNet121 could serve as an effective baseline for future work in medical image classification tasks. However, while the model performs well on the test dataset, further improvements may be needed in real-world clinical settings, where images may contain more noise or exhibit variations due to different imaging conditions. Future work could explore combining DenseNet121 with other advanced techniques, such as transfer learning, multi-class classification strategies, and external datasets, to enhance robustness and further improve accuracy.

CONCLUSION

In this study, a robust skin cancer classification model was developed using the DenseNet121 architecture to classify skin lesions into three distinct categories: *Dermatofibroma*, *Melanocytic nevus*, and *Melanoma*. The model leverages DenseNet121, a deep convolutional neural network known for its efficient use of parameters and superior feature extraction capabilities due to its dense connections between layers. This approach ensures that each layer receives input from all previous layers, promoting feature reuse and enhancing performance on complex image data such as skin lesions. The results demonstrate the potential of DenseNet121 in the field of dermatology, achieving high classification accuracy. The model was trained on a large dataset of skin images, and the performance metrics indicated that the DenseNet121-based approach effectively discriminates between benign and malignant skin conditions. The accuracy, precision, recall, and F1 score achieved by the model showed significant improvement compared to conventional models, reinforcing the value of deep learning in medical image analysis. Despite the promising results, there are opportunities for future improvements. One notable direction is the inclusion of more diverse datasets, which can help the model generalize better to different skin types and environmental conditions. Additionally, the integration of more advanced techniques such as data augmentation, transfer learning, and ensemble methods may further enhance the model's performance, enabling more accurate and reliable predictions. In conclusion, the DenseNet121-based skin cancer classification model provides a reliable tool for assisting dermatologists in diagnosing and differentiating between skin lesions. The combination of high accuracy, efficiency, and ease of implementation makes this approach a promising solution for early detection of skin cancer, ultimately contributing to the reduction of skin cancer mortality rates.

Future Work

The skin cancer classification model presented in this study utilizes DenseNet121 for the identification of three primary skin conditions: 'Dermatofibroma', 'Melanocyticnevus', and 'Melanoma'. Although this approach has yielded promising results, several directions for future work could enhance its performance, scalability, and practical application in real-world clinical settings. One key area for improvement is the integration of multiple pretrained models within an ensemble learning framework. By combining DenseNet121 with other established architectures such as VGG16, ResNet, or EfficientNet, the model can leverage the strengths of each architecture, potentially improving classification accuracy and reducing overfitting. Ensemble methods have proven effective in various domains and could provide a more robust solution for skin cancer classification. Furthermore, fine-tuning the model with advanced transfer learning techniques could further enhance its performance. While DenseNet121 offers strong results, adjusting the last few layers of the network through fine-tuning or utilizing learning rate annealing could lead to better convergence, resulting in a more accurate and efficient model. Transfer learning from datasets with diverse dermatological images would also help the model generalize better across different skin types and lesion appearances.

ABSTRACT

The necessary and sufficient conditions for the ideals to be the 2 absorbing ideals by left ideal, right ideal and by the product of left and right ideals are established in non commutative rings. Many properties of two absorbing ideals are validated.

Keywords: 2-Absorbing Ideal, Right Ideal, Left Ideal.

INTRODUCTION

Badawi[1] established that a non-zero proper ideal I of R is a 2-absorbing ideal if and only if whenever $I_1 I_2 I_3 \subseteq I$ for some I_1, I_2, I_3 of R then $I_1 I_2 \subseteq I$ or $I_2 I_3 \subseteq I$ or $I_1 I_3 \subseteq I$. Gronewald[2] classified 2 absorbing ideals into two classes namely 2 absorbing and strong 2 absorbing. He established that the intersection of two prime ideals is a 2 absorbing ideal. He characterized that 2 absorbing ideals by the product of two left ideals.

Naturally the following questions arise.

1. What is the relation between the product of right ideals with 2 absorbing ideal?
2. What is the relation between the product of an element and right ideals with 2 absorbing ideal?
3. What is the relation between the product of an element and left ideal with 2 absorbing ideal?

We try to answer these questions here.

Sweetline and Mohanraj

2-absorbing ideal

Definition. Let A be a proper ideal of a ring R . Then A is called a 2-absorbing ideal of R if $aRbRc \subseteq A$ implies that $ab \in A$ or $bc \in A$ or $ac \in A$ for all $a, b, c \in R$.

Theorem.

- (1) A is 2-absorbing ideal
- (2) $IRbRc \subseteq A$ implies $Ib \subseteq A$ or $bc \in A$ or $Ic \subseteq A$ for any right ideal I in R .
- (3) $aRJ Rc \subseteq A$ implies $aJ \subseteq A$ or $Jc \subseteq A$ or $ac \in A$ for any right ideal J in R .
- (4) $aRbRK \subseteq A$ implies $ab \in A$ or $bK \subseteq A$ or $aK \subseteq A$ for any right ideal J .
- (5) $IRJRc \subseteq A$ implies $IJ \subseteq A$ or $Jc \subseteq A$ or $Ic \subseteq A$ for any right ideals I and J .
- (6) $aRJRK \subseteq A$ implies $aJ \subseteq A$ or $JK \subseteq A$ or $aK \subseteq A$ for any right ideal J and K .
- (7) $IRbRK \subseteq A$ implies $Ib \subseteq A$ or $bK \subseteq A$ or $IK \subseteq A$ for any right ideals I and K .
- (8) $IJK \subseteq A$ implies $IJ \subseteq A$ or $JK \subseteq A$ or $IK \subseteq A$ for any right ideals I, J and K .
- (9) $IRbRc \subseteq A$ implies $bc \in A$ or $Ib \subseteq A$ or $Ic \subseteq A$ for any left ideal I .
- (10) $aRJ Rc \subseteq A$ implies $aJ \subseteq A$ or $Jc \subseteq A$ or $ac \in A$ for any left ideal J .
- (11) $aRbRK \subseteq A$ implies $ab \in A$ or $bK \subseteq A$ or $aK \subseteq A$ for any left ideal K .
- (12) $IRJRc \subseteq A$ implies $IJ \subseteq A$ or $Jc \subseteq A$ or $Ic \subseteq A$ for any left ideal I and J .
- (13) $aRJRK \subseteq A$ implies $aJ \subseteq A$ or $JK \subseteq A$ or $aK \subseteq A$ for any left ideals J and K .
- (14) $IRbRK \subseteq A$ implies $Ib \subseteq A$ or $bK \subseteq A$ or $IK \subseteq A$ for any left ideals I and K .
- (15) $IJK \subseteq A$ implies $IJ \subseteq A$ or $JK \subseteq A$ or $IK \subseteq A$ for any left ideals I, J and K .
- (16) $I_1 I_2 I_3 \subseteq A$ implies $I_1 I_2 \subseteq A$ or $I_2 I_3 \subseteq A$ or $I_1 I_3 \subseteq A$ for any ideals I_1, I_2, I_3 are equivalent for the ideals A in the rings R .

Proof. First, we prove that (1) $\Rightarrow$ (2) $\Rightarrow$ (5) $\Rightarrow$ (8) $\Rightarrow$ (16) $\Rightarrow$ (1), (1) $\Rightarrow$ (3) $\Rightarrow$ (6) $\Rightarrow$ (8), (1) $\Rightarrow$ (4) $\Rightarrow$ (7) $\Rightarrow$ (8), (15) $\Rightarrow$ (16) $\Rightarrow$ (1), (1) $\Rightarrow$ (9) $\Rightarrow$ (12) $\Rightarrow$ (15), (1) $\Rightarrow$ (11) $\Rightarrow$ (13) $\Rightarrow$ (15), (1) $\Rightarrow$ (9) $\Rightarrow$ (14) $\Rightarrow$ (15), (1) $\Rightarrow$ (16), (1) $\Rightarrow$ (10) $\Rightarrow$ (12) $\Rightarrow$ (15).

1 $\Rightarrow$ 2:

If there exists a right ideal I in R and $b, c \in R$ such that $IRbRc \subseteq A$ with $Ib \not\subseteq A, bc \notin A$ and $Ic \not\subseteq A$, then there is $a, a_1 \in I$ but $ab \notin A$ and $a_1 c \notin A$. Now $aRbRc \subseteq IRbRc \subseteq A$ but $bc \notin A$ and $ab \notin A$ imply $ac \in A$. Similarly $a_1 RbRc \subseteq IRbRc \subseteq A$ but $a_1 c \notin A$ and $bc \notin A$ imply $a_1 b \in A$. Now $ac \in A$ and $a_1 c \notin A$ imply $(a + a_1)c \notin A$ and $a_1 b \in A$ and $ab \notin A$ contradicts $(a + a_1)b \in A$. Now $(a + a_1)RbRc \subseteq IRbRc \subseteq A$ but $(a + a_1)c \notin A, (a + a_1)b \notin A$ and $bc \notin A$ which is a contradiction. Thus, (2) holds.

2 $\Rightarrow$ 5:

If there exist right ideals I, J and $c \in R$ such that $IRJRc \subseteq A$ with $IJ \not\subseteq A, Jc \not\subseteq A$ and $Ic \not\subseteq A$, then there is $b, b_1 \in J$ but $Ib \not\subseteq A$ and $b_1 c \notin A$. Now $IRbRc \subseteq IRJRc \subseteq A$ and by (2) $Ib \not\subseteq A$ and $Ic \not\subseteq A$ imply $bc \in A$. Similarly $IRb_1 Rc \subseteq IRJRc \subseteq A, Ic \not\subseteq A$ and $b_1 c \notin A$ imply $Ib_1 \subseteq A$. Now $Ib \not\subseteq A$ and $Ib_1 \subseteq A$ contradicts $I(b + b_1) \subseteq A$ and $bc \in A$ and $b_1 c \notin A$ imply $(b + b_1)c \notin A$. Now $IR(b + b_1)Rc \subseteq IRJRc \subseteq A$, but $(b + b_1)c \notin A, I(b + b_1) \not\subseteq A$ and $Ic \not\subseteq A$ which is a contradiction to (2). Thus, (5) holds.

5 $\Rightarrow$ 8:

If there exist right ideals I, J and K such that $IJK \subseteq A$ with $IJ \not\subseteq A, JK \not\subseteq A$ and $IK \not\subseteq A$ then there is $c, c_1 \in K$ such that $Jc \not\subseteq A, Ic_1 \not\subseteq A$. Now $IRJRc \subseteq IRJK \subseteq IJK \subseteq A, IJ \not\subseteq A$ and $Jc \not\subseteq A$ imply $Ic \subseteq A$. Similarly $IRJRc_1 \subseteq IRJK \subseteq IJK \subseteq A, IJ \not\subseteq A$ and $Ic_1 \not\subseteq A$ imply $Jc_1 \subseteq A$. Now $Ic \subseteq A$ and $Ic_1 \not\subseteq A$ imply $I(c + c_1) \not\subseteq A$ and $Jc_1 \subseteq A$ and $Jc \not\subseteq A$ contradicts $J(c + c_1) \subseteq A$.

Sweetline and Mohanraj

Now $IRJR(c+c_1) \subseteq IRJRK \subseteq IJK \subseteq A$ but $I(c+c_1) \not\subseteq A$, $J(c+c_1) \not\subseteq A$ and $IJ \not\subseteq A$ which contradicts (5).
Thus, (8) holds.

8 $\Rightarrow$ 16:

Straight forward.

16 $\Rightarrow$ 1:

Straight forward.

1 $\Rightarrow$ 3:

If there exists right ideal J and $a, c \in R$ such that $aRJRc \subseteq A$ with $aJ \not\subseteq A$, $Jc \not\subseteq A$ and $ac \notin A$ then there is $b, b_1 \in J$ but $ab \notin A$ and $b_1c \notin A$. Now $aRbRc \subseteq aRJRc \subseteq A$, $ab \notin A$ and $ac \notin A$ imply $bc \in A$. Similarly $aRb_1Rc \subseteq aRJRc \subseteq A$, $b_1c \notin A$ and $ac \notin A$ imply $ab_1 \in A$. Now $bc \in A$ and $b_1c \notin A$ imply $(b+b_1)c \notin A$. Then $ab \notin A$ and $ab_1 \in A$ contradicts $a(b+b_1) \in A$. Now $aR(b+b_1)Rc \subseteq aRJRc \subseteq A$, but $(b+b_1)c \notin A$, $a(b+b_1) \notin A$ and $ac \notin A$, which is a contradiction.
Thus, (3) follows.

3 $\Rightarrow$ 6

If there exist right ideals J, K and $a \in R$ such that $aRJRK \subseteq A$ with $aJ \not\subseteq A$, $JK \not\subseteq A$, $aK \not\subseteq A$, then there is $c, c_1 \in K$ but $ac \notin A$ and $Jc_1 \not\subseteq A$. Now $aRJRc \subseteq aRJRK \subseteq A$, $aJ \not\subseteq A$ and $ac \notin A$ imply $Jc \subseteq A$. Similarly $aRJRc_1 \subseteq aRJRK \subseteq A$, $aJ \not\subseteq A$ and $Jc_1 \not\subseteq A$ imply $ac_1 \in A$. Now $Jc \subseteq A$ and $Jc_1 \not\subseteq A$ imply $J(c+c_1) \not\subseteq A$. Then $ac \notin A$ and $ac_1 \in A$ contradicts $a(c+c_1) \in A$. Now $aRJR(c+c_1) \subseteq aRJRK \subseteq A$ but $a(c+c_1) \notin A$, $J(c+c_1) \not\subseteq A$ and $aJ \not\subseteq A$, which contradicts (3).
Thus (6) holds.

6 $\Rightarrow$ 8:

If there exists right ideals I, J, K such that $IJK \subseteq A$ with $IJ \not\subseteq A$, $JK \not\subseteq A$, $IK \not\subseteq A$ then there is $a, a_1 \in I$ but $aJ \not\subseteq A$ and $a_1K \not\subseteq A$. Now $aRJRK \subseteq IRJRK \subseteq IJK \subseteq A$, $aJ \not\subseteq A$ and $JK \not\subseteq A$ imply $aK \subseteq A$. Similarly $a_1RJRK \subseteq IRJRK \subseteq IJK \subseteq A$ but $JK \not\subseteq A$ and $a_1K \not\subseteq A$ imply $a_1J \subseteq A$. Now $aK \subseteq A$ and $a_1K \not\subseteq A$ contradicts $(a+a_1)K \subseteq A$. Then $aJ \not\subseteq A$ and $a_1J \subseteq A$ imply $(a+a_1)J \not\subseteq A$. Now $(a+a_1)RJRK \subseteq IRJRK \subseteq IJK \subseteq A$ but $(a+a_1)K \not\subseteq A$, $(a+a_1)J \not\subseteq A$ and $JK \not\subseteq A$, which is a contradiction.
Thus (8) holds.

1 $\Rightarrow$ 4:

If there exist right ideal $K \subseteq A$ and $a, b \in R$ such that $aRbRK \subseteq A$ with $ab \notin A$, $bK \not\subseteq A$, $aK \not\subseteq A$ then there is $c, c_1 \in K$ but $bc \notin A$, $ac_1 \notin A$. Now $aRbRc \subseteq aRbRK \subseteq A$, $ab \notin A$ and $bc \notin A$ imply $ac \in A$. Similarly $aRbRc_1 \subseteq aRbRK \subseteq A$, $ab \notin A$ and $ac_1 \notin A$ imply $bc_1 \in A$. Now $ac \in A$ and $ac_1 \notin A$ imply $a(c+c_1) \notin A$. Then $bc \notin A$ and $bc_1 \in A$ contradicts $b(c+c_1) \in A$. Now $aRbR(c+c_1) \subseteq aRbRK \subseteq A$, but $a(c+c_1) \notin A$, $b(c+c_1) \notin A$ and $ab \notin A$, which is a contradiction.
Thus (4) holds.

4 $\Rightarrow$ 7:

If there exist right ideals $I, K \subseteq A$ and $b \in R$ such that $IRbRK \subseteq A$ with $Ib \not\subseteq A$, $bK \not\subseteq A$ and $IK \not\subseteq A$ then there is $a, a_1 \in I$ with $ab \notin A$ and $a_1K \not\subseteq A$. Now $aRbRK \subseteq IRbRK \subseteq A$, $ab \notin A$ and $bK \not\subseteq A$ imply $aK \subseteq A$. Similarly $a_1RbRK \subseteq IRbRK \subseteq A$, $bK \not\subseteq A$ and $a_1K \not\subseteq A$ imply $a_1b \in A$. Now $aK \subseteq A$ and $a_1K \not\subseteq A$ imply $(a+a_1)K \not\subseteq A$. Then $a_1b \in A$ and $ab \notin A$ contradicts $(a+a_1)b \in A$. Now $(a+a_1)RbRK \subseteq IRbRK \subseteq A$ but $(a+a_1)K \not\subseteq A$, $(a+a_1)b \notin A$ and $bK \not\subseteq A$

Sweetline and Mohanraj

which is a contradiction.

Thus (7) holds.

7 $\Rightarrow$ 8:

If there exist right ideals I, J and K such that $IJK \subseteq A$ with $IJ \not\subseteq A, JK \not\subseteq A, IK \not\subseteq A$, then there is $b, b_1 \in J$ such that $Ib \not\subseteq A, b_1K \not\subseteq A$. Now $IRbRK \subseteq IJK \subseteq A, Ib \not\subseteq A$ and $IK \not\subseteq A$ imply $bK \subseteq A$.

Similarly $IRb_1RK \subseteq IJK \subseteq A, b_1K \not\subseteq A$ and $IK \not\subseteq A$ imply $Ib_1 \subseteq A$. Now $bK \subseteq A, b_1K \not\subseteq A$ imply $(b+b_1)K \not\subseteq A$. Then $Ib_1 \subseteq A, Ib \not\subseteq A$ contradicts $I(b+b_1) \subseteq A$.

Now $IR(b+b_1)RK \subseteq IJK \subseteq A$ but $(b+b_1)K \not\subseteq A, I(b+b_1) \not\subseteq A$ and $IK \not\subseteq A$

which is the contradiction.

Thus (7) follows.

8 $\Rightarrow$ 1:

Straight Forward.

15 $\Rightarrow$ 16:

Straight Forward.

1 $\Rightarrow$ 9:

If there exists left ideal I and $b, c \in R$ such that $IRbRc \subseteq A$ but $Ib \not\subseteq A, bc \not\subseteq A$ and $Ic \not\subseteq A$

then there is $a, a_1 \in I$ such that $ab \not\subseteq A$ and $a_1c \not\subseteq A$. Now, $aRbRc \subseteq IRbRc \subseteq A$, then $ab \not\subseteq A$

and $bc \not\subseteq A$ imply $ac \in A$. Similarly, $a_1RbRc \subseteq IRbRc \subseteq A$, but $a_1c \not\subseteq A$ and $bc \not\subseteq A$ imply

$a_1b \in A$. Now $a_1b \in A$ and $ab \not\subseteq A$ imply $(a + a_1)b \not\subseteq A$ and $ac \in A$ but $a_1c \not\subseteq A$ imply $(a+a_1)c \not\subseteq A$.

Now $(a+a_1)RbRc \subseteq IRbRc \subseteq A$ but $(a+a_1)b \not\subseteq A, bc \not\subseteq A$ and $(a+a_1)c \not\subseteq A$

which is a contradiction.

Thus (1) follows.

9 $\Rightarrow$ 12:

Let $IRJRc \subseteq A$ for left ideals I, J of R and suppose that $IJ \not\subseteq A, Jc \not\subseteq A, Ic \not\subseteq A$

then there exists $b, b_1 \in J$ such that $Ib \not\subseteq A, b_1c \not\subseteq A$. Since $IRbRc \subseteq IRJRc \subseteq A, Ib \not\subseteq A,$

$Ic \not\subseteq A$ implies $bc \in A$. Similarly, $IRb_1Rc \subseteq IRJRc \subseteq A, b_1c \not\subseteq A, Ic \not\subseteq A$ implies $Ib_1 \subseteq A$.

Now, $bc \in A$ but $b_1c \not\subseteq A$ contradicts $(b+b_1)c \in A$ and $Ib \not\subseteq A$ but $Ib_1 \subseteq A$ contradicts

$I(b+b_1) \subseteq A$. Now, $IR(b+b_1)Rc \subseteq IRJRc \subseteq A$, but $(b+b_1)c \not\subseteq A, I(b+b_1) \subseteq A, Ic \not\subseteq A,$

which is a contradiction.

Thus, (12) holds.

12 $\Rightarrow$ 15:

Let $IJK \subseteq A$ and suppose that $IJ \not\subseteq A, JK \not\subseteq A, IK \not\subseteq A$ then there exists $c, c_1 \in K$

such that $Jc \not\subseteq A, Ic_1 \not\subseteq A$. Since $IRJRc \subseteq IRJRK \subseteq A, Jc \not\subseteq A, IJ \not\subseteq A$ imply $Ic \subseteq A$.

$IRJRc_1 \subseteq IRJRK \subseteq A, IJ \not\subseteq A, Ic_1 \not\subseteq A$, imply $Jc_1 \subseteq A, Ic \subseteq A$ but $Ic_1 \not\subseteq A$ contradicts

$I(c+c_1) \subseteq A, Jc \not\subseteq A$ but $Jc_1 \subseteq A$ contradicts $J(c+c_1) \subseteq A$.

Now $IRJR(c+c_1) \subseteq IRJRK \subseteq A$ but $I(c+c_1) \not\subseteq A, J(c+c_1) \not\subseteq A, IJ \not\subseteq A,$

which is a contradiction.

Thus, (15) holds.

1 $\Rightarrow$ 11:

Let $aRbRK \subseteq A$. If $ab \not\subseteq A, bK \not\subseteq A, aK \not\subseteq A$ then there exists $c, c_1 \in K$ such that

$ac \not\subseteq A, bc_1 \not\subseteq A$. Since $aRbRc \subseteq aRbRK \subseteq A, ab \not\subseteq A$ and $ac \not\subseteq A$ imply $bc \in A$.

Similarly $aRbRc_1 \subseteq aRbRK \subseteq A, ab \not\subseteq A$ and $bc_1 \not\subseteq A$ imply $ac_1 \in A$. Now $ac \not\subseteq A$ and $ac_1 \in A$

imply $a(c+c_1) \not\subseteq A$ and $bc_1 \not\subseteq A$ and $bc \in A$ contradict $b(c+c_1) \in A$. Then, $a(c+c_1) \not\subseteq A,$

$b(c+c_1) \not\subseteq A$ and $ab \in A$ but $aRbR(c+c_1) \subseteq aRbRK \subseteq A$

which contradicts (1).

Sweetline and Mohanraj

Thus, (11) holds.

11 $\Rightarrow$ 13:

If either $aJ \subseteq A$ or $JK \subseteq A$ or $aK \subseteq A$, then it is done. If not, $ab \notin A$, $aK \not\subseteq A$ and $JK \not\subseteq A$, then there exist $b \in J$ and $d, d_1 \in K$ such that $Jd \not\subseteq A$, $ad_1 \notin A$ and $ab \notin A$. Now $aRbRd_1 \subseteq aRJ Rd_1 \subseteq aRJ RK \subseteq A$ with $ab \notin A$ and $ad_1 \notin A$ imply $Jd_1 \subseteq A$. Then, $Jd \not\subseteq A$ and $Jd_1 \subseteq A$ imply $J(d+d_1) \not\subseteq A$. Now, $aRbRd \subseteq aRJ Rd \subseteq aRJ RK \subseteq A$ with $ab \notin A$, $bK \not\subseteq A$ imply $ad \in A$. Then $ad_1 \notin A$ and $ad \in A$ imply $a(d+d_1) \notin A$. Thus, $J(d+d_1) \not\subseteq A$, $a(d+d_1) \in A$ and $ab \notin A$ but $aRbR(d+d_1) \subseteq aRbRK \subseteq A$. But $aRbR(d+d_1) \subseteq aRbRK \subseteq aRJ RK \subseteq A$ which is a contradiction that implies (13).

13 $\Rightarrow$ 15:

If there exist left ideals $I, J, K \subseteq R$ with $IJK \subseteq A$, $IJ \not\subseteq A$, $JK \not\subseteq A$ and $IK \not\subseteq A$ then there exists $a, a_1 \in I$ such that $aJ \not\subseteq A$, $a_1K \not\subseteq A$. Since $aRJ RK \subseteq IJK \subseteq A$, with $aJ \not\subseteq A$ and $JK \not\subseteq A$ imply $aK \subseteq A$. $a_1RJ RK \subseteq IJK \subseteq A$, $a_1K \not\subseteq A$, $JK \not\subseteq A$ imply $a_1J \subseteq A$. Now $aJ \not\subseteq A$ and $a_1J \subseteq A$ contradict $(a+a_1)J \not\subseteq A$. $aK \subseteq A$ and $a_1K \subseteq A$ contradict $(a+a_1)K \subseteq A$. $(a+a_1)RJ RK \subseteq IJK \subseteq A$. But, $(a+a_1)J \not\subseteq A$, $(a+a_1)K \not\subseteq A$, $JK \not\subseteq A$ which is a contradiction.

Thus, (15) holds.

9 $\Rightarrow$ 14:

Let $IJK \subseteq A$. If either $JK \subseteq A$ or $IJ \subseteq A$ or $IK \subseteq A$, then it is done. If not, then there is $b \in J$ such that $Ib \not\subseteq A$, $bK \not\subseteq A$ and $IK \not\subseteq A$. Then there exists $c, c_1 \in K$ such that $bc \notin A$, $Ic_1 \not\subseteq A$. Since $IRbRc \subseteq IRbRK \subseteq A$, $Ib \not\subseteq A$, $bc \notin A$ imply $Ic \subseteq A$. $IRbRc_1 \subseteq IRbRK \subseteq A$, $Ib \not\subseteq A$, $Ic_1 \not\subseteq A$ imply $bc_1 \in A$. Now $Ic \subseteq A$, $Ic_1 \not\subseteq A$ imply $I(c+c_1) \not\subseteq A$. $bc \notin A$ and $bc_1 \in A$ imply $b(c+c_1) \notin A$. Now, $I(c+c_1) \not\subseteq A$, $b(c+c_1) \notin A$ and $Ib \not\subseteq A$ but $IRbR(c+c_1) \subseteq IRbRK \subseteq IJK \subseteq A$ which contradicts (9).

Thus, (14) holds.

14 $\Rightarrow$ 15:

Let $IJK \subseteq A$ for left ideals $I, J, K \subseteq R$. If $IJ \subseteq A$, then it is done. If not, $Ib \not\subseteq A$ for $b \in J$. If $bK \subseteq A$, it is clear. If not, there is $b_1 \in J$ such that $b_1K \not\subseteq A$. Now, $IRb_1RK \subseteq IJK \subseteq A$, $Ib \not\subseteq A$ and $b_1K \not\subseteq A$ imply $Ib_1 \subseteq A$. Then $Ib \not\subseteq A$ and $Ib_1 \subseteq A$ imply $I(b+b_1) \not\subseteq A$. Similarly $(b+b_1)K \not\subseteq A$. Thus $(b+b_1)K \not\subseteq A$, $I(b+b_1) \not\subseteq A$ but $IR(b+b_1)RK \subseteq IJK \subseteq A$. Which contradicts (14).

Thus, (15) holds.

1 $\Rightarrow$ 16:

Straight Forward.

1 $\Rightarrow$ 10:

If there exists a left ideal J and $a, c \in R$ such that $aRJ Rc \subseteq A$ but $aJ \not\subseteq A$, $Jc \not\subseteq A$ and $ac \notin A$, then there is $b, b_1 \in J$ such that $ab \notin A$, $b_1c \notin A$. Now $aRbRc \subseteq A$ with $ab \notin A$ and $ac \notin A$ implies $bc \in A$ and $b_1c \notin A$ imply $(b+b_1)c \notin A$. Then $aRb_1Rc \subseteq aRJ Rc \subseteq A$, $b_1c \notin A$ and $ac \notin A$ imply $ab_1 \in A$ that contradicts $a(b+b_1) \in A$. Now, $a(b+b_1) \notin A$, $ac \notin A$ and $(b+b_1)c \in A$ but $aR(b+b_1)Rc \subseteq aRJ Rc \subseteq A$ which contradicts (1).

Thus (10) holds.

10 $\Rightarrow$ 12:

Let $IRJ Rc \subseteq A$ for left ideals I and J . If $IJ \subseteq A$ then it is done. If not, there is $a \in I$ such that

Sweetline and Mohanraj

$a \notin A$. If $a \in A$ or $Jc \subseteq A$, then it is clear. If not, there $b \in J$ such that $bc \notin A$ and $ac \notin A$.

Thus $a \notin A$ and $Jc \not\subseteq A$. Now $aRJRc \subseteq IRJRc \subseteq A$ but $a \notin A$, $Jc \not\subseteq A$ and $ac \notin A$, which contradicts (10).

Thus (12) holds.

12 $\Rightarrow$ 15:

Let $IJK \subseteq A$ for left ideals I, J and K . If $JK \subseteq A$, it is done. If not there is $c \in K$ such that $Jc \not\subseteq A$.

Now, $IRJRc \subseteq IJK \subseteq A$. By (12), $IJ \subseteq A$ or $Jc \subseteq A$, $Ic \subseteq A$.

Thus (15) holds.

ABSTRACT

Millets are small cereal grains that belong to the grass family. Resilient in harsh environments, it's commonly cultivated in Asian and African countries. Millets are rich in nutrients and plant compounds. Therefore, they may offer multiple health benefits. Diabetes is a metabolic illness that causes long-term damage to the heart, blood vessels, eyes, kidneys, and nerves. Diabetic patients are advised to take low-glycemic-index foods. Low-glycemic foods have a **low** glycemic index scale. Carbohydrates are rated from zero to one hundred on the glycemic index. Various carbohydrates have varying effects on glucose levels. The pace at which Carbohydrates elevate blood sugar is one metric by which they are ranked. Rapid elevation in blood sugar happens with high-GI Carbohydrate Foods. Foods with a low glycemic index cause a more gradual increase in blood sugar levels. Millets are rich in fibre and non-starchy polysaccharides, two types of indigestible carbohydrates that help control blood sugar levels. This cereals has a low glycemic index (GI), meaning that it's unlikely to spike blood sugar levels. Thus, millets are considered an ideal grain for people with diabetes. Millets are gluten-free grains that are rich in antioxidants, soluble fibre, and protein. In particular, they may lower cholesterol and blood sugar levels.

The author developed a 30-day millets-based traditional diet plan for diabetics. The article discussed the Importance of millets in Diabetic patients and the daily nutritional requirement for balancing diet through millets.

Keywords: Millets, Diabetic Diet, Low Glycemic food, Traditional foods, Ayush, Siddha.

INTRODUCTION

Millets are increasingly recognized as "future crops" due to their exceptional resilience to pests and diseases and their ability to thrive in dry and semi-arid regions of Asia and Africa. This diverse group of small-seeded grains includes species such as sorghum (*Sorghum bicolor* L.), pearl millet (*Pennisetum glaucum*), finger millet (*Eleusine coracana*), teff (*Eragrostis tef*), proso millet (*Panicum miliaceum*), kodo millet (*Paspalum scrobiculatum*), foxtail millet (*Setaria italica*), little millet (*Panicum sumatrense*), and fonio (*Digitaria exilis*) [1]. These grains are distinguished by their hardiness and nutritional superiority, which position them as pivotal elements in the quest for sustainable agricultural and nutritional solutions. In India, a major producer of millets, which contributes 40.62% of the global output, there has been a resurgence of interest in these ancient cereals after a prolonged period of neglect. The country produces approximately 10.91 million tonnes of millets annually. This renewed focus on millets is driven by the rising prevalence of diabetes and obesity, which have exacerbated malnutrition and necessitated a reevaluation of dietary staples. Millets offer substantial advantages over conventional cereals such as rice (*Oryza sativa*), wheat (*Triticum aestivum*), and maize (*Zea mays*) due to their superior nutritional profile. They are gluten-free and significantly richer in essential nutrients, including vitamins, fiber, proteins, and minerals such as calcium and iron [2].

The nutritional benefits of millets extend to their role in enhancing food security and improving public health. Their rich composition of vitamins, minerals, and dietary fiber, along with their ability to provide sustained glucose release and satiety, makes them an ideal food source for individuals with diabetes and those seeking to manage metabolic disorders. Millets are characterized by a favorable fatty acid profile and a higher content of protein- and sulfur-containing amino acids, such as methionine and cysteine, compared to other cereals. Although millets generally contain lower levels of lysine and tryptophan, their nutrient density can mitigate a range of health issues, including cancer, obesity, diabetes, cardiovascular disease, gastrointestinal disorders, migraines, and asthma [3-9]. Despite their significant dietary value, the consumption of millets, particularly in India, remains low. This is attributable to several factors, including inadequate processing technologies, limited investment and market incentives, a dominant focus on rice and wheat production, and rapid urbanization. Nevertheless, millets are emerging as a key ingredient in the burgeoning start-up revolution, which seeks to enhance nutrient-rich food availability and create employment opportunities. Processing techniques play a crucial role in making millets suitable for consumption. These methods, including dehulling, soaking, germination, roasting, drying, polishing, and milling, are designed to remove inedible parts, extend shelf life, and improve both nutritional and sensory qualities. Additionally, contemporary secondary processing technologies—such as fermentation, parboiling, frying, puffing, popping, malting, baking, flaking, and extrusion—are employed to develop millet-based value-added products. While these processing techniques enhance digestibility and nutritional bioavailability, they may also lead to the loss of certain nutrients. This review aims to critically examine how various processing methods impact the nutritional value of five prominent Indian millets: pearl millet, proso millet, kodo millet, foxtail millet, and little millet.

Millets and Nutritional fulfillment

1. **Protein-46-56g/day-** milk, curd, paneer, eggs, lean cuts of chicken, soy and beans
2. **Iron-** 18g/day- green leafy vegetables, nuts, beans and pulses, whole grain, pomegranate.
3. **Calcium-1g /day-** dairy products like milk, curd, paneer and green leafy vegetables like spinach, broccoli, etc to your diet.
4. **Fibre-40g/day-** fruits, vegetable, whole grains and legumes
5. **Magnesium-410mg/day-** nuts, whole grains, wheat germ, fish, and green leafy vegetables

6. Vitamin E-15mg/day- nuts, vegetable oil, eggs and green leafy vegetables
7. Vitamin C-75-90mg/day- citrus fruits, nuts, vegetables
8. **Vitamin A-** 600-900 µg/day- sweet potato, carrot, spinach, Green leafy vegetables
9. **Vitamin D-** 600 IU/day- milk, egg, salmon, tuna and mushrooms.
10. **Potassium-** 4.7g/day- bananas soybeans, Swiss chard, lima beans, potatoes and yams

Food nutrition contributes to maintaining metabolism and health. Nutrition helps humans achieve their biological potential. Millet, like rice, wheat, and maize, is rich in carbs, protein, dietary fibre, minerals, vitamins, and phytochemicals. Millets provide 320–370 kcal per 100 g. Millets contain 65–75% carbs and more non-starchy polysaccharides and fibre than basic grains. High-fibre millets improve gastrointestinal health, the blood lipid profile, and glucose clearance. Celiac and diabetic millets are low-gluten and low-glycemic. Millets include phytosterols, polyphenols, phytocyanins, lignins, and phytoestrogens, which promote health. Antioxidants, immunological modulators, and detoxifiers—phytochemicals—protect age-related degenerative diseases, including cardiovascular disease, type-2 diabetes, and cancer. Millets contain around 50 antioxidant-rich phenolic groups and their derivatives, including flavones, flavanols, flavononols, and ferulic acid, according to research. Proso, finger, and pearl millet contain phenolic antioxidants in confined and free forms, respectively. Another study found syringic acid, chlorogenic acid, ferulic acid, caffeic acid, and p-coumaric acid in proso millet. Nearly 65% of phenolics are bonded. Millets' phytochemicals and antioxidants suggest health advantages.

- ❖ In particular, proso millet is better to consume than grains. Proso millet contains niacin, folic acid, zinc, magnesium, calcium, potassium, phosphorus, iron, and zinc. Compared to lysine, proso millet has more amino acids. Compared to wheat, proso millet has 51% more amino acids. Products made from proso millet lessen glycemic response. Products made from Proso millet have a lower GI than those made from wheat and maize [12].
- ❖ Pearl millet has the energy of grains. The high levels of dietary fibre and amylose starch (20–22%) in pearl millet lower the glycemic response. Pearl millet protein, which is gluten-free and rich in prolamin, can be used by those who are gluten-sensitive. Sulfur-containing amino acids like lysine, threonine, tryptophan, and others are absent from pearl millet. Omega-3, alpha-linolenic, eicosapentaenoic, and docosahexaenoic acids are found in pearl millet. Micronutrients also include Fe, Zn, Cu, K, Mg, P, Mn, and the B vitamins.
- ❖ Like other millets, kodo millet has energy. Except for finger millet, most millets offer higher protein than kodo millet. Kodo millets include B6, niacin, folic acid, Fe, Ca, Mg, K, and Zn. In product formulations for infants and the elderly, kodo millet is digestible.
- ❖ Compared to other grains, foxtail millet has higher vitamins, minerals, essential amino acids, dietary fibre, resistant starch, lysine, and methionine. Foxtail millets provide a lot of protein. Stearic and linoleic acids found in foxtail millet aid in controlling lipid levels.
- ❖ The most carbohydrates are in finger millet. Compared to rice and wheat, carbohydrates—mostly slowly digesting starch, dietary fibre, and resistant starch—have a lower glycemic index. Compared to other millets, finger millet has higher levels of threonine, lysine, and valine but only 7% protein. There are plenty of B vitamins and micronutrients including Ca, Fe, Mg, K, and Zn [13].
- ❖ Similar to other cereal and millet crops is little millet. It contains balanced amino acids, lysine, and 8.7% protein. Its high fibre content, resistant starch, and delayed starch digestion reduce the glycemic response. Niacin, Fe, and P are all part of it. Little millet is used to create a number of goods with additional value.

Glycemic index and Millets

Foods containing carbohydrates have a wide range of effects on the Glycemic Response (GR), with some resulting in a rapid rise followed by a rapid fall in blood glucose concentrations, while others show an extended rise and a slow, extended fall in blood glucose.

The concept of the glycemic load (GL) was introduced as a means of predicting the GR; it takes into account the GI and the amount of available carbohydrate in a portion of the food eaten ($GL = GI \times \text{available carbohydrate in a given amount of food}$) [14].

Millet's low-medium glycaemic index makes it valuable to reduce the risk of diabetes and to help people with diabetes manage their blood sugar levels. Gut health is crucial to preventing diabetes, and studies show that millet promotes gut health. Finger millet, in particular, contains pro-biotics that feed gut bacteria such as *Faecalibacterium* and *Eubacterium*, and probiotic *Bifidobacterium* and *Lactobacillus*, allowing them to generate short-chain fatty acids (SCFAs) with anti-diabetic properties. Finger millet also produces various antioxidants that stop the growth of harmful bacteria, such as *Shigella* and *Clostridium histolyticum*, reducing gut inflammation and the risk of diabetes [16]. Fonio, teff, and Barnyard millet are the varieties that raise blood sugar the least, suggesting they may be the best types to prevent and manage diabetes. A study comparing the impact of millet-based dosa and rice-based dosa on blood sugar levels in people with type 2 diabetes found that post-meal blood sugar levels were significantly lower after eating the millet-based dosa [17].

DISCUSSION

Diabetes mellitus, a chronic metabolic disorder characterized by elevated blood glucose levels, has become a global health crisis. The condition poses significant health risks, including cardiovascular disease, neuropathy, nephropathy, and retinopathy. Traditional dietary approaches to managing diabetes emphasize the consumption of low-glycemic index foods that help regulate blood sugar levels. In this context, millets offer promising benefits due to their unique nutritional profile and functional properties.

Glycemic Control and Satiety

Millets are renowned for their low glycemic index (GI) and high dietary fiber content. The low GI of millets means they have a slower rate of digestion and glucose absorption, leading to more stable blood sugar levels compared to high-GI foods like white rice or refined wheat products. This slow release of glucose into the bloodstream helps in reducing postprandial hyperglycemia, a critical factor in diabetes management. Additionally, the high fiber content in millets enhances satiety, which can aid in weight management—a key component in diabetes control. Nutritional Composition: Millets are rich in essential nutrients that contribute to overall health and can aid in diabetes management. They are high in complex carbohydrates, which provide sustained energy release and help maintain steady blood glucose levels. Millets also contain substantial amounts of proteins and essential amino acids, including methionine and cysteine, which are often limited in other cereals. Their micronutrient profile includes significant amounts of vitamins (such as B vitamins), minerals (such as magnesium, potassium, and calcium), and antioxidants, which play a role in reducing oxidative stress and inflammation—a common issue in diabetes.

Dietary Fiber and Its Role

The soluble and insoluble fibers present in millets contribute to their beneficial effects on glucose metabolism. Soluble fiber helps to slow down the digestion of carbohydrates and the absorption of glucose, leading to better glycemic control. Insoluble fiber improves gastrointestinal health, enhances the excretion of bile acids, and helps in reducing cholesterol levels, which is beneficial for cardiovascular health—a concern for many diabetic patients.

Impact of Processing Methods

While millets offer numerous benefits, the processing methods used to prepare millet-based foods can influence their nutritional value and efficacy in diabetes management. Traditional processing methods such as dehulling and milling may reduce the fiber content and the levels of some micronutrients. Contemporary processing techniques, such as fermentation and extrusion, can enhance the digestibility and bioavailability of nutrients but may also lead to nutrient loss. Therefore, it is crucial to balance processing techniques to retain the health-promoting properties of millets while making them more acceptable and palatable for consumption.

Clinical Evidence and Studies: Clinical studies have shown that incorporating millets into the diet can positively impact glycemic control and overall metabolic health. Research indicates that millet-based diets may reduce fasting blood glucose levels, improve insulin sensitivity, and lower HbA1c levels in individuals with diabetes. The incorporation of millets into traditional diets, which are often high in refined grains, can offer a practical approach to managing diabetes through dietary means.

Practical Considerations and Recommendations

Despite their benefits, millets face challenges in widespread adoption due to factors such as limited availability, lack of awareness, and traditional preferences for rice and wheat. Public health initiatives and educational programs are necessary to promote the consumption of millets and their integration into mainstream dietary practices. Additionally, the development of convenient and appealing millet-based products can enhance their acceptance among the general population. Millets present a valuable dietary option for managing diabetes due to their low glycemic index, high fiber content, and rich nutritional profile. Their integration into the diet, supported by appropriate processing methods and educational initiatives, could play a significant role in improving glycemic control and overall metabolic health in diabetic individuals. Further research and development in millet-based products and their impact on long-term diabetes management are warranted to fully realize their potential benefits.

CONCLUSION

Millets offer a valuable dietary option for managing diabetes due to their low glycemic index, high fiber content, and rich nutritional profile, which collectively contribute to better glycemic control and overall metabolic health. Their ability to maintain stable blood glucose levels, combined with essential nutrients like proteins, vitamins, and minerals, makes them particularly beneficial for diabetic individuals. Although traditional processing methods may result in some nutrient loss, modern techniques can enhance the nutritional value of millets. To fully leverage these benefits, educational initiatives to promote millet consumption and further research into millet-based products are essential. Integrating millets into daily diets, supported by appropriate processing methods, holds promise for improving diabetes management and overall health.

ABSTRACT

Depression detection is a critical challenge in mental health research due to the increasing prevalence of mental disorders and the limitations of traditional diagnostic methods. Conventional approaches, such as interviews and PHQ scores, often suffer from low accuracy and delayed diagnoses. In this study, we propose a hybrid deep learning framework for depression detection, leveraging the power of transformer models and ensemble learning techniques. Specifically, we utilize the RoBERTa transformer model to extract high-quality textual features from patient responses and integrate these with an XGBoost classifier to improve detection performance. The proposed method is evaluated using a publicly available depression dataset from hugging face, achieving an accuracy of 92.8%, significantly outperforming traditional methods. The findings demonstrate the potential of combining transformer-based architectures with ensemble learning for efficient and accurate depression detection, paving the way for early intervention and improved mental health outcomes.

Keywords: Depression Detection, Deep Learning, Roberta, XGBoost Classifier, Hugging Face, Transformer, Ensemble learning, accuracy

INTRODUCTION

Mental health issues, including depression, affect a significant portion of the global population, with over 264 million people suffering from this condition worldwide [1]. Depression can stem from various factors such as sudden environmental changes, imbalances in neurotransmitter levels, or even genetic predispositions [2]. Effective

**Roshani R. Borase et al.,**

treatment options include therapy sessions and medication. However, many individuals remain undiagnosed due to a lack of awareness about depression, leading to adverse outcomes such as social withdrawal, erratic behavior, suicidal thoughts, or dependence on antidepressants. Left untreated, depression can severely impact daily activities, reducing focus and interest, and eventually causing harm to both the mind and body. With technological advancements, social media usage has surged, with approximately 3.8 billion active users worldwide [3]. Social media platforms have become spaces for individuals to express emotions, thoughts, and opinions, often providing relief by sharing unsettling feelings. These platforms enable users to post textual content that offers valuable insights for various real-world applications, including healthcare, politics, and entertainment [4]. Researchers can analyze this data to gain an understanding of users' mental health, offering opportunities for timely intervention [5].

Twitter, a popular micro-blogging platform, allows users to post concise updates, known as tweets, limited to 140 characters [16]. Its simplicity and accessibility make it a widely used platform for sharing emotions and opinions. Most tweets are publicly accessible and can be retrieved using Twitter's API, which supports complex queries, such as retrieving tweets on specific topics [6]. Additionally, Twitter supports more than 35 languages, broadening its global reach. The data shared on Twitter provides researchers with a valuable resource for analyzing mental health conditions and identifying opportunities for support and recovery [21]. Social media, while offering a platform for self-expression and connection, can also pose significant risks in certain circumstances [8]. For example, users may send, post, or share harmful content targeting others, leading to cyber bullying or harassment. Additionally, social media activity can reflect offline risks; for instance, adolescents experiencing depression might begin posting suicidal thoughts online, signaling potential dangers [11].

In recent years, natural language processing (NLP) and deep learning have emerged as powerful tools for analyzing textual data and identifying mental health concerns [13]. These technologies have been successfully applied to detect depression, anxiety, and suicidal ideation from user-generated content [15]. By leveraging computational methods, researchers can develop automated and scalable tools to identify individuals experiencing mental health issues or at risk of harm [8]. This approach holds great promise for timely intervention and support, making social media a valuable resource for addressing mental health challenges. In recent years, the emergence of social media has opened new avenues for monitoring mental health. The proliferation of user-generated content on platforms like Twitter and Facebook offers rich data for analysis, enabling the identification of emotional imbalances and depressive tendencies. Artificial intelligence (AI) and machine learning (ML) techniques have evolved significantly, providing tools that can enhance emotional intelligence in machines. These technologies facilitate text-based emotion recognition [6], which can analyze posts and tweets to gauge users' moods and potentially predict suicidal thoughts. Such early detection can lead to timely interventions, significantly impacting user well-being. Recent advancements in transformer-based models [15], such as RoBERTa, have demonstrated remarkable performance in natural language understanding tasks, making them invaluable for sentiment analysis in textual data related to mental health. RoBERTa's ability to capture nuanced emotional expressions enhances the detection of depressive signals in social media content. Additionally, tree-based algorithms like XGBoost offer robust solutions for classification problems, allowing for efficient processing of large datasets and improving prediction accuracy [16]. These algorithms can be evaluated through metrics such as precision scores and confusion matrices to determine their effectiveness in sentiment prediction [9].

Beyond textual analysis, emotions can also be inferred from facial expressions, gestures, and vocal tones, further enriching the potential for accurate detection of depression. [13]. For instance, AI applications can monitor drivers for signs of drowsiness, potentially preventing accidents. Similarly, emotion detection systems can enhance user interactions with chatbots, allowing for personalized responses that aim to improve mood and mitigate distress [23]. Furthermore, the application of emotion detection technologies can play a pivotal role in educational settings [20]. For example, identifying signs of depression in students through their interactions in online learning environments can help educators provide timely support [17]. By analysing engagement levels, communication patterns, and emotional cues, AI systems can alert educators to students who may be struggling, facilitating early intervention and promoting mental well-being in academic contexts [11]. As these technologies continue to develop, they hold

**Roshani R. Borase et al.,**

promise not only for individual mental health monitoring but also for fostering supportive environments in various sectors [15]

LITERATURE REVIEW

Depression has become a serious problem in this current generation and the number of people affected by depression is increasing day by day. However, some of them manage to acknowledge that they are facing depression while some of them do not know it. On the other hand, the vast progress of social media is becoming their “diary” to share their state of mind. Several kinds of research had been conducted to detect depression through the user post on social media using machine learning algorithms [1]. Through the data available on social media, the researcher can able to know whether the users are facing depression or not. Machine learning algorithm enables to classify the data into correct groups and identify the depressive and non-depressive data. Research work aims to detect the depression of the user by their data, which is shared on social media. The Twitter data is then fed into two different types of classifiers, which are Naïve Bayes and a hybrid model, NBTree. The results will be compared based on the highest accuracy value to determine the best algorithm to detect depression. The results show both algorithm perform equally by proving same accuracy level. [2] proposed method consists of three components; first, a textual CNN model in which a CNN model is trained with only text features, second, an audio CNN model in which CNN model is trained with only audio features and third, a combination of audio and textual model named as hybrid model in which LSTM algorithms are applied. An improved version of LSTM model named as Bi-LSTM model is also used in the proposed work. In results, training accuracy, training loss, validation accuracy and validation loss is calculated for all the mentioned models [2]. The results shows that deep learning is a better solution for depression detection in which accuracy of textual CNN model is 89% whereas accuracy of audio CNN model is 91% and loss of textual CNN is 0.2 whereas loss of audio CNN is 0.1. These results show that audio CNN is a good model for depression detection [2]. It performs better as compared to textual CNN model. It is also observed that Bi-LSTM has better learning rate as compared to other models with accuracy 88% and validation accuracy 78%. There are some parameters such as precision, F1-score, recall and support are found for evaluation of models. In results, graphs for training loss, validation loss, training accuracy and validation accuracy are plotted. At last, by using confusion matrix depression can be detected for textual CNN Model, audio CNN model, LSTM model and Bi-LSTM against true label and predicted label. [3] proposes depression detection among individuals we have conducted a survey with 21 questions based on Hamilton tool and advice of psychiatrist. With the use of Python's scientific programming principles and machine learning methods like Decision Tree, KNN, and Naive Bayes, survey results were analyzed. Further a comparison of these techniques is done [3]. Study concludes that KNN has given better results than other techniques based on the accuracy and decision tree has given better results in the terms of latency to detect the depression of a person. At the conclusion, a machine learning-based model is suggested to replace the conventional method of detecting sadness by asking people encouraging questions and getting regular feedback from them [3]. [4] Propose a depression detection model that utilizes both audio and video features extracted from the vlogs (video logs) on YouTube. We first collected vlogs from YouTube and annotated them into depression and non-depression. We then analyze the statistical differences between depression and non-depression vlogs. Based on the lessons learned, we build a depression detection model that learns both audio and visual features, achieving high accuracy [4]. We believe our model helps detect depressed individuals on social media at an early stage so that individuals who may need appropriate treatment can get help. [5] proposes the early screening of depression is highly beneficial for patients to obtain better diagnosis and treatment. While the effectiveness of utilizing voice data for depression detection has been demonstrated, the issue of insufficient dataset size remains unresolved. Therefore, we propose an artificial intelligence method to effectively identify depression [5]. The wav2vec 2.0 voice-based pre-training model was used as a feature extractor to automatically extract high-quality voice features from raw audio. Additionally, a small fine-tuning network was used as a classification model to output depression classification results. Subsequently, the proposed model was fine-tuned on the DAIC-WOZ dataset and achieved excellent classification results [5]. Notably, the model demonstrated outstanding performance in binary classification, attaining an accuracy of 0.9049 and an RMSE of 0.1875 on the test set. Similarly, impressive results were

obtained in multi-classification, with an accuracy of 0.7881 and an RMSE of 0.3810. The wav2vec 2.0 model was first used for depression recognition and showed strong generalization ability. The method is simple, practical, and applicable, which can assist doctors in the early screening of depression. [6] Study that trained and tested classifiers to distinguish whether a user is depressed or not using features extracted from his/her activities in the network and tweets. The results showed that the more features are used, the higher are the accuracy and F-measure scores in detecting depressed users [6]. This method is a data-driven, predictive approach for early detection of depression or other mental illnesses. This study's main contribution is the exploration part of the features and its impact on detecting the depression level [6].

[7] Conduct Detecting depression from user-generated content on social media platforms has garnered significant attention due to its potential for the early identification and monitoring of mental health issues. This paper presents a comprehensive approach for depression detection from user tweets using machine learning techniques [7]. The study utilizes a dataset of 632,000 tweets and employs data preprocessing, feature selection, and model training with logistic regression, Bernoulli Naive Bayes, random forests, DistilBERT, SqueezeBERT, models. Evaluation metrics such as accuracy, precision, recall, and F1 score are employed to assess the models' performance [7]. The results indicate that the BERT model achieves the highest accuracy ratio of 0.87 and the highest mean accuracy of 0.77 (across 10 cross-validation folds) in detecting depression from tweets. This research demonstrates the effectiveness of machine learning and advanced transformer-based models in leveraging social media data for mental health analysis. The findings offer valuable insights into the potential for early detection and monitoring of depression using online platforms, contributing to the growing field of mental health analysis based on user-generated content. [8] Research work, a hybrid model has been proposed that can detect depression by analyzing user's textual posts. Deep learning algorithms were trained using the training data and then performance has been evaluated on the test data of the dataset of reddit which was published for the pilot piece of work, Early Detection of Depression in CLEF eRisk 2017 [8]. In particular, Bidirectional Long Short Term Memory (BiLSTM) with different word embedding techniques and metadata features were proposed which gave good results.

Dataset

The dataset used for this study is sourced from hugging face, a platform renowned for providing diverse and high-quality datasets for research and development. This particular dataset contains user-generated content, including social media posts, tweets, and comments, focusing on mental health-related discussions. It is rich in textual data that reflects various emotional states, such as depression, anxiety, and general well-being. The dataset includes labeled examples, distinguishing between depressive and non-depressive content, which serves as the foundation for supervised learning. Preprocessing steps such as noise removal, tokenization, stop word elimination, and lemmatization will be applied to ensure the data is clean and structured. Additionally, augmentation techniques will enhance the dataset's robustness by introducing variations, helping the model generalize better to unseen data. This Hugging Face dataset provides a comprehensive and diverse resource for training and evaluating the proposed hybrid model, enabling accurate and efficient depression detection.

Proposed Methodology

The proposed methodology for depression detection involves a detailed and systematic process to ensure accurate and efficient identification of individuals at risk. The dataset will be sourced from Kaggle, comprising user-generated content such as posts, tweets, and comments related to mental health. This data will undergo preprocessing to ensure quality and consistency. Noise removal techniques will be applied to eliminate special characters, URLs, hashtags, mentions, and redundant spaces. All text will be converted to lowercase for uniformity, followed by tokenization to split the text into manageable components. Stopwords that do not add semantic value will be removed, and lemmatization will reduce words to their base forms, minimizing redundancy. To further enhance the dataset, data augmentation techniques like synonym replacement, random insertion, and back-translation will be employed, increasing diversity and robustness. After preprocessing, RoBERTa, a transformer-based model, will extract contextual embeddings from the text. These embeddings will capture the semantic and emotional nuances, serving as input features for the XGBoost classifier. The XGBoost model will then classify the text into depressive or non-

Roshani R. Borase et al.,

depressive categories. The model's performance will be optimized through hyperparameter tuning, adjusting factors such as learning rate, tree depth, and the number of estimators. The dataset will be split into training, validation, and test sets to ensure reliable evaluation. The training set will build the model, the validation set will guide hyperparameter adjustments, and the test set will assess the model's generalization to unseen data.

The entire process will be automated as a scalable pipeline, integrating data preprocessing, feature extraction, and classification into a unified workflow. This design will facilitate the model's deployment for real-world applications, such as monitoring social media content for early depression detection. By leveraging the contextual strength of RoBERTa and the classification efficiency of XGBoost, the proposed methodology aims to provide a robust and reliable solution for identifying individuals at risk of depression. Google Colab is used as the primary platform for implementing the proposed hybrid model for depression detection. This online, open-source platform provides a user-friendly interface for writing and executing Python code, making it ideal for developing and testing machine learning and deep learning models. In Colab it deals with the various accelerator type example CPU, GPU. GPU provides the most flexible processing with seconds of execution. Usually, neural networks deal under the GPU. It has 100x power seamless execution power. As a cloud-based tool running on Google servers, it integrates seamlessly with Google Drive, where the dataset and resources for the project are stored. This eliminates the need for additional setups, downloads, or installations, simplifying the development process.

For implementing the work Google Colab offers access to GPU and TPU accelerators, which significantly enhance the computational efficiency required for training deep learning algorithms such as RoBERTa and XGBoost. The platform also includes a variable panel, allowing real-time monitoring of variables, their values, and data types during code execution, aiding debugging and evaluation. Although it lacks a kernel menu, the runtime can be restarted effortlessly to refresh the environment. Another key advantage of Google Colab is its ability to facilitate collaboration. Notebooks can be easily shared as it has interface like jupyter notebook, and updates can be made in real time, streamlining collaborative development. For the proposed work, which combines RoBERTa and XGBoost, Google Colab provides the computational resources and flexibility required to preprocess data, train models, and evaluate results effectively, making it an ideal platform for this research. For implementing python programming language is used. Python is a powerful and flexible programming language widely used across various domains due to its simplicity and robust ecosystem of libraries. Libraries such as NumPy, Pandas, and Matplotlib support efficient data manipulation and visualization, while machine learning frameworks like TensorFlow, PyTorch, and Scikit-learn enable the development of complex models. Python's versatility makes it a go-to language for fields ranging from web development to artificial intelligence, providing tools that streamline workflows and enhance productivity.

Evaluation Parameters and Significance

The performance of the system should be evaluated in terms of the accuracy of classification. It is worth mentioning that a comparative analysis is done based on the common and overlapping data

Accuracy (Ac): It tells us about the exactness set of the different methods. The critical parameters are:

The classification accuracy is computed as:

$$Ac = \frac{TP+TN}{TP+TN+FP+FN} \quad (1.1)$$

The precision is computed as

$$Pr = \frac{TP}{TP+FP} \quad (1.2)$$

The F-measure or F-Score is computed as:

$$F - Measure = 2 \cdot \frac{Precision \cdot Recall}{Precision + Recall} = F - Measure = \frac{TP}{TP + \frac{1}{2}(FP + FN)} \quad (1.3)$$

Here,

(TP): True Positive

(TN): True Negative

(FP): False Positive

(FN): False Negative

EXPERIMENTAL RESULTS

The evaluation of the proposed hybrid model for depression detection, which integrates RoBERTa and XGBoost, demonstrates its effectiveness in identifying depressive tendencies based on textual data. The model was assessed using a test dataset after being trained and validated on labeled examples. The primary metric used for evaluation was accuracy, reflecting the proportion of correctly classified instances to the total instances in the dataset. The hybrid model achieved an accuracy of 92.8%, indicating a high level of reliability in distinguishing between depressive and non-depressive content. The performance of the model was observed to be consistent across both training and validation phases, showcasing its ability to generalize well to unseen data. The results highlight the superiority of the hybrid approach, as it combines RoBERTa's contextual embedding capabilities with the robust classification power of XGBoost. Furthermore, the automated pipeline ensured a streamlined process from data preprocessing to final evaluation, making the system efficient and scalable for real-world applications. Overall, the evaluation confirms the potential of the proposed methodology to serve as an effective tool for depression detection, contributing to early identification and intervention for mental health challenges.

CONCLUSION

The RoBERTa-XGBoost model for depression detection demonstrated a high classification performance, achieving an overall accuracy of 92.8%. The model effectively distinguished between depressed and non-depressed individuals, with an F1-score of 0.88 for both classes. Specifically, it attained a precision of 0.84 and recall of 0.94 for the non-depressed category, while the depressed category recorded a precision of 0.93 and recall of 0.82. These results indicate that the model is highly capable of identifying depression while maintaining a balance between precision and recall. The high recall for non-depressed individuals suggests a low false negative rate, ensuring that most non-depressed cases are correctly identified. Conversely, the high precision for depressed individuals minimizes false positives, improving the reliability of depression detection. The integration of RoBERTa's deep contextual embeddings with XGBoost's powerful classification capabilities contributed to the model's robustness and effectiveness. Overall, the findings highlight the potential of hybrid deep learning and machine learning approaches in automated mental health assessment.

Future Scope

In future enhancing model generalized by incorporating larger and complex dataset. More fine tune hyperparameters could further improve classification performance.

ABSTRACT

According to siddha text there are nine entrance organ in the body out of nine head consist seven entrance organ that is mouth,nose, eyes and ears. Mouth is primary entrance organ through it food substances consumed, so mouth is one of primayr organ for human living.Maintenance of oral hygiene important in the prevention of many diseases in eyes, ears, nose, throat, gastrointestinal tract and major joint diseases because they are interlinked[1,6]. Oral health has impact on physical,psychological and social wellbeing.Brushing the teeth with suitable material will the help the cleanliness of teeth,throat and firmness of gums. Ancient siddha text recommend a material for cleaning a teeth are astrigent in taste used as powders, leaf and twigs. They are preventing the disease of teeth and a gums. This leaves ,herbal powders and twigs have many medicinal properties .In modern world many people using brush made from bristies, after using it even washing with hot water some dirt may remain in between the Bristies, it cause disease .So twigs are superior than that modern brushes in the siddha system of medicine. Siddha system help the oral hygiene in good in manner if you follow the system for the oral hygiene it has many many beneficial effect to the body. The proverb "Aalum Velum Pallukkurudhi" says that, "Ficus bengalensis and Acacia arabica trees make the teeth strong",Neem twigs makes the teeth very clean and hygiene , Achyranthus aspera twig make the teeth cleen and

Latha Maheswari et al.,

magic charmer[2,7-9], when use Aerva lanata twigs for dental clean it has additional benefit that is it promote the reproductive health [9,2]. Additionally the leaves and the herbal powders used for cleaning the teeth have a many medicinal value and not harm to the body the body compared to chemical tooth powders and tooth paste.

Keywords: Siddha, Twigs, Oral hygiene, Mouth, Teeth, Herbal powder

INTRODUCTION

Mouth and Tongue

Tongue is the organ for taste it is a component of the element water. With the help of the teeth and tongue in the mouth which is like a sea with sweet water which never dries up, the food that is taken is mixed with saliva then ground well and swallowed. Because of this, the first thing that is produced in the mouth in the morning is waste fluid. If this is not properly cleaned bad odour is produced in the mouth and the consumed food get spoiled and this may affect the blood and many diseases may occur. Therefore keeping the mouth clean is the best way of preventing many diseases. Further, there is a close relationship between the mouth, eye, nose and the ear. Therefore, if oral health is affected, the health of the other three organs will also get affected. Therefore it is very important to keep the mouth clean. In the morning, food should be taken only after cleaning the teeth. After taking food the mouth must be gargled several times and spit out. Mouth must be gargled always before and after taking food. Cleaning the mouth The teeth must be cleaned after passing stools and urine in the morning. If the teeth are not cleaned, dirt collects in the crevices between the teeth and will produce bad smell and several germs grow there with offensive smell causing teeth and gum diseases. If they are swallowed along with food they cause indigestion, gastric ulcer, arthritis etc. Therefore it is very important to keep the teeth clean always and prevent from dirt. Realising this our ancestors considered brushing of teeth as one of the important morning duties to be done immediately after waking up in the morning. Nothing should be consumed before brushing the teeth. Brushing the teeth with suitable materials will help the teeth clear and the gums become firm, besides, the cleanliness of the tongue mouth and throat as a whole is achieved.

Materials suitable for brushing the Teeth

As stated in Pathartha Guna Chinthamani, if the teeth are cleaned with the materials of astringent taste such as powders, leaves and twigs, they remain firm without shaking till the last besides preventing the diseases of teeth and gums. Among these materials the twig is the best which should be taken from trees which are not decayed, without nodes, holes and cracks in between. The twig should be about a thickness of the little finger and a span in length.

Method of using the Twigs

The twig must be cleaned and one end must be bitten and crushed well to make it a soft flubby brush. Biting the twig helps to secrete more saliva so as to dissolve more dirt. Each tooth must be rubbed and brushed well by moving the brush up and down and from left to right so that the dirt particles in the gaps between the teeth are removed. As the end is soft there will be no harm or hurt to the gums. After this, the twig must be split into two lengthwise and each piece should be bent with both hands and inserted upto the uvula, The tongue coating must be scraped, removed and cleaned and then mouth should be gargled for twelve times, Further, the dried secretions, sputum, mucous of the nose and the dirt in the eyes, and naval should be removed. After that the hands, feet, face and other parts should be washed and cleaned. The teeth should not be brushed while standing or walking[2,6]. Brushing should be done in Kukkuda asana position.

Suitable Twigs and their Uses

Tamil siddha texts say, the twigs of the following can be used by the common people. *Acacia arabica*, *Azadiracta indica*, *Phyllanthus reticulatus*, *Ficus benghalensis*, *Tectona grandis*, *Eugenia jambolana*, *Mimusops elengi*, *Bauhinia racemosa*, *Achyranthus aspera*, *Terminalia arjuna*, *Ficus microcarpa*, *Lan Mangifera indica*, *Anthocephalus cadamba*, *Feronia ciephantum*,

Latha Maheswari et al.,

Saraca indica, *Michelia chempaca*. Twigs with astringent taste as well as bitter taste shall be used. But the teeth become very clean with the twigs of bitter taste, according to Pathartha Guna Chinthamani verse 1323. The proverb "Aalum Velum Pallukkurudhi" says that, "*Ficus bengalensis* and *Acacia arabica* trees make the teeth strong", and hence among the twigs the banyan and black babool are mostly used. *Achyranthus aspera* twig make the teeth clean and magic charmer, when use *Aerva lanata* twigs for dental clean it has additional benefit that is it promote the reproductive health.[1-5].

Restriction for using the twigs their ways to clean the teeth

Person suffering from one or more of the following diseases should not use twigs for brushing the teeth: Spongy gums due to disease, stomatitis, indigestion, dyspnoea, fever, thirst, chest pain, eye disease, tuberculosis, paralysis and headache. Roast 35 gms of *Carum copticum* with moderate heat till it turns into golden colour and make into a fine powder. Then prepare the powder of salt, *Acacia catechu*, *Quercus infectoria*, dyers oak, cinnamon bark, *Caryophyllus aromaticus* and *Piper nigrum*. Take a pinch in each of the above two powders for cleaning the teeth. There are also several other methods for preparing tooth powders. Person suffering from eye diseases, vomiting, dryness of mouth, indigestion can use combination of roasted clove, cumin and salt powder. Person suffering from soft gums and oral ulcer can use the neem tender leaf and thiripala powder for cleaning the mouth.[2,10,11]

Substances unsuitable for cleaning the Teeth

Brick powder, mud, charcoal, flower sheath of palm tree, straw and twigs from decayed trees should not be used to clean the teeth. If used, the teeth will get damaged soon and the gums will also be affected. As stated in the texts, the facial attraction and prosperity will be lost leaving one in poverty. Therefore the teeth should not be cleaned with the above mentioned substances.[2]

CONCLUSION

Owing to modernism, many people use brush made from bristles, to brush the teeth. But as they are long and made of hairs it is not possible to brush every tooth separately. The same brush has to be used daily and cleaned for reuse. After using it, it should be rinsed well with hot water. Even then some dirt may remain between the bristles, which may cause harm to the teeth. Therefore modern brushes are not superior than twigs. At times the bristles get hardened and injure the gums causing 'Anthrax' and moreover brushes are not used to brush directly but along with a paste. So, the cost of both is very high. However, these artificial brushes may be used in countries where twigs are not available. If jute fibre is used in brushes instead of hair, there is no possibility for diseases of teeth.[2,7,8,9]

ABSTRACT

A simple, rapid, precise, sensitive and reproducible reverse phase high performance liquid chromatography (RP-HPLC) method has been developed for the quantitative analysis of Sertraline hydrochloride and its impurities in pharmaceutical dosage form. Chromatographic separation of Sertraline hydrochloride and its impurities was achieved by Kromasil C18, 250×4.6 mm, 5 μ and the mobile phase containing Acetonitrile and Buffer in the ratio of (ACN/Buffer-60/15) v/v. The flow rate was 1 ml/min; detection was carried out by absorption at 225nm using a photodiode array detector at ambient temperature. Retention time of Sertraline hydrochloride (SRT), Impurity-A and Impurity-B was found to be 7.521 min, 5.081 min and 11.451 min respectively. The %RSD of impurities A & B was found to be within the acceptance criteria. The total percentage of impurities in the sample was found to be 0.006%. The proposed method was validated according to ICH guidelines. The method was found to be novel, simple, economical, suitable, precise, accurate and robust method for quantitative analysis of Sertraline hydrochloride and its impurities.

Keywords: Sertraline hydrochloride; RP-HPLC; Kromasil C18; Impurity analysis.

Joshitha et al.,

INTRODUCTION

Unwanted chemicals that remain with the active pharmaceutical ingredients (APIs), develop during the formulation process, or emerge as the APIs and formulated APIs to medicines age are known as pharmaceutical impurities. Within the pharmaceutical industry, an impurity is defined as any residual solvent or inorganic material that is not part of the drug substance or ingredient, or as any unwanted chemicals that are left behind after synthesis with APIs[1]. Identification, clarification of the structure, and quantitative assessment of impurities and degradation products in pharmaceutical formulations and bulk drug materials are all included in impurity profiling [2]. Because unknown, potentially toxic impurities are harmful to health and because selective methods should be used to identify and determine impurities in order to increase the safety of drug therapy, impurity profiling has become more important in modern pharmaceutical analysis [4]. Limits on the permissible levels of impurities present in APIs or formulations are gradually being added by various pharmacopoeias, including the United States Pharmacopoeia (USP) and the British Pharmacopoeia (BP) [5]. The study of impurity profiling aims to monitor the drug manufacturing process, identify the source of the drug sample, determine the specific relationship between two or more samples, and determine the pattern of drug distribution. Because contaminants have the potential to be teratogenic, mutagenic, or carcinogenic, their effects on health can be profound [3].

Sertraline hydrochloride (SRT) is chosen as drug of interest in this research study. Sertraline is a medication used to manage and treat the major depressive disorder, obsessive-compulsive disorder, panic disorder, post-traumatic stress disorder, premenstrual dysphoric disorder, and social anxiety disorder. It is in the SSRI (Selective serotonin reuptake inhibitor) class of medications. Sertraline mechanism of action makes it highly efficacious when used in the treatment of various psychiatric conditions. Sertraline selectively inhibits there uptake of serotonin (5-HT) at peripheral nervous system. This inhibition of serotonin reuptake results in an accumulation of serotonin. Thereby increased serotonergic activity is seen. An increased synaptic concentration of serotonin in the CNS, leads to numerous functional changes associated. Also enhanced serotonergic neurotransmission is observed. These changes are believed to be responsiblefortheantidepressantactionandbeneficialeffectsinoobsessive-compulsive [8]. It has been hypothesized that obsessive-compulsive disorder, like depression is also caused by the dysregulation of serotonin. Sertraline is shows better efficacy and acceptability when compared to other SSRI's. As we know every drug is associated with certain type of impurities which are known or unknown in case if we don't specify them. Even in marketed formulations the risk of unwanted substances which are nothing but the impurities are present which are in acceptable range. Several analytical techniques are needed to identify or estimate this kind of impurity. Various kinds of contaminants, it's crucial to create a solid procedure during process development that can be transferred and validated later on for use in quality assurance and quality control[4]. The type of impurity and the amount of data needed from the analysis are taken into consideration when choosing the right technique [7].Pharmaceutical development involves a number of complex analytical problems that call for the application of multiple analytical techniques to solve [6]. Analytical methods that can quickly address these issues include HPLC, LC/UV, LC/MS, GC/MS, CE/MS, and LC/UV. These methods also offer orthogonal detection and complementary information [9]

MATERIALS AND METHODS

Reagents and chemicals

All the materials used were either AR/GR grade or the best possible Pharma grade available as supplied by the manufacturer or supplier without further purification or investigation. HPLC analysis was carried out on a KromasilC18, 250×4.6 mm, 5μ.Sertraline hydrochloride, Impurity-A & Impurity-B were obtained from Aha laboratories, Vizag. Other chemicals used in the study are Orthophosphoric acid (GR grade), Methanol (GR grade), Acetonitrile (HPLC grade) and Water (Milli-Q- grade).

Joshitha et al.,

Preparation of Buffer

Transfer 1.0 mL of Orthophosphoric acid into 1000 mL of water and mixed well. Filter through 0.45 μ or finer porosity membrane filter using vacuum filtration kit.

Preparation of mobile phase

Prepare a degassed mixture of Acetonitrile: Buffer in the ratio of 60:15% v/v. Filter through 0.45 μ or finer porosity membrane filter using vacuum filtration kit.

Preparation of Diluent:

Diluent-1: Water is used as a diluent.

Diluent-2: Prepare a degassed mixture of Acetonitrile: Buffer in the ratio of 60:15% v/v. Filter through 0.45 μ or finer porosity membrane filter using vacuum filtration kit.

Preparation of Sertraline Hydrochloride Standard Stock solution:

Accurately weigh and transfer 10.12 mg of Sertraline Hydrochloride into 100 mL volumetric flask, dissolve and dilute to volume with diluent.

Preparation of Impurity-A Standard Stock solution:

Accurately weigh and transfer 10.14 mg of Impurity-A Standard into 100 mL volumetric flask, dissolve and dilute to volume with diluent.

Preparation of Impurity-B Standard Stock solution

Accurately weigh and transfer 10.19 mg of Impurity-B Standard into 100 mL volumetric flask, dissolve and dilute to volume with diluent.

RESULTS AND DISCUSSION

HPLC Optimized Chromatographic Conditions

Good chromatographic separations were achieved only on amylase based Kromasil C18, 250 $\times$ 4.6 mm, 5 μ , (Make: Shimadzu corporation Ltd, Japan) using the mobile phase system consisting of an acetonitrile-OPA 60:15 (V/V) The flow rate was kept at 1.0 mL/min. The sample concentration was 0.1 mg/mL in diluent (acetonitrile/OPA). The column temperature was maintained at 30 $^{\circ}$ C and the elution was monitored at 225 nm. The injection volume was 10 μ L. Good separations were observed column USP resolution > 7.5. The typical retention times of Sertraline and its impurities A & B were 7.521, 5.081 & 11.451 min, respectively. (Fig1), Table 2

System suitability

The standard solutions of SRT and impurities are injected six times to evaluate the system suitability of the method; the results (retention time) reported in Table 2, are within the limit specifications.

Specificity

Separately inject Blank, 6 replicate injections of 10 μ L each of the Standard solution, one injection of Sertraline Hydrochloride Standard solution, one Injection of Impurity-A Standard solution and one Injection of Impurity-B Standard solution, one injection of Spiked sample and record the chromatograms.

Linearity**Preparation of 50% Linearity level solution:**

(0.0005125 mg/mL Sertraline Hydrochloride, 0.0005110 mg/mL Impurity-A and 0.0005145 mg/mL of Impurity-B)

Transferred 0.50 mL of Sertraline Hydrochloride Standard stock solution, 0.50 mL of Impurity-A Standard Stock solution and 0.50 mL of Impurity-B Standard Stock solution into 100 mL volumetric flask, dissolve and dilute to volume with diluent.

Preparation of 80% Linearity level solution:

(0.0008200 mg/mL Sertraline Hydrochloride, 0.0008176 mg/mL, Impurity-A and 0.0008232 mg/mL of Impurity-B)

Transferred 0.80 mL of Sertraline Hydrochloride Standard stock solution, 0.80 mL of Impurity-A Standard Stock solution and 0.80 mL of Impurity-B Standard Stock solution into 100 mL volumetric flask, dissolve and dilute to volume with diluent.

Joshitha et al.,

Preparation of 125% Linearity level solution:

(0.0012813mg/mL Sertraline Hydrochloride, 0.0012775mg/mL Impurity-A and 0.0012863mg/mL of Impurity-B) Transferred 1.25mL of Sertraline Hydrochloride Standard stock solution, 1.25mL of Impurity-A Standard Stock solution and 1.25 mL of Impurity-B Standard Stock solution into 100mL volumetric flask, dissolve and dilute to volume with diluent.

Preparation of 150% Linearity level solution: (mg/mL)

(0.0015375mg/mL Sertraline Hydrochloride, 0.0015330mg/mL Impurity-A and 0.0015435mg/mL of Impurity-B) Transferred 1.50mL of Sertraline Hydrochloride Standard stock solution, 1.50mL of Impurity-A Standard Stock solution and 1.50mL of Impurity-B Standard Stock solution into 100mL volumetric flask, dissolve and dilute to volume with diluent.

Preparation of 50% Accuracy level preparation:

Accurately weighed and transferred 50.25mg of Sertraline Hydrochloride into 50mL volumetric flask, added 0.25mL of Impurity-A Standard Stock solution and 0.25mL of Impurity-B Standard Stock solution dissolve and dilute to volume with diluent.

Preparation of 100% Accuracy level preparation:

Accurately weighed and transferred 50.18mg of Sertraline Hydrochloride into 50mL volumetric flask, added 0.50mL of Impurity-A Standard Stock solution and 0.50mL of Impurity-B Standard Stock solution dissolve and dilute to volume with diluent.

Preparation of 150% Accuracy level preparation

Accurately weighed and transferred 50.27mg of Sertraline Hydrochloride into 50mL volumetric flask, added 0.75mL of Impurity-A Standard Stock solution and 0.75mL of Impurity-B Standard Stock solution dissolve and dilute to volume with diluent.

Precision**Preparation of Spiked sample preparation**

Accurately weighed and transferred 50.18mg of Sertraline Hydrochloride into 50mL volumetric flask, added 0.50mL of Impurity-A Standard Stock solution and 0.50mL of Impurity-B Standard Stock solution dissolve and dilute to volume with diluent.

Limit of Detection and Limit of Quantification (LOD & LOQ)**Preparation of LOD Solution:**

Transferred 3.0mL of Sertraline Hydrochloride Standard solution, 3.1mL of Impurity-A Standard solution and 3.3mL of Impurity-B Standard solution into 100mL volumetric flask, dissolve and dilute to volume with diluent.

Preparation of LOQ Solution:

Transferred 9.0mL of Sertraline Hydrochloride Standard solution, 9.5mL of Impurity-A Standard solution and 9.9mL of Impurity-B Standard solution into 100mL volumetric flask, dissolve and dilute to volume with diluent.

Robustness**Preparation of Spiked sample preparation-1:**

Accurately weighed and transferred 50.34mg of Sertraline Hydrochloride into 50mL volumetric flask, added 0.50mL of Impurity-A Standard Stock solution and 0.50mL of Impurity-B Standard Stock solution dissolve and dilute to volume with diluent.

Preparation of Spiked sample preparation – 2:

Accurately weighed and transferred 50.39mg of Sertraline Hydrochloride into 50mL volumetric flask, added 0.50mL of Impurity-A Standard Stock solution and 0.50mL of Impurity-B Standard Stock solution dissolve and dilute to volume with diluent.

**Joshitha et al.,****Preparation of Spiked sample preparation – 3:**

Accurately weighed and transferred 50.40mg of Sertraline Hydrochloride into 50mL volumetric flask, added 0.50mL of Impurity-A Standard Stock solution and 0.50mL of Impurity-B Standard Stock solution dissolve and dilute to volume with diluent.

CONCLUSION

The developed HPLC method for the identification of impurities in selected drug is simple, rapid, accurate, precise, robust and economical. The mobile phase and solvents are simple to prepare and economical, reliable, sensitive and less time consuming. Since the system validation parameters of HPLC method used for identification of impurities in sertraline hydrochloride have shown satisfactory, accurate and reproducible results (without any interference of excipients) as well, it is deduced that the simple and short proposed methods be most useful for analysis purpose.

ABSTRACT

Like other naturally occurring polysaccharides, starch has a growing appeal as a potential material for new drug delivery systems because it is biodegradable and can be modified relatively easily. However, in recent times, starch has come into focus in pharmaceutical technology; most recently because of recent advances for such technology on starch's potential to improve medicine stability, change release rates or target specific tissues or cells. Several changes, e.g. cross linking, grafting, and blending with other polymers, were investigated to adapt starch's characteristics for specific drug delivery applications. Starch based carriers used in programmed drug delivery can be designed strategically to meet targeted and sustained release (of the drug) in response to environmental cues, e.g., pH and temperature. The state of starch mediated drug delivery system's growth is reviewed up to present: their process details, advantages and drawbacks are reviewed. The invention of starch-based carriers is a big step toward more efficient and patient friendly.

Keywords: polysaccharides, environmental, temperature, Starch.

INTRODUCTION

The second most common substance found in nature is following some starch. This is a naturally occurring, renewable, biodegradable polysaccharide that is abundant throughout the plant world. In general, plants utilize photosynthetic process to make starch, while non photosynthetic species like humans can gain from that since solar chemical energy can be stored in various plant and algal organism. Starch is formed by many units of amylose and

**Iqbal Hossain and Saptarshi Samajdar**

amylopectin that are glycosidic bonded to one other to form a starch. Very few photosynthetic algal sources have a minimal level of starch, but potatoes, sweet potatoes, yams and many other foods have very abundant amounts of starch. [1] Starch is a low cost, widely available carbohydrate that has multiple health benefits when consumed on a regular basis. Starch presents excellent physicochemical and functional qualities and is suitable for industrial, medicinal and biological applications. Starch possesses a wide range of uses in many fields including the textile industry as a fabric stiffener, food industry as a preservative, additive, thickener and packaging, biofuel production, pharmaceutical industry as a drug carrier and excipient, and has recently been of considerable interest in the cosmetic, bioplastic, paper industries. [2],[3],[4]. From ancient times to the present, records of archaeology, as well as reviews of literature, show humans from a variety of ecosystems were consuming starch rich foods as parts of their diet (5). Natural polymers, such as cellulose, alginate, agar, carrageenan, and starch are being investigated as potential DDS without much human impact [6].

Starch is appealing as a macromolecule because of its physical, chemical and functional properties, namely ease of water dissolution, water retention properties, gelatinization, pasting behaviour on increase of temperature, ease of modification to specialise in attributes for functional value. Starch has a wide geographic distribution, is low in cost, and abundant [7]. It is unfortunately exceedingly hydrophilic, brittle, retrogrades and deteriorates on heating thus severely limiting its applicability in industrial polymer applications requiring the impartation of mechanical integrity. Accordingly, in the majority of cases, the functional group of starch, i.e. the single bond OH group, is substituted to overcome the previously cited drawbacks so that the obtained starches are suitable for manufacturing uses. Amylose is a linear glucose chain linked by α 1,4 glucosidase and amylopectin is a branched glucose chain with α 1,6 branching and both are considered native starch granules. [8]. Researchers investigate starch based micro and nano immobilization techniques as a drug delivery system (DDS) for treatment of various illnesses. In this methodology, the idea of synthesizing micro and nanocarriers is to deliver medications to parts within living organisms that are initiated with dissimilar physicochemical properties including, pH, temperature, pressure, surface area, conductivity, and solubility dependent on the elements of living anatomies that are framed. Properties, like pH, temperature, pressure, surface area, conductivity, and solubility, based on the affected/infected parts of living organisms. To mediate the release of medicinal medicines at specific physicochemical parameters, the DDS has been developed. Higher bioavailability is achieved by targeted release of medicines from micro and nano carriers, exposing higher drug concentrations in the biological fluids in humans. The rapid release kinetics of DDS composed of metal, metal oxide, and polymeric nanomaterials have made them useful for biological and medicinal applications. The characteristics of starch are influenced by the structure and composition. On a botanical source, growth climate, cultivation site and soil type basis, amylose to amylopectin ratio and starch structure differ [9]. To optimize the application of starch in drug delivery and other industries, the physiochemical and physio mechanical properties can be improved to satisfy the required properties of the generated system.[10]

Starch has an important part in food quality and has many industrial uses, like thickening, colloidal stabilization, gelling, bulking, water retention, and adhesion. Many studies have been conducted on the morphological, rheological, thermal, and textural characteristics of corn and potato starches due to the industry's need for new value-adding goods.[11] Starches are found in separate plant cell granules. Granules of common starches can be categorized as either partially crystalline or partially amorphous polymeric systems; crystalline portion of the granules of the common starches comes from the placement of the amylopectin molecules within the granules, whereas the amylose is, or atleast the amorphous parts thereof, mainly the amorphous and randomly distributed in the clusters of the amylopectin. For example, the Brabender Visco-amylograph, rapid Visco-analyser (RVA) and Rotating viscometers are all used to determine Starch paste viscosity. The viscoelastic and rheological properties of starches have been studied by researchers using a dynamic rheometer.[12] Modified starches provide greater functional quality than native starches and therefore are often used in processed foods. Physical techniques, which include annealing (ANN) and heat moisture treatment (HMT) alter starches without gelatinizing or damaging the granules. Both treatments had different effect on internal granule structuring, though it did not disturb the size or shape (because they do not). Starch chain interactions, granule swelling, amylase leaching, viscosity, gelatinization temperatures, retrogradation, and acid/enzyme hydrolysis are influenced by osmotically treated starches – and

**Iqbal Hossain and Saptarshi Samajdar**

industrial starches come from costly natural sources like potatoes, corn and rice. The composition of Taro as provided in raw form includes 13–29 % starch; 63–85 % moisture; and other miscellaneous items such as riboflavin, vitamin C and ash. The effort was to extract starch from plant underutilized plant such as taro which is cheaper than other natural sources. For comparison with potato and maize starch, its physical and chemical qualities were compared. Starches of potato, corn and taro have been modified in order to improve their qualities for industrial use.[13] A simple, cost effective and safe technique that does not rely on chemical or biological agents, physical alteration is a simple and inexpensive means of changing the appearance of the surface without effect on the underlying cell structure. Physical changes to starches of different kinds of plants can be used to categorize starches according to molecular integrity. Hydrothermal processes like ANN and HMT preserve the molecular integrity of starches by restraining the pre-gelatinization processes (drum drying, spray drying, extrusion cooking) which disperse in starch granular order and partially dissolve starch components.[14]

Classification

Starch is classified into three types based on its nutritional value: slowly and resistant starch, and rapidly digestible starch. Industrial applications of starch require modification of natural starches through oxidation, esterification, hydroxy methylation, dextrinization or [15] cross linking. These changes exceed the natural starch properties. In food application these modified starches are used as thickness and emulsification agent in food processing, especially in confectionery and baking operations or as adhesive gums, biodegradable substances and as sizing agent in clothing and paper industries [16]. The production of modified starch using common techniques is difficult, expensive, time consuming, and often harmful to human health.[17]. Raw materials in their natural form are called native starch. Modified starches are starches to which chemical, physical or enzymatic modifications have been completed. A hydrolysis event is the one where hydrolysed starch is a starch chain which is broken down into smaller chains of glucose. Native starches have few industrial applications because of unfavourable characteristics, such as low shear resistance, high retrogradation, and syneresis, and are commonly modified by physical, chemical, or enzymatic or combinations thereof to give desirable functional properties for specific uses. Starch is a natural, and very safe, substance that is physically modified.[18]

Source of starch

Producers of starch use a variety of plants. Climate and location as well as intended use of the starch play the predominant role in plant selection. Maize in temperate (and even subtropical) zones, cassava (manioc or tapioca) and banana in the tropics, rice in flood-prone areas, and potatoes in freezing climes may produce starch no matter what the temperature or agricultural conditions. In addition to conventional crops, cassava offers great promise because it readily adapts to tropical conditions, and as such, is an important crop in developing countries worldwide. There are new sources of starch, including the banana, which produces a high-quality starch. The development of new commercial sources of starch as well as a rising need of products of renewable resources will simplify to increase demand for starch production and hence the emergence of new starch applications.[20] From a food processing point of view, non-traditional starch sources may well offer new products with novel features and applications. This is so because of the many types of the plants that produce starch. Two major sources are uncommon starches. One source of underutilized crops are sago palm, quinoa (*Chenopodium quinoa*), young bamboo culm, canna and bore. Unconventional starch is also formed in non-conventional varieties of crops. About 4,000 potato varieties of which 98 percent are whole plants grown by smallholder farmers in Peru highlands are used exclusively for human consumption and not for starch production. [21]

Starch extraction Method

The methods of new extraction methods should be enhanced for non-conventional starches based on modifications to the previously described method. As peripatetic species explored are not native for starch patterns, comparative investigations are not always comfortable. Small changes to obtained starch can be caused by reagent used in chemical extraction and grinding operations. Tubers are cleaned from mucilage with alkaline solutions [29] or supplied with sodium bisulphite which prevents enzymatic browning, protein hydrolysis, bacterial growth and

**Iqbal Hossain and Saptarshi Samajdar**

oxidation. Starch can be degraded by milling techniques which cause impairment of the starch's pasting qualities.[30] Extraction procedures cause changes in the viscosity of the Yam starch paste and natural granule size. In order to evaluate starches in their natural state, the extraction procedure should be smooth using water and multiple washes to remove the starch to a level of purity greater than 98%, and less than 2% other nutrients. If the resulting product is of a quality the commercial use, then it is of paramount importance to caustically extract the product and the associated optimization of the process is a requirement. [31]

Structure & Properties of Starch

The world's second biggest biomass after cellulose, starch is green plants' primary type of stored carbohydrates. Starch is a polymer of glucopyranose glucose units of 6-member ring. The molecular weight of starch is between 104 to 107 Daltons.[32] As opposed to a substance like glucose units in starch the α -1-4 bonds attach them together instead of the β -1-4 bonds. The structure of the α -1-4 linked starch is random coil and β -1-4 linked cellulose is wrinkled linear shaped. Almost all of the molecules of starch (up to 100 percent in wax starches, 72 percent in standard maize starch, 80 percent in potato starch) have extremely branched structures called amylopectin. Based on the α -1,4 organization of the spine, it consists almost entirely of an amylopectin. About 5% of the branches are α -1,6 connected. In amylopectin the branch chains are crowded and [34] the branch chain sizes vary with starch type and genetic history. However, double spherical, crystallographic formations are seen as branch networks.[35] Starch granules from different plant sources have different dimensions and form. Amylose and amylopectin concentrations, however, also vary. Most grain starches are 20 to 30 percent amylose. High amylose corn or wrinkled-pea starch, for example, are some variations in genes, with 50-70 percent amylose. Wheat, rice and shiny corn contain 1 % of or less amylose. The botanical origin of starch determines the temperature at which the starch will gelatinize. The distinctiveness of these discrepancies imply starch structures and granules are also different. There is another third element in most starches, especially amylase starches, intermediary substance. This substance occurs in most grain starches at 5–10 per cent. Intermediary substance is 0.4% in smooth pea starch (33% amylase); 18.9% in wrinkled pea starch (71% amylase).[36]

Starch Modification Techniques

Ingestion of starch occurs rarely, and enterprises apply starch rarely in its unprocessed state. Unfortunately, most organic starches are restricted because they may breakdown or change when subjected to high temperatures, acid or mechanical abuse. In some cases, some starch granules will not dissolve in cold water so some starch granules are resistant to enzyme destruction and thus some component of starch powder is not available. Industrial applications routinely modify native starches to enhance qualities such as solubility and softness, and adhesiveness, and or heat resistance. Several methods to manufacture modified starches with different properties and application have been developed. These methods modify the starch structure to increase flexibility and improve chemical and physical characteristics. The result is that these altered starches become more valuable in both the food and non-food industry.[37][38]

Physical Method**Hydrothermal modification**

Two commonly used processes for changing starches without affecting the granules are annealing (ANN) and high moisture treatment (HMT). Even when compared with temperatures that will gelatinize starch, these processes take place at temperatures below that, preserving the granule shape. During these treatments the starch granules have to be flexible, and quick changes in their characteristics can be noticed. The two approaches modify to varying degrees the structure and characteristics of starch. They need to be precise temperatures and moisture levels at which to work properly. Low moisture level HMT is used and ANN is used for starches of low to medium moisture [39].

Heat-moisture treatment

The heat-moisture treatment (HMT) of pulse starches at temperatures ranging from 100 to 120°C for 16 hours results with alterations in the structure and properties of the starches obtained from smooth peas, wrinkled peas, navy beans, lentils, pigeon peas. Heat moisture treatment (HMT) of pulse starches was found to reduce amylose leaching,

**Iqbal Hossain and Saptarshi Samajdar**

granular swelling and peak viscosity. α -amylase and acid hydrolysis improve thermal stability and gelatinization temperatures, and starch breakdown.[40] The changes are due to a blend of variables including:

- 1 amylose content,
- 2 interactions between starch chains,
- 3 arrangement of amylose chains within the amorphous domains and
- 4 lipid-amylose complexes.

Annealing

Annealing is a method used to modify starch by changing its characteristics through moisture, temperature, and heating time. In this process, starch granules are soaked in water (around 40% moisture) and heated at a temperature higher than the glass transition temperature but lower than the gelatinization temperature. This treatment increases the crystallinity of starch, improves its mechanical properties and heat stability, and reduces structural relaxation. It helps starch molecules move more freely and prevents gelatinization by keeping the temperature close to the glass transition point in the presence of water or glycerol. In a study, annealing was conducted at 50 °C for 72 hours with 75% moisture on different types of hull less barley. The results showed that annealing raised the temperatures at which starch starts to gelatinize and narrowed the temperature range for gelatinization. It had little effect on the energy change (ΔH) in the starch, but it did change the starch from the B type crystal structure to the A type crystal structure [41].

Retrogradation

Starch chains can retrograde and make structured crystals. In particular, this process is particularly effective against the linear component of starch, amylose. Amylose crystals are very stable, because of this it does not breakdown when subjected to water at very high temperatures (120-150°C) and because they have not broken down, they are resistant to the enzyme amylase. Retrograding occurs more slowly in the branching portion of starch, amylopectin. Typically, it forms the blow crystalline form on the surface of the starch granule, beginning slowly above 40°C and rapidly below 70°C temperature, which renders the starch more vulnerable to amylase action than amylose.[42] Where the starch comes from a lot of which depends on the amount and qualities of retrograded starch.[43] the length of the end chains in amylopectin[44 chemistry & physical[45] the presence of other substances[46] Starch recrystallizes most easily at about 0°C, but can do so at temperatures above 100°C, mainly affecting amylase. Repeated thawing and freezing of the starch paste promotes retrogradation. Resistant starch is produced by this process that is hard for amylase enzymes to breakdown. It is the perfect material for diabetic patients as well as to use in drug delivery systems to control how fast the drug distributes.[47]

Pre-gelatinization

Physical modification of starch is most frequently realized by pre-gelatinization. Pre-gelatinised starches, or PGS, are starches that are cooked and dried. This means for example slowly gelatinizing the starch by means of drum drying, spray drying or extrusion, and drying the resulting gelled starch. In industry, PGS are most often produced by drum drying. [48] These starches are cooked and dried to avoid molecular re association. They hydrate quickly and dissolve in cold water, so without cooking, they can be used. During drum drying one or several gels are induced before starch pre-gelatinization. In the one step method the drums are the surface on which the starch slurry is deposited and cooked and dried simultaneously. The slurry is first cooked in a heat exchanger and then dried onto drums in the two-step process [49]. Currently, spray drying is used most commonly to microencapsulate ingredients that can provide high degree of solubility, good drying and emulsifying properties, non-hygroscopic behaviour, bland taste, inertness and is cost effective [50]

Ultra-High-Pressure Treatment

The UHP treatment of the starch-water mixture hydrates the softer sections of the granules, allowing them to expand and alter shape. This allows water to more easily reach the crystalline components.[51]When pressure reaches a specific level, starch granules can be modified without the use of heat; this level is determined by the type of starch and the arrangement of its crystals. Also, starch that is only partially altered by ultra-high pressure retains some of its

**Iqbal Hossain and Saptarshi Samajdar**

original granular shape.[52],[53],[54]After being treated with UHP, the starch's crystallite pattern changes from A-type to B-type. The qualities of the modified starch and how the starch responds during chemical modifications are probably going to be impacted by these alterations in the starch granules.[55],[56]Also, UHP-treated starch that is only partly gelatinized retains its granule shape and reduces the loss of amylose and swelling of the granules.[57]

Osmotic-Pressure Treatment

The so-called osmotic pressure treatment (OPT) was performed leading to optimal treatment by use of high osmotic pressures fluids. Regarding cooling, they used sodium sulphate to add in order to enhance the conditions for making a suspended homogenous solution and for distributing heat in an even manner. The gelatinization temperature of potato starch was changed from B type to type A after treatment. The industrial scale production of the modified starch is in consequence made possible, with a better distribution of heat in comparison with heat moisture treatment.[58]

Chemical Modification

Chemical modification changes the chemical content and structure of the functional groups of starch molecules when chemical and physical characteristics of starch are changed. That is how starch gelatinises, pastes and even retrogrades. This is how starch gelatinizes, pastes and even retrogrades. But it has been observed that the final results depend on the kind of substrate embraced, the reaction environment, consisting of pH level, concentration, reaction time with applicable catalysts RNA Interference and the sort of the substituent incorporated or the level of substitution which can be calculated through the ratio of degree replacement or the molar replacement and the distribution of these substituents on the starch molecules.[59],[60]

Cross-linked starch

It is crosslinked by a crosslinker. The reagents produce ether or ester linkages once the hydroxyl groups of the starch molecule are formed. Thanks to this alteration, we can make the network three dimensional, and therefore increase its stiffness of starch. This starch crosslinking increases polymerization and the molecular mass; therefore, this leads the molecules to be no longer water soluble, but soluble in organic solvents. Product can be termed mono starch or phosphate distarch phosphate (combination of the two).[61]

Dual Modifications

Using these results, a series of dual modifying approaches have been developed to improve starch properties and applications. Dual modifications are chemical and physical or chemical and enzymatic procedures. The most common form of dual chemical modification is a combination of two chemical processes, for example acetylation and oxidation; acetylation and cross linking; cross linking and hydroxy propylation [62]. The food industry uses them extensively as thickeners, binders, emulsifiers, and chemically dual modified starches. Absorption of heavy metals in non-food applications are also available. It is also known that properties of native plantain starch can be made better by application of a dual chemical modification including oxidation and acetylation. [63] Swelling power is the main factor determining the final product when using the dual Hydroxy propylation and crosslinking system. [64]

Acetylated starch

Starch molecules are acetylated (have acetyl groups (CH_3CO) added to them). Certain esters of the free hydroxyl groups in the branched chains of starch are produced when these groups react on free hydroxyl groups.[65] The enzyme's function has been blocked on starch using new technology. In their use to acetylate native starch they are based on the addition of acetyl groups by means of reactive chemicals, mainly vinyl acetate or anhydrous acetic acids in combination with an alkaline catalyst [66],[67]. Starch molecules break when acetyl groups break the bonds between the starch molecules. Acetylated starch swells more than native, and it dissolves poorly. As acetylated starch, electrostatic repulsion within the molecule prevents formation of hydrogen bonds.[68] In acetylated starch, acetyl groups replace hydroxyl and glucose anhydrous groups.[69]

**Iqbal Hossain and Saptarshi Samajdar****oxidation**

Starch oxidation is a chemical process wherein starch is allowed to react with an oxidizing substance such as sodium hypochlorite under conditions of temperature, pH and time carefully controlled. The structural, chemical and physical characteristics of the starch are changed by the addition of carbonyl and carboxyl groups. During growth, the active chlorine content of barley starch rises in parallel with increases in the carbonyl concentration of the starch. Retrograded starch oxidation increases its melting point and reduces swelling power, viscosity and the heat required for gelatinization. It also degrades the content of amylose and amylopectin.[70]

Etherification of starch

Starch ethers such as cationic, anionic, amphoteric and non-ionic starch are made when the hydroxyl groups in starch react with charged groups. By etherification, reheated hydroxyl groups are replaced with positively charged groups, which creates cationic modified starch. Tertiary or quaternary ammonium, amino, butyl, sulfuric and phosphate groups are among the common compounds used for this usually in conjunction with organic or inorganic bases.[71],[72],[73],[74],[75],[76],[77],[78] Recently, dry or wet processes have been using monomers such as 2,3 epoxy propyl trimethyl ammonium chloride (ETA) and 3 chloro 2 hydroxypropyl trimethylammonium chloride In industry a standard dry process is used where a cationic agent is sprayed onto dried starch during extrusion. Here, a semi-dry procedure is used: the cationic agent is added to the starch before the heat treatment. The starch reacts with an alkaline solution, like sodium hydroxide or in dimethyl sulfoxide in the wet process, and gives a mixed reaction while in an alkaline solution as in sodium hydroxide or a uniform reaction in the dimethyl sulfoxide.[80] Homogeneous etherification tends to be much more efficient than heterogeneous methods. That's because in heterogeneous reactions the cat ionizing agent has trouble diffusing, but in homogeneous processes the starch granules dissolve in helping the cat ionizing agent spread better.[81]

Esterification of starch

Starch esterification is an important process to change the structure and properties of starch, in order to apply it to different industrial uses. Modifications of starch with various organic acids (e.g. anhydrides or chlorides) or inorganic acids (phylate or sulphate) form starch esters. Like a starch phosphate, inorganic starch esters have higher viscosity and clarity, and are good adhesives, thickeners, stabilizers, and drug bulking agents. For starch to be used in thermoplastic polymers a high level of substitution of the –OH groups through esterification is often required. This process can also increase the hydrophobicity of this starch to improve processability, decrease its crystallinity and improve its flexibility.[82]

Acid Treatment

During acid modification, the glycosidic oxygen atom of the glycosidic group is attacked by a hydroxonium ion, breaking the glycosidic bond. After first affecting the surface of the starch granule, the acid gradually penetrates an interior of the starch granule. This technique modifies the granule structure of the starch without affecting its characteristics. In fact, depending on where acid-thinned starches come from, they can have quite different properties. [83] Both the gelatinization temperature and the width of the gelatinization endotherm are raised by acid hydrolysis. It also accelerates the rate at which acid-thinned starch retrogrades as hydrolysis proceeds. Depending on the needed viscosity or degree of modification, the concentrated starch slurry may be treated with mineral acid at temperatures below the gelatinization point for predetermined time of acid thinning of starch. Researchers have examined the same effects of many acids (HCl, HNO₃, H₂SO₄, and H₃PO₄) on the molecular weight, alkali fluidity number, iodine binding capacity and intrinsic viscosity of different starches under comparable circumstances.[84]

Applications of starch in novel Drug Delivery Systems

Bakery goods, sweets, puddings, cake fillings, biscuits, candies and gum are made from starches. A very large number of applications in the industry rely on their use also in glues, paper, in sustainable packaging (and other substances, for example dextrin, hydrocolloids). [85]

**Iqbal Hossain and Saptarshi Samajdar****Pharmaceutical Application of Starch**

The dependence of starch granules utilization on their size. Rice starch grains are so tiny (7–9 microns) that they are ideal for use as powdered medications and cosmetics. The small size of this starch exposes it to a much larger surface area and it feels velvety. It's the silky matte surface rice starch generates on your skin to blur the visibility of wrinkles, blemishes and fine lines. It is used in dry shampoos because it absorbs oil in the hair, gives volume and can be brushed out easily. For instance, the surface area of 1.0 g of rice starch is 1.6 m², [86],[87] indicating great potential for other substances to be absorbed and retained allowing for 1.0 g of rice starch to be readily used as a powder suitable for skin applications. Similarly, sago starch has been studied for its properties because it comes from sago palms. In some surgical and diagnostic tools, it could prove useful as a body powder and lubricant.[88]

Starch as a pharmaceutical excipient

Excipients are becoming important in both innovative and conventional pharmaceutical medicines. They help in development of sophisticated drugs, reliable, secure and efficient. Starch is frequently employed as an excipient in medicine, either natural or altered.[89] Starch excipients serve many advantages when producing medications: they are safe and inexpensive, and they are good for product quality. In regulated delivery systems they have also been researched as medication carriers [90][91].

Starch as a Binder

Many firms use freshly manufactured starch mucilage (made by heating a mixture of starch and water) as a binder when making tablets and capsules by the wet granulation method. This gel holds the powder particles together to form clumps following a process similar to glue. It encourages controlled drug release and provides for the even dispersion of active substance. These clusters are then combined under the right compression force to produce strong, stable tablets.[92] The second unique advantage of using starch as a binder is that it is compatible with other constituents and active pharmaceutical ingredients (APIs) found in a variety of formulations. The powder combination is usually made of granulated APIs and other excipients, to ensure consistent API dispersion and a regulated release. Starch gel is used as a binder and powders combined form a wet mass when starch gel is used to form granules. This mass is then passed with the desired granule size through sieves with mesh diameters from 1000 to 1700 microns [93].

Starch as a Glidant

Glidants increase the velocity of granules and powders by reducing friction between particles. Managing the movement of powders is crucial for meeting the weight accuracy and uniformity requirements of pharmacopeia. Effective glidants are needed in large amounts of powder, tablet, and capsule manufacturing to improve granule flow from the hopper to the packing chamber, tablet die, or capsule shell fill chamber. Starch can be used as a glidant in traditional tablet and capsule manufacturing, with a concentration of 2-10% w/w. [94]

Starch as a Lubricant

Lubricants are added in trace amounts to powders and granules used to make tablets and capsules. Their three main purposes are to reduce wear on punches and dies, minimize friction between the tablet surface and the die wall during ejection, and stop tablets and granules from sticking to the punch and dosing apparatus.[95] A good lubricant fulfills all of these requirements. Starch functions as a lubricant via glidant and anti-adherent actions, and it is typically added at a concentration of 2-10% of the weight of the granules or powder mix.[96]

Challenges and Limitations

The drawbacks when utilizing starch as a drug delivery system include: i) the lengthy process of extraction from natural sources, ii) variances in amylopectin and amylose content based on the plant and how it is processed, iii) fluctuations in starch production, iv) the danger of contamination by bacteria, and v) humidity sensibility, that may impact starch circulation, strength, and attaching ability.[97],[98]

CONCLUSION

Starch represents a promising material in the development of novel drug delivery systems due to its unique properties and versatility. Continued research into its modification and application will enhance its role in the pharmaceutical industry, leading to improved therapeutic strategies and patient outcomes.

Table 1: - Starch sources and their yield %

Source	Plant part Harnessed	Scientific Name	Yield %	Reference
Tarap	Fruits	<i>Artocarpus adonatisimus</i>	17.8	22
Breadfruit kernel	Fruits	<i>Treculia Africana, Decne</i>	69.6	23
Seed annatto	Seeds	<i>Bixa orellana L</i>	66	24
Adlay	Cereals	<i>Coixlachryma-Jobi L</i>	43.2	25
Quinoa	Pseudocereals	<i>Chenopodium quinoa</i>	48.5	26
Pea	Legumes	<i>Pisum sativum L</i>	62.5	27
Bamboo	Culms	<i>Bambusa vulgaris</i>	19.15	28
