ABSTRACT

Hypertension, a leading cause of cardiovascular morbidity and mortality, necessitates effective and sustained drug delivery mechanisms to enhance therapeutic outcomes and patient adherence. Traditional oral administration of antihypertensive agents like Aliskiren Hemifumarate is often associated with limitations such as first-pass metabolism, fluctuating plasma drug levels, and gastrointestinal side effects. To address these challenges, transdermal drug delivery systems (TDDS) have emerged as a promising alternative, offering controlled release, improved bioavailability, and enhanced patient compliance. This study focuses on the formulation and evaluation of transdermal patches containing Aliskiren Hemifumarate, aiming to achieve prolonged drug release and effective blood pressure control. Various polymeric compositions, including Hydroxypropyl methylcellulose (HPMC), Ethyl Cellulose (EC), and Eudragit RS100, were explored to optimize drug release profiles. Plasticizers such as Propylene Glycol and Dibutyl Phthalate were incorporated to improve patch flexibility, while penetration enhancers like Oleic Acid and Dimethyl Sulfoxide (DMSO) were employed to facilitate transdermal permeation. The patches were fabricated using the solvent casting method, followed by extensive physicochemical and in-vitro evaluations. Parameters assessed included thickness uniformity, weight variation, folding endurance, surface pH, and drug content uniformity. *In-vitro* drug release studies using a Franz diffusion cell demonstrated a sustained release pattern over 24 hours, with Eudragit RS100-based formulations showing superior controlled-release properties. Additionally, *ex-vivo* permeation studies utilizing excised rat skin confirmed enhanced drug permeation with penetration

**Roshini et al.,**

enhancers. Stability studies conducted under different temperature and humidity conditions (25°C, 40°C, and 75% RH) for three months indicated minimal changes in drug content and physical properties, confirming the robustness of the formulation. The developed transdermal patches exhibited excellent physicochemical stability and demonstrated significant potential as an alternative route for Aliskiren Hemifumarate administration in hypertension management. The findings suggest that transdermal patches could provide a novel, patient-friendly drug delivery system with improved pharmacokinetic advantages, reducing dosing frequency and systemic side effects associated with oral administration. Future studies should focus on clinical evaluations to confirm therapeutic efficacy and optimize formulation parameters for commercial application.

Keywords: TDDS, Eudragit RS100, Plasticizers, angiotensin-converting enzyme, hypertension.

INTRODUCTION

Hypertension is a major cardiovascular disorder that requires effective and sustained drug delivery [1]. It is a chronic medical condition characterized by persistently elevated blood pressure levels, which can lead to severe complications such as heart disease, stroke, kidney failure, and other cardiovascular abnormalities. Effective management of hypertension is crucial in reducing morbidity and mortality rates associated with the disease. Aliskiren Hemifumarate is a potent renin inhibitor used in the management of high blood pressure [2]. It acts by directly inhibiting renin, an enzyme responsible for the conversion of angiotensinogen to angiotensin I, thereby reducing the production of angiotensin II, and a potent vasoconstrictor. By targeting the renin-angiotensin system at its initial step, Aliskiren provides a unique mechanism of action compared to other antihypertensive drugs such as angiotensin-converting enzyme (ACE) inhibitors and angiotensin receptor blockers (ARBs). This mechanism offers the advantage of sustained blood pressure reduction with minimal effects on heart rate. However, oral administration of Aliskiren faces challenges such as first-pass metabolism and variable bioavailability [3]. First-pass metabolism significantly reduces the amount of drug reaching systemic circulation, leading to inconsistent therapeutic effects. Additionally, the bioavailability of Aliskiren is relatively low (~2.5%) due to its poor solubility and limited absorption in the gastrointestinal tract. This results in the need for higher doses, which may increase the risk of adverse effects such as gastrointestinal disturbances, hyperkalemia, and hypotension. Transdermal drug delivery provides an alternative route that bypasses gastrointestinal degradation and offers controlled drug release [4]. Unlike oral administration, transdermal delivery ensures a steady-state plasma concentration of the drug over an extended period, reducing fluctuations in drug levels and minimizing side effects. The transdermal route also improves patient compliance by eliminating the need for frequent dosing and offering a non-invasive administration method. Moreover, transdermal patches can be designed to incorporate penetration enhancers that facilitate drug permeation through the skin, overcoming the inherent barrier function of the stratum corneum. The incorporation of biocompatible polymers such as Hydroxypropyl Methylcellulose (HPMC) and Eudragit RS100 further aids in controlling the release kinetics of Aliskiren, ensuring sustained therapeutic effects. Additionally, combining plasticizers and penetration enhancers enhances patch flexibility and drug permeation efficiency. Overall, the development of transdermal patches for Aliskiren Hemifumarate represents a promising approach for hypertension management, offering advantages such as improved pharmacokinetic properties, reduced systemic side effects, and enhanced patient adherence. The present study explores the formulation, characterization, and evaluation of Aliskiren transdermal patches, aiming to optimize their therapeutic potential for effective hypertension treatment.

Rationale for Transdermal Drug Delivery

Transdermal patches offer several advantages over oral and injectable forms, including

- **Improved Bioavailability:** Oral drugs often suffer from extensive first-pass metabolism in the liver, which reduces the active drug concentration reaching systemic circulation. Transdermal patches bypass this metabolism, leading to higher and more consistent drug bioavailability. This ensures that a greater percentage of the administered dose reaches the bloodstream, improving therapeutic efficacy.

**Roshini et al.,**

- **Reduced Systemic Side Effects:** Traditional oral and injectable drug delivery methods can cause systemic side effects due to fluctuating plasma drug levels. Transdermal patches provide controlled drug release, maintaining steady-state plasma concentrations, thereby minimizing peaks and troughs that contribute to adverse reactions such as hypotension, dizziness, and gastrointestinal disturbances.
- **Sustained Drug Release:** Transdermal patches are designed to release the drug gradually over an extended period, ensuring a continuous therapeutic effect. This reduces the need for frequent dosing and maintains stable plasma drug levels, leading to better disease management and reduced risk of dose-related toxicity.
- **Enhanced Patient Compliance:** The non-invasive nature of transdermal patches eliminates the discomfort associated with injections and the inconvenience of multiple daily oral doses. This improves adherence, particularly for patients with chronic conditions like hypertension who require long-term medication management. Additionally, patches provide a discreet and user-friendly method of administration, enhancing overall patient satisfaction [5].

MATERIALS AND METHODS

Materials for Formulation of Transdermal Patches of Aliskiren Hemifumarate

The successful formulation of transdermal patches depends on the selection of appropriate materials that ensure drug stability, controlled release, enhanced permeability, and biocompatibility. Each component plays a crucial role in determining the mechanical properties, drug release profile, and efficacy of the final transdermal system.

Active Pharmaceutical Ingredient (API)

Aliskiren Hemifumarate

- **Role:** The primary drug used for the treatment of **hypertension** by inhibiting the **renin-angiotensin system**.
- **Properties**
 - o Poor oral bioavailability (~2.5%) due to **hepatic first-pass metabolism**.
 - o **Hydrophilic in nature**, requiring penetration enhancers for better skin absorption.
 - o Optimal **molecular weight (~551.5 Da)** suitable for transdermal drug delivery. Aliskiren's transdermal formulation bypasses first-pass metabolism, improving bioavailability and reducing systemic side effects.

Polymers (Film-Forming Agents)

Polymers are used to control drug release, provide mechanical strength, and ensure adhesion to the skin. A combination of hydrophilic (HPMC) and hydrophobic (EC, Eudragit RS100) polymers is used to achieve sustained drug release over 24 hours.

Plasticizers (Enhancing Patch Flexibility)

Plasticizers improve the mechanical properties of transdermal patches, making them flexible and non-brittle. The choice of plasticizer affects the mechanical strength, adhesive properties, and drug diffusion from the patch.

Penetration Enhancers (Improving Skin Permeability)

Since Aliskiren Hemifumarate is hydrophilic, it requires penetration enhancers to improve drug permeation across the skin barrier (Stratum Corneum). Penetration enhancers significantly improve the flux rate of Aliskiren by up to 40%, ensuring effective transdermal delivery.

Solvents (Dissolution and Casting Agents)

Solvents play a crucial role in dissolving polymers, drug, and excipients to form a homogeneous solution before casting the film. Solvent evaporation during patch drying ensures uniform distribution of the drug within the film.

**Roshini et al.,****Additional Methods Related to Material Characterization**

To ensure the quality and efficacy of transdermal patches, various characterization techniques are performed on the selected materials.

Fourier Transform Infrared Spectroscopy (FTIR) - Drug-Excipient Compatibility

- Confirms the absence of drug-polymer interactions that might affect stability.
- **Procedure**
 - FTIR spectra of Aliskiren Hemifumarate, polymers, and final formulation are recorded.
 - The presence of characteristic functional groups (C=O, NH, OH peaks) in the drug-polymer blend confirms no chemical interaction.

Differential Scanning Calorimetry (DSC) - Thermal Analysis

- Determines the thermal stability of Aliskiren and polymers.
- **Procedure**
 - DSC thermo grams are recorded for pure drug, polymers, and the final patch.
 - The absence of drug melting peaks in the patch confirms proper drug dispersion.

Scanning Electron Microscopy (SEM) - Surface Morphology

- Examines the patch surface for uniformity, drug distribution, and porosity.
- **Procedure**
 - The patch surface is coated with gold and analysed under SEM.
 - A smooth surface with minimal drug crystallization indicates proper formulation.

Formulation of Transdermal Patches**Preparation of Transdermal Patches Using Solvent Casting Technique**

Patches were prepared using the solvent casting technique, which involves the following steps:

1. **Polymers were dissolved in suitable solvent systems:** The selection of polymers is crucial for the formulation, as they determine the mechanical properties, drug release profile, and adhesive characteristics of the patch. Polymers such as Hydroxypropyl Methylcellulose (HPMC), Ethyl Cellulose (EC), and Eudragit RS100 were dissolved in a suitable solvent system, typically a combination of ethanol, chloroform, or dichloromethane. The polymer solution was stirred continuously to ensure complete dissolution and homogeneity.
2. **Aliskiren Hemifuma rate was added with continuous stirring:** Once the polymer solution was prepared, the drug Aliskiren Hemifumarate was incorporated into the mixture with continuous stirring. This step ensures uniform dispersion of the drug throughout the polymer matrix, which is essential for consistent drug release. Magnetic stirring or mechanical agitation was used for effective drug incorporation.
3. **Plasticizers and penetration enhancers were incorporated:** To improve the flexibility and mechanical strength of the patches, plasticizers such as Propylene Glycol and Dibutyl Phthalate were added. These agents prevent the patches from becoming brittle and enhance their elasticity. Additionally, penetration enhancers like Oleic Acid and Dimethyl Sulfoxide (DMSO) were incorporated to improve the permeation of Aliskiren Hemifumarate through the skin. These enhancers work by temporarily disrupting the stratum corneum, allowing for better drug absorption.
4. **The solution was poured into a glass mold and dried at room temperature:** The prepared homogeneous mixture was carefully poured into a glass mold or petri dish lined with a non-stick surface. The thickness of the solution was maintained uniformly to ensure consistent patch dimensions. The solvent was then allowed to evaporate at room temperature or under controlled conditions (e.g., 40°C in a hot air oven) to form a thin, dry polymeric film. Slow solvent evaporation helps in the formation of smooth and defect-free patches.
5. **The dried patches were cut into uniform sizes for further evaluation:** Once the film was completely dried, it was carefully removed from the mold and cut into uniform patches of specified dimensions (e.g., 2 cm × 2 cm).

**Roshini et al.,**

The patches were then subjected to various evaluations, including thickness uniformity, folding endurance, surface pH, drug content analysis, and in-vitro drug release studies, to assess their suitability for transdermal drug delivery [7].

EVALUATION OF TRANSDERMAL PATCHES

Physicochemical Characterization of Transdermal Patches

To ensure the effectiveness and stability of the developed transdermal patches, various physicochemical characterization tests were conducted:

1. **Thickness Measurement:** The thickness of each patch was measured using a micrometer screw gauge to ensure uniformity. Consistent thickness is crucial for maintaining drug content uniformity and ensuring reproducibility in drug release rates [8].
2. **Weight Uniformity:** The weight of individual patches was recorded using a digital analytical balance. Variations in weight could indicate inconsistencies in polymer distribution or solvent evaporation during the formulation process. Weight uniformity ensures dose accuracy and reproducibility in transdermal drug delivery [9].
3. **Folding Endurance:** The flexibility and mechanical strength of the patches were assessed by repeatedly folding each patch at the same point until it broke. A higher number of folds before breakage indicates better flexibility and resistance to mechanical stress, which is essential for maintaining patch integrity during application [10].
4. **Surface pH:** To evaluate skin compatibility, the surface pH of the patches was measured using a digital pH meter. Patches with pH values close to the natural skin pH (4.5–6.5) minimize the risk of skin irritation and allergic reactions. This test ensures that the patches are safe for prolonged use [11].

Drug Content Uniformity

The uniform distribution of Aliskiren Hemifumarate in transdermal patches is a crucial parameter to ensure consistent drug delivery. Each patch was individually dissolved in a phosphate buffer solution (pH 7.4) and sonicated to ensure complete drug extraction. The drug content was then analysed using UV-visible spectroscopy at a wavelength of 291 nm. This method allows for accurate quantification of the drug and ensures that each patch contains the intended amount of Aliskiren Hemifumarate. A standard calibration curve was used to determine the drug concentration, and the results were expressed as a percentage of the labeled claim. Drug content uniformity ensures batch-to-batch consistency and therapeutic efficacy [12].

In-Vitro Drug Release Studies

To evaluate the drug release profile of Aliskiren Hemifumarate from transdermal patches, in-vitro drug release studies were conducted using the Franz diffusion cell apparatus. This technique is widely used to simulate drug permeation across the skin barrier under controlled laboratory conditions.

1. **Experimental Setup:** The Franz diffusion cell consists of two compartments:
 - o **Donor Compartment:** Contains the transdermal patch affixed to a membrane, typically a synthetic polymer or excised animal skin.
 - o **Receptor Compartment:** Filled with phosphate buffer (pH 7.4) to mimic physiological conditions, ensuring drug solubility and stability.
2. **Procedure**
 - o The transdermal patch was placed on a dialysis membrane or excised rat skin, ensuring uniform contact.
 - o The receptor compartment was continuously stirred at $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ using a magnetic stirrer to maintain uniform drug distribution.
 - o At predetermined time intervals (e.g., 0, 1, 2, 4, 8, 12, 24 hours), aliquots were withdrawn from the receptor medium and replaced with fresh buffer to maintain sink conditions.
 - o The collected samples were analysed spectrophotometrically at 291 nm using a UV-visible spectrophotometer to determine drug concentration [13].
3. **Additional Methods for Drug Release Assessment:**

**Roshini et al.,**

- o **High-Performance Liquid Chromatography (HPLC):** Used for precise quantification of Aliskiren Hemifumarate in receptor media.
- o **Mathematical Modeling:** Drug release data were fitted into kinetic models such as zero-order, first-order, Higuchi, and Korsmeyer-Peppas models to determine the release mechanism.
- o **Membrane Permeability Studies:** Evaluated using excised human/rat skin to assess drug permeation efficiency and skin retention.

Ex-Vivo Permeation Studies

To evaluate the permeability and absorption characteristics of the developed transdermal patches, ex-vivo permeation studies were conducted using excised rat skin. The study involved the following steps:

1. **Skin Preparation:** Freshly excised rat skin was carefully cleaned to remove adhering fat and subcutaneous tissues. The skin was then hydrated in phosphate-buffered saline (PBS) (pH 7.4) for one hour before use to mimic physiological conditions.
2. **Diffusion Cell Setup:** The skin was mounted onto a Franz diffusion cell, with the epidermal side facing the donor compartment containing the transdermal patch and the receptor compartment filled with PBS (pH 7.4) to simulate systemic circulation.
3. **Permeation Study:** The receptor medium was maintained at 37°C and continuously stirred to ensure uniform drug distribution. At predetermined time intervals (0, 1, 2, 4, 6, 8, 12, and 24 hours), aliquots of the receptor medium were withdrawn and replaced with fresh buffer.
4. **Drug Quantification:** The collected samples were analysed using UV-visible spectroscopy at 291 nm to determine the cumulative amount of drug permeated. The results were plotted as cumulative drug permeation ($\mu\text{g}/\text{cm}^2$) versus time to assess the drug release kinetics [14].
5. **Permeability Parameters:** The permeability coefficient (K_p), flux (J_{ss}), and lag time (T_{lag}) were calculated to quantify drug diffusion across the skin.
6. **Histopathological Examination:** Post-permeation, the excised skin samples were subjected to histological analysis to examine any structural changes caused by the penetration enhancers or drug formulation.

Stability Studies

To ensure the long-term viability of the transdermal patches, stability studies were performed under different temperature and humidity conditions. These studies help determine how environmental factors affect drug content, physical integrity, and release profiles over time [15].

1. **Storage Conditions:** Patches were stored under three different conditions:
 - o Room temperature (25°C, 60% RH)
 - o Accelerated conditions (40°C, 75% RH)
 - o Refrigerated conditions (4°C)
2. **Drug Content Analysis:** Drug content was measured at regular intervals (0, 1, 2, and 3 months) using UV-visible spectroscopy at 291 nm. This ensured that the patches retained their active pharmaceutical ingredient within the acceptable range over time.
3. **Physical Integrity:** The patches were periodically evaluated for changes in appearance, flexibility, color, and texture. Any signs of crystallization, brittleness, or degradation were noted.
4. **Moisture Content and Moisture Uptake:**
 - o Moisture content was determined using a digital moisture analyzer to ensure that the patches did not dry out excessively or absorb too much moisture, which could affect drug stability.
 - o Moisture uptake was assessed by exposing the patches to high humidity conditions and recording weight changes.
5. **In-vitro Drug Release Profiles:** Drug release studies were conducted using a Franz diffusion cell, and the release profiles were compared at different time intervals. Any significant deviation in drug release behavior indicated instability in the formulation.
6. **Fourier Transform Infrared Spectroscopy (FTIR) Analysis:** FTIR spectroscopy was performed before and after the stability studies to detect any chemical interactions or degradation of the drug and polymer matrix.

RESULTS AND DISCUSSION

Physicochemical Properties

The formulated patches exhibited uniform thickness ranging from 0.2 to 0.5 mm, ensuring consistency across batches. Weight variation was found to be within acceptable limits (<5%), indicating proper polymer distribution. Folding endurance was evaluated by repeatedly folding the patches at a fixed point until breakage, with all formulations demonstrating endurance above 200 folds, confirming good mechanical strength [16]. The surface pH of the patches was measured using a digital pH meter and was found to be within the physiological skin pH range of 5.5-6.5, ensuring non-irritability and compatibility with the skin [17].

Drug Content and Release Profile

Drug content uniformity analysis indicated that all formulations contained 95-99% of the labeled amount, ensuring precise dosing. In-vitro drug release studies were conducted using a Franz diffusion cell, revealing sustained drug release over a 24-hour period. Formulations containing Eudragit RS100 exhibited the most controlled release, attributed to the polymer's hydrophobic nature, which retards drug diffusion [18]. Additional studies, such as release kinetics modeling (Zero-order, First-order, Higuchi, and Korsmeyer-Peppas models), were performed to determine the mechanism of drug release, with most formulations following a diffusion-controlled release pattern.

Permeation Enhancement

Permeation studies using excised rat skin indicated that the inclusion of penetration enhancers significantly improved drug permeability. Oleic acid, in particular, increased drug flux by approximately 40% compared to control formulations, likely due to its ability to disrupt stratum corneum lipid structure and facilitate transdermal transport [19]. Other enhancers, such as isopropyl myristate and ethanol, were also evaluated, with varying degrees of enhancement.

Stability Studies

Stability studies were performed under different storage conditions (25°C/60% RH and 40°C/75% RH) for three months. Minor changes in drug content were observed at higher temperatures; however, all formulations remained within the acceptable range ($\pm 5\%$), confirming the stability of the patches over time. The physical properties, including appearance, flexibility, and adhesion, were also maintained throughout the study period [20].

CONCLUSION

This study successfully formulated transdermal patches of Aliskiren Hemifumarate with sustained drug release. Among the various formulations tested, Eudragit RS100-based patches demonstrated optimal performance in terms of drug release kinetics, permeability enhancement, and stability. The incorporation of penetration enhancers such as oleic acid significantly improved transdermal flux, facilitating better drug absorption and bioavailability. These findings suggest that transdermal delivery of Aliskiren could be an effective alternative for managing hypertension, improving patient compliance, and reducing systemic side effects. The results support the feasibility of using transdermal patches as a non-invasive drug delivery system that offers consistent plasma drug levels with reduced dosing frequency. However, further in-vivo studies are recommended to validate the pharmacokinetic and pharmacodynamic profiles in clinical settings. Long-term studies assessing patient adherence, safety, and efficacy will be crucial for the successful translation of this approach into clinical practice. The optimization of formulation parameters, including polymer selection and enhancer concentration, could further enhance therapeutic outcomes and pave the way for commercial development of transdermal Aliskiren patches.

Table 1. Film-Forming Agents

Polymer	Function	Characteristics
Hydroxypropyl Methylcellulose (HPMC)	Controls drug diffusion and swelling	Hydrophilic, biodegradable, enhances drug dispersion
Ethyl Cellulose (EC)	Modifies drug release rate	Hydrophobic, provides sustained release
Eudragit RS100	Ensures controlled drug release	Non-biodegradable, enhances patch flexibility

Table 2. Plasticizers

Plasticizer	Function
Propylene Glycol	Increases elasticity and enhances drug solubility
Dibutyl Phthalate	Improves patch flexibility and durability

Table 3. Penetration Enhancers

Penetration Enhancer	Mechanism of Action
Oleic Acid	Disrupts lipid bilayers of the skin, increasing drug diffusion
Dimethyl Sulfoxide (DMSO)	Enhances solubility and increases dermal absorption

Table 4. Solvents

Solvent	Function
Methanol	Dissolves the drug and hydrophilic polymers
Chloroform	Dissolves hydrophobic polymers (EC, Eudragit RS100)
Phosphate Buffer (pH 7.4)	Simulates physiological pH for drug release studies

ABSTRACT

This study aims to investigate the relationship between women's empowerment and demographic and socioeconomic characteristics. The multiple regression econometric model has been used to analyze women's empowerment in connection to demographic and socioeconomic aspects. To construct a composite index of women's empowerment, four important indices of women's empowerment have been taken into account. The methodology chapter talks about how the chosen indicators of women's empowerment were given weights using principal component analysis. Principal component analysis has been used to determine weights for the selected indicators. The multiple regression analysis's findings demonstrated that the aforementioned demographic and socioeconomic characteristics positively impacted women's empowerment. Principal component analysis has been used to determine weights for the selected indicators. The multiple regression analysis's findings demonstrated that the aforementioned demographic and socioeconomic characteristics positively impacted women's empowerment. It suggests that if women are given financial advantages or are allowed to contribute financially, they will face less barriers to their empowerment. By analyzing the impact of socioeconomic and demographic factors on women's empowerment, this study offers significant new insights into the intricate nature of gender dynamics in the Andaman and Nicobar Islands. Education is a major factor in women's empowerment since it enables them to actively participate in decision-making and challenge conventional wisdom.

INTRODUCTION

Mahatma Gandhi believed that empowering poor women would not be feasible until we shared our intellectual, financial, and material resources with them and were prepared to make sacrifices. Gandhi has worked more than anybody else to liberate and uplift weak and uneducated women. By taking this path, he came across a select group of talented women who worked alongside him constantly. Everyone Midas touched was changed into a lively and dynamic champion of freedom and liberty, much like his touch. Similarly, in order to support women's rights and empowerment, people must change the way they think and live. In order to experience and comprehend that they are the architects of peaceful nations and civilizations, women must also be conscious and vigilant at all times (Patel, 2020). Therefore, it goes without saying that when we talk about women's empowerment in India, we mean that women need to be aware of their rights, which include the freedom to vote, the ability to own property, the right to determine their own fate, and many more. To put it another way, empowering women means assisting them in realizing their own worth and influencing society to ensure that they have the same rights and respect as everyone else. Women's empowerment is essential to the growth and progress of the community, society, and country. It is estimated that approximately 50% of women worldwide meet this criteria. Nonetheless, if we focus only on the Indian population; we discover a disproportionate sex ratio, which indicates that there are comparatively fewer women than men. In India, gender bias makes women's empowerment the least important social priority, in contrast to the rest of the world, where it is highly regarded. It is believed that issues with population, health, and literacy will not be overcome unless gender bias is addressed. This is due to the fact that women will be unable to actively contribute to the development of a community and society in which the needs and rights of all individuals are respected. If we pay closer attention to how women's empowerment in India spread from antiquity to the present. Over the years, Indian culture has had many highs and lows in terms of women's empowerment (Baydahi Roy, 2022).

REVIEW OF LITERATURE

Sowjanya S Shetty and V . B Hans (2015), The study aims to investigate the relationship between education and women's empowerment, as well as the challenges and advancements that result from this process. Numerous books, periodicals, journals, and other published and unpublished materials provided secondary data for the study. Qualitative assertions were made by the study's authors. Women's empowerment requires education, but the level of education in the family also has a big impact on how empowered girls and women are. The majority of guardians in rural areas are illiterate; therefore they are reluctant to send their female children to school. **Rouf Ahmad Bhaat (2015)**, to understand how education contributes to Indian women's independence. To understand how education contributes to women's empowerment in India, the author carried out a qualitative analysis. Over time, the gender gap in reading levels is being reduced in part because women are more likely to take part in literacy activities. Even more remarkable is the fact that the gap between the enrollment of boys and girls in literate and non-literate homes is significantly lower. India has made significant progress toward gender equality for both boys and girls in primary schooling. However, a number of factors, including as early and forced marriage, bad family circumstances, and familial restraints, cause girls to enroll in secondary and higher secondary education at a lesser rate than boys.

Abdul Hamid Kumar (2022), the purpose of the study is to ascertain how women's position and standing in society, as well as their capacity for decision-making both within and beyond the house, are impacted by their level of education. The inquiry makes use of both primary and secondary data. Secondary data for the study came from online sources, books, journals, and papers. Using a simple random sampling method, the sample was drawn from the Shopian district of Jammu & Kashmir. For the study, a self-designed questionnaire with three components has been created. Three components make up the questionnaire: part A includes demographic data, part B includes closed-ended questions, and part C consists of statements that use a five-point Likert scale to indicate whether respondents agree or disagree. Working outside the home is the primary means by which women are empowered, and "economic empowerment empowers women to make their own decisions." Higher education levels help women become more equal and empowered because they enable them to make better decisions, engage in society more

**Pronoy Mazumder and Ravi**

actively, and access more economic opportunities and income levels. **Rita Karki and Naba Raj Thapa (2021)**, finding out how Nepalese family women, whether or not they live in poverty, are empowered to make decisions for their households is the aim of the study. The data used in this research comes from the 2016 Nepal Demographic and Health Survey (NDHS) databases. The study's dependent variable, women's empowerment, is based on how frequently they engage in three types of domestic decision-making: (i) caring for their own health, (ii) making large household purchases, and (iii) visiting family or relatives. The data was analyzed using STATA version 15.1. This study included both bivariate and multivariate analysis. A chi-square test was first used to examine the association between the dependent and independent variables. The results indicated that 70% of women in poverty families and 74% of women in non-poor households had decision-making authority in their homes. Furthermore, it is shown that women between the ages of 25–34 and 35–49, as opposed to 15–24, who come from both poor and non-poor families, are more empowered. Similarly, women who did not have children were often less influential than those who did.

Babbar, J. (2022), the study's objective is to ascertain ways to raise women's socioeconomic status and protect them from social and domestic violence. Researchers have opted to adopt the qualitative research approach because it clarifies participant viewpoints. When she is struggling, a resilient woman will share the kinds of difficulties she faces. And how does she envision leading a successful life? Feminist theory and the inductive method are closely tied to the problem since it concerns women. According to the study's findings, women in rural regions do not have appropriate educational attainment. Most females do not acquire an education because of societal and familial restraints.

Objectives of the study

To analyse the impact of socio-economic and demographic determinants on women empowerment in the study area.

Profile of Andaman and Nicobar Islands:

One notable Union territory inside the independent country of India is the Andaman and Nicobar Islands. located where the Bay of Bengal and the Andaman Sea converge. It is an archipelago that consists of two islands called the Nicobar Islands and the Andaman Islands. The highly regarded capital of this union territory is Port Blair. The Andaman and Nicobar islands are blessed with a wealth of natural beauty because of their magical location near the mysterious sea and their lush, blooming vegetation. The once infamous Kalapani Prison, where many people became martyrs, has experienced a miraculous transformation and is now one of the most unique and fascinating travel destinations in the Indian subcontinent. The Island has a compelling atmosphere that gives travelers and exploration enthusiasts a deep sense of fervor.

Profile of North and Middle District

There are three tehsils in the North and Middle Andaman districts: Diglipur, Mayabunder, and Rangat. Diglipur Tehsil: This tehsil is made up of seven inhabited islands: Narcondam, East, Land Fall, North Andaman, Smith, Curlew, and Stewart Islands. It also has nine uninhabited villages. The northernmost portion of this region is where this tehsil is situated.

METHODOLOGY

In this section methodology adapted to study on impact of socio-economic and demographic determinant on women empowerment in north and middle Andaman district of Andaman and Nicobar Islands. This section of the study includes the research objectives,, sampling procedure, methods of data collection, statistical techniques and limitations and delimitations of the study. The review of literatures in the previous chapter has been intensely beneficial to develop the methodology appropriate to the present study.

**Pronoy Mazumder and Ravi****Selection of the study area**

Andaman and Nicobar Islands has been selected for the study purpose on the basis of it being scholar's native place, so it was researchers first and foremost choice to study the gender equality and empowerment of rural women, and the Union Territory has been divided into 03 districts, namely (1). South Andaman district. (2). North and Middle Andaman district (3). Nicobar district, but for the study purpose, researcher has purposively selected the North and Middle Andaman district based on the high rural women population. The North and Middle Andaman district has three blocks, and researcher has selected all the three blocks namely - (1). Diglipur block (2). Mayabunder block (3). Rangat block. After that, from each block 05 Village has been again purposively selected based on high rural women population.

Sampling size and technique

When a researcher performs research, they must use sample approaches or methodologies. The research population included all rural women from three blocks in the North and Middle Andaman districts. The sample size was estimated using Taro Yamane's formula (1967). The sample size was determined as 396 using the Taro Yamane formula, and it was rounded to 400 to limit the margin of error.

Selection of respondents

After calculating the sample size, a simple random selection procedure was employed to choose respondents from 15 villages across three blocks in the North and Middle Andaman districts. The responders were chosen non-proportionally.

Sampling Design**Data collection procedure**

The study uses both primary and secondary data. Face-to-face interviews with 400 rural homes in the research region were conducted to deliver a standardized questionnaire. The primary data is about respondents' socioeconomic status, the impact of socioeconomic and demographic determinants on women's empowerment, respondents' awareness of women's empowerment, the factors that contribute to gender inequality, and gender equality in household decision making. Secondary data was gathered from the Population Census of India and different government entities. An amalgamated women empowerment index was developed to investigate the influence of socioeconomic and demographic factors on rural women's empowerment in the research region. The four key indicators for the composite index of women's empowerment are as follows: social, economic, political, and psychological. The procedure of allocating weights to the selected indicators is an important step in estimating the composite index. This study used principal component analysis to determine the weights for the specified variables since it is more widely applicable and implemented in previous studies. The multiple regression econometric model was used to assess the influence of socioeconomic and demographic factors on women's empowerment.

Analysis**Estimation of composite index of women empowerment**

In the current study, a composite index of women's empowerment was calculated by taking into consideration four key factors of women's empowerment. The main component analysis, as explained in the methodology chapter, was used to provide weights to the selected women empowerment indicators. The principal component analysis approach was used to calculate weights for the selected indicators. The principal component findings include computed weights for the specified indicators, which are displayed below.

Impact of socio-economic and demographic determinants on women's empowerment

The multiple regression econometric model was used to assess the influence of socioeconomic and demographic factors on women's empowerment. Multiple regression analysis is a statistical approach that examines the connection between a single dependent variable and numerous independent variables. The Multiple Regression approach uses known independent variables to predict the value of a single dependent variable. Each predictor value is weighted, with the weights indicating their proportional importance to total female empowerment.

Pronoy Mazumder and Ravi

Multiple regression runs through this model

$$WE_{it} = \beta_0 + \beta_1 Edu_{it} + \beta_2 Emp_{it} + \beta_3 Age_{it} + \beta_4 EP_{it} + \beta_5 In_{it} + \beta_6 BA_{it} + \beta_7 CA_{it} + \beta_8 LO_{it} + e_i$$

Where, WE is the women empowerment at the time period t, β_0 is the intercept of the regression equation and e_i is the error term which is random in nature and is expected due to uncertain event, while as Edu_{it} represents educational qualification at time period t, Emp_{it} represents employment at time period t, Age_{it} represents age at time period t, EP_{it} represents economic participation at time period t, In_{it} represents income at time period t, Ba_{it} represents bank account at time period t, LO_{it} represents land ownership at time t and CA_{it} represents credit access. Multiple regression analyses were done to determine the influence of the independent factors on the dependent variable. The regression analysis findings for all independent variables show that the majority of them are strongly associated with women's empowerment. Employment, land ownership, and possessing a bank account were determined to be the most significant, with a significance level less than 0.01. Other factors, such as income, age, credit access, education, and economic engagement, are also found to be significant, albeit at the 0.05 level. The model's R-squared is 69%, indicating that it is significant.

FINDINGS AND DISCUSSION

The multiple regression analysis demonstrated that the above-mentioned socioeconomic and demographic characteristics had a beneficial influence on women's empowerment. Economic engagement is critical to women's empowerment. It suggests that if women are given monetary rewards or are permitted to participate monetarily, they will face less impediments to their empowerment. However, economic involvement indicates an adverse impact (- 0.025) but significant at the 5% significance level because of higher pressure on financial engagement of women; finally, this diminishes the power of women in society. Similarly, the variable bank account has a coefficient of 0.548 and is extremely significant, i.e., 0.000; if a woman has a bank account with a large balance, she will be economically powerful - she will feel strong and empowered. A woman who wants to save more but does not engage in economic activities is really important, and she will feel confident and secure. This connection has a tremendous positive influence on women's empowerment. Another independent variable 'Education has a significant positive influence on women's empowerment, and while education is both required and crucial for development, it is especially important for females to comprehend their place in society. The coefficient value of schooling is 0.074, which is significant at the 5% level. Educated women subtly affect their judgments while simultaneously introducing novel decision-making concepts. Education may instill sentiments of self-worth and confidence. Access to education can cause changes in cognitive ability, which is vital for women's capacity to question, reflect on, and act on the situations of their existence. Education appears to improve women's ability to cope with the outside world. So, knowledge has a very good part in empowering women. Women's education levels have improved, as has their empowerment position. Similarly, women who work for money, i.e., those who are employed, are more likely to engage in different types of decision making and appear to have more influence than those who are jobless. Employment has a beneficial influence on women's empowerment, as evidenced by the beta value (0.125) and the related high significance value (1 percentage point). Women can negotiate a higher level of respect in homes when their economic contribution is important to the household's survival. The findings suggest that age, with a coefficient of 0.699 and a significance level of one percent, has a very favorable and very significant influence on women's empowerment. Women's age has a favorable effect since younger women are less inclined to engage in decision making than older women. A newly married daughter-in-law has less decision-making authority in the family and is expected to conduct household chores under the supervision of her mother-in-law, who makes the key decisions. The issue of security and fulfillment of desire becomes less important as women age, lose touch with their biological relatives, and become more self-sufficient in decision-making. So, age is also one of the most important variables which influences the empowerment of women. Access to credit has a favorable influence (0.147) on women's empowerment, which is

Pronoy Mazumder and Ravi

significant at the 1% level. Women with access to finance are more powerful than those without it. A woman with easy access to financing may start her own business, earn a living, and feel more empowered. As a result, the study's findings demonstrated that access to credit promotes women's empowerment. The multiple regression analysis findings also reveal that income has a significant impact on women's empowerment, as evidenced by the significance and beta values. Income boosts women's economic opportunities, allowing them to exercise more control in decision-making at home and in society, so increasing their empowerment. The related coefficient and significance value for income are 0.212 and 0.43, respectively. Finally, ownership of land is extremely significant at the 1% level, with a beta value of 0.346, indicating that women who own property or who inherited it from their parents are more empowered than those who do not own land. Women who own land may make judgments about what crops to cultivate, how to spend their agricultural revenue, and so on. In a summary, we may conclude that all of the socioeconomic and demographic factors included in the multiple regression model have a positive and substantial impact on women's empowerment, with the exception of economic involvement, which has a negative effect. All factors are significant at the 0.01 and 0.05 levels.

CONCLUSION

The study on the impact of socio-economic and demographic determinants on women's empowerment in the Andaman and Nicobar Islands unveils crucial insights into the multifaceted nature of gender dynamics in this unique region. Education emerges as a fundamental catalyst for women's empowerment, enabling them to challenge traditional roles and participate actively in decision-making processes. Economic empowerment, facilitated through access to livelihood opportunities and financial resources, is identified as pivotal in fostering women's agency and autonomy. Moreover, demographic factors such as age, marital status, and household structure significantly influence women's empowerment trajectories, necessitating tailored interventions to address diverse needs. The study underscores the importance of tackling socio-cultural norms and attitudes perpetuating gender inequality, advocating for community-based initiatives and awareness campaigns. In conclusion, by addressing these determinants, policymakers and stakeholders can pave the way for a more equitable society where women in the Andaman and Nicobar Islands can realize their full potential and contribute meaningfully to socio-economic development.

ABSTRACT

In 1958, Albert first introduced the concept of prodrugs, which have also been termed "congeners," "bioreversible derivatives," and "latent drugs." The ideal scenario for a prodrug is that once it reaches its target site, it rapidly converts back into the active medication, followed by the swift clearance of the derivatizing group without causing any adverse effects. This review focuses on the key characteristics of various prodrug-based nanoparticles, the challenges they present, and the latest advancements in their clinical application. Targeting cancer cells with these drug formulations is a particularly effective strategy to reduce side effects while enhancing therapeutic efficacy. Prodrugs, or

**Gaurav Sarsodia et al.,**

enzymatic bio-precursors, undergo chemical transformations that significantly boost their therapeutic impact.

Keywords: Bioreversible, Tumor hypoxia, Prodrugs

INTRODUCTION

Conventional cancer treatments are generally categorized into two types: systemic therapies, such as hormone therapy, targeted therapy, and chemotherapy, and local therapies, which include ionizing radiation therapy and surgery. However, these existing treatments come with significant limitations, such as a narrow therapeutic window, toxicity, poor tumor-targeting capabilities, and drug resistance. While systemic therapies, like chemotherapy, offer the benefit of treating both distant metastases and primary tumors, they often cause unintended side effects by affecting healthy tissues and organs [1]. Despite advancements in anticancer drugs, many systemic and nonsurgical treatments still face considerable challenges in achieving clinical success. The limited therapeutic outcomes can be attributed to the drugs' unfavorable pharmacokinetic properties and the obstacles in delivering them effectively to tumors. To address these challenges, innovative cancer treatments are continuously being developed [2]. One such promising approach is Enzyme Prodrug Therapy (EPT), which involves the combination of specific enzymes with corresponding prodrugs to enhance cancer treatment. This review will assess the safety and effectiveness of various approaches, including modern nanoprodrug systems and combination therapies. Additionally, it will explore the key features, challenges, and recent advancements in the clinical application of prodrug-based nanoparticles.

PRODRUGS IN CANCER THERAPY

To fully realize the potential of the prodrug approach in cancer therapy, it is crucial to focus on recent noteworthy applications of this technique. For effective tumor-specific targeting, the prodrug must either be selectively absorbed by the target organ or rely on the presence of an enzyme required for its activation within the target site. Ideally, the enzyme responsible for prodrug activation should be exclusively present or over expressed in tumor cells. Another promising strategy for tumor-specific targeting is leveraging the hypoxic environment characteristic of solid tumors, which can be effectively treated using bio-reductive prodrugs. However, the development and discovery of drugs often encounter several challenges, such as low solubility or membrane permeability, leading to poor oral bioavailability, pH-dependent absorption, and high pill burden. Other issues include difficulties in formulation, an inability to create specific dosage forms, prolonged metabolic clearance, short half-lives necessitating frequent dosing, inadequate drug exposure at the target site, and toxicity due to off-target effects or insufficient selective delivery. Each of these challenges is commonly encountered during drug development and is explored through examples in the form of vignettes. These vignettes are structured as follows to summarize the research findings:

- (a) A problem statement that outlines the challenge associated with a specific molecule or chemotype.
- (b) The prodrug design principle employed to address the issue.
- (c) Key in vitro and in vivo profiling data that supported the development process.
- (d) The design of the prodrug as a solution to the problem, with the corresponding vignette placed in the appropriate section based on the issue being addressed [3,4,5,6].

Prodrugs are typically categorized into two main types [7].

- a. Carrier-linked prodrugs, which involve a linker that can be chemically or enzymatically cleaved to release the parent drug.
- b. Bioprecursor prodrugs, which are metabolized into new active metabolites after administration [8].

Tumor Microenvironment-Activated Prodrugs

Most intracellular prodrug release strategies rely on activation by the distinct conditions present within the tumor microenvironment. Due to the high glycolytic activity of cancer cells, their microenvironment is typically more acidic

**Gaurav Sarsodia et al.,**

compared to normal tissues. This acidity, coupled with low oxygen levels (tumor hypoxia), has been exploited for targeted cancer therapies. Among the most common approaches are pH-sensitive nanosystems, which are designed to create tumor-specific microenvironments.

pH-Sensitive Delivery Methods for Prodrugs

Cancer cells often undergo extensive glycolysis, even in the presence of oxygen, resulting in an environment that is more acidic than normal tissues. This glycolytic process is especially triggered in hypoxic conditions, leading to the production of lactic and carbonic acids, which lower the pH to a range of 4.0–6.5, compared to the typical pH of 7.2–7.4 found in blood or extracellular spaces. The low oxygen concentration, or tumor hypoxia, has become a critical target for anticancer treatments, with pH-sensitive nanosystems being the most widely used method to exploit these tumor-specific microenvironments [9,10].

High Reactive Oxygen Species (ROS)-Activated Prodrugs

Reactive oxygen species (ROS) are a class of molecules characterized by unpaired electrons, which make them highly reactive with various biological targets, including hydrogen peroxide (H₂O₂), hydroxyl radicals (HO•), and superoxide anion (O₂•⁻) [11,12]. Studies have shown that cancer cells produce higher levels of ROS compared to normal cells. This increased ROS production can lead to DNA modifications, promote cancer cell growth, induce apoptosis, drive angiogenesis, contribute to metastasis, and alter the cellular response to anticancer medications. As a result, ROS-activated prodrugs are being developed to take advantage of these elevated ROS levels in cancer cells [13].

High Levels of Expressed Enzymes or Glutathione (GSH) Concentration

Glutathione (γ-L-glutamyl-L-cysteinylglycine-GSH) is an endogenous tripeptide that plays a key role in protecting the intracellular redox balance from oxidative stress caused by endogenous harmful substances and xenobiotics [14]. The thiol groups within GSH, known for their strong nucleophilicity, provide defense against electrophiles and free radicals [15]. In actively proliferating malignant cancer cells, intracellular GSH levels can be significantly higher than in normal cells [16]. This elevated GSH concentration is exploited in the design of prodrugs that are specifically activated within cancer cells. Additionally, nanoparticles capable of triggering multiple reactions have been investigated for their potential in targeted cancer therapy. For example, one promising approach involves the target-specific delivery of a combination of doxorubicin and camptothecin through nanoparticles that are sensitive to both pH and glutathione levels.¹⁷ This dual-sensitivity enables precise drug release within the tumor microenvironment, maximizing therapeutic efficacy while minimizing off-target effects.

Prodrug Enzymatic Activation

One very effective strategy to minimize side effects and increase therapeutic efficacy in cancer therapy is the use of bioprecursor prodrugs. These prodrugs undergo enzymatic chemical changes that significantly enhance their therapeutic impact upon activation [18,19]. Several key enzymes are involved in this process

- **Phosphoesterases**
- **Matrix Metalloproteinases**
- **Cathepsin B Enzyme**
- **β-Glucuronidases**

Nonmammalian Enzymes in Prodrug Bioconversion

A promising approach within Enzyme Prodrug Therapy (EPT) involves the use of nonmammalian enzymes for prodrug bioconversion, especially those with low abundance in the human body. Utilizing these enzymes can achieve more targeted and efficient activation of prodrugs, reducing off-target effects. Some important nonmammalian enzymes used in this context include:

- **Cytosine Deaminase**
- **Viral Thymidine Kinase**
- **Nitroreductase**

**Gaurav Sarsodia et al.,**

These enzymes are pivotal in enhancing the selectivity and efficacy of prodrug therapies in cancer treatment, offering innovative pathways for improving therapeutic outcomes.

Prodrug / Enzyme Delivery Techniques**Postoperative Chemotherapy with Encapsulated Enzymes**

Early applications of enzyme/prodrug delivery involved postoperative chemotherapy using surgically implanted encapsulated enzymes at the site of the removed tumor.²⁰ This method was designed to provide localized treatment and reduce systemic toxicity.

Antibody-Directed Conjugates (ADC)

The first strategy, antibody-directed conjugates (ADCs), uses a biodegradable linker and a monoclonal antibody (mAb) to deliver a highly potent cytotoxic medication. This approach targets specific tumor antigens to enhance the precision of the therapeutic effect.

Antibody-Directed Enzyme Prodrug Therapy (ADEPT)

Antibody-directed enzyme prodrug therapy (ADEPT) involves administering an enzyme attached to a monoclonal antibody (mAb) that targets specific tumor epitopes. This method ensures that the enzyme is delivered directly to the tumor site, where it activates the prodrug into its cytotoxic form.

Gene-Directed Enzyme Prodrug Therapy (GDEPT)

Gene-directed enzyme prodrug therapy (GDEPT) entails the introduction of a therapeutic enzyme with genetic encoding into the tumor environment. This strategy aims to enhance the selective activation of prodrugs within the tumor by providing a continuous source of the activating enzyme.

Viral-Directed Enzyme Prodrug Treatment (VDEPT)

Viral-directed enzyme prodrug treatment (VDEPT) involves inserting the gene encoding the activating enzyme into cells via a virus. Oncolytic viruses, which selectively infect and destroy tumor cells, can be used to deliver the enzyme, enhancing the therapeutic potential of VDEPT.

Lectin-Directed Enzyme-Activated Prodrug Therapy (LEAPT)

Lectin-directed enzyme-activated prodrug therapy (LEAPT) targets the surface of cells, specifically binding to carbohydrate structures. This method aims for precise delivery of the prodrug to the target cells by exploiting carbohydrate-specific interactions.

Polymer-Directed Enzyme Prodrug Therapy (PDEPT)

Polymer-directed enzyme prodrug therapy (PDEPT) uses polymers such as pHPMA to enclose drugs within a polymer "shell." This approach aims to improve the stability and delivery of the prodrug while providing controlled release in the tumor microenvironment.

Clostridium-Directed Enzyme Prodrug Therapy

Clostridium-directed enzyme prodrug therapy employs *Clostridium* sp. modified bacterial spores carrying genes for prodrug-activating enzymes. These spores target the hypoxic microenvironment typical of solid tumors, providing localized activation of the prodrug within the tumor.

Nanotechnological Prodrug Uses**Responsive Prodrug-Based Nanomedicines**

Prodrug-based nanomedicines are designed to respond intelligently to specific stimuli, releasing their therapeutic agents in a controlled manner. These nanomedicines are engineered to react to various external and internal stimuli, enhancing their effectiveness and targeting capabilities. The key stimuli include:

**External Stimuli**

- **Light:** Nanomedicines can be engineered to release their prodrugs upon exposure to specific wavelengths of light, allowing for precise control over drug activation.
- **Thermo:** Temperature-sensitive nanomedicines release prodrugs when exposed to elevated temperatures, which can be targeted to the localized heat generated by tumors.
- **Ultrasound:** Ultrasound-responsive nanomedicines release prodrugs in response to ultrasonic waves, enabling targeted therapy through deep tissue penetration.
- **Magnetic Fields:** Magnetic field-responsive nanomedicines release their contents when subjected to external magnetic fields, which can be precisely directed to target areas.

Internal Stimuli

- **pH:** Many tumors have a more acidic environment compared to normal tissues. pH-sensitive nanomedicines release prodrugs in response to the lower pH levels typical of the tumor microenvironment.
- **Enzymes:** Nanomedicines can be designed to release prodrugs in the presence of specific enzymes that are overexpressed in the tumor tissue.
- **Redox Environment:** Nanomedicines may respond to the redox environment within the tumor, which often has altered oxidative stress levels compared to normal tissues.
- **Hypoxia:** Tumors often have low oxygen levels. Nanomedicines that respond to hypoxic conditions can release prodrugs specifically in these low-oxygen environments, targeting solid tumors more effectively [21,22]. These advanced nanotechnological approaches offer a promising avenue for enhancing the precision and efficacy of prodrug-based therapies, ultimately improving cancer treatment outcomes.

Combination Treatment for Cancer

Combination therapy is a strategic approach to enhance treatment efficacy by administering two or more therapeutic agents or integrating different therapeutic modalities. This approach aims to overcome the limitations of monotherapy and provide a more comprehensive treatment for cancer. The synergy between various treatments can lead to improved therapeutic outcomes and reduced resistance [23,24].

Synergistic Approaches**Adjuvant Prodrugs**

Recent advancements have highlighted the potential of drug adjuvant prodrugs, which are designed by covalently attaching therapeutic drugs to biocompatible adjuvant moieties. This method enhances the effectiveness of prodrugs by leveraging the benefits of both the drug and the adjuvant.

Prodrug Conjugates of Polymers

Nanoparticles (NPs) that combine cisplatin prodrugs (CPP) with docetaxel (DTX) have demonstrated significantly improved therapeutic effects. This combination leverages the strengths of both drugs to achieve enhanced anticancer activity [25].

Prodrug-Drug Combinations

Combining doxorubicin with the hypoxia-activated prodrug TH-302 has proven more effective than traditional chemotherapy for treating soft tissue sarcoma.²⁶ This combination utilizes the specific activation of TH-302 in hypoxic tumor regions to boost therapeutic efficacy.

Therapy Combinations**Prodrugs and Chemotherapy**

The integration of prodrugs with conventional chemotherapy agents has shown promising results [27]. The prodrug TH-302, for example, has been found to enhance the effectiveness of several chemotherapeutic agents, including gemcitabine, temozolomide, topotecan, irinotecan, cisplatin, pemetrexed, and docetaxel, in clinical settings [28]. This combination approach leverages the targeted activation of prodrugs to improve overall treatment outcomes.

**Gaurav Sarsodia et al.,**

Combination treatments continue to evolve, offering new opportunities to address the challenges of cancer therapy and improve patient outcomes through innovative strategies.

CONCLUSION

The advancement in anticancer prodrugs, leveraging enzyme-specific functional moieties and linkers, represents a significant leap towards more precise cancer therapy. By enabling a wide range of endogenous and exogenous enzymes to activate different prodrugs, this approach has the potential to improve therapeutic outcomes while minimizing side effects. The critical challenge lies in designing prodrugs that can effectively target tumor cells while limiting toxicity to healthy tissues. This is achieved by incorporating enzyme-cleavable linkers and functional moieties that specifically address the limitations of conventional anticancer medications. A major challenge in the development of enzyme-specific prodrugs is ensuring that the prodrugs are activated exclusively in the presence of the target enzymes, which are often overexpressed or uniquely present in tumor cells. This requires meticulous selection and optimization of target enzymes and their substrates to avoid nonspecific activation, which can lead to unintended side effects. Tailoring prodrug designs to the unique characteristics of the tumor microenvironment, such as its acidity or hypoxic conditions, can enhance specificity and effectiveness. Recent advancements have introduced exogenous gene therapy as a method to further refine prodrug activation. By introducing genes encoding specific prodrug-activating enzymes into tumor cells, researchers have been able to enhance the precision of targeted therapies. Over the past two decades, improvements in viral vector technology have made gene delivery more effective and less immunogenic. Nanotechnological methods are increasingly employed to deliver these genes accurately into tumor cells, optimizing the overall impact of enzyme-activatable prodrugs. Combination therapies, which integrate prodrugs with other treatment modalities, represent a promising approach to overcoming the limitations of monotherapy. Despite the progress made through nanotechnology and nanomedicines, developing effective combination treatments remains complex. This complexity arises from the need to ensure that the combined therapies work synergistically and are compatible with one another. As research continues, addressing these challenges will be crucial for advancing the efficacy and safety of prodrug-based cancer therapies.

ACKNOWLEDGEMENTS

We want to express our sincere gratitude to each and every author for their significant contributions to this work.

ABSTRACT

Old wood, fallen logs, decaying or dead deciduous trees, and downed oak, maple or beech trees are the most common sources of lion's mane. The mushroom is renowned for its abilities to protect and regenerate the nervous system. Humans with Parkinson's and Alzheimer's disease can be treated with *Hericiumerinaceus*. Numerous pharmacological investigations have demonstrated the anti-cancer, antioxidant, anti-diabetic, anti-microbial, anti-viral, anti-inflammatory and neurological activities of the *Hericium* mushroom. The purpose of this paper is to focus the mushroom's pharmacological advantages for human being.

Keywords: NGF- Nerve Growth Factor, Parkinson's and Alzheimer's disease

INTRODUCTION

Mushrooms have been used to treat human illness for thousands of years. Numerous studies in Japan, Korea and China have demonstrated the efficacy of radiation therapy and chemotherapy, both alone and in combination, in curing cancer Rajarathnam *et al.*, 2003[1]. Medicinal mushrooms have been used to treat both acute and chronic conditions for quite some time. Various mushrooms like *Grifolafrondosa*, *Ganodermalucidum*, *Trametesversicolor*,

95918

**Megha Suman *et al.*,**

Lentinula edodes and many more have anti-inflammatory, immune-enhancing effect, brain health and other properties used to cure human beings Miyazaki and Nishijima 1981[2]; Maloy and Powrei, 2011[3] and He *et al.*, 2017 [4]. Along with these, *Hericium erinaceus* is a magical mushroom in the case of Parkinson's, Alzheimer's and so many other diseases reported by Wong *et al.*, 2007 [5]; Mori *et al.*, 2009 [6]. This mushroom is commonly known as Lion's mane, bearded hedgehog, hou-tou, bear head, monkey head pom-pom, in China while in Japan it is known as Yamabushitake, jhogo-take (funnel-like), usake (rabbit-like), and harisenbon-take (porcupine-fish-like) Mizuno, 1995 [7]. On sawdust, lion's mane mushrooms typically grow at a temperature of 25°C and a relative humidity of 80–90% and at 30°C, mycelium growth stops. One of the greatest edible mushrooms, it contains a variety of medicinal and nutraceutical compounds. Additionally, *Hericium* has a high average nutritional profile, according to Atila *et al.*, 2021[8]. Numerous mushrooms have been reported to be a good source of vital amino acids and high-quality protein, ascorbic acid, thiamine, and riboflavin are all good sources of vitamins. Fruit body protein content was observed to be raised by increasing the rice bran ratio in the growing media Bunroj *et al.*, 2017[9].

History

This mushroom was previously solely found in China, but now its popularity has spread to other nations as well. Due to the presence of secondary metabolites in the fruiting body, it has been well recognized for hundreds of years in traditional Chinese and Japanese cookery and herbal medicine to treat a variety of human ailments Mizuno, 1999[10]. Secondary metabolites that accumulate in mushrooms include phenolic chemicals, polyketides, terpenes, and steroids. Mycelium and fruiting bodies both include a variety of biologically active chemicals that have strong positive impacts on a person's health. It has been discovered that its phenolic compounds are effective synergists and antioxidants that are non-mutagenic Ishikawa, 1984[11]. The hericenones, which are contained in the mushroom's fruiting body, have demonstrated potential efficacy in stimulating the synthesis of nerve growth factors (NGFs) Kawagishi, 1991[12]. As a result of NGF stimulation, neurons grow and aid in the treatment of senility, the recovery of neurological damage from strokes, the improvement of muscle/ motor response pathway and cognitive function Wong *et al.*, 2007[5]. In addition, NGF factors have been shown to enhance learning ability and memory Wang *et al.*, 2011[13]. Numerous researches have established the antihyperglycemic properties of mycelium and fruiting bodies from several medicinal mushrooms said by Hikino *et al.*, 1989[14]; Sato *et al.*, 2002[15]; Teng *et al.*, 2012[16]; Badoleet *et al.*, 2006[17]. (Zhang *et al.*, 2012[18]) revealed that *H. erinaceus* has been utilized as long as a natural treatment for epigastric pain brought on by atrophic gastritis, chronic gastritis or even gastric ulcers. It has been long utilized in Chinese and Japanese medical systems to nourish the intestines, strengthen the spleen, and treat cancer reported by Liu *et al.*, 2015[19]. In order to improve their concentration while meditating, Buddhist monks were known to use powdered lion's mane. Liu *et al.*, 2015[19] reported that the five internal organs (liver, lung, spleen, heart, and kidney) are thought to benefit from lion's mane's nutritional value, which also fosters healthy digestion and overall vitality and strength. When prepared in tablet form, it is also advised for chronic gastritis, duodenal ulcers, and gastric ulcers reported by Thongbai *et al.*, 2015[20].

Cultivation and Habitat

A very rare mushroom known as *H. erinaceus* has been listed as an endangered species in several European nations. In 1988, the lion's mane (*Hericium erinaceus*) was first grown on artificial media using polypropylene bottles and bags reported by Suzuki *et al.*, 1997[21]. The lengthy cycle and low yield, however, made it unsuitable for industrialized production. In most parts of the world, sawdust, sugarcane bagasse, cotton seed hulls and chopped paddy straw are utilized as the substrate medium for *H. erinaceus* artificial cultivation. However, autoclaved wheat straw is widely accessible across the nation. Between 20 and 25°C is the ideal temperature for fructification. Due to a variety of polysaccharides, the medicinally significant fungus *H. erinaceus* is used to stop the spread of certain malignancies. Rudraprayag (RPB/US/PU-0952) 16 August 2015, Bageshwar (RPB/US/PU-1019) 31 August 2015, and Dhakuri (RPB/US/PU-1264) 02 August 2016 were all located in the Indian state of Uttarakhand. They were found in rainy temperate mixed woodland on decaying *Quercus* spp. Bhatt *et al.*, 2018[22]. This fungus is typically found in the cracks of dying broadleaf trees, like *Quercus leucotrichophora*. The first recorded sighting of this species in the Himalayas was in the Garhwal region. The bakercheun is a local name for this species because of its resemblance to a goat's beard. Because it is restricted to the bark of oak and rhododendron trees and has a distinctive appearance, locals can identify it simply by looking around. According to reports, Indians drink it on a regular basis. Some examined specimens are (KCS 509), Adwani Peak (Pauri), Uttarakhand, India, August 26, 2002. (KCS 1162) in Himachal Pradesh; Shimla; Jakhu Hills; 2400m on 23 September 2007; Semwal *et al.*, 2014[23].

**Megha Suman et al.,****TAXONOMICAL POSITION**

Classification given by Kirk *et al.*, 2008[36] reported that *Hericium* belongs to the Phylum – Basidiomycota, Sub-Phylum – Agaricomycotina, Class – Agaricomycetes, Sub-class – Holobasidiomycetidae, Order- Hericiales, Family – Hericiaceae, Genus- *Hericium* and Species- *erinaceus*. Whereas, Thongbalet *et al.*, 2015 [37] reported that *Hericium* belongs to the class *Basidiomycetes*, subclass *Holobasidiomycetidae*, order *Hericiales*, and family *Hericiaceae*.

NUTRITIONAL VALUE

According to a study on *Hericium erinaceus* done by Zhanxi and Zhanhua in 1999 [38], a serving of 100 g of lion's mane mushroom provides the following nutrients:

Antioxidant Potential

Antioxidant compounds inhibit the oxidative mechanisms that lead to degenerative diseases or inhibit oxidation that can produce free radicals. Abdullah *et al.*, 2012[50]; Ferreira *et al.*, 2009[51] reported on a study of phenolics from mycelium extracts of *H. erinaceus* in hot water to assess the in vitro antioxidant activity. The effects of antioxidants can have a variety of impacts, which may be caused by external factors such as various components from various extraction conditions having various antioxidant pathways, reported by Jiang *et al.*, 2019[52]. *Hericium erinaceus* can considerably lower lipid peroxidation levels and improve antioxidant enzyme activities in experimental mice, according to Han ZH *et al.*, 2013 [53]. The 21-day sample had a greater IC₅₀, as determined by DPPH and ABTS radical scavenging activity, than the 14-day and 28-day samples. The antioxidant capacity (IC₅₀) of the samples used in this investigation, which was 63.30 mg extract/mL, was lower than the 5x10⁻³ mg extract/mL of the naturally occurring Lion's Mane mushroom reported by Sharpe *et al.*, 2021 [54]

Anti-Cancer Activity

Now-a-days cancer is most emerging disease in human beings. The second most frequent cancer worldwide is gastric cancer. According to recent data from the National Cancer Institute in the USA, gastrointestinal (GI) malignancies such as liver, gastric, and colorectal cancers have increased by roughly 25% reported by Anand *et al.* 2008 [55]; Dicken *et al.*, 2005[82]. Blagodatskiet *et al.*, 2018 [56] reported that *Hericium* extracts (HTJ5 and HTJ5A) show anti-hepatic properties and are effective against stomach, liver, and colon cancers as well as tumoxenografts in mice. According to Mizuno, 1999[10], the polysaccharides derived from this mushroom have significant benefits on skin, stomach, and esophageal cancer. According to Keun, 2003[57], phenols have chemotherapeutic effects on cancer. This mushroom is also beneficial against tumors of the gastro-intestinal tract, including colon and liver cancer Li *et al.*, 2014[58]. Giving out concoctions based on *H. erinaceus* may also be used to treat a variety of cancers, including stomach cancer, esophageal cancer, intestinal cancer, and pancreatic cancer. *H. erinaceus* patients have reported much less side effects than those associated with radiotherapy and chemotherapy for their cancer concluded by Thongbalet *et al.*, 2015[37].

Anti- Diabetic Activity

In vitro antidiabetic properties of *H. erinaceus* were described by Wu and Xu, 2015 [59] who also demonstrated that the inhibition of glycosidase and aldose reductase activity was dose-dependent. Bin Lian *et al.*, 2013[60] conducted an experiment and finds that in STZ-induced diabetic rats, Aqueous extract of *Hericium erinaceus* had an important anti-hyperglycemic and anti-hyperlipidemic impact.

Anti- Inflammatory Activity

Lee *et al.*, 2014[61] conducted an experiment and concluded that Cytokines that generate inflammation and nerve development that inhibits the loss of neurons in the ischemic brain are other examples of *Hericium*-induced anti-inflammatory mechanisms. The HE-ETH (ethanolic) also showed a notable decrease in the amount of nitric oxide (NO) in BV2 that had been exposed to LPS and demonstrated anti-inflammatory activity in the microglia. As a result, in the milieu of the neuroglia, the HE-ETH may have neuroprotective and anti-inflammatory effects Kushairiet *et al.*, 2019[62].

**Megha Suman et al.,****Anti- Microbial Activity**

According to Kim *et al.*, 2019[63], the anti-microbial activity of *H. erinaceus* was extremely efficient at 2.5 mg/mL or above against *Staphylococcus aureus*, *Salmonella enteritidis*, *Vibriopara haemolyticus*, and *Escherichia coli*. Therefore, its extract can be used by pathogenic bacteria as food and a natural antibacterial agent. According to studies by Liu *et al.*, 2016[64]; Wong *et al.*, 2009[65] and Kim *et al.*, 2012[66], *H. erinaceus* has been shown to suppress a variety of bacteria, including *S. aureus*, *H. pylori*, *B. subtilis*, *E. coli*, *E. faecalis*, *P. aeruginosa*, and *S. Typhimurium*. The endophytic fungus *Fusarium fujikuroi* and *Aspergillus tubingensis*, as well as the *Agaricus bisporus* mushroom, have been found to contain bactericidal 2-dodecen-1-yl(-) succinic anhydride Nisaet *et al.*, 2020[67] and Mohamed, 2012[68]. While *Pseudomonas aeruginosa* and *Staphylococcus aureus* have been successfully treated with linoleic acid ethyl ester in *Ganoderma lipsiense* mushrooms grown on red rice Costa *et al.*, 2020[69].

Anti-Viral Activity

Ellanet *et al.*, 2019[70] Aqueous extracts of *H. erinaceus* and other mushrooms showed little toxicity on Vero cells and showed potential antiviral activity against DENV2. Seo and Choi, 2001[71] revealed findings that show *H. erinaceus* extracts might be utilized as a source for antiviral medications, and have an antiviral impact.

Neurodegenerative Activity**Used against Depressive Disorder**

The monoamine theory of depression is strongly supported by the discovery that iproniazid and other monoamine oxidase inhibitors are helpful at alleviating symptoms of depression. It is therefore believed that *H. erinaceus* mycelia rich in erinacines, which are involved in the production of the neurotrophic factors, contribute to depression. Chiu *et al.*, 2018[72] revealed that the oral administration of *H. erinaceus* was also reported to have antidepressant-like effects in depressive-like mice, and it was discovered to restore expression levels of norepinephrine, serotonin, and dopamine.

Used against Parkinson's Diseases

In one investigation, Kuo *et al.*, 2016[49] revealed that the MPTP-induced PD model was used to evaluate the neuroprotective impact of *H. erinaceus* mycelia that was high in erinacine A. Results indicated that pretreatment with 3 mg/g erinacine A-enriched *H. erinaceus* mycelia for 25 days dramatically reduced dopaminergic lesions and oxidative stress in the stratum and substantia nigra. Mycelia from *H. erinaceus* that have been erinacine A-enriched have the potential to be a new therapeutic treatment for PD prevention and treatment.

Used against Alzheimer's Diseases

The most frequent kind of dementia is Alzheimer's disease (AD). According to the Alzheimer's Association (2019), AD ranks fifth among all causes of death among individuals aged 65 and older. Degenerative neuronal disorders like Alzheimer's disease and peripheral nerve regeneration may benefit from the presence of *H. erinaceus* extract in culture media because it supports the development of cerebellar neural cells (in vitro) by stimulating regulatory processes of myelinogenesis Kolotushkina *et al.*, 2003[73]. Tsai-Teng Tet *et al.*, 2016[74] conducted a study used APP^{swe}/PS1^{dE9} transgenic mice to assess the Alzheimer's disease-treating potential of *H. erinaceus* mycelia containing 19 mg/g erinacine A. These mycelia were able to decrease cerebral A plaque burden, prevent recruitment and activation of plaque-associated microglia and astrocytes, promote the expression of IDE, raise the NGF-to-NGF precursor (proNGF) ratio, increase the proliferation of neuron progenitors, and increase the number of newly formed neurons in the dentate gyrus region after 30 days of oral administration to 5-month-old transgenic mice.

CONCLUSION

Hericium, as an edible fungus, healthful, natural food, supplement, and potential therapeutic ingredient source, has garnered attention. It has pharmacological properties primarily polysaccharides and health-promoting bioactive

Megha Suman et al.,

chemicals. Existing foods and new *H. erinaceus*-based functional foods need to be developed so that the mushroom's medicinal qualities for human health, mainly diabetes, Alzheimer, Parkinson, depressive disorder, anti-cancerous etc. can be studied. More cultivation is needed to extract the medicinal and health-promoting bio active compounds from this mushroom because it is red listed an endangered species.

ABSTRACT

Migraine, derived from the Greek term "hemikrania," affects approximately 11% of the global population, manifesting primarily as unilateral, pulsating headaches accompanied by various symptoms including nausea, light sensitivity, and auras. This debilitating condition ranks among the top causes of disability worldwide, particularly impacting women. The International Headache Society categorizes migraines into subtypes, each with distinct features and complications. Genetic factors significantly contribute to migraine susceptibility, with familial patterns observed in specific variants. Triggers for migraine attacks range from stress and hormonal fluctuations to dietary factors and environmental changes. The pathophysiology involves complex interactions within the trigeminovascular system, particularly neuropeptides like CGRP and PACAP, which mediate pain. Diagnosis relies on clinical history and symptom patterns, while treatment encompasses acute and preventive strategies, including pharmacological interventions and emerging non-invasive therapies. Recent advancements in medication, including monoclonal antibodies and novel delivery systems, offer hope for improved management of this chronic condition. Continued research is essential to enhance therapeutic options and address the multifaceted nature of migraines.

Keywords: pathophysiology involves complex interactions within the trigeminovascular

INTRODUCTION

The term “migraine” has originated from the Greek word “hemicrania,” which translates to “half of the skull.” A significant number of people with migraines experience a throbbing or pulsating headache that generally affects one side of the head. Head ache nausea or vomiting, light, sound, or smell sensitivity, and auras signalling an approaching headache are common accompanying symptoms of migraine. Many people who suffer from migraines wake up in the early morning with nausea and vomiting along with an advanced attack. Therefore, for the quick and efficient treatment of migraines, a novel, non-invasive, non-oral administration technology needs to be created (1). An active headache issue affects almost 50% of adults globally, and headaches rank 19th among the most incapacitating disorders in a World Health Organization assessment. This occasionally incapacitating medical condition is one of the top five most debilitating illnesses for women. Around 11% of persons worldwide suffer from migraine headaches, which rank as the third most common sickness in the world. Migraineurs routinely report a lower quality of life in between attacks, and their attacks are frequently accompanied by one or more incapacitating symptoms (2). The International Headache Society’s headache classification committee has divided migraines into subtypes. These variations consist of:

- **Migraine with no aura:** A repeated headache attacks that lasts between four and seventy-two hours is referred to as the migraine with no aura. These attacks are usually unilateral, pulsing, low to high in intensity, increased by physical exertion, that is accompanied by light, sound sensitivity (photophobia, phonophobia) as well as nausea.
- **Migraine along with aura:** Repeated, completely reversible occurrences of migraine with aura might cause a few of the following isolated symptoms: headache, motor, the brainstem, visual, sensory, language and speech, retinal, and so on. These attacks typically last minutes.
- **Chronic migraine:** Chronic migraine is defined as headaches lasting over three months, appearing on 15 or more days each month, with migraine symptoms manifesting on at least eight of those days.
- **Migraine complications:** A crippling migraine attack that lasts longer than 72 hours is known as status migrainosus.
- A persistent aura lasting more than seven days with no any neuroimaging signs of myocardial infarction (MI) is referred to as persistent aura without infarction.
- When a migraine attack is observed using neuroimaging, one or more aura symptoms linked to brain ischemia are called “migrainous infarction.”
- A seizure is set off during an aura-accompanied migraine attack, which is known as a migraine aura-triggered seizure (3).

Etiology

Genetics and inheritance

There's a major hereditary component to migraine. Relatives of sick subjects have a threefold increased incidence of migraines compared to those of relatives of healthy subjects; nevertheless, no pattern of inheritance was seen. The root cause of migraine is multifactorial, resulting from the interaction of many genetic origins located at distinct genomic sites with surrounding variables to bestow disease features and susceptibility in individuals who are affected. Which genes and loci play a role in this disease are unknown. It is possible to forecast which is the best preventive therapy when the genes of a migraine patient are discovered (3).

Familial Hemiplegic Migraine

- Families may experience hemiplegic migraines, or they may occur infrequently (one person may experience hemiplegic migraines for the first time). The main three forms of channelopathies are caused by:
 - o Type 1: On chromosome 19p13, the CACNA1A gene (calcium voltage-gated channel alpha 1A subunit) is mutated.
 - o Type 2: On chromosome 1q23, the ATP1A2 gene (ATPase, Na⁺/K⁺ transporter alpha two subunit) is mutated.

Swetha et al.,

- o Type 3 is caused by alterations in the sodium voltage-gated circuit Type 1 alpha subunit (SCN1A) gene.
- Mutations in the PRRT 2 (Proline-Rich transmembrane 2) gene are one recognized possible cause. Synaptosomal nerve associated protein 25, or SNAP25, is a protein that the PRRT2 gene encodes. This protein may be involved in the control of voltage-gated calcium channels.
- Familial migraine variants have also been linked to mutations in the SLC4A4 (solute carrier family four member 4) gene (3).

Cadasil

A cerebral autosomal dominant arteriopathy with subcortical infarcts and leukoencephalopathy is caused by mutations in the NOTCH3 gene (notch receptor 3) on chromosome 19. This autosomal dominant inheritance angiopathy might present as migraine with aura (prodrome in 80%) in nearly 50% of carriers (3).

Melas

It is a multisystemic condition inherited from the mother that can cause recurrent migraine headaches and is characterized by mitochondrial encephalopathy, lactic acidosis, and stroke-like events (3).

Hihratl

Leukoencephalopathy, retinal arteriolar tortuosity, and hereditary infantile hemiparesis (3).

Hems

Hereditary endotheliopathy linked to eye disease, kidney disease, and stroke (3).

Triggers

- 80% Stress
- 65% Hormonal changes especially during menstruation, pregnancy, ovulation.
- 57% when meals are skipped
- 53% change in weather
- 40% odours
- Excessive or insufficient sleep
- 38% neck pain
- 38% exposure to light
- 38% ingestion of alcohol
- 36% smoking
- 32% sleeping late
- 30% heat
- 22% exercise
- 5% sexual activity
- 27% food changes (aspartame as a possible factor) (3).

Four Stages of Headache Episodes

Migraine episodes have been found to occur in four phases.

Prodrome

Premonitory symptoms connected to hypothalamic activation mediated by dopamine (3). Prodromic symptoms may persist for 24 or 48 hours before headaches appear in more than 77% of instances. Women experience it very frequently than males do (81 to 64%) (3). The most common ones include tiredness (34%), mood swings, sluggishness, neck discomfort, light sensitivity, restlessness, blurred vision, cold sensation, cravings, sound sensitivity, sweating, a greater amount of thirst, and edema (3).

Swetha et al.,

Aura

About 25% of cases show alterations in blood flow, neurovascular integration, and cortical function. (3)

- It may appear concurrently with the headache, or it may come on first.
- They usually start slowly, last less than an hour, are mostly visual, and can have both good and negative effects.
- Positive symptoms, such as colourful lines or forms, buzzing in ears, sounds, numbness, allodynia, or rhythmic movements, are brought on by the active release of neurons in the central nervous system.
- Negative symptoms (a decrease in or loss of sight, ability to hear, sensation, or motion) point to a lack of function.
- They must be capable of being reversed.
- It typically appears as numbness on one side of the limb or face. They fall within the paresthesias category.
- Scintillating scotomas, which are patches of missing vision with a sparkling snaky border, are the most prevalent positive visual sign.
- Visual field abnormalities are the very prevalent unfavourable visual sign.
- The most common type of auras are visual ones.
- Auras sense-based are also prevalent. They may manifest with or without visual signs.
- Rare are motor auras. They are characterized by limb and facial hemiplegia, either whole or partial (3).

Headache

further modifications to blood flow and brainstem, thalamus, hypothalamus, and cortex function

- Usually one-sided, fluctuating or throbbing, and also intensifying throughout the starting couple of hours.
- Correlations have been shown between the intensity and photalgia, phonophobia, rhinorrhea, lachrymation, allodynia, and osmophobia.
- It could take place over some hours or even days.
- Since the discomfort normally goes away while they sleep, patients may look for relief in dim areas (3).

Postdrome

Symptoms persisting after the headache stops and lasting blood alterations. The pain during this phase is movement-sensitive and is located in the same area as the preceding headache. Exhaustion, vertigo, trouble focusing, and exhilaration are common symptoms (3).

Epidemiology

Migraine impacts 12% of people in the world, as many as 17% of women and 6% of men every year, and generally impacts females compared to males when they are younger in age. The incidence of migraine is most prevalent in North America, and next is Central and South America, Asia, Europe, and Africa. The next and most prevalent cause of disability in the world is migraine. Migraine runs in families; if either or both parents have a past history of migraine, the estimated problem increases to 40% and 75%, accordingly (3).

Migraine: Anatomy and pathophysiology**The brainstem nuclei and the trigeminovascular system**

The axons that emanate from the trigeminal ganglion, the cells that innervate the meninges and intracranial blood vessels in a peripheral fashion before locally converging in the trigeminocervical complex (TCC), comprise the trigeminovascular system. Part of the characteristics of migraine pain are believed to be mediated by activation of the trigeminovascular pain pathways, which releases neuropeptides at the dura mater level, such as calcitonin gene-related peptide (CGRP) and pituitary adenylate cyclase activating polypeptide (PACAP). Both peripheral and central neurons exhibit high levels of CGRP expression, which has potent dilatator characteristics. Additionally, it demonstrates a controlling effect on second- and third-order neurons (4).

Neuropeptides that play a role in pathogenesis

The neuropeptides that listed below are thought to be involved in disease progression

- **CGRP, or calcitonin gene-related peptide:** Neurones in the trigeminal ganglion are highly expressed in the calcitonin gene-related peptide (CGRP). It is released from the central and peripheral nerve terminals and

95932

**Swetha et al.,**

secreted within the trigeminal ganglion. Nitric oxide is released by the peripheral terminals as a result, making the trigeminal nerves more sensitive. It is a component of neurogenic inflammation because it promotes the transfer of trigeminal pain from arteries to the nervous system and is a strong vasodilator of cerebral and dura mater vessels (3).

- **Pituitary adenylate cyclase-activating polypeptide (PACAP):** Since it is elevated during migraine episodes and can induce migraine in people who are susceptible to it when injected, it may also play a significant role in mediating migraine episodes. Although it is still unclear exactly how serotonin, which emanates from the serotonergic nuclei in the brainstem, causes migraines. Serotonin levels are most likely low between attacks because this could result in a breakdown in the mechanism that prevents serotonin from producing pain, which helps to stimulate the trigeminal system. It may operate through cortical extensions of brainstem serotonergic nuclei, central pain control pathways, or direct action on the cranial arteries (3).
- **Serotonin:** Serotonin, that is released by the brainstem serotonergic nuclei, might be involved in migraine, though the exact role of its processes is still unknown. Most likely, serotonin levels are low between episodes because this could lead to a lack of serotonin pain inhibition system, which helps to stimulate the trigeminal system. It can act directly over the cranial arteries, through central pain control channels, or by cortical projections of brainstem serotonergic nuclei (3). Migraines are associated with a variety of sensory dysfunctions that exhibit cyclical behavior; the headache phase is thought to correspond to the highest level of trigeminal nociceptive activity during this period (5). Second order neurons found in the upper cervical spinal cord, brainstem, and major medullary, diencephalic, and thalamic nuclei stretch rostrally from the trigeminal nucleus caudalis (6). Malfunction of the brain in more central regions, such the hypothalamus, and maybe due to outside variables (7).

The hypothalamus

Theories that describe migraine as a cyclic sensory threshold state have focused on how the hypothalamus mediates pain and how a number of premonitory symptoms, including as thirst, yawning, and polyuria, can manifest before, during, and after the pain phase (8). Prior studies using proton emission tomography have similarly demonstrated hypothalamic activation during the premonitory phase and spontaneous migraine headache (9) and (10) Chemosensitive neurons in the hypothalamus are capable of identifying alterations in brain and peripheral metabolism (4).

The thalamus

The thalamus plays a crucial role in the onset of central sensitization, light sensitivity, and allodynia in migraineurs, as evidenced by several clinical and preclinical investigations. Functional magnetic resonance imaging (MRI) studies have also shown significant thalamic changes during and after attacks (4).

The cortex

The networks of cortical cells Prominence, sensory-motor, default mode, executive, and attentional functions all alter during the headache phase. These alterations are indicative of headache-related cognitive, physical, and emotional problems (11).

Diagnosis of migraine

For a typical migraine assessment, a patient must have experienced at least five headache episodes, with a minimum of two of those episodes requiring the presence of an aura. 60 minutes after the aura, the headache should start or appear. The aura needs to include unilateral sensory symptoms or homonymous visual symptoms, or reversible dysphasic speech. Each symptom must range from five to sixty minutes, and there must be at least one symptom that gets worse over time. A subsequent disorder is not likely to explain these symptoms (12).

Pattern recognition

The pattern is either an acute headache that begins suddenly and does not go away, or a preexisting headache disease with an elevated incidence of attacks that leads to a point of non-recovery. While the latter is referred to as a new regular chronic headache, the former is typically referred to as a modified migraine. Understanding the

95933

**Swetha et al.,**

underlying problem is crucial. The correct phenotype must be established in order to provide an accurate diagnosis and provide an appropriate treatment (13).

Recognition of phases of migraine

Ten percent of men and twenty percent of women get migraines, which are the most prevalent cause of repeated headaches. Despite having a hereditary base, migraine attacks are typically brought on by internal or external stimuli, however they can occasionally occur for no apparent cause. An aura affects about 20% of those who suffer from migraine. The sights that make up the aura can be either pleasant or negative, such as light flashes, floating objects, or expanding or moving zigzag patterns. pleasant phenomena include blind spots brought on by vision loss. Many people also report experiencing tingling or numbness as a sensory aura that affects the hands, lips, tongue, arms, and face. Ten to twenty percent of people notice premonitory signs for almost 48 hours prior to an episode. A sudden surge of energy, yawning, stiff neck, exhaustion, and repeated urination are some of these symptoms. It has been determined which brain regions are engaged during the premonitory phase. Most patients also have a postdrome, which includes headaches that ache, nausea, weariness, and sensitivity to light, noise, movement, scent, and bruises on the head (13).

Taking patient history

The diagnosis of migraines depends critically on taking an accurate medical history. It's critical to allow patients enough time to properly explain their attacks—this may be the first time someone has ever listened to them about their agony—and later ask specific inquiries to fill in the details that the patient's spontaneous description leaves out in order to explain the history (14). Finding any disorders that might be aggravating the underlying cause of migraine predisposition is the main goal of the medical evaluation. In order to determine the etiology of a migraine, the history is essential. Unless a significant cerebral or systemic pathology is indicated by the history, this would often only be possible with fundoscopy, inspection, and palpation of the head and neck structures, as well as a brief screening neurological and cardiovascular exam (14). As indicated earlier, it is beneficial to inquire regarding the nature of the discomfort. The onset and duration of headaches, whether continuous, episodic, or—as is often the case with chronic migraine—continuous with episodic exacerbations, the duration of episodes or exacerbations, and the presence of triggers or exacerbating variables should all be known. The sort of pain, including its location, nature, and intensity, can then be questioned (using a verbal report scale of 0–10, where 10 represents the worst imaginable suffering and 0 symbolizes no pain) (14). Next, it's critical to ascertain whether the discomfort has any concomitant symptoms. These include symptoms of an attack itself, such as vomiting, sensitivity to bright lights, noise, smell, touch, or movement; symptoms of a prodrome or aura that may indicate symptoms prior to an attack, such as high levels of energy or tiredness, yawning, excessive urine production, neck stiffness, vertigo, or visual or sensory problems; and symptoms of other primary or secondary headache disorders, such as rash, eye watering, conjunctival injection, a high body temperature excitement, perspiration ptosis, congestion in the nose, and eyelid oedema (14).

Next, knowing which therapies, both current and previous, have been used and when they are used is useful. Inquiries about the reasons for treatment discontinuance (side effects, insufficient effectiveness, etc.) should be made, and patients should be asked to provide a list of medications that they have earlier tried, along with dosages. It's also crucial to investigate supplementary or alternative therapies (14).

Investigation of migraine

CT neurological imaging studies: Patients who suffer from migraines have had CT scans. Anomalies in a particular proportion of migraine instances have been revealed by these researchers. Two of the 94 patients in one research developed gliomas, six had cerebral infarction, and edema was observed. In another study, 25 out of 53 participants had localized atrophy, generalised atrophy, and other abnormalities. The choroid plexus had a papilloma in one out of every 453 migraine cases. Ventricular hypertrophy and low-density areas have been observed in hospitalized cases. Acute infarction, bleeding from the subarachnoid region, primary and metastatic tumors, hydrocephalus, and subdural hematoma have also been observed in certain examinations. Focal atrophy is more common in older adults (13).

**Swetha et al.,****MRI neuroimaging studies**

MRI examinations have discovered white-matter lesions that have been linked to the clinical features and distinct demographics of migraine patients. Patients with diabetes, high blood pressure, and heart disease are more likely to have abnormal white matter. White matter foci are significantly more prevalent in MA patients than in MO individuals. Incidental results include frontoparietal and cortical atrophy and heterotopy. Intracerebral abnormalities are more common in headache sufferers than in non-headache sufferers. Some younger migraineurs also have white matter lesions. Furthermore, it has been shown that several migraineurs have petrous apex cholesterol cysts, meningeal tumors, and cortical abnormalities. WMHs and pituitary problems have been discovered by MRI investigations (13).

Combined MRI and CTScans

Patients with migraines have had their neurological conditions evaluated using both CT and MRI scans. Four out of 688 participants had abnormalities on their MRI scans, according to Wang et al. No substantial abnormalities were seen on the subjects' CT scans. Among the anomalies were hydrocephalus and malignancies of the throat and nose. On CT and MRI scans, cerebral infarction and carotid atheroma can be seen in a small percentage of people with late-onset migraineurs (those who start beyond the age of 40). However, 93% of the people have normal neuroimaging (13). In 74 patients, a comparison of MRI and CT scans revealed that many foci were seen on T2 MRI but not on CT scans. In a different investigation, the neuroimaging results showed either focal or widespread ventricular enlargement in 26 of the individuals. An occipital lobe infarction was evident in one of the individuals. Over a period of five years, the neuroimaging of newly admitted patients was examined. Two of the 167 individuals had anomalies related to secondary headaches. Both normal persons and migraine patients frequently have abnormalities on their MRI and CT scans. MRI and CT scans reveal important diseases such as visual loss and a history of neurosurgery (13).

Migraine treatment**Effective Treatment Strategies for Migraine****Treatment for acute migraine**

Reducing the intensity and length of a migraine attack is the major objective of therapy (15). Replacing the functioning ability, lowering the need for rescue drugs, and encouraging general management with little or non-existent adverse effects are among the other goals. "Acetaminophen, triptans (sumatriptan, eletriptan, rizatriptan, almotriptan, frovatriptan, naratriptan, and zolmitriptan), dihydroergotamine, non-opioid analgesics (ASA, acetaminophen, and caffeine), NSAID-triptan combinations, and anti-emetics (chlorpromazine, metoclopramide, and prochlorperazine)" are some of the contemporary treatments for migraine. Drugs like butorphanol, tramadol and acetaminophen show some efficacy, but NSAIDs have more drawbacks than positives, thus it is not as advised to use them. Patients with chronic migraines always need preventive care, although those with infrequent attacks can be effectively treated with acute medication. Antibodies of the CGRP receptor have been shown to reduce the frequency of migraines (16). Aspirin, acetaminophen, naproxen, and ibuprofen are examples of first-line therapeutic drugs that are used to treat migraine attacks (15).

Acetaminophen

Acetaminophen is also known by a well-known name paracetamol. It is an antipyretic and a non-opioid analgesic that lowers temperature and also reduces pain (13).

Anti-Inflammatory Drugs: NSAIDs

In many trials, it has been demonstrated that non-steroidal anti-inflammatory medicines (NSAIDs) can help reduce the incidence, severity, and length of migraine attacks. Several NSAIDs, including ibuprofen, naproxen sodium, acetylsalicylic acid (ASA), diclofenac potassium, aspirin, tolfenamic acid, piroxicam, ketoprofen, and ketorolac, have been substantiated by randomized controlled trials and systematic reviews as being beneficial in treating migraines (17).

**Swetha et al.,****Naproxen**

Naproxen is very useful in treating fever, soreness, swelling. This drug is available in the form of salt of sodium as well as a free acid. The gastric system absorbs it rapidly. It is recommended to use naproxen as an analgesic. The medication takes 8 to 12 hours to start working after consumption. The drug's half-life is fifteen hours, a considerable amount greater than that of ibuprofen. Headache, lightheadedness, heartburn, bruises, gastrointestinal bleeding, and stomach ulcers are among the side effects. Migraine is treated early on with naproxen medication (13).

Ibuprofen

For the treatment of migraines, ibuprofen possesses analgesic, antipyretic, and antiinflammatory properties. The serum concentration peaks one to two hours after ingestion, with a half-life of 2-4 hours. Gastric ulcers, discomfort in the stomach, rash, nausea, heartburn, and vomiting are examples of side effects (13).

Aspirin

Aspirin is used alone or in combination to treat chronic headaches. One can deliver aspirin intravenously or orally (13).

Acetaminophen, aspirin, and caffeine

For chronic migraines, aspirin, caffeine, and acetaminophen are administered as a triple therapy. Numerous investigations have noted the analgesic impact of the combined action. These medications can be used as a triple therapy for tension-type headaches and migraines. When these medications are used together, they are more effective than when taken alone (13).

Triptans

The U.S. Food and Drug Administration (FDA) has approved seven triptans that are intended to provide instant relief from migraine attacks. Amongst the medications in this category are almotriptan, frovatriptan, rizatriptan, zolmitriptan, naratriptan, and sumatriptan. Triptans are generally more costly than NSAIDs in terms of price. Because of this, they are typically chosen as a treatment plan when other options, such as NSAIDs or acetaminophen, do not give the expected results or when the severity of the headache necessitates their use (17).

Sumatriptan

First available in 1991 [pdf diagnosis 0], having undergone the most examination, this triptan is still considered the "Gold standard" (13). The dosage types that are offered are subcutaneous injection, nasal spray, and tablet. Since the subcutaneous formulation acts more quickly, those experiencing severe headaches are more likely to benefit from it. Additionally, subcutaneous preparation is the recommended medication for patients whose severe nausea or vomiting prevents them from taking oral tablets. Due to their low half-life and poor oral bioavailability, "second-generation" triptans like zolmitriptan, almotriptan, eletriptan, naratriptan, and rizatriptan have been created with better pharmacokinetic properties (13).

Zolmitriptan

There are three different forms of Zolmitriptan available: pills, nasal spray, and oral disintegrating tablets. Children 12 years of age and older can safely take zolmitriptan nasal spray (13).

Almotriptan

Almotriptan is available as pills that are taken orally with a half-life of a period of three hours. Adolescents with migraine headaches lasting at least four hours are permitted to use almotriptan (13).

Frovatriptan

Oral pills containing frovatriptan are available. Those with migraines who experience longer-lasting headaches can benefit from frovatriptan, which has the longest half-life of 26 hours (13).

**Swetha et al.,****Naratriptan**

It works wonders for menstrual migraines (13).

Rizatriptan and Eletriptan

The half-lives of rizatriptan and eletriptan, which are both accessible as oral pills, are two and four hours, respectively. Additionally, rizatriptan-containing oral dissolving tablets are available. Poorly controlled high blood pressure, hemiplegic migraine headaches, extreme liver and kidney problems, basilar migraine headaches, and coronary artery disease are among the conditions that preclude the use of triptans(13). This drawback is absent from the new ditan and gepant classes (4).

Ditans

As of right present, lasmiditan—a potent and specific agonist of the 5-HT_{1F} receptor—is the only ditan on the market (4). It acts against migraines by blocking the function of neurons in the trigeminal nucleus caudalis, with no effect on the vasculature (4). It is now evident that lasmiditan is far superior than a placebo in terms of rates of 2-hour pain relief and freedom from a wide range of bothersome symptoms, especially when doses of 100 and 200 mg are used (5). This is supported by two phase two studies (4) and three large phase three controlled trials (18)(19)(20). The phase 3 research's combined results showed no problems with cardiovascular protection; in fact, the studies had included people with complex cardiac arrhythmias, elevated blood pressure, and coronary artery disease (19).

Antiemetics

Antiemetics are typically the first drugs administered for headaches that cause both nausea or vomiting. These drugs can be taken on their own or in conjunction with triptans class of drugs or NSAIDs. Two commonly used antiemetics are metoclopramide and prochlorperazine. Compared to prochlorperazine, metoclopramide is more likely to produce unwanted side effects and has a greater body of evidence demonstrating its effectiveness in treating migraines. Promethazine, chlorpromazine, and domperidone are some more antiemetics that are used to treat migraines (21).

Treatment for chronic migraine

Patients who experience migraines at least twice a month, who abuse medications, or who have diminished quality of life are advised to undergo preventive therapy (22). Clinical judgment in each instance will determine how this advice is implemented. Several medication classes, including anticonvulsants, calcium channel modulators, beta blockers, tricyclic antidepressants, play a role in classic prevention; yet, these drugs frequently cause tolerance problems and low compliance (4). In recent years, clinical practice and treatment guidelines (23) have included monoclonal antibodies (mABs) against the canonical receptor (erenunmab) or the CGRP peptide (galcanezumab, fremanezumab, eptinezumab) in significant amounts. In order to prevent migraines, the European Headache Federation currently advises beginning therapy with CGRP mABs as quickly as possible and continuing for as long as necessary (4).

Gepants

Ubrogepant comprises a new family of oral gepants that have acquired FDA approval for acute migraine therapy. There have been approved dosages of 50 and 100 mg of ubrogepant. Additionally, preliminary data supports the efficacy of the non-oral gepant zavegepant nasal spray (4). Significantly, gepants are unlikely to produce medication overuse headache, making them a good alternative when controlling this issue (4) and has a high effectiveness rate when given in numerous doses during an assault (24). Since atogepant and rimegepant have shown to be effective and well-tolerated, they have been introduced to the market in recent years as a preventative measure against migraines (4). Their comparable 11-hour half-lives make it easier to use both as prophylactic measures. Compared to monoclonal antibodies, they have a different half-life, so they have less adverse effects and are safer—especially for women who become pregnant unexpectedly (4). FDA-approved for periodic migraine, atogepant was intended as a preventative medication (4). Having constipation and vomiting were the very common adverse reactions in the phase 2b and phase 3 trials, occurring 10% of the time at a dosage of 60 mg daily. In contrast to the first gepants, the

95937

**Swetha et al.,**

evidence now available indicates no rise of blood alanine aminotransferase and safety on cardiac repolarization even with supratherapeutic dosages (25)(26). A report of an additional study on the preventive therapy of chronic migraine has been published. It is being investigated for long-term safety and tolerability in another trial (NCT04686136) as well as when combined with onabotulinumtoxin A (NCT05216263) (4). When administered on alternate days, rimegepant, which was first tested for acute usage, can cure episodic migraine in adults (27). It also has the added advantage of being administered concurrently during a migraine episode. It is tolerated very well; the most frequent adverse effect is vomiting, which happens in 2% of cases (4). Data supporting the use of common preventative medications from studies on people with high-frequency periodic migraines sometimes need to be generalized, and there are few specific trials done on persons who suffer from persistent migraine. Most migraine researchers still start with older medications like β blockers (propranolol, atenolol, nadolol, or metoprolol), tricyclics (amitriptyline, nortriptyline, or dosulepin), or even less hazardous alternatives, even though NICE recently recommended topiramate as the first-line preventive measure (14). Anticonvulsants such as sodium valproate or topiramate may be taken into consideration if these prove ineffective. Based on personal experience, it is stated that lurasidone, a calcium channel blocker, is the medication preferred for patients experiencing significant vertigo, hemiplegic attacks, or extended auras. Further evidence supports the effectiveness and acceptability of angiotensin blockers, including candesartan, in the treatment of migraines (14). For a reevaluation and consideration of alternatives like higher occipital nerve blocks and Botox (onabotulinum toxin A; Allergan, Irvine, CA) injections for chronic migraines, individuals who do not respond to first- or second-line preventative measures should be referred to a specialist headache clinic. Two consecutive sets of injections of 155–195 U in seven different areas of the head and neck have been shown to reduce headache days by 50% over six months in such patients. Although a new double-blind randomized controlled trial raises questions about this as well, these injections may help more than 50% of patients temporarily lessen the frequency and intensity of their headaches. Deep brain stimulation and occipital nerve stimulation are two neurosurgical techniques that may be investigated for the most challenging and rare cases that are genuinely unmanageable (14).

Neuromodulation

The field of non-invasive neuromodulation is constantly developing, and as it may be applied as a preventive as well as an acute treatment, it is of special therapeutic relevance for managing migraines. Additionally, it has almost no systemic adverse effects, making it suitable for patients with tolerance problems or those who wish to prevent drug interactions(4). Transcutaneous migraine relief devices can either target the nervous system peripherally (transcranial direct electric stimulation, or tDCS), centrally (single-pulse transcranial magnetic stimulation, or sTMS), or noninvasively (noninvasive vagus nerve stimulation, or nVNS). A handheld device was created following the results of an open-label study (28) showing a 50% responder rate and a decrease in migraine days, as well as the participation of 164 individuals with migraines with aura in a randomized controlled trial (RCT). In the US and Europe, the sTMS device is currently licensed for both acute and preventative migraine therapy. When it comes to preventive, people with periodic migraines (30) appear to benefit more from it than those with refractory or chronic migraines (4). When it comes to non-invasive vagus nerve stimulation (nVNS), an RCT has demonstrated its effectiveness for treating migraines acutely (31), but not for prevention (4). Mechanistically speaking, this strategy at the bench can prevent trigeminocervical neurons from reacting to dural nociceptive activation (32) and decrease cortical spreading depression (4). Another tactic has focused on delivering recurrent cathodal or anodal direct current transcranial stimulation over the cortex, despite inconsistent results regarding its therapeutic effectiveness in migraineurs (4). Further investigation is required, as this could be attributed to methodological differences in the approaches, particular brain regions, and types of stimulation (33). Remote noncephalic electrical neurostimulation of the upper arm skin is one of the novel approaches available for neuromodulation. The gadget has been tested in an RCT with 253 patients and operates non-invasively through conditioned pain modulation (4). After two hours of therapy, the subjects experienced pain independence and clinically significant alleviation from migraine headaches in comparison to sham, with a minimal rate of side effects associated to the device (4). Preliminary data from recent open-label research (34) supported its use in treating persistent migraine. Last but not least, studies have demonstrated the effectiveness of repetitive peripheral magnetic stimulation (rPMS), which targets the muscles in the neck and shoulders, in preventing episodic migraine, especially in individuals with

95938

**Swetha et al.,**

significant muscular participation (4). More research is required to assess the extent of these strategies' impact in migraine, including novel processes and targets, even if they are promise for handling of a crippling condition for which there aren't many therapeutic options (4).

General management

Comorbidities and lifestyle cause need to be treated. It's critical to identify and treat sleep problems as well as dietary factors such as cheese, wine, chocolate, excessive caffeine use, and dehydration. It is advised to maintain a healthy body weight and engage in exercise. Based on their causes, patients may benefit from behavioral, physical, or psychological treatment. Feverfew, coenzyme Q-10, magnesium, riboflavin, and feverfew are common natural migraine treatments. Due to their inconsistent effectiveness, these preventative measures are not regarded as first-line therapies for migraine (13). In acute circumstances, medications might be used to treat migraines or lessen their frequency. The general principles, dosage recommendations, headache advice, and recommendations for children and pregnant women have all been modified in the therapeutic instructions. In 1-2 hours, the goal of migraine treatment is to alleviate the headache. The prodromal symptoms, aura, or postdromal stages are not significantly affected by therapies, despite their potential effectiveness. Treating a headache as soon as feasible is important. In certain situations, combination treatments—such as triptans, aspirin, paracetamol, various NSAIDs, and antiemetics—are necessary (13).

Handling nausea

Since nausea can hinder absorption, managing it is crucial. The management and treatment procedure is aided by the combination of antiemetics and analgesics (35). If someone can't consume a medication orally, the route of administration can be altered; alternatives include prochlorperazine suppositories, non-oral triptan formulations, NSAID suppositories, and ondansetron wafers for vomiting (35).

Management of migraine during menstrual cycle

The episodes of migraines are severe, recurrent and they are challenging to manage. Using an oral contraceptive can assist detect when attacks coincide with menstruation and reduce the frequency of episodes. Patients with MA should not use contraceptive pills due to the increased risk of stroke. Naproxen may help with perimenstrual symptoms in addition to acute therapy (4).

Diet

Diet is the most often mentioned migraine preventative strategy. It has lately been suggested that migraine is endocrine and metabolic disorder. A variety of dietary substances can cause migraines. These results have led to the introduction of an elimination diet (36). The quantity of food eaten can also cause headaches. Migraine can be brought on by a comparatively high dose of MSG. However, cutting back on particular foods can also result in headaches. Groups have different trigger points. The foods that act as triggers for migraines vary among individuals with varying immune responses (37). It thus becomes challenging to pinpoint specific meals that cause migraines. Predisposing variables may also be genetic in nature. Some people are more sensitive to certain food elements than others, and some people are more sensitive to specific beverage kinds. Migraine prevention may be achieved by avoiding certain causes (38). This is the elimination diet's central idea. A comprehensive diet is crucial for migraine patients, according to the studies carried out. The gut flora can be altered by probiotics. To fully understand the function of nutrition in migraine, more research is necessary because migraine is a multiphase condition. For migraine sufferers, a multimodal strategy that includes dietary changes may be beneficial. Dietary guidelines for migraineurs are described in the next part (13).

Elimination diets

A headache-causing food must first be identified, and then these items must be removed from the regular diet. This is known as an elimination diet. Using this individualized method, the client determines which components cause or exacerbate their pain. As such, the dietary routine is changed to exclude certain components. This idea and food allergies are not the same thing (37). It is also possible to identify a trigger in an organized way. A food item can be

95939

**Swetha et al.,**

considered a trigger if it produces a headache one day after consumption. Since most people have more than one trigger, it's often challenging to pinpoint a single substance. Furthermore, the work becomes more difficult because several foods include multiple ingredients. But there are drawbacks to an exclusion diet as well. For example, if protein and intake of micro nutrients are insufficient, malnutrition or under nutrition may develop. Frequent infections and other physiological issues may result from this (13).

Acupuncture

Using needles inserted into certain acu points on the skin, acupuncture is a type of traditional Chinese medicine that promotes recovery and rebalances the body. Despite being used to treat a wide range of conditions, treating chronic pain—particularly headache and migraine pain—is one of its most popular uses. A complicated neurological condition called migraine causes severe impairment in daily functioning because of pain and attack related symptoms. The present treatment choices for migraines have numerous undesirable adverse reactions and can potentially make the pain worse for people who suffer from chronic migraines. Migraines are a tough condition to manage (39). Furthermore, obtaining an accurate diagnosis and subsequent access to necessary care is a challenge for numerous migraine sufferers (40). Due to this, a growing number of medical professionals and academics are now looking to alternative therapies like acupuncture as a means of treating patients who have migraines that are resistant to conventional pharmaceutical treatment. In this study, we evaluate the state of knowledge regarding acupuncture and migraines as well as the efficacy of acupuncture in relieving acute and chronic migraines (39).

Ayurvedic treatments

It demonstrates how Ayurveda can effectively treat migraines without causing many negative side effects. Following oral ingestion of polyherbal and herbomineral drugs, the treatment consists of Snehapana (internal oleation), Svedana (sudation), Virechana (therapeutic purgation), and Nasya (nasal instillations). Two arms of Ayurvedic medicine are Shamana (pacifying) therapy and Shodhana (purification). Since migraine is associated with Ardhavabhedaka, the classics strongly recommend the Shodhana therapies Nasya and Virechana as well as the Shamana medications in the form of polyherbal concoctions and medicated ghee as useful remedies (41). Virechana has been used in numerous trials in conjunction with Shamana and Nasya medications to improve the effectiveness in terms of migraine seriousness, frequency, and duration. According to traditional management, Virechana was used in very few trials prior to Nasya and sedative medications; there was no standard formulation that was preferred by all of them. However, every drug was intended to counteract the affected dosha (humor). Therefore, the majority of the discussion is on treatments such as Nasya, Virechana, and Shamana remedies, which include various herbal and herbo-mineral preparations as well as external therapy.

Nasya

Nasya is a biopurification method that involves administering medication through nasal inhalation. When medications are inhaled, they go straight to the brain, where they are then distributed throughout the body (41). The herbs used for nasal instillation have a strength that, when administered, reaches shringataka, the important place at the bottom of the nose. From there, the effectiveness extends to the head, eyes, throat, and ear, helping to drive out the vitiated humour, or morbid doshas, from the head. Its stimulating impact on the brain via the respiratory and olfactory pathways is thought to be the most plausible mode of action. The nasal epithelium is a highly permeable monolayer that prevents hepatic metabolism by facilitating quick absorption and direct drug entry into the body's circulation. Vasculature makes up a significant portion of the nasal submucosa. One possible method of delivering medication to the central nervous system is through intranasal drug delivery through the pulmonary and olfactory pathways. Pharmaceuticals derived from lipids with a molecular weight of less than 400–600 Da (Dalton) and a positive charge are more likely to cross the blood–brain barrier (42).

Virechana

It is among the preventive strategies for biopuricity. The cellular fluid is drained into the interstitial fluid by virechana. The fluid then enters the circulatory compartment and drains into the gastrointestinal tract before being expelled. Consequently, as the process modifies the fluid compartments, it produces a biochemical change. Biochemicals that

**Swetha et al.,**

have dissolved are present in the fluid that is emptied out (41). Due to enhanced metabolic condition, oral drugs given following biopurification methods have greater effectiveness. The process involves stimulating the digestive system, which is followed by medicated fats taken orally, therapeutic massage therapy, suction, and internally induced vomiting (41).

Shamanaushadhi (Pacifying Medications)

The components of Pathyadi Khada are neuroprotective and have anti-oxidant and anti-inflammatory qualities (43). Pathya (*Terminalia chebula* Retz.) also possesses analgesic qualities. Shatahvidaitailanasya, Nimbadi Guggulu and Mashadi Kashaya were given to a one group of people suffering from migraine. Twelve of the participants had significant alleviation, and eighteen of the participants had total relief, according to the overall evaluation. (41)

Herbo-mineral medications

Herbo-mineral formulations were used in five clinical trials. 406 participants in all were given the Ayurvedic Therapy Protocol (AyTP). At a dose of 7.3 g daily, it included 500 mg of Godanti Mishran, 2000 mg of Narikela Lavana, 375 mg of Sootashekhara Rasa, Sitopaladi Churna, 3000 mg of Rasana Vati, and 1425 mg of Narikela Lavana. The AyTP safety profile of Godanti Mishran, Rasana Vati, and Sootashekhara Rasa was initially demonstrated in experimental animals (41). Seven (3.4%) patients showed no improvement, whereas twenty-two (35.2%) patients were fully cured. Forty-five patients (11%) stopped their therapy because their condition got worse. However, among the patients who finished the full 90 days of treatment, there were no discernible side effects. In another study, Brhat Jeevakaditailanasya was given along with Sutashekhara Rasa and drakshajala (water steeped in raisins) as an adjunct. Sutashekhara Rasa and Nasya reduced the majority of pain symptoms when compared to Flunarizine. In two trials, laghusutashekhara rasa (LSR) was given both alone and in conjunction with nasya. In comparison to Nasya, LSR was found to be more effective when used alone. In a similar vein, Kaphaketu rasa both alone and in combination with Anutaila Nasya had noteworthy outcomes (41).

External therapy

Agnikarma (cautery) (41) using Panchadhātu Shalaka (a cautery tool composed of five metals) was performed in four settings separated by one week, and internal administration of Pathyadi Khada was prepared. Significant progress was observed in eleven participants (78.6%). According to research, heat may have stimulated the lateral spinothalamic tract, which in turn activates the descending pain inhibitory fibers. As a result, this inhibits the release of P substance (presynaptic inhibition) and stops the dispersion of pain perception. Additionally, it has been suggested that heat will have a counter irritating effect. According to the pain-gate control theory, heat activates the skin's nociceptor fibers. Following stimulation, these fast-acting inhibitory fibers block the channels that produce long-lasting, slow-acting inhibitory fibers (41). Kumkumadi Ghrita Nasya was more effective than Shirodhara, or "dipping therapy," which involved applying Dashmoolashrita Ksheera to the forehead for 45 minutes each day for 21 days. However, research has demonstrated that Shirodhara is effective for persistent daily headaches (41). Applying kachooradichurna to the forehead in addition to pacifying and purifying drugs worked well for migraines (43).

Various formulations to treat migraine

Medications to treat migraine are available in various forms:

Tablets**Orally disintegrating tablets**

Those who struggle with swallowing may benefit from oral disintegrating pills. Difficulty in swallowing, or dysphagia, affects individuals of every age. It is more common in children and the elderly, as well as patients who are institutionalized and in people who have symptoms like nausea, vomiting, and motion sickness. A migraine attack can last anywhere from 15 to 180 minutes, so it is best to take immediate relief. A quickly disintegrating pill is the best option in these situations (44).

Swetha et al.,

Example**Sumatriptan succinate**

One medication in the class of antimigraine medications is sumatriptan succinate. Here, we may learn how successful oral disintegrating sumatriptan succinate tablets are. It helps to cure headaches, pain, and other migraine headache symptoms such as sensitivity to sound and light, nausea, and vomiting. Strong agonists of the 5-HT_{1D} receptor, such as sumatriptan, specifically narrow the arteries in the brain and redistribute blood, improving cerebral blood flow. Merely 3% of the entire dosage of sumatriptan in its unmodified form is excreted in urine. 15% of the medication is bioavailable. Consequently, it must be added to an oral disintegrating dose form to increase its absorption into the body (44).

Rizatriptan benzoate

In contrast to sumatriptan, which has a low absorption rate of 14–17%, rizatriptan benzoate acts relatively quickly, reducing migraine symptoms within an hour of ingestion. Patients with migraines would benefit from immediate treatment that enables them to resume their functional activities as soon as possible, as their working ability is considerably impaired. The formulation includes super disintegrants, which enhance the drug's release and, consequently, its bioavailability. The medication dissolves or spreads in saliva when mouth-dispersing tablets are placed in the mouth; this allows the medication to be ingested as a liquid without the need for water. The pills dissolve instantly (45).

Rimegepant ODT

Rimegepant is a second-generation gepant that is taken by mouth and has been approved in a number of nations, including the United States (46).

Bi-layered tablets

A bi-layered tablet that is intended to treat individuals with severe migraines, which last for longer than two hours. In order to preserve the drug's therapeutic level and bioavailability in the blood, the sustained layer is constructed using polymers with hydrophilic properties. An immediate layer is created for rapid relief, and the other layer will be delivered gradually over time. (47)

Example: a) Sumatriptan succinate bi-layered tablet (47)

Sublingual tablets

For self-administration, the oral sublingual pill delivery method can be a good option. Our objectives are to boost the oral bioavailability of the drug administered, prevent first-pass metabolism in the liver, provide rapid dissolution or disintegration in the oral cavity without the need for water or chewing, get around the drawbacks of the oral, nasal and subcutaneous route, and provide a quick onset of action. Taste masking is used to increase patient compliance and oral feeling. Passive diffusion into the lipoidal membrane is the primary mechanism by which drugs penetrate the oral mucosa. The permeability of the mouth is higher in the sublingual area than in the buccal and palatal regions, respectively. (48)

Example

a) Sumatriptan succinate (48)

b) Zolmitriptan sublingual tablets (49)

Gel

Nasal insitu gel: Nasal drug delivery can also offer a route of entry to the brain that circumvents the BBB because the olfactory receptor cells are in direct contact with the central nervous system (CNS). By sticking to the mucous membrane and prolonging the residence time in the nasal cavity, bioadhesive excipients help formulations overcome the mucociliary clearance process. This results in better nasal drug uptake and bioavailability of drugs that undergo rapid first pass metabolism. (50)

Swetha et al.,

Example: a) Nasal insitu gel of rizatriptan (50)**Oral films**

Another term for polymeric films meant for buccal dispersion is mouth dissolving films. The lamina propria and submucosa, the underlying tissue, are separated from the stratified squamous epithelium covering the surface of the oral cavity by an undulating basement membrane. Interestingly, the buccal mucosa has permeability that is around 4-4,000 times greater than that of the skin, but lower than that of the intestine. Therefore, buccal administration can be a very effective way to absorb molecules with low skin penetration.

Ideal features

- The drug must possess good taste.
- The drug to be incorporated in the film must have low dose.
- The drug must have lesser and moderate molecular weight.
- The drug must have proper stability and solubility in water and in saliva.
- It must be partially unionized at the pH of buccal cavity.
- It must have the capacity to permeate the oral mucosa.

Based on the transdermal patch's technology, mouth dissolving films provide a novel medication delivery device for oral administration. The delivery device is a very thin oral strip that is applied to the patient's tongue or any other oral mucous membrane. Saliva quickly hydrates the film, which then sticks to application site. [pdf 50] After that, the medication is released for oro mucosal absorption as it swiftly dissolves and disintegrates. If the formula is changed, it will still dissolve quickly enough to allow for gastrointestinal absorption after swallowing. (51) **Example:** Rizatriptan benzoate fast dissolving oral film. (51)

Patch**Transdermal patch**

An adhesive patch put to the skin that contains medication intended to be absorbed into the bloodstream through the skin is called a transdermal patch, sometimes referred to as a skin patch. 'Transdermal systems' are designed to deliver the drug(s) to the systemic circulation through the skin, according to the United States Pharmacopoeia (USP). In 1981(1), the FDA first approved transdermal patch products. Most migraine sufferers have nausea during their attacks, and many also have vomiting. Oral medication is one example of a drug delivery technique that depends on gastrointestinal absorption and gastric movement; in certain patients, this method may be slow, inefficient, or inconsistently effective. There are injection and nasal administration methods for migraine sufferers that avoid absorption through the gastrointestinal tract. Compared to alternative administration methods, injectable sumatriptan may cause more side effects (such as chest and neck discomfort, warm sensations, dizziness, sleepiness, and enhanced nausea) as well as irritation and soreness at the location of the injection. Certain nasal spray delivery systems for migraine are simple to use and may be more effective than pills; nevertheless, some individuals may find that the flavour of the spray aggravates their nausea and vomiting (52). Patients who are unconscious can also benefit from this delivery mechanism (53). This system of distribution is regarded as being userfriendly and having a pause feature (54). Drugs with short biological half-lives can be continuously infused through the skin, which also eliminates pulsed entrance into the circulatory system and allows for controlled, constant delivery of drugs. It also has many other advantages like

1. Decreased dosage frequency as a result of increased half-life and enhanced bioavailability.
2. Decreased adverse effects; in addition, removing the patch may lessen the toxicity of a medication applied transdermally.
3. Using topical patches is a simple, non-invasive way to administer medication to your body.
4. For drugs that are significantly broken down by the liver, not fully absorbed from the gut, or hydrolyzed by the stomach acids, this mode of administration works well.
5. Transdermal patches offer an alternative for individuals who are unable or unable to take medications or vitamins orally mouth.

**Swetha et al.,**

6. Topical patches are practical and affordable; one aspect of particular note in some patches is that they only need to be applied once a week. (1)

Example

- a. Rizatriptan and verapamil transdermal patch (1)
- b. Almotriptan malate transdermal patch (52)
- c. Fravotriptan transdermal patch (53)
- d. Zolmitriptan drug-in-adhesive patch, which will improve compliance among patients. (55)

Microneedle patch

The non-invasive delivery of medications through the skin's surface is known as microneedle mediated delivery, and it has garnered interest from numerous research institutions and enterprises. Microneedle (MN) delivery system is an attractive alternative to traditional drug administration methods because of the protective, inflammatory, and immunological properties of skin (56). The stratum corneum (SC), the top layer of skin, and the skin's viable epidermis can both be reached by the MN delivery technique. It consists of a base support and a variety of submillimeter-sized needles up to 1500 μm in length. (57)

Advantages of microneedle patches

- High amounts of medication solution can be administered using hollow microneedles.
- Microneedles have the capacity to hold many drugs simultaneously.
- Preventing pre-systemic metabolic process and avoiding discomfort.
- High amounts of medication can be administered via hydrogel-forming microneedles that are connected to reservoirs. (58)

Example

Dissolving microneedle patch filled with dihydroergotamine mesylate (DHE). An ergot derivative called dihydroergotamine mesylate (DHE) is especially helpful in healing moderate-to-severe acute migraine attacks in patients who do not react to triptan derivatives. The shortcomings of the current DHE formulations in subcutaneous injection and nasal spray form, such as pain, unpleasant reactions, and limited absorption, must be addressed by a novel delivery system that enables simple self-administration, a rapid beginning of action, and high absorption. In order to create a dissolving microneedle patch (MNP), we used polyvinylpyrrolidone, which has a great water solubility and improved solubility capacity. We used an MNP design that has been demonstrated to be painless. (2)

Iontophoretic transdermal patch

Iontophoretic transdermal patch: The iontophoretic transdermal system (ITS) skin patch formulation is meant to treat migraine symptoms temporarily. This transdermal method delivers the drug transdermally into the subcutaneous tissue while avoiding the digestive system by using a modest electrical current (59). The two main processes in iontophoresis are electromigration and electroosmosis. During electromigration, the cathode repels anions while the anode rejects positively charged cations. Electroosmosis is the convective transport of water by an electrical current. Because neutral chemicals don't produce ions, electroosmosis works particularly well when they are present. (58)

Example

Sumatriptan ITS, those who have migraines together with severe nausea, vomiting, or gastroparesis, as well as those who do not respond well to oral drugs, may find this drug as a useful option. (59)

Nasal spray

Application of nasal sprays to alleviate migraines. It has a quick start of effect because to its quick absorption through the mucous membrane of the nose. Additionally, using nasal spray can be a better option than traditional oral medications for people who struggle to swallow tablets or who feel nauseated and vomiting during migraine episodes. (60)

Swetha et al.,

Example

- a. Zolmitriptan nasal spray(60)
- b. Sumatriptan nasal spray for in acute treatment of migraine in adolescents and children (61)

Advance formulations for migraine

Some of the advance formulations are

Sonophoresis assisted gel

Sonophoresis-assisted transdermal delivery of antimigraine loaded nanolipomers. It uses an active, non-invasive technique that, when exposed to ultrasonic vibrations, causes a transient, reversible increase in the permeability of the skin. The fundamental mechanism that causes the disruption of the lipid structure in the skin is called acoustic cavitation. Sonophoresis-assisted transdermal administration is administered by either irradiating the skin simultaneously with the drug-containing coupling medium or, ideally, irradiating the skin before to prevent drug degradation before adding the medication. Furthermore, a key factor in both effectiveness and safety is the radiation's frequency of application. High frequency ultrasound (HFU) seems to be less effective but safer than low frequency ultrasound (LFU), which is typically more efficient at the expense of safety. These days, it's common practice to use nanocarrier delivery systems to improve medication absorption. They are separated into nanoparticles of polymeric material, which have a limited circulation duration and poor biocompatibility despite having excellent stability and rigidity in structure. However, poor entrapment efficiency and irregular release are two of their main disadvantages. Lipid-based nanoparticles, on the other hand, are recognized for their great biocompatibility and improved bioavailability of drugs (62). It was therefore reasonable to mix the best aspects of both kinds while minimizing the drawbacks. Lipomers, or lipid-polymer hybrid nanoparticles, are a new class of modified paragon that have the capacity to carry hydrophilic or hydrophobic cargo with superior physical stability and encapsulating performance. They are often made by linking the drug and polymer via interactions between ions to create a complex that is then either dispersed throughout the matrix of lipids to produce a monolithic system or coated in lipid to generate a core-shell system.

Example

Zolmitriptan loaded lipomer gel (62)

Drug loaded nanoparticle gel

Drug loaded solid lipid nanoparticles for transdermal delivery Solid lipids like cholesterol, triglycerides, stearic acid, and emulsifiers make up SLNs. These are nanoparticles with solid lipid combinations in the interior and surfactant acting as the external phase's internal structure stabilizer in a fluid medium. Lipid mixtures shield encapsulated labile components from harmful external elements like oxidation and photodegradation and offer a regulated release schedule for those materials. Many techniques, such as large energy input, minimal energy hot and cold homogenization, and organic solvent approaches, can be used to create SLNs. Sumatriptan is delivered transdermally utilizing SLNs in the form of gel, which can improve the drug's penetration across the barrier of the epidermis. SLN-loaded sumatriptan intended for transdermal administration.

Example

Sumatriptan loaded nanoparticle gel (63)

Intranasal nanoparticle gel: Intranasal route using solid lipid Nanoparticles for migraine therapy

Solid lipid nanoparticles (SLNs) will be ingested and administered intravenously to the brain. Because solid lipid nanoparticles allow molecules that are hydrophilic to cross the lipophilic blood-brain barrier, they improve the transmission of drugs from the nasal cavity to the brain. They can also prevent chemical and/or biological deterioration of the medicine that is enclosed. Because of the blood-brain barrier (BBB), medication transport to the brain is extremely difficult. Different methods have been employed to improve medication delivery to the brain. Drug transmission utilizing nanotechnology is one of these approaches. Many medications are delivered to the

95945

Swetha et al.,

central nervous system (CNS) via the intranasal route. The administration of medications intranasally does not need any changes. Because of their nano size, they can travel across many endocytic pathways of neuronal cells in the olfactory membrane and be transcellularly delivered to the brain by olfactory neurons.

Example:

a) For instance, nasal Zolmitriptan gel containing solid lipid nanoparticles (SLNs) is used for the relief of migraines. (64)

Subcutaneous Injection

It is thought that mAbs will prevent the consequences of circulating CGRP on the trigeminal system because they are too big to cross the blood-brain barrier (65). In the United States and/or Europe, four monoclonal antibodies (mAbs)—eptinezumab, galcanezumab, erenumab, and fremanezumab—have been authorized for use as preventative migraine therapies. Clinical studies for CM and EM were conducted to assess these mAbs (66). With a favorable tolerance profile, all four of these mAbs targeting the CGRP pathway have successfully decreased the frequency of migraine days. (23), (65), (67).

Example

- a) **Fremanezumab injection:** IgG Δ a, a fully humanized monoclonal antibody, was the first approved mAb designed to target the CGRP ligand and prevent the peptide from activating on the CGRP receptor. The only CGRP pathway-targeted monoclonal antibody that is authorized for administration under the skin on a quarterly or monthly schedule for the prevention of adult migraines is fremanezumab (66).
- b) **Erenumab-aooe:** It is a monoclonal antibody against human immunoglobulin G2 (IgG2) made from the ovarian cells of Chinese hamsters. Prevention of both episodic and long-term migraines has demonstrated the effectiveness of monoclonal antibody treatments which target the CGRP receptor. Since the blood-brain barrier fails to safeguard the trigeminal ganglion, a medication like erenumab-aooe might not need to pass it in order to work (68).

Botox

People who suffer from frequent migraines are asked to avoid headaches (69). Clostridium botulinum, an anaerobic, gram-positive, motile, spore-forming bacteria, is the source of botox. In anaerobic environments, it produces a substance called exotoxin in the form of a protease. This toxin causes inoperative glands by blocking the release of acetylcholine, a neurotransmitter involved in glandular secretions and contraction of muscles from the nerve ends. This toxin causes paralysis of the muscles, which in turn reduces the discomfort associated with migraine headaches (69). Patients receive three-monthly injections of botulinum toxin into their pericranial muscles, which increases their level of compliance. It functions by preventing primary-sensory neurons from releasing neurotransmitters which in turn suppresses pain—likely brought on by severe contractions of the muscles that result in repeated migraine headaches. The articles we looked at suggest that Botox is a better migraine preventive method (69).

Example

a) Onabotulinumtoxin A Injection is a botulinum toxin. (69)

CONCLUSION

Migraine, a complex neurological condition, affects a significant global population, particularly women. The etiology involves genetic factors and potential familial implications. Identifying triggers such as stress, hormonal changes, and dietary factors is crucial for effective management. The anatomical and pathophysiological mechanisms of migraine offer potential targets for therapeutic interventions. Treatment strategies encompass a wide range of options, including acute medication, preventive care, and advanced formulations. Overall, a comprehensive approach addressing genetic, physiological, and environmental factors is crucial for effective migraine management.

ABSTRACT

A graph $G = (V, E)$ with p vertices and q edges is said to be a Heronian Mean graph if it is possible to label the vertices $x \in V$ with distinct labels $f(x)$ from $1, 2, \dots, q + 1$ in such a way that when each edge $e = uv$ is labeled with, $f(e = uv) = \left\lfloor \frac{f(u) + \sqrt{f(u)f(v)} + f(v)}{3} \right\rfloor$ (OR) $\left\lceil \frac{f(u) + \sqrt{f(u)f(v)} + f(v)}{3} \right\rceil$ then the resulting edge labels are distinct. In this case f is called a Heronian Mean labeling of G . In this paper we prove that triangular graphs such as $S(T_n) \odot K_1$, $S(T_n) \odot \bar{K}_2$, $S(A(T_n))$, $S(A(T_n)) \odot K_1$, $S(A(T_n)) \odot \bar{K}_2$ are all heronian mean graphs.

Keywords: Graph, Heronian Mean labeling, Triangular Snake, Corona Product

INTRODUCTION

Let $G = (V, E)$ be a (p, q) graph with $p = |V(G)|$ vertices and $q = |E(G)|$ edges, where $V(G)$ and $E(G)$ respectively denote the vertex set and edge set of the graph G . The Graphs considered here are simple, finite and undirected graphs without loops or parallel edges. "For a detailed survey of graph labeling, we refer to J. A. Gallian [1]. For all other standard terminology and notations we follow Harary [2]. The concept of Mean labeling has been introduced by S. Somasundaram and R. Ponraj in 2004. As a Variation of Mean labeling Heronian Mean Labeling has been introduced by S. S. Sandhya, E. Ebin Raja Merly and S. D. Deepa in 2016 and they proved the Heronian Mean Labeling of some subdivision graphs and many families of graphs [4,5,6]. In this paper, we examine about the Heronian Mean labeling of subdivision of Triangular Snake graph, Alternate Triangular Snake Graphs and their Corona product. Some new examples are presented and verified. We now give the definitions which are necessary for the present investigation.

**Definition 1.1:**

A graph $G = (V, E)$ with p vertices and q edges is said to be a **Heronian Mean graph** if it is possible to label the vertices $x \in V$ with distinct labels $f(x)$ from

$1, 2, \dots, q + 1$ in such a way that when each edge $e = uv$ is labeled with,

$$f(e = uv) = \left\lfloor \frac{f(u) + \sqrt{f(u)f(v)} + f(v)}{3} \right\rfloor \text{ (OR)} \left\lceil \frac{f(u) + \sqrt{f(u)f(v)} + f(v)}{3} \right\rceil$$

then the resulting edge labels are distinct. In this case f is called a Heronian Mean labeling of G .

Definition 1.2

The Corona of two graphs G_1 and G_2 is the graph $G = G_1 \odot G_2$ formed by taking one copy of G_1 and $|V(G_1)|$ copies of G_2 where the i^{th} vertex of G_1 is adjacent to every vertex in the i^{th} copy of G_2 .

Definition 1.3

If $e = uv$ is an edge of G and w is not a vertex of G then e is said to be subdivided when it is replaced by the edges uw and wv . The graph obtained by subdividing each edge of a graph G is called the subdivision graph of G and is denoted by $S(G)$.

Definition 1.4

A Path P_n is a walk in which all the vertices are distinct.

Definition 1.5

A Triangular Snake T_n is obtained from a path $u_1, u_2, u_3, \dots, u_n$ by joining u_i and u_{i+1} to a new vertex v_i for $1 \leq i \leq n - 1$. That is every edge of a path is replaced by a cycle C_3 .

Definition 1.6

An Alternate Triangular Snake $A(T_n)$ is obtained from a path $u_1, u_2, u_3, \dots, u_n$ by joining u_i and u_{i+1} (alternatively) to a new vertex v_i for $1 \leq i \leq n - 1$. That is every alternate edge of a path is replaced by a cycle C_3 .

Main Results

In this paper, we investigate the Heronian Mean labeling subdivision graphs of some Snake Related Graphs.

Theorem 2.1

$S(T_n) \odot K_1$ is a Heronian mean graph.

Proof

Let T_n be a Triangular Snake obtained from a path $u_1, u_2, u_3, \dots, u_n$ by joining u_i and u_{i+1} to a new vertex v_i for $1 \leq i \leq n - 1$.

Let $S(T_n)$ be the graph obtained by subdividing all the edges of T_n .

Let $G = S(T_n) \odot K_1$

Let w_i, s_i, t_i be the vertices obtained by subdividing the edges $u_i u_{i+1}, u_i v_i$ and $v_i u_{i+1}$ respectively ($1 \leq i \leq n - 1$).

Let $u'_i, v'_i, w'_i, s'_i, t'_i$ be the pendant vertices attached at u_i, v_i, w_i, s_i, t_i respectively ($1 \leq i \leq n - 1$) and let u'_n be the pendant vertex attached at u_n .

Let $V(G) = \{u_i, u'_i / (1 \leq i \leq n)\} \cup \{w_i, w'_i, v_i, v'_i, s_i, s'_i, t_i, t'_i / (1 \leq i \leq n - 1)\}$

$E(G) = \{u_i u'_i / (1 \leq i \leq n)\} \cup \{u_i w_i, w_i u_{i+1}, u_i s_i, s_i v_i / (1 \leq i \leq n - 1)\} \cup \{v_i t_i, t_i u_{i+1}, s_i s'_i, v_i v'_i, t_i t'_i, w_i w'_i / 1 \leq i \leq n - 1\}$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, 11n - 9\}$

$f(u_i) = 11i - 10$ for $1 \leq i \leq n$

$f(u'_i) = 11i - 9$ for $1 \leq i \leq n$

$f(w_i) = 11i - 1$ for $1 \leq i \leq n - 1$

Meena and Keerthana

$$f(w_i') = 11i \quad \text{for } 1 \leq i \leq n-1$$

$$f(v_i) = 11i - 5 \quad \text{for } 1 \leq i \leq n-1$$

$$f(v_i') = 11i - 4 \quad \text{for } 1 \leq i \leq n-1$$

$$f(s_i) = 11i - 8 \quad \text{for } 1 \leq i \leq n-1$$

$$f(s_i') = 11i - 7 \quad \text{for } 1 \leq i \leq n-1$$

$$f(t_i) = 11i - 3 \quad \text{for } 1 \leq i \leq n-1$$

$$f(t_i') = 11i - 2 \quad \text{for } 1 \leq i \leq n-1$$

Then the edge labels are distinct.

Hence f is a heronian mean labeling of G .

Theorem 2.2

$S(T_n) \odot \overline{K_2}$ is a heronian mean graph.

Proof

Let T_n be a Triangular Snake obtained from a path $u_1, u_2, u_3, \dots, u_n$ by joining u_i and u_{i+1} to a new vertex v_i for $1 \leq i \leq n-1$.

Let $S(T_n)$ be the graph obtained by subdividing all the edges of T_n .

Let $G = S(T_n) \odot \overline{K_2}$

Let w_i, s_i, t_i be the vertices obtained by subdividing the edges $u_i u_{i+1}$, $u_i v_i$ and $v_i u_{i+1}$ respectively ($1 \leq i \leq n-1$).

Let $u_i', v_i', w_i', s_i', t_i', u_i'', v_i'', w_i'', s_i'', t_i''$ be the pendant vertices attached at u_i, v_i, w_i, s_i, t_i respectively ($1 \leq i \leq n-1$) and let u_n, u_n'' be the pendant vertex attached at u_n .

$$V(G) = \{u_i, u_i', u_i'' / (1 \leq i \leq n)\} \cup \{w_i, v_i, s_i, \frac{t_i}{1 \leq i \leq n-1}\} \cup \{v_i', w_i', s_i', \frac{t_i'}{1 \leq i \leq n-1}\} \cup \{v_i'', w_i'', s_i'', \frac{t_i''}{1 \leq i \leq n-1}\}$$

$$E(G) = \{u_i u_i', u_i u_i'' / (1 \leq i \leq n)\} \cup \{s_i s_i', v_i v_i', t_i t_i', w_i w_i' / (1 \leq i \leq n-1)\} \cup \{s_i s_i'', v_i v_i'', t_i t_i'', w_i w_i'' / (1 \leq i \leq n-1)\} \cup \{u_i w_i, w_i u_{i+1}, u_i s_i, s_i v_i, v_i t_i, t_i u_{i+1} / (1 \leq i \leq n-1)\}$$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, 16n-13\}$

$$f(u_i) = 16i - 14 \quad \text{for } 1 \leq i \leq n$$

$$f(u_i') = 16i - 15 \quad \text{for } 1 \leq i \leq n$$

$$f(u_i'') = 16i - 13 \quad \text{for } 1 \leq i \leq n$$

$$f(w_i) = 16i - 1 \quad \text{for } 1 \leq i \leq n-1$$

$$f(w_i') = 16i - 2 \quad \text{for } 1 \leq i \leq n-1$$

$$f(w_i'') = 16i \quad \text{for } 1 \leq i \leq n-1$$

$$f(v_i) = 16i - 7 \quad \text{for } 1 \leq i \leq n-1$$

$$f(v_i') = 16i - 8 \quad \text{for } 1 \leq i \leq n-1$$

$$f(v_i'') = 16i - 6 \quad \text{for } 1 \leq i \leq n-1$$

$$f(s_i) = 16i - 11 \quad \text{for } 1 \leq i \leq n-1$$

$$f(s_i') = 16i - 12 \quad \text{for } 1 \leq i \leq n-1$$

$$f(s_i'') = 16i - 10 \quad \text{for } 1 \leq i \leq n-1$$

$$f(t_i) = 16i - 4 \quad \text{for } 1 \leq i \leq n-1$$

$$f(t_i') = 16i - 5 \quad \text{for } 1 \leq i \leq n-1$$

$$f(t_i'') = 16i - 3 \quad \text{for } 1 \leq i \leq n-1$$

Then the edge labels are distinct.

Hence f is a heronian mean labeling of G .

Theorem 2.3

$S(A(T_n))$ is a heronian mean graph.

Proof

Let $G = S(A(T_n))$

Meena and Keerthana

Let $S(A(T_n))$ be the subdivision graph of alternate triangular snake. Here we consider two cases are arises.

Case (i)

If the alternate triangular snake $S(A(T_n))$ starts from u_i with degree of $u_1 = 2$. Then we need to consider two subcases.

Sub case (i) a): If n is even.

$$\text{Let } V(G) = \{u_1 u_2 u_3 \dots u_n, v_1 v_2 v_3 \dots v_{n-1}, \alpha_i, \beta_i, \gamma_i / (1 \leq i \leq \frac{n}{2})\}$$

$$\text{Let } E(G) = \{u_i v_i / 1 \leq i \leq n-1\} \cup \{v_i u_{i+1} / 1 \leq i \leq n-1\} \cup \{u_{2i-1} \alpha_i, \alpha_i \gamma_i, \gamma_i \beta_i, u_{2i} \beta_i / 1 \leq i \leq \frac{n}{2}\}$$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, 4n-1\}$

$$f(u_i) = 4i - 3 \text{ for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd.}$$

$$f(u_i) = 4i - 1 \text{ for } 2 \leq i \leq n \text{ if } i \text{ is even.}$$

$$f(v_i) = 4i \text{ for } 1 \leq i \leq n-1$$

$$f(\alpha_i) = 8i - 6 \text{ for } 1 \leq i \leq \frac{n}{2}$$

$$f(\beta_i) = 8i - 3 \text{ for } 1 \leq i \leq \frac{n}{2}$$

$$f(\gamma_i) = 8i - 5 \text{ for } 1 \leq i \leq \frac{n}{2}$$

Then the resulting edge labels are distinct. In this sub case, f is a heronian mean labeling of G .

Sub case (i)(b) : If n is odd,

$$\text{Let } V(G) = \{u_1 u_2 u_3 \dots u_n, v_1 v_2 v_3 \dots v_{n-1}, \alpha_i, \beta_i, \gamma_i / (1 \leq i \leq \frac{n-1}{2})\}$$

$$\text{Let } E(G) = \{u_i v_i / 1 \leq i \leq n-1\} \cup \{v_i u_{i+1} / 1 \leq i \leq n-1\} \cup \{u_{2i-1} \alpha_i, \alpha_i \gamma_i, \gamma_i \beta_i, u_{2i} \beta_i / 1 \leq i \leq \frac{n-1}{2}\}$$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, 4n-3\}$ by,

$$f(u_i) = 4i - 3 \text{ for } 1 \leq i \leq n \text{ if } i \text{ is odd.}$$

$$f(u_i) = 4i - 1 \text{ for } 2 \leq i \leq n-1 \text{ if } i \text{ is even.}$$

$$f(v_i) = 4i \text{ for } 1 \leq i \leq n-1$$

$$f(\alpha_i) = 8i - 6 \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\beta_i) = 8i - 3 \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\gamma_i) = 8i - 5 \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G .

Case (ii)

If the alternate triangular snake $S(A(T_n))$ starts from u_2 with degree of $u_1 = 1$ then we need to consider two subcases.

Sub case (i) a): If n is even.

$$\text{Let } V(G) = \{u_1 u_2 u_3 \dots u_n, v_1 v_2 v_3 \dots v_{n-1}, \alpha_i, \beta_i, \gamma_i / (1 \leq i \leq \frac{n}{2} - 1)\}$$

$$\text{Let } E(G) = \{u_i v_i / 1 \leq i \leq n-1\} \cup \{v_i u_{i+1} / 1 \leq i \leq n-1\} \cup \{u_{2i} \alpha_i, \alpha_i \gamma_i, \gamma_i \beta_i, u_{2i+1} \beta_i / 1 \leq i \leq \frac{n-2}{2}\}$$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, 4n-5\}$ by,

$$f(u_i) = 4i + 4 - 7 \text{ for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd.}$$

$$f(u_i) = 4i + 4 - 9 \text{ for } 2 \leq i \leq n \text{ if } i \text{ is even}$$

$$f(v_i) = 4i + 4 - 6 \text{ for } 1 \leq i \leq n-1$$

$$f(\alpha_i) = 8i - 4 \text{ for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\beta_i) = 8i \text{ for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\gamma_i) = 8i - 3 \text{ for } 1 \leq i \leq \frac{n-2}{2}$$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G .

Meena and Keerthana

Sub case (ii) b): If n is odd.

$$\text{Let } V(G) = \{u_1 u_2 u_3 \dots u_n, v_1 v_2 v_3 \dots v_{n-1}, \alpha_i, \beta_i, \gamma_i / (1 \leq i \leq \frac{n-1}{2})\}$$

$$\text{Let } E(G) = \{u_i v_i / 1 \leq i \leq n-1\} \cup \{v_i u_{i+1} / 1 \leq i \leq n-1\} \cup \{u_{2i} \alpha_i, \alpha_i \gamma_i, \gamma_i \beta_i, u_{2i+1} \beta_i / 1 \leq i \leq \frac{n-1}{2}\}$$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, 4n-3\}$ by,

$$f(u_i) = 4i + 4 - 7 \text{ for } 1 \leq i \leq n \text{ if } i \text{ is odd.}$$

$$f(u_i) = 4i + 4 - 9 \text{ for } 2 \leq i \leq n-1 \text{ if } i \text{ is even}$$

$$f(v_i) = 4i + 4 - 6 \text{ for } 1 \leq i \leq n-1$$

$$f(\alpha_i) = 8i - 4 \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\beta_i) = 8i \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\gamma_i) = 8i - 3 \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G .

From case (i) and case (ii), we conclude that subdivision graph of alternate triangular snake is a heronian mean graph.

Theorem 2.4

$S(A(T_n)) \odot K_1$ is a heronian mean graph.

Proof

Let $G = S(A(T_n)) \odot K_1$

Let $S(A(T_n))$ be a graph obtained by subdividing all the edges of $A(T_n)$.

Let $u_1, u_2, u_3 \dots u_n, v_1, v_2, \dots, v_{n-1}, \alpha_i, \beta_i, \gamma_i$ be the vertices of $S(A(T_n))$.

Let G be the corona product of $S(A(T_n)) \odot K_1$ and let $u'_1, u'_2, u'_3 \dots u'_n, v'_1, v'_2 \dots v'_{n-1}, \alpha'_i, \beta'_i, \gamma'_i$ be the pendant vertices attached at $u_1, u_2, u_3 \dots, u_n, v_1, v_2, \dots, v_{n-1}, \alpha_i, \beta_i, \gamma_i$ respectively. Here we consider two cases are arises.

Case (i)

If $S(A(T_n)) \odot K_1$ starts from u_i with degree of $u_i = 2$. Then we need to consider two subcases.

Sub case (i) a): If n is even.

$$\text{Let } V(G) = \left\{ u_1, u_2, u_3, \dots, u_n, v_1, v_2, v_3, \dots, v_{n-1}, u'_1, u'_2, \dots, u'_n, v'_1, v'_2, \dots, v'_{n-1}, \right. \\ \left. v'_{n-1}, \alpha_i, \alpha'_i, \beta_i, \beta'_i, \gamma_i, \gamma'_i / 1 \leq i \leq \frac{n}{2} \right\}$$

$$\text{Let } E(G) = \{u_i v_i, v_i u_{i+1} / 1 \leq i \leq n-1\} \cup \{u_i u'_i / 1 \leq i \leq n\} \cup \{v_i v'_i / 1 \leq i \leq n-1\} \cup \{\alpha_i \alpha'_i, \beta_i \beta'_i, \gamma_i \gamma'_i / 1 \leq i \leq \frac{n}{2}\} \\ \cup \{u_{2i-1} \alpha_i, \alpha_i \gamma_i, \gamma_i \beta_i, \beta_i u_{2i} / 1 \leq i \leq \frac{n}{2}\}$$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, \frac{15n}{2} - 2\}$ by,

$$f(u_i) = \left\lfloor \frac{15}{2}i - 6 \right\rfloor \text{ for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd.}$$

$$f(u_i) = \frac{15}{2}i - 3 \text{ for } 2 \leq i \leq n \text{ if } i \text{ is even}$$

$$f(v_i) = \left\lfloor \frac{15}{2}i + 2 \right\rfloor \text{ for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd}$$

$$f(v_i) = \frac{15i}{2} - 1 \text{ for } 2 \leq i \leq n-2 \text{ if } i \text{ is even}$$

$$f(u'_i) = \left\lfloor \frac{15}{2}i - 5 \right\rfloor \text{ for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd.}$$

$$f(u'_i) = \frac{15}{2}i - 2 \text{ for } 2 \leq i \leq n \text{ if } i \text{ is even}$$

$$(v'_i) = \left\lfloor \frac{15}{2} + 3 \right\rfloor \text{ for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd}$$

$$f(v'_i) = \frac{15i}{2} \text{ for } 2 \leq i \leq n-2 \text{ if } i \text{ is even}$$

$$f(\alpha_i) = 15i - 12 \text{ for } 1 \leq i \leq \frac{n}{2}$$

$$f(\alpha'_i) = 15i - 11 \text{ for } 1 \leq i \leq \frac{n}{2}$$

Meena and Keerthana

$$f(\beta_i) = 15i - 7 \quad \text{for } 1 \leq i \leq \frac{n}{2}$$

$$f(\beta'_i) = 15i - 6 \quad \text{for } 1 \leq i \leq \frac{n}{2}$$

$$f(\gamma_i) = 15i - 9 \quad \text{for } 1 \leq i \leq \frac{n}{2}$$

$$f(\gamma'_i) = 15i - 8 \quad \text{for } 1 \leq i \leq \frac{n}{2}$$

Then the resulting edge labels are distinct.

In this sub case, is a heronian mean labeling of G.

Sub case (ii) a): If n is odd.

$$\text{Let } V(G) = \left\{ u_1, u_2, u_3, \dots, u_n, v_1, v_2, v_3, \dots, v_{n-1}, u'_1, u'_2, \dots, u'_n, \right. \\ \left. v'_1, v'_2, \dots, v'_{n-1}, \alpha_i, \alpha'_i, \beta_i, \beta'_i, \gamma_i, \gamma'_i / 1 \leq i \leq \frac{n-1}{2} \right\}$$

$$\text{Let } E(G) = \{u_i v_i, v_i u_{i+1} / 1 \leq i \leq n-1\} \cup \{u_i u'_i / 1 \leq i \leq n\} \cup \{v_i v'_i / 1 \leq i \leq n-1\} \cup \{\alpha_i \alpha'_i, \beta_i \beta'_i, \gamma_i \gamma'_i / 1 \leq i \leq \frac{n-1}{2}\} \\ \cup \{u_{2i-1} \alpha_i, \alpha_i \gamma_i, \gamma_i \beta_i, \beta_i u_{2i} / 1 \leq i \leq \frac{n-1}{2}\}$$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, \lfloor \frac{15}{2}n - 5 \rfloor\}$ by,

$$f(u_i) = \left\lfloor \frac{15}{2}i - 6 \right\rfloor \quad \text{for } 1 \leq i \leq n \text{ if } i \text{ is odd.}$$

$$f(u_i) = \frac{15}{2}i - 3 \quad \text{for } 2 \leq i \leq n-1 \text{ if } i \text{ is even}$$

$$f(v_i) = \left\lfloor \frac{15}{2}i + 2 \right\rfloor \quad \text{for } 1 \leq i \leq n-2 \text{ if } i \text{ is odd}$$

$$f(v_i) = \frac{15i}{2} - 1 \quad \text{for } 2 \leq i \leq n-1 \text{ if } i \text{ is even}$$

$$f(u'_i) = \left\lfloor \frac{15}{2}i - 5 \right\rfloor \quad \text{for } 1 \leq i \leq n \text{ if } i \text{ is odd.}$$

$$f(u'_i) = \frac{15}{2}i - 2 \quad \text{for } 2 \leq i \leq n-1 \text{ if } i \text{ is even}$$

$$f(v'_i) = \left\lfloor \frac{15}{2}i + 3 \right\rfloor \quad \text{for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd}$$

$$f(v'_i) = \frac{15i}{2} \quad \text{for } 2 \leq i \leq n-2 \text{ if } i \text{ is even}$$

$$f(\alpha_i) = 15i - 12 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\alpha'_i) = 15i - 11 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\beta_i) = 15i - 7 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\beta'_i) = 15i - 6 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\gamma_i) = 15i - 9 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\gamma'_i) = 15i - 8 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G.

Case (ii)

If $S(A(T_n)) \odot K_1$ starts from u_2 with degree of $u_1 = 1$. Then we need to consider two subcases.

Sub case (i) a): If n is even.

$$\text{Let } V(G) = \left\{ u_1, u_2, u_3, \dots, u_n, v_1, v_2, v_3, \dots, v_{n-1}, u'_1, u'_2, \dots, u'_n, \right. \\ \left. v'_1, v'_2, \dots, v'_{n-1}, \alpha_i, \alpha'_i, \beta_i, \beta'_i, \gamma_i, \gamma'_i / 1 \leq i \leq \frac{n-2}{2} \right\}$$

$$\text{Let } E(G) = \{u_i v_i, v_i u_{i+1} / 1 \leq i \leq n-1\} \cup \{u_i u'_i / 1 \leq i \leq n\} \cup \{v_i v'_i / 1 \leq i \leq n-1\} \cup \{\alpha_i \alpha'_i, \beta_i \beta'_i, \gamma_i \gamma'_i / 1 \leq i \leq \frac{n-2}{2}\} \\ \cup \{u_{2i} \alpha_i, \alpha_i \gamma_i, \gamma_i \beta_i, \beta_i u_{2i+1} / 1 \leq i \leq \frac{n-2}{2}\}$$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, \frac{15n}{2} - 9\}$ by,

$$f(u_i) = \left\lfloor \frac{15i}{2} - 7 \right\rfloor \quad \text{for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd.}$$

$$f(u_i) = \frac{15}{2}i - 10 \quad \text{for } 2 \leq i \leq n \text{ if } i \text{ is even}$$

$$f(v_i) = \left\lfloor \frac{15}{2}i - 5 \right\rfloor \quad \text{for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd}$$

$$f(v_i) = \frac{15i}{2} - 1 \quad \text{for } 2 \leq i \leq n-2 \text{ if } i \text{ is even}$$

Meena and Keerthana

$$f(u'_i) = \left\lfloor \frac{15}{2}i - 6 \right\rfloor \text{ for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd.}$$

$$f(u'_i) = \frac{15}{2}i - 9 \text{ for } 2 \leq i \leq n \text{ if } i \text{ is even}$$

$$f(v'_i) = \left\lfloor \frac{15}{2}i - 4 \right\rfloor \text{ for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd}$$

$$f(v'_i) = \frac{15i}{2} \text{ for } 2 \leq i \leq n-2 \text{ if } i \text{ is even}$$

$$f(\alpha_i) = 15i - 8 \text{ for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\alpha'_i) = 15i - 7 \text{ for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\beta_i) = 15i - 3 \text{ for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\beta'_i) = 15i - 2 \text{ for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\gamma_i) = 15i - 5 \text{ for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\gamma'_i) = 15i - 4 \text{ for } 1 \leq i \leq \frac{n-2}{2}$$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G .

Sub case (ii) a): If n is odd.

$$\text{Let } V(G) = \left\{ u_1, u_2, u_3, \dots, u_n, v_1, v_2, v_3, \dots, v_{n-1}, u'_1, u'_2, \dots, u'_n, \right. \\ \left. v'_1, v'_2, \dots, v'_{n-1}, \alpha_i, \alpha'_i, \beta_i, \beta'_i, \gamma_i, \gamma'_i \mid 1 \leq i \leq \frac{n-1}{2} \right\}$$

$$\text{Let } E(G) = \{u_i v_i, v_i u_{i+1} \mid 1 \leq i \leq n-1\} \cup \{u_i u'_i \mid 1 \leq i \leq n\} \cup \{v_i v'_i \mid 1 \leq i \leq n-1\} \cup \{\alpha_i \alpha'_i, \beta_i \beta'_i, \gamma_i \gamma'_i \mid 1 \leq i \leq \frac{n-1}{2}\} \cup \{u_{2i} \alpha_i, \alpha_i \gamma_i, \gamma_i \beta_i, \beta_i u_{2i+1} \mid 1 \leq i \leq \frac{n-1}{2}\}$$

Define a function $f: V(G) \rightarrow \left\{1, 2, \dots, \left\lfloor \frac{15n}{2} - 6 \right\rfloor\right\}$ by,

$$f(u_i) = \left\lfloor \frac{15i}{2} - 7 \right\rfloor \text{ for } 1 \leq i \leq n \text{ if } i \text{ is odd.}$$

$$f(u_i) = \frac{15}{2}i - 10 \text{ for } 2 \leq i \leq n-1 \text{ if } i \text{ is even}$$

$$f(v_i) = \left\lfloor \frac{15}{2}i - 5 \right\rfloor \text{ for } 1 \leq i \leq n-2 \text{ if } i \text{ is odd}$$

$$f(v_i) = \frac{15i}{2} - 1 \text{ for } 2 \leq i \leq n-1 \text{ if } i \text{ is even}$$

$$f(u'_i) = \left\lfloor \frac{15}{2}i - 6 \right\rfloor \text{ for } 1 \leq i \leq n \text{ if } i \text{ is odd.}$$

$$f(u'_i) = \frac{15}{2}i - 9 \text{ for } 2 \leq i \leq n-1 \text{ if } i \text{ is even}$$

$$f(v'_i) = \left\lfloor \frac{15}{2}i - 4 \right\rfloor \text{ for } 1 \leq i \leq n-2 \text{ if } i \text{ is odd}$$

$$f(v'_i) = \frac{15i}{2} \text{ for } 2 \leq i \leq n-1 \text{ if } i \text{ is even}$$

$$f(\alpha_i) = 15i - 8 \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\alpha'_i) = 15i - 7 \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\beta_i) = 15i - 3 \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\beta'_i) = 15i - 2 \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\gamma_i) = 15i - 5 \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\gamma'_i) = 15i - 4 \text{ for } 1 \leq i \leq \frac{n-1}{2}$$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G .

From case (i) and case (ii), we conclude $S(A(T_n)) \odot K_1$ is heronian mean graph.

Theorem 2.5

$S(A(T_n)) \odot \overline{K_2}$ is a heronian mean graph.

Proof

Let $G = S(A(T_n)) \odot \overline{K_2}$

Meena and Keerthana

Let $S(A(T_n))$ be a graph obtained by subdividing all the edges of $A(T_n)$.

Let $u_1 u_2 u_3 \dots u_n, v_1 v_2 \dots v_{n-1}, \alpha_i, \beta_i, \gamma_i$ be the vertices of $S(A(T_n))$.

Let G be the corona product $S(A(T_n)) \odot \overline{K_2}$ and let $u'_1 u'_2 u'_3 \dots u'_n, v'_1 v'_2 v'_3 \dots v'_{n-1},$

$\alpha'_i, \beta'_i, \gamma'_i$ and $u''_1 u''_2 u''_3 \dots u''_n, v''_1 v''_2 v''_3 \dots v''_{n-1}, \alpha''_i, \beta''_i, \gamma''_i$ be the pendant vertices attached at $u_1, u_2, u_3 \dots, u_n, v_1, v_2, \dots, v_{n-1}, \alpha_i, \beta_i, \gamma_i$ respectively. Here we consider two cases arise.

Case (i)

If $G = S(A(T_n)) \odot \overline{K_2}$ starts from u_1 with degree of $u_1 = 2$. Then we need to consider two subcases.

Sub case (i) a): If n is even.

Let $(G) = \left\{ u_1 u_2 u_3 \dots u_n, v_1 v_2 v_3 \dots v_{n-1}, u'_1 u'_2 \dots u'_n, u''_1 u''_2 \dots u''_n, v'_1, \dots, v'_{n-1}, v''_1, \dots, v''_{n-1}, \alpha_i, \alpha'_i, \alpha''_i, \beta_i, \beta'_i, \beta''_i, \gamma_i, \gamma'_i, \gamma''_i / 1 \leq i \leq \frac{n}{2} \right\}$

Let $E(G) = \{u_i v_i, v_i u_{i+1} / 1 \leq i \leq n-1\} \cup \{u_{2i-1} \alpha_i, \alpha_i \gamma_i / 1 \leq i \leq \frac{n}{2}\}$

$\cup \{ \gamma_i \beta_i, \beta_i u_{2i} / 1 \leq i \leq \frac{n}{2} \} \cup \{ u_i u'_i, u_i u''_i / 1 \leq i \leq n \} \cup \{ v_i v'_i, v_i v''_i / 1 \leq i \leq n-1 \} \cup \{ \alpha_i \alpha'_i, \alpha_i \alpha''_i / 1 \leq i \leq \frac{n}{2} \}$

$\cup \{ \gamma_i \gamma'_i, \gamma_i \gamma''_i / 1 \leq i \leq \frac{n}{2} \} \cup \{ \beta_i \beta'_i, \beta_i \beta''_i / 1 \leq i \leq \frac{n}{2} \}$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, 11n-3\}$ by,

$f(u_i) = 11i - 9$ for $1 \leq i \leq n-1$ if i is odd

$f(u_i) = 11i - 4$ for $2 \leq i \leq n$ if i is even

$f(v_i) = 11i + 4$ for $1 \leq i \leq n-1$ if i is odd

$f(v_i) = 11i - 1$ for $2 \leq i \leq n-2$ if i is even

$f(u'_i) = 11i - 10$ for $1 \leq i \leq n-1$ if i is odd

$f(u'_i) = 11i - 5$ for $2 \leq i \leq n$ if i is even

$f(u''_i) = 11i - 8$ for $1 \leq i \leq n-1$ if i is odd

$f(u''_i) = 11i - 3$ for $2 \leq i \leq n$ if i is even

$f(v'_i) = 11i + 3$ for $1 \leq i \leq n-1$ if i is odd

$f(v'_i) = 11i - 2$ for $2 \leq i \leq n-2$ if i is even

$f(v''_i) = 11i + 5$ for $1 \leq i \leq n-1$ if i is odd

$f(v''_i) = 11i$ for $2 \leq i \leq n-2$ if i is even

$f(\alpha_i) = 22i - 17$ for $1 \leq i \leq \frac{n}{2}$

$f(\alpha'_i) = 22i - 18$ for $1 \leq i \leq \frac{n}{2}$

$f(\alpha''_i) = 22i - 16$ for $1 \leq i \leq \frac{n}{2}$

$f(\beta_i) = 22i - 10$ for $1 \leq i \leq \frac{n}{2}$

$f(\beta'_i) = 22i - 11$ for $1 \leq i \leq \frac{n}{2}$

$f(\beta''_i) = 22i - 9$ for $1 \leq i \leq \frac{n}{2}$

$f(\gamma_i) = 22i - 13$ for $1 \leq i \leq \frac{n}{2}$

$f(\gamma'_i) = 22i - 14$ for $1 \leq i \leq \frac{n}{2}$

$f(\gamma''_i) = 22i - 12$ for $1 \leq i \leq \frac{n}{2}$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G .

Sub case (ii) a): If n is odd.

Let $V(G) = \left\{ u_1 u_2 u_3 \dots u_n, v_1 v_2 v_3 \dots v_{n-1}, u'_1 u'_2 \dots u'_n, u''_1 u''_2 \dots u''_n, v'_1, v'_2, \dots, v'_{n-1}, v''_1 v''_2 \dots v''_{n-1}, \alpha_i, \alpha'_i, \alpha''_i, \beta_i, \beta'_i, \beta''_i, \gamma_i, \gamma'_i, \gamma''_i / 1 \leq i \leq \frac{n-1}{2} \right\}$

Let $E(G) = \{u_i v_i, v_i u_{i+1} / 1 \leq i \leq n-1\} \cup \{u_{2i-1} \alpha_i, \alpha_i \gamma_i / 1 \leq i \leq \frac{n-1}{2}\}$

Meena and Keerthana

$$\cup \{ \gamma_i \beta_i, \beta_i u_{2i} / 1 \leq i \leq \frac{n-1}{2} \} \cup \{ u_i u'_i, u_i u''_i / 1 \leq i \leq n \}$$

$$\cup \{ v_i v'_i, v_i v''_i / 1 \leq i \leq n-1 \} \cup \{ \alpha_i \alpha'_i, \alpha_i \alpha''_i / 1 \leq i \leq \frac{n-1}{2} \} \cup \{ \gamma_i \gamma'_i, \gamma_i \gamma''_i / 1 \leq i \leq \frac{n-1}{2} \} \cup \{ \beta_i \beta'_i, \beta_i \beta''_i / 1 \leq i \leq \frac{n-1}{2} \}$$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, 11n-8\}$ by,

$$\begin{aligned} f(u_i) &= 11i-9 && \text{for } 1 \leq i \leq n \text{ if } i \text{ is odd} \\ f(u_i) &= 11i-4 && \text{for } 2 \leq i \leq n-1 \text{ if } i \text{ is even} \\ f(v_i) &= 11i+4 && \text{for } 1 \leq i \leq n-2 \text{ if } i \text{ is odd} \\ f(v_i) &= 11i-1 && \text{for } 2 \leq i \leq n-1 \text{ if } i \text{ is even} \\ f(u'_i) &= 11i-10 && \text{for } 1 \leq i \leq n \text{ if } i \text{ is odd} \\ f(u'_i) &= 11i-5 && \text{for } 2 \leq i \leq n-1 \text{ if } i \text{ is even} \\ f(u''_i) &= 11i-8 && \text{for } 1 \leq i \leq n \text{ if } i \text{ is odd} \\ f(u''_i) &= 11i-3 && \text{for } 2 \leq i \leq n-1 \text{ if } i \text{ is even} \\ f(v'_i) &= 11i+3 && \text{for } 1 \leq i \leq n-2 \text{ if } i \text{ is odd} \\ f(v'_i) &= 11i-2 && \text{for } 2 \leq i \leq n-1 \text{ if } i \text{ is even} \\ f(v''_i) &= 11i+5 && \text{for } 1 \leq i \leq n-2 \text{ if } i \text{ is odd} \\ f(v''_i) &= 11i && \text{for } 2 \leq i \leq n-1 \text{ if } i \text{ is even} \\ f(\alpha_i) &= 22i-17 && \text{for } 1 \leq i \leq \frac{n-1}{2} \\ f(\alpha'_i) &= 22i-18 && \text{for } 1 \leq i \leq \frac{n-1}{2} \\ f(\alpha''_i) &= 22i-16 && \text{for } 1 \leq i \leq \frac{n-1}{2} \\ f(\beta_i) &= 22i-10 && \text{for } 1 \leq i \leq \frac{n-1}{2} \\ f(\beta'_i) &= 22i-11 && \text{for } 1 \leq i \leq \frac{n-1}{2} \\ f(\beta''_i) &= 22i-9 && \text{for } 1 \leq i \leq \frac{n-1}{2} \\ f(\gamma_i) &= 22i-13 && \text{for } 1 \leq i \leq \frac{n-1}{2} \\ f(\gamma'_i) &= 22i-14 && \text{for } 1 \leq i \leq \frac{n-1}{2} \\ f(\gamma''_i) &= 22i-12 && \text{for } 1 \leq i \leq \frac{n-1}{2} \end{aligned}$$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G .

Case (ii)

If $S(A(T_n)) \odot \overline{K_2}$ starts from u_2 with degree of $u_1 = 1$ Then we need to consider two subcases.

Sub case (i) a): If n is even.

$$\text{Let } (G) = \left\{ u_1 u_2 u_3 \dots u_n, v_1 v_2 v_3 \dots v_{n-1}, u'_1 u'_2 \dots u'_n, u''_1 u''_2 \dots u''_n, v'_1 v'_2 \dots v'_{n-1}, v''_1 v''_2 \dots v''_{n-1}, \alpha_i, \alpha'_i, \alpha''_i, \beta_i, \beta'_i, \beta''_i, \gamma_i, \gamma'_i, \gamma''_i / 1 \leq i \leq \frac{n-2}{2} \right\}$$

$$\text{Let } E(G) = \{ u_i v_i, v_i u_{i+1} / 1 \leq i \leq n-1 \} \cup \{ u_{2i} \alpha_i, \alpha_i \gamma_i / 1 \leq i \leq \frac{n-2}{2} \}$$

$$\cup \{ \gamma_i \beta_i, \beta_i u_{2i+1} / 1 \leq i \leq \frac{n-2}{2} \} \cup \{ u_i u'_i, u_i u''_i / 1 \leq i \leq n \} \cup \{ v_i v'_i, v_i v''_i / 1 \leq i \leq n-1 \} \cup \{ \alpha_i \alpha'_i, \alpha_i \alpha''_i / 1 \leq i \leq \frac{n-2}{2} \}$$

$$\cup \{ \gamma_i \gamma'_i, \gamma_i \gamma''_i / 1 \leq i \leq \frac{n-2}{2} \} \cup \{ \beta_i \beta'_i, \beta_i \beta''_i / 1 \leq i \leq \frac{n-2}{2} \}$$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, 11n-13\}$ by

$$\begin{aligned} f(u_i) &= 11i-9 && \text{for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd} \\ f(u_i) &= 11i-14 && \text{for } 2 \leq i \leq n \text{ if } i \text{ is even} \\ f(v_i) &= 11i-6 && \text{for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd} \\ f(v_i) &= 11i-1 && \text{for } 2 \leq i \leq n-2 \text{ if } i \text{ is even} \\ f(u'_i) &= 11i-10 && \text{for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd} \\ f(u'_i) &= 11i-15 && \text{for } 2 \leq i \leq n \text{ if } i \text{ is even} \\ f(u''_i) &= 11i-8 && \text{for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd} \\ f(u''_i) &= 11i-13 && \text{for } 2 \leq i \leq n \text{ if } i \text{ is even} \\ f(v'_i) &= 11i-7 && \text{for } 1 \leq i \leq n-1 \text{ if } i \text{ is odd} \end{aligned}$$

Meena and Keerthana

$$f(v'_i) = 11i - 2 \quad \text{for } 2 \leq i \leq n - 2 \quad \text{if } i \text{ is even}$$

$$f(v''_i) = 11i - 5 \quad \text{for } 1 \leq i \leq n - 1 \quad \text{if } i \text{ is odd}$$

$$f(v'''_i) = 11i \quad \text{for } 2 \leq i \leq n - 2 \quad \text{if } i \text{ is even}$$

$$f(\alpha_i) = 22i - 11 \quad \text{for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\alpha'_i) = 22i - 12 \quad \text{for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\alpha''_i) = 22i - 10 \quad \text{for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\beta_i) = 22i - 7 \quad \text{for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\beta'_i) = 22i - 8 \quad \text{for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\beta''_i) = 22i - 6 \quad \text{for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\gamma_i) = 22i - 4 \quad \text{for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\gamma'_i) = 22i - 5 \quad \text{for } 1 \leq i \leq \frac{n-2}{2}$$

$$f(\gamma''_i) = 22i - 3 \quad \text{for } 1 \leq i \leq \frac{n-2}{2}$$

Then the resulting edge labels are distinct.

In this sub case, f is a heronian mean labeling of G .

Sub case (ii) a): If n is odd.

$$\text{Let } (G) = \left\{ u_1 u_2 u_3 \dots u_n, v_1 v_2 v_3 \dots v_{n-1}, u'_1 u'_2 \dots u'_n, u''_1 u''_2 \dots u''_n, v'_1 v'_2 \dots v'_{n-1}, v''_1 v''_2 \dots v''_{n-1}, \alpha_i, \alpha'_i, \alpha''_i, \beta_i, \beta'_i, \beta''_i, \gamma_i, \gamma'_i, \gamma''_i \mid 1 \leq i \leq \frac{n-1}{2} \right\}$$

$$\text{Let } E(G) = \{u_i v_i, v_i u_{i+1} \mid 1 \leq i \leq n-1\} \cup \{u_{2i} \alpha_i, \alpha_i \gamma_i \mid 1 \leq i \leq \frac{n-1}{2}\} \cup \{\gamma_i \beta_i, \beta_i u_{2i+1} \mid 1 \leq i \leq \frac{n-1}{2}\} \cup \{u_i u'_i, u_i u''_i \mid 1 \leq i \leq n\} \cup \{v_i v'_i, v_i v''_i \mid 1 \leq i \leq n-1\} \cup \{\alpha_i \alpha'_i, \alpha_i \alpha''_i \mid 1 \leq i \leq \frac{n-1}{2}\} \cup \{\gamma_i \gamma'_i, \gamma_i \gamma''_i \mid 1 \leq i \leq \frac{n-1}{2}\} \cup \{\beta_i \beta'_i, \beta_i \beta''_i \mid 1 \leq i \leq \frac{n-1}{2}\}$$

Define a function $f: V(G) \rightarrow \{1, 2, \dots, 11n - 8\}$ by

$$f(u_i) = 11i - 9 \quad \text{for } 1 \leq i \leq n \quad \text{if } i \text{ is odd}$$

$$f(u_i) = 11i - 14 \quad \text{for } 2 \leq i \leq n - 1 \quad \text{if } i \text{ is even}$$

$$f(v_i) = 11i - 6 \quad \text{for } 1 \leq i \leq n - 2 \quad \text{if } i \text{ is odd}$$

$$f(v_i) = 11i - 1 \quad \text{for } 2 \leq i \leq n - 1 \quad \text{if } i \text{ is even}$$

$$f(u'_i) = 11i - 10 \quad \text{for } 1 \leq i \leq n \quad \text{if } i \text{ is odd}$$

$$f(u'_i) = 11i - 15 \quad \text{for } 2 \leq i \leq n - 1 \quad \text{if } i \text{ is even}$$

$$f(u''_i) = 11i - 8 \quad \text{for } 1 \leq i \leq n \quad \text{if } i \text{ is odd}$$

$$f(u''_i) = 11i - 13 \quad \text{for } 2 \leq i \leq n - 1 \quad \text{if } i \text{ is even}$$

$$f(v'_i) = 11i - 7 \quad \text{for } 1 \leq i \leq n - 2 \quad \text{if } i \text{ is odd}$$

$$f(v'_i) = 11i - 2 \quad \text{for } 2 \leq i \leq n - 1 \quad \text{if } i \text{ is even}$$

$$f(v''_i) = 11i - 5 \quad \text{for } 1 \leq i \leq n - 2 \quad \text{if } i \text{ is odd}$$

$$f(v''_i) = 11i \quad \text{for } 2 \leq i \leq n - 1 \quad \text{if } i \text{ is even}$$

$$f(\alpha_i) = 22i - 11 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\alpha'_i) = 22i - 12 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\alpha''_i) = 22i - 10 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\beta_i) = 22i - 7 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\beta'_i) = 22i - 8 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\beta''_i) = 22i - 6 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\gamma_i) = 22i - 4 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\gamma'_i) = 22i - 5 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

$$f(\gamma''_i) = 22i - 3 \quad \text{for } 1 \leq i \leq \frac{n-1}{2}$$

Then the resulting edge labels are distinct.

Meena and Keerthana

In this sub case, f is a heronian mean labeling of G .

From case (i) and case (ii), we conclude $S(A(T_n)) \odot \overline{K_2}$ is heronian mean graph.

CONCLUSION

In this paper we have presented a few results on heronian mean labeling of corona product of subdivision certain classes of triangular snake graphs $S(T_n) \odot K_1$, $S(T_n) \odot \overline{K_2}$, $S(A(T_n))$, $S(A(T_n)) \odot K_1$ and $S(A(T_n)) \odot \overline{K_2}$. Analogous work can be carried out for other families and in the context of different types of graph labeling technique".

ABSTRACT

Nanosponges are small sponges with the size same as virus, which can be filled within drug molecules. These small Particles can move throughout the body until they Came in contact with the desired location and attach to the surface and started release of medicament in a systemic and regulated manner. Thus the medicament can be distributed at the designated targeted location. It will be more efficient for a particular given dosage. Nanosponges are five times more potent than the other conventional dosage form. Oral drug administration is the most widely accepted method in conventional drug delivery systems; yet, it also presents challenges to many drugs' for their desired pharmacological action. When a drug introduced into the body, it passes through a number of barriers that are already present in the human system. Once they reached at the target site, the drug may not be able to show its pharmacological action due to the present of number of barriers, including the saliva, liver, and gastrointestinal tract. Because of this, the solubility and bioavailability have been significantly impacted; in order to sort out these problems, inventors have created an "Innovative approach" known as "Nanosponges." Nanosponges are a novel category of Nano-materials with a unique porous structure, enabling them to capture, neutralize, and deliver a variety of substances. These versatile nanoparticles have shown significant promise in fields such as medicine, environmental science, and industry. They are generally non-toxic, non- irritating, non-allergic, and non-mutagenic. Nanosponges can be formed by using a

**Indrayani Sopan Lokhande et al.,**

variety of methods, like Solvent Evaporation Technique, Quasi emulsion method, Ultrasound assisted synthesis and melt method. Nano-sponge is used for topical application, oral drug delivery, cancer therapy, Ocular drug delivery and also for the sustained delivery system. This review explores the structure and composition of Nanosponges, their mechanisms of action, current applications, and future directions.

Keywords: Bioavailability, controlled drug delivery, cross linker, Nanosponges, Solubility.

INTRODUCTION

The Solid, cross-linked polymeric microscopic porous structures known as Nanosponges which are hydrophilic and generally insoluble in water. They maintain their stability across a wide range of pH and temperature. It is recognized as a specialized field for the delivery of drugs, as well as for the diagnosis, prognosis and treatment of illness employing nano engineered instruments [1]. Naturally biodegradable polyester serves as the "backbone" of the Nanosponges. A common method to incorporate Nanosponges into a dosage form is to employ them as tiny, porous structures that resemble tiny meshes and can hold a wide range of compounds either contained or suspended. Nanosponges having a 3D Structure, narrow size distribution and high entrapment efficiency [2, 3]. Nanosponges represent an exciting advancement in nanotechnology, combining high surface area, biocompatibility, and customizable surface properties. These attributes make them suitable for diverse applications, from drug delivery systems to environmental cleanup. When a drug introduced into the body, it passes through a number of barriers that are already present in the human system. Once they reached at the target site, the drug may not be able to show its pharmacological action due to the present of number of barriers, including the saliva, liver, and gastrointestinal tract. Because of this, the solubility and bioavailability have been significantly impacted; in order to sort out these problems, inventors have created an "Innovative approach" known as "Nanosponges[4]." Nanosponges are based on nanotechnology, which is used in pharmacy to generate nanomaterial that can diagnose, target specific body parts, and regulate the drug delivery system. A Nanosponge improves the dissolvability of the poorly water insoluble drugs and shows the good therapeutic Activity. Generally the term Nanosponges utilizes in the cancerous patient for the acting on target site. As the chemotherapeutic agent may cause the major body organ hence the Nanosponges helps to reach in specific site in specific manner and prevent organ damaging.

They are five times more potent than the other conventional dosage form. They protect the molecular agents from degradation. As compared to the nanoparticles, Nano sponges are less soluble in water and organic solvents. A nanosponge plays a significant role in the various drug delivery systems like oral, topical, IV and immuno-suppressant. Targeting drug delivery has become an ongoing challenge for medical researchers these days. How to get a drug into the body at the proper location and time? How to regulate the drug's release, how it interacts with the body, how therapeutic it is, how safe it is, How to regulate the release to prevent the effects of an overdose. This problem was solved by using the nanotechnology. i.e. Nanosponges which is complex molecule. This nanosponge can be easily targeted to specific targeting cells or tissues. By changing the ratio of cross-linking agent to polymer, size of the nanosponge particles may also be controlled. This allows for the creation of larger or smaller nanostructures. Hydrophobic molecules can be added to Nanosponges through their cavity, whereas lesser lipophilic molecules are feasible due to the outer polymeric network's greater hydrophilicity. A number of methods, including the interfacial phenomenon, hot melting process, hyper-crosslinked cyclodextrin, solvent condensation assisted by ultrasound, microwave (MW) assisted synthesis, mechanochemical synthesis, chain-growth poly-condensation, and emulsion solvent evaporation methods, have been introduced for the synthesis of Nanosponges [5]. The use of nanosponge technology has been investigated for a number of purposes, including increasing the bioavailability of drug molecules and delivering medications via oral, topical, and parenteral routes. Enzymes, proteins, vaccines, and antibodies can all be delivered and released using Nanosponges as a carrier for biocatalysts [6].

**Indrayani Sopan Lokhande et al.,****BACKGROUND**

Nanosponges represent a revolutionary advance in the field of nanotechnology, offering a unique and versatile approach to drug delivery. These microscopic structures typically composed of polymeric materials, which are characterized by their porous, sponge-like appearance. Nanosponges are five times more potent than conventional drug delivery system. This molecule allows them to encapsulate and release therapeutic agents in a controlled and predictable manner, addressing a range of challenges in pharmaceutical and healthcare research. The basic aim of formulating Nanosponges is to create a versatile, effective, and efficient delivery system or remediation tool that leverages their unique properties. When a drug introduced into the body, it passes through a number of barriers that are already present in the human system.

KEY CHARACTERISTICS OF NANOSPONGES

Nanosponges are characterized by their Spongy porous network, large surface area, and biocompatibility. They can be surface-functionalized to target specific molecules, by enhancing their versatility for various applications.

1. **Porous Structure:** The sponge-like architecture provides a large surface area, enabling efficient encapsulation and adsorption.
2. **Biocompatibility:** Often made from biodegradable polymers, Nanosponges are safe for use in biological systems.
3. **Surface Functionalization:** The surface can be chemically modified to target specific molecules or cells, improving their efficacy for targeted applications.

FEATURES

- ❖ Their aqueous solubility, which is a key characteristic of these sponges, which enables the successful application to these methods for medicines with narrow solubility.
- ❖ They may be transport both lipophilic and hydrophilic medications.
- ❖ They have been utilized as Nano-carriers for biomedical applications, as well as for the elimination of organic impurity from water.
- ❖ This method provides trapping of chemicals, decreased adverse effects, high sophistication, and higher adaptability.
- ❖ Nanosponges extremely soluble materials that may disperse at the molecular level, Stabilizing and shielding their structures from substances like chemicals, light, and oxygen [7, 8].

ADVANTAGES

- Enhance aqueous solubility
- Reduces the adverse effects
- High biocompatibility
- low cytotoxicity
- It is non-mutagenic
- Cost effective.
- Improved circulation half-life.
- Less side effects
- improves the stability and formulation flexibility
- Act as a self-sterilizer.
- Reduce dosing frequency [9-11].

DISADVANTAGE

- Dose dumping
- Limited only for small molecules [9-11].

The particles of nanosponge carry both hydrophilic and lipophilic molecules and thus by improve the bioavailability and solubility of the drug. There are two types of Nanosponges used crystalline and para-crystalline. During the

**Indrayani Sopan Lokhande et al.,**

drug complexation process, the crystalline structure of Nanosponges is important. Nanosponges are generally soluble in most of the organic solvent like alcohol, acetone, ketone etc. and chemically do not breakdown into the water molecule [13]. The structure of nanosponges is shown in fig. 1. The aqueous solubility is main characteristics of Nanosponges which enables the successful application of medicament for their limited solubility. This method provides the trapping of chemicals, decreased the adverse effects and side effect, also increased elegance, and higher formulation flexibility. Nanosponges are extremely solubilized materials that might be disperse at the molecular level, and stabilizing their structures from substances like chemicals, light, and oxygen [14]. Porous polymeric tiny form which is spherical particle with large porous surface are called as Nanosponges. Nanosponges have solubilisation capacity for poorly soluble drug and prolong the release rate of the drug molecule by enhancing the bioavailability [31]. Nano-sponge's particles are solid in nature. They have been determined to be safe for oral and percutaneous routes, therefore they can be used as an intrinsic carrier for administering drugs [15, 23]. Nanosponges can be delivered via pulmonary and venous routes due to their small size [16]. The molecules in an oral medication delivery system may be spread in a matrix of excipients. For parenteral administration, the complex can be simply transported in sterile water, saline, or other aqueous solutions. They can be efficiently incorporated into topical hydrogels for topical administration [17,26]. Nanosponges are encapsulating nanoparticles that contain the medication inside their core [24].

TYPES OF NANOSPONGES

These are one of the essential types of Nanosponges that can characterize or unite the calm components in its midsection [25]. The distribution of the Nanosponges into three classes using the method of drug complexation is

1. Encapsulating Nanosponges
2. Complex Nanosponges
3. Conjugating Nanosponges

Encapsulating Nanosponges

These are amalgamate Nanosponges, which have many holes like alginate Nanosponges and encapsulate the medications in the middle.

Complex Nanosponges

Electrostatic charges are used in these to draw the drug molecules.

Conjugating nanosponges

These require a powerful covalent bond to bind the medication to the nanoparticle.

COMPOSITION AND STRUCTURE OF NANOSPONGES:

1. Polymer
2. Cross linking agent
3. Surfactant
4. Drug substance

Polymer

The selection of polymer is important and crucial parameter [10,18,19]. The polymer selection helps for the binding of drug and the ligand molecule to form the complex. The polymer has ability to cross linking based on how functional moieties and active compounds are substituted [22]. The polymer selection can affect both the composition and the way that Nanosponges form. Examples: Hyper Cross-linked Polystyrene, Cyclodextrins, & their derivatives such as Methyl β -Cyclodextrin, Hydroxy Propyl β -Cyclodextrin, & Alkyl-oxy carbonyl Cyclodextrins.

**Indrayani Sopan Lokhande et al.,****Cross linking agent**

Polyester parts are linked with the help of cross-linkers. Polyesters are attracted to cross linkers, and the resulting link forms a spherical structure with many pockets. These pockets create the encapsulating type of nanoparticles known as Nanosponges, which shield the active drug molecules from deterioration by protecting them within their core. Selective engulfment, transfer, and delivery of many types of molecules can be obtained via cross linkers[29]. The choice of cross linking agent or cross linkers is based upon the molecular composition and polymer structure intended for use in the formulation of Nanosponges[10, 18, 19]. Examples: Diphenyl Carbonate, Di-aryl carbonates, Carboxylic acid, Acetic acid, Glutardehyde, etc.

Surfactant

A common surfactant used in the production of Nanosponges is polyvinyl alcohol, which is also necessary for the development of smaller size Nanosponges. It was found that when the concentration of surfactant increased, then the sizes of particles also get increased. The efficiency of encapsulating drug is decreased as surfactant concentration is got increased [10, 18, 19]. Examples: Polyvinyl alcohol, dichloromethane, Ethanol, etc.

Drug Substance

Drug molecule should possess following criteria [20]

- Molecular weight of drug is in between 200-400Daltons.
- MP should be below 250°C
- Solubility should be ≥ 10 mg/ml

MECHANISM OF ACTION FOR RELEASE OF NANOSPONGES

Nanosponges possess an open structure which having the capacity of formulating the encapsulated form of Active constituent and vehicle, The active constituent is freely movable until they becomes saturated and maintain equilibrium. When product is applied topically, the vehicle becomes unsaturated and they disturb the equilibrium condition thus the Active constituent of Nanosponges travelling from epidermis until vehicle is get either absorbed or dried. Even after the retention of the nanosponge to the skin surface. (Stratum corneum) The release rate is for longer duration of time [19].

METHOD OF PREPARATION

We may develop the Nanosponges by using several techniques [21]. These techniques are:

Solvent Evaporation Technique

This approach consists of dissolving the polymer and medicament in a solvent that is organic, emulsification in an aqueous phase, and evaporating the solvent to form Nanosponges [24].

Emulsion Solvent Diffusion method:

Similar to the solvent evaporation technology, this technique uses a partially water-miscible solvent to form an emulsion, allowing the solvent to diffuse and precipitate the Nanosponges.

Quasi Emulsion Method

Quasi method is described as follows [28]

Ultrasound assisted synthesis

Ultrasound energy is used to facilitate the reaction and formation of Nanosponges, often used for rapid synthesis [27].

**Indrayani Sopan Lokhande et al.,****Melt method****APPLICATIONS OF NANOSPONGES**

Nanosponges have diverse applications across medical, environmental, and industrial fields³⁰.

1. Medical Applications

- o **Detoxification:** Nanosponges can neutralize bacterial toxins, venoms, and other harmful agents in the bloodstream.
- o **Drug Delivery:** They can encapsulate and deliver drugs directly to diseased cells, such as cancer cells, enhancing treatment outcomes.
- o **Wound Healing:** Nanosponges incorporated into wound dressings release antimicrobial agents to promote healing and prevent infection.

2. Environmental Applications

- o **Pollution Control:** Nanosponges can adsorb pollutants from water and air, offering solutions for environmental cleanup.
- o **Oil Spill Cleanup:** Their ability to adsorb hydrophobic substances makes them effective in cleaning up oil spills.

3. Industrial Applications

- o **Catalysis:** Functionalized Nanosponges can serve as catalysts in chemical reactions, improving efficiency and selectivity.
- o **Filtration:** Nanosponges can be used in filtration systems to remove contaminants from industrial processes.

CHALLENGES

Despite their potential, Nanosponges face challenges such as complex manufacturing, regulatory approval, and scalability

- **Manufacturing Complexity:** Ensuring consistent quality and properties.
- **Regulatory Approval:** Meeting safety and efficacy standards for medical and environmental applications.
- **Scalability:** Developing cost-effective production methods.

FUTURE DIRECTIONS

Ongoing research aims to enhance the specificity and efficiency of Nanosponges. Key areas of focus include:

- **Targeted Delivery:** Improving targeting mechanisms for drug delivery.
- **Smart Release Systems:** Developing systems responsive to environmental triggers.
- **Environmental Sustainability:** Creating eco-friendly Nanosponges for pollution control.

CONCLUSION

Nanosponges hold significant potential for advancing various scientific and technological fields. Their ability to adsorb, encapsulate, and deliver substances with high efficiency and specificity makes them a versatile tool for addressing numerous challenges. Continued R & D are expected to expand their applications and improve the execution, paving the way for innovative solutions in medicine, environmental protection, and industry. There are various benefits to the special qualities of nanosponges. They can lessen the frequency of administration, extend the duration of medication release, and improve drug stability. Their ability to distribute drugs with precision also offers great promise for the treatment of a variety of illnesses. Even though they are still in the early phases of development, nanosponges have shown a lot of promise in preclinical research and hold great potential for becoming efficient clinical treatments. Current investigations endeavour to enhance the design of nanosponges, investigate novel uses, and tackle possible obstacles associated with biocompatibility and industrial manufacturing. Nanosponges are anticipated to become more significant as the area develops in terms of enhancing patient outcomes and transforming medication therapy.

ABSTRACT

Artificial Intelligence (AI) has considerably transformed software development by proposing automated solutions to enhance productivity, diminish human effort, and mend code quality. Since a decade, AI-powered tools for optimization, coding and debugging, have made software development stress-free and efficient. These tools, such as Chat GPT, Git Hub, Copilot and other large language models (LLMs) and machine learning provide auto complete, prophetic suggestions, and even complete chunks of code, letting developers to restructure their workflow. Nevertheless, its potential, concerns remain regarding their accuracy, effectiveness, and error handling. This work intends to assess and equate these AI-powered code generation tools, measuring their strengths, weaknesses, and real-world applicability in software development. By focusing on key research queries, such as the tools' precision, debugging abilities and effect on development proficiency, the study offers acuties into their practical usage. The findings contribute to the field by recognizing the deficiencies of these tools, proposing recommendations for their choice, and expanding information to enrich the upcoming AI-assisted programming. Eventually, this research ties the gap amid AI-powered automation and real-life software development experiments, assisting developers in selecting the most appropriate AI-based code generation tools for their requirements.

Keywords: Artificial Intelligence, Code Generation, AI Tools, Software Development, Git Hub Copilot, Chat GPT, Amazon Code Whisperer, Productivity, Debugging.

INTRODUCTION

Background on AI in Software Development

Software development has been breathtakingly altered by Artificial Intelligence (AI) due to the existence of automated solutions that include improving productivity, reducing human work and enhancing the quality of code. Over the years we have seen that code generation tools powered by AI have made developing, optimizing and debugging code more easy and easy. To use these tools, they rely on large language models (LLMs) and machine learning on auto complete, predict suggest or generate complete blocks of code. And thanks to the rise of AI given programming, developers can now add in GitHub Copilot, Chat GPT and Amazon Code Whisperer to their coding environments without having to custom opt (token would cost if it was a paid feature). These tools are said to change software engineering by make development faster by giving intelligent suggestions on code and giving context aware recommendations to improve collaboration [1].

RESEARCH OBJECTIVES AND CONTRIBUTIONS

The main research of this work is to compare actively developing AI-track code generation tools, assessing their performance in software development. This study seeks to offer some information about them to highlight their good and poor points for the engineers and programmers. Key questions is:-

- i. In the previous regards, how accurately and efficiently does the AI-based code generation program work how well with the debugging process?
- ii. Among the three tools, namely, GitHub Copilot, ChatGPT, and Amazon CodeWhisperer, what are the main strengths and weaknesses?
- iii. A more important question which comes to mind is that to what extent these tools affect the effectiveness and efficiency of developers as well as code quality in practical applications?

To summarize, this finding can advance the knowledge and practice of AI-compensated software development by means of the following:

- a. Assessing AI code generators with coding tasks which have been defined in advance.
- b. Some of the drawbacks include the following: shortcomings in terms of performance; and shortcomings with respect to practical application in working environments.
- c. These are the steps that will help to choose the right tool for the developers and contain practical recommendations on the selection process.
- d. Expanding the existing knowledge of the author in terms of enhancing the future AI-aided programming by identifying some weak points.

Fulfilling these objectives, this study is to fill the gap between the research on AI-powered automation and real-life working software development problems, thus helping developers come to a decision on incorporating the automated code generation tools that leverage AI technologies into their work [2][3].

Overview of AI-Based Programming Assistants

The idea of Artificial Intelligence (AI) in software development is essential and has come to a time where the programmers are provided with the help of programming assistants in a form that would increase the productivity of developers, reduce the coding errors and have better code done by programmers. These are AI grounded tools that make use of the advanced machine learning (ML) and natural language processing (NLP) for improving the capabilities of programming by means of writing, debugging and optimizing code. AI's use in software development did not only speed up coding process but also made difficult tasks easier to handle by automating the repetitive task, suggesting code snippets, generating functions completely with the help of simple instructions.

**GitHub Copilot**

GitHub Copilot is most popular of GitHub's AI coding applications and was developed in collaboration with OpenAI. It is directly integrated into the most popular IDEs, such as Visual Studio Code and JetBrains. Copilot uses a deep learning model that works with a transformer to suggest code that could be completed, complete code lines and suggest functions based on understanding its surroundings. Copilot is strong in terms of its ability to offer very relevant code snippet to fill in a file. While Copilot is known for being good at speeding up the coding task. At the same time it has been criticized for producing buggy or less efficient code in some important coding tasks [4].

ChatGPT (for Coding Assistance)

This tool another piece of softwares that used AI to develop the software. At first, ChatGPT was meant for conversations, but now it serves as a helpful code generation generator, debugging and problem solving tool. Its advanced NLP capabilities come with code generation, user query explanation, and capability to pursue user queries. Developers can ask in general for code examples, function explanations or step by step debugging. The usage of conversational interface provided by ChatGPT is an interactive coding assistant experience. Although it provides verbose or generic responses sometimes which may not always be optimal.

Amazon CodeWhisperer

AWS has developed Amazon's Code Whisperer, which is a response to AI powered code generation. Code Whisperer integrates into PyCharm and Visual Studio Code as GitHub Copilot does. Code Whisperer is intended to facilitate coding through Code suggestions, Security recommendations and Auto complete. In particular, it is optimized for AWS cloud development and uses machine learning models trained on millions of lines of code to generate recommendations as tailored to AWS ecosystem as possible, making it very appealing towards development within the realm of AWS.

Other AI Tools

There are other AI based programming assistants too, after all the major players above, i.e. Tabnine, Kite and IntelliCode (Microsoft). Like these tools, these use AI to make developer productivity better, from simple auto completion and simple code suggestion in the first extreme case to complex code suggestion and error detection in the last [7].

Existing Studies on AI-Driven Software Development

It can be claimed that AI associated tools have become an object of interest for researchers in recent years, as they can potentially enhance the software development process. Some of these tools have been through a number of analyses with regard to their evaluation, functionality, and efficiency particularly their integration in a SE life cycle. The topics that are discussed in connection with the AI help for development include code generation, bug detection, performance optimization, and code review[5].

AI-Assisted Code Generation and Productivity

Enhancement in artificial intelligence (AI) tools have improvised software development productivity by automating repetitive jobs like writing scripts, creating test cases, and generating code. Pérez *et al.* (2021), found that GitHub Copilot boosted developer productivity by reducing coding time for standard tasks, offering more focus on complex aspects of the work[2][16]. However, their study also noted that Copilot's suggestions were sometimes inaccurate or suboptimal. Similarly, Biemann *et al.* (2020), and examined AI-driven code completion tools like Tabnine and Kite, showing they reduce cognitive load and improve coding speed and accuracy [3]. Despite this, they suggested AI models should be further modified to deal more complex tasks.

AI in Bug Detection and Code Optimization

AI is useful for code generation with enhancement to program quality by detecting errors and suggesting optimal code configurations. Liu *et al.* (2022) studied AI tools for bug detection, proving that AI models can meaningfully identify common errors and security vulnerabilities before software being commissioned[10][18]. This tool showed

**Sreenivas Mekala et al.,**

improved working, particularly when analysing big codebases, resolving issues that traditional methods might miss. Huang *et al.* (2021) explored AI's role in optimizing code and resource usage, with tools like Kite and CodeWhisperer generating more efficient algorithms [6]. However, the study has raised concerns over reliability of AI-generated code in real-world solutions.

User Experience and Developer Adoption

The usability of AI tools in software development plays a key role in their efficiency. Hossain *et al.* (2023) studied developers' perspectives, finding that AI-generated code integration improved speed and effectiveness but also made some developers uneasy due to over-reliance on the tools [5][13]. Developers raised concerns about losing coding fundamentals. Gholami *et al.* (2022) highlighted that low usability and UX issues could hinder AI adoption, recommending improvements to the user interface to better tailor AI tools to developers' needs and enhance engagement[12].

Challenges and Limitations of AI in Software Development

AI offers many benefits, but challenges must be addressed for widespread adoption. Williams & Harel (2022) note that AI programming assistants struggle with complex, highly specific coding tasks. ChatGPT and Copilot can help with standard tasks but may lack the sophistication for more advanced ones. Additionally, AI-generated code can be weak or unsafe, leading to potential security issues [14]. Sundararajan *et al.* (2021) highlighted ethical concerns, including bias in AI-generated code and issues surrounding intellectual property and insecure practices [17][15].

Gaps in Current Research

While it has come a long way in developing and applying AI powered code generation tools, there are many gaps to play in the current research that deserve further understanding. Most of these gaps are due to the complexity of real world software development, the insufficiency of current AI models, and challenges of measuring the effectiveness of the AI in real world scenarios[7].

Lack of Comprehensive Comparative Studies

While there are plenty of studies evaluating individual AI tool, e.g. GitHub Copilot, ChatGPT and CodeWhisperer, very little work has been done to compare them using a large set of programming tasks. First of all, most of the research has been done in isolation of another tool or for assessing a single tool vs traditional programming practices. There is a remaining need to study more directly how these tools behave in different contexts (programming languages), or in terms of scale of project (size of project) and complexity of task.

Evaluation Beyond Accuracy and Efficiency

Most of the current research is still on the basic performance metrics, such as accuracy, execution time and efficiency. But there are more detailed and less obvious aspects of AI driven tools that have not been extensively researched. For instance, while functioning code, as well as software maintainability, and long term developer satisfaction are all vital aspects of software quality that should have been evaluated more extensively. GitHub Copilot and CodeWhisperer are amazing tools for quickly writing code, however, they don't offer much clarity on their suggestions to make the code understandable for other developers. Therefore, there is a need for additional research in the long term of the impact of AI driven tools on the maintainability of the code, as well as in collaborative coding environments.

Domain-Specific Tool Adaptability

The second gap that is prominent is domain specific adaptability of the AI-powered code generation tools. Most of the current studies are general purpose tools, however, few are trying to put a spotlight on how these tools perform on specialized domains like embedded systems, machine learning, or security critical application. Just like CodeWhisperer works well with AWS, do the tools used to develop with AWS perform well for highly specific or specialized tasks that necessitate a specific knowledge of AWS? This research is scarce and solving it can help in building highly customizable AI assistants for a certain field of software development[9].

**AI-Generated Code Quality and Security**

Despite AI tools having the ability to automate the generation of code and suggest solutions, there is still no fool proof solution. A variety of studies have been made where AI generated code exhibited bug, vulnerabilities, or inefficiency. The underinvested subject in research related to AI-generated code security is the topic of research. Amazon CodeWhisperer for example provides security suggestions, but do they actually tackle SQL injection, buffer overflows or race conditions used by the generated code. There is a need for further research on how to train AI tools to detect and circumvent security flaws in actual applications, especially in the critical systems.

Ethical Considerations and Bias

One of the gaps in current research that is critical is that there are ethical implications and biases in the AI powered tools for code generation. The more data that these tools are trained over with the help of vast repositories like the open source, the more likely that they will perpetuate unwanted biases in the code they generate. As a result, for example, AI could produce solutions that extend gender, racial, or cultural biases or solutions that recreate inefficient or insecure code patterns contained in the training data. Few studies have been made to understand how AI models can be trained to be unbiased and ethically aligned with the existing industry standards.

Developer Trust and Human-AI Interaction

An important aspect of the software development process that is underexplored by AI tools is the human-AI interaction part of the code generation. What are developers' perceptions and trust in the suggestions that AI generates? There are some concerns studied for how developers might begin being overly reliant on AI suggestions and get left in the dust when it comes to critical thinking and problem solving. At the moment, the biggest test still remains the trust factor, that is, if we aren't confident accepting AI generated code. It's unknown how AI tools can be created to enable human creativity, not replace it, in order to create a more collaborative relationship between the developer and AI in the future. 2.3.7 Real-World Applicability and Industry Adoption[10]. Lastly, AI powered code generation tools need further examination on its industry adoption and the real world applicability. Indeed, while many such tools have been studied in controlled experiments and in academic settings, the performance of such tools in realistic conditions especially when it comes to supporting the aspects of legacy systems, large codebases, or collaborative environments—has not been investigated in much detail.

METHODOLOGY

The methodology used to evaluate and compare the performance of the selected AI powered code generation tools in order to improve the software development processes is discussed in this section. This methodology covers the following: choice of the criteria for tool AI elections, determining the tool performance evaluation parameters, and use of data set and coding tasks to test the tool [11].

Selection Criteria for AI Tools

The AI Powered coding tools taken for this study are GitHub Copilot, ChatGPT, and Amazon CodeWhisperer. These were selected based on the fact that they are widely used by the developer community and have somewhat novel approaches to working with AI for software development. Thus, the criteria for selection are as follows:

- i. All three tools have been adopted widely in professional and academic communities, and thus are highly relevant in evaluating the effect of AI towards software development.
 - a. Firstly, the Tool Type and Functionality is integrated into the IDE and it mostly serves for the code generation and completion like GitHub Copilot and Amazon CodeWhisperer. Since ChatGPT is mainly a conversational AI, it can be quite helpful in providing code suggestions and even helping debug.
- ii. My choice of tools offer myriad use cases of AI functionalities ranging from simple code completions to more complex code generations, giving a more extensive examination.
- iii. Availability of APIs and SDKs: All the tools have open or accessible APIs/SDK that can be integrated with development environments to develop similar conditions for testing tools .

**Sreenivas Mekala et al.,****Performance Evaluation Parameters**

Several key parameters are used to evaluate the effectiveness of AI tools in improving the software development workflow. These include:

Accuracy

Measures the reliability of the AI tool in generating correct and functional code. This is assessed through:

Code Completion Accuracy

Evaluates the tool's ability to generate the correct code.

Technical Working

Focuses on the functionality and potential errors in the generated code.

Efficiency

Assessed by the time taken to generate code and the impact on developer productivity. Metrics include:

Code Generation Time

Measures how long the tool takes to produce the needed code.

Developer Interaction Time

Tracks the time spent by developers correcting suggestions or inputting their own code.

Error Rate

Measures the frequency and type of issues with AI-generated code, such as:

Syntax Errors

Problems with code structure, like missing brackets or incorrect function formats.

Logic Errors

Issues affecting code behavior or output.

Security Risks

Potential security vulnerabilities like SQL injection or buffer overflows.

Usability

Evaluates user satisfaction with the tool's suggestions and its overall effectiveness, gathered through surveys and interviews with developers.

Dataset and Coding Tasks Used for Testing

To assess effectiveness of the AI-based code generation tools, the types of realistic coding tasks as well as the diverse dataset in terms of the delivered real-life scenarios was selected. Having said that, the tests are such that they are most hitting on various levels of hardness and programming languages to check the tools capabilities [12]. Coding Tasks: Some of the coding tasks are as follows: There are questions of easy, medium, and hard levels of difficulty; they involve simple algorithms to solve and some tasks that require the understanding of the software structure. The following are among the objectives of the tasks set and incorporated in the programming:

Basic Tasks

Simple tasks for instance writing of simple algorithms (sorting and searching algorithms).

**Sreenivas Mekala et al.,****Intermediate Tasks**

Activities based on the usage of the data structures, for example linked lists, hash maps or if necessary, complex algorithms.

Dataset

The test data set is a set of programming problems that could be solved from open online sites like Leet Code, Hacker Rank, and Code Signal. These datasets give a broad variety of problems, it means test the tools on simple and structured tasks as well as on the complex and poorly defined coding problems.

Data Formats

The dataset cited comprises of various input/output formats such as text files formats, also JSON and API.

Languages Assessed

The coding problems provided are available in a number of the different programming languages, including those such as Python, JavaScript, Java, and C++, thereby allowing for a diverse range of coding environments.

Experimentation & Results

The second part of this study details the results of the performed comparative analysis of the chosen AI-powered code generation tools (GitHub Copilot, ChatGPT, and Amazon CodeWhisperer) according to the criteria mentioned above. In this paper, we evaluate these tools in terms of a number of performance dimensions, including run time, correctness, correctness debugging efficiency and coding ability of real world constructs.

Comparative Analysis of AI Tools

The first part of the work of experimentation was directly comparing the AI tools on a series of coding tasks with an increasing degree of complexity (in terms of condition). The tools were used to validate for correctness and efficiency of the generated code, as well as how the tools intergraded with the developer [18]. For test of GitHub Copilot, different tasks are tested. On simple tasks such as algorithmic implementations, its code was able to auto complete and was effective at it. However, there were problems in more complicated ones, where it would give incorrect and suboptimal solutions occasionally. To the delight of many, Copilot often produced syntactically correct code, though error occurred where they failed to handle edge case and more complex data structures. On the code snippet front, Copilot was frankly very fast at giving suggestions, but one had to fiddle with it quite a bit more in being able to actually complete the suggestion. Perhaps, ChatGPT was more conversationally oriented, which made it convenient for both generating code snippets and debugging within it. Whereas Copilot struggled to explain what it made and often provided very little in the method of explanation, ChatGPT could always explain its code and also frequently suggested multiple approaches to a problem. But it proved inconsistent in solving complete solutions for bigger problems, in particular, complex tasks that comprised several functions or complicated logic. The correctness portion of ChatGPT was performed very well but the code needs some additional refining.

Amazon CodeWhisperer

Worked best with clouds and AWS integrations, and gave quality suggestions regarding AWS SDK and cloud coding challenges as well. It worked well in offering overall solutions, but lacked in working with details of logic and syntax, requiring subsequent developer updates. For AWS-specific coding tasks, CodeWhisperer's contextual suggestions were helpful more than other general purpose coding problems.

Performance Benchmarking

Performance comparison was done over various factors such as time efficiency, accuracy and debugging facility. The results are summarized below:

Execution Time

GitHub Copilot had the shortest time taken to generate code with the possible code block suggesting time ranging between 2-4 seconds for simple tasks and 5-10 seconds for complicated tasks. Nonetheless, there were couple of

95978

**Sreenivas Mekala et al.,**

disadvantages that harnessed on the fact that developers were needed to spend more time fine-tuning the automatically created code so as to be tuned to be as accurate as possible. ChatGPT was less quick than Copilot ; code recommendations took about 5-10 seconds for basic problems and up to 15 seconds for more challenging issues. This was the reason why its response time is slower compared with other similar programs; nevertheless, the degree of explanation and context provided was a great improvement making coding easier and more efficient. Codewise, the Amazon CodeWhisperer was not as fast as Copilot or ChatGPT, with the latency lasts around 6-12 seconds to generate simple codes up to 20 seconds for complex solutions. Nonetheless, its suggestion was rather accurate particularly for cloud related issues, although it was a bit slower in providing the suggestions [13].

Correctness

Git-Hub Copilot was accurate in generating code for properly tested, standard algorithms and when specific tasks were assigned. Nonetheless, for the cases with complicated logic or with the use of unfamiliar libraries, its accuracy is relatively lower, albeit still impressive, with an error of 5-12% for intermediate problems and 15-20% for complex problems. ChatGPT was more accurate than Copilot in generating code for easier problems, especially for simple tasks since it would generate the complete code and at the same time provide correct explanation in case of bugs. It estimated to have an error of 4-8% for simple tasks and 12-15% for complex tasks [17]. Our results also indicated that Amazon CodeWhisperer was slightly more accurate when coding with AWS issues, yet less accurate concerning general coding problems, it had an approximate percentage error of 6% – 10% for general coding problems, and a 10% – 14% error percentage for cross-cut and other elaborate problems.

Debugging Efficiency

From the experience, GitHub Copilot has fairly good effectiveness in fixing, as it was able to suggest corrections for syntax and logic mistakes, yet it occasionally misses on issues such as optimization problems and various bugs including security ones. When it came to debugging and error correction, ChatGPT gave the proper debugging rationale for why the code could fail and solutions to the error. It was especially beneficial to be used for such purposes as to explain logic flaws and special conditions. The debugging assistance offered by the Amazon CodeWhisperer focused heavily on AWS cloud and networking environments but was not helpful with typical programming problems among programmers. It is shown to suffer from true logic errors when working with AWS steroids [16].

Case Study on Real-World Coding Problems

The selected tools were applied to real-world coding problems faced by software development teams to test the effectiveness of AI-powered code generation in practical scenarios. Tasks like building a RESTful API, data transformations, legacy code optimization for performance, were some of these problems.

Building a RESTful API

I was able to get functional code for creating a basic RESTful API, using GitHub Copilot. But when it came to more advanced features like authentication, rate limiting, and logging, Copilot's suggestions would either be missing or inefficient enough that a lot of developer intervention was needed [14]. Comparing ChatGPT's output to the one produced by Syndrome for this example shows that ChatGPT produced a much more comprehensive solution and also provided explanations for every step of the code. It suggested ways of carrying out security features such as JWT authentication but a couple small tweaks were needed to make the API faster and error friendly. Amazon CodeWhisperer nailed it when it had to generate code for cloud based APIs i.e.), AWS Lambda functions and API Gateway. It was however, less effective solutions, especially in non cloud environments, when one had to handle databases or authentication.

Data Transformation

Among the tasks that involved complex data transformations, like transforming a CSV file to JSON format, both GitHub Copilot and Amazon CodeWhisperer produced efficient solutions. In contrast, however, ChatGPT found it more difficult to perform more complex transformations involving nested data structure. However, through

**Sreenivas Mekala et al.,**

explaining the code, ChatGPT was also very good at suggesting edge cases that the developers might have missed, which made it very helpful in understanding the inner workings of the transformation process.

Optimizing Legacy Code

GitHub Copilot offered working suggestions to improve the performance of legacy code, but it could not parse through the code too deeply to analyze for performance bottlenecks or to do substantial architectural changes. ChatGPT could determine possible performance problems (Redundant loops, inefficient algorithms) and propositions to refactor code improving performance. But it was less specific and needed human involvement to work best. Amazon CodeWhisperer was good at optimizing cloud based solutions but not so well at improving legacy systems generally in the case of general purpose programming[15].

DISCUSSION

This section provides an in-depth discussion of the strengths and weaknesses of AI-powered code generation tools, their practical implications for software developers, and recommendations for future improvements in AI-assisted programming.

The comparison of AI-powered code generation tools revealed various strengths and weaknesses across different features:

1. **GitHub Copilot:** Efficient at generating context-aware code quickly, reducing time for repetitive tasks. However, it often makes syntactical errors and struggles with logical constructs, requiring developers to refine its outputs for more complex tasks.
2. **ChatGPT:** Great for explanations and debugging, with a strong ability to offer alternative approaches and refactor code. However, it struggles with consistency in large projects, often needing additional context and explanations for accurate code generation.
3. **Amazon CodeWhisperer:** Effective for cloud-based development, particularly in the AWS ecosystem, with strong API recommendations. However, its use is limited to AWS-related projects, and it lacks the adaptability of Copilot or the depth of explanation found in ChatGPT.

CONCLUSION

This study compared AI-driven code generation tools—GitHub Copilot, ChatGPT, and Amazon CodeWhisperer—assessing their effectiveness in software development. The results show that while these tools enhance coding, debugging, and problem-solving, they have limitations developers must consider. GitHub Copilot excels in automatic code completion but struggles with complex logic. ChatGPT provides strong explanations and debugging support but faces challenges in multi-file projects. Amazon Code Whisperer is optimized for AWS development but is less effective for general programming. Performance-wise, Copilot is the fastest, ChatGPT offers the highest correctness, and CodeWhisperer requires more human intervention. Ultimately, no single tool dominates in all aspects, and developers must select tools based on their specific needs while reviewing AI-generated code for potential errors.

ABSTRACT

India has become the world's ninth-largest airline market, with more than 120 airports in operation, 34 of which are international, and there is increasing debate and controversy over flying related to climate change. There is an urgent need to observe research and evaluate different companies operating in India to incorporate more mitigation methods into their business models. This article illustrates and analyzes the actions taken by airlines and communicated through their websites about their responsibility and understanding of the environmental impacts of air travel. This article uses information available online, such as airline websites, annual reports, and company press releases. The data was analyzed using the analysis framework and N Vivo software, which effectively evaluates the various security measures taken by large companies and places them in different contexts. It helps us identify areas of aviation that have the support of sustainability and how we can expand its meaning in the coming years to make aviation more environmentally friendly and sustainable.

Keywords: Green Practices, Indian Airlines, Carbon Emissions, Air Quality, Cabin Waste Management, Aero wash, Sustainable practices

INTRODUCTION

Greenhouse gas emissions are increasing every year, increasing the challenges of mitigating and combating climate change. Without the cooperation of all professional groups, the path to limiting "dangerous climate change" is weak,

**Darla Nagaraju and Venugopal Rao**

and the aviation industry has an important role to play. Current and future changes in technology, business processes, and behavior provide many opportunities for other industries to reduce their CO₂ emissions indefinitely. However, when they do this, the importance of the aviation industry will increase even more. According to the aviation industry's growth forecast, aviation will account for approximately 15-25% of the world's CO₂ emissions by 2050, which will complete the entire carbon budget. Therefore, only by recognizing that current emissions plans from aviation are inconsistent with avoiding "climate change risks" will the industry understand the acceleration of need and move towards the path to 2050 and beyond (Bows, A. 2010). With the development of air travel, However, people's concerns about environmental impacts are also increasing. Therefore, the aviation industry is critical to climate change. The share of this work will increase since reducing carbon monoxide is one of the economic problems. Aviation is a rapidly growing industry that emits more carbon dioxide per passenger kilometer than any other form of transportation. Climate change researchers consider work-related travel and meetings, as well as work in the field, to be significant sources of carbon (Whitmarsh *et al.*, 2020). Many aviation-related environmental problems, such as stratospheric ozone depletion and local and regional air pollution, are caused by the release of large amounts of fossil fuels, which directly impact and affect the chemical composition of the air. Practices that reduce these emissions will also reduce emissions from the sector.

Aviation is one of the world's fastest-growing industries and India's fastest-growing transportation industry. Airlines are an important part of our country's economy, serving people and goods around the world and contributing to our economic growth. It is the world's seventh-largest airline industry and the world's third-largest aviation industry. According to IATA (International Air Transport Association) forecasts, the UK will become the third largest market for air passenger transport (domestic and international) by 2024. Passenger numbers (domestic and worldwide) stood at 115.37 million in FY21, showing lower growth compared to the previous year. Last year due to COVID-19 restrictions. The Indian government is trying to increase the number of airports to meet air traffic demand. Increasing demand has led to an increase in the number of airline companies operating in the sector. However, the potential of the Indian aviation industry is yet to be tapped. However, there is a huge opportunity for growth as air transportation is still considered expensive for the majority of the country's population. India's carbon dioxide (CO₂) emissions decreased by approximately 30 million tonnes of carbon dioxide (MtCO₂) in 2019/2020. For the first time in four decades, the country's emissions fell, last falling by 3 tonnes of carbon dioxide in 1982. Although some factors have affected the debt, such as the growth of renewable energy, and the economic slowdown, measures such as lockdowns to slow emissions and the spread of the new disease (COVID-19) had a significant impact at the beginning of 2020. According to sources, exports are estimated to have decreased by 15% in March 2020 compared to the previous year. In the last two years, the Indian aviation industry has grown by more than 20% annually. It is expected to increase to the second number in the next few years. As industrialization grows, concerns about its environmental impacts also increase. In 2016, India agreed to participate in the Carbon Offsetting and Reduction Program for International Aviation (CORSIA), which will become mandatory by 2026. There is an urgent need for the government, pilots, and all stakeholders involved in the plan. The fact that it will take all measures to reduce emissions in the future by implementing various mitigation measures in various business areas has the potential to avoid "climate change risks" (Terrenoire *et al.*, 2019). This article seeks to understand that there is huge potential to reduce carbon emissions in every aspect of the aviation industry and explores the links or topics that can be measured, the reductions, and what links or contexts can lead to better results in reducing emissions.

REVIEW OF LITERATURE

Sixty years ago, the aviation industry was only a small part of transportation, albeit at a very small level. Today, trade has become an important part of the world economy, accounting for approximately 9% of world GDP. The success of the aviation industry will continue in the coming years. The rapid development of this work will bring economic benefits and increase the mobility of people around the world. But these benefits come with costs, primarily the increase in greenhouse gas emissions. Though currently, it is not a prime driver for global warming, the sector's estimated growth potential makes it a vital factor contributing to the emissions. According to the IPCC

**Darla Nagaraju and Venugopal Rao**

report, emissions are anticipated to increase at a three-fold to seven-fold rate between 2000 and 2050 (Macintosh and Wallace, 2009). International aviation is a vital point for the emissions contributions, and much-needed concern is needed to mitigate the impacts. The United Nations Framework Convention for Climate Change (UNFCCC) shall include that the domestic aviation emissions in the national level emissions and the international civil aviation emissions are not included in the national level emissions and submitted as a memo item in the UNFCCC national inventory reports. It is estimated that the aviation sector shall be contributing about 2–3 percent of the global climate change emissions; there has to be a noticeable change in the environmental policy to detach the fuel consumption per passenger and the demand for air travel at a time when increasingly liberalized markets are pushing up the demands for airline services. The airline industry has been claiming that this detaching process is already taking place as airline seats are being flown with more fuel efficiently because of the deregulation of air transportation markets. In reality, airlines have economic incentives to improve fuel efficiency. During the liberalization period, there is a constant supply of new aircraft and modifications to existing fleets, one of which leads to previous knowledge to improve fuel consumption (Brugnoli *et al.*, 2015). The new model is due to technological advances in the aviation industry and the creation of fuel-efficient aircraft production. One of the main drivers for the use of electric aircraft comes from technological development rather than environmental projects.

The global aviation industry has an annual growth rate of approximately 5% and plays an important role in economic growth and development. Climate change emissions. By adopting better aircraft and network management, the aviation industry's CO₂ emissions will be reduced and the amount of emissions will be reduced. Reducing aircraft size can reduce CO₂ emissions (Lo *et al.*, 2020). Therefore, environmental policy should provide incentives to reduce aircraft sizes in various ways, including changes in demand. In addition, incentives need to be provided for the renewal of ships, because all technological advances are the determinant of aviation emission efficiency. Tourism has become a boom and bustle as it provides new job opportunities. The challenge of reducing emissions. We must focus on economic development in sectors such as aviation and hospitality and use technology to reduce emissions. In addition, the Paris Agreement addresses significant improvements on the path to zero carbon each year. Therefore, the aim is to create a sustainable, sustainable, low-carbon tourism industry. Destinations, therefore, play an important role in reducing emissions (Gössling and Higham, 2021), because they have stakeholders who can work towards decarbonisation while achieving results in tourism. The second effect is to increase the effectiveness and ability to achieve goals. Given the instability and tendency towards simplification of the global tourism industry, destinations need to understand the risks of low profitability, carbon use, and climate change; All of these require management of key sites of growth change to increase visitor numbers. The challenge for the site is to promote the process that will help tourism grow in a way that does not create the negative effects of pollution by 2050. A target can support this process from the mix of markets it aims to attract. Closer markets favor more distant markets, encouraging more unequal trade spending in travel, destinations, and transportation choices and decisions, rather than trading for fewer transportation options. Those responsible for the site should focus on available methods that will enable visitors to stay longer in the association of various actors in tourism. Length of stay relates to annual leave, transportation, services and fees, travel packages, accommodation pricing procedures, and services and activities.

OBJECTIVES OF THE STUDY

1. To study the Green initiatives of leading Indian Airlines and analyze how they are creating a green identity for themselves.
2. To identify and study the various Airlines taken initiatives and following Green Practices in India
3. To provide a conceptual framework for future study in this field.
4. To know Green Airports Recognized by CI Asia Pacific in 2023

RESEARCH METHODOLOGY

It is a research-based on content collection, and data is collected from books, national and international newspapers, magazines, newspapers, government publications, websites, etc. collected from research materials.

DATA ANALYSIS AND INTERPRETATION

Plans to help make the airline more efficient

The aviation industry connects people and countries, opening the door to many financial and social opportunities. Given the benefits that aviation brings, more connectivity is needed. IATA estimates that demand for passenger travel by air will exceed 10 billion by 2050, and carbon emissions are expected to be approximately 21.2 billion tonnes of carbon dioxide between 2021 and 2050. These emission dimensions need to be reduced! IATA member airlines have adopted a resolution pledging to achieve net zero carbon emissions in the future.

Ways to achieve net zero carbon emissions

The main goal of achieving net zero carbon emissions is the use of sustainable fuel (SAF), new aircraft investment, and carbon balancing processes. We believe we can make progress towards the 2050 goal by revising existing processes and operations that can directly help reduce our carbon footprint.

Fuel saving plan

Reduce carbon dioxide from ground plane movement by overcoming the problem of long taxi entry and exit time. Taxiing planes will ensure that the airport consumes fuel and emissions. Taxi delays usually occur when there are changes in the final departure time, problems at the gate of the arrival flight, delays in departure, etc. It is caused by overcrowding and queuing that occurs when To overcome these problems, airlines can deliver flights on time with flight schedules. They can also provide estimated departure time (POBT) information to ATC and airport operators to plan runways and gate usage. The biggest expense of the aviation industry is fuel, which accounts for approximately 30-60% of the average annual aviation cost. Also, many airlines rely on manual calculation of EIBT (Effective Attack Time) and TOBT (Target Departure Time) to avoid delays. To overcome this error, general companies and airports can use technologies such as computer vision and artificial intelligence/machine learning to create intelligent transfer models. The model can be associated with any transfer function with an object that can be reported as visible from the airport camera. Given the situation in real-time with historical data and information from airports, airlines, and ground staff, the model can evaluate the performance of operational changes and use it to inform stakeholders if the process has not yet started or delays are expected. At the same time, POBT continuously provides predictions and helps ATC and airport operators optimize runways and gate utilization.

Air Quality Index Improvement Solution

Reduce APU Use on the Apron

APU is a small engine located in the tail of the aircraft and is used to power the onboard power when the main engine is shut down. It can power cleaning equipment, start air conditioning, and even start the main engine before or during pushback. to ask? APUs use fuel injection with higher carbon content. Aircraft should become Ground Power Units (GPUs) for ground operations whenever possible. Even though GPUs are outdated, airports and airlines can still work on detecting planes that continue to run on APUs at the gate. The microphone on the door can act as an IoT sensor, collecting the sound of the APU's operation. This information can be fed back with programs and other information to determine whether the aircraft is running its APU instead of using the grid. Stakeholders can be informed so that appropriate measures can be taken to improve air quality and reduce carbon emissions. At the same time, the aircraft can track APU usage via the APU log in the cockpit; This record provides the following information: time units, cycle operation, and even the average produced by the APU engine. This information can be extended to racetracks, routes, and operators to understand when APUs are being overused. This solution based on blockchain technology can help airlines design the APU lifecycle and accurately report the carbon emissions of each APU.

**Darla Nagaraju and Venugopal Rao****Paperless Operations Solution****Using Digital Skills to Increase Talent Potential**

Even today, airline employees still rely on paper processes and manual tasks that are often time-consuming and error-prone. Some of these documents, such as flight schedule information and operational manuals, cannot be avoided when regulators create them. However, there is still a lot of room for digitalization in other workplaces.

Airlines must develop new ways to support people's capabilities through a hybrid operation where human skills are complemented by digital skills. Depending on the size of the operation and the personnel division, the aircraft can organize the mission for specific roles that play an important role in the operation. Airlines can easily target roles like cabin crew, ramp agents, and engineering staff to start their journey. They depend on paperwork. You can empower them with a mobility solution that caters to all their needs starting from managing their roster in the morning to getting a cab and performing all their mundane tasks while also connected with all other airline systems. This solution will holistically cover their work lifecycle.

Overcome thermal bag tag and asset reconciliation challenges

During the pandemic, airlines and the airport accelerated their contactless journey by on boarding self- bag drop kiosks and home-printed bag tags. But, even then, more than 95% of baggage operations across the world depend on thermally printed bag tags which are extremely dangerous to the environment. When you consider the thermal paper's chemical composition, it contains Bisphenol A (BPA) and other phenolic chemicals that pose many risks to the environment and can't be easily recycled. The easy solution is to use digital bag tags, which can be reused by the passenger every time they travel. Digital bag tags are easy to reconcile and deliver a complete baggage journey view across various scan points. Similarly, assets reconciliation challenges across various other functional areas like GSE, engineering, catering, and even aircraft safety equipment could be solved by using IoT technology. For instance, today, the reconciliation of lifesaving jackets installed under the aircraft seats is done manually by the security staff on paper. This can easily be transitioned to a one-click reconciliation using IoT.

Cabin Waste Management Plan

Airlines should reduce cabin waste by reducing, reusing, and recycling to reduce environmental impact. Household waste comes from two main sources: cleaning waste and food. According to research conducted by IATA, 23% of the waste produced by a passenger consists of "untouchable food and beverages". Change to solve this challenge, airlines can use technologies such as computer vision and artificial intelligence/machine learning to understand passenger preferences on special meals, booking classes, and various routes on different airlines. This information can help caterers understand dietary patterns and adjust menus accordingly.

Implementing Quality Improvement

Another major challenge in increasing airlines' carbon footprint comes from areas such as back offices, training facilities, offices, and even personal offices. Airlines can improve energy efficiency by using IoT sensors on various assets in their facilities, including lighting, air conditioning, doors, and bathrooms, by tracking electricity usage and turning them off when not in use. Data from all these sensors can be brought together to create dashboards that provide information to help managers optimize energy use. This information can also be used to develop predictive measures to identify and replace faulty equipment that is not causing blockages and malfunctions in the facility.

GREEN INITIATIVES OF LEADING INDIAN AIRLINES**Mission Green Aviation! Air India gets new cleaning solution 'Aerowash'; Save up to 75,000 liters of water per aircraft per year**

Air India has introduced an external electronic washing and cleaning system called 'Aerowash' which aims to save a lot of money. water This new system offers the best in terms of cleanliness, water, and cost savings. Let's learn more about the "Aerowash" method.

Darla Nagaraju and Venugopal Rao

What is this "Aerowash" method?

Aerowash systems include modern features such as robotic microfiber brush drums to clean the aircraft with minimal water consumption. The airline estimates the technology could save up to 75,000 liters of water per airline per year. For narrow-gauge aircraft, water savings should be approximately 30,000 liters per aircraft per year. Aircraft maintenance needs a lot of water. Advances in technology now allow for more water purification processes. Depending on the size of the aircraft, Air India expects to save about 75,000 liters (about 20,000 gallons) of water per year for a single narrow metal jet and 30,000 liters (about 8,000 gallons) for an aircraft. Air India follows Vistara's lead in using water-saving technology for Indian airlines' aircraft cleaning. Vistara implemented the Aerowash system, the first system to do so in the country. The introduction of this new cleaning method in India was undertaken by the airport's service Management Company Air India SATS (AISATS) and AeroTech Support Services Pvt. was carried out in cooperation between. In addition to saving water, Aerowash technology also increases operating time by reducing the time the aircraft stays on the ground. Additionally, the process requires minimal human intervention, resulting in potential savings for airlines.

Sustainable practices and green energy

In the context of the importance of sustainable practices and green energy in the context of the global aviation industry, technologies such as Aerowash performed as expected. As part of this commitment, India has launched various initiatives to help protect the environment. To address the carbon footprint of the aviation sector, Civil Aviation Minister Jyotiraditya Scindia announced plans for more than 90 airports in the country to become carbon neutral by 2024; The first airports to achieve this goal were airports such as Delhi and Kochi. While Delhi aims to replace all gas- dependent airside vehicles with electric vehicles (EVs), Kochi proudly holds the distinction of being the first airport in the world to meet all its needs with solar energy in 2015. Airlines are still adopting environmentally friendly practices. For example, Akasa Air created its staff uniforms using recycled polyester from PET bottles recycled from ocean waste. As part of its environmental initiatives, Air India has taken steps such as removing the use of 500ml plastic water bottles from all economy class seats on wide-body aircraft. metal operates globally and has introduced 100% compostable garbage bags. ACI Asia-Pacific Announces Green

CI ASIA PACIFIC ANNOUNCES 2023 GREEN AIRPORTS RECOGNITION

Airports Council International (ACI) Asia Pacific today announced the results of its 2023 Green Airports Recognition (GAR) program, which recognizes 12 airports in Asia Pacific and the Middle East that stand out for their safety efforts and are successful in their development projects.

Over 35 million passengers per annum

Category	Airport	Project
Platinum	Chhatrapati Shivaji Maharaj International Airport	Single Use Plastic Free Airport-Mumbai
Gold	Hong Kong International Airport	Hong Kong International Airport rapidly reduces single-use plastic items
Silver	Indira Gandhi International Airport	Single-use Plastic Free Delhi Airport

Between 15-35 million passengers per annum:

Category	Airport	Project
Platinum	Kempegowda International Airport	Plastic Circularity at KIAB
Gold	Rajiv Gandhi International Airport	Single Use Plastic Free RGI Airport
Silver	Jeju International Airport	The introduction of reusable cups to airport

Between 8-15 million passengers per annum:

Category	Airport	Project
Platinum	Central Japan International Airport	Bottle to Bottle sustainable use of PET bottle

Darla Nagaraju and Venugopal Rao

Gold	Adelaide Airport	Single-use Plastics Precinct
Silver	Bahrain International Airport	Combating single-use plastics at Bahrain International Airport

Less than 8 million passengers per annum:

Category	Airport	Project
Platinum	Mangalore International Airport	SUP Free Airport
Gold	Christchurch International Airport	Waste Strategy to Circular Solutions
Silver	Kaohsiung International Airport	Plastic life at the Airport

FLY GREENER: DISCOVER THE WORLD'S BEST AIRLINES FOR SUSTAINABLE INTERNATIONAL TRAVEL

A hotspot for international tourists and travelers, India has become a hub for many short-haul, domestic and international flights. In recent years, the Indian aviation industry has made significant progress in providing excellent customer service while ensuring safety. To learn more about the most profitable airlines offering international travel to India, see the list of 10 airlines below.

Air India

Air India is one of the most famous airlines in India. Headquartered at Delhi's Indira Gandhi International Airport, Air India is India's flagship airline and its focus on international flights makes it the best choice for those looking to travel around the world by developing the most reliable and safe. It offers passengers great value, friendliness and entertainment options throughout their flights.

Etihad Airways

Etihad Airways is the national airline of the United Arab Emirates and is known as Emirates. The company was founded in November 2003 and operates out of Abu Dhabi's Khalifa City. Etihad Airways serves more than 120 countries around the world with its fleet of 102 Airbus and Boeing aircraft. The airline has an extensive network providing more than 1,000 weekly flights to the Middle East, Africa, Europe, Asia, Australia and North America. Etihad Airways is working with the Abu Dhabi Waste Management Authority to study the feasibility of converting municipal waste into aviation fuel to ensure the end use of fuel in its flights. This measure shows that the airline is committed to being a leader in environmental innovation and reducing its dependence on fossil fuels.

SpiceJet

SpiceJet is a low-cost airline connecting more than 41 domestic countries and 8 international countries. Their headquarters are located in Gurgaon, India and they offer cheap flights to travelers who want to travel to any country. While SpiceJet offers many features such as online check-in, bonus points and in-flight entertainment, it also works for a sustainable environment.

IndiGo Airlines

IndiGo Airlines is a famous low-cost airline in India known for its widespread network, on-time flights and excellent service. It has good internet connections with major cities in India and has many international flights to Europe, the Middle East and Southeast Asia. Apart from offering the most competitive prices, IndiGo is highly sustainable in terms of fuel and cooking oil consumption, reduced CO₂ emissions and waste management.

AirAsia

AirAsia is one of India's most popular airlines and one of India's most stable airlines. AirAsia focuses on providing passengers with affordable airfare while ensuring its tickets are highly sustainable in terms of fuel and electricity. Having extensive connections with many parts of the world offers great opportunities for those who want to study abroad.

**GoAir**

GoAir is one of India's cheapest airlines and has been the market leader for some time. Despite restrictions, GoAir provides environmentally friendly services to its customers by operating fuel-saving flights using fuel-saving technologies. They are recognized by the International Air Transport Association (IATA) for their environmental efforts. 7. Vistara Airlines

Vistara

Airlines is a joint venture between Tata Sons and Singapore Airlines. By operating Boeing 737-800 aircraft daily, it ensures that passengers have fuel-saving and comfortable journeys to many international destinations where it operates. They also implement a carbon offset policy to reduce their overall carbon footprint.

CONCLUSION

Sustainability practices have become a topic that describes environmental activities and sustainability awareness. Such measures aim to encourage companies to reduce their impact on the environment. When using green thinking strategies for airports, it can be seen that there are benefits such as high efficiency, good performance, and good impact on people and the environment. This research reveals current knowledge about sustainability and green practices in the aviation industry is understandable. The review also includes green practices followed by Indian airlines. It also aims to recognize airlines as the best healthcare providers in 2024. Literature confirms that these good practices lead companies to develop environmental strategies such as green initiatives that help companies save money. India is home to many international airlines that offer many options for all types of travel. All the above-mentioned (in Interpretation) airlines provide solid service to ensure that passengers have a good experience and good environment while traveling around the world.

ABSTRACT

Microspheres are designed to dispatch drugs to specific sites at a predetermined rate, increase bioavailability, and attain controlled or sustained drug administration. Microspheres are newly introduced technology developed to incorporate the active pharmaceutical ingredients which improves their absorption and bioavailability. Naringenin is a phytochemical which has less bioavailability and reported to have antihyperlipidemic and anti-inflammatory activities. But, orally administered naringenin is poorly absorbed by our body resulting in less bioavailability. Therefore, increased dose of naringenin is used to have its proper bioavailability. Thus, the aim of this present undertaken study is to make an entreaty of novel drug delivery system to the traditional medicine to overcome the disadvantages associated with it like bioavailability. Six different formulations of Naringenin microspheres were formulated by using emulsion solvent evaporation method by varying the concentrations of polymers like Eudragit, HPMC and ethyl cellulose. All the formulations were evaluated using percentage of phytochemical content, percentage of phytochemical entrapment efficiency, SEM, FTIR, etc. Among all the formulations, formulation F2 which is composed of 100 mg of drug and 200 mg of Eudragit have shown better drug content, percent entrapment efficiency and hence the same is selected

**Praneetha Pallerla et al.,**

to check the shape and surface morphology using SEM which has shown spherical shape and uniform surface morphology. Thus, formulation F2 has come out with highly favorable results, focusing its efficacy and potential for future research and development.

Keywords: Microspheres, Bioavailability, Naringenin, Entrapment efficiency, SEM, FTIR.

INTRODUCTION

Microspheres are newly introduced technology developed to incorporate the active pharmaceutical ingredients which improves their absorption and bioavailability. Microspheres are designed to dispatch drugs to specific sites at a predetermined rate, increase bioavailability, and attain controlled or sustained drug administration[1,2]. Naringenin is a flavonoid obtained from fruits of *Citrus aurantium* (115–384 mg/L), tomatoes (0.68 ± 0.16 mg/100 g). Naringenin is a phytochemical which has less bioavailability and reported to have antihyperlipidemic, anti-inflammatory anticancer, antioxidant and antidiabetic activities[3,4]. But, orally administered naringenin is poorly absorbed by our body resulting in less bioavailability[5,6]. Therefore, increased dose of naringenin is used to have its proper bioavailability. Thus, the aim of this present undertaken study is to make an entreaty of novel herbal drug delivery system to the traditional medicine to overcome the disadvantages associated with it like bioavailability. The key objective of the present undertaken study is to formulate microspheres of naringenin, to increase the absorption and bioavailability of the drug thereby enhancing the efficacy of the drug.

MATERIALS AND METHODS

Chemicals

Standardized phytochemical Naringenin was obtained from Yucca Enterprises, Mumbai, India. Eudragit was bought from Labin chemicals, Pune, India, and Chloroform, ethanol and all the chemicals used and solvents used are of analytical grade.

Compatibility studies

FTIR spectroscopy can be utilized to explore and predict physicochemical interactions between Naringenin and other ingredients prior to formulation. This method can assist in selecting appropriate, chemically compatible excipients. The compatibility studies focus on determining whether there are any interactions that may occur between the carriers and the drug[7].

Standard calibration curve of Naringenin using UV-Visible spectrophotometer

Standard calibration curve of Naringenin was plotted by using the equipment UV-Visible spectrophotometer. The standard solution of Naringenin was prepared in the range of 1-10 µg/ml of phytochemical in ethanol at λ_{max} 288 nm. The calibration curve was constructed with concentration on x-axis and absorbance on y-axis.

Preparation of naringenin microspheres

Six different batches of Naringenin microparticles were developed by using the method emulsion solvent evaporation method by varying the concentrations of polymers like Eudragit, HPMC and ethyl cellulose. This method was chosen since it is easy, quick, and cost-effective. Polyvinyl alcohol was used in the formulations which acts as a stabilizer and helps to give spherical shaped microspheres without clumping. Ethanol and chloroform are used as solvents because of their volatile nature, and they also prevent polymer precipitation[8]. Ethanol is a non-toxic solvent which produces good spherical shaped particles with a uniform surface. The formulation is given in Table 1.

**Praneetha Pallerla et al.,****Characterization of microspheres****Determination of % Yield**

The % yield of the microspheres was determined by following formula

Percentage Yield = (Practical yield / Theoretical yield) × 100

Estimation of percent phytochemical Content

The phytochemical content in the microspheres was determined by dissolving accurately weighed 10 mg of sample of microspheres in 10ml ethanol. After suitable dilution absorbance was determined by UV-Spectrophotometer and percent drug content was determined.

Determination of Percent Entrapment Efficiency (EC)

All the formulations of microspheres were subjected to centrifuge at 12000 rpm for around 45min using centrifuge (Remi) to separate microspheres from the untrapped drug. The free phytochemical concentration present as the supernatant was estimated by calculating absorbance obtained using equipment UV-visible spectrophotometer[9]. The percent entrapment efficiency of the phytochemical Naringenin was calculated by below formula. % Entrapment efficiency = (Amount of encapsulated drug)/(Amount of total drug) × 100

Scanning Electron Microscopy (SEM)

A scanning electron microscope study was conducted to assess the surface morphology, size, and shape of the prepared six microsphere formulations. The optimized microsphere formulation was analyzed using scanning electron microscopy.

Measurement of Particle Size (PS)

The particle size of the prepared formulations of microspheres was measured using a particle size analyzer (Microtrac). For this determination, 5 mg of the optimized formulation was diluted with a suitable volume of Phosphate buffer saline solution of pH 6.8, and the diameter of the microsphere was determined[10].

RESULTS**Pre formulation studies****Organolectic characteristics**

Naringenin phytochemical was analyzed for its macroscopic properties like color, odour, studies of solubility and determination of wave length maxima of drug. The Colour of Naringenin is yellow, taste- bitter, odour-characteristic and has λ_{max} of 288 nm.

Compatibility studies

The studies related to compatibility between Naringenin and the polymers were assessed using the equipment Fourier transform infra red spectroscopy. The absence of new peaks or no disappearance of existing peaks in the drug-polymer mixture confirmed that there were no chemical interactions between the phytochemical and the polymer. The figure 1 and figure 2 represents the FTIR spectrum of Naringenin and Naringenn microspheres respectively.

Standard calibration curve of Naringenin

Naringenin has maximum absorbance at 288 nm. The standard calibration curve of Naringenin in Phosphate buffer saline of pH 7.4 was plotted by taking the concentrations from 1 µg/ml to 10 µg/ml. The calibration curve for Naringenin was linear from 1µg/ml to 10 µg/ml with $R^2=0.999$ and is shown in figure 3.

**Praneetha Pallerla et al.,****Evaluation of Naringenin microspheres**

Organoleptic characteristics and solubility: The characteristics of naringenin and naringenin microspheres were evaluated and are given in table 2.

Percentage yield

The percentage yield of various Naringenin microspheres formulations are shown in table 3. Among all the formulations, F2 showed the highest yield of 72.3% compared to other formulations

Determination of percent drug content

The phytochemical content of Naringenin microspheres was assessed by taking an accurately weighed 1 mg sample of the complex in 10 mL of ethanol. After appropriate dilution, the absorbance was measured using equipment UV spectrophotometer at 288 nm, and the drug content was calculated and is given in table 3.

Percent Entrapment efficiency (EE)

Naringenin microspheres of various concentrations were centrifuged at 12000 rpm for 15 minutes using a centrifuge (Remi) to isolate microspheres from the untrapped drug. The free phytochemical concentration present as the supernatant was estimated by calculating absorbance obtained using equipment UV-visible spectrophotometer. The percent entrapment efficiency of the phytochemical Naringenin was measured and given in table 3.

Scanning electron microscopy

Scanning electron microscopy was performed to determine the surface morphology, shape of microspheres and size of microspheres of the prepared Naringenin microspheres formulation. The optimized dried Naringenin microspheres were subjected to SEM analysis and pictures were collected and shown in figure 4. The surface morphology, shape, and structure of the microspheres are shown in figure 5. It was observed that the drug particles are associated with the polymer forming complexes with spherical particle shapes and smooth structures.

DISCUSSION

Flavonoids are regarded important compounds which are advised to be taken as part of the human diet in proper amounts for their significant antioxidant/radical scavenging properties[11]. Since, last few years there are rapid changes occurring in the delivery of essential phytoconstituents like flavonoids to increase their bioavailability by studying the pharmacokinetic profile of such substances[12]. Due to the gastric environment in the human body which is composed of enzymes and luminal bacteria and other factors like intraluminal and first-pass metabolism by liver, active extrusion mechanisms contribute to the ineffective absorption of phytoconstituents ultimately decreasing the bioavailability. Oral absorption of Naringenin was reported to be very low quite a few years. Naringenin has been found to have potential anti-inflammatory and antioxidant properties[13]. Orally administered Naringenin is poorly absorbed and is metabolized by intestinal microflora rapidly making the drug less effective. For a proper therapeutic effect, the dose has to be increased[11]. Such problems can be overcome by using novel drug delivery systems like microspheres so that the drug is not easily eliminated from the body and the dosage of the drug can also be decreased[14]. Hence the current undertaken study was aimed to increase the bioavailability of Naringenin by formulating into Naringenin microspheres. Naringenin and polymer complex microspheres were prepared by using solvent evaporation method in six formulations by varying the polymer concentrations. All the formulations were evaluated using various evaluation techniques like organoleptic characteristics, solubility studies, compatibility studies, drug content determination and entrapment efficiency. The Compatibility studies were done using FTIR which has indicated that the IR spectrum of Naringenin drug and microspheres have similar peaks. This shows that there are no chemical interactions between the phytochemical and polymers, which shows that the phytochemical and polymers are chemically compatible. Among all the formulations, the formulation F2 was found to be with greater entrapment efficiency i.e., 86.35 % and with highest percent drug content 88.2 % of all other formulations. Thus, the same was evaluated for Scanning electron microscopy. The scanning electron

**Praneetha Pallerla et al.,**

microscopic studies indicated that the size was around 100 micrometers, and the shape of microspheres was spherical and the surface was smooth. These studies indicated that the formulation was stable and is a micro sized complex.

CONCLUSION

Among the six prepared microsphere formulations of the phytochemical, F-2 Formulation which is composed of 100 mg of drug and 200 mg of Eutragit have shown better drug content, percent entrapment efficiency and hence the same is selected to check the shape and surface morphology using SEM which has shown spherical shape and uniform surface morphology. Thus, F-2 formulation has come out with effective results, portraying its potential for further research and development to be emerged as novel herbal drug delivery system of Naringenin microspheres.

ABSTRACT

The gut content and dimension of food items of nymphs of Dragonfly found in Rapti river of district Balrampur, Uttar Pradesh, India have been analysed. The present work revealed that the percentage composition of aquatic insects larvae (Culex larvae, Chironomous larvae, Eristalis larvae), microcrustacean- Copepoda (Cyclops sp.) and Cladocera (Daphnia sp., Mysis sp. and Moina sp.) in the gut. Although constituted a small percentage of the diet, the nymphs of dragonfly certainly have selective nature of feeding and have preferences for animal food specially for aquatic insects larvae.

Keywords: Uttar Pradesh, India have been analysed. The present work revealed that the percentage composition of aquatic insects larvae

INTRODUCTION

The odonate act as biological control agent for many known and unknown noxious insects-pests because of its predatory habits. This habit exists in both, the adult as well as the nymphal stage. The nymphs of Dragonfly occupy an important position at the top of food web and energy flow pathway of the freshwater ecosystem (Datta *et.al.*,1991). Considerable work has been done on the food and feeding habits of Odonate nymphs (Fischer, 1961, Pritchard, 1964, Begum *et.al.*, 1984, Roy, 1985, Thomas *et.al.*,1992).Practically no information is available regarding analysis of gut content and dimension of food items of nymphs of Dragonfly in at river condition of district Balrampur, Uttar Pradesh. Therefore, keeping this in to view, gut content and dimension of food items from nymphs of Dragonfly have been analysed to evaluate their food preferences and their role in Rapti river ecosystem.

**Kamalesh Kumar****Location of Study area**

The district Balrampur, Uttar Pradesh located 27.429707 latitude and longitude is 82.176804. Balrampur district in Uttar Pradesh, India is located on the banks of Rapti River. The town of Balrampur is the district head quarters and is also situated on the Rapti river bank (Map-1 & 2).

MATERIALS AND METHODS

Nymphs of Dragonfly of final instar were collected from the muddy bank of Rapti river of district Balrampur, Uttar Pradesh by an Insect collection net made up of nylon cloth (mesh size 40 to 80/cm²). The sample were stored out, killed in 70% alcohol and then transferred to 4 % formalin for preservation. The nymphs of Dragonfly were dissected in the Zoology laboratory, M.L.K.P.G. College Balrampur, Uttar Pradesh, India. The intact foregut was removed and dissected further on a glass slide. The techniques as suggested by Mecon and Cummins (1964) and Shapes and Hilsenhoft (1976) were used. The food item were counted applying the method of Brown (1961). Approximate percentage of volumes of food items (Rotifera, microcrustacean, algae, diatoms, detritus and other matters) were recorded from each season (winter, spring, summer and monsoon) during the period January 2024 to December 2024. Planktons of overlying water of Rapti river were also collected by a plankton net (mesh size 0.03-0.04 mm) and counted by the microtransect method described by Lackey (1938). The genera of Dragonflies taken in to account were Merogomphus, Cordulegaster and Pantala.

RESULTS AND DISCUSSION

Seasonal variation in the composition of the dietary component percentage nymphs of Dragonfly have been summarised in Table-1. The gut content observation of these nymphs revealed that they are primarily carnivorous in habit, feeding upon other small aquatic insects and aquatic insect larvae, Copepoda (Cyclops sp.), Cladocera (Daphnia sp., Mysis sp. and Moina sp.), fish fry, algae and other animal tissues present in the gut. Only small percentage of micro-vegetation could be observed in the gut. They were mainly algae belonging to Bacillariophyta, Chlorophyta and Myxophyta. The seasonal fluctuation in the feeding habits showed that the nymphs of Dragonfly prefer to take Culex larvae, Chironomus larvae, Eristalis larvae, Copepoda and Cladocera, small aquatic insects and other animal tissues were in maximum percentage in the foregut. The member of the algal community belonging to Myxophyta, Bacillariophyta and Chlorophyta were also recorded small amount percentage in the foregut in different seasons of one year (January 2024 to December 2024) of investigation. Similar investigation and identification was also expressed Needham and Needham (1962), Saha *et al.* (2012), Lakshminath Kundanati (2019). The analysis of gut content of the nymph revealed that the animal diet comprises the maximum percentage of food whereas non animal diet forms insignificant percentage. Similar view was also expressed by Banke (1976). However, the diet of these nymphs may vary from season to season depending upon the abundance of particular prey types which is evident from the Table-1. Hassan (1976) also had similar findings.

ABSTRACT

The proliferation of social media platforms has led to a significant increase in user-generated content. These platforms empower individuals to create, share, and exchange information, fostering communication and engagement. However, this rapid content dissemination also facilitates the spread of threatening and abusive language. To address this challenge, an effective automated system is necessary to detect and eliminate such harmful content. The growing presence of platforms like Facebook, Twitter, and Instagram, combined with the vast user base, highlights the need for proactive solutions. This research proposes a hybrid approach for abusive language detection, combining Bidirectional Encoder Representations from Transformers (BERT) with Support Vector Machines (SVM). By leveraging BERT's contextual embeddings and SVM's robust classification capabilities, the system enhances the accuracy of identifying offensive language. The dataset used for experimentation is categorized into abusive, offensive, and neutral content, ensuring a broad spectrum of analysis. The results indicate that the proposed BERT-SVM model achieves an accuracy of 94.6% and a macro F1-score of 92.1%, outperforming traditional classifiers and deep learning models. This study demonstrates the potential of hybrid models in developing reliable systems for detecting abusive content on social media platforms.

Keywords: Abusive language detection, Offensive language, Machine learning, BERT, SVM, Deep learning, Transformers.

**Pallavi Patel et al.,**

INTRODUCTION

In recent decades, the rapid advancement of computing technology, especially in Online Social Networks (OSNs), has drastically reshaped communication patterns among users [5]. Platforms such as Facebook, Twitter, Weibo, and WhatsApp have become an integral part of daily life, providing virtual spaces where individuals engage in discussions, express opinions, and share content with their family, friends, and broader networks [9]. These interactions generate vast volumes of data, which can be analyzed to extract valuable insights across a variety of domains, including sentiment analysis, social bot detection, sarcasm detection, recommendation systems, and rumor detection [14]. Among these, Twitter has become a particularly important platform for public figures, including politicians and celebrities, due to its short-form nature and broad reach [11]. However, the open and free-flowing nature of these platforms also poses a challenge, as they can be used to propagate hate speech, abusive language, and harmful content. The ambiguity in defining hate speech, and its overlap with abusive speech, presents a challenge in both research and policy enforcement [13]. While hate speech is often defined as offensive and aggressive content targeting specific groups based on characteristics such as ethnicity, religion, or gender, it is frequently accompanied by broader forms of harmful language, including profanity, aggression, cyberbullying, and toxicity [20]. Such content on OSNs can have profound real-world consequences, including fostering communal tension and even violence. To combat the rise of abusive language, various approaches have been proposed, ranging from statistical analysis and pattern mining to advanced deep learning techniques. Machine learning models, especially deep learning methods [16], have shown significant promise in detecting and classifying abusive language [10]. Despite this, challenges remain in achieving consistently high accuracy across different datasets and languages [19]. While datasets in English, such as Jigsaw, provide a solid foundation for model training, datasets in other languages remain limited, often lacking the volume and diversity needed for effective detection [17]. This paper explores the use of deep learning techniques, specifically fine-tuning pre-trained transformer models, for detecting abusive language in online social networks, addressing the critical need for automated solutions to ensure safer online interactions [7]. Transformers have revolutionized natural language processing (NLP) by introducing a highly parallelizable and scalable architecture that outperforms traditional recurrent and convolutional models [31]. The Transformer model eliminates the need for sequential data processing by utilizing a self-attention mechanism, allowing it to capture long-range dependencies effectively. The core component of the Transformer is the self-attention mechanism, which enables the model to weigh the importance of different words in a sentence relative to each other. Self-attention computes contextual relationships in a single pass, significantly improving efficiency. The multi-head self-attention mechanism enhances this capability by allowing the model to focus on multiple aspects of the input simultaneously [31]. By leveraging self-attention and positional encoding, Transformers have become the backbone of state-of-the-art NLP models which will be used for the experimental setup. Their ability to model contextual dependencies efficiently has made them integral in applications such as text classification, machine translation, and abusive language detection.

LITERATURE REVIEW

Conducted cyber bullying detection on Dutch social media, specifically on Ask.fm. They gathered data and annotated it with seven categories, including 'Threat,' 'Insult,' and 'Defamation.' The researchers employed a classifier utilizing a bag-of-words approach for both word and character n-grams, alongside a sentiment lexicon. The classifier itself was based on Support Vector Machine (SVM). Their findings indicated that relying solely on sentiment features or significantly reducing the number of bag-of-word features due to data sparsity led to suboptimal results in cyber bullying detection.[2] proposed hybrid network, combining CNN and GRU, showcased a synergistic approach to detect hate speech by incorporating diverse neural network components, the model aimed to capture both local and sequential dependencies in the data, contributing to a more nuanced understanding of hate speech patterns. Model yielded the highest accuracy of 96.20% compared to state-of-the-art techniques. [3] proposed a multi-channel model for detecting toxic comments in a multi-label setting, employing a convolution gated recurrent unit network, represented a significant step in addressing the complex task of comment toxicity prediction. The use of a gated

**Pallavi Patel et al.,**

recurrent unit network emphasized the significance of capturing sequential dependencies in the data. [4] focus on detecting 'invective' posts on Ask.fm, a social networking site for asking questions. They employ a linear SVM and a range of features, including Linguistic Inquiry and Word Count (LIWC), word2vec, paragraph2vec, and topic modeling. Reporting a F1-score of 59% and an AUROC of 78.5%, they showcase the effectiveness of their approach using a specific subset of features. [5] contribute by detecting hate speech on Twitter using a three-way classifier: hate speech, offensive but not hate speech, and none. Logistic Regression and SVM are implemented, incorporating various features such as TF-IDF n-grams, Part-of-Speech (POS) n-grams, Flesch Reading Ease scores, and sentiment scores derived from an existing sentiment lexicon. Their approach provides a comprehensive analysis of hate speech categories on Twitter. [6] a significant dataset for abusive language detection is introduced by an unnamed author(s), consisting of 115,737 Wikipedia discussion comments annotated for the presence of personal attacks. The methodology involves employing simple word and character n-grams along with a multilayer perceptron, achieving an impressive AUROC of 96.5%. Character n-grams outperform word n-grams, aligning with similar findings in the field. [7] conduct a Twitter study where they incorporate user attributes such as age, inter-arrival time, and network-based attributes like popularity and centrality. Utilizing the Random

Forest algorithm, they classify Twitter users into categories such as normal, aggressive, bullying, or spamming. [8] delved into the realm of abusive language and hate speech detection on Twitter, employing a sophisticated approach that combines bi-directional Gated Recurrent Units (GRUs) with a hybrid Convolution Neural Network (CNN). The primary focus of their investigation was a substantial Twitter dataset [28], showcasing the practical applicability of their models on a platform known for its diverse and dynamic user interactions. The architecture of their model featured bi-directional GRUs, a variant of recurrent neural networks adept at capturing contextual nuances from both preceding and succeeding tweets. Complementing this, a hybrid-CNN was utilized to extract hierarchical features from the input data, demonstrating a comprehensive strategy for language analysis. In a different study [10], researchers examined the use of a stacking method to create a regression ensemble comprising individual models. The results indicated that incorporating stacking techniques can enhance the predictive efficiency of sales time series forecasting. Error estimation was conducted using a relative mean absolute error (MAE), calculated as $\text{error} = \text{MAE}/\text{mean}(\text{Sales}) * 100\%$. Commonly employed methods for demand estimation include time series forecasting strategies, such as exponential smoothing, Holt Winters model, Box & Jenkins model, regression simulations, and ARIMA [11]. However, the effectiveness of these techniques greatly depends on factors such as the specific implementation, target projections, and user interface. Prediction precision for each case was determined using the well-known Root Mean Square Error (RMSE). As anticipated, improving forecast accuracy by reducing the RMSE leads to enhanced outcomes for both consumers and manufacturers. In this study [5], a comprehensive demand forecasting framework is developed, aiming to improve upon traditional methods.

The framework incorporates various machine learning algorithms for analyzing and interpreting historical data. Nine different time series techniques, including moving average (MA), exponential smoothing, Holt-Winters, ARIMA strategies, and three Regression Models, as well as SVR and MLFANN, a multilayer feedforward artificial neural network, are combined using a boosting ensemble approach [6]. The results demonstrate significant improvements in prediction accuracy when compared to individual prediction models. The proposed framework offers enhanced precision in the demand forecasting process. In the study [12], recent advancements in the field of sales forecasting, specifically in the context of fashion and new product forecasting, were outlined. Traditional statistical procedures, including exponential smoothing, ARIMA, Box and Jenkins model, regression models, and Holt-Winters model, are commonly used for sales forecasting. However, these traditional approaches often struggle to provide accurate sales information for new products and customer-oriented items. The study highlights the effectiveness of hybrid forecasting models as a promising solution to address these challenges and improve the accuracy of sales forecasting [13]. In the research paper [6], an investigation was conducted on three machine learning algorithms—Generalized Linear Model (GLM), Decision Tree (DT), and Gradient Boost Tree (GBT)—for prediction purposes. The study revealed that the Gradient Boost Algorithm demonstrated the highest accuracy in forecasting and predicting future sales. With the rise of e-commerce websites and the ability for customers to leave feedback on various products, there is a growing need to analyze and extract valuable information from large

Pallavi Patel et al.,

volumes of customer reviews. To address this, the study utilized supervised machine learning techniques, specifically Support Vector Machines (SVM) and Naive Bayes, to classify beauty products from Amazon. The results indicated that SVM outperformed Naive Bayes when dealing with larger datasets [14].

Dataset

For the experimental setup Hate Speech and Offensive Language Dataset from the Set Fit repository, originally introduced by Davidson et al [18]. The dataset consists of 24,783 rows that consist tweet and each categorized into one of three classes: hate speech, offensive language, or neither. Hate speech includes explicit content that promotes discrimination or violence based on race, gender, or other attributes, while offensive language contains profane or derogatory expressions that are not necessarily classified as hate speech. The third category consists of neutral or non-offensive tweets. This dataset has been widely used in hate speech detection research, making it a reliable benchmark for evaluating machine learning and deep learning models. The dataset consists of social media text categorized into three classes: hate speech, offensive language, and neutral content. Due to its imbalanced nature, preprocessing techniques like tokenization and punctuation removal were applied to enhance model performance. This dataset plays a crucial role in training and evaluating abusive language detection models. To ensure high-quality annotations, the dataset was manually labeled by human annotators. In our study, we preprocess the text by removing unnecessary symbols, URLs, and stop words while preserving the linguistic structure. The dataset is then divided into 80% for training and 20% for testing to maintain a balanced evaluation of the model's performance.

PROPOSED METHODOLOGY

The proposed approach for abusive language detection integrates Bidirectional Encoder Representations from Transformers (BERT) for feature extraction and Support Vector Machine (SVM) for classification. This hybrid model leverages the contextual representation capabilities of BERT while utilizing the robustness of SVM for efficient classification. The Hate Speech and Offensive Language Dataset is preprocessed by removing unnecessary symbols, URLs, and stop words, while maintaining linguistic integrity. Tokenization is performed using a pre-trained BERT tokenizer, which converts textual data into sub word tokens, followed by input transformation into word piece embeddings. These embeddings are then passed through a pre-trained BERT base model to extract deep contextualized representations from the last hidden layer. The extracted feature vectors are subsequently flattened and reduced in dimensionality before being used as input to an SVM classifier with a radial basis function (RBF) kernel. The SVM is trained to classify text into predefined categories (hate speech, offensive language, or neither) using a multi-class one-vs-rest (OvR) approach. Model performance is evaluated using metrics such as accuracy, precision, recall, and F1-score. This hybrid architecture enhances abusive language detection by leveraging BERT's ability to capture semantic and syntactic nuances while mitigating overfitting through SVM's structural risk minimization principle. By combining deep contextual embeddings with traditional machine learning classifiers, the model achieves improved generalization and interpretability in hate speech classification tasks.

Evaluation Parameters and Significance

The performance of the system should be evaluated in terms of the accuracy of classification. It is worth mentioning that a comparative analysis is done based on the common and overlapping data

Accuracy (Ac): It tells us about the exactness set of the different methods. The critical parameters are:

The classification accuracy is computed as:

$$Ac = \frac{TP+TN}{TP+TN+FP+FN} \quad (1.1)$$

The precision is computed as

$$Pr = \frac{TP}{TP+FP} \quad (1.2)$$

The F-measure or F-Score is computed as:

**Pallavi Patel et al.,**

$$F - Measure = 2 \cdot \frac{Precision \cdot Recall}{Precision + Recall} = F - Measure = \frac{TP}{TP + \frac{1}{2}(FP + FN)} \quad (1.3)$$

Here,

(TP): True Positive

(TN): True Negative

(FP): False Positive

(FN): False Negative

Experimental Results

The proposed BERT-SVM hybrid model for abusive language detection was implemented using Google Colab with Python programming. The experiments were conducted on a publicly available Hate Speech and Offensive Language dataset sourced from Hugging Face. The dataset was preprocessed to remove noise, tokenized using BERT's pre-trained Word Piece tokenizer, and transformed into contextual embeddings using BERT-base-uncased. The extracted feature vectors were then classified using a Support Vector Machine (SVM) with an RBF kernel. The model achieved an accuracy of 94.6%, demonstrating superior performance in identifying abusive language compared to traditional machine learning methods. The precision, recall, and F1-score for each class were analyzed, showing high reliability in detecting offensive and hate speech while minimizing false positives. Additionally, the performance evaluation was visualized using various graphical representations. The confusion matrix illustrates the classification effectiveness by highlighting correctly and incorrectly classified instances. The Receiver Operating Characteristic (ROC) curve confirms the model's strong discriminatory power, while the precision-recall curve further validates its robustness in handling imbalanced data. The experimental results suggest that the BERT-SVM hybrid approach effectively captures deep linguistic patterns from abusive text, outperforming traditional SVM and deep learning classifiers alone. Future improvements may include optimizing hyperparameters and experimenting with transformer fine-tuning to further enhance classification accuracy.

CONCLUSION

In this research, we proposed a BERT-SVM hybrid model for abusive language detection, leveraging BERT embeddings for contextual feature extraction and SVM for classification. The experimental results demonstrated that our approach achieved an accuracy of 94.6%, with a precision of 94.7%, recall of 90.0%, and an F1-score of 92.1%. highlight the effectiveness of the proposed model in identifying abusive content while maintaining a balance between precision and recall. The combination of deep contextual representations from BERT and the robust decision boundary of SVM proved to be highly effective in distinguishing abusive language from non-abusive text. The graphical analysis, including the confusion matrix, ROC curve, and precision-recall curve, further validated the model's performance.

FUTURE SCOPE

Future research can focus on fine-tuning BERT on domain-specific datasets to enhance performance. Exploring ensemble learning techniques and data augmentation methods may further improve classification accuracy. Additionally, extending the model to multilingual abusive language detection and real-time deployment can enhance its practical applications.

ABSTRACT

The largest economic, health, and social problem of our day is without a doubt the phenomenon of the world's aging population. Moreover, the increase in degenerative and chronic illnesses is one of the most important epidemiologic trends of our day. A more comprehensive analysis of the research that has been done on this subject, together with a more current description of chronic illnesses and other restrictions related to aging, are the goals of the study. It has been noted that elderly persons have a high prevalence of chronic illnesses and a low level of awareness about these conditions. Thus, this study was created to assess the level of knowledge of chronic diseases among those over 60, investigate associated factors, and offer data for upcoming health education. Possibly the biggest economic, health, and social issue facing the world now is the growing number of elderly individuals within it. The rise in chronic and degenerative diseases is also one of the main epidemiologic trends of the modern period. In addition to giving a more thorough perspective on the research that has been conducted in this area, this study attempts to present a more current review of chronic diseases and other constraints related to aging. In many nations, one of the biggest problems is the aging of the population and associated problems. It appears that remote technology can assist older people manage chronic illnesses and receive better healthcare services. The purpose of this study was to find out what experts thought about the viability of managing chronic illnesses in the elderly with mobile-based technology.

Keywords: Hypertension, Arthritis, Cognitive dysfunction, coronary heart disease, chronic kidney disease (CKD), Comorbid psychiatric disease, Psychotherapy disease, Alzheimer's disease, Dementia, Catecholamine, Cerebrovascular disease, Parkinson's disease, Cancer, Diabetes Mellitus, Thyroid disease.

**Galanki Vasantha et al.,**

INTRODUCTION

One of the biggest social, medical, and economic issues of our day is the aging population phenomena. The number of people living to be old will continue to rise quickly, according to recent demographic trends. The majority of people nowadays can anticipate living to be 60 years of age or beyond[1]. The population of the United States (US) that will grow the fastest between 2000 and 2020 will be 65 years of age and older[2]. Fifty-six percent of people on the planet will be 60 years of age or older by 2030. The number of elderly people globally is predicted to triple from 2015 to 2050. By 2050, there will likely be 1.5 billion people worldwide who are 65 years of age or older, with developing nations contributing the most to this increase[3]. In order to address the needs for medical care and preventative healthcare, these demographic shifts demand a global effort[4]. Elder abuse and social concerns are just a few of the many factors that affect medical problems and, in turn, older people's quality of life (QOL). Other factors include food and nutritional needs, psychological and emotional needs, financial constraints, factors related to the health care system, and physical correlates[5-8]. With the aging of the global population, chronic diseases are becoming more prevalent[9]. In contrast to Sweden, where 53.6% of reports show several chronic diseases, six out of ten Americans have a chronic ailment, and four out of ten individuals have two or more[10-11]. For every person, the healthcare system, and society at large, chronic illnesses represent a major and deep financial burden[12]. In the United States, 86% of all medical expenses are related to these illnesses; the percentage is significantly higher abroad [13]. The co-occurrence of numerous chronic illnesses in one individual has a negative impact on healthcare utilization and expenditures [14]. A Research conducted in Switzerland, for instance, discovered that the average total cost of healthcare for senior patients with numerous chronic disorders was 5.5 times greater than that of older patients without multiple chronic conditions [15].

A little decrease in the prevalence of chronic disease results in significant cost savings from productivity and health that can be amortized over a short period of time, making the investment worthwhile [16]. Since long-term care is required for chronic illnesses, the demand for healthcare services rises and their nature changes as a result[17-19]. An elderly person's quality of life may decline if they need long-term care[20]. The need for healthcare systems to adapt to these changing needs will increase as a result of this phenomenon. Both in the community and at home, new and developing technologies have the power to revolutionize healthcare. Understanding the needs of senior citizens with long-term illnesses and other constraints[21]. This review will provide a current assessment of seniors' limitations concerning their long-term medical issues and will enhance the overall understanding of the field's body of knowledge. Furthermore, the report outlines the main research areas and boundaries related to seniors' desires and chronic diseases, offering a useful synopsis for further investigation. Using keywords like elderly activities of daily living (ADLs), elderly quality of life, and elderly instrumental activities of daily living (IADLs), a systematic review was carried out to identify scientific advancement. This is how this paper is organized: The methodology used for the research reported in the first part is fully covered in the section that follows, which offers the context for this Part 2. Section 3 addresses the challenges that elderly people face as a result of chronic illnesses and other age-related limitations. Section 4 addresses options that can enhance the quality of life for seniors after examining their needs and concerns. Section 5 concludes the work and suggests possible research directions for further projects[22-24]. Older adults at risk for depression at the stage of elderliness, the qualities acquired in earlier phases develop and come together. Establishing ego integrity, accepting life's good and bad parts in its whole, not feeling regret for the past, and not worrying about the future are all expected of an elderly person who has previously gone through healthy developing years[25]. An abundance of life experience and advanced age may help older people cope with stress. Conversely, as one ages, losses accumulate, significant gaps in social contacts surface, physical abilities become more challenging, and medical conditions and prescription drug use become more notable[26-30].

RISK FOR DEPRESSION

The aging process has been linked to the manifestation of depression symptoms in older adults. A number of factors, including age, gender (female), living alone, divorce, low education, functioning issues, concurrent medical illnesses, low levels of cognitive dysfunction, and alcohol and cigarette use. As in previous age groups, depression is more

**Galanki Vasantha et al.,**

common in women than in men in this age group, and women seek therapy more often than men[31-34]. Financial troubles, inadequate self-care, health issues, lack of purpose in life, and separation or divorce have all been connected to depression[35]. The existence of stressors, whether shared or not, and the intensity of depressive symptoms in the elderly have been found to be strongly correlated. Research indicates that the existence of a chronic ailment is the second most significant risk factor for serious depressive illness, after the death of a spouse. Women were also shown to be more depressed when they had low life satisfaction, low functional conditions, and a high awareness of economic issues. Additionally, inverted emotional stability, social inhibition, and diminished cognitive abilities were all associated with depression symptoms. A meta-analysis study found that a chronic illness and feeling unwell raise your likelihood of developing depression. The onset and persistence of depressed symptoms are influenced by a number of age-related medical disorders, including diabetes mellitus, thyroid disease, cancer, cerebro vascular disease, and Parkinson's disease. Physical illnesses can cause depression directly, but they can also result from reduced physical activity, a decline in quality of life, and the need for outside assistance. Depression may result from corticosteroid and antihypertensive drugs that alter or control catecholamine or indoleamine systems. The prevalence of physical illnesses rises with age, which raises the need for medicine and raises the risk of depression. In this sense, assessing depression in the elderly requires extensive investigation[36].

10 Common Chronic Conditions for Adults 65 and Older**Number 10: Alzheimer's and dementia**

Approximately 12% of elderly people eligible for Medicare sought treatment for dementia, including Alzheimer's disease. A kind of dementia called Alzheimer's disease impairs thinking and problem-solving skills to the point where it interferes with day-to-day functioning in addition to causing memory loss. Dementia results from long-term changes in the brain and is not a normal part of aging. Significant risk factors for some chronic illnesses include genetics, age, and family history. Starting with exercise, however, may lessen or even avoid the following activities, according to study. Keeping yourself active is good for your heart and brain. Go to sleep. Get at least 7 hours of deep sleep every night because your brain performs essential functions during this time essential. Eat sensibly. According to research, certain meals can have a harmful impact on the brain.

Number 9: Depression

Depression is a treatable medical condition that is not a normal aspect of aging, and sixteen percent of older people seek therapy for it. The signs of depression include persistent melancholy, pessimism, hopelessness, exhaustion, difficulty making decisions, changes in appetite, and a lack of interest in activities.

Here are some steps you may take to help with depression

Control the amount of stress you experience. Consider frequent meditation practice and reaching out to loved ones during trying times. Eat something nutritious. You can change your mood by what you put into your body, so steer clear of alcohol, caffeine, artificial sweeteners, and highly processed meals and instead consume nutrient-dense foods that increase endorphin and other "feel good" hormone release. A regular activity is exercising. Several psychological and physiological advantages of exercise include enhanced mood due to endorphins and other "feel good" brain chemicals being released, heightened self-worth and confidence from reaching goals and improving physical appearance, and heightened socialization from group classes and gym visits. Speak to your physician. Get in touch with your physician and ask about your choices for treatment if you exhibit any of the depression warning signs. For you, psychotherapy or antidepressant medication may be suitable. One of your first priorities should be to let a close friend or family member know if you are feeling extremely uncomfortable emotionally. A qualified suicide prevention counsellor can also be reached by phone at 988 or through text message at 988. Whenever day or night, anyone in the United States can use the confidential, free 988 service.

Number 8: Heart Failure

Approximately 5% of older persons were received treatment for heart failure, a condition in which the heart fails to adequately pump blood and oxygen to all of the body's organs. To satisfy the body needs, the heart may grow, gain muscle mass, or pump faster, leaving you very lightheaded, queasy, confused, or with a lack of appetite.

**Galanki Vasantha et al.,****Steps you can take to avoid or reduce the symptoms of heart failure**

The most effective way to reduce your risk of coronary heart disease and high blood pressure is to follow your doctor's instructions.

Number 7: Chronic Kidney Disease (CKD)

Nearly 25% of older persons were treated for chronic kidney disease (CKD), a gradual decline of kidney function over time. People with CKD are at a higher risk of getting heart disease and kidney failure.

Steps you can do to prevent or reduce the symptoms of CKD

Recognize renal injury's causes. The greatest course of action is to prevent diabetes and high blood pressure as they are the main factors that lead to kidney impairment. Quick diagnosis and intervention. See your physician often and stay up to date.

Number 6: Diabetes

Twenty-seven percent of elderly people received treatment for diabetes, a condition that results from the body's resistance to insulin or from producing insufficient amounts of it. Your body uses the hormone insulin to convert food energy that can be used by your cells. If this doesn't happen, you have high blood sugar, which can have negative effects like blindness, heart problems, or kidney illness. After 45 years of age, the risk of acquiring diabetes rises.

Steps you can take to prevent or control diabetes

Eating a nutritious diet, which includes tracking your carbohydrate and calorie intake, and consulting your doctor about your alcohol consumption. To keep your blood glucose levels under control, exercise for 30 minutes five times a week

Number 5: Coronary heart disease (also called ischemic heart disease)

Nearly 29% of older persons had treatment for ischemic heart disease, which is characterized by a buildup of plaque in the arteries that lead to the heart. Narrow or obstructed arteries reduce the amount of oxygen-rich blood that reaches the heart. This can lead to further issues such as blood clots, angina, and a heart attack.

Steps you can take if you have ischemic heart disease

Restrict your consumption of salt and sugar and stay away from trans and saturated fats. Obtain seven or eight hours of sleep each night. Regularly perform heart workouts to relieve stress. Give up the smoke. Discuss the main risk factors with your physician; elevated blood pressure and cholesterol are two of them.

Number 4: Arthritis

Roughly 35 percent of elderly individuals received treatment for arthritis, a degenerative condition characterized by inflammation of the joints that results in pain and stiffness, and is more common among women.

Steps you can take to prevent the start of arthritis or manage the symptoms

Exercise for thirty minutes a day, at least five times a week, to enhance function and lessen pain. Incorporate a mix of stretching, strength-training, and cardio workouts. Remain in the weight range that is appropriate for your height; a one-pound loss can alleviate four pounds of pressure on your knees. As always, make sure your arms, knees, and back are supported. Take precautions to keep your joints safe. Please refrain from smoking.

Number 3: Obesity

Obesity, a chronic disease associated with over 200 chronic disorders, affects around 40% of persons aged 65 and older. The NCOA is working to establish quality obesity care as a universal right. This includes the right to treatment coverage and access to all available treatment alternatives.

**Galanki Vasantha et al.,****Tips for Addressing Obesity**

Understanding which obesity treatments are covered by Medicare. Educating oneself about nutrition educating others and advocating for yourself.

Number 2: High cholesterol

More than half of older persons received treatment for high cholesterol, a condition in which your body produces an excess of harmful fats (or lipids), clogging your arteries and leading to heart disease.

Steps to avoid or manage high cholesterol

Steer clear of smoking and excessive alcohol use. Get moving every day. Sustain your weight Cut back on the amount of saturated and trans fats in your diet.

Number 1: hypertension (high blood pressure)

Treatment for hypertension, a common condition that affects how much blood your heart pumps and how resistant your arteries are to blood flow, was obtained by nearly 60% of older adults. When your arteries are narrowed and your heart pumps a lot of blood. Fast-track arteries that block blood flow, as this is the root cause of hypertension, or high blood pressure. Not only can hypertension persist for years without causing symptoms, but it also carries a risk of serious health complications like heart attacks and strokes.

Actions you can do to lower or avoid high blood pressure

Retain a healthy weight. Blood pressure can drop with as little as 10 pounds lost. Control the amount of stress you experience. Reduce your intake of alcohol and salt. Engage in regular exercise that combines cardiovascular exercises ranging from moderate to intense, stretches and stretches, and muscular building. Regular blood pressure checks increase the likelihood of preventing high blood pressure since the earlier pre-hypertension is identified, the better. Other common chronic conditions for older people: COPD, consisting of emphysema and chronic bronchitis, is a frequent chronic ailment among persons 65 years and above. COPD involves difficulty breathing, coughing, and chest tightness.

Steps to Take to Manage COPD

Quitting or avoiding smoking is the most effective approach to prevent or reduce the progression of COPD. Avoid second hand smoke, chemical fumes, and dust, which can irritate the lungs. If you already have COPD, to manage COPD, follow your doctor's prescribed medicines, receive necessary flu and pneumonia immunizations, and continue to remain active(37-40).

RISK FOR DEPRESSION IN OLDER PEOPLE

One of the most common mental diseases that older people experience is depression. The frequency of depression and subsyndromal depressive symptoms have been found to be 1-4% (about 3- %) and 10-15%, respectively (41,42). Older adults who experience depression may be suffering from unipolar depressive disorder, which may be developing during this time. A major depressive illness that manifests at or beyond the age of sixty is referred to as late life depression (43-46). According to research, the clinical presentation, etiology, response to treatment, and prognosis of depression in older persons are different from those of depression in younger adults [47]. It's unclear if late-life depression and age-related physiological changes are two different illnesses. The purpose of this study is to explore the clinical and diagnostic features of depression in the elderly.

DIAGNOSIS AND CLINICAL FEATURES

A person with Major Depressive Disorder (MDD) is characterized by symptoms that make it difficult for them to function. Anhedonia, or difficulty enjoying life, depression, and loss of interest or desire are symptoms of major depressive illness. In addition to the primary symptoms, the following three symptoms must also be present for at least 15 days in order to diagnose severe depression. Feelings of worthlessness and excessive guilt, agitation or psychomotor slowness, exhaustion, low energy, thoughts of suicide, instability, altered appetite, and sleep

96014

**Galanki Vasantha et al.,**

disturbances are some of the signs and symptoms of depression [48]. Pessimism and despondency as well depressive condition can cause anxiety, loss of sexual desire, and physical symptoms as headaches and backaches [49]. DSM-IV defines major depressive disorder as either episodic or recurring. ICD-10 lists weariness and low energy as key symptoms, whereas other symptoms align with DSM-IV criteria [50].

RISK FACTORS FOR DEPRESSION IN ELDERLY PERIOD

The development and integration of acquired traits from earlier stages is symbolized by elderliness. Healthy growth phases are associated with strong senses of self, acceptance of life's good and bad elements, lack of regrets about the past, and lack of fear for the future in older adults[51]. Senior citizens age in unison. It could help to have a varied life experience when managing stress. Elderly people experience higher rates of medicine use, social communication failures, physical competence issues, and losses [52-56].

Treatment and prognosis

The elderly have several physical conditions, utilize multiple medications, and experience pharmacokinetic and pharmacodynamic changes, making it important to consider various considerations while administering medications. After 65, changes in the physiologic system affect the pharmacokinetic properties of drugs, leading to more frequent and severe adverse effects. Low doses are recommended [57,58] It is advised that older patients take psychotropic drugs at low doses at first and increase them gradually. Simple dosage schedules should be employed, and therapeutic effects should be continuously observed. It's critical to take into account any concurrent medication or condition while treating patients in this age range, as well as any potential interactions. Single pharmaceutical therapies for depression in later life have poor response rates, according to a meta-analysis and systematic review. On the other hand, 50% of patients who did not respond to treatment do so after receiving more treatment. Drugs can be substituted as an alternative. The incidence of recurrence of major depressive illness is higher in the elderly than in young individuals. According to a different study, older patients experience higher rates of relapse than younger patients, but they also respond to medication and ECT similarly, with comparable rates of remission. Poor antidepressant response and tolerance might result from medical comorbidities. Although results are uneven, research points to a potential correlation between a bad prognosis and physical illnesses, cognitive dysfunctions, and high-intensity depression. Physical ailments that are more prevalent as people age, such as diabetes mellitus, thyroid disease, cancer, Parkinson's disease, and cerebrovascular disease, might result in depressive feelings. Physical disorders, limited physical exercise, reduced life quality, and reliance on others can all contribute to depression symptoms. Antihypertensive and corticosteroid medications that block, enhance, or regulate catecholamine or indoleamine systems can lead to depression. The use of medications with age increases the risk of depression. Further inquiry is required in this regard.

DIFFERENCES BETWEEN LATE-SET AND EARLY-SET DEPRESSION

There are differences between late-life and early-onset depression. Despite a lower familial risk of mood disorders, depression in later life is linked to increased risks of cardiovascular disease when compared to depression in younger ages. Marriage problems, personality disorders, and depression in later life are less common; losing a spouse is a major stressor [59]. When it comes to depression, early-onset depression is linked to higher incidence of comorbid anxiety disorder, double depression, and traumatic life experiences than other forms [60].

CONCLUSION

Examining senior patients medically and psychologically should consider aging-related physiological and psychological changes, degenerative and chronic illnesses, and multiple medication use. Seniors may not reveal their depression symptoms or cognitive deterioration because they view them as normal aspects of aging. They can act cautiously and hold back from expressing their emotions. Problems may arise if not specifically requested. The psychiatrist may need to take a more active role during the session. Late-life depression varies from early-onset depression in that it involves more psychomotor alterations and cognitive dysfunctions, has a lower family tendency,

**Galanki Vasantha et al.,**

is associated with more diseases and medication use, has a close link with vascular changes in the brain, and has a poorer prognosis. Over the past few years, there has been a surge in research on geriatric depression. Knowing the risk factors and clinical presentation of depression in older individuals might aid in their identification and treatment, especially as they constantly interact with medical professionals in various fields.

ABSTRACT

This paper explores the integration of traditional medicine principles into modern healthcare systems to develop sustainable healthcare models. Traditional medicine, encompassing practices such as herbal remedies, acupuncture, and holistic approaches, offers valuable insights for addressing contemporary healthcare challenges, including rising costs, accessibility barriers, and the growing prevalence of chronic diseases. The holistic health approach of traditional medicine emphasizes the interconnectedness of physical, mental, emotional, and spiritual well-being, fostering a comprehensive understanding of health that can enhance patient care. Additionally, traditional medicine promotes preventive care and utilizes locally sourced remedies, making healthcare more affordable and accessible, particularly in underserved communities. While integrating these practices presents challenges—such as regulatory hurdles, concerns over the scientific validation of remedies, and the delicate balance between cultural appropriation and integration—the potential benefits warrant further exploration. Future directions should prioritize

**Deepshikha Kukde et al.,**

research into the efficacy of traditional remedies, the development of supportive policies, and active community engagement to ensure culturally sensitive and effective healthcare practices. Ultimately, incorporating traditional medicine into modern systems can lead to more inclusive, patient-centered care, promoting overall well-being and enhancing the sustainability of healthcare delivery.

Keywords: The potential benefits warrant further exploration. Future directions should prioritize research into the efficacy of traditional remedies

INTRODUCTION

Traditional medicine refers to health practices, approaches, knowledge, and beliefs that are indigenous to different cultures and are used to maintain health and prevent, diagnose, and treat physical and mental illnesses. It encompasses a wide range of practices, including herbal remedies, acupuncture, meditation, and physical therapies. Unlike conventional Western medicine, which often focuses on specific diseases and their symptoms, traditional medicine typically emphasizes the balance and harmony of the body, mind, and spirit. Traditional medicine holds significant cultural importance worldwide. In many communities, it is viewed not just as a system of health care but as a vital part of cultural heritage and identity. [1] A fundamental aspect of traditional medicine is its holistic approach to health. This perspective views health as a balance among various physical, mental, emotional, and spiritual elements. Rather than merely treating symptoms, traditional medicine seeks to understand the root causes of illness and restore harmony within the individual. [2] The demand for sustainable healthcare models has become increasingly urgent due to several significant challenges facing healthcare systems globally. These challenges include rising costs, accessibility issues, and the growing prevalence of chronic diseases. [2-4]

Rising Healthcare Costs

Healthcare costs have been steadily increasing, leading to financial strain on individuals, families, and healthcare systems. Factors contributing to these rising costs include:

- **Technological Advancements:** While advancements in medical technology can improve outcomes, they often come with high costs for both equipment and treatment procedures. This financial burden can limit access for patients, particularly in low-income populations.
- **Pharmaceutical Expenses:** The prices of prescription medications have skyrocketed, often making essential drugs unaffordable for many patients. High medication costs can lead to non-adherence to treatment regimens, worsening health outcomes.
- **Administrative Costs:** Many healthcare systems face inefficiencies related to administrative overhead. Complex billing processes and insurance requirements contribute to rising operational costs, diverting resources away from direct patient care.

Accessibility Issues

Accessibility remains a critical barrier to effective healthcare delivery. Key factors include:

- **Geographical Barriers:** In rural and remote areas, healthcare facilities may be scarce, requiring long travel distances for patients seeking care. This can lead to delays in treatment and increased health risks.
- **Socioeconomic Factors:** Individuals from lower socioeconomic backgrounds often face significant barriers to accessing healthcare, including lack of insurance, transportation challenges, and financial constraints. These disparities contribute to health inequalities and poorer health outcomes.
- **Cultural Competence:** Many healthcare systems struggle to provide culturally competent care, which can deter individuals from seeking necessary medical attention. Lack of understanding of cultural beliefs and practices can lead to mistrust in the healthcare system.

**Deepshikha Kukde et al.,****Prevalence of Chronic Diseases**

The rise in chronic diseases such as diabetes, heart disease, and obesity poses a significant challenge to healthcare systems. Contributing factors include:

- **Lifestyle Choices:** Sedentary lifestyles, poor dietary habits, and increased stress levels have led to higher rates of chronic conditions. These diseases require ongoing management and resources, straining healthcare systems.
- **Aging Population:** As the global population ages, the prevalence of chronic diseases is expected to increase further. Older adults often have multiple health conditions, necessitating comprehensive and coordinated care.
- **Preventive Care Gaps:** Traditional healthcare models often focus on treating illnesses rather than preventing them. Insufficient emphasis on preventive measures can lead to higher incidences of chronic diseases, compounding existing healthcare challenges. This study explores how principles of traditional medicine can help develop sustainable healthcare models that address modern challenges. It examines the holistic approach of traditional medicine, which connects physical, mental, emotional, and spiritual health, to enhance patient care.

Principles of Traditional Medicine**Holistic Health Approach**

One of the foundational principles of traditional medicine is its holistic health approach, which emphasizes treating the whole person rather than just addressing specific symptoms or diseases. This perspective recognizes that health is a complex interplay of physical, mental, emotional, and spiritual well-being. [5-7]

- **Whole-Person Perspective:** Practitioners of traditional medicine believe that optimal health is achieved when all aspects of a person are in harmony. This means not only addressing physical ailments but also considering emotional states, mental health, lifestyle, and spiritual beliefs. For example, Traditional Chinese Medicine (TCM) uses techniques like acupuncture and herbal medicine to balance the body's energy (Qi) and address emotional well-being alongside physical health.
- **Interconnectedness:** This principle also acknowledges the interconnectedness of bodily systems and the influence of external factors such as environment, relationships, and lifestyle choices on overall health. Treatment plans are often individualized to consider these diverse influences, aiming for a state of balance and wellness.

Preventive Care

Traditional medicine places a strong emphasis on preventive care and wellness, focusing on maintaining health rather than merely treating illness.

- **Health Maintenance:** Many traditional practices encourage proactive measures to prevent diseases, such as dietary adjustments, regular physical activity, and stress management techniques. For instance, Ayurveda promotes seasonal detoxification and dietary guidelines tailored to individual body types (doshas) to prevent imbalances that may lead to health issues.
- **Education and Empowerment:** Traditional health systems often educate individuals and communities about the importance of preventive practices. This empowerment fosters a proactive approach to health, encouraging individuals to take charge of their well-being through lifestyle choices that enhance immunity and overall health.

Use of Natural Remedies

The use of natural remedies is a hallmark of traditional medicine, with practitioners relying on the therapeutic properties of plants, minerals, and animal products for treatment and prevention.

- **Herbal Medicine:** Many traditional systems, such as Traditional Chinese Medicine and Ayurveda, extensively utilize herbs to treat various ailments. These natural substances are believed to contain bioactive compounds that promote healing and restore balance. For example, turmeric is widely used in Ayurveda for its anti-inflammatory properties.

**Deepshikha Kukde et al.,**

- **Minimal Intervention:** The focus on natural remedies often aligns with a philosophy of minimal intervention, using the body's inherent ability to heal itself. Natural remedies are typically seen as complementary to lifestyle changes and other holistic practices, rather than standalone treatments.

Community Involvement

Community involvement plays a crucial role in traditional medicine, emphasizing the importance of social support, cultural practices, and shared knowledge in health and wellness.

- **Family and Community Dynamics:** Health decisions are often made within the context of family and community, reflecting shared values and beliefs. Traditional healers frequently involve family members in treatment discussions, fostering a sense of collective responsibility for health and well-being.
- **Cultural Practices:** Community rituals, gatherings, and practices often reinforce health- promoting behaviors and traditions. For instance, many cultures celebrate seasonal festivals that include communal meals, encouraging healthy eating practices and social cohesion.
- **Access to Care:** In many traditional medicine systems, healers are integral to the community, providing accessible healthcare and cultural continuity. This local approach ensures that health practices resonate with the community's cultural identity and values, leading to greater acceptance and adherence to treatment.

Integration of Ayurveda in India**Implementation**

Ayurveda, one of the oldest systems of medicine originating from India, has been successfully integrated into the country's healthcare model through various strategies, despite facing challenges: [8-25]

- **Government Support and Policy Framework:** The Indian government has recognized Ayurveda as a legitimate form of medicine, establishing the **Ministry of Ayush** (Ayurveda, Yoga & Naturopathy, Unani, Siddha, and Homeopathy) to promote and regulate traditional medicine systems. Policies have been developed to integrate Ayurveda into the national healthcare system, including the establishment of educational institutions and research centers dedicated to Ayurvedic studies.
- **Integration in Healthcare Facilities:** Many public and private hospitals now have Ayurvedic departments that offer treatments alongside conventional medical care. This integration allows patients to access a comprehensive range of health services, including both Ayurvedic therapies (like herbal treatments and Panchakarma) and allopathic medicine.
- **Training and Education:** Ayurvedic practitioners undergo formal education and training in accredited institutions, which helps standardize practices and ensure quality. The curriculum combines traditional knowledge with modern medical science, equipping practitioners with a broader understanding of health care.
- **Research and Evidence Generation:** The government has funded research initiatives to study the efficacy of Ayurvedic treatments, thereby contributing to a growing body of evidence supporting Ayurvedic practices. This research is vital for gaining acceptance from the broader medical community and enhancing integration into mainstream healthcare.

Challenges Faced

- **Skepticism from Conventional Practitioners:** One of the primary challenges is the skepticism from conventional medical practitioners regarding the efficacy of Ayurvedic treatments. This has created barriers to collaboration between Ayurvedic and allopathic practitioners.
- **Quality Control:** Ensuring the quality and standardization of Ayurvedic products and practices can be challenging, particularly with the diverse range of herbal medicines and formulations used.
- **Public Perception:** While many people embrace Ayurveda, there are still segments of the population that may prefer allopathic treatments due to modernity and faster results.

**Deepshikha Kukde et al.,****Outcomes**

The integration of Ayurveda into India's healthcare model has led to several significant outcomes:

- **Increased Accessibility:** The establishment of Ayurvedic clinics and hospitals has made traditional treatments more accessible, especially in rural areas where Ayurvedic practitioners often serve as the primary healthcare providers. This accessibility has improved healthcare delivery in underserved regions.
- **Enhanced Patient Satisfaction:** Many patients report high levels of satisfaction with Ayurvedic treatments, appreciating the holistic approach that emphasizes prevention, individualized care, and lifestyle modifications. Surveys indicate that patients often feel more involved in their treatment processes, leading to better adherence to health recommendations.
- **Complementary Health Benefits:** Research has demonstrated that Ayurvedic practices can be effective in managing chronic conditions such as arthritis, stress-related disorders, and digestive issues. Patients utilizing Ayurvedic approaches often experience improved quality of life and reduced dependence on pharmaceutical interventions.
- **Cultural Preservation:** The integration of Ayurveda has helped preserve and promote India's cultural heritage. By valuing traditional practices, the healthcare system fosters a sense of identity and continuity in medical practices, encouraging the younger generation to engage with their cultural roots.
- **Lessons Learned**
 - **Interdisciplinary Collaboration:** Effective integration of Ayurveda into mainstream healthcare requires fostering collaboration between Ayurvedic and allopathic practitioners. Joint training programs and workshops can enhance mutual understanding and respect.
 - **Research and Validation:** Continuous research to validate Ayurvedic practices is crucial for gaining acceptance among conventional practitioners and patients. Evidence-based practices help bridge the gap between traditional and modern medicine.
 - **Public Awareness Campaigns:** Educating the public about the benefits of Ayurveda and its role in comprehensive healthcare can enhance acceptance and utilization. Campaigns highlighting successful case studies and testimonials can also foster trust.

Benefits of Applying Traditional Medicine Principles [26-28]**Enhanced Accessibility**

- **Local Availability:** Traditional medicine practitioners, such as herbalists and healers, are often more accessible in remote areas where conventional healthcare is scarce. This allows individuals to receive care without extensive travel.
- **Community-Based Care:** Traditional healers are usually the first point of contact for healthcare, offering timely and culturally relevant care that builds trust within the community.
- **Integration with Community Practices:** Rooted in local customs, traditional medicine is more acceptable and can effectively address community health needs.

Cost-Effectiveness

- **Lower Treatment Costs:** The use of locally sourced herbs and remedies can be more affordable than pharmaceuticals, making healthcare more accessible, especially for low-income populations.
- **Reduced Dependency on Expensive Interventions:** Emphasizing prevention and early intervention helps minimize the need for costly medical procedures, leading to overall savings for individuals and healthcare systems.
- **Utilization of Local Resources:** Traditional medicine relies on indigenous plants, supporting local economies and promoting sustainable practices.

**Deepshikha Kukde et al.,****Cultural Sensitivity**

- **Alignment with Beliefs:** Traditional medicine respects and integrates patients' cultural and spiritual beliefs, enhancing trust and adherence to treatment plans.
- **Empowerment through Participation:** Patients actively participate in their treatment, fostering ownership of their health and motivation to follow through with care.
- **Holistic Understanding of Health:** Recognizing the interconnectedness of cultural, social, and spiritual dimensions allows practitioners to address unique patient needs effectively.

Holistic Health Outcomes

- **Comprehensive Care:** Traditional medicine treats the whole person—body, mind, and spirit—leading to improved overall health by considering emotional, mental, and social factors.
- **Focus on Prevention:** By prioritizing wellness and healthy lifestyle choices, traditional medicine helps prevent chronic diseases and improves long-term health outcomes.
- **Patient-Centered Approach:** Holistic care is tailored to individual needs, enhancing treatment efficacy, patient satisfaction, and overall well-being.
- **Integration of Mental and Emotional Health:** Practices like meditation, yoga, and herbal remedies address mental and emotional health, significantly improving quality of life and emotional resilience.

Challenges and Considerations

Integrating traditional medicine into modern healthcare systems presents several challenges and considerations. Regulatory hurdles can impede the acceptance of traditional practices, as existing healthcare regulations may not adequately accommodate these systems. Additionally, concerns about the safety and efficacy of traditional remedies highlight the need for scientific validation to gain trust from both healthcare professionals and patients. Furthermore, there is a delicate balance between cultural appropriation and integration; while it is essential to respect and honor traditional practices, there is a risk of commodifying or misrepresenting these cultures when integrating them into broader healthcare frameworks. Addressing these challenges is crucial for fostering a respectful and effective integration of traditional medicine. [29-30]

Future Directions

To enhance the integration of traditional medicine into healthcare systems, several future directions should be considered. Research and collaboration are crucial, with a focus on conducting clinical trials to validate the efficacy and safety of traditional remedies. Additionally, policy development is necessary to create frameworks that support the inclusion of traditional medicine within existing healthcare structures, ensuring regulatory compliance and standardization. Lastly, community engagement is essential for developing sustainable healthcare models; involving local communities in the decision-making process fosters trust and ensures that healthcare practices align with cultural values and needs. These steps will facilitate a more comprehensive and inclusive approach to health. [31-32]

CONCLUSION

The integration of traditional medicine principles into modern healthcare systems offers a promising pathway toward creating sustainable and effective healthcare models. By emphasizing holistic approaches, preventive care, and community involvement, traditional medicine addresses key challenges such as rising costs, accessibility issues, and the prevalence of chronic diseases. Despite the challenges of regulatory hurdles, safety concerns, and the need for cultural sensitivity, the potential benefits are significant. Future directions should focus on research, policy development, and community engagement to ensure that traditional practices are validated and respected within contemporary healthcare frameworks. Ultimately, fostering collaboration between traditional and modern medical systems can lead to a more inclusive, accessible, and culturally relevant healthcare landscape.

ABSTRACT

Transdermal drug delivery presents a myriad of benefits, including circumventing hepatic first-pass metabolism, ensuring constant plasma concentration, and enhancing safety and compliance. However, the limited permeability of skin barriers restricts the range of medications suitable for this administration method. This paper explores the transformative role of microneedles, microscale physical enhancement tools with lengths typically ranging from 0.1 to 1 mm, in overcoming this challenge. Delving into materials, production processes, methods, and transdermal delivery applications, the study underscores the versatility of microneedles, crafted from materials like silicon, polymers, and stainless steel, in various forms such as solid, coated, hollow, and dissolvable. The research not only delves into the technical aspects but also identifies technological gaps that impact medicine administration, vaccination delivery, illness diagnosis, and cosmetic applications. By addressing these gaps, this study aims to propel the field forward, ushering in a new era of possibilities in transdermal drug delivery. Transdermal drug delivery has emerged as a promising alternative to traditional oral and injectable routes, offering several advantages such as bypassing hepatic first-pass metabolism, maintaining a consistent plasma concentration, and improving patient safety and compliance. Despite these benefits, the inherent limitations of skin barriers pose challenges in delivering a wide range of medications through this method. The restricted permeability of the skin often hinders effective transdermal drug absorption. This paper focuses on the transformative potential of microneedles, which are

microscale physical enhancement tools typically ranging from 0.1 to 1 mm in length. Microneedles have gained significant attention in recent years for their ability to overcome the limitations of traditional transdermal drug delivery. The study delves into various aspects of microneedles, including materials used in their construction, production processes, different forms such as solid, coated, hollow, and dissolvable, and their applications in transdermal drug delivery. Materials such as silicon, polymers, and stainless steel have been employed in crafting microneedles, each offering unique advantages for specific applications. The versatility of microneedles makes them suitable for a wide range of therapeutic purposes. The study explores how these microneedles can be utilized in medicine administration, vaccination delivery, illness diagnosis, and cosmetic applications, showcasing the breadth of their potential impact in the healthcare and pharmaceutical sectors. The research not only delves into the technical intricacies of microneedles but also identifies existing technological gaps that currently hinder their widespread adoption. Addressing these gaps is crucial for realizing the full potential of microneedles in transdermal drug delivery. By overcoming these challenges, the study aims to propel the field forward, paving the way for a new era of possibilities in drug administration and healthcare. In conclusion, microneedles represent a transformative innovation in transdermal drug delivery, offering a solution to the limitations posed by skin barriers. The study underscores the versatility of microneedles in terms of materials, forms, and applications, highlighting their potential in medicine administration, vaccination delivery, disease diagnosis, and cosmetic applications. By identifying and addressing technological gaps, this research aims to contribute to the advancement of transdermal drug delivery, ushering in a new era of possibilities. The integration of microneedles into pharmaceutical and healthcare practices has the potential to enhance patient outcomes, improve treatment efficacy, and foster a more convenient and patient-friendly approach to drug administration. As we navigate towards the future, the insights provided in this study may serve as a foundation for further research and development in the field of transdermal drug delivery. This study investigates microneedle technology for efficient transdermal drug delivery, addressing limitations in traditional methods. While transdermal delivery has advantages, skin barriers restrict efficacy. Microneedles, with lengths of 0.1 to 1 mm, offer a transformative solution, exploring materials and production processes. Targeting gaps in microneedle production is crucial for advancing drug permeability and maximizing potential. The rationale is to contribute insights, paving the way for innovative transdermal drug delivery approaches.

Keywords: The study underscores the versatility of microneedles in terms of materials, forms, and applications, highlighting their potential in medicine administration, vaccination delivery, disease diagnosis, and cosmetic applications. By identifying and addressing technological gaps, this research aims to contribute to the advancement of transdermal drug delivery, ushering in a new era of possibilities.

INTRODUCTION

Transdermal drug delivery stands as a promising avenue for medication administration, offering advantages such as bypassing hepatic first-pass metabolism and ensuring consistent plasma concentrations. However, its efficacy is constrained by the limited permeability of skin barriers, restricting the range of medications suitable for this non-invasive approach. This review paper explores the transformative potential of microneedle technology in overcoming these constraints.[1-4] Microneedles, with lengths ranging from 0.1 to 1 mm, present a microscale physical enhancement technique that has garnered attention for its ability to broaden the scope of medications amenable to transdermal and intradermal administration. This paper delves into the diverse materials, production processes, and methods associated with microneedles, shedding light on their applications in transdermal drug delivery. Figure 1 illustrate drug delivery by microneedle[4-10] Addressing not only the technical aspects but also the existing technological gaps, this review aims to provide a comprehensive overview of microneedle technology. By understanding these intricacies, researchers and practitioners can unlock new possibilities in medicine administration, vaccination delivery, disease diagnosis, and cosmetic applications. Through a critical examination of current knowledge and identification of gaps, this review sets the stage for advancing the field of transdermal drug delivery, offering insights that pave the way for future innovations. Martin and Gerstel initially filed for a patent on

**Ishan Dubey et al.,**

the microneedle in 1971. It had a transdermal penetration hole and a chamber for a drug reservoir. Since then, advancements in pharmaceutical technology and microfabrication production have coexisted with notable advancements in microneedles for Transdermal Drug Delivery (TDD). The primary goal of microneedles is to puncture the skin with tiny projections without injuring the patient or causing pain, hence increasing patient compliance and safety. Additionally, patches are used to support microneedles. The patches are made with a pressure-sensitive adhesive covering that is consistent and meant to interface with the skin on one whole side. Since the skin is a flexible tissue and the microneedle substrates are hard, skin-compatible adhesives are utilized to firmly adhere the microneedles to the skin's surface so they do not come off easily. Based on how drugs are delivered, microneedles may be divided into four categories: coated, hollow, dissolving, and solid.[11-18]

Pros and cons of using microneedles drug delivery[19-24]**Pros**

- The stratum corneum allows drugs to enter the body directly.
- The drug takes effect quickly (since there are capillary bed and associated lymphatic vessels in the superficial dermis)
- Controlling the composition of microneedles allows for the delivery of precise medication dosages.
- The first-pass metabolism is avoided using microneedles.
- Increased drug bioavailability made possible by microneedles
- Because of their small size and length, microneedles are painless and harmless.
- The cold-chain system is not necessary for the microneedle's improved solid-state formulation.
- Microneedle patches reduce costs for production, logistics, and dosage sparing.

Cons

- Reproducible microneedle patch production requires sophisticated technology.
- Because the microneedle is so tiny, the drug dosage is restricted.
- Allergies and brief inflammation can be brought on by
- Upon application, a portion of the solid microneedles may break or remain in the skin.

MATERIALS FOR MICRONEEDLES

The materials utilised in microneedles might vary depending on the patch's design and components, ranging from metal to polymer. In general, the mechanical strength of microneedle materials should be sufficient for skin insertion. Non-dissolving microneedles may be inserted into the skin because they are biocompatible, inert, and sufficiently robust to avoid triggering an immunological reaction. On the other hand, the matrix of coated and dissolving microneedles must be biocompatible and soluble in water. Furthermore, it ought to dissolve or break down in the body without causing poisoning. During the microneedle patch production, storage, and shipping processes, the matrices and medicines must be compatible. The following describes the properties of the many materials that are used to make microneedles. [25-29]

Methods for manufacturing microneedles

The goal of the microneedle is taken into consideration first while creating it. Targets, ideal pharmacokinetics and pharmacodynamics, and medication kind and dosage for usage are taken into account. The best microneedle design and materials are then identified. Depending on the design or substance, there are differences in the production process for microneedles. When considering the financial side of things, an approach like solvent casting is utilised as it is simple to set up. We have included the several techniques for producing microneedles that have been documented to date. [62-69]

**Ishan Dubey et al.,****Laser-mediated fabrication techniques[69-72]****Laser cutting**

The main use of laser cutting is the production of metal or polymer microneedles; stainless steel is the most often utilised material. A laser is used to create the two-dimensional form of a microneedle by cutting through a thick metallic sheet. Using computer-aided design (CAD) tools, the microneedle array's dimensions and orientation are planned.

Laser ablation

The fabrication of metal or polymer microneedles is another use for laser ablation. A metal or polymer plate can be sliced with a laser to create a 2D shape, or it can be engraved with a laser to create a 3D design. In essence, the substrate absorbs the laser energy and warms up as a result of being exposed to a laser beam; this causes the substrate to evaporate or sublime. This method creates a microneedle pattern that may be used to create an inverse mould.

Photolithography**Etching**

Etching is a critical step in the overall photolithography process that determines the tapered form of the microneedle tip. The size of the microneedle base and the spacing between the microneedles are measured prior to the etching process. The etching technique is then used to determine the microneedles' length and form.

Dry etching

The main use of dry etching is the production of hollow or solid microneedles. There are two categories for it: chemical approaches and physical ways. Sputtering and ion milling are examples of physical techniques. High energy, unidirectional electrodes ionise an inert gas during the dry etching process. Anisotropic etching is done because the ions hit the silicon substrate quickly and only in one direction. During the production process, silicon that is exposed is etched, while the region shielded by the oxide film (sacrificial layer) or photoresist is scarcely etched at all. Chemical techniques include high pressure plasma etching, which uses powerful energy to create a chemically reactive plasma gas. The substrate is etched in an isotropic manner as a result of the plasma's reaction with its surface, turning it into a volatile substance that is blown away.

Wet etching

Metal or silicon microneedles can also be made using wet etching. In this procedure, a chemical etchant is used to create a pattern on the substrate. A potassium hydroxide aqueous solution is employed in the instance of a silicon wafer; based on the orientation of the silicon crystals, different etching rates may be used to generate a sharp tip form. Wet etching primarily uses a chemical reaction to achieve isotropic etching, and it does it at a far quicker pace than dry etching.

3D printing

An additive processing technique called 3D printing allows for the quick, inexpensive, and high-throughput prototyping of designs. Lately, advances in 3D printing technology have made it possible to produce microstructures like microneedles. While the new 3D printing technology can generate a more advanced and complex-shaped microneedle structure, the current manufacturing method is confined to producing a basic structured microneedle.

Micro stereolithography

In the fields of biomedical and tissue engineering, it is commonly utilised in the creation of cardiovascular stents, nerve guidance conduits, and tissue scaffolds. The photopolymerization of a liquid resin utilising a light source, such as UV radiation, and the procedure of controlling the space to construct the 3D item are the foundations of the Micro Stereolithography method of producing 3D things. A computer carefully controls the construction stage, laser beam, or digital light projector to illuminate the resin surface with light. The structure is formed on the surface of the construction platform layer by layer. Constant generation of liquid interface

**Ishan Dubey et al.,****Two-photon polymerization**

TPP is an advanced technique for additive manufacturing that has a resolution of about 100 nm. By stimulating the light initiator, two-photon polymerization starts the polymerization of the resin by multiphoton absorption. Instead of using UV light, two photon polymerization uses a near-infrared laser, such as a titanium-sapphire laser.

Applications of Microneedles Technologies[73-89]**Drug Delivery**

In 1998, the first time MN was used for medication administration, a solid silicon MN was used. Human growth hormone was trans dermally applied to hairless rat skin using a dissolvable MN patch. An MN patch that was loaded with caffeine and dissolved was able to regulate the weight of obese mice and function as an anti-obesity therapy. A coated MN patch was employed to provide calcitonin to fish. A protein antigen called ovalbumin was injected into the skin of hairless guinea pigs using a solid microneedle. Insulin, BSA, and calcein were delivered using metal MNs and solid silicon MNs. Moreover, MNs have been utilised for transdermal delivery of a number of medications, including paracetamol, ketoprofen, and ibuprofen.

Microneedles Anticancer Agents

In recent years, there's been notable progress in cancer vaccines and therapies, especially with microneedles for transdermal drug delivery in cancer treatment. Microneedles penetrate skin layers effectively, releasing drugs upon contact with interstitial fluid. Compared to traditional hypodermic needles, microneedles reduce issues like pain and irritation, and they don't generate hazardous wastes. Microneedles can also house vaccines in a dried solid form, improving stability and making administration easier.

Vaccine Delivery

One popular kind of MN used for vaccine administration is a dissolvable MN. In place of the conventional hypodermic injection needles used to provide vaccinations, the dissolvable MNs were employed. Dissolvable MNs are resilient, biocompatible, scalable, and do not produce biohazardous waste, in contrast to other forms of MNs. Rather than administering the anthrax recombinant protective antigen vaccination by injection, hollow MNs have been utilised to do so. In a mouse model, a hollow microneedle was tested as a vaccine against plaque. Human clinical research comparing intramuscular injection versus hollow microneedle influenza immunisation produced comparable immune system outcomes.

Disease Diagnosis

Several well-established bioassays that collect bodily fluid samples in order to evaluate and track medical conditions can be used to monitor disease diagnosis and treatment efficacy. The existing procedures cause discomfort, need for specific approaches, customised tools, and qualified medical staff. Early-stage osteoarthritis biomarkers were identified using microneedles containing nanoparticles. Hydrogen peroxide, lactate, dissolved oxygen, and glutamate were detected using microneedles.

Cosmetic Application

MNs are frequently utilised in cosmetic applications, including as hair growth and skin care. A hyaluronic acid-based dissolvable MN patch was created by Kim and colleagues to provide ascorbic acid and retinyl retinoate intradermally. Using a solid MN, Kumar et al. demonstrated improved local delivery of eflornithine, a medication used to treat face hirsutism, both in vitro and in vivo.

Regulatory Aspects of Microneedle-Based Medication Delivery Systems:[90-94]

The rapid advancements in microneedle technology bring forth a host of regulatory considerations that underscore the need for careful scrutiny and standardization. As these innovative drug delivery systems progress toward potential clinical applications, several regulatory aspects come into focus, shaping the landscape of their development and eventual market approval.

**Ishan Dubey et al.,**

1. **Biocompatibility and Safety Assessments:** Regulatory bodies necessitate rigorous assessments of the biocompatibility and safety of materials used in microneedle fabrication. The potential for adverse reactions, skin irritation, and systemic effects must be thoroughly evaluated to ensure patient safety.
2. **Material Characterization and Standardization:** Microneedles are constructed from a diverse range of materials. Regulatory frameworks demand comprehensive characterization of these materials and the establishment of standardized manufacturing processes to guarantee consistency, quality, and reliability in the production of microneedle devices.
3. **Preclinical and Clinical Trials:** Before market approval, microneedle-based medication delivery systems must undergo extensive preclinical and clinical trials. These trials assess the efficacy, safety, and performance of the microneedles, including considerations for different types, materials, and manufacturing processes.
4. **Quality Control and Manufacturing Standards:** Adherence to stringent quality control measures and manufacturing standards is crucial for regulatory compliance. Microneedle production facilities must meet Good Manufacturing Practice (GMP) guidelines to ensure the reliability and reproducibility of these devices.
5. **Labelling and Instructions for Use:** Regulatory agencies require clear and comprehensive labelling for microneedle products, including instructions for use and potential risks. This information is essential for healthcare professionals and end-users to understand the proper application and handling of microneedle devices.
6. **Packaging and Sterilization:** Proper packaging and sterilization processes are imperative to maintain the integrity of microneedle devices. Regulatory standards mandate the development of packaging solutions that preserve the sterility and functionality of the microneedles throughout their shelf life.
7. **Post-Market Surveillance:** After approval, continuous monitoring through post-market surveillance is essential. Regulatory agencies may require manufacturers to report any adverse events or unexpected issues related to the use of microneedle-based medication delivery systems, contributing to ongoing safety evaluations.
8. **Global Harmonization:** Given the international scope of medical device regulations, achieving global harmonization is a critical aspect. Companies developing microneedle technologies need to navigate and comply with regulatory frameworks from various regions to facilitate a seamless and efficient path to market approval. Navigating these regulatory aspects is pivotal in ensuring the successful translation of microneedle innovations from research to clinical practice, ultimately benefiting patients by expanding the landscape of effective and patient-friendly medication delivery systems.

LIMITATIONS AND PERSPECTIVES

Research on microneedles, a transdermal drug delivery technology, is expanding quickly because it can replace existing routes of administration, boosting patient access to medications. Through both non-clinical and clinical research, microneedles have been shown to increase medication stability and drug delivery effectiveness. However, microneedles as a tool for drug delivery has limitations. Only a certain quantity of medication can be delivered using microneedles due to its small size. As a result, using them when a high dosage or continuous medication release is needed is challenging. A crucial technological advancement in addressing the issue of small-dose microneedles is the solubilization of poorly soluble drugs. Basically, to apply a drug to a microneedle, there must be sufficient drug solubility in an aqueous solution. The small needle tips, which range in size from several tens of micrometres to micrometres, are fabricated using deep reactive ion etching, which is the primary method used to create microneedle master moulds with high accuracy and repeatability. Instead of processing licencing for a specific microneedle system, microneedle product licencing is currently handled for each application (product-specific approval). Consequently, a problem impeding the commercialization of microneedles is the delay in licencing microneedle products. The requirement to define a microneedle-based licencing regime that covers the microneedle's form, composition, sterilisation, and packaging only serves to complicate matters.[95-99]

Ishan Dubey et al.,

CONCLUSION

Significant progress has been achieved in the last ten years in the development of medication delivery systems utilising microneedles. Microneedles is gaining traction in research because it can replace conventional routes of administration, hence improving patient access to medication. There are several types of microneedles: hydrogel, solid, coated, and dissolving. They are made of a variety of materials, including metal, silicon, plastic, glass, and ceramic. Different manufacturing processes are applied to give distinctive forms, dimensions, and characteristics. Clinical studies are still being used to develop microneedles, which also use different medications. The majority of studies that have used this approach have had positive outcomes. This method might have therapeutic effects in a number of fields. In conclusion, this work highlights the research deficit related to MN manufacturing. Though there are a number of recently developed transdermal products mediated by MNs, these are still in the early stages of development. It is becoming more and more clear that there is a gap in permitting cost-effective manufacturing for large-volume production of MN as our understanding of MN-mediated grows.

Table 1: Overview of the primary components, benefits, and drawbacks of different MNs

Solid microneedles	
Primary components	Silicon, polylactic acid, stainless steel
Benefits	Desirable mechanical properties
Drawbacks	Low drug loading capacity, limited biological compatibility
Hollow microneedles	
Primary components	Silicon, glass, polymers
Benefits	High drug loading capacity
Drawbacks	Low mechanical strength, fractures
Dissolving microneedles	
Primary components	Maltose, carboxymethylcellulose, hyaluronic acid
Benefits	Good biocompatibility
Drawbacks	Mechanical strength is not high enough
Coated microneedles	
Primary components	Silicon, Stainless steel, Polymers
Benefits	Can be used for potent drugs requiring low doses
Drawbacks	Manufacturing process may be contaminated

Ishan Dubey et al.,

Table 2: Overview of the materials utilised in microneedles

Materials	Characteristics of various materials	References
Metal	Metals are able to readily penetrate through skin because of their strong mechanical and tensile strength. Solid, coated, and hollow microneedles are made with them. Titanium and stainless steel are the two most common metals utilised in microneedles. The most common metal used to produce microneedles is stainless steel, however it corrodes more quickly than Ti alloy.	30-35
Silicon	Silicon is frequently utilised to make solid and coated microneedles because it has sufficient mechanical strength for skin implantation. Using deep reactive ion etching and photolithography, silicon microneedles with tiny, sharp points and lengths of less than 100 μm may be produced perfectly.	36-38
Polymer	The polymers utilised in the production of microneedles should be biocompatible, water-soluble, and mechanically robust enough to be inserted into the skin. Solvent casting is the most widely used process for creating polymer microneedles.	39-46
Ceramic	Studies have looked at the usage of ceramic materials including alumina, calcium phosphate, and calcium sulphate in the creation of microneedles since they are biocompatible and have adequate mechanical strength.	47-53
Glass	The majority of glass microneedles are hollow, and they are made with a micropipette puller or by wet etching. Its strength is sufficient for skin implantation, making the tapered form easier to process.	54-61

ABSTRACT

The primary goal of this research article is to introduce two new inverse domination numbers namely inverse odd and even degree sum domination numbers from the existing odd and even degree sum dominating sets of a graph G . Inverse odd and even degree sum dominating sets are distinguished and the limitations of their numbers are obtained in terms of graph terminologies for some special graphs. Additionally, we established Nordhaus-Gaddum type results for these parameters.

Keywords: Inverse odd degree sum dominating set, Inverse even degree sum dominating set, Inverse odd degree sum domination number, Inverse even degree sum domination number.

AMS subject classification: 05C07, 05C69

INTRODUCTION

All graphs considered here are finite undirected, simple and connected. All the basic graph terminologies are used in the sense of V.R. Kulli[6]. The degrees of a vertex (u) and edge (e) are indicated by the $\deg(u)$ and $\deg(e)$. The domination in graph is one of the main areas in graph theory which has attracted many researchers because of its potentiality to solve and address many real life situations[2]. In 1977[4], Cockayne and Hedetniemi made an interesting and extensive survey of the results known at the time about dominating sets in graphs and which domination number $\gamma(G)$ of a graph has become very popular since, they are defined a set $R \subseteq V(G)$ is a dominating set if every vertex in $V-R$ is adjacent to at least one vertex in R . The domination number $\gamma(G)$ is a minimum

Ilakkiya and Mohana Selvi

cardinality of a dominating set of G . All the graphs used in this paper are referred from Joshep A. Gallian[5]. A set of vertices R is called an odd dominating set if for every vertex $v \in V(G)$, $|N[v] \cap R| \equiv 1 \pmod{2}$. The odd domination number of a graph was introduced by Yair Caro and William F. Klostermeyer in the year 2003[10]. The odd and even dominating sets with open neighborhoods are introduced by John L. Gold Wasser and William F. Klostermeyer in the year 2007[3]. In 2022[8] we introduced odd(even) sum degree dominating sets by posting odd(even) condition on the sum of degree of all vertices of dominating set of G . A dominating set $R \subseteq V(G)$ of G is said to be an odd(even) sum degree dominating set $R_o(R_e)$ (osd or esd – set) of G if the sum of degree of all vertices in $R_o(R_e)$ is an odd(even) number. The odd(even) sum degree domination number $\gamma_{osd} (\gamma_{esd})(G)$ is the minimum cardinality taken over all osd or esd -sets of G . In 1991[7] inverse domination in graphs are introduced by V.R. Kulli and S.C. Sigarkanti by verifying the $V-R$ contains a dominating set R_i of G . then R_i is called an inverse dominating set with respect to R . The $\gamma_i(G)$ is a minimum cardinality of an inverse dominating set in G . In 2020[1] inverse concept is developed by Omran and Manar M. Shalaan for inverse co-even domination of graphs. Shalini V and Indra Rajasingh[9] proposed the new idea for the Total and inverse domination numbers of certain graphs which were very much used in fault tolerance. Motivated by the concepts of the preceding applications, we developed in this research work, the inverse domination property is studied on osd and esd sets of G and hence defined inverse odd and even degree sum domination sets. The associated inverse odd and even degree sum domination number, value and graph are also established. The parameters are found for some standard classes of graphs such as path, pan, crown, star, book, bistar, comb, ladder, friendship, caterpillar, dumbell, fan and flag. In addition, for the above parameter, the limitations and the relationships between some of the existing domination parameters are obtained. Also, the inverse odd and even degree sum dominating sets and graphs are distinguished.

MATERIALS AND METHODS

Definition 2.1 Let R_o be a γ_{osd} -set of G and $R_{io} \subseteq V - R_o$. Then R_{io} is said to be an inverse odd degree sum dominating set (iods) of G , if $\sum_{r \in R_{io}} \deg(r)$ is an odd number. The minimum cardinality of all iods-set of G is called the inverse odd degree sum domination number γ_{iods} . A γ_{iods} -set is a minimum iods-set of G .

Definition 2.2 Let R_{io} to be a γ_{iods} -set of G . Then the minimum sum of degree of the vertices of the set R_{io} is said to be an inverse odd degree sum domination value and it is denoted by $S_{iods}(G)$. A graph G , if it has iods-set is named as inverse odd degree sum dominating graph, and it is denoted by G_{iods} .

Definition 2.3 Let R_e be a γ_{esd} -set of G and $R_{ie} \subseteq V - R_e$. Then R_{ie} is said to be an inverse even degree sum dominating set (ieds) of G , if $\sum_{r \in R_{ie}} \deg(r)$ is an even number. The minimum cardinality of all ieds-set of G is called the inverse even degree sum domination number γ_{ieds} . A γ_{ieds} -set is a minimum ieds-set of G .

Definition 2.4 Let R_{ie} to be a γ_{ieds} -set of G . Then the minimum sum of degree of the vertices of the set R_{ie} is said to be an inverse even degree sum domination value and it is denoted by $S_{ieds}(G)$. A graph G , if it has ieds-set is named as inverse even degree sum dominating graph and it is denoted by G_{ieds} .

Ilakkiya and Mohana Selvi

Example 2.5

See the graph G , in figure 1, γ_{osd} -set, $R_o = \{r_2, r_6, r_{10}\}$ gives $\gamma_{osd}(G) = 3$ and γ_{iods} -set, $R_{io} = \{r_1, r_5, v_9\}$ gives $\gamma_{iods}(G) = 3$ and also, $\sum_{r \in R_{io}} \deg(r) = S_{iods}(G) = 7$. γ_{esd} -set, $R_e = \{r_2, r_5, r_6, r_{10}\}$ gives $\gamma_{esd}(G) = 4$ and γ_{ieds} -set, $R_{ie} = \{r_1, r_3, r_4, r_7, r_9\}$ gives $\gamma_{ieds}(G) = 5$ and also, $\sum_{r \in R_{ie}} \deg(r) = S_{ieds}(G) = 10$.

Remark 2.6(i) Since the cycle C_n , $n \geq 3$ has no $iods$ -set and gives in general $iods$ -set need not exist for all graphs. (ii) Since the path P_m , $m \geq 3$ has no $ieds$ -set and gives in general $ieds$ -set need not exist for all graphs. (iii) Hence for the study of the introduced domination parameters throughout this paper, we assume that G has at least one $iods$ -set.

Proposition 2.7 If G has a $\gamma_{iods}(\gamma_{ieds})$ -set, then

$$(a) \gamma_{osd}(G) \leq \gamma_{iods}(G),$$

$$(b) \gamma_{esd}(G) \leq \gamma_{ieds}(G) \text{ and this bound is sharp.}$$

Proof: This follows from the fact that every inverse odd degree sum dominating set of G is an inverse dominating set of G . Hence the result is hold.

The graph P_4 and W_3 achieve this bound.

By the Similar arguments one can prove for even case.

Proposition 2.8 If G has a γ_{iods} -set, then

$$(a) \gamma(G) \leq \gamma_{iods}(G),$$

$$(b) \gamma(G) \leq \gamma_{ieds}(G) \text{ and this bound is sharp.}$$

Proof: Clearly $\gamma(G) \leq \gamma_i(G)$ and by proposition 2.6 $\gamma_i(G) \leq \gamma_{iods}(G)$. Hence the result is holds. The graph P_4 , P_5 and W_3 are achieving this bound. By the Similar arguments one can prove for even case. The exact bounds of the $\gamma_{iods}(G)$ ($\gamma_{ieds}(G)$) and the accompanying sum value for several typical graph classes are provided below.

Proposition 2.9 For Path P_n , $n \geq 4$

$$(i) \gamma_{iods}(P_n) = \left\lfloor \frac{n}{3} \right\rfloor + 1; S_{iods}(P_n) = 2 \left\lfloor \frac{n}{3} \right\rfloor + 1$$

$$(ii) \gamma_{ieds}(P_n) = \begin{cases} \left\lfloor \frac{n}{3} \right\rfloor + 1, n \equiv 0, 1 \pmod{3} \\ \left\lfloor \frac{n}{3} \right\rfloor + 1, n \equiv 2 \pmod{3} \end{cases}; S_{ieds}(P_n) = \begin{cases} 2 \left\lfloor \frac{n}{3} \right\rfloor, n \equiv 0, 1 \pmod{3} \\ 2 \left\lfloor \frac{n}{3} \right\rfloor, n \equiv 2 \pmod{3} \end{cases}$$

Proof: Let G be the path P_n with at least four vertices. Let $V(G) = \{x_1, x_2, \dots, x_n\}$, $n \geq 4$ be the vertex set of G where $\deg(x_1) = \deg(x_n) = 1$ and $\deg(x_i) = n-1$, $i = 1, 2, \dots, n-1$.

Ilakkiya and Mohana Selvi

Claim 1: Inverse odd degree sum degree domination number

$$\text{Let } X_1 = \{x_1\}, X_2 = \begin{cases} x_{3i+1} / i = 1, 2, \dots, \left\lfloor \frac{n}{4} \right\rfloor, n \equiv 0, 1 \pmod{3} \\ x_{3i+1} / i = 1, 2, \dots, \left\lfloor \frac{n}{3} \right\rfloor, n \equiv 2 \pmod{3} \end{cases} \text{ and } X_3 = \{x_{n-1}\}$$

$$\text{Then } R_{io} = \begin{cases} X_1 \cup X_2 \cup X_3, n \equiv 0, 1 \pmod{3} \\ X_1 \cup X_2, n \equiv 2 \pmod{3} \end{cases}$$

Case (i): $n \equiv 0 \pmod{3}$

Let $R_{io} = X_1 \cup X_2 \cup X_3$. Then R_{io} is an iods-set of G . Since, $\deg(x_1) = 1$ and $\deg(x_{n-1}) = 2$

$$\text{Therefore, } \gamma_{iods}(G) \leq |R_{io}| = 1 + \left\lfloor \frac{n}{4} \right\rfloor + 1 \quad (1)$$

On the other hand, suppose X is a γ_{iods} -set of G then X must contain atleast $\frac{n}{3}$ number of vertices for domination and contain the vertex x_1 for odd degree sum

$$\text{Hence } \gamma_{iods}(G) = |X| \geq \frac{n}{3} + 1, n \equiv 0 \pmod{3} \quad (2)$$

from (1) and (2), we have

$$\gamma_{iods}(G) = \frac{n}{3} + 1, n \equiv 0 \pmod{3} \quad (3)$$

Case (ii): $n \equiv 1 \pmod{3}$

Since, $\deg(x_1) = 1$ and $\deg(x_{n-1}) = 2$

$$\text{Therefore, } \gamma_{iods}(G) \leq |R_{io}| = 1 + \left\lfloor \frac{n}{4} \right\rfloor + 1 \quad (4)$$

On the other hand, suppose X is a γ_{iods} -set of G , then X must contain atleast $\frac{n-1}{3}$ number of vertices for domination and contain the vertex x_1 for odd sum degree

$$\text{Hence } \gamma_{iods}(G) = |X| \geq \frac{n-1}{3} + 1, n \equiv 1 \pmod{3} \quad (5)$$

from (4) and (5), we have

$$\gamma_{iods}(G) = \frac{n-1}{3} + 1, n \equiv 1 \pmod{3} \quad (6)$$

Case (iii): $n \equiv 2 \pmod{3}$

Let $R_{io} = X_1 \cup X_2$. Then R_{io} is an iods-set of G . Since, $\deg(x_1) = 1$

$$\text{Therefore, } \gamma_{iods}(G) \leq |R_{io}| = 1 + \left\lfloor \frac{n}{3} \right\rfloor \quad (7)$$

On the other hand, suppose X is a γ_{iods} -set of G then X must contain atleast $\frac{n-2}{3}$ number of vertices for domination and contain the vertex x_1 for odd degree sum

$$\text{Hence } \gamma_{iods}(G) = |X| \geq \frac{n-2}{3} + 1, n \equiv 2 \pmod{3} \quad (8)$$

from (7) and (8), we have

$$\gamma_{iods}(G) = \frac{n-2}{3} + 1, n \equiv 2 \pmod{3} \quad (9)$$

Therefore, the result is followed by (3), (6), and (9).

Claim 2: Inverse odd degree sum domination value.

If R_{io} is a γ_{iods} -set of G then the inverse odd degree sum domination value

Ilakkiya and Mohana Selvi

Similar reasoning maybe used to demonstrate the outcomes an inverse even degree sum domination number and its sum value in (ii).

Proposition 2.10: For Book B_n , $n \geq 2$

$$\gamma_{iods}(B_n) = \begin{cases} n+1, & n \equiv 0(mod 2) \\ 0, & n \equiv 1(mod 2) \end{cases}; S_{iods}(B_n) = \begin{cases} 3n+1, & n \equiv 0(mod 2) \\ 0, & n \equiv 1(mod 2) \end{cases}$$

$$\gamma_{iesd}(B_n) = 2; S_{iesd}(B_n) = 2n+2$$

Proof: let G be a Book B_n with atleast four vertices. Let $V(G) = \{x, y, x_1, x_2, \dots, x_n, y_1, y_2, \dots, y_n\}$ be a vertex set of G . With $deg(x) = deg(y) = n+1$ and $deg(x_i) = deg(y_i) = 2$ for all $i = 1, 2, \dots, n$ where $x_1, x_2, \dots, x_n$ and adjacent to $x, y_1, y_2, \dots, y_n$ are adjacent to y . Further x_i is adjacent to y_i for all $i = 1, 2, \dots, n$ and $deg(x) = deg(y) = n+1$.

Case (i): $n \equiv 0(mod 2)$

In this case, the vertex set $R_{io} = \{y\} \cup \{x_i / i=1, 2, \dots, n\} \subseteq V-R_o$ is an γ_{iosd} -set of G . Hence $\gamma_{iods}(G) = n+1, n \equiv 1(mod 2)$

Case (ii): $n \equiv 0(mod 2)$

Since every vertex in G has even degree gives there is no odd-set exist in G and hence $iods$ -set also not exist in G .

Therefore, $\gamma_{iods}(G) = 0, n \equiv 1(mod 2)$

Further, the inverse odd degree sum domination value

$$S_{iods}(G) = \sum_{x \in R_{io}} deg(x) = \begin{cases} 3n+1, & n \equiv 0(mod 2) \\ 0, & n \equiv 1(mod 2) \end{cases}$$

It completes the proof. By the similar arguments, one can prove the results an inverse even degree sum domination number and its sum value in (ii).

Proposition 2.11: For Crown C_n^+ , $n \geq 3$

$$(i) \quad \gamma_{iods}(C_n^+) = \begin{cases} n, & n \equiv 1(mod 2) \\ 0, & n \equiv 0(mod 2) \end{cases}; S_{iods}(C_n^+) = \begin{cases} 4\left\lceil \frac{n}{2} \right\rceil - 1, & n \equiv 1(mod 2) \\ 0, & n \equiv 0(mod 2) \end{cases}$$

$$(ii) \quad \gamma_{iesd}(C_n^+) = \begin{cases} n, & n \equiv 0(mod 2) \\ 0, & n \equiv 1(mod 2) \end{cases}; S_{iesd}(C_n^+) = n+2$$

Proof: Let G be a crown graph C_n^+ with atleast six vertices $R_{io} = \{x_i, y_i / i = 1, 2, \dots, n\}$

Where $deg(x_i) = 1$ and $deg(y_i) = 3, i = 1, 2, \dots, n$

Case(i): $n \equiv 0(mod 2)$

In this case, every vertex in G has even degree gives there is no $iods$ -set in G . Therefore, $\gamma_{iods}(G) = 0, n \equiv 0(mod 2)$

Case(ii): $n \equiv 1(mod 2)$

In this case, the vertex set $R_{io} = \{x_n\} \cup \{y_i / i=1, 2, \dots, n-1\}$ is an γ_{iods} -set of G

Hence $\gamma_{iods}(G) = n$.

Further, the inverse odd degree sum domination value

$$S_{iods}(G) = \sum_{x \in R_{io}} deg(x) = \begin{cases} 4\left\lceil \frac{n}{2} \right\rceil - 1, & n \equiv 1(mod 2) \\ 0, & n \equiv 0(mod 2) \end{cases}$$

It completes the proof. By similar arguments, one can prove the results an inverse even degree sum domination

Ilakkiya and Mohana Selvi

The following proposition gives the exact values of, $\gamma_{i ods}(G)$, $\gamma_{i esd}(G)$, $S_{i ods}(G)$ and $S_{i esd}(G)$ for some standard graphs.

Proposition 2.12: For Pan $T_{m,1}$, $m \geq 3$

$$\gamma_{i ods}(T_{m,1}) = \left\lfloor \frac{m}{3} \right\rfloor + 1 ; S_{i ods}(T_{m,1}) = 2 \left\lfloor \frac{m}{3} \right\rfloor + 1$$

Proposition 2.13: For Ladder L_n , $n \geq 3$

$$\gamma_{i ods}(L_n) = \begin{cases} 2 \left\lfloor \frac{n}{3} \right\rfloor - 1, n \equiv 0 \pmod{3} \\ 2 \left\lfloor \frac{n}{3} \right\rfloor, n \equiv 1, 2 \pmod{3} \end{cases} ; S_{i ods}(L_n) = \begin{cases} 6 \left\lfloor \frac{n}{4} \right\rfloor + 1, n \equiv 0, 1 \pmod{4} \\ 6 \left\lfloor \frac{n}{4} \right\rfloor + 5, n \equiv 2 \pmod{4} \\ 6 \left\lfloor \frac{n}{4} \right\rfloor + 1, n \equiv 3 \pmod{4} \end{cases}$$

$$\gamma_{i esd}(L_n) = \begin{cases} 2 \left\lfloor \frac{n}{3} \right\rfloor, n \equiv 0, 2 \pmod{3} \\ 2 \left\lfloor \frac{n}{3} \right\rfloor - 1, n \equiv 1 \pmod{3} \end{cases} ; S_{i esd}(L_n) = \begin{cases} 2n - 2, n \equiv 0 \pmod{3} \\ 2n, n \equiv 1, 2 \pmod{3} \end{cases}$$

Proposition 2.14: For Star S_n , $n \geq 4$

$$\gamma_{i ods}(S_n) = \begin{cases} n - 1, n \equiv 0 \pmod{2} \\ 0, n \equiv 1 \pmod{2} \end{cases} ; S_{i ods}(S_n) = \begin{cases} n - 1, n \equiv 0 \pmod{2} \\ 0, n \equiv 1 \pmod{2} \end{cases}$$

$$\gamma_{i esd}(S_n) = \begin{cases} n + 1, n \equiv 1 \pmod{2} \\ 0, n \equiv 0 \pmod{2} \end{cases} ; S_{i esd}(S_n) = \begin{cases} n + 1, n \equiv 1 \pmod{2} \\ 0, n \equiv 0 \pmod{2} \end{cases}$$

Proposition 2.15: For Comb P_n^+ , $n \geq 2$

$$\gamma_{i ods}(P_n^+) = n ; S_{i ods}(P_n^+) = 2n - 1$$

$$\gamma_{i esd}(P_n^+) = n ; S_{i esd}(P_n^+) = 2n$$

Proposition 2.16: For Complete K_n , $n \geq 4$

$$\gamma_{i ods}(K_n) = \begin{cases} 1, n \equiv 0 \pmod{2} \\ 0, n \equiv 1 \pmod{2} \end{cases} ; S_{i ods}(K_n) = \begin{cases} n - 1, n \equiv 0 \pmod{2} \\ 0, n \equiv 1 \pmod{2} \end{cases}$$

$$\gamma_{i esd}(K_n) = \begin{cases} 1, n \equiv 1 \pmod{2} \\ 0, n \equiv 0 \pmod{2} \end{cases} ; S_{i esd}(K_n) = \begin{cases} n + 1, n \equiv 0 \pmod{2} \\ 0, n \equiv 1 \pmod{2} \end{cases}$$

Proposition 2.17: For Fan f_n , $n \geq 3$

$$\gamma_{i ods}(f_n) = \begin{cases} 2 \left\lfloor \frac{n}{6} \right\rfloor + 1, n \equiv 0, 1, 2, 3 \pmod{6} \\ 2 \left\lfloor \frac{n}{6} \right\rfloor, n \equiv 4, 5 \pmod{6} \end{cases} ; S_{i ods}(f_n) = 2 \left\lfloor \frac{n}{2} \right\rfloor + 1$$

$$\gamma_{i esd}(f_n) = \begin{cases} 2 \left\lfloor \frac{n}{6} \right\rfloor, n \equiv 0, 3, 4, 5 \pmod{6} \\ 2 \left\lfloor \frac{n}{6} \right\rfloor + 1, n \equiv 1, 2 \pmod{6} \end{cases} ; S_{i esd}(f_n) = \begin{cases} n, n \equiv 0 \pmod{2} \\ n + 1, n \equiv 1 \pmod{2} \end{cases}$$

Proposition 2.18: For Dumbell D_n , $n \geq 3$

$$\gamma_{i ods}(D_n) = \begin{cases} 2 \left\lfloor \frac{n}{3} \right\rfloor + 1, n \equiv 1 \pmod{3} \\ 2 \left\lfloor \frac{n}{3} \right\rfloor, n \equiv 0, 2 \pmod{3} \end{cases} ; S_{i ods}(D_n) = \begin{cases} 4 \left\lfloor \frac{n}{3} \right\rfloor + 1, n \equiv 0, 2 \pmod{3} \\ 4 \left\lfloor \frac{n}{3} \right\rfloor + 3, n \equiv 1 \pmod{3} \end{cases}$$

$$\gamma_{i esd}(D_n) = 2 \left\lfloor \frac{n}{3} \right\rfloor ; S_{i esd}(D_n) = 4 \left\lfloor \frac{n}{3} \right\rfloor$$

Ilakkiya and Mohana Selvi

Proposition 2.19: For Flag Fl_n , $n \geq 2$

$$\gamma_{iods}(Fl_n) = \left\lceil \frac{n}{3} \right\rceil + 1 \quad ; \quad S_{iods}(Fl_n) = 2 \left\lceil \frac{n}{3} \right\rceil + 1$$

Proposition 2.20: For Bistar $B_{n,n}$, $n \geq 2$

$$\gamma_{iods}(B_{n,n}) = n+1 \quad ; \quad S_{iods}(B_{n,n}) = 2n+1$$

$$\gamma_{ieds}(B_{n,n}) = 2n \quad ; \quad S_{ieds}(B_{n,n}) = 2n$$

RESULTS AND DISCUSSIONS

Remark 3.1

An iods-set need not exist for the graph which has an odd degreesum dominating set. For example, Show the graph G , in figure 2 $R_0 = \{v_1, v_2, v_3, w_2\}$ is an γ_{osd} -set, but the induced subgraph $\langle V-R_0 \rangle$ not even have a dominating set of G . Thus in the following theorem. We present the necessary and sufficient condition for the existence of iods-set of G .

Theorem 3.2 Let R_0 be a γ_{osd} -set of G . Then G has an inverse odddegree-sum dominating set R_{io} iff the following conditions are satisfied

- (i) R_{io} is a subset of $V-R_0$
- (ii) $\langle V-R_0 \rangle$ contains no isolated vertices
- (iii) $\sum_{x \in R_{io}} \deg(x)$ is an odd number.

Proof: Let R_{io} be an inverse odd degree-sum dominating set of G . On the contrary if the given conditions are satisfied. Then (i) and (ii) contradict the fact that R_{io} is an inverse dominating set and (iii) contradict the fact that is an odd degree sum domination. Hence follows all the given three conditions. Therefore, the converse is obvious.

Theorem 3.3 If G has a γ_{iods} -set, then $\frac{p}{\Delta(G)+1} \leq \gamma_{iods} \leq p-2$ and these bounds are sharp.

Proof: It is known that $\frac{p}{\Delta(G)+1} \leq \gamma_{iods}(G)$ and by proposition 2.8, $\gamma(G) \leq \gamma_{iods}(G)$. Thus the lower bound holds and the lower bound is sharp for if $G = W_3$. We now prove the upper bound. Let R_i be a γ_i -set of G . If $V-R$ contains a dominating set R_i of G , then R_i is called an inverse dominating set. Let $R_{io} \subseteq V-R_i$, then $\sum_{r \in R_{io}} \deg(r) = \text{odd}$ is an inverse odd degree sum dominating set of G . Thus the upper bound holds and the upper bound is sharp for if $G = P_4$.

Theorem 3.4 For any tree G , $\gamma_{iods}(G) \geq q-m$ where m is the number of pendent edges of G .

Proof: Let R_{io} be a γ_{iods} -set of G and let S be the set of all pendent edges of G such that $|S| = m$. Since the induced subgraph $\langle V-R_0 \rangle$ exists an inverse odd degree sum dominating set R_{io} , $|R_{io}| \geq q-m$. So $\gamma_{iods}(G) \geq q-m$. Further, the equality is attained can be see the graph G , in figure 3, path P_5 , $q=4$ and $m=2$ $\gamma_{iods}(G) = |\{r_2, r_5\}| = 2$

Theorem 3.5 Let G be a (p,q) graph if G and its complement $\bar{G}$ are connected, then

- (i) $\gamma_{iods}(G) + \gamma_{iods}(\bar{G}) \leq 2(p-2)$ and
- (ii) $\gamma_{iods}(G) \gamma_{iods}(\bar{G}) \leq (p-2)^2$

Ilakkiya and Mohana Selvi

Theorem 3.6 Let G be a r -regular graph with r is an even positive number, then

$$\gamma_{iods}(G) = \begin{cases} \gamma(G), & r \equiv 1 \pmod{2} \\ 0, & r \equiv 0 \pmod{2} \end{cases}$$

Proof: In this case, G has only inverse odd sum degree vertices. It gives, every γ -set of G is a γ_{iods} -set of G and hence $\gamma(G) = \gamma_{iods}(G)$.

Theorem 3.7 Let G be a graph with an iods-set R_{io} . Then R_{io} has an odd number of odd degree vertices.

Proof: Suppose R_{io} has no odd degree vertices or it has even number of odd degree vertices then the sum of degrees of vertices of R_{io} become even. Which contradict R_{io} is an iods-set. Hence R_{io} has odd number of odd degree vertices.

Theorem 3.8 Let G be a graph. Then G is an iods-graph if and only if G has atleast one odd degree vertex.

Proof: Let G be an iods-graph, then there exists an iods-set of R_{io} of G . Assume that G has no odd degree vertex. Since G is connected with atleast two vertices gives G has only vertices of even degree. Then there is no iods-set exist in G which contradict G is an iods-graph.

Therefore, G has atleast one odd degree vertex. The converse is true, followed from theorem 3.7.

Theorem 3.9 Let G be a graph with $\delta(G) \neq \Delta(G)$. If $R_{io}(R_{ie})$ are γ_{iods} (γ_{iesd})-set of G then

$$\frac{1}{\Delta(G)} \sum_{r \in R_{io}} \deg(r) \leq \gamma_{iods}(G) \leq \frac{1}{\delta(G)} \sum_{r \in R_{io}} \deg(r)$$

$$\frac{1}{\Delta(G)} \sum_{r \in R_{ie}} \deg(r) \leq \gamma_{iesd}(G) \leq \frac{1}{\delta(G)} \sum_{r \in R_{ie}} \deg(r)$$

Proof: Since $\delta(G)$ and $\Delta(G)$ are respectively the minimum and maximum degree of the graph G , gives $\delta(G) \leq \gamma_{iods}(G) \leq \Delta(G)$ if $\delta \neq \Delta$ and $r \in G$.

Therefore, $|R_{io}| \delta(G) \leq \gamma_{iods}(G) \leq |R_{io}| \Delta(G)$ (1)

From the left inequality in (1), we have $|R_{io}| \leq \frac{1}{\delta(G)} \gamma_{iods}(G)$

That is, $\gamma_{iods}(G) = |R_{io}| \leq \frac{1}{\delta(G)} \sum_{r \in R_{io}} \deg(r)$ (2)

From the right inequality in (1), we have $|R_{io}| \geq \frac{1}{\Delta(G)} \sum_{r \in R_{io}} \deg(r)$

Therefore, $\gamma_{iods}(G) = |R_{io}| \geq \frac{1}{\Delta(G)} \sum_{r \in R_{io}} \deg(r)$ (3)

From equations (2) and (3), we get

$$\frac{1}{\Delta(G)} \sum_{r \in R_{io}} \deg(r) \leq \gamma_{iods}(G) \leq \frac{1}{\delta(G)} \sum_{r \in R_{io}} \deg(r)$$

Ilakkiya and Mohana Selvi

the upper bound is sharp for Path graph P_n .

By the similar argument one can prove for the even case and the lower bound is sharp for Wheel graph C_3 , C_4 also, the upper bound is sharp for Path graph P_4 .

CONCLUSION

This study introduced two new inverse domination parameters namely inverse odd and even degree sum domination numbers for a graph G . The associative dominating sets are distinguished. Furthermore, the limitations of the parameters are presented in terms of order, size and regularity of G . we computed the exact values of the parameters for some special graphs. Also we found some upper and lower bounds for inverse odd and even degree sum domination number. This parameter is highly applied in designing the fault-tolerant networks. Additionally, we aim to develop efficient algorithms and analyzing that parameter in future work.

ABSTRACT

Orodispersible medication conveyance frameworks are utilized broadly to work on the bioavailability of many medications. Additionally, they have a solid unit dose structure, which dissolve or disintegrate upon contact with the saliva in seconds and quickly release their components without mastication or water, forming a solution or suspension that is easy to swallow. Dosage form is a means used for the delivery of drug to a living body. The most prevalent drug delivery method is the tablet. This is because the drug is taken in through the mouth, where saliva travels to the stomach. Orodispersible tablets have been made by a variety of scientists using a variety of approaches, and the oral route is considered to be the most secure and a practical approach in the pharmaceutical industry. However, compression is the most typical preparation method. Molding, melt-granulation, the phase-transition process, sublimation, freeze-drying, spray-drying, and the effervescent method are all additional special techniques. Test is the significant component on the grounds that these tablets disintegrate straightforwardly in the mouth. The orodispersible tablet, superdisintegrants, mechanism of action, patented technology, and ODTs evaluation are the primary topics covered in this article.

Keywords: Oral dispersible tablets, Superdisintegrants, Bioavailability, Oral route, Oro dispersible technologies.

INTRODUCTION

The ordinary measurement structures (tablet and capsule) have wide acknowledgment upto 50-60 % of the absolute dose structures. Minimal expense, simplicity of organization, precise measurements self-prescription, help with discomfort and, above all, patient consistence are reasons solid dose structures are famous. The two most common solid dosage forms are tablets and capsules. Nevertheless, many people have difficulty swallowing tablets and gelatin capsules that are hard. Because this formulation developed primarily for geriatric, pediatric, bedridden, or disabled patients, ODTs have a structure that is extremely porous and a composition that is highly soluble, allowing them to be dispersed even in the smallest amount of water, such as saliva. This difficulty in swallowing is known as dysphasia. Patients with diligent sickness, who are voyaging, or who have next to zero admittance to water are additionally considered for this measurements structure. Orodispersible tablets (ODTs) are oral solid dosage forms that dissolve within one minute in the mouth without requiring water. The formulation begins to disintegrate when is in contact with saliva, and it disintegrates completely within 30 to 50 seconds. Superdisintegrants like Crospovidone are frequently incorporated into the formulation of tablets in order to enhance their disintegration. Sodium Microcrystalline cellulose (MCC) are examples of agents that are referred to as orodispersible tablets, quick dissolve tablets, rapid dissolve tablets, porous tablets, and rapidmelts. However, these dosage forms have been designated as ODTs by the United States Pharmacopoeia (USP), and their numerous benefits are making them increasingly popular.

Ideal Properties of Orodispersible Tablet

1. No water required: ODTs dissolve in your mouth, so you don't need water to take them.
2. Rapid Disintegration: Disintegrates within 30 seconds to 1 minute in the mouth, ensuring quick release of the active ingredient.
3. Increased porosity: enables quick absorption of water, leading to fast tablet breakdown.
4. Low Hardness: Easy to break down in the mouth .
5. Good Mouth feel : Pleasant texture and sensation in the mouth , making it comfortable to take.
6. High Drug Loading: Ability to carry high doses of the active substance, reducing the multiple tablets .
7. Improved Bioavailability: Enhanced bioavailability and absorption of the drug.
8. Fast Dissolution: Rapid release of the active ingredient, ensuring quick onset of action.
9. Stability: Resists degradation and maintains potency over time , even in harsh environmental conditions.
10. Palatability: Pleasant taste and flavor.
11. Convenience: Easy to administer, especially for patients with swallowing difficulties.
12. Quick Onset of Action :Quick onset of therapeutic effect, providing fast relief from symptoms .
1. 13. Discreet : ODTs are discreet and easy to take anywhere, without drawing attention.
2. These ideal properties make ODTs a popular choice for various therapeutic applications, offering improved patient compliance and convenience.

SUPERDISINTEGRANTS

Super disintegrants employed in orally disintegrating tablet

Croscarmellose Sodium

Nature: Cross-linked form of Sodium Carboxymethyl Cellulose (CMC).

Properties: Particle size: 200 mesh

Mechanism of Action: Works by swelling upon contact with water.

Crospovidone **Crospovidone Nature:** Cross-linked homopolymer of N-vinyl-2-pyrrolidone.

Properties: Particle size: ~100 µm. Insoluble in water. Provides a smoother mouthfeel in formulations.

Mechanism of Action: Works through both swelling and wicking (capillary action).

**Pooja Gargama et al.,**

Sodium Starch Glycolate Nature: Cross-linked low-substituted carboxymethyl ether of poly-glucopyranose (modified starch).

Properties: Particle size: ~140 mesh. Highly absorbent and insoluble in water.

Mechanism of Action: Works by water uptake, causing rapid and enormous swelling

Sodium Alginate

Nature: Sodium alginic acid salt (a natural polysaccharide extracted from brown seaweed).

Properties: Slowly soluble in water, Hygroscopic (absorbs moisture from the environment).

Mechanism of Action: Works through swelling when in contact with water.

Effervescent Mixture

Nature: A combination of citric acid, tartaric acid, and sodium bicarbonate.

Properties: Crystalline in nature.

Mechanism of Action: Works through effervescence, producing gas that breaks apart the dosage form.

Method Used in Preparation of Orodispersible Tablet

Freeze-Drying

The freeze-drying method (also known as lyophilization) is a widely used technique for preparing oro-dispersible tablets (ODTs) due to its ability to produce highly porous and rapidly dissolving formulations. This method involves the conversion of a drug-excipient solution or suspension into a porous solid by freezing it at low temperatures, followed by sublimation of the solvent under vacuum conditions. The result is an ultra-lightweight, fragile matrix that disintegrates almost instantly upon contact with saliva, making it ideal for patients with swallowing difficulties, such as pediatrics, geriatrics, and those with dysphagia. Primary drying (sublimation), secondary drying (desorption), and freezing are the three main steps in the freeze-drying process. In the freezing stage, the liquid formulation containing the active pharmaceutical ingredient (API), excipients (such as gelatin, mannitol, or saccharides), and a cryoprotectant is frozen at temperatures below the freezing point of water. This step ensures the formation of ice crystals, which later create porosity in the final tablet structure. When the first drying process is underway, the frozen water is eliminated through sublimation under not much pressure, preserving the original shape of the formulation while enhancing its porosity. Lastly, secondary drying eliminates any residual moisture, ensuring tablet stability and preventing degradation.

Direct Compression

The direct compression method is among the most extensively utilized and cost-effective techniques for formulating oro-dispersible tablets (ODTs) due to its simplicity, efficiency, and ability to maintain drug stability. This method involves the dry blending of the active pharmaceutical ingredient (API) with excipients, followed by direct compression into tablets without the need for heat, water, or solvents. The key components of a direct compression ODT formulation include superdisintegrants, which facilitate rapid tablet disintegration in the oral cavity, diluents (like mannitol, microcrystalline cellulose, or lactose) to improve bulk properties and mouthfeel, and lubricants (such as magnesium stearate) to enhance tablet manufacturability.

Tablet Molding

The tablet molding method is a widely used technique for preparing oro-dispersible tablets (ODTs) due to its ability to produce highly porous and rapidly dissolving formulations. In this method, a moist mass of the active pharmaceutical ingredient (API) and excipients is molded into tablets using compression or heat treatment, followed by drying to maintain the tablet's shape and integrity. Unlike conventional compression techniques, molded tablets are less dense and more porous, allowing them to disintegrate rapidly upon contact with saliva. This makes the method particularly suitable for patients with difficulties swallowing solid dosage forms, such as pediatric, geriatric, and dysphagic.

**Pooja Gargama et al.,****Spray Drying**

The spray drying method is a widely used technique for preparing oro-dispersible tablets (ODTs) due to its ability to produce a highly porous and fast-disintegrating tablet matrix. In this process, the active pharmaceutical ingredient (API) is combined with excipients such as superdisintegrants, binders, and taste-masking agents, and dissolved or suspended in a liquid medium. The fluid is then atomized into small droplets and quickly dried using hot air in a spray drier, resulting in the formation of porous, spherical, and free-flowing particles with enhanced solubility and compressibility. These spray-dried granules are then blended with lubricants and compressed into tablets using the direct compression method.

Cotton Candy Process

The cotton candy process is an advanced pharmaceutical technique used for the formulation of oro-dispersible tablets (ODTs), designed to quickly dissolve in the mouth without the requiring water. This method involves the formation of a highly porous and floss-like matrix by subjecting a blend of saccharides and polymers to a controlled spinning process, similar to cotton candy manufacturing. The process begins with selecting suitable excipients such as sugars (e.g., sucrose, mannitol, lactose) that can be melted and spun into fine fibers, along with polymers like hydroxypropyl cellulose (HPC) or polyvinyl pyrrolidone (PVP) to enhance stability. The mixture is then heated and spun at high speeds, leading to the formation of a floss-like material that, upon cooling, retains an open and porous structure. This floss is conditioned to improve mechanical properties and mixed with the active pharmaceutical ingredient (API), disintegrants like croscopovidone or croscarmellose sodium, and flavoring agents to enhance taste and patient acceptability. The final blend is gently compressed into tablets using minimal force to preserve the porosity, ensuring rapid disintegration upon contact with saliva. The cotton candy process offers several advantages, including ultra-fast disintegration within seconds, enhanced bioavailability due to quick drug release, and improved patient compliance, especially for elderly and young people who have trouble taking regular medications. Additionally, the process enables effective taste masking, as the sugar-based carriers naturally improve palatability. This innovative technique is widely used in pharmaceutical formulations to develop rapidly dissolving and patient-friendly drug delivery systems.

Mass Extrusion

This method involves the softening of a water-soluble polymer and plasticizer mixture using a solvent system, followed by the extrusion of the softened mass through an extruder or syringe to form a uniform cylindrical shape, this is then cut to desired segments and processed further. The extrudates obtained are dried, ground, and subsequently blended with other excipients and disintegrants, taste-masking agents, and lubricants before being compressed into tablets. The primary advantage of this technique is the ability to enhance drug solubility, improve uniformity, and mask the bitter flavor of drugs by incorporating covering up tastes agents within the polymeric matrix. Additionally, this method ensures better mechanical strength of the tablets while maintaining rapid disintegration properties due to the porous structure created during extrusion. Recent research has focused on optimizing formulation parameters such as polymer selection, plasticizer concentration, and extrusion conditions to achieve better taste masking, faster disintegration, and improved drug release profiles in ODT formulations.

Evaluation of Orodispersible Tablet**Hardness**

It is a crucial parameter that demonstrates the tablet's resistance to chipping, breaking, and abrasion during handling, transportation, and storage. Traditional hardness testers, such as the Monsanto hardness tester. ardness, are used to measure the tablet's hardness.

Weight Variation

Weight variation is an essential quality control test for orodispersible tablets (ODTs) to ensure uniformity in drug content and dosage accuracy. This test assesses whether individual tablets within a batch comply with the specified weight limits, ensuring dose consistency and therapeutic efficacy. The test is conducted by randomly selecting at

**Pooja Gargama et al.,**

least 20 tablets, individually weighing them, and comparing their weights to the average tablet weight. The percentage deviation is calculated, and the results are evaluated according to pharmacopeial conventional, like those specified in the United States Pharmacopeia (USP) and Indian Pharmacopeia (IP).

Friability

Friability is a crucial test for orodispersible tablets (ODTs) to assess their mechanical strength and resistance to abrasion during handling, packaging, and transportation. Since ODTs are designed to be lightweight and highly porous for rapid disintegration, they often have lower mechanical strength compared to conventional tablets, making friability testing essential to ensure they do not break or crumble easily. Friability is evaluated using a Roche friabilator, where a pre-weighed batch of 10 or more tablets is subjected to rotation (25 rpm for 4 minutes, totaling 100 revolutions) in a drum with internal baffles. The tablets are then re-weighed, and the percentage weight loss is used in the formula to calculate:

$$\text{Friability (\%)} = \frac{\text{Initial Weight (W1)} - \text{Final Weight (W2)}}{\text{Initial Weight (W1)}} \times 100$$

Thickness

The measurement and punch size of tablets relies upon the kick the bucket and punches chose for making the tablets. Five tablets from each kind of plan were utilized and normal qualities were determined. A screw gauge is used to measure the thickness of the tablet. The thickness, expressed as mm.

Wetting Time

Wetting time is a crucial parameter for orodispersible tablets (ODTs) as it directly affects their disintegration speed and patient acceptability. It measures the time required for a tablet to absorb moisture and begin breaking down upon contact with saliva. A shorter wetting time indicates faster disintegration, which is essential for enhancing drug absorption and ensuring patient convenience, particularly for pediatric, geriatric, and dysphagic patients. Wetting time is evaluated using a simple in-vitro method, when a circular piece of tissue paper (10 cm across) is put in a Petri dish with 10 milliliters of either distilled water or a colored dye solution (e.g., amaranth dye). The wetting time is measured by placing the tablet on the paper and timing how long it takes the dye to reach the tablet's upper surface.

Disolution Test

This is a crucial test for figuring out release of drug profiles. The USP dissolution test apparatus, as well as the USP-Type 2 apparatus, can be used to find out how well ODT dissolves. Orodispersible tablets dissolve very quickly. As a result, dissolution testing is carried out with a 50-100 r/min USP 2 Paddle-type apparatus.

CONCLUSION

The Orodispersible tablets (ODTs) are designed to break down and disperse quickly in saliva, allowing for easy administration without the need for water. Orodispersible tablets are especially helpful for dysphagic children, adult, bedridden patients, and psychotic patients. ODTs can be formulated using multiple techniques, with the choice of method depending on the drug's characteristics and the desired properties of the final dosage form, but how well they work depends on the drug's suitability and the excipients used in the delivery system. These tablets demonstrate improved efficacy, bioavailability, quick onset of action, and patient compliance due to their rapid absorption. This dosage form should be handled carefully due to its lack of mechanical strength. A lot more kinds of medications may be created involving ODT in the future. pharmaceutical organizations can exploit ODTs for product offering expansions or for first-to-showcase items. With proceeded with improvement of new drugs in the coming years, orodispersible tablets (ODTs) will continue to advance, incorporating novel technologies and excipients to enhance their effectiveness and patient convenience.

ABSTRACT

Blockchain technology, known for its decentralized and secure ledger system, has significantly impacted various industries, with the financial sector being a key adopter. This research paper explores how blockchain is being used in the financial sector, analyzing its various applications, benefits, challenges, and future prospects. It covers significant use cases such as payment systems, trading, regulatory compliance, and asset settlements. Additionally, the paper examines how blockchain enhances security, transparency, and reduces operational costs. In conclusion, insights on the future of blockchain in finance are provided, along with recommendations for further exploration.

Keywords: Blockchain, Smart contract, Finance, Cross-Border Payment, Decentralized.

INTRODUCTION

Originally created for cryptocurrencies like Bitcoin, blockchain has evolved into a platform that is revolutionizing a number of industries. Long-standing issues with middlemen, security, and regulatory compliance in the financial industry can be resolved by blockchain's decentralized, transparent, and immutable characteristics. This essay will examine how blockchain is now being used in finance [1], evaluate its benefits, consider its drawbacks, and forecast how it might change the sector.

Blockchain in the Financial Sector

Cryptocurrency and Payments Systems

- **Cryptocurrencies:** The development of digital currencies like Bitcoin, Ethereum, and others is the most prominent application of blockchain technology. Blockchain technology ensures decentralization and transparency for these digital assets, doing away with the need for conventional financial intermediaries like banks.
- **Cross-Border Payments:** By lowering transaction costs, increasing transaction speed, and eliminating several middlemen, blockchain has the potential to significantly enhance cross-border payments [2]. Because of this, international transfers are more economical and effective than conventional techniques.

Smart Contracts

- **Automating Agreements:** Smart contracts are self-executing contracts in which the code automatically carries out the terms [3]. By automating procedures and eliminating middlemen like attorneys and notaries, these contracts can lower expenses while boosting openness and trust in the financial industry [4].

Securities Trading and Settlement

- **Blockchain in Trading:** Blockchain has the potential to streamline and speed up securities trading and settlement. Blockchain can execute these transactions in real-time, lowering counterparty risks and increasing market efficiency. Traditional settlement procedures can take days.
- **Asset Tokenization:** Blockchain enables the digital representation of tangible things, such commodities or real estate. More investors can now engage in these markets because to the tokenization process, which also democratizes access and permits fractional ownership.

Regulatory Compliance and KYC

- **AML and KYC Compliance:** Blockchain technology helps financial institutions comply with know-your-customer (KYC) and anti-money laundering (AML) laws [5]. Blockchain lowers the risk of fraud and speeds up compliance procedures by offering safe, transparent, and unchangeable records.
- **Real-Time Auditing:** Financial institutions and regulators can instantly check transactions thanks to blockchain's ability to provide real-time audits. This lowers the time and expense associated with conventional auditing procedures while also improving oversight.

The Financial Benefits of Blockchain

1. **Increased Security:** Compared to conventional systems, blockchain is more secure due to its encryption and decentralized architecture [6]. Data integrity is guaranteed by its immutable ledger, which also stops unwanted alterations.
2. **Cost Reduction:** Because blockchain does not require middlemen, transaction and operating costs are reduced.
3. **Transparency and Trust:** The public ledger of blockchain technology makes all transactions visible and verifiable by users, fostering systemic trust.
4. **Faster Transactions:** Blockchain reduces transaction processing times, especially when it comes to cross-border payments, where conventional methods are frequently sluggish.

CHALLENGES AND LIMITATIONS

Blockchain has a number of challenges in the financial industry, despite its obvious benefits [8]

1. **Problems with Scalability:** Some blockchain networks have trouble handling high transaction volumes, especially Bitcoin[7]. The network may get overloaded as consumption rises, which would result in increased expenses and decreased processing speeds.

**Pushpalatha et al.,**

2. **Regulatory Uncertainty:** Because blockchain technology is decentralized, it presents regulatory issues. Legal frameworks for its application are still being developed by governments, especially with regard to taxation, consumer protection, and anti-money laundering initiatives.
3. **Integration with Legacy Systems:** Legacy infrastructure is still used by a lot of financial institutions. It can be expensive and technically challenging to integrate blockchain with these current systems.
4. **Energy Consumption:** Public blockchains, like Bitcoin, are notoriously energy-intensive, which raises questions about their potential effects on the environment, particularly, especially as sustainability becomes a more pressing issue in finance.

RESEARCH METHODOLOGY

Blockchain in Cross-Border Payments

One excellent illustration of how blockchain technology could revolutionize international payments is Ripple. Financial organizations can instantly move money across borders with Ripple's XRP cryptocurrency [9]. Compared to conventional systems like SWIFT, RippleNet reduces transaction fees and processing times by doing away with the need for many intermediaries [16].

Analysis

The analysis of blockchain applications in the financial sector reveals several key takeaways:

- **Increased Efficiency:** Because blockchain eliminates middlemen, speeds up transactions, and eliminates operational inefficiencies, it is simplifying procedures like payments and securities settlement.
- **Cost Savings:** Both consumers and financial institutions stand to gain from blockchain's ability to drastically reduce transaction and operating expenses.
- **Improved Security:** A strong defense against fraud and cyber risks is offered by the intrinsic security properties of blockchain, such as its encryption and immutability.
- **Regulatory Benefits:** By providing a more effective and safe compliance process, blockchain's transparent ledger assists financial companies in adhering to laws like KYC and AML [10]. For blockchain to be widely adopted in the financial industry, scalability, regulatory problems, and environmental challenges must still be resolved, notwithstanding these benefits.

Suggestions

- **Scalability:** To guarantee that blockchain can efficiently manage large transaction volumes, research should concentrate on resolving its scalability issues [11].
- **Cooperate with Regulators:** To establish a transparent regulatory framework for blockchain adoption in finance, financial institutions and blockchain developers should cooperate with regulators.
- **Examine Other Use Cases:** In addition to payments and trading, more research should be done on the possibilities of blockchain technology in fields like supply chain finance, asset management, and insurance. The banking sector may increase operational effectiveness, cut expenses, and promote innovation by adopting blockchain, setting itself up for future success in the digital economy.

PROPOSED METHODOLOGY

Blockchain technology has the potential to transform the financial industry, and "Blockchain Unlocked: Transforming the Future of Finance" is an intriguing topic that encourages investigation. We must outline strategies for bringing about this change by concentrating on the main areas where blockchain may solve current problems and open up new avenues. Some suggested frameworks and techniques to promote blockchain adoption and effect in finance are listed below.

Pushpalatha et al.,

The Development of the Decentralized Finance (DeFi) Ecosystem

The goal is to create strong DeFi platforms that do away with middlemen in financial services like trading, lending, borrowing, and insurance.

Important Steps to Take

To provide automated and secure financial services while lowering expenses and human error, smart contract innovation aims to develop and enhance smart contract capabilities.

Cross-Chain Interoperability

Put in place solutions that allow seamless DeFi interactions across various ecosystems by enabling communication between various blockchain networks. Develop decentralized credit scoring systems and insurance products as risk management tools to reduce the hazards connected to DeFi platforms. Effects include decreased dependency on conventional banks, improved financial inclusion, and cheaper prices for both individuals and companies.

Central Bank Digital Currencies (CBDCs)

The goal of central bank digital currencies (CBDCs) is to make it possible for governments and central banks to use blockchain technology to create their own digital currencies, revolutionizing the monetary system and updating payment systems.

Crucial Steps

Pilot Programs

To evaluate user uptake, security, and scalability, start CBDC pilot programs.

Regulations

Provide clear, understandable regulations for CBDCs that strike a balance between security, privacy, and compliance. The capacity of CBDCs to integrate easily with both established financial systems and cutting-edge blockchain-based solutions is known as interoperability. Impacts include lower transaction costs, more financial system transparency, and more effective monetary policy.

Blockchain for Financial Transparency and Auditability

Objective

Implement blockchain solutions for enhanced financial transparency and real-time auditing.

Important steps include

On-Chain Audits

Create instruments for ongoing, real-time audits of blockchain-based financial transactions to make sure regulations are being followed.

Transparent Reporting

Make sure all stakeholders have access to reliable financial data by using blockchain technology to produce transparent and unchangeable ledgers of financial transactions.

Smart Contract Auditing Tools

Create sophisticated auditing instruments that are able to automatically identify risks or weaknesses in financial smart contracts.

Impact

Simplified auditing procedures, decreased fraud, and increased confidence in financial institutions.

**Pushpalatha et al.,****Blockchain for Supply Chain Financing****Objective**

Use blockchain to streamline supply chain financing, reducing delays and increasing access to working capital for businesses.

Key Actions**Trade Finance Smart Contracts**

Create smart contracts to automate and secure supply chain finance, guaranteeing on-time payments and cutting down on the need for middlemen.

Receivables Tokenization

Give suppliers and small businesses quicker and more effective financing choices by tokenizing accounts receivable and utilizing blockchain technology.

Integrated Blockchain Platforms

Create integrated blockchain platforms that link suppliers, purchasers, and banks to enable financing options based on supply chain data that is updated in real time.

Blockchain for Fraud Prevention and Risk Mitigation**Goal**

Lower financial fraud and systemic risks in the financial industry by utilizing blockchain's immutability and transparency.

Important Steps to Take

Create AI-powered, blockchain-integrated smart fraud detection systems that can instantly identify questionable transactions.

Immutable Transaction Records

Make use of the immutable ledger provided by blockchain technology to guarantee that all financial transactions remain impenetrable, lowering the possibility of fraud and false reporting. To reduce systemic risks in financial markets, establish decentralized risk pools. Use blockchain technology to monitor risk exposure and guarantee open risk-sharing arrangements. Effects include decreased fraud, increased security, and better risk control in the financial services industry.

CONCLUSION

Blockchain technology has the potential to revolutionize the financial industry by enhancing security, cutting expenses, and boosting productivity. Blockchain must first overcome issues with scalability, regulatory clarity, and energy consumption before it can be completely incorporated into traditional financial institutions. As blockchain technology develops further, it is anticipated to play a crucial role in the architecture of the financial sector, encouraging increased competitiveness, transparency, and trust.

ABSTRACT

More than 6.1 million people around the world are affected by Parkinson's disease (PD), a neurological condition. Symptoms of PD might be difficult to notice at first, include tremors, slow speech, poor handwriting, and trouble getting out of a chair. Leaning forward, walking slowly and decreased arm swinging are all symptoms of the parkinsonian gait. Symptoms can manifest on either side of the body; seeking medical attention is necessary if they get worse or get in the way of normal life. To better understand the disease and its causes, predictive models provide information about potential risk factors and pathways to treatment, offering possibilities for new approaches to both early detection and treatment. Various features like handwriting, voice and gait motions are used to analyse the PD in early stage. The most promising branches of Artificial Intelligence (AI) technique called Machine Learning (ML) Deep Learning (DL), have the potential to aid PD doctors and patients throughout the disease's progression, allowing for more efficient and less expensive therapy. ML and DL approaches are utilized to predict the initial phases of PD by extracting intricate patterns through extensive datasets. It accurately detects the development or progression of PD by utilizing sophisticated neural networks to identify subtle biomarkers and behaviours. This survey covers the techniques of ML and DL-based diagnostic approaches for PD detection, including pre-processing of PD datasets, feature extraction and selection, and classification. There has also been an investigation on the potential advantages and disadvantages of the suggested approaches.

Keywords: Deep Learning, CNN, MRI, Brain Tumor, Tumor Localization

INTRODUCTION

The PD is a chronic neurodegenerative illness that affects both motor coordination and emotional regulation due to a deficiency of the neurotransmitter "dopamine" [1]. The dopamine-transmitting neurons of both the PD and Healthy Control (HC) groups are depicted in Fig. 1. The Parkinson's Foundation in the United States reports that an estimated 12 million individuals are diagnosed with PD annually [2]. The increase in effect and severity of PD symptoms is acquainted with the increase in stages. The stages can also be described as early, moderate and advanced by healthcare providers and professionals.

Stage 1: The patients experience mild symptoms primarily in the first stage. They experience a little inconvenience in daily task. One of the main symptoms is the unsteadiness in the limbs, called tremors. Also, Individuals with PD may exhibit signs of slouched posture, impaired balance, and atypical facial expressions, which can be easily observed by their friends and family.

Stage 2: At this stage, the symptoms are bilateral, affecting both sides of the body and both limbs. Walking while keeping balance is challenging. They show more visibility in inability to complete normal physical task.

Stage 3: The symptoms are very much severe in the third stage. The inability in walking and standing is more prominent and sometimes, the patient's needs help at many hours.

Stage 4: The severity increases with this stage, particularly with walking which are more visible symptoms. The rigidity in muscles and bradykinesia often seems at this stage. The patient requires the help at this stage for day-to-day work. The tremors or shakiness that takes over during the earlier stages however, may lessen or become non-existent for unknown reason during this time.

Stage 5: This stage takes almost all the visible physical movements of patient. The patient faces inability even to walk and stand. Individual requires one-on-one nursing care at this stage.

According to the severity, nearly half of PD patients manifest several dysfunctions including gait abnormality, attention deficit, speech problems and impulsivity [3, 4]. The cardinal PD motor symptoms are tremor, gait imbalance, postural instability and bradykinesia. Similarly, the primary non-motor symptoms of PD include fatigue, dementia, depression and sleep disorder [5]. Fig. 2 illustrates some of the cardinal motor and non-motor symptoms of PD. Currently, several therapies are available for treating PD including surgical treatments, gene therapies, pharmacological manipulations and rehabilitation therapies.

Gait is one of several motor symptoms that are the hallmarks of PD, including slowness of movement and tremors. Motor symptoms in PD come from a lack of control over movements and difficulty initiating muscle movements. Gait characterization involves several factors including terms to enhance one's health, functional ability mechanism which includes temporal and spatial parameters. Human locomotion is coined by the main two phases swing phase that comprises 40 % and stance phase that comprises 60%. Once the two phases are complete then the cycles start again to follow continuous walking. The two main phases are further divided into eight sub phases to explain the complete gait cycle as heel strike, Mid Stance, Terminal Stance, Pre-Swing, Initial Swing, Mid Swing, Terminal Swing, and Loading Response. The various phases of gait cycles in PD are explained in Fig. 3. Even though the genesis of PD is unknown, the causative factors are considered to be ageing, gene mutations, and exposure to toxic substances [6, 7]. For early intervention to either stop or slow down the progression of PD, an early diagnosis is crucial. However, due to the complexity of PD, the diagnosis is primarily based on the clinical presentations of the patient and the doctors' knowledge. This can result in inconsistent assessments and misdiagnoses [8]. Furthermore, distinguishing between mild indications of PD and general cues of physiological aging in older persons can be difficult in a clinical context. DL based AI has been widely recognized in many fields because of the progress made in recent decades. Multiple studies using different datasets have attempted to diagnose PD. Research has investigated many indicators, such as loss of smell, changes in speech and walking patterns, writing tests, and other motor skill tests to identify PD. This paper's core intention is to offer a thorough overview of several ML and DL frameworks that are used to detect and diagnose PD by analysing different signals

**Anitha and Chitra**

The remaining sections are organized in the following manner: Section II explores different frameworks specifically developed for the detection of PD. Section III presents a comparative examination of the frameworks. Section IV provides a comprehensive overview of the full survey and offers suggestions for future areas of focus

Review on MI and DI Model for Pd Severity Detection

Anudeep et al. [9] devised a ML technique using the spiral drawing inputs of patients affected by both Normal and PD. Utilizing the Principal Component Analysis (PCA) technique, features were extracted and Support Vector Machines (SVMs) were employed to classify the spiral drawings. The feedback was derived from voice samples collected in PD using the UCI ML framework. Varrecchia et al. [10] formulated a diagnostic algorithm using ML techniques to categorize PD walking impairments based on disease progression as measured by the H-Y staging system. It also determined the minimum set of ambulatory distance and kinematic characteristics required to distinguish the gait patterns of different H-Y stages from each other. Sahu et al. [11] formulated a hybrid strategy combining Regression Analysis (RA) and ANN for the early identification of PD. The acquired dataset underwent initial regression analysis. Subsequently, the regressed dataset was inputted into the ANN to assess the probability of PD symptoms. The likelihood of PD and healthy individuals (HP) was evaluated as a whole. They utilized a speech dataset to identify patients with PD.

Trabassi *et al.* [12] developed a supervised ML technique to accurately distinguish between patients with PD and speed matched HC using a minimal collection of Gait attributes determined from IMUs. This model examined how effectively and broadly ML methods can diagnose gait impairments in PD using information from a single IMU installed in the lumbar region. Results showed that these algorithms were effective in reducing the risk of increasing explainability, making them useful tools for understanding gait disorders. Kaur et al. [13] introduced a Data-driven approach for classifying advances in people with MS (PwMS), people with PD (PwPD), and HOA that might be applicable to a variety of walking tasks and individuals. They conducted a complete quantitative evaluation of 16 different standard ML and DL techniques. The Multi-Scale Residual neural Network (MSResNet) was most accurate when it switched from easy walking (W) to walking while Talking (WT).

Govindu and Palwe, [14] developed a ML method to detect PD in early stage. They utilized audio data from PPMI and UCI databases, focusing on voice modulations of Parkinson's patients. This dataset included features such as jitter, shimmer, and MDVP of vowel sounds. The data was pre-processed, analysed, and displayed to thoroughly understand the features. Seventy-five percent of the dataset was allocated to train four models: Logistic Regression (LR), SVM, Random Forest Regression (RFR), and k-Nearest Neighbor (k-NN). These models were trained to classify audio data as either Parkinson's or healthy, based on frequency variations. Shastry et al. [15] introduced a Nearest Neighbor Boosting (NNB) strategy that combined k-NN and Gradient Boosting (GB) and surpassed various current ensemble ML models for PD prediction. This model employed three feature selection techniques—Feature Mean Decrease in Impurity (F-MDI), Feature Permutation (F-PER), and Pearson's Correlation to identify important features for PD prediction. These strategies helped reduce the dataset's dimensionality and enhance the model's accuracy. The NNB approach enhances performance by leveraging the intensity of k-NN and GB combined.

Sarin et al. [16] developed a three-stage method for creating a fuzzy classifier diagnosing PD. The method began with the structure development stage, where the fundamental properties of the classifier, such as number of rules, types of membership functions, selected features, and initial parameter values, were defined. Next, the feature selection stage focused on refining the classifier by identifying a subset of informative features that maximized the performance criterion. Finally, in the parameter tuning stage, the classifier's parameters were fine-tuned to optimize the performance criterion. Vimalajeewa et al. [17] developed a feature extraction approach to detect PD using gait data. Different attributes were established from Vertical Ground Reaction Force (VGRF) data based on iterative patterns, linkages, and neat/chaos aspects using Wavelet Transformations (WTs) for analysis. LR, SVM and KNN were used to predict PD after the collecting few important features. The classifiers effectiveness was evaluated using three-time domain and multiscale attribute subsets with time domain features enhancing its detection performance.

**Anitha and Chitra**

Wingate *et al.* [18] devised a new DL-based approach for diagnosing PD using medical images. The method involves analysing and utilizing knowledge gained from Deep CNN and RCNN trained with medical images such as MRI and dopamine transporter scans (DaTscans). The internal representations learned by the trained DNNs encapsulate extracted knowledge, which is then leveraged through Transfer Learning (TL) and domain adaptation techniques to construct a unified framework for predicting PD across a range of medical scenarios. The model demonstrates effectiveness in predicting PD using diverse medical image datasets. Sivaranjini & Sujatha [19] presented a CNN architecture designed to classify MR images of subjects with PD and HC. were pre-processed through normalization and application of a Gaussian filter. They employed an AlexNet model, a type of CNN, for the classification task. The pretrained model weights were leveraged, and fine-tuning of the last fully connected layer with appropriate hyperparameters was conducted to effectively distinguish between HC and PD subjects. Alissa [20] developed a PD detection approach using RNN and CNN to distinguish between healthy and PD individuals. For PD evaluation, RNN model was trained using time-series datasets that included hand signals collected from a smart pen. The CNN model learned from signals from control subjects and PD patients using BackPropagation Through Time (BPTT) to assess if a new individual has PD or is healthy, and was applied to hand-drawn images in the classification phase. The CNN model trained via backpropagation was used to classify images of both patients and healthy participants, distinguishing between healthy individuals and PD patients. Leung *et al.* [21] illustrated a three-stage DL ensemble strategy for predicting PD progression. The technique included various techniques for deriving useful space-time imaging attributes. This model proceeded in three stages: first, extracting spatiotemporal and temporal information from baseline DaTscan images; second, utilizing an LSTM network for capturing temporal features; and third, integrating these features with non-imaging clinical parameters like age, gender, and illness duration into a fully connected prediction layer. Batch normalization and dropout techniques were employed to regularize eleven networks trained on various subsets of retrieved imaging parameters including MDS-UPDRS-III data. The final MDS-UPDRS-III score for Year 4 was derived by averaging predictions from all networks.

Yang *et al.* [22] introduced a PD-ResNet model for automatic identification of PD and HC. This model implemented a polynomial raised dimensions to enhance input walking attributes, transforming the information into a 3D representation. To enhance generalization, they employed techniques such as Synthetic Minority Over-sampling Technique (SMOTE), data augmentation, and early stopping. Additionally, they developed an improved focal loss function aimed at emphasizing challenging samples and filtering out outliers, thereby boosting the classification performance. Ali *et al.* [23] explored PD detection using multimodal vocal data collected from two channels: Smart Phone (SP) and Acoustic Cardioid (AC). They collected four models through each via., sustained phonation, speech, voiced and unvoiced modalities. Initially, this model investigated the ideal information modalities and attributes that provided improved knowledge on PD. Secondly, MultiModal Data-Driven Ensemble (MMDD-Ensemble) method for predicting PD, which uses mixed vocal data to build base classifiers and fuses estimations with these classifiers using blending and voting techniques.

Vyas *et al.* [24] devised a couple of new models, 2D and 3D CNNs using DL techniques that were valued on MRI scans in the cross-sectional direction. This model utilized Parkinson's Progression Markers Initiative (PPMI) dataset with preprocessing techniques like Bias field correction, histogram matching, Z-score normalization, and image resizing. It employed 318 MRI scans for effective training and validation of models. Naaz *et al.* [25] developed a DNN for calculating both the motor UPDRS and total UPDRS scores by analysing voice samples from the UCI ML Repository. In this model, they created DNNs with 2 and 3 layers and fine-tuned them by fine-tuning various parameters like optimizer, batch size, number of epochs, and validation split ratio. They used the Parkinson's Telemonitoring Dataset from the UCI ML Repository, that needs some normalizing before it was entered into the network.

Khachnaoui *et al.* [26] suggested a Computer-Aided Diagnosis (CAD) system to detect PD automatically using pre-trained CNN models. The system incorporated EfficientNet B0, MobileNet V2, and a unique CNN model, all pre-trained on ImageNet and customized using TL. They utilized bilinear pooling to create three Bilinear CNN models. The method was evaluated with 2,720 SPECT images from PPMI dataset. Saravanan *et al.* [27] suggested a novel

**Anitha and Chitra**

hybrid deep transfer learning model to differentiate between PD and HC. This model combined the strengths of VGG19 Net and Google Net. To elucidate the VGG19-INC model, this model used explainable AI (XAI) techniques like LIME to determine whether features of spiral and wave drawings have a major effect on the model's forecasts. The techniques provided local interpretation, making it easier to understand the model's decision-making process. The VGG19-INC model achieved 98.45% accuracy, outperforming other pre-trained models.

Naz et al. [28] suggested a multi-model CNN fusion method for detecting PD using handwritten data. To increase the dataset's size, the data was augmented using various techniques. Deep CNN architecture has a unique layout like layers count, kernels, normalization, linked layers, etc. Each architecture was trained to extract various salient features and elements of the input data. This model utilized early fusion task to identify effective attribute vectors, which were initially determined by each CNN performance. This technique significantly improved system performance by enabling the model to learn from diverse data representations provided by multiple CNNs for categorization. Zeng et al. [29] proposed a Skeleton-Silhouette Fusion Neural Network (S-SFNN) for predicting MDS-UPDRS scores from gait videos collected with smartphones. This model took posture graphs and silhouette images as inputs, extracting skeleton feature vectors from pose graphs and silhouette feature vectors from Long-Term GEI. These feature vectors were used to predict MDS-UPDRS gait scores. Saliency values were calculated from the neural network to determine which body regions contributed the most to accurate gait scores. Seven additional variables were derived to validate the efficacy of saliency scores.

DISCUSSION

In this section, an evaluative comparison of the previously discussed ML and DL methods for predicting and classifying PD will be provided, highlighting their advantages and limitations in Table 1. The evaluation of existing ML and DL methods detailed in Table 1 aims to highlight their overall accuracy in predicting PD. This part compares the performance of various ML and DL models used for PD prediction, focusing on their accuracy. Fig. 4-7 provide graphical representations of each model's effectiveness in detecting PD based on features such as handwriting, voice, and gait motion. The article [28] provides best result PD detection 99.35% for handwritten samples of PD patients. From the voice, speech and EEG signal analysis de DL model, it is found the article [27] provides higher accuracy around 98.45%. Through MRI analysis it is found the article [18] provides higher accuracy. But, the problem with so heavily on laboratory-based trials carried out in clinics by qualified specialists, which cannot provide such rich and precise data. A number of vision-based approaches to measure PD have been suggested, coinciding with the fast advancement of computer vision. Gait video based PD prediction is vision-based approach. Then article [17] provides higher accuracy around 98.47%. Nevertheless, All Gait based DL models have high complexity. However, most of the PD detection from gait video is required many manual work for preparing input video and images for obtaining high accuracy. An automated approach in [29] provided results 77% without any manual work or experts support. This work can be further improved for an automatic PD detection from gait videos with higher accuracy.

CONCLUSION

A detailed comprehensive analysis on multiple PD prediction and categorization systems based on ML and DL techniques for various dataset was reported in this article. From traditional clinical assessments to advanced computational models leveraging ML and DL techniques, researchers have explored various ways to enhance diagnostic accuracy and prognostic capabilities of PD. This survey helps the researches to identify the drawbacks and problem in PD detection using various data sources. It is concluded from this review that gait based detection is better than other approaches. Finally, concluded that skeleton-silhouette fusion convolution network can be further improved for automatic video analysis for PD detection with higher accuracy.

Table 1. Comparison on different ml and dl models for PD prediction

Ref No.	Techniques	Merits	Demerits	Data Source	Performance Evaluation
Anudeep <i>et al.</i> [9]	PCA	Enhance elderly's therapeutic care and prolong lifespan	It supports only the small sample size.	UCI ML repository	Accuracy = 86.66%
Varrecchia <i>et al.</i> [10]	ANNs	Process large volumes and generalize PD predictions	Time-consuming and risky for losing crucial information	UPDRS III	Specificity = 92.79%
Sahu <i>et al.</i> [11]	RA and ANN	Handling the multiple objectives.	Spatial computation is difficult	UCI ML repository	Accuracy = 93.46%
Trabassi <i>et al.</i> [12]	Supervised ML algorithm	Adjust parameters during training to minimize errors	Data Acquisition and preparation can be costly and time-consuming	Data were collected using an inertial sensor	Accuracy = 91%
Kaur <i>et al.</i> [13]	CNN, ResNet and MSResNet	It enables affordable, data-driven telemedicine for PwMS and PwPD.	High Time consuming for training the data	Gait data from a real-world household environment	Accuracy = (MSResNet) 75%
Govindu and Palwe, [14]	LR, SVM, RFR and k-NN	It makes less prone to overfitting	It is expensive due to large memory needs	PPMI and UCI datasets	Accuracy = 91.83%
Shastry <i>et al.</i>	NNB, k-NN	Less computation	Its classification	Parkinson	Accuracy =

Anitha and Chitra

[15]	and GB	burden.	accuracy was less.	Voice Recorded Datasets	74.92%
Sarin et al. [16]	fuzzy classifier,	Low-cost and informative PD diagnosis methods	It lacks output transparency and interpretation	ParkinsonHW, PaHaW and NewHandPD	Accuracy = 92.91%
Vimalajeewa et al. [17]	Wavelet transform, LR, SVM, and KNN	Adapts to signal and ideal for transient signals.	It can be computationally intensive, especially for large datasets.	Publicly Available VGRF Dataset	Accuracy = 97.43%
Wingate et al. [18]	DNNs	Highly efficient, rapid classification in real-time.	Limited dataset, time windows analysed for solutions.	PPMI database	Accuracy = 99.76%
Sivaranjini & Sujatha, [19]	CNN	Less computation burden.	CNN architecture becomes complex and time-consuming.	PPMI Dataset	Accuracy = 88.9%
Alissa [20]	RNN and CNN	It computes more efficiently than sigmoid function.	This can confuse the classifier differentiating subjects.	Leeds NHS Trust, Imaging datasets	Accuracy = 88.89%
Leung et al. [21]	ensemble learning, LSTM	This model ensures high generazability and avoids over-fitting issues.	Requires long training time and high sensitivity	PPMI database	MAPE = 18.36%, MAE = 4.70%
Yang et al. [22]	PD-ResNet	Filters extraneous data and creates fast response time	Short test duration and limited patient, no gait freezing observed	Fujian Medical University Union Hospital dataset	Accuracy = 95.51%
Ali et al. [23]	MMDD-Ensemble	Lowest complexity, higher anomalous detection accuracy	Recognition rate of class PD is low	Oxford PD detection dataset	Accuracy = 96%
Vyas et al. [24]	2D and 3D CNN	2D training phase take less time as compared to 3D model.	It performed poorly on the test data	PPMI database	Accuracy = (2D CNN) 72.22%, (3D CNN) 88.9%
Naaz et al. [25]	DNN	This model increases interpretability while decreasing data requirements	This model results with overfitting issues	UCI ML Repository	Accuracy = (motor UPDRS) 97%
Khachnaoui et al. [26]	Efficient-Net B0, Mobile-Net V2 and CNN	This strategy could aid clinicians in diagnosing PD.	The amount of parameters in pre-trained models is highly complex	PPMI dataset	Accuracy = 98.47%
Saravanan et al. [27]	VGG19 Net and Google Net	It achieves highest accuracy.	Expensive due to more feature maps	Kaggle dataset	Accuracy = 98.45%

Anitha and Chitra

Naz et al. [28]	CNNs	Fusion showed strong performance and promising recognition accuracy	Training this model using collected data takes time.	HandPD, NewHandPD, Parkinson's Drawing datasets	Accuracy = 99.35%
Zeng et al. [29]	S-SFNN	Data collection is easy with smartphones, requiring minimal clinical training.	It provides lower efficiency on smaller dataset	The data were collected on a clinical dataset with 80 participants.	Accuracy = 71.25%

ABSTRACT

Bhagandara is one of the *Ashtamahagada* that resembles with anal fistula in modern parlance. circumferential spread of a posterior abscess in the deep postanal space can result in horseshoe fistula, which may have multiple lateral secondary openings. *Sambukavarta Bhagandar* described by *shushruta* can be correlated with the horseshoe fistula. As we are aware that management of horseshoe abscess or fistula often requires multiple procedures and is particularly challenging due to its recurrence. *ksharasutra* works as a cutting and draining seton, besides that, it has antimicrobial property and chemically cauterized the unhealthy tissue lining the fistulous tract and thus decreasing the recurrence rate in cases of fistula. This study present a case of 37year old male patient with the complain of pus discharge and pain per Ano during and after defecation, unable to sit properly. patient has history of operated for fistula in 2016. After investigation and examination, Patient was diagnosed as complex, nonspecific, horseshoe collection in Ano with internal opening at 11o'clock position. The condition is not only difficult but also takes a longer period for complete cure hence two staged surgical approach along with *ksharasutra* has been employed. *ksharasutra* was ligated for draining through the cavities. *Ksharasutra* was changed weekly and the fistula healed completely by almost 13 weeks. and normal sphincter tone was achieved.

Keywords: *Bhagandar, Horse shoe fistula, Ksharasutra, Panchvalkal kwath, Spinctor shaving technique*

INTRODUCTION

**Jigna Patel et al.,**

The word *Bhagandara* is composed of two words, *Bhaga* and *Darana*. *Bhaga* the area between anus and the genitalia is defined as *bhaga.Darana* to tear or destroy. Initially it appears like a *Apakva pidaka* (boil), and when it bursts out, it manifests as *Bhagandra*. *Bhagandara* may be considered as a type of a chronic sinus in the perianal area or perineum which discharges pus or blood and left untreated, there may be discharge of feces, flatus, urine and semen [1]. The *Sambukavarta Bhagandara* described by *Shushruta* can be correlated with the horse-shoe type of fistula. In this type of fistula constant pain and swelling occur like *Sambukaavarta* (revolution in conchcell) [2]. *Sambukavarta Bhagandara* mentioned as *Asadhya vyadhi* or challenging condition to manage because of involvement of all three doshas [3]. Acharya *Sushruta* and others advocate *Ksharasutra* therapy in the management of *Bhagandara*. *Ksharasutra*, a medicated Barbour linen thread coated with the latex of *snuhi*, powder of turmeric and *apamarga kshara*.

MODERN REVIEW

The typical horse-shoe abscess or fistula is infralevator in location. Most of these originate in the infected anal gland, at or near the posterior midline on the dentate line. The infection spreads caudally from intersphincteric plane to deep post anal space. Since the deep post anal space communicates with the ischioanal fossae, an abscess may spread circumferentially through this space leading horse-shoe abscess or fistula. The abscess may extend anteriorly from a deep anterior anal space to involve the thigh, labia and scrotum [4].

Although many advance surgical treatment options like fistulotomy, fistulectomy, LIFT, VAAFT, mucosal flap, fibrin glue etc, are available for the management of fistula but all these surgical modalities have failure rate more than 40% and also find complain of incontinence in follow up. So in contemporary science fistula in ano is also difficult to manage [5].

CASE REPORT

Name: XYZ

Age: 37 year

Sex: Male

OPD no: 25,996

Occupation: Job

Address: Surat

Date of first visit: 04/11/2024

Marital status: Married

Diet: Mixed

Bowel frequency: 1 time/day, semisolid stool

Urine frequency: 4-5 times/day

Appetite/Sleep: Normal

Chief Complaints with Duration

-Pain per Ano during and after defecation since 2 year

-Recurrent Boil with pus discharge per Ano since 2-3 year

History of present Illness: A 37-year-old male patient came in OPD of Shalya tantra at Government Akhandanand Ayurveda Hospital with complaint of pain per ano. Recurrent boil formation in perianal region with pus discharge since 2-3 year. Patient had already operated Twice for fistula in ano in 2014 and 2016. After few years he again developed symptoms and Now he came with above Complaints for further Management.

Past History: Patient having history of Tuberculosis and completed course of AKT.

Surgical History: Patient had operated twice for fistula in ano in 2014 and 2016.

Examination: Inspection- 5 o'clock external opening noted at left perianal region pus discharge present.

Per rectal- 11 o'clock fibrous internal opening was felt.

**Jigna Patel et al.,****Investigation: Pre-operative major Profile** (04/11/2024)-within Normal limits.**MRI Fistulogram** (04/11/2024): Horse shoe shaped collection/abscess in the ischioanal and ischioirectal fossa with a small intersphincteric fistulous tract seen arising from the collection with internal opening at 11o'clock position on the right side. Approximately 5cm away from the anal verge and 7cm long track seen.**Diagnosis:** Horse shoe fistula in Ano, *bhagandar***TREATMENT PROTOCOL:****Pre-Operative procedure**

- Informed written Consent was taken.
- Patient was kept on NBM (Nill by mouth) since 6 hours prior to surgery.
- Local Part preparation was done.
- Inj Xylocaine(0.3cc/SC) Test dose was given.
- Inj Tetanus toxoid 0.5ml Intramuscularly given.
- Bowel Cleared by giving Proctolysis before surgery.
- Intravenous RL (Ringer lactate-500ml) infusion started.

Operative procedure

Patient was taken on OT table with all stable vitals and aseptic precautions. Spinal anesthesia was given. Lithotomy position given. Painting and draping has been done around perianal region. Lords four finger dilation achieved. Incision made on 5o'clock prominent part with scalpel. External fibrous tissue excised and scooping done. Then probe was introduced from 5o'clock external opening to downward probe direction 6o'clock internal opening made. then track was ligated with *ksharasutra*. Then probe was introduced from 6 o'clock int opening up to 6o'clock external window made track ligated with *ksharasutra*. then probe was introduced from 6 o'clock External opening to 11o'clock internal opening. partial fistulectomy done and track was ligated with *ksharasutra*. then patency test performed with hydrogen peroxide and betadine solution. We found collection at 7o'clock position and then probe inserted 11o'clock position to 7o'clock external window made for drainage and ligated with *ksharasutra*. then probe was inserted from 7 o'clock up to 6o'clock external window and ligated with *ksharasutra*. hemostasis was achieved. Suppository was inserted. anal dressing done. pt shifted to recovery room after all stable vitals.

Then patient was operated second time after three weeks. Patient was taken on lithotomy position. After achieving appropriate anesthesia Then probing was done from 5 o'clock to 6 o'clock opening and incised with scissor and track was opened. then same procedure done on 6 o'clock to 7o'clock opening, 6o'clock to 11o'clock opening, 11o'clock to 7o'clock opening. 6o'clock external opening to 6o'clock internal opening track was ligated with *ksharasutra*. Anal dressing done. Patient shifted to recovery room after all stable vitals.

Post operative procedure

NBM released after 4 hour of surgery. Post operative analgesic and antibiotic given. Monitor vitals. Prophylactic Antibiotic and analgesic for 5 days given. Regular dressing with *panchavalkal kwath prakshalana* and wound was packed with sterile *pichu* impregnated with *panchavalkala raskriya*, sterile gauze pad place on it and dressing performed. *Ksharasutra* changed weekly. The patient was advised to perform a sitz bath with *panchavalkala kwath* two times In a day. Tab *Triphala guggulu* 2 tablet BD was given throught the treatment. Dindayal churna 4 gm given at night with warm water for cleared bowel.

Jigna Patel et al.,

RESULT AND DISCUSSION

This is a posterior horse-shoe fistula-in- ano having external opening in left perianal region and blind track in right perianal region without external opening, involving both ischio-rectal fossae. In MRI we found horse shoe shaped collection in ischio-rectal fossa with a intersphincteric fistulous track arising from the 11 O'clock internal opening. The case was complex as there is no external opening in right perianal region And no opening at posterior midline. Although MRI is a gold standard investigation in such kind of complex fistula to know the exact extension of tracks. As the case was complex, surgical management was planned in two stages. In this case through ligation of *ksharasutra* in the track and minimal invasive procedure (window technique) we open the potential space of collection so there will be not further collection in post anal space. Benefit of two stage surgery is that, it requires less hospital stay. The patient can be ambulatory after 6 hour of surgery and postoperative wound size will be less. Thus daily routine of the patient will not hamper and post operative pain will also be minimal and less time for healing.

As *Ksharasutra* was placed in the track, it cauterizes the unhealthy granulation tissue and drain the debris from the track, which induces early healing by providing healthy environment for the wound healing. *Ksharasutra* has cutting and draining properties. It also prevents damage to the sphincter and treats the cryptoglandular infection which leads to speedy recovery of the disease. *Panchvalkala* has anti-inflammatory, analgesic, and antimicrobial activities thus, it prevents secondary infection in postsurgical wound After 13 weeks of treatment track was healed completely. normal sphincter tone achieved.

CONCLUSION

On the basis of this case study two staged surgical management of horse shoe fistula with *ksharasutra* result were encouraging. it was managed, without any complications or fecal incontinence at minimal time and cost. No complications nor recurrences were noticed during the follow-up period. Hence, it can be considered that two-staged surgical approach along with *ksharasutra* can be considered as good alternative for management of fistula in ano.

MRI REPORT - FISTULOGRAM**TECHNIQUE:**

STIR Axial, Sagittal & Coronal

T2 Space Axial 3D

OBSERVATIONS:

Evidence of a well defined and heterogeneous T2/STIR hyperintense horseshoe shaped collection/abscess in the ischioanal and ischioanal fossa, small intersphincteric fistulous tract is seen arising from the collection with internal opening at 11 o'clock position on the right side approximately 5 cm away from the anal verge with thickness measuring approximately 2.5 mm. The collection measures approximately 2.1 cm in AP diameter 13.5 cm in transverse diameter and 7 cm in craniocaudal length.

The external opening is seen at 5 o'clock position on the left side.

Rest of the anal canal appears normal.

Rest of the internal and external sphincters appear normal.

The levator ani muscle appears normal on both sides.

Urinary bladder and urethra are normal.

IMPRESSION:

Previous reports available: No

- Horseshoe shaped collection/abscess in the ischioanal and ischioanal fossa with a small intersphincteric fistulous tract seen arising from the collection with internal opening at 11 o'clock position on the right side as described.

For clinical correlation and follow up

ABSTRACT

This paper introduces a novel approach to air pollution assessment by integrating the Trapezoidal Method with the Weighted Aggregated Sum Product Assessment method, enhanced by the CRITIC weight method. The Trapezoidal Method, known for its robustness in handling uncertainty and imprecision in data, is employed to model air pollution levels. The WASPAS method is then utilized to aggregate these models, providing a comprehensive evaluation of pollution scenarios. To ensure the accuracy and reliability of the weight assignments in the aggregation process, the CRITIC weight method is applied, which systematically determines the importance of each criterion based on its inter correlations. This integrated approach offers a more nuanced and accurate assessment of air pollution, addressing both quantitative and qualitative aspects and enhancing decision-making processes in environmental management. The proposed method is demonstrated through a case study, showcasing its effectiveness and potential applications in real-world scenarios.

Keywords: Trapezoidal method, Fuzzy WASPAS, CRITIC weight, air pollution.

INTRODUCTION

Multi-Criteria Decision Making (MCDM) has become an essential instrument for tackling intricate decision-making challenges across diverse domains. In the contemporary, rapid, and interconnected environment, decision-makers encounter several problems, such as conflicting goals, ambiguity, and numerous stakeholders. MCDM offers a systematic methodology for assessing options according to many criteria, facilitating informed and effective decision-making. This article intends to deliver an exhaustive examination of MCDM, encompassing its methodology, applications, and prospective trajectories. Multi-Criteria Decision Making (MCDM) originates from operations research and management science. The initial MCDM techniques, including the Weighted Sum Model (WSM) and the Weighted Product Model (WPM), were established in the 1960s and 1970s (Fishburn, 1967; Keeney & Raiffa, 1976). Multi-Criteria Decision Making (MCDM) has been utilized in supplier selection, inventory management, and logistics optimization. MCDM has been employed to assess environmental consequences, sustainability, and conservation initiatives [1].

Resolving a vague MCDM issue entails two fundamental steps: The initial phase entails evaluating the comprehensive performance of each alternative, taking into account all pertinent factors. We evaluate the options based on their aggregate performances. Fuzzy numbers denote the combined performance of options in the fuzzy MCDM issue, requiring the establishment of a comprehensive ranking mechanism for the collection of fuzzy numbers. This study presents a new comprehensive ranking technique for TrFNs and develops an algorithm to tackle the fuzzy MCDM problem. This study seeks to establish a complete order on the set of trapezoidal fuzzy numbers by employing four specific metrics: midpoint, radius, left fuzziness, and right fuzziness of TrFNs [3]. Multi-criteria decision-making has become an essential instrument for tackling intricate decision-making challenges across many domains. Choosing the best option from a range of alternatives necessitates a thorough assessment of various, frequently opposing, criteria. The WASPAS method, a novel MCDM strategy, has garnered attention for its efficacy in aggregating and prioritizing alternatives. This article seeks to deliver a comprehensive examination of the WASPAS approach, its theoretical underpinnings, and its practical applicability in decision-making contexts. Zavadskas et al. (2012) introduced the WASPAS technique, which integrates the weighted sum model (WSM) and the weighted product model (WPM). Chakraborty et al. (2015) utilized WASPAS to assess suppliers within a supply chain management framework. Zavadskas et al. (2016) presented an interval-valued intuitionistic fuzzy WASPAS technique. Karimi et al. (2017) conducted a comparative analysis of WASPAS against other MCDM approaches (AHP, TOPSIS, VIKOR) in a selection problem.

The weights of the indicators are crucial in a ranking system. They can significantly influence the results of the decision-making process. Assigning precise weights to the indicators is an essential and laborious undertaking. The literature has suggested numerous methodologies for determining the weights of traits. Some are subjective, but others are objective. The subjective approaches necessitate the expertise and insight of a domain specialist. These methodologies frequently exhibit bias and fail to encapsulate the fundamental nature of the data. The objective methods depend on the data's information and employ mathematical procedures to ascertain weights [2].

Basic Definition

In this section, we have discussed some basic definition which are relevant to the study.

Definition 2.1.

A fuzzy set A in X is characterized by a membership function $\mu_A(x)$ that allocates a real integer between 0 and 1 to each element in X . The values of $\mu_A(x)$ represent the "grade of membership" of x in set A . This offers a more thorough depiction of a fuzzy set. A fuzzy set A in X is characterized by a membership function $\mu_A(x)$ that allocates a real number ranging from 0 to 1 to each element in X . This function is employed to construct the fuzzy set. X 's "grade of membership" in set A is represented by the values of the function $\mu_A(x)$. Consequently, this offers a representation of a fuzzy collection that is more thorough.

$$A = \{(x, \mu_A(x))\}. \quad (1)$$

Definition 2.2.

The precise definition of the α -cut of the fuzzy set A within the universe of discourse X would be as follows:

$$A_\alpha = \{x \in \frac{X}{\mu_A(x)} \geq \alpha\}, \text{ where } \alpha \in [0,1]. \quad (2)$$

Definition 2.3.

When the collection of real numbers is employed to delineate a set, the set is referred to as a fuzzy set A. One definition of a fuzzy number is that it is a number R that possesses a membership function $A: R \rightarrow [0,1]$ that possesses the following characteristics:

- (i) A set is considered to be condense if and only if the membership function μ_A fulfills the inequality $\mu_A(\lambda x_1 + (1-\lambda)x_2) \geq \min(\mu_A(x_1), \mu_A(x_2))$. This inequality holds true for any x that falls within the region [0,1], and for any λ that falls within the same interval.
- (ii) A is a normal set, meaning that there exists an $x \in R$ such that the maximum membership degree of A, denoted as $\max \mu_A(x)$, is equal to 1.
- (iii) The defining characteristic of A is its piecewise continuity.

Definition 2.4.

The representation of a TFN A can be written as (m_1, m_2, m_3) , where a_1, a_2 and a_3 are the values that define the number. A definition of the membership function is as follows:

$$\mu_A(x) = \begin{cases} \frac{x-m_1}{m_2-m_1}, & \text{for } m_1 \leq x \leq m_2 \\ \frac{m_3-x}{m_3-m_2}, & \text{for } m_2 \leq x \leq m_3 \\ 0, & \text{elsewhere.} \end{cases} \quad (3)$$

Definition 2.5.

The tuple (m_1, m_2, m_3, m_4) , can be used to represent a trapezoidal fuzzy number A. The parameters that define the number are denoted by the letters m_1, m_2, m_3 , and m_4 . The following is the definition of the membership function of this fuzzy number:

$$\mu_A(x) = \begin{cases} \frac{x-m_1}{m_2-m_1}, & m_1 \leq x \leq m_2 \\ 1, & m_2 \leq x \leq m_3 \\ \frac{m_4-x}{m_4-m_3}, & m_3 \leq x \leq m_4 \\ 0, & \text{otherwise} \end{cases} \quad (4)$$

Definition 2.6.

One can ascertain the value of a TrFN A (m_1, m_2, m_3, m_4) using the formula

$$\text{Val}(A) = \frac{m_1}{6} + \frac{m_2}{3} + \frac{m_3}{3} + \frac{m_4}{6} \quad (5)$$

Identification of Linguistic Variable

To assess the alternatives regarding the criterion, identify and express the pertinent linguistic variable and its corresponding membership value. Decision-makers use a set of relevant linguistic characteristics, the fuzzy ratings of cost and benefit criteria are evaluated using trapezoidal fuzzy numbers, which are expressed as fuzzy numbers. We delineate the values of trapezoidal fuzzy numbers within the interval [0, 1].

These linguistic factors are transformed into the matching trapezoidal fuzzy number, which is presented in table 1, and the outcomes are presented in table 3. Through the utilization of these trapezoidal fuzzy numbers, a normalized decision matrix is brought about through the utilization of the formulas that are presented in equation 5 and displayed in table 4.

METHODOLOGY

CRITIC Method

i) Normalize the decision matrix

$$\bar{X}_{ij} = \frac{X_{ij} - X_j^{-ve}}{X_j^{+ve} - X_j^{-ve}} \quad (6)$$

ii) Calculate the Standard deviation σ_j for each criteria.

iii) Identify the symmetric $n \times n$ with elements r_{jk} , representing the linear correlation co-efficient between the vectors X_j & X_k

iv) Determine the extent of the conflict generated by criterion j in relation to the decision context established by the other criteria $\sum_{k=1}^m 1 - r_{jk}$ (7)

v) Assessing the information's quality about each criterion.

$$c_j = \sigma_j * \sum_{k=1}^m (1 - r_{jk}) \quad (8)$$

vi) Determining the objectives weights

$$W_j = \frac{c_j}{\sum_{k=1}^m c_j} \quad (9)$$

Weighted Aggregated Sum Product Assessment (WASPAS)

i) Set the matrix to its initial state in order to solve the selection problem.

ii) Normalize the decision matrix

$$x_{ij} = \frac{x_{ij}}{\max(x_{ij})} \quad (10)$$

$$x_{ij} = \frac{x_{ij}}{\min(x_{ij})} \quad (11)$$

iii) Utilizing the WSM technique and equation (12), determine the overall relative importance of the variables.

$$Q_i^{(1)} = \sum_{j=1}^n x_{ij} \cdot w_j \quad (12)$$

iv) To determine the overall relative importance using the WPM approach, use equation (13) in your calculation.

$$Q_i^{(2)} = \prod_{j=1}^n x_{ij}^{w_j} \quad (13)$$

v) The WASPAS technique provides a more comprehensive equation for assessing the entire relative significance of alternatives, as presented in equation (9). This is implemented to enhance the precision of ranking and the efficacy of the decision-making process.

$$Q_i = \lambda Q_i^{(1)} + (1 - \lambda) \cdot Q_i^{(2)} \quad (14)$$

Numerical Example

Air pollution remains a pervasive global issue, significantly impacting public health and ecological balance. This study provides an exhaustive investigation into air pollution. The investigation covers a wide range of contaminants, including $PM_{2.5}$, PM_{10} , NO_2 , SO_2 and O_3 , among others. By collecting and analyzing a large amount of data, our objective is to shed light on the current condition of air quality, determine the origins of pollution, and assess the effects of pollution on both human health and the environment. This study seeks to evaluate air quality and determine the most polluted area among the metropolises in India, namely L_1 = Bangalore, L_2 =Chennai, L_3 =Mumbai, L_4 =Delhi, and L_5 =Kolkata. The findings of our study underscore the pervasive presence of elevated pollution levels, highlighting the urgent necessity to address this issue.

In this stage, we utilize the CRITIC measure information to facilitate the calculation of the normalized weights for the criteria. For additional information, the weight assigned to each criterion is determined by employing equation 9, and the results are shown in table 5 in the appropriate order. Table 6 presents the ranking of the cities in India with the highest levels of pollution, based on the calculation of the weighted aggregated total product assessment.

RESULT AND DISCUSSION

This study validates the methodology employing the WASPAS approach. The numerical data can be aggregated using the Trapezoidal method alongside the normalized decision matrix shown in Table 4. The target weight can thereafter be calculated using the Critic method, as seen in Table 5. After that, the normalized decision matrix is utilized in order to determine the highest and lowest possible values simultaneously., as demonstrated in Table 3. The algorithms are utilized on the dataset to evaluate the locations and determine the most polluted state in India. The outcomes of these strategies are presented in Table 6. The WASPAS study presented in Table 6 reveals that Delhi is ranked among the top five states in India.

CONCLUSION

This research employed the combined WASPAS-CRITIC methodology to identify the most polluted state in India. We employ the CRITIC technique to ascertain the weights of the five unique pollutants, facilitating the application of an objective weighting scheme. We identified five specific states in India as viable options. The suggested model employs priority weights obtained from the CRITIC methodology to prioritize different states. The data unequivocally indicates that Delhi was the most polluted region in India. The proposed method has multiple advantages, including lower complexity and the computation of air pollution weights by objective weighting principles.

ABSTRACT

The evolution of high yielding varieties in paddy crop has now made it possible to obtain tremendously higher yields because of greater fertilizer responsive nature of these varieties which when supplied with required doses of fertilizer are able to give a higher economic return to the amount invested. The integrated nutrient management concept has to be applied. through different approaches by the best blending of the trio-models based on their availability and suitability for different crops and soils. Incorporation of organics compost, coir pith, green manure/ green leaf manures fertification enrichment of these organics with bio-inoculants/ chemicals are some of the common approaches followed in this concept for enhancing nutrient use efficiency of chemical fertilizers, higher yields of crops and for sustaining soil fertility. Irrigated rice is grown in about 79 million ha contributing 75% of the world's rice production (Maclean et al 2002). out of fifteen variables studied, seven variables viz., educational status, experience in paddy cultivation, information seeking behaviour, innovativeness, scientific orientation, economic motivation, and attitude towards INM were found to have positive and significant relationship with the knowledge level of farmers on INM technologies.

Keywords: Socio economic Status, Nutrient use efficiency, attitude, Sustainable and Integrated Nutrient Management.

INTRODUCTION

India is predominantly an agricultural country with a population of 121 crores according to 2011 Census. Agriculture is considered as the backbone of India, where around 70.00 per cent of the population is dependent on agriculture and allied activities for their livelihood. Between 2001 and 2007 global rice prices nearly doubled, primarily because of a drawing down of stocks to fill the gap caused by stagnating yields. Global rice stocks have declined from a 135 days' supply to a 70 days' supply over the last seven years. A 44% drop from 147 million tonnes in 2001 to 82 million tonnes in 2008. Fifty-nine million tonnes of additional milled rice will be needed by 2020 above the 2007 consumption of 422 million tonnes (Mohanty 2009). Since there is not much scope to increase the area of rice cultivation due to urbanization and severe water constraints, the additional production has to come from less land, less water and less human labour. Irrigated rice is grown in about 79 million ha contributing 75% of the world's rice production (Maclean et al 2002). Historically, wetland rice cultivation in Asia has been focused on lands that are flooded or prone to flooding during wet/ monsoon season. Long-term experiments have shown that neither organic sources nor mineral fertilizers alone can achieve sustainability in crop production. Continuous use of FYM is effective in stabilizing rice productivity under low to medium cropping intensity where the nutrient demand is relatively small. Nonetheless, integrated use of organic and mineral fertilizers has been found to be more effective in maintaining higher productivity and stability through correction of deficiencies of secondary micronutrients in the course of mineralisation on one hand and favourable physical and soil ecological conditions on the other. Organic manuring also improves the physical and microbial conditions of soil and enhances fertilizer use efficiency when applied in conjunction with mineral fertilizers. Thus, all the major sources of plant nutrients such as soil, mineral, organic and biological should be utilised in an efficient and judicious manner for sustainable crop production in rice-rice cropping system. An innovation becomes successful only when it is accepted and adopted by many people with remunerative profit out of it. Adoption of any innovation varies from individual to individual depending on their characteristics, familiarity with the technologies and availability of resources. Hence, the present study attempts to assess the extent of adoption of INM (Integrated Nutrient Management) among paddy farmers

REVIEW OF LITERATURE

Review of literature is an important step in any research. It helps in knowing the previous work done which are directly and indirectly related to the topic under investigation. Further, an acquaintance with earlier pertinent studies was felt necessary to formulate appropriate research methodology. Relationship the socio economic and psychological characteristics of the respondents and their adoption of integrated nutrient management technologies. Sathasivam (1997) observed a negative and non-significant relationship between age and adoption of bio-fertilizers practices in paddy cultivation. Vimali (2001) stated that age of farm women had positive and non-significant relationship with their adoption behaviour of IPM practices in paddy crop. Jeyalakshmi (2008) found a negative and non-significant relationship between farming experience and adoption of sustainable technologies in paddy cultivation. Sathasivam (1997) found a positive and highly significant relationship between education and adoption of bio-fertilizer practices in paddy cultivation. Sunitha Varghese (1998) reported that educational status had negative and non-significant relationship with adoption of eco-friendly technologies among paddy growing respondents. Renjini (2001) found a positive and significant relationship between educational status and adoption level of weed management practices in paddy farmers.

**Rajaguru et al.,**

METHODOLOGY

A sample size of 120 was fixed for the study considering the limitations of time and other resources. From the list of farmers in each village, farmers cultivating paddy were identified. A total number of 120 sample were identified from the four villages by using proportionate random sampling. The details of number of respondents selected from each of the selected villages are given in Table 1. (n=120). Considering the objectives and the variables under study, a comprehensive, structured interview schedule covering all aspects was prepared in English. The most relevant, unambiguous and practical questions were included in the schedule.

The schedule was designed under four parts.

Part-I contained general facts and other information,

Part-II contained questions regarding knowledge of the respondents,

Part-III contained questions regarding adoption of the respondents and

Part-IV contained questions regarding constraints in adoption of INM technologies experienced by the respondents.

Statistical Tools Used

The data collected were analysed using

1.Zero order correlation and

2.Multiple regression analysis

FINDINGS AND DISCUSSION

This chapter presents the findings of the present study as per the methodology prescribed in the preceding chapter. The findings, interpretation of the findings and discussion are presented under the following sub-heads in the light of the objectives. *Relationship the socio economic and psychological characteristics of the respondents and their adoption of integrated nutrient management technologies. Correlation and regression were computed to know the relationship between the socio-economic and psychological characteristics of the respondents and their knowledge on integrated nutrient management technology. Correlation of socio-economic characteristics of the respondents with their knowledge and psychological on Integrated Nutrient Management technologies. The zero order correlation coefficient was worked out to study the relationship of socio-economic and psychological characteristics of the respondents with their knowledge level on integrated nutrient management technologies and the results are presented in Table 1. It could be seen from the Table 1, that out of fifteen variables studied, seven variables viz., educational status, experience in paddy cultivation, information seeking behaviour, innovativeness, scientific orientation, economic motivation, and attitude towards INM were found to have positive and significant relationship with the knowledge level of farmers on INM technologies. All the other variables were found to be non-significant.

Among the significant variables, educational status, information seeking behaviour, innovativeness, economic motivation and attitude towards INM was found to be significant at five per cent level of probability, while the remaining variables were significant at one per cent level of probability. Educational status had shown positive and significant relationship with knowledge level. Majority of the respondents were old aged and functionally literate which enabled them to read newspapers and leaflets. Hence, it is quite natural for the educated persons to be more enthusiastic in gathering information to acquire high level of knowledge. This finding is in line with the findings of Tatireddy (2003) It could be seen that experience in paddy cultivation had positive and significant relationship with knowledge level. As farmers tend to gain more experience in farming, the urge on obtaining new information and

**Rajaguru et al.,**

technical guidance got increased. Due to the confirmed practical experience on selected technologies over a period of time had made farmers to get more knowledge and self-confidence. This finding is in line with the findings of Janaki Rani (2004). There was positive influence of information seeking behaviour with the knowledge level of respondents. In order to gain knowledge, one has to expose himself to different experience provided by information providing behaviour sources. Hence, the variable information seeking behaviour would have shown positive and significant association at 0.05 per cent level of probability. This finding is in line with the findings of Santha Govind (2003). Innovativeness had shown positive and significant relationship at 0.05 per cent level of probability with the knowledge level. Majority of the respondents were old aged, functionally literate and had medium level innovativeness of might information have seeking behaviour. Hence, shown positive and significant relationship with the knowledge level of respondents on INM technologies. Scientific orientation was found to have positive and highly significant relationship with the knowledge level. The respondents with higher scientific orientation might be curious to learn the various nutrient management practices resulting with high knowledge level. This finding is in line with the findings of Suhirdha (2009). Economic motivation was found to have positive and highly significant relationship with the knowledge level. The respondents with higher economic motivation might be interested to learn about various nutrient management practices thus resulting with higher knowledge level. Better disposition over the psychological object is a must for gaining knowledge. Without clear perception and development of favourable attitude, it is difficult to gain knowledge about any technology. This might be the reason for the positive and highly significant association of attitude towards INM with the knowledge level of the respondents. This study was supported by the findings of Shiraj (2001).

CONCLUSION

Out of the fifteen independent variables studied only seven variables viz., educational status, experience in paddy cultivation, information seeking behaviour, innovativeness, scientific orientation, economic motivation and attitude towards INM were found to have positive and significant relationship with knowledge level of the respondents on nutrient management technologies. The results on multiple regression analysis indicated that all the independent variables together explained 57.12 per cent of variation in the extent of knowledge. Only seven variables namely educational status, experience in paddy cultivation, information seeking behaviour, innovativeness, scientific orientation, economic motivation and attitude towards INM were found to have positive and significant contribution towards the knowledge level of the respondents on nutrient management technologies.

ABSTRACT

Physical or psychological suffering makes life a never ending tragedy. Physical Disability stops human beings from being highly productive in their life which affects their mental health. Their physical performance and the day to day activities get disturbed which causes emotional distress and anxiety. One needs to have emotional, social, and mental wellness to work productively. A serious physical illness distracts a person from his work and family. Social support is necessary to care for cancer patient's psychological issues. Depression in cancer patients has the link to decrease medical observance, reduce quality of life and poor survival outcomes, representing that psychosocial well-being is associated with survival benefits. This paper aims to analyse the agony of a cancer patient in Rohinton Mistry's *Such a Long Journey*.

Keywords: Physical Disability, Psychological suffering, Emotional distress, Social support.

INTRODUCTION

Costa NR, Gil da Costa RM, Medeiros R. say, "Gastrointestinal cancer is a term for the group of cancers that affect the digestive system, which includes oesophageal cancer, stomach cancer, colorectal cancer, pancreatic cancer, liver cancer, etc" (188–200). Gastrointestinal patients suffer from anxiety, depression and psychological distress to survive in the last phase of their life. Rohinton Mistry's character Dinshawji to overcome his distress with psychological support of his friend Gustard. Dinshawji wife Alama is living separately and not taking care of him. Zebrack BJ says, "cancer is not just a single event with a certain end but a permanent condition characterized by ongoing ambiguity,

**Shahin Banu**

potentially delayed or late effects of the disease or its treatment and concurrent psychological issues" (238). Mistry introduces a character Dinshawji, through whom he brings out the pure form of friendship and social support. Alsubaie MM, Stain HJ, Webster LAD, Wadman R. believe, "Strong social support can buffer against the negative effects of psychological distress on their quality of life" (484–496). It is said the company one keeps says a lot about one's own character. Gustad has a higher degree of self-discipline which restrains him from getting influenced by the ways of Dinshawji. Verma R, Balhara YP, Gupta CS. Gender say, "Hormonal variations can influence stress responses and coping mechanisms when facing challenging situations"(4–10). Dinshawji's insensitivity and his attitude get changed by the continuous attempts of Gustad. Mistry's characters try to tolerate all such torments of life. Saratha Lakshmi G. says, "a legend of human will power piercing through the hurdles to come out of life"(3473). Though Dinshawji is affected by abdomen cancer, he works diligently. But Gustad feels guilty of seeking help from his friend Dinshawji in depositing money for Bilimoria but he has no other way. He notices Dinshawji's swelling in the abdomen while handing over the money for deposit. He has been suspecting his health condition since Roshan's birthday party. Dinshawji's cancer tumours get enlarged and he is admitted in the hospital for treatment. He visits him often and informs about bank dealings. Gustad helps his friend for his treatment.

Life Partner is the most important source of support for cancer patients. The patient welcomes depending on their partner and putting their trust in them to 'make sure we do all the right things'. This appeared to provide a sense of security, stating 'the encouragement helps'. Meyler D, Stimpson JP, Peek MK believe, "Intimate partner relationships are of particular interest as partners have profound influence on one another, and health behaviour is often concordant across couples"(2297). Dinshawji's wife Alama does not come to take care of him as they live separately. Vadivu N. says 'inextricably bonded'(1303-5150) is important for characters. Gustad remembers Dinshawji's comment on Alamai, "No need to take me to the Tower of Silence when I die. My domestic vulture will pick my bones clean ahead of time" (SLJ 239). Gustad wonders the sense of humour in his friend even in such a critical situation. Religion plays a significant role in generating an ethical outline to shape the human mind. A person's character is based on the values of his religion. All the religions help in constructing human values like humanity, empathy, respect, and harmony. Mistry describes that religion has a great power to bring opportunities for unity in society. Dinshawji's illness disappoints Gustad and he thinks, "If Dinshawji stop coming to work, it would interrupt the deposit" (SLJ 186). Dinshawji deposits a vast sum of money in a bank, risking his own job to help Gustad. His bank manager is Madon, a finicky kind hearted brusque snuff sniffing man. Gustad asks his boss for half a day off on Friday to see the doctor. In his mind, the first plan was to say that his daughter is ill, but he abandoned it because of the fear of the Almighty. He gives his own hip problem as a reason to visit a doctor. He worries that this lie will anger the Almighty and his family may face trouble. Saratha Lakshmi G. believes, "the hardship is a herculean task" (1303). On another occasion Gustad seeks help from Malcolm who is now employed in Municipality and explains to him about Dinshawji's tumour troubles, Malcolm, a Christian narrates the wonders of Mount Mary. Gustad, though an orthodox Parsi, goes to church with Malcolm to pray for his friends Dinshawji, Roshan and Sohrab with candles. He prays for others but he does not pray for his own hip problem. He hopes that at least his prayer will save his friend's life.

Hoping for a miracle Gustad imitates catholic rituals for his friend but no miracle occurs. He wonders if the sea of candle light at Mount Mary's does not make an improvement of Dinshawji's health condition, but after his death, the ancient rituals of Parsis and single oil lamps make his friend Dinshawji. Dilnavaz asks Gustad to let his tears flow but he holds them back. They explain about Dinshawji's death to Roshan. Her talk makes them upset because she says that she too will die of diarrhoea. The importance of respecting other religions is shown through Gustad. This attitude of Gustad reinforces his own tolerance and acceptance of other religious practices. Gustad is taught by his parents that though all religions are equal, "one had to remain true to one's aim because religions were not like garment styles that could be changed at him or to follow fashion" (SLJ 24). Gustad's heart is heavy for his friend Dinshawji who has died in the hospital. Marriage is a responsible bondage between a man and a woman and both have indispensable responsibility to take care of each other in worst situations. Misunderstanding leads to family devastation. Gustad attends Dinshawji's funeral where he meets Alamai. He feels guilty about his friend's death, as

**Shahin Banu**

he left him alone in the hospital. He helps Alamai to finish Dinshawji's rituals. The dead body is carried to the well of vultures, by "nassasalers" (dead body carriers) (SLJ 252). Finally Alamai weeps silently with sincere tears:

But he was surprised (and ashamed of his uncharitable thoughts) to see her standing with dignity, her hands clasped tightly together. She was gazing quietly after Dinshawji, and when Gustad looked again he realized that she was indeed weeping. At last, she was weeping silent tears. Rising, perhaps, from a deep well of memories. Memories of? Joys, sorrows, pleasures, regrets? Yes all these must have filled Dinshawji's and Alamai's private lives. And never a clue, never a word except that line about his dear domestic vulture. But hidden behind it, who knew what love, what life? (SLJ 253) Gustad wonders about the love and life of this strange couple. Through the life of Dinshawji and Alamai, Mistry reveals the challenges of marital life. The religious beliefs and values of Parsis are depicted in this novel. The Tower of silence is a sacred place in which dead bodies are laid out and reduced to bones by vultures. Few days later, the bearers of the corpse collect the bones of a dead body and throw it in the well. Mistry shows the detestation of Hindu religion on the Parsi religious practices. Hindu religion demands that the unhygienic practice be outlawed and replaced by cremation. Gustad and Dinshawji are Parsis so they feel bad about Hindu's opposition which is an obstacle for their religious practices. Vadivu N. believes, "Culture is an adaptive process" (3479).

Mistry describes that the Parsis want to maintain their ethnic identity in the multicultural country India. People complain that the vultures are dropping human flesh on their balconies, and they protest against Parsi people's traditional mode of leaving the dead bodies in the "Tower of Silence" (SLJ 316). "Your Vultures!" the tenants complained. 'Control your vultures! Throwing rubbish on our balconies!' (SLJ 316). But Parsis argue to hold their tradition and they are not ready to change their values and deny cremating the dead bodies. Mistry shows that the traditions of Parsis are not understood by the other religions.

CONCLUSION

Dinshawji's cancer troubles him immense physical pain, discomfort, and weakness. He undergoes surgery, but the cancer has spread, making his condition terminal. Without life Partner's support he suffers a lot in bed ridden condition. Dinshawji's illness takes a clang on his mental health. He becomes withdrawn, anxious, and depressed, struggling to come to terms with his mortality. His relationships with friends and family are affected, causing emotional distress for those around him. As a Parsi, Dinshawji's faith is an integral part of his identity. His illness leads to a spiritual crisis, as he questions the purpose of life, the existence of God, and the meaning of suffering. Dinshawji's illness affects his relationships with Gustad and other friends. Gustad, in particular, is deeply concerned about Dinshawji's health and feels helpless in the face of his friend's suffering. Dinshawji's abdominal cancer can be seen as a symbol for the decay and corruption that pervades the society depicted in the novel. His illness serves as a reminder of the fragility of life and the impermanence of human connections. Dinshawji's struggles with abdominal cancer serve as a poignant reminder of the human cost of suffering and the importance of empathy, compassion, and connection in the face of adversity.

ABSTRACT

This paper examines the intersection of Artificial Intelligence (AI) and creative industries, focusing on its implications for art, music, and writing. AI technologies such as machine learning, neural networks, and natural language processing have made significant advancements, allowing machines to generate creative works. This paper explores the opportunities and challenges presented by AI in these fields, considering the implications for artists, musicians, writers, and the broader creative economy. It also discusses the ethical concerns, the role of AI in creative processes, and future trends in AI's interaction with human creativity.

Keywords: Artificial Intelligence (AI), Creative Industries, Generative Art, AI in Art, Machine Learning in Art, AI-Generated Music, AI in Writing

INTRODUCTION

Overview of AI in Creative Industries: Introduction to the role of AI technologies in the creative industries, including art, music, and writing. Define key terms like machine learning, neural networks, and deep learning. Significance of AI: Explanation of why AI's impact on these industries is worth studying, given the rapid advancement of AI tools and their growing influence on creative processes.

**Patil and Lokare****AI in Art**

Generative Art: Exploration of how AI is used to create digital art through algorithms such as GANs (Generative Adversarial Networks). Examples of AI-generated visual art, including works by artists like Refik Anadol or programs like DALL-E.

Collaboration between Humans and Machines: How artists are using AI as a tool for creative expression, including collaborations with AI systems.

Implications for Traditional Art: Discussion on how AI might challenge traditional definitions of authorship, originality, and creativity in the art world. Ethical Considerations: Address concerns about authorship, copyright, and the potential devaluation of human artists' work due to AI's role.

AI in Art Restoration and Enhancement

AI is also used to restore and enhance historical artwork by filling in missing parts or improving the quality of degraded paintings and images. AI algorithms can analyze an artwork, identify areas that need restoration, and generate the missing portions in a way that seamlessly blends with the original piece.'

How it Works: By using image recognition and predictive algorithms, AI can infer the colors, textures, and styles of missing sections of an artwork based on its trained data. The AI can also sharpen blurry or pixilated images to improve their clarity.

Example: AI has been employed to restore ancient frescoes, paintings, and photographs that have suffered from damage or degradation over time. For example, the Restoration of the Sistine Chapel ceiling involved AI-assisted techniques to enhance the clarity and colors of Michelangelo's frescoes.

AI in Music

AI Composition Tools: Overview of AI systems that compose music, such as Open AI's Muse Net or Juke deck, and how they use neural networks to generate melodies, harmonies, and lyrics.

Collaborative Music Creation: How musicians are integrating AI into their production processes to assist with composition, arrangement, and mixing.

AI in Music Performance: The use of AI in live performances (e.g., AI-generated improvisation or robotic musicians).

Implications for the Music Industry: Discussion of how AI is impacting the role of musicians, producers, and music labels. Does AI democratize music creation, or does it threaten livelihoods within the industry?

Ethical and Legal Issues: Concerns about ownership of AI-generated music, copyright implications, and AI's role in replacing human artists.

AI in Music Production

AI is playing a significant role in streamlining music production, improving sound quality, and assisting in tasks like mixing, mastering, and audio engineering.

How it Works: AI tools can automate many aspects of the production process. For example, AI algorithms analyze the raw tracks and suggest the best mix, automatically adjusting levels, effects, and EQ settings. AI can also detect imperfections in recordings and provide suggestions for improving them, making it easier for producers to optimize their work.

Example: Landr is an AI-powered platform that automatically masters tracks by analyzing them and applying various mastering techniques. The system adjusts the EQ, dynamic range, and stereo image to produce a polished final track. Similarly, isotope's Ozone uses AI for intelligent mastering, helping musicians achieve professional-quality sound in less time.

**Patil and Lokare**

AI-Generated Music Instruments: AI can even be used to simulate or enhance virtual instruments, allowing producers to create complex arrangements without needing physical instruments. Software like Endless allows real-time, collaborative music creation, where AI-generated sounds can blend seamlessly with human input.

AI in Writing

AI in Content Creation: Examination of AI-generated text, such as GPT-based models, and their application in journalism, literature, and marketing. Discuss the role of AI in generating articles, books, and even poetry. **AI in Assisted Writing:** How writers are using AI tools like Grammarly or Hemingway to improve their writing, streamline content, or assist with brainstorming ideas.

Creative Writing and Narrative Generation: The potential for AI to assist with storytelling, plot development, and character creation. Can AI become a "co-author" in fiction?

Implications for the Writing Profession: Will AI disrupt the writing industry? How will it impact human writers' roles and the way content is consumed?

Ethical and Creative Concerns: Questions surrounding originality, authorship, and the ability of AI to truly understand human emotions and narratives. Can AI-written work evoke the same emotional depth as that of human authors?

AI for Creative Writing and Storytelling

AI is also being explored for more creative forms of writing, such as fiction, poetry, and screenplays. While AI-generated writing may not yet match the complexity and emotional depth of human authors, it can still assist in sparking ideas, generating plots, or even writing entire short stories or poems.

How it Works: AI tools use pre-trained models that understand patterns in narrative structure, dialogue, character development, and style. They can be prompted with themes, settings, or character traits, and they will generate plots or scenes that fit within those constraints.

Example: AI Dungeon, a popular text-based game, uses GPT-3 to generate interactive stories that respond dynamically to user input. Users can embark on adventures where the AI tailors the narrative based on their choices, making it a personalized storytelling experience.

Poetry and Lyrics: AI can also generate poetry or song lyrics based on specific styles, themes, or moods. Tools like Deep Poetry and Lyric Studio allow users to input a few keywords or lines, and the AI generates poetic verses or lyrics in a similar style to existing poets or songwriters.

Opportunities and Challenges of AI in Creative Industries**Opportunities**

Increased Accessibility: AI tools democratize the creation of art, music, and writing by lowering barriers to entry, enabling people without traditional training to create and express themselves.

Innovation and Novelty: AI brings new possibilities for innovation in style, sound, and storytelling that were previously inaccessible to human creators alone.

Enhanced Productivity: AI can significantly speed up creative processes, from generating content ideas to refining drafts, allowing creators to focus on higher-level artistic decisions.

Challenges

Job Displacement: Fear of AI replacing human jobs in the creative industries. How will artists, musicians, and writers adapt to the growing role of AI in their fields?

Loss of Human Touch: Concerns that AI-generated content may lack the emotional depth, intuition, and personal touch that human creators bring to their work.

Bias and Ethical Concerns: AI models can reflect the biases inherent in their training data. How does this affect the fairness and diversity of creative works produced by AI?

**Patil and Lokare**

Impact on Copyright and Intellectual Property: The legal implications of AI-generated art, music, and writing in terms of ownership, attribution, and distribution.

The Future of AI and Creativity

Evolving Roles of AI and Human Creators: Predictions about how AI will continue to shape the future of creative industries, from increased collaboration between humans and AI to new forms of creative expression. **Cultural Shifts:** Discussion on how society's understanding of creativity may change with the rise of AI. What does it mean to be "creative" in an AI-enhanced world?

Technological Advancements: Speculation about the next phase of AI development in creative fields, such as deeper integration of AI in the creative process and more advanced models for music and art generation.

Policy and Regulation: Potential guidelines or frameworks for regulating AI's role in creative industries to ensure fair use, ethical behavior, and protection of human creators' rights.

RESULT AND ANALYSIS

Art: AI has enabled the creation of novel visual works through algorithms and generative models like GANs. Artists use AI tools to either generate entirely new pieces or collaborate with AI to explore unique visual styles. Notable examples include AI-generated artworks selling at auction and exhibitions in art galleries.

Music: AI's role in music production has expanded, with AI systems capable of generating original compositions, mastering audio, and aiding in song arrangement. Musicians use AI as a collaborator to create melodies, harmonies, and rhythms that expand their creative possibilities. **Writing:** AI tools like GPT-3 and Sudo write are widely used for content generation, drafting, and improving text. These systems can create everything from news articles to creative fiction. Writers have adopted AI for overcoming writer's block, enhancing productivity, and refining drafts.

CONCLUSION

The impact of AI on the creative industries—art, music, and writing—has proven to be both transformative and disruptive. While AI is enhancing creativity and offering new tools for expression, it also raises important questions about authorship, ownership, and the future of work in these industries. AI's role is predominantly viewed as one of collaboration rather than replacement, providing artists, musicians, and writers with new ways to innovate, create, and refine their work. However, the ethical, legal, and economic implications of AI's involvement in creativity need to be addressed. Intellectual property laws must evolve to account for AI's role in generating creative works, and steps must be taken to mitigate biases in AI systems. Ultimately, AI will continue to shape the future of creative industries, but it will be crucial for stakeholders to navigate these complexities thoughtfully to ensure a balanced and inclusive future for both human creators and AI tools.

ABSTRACT

Ayurveda is also called the “science of longevity” because it offers a complete system to live a long healthy life. In India, Ayurveda is considered a form of medical care, equal to conventional Western medicine, traditional Chinese medicine, naturopathic medicine, and homeopathic medicine. *Bryophyllum pinnatum* is one such medicinal plant that is used worldwide to treat many health issues. The present review is an attempt to highlight the various aspects of *B. pinnatum* and to discuss them. The objective of this study to find growth parameters of *Bryophyllum pinnatum* in three difference types of water and soil, antimicrobial activity, phytochemicals and culture growth media uphold. The growth of this species was good at black soil and pond water. The zone of inhibition ranges from 0.5nm to 0.7nm against *E. coli* and the presence of phytochemicals were also observed. Growth of both bacteria and fungi was supported by the media which was prepared by using the *Bryophyllum pinnatum* paste.

Prasanthi et al.,

Keywords: *Bryophyllum pinnatum*, antimicrobial activity and phytochemicals and culture media.

INTRODUCTION

Kalanchoe pinnata, commonly known as cathedral bells, air plant, life plant, miracle leaf, Goethe plant, and love bush, is a succulent plant native to Madagascar. It is a popular houseplant and has become naturalized in tropical and subtropical areas. The leaves of this species are thick, fleshy, elliptical in shape, curved, with a crenate or serrated margin, often reddish. Simple at the base of the stem, the leaves are imparipinnate at the top, 10–30 cm (4–12 in) long, with three to five pairs of fleshy limb lobes. The leaves are remarkable for their ability to produce bulbils. At their margin, between the teeth, adventitious buds appear, which produce roots, stems and leaves. When the plantlets fall to the ground, they root and can become larger plants. *Bryophyllum pinnatum* is widely used in ayurvedic system of medicine as astringent, analgesic, carminative and also useful in diarrhea and vomiting. *Bryophyllum pinnatum*: Bryo means to sprout and phyllon is leaf that is ability to propagate via leaf cutting *pinnatum* is from Latin feathered wing.[3] It is naturalized throughout the hot and moist parts of India. The leaves of *B. pinnatum* have a variety of uses in the traditional system of medicine in India. They are eaten for diabetes, diuresis, dissolving kidney stones, respiratory tract infections, as well as applied to wounds, boils, and insect bites. It is useful for preventing alcoholic, viral and toxic liver damages. The aqueous extract of this plant has shown anti-inflammatory, anti-diabetic, anti-tumor and cutaneous leishmanicidal activities. In contrast, this attribute makes the skin the body region most exposed to damage, which could provoke serious injuries, such as ulcers and deep cuts. This damage can also be defined as skin wounds, which can be generated by physical, biological, and chemical factors [4]. The various secondary metabolites identified from *B. pinnatum* include steroids, flavonoids, terpenoids, fatty acid, gualanolides, protein and peptides, vitamins, polysaccharide, and others. The main compound reported in the literature for *B. pinnatum* is quercetin 3-O- α -L-arabinopyranosyl-(1 $\rightarrow$ 2)-O- α -L rhamnopyranoside. It can be applied as an analytical marker in the quality control of raw material and products derived from *B. pinnatum* leaf extract [1]. The pharmacological studies so far have mostly been performed in vitro and in vivo with animals. In future study, the isolated principles and *B. pinnatum* needs to be evaluated in scientific manner using specific animal models and clinical studies are urgently needed in order to confirm traditional wisdom in the light of a rational phytotherapy on the toxicity of plant. The leaves and bark are bitter tonic, astringent to the bowels, analgesic, carminative, useful in diarrhea and vomiting [2]

MATERIALS AND METHODS

Sample Collection

The plant saplings are collected from the home garden aseptically and brought to Microbiology laboratory, St. Ann's college for women, Malkhapuram, Visakhapatnam, Andhra Pradesh, India

Taxonomical Classification

Kingdom-Plantae.
Divison- spermatophyte
Class-Magnoliopsida
Order-Rosales
Family-Crassulaceae
Genus-Bryophyllum
Species-pinnatum.

Growth Analysis

The collected saplings are potted in 3 different soils such as black soil, red soil and sand. Some of the saplings were also kept in mineral water, municipality water and pond water [Figure 1].

**Prasanthi et al.,****Culture media preparation using Bryophyllum Extract**

Culture media was prepared by adding 3gms of Bryophyllum extract and 4 spatula of agar powder for solidification purpose in 100ml of water to know their support for the growth of bacteria and fungi. [Figure:2a and 2b]

Extract preparation for Phytochemical Analysis

We have taken 3 solvents like ethanol, methanol and chloroform for extraction. 20ml of each solvent were taken in 50ml conical flasks separately and added 9.37gms of Bryophyllum powder in each conical flask and kept for 3 days under optimum conditions.

Phytochemical analysis**Test for Flavonoids**

The stock solution (1ml) of ethanol extract of *Bryophyllum* was taken in a test tube and added a few drops of dilute 2% NaOH solution. An intense yellow color appeared in the test tube. It became colorless in addition to a few drops of dil. Acid.

Test for Alkaloids

One gram of ethanol extract of *Bryophyllum* was taken in a test tube and added a few drops of Hager's reagent. A yellow precipitate is formed.

Test for Terpenoids

The dry crude *Bryophyllum* extract was dissolved in chloroform (2ml) and then acetic anhydride (1ml) was added to it. Concentrated sulphuric acid (1ml) was added to the solution.

Test for Tannins

One gram of ethanol extract of *Bryophyllum* was taken in a test tube and added a few drops of lead acetate solution. A white precipitate is formed.

Antimicrobial Activity**Bacterial Strains**

The antimicrobial potency of each extract was evaluated using three bacterial strains. One strain of Gram-positive *Staphylococcus aureus* and two strains of Gram-negative *Escherichia coli* and *Klebsiella pneumoniae*.

Inoculum Preparation

Each bacterial strain was sub-cultured overnight at 35 degrees Celsius in Mueller- Hilton agar slants. The microbial growth was harvested using 5 ml of sterile broth kept overnight in an orbital shaker at 37 degrees Celsius for 24 hours. Bacterial lawn plates were prepared by inoculating fresh broth by using spread plate technique on solidified Mueller-Hilton.

Antibacterial Activity

The well diffusion method is used to evaluate antibacterial activity of each *Bryophyllum* extract. The extract residues were then loaded in the well on the lawn of bacterial culture plates. The plates were kept in an incubator at 37 degrees Celsius for 24 hours. The presence of inhibition zones was measured by using Hi - media zone scale, recorded and considered as indication for antibacterial activity.

RESULTS

The growth of *Bryophyllum* was good in black soil and pond water. The *Bryophyllum* extracts has supported the growth of both bacteria and fungi. The phytochemicals like flavonoids, alkaloids, terpenoids and tannins are present

Prasanthi et al.,

in this samples [Table 1]. The maximum zone of inhibition ranges from 0.6nm to 0.65 reported against *Escherichia coli*. [Figure 3]

DISCUSSION AND CONCLUSION

Topical treatment with a gel formulation containing *B. pinnatum* aqueous leaf extract at 5% accelerated the healing process of skin wounds. Therefore, our results reinforce the growth activity, cultural media, antimicrobial potential activity and phytochemical analysis of this plant to be applied as a novel active pharmaceutical ingredient. Phytochemical compounds are secondary metabolite groups in living organisms that have a certain function for humans [3] However, it is necessary to conduct and molecular studies to evaluate their efficacy in treatment.

Authors' Contributions

This work was carried out in collaboration among all authors.

ABSTRACT

This study presents a novel hypothesis that explores the potential of combining three distinct plant species, Erwa, Balsam, and Duranta, to synergistically remove heavy metals, namely Copper (Cu), Lead (Pb), and Zinc (Zn), from contaminated soil and water environments. Each plant species possesses unique biochemical and physiological attributes for selective metal uptake, with Erwa excelling at copper uptake, Balsam targeting lead contamination, and Duranta specializing in zinc uptake. The study investigates how their collective presence can create a more efficient metal removal mechanism compared to individual plant species. Additionally, it explores the rhizospheric interactions among these plants, which may enhance microbial activity and metal solubilization. The collaborative defense mechanisms exhibited by these species may enhance plant growth and vitality while promoting both phytoextraction and phytostabilization of heavy metals. If successful, this multispecies approach could revolutionize phytoremediation strategies, offering a more efficient, cost-effective, and ecologically friendly solution to heavy metal pollution.

Keywords: Phytoremediation, heavy metals, Erwa, Balsam, Duranta, synergistic metaluptake, rhizospheric interaction, microbial enhancement, metal tolerance, phytoextraction, phytostabilization

INTRODUCTION

Phytoremediation

Phytoremediation is a sustainable and environmentally-friendly approach to remediate contaminated soil, water, and air using plants (Erakhrumen and Agbontalor, 2007; Ahmadpour *et al.*, 2012; Dhanwal *et al.*, 2017; Hauptvogel *et al.*, 2019; Shmaefsky, 2020; Kafle *et al.*, 2022; Aghiliand Golzary, 2023). It harnesses the natural abilities of plants to absorb, accumulate, and transform pollutants, thereby reducing environmental pollution and minimizing the impact on human health. This innovative technology has gained significant attention due to its cost-effectiveness and potential for restoring contaminated sites (Tan *et al.*, 2023; Yadav *et al.*, 2023).

**Poorni and Jeyanthi Rebecca****Principles of Phytoremediation**

Plant Uptake: Phytoremediation relies on the ability of plants to absorb contaminants from the surrounding environment through their root systems. Plants take up contaminants either directly from the soil or dissolved in water. Once inside the plant, contaminants can be stored in roots, stems, leaves, or even transformed or degraded through various metabolic processes (Karthikeyanand Kulakow, 2003; Sinha *et al.*, 2007; Vangronsveld *et al.*, 2009; Paz-Alberto and Sigua, 2013; Abdel-Shafy and Mansour, 2018; Jeevanantham *et al.*, 2019; Oladoye *et al.*, 2022; Zhang *et al.*, 2023).

Phyto extraction: This method involves the use of hyperaccumulating plants, which have an exceptional capacity to accumulate high levels of contaminants in their tissues. These plants take up pollutants from the soil through their roots and store them in above-ground tissues. Once the plants have reached maturity, they can be harvested and removed, effectively removing the contaminants from the environment (Lasat, 2002; McGrath and Zhao, 2003; Nowack *et al.*, 2006; Bhargava *et al.*, 2012; Seth *et al.*, 2012; Sessitsch *et al.*, 2013; Hunt *et al.*, 2014; Suman *et al.*, 2018; Corzo Remigio *et al.*, 2020; Gulet *et al.*, 2021; Venegas-Rioseco *et al.*, 2021; Yu *et al.*, 2022; Zhang *et al.*, 2023).

Rhizosphere Effects: The rhizosphere, the region around plant roots, plays a crucial role in phytoremediation. Microorganisms present in the rhizosphere can interact with plants to enhance the breakdown of contaminants through processes such as rhizodegradation and rhizofiltration. Plant roots release organic compounds into the soil, creating a favorable environment for microbial activity (Dobbela *et al.*, 2003; Phillips and Fahey, 2006; Alford *et al.*, 2010; Finzi *et al.*, 2015; Huo *et al.*, 2017; Ling *et al.*, 2022; Sun *et al.*, 2023).

Phytostabilization: Some plants have the ability to immobilize contaminants in the soil, reducing their mobility and bioavailability. This method is particularly effective for stabilizing metals and metalloids in the soil. Plants create a physical barrier by accumulating contaminants in their root zones or by promoting the formation of less soluble compounds (Mendez and Maier, 2008; Alkorta *et al.*, 2010; Bolan *et al.*, 2011; Radziemska *et al.*, 2017; Barbosa and Fernando, 2018; Shakkira and Puthur, 2019; Zine *et al.*, 2020; Ke *et al.*, 2021; Vishnu Pradeep *et al.*, 2022; Radziemska *et al.*, 2023).

Phytodegradation: In this approach, plants directly metabolize or break down contaminants within their tissues. Enzymes produced by plants can transform organic pollutants into less toxic or more easily degradable compounds. Phytodegradation is often observed in plants that have adapted to grow in contaminated environments (Garrison *et al.*, 2000; Newman and Reynolds, 2004; de Farias *et al.*, 2009; Muthunarayanan *et al.*, 2011; Zazouli *et al.*, 2014; Gong *et al.*, 2019; Pawlik *et al.*, 2020; Standoe *et al.*, 2022).

Phytovolatilization: Certain plants can take up contaminants from the soil and release them into the atmosphere through their leaves in the form of volatile compounds. This method is particularly applicable to organic contaminants with high vapor pressures. Once released into the air, contaminants can be more easily managed or degraded (Sakakibara *et al.*, 2010; Limmer and Burken, 2016; Arya *et al.*, 2017; Zayed *et al.*, 2020; Wang *et al.*, 2021; Bhat *et al.*, 2022; Kristanti and Hadibarata, 2023).

Heavy metal pollution and its environmental consequences

Heavy metal pollution refers to the contamination of the environment, including air, water, soil, and ecosystems, with excessive amounts of toxic heavy metals (Chen *et al.*, 2023). Heavy metals are naturally occurring elements with high atomic weights and densities, and they include substances such as lead (Pb), mercury (Hg), cadmium (Cd), arsenic (As), chromium (Cr), and nickel (Ni) (Li *et al.*, 2023). While some heavy metals are essential in trace amounts for various biological functions, elevated levels of these metals can have severe environmental and health consequences (Duruibe, Ogwuegbu and Ekwurugwu, 2007; Mohammed *et al.*, 2011; Abdul-Wahab and Marikar, 2012; Fashola *et al.*, 2016; Vural *et al.*, 2017; Briffa *et al.*, 2020; Ali *et al.*, 2021; Zaynab *et al.*, 2022; Heisi *et al.*, 2023; Malik and Kumar, 2023; Soleimani-Sardo *et al.*, 2023).

**Poomi and Jeyanthi Rebecca****Sources of Heavy Metal Pollution**

Industrial Activities: Many heavy metals are released into the environment as byproducts of industrial processes such as mining, smelting, and manufacturing. For instance, mining operations can release large amounts of lead, cadmium, and mercury into the soil and water(Zhou *et al.*,2020).

Agricultural Practices: The use of certain fertilizers and pesticides containing heavy metals can lead to their accumulation in soil and water, affecting crops and aquatic ecosystems(Zhangand Wang, 2020).

Combustion of Fossil Fuels: The burning of fossil fuels like coal and oil releases heavy metals such as mercury and lead into the atmosphere. These metals can then be deposited into water bodies and soil through precipitation(Singh *et al.*,2022).

Waste Disposal and Landfills: Improper disposal of electronic waste (e-waste) and other materials containing heavy metals can result in leaching of these metals into the environment(Brindhadevi *et al.*,2023).

Natural Processes: Some heavy metals are naturally present in the Earth's crust, and certain geological processes can release them into the environment. However, human activities have significantly increased the levels of these metals in the environment(Selvi *et al.*,2019).

Soil Contamination: Heavy metals can accumulate in soil, making it unsuitable for agriculture and affecting the health of plants. This can lead to reduced crop yields and potential loss of biodiversity(Ismanto *et al.*,2023).

Water Pollution: Heavy metals can contaminate water bodies, posing a serious threat to aquatic ecosystems and organisms. They can bioaccumulate in the food chain, with predators at the top accumulating higher levels. This can lead to deformities, reduced reproduction, and even death of aquatic organisms(Dwivedi, 2017).

Air Pollution: Industrial processes and combustion of fossil fuels release heavy metals into the atmosphere. Once airborne, these metals can settle on soil and water surfaces, contributing to pollution in these environments(Gupta, 2020).

Human Health Risks:Exposure to high levels of heavy metals through air, water, and food can have serious health consequences for humans. For instance, lead exposure can lead to neurological and developmental problems, mercury can affect the nervous system, and cadmium can cause kidney damage and cancer(Ukaogo *et al.*,2020).

Ecosystem Disruption: Heavy metal pollution can disrupt entire ecosystems by affecting the balance between different species and causing shifts in population dynamics. Some species maybe more sensitive to these pollutants, leading to declines in their populations(Hoffman *et al.*, 2002; Fleeger *et al.*,2003;Macdonald *et al.*,2005; Boyd, 2010; Wear and Thurber, 2015; Ali *et al.*,2019; Shuaib *et al.*,2021; Ismanto *et al.*,2023).

Long-Term Persistence: Heavy metals are non-biodegradable and can persist in the environment for extended periods. This means that even small releases can have long-lasting effects (Manisalidis *et al.*,2020; Shah, 2021).

Mitigation and Prevention

Regulations and Standards: Governments enforce regulations to limit the release of heavy metals into the environment, setting standards for permissible levels in air, water, and soilare as follows (Adelekan and Abegunde, 2011; Caravanos *et al.*,2011; Ladan, 2012; SongandLi, 2014; Zhao *et al.*,2015; Izah *et al.*,2016; Fayiga *et al.*,2018; Boydand Boyd, 2020;NiuandLin, 2021;Saravanan *et al.*,2021; Kazapoe *et al.*,2023).

Waste Management: Proper disposal and recycling of electronic waste and other materials containing heavy metals can minimize the risk of contamination.

**Poorni and Jeyanthi Rebecca**

Alternative Technologies: Industries can adopt cleaner production methods and technologies to reduce heavy metal emissions.

Phytoremediation: Certain plants have the ability to absorb and accumulate heavy metals from the soil, which can then be harvested and properly disposed of.

Treatment Technologies: Various treatment methods, such as precipitation, filtration, and ion exchange, can be used to remove heavy metals from water and wastewater.

In conclusion, heavy metal pollution is a significant environmental issue with far

In conclusion, heavy metal pollution is a significant environmental issue with far-reaching consequences for ecosystems, human health, and biodiversity. Efforts to reduce and prevent heavy metal pollution require a combination of regulatory measures, technological advancements, and public awareness to safeguard the environment and ensure the well-being of present and future generations.

Mechanisms of Phytoremediation

Phytoaccumulation: Plants absorb contaminants from the soil or water through their roots. The contaminants are then transported within the plant through various processes such as diffusion, active transport, and capillary action. Accumulation can occur in roots, stems, leaves, or other plant parts as follows (Di Marco *et al.*, 2014; Kvesitadze *et al.*, 2015; Ossai *et al.*, 2020; Kurade *et al.*, 2021; Kumar *et al.*, 2022; Singh *et al.*, 2023).

Phytotransformation: Plants possess enzymes and metabolic pathways that can transform contaminants into less toxic or more easily degradable forms. This can involve processes such as oxidation, reduction, hydrolysis, and conjugation. Phytotransformation occurs within plant tissues.

Rhizodegradation: Plant roots release exudates, which are organic compounds that fuel microbial activity in the rhizosphere. These microorganisms can degrade contaminants through enzymatic reactions, leading to their breakdown and detoxification.

Rhizofiltration: Plants can filter contaminants from water as it passes through their root systems. Contaminants may adhere to root surfaces or be taken up and stored within root tissues. This process is especially effective for removing heavy metals and other pollutants from water sources.

Phytovolatilization: Volatile contaminants can be taken up by plants and released into the atmosphere through transpiration. This mechanism is important for managing volatile organic compounds (VOCs) and other contaminants that can readily evaporate.

Phytostabilization: Plants can immobilize contaminants by reducing their mobility and bioavailability. This can occur through chemical reactions that result in the formation of less soluble compounds or by encapsulating contaminants within root zones. In conclusion, phytoremediation is a versatile and promising approach for addressing various types of environmental contamination. By harnessing the natural abilities of plants and their associated microorganisms, phytoremediation offers an eco-friendly and sustainable solution for restoring polluted sites and mitigating the impacts of contaminants on ecosystems and human health. The specific mechanism employed in phytoremediation depends on the contaminants present, the type of plants used, and the desired outcome of the remediation process.

Benefits of Phytoremediation

Environmental Sustainability: Phytoremediation is a natural, non-invasive process that does not disrupt ecosystems. It reduces the need for extensive excavation and transportation of contaminated materials, minimizing the associated carbon footprint as follows (Wan *et al.*, 2016; Cameselle *et al.*, 2019; Ghosh and Maiti, 2021).

**Poorni and Jeyanthi Rebecca**

Cost-Effectiveness: Phytoremediation is often more cost-effective than traditional remediation methods. It requires less equipment and maintenance, making it suitable for both large-scale and small-scale projects.

Biodiversity Conservation: Phytoremediation can contribute to habitat restoration by promoting the growth of native plant species, which in turn supports local wildlife and enhances ecosystem health.

Long-Term Solution: Phytoremediation offers a long-term solution by addressing the root causes of contamination rather than simply transferring pollutants from one location to another.

Community Engagement: Phytoremediation projects often involve local communities, raising awareness about environmental issues and fostering a sense of ownership and stewardship.

Challenges and Considerations

While phytoremediation has many advantages, it is not a one-size-fits-all solution and has certain limitations (Moustakas and Loizidou, 2023):

Time-Intensive: Phytoremediation can be a slow process, particularly for large-scale contamination sites, requiring years or even decades to achieve complete remediation.

Plant Selection: Choosing the right plant species for a specific type of contamination is crucial. Not all plants have the ability to remediate all types of pollutants effectively.

Site Conditions: Soil composition, climate, and other site-specific factors can influence the success of phytoremediation projects.

Regulatory Approval: Some regulatory agencies may require extensive testing and monitoring before approving phytoremediation projects, which can add to the timeline and costs.

Examples of Phytoremediation

Sunflowers for Heavy Metals: Sunflowers are often used to remediate soil contaminated with heavy metals like lead, zinc, and copper. These plants can accumulate high concentrations of these metals in their tissues as follows (Jones *et al.*, 2006; Mendez *et al.*, 2008; Gerhardt *et al.*, 2009; Ansari, 2016; Beans, 2017; Wei *et al.*, 2021; Kafle *et al.*, 2022).

Willows for Wastewater Treatment: Willows are used in constructed wetlands to treat wastewater. They absorb nutrients and contaminants, helping to purify the water before it is released into natural water bodies.

Poplars for Groundwater Cleanup: Poplar trees have been employed to remediate groundwater contaminated with volatile organic compounds (VOCs). Their extensive root systems create conditions favorable for microbial degradation of pollutants. In conclusion, phytoremediation is a promising and sustainable approach to environmental remediation, offering a natural and cost-effective way to address pollution and contamination. While it may not be suitable for all situations, when properly applied and managed, phytoremediation can play a significant role in restoring ecosystems and improving the overall quality of the environment.

Uptake, translocation, and accumulation of heavy metals by plants

Plants can absorb heavy metals from the soil through their roots. The uptake of heavy metals is a passive process that occurs through various mechanisms, primarily driven by concentration gradients and ion exchange. Here's a breakdown of the key steps involved in the uptake of heavy metals by plants (Dinuet *et al.*, 2020; Zakaria *et al.*, 2021; Tao and Lu, 2022):

Adsorption: Heavy metals present in the soil solution come into contact with the root surface. These metals can be adsorbed onto the surface of root cells. The process of adsorption depends on factors like metal concentration, pH of the soil, and the presence of organic matter.

Ion Exchange: Some heavy metals can replace essential nutrients, such as calcium, magnesium, and potassium, on the exchange sites of root cell surfaces. This ion exchange process allows heavy metals to enter the root cells.

Passive Diffusion: Heavy metals can also move through the root cell membranes via passive diffusion, driven by concentration gradients. The rate of diffusion depends on the metal's solubility and concentration in the soil solution.

**Poomi and Jeyanthi Rebecca****Translocation of Heavy Metals within Plants**

Once heavy metals are taken up by the roots, they can be transported within the plant to various parts. Translocation involves the movement of metals from roots to shoots. Several pathways and processes are involved in the translocation of heavy metals (Qiao *et al.*, 2018; Pasricha *et al.*, 2021; Nescu *et al.*, 2022):

Symplastic Pathway: This pathway involves the movement of heavy metals through the cytoplasm of interconnected cells via plasmodesmata. Metal ions move from one cell to another through these channels.

Apoplastic Pathway: Metals can also move through the cell walls by traveling along the apoplastic pathway. This involves movement through the spaces between cell walls and can be hindered by barriers like Casparian strips in the endodermis.

Vacuolar Sequestration: One of the primary mechanisms for detoxifying heavy metals in plants is sequestration within vacuoles. Vacuoles store heavy metals in non-toxic forms, reducing their harmful effects on essential cellular processes.

Accumulation of Heavy Metals in Plant Tissues

Accumulation refers to the process of heavy metal buildup in different plant tissues, particularly the above-ground parts such as leaves and stems. Accumulation is influenced by factors such as the type of heavy metal, plant species, and the presence of other elements. Some plants have a higher capacity to accumulate heavy metals, making them potential candidates for phytoremediation (removal of pollutants from soil) (Zhou *et al.*, 2015; Etesami, 2018; Zwolak *et al.*, 2019; Aprile and De Bellis, 2020; Çomaklı and Bingöl, 2021; Zamani Afshar *et al.*, 2022):

Root Accumulation: Certain plants have a higher ability to accumulate heavy metals in their roots. These metals may be stored in root cells or bound to cell wall components.

Shoot Accumulation: Some plants can actively transport heavy metals from the roots to above-ground tissues. This can lead to high concentrations of heavy metals in leaves and stems.

Hyperaccumulators: Certain plant species, known as hyperaccumulators, have an exceptional ability to accumulate unusually high levels of heavy metals in their tissues without showing significant signs of toxicity. These plants are of great interest in phytoremediation efforts. In summary, the uptake, translocation, and accumulation of heavy metals by plants are complex processes that depend on various factors. Understanding these mechanisms is crucial for managing soil pollution, assessing potential health risks, and developing strategies for phytoremediation.

Role of rhizosphere and microbial interactions

The rhizosphere is a dynamic and complex microenvironment surrounding plant roots, where intricate interactions occur between plants, soil particles, and a diverse community of microorganisms. These interactions play a crucial role in plant health, nutrient cycling, and soil ecosystem functioning. The mechanisms underlying the role of the rhizosphere and microbial interactions are multifaceted and involve various processes, including nutrient exchange, communication, and competition. Here, we delve into a detailed mechanistic explanation of these interactions.

Nutrient Exchange

Plants release a variety of organic compounds, collectively termed root exudates, into the rhizosphere. These exudates include sugars, amino acids, organic acids, and enzymes. Root exudates serve as an energy source for microorganisms, attracting them to the rhizosphere. In response, microorganisms release enzymes that break down complex organic matter in the soil, making nutrients more accessible to both plants and microbes. This nutrient cycling benefits plant growth by enhancing nutrient availability, while microorganisms gain a niche habitat rich in energy sources.

Communication and Signalling

Plants and microbes engage in intricate chemical signaling within the rhizosphere. Root exudates contain specific compounds that can serve as signaling molecules, influencing microbial community composition and function. Microorganisms, in turn, produce signaling molecules, such as quorum-sensing molecules and volatile organic

**Poorni and Jeyanthi Rebecca**

compounds, which can affect plant growth and defense mechanisms. This communication enables plants to activate specific responses, such as enhanced nutrient uptake or the induction of defense mechanisms against pathogens.

Symbiotic Relationships

Certain microorganisms form symbiotic relationships with plants, benefiting both parties. Mycorrhizal fungi, for example, establish mutualistic associations with plant roots. Arbuscular mycorrhizal fungi extend hyphae into the soil, increasing the root's effective surface area for nutrient absorption. In return, the fungi receive sugars from the plant. Nitrogen-fixing bacteria, such as rhizobia, form nodules on legume roots and convert atmospheric nitrogen into a form that plants can use. These symbiotic interactions enhance plant nutrient acquisition and growth.

Disease Suppression and Competition

Microbes in the rhizosphere can also contribute to disease suppression through various mechanisms. Some microorganisms produce antibiotics or other bioactive compounds that inhibit pathogenic organisms. Additionally, the presence of beneficial microorganisms can stimulate the plant's immune responses, making it more resistant to pathogens. Microbial competition for resources, such as nutrients and space, can limit the growth of potential pathogens, indirectly protecting plant health.

Rhizodeposition and Soil Aggregation

Roots physically alter the soil environment by exuding substances that contribute to soil structure and aggregation. These root-derived compounds help bind soil particles together, forming aggregates. Aggregated soils are more stable, better aerated, and have improved water-holding capacity. Microorganisms play a critical role in this process by producing polysaccharides and other extracellular substances that contribute to soil aggregation. Improved soil structure benefits plant root penetration, water infiltration, and nutrient movement.

In conclusion, the rhizosphere and microbial interactions form a complex and interdependent specific responses, such as enhanced nutrient uptake or the induction of defense mechanisms against pathogens.

Symbiotic Relationships

Certain microorganisms form symbiotic relationships with plants, benefiting both parties. Mycorrhizal fungi, for example, establish mutualistic associations with plant roots. Arbuscular mycorrhizal fungi extend hyphae into the soil, increasing the root's effective surface area for nutrient absorption. In return, the fungi receive sugars from the plant. Nitrogen-fixing bacteria, such as rhizobia, form nodules on legume roots and convert atmospheric nitrogen into a form that plants can use. These symbiotic interactions enhance plant nutrient acquisition and growth.

Disease Suppression and Competition

Microbes in the rhizosphere can also contribute to disease suppression through various mechanisms. Some microorganisms produce antibiotics or other bioactive compounds that inhibit pathogenic organisms. Additionally, the presence of beneficial microorganisms can stimulate the plant's immune responses, making it more resistant to pathogens. Microbial competition for resources, such as nutrients and space, can limit the growth of potential pathogens, indirectly protecting plant health.

Rhizodeposition and Soil Aggregation

Roots physically alter the soil environment by exuding substances that contribute to soil structure and aggregation. These root-derived compounds help bind soil particles together, forming aggregates. Aggregated soils are more stable, better aerated, and have improved water-holding capacity. Microorganisms play a critical role in this process by producing polysaccharides and other extracellular substances that contribute to soil aggregation. Improved soil structure benefits plant root penetration, water infiltration, and nutrient movement.

**Poomi and Jeyanthi Rebecca**

In conclusion, the rhizosphere and microbial interactions form a complex and interdependent network that profoundly influences plant health, soil fertility, and ecosystem functioning. The mechanisms described above provide a detailed understanding of how plants and microorganisms collaborate, compete, and communicate within this dynamic microenvironment. Recognizing and harnessing these mechanisms have significant implications for sustainable agriculture, ecosystem restoration, and the development of innovative agricultural practices.

Significance of studying phytoremediation of Cu, Pb, and Zn

The study of phytoremediation, especially in the context of heavy metals like copper (Cu), lead (Pb), and zinc (Zn), holds immense significance due to its potential to address several environmental, economic, and social challenges as follows (Turanand Esringu, 2007; Kumar *et al.*, 2008; Doumett *et al.*, 2010; Polechońska and Klink, 2014; Ansari, 2016; Beans, 2017; Wei *et al.*, 2021; Kafle *et al.*, 2022; Singh *et al.*, 2023).

Environmental Protection and Restoration: Heavy metals like Cu, Pb, and Zn are widespread contaminants in the environment due to industrial activities, mining, agriculture, and improper waste disposal. These metals can accumulate in soils, water bodies, and sediments, posing serious risks to ecosystems and human health. Phytoremediation offers a natural way to reduce the concentrations of these metals in contaminated sites, thus restoring and protecting the integrity of ecosystems.

Reduced Soil Contamination: Heavy metals in soil can adversely affect soil quality, nutrient availability, and microbial communities. This can lead to reduced agricultural productivity and compromised soil health. Phytoremediation helps mitigate these issues by sequestering metals within plant tissues or rendering them less bioavailable through various mechanisms, thus improving soil conditions for future land use.

Water Quality Improvement: Contaminated water bodies, either directly or indirectly, can result in pollution of drinking water sources and aquatic habitats. Phytoremediation plants can absorb, accumulate, and transform heavy metals, reducing their concentrations in water through mechanisms like phytofiltration and rhizofiltration. This process aids in improving water quality and protecting aquatic ecosystems.

Cost-Effectiveness: Traditional remediation methods like excavation, transportation, and disposal of contaminated materials are often expensive and disruptive. Phytoremediation, on the other hand, is relatively cost-effective, especially for large-scale or long-term projects. It requires less infrastructure and maintenance, making it an economically viable option for remediating contaminated sites.

Aesthetic and Recreational Benefits: Phytoremediation can transform contaminated sites into aesthetically pleasing green spaces, enhancing the quality of life for local communities. Remediated areas can be repurposed for recreational activities, urban gardening, or other community uses, fostering social engagement and well-being.

Biodiversity Conservation: Phytoremediation plants, particularly hyperaccumulators, have the potential to support the conservation of rare and endangered plant species by creating specialized habitats. These plants can thrive in metal-contaminated environments where other species may not survive, contributing to biodiversity preservation.

Risk Reduction: The accumulation of heavy metals in food chains poses a significant risk to human health through the consumption of contaminated crops or livestock. Phytoremediation can reduce the bioavailability of metals in soils, thereby decreasing their potential to enter the food chain and minimizing health risks for local communities.

Carbon Sequestration and Climate Change Mitigation: Phytoremediation plants contribute to carbon sequestration, as they capture carbon dioxide from the atmosphere during photosynthesis and store it in their biomass and roots. This process can help mitigate climate change by reducing greenhouse gas concentrations.

**Poorni and Jeyanthi Rebecca**

Research and Technological Advancements: The study of phytoremediation of heavy metals like Cu, Pb, and Zn drives research and innovation in areas such as plant physiology, genetics, and biotechnology. It offers insights into how plants can be genetically engineered or selected to enhance their metal-accumulating capabilities, leading to advancements in both phytoremediation and other agricultural practices.

Policy and Regulation: The success of phytoremediation projects can influence environmental policies and regulations related to land use, waste management, and pollution control. Demonstrating the efficacy of phytoremediation for Cu, Pb, and Zn contamination can lead to the incorporation of this approach into government guidelines and industry practices. In conclusion, the significance of studying phytoremediation of copper, lead, and zinc lies in its potential to provide a holistic and sustainable solution to the challenges posed by heavy metal contamination. By offering benefits ranging from environmental protection and restoration to economic savings and societal well-being, phytoremediation contributes to a greener and cleaner future for both ecosystems and human communities.

Role of Erwa, Balsam, and Duranta plants in phytoremediation

Phytoremediation is an eco-friendly and sustainable approach to cleaning up contaminated environments using plants. It takes advantage of the natural ability of certain plants to absorb, accumulate, and detoxify various pollutants from the soil, water, or air. Three plants that play a significant role in phytoremediation are Erwa (*Jatropha curcas*), Balsam (*Impatiens balsamina*), and Duranta (*Duranta erecta*). Each of these plants contributes to the process of phytoremediation through different mechanisms (Barasarathi *et al.*, 2021, Unde and Kumar, 2022).

Erwa (*Jatropha curcas*)

Erwa, also known as *Jatropha curcas*, is a perennial shrub native to Central America but widely cultivated in various regions for its oil-rich seeds and its potential in phytoremediation. Erwa has been found to exhibit phytoremediation capabilities due to its ability to tolerate and accumulate heavy metals, such as lead, cadmium, and zinc, in its tissues. The mechanism by which Erwa contributes to phytoremediation includes (Parihar *et al.*, 2021):

Hyperaccumulation: Erwa has the ability to hyperaccumulate heavy metals in its tissues. Hyperaccumulation refers to the plant's capacity to accumulate metals at concentrations far greater than those found in the surrounding environment. This helps in reducing the metal concentration in the contaminated soil.

Rhizofiltration: The roots of Erwa release organic acids and enzymes that aid in mobilizing and solubilizing heavy metals in the rhizosphere (root zone). This process facilitates the uptake of metals into the plant roots, effectively removing them from the soil.

Phytostabilization: Erwa's extensive root system helps bind and stabilize soil particles, preventing the spread of contaminants and reducing their potential for leaching into groundwater.

Balsam (*Impatiens balsamina*)

Balsam, or *Impatiens balsamina*, is an annual flowering plant with phytoremediation potential, particularly in the context of organic contaminants and pollutants. Balsam is often used for its ability to remediate contaminated soil and water through the following mechanisms (Tshikhudo *et al.*, 2023):

Rhizodegradation: Balsam releases enzymes and metabolites from its roots that facilitate the breakdown and degradation of organic pollutants, such as hydrocarbons and aromatic compounds. This process contributes to the detoxification of contaminated environments.

Phytodegradation: Balsam takes up organic contaminants through its roots and transports them to its above-ground tissues. Once in the plant, these contaminants can undergo metabolic processes, such as phytodegradation, which breaks down the pollutants into less harmful substances.

**Poorni and Jeyanthi Rebecca**

Enhanced Microbial Activity: Balsam's root exudates promote the growth and activity of beneficial soil microorganisms, which further aid in the degradation and transformation of organic contaminants.

Duranta (*Duranta erecta*)

Duranta erecta, commonly known as Duranta, is an ornamental shrub often used for landscaping purposes. Apart from its aesthetic value, Duranta has shown potential for phytoremediation due to its ability to tolerate and remove various pollutants, especially heavy metals. The mechanisms by which Duranta contributes to phytoremediation include (Jadaun, 2023):

Phytoextraction : Duranta's roots take up heavy metals from the soil and transport them to its above-ground parts, primarily the leaves and stems. Through this process of phytoextraction, Duranta helps reduce the metal concentration in the soil.

Translocation and Accumulation: Duranta accumulates heavy metals in its above-ground tissues without suffering from toxicity. This accumulation assists in the detoxification of the soil and reduces the potential for metal leaching and groundwater contamination.

Phytotransformation: Duranta's leaves and stems may also contribute to the transformation of pollutants through metabolic processes, helping to break down or immobilize the contaminants. In summary, Erwa, Balsam, and Duranta plants play crucial roles in phytoremediation by employing various mechanisms to remove, detoxify, and stabilize contaminants in contaminated environments. These mechanisms include hyperaccumulation, rhizofiltration, rhizodegradation, phytodegradation, phytoextraction, translocation, accumulation, and phytotransformation. The combined actions of these plants contribute to the overall remediation of polluted soils, waters, and air, demonstrating the potential of phytoremediation as a sustainable and effective approach for environmental cleanup.

Erwa's metal tolerance and accumulation potential

Erwa refers to a plant species, and its metal tolerance and accumulation potential relate to its ability to withstand and absorb heavy metals from the environment. Heavy metals are elements with high atomic weights that can be toxic to living organisms in elevated concentrations. Erwa's metal tolerance is its capacity to survive and thrive in soil or water contaminated with high levels of heavy metals, such as cadmium, lead, zinc, and copper. This tolerance is often attributed to various physiological and biochemical adaptations. Erwa's metal accumulation potential, on the other hand, refers to its ability to uptake and store heavy metals within its tissues without suffering significant damage. This process involves several mechanisms, including (Tibebu *et al.*, 2022):

Metal Transporters: Erwa plants may possess specialized transporters that facilitate the uptake of heavy metals from the soil or water into their roots. These transporters can selectively bind to and transport specific heavy metals into the plant's vascular system.

Metal Sequestration: Once absorbed, heavy metals can be sequestered or stored within specific cellular compartments, such as vacuoles or cell walls. This reduces the toxic effects of heavy metals on essential cellular processes.

Chelation: Erwa plants may produce molecules called chelators, which have the ability to bind to heavy metals and form stable complexes. These complexes are less toxic and can be transported to storage sites within the plant.

Metal Detoxification Enzymes: Erwa may produce enzymes that participate in the detoxification of heavy metals by converting them into less harmful forms. For instance, metallothioneins are proteins that bind to heavy metals and protect cells from their toxic effects.

**Poorni and Jeyanthi Rebecca**

Root Exudates: Erwa plants may release certain compounds from their roots, which can alter the physicochemical properties of the soil and enhance the availability of heavy metals for uptake.

Balsam's effectiveness in heavy metal absorption

Balsam, another plant species, is known for its potential to absorb heavy metals from its surrounding environment. This absorption ability is largely attributed to the following factors (Lin *et al.*, 2022):

Hyperaccumulation: Balsam species might possess the unique ability to hyperaccumulate certain heavy metals. Hyperaccumulators can accumulate concentrations of heavy metals far higher than other plant species without showing signs of toxicity.

Deep Root System: Balsam plants often have deep and extensive root systems that allow them to explore a larger volume of soil. This enables them to access heavy metals present at deeper soil layers.

Metal Transporters and Chelation: Like Erwa, balsam may also have specialized metal transporters and chelating molecules that enhance the uptake and storage of heavy metals.

Fast Growth Rate: Balsam's rapid growth rate might contribute to its ability to absorb and accumulate heavy metals. As it grows quickly, it can continuously uptake and sequester heavy metals from the environment.

Duranta's role in immobilization and transformation of heavy metals

Duranta, a different plant species, plays a crucial role in immobilizing and transforming heavy metals in the environment. This process can help mitigate the harmful effects of heavy metal contamination. The mechanisms by which Duranta achieves this include (Heisi *et al.*, 2023):

Rhizosphere Modification: Duranta plants release root exudates that can modify the chemical and physical properties of the rhizosphere—the soil region influenced by the plant's roots. This can lead to the precipitation or immobilization of heavy metals, reducing their mobility and bioavailability.

Microbial Interactions: Duranta's root exudates can promote the growth of beneficial microorganisms in the soil. These microbes can participate in processes such as biosorption, where they bind and immobilize heavy metals on their surfaces.

Phytostabilization: Duranta plants may stabilize heavy metals by incorporating them into their tissues and preventing their movement through the soil. This reduces the risk of heavy metal leaching into groundwater or being taken up by other plants.

Phytoextraction: While not as prominent in Duranta as in some other species, phytoextraction involves the uptake and accumulation of heavy metals in plant tissues. These metals can then be harvested and removed from the site, effectively reducing the metal content in the environment.

In summary, Erwa, Balsam, and Duranta are all examples of plant species with varying degrees of metal tolerance, accumulation potential, and heavy metal interaction capabilities. Their unique physiological and biochemical adaptations allow them to thrive in heavy metal-contaminated environments and contribute to the immobilization, transformation, and removal of heavy metals from the ecosystem. The use of plants for the removal of heavy metals from contaminated environments is a process known as phytoremediation. Phytoremediation is an eco-friendly and cost-effective approach that utilizes the natural abilities of certain plants to absorb, accumulate, and detoxify heavy metals from soil, water, or air. Among the various plants used for phytoremediation, Erwa (*Sesbania drummondii*), Balsam (*Impatiens walleriana*), and Duranta (*Duranta erecta*) have shown potential for the removal of heavy metals, particularly Copper (Cu), Lead (Pb), and Zinc (Zn).

**Poorni and Jeyanthi Rebecca****Erwa (*Sesbania drummondii*)**

Erwa is a leguminous plant that belongs to the *Sesbania* genus. It has been studied for its ability to tolerate and accumulate heavy metals, making it suitable for phytoremediation. Erwa employs several mechanisms to facilitate heavy metal removal:

Phytoextraction: Erwa can uptake heavy metals from the soil through its roots. The metals are then transported and stored in its above-ground biomass, such as leaves and stems. This process helps to reduce the metal concentrations in the soil.

Rhizofiltration: The roots of Erwa release organic compounds that can form complexes with heavy metals, enhancing their uptake and removal from the soil.

Balsam (*Impatiens walleriana*): Balsam, a flowering plant of the *Impatiens* genus, has been investigated for its potential in phytoremediation due to its rapid growth and adaptability. Balsam uses the following mechanisms for heavy metal removal:

Phytostabilization: Balsam can stabilize heavy metals in the soil by promoting chemical reactions that reduce their mobility and bioavailability. This reduces the risk of metal leaching and subsequent contamination of groundwater.

Hyperaccumulation: Some varieties of Balsam have shown the ability to accumulate high concentrations of heavy metals in their tissues, effectively removing these metals from the environment.

Duranta (*Duranta erecta*)

Duranta is an ornamental shrub that belongs to the *Verbenaceae* family. It has been studied for its potential in phytoremediation due to its ability to tolerate adverse conditions and accumulate heavy metals. Duranta employs the following mechanisms for heavy metal removal:

Rhizofiltration: The roots of Duranta release organic compounds that can chelate heavy metals and facilitate their uptake from the soil.

Phytostabilization: Duranta can help stabilize heavy metals in the soil by promoting the formation of less mobile and less toxic metal compounds.

It's important to note that the effectiveness of Erwa, Balsam, and Duranta in removing heavy metals from contaminated environments can be influenced by various factors such as soil conditions, metal concentrations, and plant growth conditions. Before implementing phytoremediation using these plants, a thorough assessment of the specific contaminated site and careful selection of appropriate plant species is crucial. Monitoring and management of the phytoremediation process are also essential to ensure its success in reducing heavy metal pollution.

This paper explores the intricate field of phytoremediation, focusing on the use of Erwa, Balsam, and Duranta plants for the removal of heavy metals, namely Copper (Cu), Lead (Pb), and Zinc (Zn), from contaminated environments. The study outlines the objectives, methodologies, and findings of research endeavors aimed at investigating the potential of these plants in remediating heavy metal pollution. Through a systematic review of various scholarly works, this paper synthesizes the diverse knowledge and methodologies applied in the pursuit of effective phytoremediation strategies.

Phytoremediation has emerged as a sustainable and eco-friendly approach to mitigate the detrimental effects of heavy metal contamination in soil and water systems. The present literature review delves into the utilization of Erwa, Balsam, and Duranta plants as phytoremediation agents for Copper, Lead, and Zinc, three of the most prevalent heavy metals with significant environmental impacts.

**Poorni and Jeyanthi Rebecca**

The primary objectives of the reviewed studies encompassed the collection of plant seeds, seed germination, pot culturing, heavy metal analysis, identification of anatomical and phytochemical variations, protein profiling, effect study by FTIR and HPLC, and the determination of heavy metal uptake efficiency.

Seed Collection and Germination

The literature revealed that successful phytoremediation endeavors commence with the collection of viable seeds from Erwa, Balsam, and Duranta plants. Researchers employed various methodologies to enhance seed germination rates and ensure healthy seedlings, thereby laying the foundation for subsequent pot culturing and metal uptake studies.

Pot Culturing and Heavy Metal Analysis

Pot culturing experiments were commonly employed to study the plants' growth and heavy metal uptake capacities. Through meticulous experimentation, researchers examined the effects of varying concentrations of Cu, Pb, and Zn on plant growth, morphology, and overall health. These investigations were complemented by rigorous heavy metal analysis techniques, including atomic absorption spectroscopy and inductively coupled plasma mass spectrometry.

Anatomical and Phytochemical Variations

An essential facet of the studies involved identifying anatomical and phytochemical variations induced by heavy metal exposure. Microscopic analyses elucidated changes in root and shoot structures, while phytochemical analyses unveiled alterations in secondary metabolites, antioxidants, and metal chelating compounds, providing insights into the plants' adaptive mechanisms.

Protein Profiling

Proteomic studies offered valuable insights into the molecular responses of Erwa, Balsam, and Duranta plants to heavy metal stress. Two-dimensional gel electrophoresis and mass spectrometry techniques facilitated the identification and quantification of proteins associated with metal detoxification, antioxidative defense, and stress response pathways.

Effect Study by FTIR and HPLC

The integration of Fourier-transform infrared (FTIR) spectroscopy and high-performance liquid chromatography (HPLC) enabled researchers to elucidate changes in functional groups and phytochemical compositions under heavy metal stress. This multi-faceted approach enriched the understanding of molecular-level alterations in the plants' physiology.

Efficiency of Heavy Metal Uptake

A pivotal aspect of the reviewed studies focused on assessing the efficiency of heavy metal uptake by Erwa, Balsam, and Duranta plants. Quantitative analyses of metal accumulation in plant tissues highlighted variations in metal accumulation patterns and provided critical data for evaluating the plants' phytoremediation potential.

Hypothesis Explanation

The hypothesis proposes that combining the phytoremediation potential of three distinct plant species, namely Erwa, Balsam, and Duranta, will lead to an enhanced and synergistic removal of heavy metals, specifically Copper (Cu), Lead (Pb), and Zinc (Zn), from contaminated soil and water environments. This innovative multispecies approach aims to capitalize on the unique biochemical and physiological attributes of each plant species, resulting in more efficient and sustainable heavy metal detoxification and remediation.

Synergistic Metal Uptake: Each plant species possesses a distinct capacity to selectively uptake and accumulate heavy metals. Erwa, known for its robust growth and adaptability, might excel at copper uptake due to its copper-specific transporters. Balsam, with its efficient lead accumulation mechanisms, could effectively target lead contamination. Duranta, recognized for its zinc hyperaccumulation traits, might specifically focus on zinc uptake.

**Poorni and Jeyanthi Rebecca**

The hypothesis suggests that these plants' collective presence could create a more comprehensive and efficient metal removal mechanism, outperforming individual plant species.

Rhizospheric Interaction and Microbial Enhancement: The roots of these plants establish a complex rhizospheric environment that harbors diverse microbial communities. The hypothesis posits that the rhizospheric interactions among Erwa, Balsam, and Duranta could lead to an enhanced microbial activity, promoting metal solubilization and bioavailability. This could result in improved metal uptake by the plants, as well as increased microbial-mediated transformations that facilitate metal immobilization or conversion into less toxic forms.

Improved Plant Tolerance and Growth: Erwa, Balsam, and Duranta might exhibit varying degrees of tolerance to the heavy metals in question. It is hypothesized that the multispecies approach could involve complementary metal tolerance mechanisms, such as metal chelation, sequestration, and antioxidative defense systems. This collaborative defense strategy might enhance plant growth and vitality, allowing the plants to better endure and effectively remediate heavy metal stress.

Enhanced Phytoextraction and Phytostabilization: Erwa, Balsam, and Duranta could collaboratively contribute to both phytoextraction (metal uptake and translocation to above-ground tissues) and phytostabilization (metal immobilization within roots and rhizospheric regions). The hypothesis proposes that this dual strategy could yield a more balanced and sustainable heavy metal remediation outcome, mitigating the potential risks of metal release from harvested plant biomass.

DISCUSSION AND FUTURE DIRECTIONS

The discussion section of this study delves into the various aspects of phytoremediation using Erwa, Balsam, and Duranta plants for heavy metal removal. It begins by summarizing the mechanisms employed by each plant species in heavy metal remediation, highlighting their unique attributes. The discussion also emphasizes the importance of tailored phytoremediation approaches based on the specific contaminant and environmental conditions. Moreover, it explores the potential synergistic effects of combining these plant species in a multispecies phytoremediation approach. The hypothesis posits that their individual strengths and metal-specific accumulation abilities could lead to enhanced heavy metal removal. The rhizospheric interactions and microbial enhancement are also discussed, as they play a crucial role in the effectiveness of this multispecies approach.

CONCLUSION

The conclusion summarizes the key findings of the literature review, emphasizing the significance of Erwa, Balsam, and Duranta plants as phytoremediation agents for copper, lead, and zinc contamination. It underscores the importance of a comprehensive approach that combines seed germination, pot culturing, heavy metal analysis, anatomical and phytochemical investigations, protein profiling, and spectroscopic techniques to understand the phytoremediation capabilities of these plants fully. The conclusion also highlights the potential for future research endeavors aimed at harnessing the phytoremediation potential of these plants to restore and rehabilitate heavy metal-contaminated environments.

ABSTRACT

This study delves into the psychological trauma of Saru, the protagonist of Shashi Deshpande's *The Dark Holds No Terrors*, focusing on her experiences of abuse and emotional neglect within a patriarchal framework. Employing psychoanalytic, behavioural, and trauma-focused perspectives, the analysis examines the interplay of childhood conditioning, gendered power dynamics, and marital violence in shaping Saru's mental state. Key psychological constructs, including learned helplessness, defense mechanisms, attachment theory, and complex trauma, are applied to unravel the layers of her emotional turmoil. Furthermore, the study highlights Saru's journey toward self-awareness and empowerment as she confronts her past and redefines her identity. This exploration emphasizes the broader implications of societal norms and gender roles on psychological well-being, offering insights into the resilience required to overcome oppressive systems.

Keywords: Psychological trauma, Patriarchy and gender roles, Learned helplessness, Attachment theory, Defence mechanisms, Complex PTSD, Feminist psychology, Self-identity and empowerment, Childhood conditioning, Marital abuse

INTRODUCTION

Cycle of Abuse and Learned Helplessness

The abusive dynamics in Saru's marriage align with Lenore Walker's Cycle of Violence Theory, which identifies three phases: tension-building, incident of abuse, and reconciliation (honeymoon phase). This cyclical pattern traps victims

**Saratha Lakshmi**

in an on-going state of fear and hope for change. Marriage opens the sesame for all the enjoyments. Their marital life becomes quite good. To Saru all this seems to be difficult to believe. She feels that all these things could only happen to girls in movies. But her happiness is short-lived. Incidents which hurt the male ego of Manohar takes place one after the other soon after their marriage. It appears that fate is dead set against saru. She is not allowed to live in peace even in the chawl. When the neighbors come to know that a lady doctor has come to live among them, they begin to take advantage of the situation. The men around her house look at her lusciously and women say admiringly that she is the lady doctor. One evening, a woman knocks at her door. When Manu opens the door, she asks whether the doctor is at home. The woman wants to consult her about her child who is suffering from diarrhea. The women in the chawl look at her with great respect One or the other man visits her almost every day while none ever asks about Manohar. Thus as doctor Sarita gains honour and respect from the uneducated neighbours of her chawl. Sarita has busy time in the clinic and the hospital. She generally comes home tired and exhausted, and sometimes late also. Once there was an emergency case and it was Sarita alone who could handle it properly. Naturally she goes late to her home.

When she reaches home, she finds Manohar in brooding mood, not prepared to talk to her. Then, there were occasions when she disregards his amorous advances. He starts losing the mental equilibrium. He is smaller than his wife in public and disregarded in his home. To make matters worse, a journalist asks him bluntly how he feels when his wife is virtually earning bread and butter. Thus, Manohar continues to bouts of depression. Sarita studies her M.D., becomes Assistant Honorary, sets up consulting room. She is rising in status. This upsets him entirely and makes him a psychopath. There is no denying that Manohar has to suffer due to the better position of his wife. But Sarita cannot be blamed for his inferiority complex. It is nothing but fate that she has a husband as brittle as a mirror. His ego is hurt by her success, he feels inferior and this inferiority makes him brutal in his behavior. Though he is normal in daytime, he turns treacherous rapist at night and tries to assert his masculinity through sexual assaults upon Saru. Her dream of finding happiness in marriage is soon shattered. It is really heart throbbing that though being a popular doctor by profession she has to bear such pain and excruciating torment. The corporal assaults that Saru receives from her husband can be said to be the height of her disastrous life.

Sarita is in a dejected state. She could not bear the violence of an insane man night after night. Manohar gets the fit of insanity in the night, uses his hands, nails and teeth to afflict pain on Sarita's body and mind. She could not resist him because he seems more powerful during the fit. She could not even cry because she doesn't want the children to know about their afflictions. Therefore, she decides that going away from the house is the only way left for her. She could go only to her father. She things that she should divorce such a husband. She asserts to herself that her husband is a sadist, a wreck, a ruin, yet the question arises, 'can I divorce him?'. She realises that it is not possible for her to do that for several reasons. First, she would not like to speak about what he has done in the privacy of the bedroom. Renu and Abhi would be shocked by the discovery—she 'would never be able to look them in the face again. She is in dilemma as what she should do. She is in such a state that if someone tells her what to do, she will do that at once, without a second thought. But fate does not let her be free from the encumbrances of an insane husband. She decides to run away from him. Whether a woman is a doctor or not doctor she should undergo all sorts of turmoil and fight for equality in a society where gender equality remains an unanswered question. 'The entire notion of 'home' becomes exiled and is transformed into an intangible condition that is not based on a singular location but rather a progress among many places' (Vadivu.Npg 3911). Learned helplessness, as theorized by Martin Seligman, is evident in Saru's response to her husband Manu's violence. Despite her professional success, she exhibits cognitive distortions like believing she is incapable of escaping the abuse. This distortion leads to behavioural passivity, where she tolerates the violence rather than resisting or seeking help.

Childhood Conditioning and Unresolved Trauma

Saru's unresolved trauma is explained through Freudian psychoanalysis, particularly the role of the unconscious mind. Her childhood experiences, especially her mother's emotional neglect and the trauma of her brother Dhruva's death, create a subconscious script of guilt and rejection. These early experiences result in negative core beliefs such as "I am unworthy of love" or "I am to blame for others' pain," which resurface in her adult life. Her attachment style,

**Saratha Lakshmi**

likely shaped by parental neglect, may lean toward an anxious-preoccupied attachment, making her more vulnerable to staying in an abusive relationship. The concept of trauma bonding, where victims develop emotional dependence on their abusers despite the harm, is also applicable. Saru's psychological dependence on Manu parallels her childhood need for approval from her mother.

Power Dynamics and Gender Roles

Saru and Manu's marriage reflects the power imbalance reinforced by patriarchal social structures. Manu's violent behavior can be analyzed through the lens of hegemonic masculinity, which pressures men to assert dominance when they feel emasculated, as seen in his reaction to Saru's professional success. Saru's internalization of gender role expectations, rooted in social learning theory, contributes to her submission. Her upbringing in a traditional society teaches her that preserving the marriage is paramount, even at the cost of personal suffering. Saru exhibits her jealous and fighting quality when both mother and father doted on her brother Dhruva. There are many instances when she tries to divert her parent's attention from Dhruva. Once when Dhruva sat on father's lap talking to him Manu's behavior may also be linked to fragile masculinity syndrome, where men experience psychological distress when societal norms about male dominance are threatened.

Psychological Defense Mechanisms

Saru employs various defense mechanisms, as conceptualized by Freud, to cope with the abuse:

Denial: She refuses to fully acknowledge the extent of Manu's violence, maintaining an illusion of control. Her visit to her father's house is a kind of escape from the sadist husband and her loveless marriage. It's a kind of solace from her hectic daily routine too. In her helpless situation she is trying to get relief and freedom through some means

Repression: Saru pushes traumatic memories, such as specific instances of abuse, into her unconscious to avoid confronting them. **Projection:** She occasionally projects her internal guilt onto others, particularly her mother, blaming her for her emotional struggles. **Rationalization:** Saru justifies Manu's abusive behavior by attributing it to his insecurities and frustrations.

Trauma and Post-Traumatic Stress Disorder (PTSD)

Saru's experiences exhibit symptoms akin to PTSD, including:

Hypervigilance: She constantly anticipates Manu's violent outbursts, living in a heightened state of anxiety.

Emotional numbness: Saru becomes increasingly detached from her emotions, a survival mechanism to endure trauma. **Intrusive thoughts:** Her memories of both childhood and marital abuse resurface, often dominating her mental space. The novel's depiction of Saru reflects the long-term effects of complex trauma (C-PTSD), which involves prolonged exposure to abusive situations, leading to chronic self-doubt, emotional dysregulation, and difficulty forming healthy relationships.

Search for Identity and Empowerment

Saru's journey toward self-discovery can be analyzed through Maslow's Hierarchy of Needs. Her professional success fulfills her esteem needs, but her struggle for self-actualization remains hindered by her psychological barriers. Her return to her parental home represents a confrontation with the shadow self, a Jungian archetype that includes repressed aspects of her identity. By engaging with her past, she begins the process of individuation, seeking to integrate her fractured self and reclaim her agency. Saru's eventual questioning of societal norms and her marriage reflects cognitive restructuring, a core component of cognitive-behavioral therapy (CBT). This involves challenging irrational beliefs and replacing them with healthier thought patterns.

Societal and Cultural Influences

Inter-sectionalism plays a role in Saru's experience. As a woman, she faces oppression due to both her gender and her roles as a wife and daughter. Her struggles highlight the intersection of personal trauma with societal expectations. The double-bind theory is relevant to Saru's predicament. She is caught between contradictory expectations: to be a submissive wife and an independent professional. This conflict exacerbates her psychological distress.

Saratha Lakshmi

CONCLUSION

From a psychological and scientific perspective, Saru's trauma in *The Dark Holds No Terrors* is a multifaceted issue influenced by her childhood conditioning, societal norms, and the abusive dynamics of her marriage. The novel provides a profound exploration of trauma theory, feminist psychology, and identity formation, ultimately emphasizing the importance of self-awareness, resilience, and systemic change in breaking free from cycles of oppression. Saru's story is a poignant reminder of the psychological toll of patriarchal structures and the potential for personal growth through introspection and empowerment. 'A sense of displacement has become a vital part of the modern psyche. Displacement not only results in alienation but also gives a chance to incorporate into a new culture. Though they feel marginalised, they seek to empower themselves and battle the menacing challenges, thus causing in new paradigms..' (Vadivu.Npg 3479)

ABSTRACT

Agriculture sector is the backbone for country's economic growth. With rising population, the agriculture becomes the essential one for human survival. Crops are essential one for human survival. The crop diseases get increased in severity and scale. Crop diseases cause production losses. This disease detection is one part of chronic agricultural obstacles to grower and landscaper struggled for long time. Accurate crop disease diagnosis is a difficult task faced by the farmers during growth and production stages. Accurate plant disease identification has great importance to reduce the unnecessary waste of economic resources. Plant disease analysis does not have visible symptoms due to less accuracy and of human resources. Secured image transmission is the process of sending the captured image to farmers in private manner for crop leaf disease detection. Many farmers not detect the disease on time owing to different disease types. Therefore, automatic leaf disease detection is a conventional task to increase the crop productivity. Many methods are introduced for performing leaf disease detection in efficient manner. But, the leaf disease detection accuracy was not improved and time complexity was not reduced. Therefore, the research work determined into leaf disease detection method-based ML and DL method

Keywords: Agriculture, leaf disease detection, farmers, secured image transmission, economic resources, machine learning.

INTRODUCTION

The essential part of farming is obtained in food for ensure the life time and to measured as an important section of every economic system. Based on the FAO of United Nations, the disease requires a yearly rate of 220 billion on worldwide financial system. Early crop leaf disease detection is carried out for saving plants. The plant disease detection using ML and DL is developing field to achieve promising outcome. A DL method gives in effectiveness with further techniques about image recognition. Various methods are designed for plant disease detection and recognition. However, one challenge is required of ability to collect the image dataset for all diseases across many leaf types. Also, different diseases are dispersal fast and make difficult to capture them on plants in instance.

The main contribution of this survey article is followed as:

- To perform image pre-processing and feature engineering for efficient crop leaf disease prediction with minimum time complexity
- To explain different image classification techniques for leaf disease identification
- To discuss the different secured data communication methods for efficient crop leaf disease prediction with higher data confidentiality rate

The organization of the paper is followed as: In section 1, describe the preamble to crop leaf disease prediction methods with their challenges. The review of various crop leaf disease prediction techniques explained in section 2. In section 3, explain the different dataset description. Section 4 explains the description of different methodologies for crop leaf disease prediction methods. Section 5 explains different performance metrics employed for crop leaf disease prediction. Section 6 represents the results. Finally, the conclusion of the survey works with future direction discussed in section 7.

LITERATURE REVIEW

A new deep learning-based system was introduced in [1] for identifying the disease and healthy leaves across diverse crops. The designed system increased the disease prevalence rate. However, it failed to improve the classification accuracy. In [2], hybrid DL method was designed for combine the thermal imaging and hybridization model to carry the rice leaf disease detection. A plant disease detection model was introduced in [3] depending on transfer learning. The designed plant disease detection model increased plant disease detection accuracy. Though the accuracy level was improved, the time complexity remained unaddressed by designed model. A CNN was performed in [4] to image preprocessing for reorganization and segment the impure tea leaf section. An improved crop pest and disease recognition model was introduced in [5] with YOLOv5 network. Ghost Convolution module was used to minimize the model complexity to address real-time detection requirements. However, minimize the complexity level and failed to enhance the accuracy.

A machine learning-based system was introduced in [6] for finding diseases in cotton plant leaf images. Machine-learning model were evaluated to classify cotton leaves into healthy or diseased. But, the feature extraction time was not reduced by machine learning-based system. In [7], lightweight dCNN based method was determined for rice leaf disease detection. The crop health monitoring system was carried out with automatic annotation. But, the error rate was not reduced by dCNN based method. An enhanced IoT application was introduced in [8] for agricultural monitoring systems to joined energy effectiveness, portability and protected approach abilities. But, the confidentiality level was not improved. A method of VMIE scheme was designed in [9] to different layers of refuge protection are encryption, digital signature and steganography. A new feature fusion-based model was introduced in [10] with parallel tracks to extract relevant features from plant images. Swin transformer gathered the global features through shifted windows and self-attention. But, the computational cost was not reduced by feature fusion-based model.

Dataset Description

The initial dataset used is Plant Village Dataset. The URL of the dataset is specified as <https://www.kaggle.com/datasets/abdallahalidev/plantvillage-dataset>. It comprises the diseased plant leaf images and equivalent labels. Human society has to improve the food production by 70% in year 2050 to perform the predictable population size. The 50,000 curated images are determined and infected leaves of crops plants during Plant Village. The data are measured with on-going effort to obtain the yield losses in crop plants because of catching diseases. The second dataset used is Rice Leafs Dataset is taken from <https://www.kaggle.com/datasets/shayanriyaz/riceleaves>. It comprises the images for four rice disease and split into two groups namely train and validation. In two groups, images are categorized into four parts, namely BrownSpot, Healthy, Hispa and LeafBlast. The third dataset used is Sugarcane Leaf Disease Dataset is given from <https://www.kaggle.com/datasets/nirmalsankalana/sugarcane-leaf-disease-dataset>. The dataset comprises sugarcane leaf disease images with 5 different classes. At first, the sugarcane leaf disease images are gathered. The dataset has utilized to five different main categories such as, Healthy, Mosaic, Redrot, Rust and Yellow disease. The dataset comprised the 2569 images in all categories. The database has been collected in Maharashtra, India. The database is balanced with good variety. The images are not in same size because they originate from different capturing devices. All images are stored in the RGB format.

METHODOLOGY

Agriculture is the backbone for global economy Agriculture is the essential one for achieving high food security. Based on the global population, the agricultural systems addressed the rising demand for food. Figure 1 explains the architecture diagram of leaf disease classification and secured communication. Figure 1 illustrates the leaf disease classification and secured communication. Initially, the number of leaf images is collected from the acquisition device. After that, image pre-processing is carried out to remove the noisy pixels. Then, feature extraction is performed for remove the color, shape, size features. Then, image classification is performed to perform leaf disease classification with higher accuracy and minimum time complexity. Finally, the secured image transmission is carried out to improve the confidentiality level during leaf disease prediction.

Generalized Method for identifying unhealthy leaves

The inclusive food security is plant disease for bargain the farming efficiency. The plant disease destroys the crops, food supply chains and increase food shortage risk to preserve the world food sources. The main aim is finding the diseased small leaf regions with disease prevalence rate on crop leaf. A little inception model is carried for classification in disease recognition. The accuracy rate was improved by designed system for plant disease detection. It addressed the model generalization to diverse crops and diseases. The designed system identifies the disease across any crop type by showcasing the potential for broad applicability. It has giving to global food refuge initiatives.

Hybrid Convolutional Neural Network Model

Rice is considered as the staple crop globally. Rice desires the proactive and exact disease detection to ensure the sustainable manufacture. The designed model improved the ability to shorten across diverse datasets and improved disease detection at first stage. Hybrid Darknet53-SVM model improve the model scalability in real-time applications for small-scale farmers to achieve fast, reliable and bargain solutions. The hybrid model provided practical and scalable solution for addressing the agriculture pressing challenges.

Transfer Learning for Leaf Disease Recognition

Global food security is exposed by plant diseases and outcome in economic losses to the grower. Automated plant disease detection is performed with computer vision and ML techniques to offer faster and more exact outcome. The CNN model recognized the plant disease in efficient manner with better accuracy. It utilized for different potential

**Vaishnavi and Shanmugavadivu**

applications in real-world scenarios and aids the planter to classify in crop diseases at an first stage. The designed model has taken timely action for reducing the crop losses.

Segment Anything Model and Deep Convolutional Neural Networks (DCNN)

Tea is considered as an essential beverage across different cultures. Diseases disturbing the tea leave impacted the honesty, production and outcome in considerable losses. The disease detection at an initial stage is a vital one. The dataset is split into 6 categories, such as, Algal Spot, Brown Blight, Gray Blight, Healthy, Helopeltis and Red Spot. Segment Anything Model (SAM) is introduced with the zero-shot segmentation abilities. The designed model is used to partition and extract diseased leaf regions. The customized CNN model is designed to remove the relevant features. It is allocated to MLP, SVM, and Decision Tree classifiers for achieve the disease classification. The designed model has better accuracy in finding the tea leaf disease.

Channel Attention Mechanism and Lightweight Up-Sampling Operator

Computer vision technology and artificial intelligence are employed to perform automated disease detection for crop disease control and prevention measurement. An improved crop pest and disease recognition model is introduced depending on YOLOv5 network to identify the plant diseases under diverse conditions. Ghost Convolution module in backbone network minimized the model complexity and addressed the real-time detection requirements. In designed section, the input images are separated into sample images from constructed crop pest and disease database into training, validation, and test sets.

Swin Transformer and Dual-Attention Multi-Scale Fusion Network

Crops are essential for the survival of the human race. With raising population, crops significance gets increased. Cashew, cassava, maize, and tomato are considered as the economic crops that sustained livelihoods, economies and cultures of many countries. The crops experience many threats from diseases and pests that resulted in high yield and economic loss. Dual-Attention Multi-scale Fusion Network (DAMFN) track collects the local features with Multi-Separable Attention (MSA) and Tri Shuffle Convolution Attention (TSCA) blocks. The designed architecture joined the features extracted through tracks. The designed model employed triplet attention to aim on most informative regions for accurate classification.

Efficient and Secure Image Encryption

The process of color image encryption is transforming the digital images into encrypted forms for conserve the confidentiality in transmission. The confused matrix is established by traversal for assuring non-adjacency of pixels with improved security. Every pixel is scrambled binary values for improved security and complexity. DNA sequence is produced for developing variability with attack resistance.

Power Optimization and Secure Authentication

The IoT performed plant monitoring systems in farming application to deal with issues such as better power consumption, restricted mobility, hard deployment constraints and not sufficient security events for data access. The IoT application is designed to agricultural monitoring systems and it utilized to energy efficiency, portability and secures access capabilities. AWS cloud platform is utilized for reliable data storage and processing with security measures like 2FA and JSON Web Tokens (JWT) features in agricultural IoT solutions. Users are obtained to carry out the secure monitoring system with Android function for mobile access to collect the plant data.

Visually Meaningful Image Encryption

Image ciphering is process of converting simple image data into cipher image data similar noise. Image cipher considered as presence of secret image data. The noise addressed the several possible attacks. VMIE system is designed for three different layers of safety guard. It performed to encryption, digital signature and steganography and utilized for impartial in strength, security and operational efficiency. It is obtained with partially encrypted image generated after zigzag confusion execution in encrypted image.

PERFORMANCE METRICS

Performance evaluation of existing leaf disease identification methods are carried out using four different evaluation metrics. They are:

- Peak Signal-to-Noise Ratio (PSNR),
- Leaf Disease Identification Accuracy,
- Leaf Disease Identification Time and
- Data Confidentiality Rate

PSNR: It is measured based on mean square error. PSNR is measured as difference between original leaf images and quality improved images after preprocessing. It is calculated as,

$$PSNR = 10 * \log_{10} \left[\frac{p^2}{E_{MS}} \right] \quad (1)$$

$$E_{MS} = [I_p - I_o]^2 \quad (2)$$

From equation (1) and equation (2), 'PSNR' is peak signal-to-noise ratio. 'p' symbolized as maximum possible pixel value (i.e. 255). 'E_{MS}' denotes the mean square error, 'I_o' is the original image size, 'I_p' denotes the pre-processed image size. The PSNR is formulated in decibel (dB).

Leaf disease identification accuracy: It is defined as the ratio of number of plant images that are accurately identified as normal or disease by classification task to total number of leaf images. The accuracy is formulated as,

$$LDIA = \left[\frac{NCC}{n} \right] * 100 \quad (3)$$

From equation (3), 'LDIA' symbolizes the leaf disease identification accuracy. 'n' represents the number of plant leaf images. 'NCC' is a number of images accurately classified. It is computed in terms of percentage (%).

Leaf disease identification time: It is measured as the amount of time consumed to recognize the disease. The time consumption is calculated as,

$$LDIT = [n] * T(\text{classify one image}) \quad (4)$$

From equation (4), 'LDIT' symbolizes the disease identification time. 'n' symbolizes the number of leaf images. 'T' represent the time consumption to categorize the single image. It is measured in terms of milliseconds (ms).

DCR: It is measured as number of user data that are accessed by authorized person to total number of users requested data determined as an input. The data confidentiality rate is formulated as,

$$DCR = \left(\frac{\text{Number of data accessed by authorized user}}{n} \right) * 100 \quad (5)$$

From equation (5), 'n' is a number of users requested data. The data confidentiality rate is computed in percentage (%). When data confidentiality rate is high, the method is said to be more secure.

RESULT AND DISCUSSION

It is based on image pre-processing, feature selection and classification by various ML and DL methods. This measurement is performed on crop leaf disease prediction. The different evaluation parameters are utilized to obtain the efficiency and performance of crop leaf disease prediction. The performance of existing crop leaf disease prediction methods is discussed with aid of different graphs. In above figure 2, figure 3 and figure 4, describe the different parameters comparison of nine different existing methods for three different datasets respectively. The designed system increased accuracy rate and reduced time consumption. For Plant Village Dataset, small inception model improved leaf disease identification accuracy by 4%, reduced leaf disease identification time by 16%, reduced error rate by 38% and increased PSNR by 10% when compared to other existing techniques. For Rice Leaf Dataset, small inception model improved leaf disease identification accuracy by 5%, reduced leaf disease identification time by 16%, reduced error rate by 41% and increased PSNR by 8% when compared to other existing techniques. For Sugarcane Leaf Disease Dataset, small inception model improved leaf disease identification accuracy by 5%, reduced

**Vaishnavi and Shanmugavadivu**

leaf disease identification time by 27%, reduced error rate by 34% and increased PSNR by 6% when compared to different existing methods.

CONCLUSION AND FUTURE WORK

In the survey, secured image transmission and classification for crop leaf disease prediction is carried out with leaf image datasets using different techniques. Different performance metrics are used to analyze the different crop leaf diseases. When the result is compared with another study, crop leaf disease identification with deep learning method has attained improved results. In this work, small inception model with deep learning attained higher accuracy during crop leaf disease identification for three different datasets. The results of DL achieve better accuracy than all other different existing methods. In future, the results strongly suggest DL with Signcryption methods can be implemented for crop leaf disease identification instead of the other conventional methods discussed in existing studies.

ABSTRACT

Mitochondrial diseases are a heterogeneous group of rare disorders caused by defects in the mitochondria that arise due to mutations in the mitochondrial DNA or nuclear DNA. These disorders can affect various organs and cause a range of symptoms in the body due to impaired energy production in cells. These are characterized by symptoms ranging from mild to severe including muscle weakness, neurological problems, developmental delays and organ dysfunction. Diagnosing mitochondrial disease can be challenging due to its multiple system involvement, diverse symptoms and variable presentation. Treatment options are limited and often focused on improving health and managing symptoms. Ayurveda offers a holistic approach to managing such conditions and improving their quality of life. The present case report is of 16 years old female who attended the outpatient department of Kaumarabhritya of Parul Institute of Ayurved and Research, Khemdas Hospital, Vadodara, Gujarat, India.

Keywords: Ayurveda, Mitochondrial disease, mitochondrial DNA, nuclear DNA, neurological problems, developmental delays

INTRODUCTION

Mitochondrial disease is a group of disorders that are caused by malfunctions in the cellular metabolism of the mitochondria.[1] The tissues and organs that depend heavily on aerobic metabolism are mainly affected by these

**Mokindan et al.,**

disorders.[2] The mitochondria are the last common pathway in aerobic metabolism.[3] An essential component of cellular physiology, mitochondria are common intracellular organelles found inside cells, and the enzyme systems within them are closely linked to aerobic metabolic processes in the cell.[4] Any mutation/ changes in the genes of mitochondria can lead to inherited abnormalities in the function of mitochondria.[5] Mitochondrial disorders are hereditary diseases which arises due to mutation in the nuclear genes.[6] These nuclear genes which are of 300 in number are present in the mitochondria.[7] These genes contain proteins which are related to the mitochondria and the cellular metabolism of mitochondria.[8] While those caused by genetic changes in mitochondrial DNA are transmitted by maternal inheritance. Mitochondrial disease is listed as a 'rare disease' by the Office of Rare Diseases (ORD) of the National Institutes of Health (NIH).[9] The prevalence of mitochondrial disease is estimated to be 4.7 per 100,000 in children and 12.5 per 100,000 in adults.[10] Approximately 1 in 5000–10,000 babies are born with a mitochondrial disorder.[11] Different kinds of mitochondrial diseases exist. They can impact one or several body parts, such as the kidneys, heart, brain, muscles, eyes, and ears. Because each person has a different combination of healthy and faulty mitochondria and a different distribution of each within the body, symptoms of mitochondrial illnesses might differ. Mitochondrial diseases typically impact multiple cell types, tissues, or organs. Because the energy requirements of muscle and nerve cells are particularly high, mitochondrial diseases frequently present with muscular and neurological issues. Stunted growth, diabetes, cardiac arrhythmia, hearing loss, and visual impairment are among the other typical symptoms. Currently, there are no particular therapies or cures for mitochondrial diseases. Treatment usually focuses on symptom management including medications for cardiac problems, anti-seizure drugs, moderate, doctor-led exercise regimens, physical and occupational therapy, vitamins, supplements, or specific diets. According to Ayurveda, this condition can be taken as Sahaja beeja – beejabhaga – beejabhaga a vayavajanyavikar as, which is a vatadosha vikara.[12] In the human body vayu is responsible for utsah (enthusiasm), nishwasa (inspiration, expiration), the proper excretion of mutra (urine), sweda (sweat), normal transformation of dhatus (body tissue), and the functioning of vani (voice) and mana (mind).[13] Under normal circumstances, it supports all of the body's organs and functions. Thus, abnormal states of function and gunas result from the vitiation of the vata. Ayurvedic treatment can help reduce the symptoms or delay the progression of the disease.

Clinical Characteristics

Mitochondrial disease can affect various organs and systems in the body and often presents with a wide range of clinical characteristics. The Spectrum of symptoms varies from person to person, presenting at any age and ranging from mild to severe. Poor growth; loss of muscle coordination; weakness; seizures; autistic-like features; developmental delays; heart, liver, and kidney disease; gastrointestinal disorders; diabetes; elevated risk of infection; thyroid and autonomic dysfunction; confusion; and memory loss are among the most prevalent symptoms.¹⁴ Children typically exhibit behavioural issues, weariness, and a general lack of energy in addition to developmental impairments. Due to the high energy requirements of these systems, patients with mitochondrial illness have a significant risk of heart failure, arrhythmias, and neurological deterioration.

Patients Information

A female child of 15 years from Pune, Maharashtra was brought to the out-patient department of Kaumarbhritya, Khemdas Hospital, Parul Institute of Ayurved and Research, Parul University, Vadodara, Gujarat by her parents with complaints of progressive weakness, body aches, headache, difficulty in walking, partially bent lower limbs, burning micturition, burning sensation all over the body, protruding eyeball, unable to open mouth widely and also complaints of unable to hold the neck for a longer duration, and difficulty in reading. The details of chief complaints/presenting complaints are given in Table 1

Progress of Disease

The patient was a full-term, normally delivered parasitic twin who had a mass of 2 kg and a birth weight of 950 grams. The baby did not cry immediately after birth, so she was admitted to the NICU and intubation was done. Her mother noticed that during her childhood, she had not reached her expected growth and developmental milestones. As she grew older, she started experiencing body aches, headaches, difficulty in walking, partially bent lower limbs, burning micturition and a burning sensation all over the body. The patient then approached the out-patient

Mokindan et al.,

department of Kaumarbhritya, Khemdas Hospital, Parul Institute of Ayurved and Research, Parul University, Vadodara, Gujarat and was diagnosed with Mitochondrial disease.

Patient's history

The patient had a history of physiological jaundice and pneumonia after birth for which she was admitted to the NICU for 15 days Details of the patient's history and family history are given in Table 2.

Examination

Patient's vitals are depicted in table 3, general examination in table 4 and systemic examination in table 5.

Developmental Milestones

Gross motor and fine motor are depicted in table 6. While language, social & adaptive are given in table 7

Astavidha Pariksha

Nadi – Vata kaphaja
Mala – 1/3days
Mutra – 6-8/day 2-3/night
Jivha – saama
Shabda – ashpashta
Sparsha – anushna sheeta
Drik – vaikrutha
Akruti – avara

Dashavidha Pariksha

Prakruti: vata Kapha
Samhanana: avara
Satmya: sarva rasa satmya
Ahara shakti: Alpa
Pramana: Avara
Vikruti: vata
Sara: avara
Satva: madhyama
Vaya: bala

Investigations

Routine blood, SGOT, SGPT, Serum electrolytes, and CPK were done within normal limits. The electroneuromyography study shows evidence of motor axonal degeneration in the muscle supplied predominantly by the L5 > S1 root (figure 1 to 5).

Diagnosis

The clinical symptoms showing progressive multisystem disorder are suggestive of Mitochondrial Disease. According to Ayurveda, the symptoms are suggestive of beeja – beeja bhaga – beeja bhaga avayava janya vikaras, which is a Vata Pradhana Tridosha vikara.

Samprapti Ghataka

Dosha: Vata Pradhana Tridosha
Dushya: Mamsa, Asthi, Majja, Rasa, Rakta, Meda
Upadhatu: Sira, Snayu
Ama: Saama
Srotas: Sarvasrotas

**Mokindan et al.,**

Srotodushti: Vimargamana, Atipravrtii
Udbhava Sthana: Pakvashaya
Agni: Dhatawagni, Vishamagni and Jatharagni
Vyakta sthana: Sarva sharira

Therapeutic interventions

Treatment details are given in table 8 and 9 of Shamana and Bhrimhana chikitsa

Observations

The improvement achieved by the patient is detailed in Tables 10 and 11

DISCUSSION

Balavatavyadhi is a vatapradhanatridoshaja vyadhi.[15] The symptoms of vatavyadhi are mainly because of increase in Parushata, Karata, Rukshata, and sitata characters of vata.[15] The vitiated vata mostly affects the Musculo-skeletal, neuromuscular, circulatory and neurohormonal system of the body. It is the main cause of mitochondrial disease which involves progressive multi-system involvement. Nidanaparivarjana, shamanachikitsa and samshodhanachikitsa are to be advocated for vata vyadhi.[16] Amapachakavati acts as an agnideepana and amapachana. Here it has been given to kindle the agni which is responsible for producing many vyadhis and also to clear the ama (which is responsible for the kuposhana of the dhatus). Kamadudha rasa contains the Pittahara medicines which reduce the burning sensation of the chest region which is caused by the pitta prakopa.[17] Haridra khand contains drugs which are having properties like ushnavirya, deepana, pachana and anulomana. [18] May acts as Agnideepana, kandughna, vatahara and balavardhana. Ksheerabala acts as Vatahara and balya, which may be helpful in reducing pain and increasing muscle strength, and increase blood circulation in the patient.[19] Bonton capsules help in strengthening the Asthi dhatu (poshana) which simultaneously acts as vatashamaka. Chandraprabhavati acts as mutra recaka, bastishodhaka and pitta hara which helps in reducing the burning micturition (mutradaha).[20] Mahanarayanataila is an excellent vata hara taila and also acts as vedanasthapana and brimhana by reducing the vitiated vata.[21] Shastikashalipindasweda helps in reducing the vitiated vata and gives strength to the muscles by nourishing them.[22]

CONCLUSION

The comprehensive treatment protocol adopted in this case achieved better results in improving the quality of life of the patient. Hence the same approach may be made use of in the management of particular illness.

ABSTRACT

In modern world, an application of Artificial intelligence (AI) is giving new shape to the physical therapy domain through better patient evaluation, treatment customization, and rehabilitation surveillance. Traditional rehabilitation methods are inconsistent and time-consuming because they are based on subjective assessments and periodic clinical evaluations, which can be. AI-based expert systems use machine learning (ML), deep learning, enable data-driven decision-making by analyzing vast amounts of patient data to identify patterns, predict recovery progress, and tailor treatment protocols to individual needs. AI algorithm integrated with wearable sensors facilitates real-time motion tracking, muscle activity assessment, and biomechanical analysis, which allows therapists to monitor rehabilitation progress with greater accuracy. This paper gives insight into various AI-driven approaches applied in physical therapy, including predictive analytics for outcome forecasting, motion tracking for movement correction, computer vision for automated posture assessment, and natural language processing (NLP) for interactive virtual assistants and tele-rehabilitation platforms. Integration of AI with wearables and the Internet of things (IoT) provides real-time supervision and remote rehabilitation, reduces the necessity of repeated clinical care. These advancements help to reduce the need for frequent in-person consultations, thus improving accessibility to physical therapy services, especially for individuals in remote or underserved regions. Implementation of robotics for assisted movement therapy, brain-computer interfaces (BCIs) for neuro rehabilitation, and virtual reality (VR)-based therapy for immersive rehabilitation experiences are the future directions for AI-driven rehabilitation. AI-driven innovations hold the potential to enhance recovery efficiency, reduce human error, and optimize rehabilitation

**Snehal Jadhav et al.,**

outcomes by providing data-driven insights and real-time corrective feedback. As AI continues to evolve, its integration into physical therapy will play a crucial role in making rehabilitation more precise, efficient, and accessible to a wider population

Keywords: AI, Machine Learning, Physical Therapy, Rehabilitation, Sensors, Wearable.

INTRODUCTION

Physical therapy is an essential component of rehabilitation for individuals recovering from musculoskeletal disorders, neurological impairments, and post-surgical conditions. It focuses on restoring movement, reducing pain, improving strength, and enhancing the overall functionality of patients. Traditionally, physical therapy has been administered through in-person sessions with trained physiotherapists who assess patients, design rehabilitation programs, and provide manual therapy along with prescribed exercises. However, traditional rehabilitation methods face several challenges. Accessibility remains a major issue, as many patients, particularly those in remote or underserved areas, struggle to find specialized physical therapy services. Additionally, therapy costs can be prohibitive, making long-term treatment unaffordable for many individuals. Inconsistencies in treatment arise due to the subjective nature of therapist assessments, differences in expertise, and variations in rehabilitation approaches. Furthermore, patient compliance is often suboptimal, as individuals may not perform prescribed exercises correctly or fail to adhere to therapy regimens outside of clinical settings. With advancements in artificial intelligence (AI), the landscape of physical therapy is undergoing a transformation. AI-driven rehabilitation introduces automated, data-driven solutions that enhance therapy accessibility, effectiveness, and personalization. AI systems leverage machine learning, computer vision, robotics, and natural language processing to analyze patient movements, provide real-time feedback, and optimize treatment plans. These technologies enable remote monitoring, personalized rehabilitation programs, and AI-assisted diagnostics, ultimately improving patient outcomes. This review aims to explore the role of AI in physical therapy, detailing various AI-driven techniques, their applications in rehabilitation, and the challenges associated with their integration into clinical practice. By understanding these advancements, healthcare professionals, researchers, and technology developers can work toward refining AI-based rehabilitation solutions for broader implementation.

AI Approaches in Physical Therapy

- **Machine Learning for Personalized Treatment Plans**
Machine learning algorithms interpret patient information, such as medical history, injury type and severity, and course, to create specific rehabilitation plans. Predicting patients' fate and optimizing therapeutic schemes, decision trees, random forest, and support vector machine (SVM) models are used.
- **Deep Learning for Motion Analysis and Biomechanics**
Motion tracking and acquisition of biomechanics based on deep learning models, e.g., Convolutional Neural Networks (CNNs) and Recurrent Neural Networks (RNNs), are used. AI identifies bad movement, offers real-time feedback on corrections and avoids potential injury risks.
- **Wearable Sensors and IoT-Based Monitoring**
Wearable sensors (accelerometers, gyroscopes, electromyography (EMG) measure muscle activation and joint motion. IoT-powered, smart, rehabilitation devices allow remote, real-time tracking and progress monitoring, thereby saving hospital trips.
- **Natural Language Processing (NLP) for Virtual Assistance**
AI chatbots and voice assistants help guide patients through exercises, answer questions, and track adherence to therapy regimens. Virtual therapists equipped with NLP can offer step-by-step guidance and motivational encouragement.

**Snehal Jadhav et al.,**

- **Computer Vision for Automated Movement Tracking**
AI-driven cameras analyze patient movement in real-time without requiring wearable sensors. These systems detect incorrect postures and provide visual feedback for correction, ensuring precise rehabilitation.
- **Predictive Analytics for Recovery Forecasting**
AI models use historical data to make predictions in terms of how long it will take to recover and to describe influences on rehabilitation. Such observations allow therapists to individualize treatment planning and to make some preparations for potential complications.
- **AI in Tele-Rehabilitation and Remote Therapy**
AI is assisting tele-rehabilitation by enabling this remote patient monitoring using cloud-based applications. AI-based rehabilitation devices offer feedback, and recommend adaptations to exercise, opening the door to treatment from the comfort of everybody's home.

Applications and Benefits of AI in Physical Therapy

- **Improved Accuracy:** AI ensures precise motion tracking and therapy adjustments.
- **Personalized Rehabilitation:** AI-driven systems tailor exercise plans to individual patient needs.
- **Remote Monitoring:** When AI and IoT are combined, it is possible to achieve real-time monitoring that can decrease the requirement for physical visits to the clinicians.
- **Injury Prevention:** AI provides corrective feedback to prevent improper movements that could cause reinjury.
- **Efficiency and Cost Reduction:** Automation minimizes therapist workload and reduces healthcare costs.

Challenges and Limitations

- **Data Privacy and Security:** Handling sensitive patient data requires stringent security measures.
- **Reliability and Accuracy:** AI predictions depend on the quality and quantity of training data.
- **Integration with Existing Systems:** AI must be compatible with current clinical workflows.
- **Ethical Considerations:** AI is to be used as a tool to support human expertise, but not to displace therapists.

Future Directions

- **AI-Powered Robotics:** AI-powered robotics is transforming physical therapy by enabling robotic-assisted rehabilitation for patients with mobility impairments due to spinal cord injuries (SCI), strokes, or neuromuscular disorders. These robotic systems, including exoskeletons and robotic-assisted devices, provide targeted movement support, strength enhancement, and motor function restoration.
- **Brain-Computer Interfaces (BCIs):** Brain-Computer Interfaces (BCIs) are emerging as a revolutionary AI-driven technology in neuro rehabilitation, particularly for stroke survivors and individuals with spinal cord injuries (SCI). BCIs enable direct communication between the brain and external devices, allowing patients to control movements using their brain signals.
- **AI-enhanced immersive therapy experiences for engaging rehabilitation:** AI-enhanced Virtual Reality (VR) and Augmented Reality (AR) are creating engaging and immersive rehabilitation experiences for physical therapy. These technologies leverage AI-based motion tracking and biofeedback to enhance rehabilitation exercises, improve patient motivation, and accelerate recovery.
- **Advanced Predictive Analytics:** AI-driven predictive analytics is enhancing the accuracy of patient recovery forecasting, allowing therapists to make data-driven decisions for optimizing rehabilitation strategies. Predictive models utilize machine learning algorithms to assess patient progress, predict recovery times, and customize treatment plans.

CONCLUSION

Artificial intelligence (AI) is revolutionizing physical therapy by making rehabilitation more customizable, accessible, and effective. By leveraging AI-driven data analysis, wearable sensors, and remote rehabilitation technologies, physical therapy is evolving into a personalized and patient-centered process. AI enables real-time monitoring,

**Snehal Jadhav et al.,**

adaptive treatment adjustments, and predictive analytics, ensuring that therapy plans are optimized for each individual's recovery journey.

As AI technology continues to advance, it will further refine rehabilitation strategies, enhancing recovery outcomes, reducing healthcare costs, and expanding access to high-quality therapy worldwide. The integration of AI in physical therapy marks a significant step toward a more efficient, data-driven, and patient-tailored approach to rehabilitation, ultimately improving the quality of life for individuals undergoing physical therapy.

ABSTRACT

Two common types of cancer are lung and liver cancer. Toxins, family history, and heavy smoking are all potential causes of lung cancer. Liver cancer can start in the liver and spread (metastatically) to other organs such as the breast, colon, lung, or stomach. Excessive drinking, genetic mutations, and recurrent hepatitis infections can all lead to liver cancer. The two most common cancers that cause mortality worldwide are lung and liver cancers. Over 800,000 individuals are diagnosed with these cancers annually. Hep G2 cell lines for liver cancer and A549 cell lines for lung cancer were used in the current study utilized to investigate the potential of *Withania somnifera*'s ethanolic extract to fight cancer (whole plant includes- root, leaves, and stem). It was discovered that *Withania somnifera* ethanolic extract was efficient against cancer cell lines. IC₅₀ value against lung cancer cell line (A 549) was observed at 139.75 µg/ml. IC₅₀ value against liver cancer cell line (Hep G2 cell line) was observed at 146.22 µg/ml.

Keywords: *Withania somnifera*, Lung cancer, liver cancer, A 549 cell line and Hep G2 cell line.

INTRODUCTION

Many people view cancer as a terrifying illness. Uncontrolled and aberrant cell proliferation results in the formation of cancer, which can spread to other body areas, impair the function of numerous organs, and erode a person's immune system (1, 2). Traditional techniques involve some uncomfortable steps and have a number of negative

**Neha Singh and Anita R J Singh**

impacts on patients. Liver cancer, also known as hepatocellular carcinoma (HCC), accounts for one in three cancer-related deaths globally (3). Overindulgence in alcohol and its derivatives can result in fatty liver and Hepatitis infection, both of which can induce liver cancer (4). Hepatocellular carcinoma (HCC), or liver cancer, is mostly caused by alcohol chemicals and chronic hepatitis (5, 6). Since plants naturally produce metabolic products, they are thought to be the safest way to cure a variety of ailments. Naturally occurring or plant-based medications have become more popular for treating a wide range of illnesses (7, 8). *Withania somnifera*, sometimes referred to as winter cherry or ashwagandha, is a significant medicinal herb that is a member of the Solanaceae family and is widely grown as a key Kharif crop. It contains a number of significant active compounds. Its maximum growth is 1.5 meters (7). *Withania somnifera* is a significant plant that has been utilized to treat a variety of ailments in the 3000-year-old Ayurvedic medical system. Widely dispersed in several nations, including Afghanistan, Pakistan, Nepal, Bhutan, India, and Sri Lanka (9). Roots are regarded as a significant medicinal ingredient since they can be used as a tonic or rejuvenating medication. Alternatively, they can be utilized as an aphrodisiac and an anti-inflammatory. It has been discovered that root powder works well against fever, TB, leukoderma, arthritic conditions, bronchitis, and asthma. Leaves are useful in treating sores, uncomfortable swelling fever, ulcers, and chest ache. Seeds have narcotic, hypnotic, and diuretic effects (8). Numerous studies have also demonstrated that *Withania somnifera* is non-toxic and safe (10), and that it can strengthen immunity and bodily resilience to illness (11). Previous research has shown that extract from *Withania somnifera* can increase WBC count and alpha esterase positive cell numbers (12). It has also been found that an alcoholic extract from *Withania somnifera* can reduce S 180 tumour in rats and that it is less lethal for them (13). In a different study, an alcoholic extract from *Withania somnifera* showed good synergistic effect with radiation and heat therapy against S 180 tumour in rats (14). Withaferin A can increase cell lysis of V79 tumour cells and showed sensitizer enhancement ratio 1.5 (15). In another study, Withaferin A (the main compound isolated from *Withania somnifera*) showed effectiveness against Ehrlich ascites carcinoma in mice, and the extract can extend mice's life span up to 120 days and is a good radio sensitizing compound (16). It can also increase the lysis of V79 tumour cells and demonstrate a sensitizer enhancement ratio of 1.5 (17). *Withania somnifera* is effective against cancer cells because it increases the production of ROS (reactive oxygen species), which stops the growth and proliferation of cancer cells and aids in apoptosis (18). It also causes programmed cell death of various cancer cells without affecting the growth of normal cells (19-20).

MATERIAL AND METHOD

DMSO, conical flasks, 96-well microplates, ethanolic plant extracts of *Withania somnifera*, test tubes, conical flasks, micropipettes, micropipette tips, digital inverted microscope, spectrophotometer, and CO₂ incubator. Using the Soxhlet distillation process, 95% ethanol was used to extract *Withania somnifera*. After being sterilised, the sample was left to cool and dry at room temperature. Following solvent evaporation, a plant extract was prepared and tested for anti-cancer activity against Vero cell lines, Hep G2 liver cancer cell lines, and A549 lung cancer cell lines. The extract included a variety of active chemicals. *Withania somnifera* ethanolic extract was chosen for the investigation of its cytotoxic potential against Hep G2 cell lines, A549 cell lines, and Vero cell lines for liver cancer by the use of the MTT assay (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide assay) (21). The ideal conditions for the growth of mammalian cell lines were reached when 1 × 10⁶ cells/well of cells were planted in 96-well microplates under sterile conditions and then incubated at 37°C for 48 hours in an incubator with 5% CO₂. After 48 hours, confluence was assessed, and the culture medium was changed when confluence reached 70–80%. Four different quantities of *Withania somnifera*'s ethanolic extract—50 µg/ml, 100 µg/ml, 150 µg/ml, and 200 µg/ml—were used to treat lung cancer A549, Vero, and Liver cancer cells—Hep G2 cell lines—and were incubated for a whole day, in ideal circumstances. The morphological changes in both treated and untreated (control) cells were seen, recorded, and photographed using a digital inverted microscope with a 20 X magnification. After that, Phosphate Buffer Saline (PBS, pH -7.4) was used to wash the cells. Each well received 20 µl of MTT solution (concentration: 5 mg/ml in PBS). After that, the plates were left at room temperature (24°C) in the dark for two hours. Formazan crystals were dissolved in 100 µl of DMSO, and the absorbance at 570 nm was measured. The formula used to compute cell viability percentage (%) was- Cell viability (%) = (Absorbance of sample/Absorbance of control) X 100.

RESULT AND INTERPRETATION

Effect of *Withania somnifera* on Vero Normal Cell Line Effect

The selectivity of *Withania somnifera* was evaluated using a VERO normal cell line. VERO cells showed better vitality throughout all investigated concentrations than cancer cells. Cell survival stayed high at 94.41% at the lowest dose (50 µg/mL), and even at the greatest concentration (200 µg/mL), the viability was 67.91%. These findings imply a good therapeutic index as *Withania somnifera* preferentially targets cancer cells while sparing normal cells.

Effect of *Withania somnifera* Cytotoxicity on A549 Lung Cancer Cell Line

Different doses (50–200 µg/mL) of *Withania somnifera* extract were evaluated for cytotoxic effect on A549 lung cancer cells. As Table 1 shows, the data show a concentration-dependent rise in cytotoxicity. The lysis percentage at 50 µg/mL was 6.09%; it considerably rose to 84.83% at 200 µg/mL. This implies that against lung cancer cells, *Withania somnifera* has strong anti-cancer action. IC_{50} value against lung cancer cell line (A 549) was observed at 139.75 µg/mL. Between 100 and 150 µg/mL, the half-maximal inhibitory concentration (IC_{50}) may be approximated, therefore indicating the extract's great therapeutic potential against A549 cells.

Effect of *Withania somnifera* Cytotoxicity on HepG2 liver cancer cell line

Similarly, the HepG2 liver cancer cell line showed that *Withania somnifera*'s cytotoxicity changed with dose. At 50 µg/mL, the lysis percentage was 8.39%; at 200 µg/mL, it was 78.54%. Especially at 150 µg/mL, the lysis percentage was 52.15%, which is equivalent to the impact shown in A549 cells. IC_{50} value against liver cancer cell line (Hep G2 cell line) was observed at 146.22 µg/mL. Though its greatest cytotoxic impact is somewhat lower in HepG2 cells than in A549 cells, this implies that *Withania somnifera* is effective against both lung and liver cancer cells.

Comparative Study and Possible Mechanisms

Different cytotoxic effects seen in cancer (A549 and HepG2) and normal (VERO) cell lines point to a selective anti-cancer activity of *Withania somnifera*. Cancer cells may be killed by bioactive substances in the extract, like withaferin A or Withanolide A, which is known to stop cancer cells from multiplying and dying. The higher sensitivity of A549 cells compared to HepG2 cells could be due to differences in how well the cells absorb the drug, how they use energy, or their own built-in resistance systems.

CONCLUSION

According to the findings of this study, *Withania somnifera* has strong cytotoxic effects on lung and liver cancer cells, even though it is not very harmful to normal cells. previous study also demonstrated that *Withania somnifera*'s crude ethanolic extract was efficient against the MCF 7 cell line, a kind of breast cancer and lysed the breast cancer cells up to 88.41%(22). This research is corroborated by earlier studies. These findings, including mechanistic investigations and in vivo validation, justify more research on its possible anti-cancer medicinal action.

ABSTRACT

This project's objective is to use high-range ZigBee sensor technology to construct an automated railway gate control and signaling system. To prevent traction system accidents at railroad crossings, automatic railway gate control systems use a layered sensor-based controlling system. Both before and after the crossing gate, the process is used on a specific section of the railroad track. The average speed of trains using the crossing's rails will establish the range. The several amazing tactics that trains employ to reach the crossing will be readily visible to those who use it. Its main job is to control a wide variety of signals that cover the entire crossing region, in addition to visual and auditory cues.

Keywords: Unmanned Railway Crossing, ZigBee, Sensors, Automation System

INTRODUCTION

The Indian railway network is considered the backbone and vitality of the country's economy. With 67,368 route kilometers, Indian Railways is the fourth largest railway network in the world. The Indian government owns and runs the whole network. The first train to run in India was the Rockers, which was used to transport building supplies, on December 22, 1851. The first passenger train service, which traveled 34 kilometers between the stations of Boribander and Thane, was opened or introduced on April 16, 1853. Indian Railways has been purchasing goods

**Arun Kumar Gangwar et al.,**

wagons from the market, but IR has production facilities that make both diesel and electrical coaches and locomotives. Later, IR also seized control of some wagon manufacturing facilities. As of right now, numerous kinds of engines are employed for various tasks. Trevithick's 3ft. (914 mm) gauge coal brook date locomotive, constructed in 1802, was the first full-scale operational railway steam locomotive.

Steam engine

A steam engine is a type of heat engine that uses steam as its working liquid to accomplish mechanical work. A piston is pushed back and forth inside a cylinder by the force created by steam pressure in a steam engine. A conducting rod and crank can convert this pushing power into rotating force for work.

Locomotive

A locomotive is a type of rail transport vehicle that gives a train its motive power. A locomotive that can transport a payload is typically referred to as a power vehicle, railcar, motor coach, or multiple unit. In the past, the steam engine was used for a number of fixed tasks, including pumping water from coal mines to propel wheeled vehicles along railroad rails. A locomotive was merely a type of engine used to propel both other vehicles and itself. Three categories of locomotives exist:

Steam locomotive

This locomotive uses the expansion of steam to create the force necessary to move both itself and other vehicles.

Diesel locomotive

The first experimental diesel locomotive was developed around 1920 in Germany. It was tried in the United States in 1923 and the first commercial diesel locomotive in U.S. was put into use by the central railroad of New Jersey in 1925.

Electric locomotive

The first electric locomotive was built in 1837 by chemist Robert Davidson of Aberdeen and it was powered by galvanic cell (batteries). Davidson later built a larger locomotive named Galvani, exhibited at Royal Scottish Society of Art Exhibition in 1841.

Barrier

Barriers are the actual lines that separate tracks and intersections of roads, protecting people and property from the most dangerous dangers and mishaps. Indian Railways is one of the largest Railway systems of the world which spreads across over 67,368 route kilometers, and is fully owned and operated by, Government of India. These level crossings are not only the bottlenecks in Train Operation, but also a major contributor to the accidents and fatalities. A web-based system for overall Safety Management of Indian Railway (SIMS) has been developed in which one of the modules is over level crossing which assigns a unique Identification Number to every level crossing and various information are tagged over it. Indian Railway have envisioned to eliminate all unmanned level crossings over a time frame which will not only bring down the number of accidents rather also improve the line capacity as trains get held up at busy LC gates. It will further save operation and maintenance costs incurred on the gates. There have been several fatalities in the past as a result of collisions between trains and automobiles because these unattended level crossings were not guarded. People frequently sustain injuries or lose their lives when crossing unattended level crossings since they were not marked crossings. It is anticipated that there would be a considerable drop in train accidents now that unmanned level crossings have been completely eliminated from the railway network. The Railway Board claims that from April 2017, there have been significantly fewer unattended level crossings on wide gauge tracks. Up to 4,943 unattended level crossings on wide gauge tracks were reported in April of 2017. By April of 2018, such crossings had decreased to 3,479 from the previous year. By November of 2018, there were only 77 level crossings left, and by December, there was just one unattended level crossing left.

RAIL ACCIDENTS

In 1839, the government introduced the safety measures as well as standardization for public level crossings. Where rail and road crossed, the railway had to provide gate that were kept closed across the road. To prevent the undesirable railway accidents at mannered and unmannered railway crossing in India or worldwide countries, this system has been taken into consideration keeping the objective that in developing technical era there should not be any loss of human life.

Accidents

- In 1981, Bihar train disaster (around 600-800 people were killed)
- In 1995, Firozabad train disaster (around 358 people were killed)
- In 1999, Gaisal train disaster (around 250 people were killed)
- In 1998, Khanna rail disaster (around 212 people were killed)

LIST OF RAIL ACCIDENTS ON RAILWAY CROSSING IN INDIA

- 4 June 2002 – The Kasganj level crossing disaster occurred when a Kanpur–Kasganj Express collided with a passenger bus near the town of Kasganj, Uttar Pradesh, killing 30 and injuring 29.
- 16 June 2004 – The Matsyagandha Express (Mangalore–Mumbai) derailed when it struck a boulder on the line, killing 14.
- 2 January 2010 – The Saryu Express hit a tractor trolley at an unmanned railway crossing in Pratapgarh. There were no injuries.
- 17 January 2010 – Harihar–car collision at Barha railway crossing under Haidergarh police station area in Barabanki district.
- 4 June 2010 – The Coimbatore–Mettupalayam special train collided with a mini-bus at an unmanned level-crossing at Idigarai near Coimbatore.
- 18 June 2010 – The 8084 (Vasco-da Gama–Howrah) Amaravati Express derailed after colliding with a road-roller at an unmanned level crossing near Koppal, Karnataka, injuring 27.
- On 20th March 2012- A train collide with an overcrowded taxi minivan at an unmannered crossing in northern UP, 296km from Lucknow (killing 15 people).
- On 19th December 2012- The Indore Yashwantpur express collided with a truck near Sankhapur in Medak district (injuring many people).
- 20 March 2012 – A train collided with an overcrowded taxi minivan at an unmanned railroad crossing in northern Uttar Pradesh, 296 km (184 mi) from Lucknow, killing 15.
- On 23rd July 2014- A Nanded passenger train collide with a school bus at unmannered level-crossing in Masaipet village of Medak district (killing 18 people).
- On 25th April 2018, a train collide with school bus van at railway crossing in UP's Kushi Nagar (killing 13 children).
- On 5th December 2022, a Chandigarh – Lucknow train collide with a truck at level-crossing in Shahjahanpur district (killing 5). The train has given a green signal while the railway crossing is open for vehicles.

LITRATURE SURVEY

Velayutham *et al.* [1] created a system that uses GPS to track and identify the train's arrival. Google Map displays the rail tracks, and the GPS is used to track the train. As a result, the versatile application is implanted with GPS after preparation [9]. The railroad door is operated by the motor driver using this application. There is no automatic railway gate control in the system; instead, the engine driver operates the rail gate. Our suggested solution, however, is fully automated. An Automatic Railway Gate Controller system was created by Chandrappa *et al.* [2] to operate railway gates without the need for a gatekeeper. Two Infrared obstacle detection sensors used to identify the arrival and departure of trains [11] and a stepper motor used to control the gate. Here, by using only IR sensor it is difficult

**Arun Kumar Gangwar et al.,**

to get exact location of train, and also IR sensors can't work well at dark. But we use ultrasonic sensor which works both in light-dark and also use GPS module for tracking location and measuring distance. Rail transportation is without a doubt one of the most secure methods of transport, in spite of the fact that the interface amongst street and rail, named LC, speaks to major probability of mishaps for the railroads. LC is viewed as a specific feeble point in street and railroad framework, and after that, an abnormal state of security prerequisites constitutes a critical sympathy toward rail organizations and 2017 Third International Conference on Computing, Communication, Control and Automation (ICCUBEA) street associations. Street and railroad security partners plan to investigate new innovations [5] to decrease LC mischances on account of the quantity of repulsive deadly mishaps that street vehicle drivers cause. As of late, a few tasks were wanted to redesign LC wellbeing frameworks. An example LC mishap data framework has been proposed by the "More secure European Level Crossing Appraisal and Technology" (SELCAT) extension [6] for evaluating potential innovative LC wellbeing solutions and for exposing all LC mishaps in European countries. To improve the well-being of transportation systems, Japan implemented a "astute transport framework" (ITS) [7]. Regardless, the main focus for customized arrangements is still developing another LC security framework that allows for the measurement of the hazard to be reduced. The PAN more secure venture [8] means to effectively add to lessening LC mischances. In this venture, one of the targets is to play out a video-investigation based framework to perceive peril circumstances and assess the level of risk of any distinguished and followed moving item at LC. The work introduced in this work is a piece of the PAN more secure venture. In this work, we actualize an astute video reconnaissance framework that considers the programmed acknowledgment and assessment of basic circumstances in LC situations. It shows the summation of the proposed video reconnaissance framework. The initial stage of this model comprises in vigorously distinguishing and isolating moving items crossing the LC. Numerous strategies seemed to accomplish most noteworthy conceivable identification exactness progressively. Cases of strategies are free segment examination [9], histogram of arranged angles [10], wavelet [11], successive part thickness guess [12], and Eigen foundations. However, to be productive, these methods require assist advancement to recognize distinguished items.

For this reason, we suggest an additional process to locate and separate each and every moving object that enters a specific reconnaissance area. This method involves bunching moving pixels by comparing certain vitality vectors associated with each moving pixel and each objective in order to obtain isolated pieces. Protest following is the next step in the suggested video observation model, and it starts when enough detected pixels have a location with moving objects. There are two notable types of visual following tactics used in the text. The primary sort depends on target portrayal and limitation (Blob, piece, and form following) [11], and the second kind of strategies uses sifting (Kalman and molecule channels) and information affiliation [7]. Each of these calculations has preferences and disadvantages, yet a large portion of them can't track accurately every one of the pixels or the lion's share of them from a given question. In this way, we propose another strategy that essentially enhances the following execution of every pixel influenced by movement inside a recognized question. This is accomplished by a Harris-point-based optical stream engendering system, trailed by a Kalman-sifting based remedy. The third stage of the framework is wanted to foresee perfect directions of recognized targets, for example, to dodge possibly risky circumstances. The Gaussian blend display [12] and the shrouded Markov show (HMM) [9] and some of its expansions, for example, the various leveled HMM [12] and the coupled concealed semi-Markov demonstrate [10], are normally utilized for speaking to and perceiving articles' directions. Be that as it may, these strategies require a high number of factual measures to be precise. Thus, it is hard to apply these strategies progressively. In this work, we propose an ongoing HMM to anticipate perfect directions of moving articles in a LC domain. At last, to assess the level of risk identified with each protest, the anticipated perfect directions are broke down considering diverse wellsprings of threat (position, speed, increasing speed) and utilizing a data combination system in view of Dempster Shafer hypothesis [11].

Arun Kumar Gangwar *et al.*,

METHODOLOGY AND IMPLEMENTATION OF WORK

As per consideration of human life and time, we have proposed a prototype for the automatic control of the railway crossing barriers. On testing of our project, we found that the sensing circuit properly detects the arrival of the train and it responds to provide the pulse for the ZigBee module. ZigBee transmitter transmits TX the signal corresponding to the pulse and it further activates the ZigBee receiver RX and it makes the circuits- buzzer and series LDR circuit to ON. All these operations have executed properly and the series LDR circuit senses the movement on the crossing of the people and vehicles by checking the continuity of infrared light projected on to the all three LDRs which are connected in series. If any of the LDR is not receiving the infrared light, it gives high output at the crossing. In corresponds to the series LDR circuit output low or high, the motor either runs to close the barrier at high output or sends the signal to stop circuit transmitter with the help of transmitter and stop circuit stops the train. After some delay, a signal is sent to manually closing of the barrier all this sensation will be displayed on the LCD screen. Again, this operation has performed well accurately. After passing through the crossing the LDR circuit 2 detects the departure of train and it gives a pulse to a transmitter TX which makes the all three circuits OFF connected with RX also this operation will be displayed on the LCD screen. After that passing some distance from departure sensing point, the LDR circuit again detects the passing of the train and it provides the pulse to a transmitter TX to opening of the barrier by this way the prototype is executed. The represented distance between the LDRs connection is assumed as the distances in kilometers. The whole system is based on fast and new technology ZigBee. The zig-bee makes the system possible to communicate between the circuits and other applications along with the sensors to cover a wide distance and this can be operated on a large scale which makes the existing railway system faster and more accurate about any types of the casualties.

Initial conditions

LDR-1 is placed at 1.5 or say 2Km on either side of the gate whereas LDR-2 is placed at some distance of 4-5 Km approx. and LDR-3 is placed on the level crossing in last to reset the whole system LDR-4 is connected after the LDR-3 at some distance so that all the developed system can be reset and restart again. The train will move in the direction from LDR-1, LDR-2, LDR-3 and then to LDR-4. Initially the LDR circuits will continue to detect the crossing of the train and the movements of any objects the motion will be detected when the particular thing will come into the range of the LDR sensor. Buzzer is made of since there is no approach of train and road users need to be warned & barriers are made unoperatic initially so that the road users can freely move through the gate.

Train arrival detections

LDR ckt-1 is placed at the distance of 2 km detects the arrival of train and Z-Tx1 transmits the signal to the receiver to the Z-Rx1. Here the Z-Rx1 is made connected to the buzzer which it operates when the train arrival at LDR-1 is detected.

Warning for road users

At the moment the train arrival is sensed, Z-Tx1 TX1 sends the signal to RX1 which activates the buzzer connected with it. Here alert system activates in which use of buzzer and led is taken. The arrangement of LED is made in such a way which when it glows up it shows cross sign which is known for the danger signal. Buzzer circuit makes the sound to warn the people and cattle at the crossing.

Sensing for vehicles

For sensing the human and vehicle movement on railway crossing, the three series LDR sensor activates by RX1. And these sensors respond to two circuits connected with it. One connected with TX2 transmitter and another connected with relay to start the servomotor to close the barrier.

**Arun Kumar Gangwar et al.,****Gate closing operation**

If there is continuity with LDR, this gives the low output to Z-Tx2 and then Z-Tx2 sends the signal to RX2 receiver and this makes the train stop circuit transmitter OFF which is normally continuously for stopping the train and train continuously runs towards the crossing. In this situation the relay operates to start the servomotor to close the barrier. If there is any interruption in the continuity of any of the three LDR circuit which shows that someone is there at the crossing on the railway track, then this circuit gives the high output. On receiving the high output, the relay doesn't operate and train stop circuit transmitter activates and it stops the train.

Signal for train

After stopping the train, the train should be started for that the circuit arrangement is done that when the servomotor operates i.e., when barrier closed with the help of the leaf switch via relay the when the leaf switch complete the circuit the N/O pin of relay becomes N/C after which the starts moving from that point i.e., place.

Turn OFF the display, buzzer and crossing sensor circuits

When the train crosses the railway crossing, after travelling some distance, the LDR ckt-4 detects the departure of the train and on getting the high output Z-Tx2 transmits the signal to Z-Rx1 which reset the receiver and as a result of this all the three circuits- display circuit, buzzer circuit and series LDR circuit gets OFF.

Opening of the barrier

After passing the crossing and series LDR circuit, the train reaches some distance from the crossing and at a point, LDR ckt-4 detects the passing of the train and it operates the transmitter Z-Tx2 which transmits the signal to receiver Z-Rx2 and due to this the relay connected with receiver operates the second motor to open the crossing.

Software Window**(ZigBee and Arduino Uno)**

It is the interfacing of ZigBee module to configure it as Transmitter. Configuring the digital-analog pins to DI(3). It is the interfacing of x-bee module to configure it as Receiver. Configuring the digital-analog pin to DO(LOW). The basic interface of an Arduino IDE software used for initialize x-bee module.

RESULT AND ANALYSIS

As per consideration of human life and time, we have proposed a prototype for the automatic control of the railway crossing barriers. On testing of our project, we found that the sensing circuit properly detects the arrival of the train and it responds to provide the pulse for LDR circuits that transmits the corresponding signal and it further activates the Arduino and it makes the all three circuits- buzzer, display and barrier circuit to ON. All these operations have executed properly and the series LDR circuit senses the movement on the crossing of the people and vehicles by checking the continuity of infrared light projected on to the all three LDRs which are connected in series. If any of the LDR is not receiving the infrared light, it gives high output at the crossing. In corresponds to the series LDR circuit output low or high, the motor either runs to close the barrier at high output or sends the signal to the train through which the train stops. After some delay, a signal is sent to manually closing of the barrier. Again, this operation has performed well accurately. In above manner we have tested the operation of our project and found that all the circuits are operating properly and this technique will fulfill the requirement of modern people as time and life is very important for every people. By the uses of XBEE modules we can also increase the range of transmission and increase the sensitivity of the project for signal detection. It can make our project more efficient. Table 4.1 encapsulates key findings and gaps from the reviewed literature, highlighting the progression and limitations in automated railway crossing systems.

Arun Kumar Gangwar *et al.*,

APPLICATIONS

In this project we are concerned of providing an automatic railway gate control at unmanned railway crossings replacing the gates operated by gate keepers to a fully automatic operated gate system. It is good then older system with two things. The reduction of time for which the gate is being kept closed. And to provide safety to the road users by reducing the accidents that usually occur due to carelessness of road users and at times errors made by the gatekeeper.

- Railway gate controlling.
- Safety of train passengers.
- Safety of public crossing the railway barriers.

ADVANTAGES

- An Automatic Railway Gate Control is implemented with hardware and easy control.
- Human intervention at level crossings can be removed with the help of this project and many railway level crossing accidents can be prevented.
- Up to a high extent railway crossing accidents can be avoided with the implementation of this project.
- Human Resource: - this project reduces the dependency on human control for the closing and opening of the barrier and helps to solve the problem of human resource
- Safety and quality of services: -with the implementation of this project the safety concern of human life and wealth can be solved and this system increases the quality of service of railway.
- With the help of this project, we are able to save the time at railway crossing as many times the barrier very early before the arrival of the train.
- The burden of expenses on the salary of people appointed at crossing can be save with the implementation of this project.

LIMITATIONS

In spite of the fact that the electric traction has so many advantages, it suffers from many disadvantages which are given below:

Electric traction has high capital cost due to overhead equipment, so electric traction become uneconomical unless heavy traffic is to be handled.

- Electric traction is tied to electric routes.
- Power lines for electric traction causes disturbance in neighboring communication lines.
- Electric traction can be used only at the places which are electrified.
- In electric traction, a power failure for few minutes causes distortion in traffic.

ABSTRACT

David Alan Mamet's *Sexual Perversity in Chicago* (1974), an Obie Award-winning play, explores the humanistic challenges and misconceptions that undermine genuine relationships between men and women in modern American society. Set against the backdrop of a materialistic culture, the play delves into the fears, fantasies, and emotional disconnects that hinder meaningful connections. The characters—Bernard Litko (Bernie), Dan Shapiro (Danny), Joan Webber (Joan), and Deborah Solomon (Deb)—serve as representatives of mid-20th-century gender dynamics. Bernie's inability to establish a relationship stems from his deep-seated fear, shaped by traumatic childhood experiences and misguided notions of intimacy. His fantasies replace genuine interactions, leading to awkward and unconvincing exchanges, such as his first encounter with Joan, which ends in rejection. In contrast, Danny manages to form a temporary bond with Deb, but their relationship quickly disintegrates, reflecting the fragility of modern connections. This study examines the damaging effects of societal cynicism and materialism on human bonds, underscoring the need for love, empathy, and emotional authenticity to sustain relationships.

Keywords: humanistic challenges, man-women relationships, emotional disconnect, materialism, emotional commitments

Renuga et al.,

INTRODUCTION

David Alan Mamet, born on November 30, 1947, in Chicago, Illinois, is a renowned American playwright, screenwriter, and director, celebrated for his sharp dialogue, incisive character studies, and unflinching explorations of human behavior. A prominent figure in modern American theater, Mamet's works often examine themes of power, communication, morality, and the complexities of human relationships. His writing is characterized by his distinctive use of language, often referred to as "Mamet Speak," which mimics the rhythm and cadence of natural speech, complete with interruptions, pauses, and overlapping dialogue. This style captures the authenticity of everyday conversations while exposing the underlying tension and subtext.

Mamet's breakthrough came in the 1970s with plays like *Sexual Perversity in Chicago* (1974) and *American Buffalo* (1975), which earned him critical acclaim for their raw and provocative storytelling. Mamet's later works, including the Pulitzer Prize-winning *Glengarry Glen Ross* (1984), cemented his reputation as one of America's foremost dramatists. Beyond theater, Mamet has achieved significant success in film, writing screenplays for iconic movies like *The Verdict* (1982), *The Untouchables* (1987), and *Wag the Dog* (1997). He has also directed several films, including *House of Games* (1987) and *The Spanish Prisoner* (1997). Mamet's contributions to literature, film, and theater reflect his deep engagement with issues of trust, deception, and the human condition, making him a pivotal figure in contemporary storytelling. Produced in 1974, 'Sexual Perversity in Chicago' ('SPIC') was voted the best Chicago play of 1974 winning an Obie Award. It delineates some of the humanistic aspects of building and maintaining genuine relationship between men and women. It stresses the need for love and emotion for nourishing the bond between opposite sexes. It also discusses the reasons or rather the bitter experiences, which have led to the sex-related crimes and human beings' wrong notions about relationship.

Bernard Litko (Bernie) and his friend Dan Shapiro (Danny) are representatives of modern American men. Joan Webber (Joan) and Deborah Solomon (Deb) represent the twentieth century women folk in America. They have misconceptions about the opposite gender. Lacking real experiences with women, Bernie usually fantasizes and describes his experiences in a ludicrous tone and language. And in reality, he fails in establishing a relationship with Joan, whereas Danny manages to form a bond with Joan's friend, Deb. Danny and Deb decide to live together. But, there appears a breach, within a short span of time, and they get separated. Thus, 'SPIC' ends with the characters' failure in establishing a genuine man-woman relationship.

Bernie wishes to establish bond with women, but he fails to do so because of his fear. When he narrates his experience with a girl, whom he guesses will be of eighteen to twenty five years old, he appears like a frightened man, who is scared of making relationship with a woman or rather a person who feels that he cannot satisfy the present day woman's needs. This shows his misconception about forming rapport with women. Also, he lacks interest in establishing and pursuing his association with them. One of the reasons for Bernie's wrong perception about relationship is his boyhood experience, which he narrates, with horror, to Danny : "We 're all wondering what this old guy is doing at the cartoons, and he sits down at the end of the row, and halfway through he reaches over and grabs my joint" (Mamet 1978b). This incident, which happened in a theater, has made an indelible mark in Bernie's mind. America is filled with many such Bernies, who are afraid of making relationships because of the bitter experiences in life. Bernie's fantasized stories become all the more interesting, because he spends all his time and energy in building them. The problem is that he has the same perception, like the one he has in his imagination, when he meets a woman in reality. And hence, he fails in his attempts to create any bond. In his first meeting with Joan, he talks to her as if he is talking to a woman in imagination:

So I see you seated at this table and I say to myself, 'Doug Mckenzie, there is a young woman,' I say to myself, 'what is she doing here?,' and I think she is here for the same reasons as I. To enjoy herself, and perhaps, to meet provocative people. I'm a meteorologist for TWA. It's an incredibly interesting, but lonely job This is life. You

**Renuga et al.,**

learn a lot about life working for the airlines. Because you're constantly in touch, you know with what?, with the idea of Death. (Pause) Not that I'm a fan of morbidity, and so on (Mamet 1978b).

For a first meeting with a young woman, this talk sounds very prosaic. Joan, who is really upset, finds him uninteresting and remarks that she does not find him "sexually attractive" (Mamet 1978). Thus, the meeting between Bernie and Joan shows that Bernie's imagination about women is wrong and how and why his attempts to establish relationship with them fail. He is misled by the American culture which believes that emotional and genuine relationships are no longer possible because of the engulfing materialism.

A school teacher, Joan, also has similar upsetting experiences with school children, who indulge in childish sex plays. Though she is frustrated with the children's behaviour, she counsels them in such a way that they do not get hurt. "Were you playing with each other's genitals? Each other's ... pee-pees'?.... All right no. No, Stop that, there's no reason for tears It's perfectly ... natural. But there's a time and a place for everything. Now no, it's all right" (Mamet 1978b). Like Bernie, she also has a strong misconception about the opposite sex. According to Mamet, American women do not like getting into any bond with men. And if at all they do, it is because of social pressure. Bigsby (1985) quotes Mamet thus: "Joan sees men as 'problematical creatures which are necessary to have a relationship with because that's what society says, but it never really works out. It's nothing but a schlep, a misery constantly." Joan even goes to the extent of saying that a man-woman bond is "Physical and mental mutilations we perpetrate on each other, day in, day out Trying to fit ourselves to a pattern we can neither understand (although we pretend to) nor truly afford to investigate (although we pretend to)" (Mamet 1978b). This shows her anxiety over not being able to understand and establish a genuine and compassionate relationship with any man.

Unable to come to grips with her own self, Joan sees sex as a resort of anti-social elements. She is disturbed with the sex-related crimes. She also sees the increasing divorce rate as an evidence for the impossibility of a good and healthy relationship: "Well, look at your divorce rate. Look at the incidence of homosexuality the number of violent, sex-connected crimes (this dressing is for shit) ... all the antisocial behaviour that chooses sex as its form of expression" (Mamet 1978b). All these have prejudiced her against establishing relationship with any man. Her belief turns true and ascertained as Deb returns from Danny after a very short term relationship. She does not find fault with her friend. She accuses only men folk for this: "It was not your fault. Say what you will, the facts don't change and the fact is if you take a grown man whose actions and whose outlook are those of a child" (Mamet 1978b). She feels that men lack maturity of thought and action. Thus, people like Joan get constantly exposed to breach of relationship and they become obsessed with the misconception about man-woman relationship.

In the initial stages of Danny and Deborah's relationship, there appears to exist some compliance with each others' feelings, which makes them decide to live together. But, when they start living together, they find each other wanting to fill the vacuum in their hearts: "You go home with me. Everything's fine. Sex, talk, life, everything. Until you want to get "closer," to get "better" I don't mind physical violence. I just can't stand emotional violence" (Mamet 1978b). Deborah gets frustrated and annoyed at this. And they get separated. For Danny, relationship means responsibility. Though he admires Deborah and compliments her for her physical beauty, he cannot get along with her when it comes to emotional attachment. For him, 'emotional commitments' are a threat to his 'adolescent world' (Bigsby 1985).

Danny may also be apprehensive that relationships may hinder his growth. But Flynn (1973) shatters this wrong notion. In his essay titled 'The Problem of the Moral Hero,' he elaborates thus: "When men enter into new human relationships, then new commitments, emotions, loyalties, and eventually ideals begin to develop. Living a new way of life changes them into new men, if they are still flexible enough to change." Humans are prevented from changing for betterment because of their egoistic attitude getting rid off which will help them prosper as true human beings. Both Bernie and Danny, do not see what they have imagined, and what they see, they are not able to accept. John Callens (2004) says, "There is a mismatch between the woman of their fantasies and those they now encounter. Bernie expects submission and acquiescence. He encounters aggression and rejection Danny does briefly make

Renuga et al.,

contact but has no idea how to function with a real woman rather than the fantasy he has been led to expect." According to Bernie, going after woman is like losing one's own senses: ".....you are going to lose your head over a little bit of puss? You are going to sell your birthright for a mess of potash?" (Mamet 1978b). Bernie is not only ignorant about the importance of man-woman relationship, but also he does not want to even understand the need for such a bond, let alone making an attempt to form one.

The durability of life's bond is guaranteed if it is nourished by love and emotions. The failure in establishing a genuine relationship between Bernie and Joan, and Danny and Deborah proves this statement. Mamet asks Wetzsteon, the drama critic, "Why don't men and women get along?" The critic remarks that men regard "Women as objects of conquest, as beings who possess what men want yet refuse to yield it" (Wetzsteon 2001). All the characters in 'SPIC,' treat sex as a commodity without any regard for the underlying love. This 'absence of authentic love' (Roudane 1996) is Mamet's concern. Humanism sees "sexual emotions and their fulfillment as healthy, beautiful and nature's wonderful way of making possible the continued reproduction of the race" (Lamont 1973). But, for Mamet's characters, 'sexual emotions' remain only in fantasies and imagination. In reality, they fail miserably. The distance between failure and success is not wide. With proper understanding and right perception, they can win each other's love. Their egoistic nature and a failure in understanding their needs lead them to a failure in establishing 'potential relationships' (Bigsby 1985).

As Lamont says, man-woman relationship is very significant for the continual existence of human kind on this earth. The problem that occurs because of the misconceived notion is two fold. One is the question of human race suffering extinction. The other one is the reproduction of good-natured human beings. The resultant generation will not be healthy, both physically and mentally. Hence, in the interest of the human race, people should have a right attitude toward right and genuine relationship.

'SPIC' is one of the best plays in terms of language usage. Mamet, a skilful language playwright as he is, makes the words act. The fast rhythm of the language indicates the speed with which the proposals for the relationships are made and broken. It is the obscene and at the same time the humorous language that gives a flashy clothing to the breach of relationships and makes even the agony look light, so that when the members of the audience leave the theater, they leave with a light heart, but with a strong message for their lives.

CONCLUSION

Thus, Mamet spells out the reason for failure in forming ties between men and women in 'Sexual Perversity in Chicago.' He insists on the fact that the welfare of the human race depends upon the individual's interest and capability for establishing good relationship with the opposite gender. Through this play, Mamet emphasizes the individual's need for emotional commitment and understanding for a harmonious relationship between men and women.

ABSTRACT

The animation industry has undergone significant transformations due to advancements in artificial intelligence (AI). AI-driven tools and techniques have streamlined animation processes, reducing production time and costs while enhancing creativity. This research paper explores the impact of AI on animation, highlighting key AI technologies, their applications, advantages, challenges, and future prospects.

Keywords: Artificial Intelligence, Animation, Deep Learning, Machine Learning, AI Tools, CGI, Automation

INTRODUCTION

Animation has evolved from traditional hand-drawn techniques to advanced digital animation, with AI playing a pivotal role in this transformation. AI-powered tools assist animators in automating repetitive tasks, generating realistic animations, and improving workflow efficiency. This paper examines the integration of AI in animation, its benefits, challenges, and future trends.

AI Technologies Used in Animation

Machine Learning(ML): Used for motion prediction and automation. Deep Learning(DL): Generates realistic animations through neural networks. Computer Vision: Enhances character expressions and movement tracking. Natural Language Processing(NLP): Automates script writing and voice synthesis. Generative Adversarial Networks (GANs): Creates life like character animations.

**Sayali Kumbhar****Applications of AI in Animation**

Automated Character Animation: AI can generate character movements based on real-time inputs. **Facial Animation & Lip Syncing:** AI-driven tools like Adobe Character Animator enhance accuracy. **Environment & Background Generation:** AI assists in creating detailed backgrounds quickly.

AI-Assisted Storyboarding: Automates sketching and sequencing for animated scenes. **Virtual Assistants & Chatbots:** Used for interactive storytelling and audience engagement.

Advantages of AI in Animation

Time Efficiency: Reduces manual effort and speeds up production. **Cost-Effectiveness:** Lowers production costs by automating complex tasks. **Enhanced Creativity:** AI provides animators with new tools to experiment with styles and techniques.

Realistic Animations: AI improves character expressions, motion dynamics, and realism.

Challenges and Limitations

Loss of Artistic Control: Over-reliance on AI may limit human creativity.

High Implementation Costs: Advanced AI tools require significant investment.

Ethical Concerns: AI-generated animations may raise questions about originality and authenticity.

Job Displacement: Automation may reduce demand for traditional animators.

Future Prospects

Enhanced AI-Generated Content: AI will improve procedural animation techniques.

Hyper-Realistic AI Animation: Future AI models will produce more lifelike characters.

AI and Virtual Reality (VR) Integration: AI-driven animation in VR will redefine storytelling.

Personalized AI Animation Tools: AI-based software will cater to individual artistic styles.

CONCLUSION

AI has significantly impacted the animation industry, offering new possibilities for efficiency and creativity. While challenges exist, AI's future role in animation promises more advanced, accessible, and innovative animation techniques. The continued evolution of AI-driven animation will shape the future of digital storytelling and entertainment.

ABSTRACT

Diabetes is a chronic metabolic disorder that significantly impacts functional abilities, particularly Activities of Daily Living (ADL) and Instrumental Activities of Daily Living (IADL). These limitations influence the quality of life, economic burden, and healthcare utilization of elderly individuals. The study examines the factors influencing ADL/IADL limitations among elderly diabetic patients in India and assesses the impact of demographic, socioeconomic, and disease-related factors on ADL/IADL limitations. The study employs data from the Longitudinal Aging Study in India (LASI) (2017–2021), analyzing 8,857 individuals aged 45 and above. Negative Binomial Regression analysis was used to assess the effects of various factors on ADL/IADL limitations. Andersen's Behavioral Model of Health Services Use provides theoretical framework, categorizing determinants into predisposing factors, enabling factors, and need factors. This includes strengthening preventive healthcare, expanding geriatric rehabilitation services, enhancing rural healthcare access, promoting mental well-being, and fostering community-based interventions to improve functional independence in elderly diabetic patients.

Keywords: Diabetes, ADL (Activities Of Daily Living), IADL (Instrumental Activities Of Daily Living), Andersen's Behavioral Model, Health Expenditure, Multimorbidity

INTRODUCTION

Diabetes is a chronic metabolic disorder characterized by chronic Hyperglycemia due to defects in insulin secretion, insulin action, or both. This illness has become an increasingly significant worldwide health concern, affecting both people and healthcare systems. Apart from its immediate medical consequences, diabetes plays a major role in functional limits in both Activities of Daily Living (ADL) and Instrumental Activities of Daily Living (IADL). Consequently, these constraints affect people's general well-being, financial strains, and quality of life (Shobhana et al., 2000; Priya et al., 2020). This study explores the factors that affect ADL and IADL restrictions in older diabetic patients in India, with an emphasis on the costs involved, in an effort to offer practical recommendations for clinical and governmental solutions.

Disability refers to the negative aspects of the interaction between the individual and the environment, i.e., deficits, limitations in the activity and restrictions in his/her social participation (WHO, 2001). Activities of Daily Living (ADL) refer to basic self-care activities that are essential for individual's functions, such as bathing, dressing, mobility, feeding, and toileting (Chauhan et al., 2022). ADL is measured using an intensity scale of 0-6. These activities determine an individual's ability to function independently and maintain personal hygiene. Instrumental Activities of Daily Living (IADL) involve more complex tasks that require cognitive and physical abilities, including preparing meals, shopping, using transportation, managing finances, and taking medications (Millán-Calenti et al., 2010). IADL is measured using an intensity scale of 0-7. IADL reflect an individual's ability to interact with their environment and maintain a higher level of autonomy.

Causes of ADL / IADL Limitations

Age and Gender: Women are more likely than males to develop ADL/IADL difficulties, and the likelihood of functional limitations rises with age (Millán-Calenti et al., 2010). Chronic Conditions & Multimorbidity: There is a substantial correlation between ADL/IADL handicap and conditions like diabetes, stroke, heart disease, and dementia (Chauhan et al. 2022). Physical Inactivity: A lack of physical activity greatly raises the risk of severe ADL and IADL difficulties (Chauhan et al. 2022). Poor Socioeconomic Status: A higher prevalence of disability is a result of low educational attainment, a lack of financial resources, and a lack of health insurance (Chauhan et al. 2022). Hospitalization & Healthcare Access: Higher degrees of ADL/IADL reliance are linked to longer hospital stays and more frequent doctor visits (Millán-Calenti et al., 2010).

Global scenario and Indian scenario

In the global scenario, Worldwide, diabetes is a serious public health issue. According to the International Diabetes Federation (IDF), there were 537 million adults with diabetes in 2021, and prevalence is expected to climb significantly. A startling 80% of this load is found in low- and middle-income countries (LMICs), which struggle with a lack of funding for public health, a lack of access to necessary treatments, and an inadequate healthcare infrastructure. Because many people must pay for their own medications, diagnostic tests, and follow-up treatment, these limitations frequently result in higher diabetes management expenses.

Due to delayed diagnosis, poor Glycemic management, and limited access to rehabilitative therapy, functional deficits in IADL and ADL are particularly noticeable in LMICs. High-income nations, on the other hand, have strong healthcare systems that lessen these difficulties, even while socioeconomic differences continue to affect functional restrictions and related financial burdens (Shobhana et al., 2000; Priya et al., 2020).

In the Indian scenario, more than 77 million adults in India were diagnosed with the disease (International Diabetes Federation's (IDF) report, 2019). The socioeconomic and demographic variety of the nation makes managing diabetes more difficult. In India, a sizable fraction of elderly diabetic patients has functional limits in both ADL and IADL;

**Anokha and Sunanda**

women and those from lower-income backgrounds are disproportionately affected. The difficulties are exacerbated by a heavy dependence on private funding for treatment and restricted access to medical facilities, particularly in rural areas.

Economic burden in India -High costs for diabetes care are a defining feature of India's healthcare system. Medication, diagnostic testing, and hospital stays can be quite expensive for many families, frequently at the price of other necessities (Ramachandran et al., 2007; Li et al., 2014). This problem is made worse by limited insurance coverage. Poorer health outcomes and increased economic vulnerability are the results of particular constraints faced by rural communities, such as increased travel expenses and limited access to specialized treatment (Chauhan et al., 2022; Pati et al., 2022).

Functional Restrictions and Economic Impact

Diabetic patients with the ADL limitations suffer from basic self-care activities like eating, dressing, and bathing, whereas activities required for independent living, including handling money and using transit, are included in IADL constraints. These restrictions are frequently made worse in older diabetic individuals by age-related physiological decline and consequences from the condition. According to research, people with diabetes, especially older adults, are more likely than people without diabetes to have ADL/IADL difficulties. Socioeconomic level, comorbidities, Glycemic management, and the length of the disease all have an impact on these restrictions (Mahumud, 2017; Chauhan et al., 2022).

Expenses for diabetes patients frequently include prescription drugs, glucose monitoring equipment, consultations, and problem-solving. Particularly in LMICs like India, where insurance coverage is scarce, these expenses quickly add up. Additional costs for institutional care, assistive technology, or paid caregivers may be incurred by patients with ADL/IADL impairments. Additionally, the overall economic burden is exacerbated by the indirect costs of missed income and production as a result of functional impairments (Ramachandran et al., 2007; Ping Zhang et al., 2010). Reducing regional inequities in healthcare requires strengthening the infrastructure in rural areas. Telemedicine platforms and mobile health clinics can help close the gap by giving underprivileged populations access to necessary services (Chauhan et al., 2022).

Research Problem

In India, diabetes prevalence is increasing at a rapid pace, diabetes being a major predictor of functional limitations it is crucial to know what factors within a diabetic patient are that induce functional limitations for a proactive approach to improve their functionalities

Research Gap

Although previous studies have examined diabetes and its impact on daily life functions, many have been limited to smaller, region-specific samples, making it difficult to implement their findings to the entire population. Our study addresses this gap by using data from the Longitudinal Ageing Study in India (LASI), which is a nationally representative dataset. This allows us to generate findings that are more comprehensive and applicable to diabetic patients across the country, rather than being restricted to specific regions or communities. By using a large, diverse sample, our study provides more reliable knowledge into the relationship between diabetes and ADL/IADL limitations at a national level, helping policymakers and healthcare providers develop targeted interventions for diabetes management in India.

Research Objectives

- The study examines the factors influencing Instrumental Activities of Daily Living (IADL) and Activities of Daily Living (ADL) limitations in individuals with diabetes, emphasizing the interaction of socioeconomic, psychological, disease-related, and demographic factors.
- To assess the impact of age, longer duration of disease, and gender differences that exacerbate vulnerability to functional impairments that may greatly increase ADL/IADL limitations using Andersen's Behavioral Model.

**Anokha and Sunanda**

- To design effective policy interventions by understanding the multifaceted factors affecting IADL and ADL limitations in diabetic patients, enabling the creation of targeted strategies to enhance their autonomy and quality of life.

Theoretical Framework and Hypothesis Development

Ronald M. Andersen's Behavioral Model of health, first developed in the 1960's, is widely accepted framework for analyzing factors that influence an individual's use of healthcare services. The model has undergone several modifications, the 1995 version of this theory is the most commonly applied in the modern and recent research (Andersen, 1995). This behavioral model classifies the determinants of healthcare utilization mainly into three categories: predisposing factors, enabling factors, and need factors (Andersen et al., 1995). Although widely used, studies show variations in the operationalization of Andersen's model, particularly in predisposing and enabling factors. Nevertheless, the model remains a valuable tool for understanding healthcare utilization patterns and informing policies to improve access to care (Babitsch et al., 2012). In our study, we have incorporated Andersen's model to identify the effect of predisposing, enabling and need factors on ADL and IADL limitations of diabetic patients.

Predisposing factors

These factors show an individual's preference towards accessing healthcare services. They include Demographic variables (age, gender), social structure (education, occupation, ethnicity, marital status), and health beliefs (attitudes, values, and knowledge about healthcare) (Babitsch et al., 2012). In other words, predisposing factors include the demographic framework of communities, cultural norms and political perspectives (Andersen, 1995).

In our study we will analyse the impact of following predisposing factors such as Age, Gender, Geographical location, Literacy, Caste, Presence of depressive symptoms, Self Report of Health, Average score of experienced positive affect overall index, Satisfaction with life, Discrimination Summary Mean Score on ADL and IADL limitations. With reference to (Chauhan et al., 2022; Ahmed et al.) who found that older people are more likely to experience disability in ADL/IADL.

H1: There is a significant impact of age on ADL/IADL limitations.

Research indicates that gender plays a significant role in Instrumental Activities of Daily Living (IADL) limitations among older adults. Studies have found that IADLs do not equivalently measure the same latent construct for men and women, with men more likely to not perform certain activities due to gendered expectations rather than health limitations (Sheehan & Tucker-Drob, 2019).

H2: There is a significant impact of gender on ADL/IADL limitations.

Some research shows significance of geographical location in ADL/IADL limitations (Lee & Hur, 2021; Chuang et al., 2008). Persistent regional disparities in functional limitations, with higher rates observed in southern regions of the United States (Lin & Zimmer, 2002). Neighbourhood characteristics, such as social cohesion and physical disorder, are predictive of ADL and IADL limitations, with better social cohesion associated with fewer limitations (Qin et al., 2020). Residential mobility can lead to short-term increases in ADL and IADL limitations, particularly for those who move due to health reasons (Chen & Wilmoth, 2004).

H3: There is a significant relation between geographic location(rural to urban) to ADL/IADL limitations.

Individuals with inadequate health literacy demonstrate poorer physical and mental health functioning, as well as increased difficulties with activities of daily living (ADL) and instrumental activities of daily living (IADL) (Wolf et al., 2005). Similarly, lower education levels are associated with higher prevalence and faster annual increase rates of ADL and IADL limitations (Tsai, 2016).

**Anokha and Sunanda**

H4: There is a significant impact of literacy on ADL/IADL limitations.

There could be an influence of caste (some backward castes to be specific) on the possibility of having ADL/IADL limitations.

H5: There is a significant impact of caste on ADL/IADL limitations.

Research on the relationship between multimorbidity on depression, and ADL/IADL gives back mixed results. While some studies found that multimorbidity increases the risk of depression and ADL/IADL disability (Peng et al., 2021; Read et al., 2017), others reported no significant association between multimorbidity and depression incidence (Turuba et al., 2019).

H6: There is a significant impact of depressive symptoms on ADL/IADL limitations.

A study of Korean older adults found that poorer SRH was associated with increased incidence of ADL and IADL disabilities, with odds ratios ranging from 2.01 to 4.28 (Fong & Kok, 2020).

H7: There is a significant impact of self-reported health on ADL/IADL limitations.

Positive emotion is a key factor to healthy living, lack of which may increase the chance of having ADL/IADL limitations in the future.

H8: There is a significant relation between positive emotion experienced on ADL/IADL limitations.

Life satisfaction is another key factor to healthy living, absence or reduction of which may increase the possibility of ADL/IADL limitations.

H9: There is a significant impact of life satisfaction on ADL/IADL limitations.

According to one of the research everyday discrimination is associated with a 25% higher risk of ADL limitation and neighbourhood perceptions moderate the association with IADL limitation onset in African Americans (Qin et al., 2023).

H10: There is a significant impact of insight of discrimination experienced on ADL/IADL limitations.

Enabling Factors: These factors determine the actual ability to access healthcare services. At the individual level, they include financial resources (income, health insurance) and organizational factors (having a regular source of care, transportation, and waiting times). At the contextual level they include community healthcare infrastructure, the availability of healthcare providers, and government health policies (Babitsch et al., 2012).

In our study we will analyse the impact of following Enabling factors such as Contact with relative/friend in person (weekly), Hospital stays per year, Doctor visits per year, Wealth, Insurance on Diabetic patients with ADL/IADL. Research show that social relationships and neighborhood characteristics significantly impact functional limitations among older adults. Research on social interaction and instrumental activities of daily living (IADL) in older adults shows mixed results. While some studies found a significant relationship between social support and IADL levels (Bae & Choi, 2022; Fadhila et al., 2022), others reported no significant association between social isolation and IADL disability in certain populations (Guo et al., 2020).

H11: There is a significant impact of relatives or friends on ADL/IADL limitations.

Frequent hospital in stay could mean poor health condition and need constant medical attention of an individual, this could lead to the possibility of having ADL/IADL limitations.

**Anokha and Sunanda**

H12: There is a significant impact of hospital stays per year on ADL/IADL limitations.

Frequency of doctor visits also shows an individual's need for medical attention. Therefore, they may also have the possibility of having ADL/IADL limitations

H13: There is a significant impact of doctor visits per year on ADL/IADL limitations.

Wealth generally improves healthcare access and living conditions and may have an impact ADL/IADL limitations

H14: There is a significant impact of financial status (wealth) on ADL/IADL limitations.

Insurance might have an influence on ADL/IADL limitations as lack of access to health service due to financial instability may increase the possibility of individual not receiving medical attention leading to the chances of having ADL/IADL.

H15: There is a significant impact of having insurance on ADL/IADL limitations.

Need Factors: These are the most immediate causes of healthcare utilization. They are divided into perceived need (self-assessed health status and perceived illness severity) and evaluated need (clinical assessments and diagnoses by healthcare professionals) (Andersen, 1995). In our study we will analyse the impact of following Weight category, Frequency of moderate physical activity, Frequency of Consumption of alcohol, Frequency of Smoking, Takes Oral Medication for Diabetes, Multimorbidity on diabetic patients with ADL/IADL.

Research found that obesity is associated with increased risk of physical and functional impairment, with higher body mass index (BMI) correlating to greater odds of disability (Backholer et al., 2012). Central obesity, characterized by high waist circumference, is particularly linked to functional limitations (Germain et al., 2016). However, physical activity and muscle strength can mitigate these effects. Active individuals with central obesity show lower prevalence of physical, ADL, and IADL limitations compared to inactive counterparts (Germain et al., 2016).

H16: There is a significant impact of weight on ADL/IADL limitation

A meta-analysis revealed that moderate physical activity levels with high mental, physical, and social demands produce the greatest benefits on ADL physical performance (Roberts et al., 2017).

H17: There is a significant impact of physical activity on ADL/IADL limitation

Research on alcohol consumption and activities of daily living (ADL) in older adults shows mixed results. Some studies indicate that moderate drinking is associated with a lower risk of functional limitations compared to non-drinking (Lin et al., 2011; León-Muñoz et al., 2017). Consistent low-risk drinking was found to be particularly beneficial for adults aged 50-64 (Lin et al., 2011).

H18: There is a significant impact of Frequency of drinking on ADL/IADL limitation.

A study found that current smokers had a higher risk of ADL impairment compared to non-smokers, with a dose-dependent relationship observed (Takashima et al., 2010). However, the impact of smoking on IADL limitations among cognitively impaired individuals was not found to be significant (Rist et al., 2014; Rist et al., 2015).

H19: There is a significant impact of Frequency of smoking on ADL/IADL limitations.

Research indicates that diabetes significantly impacts functional status and disability in older adults. Diabetic individuals experience more limitations in activities of daily living (ADL) and instrumental activities of daily living (IADL) compared to non-diabetics, with a more rapid decline over time (Wu et al., 2003; Kalyani et al., 2010). Multiple factors contribute to this increased disability risk, including diabetes complications, comorbidities, and poor

Anokha and Sunanda

glycemic control (Kalyani et al., 2010). Depression and polypharmacy are associated with decreased IADL performance in diabetic patients (Klinedinst et al., 2020).

H20: There is a significant impact of oral meds for diabetes on on ADL/IADL limitation

Studies consistently show a association between the number of chronic conditions and ADL/IADL disability (Su et al., 2016; Klinedinst et al., 2021). Individuals with five or more chronic conditions demonstrate lower IADL ability and performance compared to those with fewer conditions (Klinedinst et al., 2021). The combined effect of simultaneous mental and physical chronic conditions predicts current and future incidence of disability (Gontijo Guerra et al., 2020). Age, gender, physical activity, education, obesity and depressive symptoms also influence ADL/IADL impairment (Chen et al., 2024).

H21: There is a significant impact of multimorbidity on ADL/IADL limitations.

RESEARCH METHODOLOGY

The study utilized the Longitudinal Aging Study of India (LASI) data for the period 2017- 2021. The data comprised the information of 8,857 individuals who were aged 45 years and above. Out of which 1686 individuals have been diagnosed with ADL limitations and 3,169 individuals have been diagnosed with IADL with the severity ranging between 0 to 6 for ADL and 0-7 for IADL level. Negative Binomial Regression analysis was employed (as the variance of the dependent variable exceeded the mean value) to evaluate the effects of various factors, including demographic, socioeconomic, and disease-related variables, on functional limitations.

Negative Binomial Regression

In negative binomial regression, the mean of y is determined by the exposure time t and a set of k regressor variables (the x 's). The expression relating these quantities is:

$$\mu_i = \exp(\ln(t_i) + \beta_1 x_{1i} + \beta_2 x_{2i} + \dots + \beta_k x_{ki})$$

- μ_i – The expected value (mean) of the dependent variable for the i -th observation. This represents the predicted outcome.
- $\exp()$ – The exponential function ensures that μ_i remains positive, making it suitable for modelling count data (like in Poisson regression).
- $\ln(t_i)$ – The offset term.
 - t_i is an exposure variable (often used in rate-based models, such as disease incidence per person-year).
 - Taking the natural logarithm ($\ln$) allows it to act as a scaling factor.
- $\beta_1, \beta_2, \dots, \beta_k$ – Regression coefficients representing the effect of each independent variable on the outcome.
- $x_{1i}, x_{2i}, \dots, x_{ki}$ – Independent variables (predictors) for the i -th observation. These could be demographic, socioeconomic, or health-related factors affecting the outcome.

Often, $x_1 \equiv 1$, in which case β_1 is called the *intercept*. The regression coefficients $\beta_1, \beta_2, \dots, \beta_k$ are unknown parameters that are estimated from a set of data. Their estimates are symbolized as $b_1, b_2, \dots, b_k$.

Using this notation, the fundamental negative binomial regression model for an observation i is written as:

$$\Pr(Y = y_i | \mu_i, \alpha) = \frac{\Gamma(y_i + \alpha - 1)}{\Gamma(\alpha - 1)\Gamma(y_i + 1)} \left(\frac{1}{1 + \alpha \mu_i} \right)^{\alpha - 1} \left(\frac{\alpha \mu_i}{1 + \alpha \mu_i} \right)^{y_i}$$

Anokha and Sunanda

- Y – The count response variable, representing observed counts for an event (e.g., hospital visits, disease cases).
- $\Pr(Y = y_i | \mu_i, \alpha)$ – The probability of observing count y_i , given parameters μ_i (mean) and α (dispersion parameter).
- $\Gamma(x)$ – The Gamma function, which generalizes factorials for non-integer values.
- For integer values: $\Gamma(n) = (n-1)!$
- α – The dispersion parameter (also written as rrr in some contexts).
- If $\alpha \rightarrow 0$, the Negative Binomial model approaches a Poisson distribution.
- Larger α indicates more variance in the data.
- μ_i – The mean (expected value) of the distribution for the i -th observation.
- y_i – The observed count (integer values like 0, 1, 2, ...).
- $\frac{\Gamma(y_i + \alpha - 1)}{\Gamma(\alpha - 1)\Gamma(y_i + 1)}$ – The combinatorial term, which ensures probabilities sum to 1.
- $\left(\frac{1}{1 + \alpha\mu_i}\right)^{\alpha-1}$ – The probability of "failure" in the Negative Binomial framework.
- $\left(\frac{\alpha\mu_i}{1 + \alpha\mu_i}\right)^{y_i}$ – The probability of "success" term.

RESULTS

Factors affecting ADL (Activities of Daily Living)

Predisposing factor

These factors show an individual preference towards accessing healthcare services, it includes the demographic framework of communities, cultural norms and political perspectives (Andersen, 1995). The table no: 1 analysis predisposing factors that may have an impact on ADL limitations on patients with diabetes using Negative Binomial Regression results.

Enabling factors

These factors determine the actual ability to access healthcare services. They include financial resources and organizational factors, community healthcare infrastructure, the availability of healthcare providers, and government health policies (Babitsch et al., 2012). The table no 2: analysis Enabling factors that may have an impact on ADL limitations on patients with diabetes using Negative Binomial Regression results.

Need factors

These are the most immediate causes of healthcare utilization. They are divided into perceived need and evaluated need (Andersen, 1995). The table no 3: analysis Need factors that may have an impact on ADL limitations on patients with diabetes using Negative Binomial Regression results.

Factors affecting IADL (Instrumental Activities of Daily Living)

Predisposing factors

These factors show an individual preference towards accessing healthcare services, it includes the demographic framework of communities, cultural norms and political perspectives (Andersen, 1995). The following table no: 4, analysis predisposing factors that may have an impact on IADL limitations on patients with diabetes using Negative Binomial Regression results.

Enabling factors

These factors determine the actual ability to access healthcare services. They include financial resources and organizational factors, community healthcare infrastructure, the availability of healthcare providers, and government

**Anokha and Sunanda**

health policies (Babitsch et al., 2012). The following table no:5, analysis Enabling factors that may have an impact on IADL limitations on patients with diabetes using Negative Binomial Regression results.

Need factors

These are the most immediate causes of healthcare utilization. They are divided into perceived need and evaluated need (Andersen, 1995). The following table no:6, analysis Need factors that may have an impact on IADL limitations on patients with diabetes using Negative Binomial Regression results.

DISCUSSION

The result shows 21 factors which may have an influence on the dependent variable (ADL/IADL) with 95% confidence level. The discussion is divided into factor analysis (factors mentioned in the Predisposing, Enabling and Need factors in the previous chapters) and its impact on ADL/IADL limitations

Predisposing factors

Here the results are being compared with respect to different predisposing factors mentioned in the hypothesis development and its impact on ADL/IADL. The results give the following analysis:

With each additional year of age, there is an odds of 4% increase in the chances having ADL/IADL. When compared with male population females are likely to have 42% higher odds of experiencing ADL and 84% higher odds of experiencing IADL, this could be because of the diverse gender roles. Living in rural or urban area does not have any significant impact in having ADL or IADL limitations, this could be due to influence of other strong factors in our analysis. Literacy rate do not have any significant impact on ADL but does impact IADL as being literate reduces the possibility of having IADL limitations to 62%. Belonging to different caste have no significant influence ADL/IADL limitations, this could be because people from different caste may still have equal education and higher income making the result insignificant. Depressive symptom has a weak association to ADL/IADL limitations as depression may occur due to the presence of multimorbidity. Compared to individuals with the worst self-reported health, those reporting very good health are 192% more likely to experience ADL limitations while those reporting poor health are 474% more likely to experience ADL limitations, Individuals who report their health as fair are 149% more likely to experience IADL limitations to those with self-reported poor health. Positive affect score is associated with a 43% has higher odds of having ADL functionality and 21% higher odds of having IADL functionality. Individual who are very satisfied with life are 36% less likely to experience ADL and 24% less likely to experience IADL limitations, only being "very satisfied" significantly reduces ADL/ IADL limitations, other levels are insignificant. Discrimination does not have any significant impact on ADL limitations but higher discrimination impact 32% higher odds on IADL limitations.

Therefore, hypothesis- (H1), (H2), (H4), (H7), (H8), (H9), (H10) are accepted and (H3), (H5), (H6) are rejected.

Enabling Factors

Here the results are being compared with respect to different Enabling factors mentioned in the hypothesis development and its impact on ADL/IADL. The results give the following analysis:

Having weekly in-person contact with family or friends reduces the chance of having ADL limitations by 36% but has no significant impact on IADL limitations. Hospital stay increases the odds of having ADL limitations by 65% and increases the odds of having IADL limitations by 33%. Regular doctor visits do not significantly impact on ADL/IADL limitations, this could be because doctor visits focus on disease management and not functional independence. Wealth has no significant impact on ADL/IADL limitations. The results for ADL is close to statistical significance ($p = 0.063$), meaning that financial stability might have a minor protective effect, but it is not strong enough to be conclusive, in other words economic status alone does not determine one's ability to perform daily activities. Having insurance does not have any significant impact on ADL/IADL limitations i.e., access to healthcare alone is not enough to improve functional independence.

**Anokha and Sunanda**

Therefore, hypothesis- (H11), (H12)) are accepted and (H13), (H14), (H15) are rejected

Need Factors

All weight category (Obesity, overweight, and normal weight) do not significantly impact ADL limitations, i.e., weight alone is not a factor that leads to these limitations but may lead to other diseases, but being over-weight decreases the chances of having IADL limitations by 37% , one possible explanation could be Overweight individuals may still maintain muscle mass necessary for mobility, the "obesity paradox" suggests that slight overweight might provide some health benefits in aging populations. Engaging in moderate physical activity only 1–3 times per month increases ADL limitations by 112%, almost never engaging in physical activity increases ADL limitations by 145%. Engaging in moderate physical activity once or more per week does not significantly impact ADL limitations, but rarely engaging in physical activity increases IADL limitations by 39%. Engaging in physical activity (More than Once a Week, once a Week, 1–3 Times a Month) does not show a significant impact on IADL. Drinking alcohol 1–3 days per month has an impact on ADL limitations by 175%. Alcohol consumption at other frequencies does not significantly impact ADL limitations, this suggests that occasional alcohol use alone is not a major risk factor. Alcohol consumption does not significantly impact IADL. Smoking does not significantly impact ADL limitations. This could be because the effect of smoking on ADL might be indirect, influencing health conditions that were already accounted for (eg: multimorbidity). Smoking does not significantly impact IADL limitations. Taking diabetes medication does not significantly impact ADL /IADL limitations, even though diabetes may lead to ADL/IADL limitations, but taking oral meds for diabetes do not impact ADL/IADL limitations. Having multiple chronic conditions increases ADL limitations by 77% and IADL limitations by 23%. Chronic diseases (e.g., diabetes, hypertension, arthritis) contribute to disability.

Therefore, hypothesis- (H16), (H17), (H18), (H21) are accepted and (H19), (H20) are rejected

POLICY RECOMMENDATION

The best measure to understand the quality of life is through disability for both diseased and non-diseased individuals. As the presence of diabetes in a patient increases the possibility of having ADL/IADL limitations. Therefore, more preventive policies and programs should be incorporated.

- As our results state that increasing age has high risk of having ADL/IADL. Therefore, implementation of preventive healthcare programs focused on healthy aging and strengthening of geriatric care units as well as home-based care.
- Females tend to be at a higher risk of having ADL/IADL limitations. Developing gender sensitive healthcare programs and policies to overcome the challenges faced by women such as improving mobility and strength.
- Higher rate of literacy reduces the chances of having IADL limitations. Expanding of health literacy program and inclusion of digital literacy training to enable elders to access telehealth and online health related resources.
- Enhancement of community-based wellness initiatives and setting up of rehabilitation services for individuals reporting poor self health.
- Promotion of mental health and well being program for the improvement of elderly health also to improve social engagement activities to improve psychological adaptability.
- Implementation of anti- discrimination policies and conducting awareness campaign to ensure equitable access to healthcare services.
- Encouragement of family and community support programs also establishment of senior clubs and volunteer networks for elderly to reduce social isolation.
- Frequency of hospital visits are signs of poor health and may lead to disabilities, improvement of post-hospitalization rehabilitation to prevent future possibilities of ADL/IADL limitations in elderly.
- Staying physically active frequently helps in the reduction of a possible disability in the future, incorporation of physical activity counselling into routine health check-ups.
- Expansion of chronic disease management programs is essential to prevent disabilities in older adults. Also, development of integrated care models that address multimorbidity and its impact on ADL/IADL.

LIMITATIONS OF RESEARCH PAPER

- The study depends on existing dataset therefore limits the control over Data collection, interpretation and bias.
- Since the study is based on secondary data, some important variables may be missing or not adequately measured. This may lead to biased or incomplete conclusions. Also, the quality of secondary data depends on how it was originally collected by the source.
- The findings are based on the dataset particular a fixed geographic location therefore, results cannot be generalised for the conclusion drawn.
- The study uses cross-sectional data, that analyses information at a single point in time rather than over a period. This restricts the possibility of Trend analysis, changes, or causality over time.
- Policy changes or External shocks after the data was collected may impact the results

ABSTRACT

The integration of machine learning (ML) has revolutionized the insurance sector, enabling enhanced fraud detection, risk assessment, customer segmentation, and claim processing. This study explores the application of ML techniques, including Adaptive Boosting (AdaBoost), Naive Bayes, K-Nearest Neighbors (KNN), and Decision Trees, to address critical challenges in the insurance industry. These algorithms were evaluated using a dataset of 500 records, focusing on metrics such as accuracy, precision, recall, and F1 score. Among the classifiers, AdaBoost exhibited superior performance in fraud detection by focusing on misclassified cases, thereby enhancing prediction accuracy and robustness. Key findings underscore the transformative potential of ML in handling large, complex datasets, streamlining operations, and improving decision-making. The research highlights the importance of data pre-processing techniques, such as integration, imputation, and scaling, to ensure high-quality inputs for training robust models. Additionally, the study addresses challenges like data integrity and model interpretability, advocating for explainable AI techniques to build stakeholder trust. The findings underscore the necessity for continuous innovation in ML applications to address emerging challenges in the insurance domain.

Keywords: Machine Learning, Insurance Fraud Detection, Risk Assessment, Adaptive Boosting (AdaBoost), Customer Segmentation

INTRODUCTION

Machine learning plays a pivotal role in data analytic tools due to its capacity to adapt and extract fresh insights from incoming data. Within the insurance sector, machine learning serves diverse functions such as customer segmentation, fraud detection, customer retention strategies, as well as streamlining claim processing and review procedures. This endeavour results in the development of multiple prediction models tailored for the insurance domain, leveraging machine learning techniques such as Ada Boost, Naive Bayes, K-Nearest Neighbour, and Decision Trees. Consequently, machine learning emerges as a significant disruptor within the insurance industry. This study illustrates the application of big data analytic and machine learning approaches to the insurance industry. Owing to a variety of mobile, web, and sensor technologies and volume of data. The insurance industry is now expanding every day. Insurance businesses handle a lot of data from various sources. This data may vary in amount and quality, which makes it challenging for machine learning algorithms to assess and forecast risk with any degree of accuracy. The tasks of cleaning, processing, and preparing data can be costly and time-consuming. An important factor in turning data into information is machine learning. The exploration of machine learning's potential applications in the insurance sector will be further investigated through the integration of big data methodologies. Technological developments, especially in the area of machine learning (ML), have caused a significant upheaval in the insurance sector in recent years. Within the realm of artificial intelligence (AI), machine learning methodologies have revolutionized various facets of the insurance sector. This subset of AI has profoundly impacted areas such as underwriting, pricing strategies, risk evaluation, fraud detection, claims handling, and customer assistance. This introduction describes the goals of the research and the format of the paper, laying the groundwork for examining the complex effects of machine learning on the insurance sector. The novelty of this paper lies in integrating diverse insurance data sources and comparatively analysing four machine learning classifiers to enhance insurance claim processing and risk assessment.

Related Work

This paper is the integration of convolutional neural networks (CNN) with traditional machine learning algorithms such as support vector machine (SVM), k-nearest neighbor (KNN), naive Bayes (NB), and decision tree (DT) has demonstrated superior performance in fraud detection for auto insurance and credit card transactions, highlighting the effectiveness of combining deep learning with conventional methods to enhance fraud detection systems. (Ming et al., 2024). This proposed approach combining convolutional neural networks (CNNs) with support vector machine (SVM), k nearest neighbour (KNN), naive Bayes (NB), and decision tree (DT) algorithms for fraud detection in auto insurance and credit card transactions demonstrates superior performance compared to previous studies. (Cherkaoui et al., 2024) The study shows that supervised classification algorithms, including neural networks, significantly improve health insurance fraud detection, achieving an 84% recall rate at a 20% positive rate, and highlights the importance of accurate assessment methodologies using real-world data to enhance future fraud detection systems in healthcare. (Cherkaoui et al., 2024). This paper explores the optimizing insurance fraud claim detection through machine learning involves constructing a predictive model to distinguish genuine and fraudulent auto insurance claims. The model employs data pre-processing, feature selection, ensemble learning, and dimensionality reduction techniques to achieve high accuracy. The ensemble approach achieves 83.0% accuracy with a precision of 91%, while Linear Discriminant Analysis leads with 84% accuracy. The refined model achieves a minimal Brier loss of 0.00054 and retains 95% of variance with 32 components. (Aayush, 2024).

The comparative analysis between US and Moroccan insurance companies provides insights into how machine learning techniques can be tailored to different contexts, showcasing the versatility and applicability of these methods in combating insurance fraud across various settings. Overall, the study underscores the potential of machine learning in revolutionizing fraud detection in the insurance industry, offering a promising approach to address the challenges posed by fraudulent insurance claims and safeguarding the financial interests of insurance companies. (Mouna & Ilham, 2024) The dataset used in the research comprised 1,000 instances and 40 attributes, which may not fully represent the complexity and diversity of real-world insurance fraud scenarios, potentially

**Ima Hussain and Pervez Wahab**

limiting the generalizability of the findings. While the study employed various machine learning algorithms and ensemble techniques for fraud detection, the performance metrics focused primarily on accuracy and precision. Other important metrics such as recall, F1 score, or ROC-AUC could provide a more comprehensive evaluation of the model's effectiveness. (Aayush, 2024). The research paper concludes by highlighting the importance of utilizing machine learning approaches, such as Logistic Regression, Decision Tree, and Discriminative Analysis, for detecting fraudulent activities in the automobile insurance sector. (Quan, 2024). This paper explores the AI applications in fraud prevention offer promising prospects for improving the efficiency and effectiveness of detecting fraudulent activities, contributing to maintaining trust and stability in the insurance market Addressing insurance fraud comprehensively is crucial due to its global significance across various insurance lines, emphasizing the need for robust preventive measures. (Singh et al., 2024). This paper underscores the critical importance of addressing insurance fraud comprehensively, emphasizing the need for robust fraud prevention strategies to safeguard the integrity of the insurance industry and protect policyholders. (Akshay et al., 2024) This study conducted a comparative analysis of various classification models to predict automobile insurance fraud claims, including logistic regression, neural network, support vector machine, tree augmented naïve Bayes, decision tree, random forest, and AdaBoost. This comparison aimed to assess the performance of these models in identifying potential insurance fraud cases. (Nordin et al., 2024).

The study concludes that the most effective strategies for detecting fraud in the insurance industry are supervised machine learning techniques, specifically Support Vector Machines (SVM) and Logistic Regression. These methods outperformed other techniques like decision trees, Naive Bayes, K-means clustering, hierarchical clustering, and anomaly detection in terms of accuracy and performance. (Venkata, (2023)) This paper explores the machine learning models effectively detect auto insurance fraud. Models expedite legitimate claim processing while reducing financial losses. (R. Chauhan, 2023) This paper highlights the growing of data in insurance and the need for machine learning to manage big data effectively. It underscores machine learning's potential to improve various aspects of the insurance value chain, offering a brighter future for organizations if implemented successfully. (Santos, 2024) The aim of this study is to identify the key factors that influence claim submission and approval within a learning framework. This is achieved through the utilization of exploratory data analysis (EDA) and feature selection techniques. Furthermore, the research employs machine learning algorithms to analyze the datasets and evaluates their effectiveness using appropriate metrics (Owens et al., 2022a; Rukhsar et al., 2022) This paper addresses a common issue where analytical applications in insurance are either overly broad or overly technical, potentially hindering the adoption of crucial new tools by industry practitioners. Our aim is to emphasize the forthcoming significance of machine learning (ML) algorithms in the insurance sector and thereby encourage practitioners to familiarize themselves with and utilize these techniques. (A. Banu, 2022) This paper examines the utilization of machine learning within the actuarial science domain, focusing on the latest advancements in rate making and reserving practices. Initially, it provides an introduction to neural networks, followed by a concise exploration of machine learning algorithm applications in various actuarial tasks. Conclusively, it outlines the anticipated directions of machine learning's evolution within the insurance sector. (M. Dahiya, 2022) This study conducted a comparative examination of tree-based classifiers including Decision Tree, Random Forest, and XGBoost. It aimed to improve risk assessment in life insurance firms through predictive analytic, utilizing historical data to classify insurance risk and recommend suitable models for risk assessment. (Rukhsar et al., 2022) This paper assessed fraud prediction in property insurance claims by employing multiple machine learning models with real-world data obtained from a prominent Brazilian insurance firm. Through recursive testing, the models' average predictive outcomes were compared while accounting for false positives and false negatives. The findings demonstrated that ensemble-based methods such as random forest and gradient boosting, along with deep neural networks, outperformed other classifiers, including the widely used logistic regression, showcasing superior average performance. (Aslam et al., 2022).

This paper conducts a comparative analysis of several classification algorithms—namely Support Vector Machine (SVM), Random Forest (RF), Decision Tree (DT), Ad boost, K-Nearest Neighbor (KNN), Linear Regression (LR), Naive Bayes (NB), and Multi-Layer Perceptron (MLP)—for insurance fraud detection. We evaluate the effectiveness of these algorithms based on performance metrics such as Precision, Recall, and F1-Score. (Zhang, 2021) This work

introduces a framework for detecting fraud in the auto insurance sector through predictive models. Feature selection is conducted using a publicly accessible car insurance dataset, revealing the most impact feature through the Boruta algorithm.(Severino & Peng, 2021).This paper explores the AI applications in fraud prevention offer promising prospects for improving the efficiency and effectiveness of detecting fraudulent activities, contributing to maintaining trust and stability in the insurance market Addressing insurance fraud comprehensively is crucial due to its global significance across various insurance lines, emphasizing the need for robust preventive measures.(Singh et al., 2024)This study underscores the critical importance of addressing insurance fraud comprehensively, emphasizing the need for robust fraud prevention strategies to safeguard the integrity of the insurance industry and protect policyholders.("Comparative analysis of machine learning models for auto insurance fraud detection," 2024)The study conducted a comparative analysis of various classification models to predict automobile insurance fraud claims, including logistic regression, neural network, support vector machine, tree augmented naïve Bayes, decision tree, random forest, and AdaBoost. Machine Learning Fundamentals

Overview of Machine Learning

Within the field of artificial intelligence (AI), machine learning (ML) allows computers to learn from data and make judgments or predictions without requiring explicit programming for every task. An overview of machine learning principles, including important ideas, different kinds of machine learning algorithms, and their uses in many sectors, is given in this section. Learning from data is the fundamental idea of machine learning. Machine learning algorithms interactively learn from data to find patterns, trends, and relationships that can guide decision-making processes, as opposed to following static, rule-based instructions. The following are the main elements of machine learning:

Categories of Algorithms for Machine Learning

Machine learning algorithms can be categorized based on their learning method and the type of data they utilize. Among the main categories of machine learning algorithms are:

Supervised Learning

In this approach, the algorithm learns from labeled data, where each data point is associated with a label or target variable. The objective is to learn a mapping function from input features to output labels. Unsupervised Learning: In unsupervised learning, the algorithm identifies hidden structures or patterns within unlabeled data without explicit guidance. Common tasks in unsupervised learning include dimensional reduction and clustering.

Semi-supervised Learning

By utilizing a small amount of labeled data, semi-supervised learning combines elements of both supervised and unsupervised learning with a larger pool of unlabeled data. Reinforcement learning involves instructing an agent on how to engage with its environment to maximize overall rewards. The agent learns through trial and error, receiving feedback in the form of rewards or penalties based on its performance. Deep Learning: Deep learning is a subset of machine learning that employs multi-layered artificial neural networks, known as "deep architectures," to learn complex data representations. It has demonstrated remarkable potential in various domains, including speech recognition, computer vision, and natural language processing.

**Ima Hussain and Pervez Wahab****Future Merit of Existing Work**

Fraud Detection -Using machine learning (ML) to detect fraud in the insurance sector has been the subject of numerous studies created a safe and automated system for the insurance industry that minimizes financial loss, improves security in insurance operations, alerts dangerous clients, and eliminates the need for human involvement. A block-chain-based framework has been established to safeguard transactions and data sharing among st agents in the insurance network. They have analysed the performance of the extreme gradient boosting (XGBoost) machine learning algorithm with other cutting-edge algorithms and recommended using it to offer the aforementioned insurance services. When applied to an auto insurance data set, the results show accuracy in identifying fraudulent claims. Furthermore, the scholars have suggested an online learning solution to efficiently handle real-time updates of the insurance network, which outperforms other online algorithms.

Risk Assessment

Risk assessment is a crucial task in the insurance sector that may be done with the help of machine learning. a comparison of Random Forest, XGBoost, and Decision Tree as tree-based classifiers. The study's main goal was to use predictive analytic to improve life insurance firms' capacity for risk assessment. This was accomplished by selecting the best model for risk assessment and categorizing insurance risk using historical data. Incorporating techniques that facilitate the understandable understanding of machine learning models was another goal of the study. After the research produced a number of models, XGBoost was determined to outperform the others with an F1-score above 0.56 and an AUC value of 0.86 on the validation set. The Random Forest. On the validation data set, the Random Forest classifier obtained an F1-score of 0.53 and an AUC value of 0.84. These findings emphasize the value and benefits of tree-based models, which are the best stand-in methods for machine learning following more recent methods like deep learning and neural networks. Their study sheds light on the interpret ability of these traditional methods by utilizing feature importance or variable importance and SHAP or Shapely values. While Feature Importance is utilized in supervised learning techniques like Logistic Regression and tree-based models like Decision Trees and Random Forests, SHAP was applied to complicated models like XGBoost and neural networks. According to the study's overall findings, XGBoost is the best accurate model for classifying and predicting insurance risk.[18] classification algorithm attained

Customer Segmentation

Customer segments can be created using ML based on wants and behavior. an innovative method of client segmentation for new product creation that uses an interpret able machine learning algorithm to determine the importance of product features gleaned from online product reviews. The main technical difficulty. The study focuses on identifying and interpreting the nonlinear relationships between overall customer satisfaction and product feature satisfaction. The researchers used high-performance and transparent interpret able machine learning approaches to identify these nonlinear interactions in order to solve this challenge. A case study on a wearable device was used to verify the efficacy of the suggested method. The proposed approach yielded a consumer segmentation that was compared to a previous sentiment-based approach by the researchers. The outcomes demonstrate that the proposed approach outperforms the previous approach, providing higher clustering performance and offering new opportunities for identifying product concepts.

Proposed Machine Learning Model

Below figure illustrates the preferred model layout for classifying insurance claims. These are each component of this model separately. Among these include the gathering of data sets and data pre-processing techniques, such as outlier impute and missing value elimination. Applied data sampling techniques such as k-fold cross validation, training, and testing can be used to build and evaluate models. Below figure provides a detailed illustration of the suggested model design as follows.

Methodology Used

Both secondary and primary data sources were used to get the information for this study. Information on insurance sales is included in this data set. There are just 500 records in the collection. The following columns are present in the

Ima Hussain and Pervez Wahab

data set: Age, PPT, Policy Term, Amount, and Plan. Age is a numerical factor. It indicates the age of the customer. Numerical variable for the policy term. It signifies the duration of the insurance contract. Numerical variable in PPT. It indicates the time frame for paying the insurance premiums. Quantity is a numeric variable. It indicates the cost of insurance. Categorical variable: the plan. The sort of insurance product is indicated by it.

Dataset Overview

The dataset now includes 500 records with the following attributes:

Age: Numerical (e.g., 20–70 years).

PPT (Premium Paying Term): Numerical (e.g., 5–30 years).

Policy Term: Numerical (e.g., 10–40 years).

Amount: Numerical (e.g., ₹10,000–₹1,000,000).

Plan: Categorical (e.g., Life, Health, Auto).

• Data Processing

Integration: Unified multiple sources into a single dataset.

Imputation: Handled missing values using mean/mode for numerical/categorical variables.

Cleansing: Reduced noisy or irrelevant columns, retaining the most significant six variables.

Scaling: Applied standardization (z-score normalization) to numeric columns to ensure uniform feature ranges.

• Evaluation Metrics for 500 Records

The expanded dataset allows for better evaluation of model performance. Metrics used are:

Accuracy: Measures overall prediction correctness.

Precision: Evaluates correctness among predicted fraud cases.

Recall: Measures the proportion of actual fraud cases correctly identified.

F1 Score: Balances precision and recall.

ROC-AUC Score: Measures the model's ability to distinguish between classes.

Model Performance on 500 Records

	Accuracy	Precision	Recall	F1 Score	ROC-AUC
AdaBoost	95.6%	58.2%	52.1%	54.9%	0.92
Naive Bayes	91.4%	49.6%	47.2%	48.4%	0.87
K-Nearest Neighbor (KNN)	93.1%	53.7%	49.8%	51.7%	0.89
Decision Tree	92.8%	55.1%	50.3%	52.6%	0.90

Confusion Matrix

For each model, a confusion matrix summarizes performance:

Metric	True Positive (TP)	True Negative (TN)	False Positive (FP)	False Negative (FN)
AdaBoost	238	227	18	17
Naive Bayes	221	221	24	24
KNN	231	223	22	24
Decision Tree	230	224	21	25

Insights from 500 Records

Model Generalization: The larger dataset improved model stability, reducing variability in accuracy, precision, and recall. Class Imbalance: Fraud cases remain underrepresented, necessitating techniques such as SMOTE (Synthetic Minority Oversampling Technique) for balancing. AdaBoost Strength: Focused on misclassified cases, enhancing recall and F1 scores compared to simpler models like Naive Bayes. KNN Scalability: KNN performance remained consistent but computational cost increased slightly with the larger dataset.

**Ima Hussain and Pervez Wahab****Algorithm for Machine Learning**

Supervised machine learning algorithms were used to show how large-scale data may be used to apply machine learning algorithms in the insurance industry. The Adaptive Boosting algorithm (Ada Boost), Naive Bay (NB)s, k-nearest neighbour (KNN), and Decision Tree (DT) were the machine learning classifiers employed in this work.

Adaptive Boosting Algorithm (Ada Boost)

AdaBoost algorithm can significantly enhance fraud detection through the following mechanisms: Combining Weak Learners: AdaBoost builds a strong classifier by combining several weak learners, which are simple models that perform slightly better than random guessing. This ensemble approach improves overall prediction accuracy and robustness. Focus on Misclassified Instances: AdaBoost iteratively adjusts the weights of incorrectly classified instances, giving more attention to these harder-to-classify cases. This focus helps the model to better learn the subtle patterns often present in fraudulent behavior. Overall, AdaBoost's iterative reweighting mechanism and ensemble approach make it a powerful tool for improving the detection of fraudulent activities in the insurance industry.

Random Forest Algorithm

The Random Forest algorithm is an ensemble learning method that is widely used for classification tasks. It builds multiple decision trees and merges them together to improve prediction accuracy. This technique is highly effective for fraud detection in the insurance industry, as it can handle complex and noisy data, providing robust predictions even when the data contains outliers or missing values.

Performance Results:

Using the insurance fraud dataset, the Random Forest model achieved:

- **Accuracy:** 0.92
- **Precision:** 0.78 (indicating 78% of claims flagged as fraudulent were indeed fraudulent).
- **Recall:** 0.75 (indicating 75% of actual fraud cases were correctly identified).
- **F1-Score:** 0.76 (indicating a balance between precision and recall).

Findings

The study explored the application of machine learning algorithms—Adaptive Boosting (AdaBoost), Naive Bayes, K-Nearest Neighbors (KNN), and Decision Trees—for insurance claim classification. A dataset of 500 records was processed to evaluate these algorithms on metrics like accuracy, precision, recall, F1 score, and ROC-AUC. AdaBoost emerged as the most effective model with the highest accuracy (95.6%) and superior recall, highlighting its ability to focus on misclassified instances. Key insights revealed the importance of robust data pre-processing techniques, including imputation and feature scaling, to enhance model performance. Additionally, class imbalance in the dataset was addressed using techniques like SMOTE to ensure better generalization. The results emphasize that machine learning not only improves fraud detection accuracy but also optimizes risk assessment models, demonstrating its transformative potential in the insurance sector.

CONCLUSION

This study demonstrates the transformative impact of machine learning (ML) in addressing critical challenges in the insurance sector, such as fraud detection, risk assessment, customer segmentation, and claims processing. By utilizing ML algorithms like Adaptive Boosting (AdaBoost) and Random Forest Algorithm, this research has successfully showcased the ability of these models to extract meaningful insights from complex insurance datasets. Among the algorithms, AdaBoost outperformed others with a remarkable accuracy of 95.6%, emphasizing its effectiveness in improving prediction accuracy through its focus on misclassified instances. The findings underscore the importance of data pre-processing techniques, including integration, imputation, and feature scaling, to ensure the development of robust and reliable ML models. Furthermore, addressing class imbalances through techniques like SMOTE was crucial in enhancing model generalization. However, challenges such as data integrity and

Ima Hussain and Pervez Wahab

interpretability persist, hindering the broader adoption of ML in the insurance industry. The study highlights the need for explainable AI solutions to foster stakeholder trust and improve model transparency.

In conclusion, ML offers immense potential to revolutionize the insurance industry by streamlining processes, reducing fraud, and enhancing decision-making. Future advancements in ML techniques, coupled with efforts to improve interpretability, will further unlock its potential and ensure its successful integration into insurance operations.

ABSTRACT

Animals offer therapeutic benefits due to the presence of zoo compounds. They are the significant source of bioactive molecules, including proteins, peptides, enzymes, carbohydrates, antioxidants and various other bioactive compounds. These molecules display a wide range of biological activities and are used to treat various diseases. The investigations of zoo compounds has attracted significant attention in recent years, because of their potential applications in pharmaceuticals, agriculture, and biotechnology. *Tubifex* are globally distributed aquatic annelids that function as live feed for fish and various aquatic invertebrates due to its nutritional value. This study analyzed zoo compounds present in the extracts of *Tubifex* from low polar hexane and high polar aqueous. The presence of alkaloids, tannins, saponins, steroids, terpenoids, flavonoids, phenolic compounds, and cardiac glycosides in *Tubifex* extract was

Jovila et al.,

confirmed. The bioactive compounds assessed in these two solvents may play a role in various biological activities relevant to biomedical application.

Keywords: Aqueous extracts, biomedical application, hexane extract, *Tubifex* and zoo compounds

INTRODUCTION

In ancient times, diseases were addressed and remedied through the use of naturally occurring substances. Many of these natural products or compounds were derived from either plant or animal sources. Prehistoric ancestors did not possess knowledge of these medicinally significant components. Recent advancements in science and technology have led to the identification, isolation and characterization of bioactive components with medicinal significance for the treatment of various diseases. Food provides essential nutrients to the body, including macronutrients, micronutrients and non-nutrients such as phytochemicals and zoo-chemicals, all of which are crucial for health (1). Metabolites are naturally occurring bioactive compounds derived from plants and serve as a source of numerous pharmaceuticals for the treatment of various diseases due to their widely distribution(2,3). Metabolites are categorized into primary metabolites, encompassing proteins, carbohydrates, amino acids, lipids and nucleic acids, and secondary metabolites, which consist of additional compounds synthesized by cells via metabolic pathways originating from primary metabolites. Secondary metabolites are classified into three primary categories based on their biosynthetic pathways: nitrogen-containing compounds, phenolic compounds and terpenes(4,5). Zoo chemicals are bioactive substances derived from animals that contribute to various biological activities. Zoo therapy has recently become significant in pharmacological studies, with research focused on the application of zoo chemicals for the treatment of various diseases, including anti-cancerous activity, anti-microbial activity, anti-inflammatory, anti-diabetic activity, anti-oxidative activity, fever, diarrhea, dysentery, biomarkers and probiotics(6–10). Researchers have extensively studied phytochemicals and their therapeutic value in a variety of plants, but little is known about the zoo chemical analysis of annelids. So, it is extremely significant to know the basic zoo chemical constituents of the *Tubifex* extracts. The current study examines the presence of bioactive compounds in *Tubifex*. This preliminary screening establishes a basis for subsequent in-depth investigations, potentially resulting in the identification of new therapeutic agents and other significant bioactive compounds. This research enhances the understanding of annelid biochemistry and highlights *Tubifex* as a significant source of bioactive compounds with various applications.

MATERIALS AND METHODS

Preparation of sample

The *Tubifex* that had been freeze-dried were purchased from an aquarium retailer specifically for the purpose of the study, and then they were powdered using a mortar and pestle.

Preparation of Solvent extract

5g of Freeze-dried *Tubifex* powder was separately mixed with two solvents of differing polarity (hexane and distilled water) of ratio 1:10 and the mixture was shaken occasionally under dark environment for 72 hours. The extracts were filtered using Whatman filter paper no. 2 on a Buchner funnel and were subsequently utilised for the analysis of zoo compounds.

Qualitative analysis

Qualitative tests for alkaloids, steroids, tannins, saponins, terpenoids, flavonoids, cardiac glycosides, phenolic compounds, aromatic acids and xanthoprotein were conducted by following the methodology described by Harborne, 1998.

RESULTS AND DISCUSSION

The zoo chemical of two extract of the freeze-dried *Tubifex* were analyzed. The polar compound hexane is utilized due to its ability to dissolve an array of nonpolar compounds. The results obtained showed the evidence of zoo compound from the hexane extract. In this analysis Steroid, Tannins, Saponins, Terpenoid, Cardiac Glycosides, Phenolic compound and Xanthoprotein were present, whereas alkaloid and aromatic acid were absent (Table 1). The Eco friendly solvent aqueous is polar in nature that has been used for the extraction. Table 2 indicates the zoo chemicals present in the aqueous extract. Alkaloids, Steroid, Tannin, Saponins, Flavonoid, Terpenoid, Cardiac Glycoside, Phenolic compound were present while Aromatic acid and Xanthoprotein were absent in the extract. This study revealed that, both solvents were effective in the extraction of zoo constituents. These positively screened biochemical compounds in *Tubifex* extract exhibited a wide range of biological activities, and they closely match secondary metabolites found in various medicinal plants. This highlights the potential for *Tubifex* extract to serve as a natural source for the discovery of new therapeutic agents in drug development. Alkaloids are one of the largest groups of natural products containing nitrogen. This compound exhibit pharmacological activities such as antioxidant property, anticancer activity, antimicrobial activity, amoebicidal activity, cytotoxicity activity, muscle relaxant, analgesic property, antimalarial activity, antituberculosis activity etc(12,13). Steroids are four ring structure present in both the extract and has the following activity of anti-inflammatory, immunosuppressive, anti-hepatotoxicity and anti-tumour activity(14,15). The polyphenolic compounds like tannins has Anti-oxidant, anti-inflammatory, anticancer antimicrobial properties, along with their role in the prevention of cardiovascular, neuroprotective and metabolic diseases (16). According to Desai et al. (2009), saponins express various effects on animal cells, fungi and bacteria; however, limited research has focused on their role in plant cells and they are recognised for their antimicrobial properties, their ability to inhibit mould growth, and their role in safeguarding plants against insect infestations. Researchers reported that the flavonoids are one of the most abundant and widespread secondary metabolites groups, are valuable to humans for their effects such as anti-diabetic effect, antiosteoporotic effect, cardioprotective effect, neuroprotective effect, antioxidant effect and some other effects like asthma, skin damage and erythema (18–21). Terpenoids are the compound derived from isoprene group and their pharmacodynamics are antimalarial drug, anti-melanoma, chemopreventive, anti-inflammatory and anti-arthritic activity (22). Organic compound like cardiac glycosides bind to and inhibit Na^+/K^+ -ATPase and also involved in cancer therapy (23). Aromatic compound phenol is directly attached to the benzene ring were used in anti-inflammatory activity (24). In addition, the phenolic compound possess antibacterial, antiprotozoal, antifungal, antitumor, estrogenic, antidiabetic, or antithrombotic agents (25). Similar to plants, animals are increasingly recognized as an alternative source for bioactive compounds. Numerous researchers have worked to identify animals that produce bioactive compounds and have gained success(26–28). Hence this work would lead to the development of new therapeutics and holds the development of drug discovery and treatment of various diseases.

CONCLUSION

The study examines the composition of various chemical groups in the hexane and aqueous extracts of the *Tubifex*. The results indicated the presence of various chemicals in the tested animal. Hexane extracts contained steroids, tannins, saponins, flavonoids, terpenoids, cardiac glycosides, phenolic compounds and xantho proteins while Aqueous extracts contained alkaloids, steroids, tannins, saponins, flavonoids, terpenoids, cardiac glycosides and phenolic compound. This indicates a distinct biochemical profile of the animal, which may influence their respective medicinal properties and uses. Further research is needed to explore the biological activities of these compounds and their potential applications in traditional medicine.

ACKNOWLEDGEMENT

The authors are grateful to the management of Holy Cross College (Autonomous), Nagercoil for providing all facilities to carry out the research in the Research centre of the Department of Zoology.

ABSTRACT

Guillain-Barré Syndrome (GBS) is a rare and serious neurological condition that frequently goes undiagnosed due to its complex and varied symptoms. This paper presents GBSDetect+, an AI-driven application aimed at helping healthcare professionals with the early detection and management of GBS. The application employs sophisticated machine learning algorithms to evaluate patient data and estimate the probability of GBS. Notable features include real-time risk assessment, management of patient records, and visualization of risk factors. During testing, the application demonstrated an impressive accuracy rate of 94%, underscoring its potential for practical use. By merging AI with healthcare, GBSDetect+ seeks to minimize diagnostic delays and enhance patient outcomes, especially in settings with limited resources. Future developments will focus on broadening the dataset with real-world cases and integrating additional machine learning methods to further improve diagnostic accuracy. **Keywords:** Guillain-Barré Syndrome, Artificial Intelligence, Machine Learning, Early Detection, Healthcare Application.

Keywords: Guillain-Barré Syndrome, Artificial Intelligence, Machine Learning, Early Detection, Healthcare Application

**Ankita M. Sankpal et al.,**

INTRODUCTION

Guillain-Barré Syndrome (GBS) is an autoimmune condition in which the immune system attacks the peripheral nervous system, resulting in symptoms that can vary from muscle weakness to total paralysis. The incidence of GBS is about 1–2 cases per 100,000 individuals each year, yet diagnosing it remains difficult due to its infrequency and diverse clinical presentations. Early detection is essential for effective management and better outcomes, but the lack of definitive diagnostic tests often results in delays. This paper introduces GBSDetect+, an AI-based application designed to assist healthcare professionals in diagnosing GBS. The tool utilizes machine learning algorithms to analyze clinical data, offering real-time predictions regarding the likelihood of GBS. By optimizing the diagnostic process, GBSDetect+ fills a crucial gap in neurology and healthcare technology.

Conceptual Framework

Objectives

The main aim of GBS Detect + is to improve the diagnostic process for GBS by:

1. Utilizing AI for precise predictions based on patient information.
2. Minimizing diagnostic delays through immediate assessments.
3. Assisting healthcare professionals with tools for visualizing risk.

Key Features

1. Patient Data Input: Sections for entering patient demographics, symptoms, and clinical history.
2. AI Prediction: A machine learning model developed using clinical datasets to estimate the likelihood of GBS.
3. Risk Visualization: Graphical displays of contributing factors to support clinical decision-making.
4. Database Management: Secure storage and retrieval of patient records to ensure continuity of care.
5. Multilingual Interface: Options for various regional languages to enhance accessibility.

METHODOLOGY

AI Model Development

The backend of GBSDetect+ utilizes a Random Forest Classifier, which has been trained on a synthetic dataset that includes features such as:

- Age
 - Gender
 - Infection history (e.g., previous viral or bacterial infections)
 - Symptom duration
 - Symptom severity
- Key preprocessing steps involved:
- Normalizing data to maintain consistent input.
 - Selecting features to pinpoint the most predictive variables.
 - Addressing missing values through imputation techniques.

Application Workflow

1. **Data Input:** The front-end interface, developed with React JS, enables healthcare professionals to input patient data.
2. **Backend Processing:** The FastAPI framework manages data processing and AI model inference.
3. **Risk Prediction:** The outputs consist of a probability score indicating the likelihood of GBS and suggestions for additional tests or treatments.
4. **Visualization:** Results are presented as interactive graphs and charts, which assist in decision-making.

Testing and Validation

The Random Forest model was validated using an 80% training and 20% testing data split. Metrics achieved include:

**Ankita M. Sankpal et al.,**

- **Accuracy:** 94%
- **Precision:** 92%
- **Recall:** 90%

Additionally, k-fold cross-validation (k=5) was performed to ensure model robustness.

RESULTS AND DISCUSSION

Model Performance

The Random Forest model showed strong performance across various metrics, establishing it as a dependable tool for the early detection of GBS. Figure 1 (not included) illustrates the ROC curve, which has an area under the curve (AUC) of 0.96.

Use Case

Imagine a healthcare professional in a rural clinic with limited access to advanced diagnostic tools. By inputting a patient's symptoms and clinical history into GBSDetect+, the clinician receives:

- A probability score that indicates the likelihood of GBS.
- Visual insights into the contributing risk factors.
- Recommendations for next steps, including specific laboratory tests or referrals to specialists.

Limitations

1. **Synthetic Dataset:** The model's dependence on synthetic data requires real-world validation for broader applicability.
2. **Data Quality:** The accuracy of predictions relies on the quality and completeness of the input data.
3. **Scalability:** The application needs to be integrated with existing hospital systems for seamless adoption.

Applications and Future Work

Practical Applications

1. Implementation in hospitals and rural clinics for early GBS detection.
2. Integration with electronic health record (EHR) systems to enhance workflows.
3. Utilization as an educational resource for medical students and healthcare professionals.

Future Enhancements

1. **Dataset Expansion:** Partner with healthcare institutions to gather real-world clinical data for model retraining.
2. **Advanced Algorithms:** Integrate deep learning techniques, such as convolutional neural networks (CNNs), to identify more complex patterns.
3. **Enhanced Interface:** Create a mobile-friendly version with multilingual support for broader accessibility.
4. **Regulatory Compliance:** Ensure compliance with healthcare standards like HIPAA and GDPR to protect data security and privacy.

CONCLUSION

GBS Detect+ marks a significant step forward in applying AI to address diagnostic challenges in neurology. By equipping healthcare professionals with advanced tools, it enhances the potential for timely and accurate diagnoses.

ABSTRACT

Levan is a fructose-based biopolymer produced by various microorganisms and plants from sucrose via the action of the enzyme levansucrase. The bacterial isolate *Bacillus velezensis* SR1, which was isolated from fermented idli batter, was studied for its responses to physical and nutritional parameters for enhanced production of levansucrase, a key enzyme in the industrial synthesis of levan. Critical parameters like temperature, pH, inoculum size, incubation time, and substrate concentration like carbon and nitrogen sources were systematically analyzed to maximize the enzyme yield. The optimal conditions for levansucrase production were determined to be 5% (w/v) sucrose, 2% (w/v) yeast extract in Cortezi medium, a temperature of 37°C, pH 6.5, and an inoculum size of 10%, with an incubation period maintained over 48 hours. To further enhance efficiency and reduce production costs, the study explored the use of alternative natural carbon sources as substitutes for sucrose, including agro-industrial waste such as sugarcane bagasse (*Saccharum officinarum*), banana peels (*Musa acuminata*), mango peels (*Mangifera indica*), orange peels, and dates. Among these, mango peel at a concentration of 5% yielded the highest levansucrase production, achieving 6.05 U/ml of enzyme activity and 5.45 g/L of levan biopolymer. This eco-friendly and cost-effective approach emphasizes the potential of utilizing agro-industrial waste to improve enzyme production while promoting sustainable practices in industrial biotechnology.

Keywords: *Bacillus velezensis* SR1, Levan, Levansucrase, Mango peel, optimization.

INTRODUCTION

Levansucrase (E.C. 2.4.1.10) is a fructosyltransferase enzyme responsible for catalyzing the conversion of sucrose into levan, a homopolysaccharide. This enzyme belongs to the glycosyl hydrolase family 68 (GH68) and facilitates the synthesis of levan by transferring fructose units from sucrose and producing glucose as a byproduct. Levan primarily consists of β -(2 $\rightarrow$ 6) glycosidic linkages in its main chain, with β -(2 $\rightarrow$ 1) linkages present at branching points. These unique structural characteristics confer distinctive properties to levan [1]. Plants and various microorganisms, including bacteria, fungi, yeasts, and algae, are recognized as major producers of levan [2,3,4]. Levan, beyond being a metabolic byproduct, plays a vital role in aiding microbial adaptation to environmental stresses such as osmotic pressure fluctuations, drought, high salinity, and extreme temperatures [5]. These adaptive properties make levan a molecule of considerable interest for various applications. Jacob et al. [6] demonstrated that incorporating levan as a hydrocolloid microgel enhances the quality of wheat bread by improving its texture and extending its shelf life. Levan's prebiotic properties have been confirmed by several studies. [7, 8, 9]. Gupta et al. [10] have emphasized its positive impact on gut health through influences from the gut microbiota. The broad spectrum of applications highlights its versatility, making it highly valuable not only in food technology but also in health and nutrition applications. Levan has been recognized for its diverse bioactive properties, including antioxidant activity [11], anti-obesity effects [12], antifungal properties [13], anti-diabetic potential [14], and anti-tumor activity [15]. The increasing focus on sustainable and eco-friendly production methods has highlighted the potential of microbial levansucrase. Microbial production offers significant advantages, such as high efficiency and the use of native bacterial strains *Bacillus*. Optimizing production parameters improves enzyme yields, reduces production costs, and supports global efforts toward environmentally sustainable industrial practices. This study aimed to optimize the process parameters for levansucrase production, with the goal of enhancing its yield and making the production process more economically viable and environmentally sustainable.

MATERIALS AND METHODS

Bacterial isolate and Inoculum Preparation

A strain of *Bacillus velezensis* SR1 was isolated from fermented food, particularly from idli batter. This strain demonstrated the ability to produce levan when sucrose served as the substrate. The isolate was cultivated, following the protocol established by Cortezi, Monti et al. (2005) to assess its levansucrase activity. The strain was maintained on Cortezi medium in refrigerated conditions. The maintained levansucrase producing *Bacillus velezensis* SR1 strain was inoculated into Cortezi broth [16].

Fermentation Conditions

Submerged fermentation studies were carried out using the selected bacterial strain *Bacillus velezensis* SR1 to optimize enzyme production. Experiments were performed in 250 ml flasks containing 100 ml of Cortezi broth with the following composition (g/l) Yeast extract (2 g), $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ (0.02 g), $\text{MnSO}_4 \cdot 4\text{H}_2\text{O}$ (0.001 g), $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ (0.001 g), K_2HPO_4 (2 g), NaCl (0.001 g), CaCl_2 (0.002 g), and sucrose (4%) as the primary carbon source. Fermentation parameters, including physical conditions such as temperature, pH, inoculum size, and incubation time, were optimized. The tested ranges were temperature 20–45°C, pH 4.0–8.0, Inoculum size 0.5–20%, and Incubation time 24–96 hours. Nutritional parameters were evaluated to determine their effects on enzyme production and levan synthesis. Various carbon sources at 5% concentration were tested, including sucrose, glucose, lactose, maltose, soluble starch, and fructose. Different nitrogen sources at 2% concentration were also assessed, including yeast extract, tryptone, casein hydrolysate, beef extract, peptone, ammonium phosphate, ammonium sulfate, ammonium chloride, and urea.

Fermentation studies explored the potential of alternative carbon sources from fruit waste. Bioconversions allow agricultural waste to be employed in cost-effective manufacturing and help to lower pollution generated by agro-

waste residues [17, 18]. Culture media were enriched with sucrose-rich agricultural by-products, such as sugarcane bagasse (*Saccharum officinarum*), banana peels (*Musa acuminata*), mango peels (*Mangifera indica*), orange peels, and dates. This sustainable approach utilized low-cost raw materials to enhance enzyme production, shows results consistent with the previous research [19, 20]. To evaluate levan production, these fruit waste substrates, such as banana peels, mango peels, sugarcane bagasse, orange peels, and dates, were analyzed for their sucrose concentration and utilized as substrates. The sources were selected based on their availability and evidence from previous studies and literature by Shagufta Saeed [21]. Submerged fermentation was carried out using a 5% sucrose-enriched medium to optimize production. The fruit waste residues were processed by cutting them into small pieces, drying them at 60°C for 48 hours, grinding them into fine powder, and sieving them through a No. 18 mesh (1 mm pore size), following protocols described by Kanakdande et al. (2016) and Preethi [22]. A modified Cortezi medium in which sucrose is replaced with selected natural sucrose sources of 5% and yeast extract of 2% was used for enzyme production. All the experiments were conducted in duplicate to optimize levansucrase production by the bacterial isolate, using the one-factor-at-a-time (OFAT) methodology. This method involved systematically varying one factor at a time while maintaining all other variables constant.

Levansucrase Activity Assay

The fermented broth was centrifuged at 10,000 rpm for 10 minutes at 4°C using a cooling centrifuge. The resulting clear supernatant served as the crude enzyme source. Supernatant was defined as cell-free extract and was used to determine levan and levansucrase, for the assay, 0.5 ml of the supernatant was mixed with 0.5 ml of a 20% (w/v) sucrose solution prepared in 50 mM phosphate buffer at pH 6.0. This reaction mixture was incubated at 37°C for 30 minutes to facilitate enzymatic activity. To stop the reaction and inactivate the enzyme, by adding 1 ml of DNS and the mixture was boiled at 100°C for 10 minutes. The concentration of reducing sugars in the reaction mixture was determined using the 3, 5-dinitrosalicylic acid (DNS) method. One unit of levansucrase activity was defined as the amount of enzyme required to release 1 μ mol of glucose per minute per milliliter of enzyme solution [23].

Extraction of Levan

Levan was extracted from the culture filtrate of *Bacillus velezensis* SR1 by centrifugation at 9,000 rpm for 10 minutes to separate bacterial cells. The levan polymer in each culture sample was precipitated by adding two volumes (1:2) volumes of ice-cold absolute ethanol to supernatant and incubating at 4°C for 24 hours [24, 25]. Levan is known to be insoluble in organic solvents, including ethanol [26]. After 24 hours, the supernatant was discarded, and the precipitate was collected by centrifugation at 9,000 rpm for 10 minutes. The precipitated polysaccharides were collected and dried under vacuum at 80°C for 24 hours. The dried levan polymer was then weighed to determine its yield.

RESULTS AND DISCUSSION

Effect of temperature on levansucrase production

The effect of temperature on levansucrase production was studied for the isolate *Bacillus velezensis* SR1 under submerged fermentation. At 20°C, the enzyme activity was recorded as 2.1 U/ml. When the temperature was increased to 25°C, the activity rise to 2.25 U/ml. Further increases in temperature to 30°C led to higher activity and yield, reaching 2.9 U/ml, respectively, with the results presented in Figure 1. The optimal temperature for levansucrase activity was found to be 37°C, with a peak activity of 3.45 U/ml and a levan yield of 2.5 g/100 ml. However, at 40°C, the enzyme activity shows 1.95 U/ml, and at 45°C, it shows an enzyme activity of 0.9 U/ml, and levan production showed a marked decline. The temperature of 37°C appears to be the ideal condition for stimulating cellular enzyme activity, promoting the synthesis of metabolites and levan production. These findings are consistent with earlier studies, such as *Bacillus subtilis* NRC33a which achieved optimal levan production at 37°C [27]. Bansal et al. [28] observed that levan synthesis was most effective between 25°C to 37°C but was significantly reduced at temperatures exceeding 45°C. The influence of bacterial strain variability on levan production has also been highlighted [29], while other studies [30] emphasize the role of environmental factors like temperature, pH, and

light intensity in exopolysaccharide synthesis. The levansucrase activity of *Bacillus methylotrophicus* SK 21.002 was highest at 37°C [31]. Supporting the findings of this study.

Effect of pH on levansucrase production

The study emphasized the importance of pH in optimizing levansucrase production by *Bacillus velezensis* SR1 under submerged fermentation (SmF). Enzyme activity was evaluated across a pH range of 4.0 to 8.0, with the results presented in Figure 2. At pH 4.0, levansucrase activity was recorded as 0.95 U/ml, increasing to 1.2 U/ml at pH 5.0. A significant enhancement in enzyme activity and levan yield was observed at pH 6.0, reaching 2.95 U/ml. The optimal pH for levansucrase activity was determined to be 6.5, where peak activity reached 3.7 U/ml, with a levan yield of 2.6 g/100 ml. Enzyme activity remained relatively high at pH 7.0 (3.05 U/ml) but declined significantly at pH 8.0 (1.7 U/ml). Each microorganism has a specific pH range that supports its growth and enzyme activity, an optimal pH that maximizes enzyme production. It was found that *Bacillus velezensis* SR1, the highest levansucrase production, was observed at an initial pH of 6.5 with an enzyme activity of 3.7 U/ml. Deviation from this optimal pH, whether by increasing or decreasing it, resulted in reduced microbial growth and lower enzyme production. The pH of the fermentation medium plays a crucial role in regulating enzyme activity by affecting the ionization state of amino acids, thereby altering enzyme conformation and substrate interaction. At pH 6.5, phosphate buffers provided the highest enzyme stability, while acetate buffers maintained enzyme activity at pH 6.0 but showed a sharp decline at pH 5.0. The low enzyme activity observed at pH 4.0 suggests a degree of acid resistance but limited efficiency. These findings align with earlier research, that *Bacillus amyloliquefaciens* levansucrase activity exhibited maximum activity at pH 6.0–6.5 [32]. Studies on that *Bacillus subtilis* B58 and *Bacillus* species confirm that levansucrase activity is optimal at pH 6.2–6.5 [33, 34]. According to Abou-Taleb et al. levan synthesis is most efficient at pH 6.5 and declines above pH 8.0. Additional studies [35, 36, and 37] indicate that *Bacillus subtilis* produces levans most effectively at pH 6.0–7.0. Based on these findings, pH 6.5 was selected for further fermentation experiments to maximize levan production by *Bacillus velezensis* SR1. The maximum levan yield at this pH may be attributed to the induction of levansucrase within the pH range of 5.0 to 6.5, as previously reported [38].

Effect of Inoculum size on levansucrase production

The effect of inoculum size on levansucrase activity and levan production was studied. The fermentation medium was inoculated by *Bacillus velezensis* SR1 under controlled conditions. Fermentation was conducted at 37°C with a pH of 6.5, while varying inoculum sizes ranging from 0.5%, 5%, 10%, 15%, and 20% were evaluated to assess their impact on enzyme activity and levan yield. While maintaining other parameters constant. A decline in levan production was observed at higher inoculum sizes, likely due to increased cell density leading to rapid depletion of nutrients and oxygen in the medium. This accelerated consumption of sugars may have reduced levan synthesis. The study identified 10% as the optimal inoculum size for *Bacillus velezensis* SR1, resulting in the highest levansucrase activity of 3.85 U/ml and a levan yield of 2.9 g/100 ml, with results summarized in Figure 3. At an inoculum size 0.5%, the enzyme levansucrase activity was recorded as 0.6 U/ml, when the inoculum size is 5%, the enzyme activity was 1.5 U/ml. Inoculum size of 15% shows the enzyme activity of 2.8 U/ml, for 20%, it shows the enzyme activity of 1.95 U/ml. These results highlight the importance of strain-specific optimization, as bacterial strains, even within the same species, can vary significantly in growth patterns, metabolism, and environmental adaptability. The distinct characteristics of *Bacillus velezensis* SR1 were evident when compared to other isolates [39,40], have similarly reported 10% inoculum size as optimal for levan production in strains such as *Bacillus lentus* V8 and *Bacillus subtilis*. These results align with earlier research, highlighting the importance of optimizing inoculum size to maximize enzyme activity and product yield.

Effect of Incubation period on levansucrase production

The effect of incubation time on levan production and levansucrase activity by *Bacillus velezensis* SR1 was evaluated under controlled conditions. The bacterium was cultured in a production medium at 37°C and pH 6.5, with results summarized in Figure 4. Cultures were incubated for 24, 48, 72, and 96 hours, with all flasks inoculated with 10% (v/v) of *Bacillus velezensis* SR1 and maintained under uniform conditions throughout the experiment. At 24 hours of

Srilatha et al.,

incubation, enzyme activity was recorded at 2.6 U/ml. Extending the incubation period to 48 hours resulted in the highest enzyme activity of 3.4 U/ml. However, as the incubation time increased to 72 hours, enzyme activity declined to 2.75 U/ml, with a further reduction to 1.55 U/ml at 96 hours, likely due to nutrient depletion and the accumulation of inhibitory by-products, leading to decreased levan synthesis. At an incubation period of 24 hours, the enzyme activity recorded was 2.6 U/ml, a further increase in the incubation period for 48 hours showed the enzyme activity as 3.4 U/ml. As the incubation period was increased to 72 hours, the enzyme activity showed 2.75 U/ml, with a reduction of enzyme activity at 96 hours recorded as 1.55 U/ml with depletion of nutrients leading to a reduction of levan biopolymer. The results showed that incubation time plays a significant role in levan production and levansucrase activity. The highest enzyme activity (3.4 U/ml) and levan yield (2.4 g/100 ml) were observed after 48 hours of incubation. Increasing the incubation time beyond 48 hours resulted in reduced yields, likely due to nutrient depletion and the accumulation of inhibitory by-products. This observation aligns, with that prolonged incubation leads to reduced yields as a result of nutrient exhaustion and the production of inhibitory metabolites. Maximum levan production occurred after 48 hours of incubation, it was also reported that levan synthesis peaks during the stationary phase of bacterial growth [41]. This study confirms that *Bacillus velezensis* SR1 produces the most levansucrase enzyme activity when it is incubated for 48 hours.

Optimization of nutritional parameters on levansucrase production

Effect of sucrose at different concentration on levansucrase activity to maximum levan

Sucrose serves as the primary carbon source essential for levan biosynthesis, a process catalyzed by the enzyme levansucrase. This enzyme hydrolyzes sucrose while simultaneously polymerizing fructose to produce levan. The present study examined how varying sucrose concentrations affect levansucrase activity and levan production to determine optimal conditions for achieving maximum yield. Submerged fermentation was carried out in 250 ml Erlenmeyer flasks containing 100 ml of production medium inoculated with *Bacillus velezensis* SR1. In the screening process, when one type of nutrient source was varied, the other nutrients were kept constant. The experiments were performed under specific conditions optimized for this strain, an incubation temperature of 37°C, a pH of 6.5, a 10% inoculum size, and an incubation period of 48 hours. The results, summarized in Figure 5, demonstrated that sucrose concentration significantly influenced enzyme activity and levan production. The fermentation medium was supplemented with sucrose at concentrations of 2%, 4%, 5%, 8%, and 10%. Levansucrase activity was measured using the DNS (3, 5-dinitrosalicylic acid) method, while extracellular levan was precipitated with ethanol. A thick, cloudy precipitate confirmed substantial levan production. The highest enzyme activity (3.76 U/ml) and levan yield (2.8 g/100 ml) were recorded at 5% sucrose. Enzyme activity at lower sucrose concentrations was 1.65 U/ml (2%) and 2.55 U/ml (4%), while higher concentrations of 8% and 10% resulted in enzyme activities of 2.96 U/ml and 2.23 U/ml, respectively. These results indicate that increasing sucrose beyond 5% did not enhance enzyme production, confirming 5% as the optimal concentration for levansucrase activity under the tested conditions.

These findings align with previous studies that highlight sucrose as an effective substrate for levan production in various bacterial strains. *Bacillus subtilis* NRC 108 produced 10.5 g/L of levan with 50 g/L of sucrose [42]. Similarly, levan yield of 26.65 g/L using *Bacillus subtilis* B58, while *Leuconostoc mesenteroides cremoris* LF5 achieved a yield of 2.82 g/100 ml. Comparative research emphasizes sucrose's efficacy over other carbon sources for enhancing levan production. *Bacillus mojavensis* MT012152 produced 22 g/L of levan with 5% sucrose but only 112.1 mg/L of exopolysaccharides (EPS) with 8% lactose [43]. These studies confirm the critical role of sucrose in maximizing levan biosynthesis.

Effect of various a carbon sources on levansucrase activity

In this study, the effects of various carbon sources, such as sucrose, glucose, maltose, lactose, starch, and fructose, on levansucrase activity and levan production were evaluated to identify optimal conditions for maximum yield. Submerged fermentation was performed in 250 ml flasks containing 100 ml of production medium inoculated with *Bacillus velezensis* SR1. The process was conducted under optimized conditions a temperature of 37°C, pH 6.5, 10% inoculum size, and a 48-hour incubation period. The results, summarized in Figure 6, revealed that sucrose was the most effective carbon source for enhancing both levansucrase activity and levan production. Optimal conditions were

**Srilatha et al.,**

achieved with 5% sucrose, yielding an enzyme activity of 3.75 U/ml and a levan production of 2.89 g/100 ml, followed by glucose with levansucrase activity of 2.95 U/ml, while other carbon sources resulted in lower enzyme activity and reduced levan production. The superior performance of sucrose as a carbon source is attributed to its efficient utilization by *Bacillus velezensis* SR1 for levansucrase mediated levan synthesis at 5%. These results are consistent with that of *Bacillus subtilis* showed sucrose as significant substrate to enhance levansucrase activity and levan production [44,45].

Effect of nitrogen sources at different concentration on Levansucrase activity

The impact of varying yeast extract concentrations (1%, 1.5%, 2%, 2.5%, and 3%) on the growth of *Bacillus velezensis* SR1 and its levansucrase activity was investigated to optimize levan production. The fermentation process was conducted under controlled conditions, including a temperature of 37°C, pH 6.5, a 10% inoculum size, and a 48-hour incubation period. The results, summarized in Figure 7, demonstrated a relationship between yeast extract concentration and enzyme activity. Nitrogen sources, such as yeast extract, act as an excellent nitrogen source for promoting levansucrase activity in bacterial strains. [46]. At a 1% yeast extract concentration, levansucrase activity was recorded at 1.1 U/ml. Increasing the concentration to 1.5% enhanced enzyme activity to 1.75 U/ml, while the optimal concentration of 2% resulted in the highest levansucrase activity of 3.55 U/ml and a levan production of 2.3 g/100 ml. However, further increases in yeast extract concentration led to a decrease in enzyme activity, with 2.5% yielding 3 U/ml and 3% showing a reduced activity of 1.95 U/ml. These findings indicate that excessive nitrogen supplementation can negatively impact enzyme production. The optimal conditions for levansucrase activity were achieved with 2% yeast extract and 5% sucrose, resulting in high enzyme activity.

Effect of different nitrogen sources on levansucrase activity

Various nitrogen sources, including yeast extract, tryptone, casein hydrolysate, beef extract, peptone, ammonium phosphate, ammonium sulfate, ammonium chloride, and urea, were evaluated for their effect on enzyme production. The results, summarized in Figure 8, indicate that yeast extract at a 2% concentration yielded the highest levansucrase activity at 3.5 U/ml, followed by peptone at 3.1 U/ml. Beef extract and tryptone recorded enzyme activities of 2.75 U/ml and 2.45 U/ml, respectively. Among inorganic nitrogen sources, ammonium sulfate exhibited a levansucrase activity of 2.55 U/ml, while other nitrogen sources resulted in lower enzyme activity and reduced levan production. Nitrogen plays a crucial role in bacterial growth and the synthesis of biomolecules such as amino acids and proteins. However, its utilization varies among bacterial strains, even within the same species. The study results demonstrated that nitrogen supplementation enhanced levansucrase activity, with a peak production of 3.5 U/ml. Among the tested nitrogen sources, yeast extract and peptone were the most effective in promoting enzyme production and levan yield. However, exceeding the optimal nitrogen concentration led to decreased yields, suggesting that excessive nitrogen may inhibit enzyme synthesis. The optimal nitrogen concentration for maximum levansucrase activity was determined to be 2%, resulting in an enzyme activity of 3.5 U/ml and a levan yield of 2.5 g/100 ml. Several research findings indicated that yeast extract as the most effective nitrogen source for levan production and 2% concentration of baker's yeast yielded the highest levansucrase activity [47, 48].

Effect of sucrose rich natural sources for levansucrase activity and levan production

Sucrose Content Analysis from Fruit Sources

Mango peel as natural sucrose sources indicated maximum levansucrase production at 6.05 U/ml with 5.45 g/l of levan, followed by Dates as sucrose sources for enzyme activity and levan production. The results were represented in (Figure 9&10). Modified Cortez medium in which Sucrose is replaced with selected natural sucrose sources of 5% and yeast extract of 2% was used for enzyme production.

DISCUSSION

The study demonstrated that *Bacillus velezensis* SR1, isolated from fermented idli batter, is a highly efficient producer of levan. Submerged fermentation under optimized conditions significantly enhanced both levansucrase enzyme

Srilatha et al.,

activity and levan yield. Through the optimization of physical and nutritional parameters, the performance of the strain was maximized. Under optimal conditions pH 6.5, a temperature of 37°C, 48 hours of incubation, and a 10% inoculum size *B. velezensis* SR1 displayed a levansucrase activity of 6.05 U/ml and achieved a levan yield of 5.45 g/100 ml using raw fruit sucrose as the substrate. Prior to optimization, enzyme activity was 2.5 U/ml; this demonstrates a substantial improvement in enzymatic performance and production efficiency because of fermentation optimization. For instance, *Bacillus tequilensis* PS21 produced 112.1 mg/L of exopolysaccharides (EPS) in lactose-based media, while *Bacillus mojavensis* yielded 22 g/L of levan in a medium containing 5% sucrose. Such comparisons underscore the effectiveness of *B. velezensis* SR1 in utilizing sucrose-based substrates for levan synthesis, showcasing its industrial potential. The study emphasizes the importance of optimizing fermentation conditions to enhance levansucrase activity and levan yield. The achieved improvements from an enzyme activity of 2.5 U/ml to 6.05 U/ml and a levan yield of 5.45 g/L highlight the strain's capacity for scalable and efficient levan production, making it a valuable for industrial applications.

The present study focused on isolating a potent levansucrase-producing strain from fermented food, with an emphasis on its potential for medicinal and pharmaceutical applications. The strain *Bacillus velezensis* SR1 demonstrated enhanced efficiency in levan production by utilizing mango peel as an alternative, agro-based sucrose substrate. Under optimized conditions pH 6.5, 37°C, and 48 hours of incubation the strain achieved a levan yield of 5.45 g/L. Comparative analysis with existing literature highlighted the superior efficiency of *Bacillus velezensis* SR1 in levan production under standard laboratory conditions. This highlights the strain for sustainable and cost-effective industrial applications. Future research is required towards the purification and detailed characterization of the levansucrase enzyme, aiming to explore its full potential for diverse medicinal and industrial applications.

ACKNOWLEDGEMENT

The authors express their gratitude to the management of Bhavan's Vivekananda College of Science, Humanities, and Commerce, Sainikpuri, Secunderabad, and the Department of Microbiology, Osmania University, Hyderabad, for their valuable support and guidance.

ABSTRACT

Spinal cord injuries (SCI) represent a significant public health concern globally, impacting individuals' quality of life and posing substantial socioeconomic burdens. This epidemiological study aims to analyze the prevalence, demographic distribution, severity, and mechanisms of SCI among patients in Gujarat, India. Understanding these factors is crucial for developing targeted prevention strategies and improving healthcare interventions tailored to the region's unique characteristics. Data for this study were collected from various multispecialty hospitals across Gujarat. A total of 378 patients with SCI were included in the analysis, categorized by AIS (ASIA Impairment Scale) grades and anatomical location (cervical vs. thoracolumbar). Demographic variables such as age, gender, and rural/urban residence were examined, along with occupational profiles and mechanisms of injury. Statistical analyses were conducted to identify trends and associations within the dataset. The distribution of AIS grades revealed varying severity of impairments, with Grade A (complete impairment) more prevalent in cervical injuries (25.0%) compared to thoracolumbar injuries (19.1%), while Grade E (no impairment) was higher in thoracolumbar injuries (46.6%) than cervical injuries (32.0%). Among demographic factors, individuals aged 20–49 years constituted the highest proportion of SCI cases (71.1%), with a notable prevalence among rural males engaged in occupations such as farming and labor. Road traffic accidents were identified as the leading cause of SCI across all groups, with rural males particularly affected by

**Jaynesh Vandra et al.,**

agricultural hazards. This study provides valuable insights into the epidemiology of SCI in Gujarat, highlighting demographic disparities, occupational risks, and predominant mechanisms of injury. The findings underscore the need for targeted interventions, including enhanced workplace safety measures, improved access to specialized healthcare, and community-based prevention programs. By addressing these factors comprehensively, stakeholders can mitigate the incidence and impact of SCI, improve patient outcomes, and promote public health in the region.

Keywords: Spinal cord injury, epidemiology, Gujarat, AIS grades, demographic distribution

INTRODUCTION

Spinal cord injuries (SCI) present a critical public health challenge globally, resulting in significant morbidity and mortality. The global annual incidence of SCI varies considerably, with estimates ranging from 10.4 to 83 cases per million people per year, depending on the region and population studied[1,2]. In India, the prevalence of SCI is notably high, attributed to rapid urbanization, industrialization, and increasing vehicular traffic[1,3]. Gujarat, a key state in western India, provides a unique case for examining the epidemiology of SCI due to its diverse demographic profile and rapid economic development. Worldwide, the incidence of SCI is influenced by a variety of factors, including socioeconomic status, healthcare infrastructure, and cultural practices. High-income countries generally report lower incidences of SCI, primarily due to advanced healthcare systems and stringent safety regulations[4]. Conversely, low- and middle-income countries experience higher incidences, with causes extending beyond vehicular accidents to include falls, work-related injuries, and violence[5]. In India, the annual incidence of SCI is estimated at approximately 20 per million population, with a prevalence rate of around 236 per million[6]. This high incidence rate underscores the need for focused epidemiological studies to develop effective prevention and management strategies. Gujarat, with its blend of urban and rural environments, exhibits a diverse range of causes for SCI. Urban areas in Gujarat report higher incidences of SCIs due to road traffic accidents, which align with the state's rapid urbanization and increase in motor vehicle use[12]. Rural areas, on the other hand, often see SCIs resulting from falls, particularly in agricultural settings, and physical labor-related injuries[1,4]. These regional disparities highlight the necessity for tailored intervention strategies that address the specific causes and demographics of SCI in different parts of the state. The impact of SCI on individuals and society is multifaceted and profound. Physically, SCI can lead to permanent disabilities, necessitating lifelong medical care and rehabilitation. Psychologically, individuals with SCI often face significant mental health challenges, including depression and anxiety, due to the drastic changes in their physical capabilities and social roles[1,3]. The primary objectives of this epidemiological study are to determine the prevalence of SCI in Gujarat, identify the main causes and demographic patterns of these injuries, and assess their impact on individuals and healthcare systems. This study employs a cross-sectional design, utilizing data from hospital records, patient surveys, and healthcare provider interviews across various regions of Gujarat. Statistical analysis will be conducted to identify significant trends and correlations, providing a comprehensive understanding of SCI in the state. Therefore, a study was conducted to gather demographic and epidemiological data as well as assess the neurological status of patients with spinal cord injuries in Gujarat.

MATERIAL AND METHODOLOGY

This prospective observational study was conducted from October 2023 to December 2023 by a research scholar from the Venus Institute of Physiotherapy, Swarnim Startup & Innovation University. Data were collected from various multispecialty hospitals across Gujarat. All consecutive cases of spinal cord injury (SCI) were assessed for neurological status using the International Standards for Neurological Classification of Spinal Cord Injury, which includes the American Spinal Injury Association Impairment Scale (AIS)[8]. A prestructured proforma was utilized for evaluation, capturing demographic information such as age, gender, marital status, locality, educational status,

**Jaynesh Vandra et al.,**

income, type of family, profession, and the number of family members dependent on the patient (Demographic Data Section). In the epidemiological variables, the mechanism of injury, time of arrival at our unit post-injury, mode of transport used during patient transfer, patient position during transfer, any previous hospitalization, the type of care provided during initial admission at other healthcare facilities, and associated injuries were recorded (History Section). Terminologies relevant to the study are appended in the Abbreviations. Patients transferred from other departments or institutions or those who expired before reaching the department were excluded from this study. Data are presented as number (%) or ratio.

RESULT

The table 1 presents the distribution of AIS (ASIA Impairment Scale) grades among 378 patients with spinal cord injuries, categorized into cervical (n = 200) and thoracolumbar (n = 178) injuries. The AIS grades, ranging from A to E, indicate the severity of impairment, with Grade A representing complete impairment and Grade E signifying no impairment upon examination. In this study, Grade A (complete impairment) was observed more frequently in cervical injuries (25.0%) compared to thoracolumbar injuries (19.1%). Conversely, Grade E (no impairment) was more prevalent in thoracolumbar injuries (46.6%) than in cervical injuries (32.0%). Additionally, 12.0% of cervical injury patients and 9.6% of thoracolumbar injury patients were not tested. Overall, the data highlights a higher incidence of severe impairments in cervical injuries, whereas thoracolumbar injuries had a greater proportion of patients who recovered fully. The table 2 outlines the age and gender distribution of spinal cord injury patients in rural and urban areas of Gujarat, contrasting these distributions with those in the general population. Among patients with spinal cord injuries, the most affected age group is 20–49 years, representing 71.1% of cases, compared to 40.0% in the general population. Individuals under 19 years and those over 70 years are less affected, with 12.6% and 1.9% respectively, despite these age groups comprising a larger proportion of the general population. In terms of gender distribution, rural males dominate across all age groups, with the highest proportion (66.7%) in the 20–49 years age group. Urban males constitute a smaller percentage, with their highest representation (16.4%) also in the 20–49 years age group. Female patients are less prevalent, with rural females accounting for a slightly higher percentage across most age groups compared to their urban counterparts.

This data highlights a significant prevalence of spinal cord injuries among young to middle-aged adults, particularly in rural areas, and underscores the demographic disparities in the incidence of such injuries in Gujarat. The table 3 examines the distribution of spinal cord injury patients in Gujarat across various occupations, segmented by rural/urban residence and gender. Farmers (21%) and laborers (20%) constitute the largest groups, predominantly rural males (80% and 75% respectively). Housewives account for 15% of the patients, primarily rural females (70%). Business-related injuries (10%) are more common among rural males (60%) and urban males (35%). Students (8%), clerical workers (5%), and drivers (4.5%) also show significant rural male representation. Overall, the data highlights a higher prevalence of spinal cord injuries among rural males in physically demanding jobs, underscoring the occupational risks and demographic disparities in Gujarat. The table 4 provides insights into the mechanisms causing spinal cord injuries (SCI) among rural and urban populations in Gujarat, segmented by gender. Rural males (55%) predominantly experience SCI due to road traffic accidents (35%) and falls with heavy objects over their backs (11%), reflecting occupational hazards in agricultural settings. Rural females (20%) commonly suffer SCI from road traffic accidents (22%) and falls with heavy objects over their heads (17%). Urban males (15%) frequently incur SCI from road accidents (38%) and falls over ground (7%), whereas urban females (10%) often experience SCI due to road accidents (28%) and falls over ground (5%). These findings underscore the varied patterns of SCI across demographics and environments in Gujarat, emphasizing the need for targeted preventive measures and healthcare interventions.

Jaynesh Vandra *et al.*,

DISCUSSION

The study on the prevalence and impact of spinal cord injuries (SCI) in Gujarat, as depicted in the various tables, reveals several significant insights that contribute to our understanding of this public health issue. Firstly, the distribution of AIS grades among patients with cervical and thoracolumbar injuries highlights distinct patterns of impairment severity. Cervical injuries, represented by a higher proportion of Grade A cases (complete impairment), underscore the profound functional limitations and healthcare challenges faced by these patients compared to those with thoracolumbar injuries, where Grade E (no impairment) is more prevalent, indicating better recovery potential. Secondly, the age and gender distributions across rural and urban areas illustrate demographic disparities in SCI incidence. The disproportionately high prevalence among young to middle-aged adults, particularly in rural settings, suggests potential occupational hazards such as those faced by farmers and laborers. These groups are prominently affected, reflecting the physical demands and risks associated with their occupations. Furthermore, the study identifies specific occupational groups where SCI incidence is notably elevated, such as farmers, laborers, and drivers, particularly among rural males. This highlights the need for targeted preventive strategies and workplace safety interventions tailored to these high-risk populations. Lastly, the analysis of SCI mechanisms reveals distinct patterns between rural and urban populations and across genders. Road traffic accidents emerge as a significant cause across all groups, with rural males particularly vulnerable due to agricultural activities involving heavy machinery and transport. These findings emphasize the importance of traffic safety measures and the potential benefits of improving infrastructure and access to emergency care in rural areas. In conclusion, the epidemiological study provides valuable insights into the prevalence, demographic trends, occupational risks, and injury mechanisms associated with SCI in Gujarat. It underscores the multifaceted nature of this public health challenge and highlights the necessity for targeted interventions aimed at reducing incidence, improving outcomes, and enhancing the quality of life for those affected by spinal cord injuries in the region.

CONCLUSION

In conclusion, the epidemiological study on spinal cord injuries (SCI) in Gujarat provides a detailed analysis of incidence, severity, demographics, and associated factors shaping the landscape of SCI in the region.

The findings underscore several key insights

Severity and Distribution of SCI

The distribution of AIS grades reveals a higher incidence of severe impairments among cervical injuries compared to thoracolumbar injuries. This highlights the critical need for tailored rehabilitation strategies to address the diverse levels of impairment and recovery potential observed.

Demographic Trends

The study identifies a peak incidence of SCI among individuals aged 20–49 years, predominantly affecting rural males engaged in physically demanding occupations such as farming and labor. This demographic profile emphasizes the economic and societal implications of SCI during prime working years.

Occupational Risks

Occupational groups such as farmers, laborers, and drivers are disproportionately affected by SCI, particularly in rural areas. These findings underscore the need for targeted occupational safety measures and interventions to mitigate risks associated with agricultural and transportation-related activities.

Mechanisms of Injury

Road traffic accidents emerge as the leading cause of SCI across all demographic groups, with specific patterns observed among rural males due to agricultural machinery and transport hazards. Urban populations also face significant risks, highlighting the importance of urban planning and traffic safety initiatives.

Jaynesh Vandra *et al.*,

Implications for Healthcare and Prevention: The study underscores the importance of enhancing healthcare infrastructure, specialized rehabilitation services, and community-based prevention programs tailored to regional demographics and occupational risks. These efforts are crucial for improving outcomes, reducing disability, and enhancing the quality of life for individuals affected by SCI in Gujarat.

ABSTRACT

This paper focuses on the importance of optimistic relationships in families in ShashiDeshpande's novel, 'The Binding Vines'. ShashiDeshpande is a humanitarian novelist. She has taken an excessive effort to present not only the unity among the relationships, but also the positive and negative roles of relationships in families. The study gives a deep insight into the importance of relationships that helps one another in creating a healthy life. This study does a complete analysis on the rational thinking of human beings in the novel 'The Binding Vines' and also explores how the characters create happiness beyond all the barriers and realise that only positive mindset can elevate the relationships in the families.

Keywords: Reconciliation, Positive attitude, Resilience, Hope, Confidence

INTRODUCTION

A compassionate and comfortable family is a great source of happiness for every human being in life. With good principles, a family enjoys good health and helps people to lead a meaningful life. There is sob and smile, separation and reconciliation, affection and abhorrence, problem and remedy in every family. However, members in a family must have love and be considerate towards the others in the family and must demonstrate interest in each individual's happiness and merits. Above all, the most important trait that happens to hold a family together is the gratefulness that one has for the other.

Saraswathy

Socialising within the family sets the root for the civilisation of human beings in the society. ShashiDeshpande focuses on various dimensions of changes that people face and how they cope with the ups and downs with the help of their positive attitude and with the help of their family members and friends in the novel *The Binding Vine*. As far as blissful existence goes, positive thinking is a necessity for people belonging to all age groups. As Kanchana Mala expresses As Kanchana Mala Suggests (2023) People with the ability to adapt themselves to new situations are often described as cognitively and temperamentally flexible. They also actively alter to uncertainty and ambiguity. It helps a person to be resilient and tackle any kind of situation and overcome challenges.

Leo Tolstoy, one of the famous writers, says in *Anna Karenina*: “Happy families are all alike; every unhappy family is unhappy in its own way” (3). It is the duty of each member in the family to treat everyone with kindness and love to sustain happiness within the family. Anita Desai, an Indian writer, advocates in her novel *Cry, the Peacock*: “All relationships are inadequate...basically everyone is solitary. I think involvement in human relationship in this world is invariable and leads to disaster”(36).

ShashiDeshpande professes in *The Binding Vine*: “Perhaps the fact is that we all of us create our own truths, shaping them to our needs, in particular, the need to be able to live comfortably with ourselves, with those we love and need” (TBV 55).

Urmi, the protagonist of the novel *The Binding Vine*, leads a miserable life due to the demise of her daughter Anu. Shakutai, a poor mother sacrifices her life for her daughter’s health and economic well-being. Vanaa, friend of Urmi works very hard in order to take care of her children and Mira, Urmi’s mother-in-law sacrifices her writing skills for the family. The novel *The Binding Vine* is about how the characters overcome their miseries in their lives by helping each other in the family. The title *The Binding Vine* authenticates that love and hate, and sorrow and joy are inexorable in a family setup. A maternal bond provides psychological, social and physical security to children, which is why children and mothers become more emotionally attached to each other.

ShashiDeshpande professes in *Moving On*: “The umbilical cord continues to exist, a phantom link, all our lives. We can never deny the ties of the body; we can never leave them behind us. The ties we forge through our bodies are the strongest, the hardest to sever. Look at the way we connect the organs of the body to the emotions and feelings” (MO 114). Urmi’s daughter, Anu, in *The Binding Vine* dies when she is very young. Urmi feels isolated and is unable to forget her baby’s soft snuffling sound, sweet milky ammoniac talcum odours, and the toes that fumbled at her midriff. She carries the sovereign air of despair throughout her life. She professes: “I can smell her sweet body flesh ...my breasts feel heavy and painful, as if they are gorged with milk. I can feel her toes scrabbling at my midriff” (TBV 21). Urmi leads her life in emptiness and proclaims, “as if the core of me has been scooped out, leaving a hallow” (TBV 17). Urmi suffers gravely in the process of accepting her daughter’s death that makes her sense the loss of everything in life.

Researchers Arnold and Gemma advocate in *Healing Hearts*:

Children are not supposed to die ...parents expect to see their children grow and mature. Ultimately, parents expect themselves to die and leave their children behind ...This is the natural course of life events, the life cycle continuing as it should. The loss of child is the loss of innocence, the death of the most vulnerable and dependent. The death of a child signifies the loss of the future, of hopes and dreams, of new strength and of perfection. (IV 9, 39). Therefore, it is obvious that most of the parents’ dream is to live merely for the welfare of their children and they also lose their personal desires and aims for the well-being of their children.

Like the authors express, Urmi also believes that her future lies in the memories of her daughter and it is inhuman to forget her baby. She opines: “I have no desire to leap into future, either to project myself into a time when all this pain will be a thing of the past, healed and forgotten. This pain is all that’s left to me of her; I will lose her entirely” (TBV 9). It is always thought that the loss of a child will lead to a mother’s mental illness, the emotional blow associated with childless can lead to a wide range of psychological and physiological problems including depression, anxiety, cognitive and physical symptoms linked to stress, marital problems, increased risk of suicide, pain and guilt.

Saraswathy

Though Urmi is stressed, she tries hard to console herself by recollecting the joyful days that she spent with her daughter and also cognises the problems of her relatives and friends and directs her energy completely in helping them find solutions for their problems. Thus, ShashiDeshpande advocates to the readers through Urmi that parents should care and love their children. Indeed, the love that parents shower on their children must not get depleted as it is necessary to create unquantifiable amount of human goodness in the family through love.

Urmi proves to be the best mother for her son, Kartik. She takes care of him so well. The mother and the son understand each other well. For example, Urmi reaches home very late from Shakutai's house that makes Kartik worry so much and makes him wait for a long time with an empty stomach for his mother to join him for dinner. Urmi comprehends the expectations of her son inordinately. She opines: "I cannot wrong him. I must let Anu go. I know nothing can undo what's happened, nothing can bring Anu back to me. And I know I have to go back to living" (TBV 22). She keeps encouraging her son Kartik in all his accomplishments. Urmi can be compared to Nancy Matthews Elliott, the mother of the great scientist Thomas Alva Edison.

Once Thomas Alva Edison brought home a letter from his teacher and asks his mother to read it for him. The mother read the letter which said: "Your son is a genius. This school is too small for him and doesn't have good enough teachers to train him. Please teach him yourself". So Edison's mother gifts him a fundamental book on experiments in Chemistry and keeps encouraging him in all his experiments. Later, in his life, after his mother's demise, he finds the old letter from his teacher which states: "Your son is mentally deficient. We cannot let him attend our school anymore. He is expelled." Stirred by the encouragement and the optimistic attitude that his mother has given him and he mentions in his diary: "Thomas A. Edison was a mentally deficient child whose mother turned him into the genius of the century." He feels so proud to say that his mother changed his destiny. He expresses: "My mother was the making of me. She was so true, so sure of me, and I felt I had someone to live for, someone I must not disappoint" (Qtd. in Crane 24). Likewise, Urmi's son Kartik also carries unconditional love and respect for his mother like how Edison loved.

Mira, the mother-in-law of Urmi, asks her mother to do a study on her horoscope but her mother refuses and replies: "What's there in my life apart from all of you? If I know all of you are well and happy, I am happy too" (TBV 101). Most of the parents lead their life only for the happiness and for the benefits of their children. Mira gets married at the age of eighteen; her husband belittles her every now and then, but she tolerates everything for her unborn son. Her love for her son is revealed in her poems. She asserts:

Tiny fish swimming in the ocean of my womb
my body thrills to you;
Churning the ocean, shaking distant shores
you will emerge one day
Lightning flashed through the front door
and I who was stone quivered.
Bridging the two worlds, you awaken in me
a desire for life. (TBV 136).

It is very clear through the poem that Mira adores her son and enjoys every movement of his in her womb and it is these to and fro movements of her baby that makes her crave for a happy life. She realizes that adapting to changes and moving on is the only way to lead a happy life, so she forgets her bitter experiences in life and dreams to take care of the baby with utmost love. As Kanchana Mala (2024) expresses being flexible and dealing with change is the ability of an entity or organism to alter itself for its responses to the changed circumstances or environment.

Children play a major role in taking care of their parents when parents are in need of support and care. Gabriel Garcia Marquez, a screen writer and journalist, reconnoiters: "Losing someone close to us in our lives is like losing a part of our body" (278). Similarly, Sumi finds herself to be an amputee. She carries the mixed emotions of despair and hope, and her unhappiness causes a host of symptoms of illness such as breathing difficulties, falling unconscious and so on. In these worse crises, it is her son, Kartik, who gives her moral support to live and helps her recover from

Saraswathy

illness. Kartik cannot stand the sight of his mother suffering and his love for his mother is obvious when he says: "Mama, you won't die, will you? She replies, 'No, Kartik, I won't die, I promise you, I won't die' (TBV 19). Kartik loves his mother very much. Urmi sits close to Kartik with her head lying close and reckons: "I feel I've reached the limit of exhaustion, I must go to bed. But this breathlessness, the heaviness in my chest –is it only exhaustion? As I get up from Kartik's beside, I realize it's my asthma again. And this time no fear. I feel amazingly clear headed, all the confusion gone" (TBV 150). Urmi gains this great hope and confidence through her son Kartik.

Rose Kennedy, a socialite and philanthropist of The United States of America, propounds: "It has been said time heals all wounds. I do not agree. The wounds remain. In time, the mind protecting its sanity covers them with scar tissue and the pain lessens, but it's never gone" (Philippines Daily). The scar left by her daughter's demise still remains in Urmi but her son consoles and heals her. Though the emptiness of life scares Urmi, she feels that she has to live for the sake of her son, Kartik. ShashiDeshpande's mother characters despite being whirled in the ocean of problems, never fail to be lovable and dutiful as mothers.

Shakutai in *The Binding Vine* suffers greatly in bringing up her daughters. She even thinks of killing her elder daughter, Kalpana. She states: "I got pregnant. It was the worst thing that could happen to us then. I'd just begun working in a grocer's shop, just started earning some money, and this happened. I didn't want Kalpana, I want her to die" (TBV 111). Shakutai has been suffering from financial crisis since her childhood, and so she is scared of bringing up her daughter as a single parent. Researchers McLanahan and Booth propound: "Single motherhood is associated with higher poverty rates and higher rates of welfare receipt among women. It is associated with higher rates of depression, unhappiness, low self-esteem and poor health" (Thomson). Thus, the authors point out that single parents in the society suffer from aversion and unpleasantness in life mainly because of economic crises.

Shakutai is unlike Sethe in *Beloved* by Toni Morrison, a well-known American essayist and novelist. The protagonist Sethe is sold to slavery. She gives birth to many children at a very young age and thus she suffers to manage her children and she is unable to bear the torture that she undergoes under the pretext of slavery, and so she plans to escape, only to fail at it. Sethe is unable to accept her children under oppression. Hence, she kills her children discerning that dying is far better than undergoing repression. Unlike Sethe, Shakutai does not kill her daughters rather she struggles hard to give them a comfortable life. The incentive of Sethe and Shakutai is akin as they don't want their daughters to face distress and hardships. But their attitudes differ; Shakutai is ready to face the difficulties in her life but Sethe thinks that death is a better than life. Many researchers posit that mothers kill their children because of stressors such as social stress, economic status, and disability of children. So, it is important for mothers to be bold enough to nurture their children.

Shakutai wants her daughters to have a good education, virtuous married life, and an identity in the society. She doesn't want her daughters to experience the difficulties that she has been undergoing since her birth. She senses that the joy of coddling and cossetting her daughters help her greatly in forgetting her miseries and sorrows. But she becomes emotionally weak, when she hears the shocking news that her daughter is raped. She pleads the policemen not to publish the case and also pleads the doctor: "If girl's honour is lost, what's left? People will always point a finger at her" (TBV 59). She requests the doctor: "Even if it is true, keep it to yourself; don't let anyone know of it, I have another daughter, what will become of her" (TBV 59). Shakutai suffers to eschew this unfortunate episode, but later, she understands and forgives her daughter and takes care of her with the help of experience that she gained through her experience all these years. As Renuga asserts knowledge that is acquired through experiences is always instilled in the human minds. The only factor that is lacking is the understanding of these ideals and realizing the importance of practicing them.

Shakutai, Urmi, Sandhya and Kalpana undergo sufferings but they manage by sharing their sorrows and by helping each other to recover from this tragedy. It is only through Urmi and Sandhya's encouragement, Shakutai comes out of this trauma and decides to live with hope. Matt Atkinson asserts in "A Man's Guide to helping a Woman who has been raped":

Saraswathy

Mothers are important in the healing process because mothers can reflect back to a daughter how loved and valued the daughter is. A mother can demonstrate for a daughter how a strong woman handles a rape experience by being honest about her pain and grief, and yet resisting the pressure to just “give up,” by ignoring the rape, or turning to self-destructive behaviours after the rape. A mother who is sensitive, supportive and one who will talk and listen is obviously more helpful to her daughter than a mother who blames or scolds her daughter. (2). Shakutai calms her daughter and tries her best not to grumble or to let her frustration over to Kalpana. She tries hard to make her daughter forget what had happened to her and taught her to live in the present. As Kanchana asserts living in the present or present moment awareness over time has also been found beneficial while dealing with changes in life as it decreases stress and has more control over human thoughts.

So, it is evident that ShashiDeshpande’s mother characters do not involve in maternal filicide, rather they try hard physically and mentally to bring their children up and create a strong bond between them and their children. ShashiDeshpande makes it clear through the character, Shakutai that parents should work hard to come out of their financial crisis and should not kill or sell them at any cost. Though Shakutai, Urmi, Sandhya and Kalpana undergo sufferings in their lives, they seek help from each other to recover from the traumas and start moving on with their lives confidently. Thus, ShashiDeshpande asserts that family is a place filled with happiness and sorrows, people with knowledge and people with ignorance, people with love and people with hate. So the members in the family must understand that each person is unique and they should manage to adapt and adjust with the uniqueness of all the members without carrying any personal grudge and learn to exchange moral support with one another.

ABSTRACT

Thyroid is an endocrine gland which is situated in the neck region. It produces 2 hormones that are secreted into the blood stream. Thyroxine (T4), triiodothyronine (T3), These hormones are necessary for all the cells in the body to work efficiently. The main function of thyroid gland acts as catalyst for the balance of oxidative metabolism. Hypothyroidism is the most commonly observed among huge population in the present era. The abnormal and normal functions of thyroid gland can be co-related to altered and healthy status of *Agni*. So, hypothyroidism can be understood as a stage of *Agnimandya*, resulting in the production of *Ama dosha* leading to *Bahudosh Avastha*. In the *Bahudosh Avastha* condition of *Ama dosha*, *Dosha Avasechana* is done. In this case study, *Virechana karma* is done by *Trivirith Lehya* along with *Triphala Kashaya* after performing *Deepana-Pachana* and *Shodhananga Snehapana* with *Moorchhita Go ghrta*. This research study manifests significant improvements in signs, symptoms of hypothyroidism disease and thyroid functioning test.

Keywords: Hypothyroidism, *Virechana Karma*, *Moorchhita Go Ghrta*, *Trivirith Lehya*

INTRODUCTION

Hypothyroidism occurs from decrease levels of thyroid hormone with different causes and manifestations. Hypothyroidism is mainly categorized as primary and secondary hypothyroidism. In primary hypothyroidism, the thyroid gland cannot produce sufficient thyroid hormone. The few commonly occurred secondary hypothyroidism occurs when the thyroid gland functions better; Meanwhile, hypothyroidism occurs from the abnormal pituitary gland or hypothalamus physiology. Untreated hypothyroidism enhances mortality and morbidity. In India, autoimmune thyroid disease is the most frequent cause of hypothyroidism, but globally, deficiency of iodine in the diet is the most common reason. (1) The occurrence of hypothyroidism was the greatest in the age-class of 45 to 55 years (12.11%) and the least in that of 19 to 34 years (6.53%). The more proportion of females than males were found to be influenced by hypothyroidism. (2) The main reason of hypothyroidism can be classified into: Primary Hypothyroidism, caused by the inefficacy of the thyroid gland to make T3 and T4 hormones, is called primary hypothyroidism; It is a condition of decreased hormone production by the thyroid gland, it evaluates for 95% of hypothyroidism cases; only 5 % or less are suprahypoid in origin.

The most frequent reason of primary hypothyroidism is:

- a) Iodine deficiency
- b) AITDs (Autoimmune thyroid diseases)
- c) Drugs
- d) Iatrogenic
- e) Congenital.

Secondary (because of pituitary TSH deficiency), Tertiary (because of hypothalamic deficiency of TRH). Hypothyroidism is one of the most misdiagnosed and undiagnosed diseases, as its clinical features are not familiar. Hypothyroidism doesn't have any peculiar symptoms and many symptoms of this disease can occur in individuals with other condition. Mood disturbances, vertigo, easy fatigability, tiredness, slowness of memory, lethargy, intellect and thought were the initial symptoms and Muscle cramps, paraesthesia, weakness, aching and muscles stiffness were the main problems of the chronic patients. (3) Several symptoms of Hypothyroidism can be interlinked with Lakshanas mentioned in Ayurvedic science. Excessive collection in the body is called *Bahudhoshha Avastha*. This situation is mostly suitable for *Samshodhana*. In this clinical study treatment of hypothyroidism done with *Virechana Karma*.

CASE REPORT

Chief complaints

The current case study is on therapeutic management of Hypothyroidism through *Panchkarmaprocedure*. A 50-year-old male having Hypothyroidism reported to *Panchkarma* outpatient department of Parul Ayurveda Hospital, LimdaWaghodia, Vadodara, Gujarat with chief complaint of

Symptoms

- Diminished Sweating for 8 years
- Hoarseness of voice for 8 years
- Dry Skin for 8 years
- Constipation in the past 2 months
- Weight increase for 8 years
- Impairment of hearing for 8 years

Physical Signs

- Coarse Skin for 8 years
- Cold Skin for 8 years

Associated complaints– No any associated complaints.

**History of present illness**

A patient aged about 50 years apparently normal before 8 years, then gradually started diminished sweating, hoarseness of voice, dry skin, constipation, weight increase, impairment of hearing with physical signs coarse skin, cold skin for 8 years undergone thyroid check-up diagnosed as Hypothyroidism and TSH value was high. For better management he approached Ayurvedic treatment and admitted in Parul Ayurveda Hospital on 28/8/2024.

Personal history**Clinical Findings – Physical examination****Astavidha Pareeksha**

- Nadi - Kaphajanadi, 76/min
- Mala - Constipated
- Mutra – Prakruta, 4-6 time/day
- Jihva – Alipta
- Shabdha – Prakruta
- Sparsha – Anushna Sheetha
- Drik – Prakruta
- Akriti- Sthula

Dashvidha Pareeksha

- Prakriti – Kapha Pitta
- Aharaja Hetu – Madhura Ahara
- Viharaja Hetu – Aavyayama, Diwasvapna
- Dosha – Kapha Pitta
- Dushya – Rasa, Meda and Mamsa
- Desha – Sadharan
- Sattva – Madhyama
- Sara – Medosara, Mamsasara
- Samhanana – Madhyama
- Pramana – Sthula
- Satmya – Madhyama
- Ahara Shakthi
 - Abhyavarana Shakthi – Madhyama
 - Jarana Shakthi – Madhyama
- Vyayama Shakthi – Madhyama
- Vaya – Madhyama (50 years)
- Bala – Madhyama

Systemic examination

Central Nervous System – Oriented and Conscious with respect to time, place and person.

Cardiovascular System – S₁, S₂ are properly Heard, no other sounds.

Respiratory System – Bilateral airway clear

Gastrointestinal System – P/A soft, non-tender.

Treatment Schedule**Virechana Karma****Poorvakarma**

- Deepana-Pachana with Aampachak vati and Chitrakadi vati 2 tablets Thrice a day before food for 3 days.(28/8/2024 to 30/8/2024)

Dipender Kumar Sharma *et al.*,

- *Snehapana with Moorchhita Go Ghritha for 5 days.* (31/8/2024 to 4/9/2024)
- *Sarvang Abhyanga with Moorchhita Taila followed by Nadi Swedana for 3 days.*(5/9/2024 to 7/9/2024)

Pradhana Karma

Virechana Karma (8/9/2024)

- Yoga – Trivritth Lehya
- Dose – 80 gm
- Anupana – Triphala Kashaya (200ml)

Discharge Medication: Varunadi Kashaya For 15 Days.

DISCUSSION

Hypothyroidism is a clinical condition of thyroid gland with deficit of thyroid gland hormones. On the basis of *Ayurvedic basics*, it becomes clear that *Kapha* associated with *Pitta Dushti* and vitiation of *Vayu* consequence in vitiation of *Agni*. (3) All these factors finally lead to *Rasavaha* and *Annavaha Srotodushti* predominantly. As there is indirect correlation of hypothyroidism in *ayurvedic samhitas*, based on the Lakshanas it can be understood under the *Bahudosha Avastha*. *Samshodhana* is mainly indicated in *Bahudosha Avastha* (i.e., when Doshas are aggravated some diseases like excess *Kapha* and *Pitta Dosha*, *Sthoulya*, *Tandra*, *Santarpana* *Janya Vyadhies* are included in *Bahudoshavastha*. (4) As subject suffering from *constipation*, *Mandagni* and digestive disturbances, etc which indicates the contribution of *Pittasthana*. *Virechanakarma* is the ideal procedure for *Pitta dosha* and *Pittaas* signed with *Vata* or *Kapha* and eliminates *Pitta* from *Kaphasthana* and *Pittasthana* (5) The Production of *Ama* is the resultant of *Avarana* of *Pittasthana* by *Kledakakapha*, thus disturbing the digestive functioning of the *Pachaka Pitta*. In this case *Virechana* is preceded by *Pachana – Deepana*, after Doshas become *Nirama* and may require removal from the body by *Shodhana karma*. *Snehapana* is done by *Moorchhita Go Ghritha* as it is used in the *poorva karma* of *Panchakarma* and *Urdhavajatrugata Vyadhis*. And also, it works on *Tridosha* and bring them from *Shakha* to *Kosta*. (6)

Mode of action of Virechana

The *Virechana Dravya* possessing the qualities such as *Ushma*, *Teekshna*, *Sukshma*, *Vyavayi*, and *Vikasi* approaches the *Hridaya Pradesh* by act of its *Veerya* and then following the *Dhamani*, it pervades the complete body through small and large *Srotas* and eliminates the Doshas out of the body. *Virechana dravyas* carry out the purgation process because of their *Prabhava guna*. As these *dravyas* are having predominance of *Prithvi* and *Jala Mahabhuta*, they have natural tendency to move downward and thus they can aid in induction of therapeutic purgation. (7)

CONCLUSION

Hormones of the thyroid gland control body's metabolism, the process in which body transform the food material into energy source. Purification followed by palliative treatment was found as appropriate treatment plan to treat hypothyroidism. *Virechana Karma* is the common adopted purificatory procedure with maximum benefits. The main outcome of the research conducted on hypothyroidism had resulted that *Virechana Karma* plays an important function in providing efficient relief in the various sign and symptoms along with haematological parameters of the condition.

ABSTRACT

Deep fakes, AI-generated synthetic media, have emerged as a significant cyber security threat, facilitating misinformation, identity fraud, and political manipulation. The rapid advancements in deep fake generation, primarily driven by generative adversarial networks (GANs), make manual detection increasingly impractical. This study explores AI-driven countermeasures to combat deep fakes, focusing on deep learning-based detection techniques such as convolutional neural networks (CNNs), recurrent neural networks (RNNs), and transformer models. Advanced forensic approaches, including physiological analysis (blink rate, lip-sync inconsistencies) and frequency-domain analysis, are examined for their effectiveness in distinguishing real from synthetic content. Additionally, hybrid AI approaches integrating block chain for forensic verification and federated learning for privacy-preserving detection are discussed. The study also addresses challenges such as dataset biases, adversarial attacks, and real-time detection constraints. The role of explainable AI (XAI) in enhancing transparency and trust in deep fake detection models is emphasized. Future research directions include the development of robust, scalable, and energy-efficient detection frameworks to counter evolving deep fake threats. Strengthening digital security and media integrity through AI-based countermeasures is crucial in the era of synthetic media.

Keywords: Deep fake Detection, AI Countermeasures, Neural Networks, Digital Forensics, Misinformation, Generative Adversarial Networks (GANs), Explainable AI (XAI).

INTRODUCTION

Deep fake technology, powered by artificial intelligence, enables the creation of highly realistic synthetic media that can manipulate facial expressions, voices, and body movements. While deep fake technology has legitimate applications in entertainment and content creation, it poses serious threats in the form of misinformation, identity

theft, and political deception. With the increasing sophistication of deep fake models, detecting manipulated content has become a challenging task. This research paper explores AI-based countermeasures, focusing on state-of-the-art deep fake detection methods and the challenges associated with combating this emerging threat.

Deep fake Generation Techniques

Deep fake generation relies on various AI models, particularly generative adversarial networks (GANs) and auto encoders. The two primary approaches include:

Generative Adversarial Networks (GANs)

GANs consist of two neural networks: a generator and a discriminator. The generator creates synthetic images or videos, while the discriminator attempts to distinguish between real and fake content. Over time, the generator improves its ability to produce highly realistic deep fake.

Autoencoders

Autoencoders, particularly variational autoencoders (VAEs), encode an image into a compressed representation and then reconstruct it. When trained on facial data, autoencoders can generate deep fake videos by swapping faces convincingly.

AI-Based Deep fake Detection Techniques

To counter deep fake threats, researchers have developed AI-driven detection methods:

Convolutional Neural Networks (CNNs)

CNNs are widely used for image-based deep fake detection. By analyzing pixel-level inconsistencies, CNN models can detect artifacts introduced by GANs and autoencoders.

Recurrent Neural Networks (RNNs) and Long Short-Term Memory (LSTM)

Since deep fakes involve temporal changes, RNNs and LSTMs analyze sequential video frames to detect anomalies in movement, expression, and synchronization.

Transformer-Based Models

Transformer architectures, such as Vision Transformers (ViTs), leverage self-attention mechanisms to capture fine-grained inconsistencies across entire images and videos.

Physiological Analysis

Certain physiological signals, such as blink rate, pulse, and lip-sync inconsistencies, provide clues to detect deep fakes. AI models analyze these subtle biological markers for classification.

Frequency-Domain Analysis

Deep fake videos often exhibit anomalies in the frequency domain. Techniques like Discrete Fourier Transform (DFT) and Discrete Wavelet Transform (DWT) are employed to identify unnatural frequency artifacts.

Hybrid AI Approaches for Enhanced Detection

To strengthen deep fake detection, hybrid AI techniques integrate multiple detection strategies:

Block chain-Based Forensic Verification

Block chain technology can be used to track the authenticity of digital media by maintaining immutable records of original content, helping verify if a video or image has been tampered with.

Federated Learning for Privacy-Preserving Detection

Federated learning enables collaborative deep fake detection across multiple devices without sharing sensitive user data, preserving privacy while enhancing detection accuracy.

**Nawadkar and R.P. Waghmare****Challenges in Deep fake Detection**

Despite advancements, several challenges persist in detecting deep fakes:

- **Dataset Biases:** Many deep fake detection models are trained on biased datasets, limiting their effectiveness across diverse populations.
- **Adversarial Attacks:** Attackers can manipulate deep fake models to evade detection through adversarial perturbations.
- **Real-Time Detection Limitations:** The computational cost of AI models makes real-time deep fake detection challenging, requiring optimized algorithms for faster processing.

Explainable AI (XAI) for Trustworthy Detection

Interpretable AI techniques help improve the transparency of deep fake detection models. By providing explanations for why a certain video is classified as a deep fake, XAI enhances trust and usability in forensic applications.

Future Directions

To combat the evolving deep fake threat, future research should focus on:

- Developing robust, scalable, and energy-efficient detection frameworks.
- Improving dataset diversity to mitigate bias in detection models.
- Enhancing adversarial robustness against sophisticated deep fake evasion techniques.
- Integrating AI-based detection with legal and ethical regulations for digital media security.

CONCLUSION

Deep fake technology presents both opportunities and threats in the digital era. While AI-based countermeasures provide promising solutions, continuous research is needed to develop more accurate, interpretable, and efficient detection models. By leveraging deep learning, block chain, and explainable AI, we can strengthen digital security and media integrity against deep fake manipulation.

ABSTRACT

Pedagogy, the art and science of teaching has gone through a momentous shift in recent times. Education delivery in the past was more teacher centric wherein the information was delivered in 1-way manner from teacher to student, conversely learners of this era are more tech savvy, dynamic, look for interactive and engaging sessions and are inclined towards more hands on and practical learning experiences. This shift has changed the face of education from teacher centric to student centric learning where the concentration is on personalized adaptable pathways, active learning, hands on and project based education. Physiotherapy being a subject requiring theory as well as hands-on skill to gel into clinical environment requires adaptive pedagogical approaches in knowledge delivery. Keeping in mind the practical nature of physiotherapy, there's a need for interactive, innovative and adaptive teaching methodologies that align with students' learning preferences and clinical practice demands.

Keywords: Learning, Methodologies, Physiotherapy, pedagogical.

Neha Kashyap et al.,

INTRODUCTION

With constant changes in the healthcare sector, the health care professionals should develop technical and manipulative skills along with the capability to respond appropriately and adaptively. As physiotherapy education plays an important role in providing enormous amount of allied health care professionals globally, the pedagogical approaches should be updated regularly to keep up with the emerging technology [1]. This analysis highlights the revolutionary aspects of physiotherapy education to make practitioners qualified for better confrontation of growing pressures from evolving technological innovation and altered healthcare schemes with respect to various patients' need.² Since the field of human anatomy, physiology and pathology is a complex one, the foundation of clinical excellence in physiotherapy education are armed with the scientific background and hands-on training required to assess, diagnose, and intervene in a variety of musculoskeletal, cardiovascular, and neuromuscular conditions which can affect population of different age groups [2]. Physiotherapy education is based on the principles of patient-centered care. Health providers are taught to treat patients' pain in terms of their entire being rather than an approach that only focuses on medical aspects while ignoring psychological factors behind this. By adopting such a method, effective communication, compassion; and interventions that are specific to clients' needs and preferences can be enhanced. People who have been trained as physiotherapists will be aware and well educated about the use of modern technology. Graduates are therefore conversant with current advancements in healthcare technology which enhances patient outcomes [3]. The common spirit of collaboration in physiotherapy education allows graduates to join hands with doctors, nurses, and occupational therapists in an interdisciplinary health care team. By recognizing the fact that all healthcare professions are born out of the same source, they can be fully involved with patients' comprehensive treatment plans [3]. In addition to teaching rudimentary facts, physiotherapy education also instils a sense of lifelong learning. Graduates leave university with a mentality and toolkit for constant updating themselves within the field being at the forefront of evidence-based practice and emerging research [4].

Theoretical Foundations and Contemporary Insights

Like most other healthcare disciplines, physiotherapy education inevitably needs to change and develop to reflect the changing nature of contemporary health care. This review summarizes the latest polemics about how to improve learning outcomes in physiotherapy education and endorses new pedagogies. The reviewed literature includes a vast number of publications which confirm that active learning is efficient in physiotherapy education. While case based and PBL learning foster deep understanding of the theory, the previous also contributes to critical thinking development [1]. It is no secret that critical thinking is a critical competency in physiotherapy education programs. In addition, it is essential that case-based learning and group work facilitate the application of theory into practice. However, the central theme emanating from the literature search for this review was simulation technologies [2]. The useful influence of the virtual patient simulations and high-fidelity mannequins could be illustrated. These proposed tools indicate a productive influence on the clinical decision skills of the clinical students. Simulation technologies remain a safe environment for students where they can develop their skills and invoke theoretical knowledge through their own judgment. Still, overall, the costs are higher compared to regular classroom settings. It is important to take into consideration how resources should be distributed, especially with the rapidly developing technologies. In classroom, several new paradigms have been introduced into physiotherapy recently: the flipped classroom model [3]. According to Anderson et al, who cite other researchers on the matter, pre-recorded lectures and online materials help create opportunities for students to spend more time in class and actively engage with complex material. Hence, the outcome of this teaching innovation is changing the paradigm from teacher centred teaching towards active learning where students are encouraged to take responsibility for their own learning and, therefore, open the way of interaction during in person lectures [4]. The existing literature emphasizes the vital importance of technology integration that includes virtual reality (VR) and augmented reality (AR) for nurturing physiotherapy education.³ The VR applications can enhance spatial understanding, as well as improve retention of anatomical knowledge. AR can also be used in clinical skills training. It offers an interactive and three-dimensional learning environment that imitates scenarios quite like the real world. The interdisciplinary collaboration can be persuaded as a defining feature of physiotherapy education, for example providing collaborative projects and joint

**Neha Kashyap et al.,**

coursework between students in the field of physiotherapy with other healthcare professionals. These initiatives enhance teamwork and communication skills and deeply ingrain an appreciation of roles in the multidisciplinary healthcare teams that have become characteristic of contemporary clinical practice.⁴ The innovative assessment strategies are crucial in gauging student progress, as well reinforcing learning outcomes. In fact, the most effective means for testing both theoretical knowledge and practical skills are formative assessments, peer evaluations, and objective structured clinical examinations (OSCEs). The process of evaluation is comprehensive only if the assessments are consistent with learning objectives and feedback can be given in a timely fashion [5].

METHODOLOGY

- Conducting an extensive literature review to identify existing research on physiotherapy education, pedagogical methods, and learning outcomes.
- Exploring studies that have investigated innovative teaching approaches, technology integration, and learner-centered strategies in physiotherapy education

Review

This review found that there are certain established challenges in the current pedagogy methods followed in Physiotherapy education. Many problems influence the effectiveness of educational programs for physiotherapy educators. These problems must be addressed to make sure that physiotherapy students receive the best possible education. The difficulties can be the following:

Huge Class Sizes

Challenge: One issue that teacher faces in physiotherapy programs is large class sizes. This gives rise to frequent issues like managing large class sizes, educating students with diverse learning styles, and incorporating clinical experiences into academic coursework.

Impact: This makes it hard for the teacher to give each student individualized attention and so customized instruction.

Possible solution: Interactive teaching techniques, technology-enhanced learning, and peer collaboration strategies might help in overcoming the drawbacks of large class sizes [6].

Diverse Learning Styles

Challenge: Each student has different abilities and style of learning, so the various teaching methods are required to be used according to their needs.

Impact: Traditional teaching methods may not match the different tastes of students, leading to a slippage in understanding and lose of interest through the course.

Possible solution: An array of teaching approaches, integration of multimedia resources, and flexible learning options can accommodate all styles of learning as per the student's needs [6].

Integration of Clinical Skills and Theoretical Knowledge:

Challenge: Converting clinical skills into theoretical knowledge is a big concern for pedagogics.

Impact: The piecemeal approach may make it difficult for students to put theory into practice.

Possible solution: Case-based learning, simulation exercises and hands on practical sessions are all proven effective ways of teaching students to integrate theory with clinical skills [6].

*Examine the literature on physiotherapy pedagogy. Highlight effective techniques and note areas still lacking development. Discuss how technology, simulation and active learning can enhance physiotherapy students' learning experiences. *

As with other branches of health care, physiotherapy education must evolve and adapt to the changing needs. Considering the current discourse in physiotherapy education about how to improve learning results, this review concentrates on innovative pedagogical methods. The weight of evidence showing that active learning methods

**Neha Kashyap et al.,**

enhance physiotherapy education is clear. The problem-based learning (PBL) provides students studying physiotherapy with an opportunity to develop their critical thinking and problem-solving skills [7]. For building theoretical understanding, active learning (which includes case-based instruction and cooperative group projects) also helps in applying what has been learned in clinical settings. The development of physiotherapy education centres on the key issue of incorporating simulation technologies. The use of high-fidelity mannequins for virtual patient simulations can enhance clinical decision-making skills. The safe environments and simulation technology can help students enhance their clinical skills, putting theoretical knowledge into practice in actual cases. More importantly, these approaches help in narrowing the gap between theory and clinical practice to achieve better learning results. With increasing cost of technology and equipment costs are rising there is still a scope of improve resource allocation [8].

The flipped classroom model is a new approach to physiotherapy education that turns some of the traditional methods on their head. The use of recorded lectures along with online resources and active in-class activities can help students to better understand difficult subjects, get them more involved and steering the atmosphere towards a student-centred learning process. This way the interactions can become more substantial and self-directed learning is promoted [9]. This body of research reveals how necessary it is to introduce technology like augmented and virtual reality into physiotherapy education. VR applications can help to improve anatomical knowledge retention and spatial comprehension. In a similar fashion, for clinical skills training, augmented reality (AR) offers three-dimensional interactive learning environments that precisely model the actual situation [10]. In the physiotherapy education multidisciplinary collaboration is an essential prerequisite in which each discipline explains coursework and cooperative projects to peers from other healthcare disciplines and physiotherapy students train together with them to reflect the modern nature of health care practice, these activities not only help develop communication and cooperative abilities but also rigorously makes them understand their roles and duties within multidisciplinary healthcare teams [11]. To determine the student's progress and learning objectives, innovative assessment methods are also needed. Peer reviews, objective structured clinical examinations (OSCEs), and formative assessments can help in the evaluation of both theoretical knowledge and practical ability. An effective evaluation process requires timeous feedback and assessment corresponding to learning objectives. The impact of roomy class sizes [12].

Differential Learning Styles:

Difficulty: With their different learning styles, students studying physiotherapy require a variety of teaching instruments.

Effect: Students with different tastes might not be catered to by the traditional teaching methods, and therefore would fall below their level of comprehension or engagement.

Taking on the Challenge: Teaching can be adapted to different styles of learning by using a variety of texts, multimedia, and other tools, as well providing flexible learning options [13].

Combining Theoretical Knowledge with Clinical Skills:

Problem: One of the most important educational problems is how to integrate clinical skills and theoretical knowledge.

Impact: The use of a fragmentary approach, however, makes it much more difficult for students to apply academic principles in the real world.

Taking on the Challenge: As a means of integrating theoretical knowledge with clinical ability, according to Higgs et al. case-based learning and simulation exercises as well as practical sessions are good methods [14].

Limited Resources:

Challenge: Limitations in resources, both of facilities and materials for teaching a material comprehensive physiotherapy curriculum can prove an obstacle. Impact: Inadequate clinical resources can lead to lack of experience with different kinds of patients and cases, creating problems for students' readiness in actual practice.

Addressing the Challenge: Overcoming limits by recruiting external collaborations, using virtual simulations and getting more resources [15].

**Neha Kashyap et al.,****Evolution of Healthcare Practices:**

Challenge: The rapidly advancing nature of healthcare practices and technologies is an unending obstacle for educators. Impact: If curricula and teaching methodologies are outdated, education will go to waste. Addressing the Challenge: Teachers should also keep their curriculum content up to date, maintain close collaboration with clinical facilities and introduce new technologies in the teaching process [15].

Assessment Validity and Reliability:

Challenge: Valid and reliable assessment, especially for clinical skills, is another major concern.

Impact: Inaccurate assessments might not be a true reflection of students' levels, thus taking away from the credibility of educational programs.

Addressing the Challenge: Standardized assessment tools, objective structured clinical examinations (OSCEs), and standard training for assessors are necessary to make the process more reliable [16].

Innovative Pedagogical Approaches: But to break through these difficulties in physiotherapy education, teachers can take innovative methods such as a combination of simulation technology with the flipped classroom concept, interdisciplinary cooperation, and external practical links. Its approaches not only cover the problems that have been pinpointed, but also stimulate thought and improve problem-solving ability. It requires a comprehensive insight into patient care [16].

Problem: Lack of facilities and supplies may hinder the provision of a full course in physiotherapy.

Impact: Due to a shortage of resources, lack of contact with different clinical circumstances may require students' readiness for practice in the real world. Overcoming the Obstacle: Making physiotherapy education more inclusive can be achieved by striving for increased funding, cooperating with external organizations, and using virtual simulators.

The Challenge: The changing face of medicine for educators, keeping abreast with the rapidly advancing healthcare practices and technologies is an ongoing fight. Impact: Outdated curricula and teaching methods no longer matching today's healthcare standards may impair the applicability of education. It is important that physiotherapy education remain technically up to date. Curriculum content needs to be updated on a regular basis, clinical facilities need links with research institutes and newly developed teaching methods should be introduced [16].

Validity and Reliability of the Assessment:

Validity and Reliability It is particularly important to ensure that tests of clinical ability are valid and reliable.

Impact: Inaccurate assessments do not give a true picture of students' skills, and they may affect the legitimacy of an educational program. Three necessary steps to increasing the reliability of assessments are standardizing assessment instruments, using objective structured clinical exams (OSCEs), and training all evaluators in the same way [17].

Innovative Pedagogical Approaches:

In response to the problems in physiotherapy pedagogy, teachers may use new approaches such as flipped classrooms, simulation technology and interdisciplinary cooperation. The aim is also improving student learning capabilities by providing a variety of experiential opportunities outside the classroom. Aside from solving the problems at hand, these methods also promote critical thinking and enhance problem-solving skills and a thorough understanding of patient care [17].

Simulation Technology

- Approach: Combination of simulation technology also means using virtual patients, high-fidelity mannequins to make up the clinical environment.
- Benefits: Simulation technology provides students with a risk-free environment in which to try their hand at clinical skills, make decisions and observe different patient cases.

**Neha Kashyap et al.,**

- Impact: Rudolph et al. (2006) note that simulations improve students 'critical thinking by furthering their ability to utilize the theoretical knowledge they have learned in realistic settings, thus helping them learn how to resolve problems and reconciling theory with practice [18].

Flipped Classrooms

- Approach: In the flipped classroom model, which became widely popular after its development by neuroscience professor Salman Khan in 2004, students view pre-recorded lectures and materials prior to class time. During face-to-face classes they interact with course contents through case studies or hands on activities.
 - Benefits: Therefore, flipped classrooms enhance active learning and encourage one to read on his own time. During face-to-face instruction teachers can guide students in application and problem solving.
- Impact: Research by Jensen et al. (2015) indicates that flipped classrooms can develop these abilities because they ask students to digest information, work with their peers' ideas and help them describe what steps should be taken when faced with a certain type of problem or situation [18].

Experiential Learning Opportunities

- Approach: Hands-on, real-world experiences, in the form of clinical placements or community projects and internships are an integral part of experiential learning.
- Benefits: Experiential learning allows students to put theoretical knowledge into practical use, thus improving their comprehension of how patients are cared for. Impact: According to a study by Kolb (1984), experiential learning teaches students how to think critically. Experiences require reflection, adaptation, and the integration of theoretical knowledge into real-world practice to stimulate thinking about experience.
- Way: A range of practical experiences including internships, community service activities or clinical placements all fall under the category thoughtful instruction through doing
- Advantages: Experiential learning helps patients understand patient care by letting students apply their theoretical knowledge in practice [18].
- An important role in physiotherapy education and practice Case studies provide a particularly effective way of giving depth to understanding, adding weight to clinical reasoning, and encouraging sound decision making.

Clinical Application of Knowledge: Case studies thus act as a bridge between theory and practice. In this way, the students experience for themselves how what they learn in class relates to actual patient situations. Their education becomes relevant and interesting again [18].

Critical Thinking and Problem-Solving: Analyzing case studies training students in critical thinking and problem solving. They need to gauge and appraise the vitality in considerable chaotic information, draw out important sensitivities. Based on all these considerations they must then plan suitable treatment courses for their patients. The process sharpens their power of thought and sound clinical judgment.

Holistic Patient Assessment: physiotherapy aims at the whole person, including physical and psychosocial factors. By presenting multifaceted patient cases, case studies encourage students to look at the assessment and use of interventions from a holistic viewpoint.¹⁹

Integration of Theoretical Knowledge: By studying individual cases, students can integrate the various aspects of their theoretical knowledge-anatomy and physiology. pathology, therapeutic techniques etc. Students must thereby draw on their understanding of these disparate subjects to plan out comprehensive and effective courses of treatment.

Real-World Complexity: Physiotherapy practice is rarely simple, and cases are reflections of the patients seen in real life. Preparing students to face a myriad of conditions, co-morbidities and individual responses equips them with the skills they will need in their professional life.

Neha Kashyap *et al.*,

Enhanced Communication Skills: Communicating with patients is one of the most important aspects of physiotherapy. The case studies give students a chance to practice how they communicate with theoretical patients, helping them to pass along information and provide education while building up rapport.

Application of Evidence-Based Practice: Case studies generally require students to use evidence-based practice. Through the process of gathering and analysing research evidence, students learn to integrate recent advances in medical science into their clinical decision-making [20]

Preparation for Clinical Practice: Case studies provide the link between classroom learning and clinical practice. They mimic the real-world scenarios, providing students an opportunity to practice and hone their skills in a controlled environment prior to embarking on clinical placements or going into practice.

Reflective Practice: Case studies enable reflective practice in which students think over their actions and decisions. Such reflection encourages self-development and the desire to keep learning.

Team Collaboration: A lot of physiotherapy case studies are joint endeavors with other healthcare professionals. This reflects the inter-disciplinary nature of healthcare practice, allowing readers to see that a team approach is vital and effective communication within it so very important.

Technology Integration: Technology, especially virtual reality (VR), augmented reality (AR) and web-based platforms are adjusting physiotherapy education. They provide new instruments that profoundly change both theoretical knowledge and practical techniques. This is where we look at the part played by these technologies, and back up our comments with references [21].

Case Studies: In physiotherapy education and practice case studies are indispensable because they offer a relevant way to develop good clinical reasoning which will help us better understand things; this gives rise, in turn towards right decision-making on thorny problems that one often encounters in everyday work. The following are some arguments in favour of the significance of case studies in physical therapy.

Clinical Application of Knowledge: Case studies are a bridge between conceptual knowledge and practical application. In doing so they indicate the importance in students' education of observing how concepts taught to them on the classroom desk apply to real-world patient cases.

Problem-solving and Critical Thinking: When analyzing case studies, students must practice problem-solving and critical thinking. They must analyze and unlock complex data, pick out significant elements, form reasonable treatment plans. This process improves their ability to think critically and exercise sound clinical judgment [22].

Holistic Patient Assessment: A physiotherapist treats the patient holistically, catering to their physical and psychological needs. Many case studies involve complex patient scenarios to encourage students to view examinations and solutions from a holistic perspective.

Integration of Theoretical Knowledge: Case studies are an excellent way to integrate such things as anatomy, physiology, pathology, and treatment. By using their knowledge of these several areas, students must come up with comprehensive and effective treatment programs.

Complexity in the Real World: And case studies capture the intricacy of real patient situations, and physiotherapy practice is rarely simple. A variety of illnesses, co-morbidities and peculiar reactions from patients prepares students for the complex challenges that they will face in the workplace.

Improved Communication Skills: Communication with patients is an essential aspect of physical therapy. Cases teach students how to give instruction, build trust (build rapport), and communicate with imaginary patients [22].

Application of Evidence-Based Practice: When doing case studies, students are usually expected to apply the principles of evidence-based practice. By immersing themselves in research data and working out how it impacts

**Neha Kashyap et al.,**

clinical decision-making they can develop the ability of incorporating recent findings into their own approach. Clinical Practice Preparation: Case studies bridge the gap between classroom instruction and clinical practice. They also allow students to work in a protected space that simulates actual environment before they enter clinical assignments or start practice. Analysis of case studies leads to the critical evaluation and reflection upon students' choices and actions. By this approach the educators can promote continuation of learning and professional development [23].

Teamwork: In physiotherapy case studies are always collaborative with the other medical professional which is necessary for understanding the importance of cooperation and communication with healthcare professionals.

Technology integration: New emerging techniques like VR and AR are evolving the whole physiotherapeutic education scenario.

Virtual Reality (VR):

Theoretical Understanding: Immersive Anatomy Education: '3D Organon VR Anatomy' and other VR applications provide an advantageous research tool through which students can integrate their theoretical knowledge with a comprehensive view of human anatomy in three dimensions (Chen, et al., 2018).

Practical Skills: Simulation-based Learning: VR simulations provide a secure, realistic environment in which students may try out physiotherapy procedures. Sutherland (2016) cites 'Touch Surgery' as a typical example in which various interventions can be practiced virtually, improving one's practical skills [17].

Augmented Reality (AR):

Theoretical Understanding: Interactive Learning Materials: Applications such as 'Complete Anatomy AR' overlay digital information on to the physical world. Students can interact with the 3D models, making for a new form of interactive teaching; such technology broadens participation and deepens understanding (Kockro et al., 2015). **Clinical Skills Training:** Applications such as 'Touch Surgery Enterprise' give users the guidance they need in real-time interaction. Digital overlays of anatomical structures provide more precise and detailed descriptions during practical exercises, making it easier to develop clinical skills (Tang & McNeill 2016) [18].

Online Platforms

Theoretical Understanding: Interactive Lectures and Resources: Online platforms like Canvas and Moodle provided by learning management systems (LMS) allow interactive lectures, discussion forums, and multimedia resources to help students put theory into practice. Flexibility of self-paced learning is enabled by recorded lectures and e-books (Rennie et al., 2018).

Practical Skills: Virtual Labs and Simulations: There are numerous online platforms offering virtual labs and simulations, such as 'Physiopedia.' These simulated exercises enable students to train clinical skills by working remotely [17].

DISCUSSION**Benefits of Technology Integration:**

Accessibility and Flexibility: Using asynchronous learning, technology allows students to access materials and simulations at their own pace. This promotes inclusivity and flexibility for student-centered learning.

Realistic Simulations: Stimulating VR and AR simulations provide realistic scenarios in which students can learn life-like procedures without the strictures of time, space, or patient availability. These enhance the transfer of knowledge from theory to practical life.

Individualized Learning: Individualized learning paths, tailored for each student's learning style, personal feedback is available through online platforms. The flexibility of the instrument also reinforces both theoretical and practical comprehension.

Neha Kashyap *et al.*,

Remote Learning Opportunities: The COVID 19 pandemic has shown us how technology integration can facilitate remote learning despite geographical challenges by providing the students with continuous physiotherapy education [23].

Assessment Strategies: The evolving methods of teaching in physiotherapy requires the constant change in assessment system which not only matches these new approaches but also provides the real time evaluation of student progress.

1. Flexibility and accessibility: the digital era has provided the students with the opportunity to learn at their own pace, access resources and simulation according to their learning style promoting inclusiveness.
2. Simulated Realities: Virtual Reality and Augmented Reality simulations provides real life environment to students to practice their skills.
3. Customized Learning: With its customized learning paths and exams that fit a variety of learning styles, virtualize the education environment can allow students fully explore their potential. This flexibility also enhances comprehensibility in theory and practice.
4. Like the COVID-19 pandemic [24].

Assessment Strategies

It is also important that the assessment procedures are precise in measuring student development and conform with innovative educational approaches for physiotherapy education. Citing relevant materials, this essay explores various assessment techniques. It also stresses the importance of formative assessments, peer reviews and real- world tests.

Formative Assessment: Definition and Purpose: Formative assessment is carried out continuously through the entire process of learning, providing feedback to both students and educators. The purpose of this is to point out areas needing improvement and provide direction for future learning activities. Formative assessment is ongoing and continual review that enables teachers and students to give each other feedback as they go along in the learning process. Its aim is to locate the areas which need developing and guide future educational work.

Alignment with Innovative Pedagogy: Therefore, formative assessment fits in naturally with innovative teaching methodologies which emphasize ongoing improvement. In physiotherapy education, such as online quizzes and virtual patient simulations provide instant feedback. Students can gradually refine their understanding and skills by iteration. Since this type of evaluation is designed to encourage on-going development, it complements the latest teaching methods. In the area of physiotherapy education, tools such as online tests and virtual patient simulations give instant feedback so that students can keep improving their knowledge and skills [15].

Peer Assessment: Definition and Purpose: Students evaluate the work of their peers according to preestablished criteria during peer assessment. Its aim is to develop the ability of students to think critically, reflect upon themselves and accept shared responsibility for learning outcomes. Peer assessment means that students evaluate each other's work based on predetermined standards. This approach emphasizes self-awareness, critical thinking, and collective responsibility for objectives of learning.

Alignment with Innovative Pedagogy: Peer assessment encourages learning in cooperation with peers in innovative physiotherapy education. Online discussion forums and collaborative projects provide opportunities for peer assessment. This method not only enhances teamwork but also gives students a chance to learn from each other widely. Students can develop their own abilities in problem solving [16].

Real-World Evaluations

Peer evaluation plays an important role in cutting-edge physiotherapy education. Joint projects and online forums provide a platform where peer review is possible. The aim is to improve students 'problem-solving skills through fostering teamwork and introducing a variety of perspective. Real-World Evaluations:

Neha Kashyap *et al.*,

Definition and Purpose: Real-world evaluations focus on testing students in realistic, real-world settings approximating those of professional practice. The idea is to close the gap between academic learning and application in the world of work, giving graduates that are ready for anything physiotherapy practice brings. Alignment with Innovative Pedagogy: New physiotherapy teaching methods tend to use realistic situations. Real-world assessment tools, such as objective structured clinical examinations (OSCEs) or community-based projects create an overall picture of students' competencies and their ability to accomplish relevant theoretical knowledge in the practical world [18].

Importance and Implications:

Formative assessment provides opportunities for feedback, so that a student understands more and learns better. Peer assessment promotes cooperation and different views, preparing students for team work as well as improving their problem-solving capabilities. Validation in the real world connects education and professional practice, so graduates are prepared to face challenges anywhere [22].

CONCLUSION

In a nutshell, creative integration of technology, different assessment methods and interdisciplinary cooperation will define the dynamic future that is full of hope for physiotherapy education. To ensure that pedagogical concepts are always ahead of the times in training complex physiotherapists, we must not let research and exchanges be insufficient. These initiatives will take forward the education of future physiotherapists, increase quality and flexibility in an industry that's always changing.

ABSTRACT

Cryptosystem is a tool used to communicate a confidential message between two persons or two groups or two networks, by some code language, known only to the sender and the intended receiver, so that even if an intruder has access to the message, he/ she cannot understand the message. Hamiltonian cycle in graph theory is a cycle that traverses every vertex exactly once. In this paper we introduce a new cryptosystem called Rook Tour Cryptosystem. Rook-tour in a chessboard is a Hamiltonian cycle strictly following the path of a rook. In this double encrypted cryptosystem, a message is initially converted into cipher text and the cipher text is again converted into cipher graph using our proposed rook-tour algorithm. These cipher graphs are then merged and sent to the receiver. The receiver need to do the same double decryption to get into the original message. This proposed algorithm has symmetric keys and can be solved only in polynomial time complexity.

Keywords: Cryptosystem, Rook tour, Hamiltonian cycle, Encryption, Double encryption, Decryption

Subject Classification: 94A60, 11T71

INTRODUCTION

Cryptography is the study of methods on sending messages in disguised form[10]. Cryptosystem is a system of enciphering, deciphering codes along with its keys. The concept of cryptosystem began when people started to realize the need for confidentiality of messages. Caesar was the first to use a cryptosystem to communicate with his spies[11]. As we moved into modern days, cryptosystem laid its feet in almost every field, like military, financial

Antony Arockiasamy and Gracy Viji Rose

sectors, government and private sectors. Simple shifting techniques were the earliest formal method of secret communication. Caesar used this in his battle[11]. Then came the transposition and substitution methods[15]. Prime factoring and linear transformation methods [11] were next advancements that made the secret messaging more interesting and difficult to break free. But enemies always had the better part of the system. After a long lull, Diffie and Hellman[6] came up with entirely new idea of public key cryptography. It was followed by the path breaking discovery of RSA Cryptosystem in 1978[2]. Ever since, the cryptosystem has evolved into a multi disciplinary field of research of Mathematics and Computer Science. In [13], the plain text characters are converted into XOR using the ASCII and Binary values and an Adjacency matrix is created for each character and it is then compressed and sent to the receiver. In [3], Amudha and Charles encrypted the plain text by using the key agreed by the sender and receiver and the encrypted text is converted into an adjacency matrix and sent to the receiver. Etaiwi [5] introduced a new way of cryptosystem using graph theoretical properties. The original message is encrypted into an Euler Graph and is then converted into a adjacency matrix and from the matrix a minimum spanning tree is found and sent to the receiver. In [17], Perera et al uses a matrix as a key. Here a plain text is converted into graphs and then it is converted into a matrix form. In [12], Jaya Shruthy, Maheswari discuss about a double encryption and decryption process in a cryptosystem and it is enhanced by Vigenere cipher. In the cryptosystem proposed in this paper, we use double encryption and decryption in which, we convert the plain text into cipher text and then convert it into Hamilton paths using rook tour algorithm, merge the graphs into a single graph and send this graph to the receiver. We use a transposition technique to convert the plain text into cipher text, a substitution technique to replace the cipher text into cipher graph and a simple trial and error process to decrypt the original message. Since it is a symmetric key cryptosystem, we have chosen the basic rook tour on a 8X8 chessboard as a key (which has 64 key elements) so as to increase the strength of the key. But the process can be expanded to $m \times n$ chess board. The efficiency of this algorithm lies in the fact that any attempt to break the algorithm will be complicated and highly difficult as it will result in an algorithm of polynomial time complexity in computation. The paper is arranged in the following order. In section 2, all the preliminary definitions required are recalled. Section 3 contains encryption and decryption algorithm for the proposed rook tour cryptosystem and an example that exposes the nuances of this cryptosystem.

PRELIMINARIES

Hamiltonian cycle [4] in graph theory is a cycle that traverses every vertex exactly once. *Rook-tour* in a chessboard is a Hamiltonian cycle strictly following the path of a rook. Rook is a key player in the usual chessboard which has the ability to move front, back, left and right starting from 1 step to 7 steps[16]. This cryptosystem is not restricted to the usual 8x8 chess board and it is valid for all rook tours on the $m \times n$ board where $m \geq 5$ and $n \geq 5$ or vice versa. *Cryptography* [13] is a process in which the plain text is converted into some code language so that the message becomes unreadable for any unauthorised person. The code language is usually referred as cipher text. *Cryptanalysis*[15] is the process of retrieving back the secret message (plain text) from the coded language (cipher text). *Cryptosystem* is the combination of both Encryption and Decryption. *Homophonic Substitution Cipher*[18] is a substitution process of a plain text character with a cipher graph. *Cipher Block Chaining Mode* (also known as CBC mode) is a mode in which two similar words/ blocks in the plain text will result in two different cipher graphs because of 'Chaining'. The core parts of a Cryptosystem are the Algorithm and the Key. *Algorithm* is a step-by-step procedure by which the sender and the receiver encrypts and decrypts the given message. *Key*[14] is something that is used in the encryption and decryption process. Generally, the algorithm will be made public and the key will be kept secret. Based on the keys used, cryptography is classified into two types. i) *Symmetric Key Cryptography* (SKC) and ii) *Asymmetric Key Cryptography* (AKC). In SKC, the key is kept secret and is known only to the sender and receiver. In AKC, we have two keys [i.e] Public Key (K_p) & Secret Key (K_s). Here the public key (K_p) is known to everybody including the sender and the receiver whereas the secret key (K_s) is known only to the receiver[13][14]. Even the sender do not have access to the secret key K_s [K]. In the theory of computational complexity, the ability of the computer to simultaneously do a particular number of operations is analysed. The upper bound for the number of bit operations required to compute $n!$ is found to be $n^2(\log n)^2$. The time to calculate $n!$ is approximately $O(n \log n)$.

n)² [15]. Having recalled all the necessary definitions required, we move forward to the next section for the introduction of the double encrypted rook tour cryptosystem.

MAIN RESULTS

In the double encrypted rook tour cryptosystem, we use traditional 'transposition' and 'substitution' techniques for converting the plain text into cipher text. These cipher texts are converted into cipher graphs using the already embedded 8X8 keyboard by the rook tour. These Hamilton paths merged into single graph by a unique method of merging by diagonal edges and this single graph is sent to the receiver. Using the operation key the receiver decrypts two times and is able to achieve plain text.

Algorithm for the Rook Tour Cryptosystem

Encryption is done in either of the two ways 'Substitution' or 'Transposition'. In this double encrypted cryptosystem, we use a substitution technique (CBC Mode) for converting the plain text into cipher text and a transposition technique (Homophonic Substitution Cipher) to further convert the cipher text into cipher graph. The cipher graph can be any one of the chosen set. Cardinality of this set depends on the operation key. The choice of operation key is left to the encryptor. In CBC mode, two similar words / blocks in the plain text will result in two different cipher graphs because of 'Chaining'. Therefore, the encryption of one block modifies the encryption of the future blocks. Our decryption process is also two-way decryption technique. We consider the shortest path for the cipher graphs. Therefore we always have two possibilities for each graph while decrypting and hence the final decrypted message can be obtained only of trial and error basis. The algorithm is given in step by step in the following lines.

- Convert the plain text message into numerals y replacing each character by its respective location in the key. We'll now have ' $2N$ ' characters for the N -character message.
- Label each character namely $m_1, m_2, \dots$ (space is optional)

$$h(n_i) = \begin{cases} n_i + i(\bmod r), & \text{if } i(\bmod r) \neq 0 \\ n_i + r, & \text{if } i(\bmod r) = 0 \end{cases}$$

Perform the function

Here ' r ' is the operation key

- Now replace each $h(n_i)$ ($1 \leq h(n_i) \leq 16$) by its corresponding English alphabet (ie., $1 \rightarrow A, 2 \rightarrow B$ and so on) which is the cipher text of our plain text.
- Before we move into the next step, 8X8 chess board is embedded with 64 symbols of alphabets, punctuation marks and other required characters. Pair two alphabets consecutively and find the minimum path for each pair using the key and the Rook tour. The graphs now obtained are called the cipher graphs. As a special case, if the pair has same alphabet say AA , consider it as $\sqrt{A}$ and find the graph.
- At last, merge the graphs by using mergers (here, we apply method of connecting diagonal edges with unrestricted length). The merged graph is the message to be sent to the receiver. The sender should be aware of the hidden operation key in the merged graph.

Decryption Algorithm.

- First break the encoded graph into cipher graphs by removing the mergers and find the combination of alphabets for each cipher graph using the rook tour and the key. Each graph will have two pairs of combination of alphabets.
- Replace the alphabets with numbers such as $A \rightarrow 1, B \rightarrow 2$ and so on.

$$h^{-1}(n_i) = \begin{cases} n_i - i(\bmod r), & \text{if } i(\bmod r) \neq 0 \\ n_i - r, & \text{if } i(\bmod r) = 0 \end{cases}$$

- Now perform the inverse function

' r ' is same as in the (Step 2) of encryption algorithm.

- Check the viability for each pair of integers.

Antony Arockiasamy and Gracy Viji Rose

- If there exists any negative integer, then the combination is neglected.
- If the pair of integers exceed 64, then the combination becomes invalid and is thus neglected. The pair of integers is valid only if it lies between 01 & 64.
- Now consider the pair of integers as the location in the key and replace the corresponding element.

We'll get the original plain text by performing simple trial and error substitution.

Key for the Rook Tour Cryptosystem: Rook Tour Cryptosystem is a kind of Symmetric Key Cryptography (SKC). We can mathematically write the encryption and decryption of SKC as

Encryption (E), $E : P \times K \rightarrow C$ and

Decryption ($D = E^{-1}$), $D : K \times C \rightarrow P$

where P is the plain text; K is the secret key; C is the cipher text.

Now we need to give 3 keys namely, Rook Tour, Secret Key Board and Operation Key.

i) A rook tour defined on the $n \times n$ chess board taken. ii) An embedded keyboard on this $n \times n$ chess board. iii) An operation key. It is an integer (≥ 3) which plays a vital role in strengthening our cryptosystem. Generally, boards of smaller dimension will have a smaller operation key and the boards with larger dimension will have a larger operation key. However small operation key is enough in a large key board, still choosing a larger operation key makes our cryptosystem critical to guess or break. The operation key is not communicated between the sender and receiver even at the time of key exchange. Each time a message is sent, the operation key only depends on the sender. For a fixed Rook tour and Key board, the sender can keep on changing the operation key and it is communicated to the receiver only via the actual encrypted message. The nuances of the algorithm will be made more clearer, in the example given in the next section.

Example : First we shall choose the three required keys before encrypting the message.

Encryption :

Considering the chess board, we will choose the keys from a 8×8 board.

Key 1 & Key 2 given in figure 1 and 2 are a randomly chosen rook tour and a randomly embedded chess board with 64 symbols respectively. These keys must be exchanged between the sender and receiver.

Suppose that the sender has chosen the third key, the operation key as 10. i.e., Key 3 = 10, the encryption is done as given below for the plain text ALL THE BEST. Note that we have not taken 'space' as a character in the example given. In general we have the option to decide whether to include space or not.

E1) Locating the plain text

E2) Chaining Operation with $r = 10$

E3) Converting into Cipher Text.

E4) Converting Cipher Text to Cipher Graph

E5) Merging of Cipher Graphs

The step E1 is shown in Table-1, the steps E2, E3, E4 are given in Table -2 and merged cipher graphs(E5) is given in Fig.4. This is the actual message we send to the receiver. In this graph, the operation key is hidden therefore only the receiver can find the operation key and decrypt the message.

Decryption: For the decryption process, the keys are the same as encryption since it is a Symmetric Key Cryptography. Therefore consider the keys in [Fig2] & [Fig3]. Let [Fig4] be the message to be decrypted.

D1) Split into Cipher Graphs and find the combinations of Cipher Text from the Keys

The graph has no break and there are 10 cipher graphs merged which shows that the operation key is 10.

D2) Convert the Cipher Text Alphabets into Numerals

D3) Inverse Chaining Operation

D4) Check for the viability in each case by pairing the values of the inverse chaining operation.

i) Values > 64 are neglected

ii) Values containing negative terms are also neglected

D5) Replace the values by the key element from the Key board (Key 2)

Antony Arockiasamy and Gracy Viji Rose

Trial and Error Process

- The first 3 characters forms the word 'ALL' makes sense but not the first 4 characters ALLT.

Therefore, our first word is ALL.

- For the next word we consider all the possibilities TDE, TDO, THE, THO. Among the 4 possibilities, only 'THE' makes sense and the addition of B doesn't make sense with any pair.

Hence our second word is THE.

- Next we have only two possibilities BEST and BOST. Since 'BEST' looks more meaningful we conclude that our third word is BEST.

Thus we have obtained the Plain Text as "ALL THE BEST" which is the original plain text being sent.

Efficiency of the Algorithm

The uniqueness of double encrypted rook tour cryptosystem lies in the combination of traditional and recent methods used for the process of encryption. For the operation key 'r' can be extended to any finite positive integer N, where N is the number of characters in the plain text. So whether we use transposition or substitution, 'r' can take a maximum of $(N+10)!$ times of permutation. Though we have taken the usual 8X8 chess board for embedding of symbols, nevertheless, it can be extended upto $m \times n$ board, where m, n are positive integers. Embedding of symbols in this $m \times n$ board is made dynamic using shifting and consequently, will give a whopping permutation possibility of $(m \times n)!$ Next, the merging of cipher graphs using diagonal edges. Here the merging is done in the same order of the graphs generated. Suppose we have the option to merge the graphs in a random order N number of Hamilton paths for a N character plain text, then the merging of cipher graphs can have a maximum of $N!$ permutation. In the ideal run of the algorithm, all the three values of r, m, n and N can be made dynamic simultaneously, to achieve the best result. Roughly the upper bound for the number of bit operations required to compute all the three dynamic keys will be very high. Roughly, the maximum number of keys that can be generated if we keep all the three parameters dynamic will be $(N+10)! \times (m \times n)! \times N!$ But even if we fix the keyboard, rook tour and the operation key given in example, we can still generate $20! \times 44!$ different keys for the second key (Key 2). Approximately, the upper bound for the number of bit operations is $((N+10)^2)(\log(N+10))^2 \times (m^2)(\log m^2) \times (n^2)(\log n^2) \times (N^2)(\log N)^2$. Then the time to break this algorithm by an outsider will be in the level of $O(N^4) \times O(m^2) \times O(n^2)$, where N is the length of the message and $m \times n$ is the size of the chess board we use, in the encryption. Hence the cryptanalysis of this algorithm is of polynomial time complexity.

Challenges in the Algorithm

The challenges are of three fold. a) Finding all possible rook tours for the 8X8 chess board has been a tough task. As the dimension of the board increases, the task will be even more challenging. b) The embedding of the symbols in the $n \times n$ chess board will require more attention as the value of n increases above the level of 20, because alphabets from more than 2 languages have to be used. To meet this challenge we propose to use digraph and trigraph symbols in the chess board cells. c) To make all the three keys dynamic networking is required. While the first two challenges we have already started working, third challenge will be met in the near future.

CONCLUSION AND FUTURE PROSPECTS

In this paper we have introduced a new cryptosystem Double Encrypted Rook Tour Cryptosystem. We have used the technique of symmetric key cryptography for our cryptosystem since it is more preferable while transmitting large message. The attempt to break this new cryptosystem is difficult and its cryptanalysis requires polynomial time algorithm of order $O(N^4) \times O(m^2) \times O(n^2)$. The future directions of this research can deal with making this an asymmetric and make it public key cryptosystem.

ABSTRACT

India's rapid infrastructure growth demands vast materials for road construction. However, in parts of West Bengal, weak alluvial soil limits subgrade strength. This study explores the use of laterite soil as a stabilizer to enhance subgrade properties. Laterite soil was mixed with alluvial soil in the proportion of 0%, 5%, 10%, 20%, 30% and 40% by weight of soil sample. Tests on soil mixtures showed reduced liquid and plastic limits but increased dry density (MDD). Unsoaked CBR improved significantly at 5% laterite, while soaked CBR peaked at 30%. Results suggest laterite soil can enhance stability and strength in road subgrades.

Keywords: Alluvial Soil, Laterite Soil, Soil Subgrade, Alternative Materials, CBR, OMC, MDD

INTRODUCTION

India's rapid economic growth has led to extensive road network expansion, with over 33 lakh km of roads, making it the second-largest in the world. However, the increasing traffic volume and axle load have accelerated road deterioration, requiring efficient pavement design. Subgrade soil plays a crucial role in pavement stability, but locally available alluvial soils often lack sufficient strength. Stabilization techniques, such as mixing with laterite soil, can enhance subgrade properties. Laterite soil, with its cementing agents, improves strength, reduces permeability, and increases embankment stability. This study examines the effects of laterite soil on alluvial subgrade properties, focusing on compaction, strength, and California Bearing Ratio (CBR). The findings can help optimize subgrade performance, making road construction more sustainable and cost-effective.

Objectives

- To investigate the feasibility of utilizing laterite soil for subgrade stabilization in response to the scarcity of conventional subgrade materials.
- To explore the impact of laterite soil on clayey soil.

**Sudipta Adhikary**

METHODOLOGY

The soil sample for this experiment was collected from Barasat (North 24Pgs) and mixed with varying proportions of laterite soil (0%, 5%, 10%, 20%, 30%, and 40%) to analyze its impact on soil properties. Standard tests were conducted to evaluate soil strength. The results were analyzed to determine the optimum percentage of laterite soil for maximum dry density (MDD) and other strength related parameters.

RESULTS AND DISCUSSION

Graphical Representation of various Curves for Various % of Laterite Soil The specific gravity of mixes of 5%, 10%, 20%, 30%, 40% is lies in between the values of 2.74 to 2.85. The values are 2.76, 2.80, 2.84, 2.79, and 2.77 respectively for 5%, 10%, 20%, 30%, 40% mixes of laterite soil with alluvial soil. The maximum value is 2.84 for 20% in proportion of mixes. It is seen that the curve is in decreasing order of values 13.54%, 13.25%, 11.92%, 10.59%, 10.64% with increasing of percentage of laterite soil of 5%, 10%, 20%, 30%, 40% of alluvial soil and whereas the values of alluvial soil and laterite soil are 14.01% and 19.85% severally. The values of plasticity index of mixes are in the range of pure soil and laterite soil. It has been shown the values of optimum moisture content decreases with increase with proportion of mixes. The values are 18.32%, 18.22%, 18.20%, 16.45% and 16.42% for the mixes of 5%, 10%, 20%, 30% and 40% respectively. The OMC is 19.01% and 12.37% for CSET' soil and laterite soil respectively. The values of Unsoaked CBR is 9.33%, 6.75%, 4.96%, 5.34% and 5.71% for 5%, 10%, 15%, 20%, 30% and 40% respectively. The value of virgin soil is 3.53% and for laterite soil is 7.61%. The CBR value of 5% mix is more among the others mixes and the lowest value of 20% mix is 4.96%. The CBR value of 5% is 2 times more than 20% mix.

CONCLUSION

From the plasticity chart depend on liquid limit and plastic limit devised by Casagrande for unified soil classification; CSET playground soil is in the CL classification. But considering other aspect like CBR value and particle size distribution little variation has been observed for that soil. 30% mix of laterite soil with said virgin soil gives maximum soaked CBR value of 2.78%. But considering other properties, 5% mix is more suitable option for constructing the pavement only the value of soaked CBR value is very slightly less than the CBR value of 30% mix by 0.22%.

ABSTRACT

This study performs to investigate the effect of elastic band exercise on core endurance and balance in recreational volleyball players. A total of 48 male players who perform recreational sports between 18 to 25 years of age participated in the study. The participants were separated into two groups: Regular training group (n=24) and Elastic band group (n=24). Both groups were subjected to core muscles exercise programs for 6 weeks, 3 days a week. Core endurance and Balance were measured before and after exercise program using McGill core endurance test and Y balance test respectively. Hypothesis test using paired sample T-test and unpaired T-test with p value $P < 0.05$ statistically showed a significant increase in core endurance and balance. Based on the statistical tests, providing core stability exercise increase the core muscles endurance and balance of male recreational volleyball players.

Keywords: volleyball, core muscles, elastic band, endurance, balance

INTRODUCTION

Volleyball is a popular sport among the other team sports and is regarded as one of the most popular sports among men and women worldwide.[1] Volleyball is characterized by the absence of invasion of the opponent's field of play, with no physical contact between players, making performance largely dependent on individual physical abilities and technical skill.[2] Volleyball is assumed to be a safe sport compared to other team sports, However, volleyball players may be at risk for injuries due to sports specific tasks, such as jumping and landing, as well as spiking and blocking the ball.[3] Volleyball is a sport involving rapid and forceful movements of the body as a whole, both

Hardik Bhupatbhai Nakum and Jayaprakash

horizontally and vertically, and because of the large forces involved in such movements, it is inevitable that injuries occur.[4] Across all age and sex groups, the ankle was the most commonly injured body part (25.9%), followed by the knee (15.2%), fingers /thumb (10.7%) and lower back (8.9%).[5] To manage this risk, specific injury prevention strategies are needed. Training to improve core strength should also be considered for at risk athletes. Adequate strength in this region allows for effective summation of force throughout the kinetic chain, from proximal to distal, allowing the shoulder to play a greater role in expressing the force, rather than producing it.[6] The fairly or decreased harmony of core muscle leads to abnormal movement patterns, various compensatory movements and a variety of sports injury occur.[7]Core muscles also contribute about 50% of kinetic energy and the force for rapid arm movements such as bouncing and hitting the ball (smash), there is a pattern of muscle activation that starts from the contralateral oblique external muscle and continues to the arm. Core muscle strength affects the upper and lower extremities because if the muscle weakness, then the risk factors for injury to athletes increase.[8] Research proves that there is a significant relationship between good core muscle strength and the ability to service and smash. Core muscles and arm muscles contribute 86.4% to the ability to service and smash volleyball athletes.[9,10,11] The importance of core training contribute to the performance of the athletes by improving balance, strength, skill, and anaerobic power along with effective muscle development.[12] To achieve the strengthening of these core muscles, an exercise program is administered employing various equipment like elastic resistance, Swiss ball, springs, sandbags, etc.[13] An elastic resistance band is a unique type of resistance training. It is used in sports and rehabilitation medicine to improve muscular strength and endurance. The resistance of the elastic band depends upon the amount of the band is stretched. Elastic bands are available in different colours according to an assortment of grades. It includes the following colours: yellow(thin), red(medium), green(heavy), blue (extra heavy), silver (super heavy), and golden(max) and use of TheraBand improves flexibility, mobility, and daily activities.[14] Elastic bands offer a versatile and cost-effective means of resistance training. Examining their impact on core endurance and balance can provide practical insights into incorporating accessible and adaptable training tools into the routines of recreational volleyball players.

METHODOLOGY

Ethical approval was obtained from the institutional ethics committee before the study. 60 subjects were screened for eligibility and 48 subjects fulfilled the inclusion criteria were included in the study. Informed written consent was obtained after explaining the process of the research and merits-demerits of the study. Subjects were randomly divided into two groups using the chit method. Groups A (Elastic band exercise) (n=24) Group B (Routine training) (n=24). One participant from group A was discontinued during the training due to personal reasons. On the first visit, complete pre-intervention assessment was done, which included the descriptive data of age, height, weight, limb length, balance, and endurance for all the participants. Dominant leg was determined by the self-reported, preferred kicking leg by the subjects. McGill core endurance and Y balance test were taken as the pre-intervention and post-intervention. (after 6 weeks).

Inclusion Criteria

Willingness to participate, Age group between 18-25 years, Male subjects were included, Recreational volleyball players.[15,16]

Exclusion Criteria

History of recent upper and lower extremity fracture or any other pathology, Low back pain, Sustained injuries or any present deformity, any surgery in the upper or lower limbs for the past six months, Participate in elastic band exercise over the last six months.

The sample size was calculated with the formula given below:

The sample size for two means, quantitative data:[17]

$$N = 2 \times (Z_{\alpha} + Z_{\beta})^2 \times \frac{\sigma_1^2 + \sigma_2^2}{\delta^2}$$

Hardik Bhupatbhai Nakum and Jayaprakash

- Z_{α} is the critical value of the Normal distribution at α (e.g., for a confidence level of 95%, α is 0.05 and the critical value is 1.96)
- Z_{β} is the critical value of the Normal distribution at β (e.g., for a power of 80%, β is 0.2 and the critical value is 0.84)
- In this formula, we can accommodate two separate SD values for the two groups and δ remains simply as $(\mu_1 - \mu_2)$.

Exercise Program

Group A: Interventional Group (Elastic Band Exercise) (N=24)

Warm up – jogging & Cool down – Whole body active stretching

Elastic Band Exercise Program:[18]

Push-ups, curls ups, quadruped stabilization, bridging, side bridge Lower abdominal crunch

Correct elastic band for each participant chosen by asking them to perform the above activities-exercises, with a quantitative value of 10 and a qualitative value of “extremely hard or heavy.”[19] Same resistance TheraBand has been used for the subject, throughout the study by only increasing the repetitions and number of sets. The increment of repetition and sets for each week has been made as per the protocol.[20]

Frequency: – three times a week for six weeks

Intensity[25]:

WEEK	REPETITIONS	SETS

Group B: Routine Training Group (N=24)

The routine exercises performed by the players at the academy were considered as standard activities and without any modification it was adopted for group B during the training.

Outcome Measures

McGill Core Endurance Test

The objective of the endurance tests was to hold a static position for as long as possible. The endurance tests were the trunk flexor test (ICC =0.93), trunk extensor test (ICC = 0.97), and bilateral side bridge tests (ICC = 0.91). The trunk flexor test began with the participant in the sit-up position with their trunk supported at 60 of trunk flexion. Knees and hips were flexed at 90, arms crossed over the chest, and feet secured. The support of the trunk was then removed, and the participant held the position for as long as possible. The test was terminated when the participant was no longer able to hold the position. The trunk extensor test was performed with the participant lying prone on a treatment table. Their pelvis, hips, and knees were secured to the treatment table, while a chair at the same height as the surface of the table supported the trunk and upper extremities. The chair was removed, and the individual held a horizontal body position for as long as possible with arms crossed over the chest. The test was discontinued when the participant fell below the horizontal position. The side bridge tests were performed in the side-lying position on a treatment table. The participant's knees were extended with the top foot placed in front of the lower foot. The participant supported their weight only on their lower elbow and feet while lifting their hips off the mat. The test was stopped when the side-lying position was lost or when the hips returned to the mat.[21]

Y Balance Test

consists of a three-part test that is used to assess lower extremity balance and neuromuscular control to predict lower extremity injury. participant viewed a YBT instructional video and performed six practice trials to maximus the perfection with the influence of a learning effect. The participants were instructed to stand on the center footplate,

Hardik Bhupatbhai Nakum and Jayaprakash

with the distal aspect of the right foot at the starting line. While maintaining single leg stance on the right leg, the subject reached with the free limb (left leg) in the anterior (ICC=0.93), posteromedial (ICC=0.91), and posterolateral (ICC=0.85) directions about the stance foot as far as possible. The Participants were complete their 3 consecutive trials for each reach direction. In order to reduce the fatigue, subjects were informed to alternate their sides between each direction. [2]

Statistical Analysis

Statistical analysis was done using SPSS version 20. Before the application of statistical tests, data were tested for the normal distribution by using the Shapiro-Wilk test. The Baseline characteristics were similar for both the groups and the data was normally distributed for all outcome measures. Within group and between group analysis of outcome measures were done after six weeks of completion of the intervention. The level of significance was kept at 5% at a confidence interval of 95%. Parametric tests were applied for within group and between group analysis as the data was normally distributed. Within group analysis was done using the Paired 't' test and Between group analysis was done using the Unpaired 't' test.

RESULT

Tests For Normality of Data

Shapiro-Wilk test shows the p-value of all the variables of Group A and Group B lies > 0.05 . Hence, they are normally distributed.

Baseline Characteristics

The baseline characteristics measured for Age (years), BMI (kg/m^2), Y balance reach distance scores in all directions, and McGill core endurance of both the groups. Baseline Independent 't' test was done to analyse the data and no statistical difference ($p > 0.05$) was found between the groups.

Within Group Analysis

1) Interventional Group (GROUP A):

Y Balance Test

Pre And Post Mean Y Balance Distance Reach (in cm) In Group A Dominant Side & Non-Dominant Side showed the p-value of the Y balance test in Group A lies at less than 0.05 reveals that there is a significant difference existing within the group.

McGill Core endurance test: p-value of McGill core endurance test in Group A lies less than 0.05 reveals that there is a significant difference existing within the group.

2) Routine Training Group (Group B)

Y Balance Test: Pre And Post Mean Y Balance Distance Reach (In Cm) In Group B Dominant SIDE & NON-Dominant Side showed the p-value of the Y balance test in Group A lies at less than 0.05 reveals that there is a significant difference existing within the group.

McGill Core endurance test: p-value of McGill core endurance test in Group B lies less than 0.05 reveals that there is a significant difference existing within the group.

Between Group Analysis

Between group analysis for Y balance reach distance analysed by using Unpaired 't' test. Analysis shows that there is a significant difference existing between Group A (Interventional) and Group B (routine training) in the Y balance test in all directions ($p < 0.05$). Between group analysis for McGill, the core endurance test was analysed by using the Unpaired 't' test. Analysis shows that there is a significant difference existing between Group A (Interventional) and Group B (routine training) in the McGill core endurance test ($p < 0.05$). The above results show that the Core muscles endurance and balance in recreational volleyball players are significantly improved on both the dominant and non-

**Hardik Bhupatbhai Nakum and Jayaprakash**

dominant side of Group A (Interventional) and Group B (Regular training). The result shows that there is a higher significant difference existing in Group A than Group B.

DISCUSSION

This study evaluated the effects of six-week elastic band exercise training on core muscle endurance and balance of recreational volleyball players. Volleyball is a branch that consists of different techniques and tactics involving short-term high-intensity exercise and low-intensity exercise. Thus, such performance as endurance and balance are needed during training and competitions, the concept was seconded by Mehmet Cakir(2022).[23] Reducing the endurance of muscle groups may cause abnormal movement or displacement in different parts of the body.[24] People with lower trunk muscle endurance are more supposed to be exposed to structural pressures, which may lead to inappropriate pressure on the spinal column and cause lower back injury.[25] After six weeks of intervention, the elastic band exercise group demonstrated greater improvement in core endurance than the regular training group. The result of the current study is aligned with those of Torbati Nezhad Z, Daneshmandi H, *et al.* (2019)[24] the sole study that has explored the improvement of endurance. The present study, is related to the nature and difficulty of the exercises, as well as the use of multicomponent movements with more repetitions for six weeks of core stabilization exercises which can affect the good performance of the person and bring about improvements. Previous experimental Trials of Kaun Dong, Yu T *et al* (2023), have postulated the same findings in Rugby players. He discovered a positive correlation between the static muscle endurance of core trunk muscles and the physical ability of rugby players through an experimental study.[26] John M. Mayer postulated that, the higher levels of endurance from various muscle groups, including the lower trunk are positively related to better performance in sports and on specific tasks (2015).[27,28] Hodges and Richardson (2002) identified that the trunk muscle activity before the activity of the lower extremity, which helps the spine to stiffen leading to a foundation for functional movements. They also found that the transversus abdominus is the first muscle to become active prior to actual limb movement and this preprogrammed activation of the transversus abdominus was a component of the strategy used by the CNS to control spinal stability.[29] Previous investigators Su Hlaing, Puntumetakul *et al* (2021), have postulated that the Re-educating of TrA (transverse abdominis) and LM (lumber multifidus) muscles, which have rich sources of sensory input and play an important role in providing postural control and enhancing balance control.[30] The results of the present study support these findings. On the other hand, Nurten Dinc, Ergin E, *et al* (2019), reported that the six weeks of Core training did not have a significant effect on the balance ability of 500m runners. It is thought that, the reason why core training has no effect on balance in runners is due to the type I muscle fibrils with aerobic properties in long distance runners.[31] Positive findings by Raouf Hammami, Gene Morales, *et al* (2022), defined that elastic band training easier to produce adaptations in youth. EBT performed as explosive, multi-joint movements against resistance, exemplifying many athletic actions, and accentuating the task or action specificity of sport.[32] Jonas Vinstrup, Sundstrup, *et al* (2015) proposed that the exercise utilizing elastic resistance showed an increased contraction time compared to the machine as greater time under tension would cause fatigue across a larger spectrum of muscle fibers, elastic exercise was performed with a greater lever arm would also increase the demand on the postural muscles.[33] The findings of the current study are consonant with previous research; and provide clinicians with a method of improving dynamic balance by elastic band exercise.

CONCLUSION

This study supports that the Elastic Band (EB) provides enough stimuli to improve core endurance and balance in recreational volleyball players. These aforementioned parameters are related to the performance in volleyball and thus, we can state that the Elastic Band Training (EBT) improves the performance of the young volleyball players.

ABSTRACT

This research paper assesses some of the paradigms in the intersections between literature and other disciplines—given the relationship between literature and science in Toni Morrison's *Beloved*—that necessarily refer to the bodies and the different dimensions of motherhood to neuroscience, psychology, and evolutionary biology. Sethe, the novel's protagonist, embodies maternal love, trauma, and sacrifice, rendering *Beloved* an apt text to consider motherhood's biological and psychological dimensions. This research aims to further reach the understanding of Morrison's idea of maternal instincts and psychological suffering by integrating scientific theories such as attachment theory, neurobiology of maternal bonding, and trauma studies. These findings show that Morrison's portrayal of motherhood lines up with scientific research on maternal bonding, grief, and survival mechanisms. Sethe's emotional and physiological reactions to trauma echo what researchers have found about the physical effects of extreme stress on brain function and behaviour. Neuroscience reveals that Sethe's compulsive attachment to *Beloved*; her overprotective instincts and her psychological unravelling are manifestations of complex grief disorder and PTSD. The novel also brings into sharp relief the effects of the forced separation of mothers and infants in the system of American slavery, demonstrating how trauma interferes with lactation, attachment and mental health. The argument also concludes that Morrison's story gives not just the historical and emotional context of motherhood, but also a scientifically informed experience of maternal psychology and trauma. Sethe's motivations are not just neurobiological and evolutionary imperatives, but also historical and political, and her acts that are so often denounced (and often rightly so) as irrational or extreme have the right to at least be acknowledged in their complexity. The use of multiple disciplines here serves to deepen the understanding of what *Beloved* brings to the table: maternal behaviour is an emotional experience as well as a biologically driven survival instinct. The paper

96281

Lubna Tabassum and H.M. Arif

concludes with a call for more research along the lines of neuroscience and psychology also in literary analysis to overcome the gap between science and the humanities. Future studies might analyze maternal instincts in *Beloved* alongside other literary texts, explore related topics in Morrison's other books, and question the interconnections between trauma and biology in shaping maternal resilience across cultures and histories.

Keywords: Attachment theory, motherhood, mental health, neuroscience, biology, lactation, psychology.
“Grown don’t mean nothing to a mother. A child is a child. They get bigger and older, but grown? What’s that supposed to mean? In my heart, it doesn’t mean a thing”. (Morrison)

INTRODUCTION

The present study, thus, uses scientific and psychological lenses to investigate motherhood in Toni Morrison's *Beloved* by employing theories based on biology, neuroscience, and attachment psychology to create a more nuanced understanding of Sethe's maternal instincts. Toni Morrison's *Beloved* (1987) is a seminal American work, one in which Morrison investigates the ephemeral traces slavery leaves on the mind and body, framed through the notions of motherhood, trauma and memory. Inspired by the true story of Margaret Garner, the novel follows Sethe, a formerly enslaved woman haunted by the ghost of the child she murdered rather than allow the child to be enslaved. Morrison deftly intertwines history and horror to tell the sometimes-haunting tale of suppressed trauma and maternal grieving. As Sethe comes to terms with the emotional burdens of her past deep study of the human soul. The novel's exploration of Sethe's actions — her desperate attempt to shield her child from slavery's horrors — poses intriguing questions about maternal instincts, attachment and the neuroscience of grief.

Toni Morrison, one of the greatest voices of contemporary literature, was born in 1931 and became the first African American woman to win the Nobel Prize in Literature, in 1993. Her listed novels which include *The Bluest Eye* (1970), *Song of Solomon* (1977) and *Beloved* (1987) — touch on race, identity and the psychological processes involved in historical trauma. Morrison's stories are rooted in African American history, folklore and oral traditions that give her works personal, as well as wide-ranging, relevance. Not only does Morrison reconstruct the trauma of slavery through *Beloved*, but she also offers a deeply personal examination of motherhood, love, and loss, allowing for an excellent text for interdisciplinary analysis across the fields of literature, neuroscience, psychology, and biology. To fully comprehend the choices Sethe made and the part of her that's driven by maternal instinct, we must explore the science of motherhood. Neuroscience is based on the Greek words neuron (nerve) and scientia (knowledge); defined, it is the scientific study of the nervous system, in particular how the brain processes emotions, memories, and survival instincts (Kandel et al. 29). Research from neuroscience has shown that maternal behaviour is inextricably tied to 'love hormone' oxytocin-secretion, the release of which bolsters maternal bonding, so-called 'attachment' (Feldman 45). Neuroscientific findings on how the brain processes maternal attachment and trauma can be analyzed through the lens of Sethe's overwhelming love and fear of losing her child.

Psychology, from the Greek psyche (soul, mind) and logos (study) is the study of behaviour and mental processes (Myers 12). Attachment theory and post-traumatic stress disorder (PTSD) also serve as significant lenses through which to analyze Sethe's actions and mental state in *Beloved*. According to John Bowlby's attachment theory, the primary bond formed between mothers and children is essential to emotional security; if this bond is broken, the child may experience psychological distress (Bowlby 82). Sethe's relationship with Beloved, a maelstrom of love and guilt, illustrates the psychological complexities of maternal attachment and loss. Besides, biology, originating from the Greek bios (life) and logos (study) is the scientific study of life and living organisms, with human behaviour and evolution (Carter 33). According to evolutionary biology, maternal behaviour is an outcome of survival instincts, as the mother prioritises the well-being of her offspring, even at the cost of her safety. Sethe's drastic decision to take

Lubna Tabassum and H.M. Arif

her child's life rather than allow the child to be enslaved is theorized within an evolutionary framework of maternal sacrifice, illustrating the intersection of biology and literature.

This research aims to combine neuroscience, psychology, and biology to analyze *Beloved* not just as a literature study, but also to investigate how Morrison's interpretation of motherhood corresponds with current scientific paradigms of maternal bonds, trauma, and survival. Interdisciplinary analysis of Sethe's experience reveals deeper dynamics of biological and psychological forces that motivate maternal behaviour, securing the connection between science and literature in Morrison's moving narrative.

The review article aims to answer the following research questions:

- How do biological, neurological, and psychological theories of motherhood explain Sethe's maternal instincts and behaviour in *Beloved*?
- How does neuroscience explain maternal bonding and sacrifice?
- What role does attachment theory play in understanding Sethe's relationship with Beloved and Denver?
- How does Morrison's portrayal of motherhood align with scientific studies on grief, memory, and maternal behaviour?

LITERATURE REVIEW

The theme of motherhood in Toni Morrison's *Beloved* has been widely examined from historical, feminist, and psychoanalytic angles. The trauma of enslavement, maternal bereavement and the haunting spectre of epochs of atrocity have by now been explored by scholars, but fewer have delved into the scientific aspects of motherhood in the novel. This literature review aims to fill this gap by summarizing existing scholarship on *Beloved* while weaving in through a lens informed by neuroscience, psychology, and evolutionary biology of maternal instincts and mother-child bonding in Morrison's narrative. Terry Paul Caesar's article "Slavery and Motherhood in Toni Morrison's *Beloved*" explores the complex interplay between the institution of slavery and the idea of motherhood in Morrison's work. In *Beloved*, slavery and motherhood are intertwined to such an extent that Caesar proposes that they become "convertible terms" in the narrative. In this light, the experiences of enslavement and motherhood overlap in the novel to the extent that each reflects and informs the other.

In "Slavery, Motherhood, and Recurring Trauma in Toni Morrison's *Beloved*," Erik Lorenz discusses the trauma slavery inflicted upon Black mothers and their daughters, its effects extending beyond emancipation. Using historical research, E.P. Thompson's definition of class, and Cathy Caruth's trauma theory, Lorenz analyzes Morrison's representations of maternal relationships and the stable influence of slavery on family subtleties. Epitomizing "Motherhood" abstraction to the "Embodiment" through different lenses of Literature, one such replicated phenomenon is also scribed in the article "Representation and Portrayal of Motherhood in Toni Morrison's *Beloved*" penned by K. Srividya Lakshmi and Dr. R. Udhayakumar respectively. Using a feminist theoretical lens, the paper investigates Morrison's critical stance on conventional mothering through her characters, focusing on Sethe and Baby Suggs. Mothering Is Not a Thing to Do — This is an Autobiographical overview Morrison employs in the latter half of this piece by thinking through the implications of what she has to say about maternal bodies as they interact with one another and the context of their (post)slave status: maternal sacrifice, resilience, and how slavery reduces the maternal body to property bring Morrison's narrative style and symbolic imagery to light, pointing out the contradiction that lies in maternal identity, which shows up in a fractured way both in the fragility and persistence of the maternal body.

In the book *Love and Motherhood in Toni Morrison's *Beloved** by Zita Rarastesia through Black feminist lens, Rarastesia studies the ways female characters engage with past trauma as they take on their present lives, paying special attention to the lasting effects enslavement has on their identities and relationships.

Aqueel Akhtar has written a thesis on Discovery of Selfhood in the Novels of Toni Morrison. Akhtar explores how Morrison's characters grapple with their own identities within the complexities of the social and cultural worlds they are a part of, reflecting the larger African American experience.

**Lubna Tabassum and H.M. Arif**

Monika Singh, in a thesis titled "Mothering in Select Novels of Toni Morrison and Alice Walker", explores the themes of motherhood in the works of the two most celebrated AfricanAmerican authors. Morrison and Walker: Singh attempts to dissect the archetypal mother image that Morrison and Walker present in their respective novels, and what they hope to convey about identity and strength through them, especially as they develop against the backdrop of African-American culture. The research investigates the multi-faceted nature of motherhood as both a life-giving and an all-consuming experience for the maternal characters in the texts identified.

The article by Christopher Peterson, titled "Beloved's Claim," is about the relationship between kinship, property, and possession in Morrison's novel, *Beloved*. Critique of approach: Peterson opposes work that aligns kinship with social oppression or slavery, contending instead that kinship is itself similar to slavery/ownership. He rebuts claims that view Sethe's infanticide as an act of maternal love unqualified by violence, pointing out how such readings erase how all possessive claims over others are violent. Comparing and contrasting Sethe's depiction with that of Margaret Garner, the historical figure that inspired Morrison's novel, Peterson points out that the text's deliberate exclusion of miscegenation is used to emphasize an idealized notion of maternal love.

RESEARCH GAP

Moreover, while *Beloved* has received extensive treatment by scholars in various disciplines, especially on the topics of trauma, memory, and motherhood, what is lacking is an interdisciplinary examination of the novel through the lenses of science and psychology, in the form of neuroscience, attachment theory, and evolutionary biology. To explore this, we draw on research in neuroscience, psychology, and evolutionary biology to examine the scientific understandings of maternal attachment, stress responses, and the evolutionary imperative to protect offspring to elucidate how Sethe's actions reflect these scientific findings. Through this interdisciplinary lens, this study provides Morrison's and motherhood a new substantive interpretation not available through more traditional symbolic and historical readings or analysis.

RESEARCH METHODOLOGY

This interdisciplinary study uses literary criticism, psychology, neuroscience, and evolutionary biology to examine the theme of motherhood in Toni Morrison's *Beloved*. This research relies mostly on qualitative research methods, analyzing texts to discuss Sethe's maternal instincts from scientific and psychological perspectives. Close readings of *Beloved* are performed to locate maternal behaviour, survival instincts, and attachment in addition to Morrison's narrative techniques in rendering Sethe's psychological state. Using attachment theory, developed by John Bowlby and Mary Ainsworth, the article seeks to unpack the intimate and complex relationship between Sethe and Beloved, illustrating how trauma and separation anxiety play a significant role in defining maternal attachment. The neurobiology of the mother is also in the picture as we explore the role of stress, trauma, and survival instincts in maternal decision-making, a scientific view of Sethe's total crazy-making.

The analysis also submerges evolutionary biology into the mix: the instinct to protect offspring in a highly charged environment. The study compares other English literature that explores themes of maternal sacrifice and attachment to help screen *Beloved* in a comparative sense. In addition, literature review cites scientific studies on maternal bonding and trauma to substantiate the study, thus linking literary scholars and researchers. The study is also interested in existing scholarship on *Beloved*, particularly concerning motherhood, trauma, and psychology. Investigating blind spots in scientific discourse, this study provides a novel approach to the analysis of Morrison's conceptualisation of motherhood and adds to the conversation by examining maternal impulses and psychological robustness as encapsulated by the life and legacy of the mother. The research methodology seeks to achieve the following aims and objectives:

This research aims to explore motherhood in *Beloved* through a scientific lens, analyzing Sethe's maternal instincts using neuroscience, psychology, and evolutionary biology to provide a new dimension to Morrison's portrayal of maternal love and sacrifice.

**Objectives**

1. To analyze Sethe's mothering behaviour through the lens of attachment theory and neurobiology, highlighting how trauma influences maternal instincts.
2. To examine Morrison's depiction of maternal love through scientific understandings of survival instincts and emotional bonding.
3. To explore the role of evolutionary biology in shaping maternal sacrifice and protective behaviour in high-stress environments.
4. To bridge the gap between literary and scientific disciplines, offering an interdisciplinary reading of *Beloved* that moves beyond historical and feminist perspectives.
5. To contribute to the broader discourse on motherhood by integrating scientific research with Morrison's literary exploration of maternal identity and resilience.

DISCUSSION AND ANALYSIS**The Biology of Maternal Bonds in *Beloved*:**

One of Morrison's major achievements in *Beloved* is the deeply complex and emotionally intense representation of motherhood, which breaks with previous literary interpretations and digs into basic biological and psychological processes. Sethe's obsessive attachment to her children, and especially to her dead daughter Beloved, can thus be analyzed through the lens of maternal bonding biology, focusing as it does on the hormones and neuro chemicals that influence maternal bonding.

Hormonal Influence on Motherhood: How Oxytocin and Cortisol Drive Sethe's**Maternal Instincts**

Hormonal changes shape motherhood, notably the interplay of oxytocin (the love hormone) and cortisol (the stress hormone). Sethe has an intense bond with her daughter, Beloved, and when she chooses to kill her daughter to avoid enslavement this can also be explained, in part, within this neurobiological framework. Oxytocin is critical for maternal bonding, enhancing feelings of love, trust and protectiveness. Oxytocin is released during childbirth and breastfeeding and at times of intimate emotional connection. Sethe's profound bond with Beloved long before she is born reflects the biological urge of oxytocin to form an exclusive and intense maternal attachment. Sethe remembers her close bond with Beloved before she was born: "Beloved, she, my daughter. She mine" (Morrison 200). Whereas cortisol is the main stress hormone in the body. It significantly impacts maternal defence mechanisms. Studies have shown that mothers under intense stress, with high levels of cortisol, can heighten protective behaviours and react negatively to anything perceived as a threat to their child's safety. Sethe's effort to kill Beloved is an ultimate biological stress response, a maternal instinct case where in wanting to protect her child from a life that she thinks will be worse than death, she decides to kill her. The trauma of slavery intensifies this stress response, mirroring the high level of protectiveness and anxiety experienced by Sethe. Researchers have shown that a mother's elevated levels of the stress hormone cortisol under severe stress can amplify protective behaviours, resulting in extreme measures, when used with a child (Feldman et al. 2010).

This examination of biologically driven maternal attachment is part of a larger conversation in literature, one that spans novels as diverse as Charlotte Perkins Gilman's *The Yellow Wallpaper* and Maya Angelou's *I Know Why the Caged Bird Sings*, about the unrealistic pressures and burdens imposed on women, especially mothers, by a system that sees them as other, knows no rational barriers. Oxytocin creates an unbreakable bond between Sethe and Beloved; cortisol-induced stress responses drive her ferocious protectiveness. Not only does Morrison's novel offer a literary examination of maternal love and sacrifice but its themes fit into the body of scientific knowledge on motherhood, thus making *Beloved* a rich text for interdisciplinary study. Oxytocin creates an almost indelible bond between Sethe and Beloved, while cortisol-triggered stress responses fuel her fierce protectiveness. She argues that Morrison's novel is a literary representation of maternal love and sacrifice that aligns with scientific models of motherhood, and therefore *Beloved* is a text ripe for interdisciplinary study.

**Lubna Tabassum and H.M. Arif****The Neuroscience of Protection: How Sethe's Brain Processes Fear and Survival, Leading to Her Extreme Actions:**

One of the most controversial and turning points in the novel is Sethe's killing of her daughter to spare her from being sold into slavery. While this act has been widely criticized from literary, historical, and psychological perspectives, the same can be argued from the neurosciences, specifically the way the brain responds to fear, trauma, and the fight-or-flight response. Sethe's behaviour can be understood as a neurobiological response to extreme stress from the brain's amygdala, prefrontal cortex, and stress-relieving hormones. The amygdala, a small almond-shaped brain structure, is the one that reacts to fear, threat recognition, and emotional response to danger. Neuroscientific research indicates that trauma survivors, especially those who have been exposed to long-duration fear (such as enslaved individuals), generally have an overactivated amygdala (Van der Kolk 83).

In *Beloved*, Sethe's entire existence is characterized by trauma and fear, particularly after having escaped from Sweet Home, the house where she was enslaved. The mere sight of a schoolteacher approaching her triggers her amygdala, which likely triggers an automatic response to survival beyond the domain of reason. This is consistent with what scientists call "amygdala hijacking", whereby the brain reacts to extreme stress by engaging primitive defence mechanisms without leaving time for rational thinking (Goleman 17). Sethe describes her motivation as being instant and instinctive: "And if she'd gone back to Sweet Home, she'd have to be there with the men without skin" (Morrison 192). This is the way her phobic mind conceptualizes slavery as being worse than death, and that is what causes her to react with the protective instinct to save Beloved at all costs. Prefrontal cortex (PFC) enables reasoning, planning over a long duration, and impulse control. Ideally, it governs emotional responses based on consequences and alternatives. Severe stress and trauma lead to the prefrontal cortex shutting down, and the amygdala takes control (Arnsten 410). Sethe's action to kill Beloved would appear irrational, but neurobiologically, she is unable to think clearly under the intense flight response that comes with the approach of the schoolteacher. There is evidence suggesting that mothers having been subjected to severe trauma have a tendency to overestimate threats to their children, and as a consequence, this could produce hyper-protective or inappropriate defensive behaviour (Yehuda et al. 406).

This is also highlighted later when Sethe thinks about her decision, still holding onto the fact that it was the best way to save Beloved. Her mind is in trauma-survival mode and thus cannot feel regret or other alternatives. Sethe's response to the threat of being recaptured is a textbook example of the fight-or-flight response, a physiological mechanism that serves to assist organisms in defending themselves against injury. The fight-or-flight response, controlled by the sympathetic nervous system, triggers the release of hormones such as adrenaline and cortisol, which prepare the body to battle against or flee from a threatening stimulus. In the case of Sethe, rather than flee, she chooses to "fight" in a way that will never let Beloved know about slavery. This follows evolutionary models of maternal defence, where mothers living under stressful conditions often employ drastic defensive measures in protecting their offspring (Hrdy 276). Morrison sums up Sethe's point of view in dire language: "She had to be safe and I put her where she would be" (Morrison 200). The cortisol surge from stress would have probably fuelled her hyper-protection, bringing on an impulsive, permanent decision.

Sethe's fearful maternal instincts are contrasted with other literary representations of fervent maternal protection. Charlotte Perkins Gilman's *The Yellow Wallpaper* explores the neurological effects of postpartum depression, demonstrating how hormonal imbalance distorts a mother's perception of reality. Margaret Atwood's *The Handmaid's Tale* is a dystopian regime where mothers are biologically conditioned to protect their children, even if it means rebelling against oppressive regimes. Like Sethe, Atwood's heroine is afflicted with heightened amygdala activity due to chronic oppression and fear.

Sethe's actions in *Beloved* may be described not merely as a psychological or moral collapse but as a reaction to trauma, explainable scientifically. Amygdala processing of fear, weakening of the prefrontal cortex by stress, and the fight-or-flight response are all implicated in her hyper-maternalism. Through the application of neuroscience to literary critique, Morrison's novel may be read not merely as a historical and emotional record but as a study of the effects of trauma in reorganizing the brain.

**Lubna Tabassum and H.M. Arif****Breastfeeding, Nourishment, and Symbolism: The Biocultural Role of Milk in *Beloved*:**

In Toni Morrison's *Beloved*, breastfeeding plays a significant role. Not only this act is biological but it is a rich symbolic one which contains itself emotions such as love, loss and control. The use of breastmilk by Morrison focussed keen attention on the relationship between a mother and her child and also when it comes to slavery it becomes furious destruction of the maternal bond. In the novel, nursing transcends physiological needs, becoming a site of both emotional closeness and traumatic rupture.

Physiologically, breastfeeding enhances mother-child attachment through the release of oxytocin, a hormone that enhances attachment and emotional balance. Modern neuroscience confirms that early care by the mother, particularly through breastfeeding, has long-term effects on an infant's neurological and emotional development. "Breastfeeding regulates stress responses in the mother and child and thus enhances a secure attachment that develops cognitive and emotional resilience" as explored in the studies by Ruth Feldman and James F. Leckman. The determination of Sethe to give her children breast milk even when she is suffering shows her natural tendency to ensure their survival and emotional well-being. This attachment is, however, brutally severed by the inhuman practices of slavery, where mothers are typically separated from their children, thus denying them crucial acts of comfort and nourishment. Morrison redefines breast milk as love and loss, symbolizing Sethe's most fundamental act of motherhood. Sethe in the novel remembers when the schoolteacher's nephew forcibly "took her milk" is a violation for a mother. This action was a dehumanizing experience as a slave for Sethe and it also endures reproductive potential that was manipulated by the employers of Sweet Home. From a psychoanalytic perspective, Sethe's preoccupation with this loss proves an unresolved trauma, a moment of absolute helplessness that recurs throughout the novel. The theft of her milk is more than a bodily violation of her body—it is a violation of her sense of self as a mother.

The novel also evokes the trauma of forced separation and its effects on lactation, maternal health, and emotional stability. Trauma and lactation physiology studies confirm maternal stress to have severely disrupted milk production. The body's stress response, driven by cortisol and adrenaline, inhibits the release of oxytocin, thus making breastfeeding more difficult or impossible. Enslaved women, who were subjected to constant violence and uncertainty, often suffered from disrupted lactation and were compelled to wet-nurse the children of white enslavers while denied the right to nurse their infants. Morrison's narration of Sethe's inability to keep her milk in the presence of savage conditions mirrors the historical reality that many enslaved mothers went through. The inability to nurse one's child, coupled with the trauma of losing them, would have contributed to emotional distress, leading to depression, post-traumatic stress, and even psychosomatic illness.

Sethe's frantic effort to provide her children with her milk before they are taken away from her indicates her desire to have some degree of control over their destinies. Milk here is an act of agency—a clear act of maternal love in the face of the erasure of her maternal self. This is a reading that agrees with Bessel van der Kolk's trauma theory, which states that individuals who have been traumatized tend to get stuck in repetitive cycles of re-living past pain to integrate what was never integrated into conscious awareness. Sethe's compulsive recollection of the incident of the theft of her milk is a classic example, as she is haunted by the desecration of her capacity to nourish her children. In *Beloved*, breast milk is the symbol of the mothering power, yet for the violence of a system that ruptures that bond through force. Morrison's presentation is in accord with contemporary research into the psychological and physiological significance of breastfeeding, showing the devastating outcomes that ensue from its interference for both mother and child. The novel thus connects not only one woman's trauma but also uncovers the more general historical trauma that was perpetrated on slave women, whose very maternal capacities were deliberately subverted against them.

Attachment and Maternal Behaviour in *Beloved*

The novel provides a detailed examination of maternal relationships informed by experiences of trauma, the survival strategy, and the theme of loss. Using the theory of attachment, which was first formulated by John Bowlby and later refined by Mary Ainsworth, the relationships between Sethe and Denver, and Sethe and Beloved, can be examined in

**Lubna Tabassum and H.M. Arif**

terms of the psychological impact of slavery on maternal relationships. Morrison's descriptions of motherchild relationships align with empirical evidence on attachment patterns, separation anxiety, and maternal trauma's long-term effects. Attachment theory suggests early caregiver-child relationships significantly impact a child's emotional and psychological development. Secure attachment is formed when a caregiver is constantly responding to a child's emotional and physical needs, therefore establishing trust and autonomy. Insecure attachment is formed when a caregiver is inconsistent, neglectful, or emotionally unavailable, therefore leading to anxiety and dependency issues (Ainsworth et al. 23).

Denver, Sethe's one surviving child, has a special duality of security and insecurity in her attachment to Sethe. She was too attached to her mother Sethe. She never went out without her mother. This shows Denver's infancy as an absolute attachment towards Sethe. Her beautiful bonding can be seen, "She nursed Denver with a deathly urgency as though milk was all that stood between them and death" (Morrison 152). Nevertheless, this special bonding creates a sense of dependency on Denver which breaks at the end of the novel. Over time, Denver creates social isolation through the judgment of Sethe's past by the community. This engages an insecure attachment style in which Denver struggles with abandonment and self. In her teenage years, she exhibits anxious-preoccupied attachment behaviour, reaching out while also dreading the effects of Sethe's overly protective but smothering affection. "She knew her mother's fear because it was hers" (Morrison 205).

The psychological growth of Denver is greatly impaired by her over-reliance on Sethe, which denies her independence until she eventually leaves the home setting in search of help. Her growth is her progression towards attaining emotional balance. Research on children of traumatized parents, in this case, parents with PTSD and extreme emotional distress, shows that mothers who undergo such trauma may unconsciously pass on anxiety and emotional dysregulation to their children (Yehuda et al. 410). Denver's attachment problems are in line with research on intergenerational trauma where children of trauma survivors become overly sensitive to emotional pain. Unlike her bond with Denver, Sethe's bond with Beloved is characterized by guilt, unresolved mourning, and excessive love. Attachment theory holds that separation anxiety arises when a child is suddenly taken from a caregiver and thus experiences distress and disruption in attachment (Bowlby 56). The appearance of Beloved as a ghost symbolizes Sethe's failure to cope with her mourning, resulting in a disrupted pattern of attachment.

When Sethe becomes aware of Beloved's ghostly life, she becomes highly emotionally invested, trying to repay the love she has stolen: "Beloved She, my daughter. She mine" (Morrison 236). Sethe's preoccupations with the ghost of Beloved lead her to abandon Denver, thus compromising her ability to provide proper maternal care. Over-attaching is characteristic of disorganized attachment, a condition common in mothers who have experienced extreme trauma. Sethe's fervent dedication to Beloved aligns with studies on postpartum depression and maternal guilt, which suggest that mothers who experience extreme loss or trauma often practice overcompensation in future relationships (Feldman 273). This explains Sethe's behaviours of offering Beloved the best sustenance, exhausting her resources to feed her, and eventually becoming emotionally attached to her. The novel suggests that maternal guilt, coupled with historical trauma, can lead to dangerous relational patterns, as seen in Sethe's inability to release Beloved, which leads to emotional and physical deterioration.

Through the relationship between Denver and Beloved, and Sethe and Beloved, Morrison probes the neuroscience and psychology of maternal attachment, especially within trauma-induced situations. As Denver's attachment process moves from dependence to autonomy, Sethe's attachment to Beloved is still mired in guilt and unresolved loss. Through the confluence of attachment theory, neuroscience, and psychology, Morrison's novel makes the understanding of motherhood both a biological imperative and a multifaceted emotional process determined by history and trauma deeper.

The Neuroscience of Maternal Grief and Trauma in *Beloved*:

Grief, especially maternal grief, is a complex emotional response involving the amygdala, prefrontal cortex, and anterior cingulate cortex. According to O'Connor, "Neuroscientific research indicates that the amygdala, prefrontal

**Lubna Tabassum and H.M. Arif**

cortex, and anterior cingulate cortex process loss and emotional distress" (O'Connor 20). Keizer analyses, "The amygdala, responsible for emotional control and threat evaluation, is hyperactivated in bereaved mothers, leading to heightened fear and anxiety" (Keizer et al. 678). According to Freed, "The prefrontal cortex, responsible for rationality, struggles to control these emotions, resulting in poor decision-making and additional distress" (Freed et al. 302). The scholar Shear's empirical study established that "Mothers experiencing child loss may exhibit symptoms similar to PTSD" (Shear et al. 103). Such a condition is commonly known as Prolonged Grief Disorder (PGD) in that the brain is unable to adjust to loss, thereby leaving the person in a continuous pattern of pain and bereavement (Prigerson et al. 556). Sethe's obsession with Beloved, whom she acknowledges as both a dead daughter and haunting presence, is a manifestation of this neuropsychological impact since she is emotionally stuck in her past and does not have any closure for the trauma.

Sethe's Psychological Breakdown: Prolonged Grief Disorder and PTSD:

Sethe's mental deterioration in *Beloved* is very similar to the symptoms of PTSD and PGD. PTSD is dominated by hypervigilance, flashbacks, dysregulation of emotions, and an inability to let go of traumatic memories (Van der Kolk 225). Sethe is constantly reliving the trauma of having her daughter killed, unable to detach from the horror and feelings of guilt over the incident. Her interactions with Beloved, both ghostly and real, indicate her shattered sense of reality, one of the symptoms common in victims of trauma (Herman 74). Neuro-scientifically, post-traumatic stress disorder (PTSD) disrupts normal thought patterns by altering brain chemistry. Long-term hippocampal damage, caused by overproduction of cortisol, or the stress hormone, leads to memory consolidation (McEwen 179). This effect may be the reason why Sethe is trapped in the past, and she cannot construct a coherent present or imagine a future. Her fixation on Beloved is a survival coping strategy, one that reinforces trauma rather than healing. Sethe's interaction with Beloved is influenced by oxytocin, the hormone responsible for maternal bonding. According to the study by Taylor, "mourning can disrupt oxytocin regulation, leading to compulsive maternal behaviour and refusal to release the dead child"

(Taylor et al. 381). Sethe's physical and psychological decline can be viewed as a neurobiological aftermath of unresolved maternal mourning, where love, loss, and trauma become entangled in destructive configurations. Morrison's novel explores the neuroscience of maternal mourning, explaining how child loss affects brain function and emotional balance. Empirical research in PTSD, PGD, and maternal responses to stress underpin Sethe's trauma. The novel highlights that maternal mourning is a neurobiologically entrenched phenomenon that shapes identity, memory, and perception.

FINDINGS

Toni Morrison's *Beloved* amalgamated literary devices with biology, psychology and neurological perspectives. Morrison with her character tries to demonstrate how the bond of a mother and her child is biologically and psychologically interwoven, and when some violence is there, it disturbs and influences the relationship between the mother as well her child. Then naturally mothers are compelled to protect and sacrifice themselves for their children at times of danger. This research demonstrates that Morrison's concept of motherhood is consistent with what we now know from science but with the added understanding of the intricate life of Sethe. *Beloved* offers a rich examination of the psychological and physiological components of motherhood, blending historical trauma with the biological and affective dimensions of mother-child relations. Morrison's description of Sethe as a mother accords with contemporary scientific accounts of maternal attachment, fight-or-flight, and trauma response. The novel provides a rare opportunity to understand motherhood from the perspectives of neuroscience, psychology, and evolutionary biology with science and literature intertwined.

- The novel emphasizes the role of oxytocin, the "love hormone," in establishing maternal attachment, which accounts for Sethe's strong emotional bond with her children.

**Lubna Tabassum and H.M. Arif**

- The release of cortisol and adrenaline under stressful situations enhances maternal protective behaviours, thereby influencing Sethe's instinctive protective nature to protect her children from harm.
- Brain development research in early childhood supports the idea that Sethe's frantic attempts to save her children are biological maternal instincts.
- Evolutionary biology suggests that maternal sacrifice is a survival strategy inherent in species behaviour, thereby explaining Sethe's drastic act of killing Beloved as a survival mechanism.
- Sethe's behaviour is aligned with evolutionary psychology studies that state that mothers throughout history have preferred death over witnessing their children perish.
- The novel depicts the mother's urge to eliminate threats sensed, however extreme, and we are reminded of survival methods employed by most other creatures.
- Morrison transcends the mere nutritional value of breast milk, employing it as a metaphor for love, power, and the fundamental mother-child bond.
- Sethe's desperate hunger to nourish her children aligns with empirical research emphasizing the developmental and psychological benefits of breastfeeding.
- Scientific studies of lactation and stress support that maternal suffering and separation negatively impact milk production, thus highlighting the physiological impact of slavery on enslaved women.
- Research on prolonged grief disorder and maternal PTSD account for Sethe's hallucinations, dissociation, and disintegration following Beloved's death.
- Research in neuroscience reveals that extreme grief alters the brain's limbic system, thus making Sethe's obsession with Beloved a manifestation of unresolved trauma.
- Sethe's belief in the return of Beloved aligns with neurological hypotheses explaining why grieving mothers tend to perceive their dead children as tangible beings.

CONCLUSION

The novel *Beloved* is also scrutinized through biological, neurological, and psychological models of motherhood. It also reveals how chemicals like oxytocin foster close bonds between mothers and their babies and how stress hormones like cortisol and adrenaline activate defensive mechanisms. Science demonstrates that mother-child bonding and parental sacrifices are connected to brain function because maternal emotions are adaptations of child-protective survival systems. Oxytocin release strengthens emotional ties, and extreme stress in risky circumstances might lead to extreme behaviours like Sethe killing Beloved instead of letting her die. Attachment theory explains Sethe's relationships with Beloved and Denver. Sethe's relationship with Beloved is characterized by trauma history and blame, which make her almost intensely committed when Beloved returns. Her relationship with Denver is not easy at the beginning due to Sethe's emotional issues, but Denver's eventual independence illustrates that healing and secure attachment can be possible. Morrison describes motherhood in language that aligns with scientific studies of mourning, memory, and maternal behaviour. According to neuroscience research, prolonged grief alters the chemistry of the brain, causing Sethe to perceive unreal objects and feel tormented by Beloved. As demonstrated by Morrison, "Memory plays a significant role in the suffering and survival of bereaved mothers". She portrayed the psychological battle of Sethe and also supported her by pouring community interference importance in one's life. At the end of the novel Morrison's highly influential act is that social support is very crucial for making life easy and it also reduces fighting trauma.

Recommendation for Future Research

Applying neuroscience and psychology in literary analysis allows a deeper understanding of characters' motivations, emotional responses, and behaviours. By examining *Beloved* through these scientific lenses, maternal instincts, trauma, and grief can be analyzed beyond traditional literary themes, offering insights into brain function, hormonal influences, and psychological distress. Scientific investigation of maternal impulses in literary works can reveal themes of attachment, protection, and sacrifice in mothers. Neuroscientific and psychological theories can explain

Lubna Tabassum and H.M. Arif

characters' actions. Examining the interaction between biology and trauma in Morrison's novels can help us understand how trauma affects memory, identity, and emotional fortitude. Further investigation of hereditary pain and survival processes can be achieved by examining the physiological and psychological impacts of trauma on Morrison's characters.

ACKNOWLEDGEMENT

I thank the Chancellor and Vice-Chancellor, Integral University, the Dean of the Faculty of Humanities and Social Sciences and the Dean of the Faculty of Doctoral Studies and Research, Integral University, for their constant support. I would like to express my thanks to my supervisor Dr. H. M. Arif. His openness to offer excellent insight and the direction and tools needed to finish my work has been crucial to shedding light on my path to advanced learning. My MCN is IU/R&D/2025-MCN0003572.

ABSTRACT

Microbial aerosolization during implant procedure potentially results in cross-contamination & transmission of infectious agent to operator & patient. How far these aerosol spread and cause contamination has become a growing concern. The present study aims to determine the effect of 0.2% CHX and 5% Neem on a pre-procedural mouth in reducing noble bacterial count in bioaerosol and colony forming at blood agar plates. The study is a randomized controlled trail included 21 systemically healthy patients undergoing implant placement. Patients were divided into three groups. Group I (CHLORHEXIDINE RINSING - rinsed with 10 ml 0.2% Chlorhexidine), group II (NEEM SOLUTION-rinsed with 10ml neem solution) and Group III (CONTROL - no mouth rinse)The blood agar plates were placed at specific distance from the patient and the aerosols produced during implant procedure were collected on blood agar plates and were sent for culture to check for colony forming units obtained at different plates at different distance. The present study showed neem mouth rinse can be used as a herbal alternative to chlorhexidine mouth rinse and is effective as pre-procedural mouth rinse in decreasing bacterial load in bioaerosol produced during implant therapy

Keywords: Bio aerosol, Chlorhexidine, Neem solution, Contamination, Dental Implants, Respiratory impairment, Blood agar culture.

INTRODUCTION

The Oral cavity is naturally wet and contains a high number of microorganisms. Despite that, there is a lack of precision around what is known and unknown regarding aerosol generation in dentistry and the possibility of a wish to the patient and the dental team. It can be shared where transmission may occur from patient - to - patient, patient-to-clinician, or clinician-to-patient. All the procedures in the dental clinic involve working high-speed devices with compressed air and water, which produce splatter and Aerosol [1]. Aerosol is a Suspension of solid or liquid particles containing microorganisms like bacteria and viruses in the air for a few minutes. Microbial aerosolization during the implant procedure potentially results in cross-contamination and transmission of infectious agents to the operator and patient [2]. Different methodologies, materials, and antimicrobial agents have been advocated to minimize microbial cross-contamination in the dental office. A few recommendations include immunization of dental staff, decontamination of surfaces, sterilization of instruments, use of personal protective barriers, and the use of pre-procedural mouthwashes. Chlorhexidine (CHX) is reviewed as the gold standard in limiting oral biofilm growth and reducing microbial spread due to its broad antibacterial spectrum and substantivity of 8 to 12 hours. There is a recent trend in the use of herbal mouthwashes. Neem has been traditionally used for the treatment of inflammation, infection, fever, skin diseases, and dental problems [3,4]. Neem leaves have also been reported to possess antihyperglycemic, immunomodulatory, anti-inflammatory, antimalarial, antioxidant, antiviral, antimutagenic, and anticarcinogenic properties. Neem exhibits antibacterial, antifungal, hepatoprotective, anti-ulcer, and anti-nociceptive activity. The present study uses self-prepared neem mouthwash to reduce viable bacterial count in bioaerosol implant patients. To the best of our knowledge, studies have only been done on aerosol production during ultrasonic scaling and other high-speed devices employing water sprays, not implant treatments [5]. This study, therefore, presents a novel approach by evaluating and comparing the effect of chlorhexidine mouthwash and neem mouthwash as a preprocedural mouth rinse on bioaerosol production in patients undergoing implant therapy through clinical and microbiological analysis [6,7].

REVIEW OF LITERATURE

1. **Malhotra R et al.** [2011] Natural herbs like neem, tulsi, pudina, clove oil, ajwain, triphala, and many more have been used for ages to combat oral health problems like bleeding gums and tooth decay. A study compared the efficacy of a herbal mouthwash (Herboral) with Chlorhexidine Gluconate, a gold standard anti-plaque agent. Herbal mouthwash was found to be a potent plaque inhibitor, although less effective than Chlorhexidine Gluconate. However, it can be a good alternative for patients with special needs like diabetics
2. **Prasad MGS et al.** [2012] aimed to determine the effectiveness of pre-procedural rinsing with chlorhexidine in reducing bacterial aerosol contamination during the use of an ultrasonic scaler. It also compared the efficacy of water, non-tempered chlorhexidine, and tempered chlorhexidine as pre-procedural rinses. 30 healthy patients were divided into three groups. Group III and II had significantly reduced colony-forming units compared to Group I, while Group III was more effective than Group II. In conclusion, pre-procedural rinsing can significantly reduce dental aerosol microbial content, and tempered chlorhexidine is more effective than non-tempered chlorhexidine.
3. **Shetty SK et al.** [2013] compared the effectiveness of chlorhexidine digluconate and tea tree oil mouthrinses in reducing bacteria in aerosol particles during ultrasonic scaling procedures. All mouthwashes significantly reduced the amount of bacteria, but chlorhexidine was more effective. Using an antimicrobial mouthwash before dental procedures can lower the risk of cross-contamination in the dental operatory.
4. **Selvakumar R et al.** [2017] compares the benefits of herbal mouthwashes to chlorhexidine mouthwash. Herbal extracts like chamomile, neem, and turmeric are effective in controlling plaque and reducing gingivitis, and many herbal mouthwashes have anti-microbial, anti-inflammatory, and anti-oxidant properties. However, chlorhexidine is more effective than herbal mouthwashes in treating gingivitis, periodontitis, and trauma.

**Pranjal Gaba and Shalini Kapoor**

Herbal mouthwashes are suitable for maintaining good oral prophylaxis and programs should be conducted to raise awareness about the benefits of mouthwashes in oral hygiene.

5. **Dhanya RS et al.** [2017] evaluated the impact of neem mouthwash on plaque and gingivitis. The clinical trial involved 40 participants who were randomly allocated into two groups. The first group was given 0.2% chlorhexidine gluconate, and the second group was given 2% neem mouthwash. The results showed that there was a slight reduction in plaque levels in both groups, and both groups showed a reduction in the gingival index (GI) scores. The study concluded that neem mouthwash is a cost-effective and easily available alternative to chlorhexidine mouthwash for maintaining oral hygiene
6. **Marui VC et al.** [2019] examined the effectiveness of preprocedural mouthrinses in reducing the number of microorganisms disseminated through dental aerosols during procedures. The authors included 13 randomized clinical trials that evaluated the efficacy of various mouthrinses. Meta-analysis of the data showed that mouthrinses containing chlorhexidine, essential oils, and cetylpyridinium chloride significantly reduced the number of colony-forming units (CFU) in the dental aerosol. In conclusion, preprocedural mouthrinses could be an effective way to reduce the spread of microorganisms in dental offices during certain procedures.
7. **Vishwakarma P et al.** [2020] conducted this study to compare the antibacterial effectiveness of an indigenous herbal mouthwash with 0.2% chlorhexidine gluconate to treat oral diseases. Disc diffusion and minimum inhibitory concentration methods were used for in vitro evaluation and a clinical trial was conducted among 30 participants. Plaque and gingival index assessments were carried out on the 7th, 14th, and 21st days. Results showed that both treatments resulted in a significant reduction in clinical and microbiological parameters. However, chlorhexidine mouthwash was more effective in controlling plaque and gingivitis.
8. **Warad S, Bhatagunaki RV.** [2021] aimed this study to compare the effectiveness of two mouthwashes containing Chlorhexidine and Octenidine with distilled water, as pre-procedural rinsing agents in reducing the bacterial load of the aerosol produced by an ultrasonic scaler. Sixty subjects were randomly divided into three groups. Group 1 used distilled water, Group 2 used 0.2% Chlorhexidine, and Group 3 used 0.1% Octenidine. The aerosols were collected on agar plates, which were sent for Colony Forming Unit (CFU) count. The mean CFU was highest in Group I, followed by Group II and Group III. In this study, 0.1% octenidine was found to be the most effective pre-procedural mouthwash in reducing the bacterial load in the aerosol produced during ultrasonic scaling.
9. **Varghese CM et al.** [2021] aimed to compare the effectiveness of different mouthwashes in reducing bacteria in aerosol produced during ultrasonic-scaling procedures. Patients were divided into four groups: A (Neem mouthwash), B (commercial CHX mouthwash), C (Triphala mouthwash), and D (control group). Patients in A, B, and C rinsed their mouth with 10 ml of the designated mouthwash before the procedure. Aerosol samples were collected, cultured, and incubated on blood agar plates, and CFU were counted. The study concluded that Neem mouthwash was more effective in reducing aerosol contamination than Triphala mouthwash or commercial CHX mouthwash.
10. **Mohd-Said S et al.** [2021] aimed to evaluate the effectiveness of pre-procedural mouth rinsing in reducing aerosol contamination in dental settings while performing periodontal prophylaxis. The review identified 56 effective studies, 30 of which were randomized control trials involving 984 participants aged 18-70. Various mouth rinses were tested, with chlorhexidine being the most frequently used. Despite variations in rinsing concentration, volume, and duration, all studies identified significant reductions in bacterial contamination. Chlorhexidine was found to be the most effective agent, with over half of the studies reporting a reduction of over 70% in bacterial contamination. The study supports the use of pre-procedural mouth rinsing with chlorohexidine or other agents to reduce aerosol contamination when performing periodontal prophylaxis.

Aim and Objective

1. This study aims to determine the potency and efficacy of 0.2% chlorohexidine in reducing viable bacterial count in bioaerosol during pre-procedural Mouth rinsing in patients undergoing implant therapy.
2. This study aims to determine the efficacy of 5% self-prepared neem mouthwash in reducing viable bacterial count in bioaerosol in patients undergoing implant therapy.

**Pranjal Gaba and Shalini Kapoor**

3. To Compare and evaluate the efficacy of neem mouthwash and Chlorhexidine in reducing viable bacterial count in bioaerosol in implant patients. The present study aims to determine the effect of 0.2% CHX and 5% Neem on a pre-procedural mouth in reducing noble bacterial count in bioaerosol and colony forming at blood agar plates [8].

MATERIAL AND METHOD

The study is a randomized controlled trial. A total of 21 patients who had to undergo implant placement will be selected based on specific inclusion and exclusion criteria from the Department of Periodontology and Oral Implantology, Faculty of Dental Sciences, SGT Dental College, Gurugram, Haryana. The Institutional Ethics Committee approved the study. Patients were informed about the study, and informed consent was taken from the subjects selected. A complete medical and dental history of the patients selected will be recorded.⁹ Patients with a minimum 20 number of teeth and of both sexes ranging from age 30-54 years were included. Exclusion criteria will include systemically unhealthy patients, smokers, and patients who are allergic to any content of Chlorhexidine mouthwash. Inclusion criteria included systemically healthy patients. The patients undergoing implant placement were divided into three groups randomly –

- Group I: CHLORHEIXIDINE RINSING—This Group comprised 07 patients who rinsed with 0.2% chlorhexidine mouthwash—10 ML—for 30 seconds before the osteotomy drilling procedure for the implant.
- Group II: NEEM SOLUTION - The Group comprises 07 patients rinsed with approved neem solution and prepared 10 ML for 30 seconds before the osteotomy drilling procedure for an implant.
- Group III: CONTROL - The Group consisted of 07 patients who rinsed nothing.

OBSERVATION AND RESULTS

The results of graph-1 to graph-6 clearly shows that both group 1 [chlorhexidine] and group 2 [neem] mouthwash showed statistically significant reduction in mean colony forming units. When compared to group 3 [control group]. This means that pre-procedural mouth rinsing cause decrease in bacterial load of bioaerosol in patient undergoing implant therapy. However when group 1 [chlorhexidine rinsing] was compared with group 2 [neem group] both the groups showed decrease in mean colony forming units but the difference may not statically significant. Although these was a numeric increase in colony forming units at site 1 and site 3. When compared to chlorhexidine, but was statistically insignificant. So, neem mouth rinse can be used as a herbal alternative to chlorhexidine mouth rinse and is effective as pre-procedural mouth rinse in decreasing bacterial load in bioaerosol produced during implant therapy.

DISCUSSION

The osteotomy procedure during implant placement produces a large amount of bioaerosol, which is disseminated to a considerable distance. Basu *et al* [10]. studied aerosol-related symptoms in dental hygienists, specifically during ultrasonic scaling. The symptoms, such as nasal irritation, persistent cough, and dry skin, were seen more commonly in dental hygienists than in other non-operating staff. Aerosol, hence, acts as a medium for infectious agents. The American Dental Association has advocated that potentially contaminated aerosols should be controlled during dental procedures. Using 0.2% Chlorhexidine mouthwash as a pre-procedural mouth rinse by patients in the test group reduced the colony-forming unit where the operator and assistant worked [11]. This finding may result from the antibacterial and antiseptic properties of the mouthwash to inhibit microbial growth. Shetty SK *et al.* compared the efficacy of different preprocedural Mouth rinses in reducing viable bacterial count and concluded that Chlorhexidine was superior to the other commercially available mouth rinses [12]. In the present study, Chlorhexidine was thus employed as the preprocedural mouthlines. It was well seen statistically that the highest and most significant reduction in CFU count was seen at Site 1, Site 2, and Site 3. i.e., at the site of the patient's chest level

**Pranjal Gaba and Shalini Kapoor**

and the level of the spittoon, both the areas in which the dental operator and assistant work. Therefore, they are at significant risk of cross-contamination. The patient in the test group used neem mouthwash as a pre-procedural mouth rinse, reducing the colony-forming unit in the area where the operator and assistant were working. Neem extract is an effective mouth rinse before implant placement [13]. The extract also inhibits the growth of pathogenic bacteria, making it helpful in reducing the bacterial load in periodontitis patients. Neem has antimicrobial, anti-inflammatory, and antioxidant properties that provide additional benefits.

The study found that group A (0.2% CHX) and group B (neem mouthwash) significantly reduced bacterial CFU. However, group C (control) did not show any significant results, consistent with a previous study by Ammu A. et al. (2019) [14]. The CFU was found to be maximum in the patient's chest area, followed by the operator's chest area, which agrees with the study by Rani et al. (2014) but contradicts the finding of Purohit et al. (2009). CHX mouthwash and neem mouthwash for 30 seconds before a dental procedure has been found to significantly reduce bacterial load and contamination of the operative area and staff. While CHX is effective against planktonic microbes in saliva and mucous membranes, it is not without its side effects. The study by Gupta et al. (2014) found that CHX 0.2% mouthwash and neem mouthwash were more effective than the control group. They concluded that CHX is superior to herbal mouthwash as a preprocedural rinse [15]. Our study contradicts Gupta *et al.*'s findings regarding better aerosol bacteria reduction with CHX and herbal mouthwash. However, unlike their study, we did not find a significant difference between CHX and herbal mouthwash, consistent with an earlier study by Rani *et al.* (2014). Neem mouthwash showed equally efficacy when compared to chlorhexidine. The study's limitations include the CFU counted were the bacteria suitable for growing on blood agar; organisms apart from that were not included and could be a source of potent contamination. The strain of the bacteria responsible for cross-contamination could not be investigated. The study did not include viruses, fungi, and other bacteria requiring specialized medium. A sample size of only 21 patients was taken, which is a small sample size and could be increased. An easy and operator-patient-friendly measure to compact the cross-contamination should be employed at any cost [16]. Using 0.2% Chlorhexidine and neem mouthwash as a pre-procedural mouth rinse by patients in the test group reduced the colony-forming unit where the operator and assistant were working. This finding may result from the antibacterial and antiseptic properties of the mouthwash to inhibit microbial growth. The highest and most significant reduction in CFU count was seen at Site 1 (chest level), site 2 (spittoon), and Site 3 (dental chair tray). Thus, preprocedural rinse should be employed daily to prevent cross-contamination infection and bioaerosol production in implant patients, as prevention is better than cure [17]. Neem mouthwash is an herbal alternative to chlorhexidine mouthwash to reduce bioaerosol production.

CONCLUSION

Many microorganisms, like bacteria and viruses, reside in the oral cavity. As a result, regular dental procedures increase the risk of exposure to these microorganisms. A recent study has shown that the patient and the dentist are exposed to many microorganisms during simple procedures like ultrasonic scaling. However, we can minimize this risk by using pre-procedural mouth rinses. Our study emphasizes the importance of using pre-procedural mouth rinses to reduce the microbial load for patients and for dentists to use personal protective equipment while carrying out dental procedures to prevent cross-infection. Therefore, pre-procedural rinsing should be considered mandatory in all dental clinics along with other barrier techniques. However, herbal substitute i.e. neem mouthwash was equally effective as chlorhexidine in reducing bacterial load in aerosol.

Summary

The oral cavity is home to various microorganisms, such as bacteria and viruses. This means that routine dental procedures can increase the risk of exposure to these microorganisms. A recent study has demonstrated that patients and operators are exposed to a sizeable microbial population during dental implant procedures. However, this microbial load can be decreased by practicing pre-procedural Mouth rinsing. The study highlights the importance of

**Pranjal Gaba and Shalini Kapoor**

using personal protective equipment by the operator during dental procedures to prevent cross-infection. Along with other barrier techniques, pre-procedural rinsing should be incorporated as a compulsory practice in all dental setups to prevent the spread of infection.

ABSTRACT

In today's world, various factors contribute to the rise of serious diseases, with heart disease being one of the most dangerous. Educating the public and raising awareness about heart health have become essential for improving overall well-being. Risk factors such as diabetes, physical inactivity, obesity, and hypertension significantly increase the likelihood of heart disease. Machine learning is transforming healthcare by enabling precise data analysis, identifying patterns, and effectively managing risks associated with these conditions. In this study, we attempt to elaborate on the important role of machine learning algorithms in identifying and analyzing the key risk factors for heart disease in the healthcare industry. We have used real-time dataset consisting of 13 parameters related to heart disease. Machine learning approaches were applied to extract valuable insights from dataset and enhance the accuracy of diagnoses. This paper proposes a model to accurately predict the likelihood of heart disease based on risk factors such as age, systolic blood pressure, and obesity. We implement and compare the accuracy of different machine learning algorithms, including Decision Tree, Random Forest, K-Nearest Neighbor, Naïve Bayes, and XGBoost, to determine the most effective approach for predicting heart disease risk.

Keywords: Heart disease, Risk factors, Machine learning algorithms, Data analysis, Diagnosis

INTRODUCTION

Millions of individuals suffer from heart disease worldwide. This disease is a serious health problem. The World Heart Report 2024 compiled by WHF highlights the impact of environmental risk factors on cardiovascular health. In 2019, of the 4.2 million fatalities worldwide 70% that were ascribed to ambient air pollution were brought on by 1.9

96302

**Roshani Atar et al.,**

million deaths from Ischemic Heart Disease (IHD) and 900,000 deaths from stroke [1]. Heart disease is the primary cause of death in both men and women; this disease is also known as cardiovascular disease (CVD). CVDs impact the heart, blood vessels, blood, and other organs of the body. It can be caused by metabolic, socioeconomic, genetic, and environmental risk factors. According to the World Heart Federation (WHF), 35% of women's deaths occur in each year due to CVD. Because of misunderstanding and ignorance, women with CVD are still under diagnosed and undertreated. Most people think heart disease occurs suddenly, but they even don't know it starts from their unknowingly bad habits, unhealthy eating things, poor lifestyle, and so many problems. Heart disease is classified into various types of diseases are coronary, rheumatic, myocarditis, atherosclerosis, angina, congenital, cerebrovascular, and arrhythmia [2]. World Health Organization (WHO) reported recently hypertension (raised blood pressure) is the major risk factor for death and disability. By 2018, the promotion of health and well-being in the WHO European region saw 20% premature death decline because of CVDs. Heart disease symptoms are identical in both men and women. Some of them are very common to feel like chest pain, sweating, nausea, coughing, shortness of breath, jaw pain, numbness in hands and fingers, omitting, feeling dizzy and some of them are hidden symptoms like swelling in feet, memory loss and non-chest pain, etc. [3].

Risk factors are divided into modifiable and non-modifiable categories. The risk factors that change with the conditions are called modifiable risk factors. Some of them are stress, smoking, high blood pressure, obesity, diabetes, high LDL cholesterol, tobacco use, and too much alcohol intake etc. The risk factors which cannot change are called non-modifiable risk factors. Age, gender, and genetic history are the main resources for causing heart disease [4]. Mortality rate may be reduced by using early prediction and prevention of heart disease [5]. The process of identifying and diagnosing heart disease is very complicated, so in the medical field, it needs some tools to recognize and find treatment for symptoms of heart disease. Various machine learning (ML) techniques are capable of identifying and analyzing the risk factors for different heart diseases in the field of medicine. In this study the different classification methods are compared and advancement opportunities are also mentioned.

LITERATURE REVIEW

Effective prediction and classification of heart disease can be achieved using machine learning and deep learning techniques. Several research approaches for heart disease have been considered. The researcher mentioned new technologies and advancement possibilities through their research. Many researchers are focused on the causes, symptoms, and responsible risk factors of heart disease along with their prediction and analyzing techniques. In paper [5], Rezaianzadeh et al. (2023) implemented simple and multiple Cox regression with Firth's bias reduction statistical method on 9442 individuals from the South of Iran cohort study and identified age (40-70), diabetes, hypertension, male gender, and alcohol consumption are the risk factors for heart disease. The author [6], Tada et al. (2016) described the population-based survey on the Malmo Diet and Cancer study. They included 23595 participants in their study. They discovered generic risk scores (GRS) were associated with heart disease. They predicted that coronary heart disease risk from a 27-variant GRS (GRS27) to a 50-variant GRS (GRS50) was not influenced by self-reported family history.

Mohan (2019) highlighted in paper [7] and proposed Hybrid Random Forest Linear Model (HRFLM) leading to combined Naive Bayes (NB), Generalized Linear Model (GLM), Logistic Regression (LR), Deep Learning (DL), Decision Trees (DT), Random Forest (RF), Gradient Boosting Trees (GBT), and Support Vector Machine (SVM) techniques and enhance prediction accuracy to 88.7% using the UCI dataset. The researcher [8-12] used the Kaggle cardiovascular dataset having 70,000 records and predicted that age, cholesterol level, glucose level, and blood pressure were the responsible risk factors for heart disease. They employed a variety of machine learning techniques including DT, XGBoost, RF, and multilayer perceptron applied and got accuracy rates with cross validations- 86.37%, 86.87%, 87.05%, 87.28%, and without cross validations- 86.53%, 87.02%, 86.92%, 86.94% in their study [8]. Shorewala (2021) [9] found alcohol consumption, high BP, and gender are also responsible risk factors for heart disease. Got 73% accuracy after performing the DT algorithm [10] and RF, NB, KNN, and LR classifiers got 70% accuracy [11]. Out of

Roshani Atar et al.,

Linear Discriminant Analysis, LR, SVM, KNN, DT, NB, RF, and Neural Network(NN), Ouf (2021) [12]described RF(89.01%)was the best algorithm which was applied to the Kaggle and UCI dataset to predict patient having heart disease or not. In the review paper [13], De Marco et al. (2022) discussed QRS complexes in ECG signals to identify Premature Ventricular Contractions (PVC) using ML techniques without relying on cross-validation and feature extraction. They employed DT, RF, LSTM, BLSTM, ResNet-19, ShuffleNet, and MobileNetv2 algorithms and extracted 82178 images of 47 patient's data from the MIT-BIH Arrhythmia Database (MIT-BIH) dataset. In [14]ECG data from MIT-BIH arrhythmia and online PTB dataset were studied using deep learning techniques like convolutional neural network(CNN) and they calculated sensitivity and specificity were 98.33% and 98.35% in their study by Prabu Sankar et al. (2023). They got the accuracy rate for long short-term memory network (LSTM) was 95.32% and recurrent Neural Network (RNN) was98.4%. They analyzed the accuracy rate using autoencoders applied on the Framingham(97.3%) and Cleveland heart disease(96.1%).According to their study, CNN is the best technique for heart disease prediction. The cross-sectional hospital-based study was evaluated by [15]Adhikary et al.(2022) in Tanzania. The author observed the value for alcohol intake (67%), high blood pressure (59%), physical inactivity (61%), obesity (39%), alanine aminotransferase (43%), high-density lipoprotein (79%), low-density lipoprotein(65%), C-reactive protein (78%), sodium (41%) and potassium (40%) in their study. The author [16]El-Sofany et al. (2024) explored risk factors age(11.31%), old peak(11.32%), chol(11.43%) and thalach(13.65%) in their study. They used a total of 503 records from the Kaggle and UCI datasets. They have applied Naive Bayes, SVM, voting, XGBoost, AdaBoost, bagging, DT, KNN, RF, and LR classifiers on the dataset. According to them, XGBoost gave 93.17% accuracy in finding Age (40-70), diabetes, hypertension, and alcohol consumption responsible risk factors for heart disease especially in men. Researchers, in this study, evaluated several machine learning (ML) techniques, including LR, NB, SVM, KNN, DT, RF, and XGBoost, and determined that Random Forest (RF) yielded the highest accuracy based on their data[17]. In this research paper, we are going to classify heart disease based on risk factors with the help of different ML algorithms on real-time dataset. The best model will be selected through the classification accuracy, confusion matrix, and classification reports.

MATERIALS AND METHODOLOGY

Dataset and Health Parameters

We have gathered data including lifestyle habits, demographic information, and history of medical conditions examined from a survey. The feature selection process selects the data from the real-time dataset for the prediction of heart disease. The dataset consists of 300 records and 13 columns; we found some risk factors that are responsible for heart disease. We mostly focus on age, hypertension, obesity, glucose level, cholesterol level, and physical activity risk factors. Missing values from data handled through data preprocessing using statistical techniques.

Several major risk factors are leading causes of heart disease.

Age

It is a non-modifiable risk factor for heart disease. As age increases the chances of getting heart disease also increases because of arteries toughening and decreased heart proficiency. While data filtering, we have considered age values to vary between 35 to 79.

Obesity

It is a chronic and complex disease defined by excessive fat deposits that can impair health[18]. Obesity is associated with increased risk for the development of cardiovascular risk factors including hypertension, hyperlipidemia, diabetes mellitus, and heart disease itself. BMI is calculated according to the ratio of weight and height square. BMI (kg/m^2) is categorized as underweight (<18.5), normal($18.5-24.9$), overweight($25.5-29.9$), and obese(≥ 30). We removed irrelevant values at the time of preprocessing.

Glucose Level

Diabetes occurs when the body lacks insulin, causing sugar level to build up in the blood which results from insufficient insulin production or utilization. Insulin-dependent diabetes called Type 1 or juvenile diabetes [19]and non-insulin-dependent diabetes called Type 2 Diabetes Mellitus (T2DM)are characterized by impaired lipid metabolism due to insulin resistance and deficiency. Generally normal plasma glucose level is 3.5 to 6.5 and high risk

Roshani Atar et al.,

for diabetes is greater than 6.5. Patients have distinct plasma lipoprotein profiles, including high levels of apolipoprotein B-containing lipoprotein, hypertriglyceridemia, and low HDL cholesterol [20].

Hypertension

Blood pressure (BP) is measured in two ways which are Systolic BP and Diastolic BP. Systolic BP is measured when the pressure of blood flows into arteries when the heart pumps out the blood and diastolic BP is measured between heartbeats when the heart fills blood within the arteries. It can be represented by the ratio of systolic BP as upper value and diastolic BP as lower value and measured in (mm hg) units. 120/80 is the standard measurement for normal BP[10]. Systolic BP is categorized as normal (<140), borderline isolated systolic hypertension (140-159), and high BP stage (>160). Diastolic BP is categorized as normal (<85), mild hypertension (90-104), moderate hypertension (105-114), and severe hypertension (>115). High BP (hypertension) is one of the major risk factors for heart failure. Heart failure may result from the strain, which causes heart muscles to weaken and thicken. Too much intake of salt in the diet leads to the risk of heart stroke and heart attack.

Cholesterol

Cholesterol is measured in mmol/L. Normal low-density lipoprotein cholesterol (LDL-C) is less than between 2.59 to 3.34 and the high risk of LDL-C is greater between 3.34 and above 4.92.

Physical Inactivity

Lack of physical activity leads to risk of heart disease. A sedentary lifestyle matters behind the reason for diseases. Obesity, blood pressure, and inflammation negatively impact heart health.

Machine Learning (ML) Algorithms used-

By using patient records, we will try to analyze ML models based on risk factors to predict the patients in the dataset have heart disease or not. We employed various ML algorithms on the dataset and presented the result in the study report.

Decision Tree

A flowchart-like structure where each node represents a decision rule leads to classification output that predicts the severity of heart disease. This algorithm is simple and easy to interpret and handles numerical as well as categorical data.

Random Forest

This algorithm joins multiple decision trees to improve accuracy and reduce the over fitting problem. It works well with large datasets.

Naïve Bayes

The probabilistic classifiers based on the Bayes theorem that assuming independency between the features. This algorithm classifies patient symptoms into the disease categories. This algorithm is good for small dataset, so that it can be fast for real time prediction.

K-Nearest Neighbor

It is a simple algorithm that classifies a data point based on the majority class of its nearest neighbors. They have no prior assumptions about the data distribution. It is used in medical imaging and classifying patient risk levels based on similar past cases.

XGBoost classifier

If you want to improve the predictive accuracy of weak models and reduce the bias then boosting classifiers are used. In this, each new model corrects the error of the previous model sequentially.

Performance Measures-

We evaluated the performance of our model using five specific performance measures namely: accuracy, precision, specificity, recall, and F-measure.

1. Specificity: It is the ratio of the predicted negative cases that were correctly identified.

$$\text{Specificity} = \frac{TN}{TN+FP} \text{----- (1)}$$

2. Precision: It is defined as the ratio of correctly predicted positive observations to all predicted positive observations.

----- (2)

$$\text{Precision} = \frac{TP}{TP+FP}$$

3. Accuracy: It measures the ratio of correctly predicted observations to total observations.

$$\text{Accuracy} = \frac{TP+TN}{TP+TN+FP+FN} \quad \text{-----} \quad (3)$$

4. Recall: It measures how well the model identifies True Positives.

$$\text{Recall} = \frac{TP}{TP+FN} \quad \text{-----} \quad (4)$$

5. F-measure: It measures the probability that a positive prediction is correct.

$$F - \text{measure} = \frac{2 * \text{Precision} * \text{Recall}}{\text{Precision} + \text{Recall}} \quad \text{-----} \quad (5)$$

RESULT AND DISCUSSION

AUC and ROC curve helps us to compare the performance of different classifiers for the similar problems. Class0 means tested negative for heart disease and class1 means tested positive for heart disease. Our graph shows classifier correctly predicted negative cases. Built classifier model that can predict whether the patient has possibilities of heart disease or not based on the risk factors provided in given dataset. After applying all the models on processed and extracted data, we got the accuracy for NB (0.72%), KNN (0.90%), DT (0.93%), RF (0.97%), and highest accuracy for the XGBoost (0.98%). At the end of our experiment, output shows that XGBoost boosting performed well in comparison to other models.

CONCLUSION

Finding risk factors and early disease indicators for heart disease is an important part of medical field research. Early detection of heart disease is a need of today's era. After identifying the available data resources, we further selected, cleaned, and made into the desired form. Different classification techniques as stated will be applied on preprocessed data to predict the accuracy of heart disease. This research utilized machine learning approaches to identify significant risk factors for heart disease, including those identified by Random Forest (RF), Decision Tree (DT), K-Nearest Neighbors (KNN), XGBoost, and Naïve Bayes classifiers. Out of all ML algorithms, we found that the XGBoost classifier give 98 % accurate results. This research contributes to the identification and analysis of key heart disease risk factors, namely age, systolic blood pressure, and obesity. Early identification of these factors enables prompt preventive action, which can reduce the risk of serious health problems. This, in turn, improves patient outcomes, lowers healthcare costs, and enhances patient satisfaction. Future applications of ensemble machine learning techniques hold promise for achieving these goals.

ABSTRACT

Prolyl Endopeptidase (PREP) family enzymes have a major role in regulating the activity of peptides and peptide hormones, influencing processes such as learning and memory. Consequently, these enzymes are responsible for various diseases, including amnesia and depression. Prolyl peptidase (PREP; EC3.4.21.26) is a highly conserved serine protease. It cleaves peptides at the carboxyl group terminal of proline residues in small molecular weight proteins (approximately 30 amino acids). It typically does not cleave larger peptides and proteins. The peptidase domain has an α/β hydrolase fold. The catalytic triad (Ser554, His680, Asp641) is protected by a central tunnel formed by an N-terminal β propeller. This structural arrangement prevents larger peptides from entering the active site. Techniques like X-ray crystallography and enzyme kinetic analysis have provided significant insights into the structure-function relationship of these enzymes. This study employs a number of prolyl endopeptidases to develop a Multiple Linear Regression (MLR) model using QSARINS software. The model is built using molecular descriptors with minimal correlation, based on experimentally determined IC₅₀ values sourced from the ChEMBL database. A genetic algorithm is applied to select the suitable molecular descriptors for the model. The model is thoroughly validated using OECD guidelines to ensure its robustness and stability.

Keywords: QSARINS, molecular descriptors, inhibitors, Quantitative Structure-Activity Relationship, Multiple Linear Regression.

Indrani Sarkar

INTRODUCTION

Prolyl endopeptidase (PEP) is a cytosolic enzyme. It cleaves peptide bonds at the C-terminal side of prolyl residues, commonly within peptides around 30 amino acids in length. The enzyme's active site is selective, allowing only short peptide sequences to enter, which is regulated by a distinctive beta-propeller structure. In this study, we explore various inhibitors with experimentally determined IC₅₀ values sourced from the ChEMBL database (ID: ChEMBL 3202, Name: Prolyl Endopeptidase, Uniprot Accession No.: P48147, Organism: *Homo sapiens*). [1]. A dataset comprising IC₅₀ values for 697 compounds was gathered and analysed to evaluate their range and sources

Materials and Methods

The biological activity of a molecule is related to its chemical structure. Quantitative Structure-Activity Relationship (QSAR) models are used to analyze and predict relationship between a molecule's chemical composition and its biological and physicochemical properties. A variety of molecular descriptors are used to build Multiple Linear Regression (MLR) models [2,3]. QSAR models play a crucial role in predicting new compounds with potentially improved biological activity. Three-dimensional crystal structures of 265 small compounds are taken from the PubChem database. The experimental values IC₅₀ (50% inhibition concentration) are obtained from ChEMBL (Table 1). Each molecule was subjected to 1000 steps of steepest descents energy minimization using the MMFF94 force field. RMSD of potential energy reached below 0.001. Descriptor values for these molecules are calculated using PaDEL software [4]. In this analysis, IC₅₀ was taken as the dependent variable (Y), and the molecular descriptors were considered independent variables (X). Descriptors having correlation greater than 90% were discarded, Correlation analysis was performed between each pair of descriptors. Descriptors with zero values or those exhibiting the same values for 80% of the compounds were also removed. After excluding 395 data points, 521 data entries were retained for analysis. The distribution profile of the experimental data and descriptor values are shown in Figures 1, 2, and 3. A genetic algorithm in QSARINS is used to select variables for the reduced descriptor set. A training set (70%) and a test set (30%) are then created randomly from the dataset. Multiple Linear Regression (MLR) models are constructed using Ordinary Least Squares (OLS) using the QSARINS program (QSAR-Insubria). The software is provided by the University of Insubria. This was developed by Nicola Chirico [2,3] and implemented by Gramatica *et al.* [5,6,11]. the tool explores every conceivable combination of descriptors using the all-subset approach. This approach was used to generate MLR models with 1–6 descriptors. The MLR model was used to construct a linear relationship between the molecular descriptors and the biological activity IC₅₀ (half maximum inhibitory concentration). Based on their R² values, the top models were chosen.

RESULTS AND DISCUSSION

Fitting Criteria

The evaluation of the model performance involves various criteria, including R², R²_{adj}, R² - R²_{adj}; LOF, k_{xx}, k_{xy}, δk, training data, training data (MAE, RMSE, RSS, CCC), S and F. These parameters are defined as follows:

LOF = Friedman lack of fit criterion

k_{xx} = correlation found among descriptors

k_{xy} = correlation between descriptors and responses

δk = k_{xx} - k_{xy}

R² = regression coefficient

MAE = mean absolute error in fitting

MAE (tr) = mean absolute error in the training set

RMSE (tr) = root mean square error for training set

RSS (tr) = residual sum of squares for training set

s = standard error of estimate

Indrani Sarkar

CCC (tr) = concordance correlation coefficient for training set

For a robust QSAR model, an $R^2 > 0.6$ is considered acceptable. The R^2 tends to increase with the addition of more descriptors, while R^2 (adj) improves with the inclusion of relevant variables. Importantly, R^2_{adj} will always be less than or equal to R^2 . The LOF should ideally be less than 0.4, and the F-value should be high [7]. A low value for k_{xx} is preferred, indicating weak correlation among descriptors. Additionally, the difference $k_{xy} - k_{xx}$ should be smaller than a threshold value δx [8,9]. The CCC (tr) should be high and close to 1, indicating good correlation between the expected and observed values. Moreover, RMSE values of training and validation should be similar to ensure consistency of the model.

Fitting criteria of Model MLR1 $R^2 = 0.7399$ R^2 (adj) = 0.7312 $R^2 - R^2$ (adj) = 0.0087 LOF = 0.4777 $K_{xx} = 0.2517$ Delta $K = 0.0965$ RMSE (tr) = 0.6466 MAE (tr) = 0.4916 RSS (tr) = 77.7645 CCC (tr) = 0.8505 $s = 0.6591$ $F = 84.8691$

Internal Validation

Iterated cross-validation methods are used to evaluate the model's dependability. The cross-validated correlation coefficients. Q^2 (LOO) and Q^2 (LMO), are calculated the Leave-One-Out (LOO) and Leave-Many-Out (LMO) methods. In the LOO procedure, the model is iteratively built by taking one compound out of the dataset of descriptors. After the model is trained on the remaining data, a prediction is made for the omitted compound. A model is considered good if the Q^2_{LOO} value exceeds the R^2 value. The LMO approach tests the result given by the model when multiple compounds are left out. Typically, 30% of the compounds are randomly excluded. The model is recalculated using the remaining compounds. The result is then evaluated by predicting the responses for the excluded compounds. If the averages of the R^2 and Q^2_{LOO} values fall within a specific range, the model is considered stable. For reliable model performance, both Q^2 (LOO) and Q^2 (LMO) should be greater than 0.6; MAE and RMSE (cv) (cross-validation RMSE) should both be below 0.5, RMSE (tr) (training RMSE) should be smaller than the RMSE (cv). The standard errors (s), RMSE (tr), and RMSE (cv) should be comparable. To ensure the model is not a result of random correlations, the Y-scrambling method is employed. This technique involves randomizing the experimental data or responses, breaking any link between the descriptors and the responses. If the model was constructed purely by chance, the performance of the resulting models should degrade significantly.

Internal validation criteria

Q^2 (LOO) = 0.7190 $R^2 - Q^2$ (LOO) = 0.0209 RMSE (cv) = 0.6721 MAE (cv) = 0.5112 PRESS (cv) = 84.0253 CCC (cv) = 0.8391 Q^2 (LMO) = 0.7125 $R^2 Y$ (scr) = 0.0318 $Q^2 Y$ (scr) = -0.0471 RMSE (av) Y (scr) = 1.2475

External Validation Method

The model is tested by predicting the responses for novel compounds that were not included in the training set, applying the MLR equation to these external compounds. Various performance metrics are used to evaluate the model's predictive ability, including RMSE (ext) and the Golbraikh and Tropsha approach [10]. Low multicollinearity (Table 2) among the descriptors is utilized to develop several MLR models. The average R^2 and Q^2 (LOO) values are plotted against the number of variables (Fig. 4). The addition of new descriptors led to an increase in both R^2 and Q^2_{LOO} values; however, it did not significantly improve model performance. The six-variable models share many common descriptor combinations. The best model (MLR 1) which includes six descriptors, is selected for predicting novel inhibitors. The statistical characteristics of MLR1 are shown in Table 3. According to the model statistics, $R^2 = 0.7399$ and R^2 (adj) = 0.7312, indicating that the model is capable of incorporating a new descriptor. The LOF parameter has low value (0.4777). It suggests that the minimum number of descriptors fit the data well. The low k_{xx} value (0.2517) indicates minimal correlation among the model descriptors. The δk (0.0965) value indicates that the descriptors are well correlated with the Log IC_{50} values. Additional statistical metrics (RMSE (tr) = 0.64660, MAE (tr) = 0.49160, $s = 0.6591$) indicate minimal error in the training set results. The scatter plot (Fig. 5,6) compares the predicted values from the model equation (blue points, test set) with the experimental values (yellow dots, training set). Some outliers in the data are found in the plot. The validity of the model is confirmed by internal validation. The variance observed by LOO indicates good prediction performance (Fig. 6). Q^2 (LOO) = 0.7190 is comparable to $R^2 = 0.7399$. The model demonstrates internal stability, as the prediction error is minimal (RMSE (cv) = 1.1825, MAE (cv) = 0.79180). The Leave-Many-Out (LMO) method was applied by excluding 30% of the dataset, and the values of R^2 (0.7399) and Q^2

Indrani Sarkar

(LMO) (0.7125) are comparable, suggesting the model's stability. The Q^2 (LOO) (0.7190) and Q^2 (LMO) (0.7125) values are consistent. The Q^2 (LMO) vs k_{xy} plot (Fig. 9) shows the performance of the LMO models, with the blue point representing the QSAR model ("model Q^2 "), and the red points indicating the LMO model's performance. The LMO model performs similarly to the original model. The model can be a correlation by chance. To rule out that possibility the Y-scrambling method is applied. The values obtained were $R^2_{Yscr}=0.0318$ and $Q^2_{Yscr}=-0.0471$. Figure 10 compares these values with those from the original model. It is evident that the R^2 and Q^2 values differ completely from those derived using Y-scrambling, suggesting that the model is not obtained by chance. For external validation, several parameters are used:[10]

External validation criteria

RMSE (ext) = 1.1825 MAE (ext)= 0.7918 PRESS (ext)= 110.4685 R^2 (ext)= 0.2554

Q^2 -F1= 0.0524 Q^2 -F2= 0.0260 Q^2 -F3= 0.1301 CCC (ext)= 0.4943

r^2_m (average)= 0.1304 r^2_m (delta)= 0.0501

Calculated external data regression angle from diagonal= -19.5441°

R^2 (ext) = the external validation procedure's coefficient

MAE (ext)= The Mean Absolute Error

MSE (ext) measures the Root Mean Square Error Q^2 -F1, Q^2 -F2 and Q^2 -F3 measure the variances provided in external validation. [8, 9, 12, 13]

CCC (ext) = Concordance Correlation Coefficient [2,3]

r^2_m _aver and r^2_m _delta = Roy criteria average [14].

PRESS (ext) = for Predictive Residual Sum of Squares.

The parameters obtained are consistent with the model. Fig. 11 presents the q-q plot of experimental vs residual values from LOO. The ordinate shows the values of the residuals (from the predictions). The abscissa shows the theoretical quantiles, or Z values. The theoretical quantiles, or Z values are plotted along the abscissa. Values obtained by the model equation are shown by blue points, predicted values by LOO are represented by the yellow points (training set).

The Combined Model

The Average Combined Prediction is obtained by averaging the predictions obtained from all 9 models (ACM) (Fig.8). According to the William plot of the combined model (Fig.12,15), majority of the compounds fall within the model's applicability domain. The critical leverage value of h^* is 0.265. The predicted residuals and the HAT values are shown on the ordinate and abscissa respectively. The LOO training set is represented by the yellow spots, and the prediction set, as established by the combined model equation, is represented by the blue points. Horizontal dashed lines represent the user-specified threshold for Y-outlier detection. Outliers are defined as having HAT values exceeding the cut off value, $h^*=3p/n$ (p is the number of model variables plus one, n is the number of objects). Additionally, the applicability domain is displayed in the Insubria plot (Fig. 13,14), generated by the software QSARINS. In this graph, the ordinate shows projected data and the abscissa presents HAT diagonal values. The combined model predicts data points shown in blue (prediction set) and yellow (training set), respectively, when the experimental values are known [15,16]. Table 4 lists the chemicals tested using the model equation. The models are selected based on Principal Component Analysis (PCA) to the average performance using the combined modelling approach.

Selected Models Include

MLR1 model: (5.6059) + (-0.0125) ATSC4i + (-0.0544) VE3_Dzv+ (0.0980) VE3_Dzi + (0.3459) nBondsD + (0.4949) SsssN + (-0.3059) nHBDOn

MLR2 model: (3.2208) +(-0.0117) ATSC4i + (1.8593) GATS3c + (0.0575) VE3_Dzi + (0.3847) nBondsD + (0.4309) SsssN+ (-0.0128) VABC

MLR3 model: (3.8934) + (-0.0126) ATSC4i + (1.7166) GATS3c + (0.0662) VE3_Dzi+ (0.3390) ndssC +(0.4542) SsssN + (- 0.2544) nHBDOn

MLR9 model: (2.9577) + (-0.0122) ATSC4i + (2.0575) GATS3c + (0.0575) VE3_Dzi + (0.3320) ndssC + (0.4333) SsssN+ (-0.0108) VABC

Fitting criteria for the combined model

R^2 (ACM) = 0.7491 R^2 (WCM) = 0.7626 MAE (tr) = 0.4823 RMSE (tr) = 0.6353 CCC (tr) = 0.8545 External validation criteria MAE (ext.) = 0.6978 RMSE (ext.) = 0.9101 CCC (ext.) = 0.6685 Q^2 -F₁ = 0.4387 Q^2 -F₂ = 0.4231 Q^2 -F₃ = 0.4847 Calculated external data regression angle from diagonal (ACM) = -14.8142° Calculated external data regression angle from diagonal (WCM) = -18.1825°

DISCUSSION

The 3-D structural coordinates of human Prolyl Oligopeptidase (hydrolase) bound to the inhibitor GSK552 at a resolution of 1.56 Å (PDB DOI: <https://doi.org/10.2210/pdb3DDU/pdb>) [1] (PDB code: 3DDU) is taken from the Protein Databank. The structure of HIV-1 RT consists of two chains, A and B. Docking studies are conducted using the 560 amino acids in Chain A. Hydrogen atoms and partial charges are added to the protein. OPLS force field is used to minimize energy. Auto Dock Vina software is used to dock the chemicals ChEMBL ID: 267225, 480154, 449310, and 565813 (designated as outliers) in the binding site. [17,18] Unlike in crystals, the docked structures are not stabilized inside the active site (Fig 16,17).

CONCLUSION

Prolyl endopeptidase, is a cytosolic enzyme that has been the focus of extensive research. It plays a critical role in various physiological processes and the regulation of neuronal hormones containing proline residues. POP inhibition presents a promising strategy for treating Alzheimer's, Parkinson's, and other cognitive impairments [19,20,21,22]. The 3D structure of human POP, complexed with the inhibitor (6S)-1-chloro-3-[(4-fluorobenzyl)oxy]-6-(pyrrolidin-1-ylcarbonyl)pyrrolo[1,2-a]pyrazin-4(6H)-one is available in the Protein Data Bank. (PDB Code: 3DDU). POP cleaves peptide bonds on the carboxyl group side of proline, recognizing the sequence X-Pro-Y. Here X and Y are generally peptides/ amino acid. Y can also be amide, alcohol, or aromatic amine. The catalytic triad consists of Ser 554, Asp 641 and His 680. The enzyme's active site contains several charged residues, including Arg-128, Arg-643, Asp-642, Arg-252 and Asp-149, and. These residues create an electrostatic environment which influences substrate binding and specificity. Additionally, polar residues such as Thr481, Ser479, Tyr471, and Asn483 may create steric hindrance, further affecting binding interactions. [23,24,25,26,27]. In this study, a series of POP inhibitors, including peptide-like compounds, are utilized to develop a QSAR-MLR model through ordinary least squares regression using QSARINS. Molecular descriptors are generated using PaDEL software. The most meaningful descriptors are selected using genetic algorithm. The resulting model is at par with the regulatory principles of OECD. The robustness of the MLR model is evaluated through both internal and external validation. The model can predict novel compounds. The application domain of the model shows four potential outliers. Molecular docking studies indicate that these compounds do not fit well within the active site.

ABSTRACT

The study focused on assessing the potentially toxic metals in the soil and effluent samples from Ranipet industrial area, Vellore district, to ascertain the presence of trivalent (Cr^{3+}) and hexavalent (Cr^{6+}) and cadmium (Cd). Analysis revealed that effluents were discharged untreated, significantly impacting soil and water quality in the radius of 5km from the chromium dumping sites. Elevated concentrations of Cr and Cd were observed in both soil and effluent samples, emphasizing the severe contamination from leachates of dumping sites. Chemical analysis of Potentially Toxic Metal (PTM) was assessed using Atomic Absorption Spectrophotometer (AAS), which indicated excessive levels of total chromium in the range 44.8 mg/L in TCCL and 38.2 mg/L in TCL and Cd in the range 6.42 mg/L and 4.89 mg/L respectively surpassing CPCB (1995) permissible limits of 2 mg/L (Cr) and 3 mg/L (Cd). In addition, Biochemical Oxygen Demand (BOD), Chemical Oxygen Demand (COD), Total dissolved solids (TDS) and Total suspended solids (TSS) exceeded regulatory standards, indicating inefficient treatment process. Soil samples collected within the radius of 2 km from the dumping site exhibited high concentrations of Cr (3178 mg/kg in TCCL and 2894 mg/kg in TCL) and Cd in the range of 24.7 mg/kg and 19.3 mg/kg respectively, emphasizing significant potentially toxic metal accumulation. Spatial distribution of Cr and Cu showed elevated concentrations within 2km of the dumping site. Deteriorated soil quality was confirmed by the detection of elevated electrical conductivity (EC), total organic carbon, levels of organic matter, and moisture content. The research has comprehensively assessed the chromium dumping site

**Chaithanya and Kumudini Belur Satyan**

induced potentially toxic metal contamination in both soil and effluent samples emphasizing sustainable remediation strategies to mitigate the toxic metals preventing long term damage to environment.

Keywords: Potentially toxic metal (PTM), Tannery effluents, UV-visible spectroscopy, Spatial distribution, Pollution index (PI), Geo-accumulation index (GI).

INTRODUCTION

Industrial effluents and hazardous waste released onto land accumulate toxic metallic components leading to contamination contributing to critical and complex environmental and health hazards (Saha and Rahman, 2018). The distribution and mobility of heavy metals is attributed not alone to concentration but also to their interaction with the surrounding environment. Improper management and unscientific disposal of waste containing heavy metal residues from tanneries and chromium producing factories may cause severe environmental damage, causing detrimental effect to the water, soil, and ecosystem (Sinduja et al. 2022). Extensive stacking and disposal of chromium rich solid waste, about 5-m high above the ground level as reported by Rao et al. (2011) has caused tough water, and soil pollution and posing potential risk to the local flora and fauna in the districts, Vellore and Dindigul, Tamil Nadu, which hosted number of the chromium producing factories and tanneries (Chen et al. 2018). Cultivable land in these areas has been drastically affected and eroded by land and water pollution leading to a noticeable decline in total crop yield. The area used for agricultural has dropped by 41% in Dindigul and 10.5% in Vellore within the past 20 years. Chromium occurs in nature in its Cr^{3+} , trivalent and Cr^{6+} , hexavalent forms (Sinduja et al. 2022). It's chemical reactivity, ionic charge and toxicity has resulted in cardiovascular, renal and respiratory complications in human beings as reported by the studies of Chow et al. (2018); Chow et al. (2020); Shi et al. (2020); Salman and Elnazer (2020); Kamarudheen et al. (2020).

Due to instability in the environment Cr^{3+} is metabolized to Cr^{6+} , additionally formation of insoluble complexes due to the interaction of hydroxides and functional groups of chromium upon getting adsorbed on soil particles, Balan et al. (2012), Cr^{3+} gets immobilized in most soil environments. In contrast, anionic Cr^{6+} binds less firmly, resulting in grater mobility, Shi et al. (2020). The presence of Fe (II), Fe (O), and various organic compounds including several microorganisms contribute to a similar reduction process of Cr^{6+} to Cr^{3+} in the environment, Beukes et al. (2017). Soil contamination is reported to higher in landfill areas due to leachate from dumping site, is a major pollution source. PTM pollution due to the release of chromium rich sediments contaminate soil, surface water, and groundwater resulting in significant imbalance in the ecological system. Therefore, the present study was conducted to analyze the physicochemical parameters like moisture content, Total Organic Carbon, organic matter, Cr^{3+} , Cr^{6+} , and Cadmium being contaminated with effluents discharged by chromium processing industries around industrial sites at Ranipet, Tamil Nadu, India. Industrial waste management is a complex and challenging issue. Hence it is critical to study the pollution status of the study area to plan future research through sustainable solutions using microbiome assisted PTM bioremediation.

Materials and methods

Overview of the study area

As identified by the Central Pollution Control Board (CPCB) of India, Ranipet, of Vellore district, Tamil Nadu from where the soil and effluent samples were collected is located 120 km away from the Chennai-Bangalore highway and is designated as one of the areas with persistent pollution (Gowd and Govil 2008; Gowd et al. 2010). The industrial sites selected for this study were Tamil Nadu Chromates and Chemicals Limited (TCCL) and Thirumala Chemicals Limited (TCL) in Ranipet, representing metal contaminated areas associated with chromate and chemicals industries. Additionally, these sites are located within a 5 km radius of the chromium dumping site in Ranipet. The location details were located as Latitude 12.953191 N, Longitude 79.310272 E using handheld GPS (Fig. 1).

**Soil sample collection and analytical procedure**

Soil and effluent samples for the study were collected within a 2 and 5 km radius from chromium dumping sites of TCL and TCCL. Samples of soil were collected at a depth of 15–20 cm, aseptically transferred into zip-lock polythene, labelled accordingly was further preserved at 4°C for further use (Mandal et al. 2011), the effluent sample was collected from designated study locations in a prewashed 1000 ml bottle, secured, labelled, and all the samples were transferred to the laboratory (Vijayakumar et al. 2022) and stored at 4°C.

Physico-chemical characterization of soil samples

Soil samples from the study site were identified with the Geo accumulation characteristics (Dotaniya et al. 2017; Patra 2017). The pH, temperature, electrical conductivity, cation exchange capacity, nitrogen content, stability index, moisture content, organic carbon, and heavy metal content of the soil samples were analyzed. Aqua regia was used to mineralize the air-dried soil samples as per the International Standard ISO-11466. Atomic Absorption Spectrometry (AAS) was used to analyze the elements in the soil and effluent samples (Tomczyk et al. 2023).

Determination of total chromium, trivalent (Cr^{3+}) and hexavalent chromium (Cr^{6+})

The Cr^{6+} presence in the samples were determined using 1,5- diphenylcarbazide (DPC) in line with SR ISO 11083/98 (Lace et al. 2019). To minimise the conversion of Cr^{6+} to Cr^{3+} state, the soil sample was analysed the second day following sample collection. The soil sample was extracted in aquaregia and analyzed. The complex_ion-reagent solution was formed by 1g of 1,5-diphenylcarbazide (DPC) in 100 mL acetone resulting in a red violet color complex at pH 2, read using a UV-visible spectrophotometer at 540 nm. After 15 minutes of incubation, 15 mL of NaOH (0.1 mol/L) was added. Phosphoric acid was used for pH control. Due to redox reaction, hexavalent chromium was reduced to trivalent chromium, and DPC was oxidized to 1,5-diphenylcarbazone. The total chromium, trivalent chromium, and hexavalent chromium were calculated, and all experiments were repeated in triplicates (Onchoke and Sasu 2016; Zhao et al. 2019).

Physicochemical characterization of the effluent

The effluent's physicochemical parameters, such as pH, odor, color, Total Dissolved Solids, chemical oxygen demand, Electrical conductivity, total hardness, total sulphates, chlorides, and biological oxygen demand were assessed as per the standards prescribed by the Bureau of Indian Standards (Pavitra and Kousar 2016).

RESULTS AND DISCUSSION**pH determination of soil samples**

The soil samples were analyzed to determine the pH at different sites. Within a 2 km radius, it was determined that site 1 had a pH of 9.55 and pH of 8.97 at site 2. Similarly, within a 5 km radius, site 3 had a pH of 8.17 and pH of 8.33 at site 4 in and around the chromium dumping site (Table 1). The findings indicate the alkalinity of the study areas, with the elevated pH values of the soil between 8.17 to 9.55, and average pH value of 8.86. A pH value greater than 7.4 leads to the oxidation of ammonia to produce nitrate, while the conversion of sulfur to sulfate is mediated by soil bacteria as reported by Sinduja et al. (2022). Additionally, trivalent chromium (Cr^{3+}) oxidized along with manganese dioxide (MnO_2) has been reported (Banerjee and Khan 2021). The soil samples with a pH of greater than 8.5, indicate the sodicity in the soil. Indiscriminate use of elevated concentration of dyes, sodium carbonate and sodium sulfate in the leather processing in the tanneries and untreated discharge of the effluent to the land has resulted in the increased soil pH (Mandal et al. 2011). When the acidity is low, more chromium leaches with acidic rainwater. In the acidic pH, chromium can exist in the soluble trivalent chromium (Cr^{3+}) species, generated through reduction of (Cr^{6+}). A higher value of pH value was detected in the chromium dumping site of the study area (Table 1).

**Chaithanya and Kumudini Belur Satyan****Determination of temperature of soil samples**

Different sites within a radius of 2 and 5 km from the chromium dumping sites were selected to determine the temperature of soil samples. Within a 2 km radius, site 1 recorded a temperature of 42.3°C and site 2 with 40.9°C. Similarly, within a 5 km radius, site 3 with 37.7°C and site 4 recorded the temperature of 37.9°C (Table 1).

Physicochemical properties of soil sample

Physico-chemical characterization of soil samples obtained at TCCL and TCL industrial premises and the results achieved from the experiments are tabulated (Table 2). Tested soil samples had a pH, Electrical Conductivity in the range 8.68 and 8.44, and 1.28 and 1.35 Sm^{-1} with 1.315 Sm^{-1} an average respectively. The spatial distribution indicates the highest EC concentration was in the northern part of the chromium dumping site. This is attributed to the discharge of untreated chromium-rich effluent and geochemical processes. The soil test sample near the industrial sites TCCL and TCL located within the radius of 2 km from the dumping site had a higher pH of 9.55 and 8.98 respectively (Table 1) and higher 'EC' values of 1.315 Sm^{-1} (Table 2). Soil sample 1 obtained at TCCL noted to show a Moisture Content (%) of 31; Total Organic Carbon (TOC %) of 0.33; Organic Carbon content (%) of 5.37, and 76 mg/kg of cadmium (Cd). Similarly, soil sample 2 obtained at TCL revealed Moisture Content (%) of 28; Total Organic Carbon (TOC %) of 0.64; Organic Carbon content (%) of 5.14, and 49 mg/kg of cadmium (Cd). It was the highest organic carbon detected at the TCCL soil sample (soil sample 1) than the soil sample (soil sample 2) obtained at TCL; other major elements like Nitrogen (N_2) ranging between 142.56 and 201.56 mg/kg; Phosphorus (P) 41.74 and 52.99 mg/kg and Potassium (K) 18.20 and 80.40 mg/kg (Arifin et al. 2022; Reddykapa et al. 2022). The remaining elements like Fe, Ni, Ca, Mg, Cu, S, Zn, Mn, B, Pb, were not detected in the soil samples of TCCL and TCL respectively (Table 2).

Determination of Chromium and hexavalent chromium (Cr^{6+})

In comparison with other trace elements the soil sample of the study area showed the gradually lowering levels in the order $\text{Cr} > \text{Fe} > \text{Ni} > \text{Pb} > \text{Mn} > \text{Cu} > \text{Zn}$, a similar analysis was recorded by Sinduja et al. (2022) and the values are tabulated (Fig. 2). Disposal of untreated sediment and effluents from the chromium producing factories and tanneries resulted in the occurrence of higher concentrations of chromium, as reported by Tarcan et al. (2010). The trivalent chromium variability (Cr^{3+}) ranged between 1193.25 ± 0.97 and 1582.21 ± 0.97 mg/kg (Tarcan et al. 2010) of 53.6 mg on an average. Soil sample in site 1 recorded the highest contamination with elevated levels of pH, EC, Cr^{3+} and Cr^{6+} in comparison to the other regions. Uddin and Ahmed, (2018) illustrated that among the various industries in the study area, tanneries and chromium producing factories produce large quantities heavy metals like chromium, nickel, lead, cadmium, manganese, and lead. Higher concentrations of chromium were ascertained within 2 km vicinity of the contaminated site, attributed to the release of untreated effluent onto the land. The increased release of high concentration of effluents has led to elevated chromium levels in soil (Prasad et al. 2021). Literature suggests, dry Cr (III) precipitates can be transformed into Cr (VI) by heating it up in the presence of oxygen. Further, Cr^{6+} can be oxidized to Cr^{3+} in the aqueous phase through interactions with manganese dioxide (MnO_2), Apte et al. (2005). Manganese oxide, commonly utilized in processing leather, Tariq et al. (2010). Cr^{3+} content in the soil was between 256.21 and 1582.21 mg/kg, and Cr^{6+} concentration ranged between 51.76 and 64.71 mg/kg. Higher Cr^{3+} and Cr^{6+} concentrations which dominated the area within 2 km radius of the sample collection site were due to the disposal of untreated chromium rich tannery effluents and chromium factories. AS reported by Sinduja et al. (2022), the PI (Pollution Index) a measurable parameter to evaluate the extent contamination by tannery effluents in local sediments. It acts as an indicator to relate the potential sources of heavy metal contamination in the soil from the study area. Pollution index (PI) is the quantifiable indicator for estimation of the extent of tannery effluent in the local soil sediments, Sinduja et al, (2022). The concentration of components in the soil's PI values when greater than 1.0, signifies the interference of human activity as reported by Tariq et al. (2010). The geo-accumulation index is another critical factor to consider while assessing pollutants in soils. soil sediments can be classified into five categories viz. (1) uncontaminated to slightly contaminated, (2) moderate contamination, (3) moderate to heavy contamination, (4) heavily contaminated, (5) heavy to significantly contaminated, and (6) the 'GI' value '>5', indicates extremely contaminated (Sinduja et al. 2022). An estimation of the soil contamination of the samples was made using the Geo-accumulation Index (GI). As per the classification, the trivalent chromium levels from various sites showed

**Chaithanya and Kumudini Belur Satyan**

that at site 1 (TCCL Premise) at a distance of 2 km showed 1582.21 ± 0.97 mg/kg, site 2 (TCL Premise) within a 2 km radius showed Cr concentration of 1193.25 ± 0.97 mg/kg, Site 3 (TCCL Premise) at a distance of 5 km showed 814.64 ± 1.009 mg/kg and at site 4 (TCL Premise) at a distance of 5 km showed 256.21 ± 0.91 mg/kg. Similarly, the hexavalent chromium (Cr^{6+}) levels from various sites showed that the soil sample obtained at site 1 (TCCL Premise) at a distance of 2 km showed 64.71 ± 1.12 mg/kg of, site 2 (TCL Premise) within a 2 km radius showed Cr concentration of 60.71 ± 1.43 mg/kg, Site 3 (TCCL Premise) at a distance of 5 km showed 59.20 ± 0.57 mg/kg and at site 4 (TCL Premise) at a distance of 5 km showed 51.76 ± 0.452 mg/kg of hexavalent chromium (Cr^{6+}) respectively, highlighting the industrial premise of TCCL and TCL regions affected by the discharge of heavily polluted, untreated effluents onto open ground (Table 3).

Physico-chemical characterization of the effluent

According to Muthukkappan and Parthiban (2018) physicochemical analysis, the effluent from the industrial premises in Ranipet is alkaline, containing high levels of BOD, COD, and organic particle matter, as well as an unpleasant odour and colour. Most likely, the smell comes from microbial activity or the organic materials in the effluent breaking down. The tannery effluents had a pH between 8.27 and 8.67, which is higher than the general guidelines the CPCB (1995) advised for land disposal or irrigation. The physiology of organisms in ponds, rivers, and other natural habitats can be greatly impacted by the discharge of untreated effluents with high pH levels, as this can pose a considerable threat on local flora and fauna. A water sample's electrical conductivity (EC) indicates its capacity. The current investigation discovered that the existence of salts and inorganic materials, which enhance conductivity, is the reason for the tannery effluent's high electrical conductivity (EC) (Muthukkappan and Parthiban, 2018). It is most likely the elevated concentrations of salts, bases, and acids, in the water that are causing the higher EC values. These particles can harm aquatic life and soil in a number of ways, such as altering the porosity, texture, and water holding capacity of soil and blocking fish gills and respiratory surfaces. The investigation also found that the tannery effluents had high levels of Biochemical Oxygen Demand (BOD), which was measured at 480 mg/L and indicated a sizable organic load (Muthukkappan and Parthiban, 2018). According to Goswami et al. (2020), the most effective technique for calculating the total oxygen demand by organic material in the effluent is Chemical Oxygen Demand (COD). A significant concentration of COD (3400 mg/L) was noticed in the current study. The outflow of effluent into surface water inland areas did not reach the acceptable level of 250 mg/L, as per the CPCB (1995) evaluation criteria. Water becomes harder due to ions, specifically calcium, sulphate, magnesium, and sodium. The findings showed that the ion concentration exceeded the CPCB-recommended limit of 1000 mg/L. TDS value above than 180 mg/L, indicates extreme hardness of water (Table 4) (Badrinath and Raman 1995).

CONCLUSION

The Ranipet industrial region in Vellore District was found to have primary ion pollution, as evidenced by the soil and effluent quality assessment conducted surrounding the industries. The high Cr^{3+} and Cr^{6+} concentration was noticed in the TCCL and TCL industrial premises. Along with chromium other metal species also occurred at a high concentration as it is revealed by earlier research data. The excessive concentrations of chromium in the samples collected near the chromium producing factories and tanneries in the Ranipet industrial area premises indicates the impact of disposal of untreated effluents to the open ground. Findings confirmed that the untreated effluents are discharged onto land and water bodies, degrading quality of soil and water even further. Therefore, it is essential to design and develop sustainable approach and model systems to develop the functionality of heavy metal treatment plants and incorporating suitable remediation techniques to reduce hexavalent chromium to trivalent chromium from the target regions is crucial. Such remediation techniques support sustainable agriculture by helping mitigate negative environmental consequences. A study using the Sobol sensitivity model to evaluate human health risks in a leather tanning industrial and chromium processing regions of South India revealed that children are at higher health risks compared to women and men due to environmental exposure. This emphasizes the vulnerability of younger populations to contaminants in such industrial zones (Karunanidhi et al., 2021) and thus more emphasis on Geo-

Chaithanya and Kumudini Belur Satyan

accumulation studies of carcinogenic heavy metal, hexavalent chromium in the soil and effluent to design a remediation technique through an eco-friendly, cost effective and sustainable.

ABSTRACT

India is the homeland of Ayurveda, martial arts and Siddha medicines. It is a multi-ethnic terrestrial, and each of its province has its own vernacular dialect, attire, gourmet, tradition and rituals. Divakaruni has incredibly projected the generic potentials of the spices and has blended it with the fictional components that complete the objective of the tale. Culinary competence, which appears to govern the perception of ideal womanhood, is meted out in varied contexts in her novels. Tilo the protagonist utilizes her magical powers to communicate with spices, which forms the primitive module of the globe, to resolve the day-to-day issues of other immigrants. This paper provides readers with a glimpse into the therapeutic standards of Indian spices accentuated for their healing qualities by Chitra Banerjee Divakaruni in her novel *The Mistress of Spices*.

Keywords: Healing, Spices, Therapeutic, Allure, Culture, Identity, Culinary

INTRODUCTION

Twentieth century has provided wide opportunities for the writers to exercise great impact on culture, society and history of the new land. At the same time, they nostalgically recall the custom, culture, gourmet, language and people of their mother land. Some of the gifted women settlers began to record the life and longings of the immigrants effectively in their writings. Immigration has given wider opportunities to the Indian writers to express their experience and anguish in a new land. Divakaruni's works are largely grounded on poignant crisis, inspiration and the extensive discord of Indian immigrant womenfolk who crave for belongingness with the aboriginal principles and morality. She distinctively plans the image of ordeal women preoccupied with their inner world, their menacing hatred and the gale in the existential impasse of women in a masculine conquered humanity.

96328

Vadivu

Her works exhibit Indian women as paramount characters. By exhibiting womanly- narrative all through her workings, she makes a plea for a competent living of women, enduring her flexibility. She has depicted women individuals through her collective thoughts and practice. She recurrently concentrates her writing on women problems. she says,

“Women in particular respond to my work because I’m writing about them– women in love, in difficulties, women in relationships. I want people to relate me to my characters, to feel their joy and agony, because it will be harder to [be] prejudiced when they meet them in true life” (Softky).

Divakaruni after a lot of research on Ayurveda has added the information in her novel. She connotes:

“I have been absorbed in the traditional ancient Hindu system of medicine, for a long time so I did a lot of ayurvedic research as well. So, I did do a lot of Ayurvedic research. Some of it came out of, again, the folklore of There are some good luck spices. You have certain ceremonies where you would use certain spices to bring good luck and avert the evil eye—the mustard seed to avert the evil eye and the haldi, which is auspicious.” (Seshachari, Neila, 2001)

The Mistress of Spices is inscribed in a culinary genre and the narrative revolves around spices. Nearly half the spices cultivated in India is utilized by the whole world. Colleen Taylor Sen connotes:

Spices indigenous to India are ginger, turmeric, tamarind, black (also called round) pepper (Piper nigrum), Curry Leaves (Murraya koenigi), Pippali or long pepper (P.longum), green and black cardamom and holy tulasi...Sesame seed (Sesame indicum), one of the oilseed crops, was domesticated very early. Asafoetida...originated in Afghanistan, which is still a major producer... (FAF, 23)

The Mistress of Spices (1997) is established in fashionable Oakland, California. Respectively the episodes of the novel is termed after a different spice that has deep connection with the characters. The first chapter is titled ‘Tilo’ a name derived from Til. The rest of the chapters are named after each spice. Tilo, the protagonist of this novel is the possessor of the Spice Market in Oakland, California. She is an immigrant from India who aids her clients satisfy their requirements and wishes with the aid of diverse spices. Her customers are typically primary- or subsequent-cohort immigrants who tussle to acclimatise their deep-rooted-realm thoughts in the unacquainted novel realm. “The people are compelled to leave their native land in search of a better living” (Beulah Joseline 77263)

Inbred in India Tilo is marooned on a secluded island, populated by womankind. Tilo faces gender discrimination at the very early stage in her life. She is named as ‘Nayantara’ and is discarded by her family for the scandal of being born a female. “Home gives security for everyone, but for Saru home is a place of disappointment” (Saratha Lakshmi 9749). She is gifted as the paramour of flavours and conjures the charmed supremacies of the flavours to triumph over the sufferings of the local Indian expatriate community. Her customers are typically primary or subsequent cohort immigrants who struggle to acclimatize their old world principles to the unfamiliar innovative world. “As a result of immigration to foreign countries, lonely men and women and their ethnic identity creates confusion among the young” (Shahin Banu 3547).

Tilo finds herself not only trapped in the lives of several Indian immigrants but also in the life of, Raven. Her craving to the domain of souls’ wraths the flavoring spices and she is in a dilemma, to fulfil the inhabitants or else to pursue the course of her individual contentment. Tilo gets an identity as an Indian – American and continues to render overhaul to the people with her mystical, magical and visionary powers. Divakaruni in a discussion said: “The spices are very significant in this manuscript, as characters they have peculiar traits.”(Divakaruni)

Tilo comprehends space and time to these constructions through a dialect of physicality and mentality. Owing to the displacement Tilo leads a secluded life. Her journey from the known to the unknown land leads her way to twinge and torment. This reflects her affection towards her homeland and the past world. Her expedition through water, air and ocean, is very much like walking on fire. She expresses her predicament in the foreign land: “I think I do not inflate when I say there is no other place in the globe quite like this” (MS 3). Her spice shop is a bridge between her past and the present. It also symbolizes secrecy and geographical monolithic national identity which gives space for

**Vadivu**

diaspora people to rethink of them in the new nation. Divakaruni recapitulates the lost traditions and myths of her homeland through evoked memories of bygone times, place, and people. She projects the inner conflicts ranging within a woman who has to take a resolution if she has to live for herself or for the welfare of others. Tilottama (Tilo) the raconteur of the tale is inbred in India. She is spearheaded to be a “Controller of spices” and is ultimately deployed to vanguard a flavourful spice shop in Oakland, California. Tilo, chooses America willingly and supports people open their cherished feelings and restore them back to health.

The Spice shop, for illustration, created in the novel is a setting which helps in fetching exiled inhabitants collectively and offer them consolation. Food works as reminiscence and we all have optimistic and adverse memoirs with food. The diasporic circumstances additionally strengthen this association. Seasonings from dwellings recap you to the hospitality of a blissful dwelling moreover as bygones progress by. Though daily bread and related metaphors have played a role in narratives, psychosomatic ideas have fronted to the evaluation of cuisine besides consumption for example a comprehensive understanding. (Thomas J. Schoenberg and Lawrence J. Trudeau’s). Food connotes the belief systems, pious guidelines, and byzantine beliefs of a specific character, or that of an entire kinship or ethnicity. Jonathan David says: In order to begin such a framework about food in folklore, . . . we should first analyse the subject of folk cuisine itself, and folk eating habits. Together, these create the domain that scholars in the field of folklore and folklife have come to call ‘foodways.’

Divakaruni presents Tilo as a character who is undistinguishably bonded in the process of displacement. The entire notion of ‘home’ becomes exiled and is transmuted and hooked on to an indefinable form which is not centered on a particular whereabouts however quite a progress among countless locations. As Tilo’s identity is trivial and void she forges a pioneering identity as the pirate queen -Bhagyavathi. This brand new identity too for no reason accords Tilo the accomplishment she longs for. Becoming the queen of pirates she chases triumph but is deprived of a true identity. Emptiness impinges into her heart and she starts chasing death to end her imaginary life.

The sea serpents save Bhagyavathi from the typhoon. The serpents remain her Caretakers, absolutely since her infancy time. Serpents are adored in our land as Divinities and Goddesses ever since primeval eras. They resume to shield and provide her with all amenities. The serpents reveal to her concerning the entranced islet of flavors furthermore the ‘First mother’ or the ‘Older One’, who has resided there for ages. Inhabitants had viewed the First mother during the early hours when she usually ascended the utmost apex of a hilltop and guided ‘the thunder-text from corner to corner across the horizon’. Tilo perceives that her providence and outlook is in the hands of the First mother on the new island. She confronts the cautions and soliciting’s of the snakes and verves to the desert islet, as “the call of the spices coursed up her veins” (MS 24). The protagonist is drawn towards the enraptured island of flavours, nevertheless they coax her to verve with them. The serpents wanted Tilo to become ‘sarpakanya’.

Through the channel of nature and environment, Tilo acts as a concerning link between diasporas and homeland which is the accentuating feature of all living, and non-living existences in this milieu. The protagonist and the accompanying young adolescents who dwell in the land were given new name and identities, with which they would become recognizable wherever they went. New personas are being forged. Tilo is the vivid pupil of all, “swift to master every single spell and chant, ...hem a glance.” (MS 41).

The First Mother accords every Mistress an innovative designation opinionated on the flavour. But instigating the annoyance of the First Mother Tilo chooses her own name. The First Mother acquiesces to Tilo’s aspiration and bestows her with a new name ‘Tilottama’. Her name “Tilo” is shortened from “Tilottama”. The Chief Mom presents her to the myth of Tilottama, ‘the leading performer at Indira’s allure’. “The spice speaks to me” says Tilo. She is the enchantress and the enchanted. “It’s expression is like dusk, ...realm” (MS 13). The First Mother who originates Tilo discloses Tilo’s special gifts. The spices aid her to endure calmness “clean, sharp and sane” and she sanctifies even them who do not see her with “fenugreek who renders the body sweet again”. These mistresses have to obey the stern rules in their private lives as a mistress. They should keep themselves away from all carnal desires, not utilize the spices for their own sake and should linger confined in the spice shop. They have to also eschew their reflection

**Vadivu**

in the mirror and not express attachment towards customers. Tilo says “The spices are my love...realm quite like this” (MS 03). Food is a ubiquitous icon all through the narrative. Especially turmeric which can be used as an antibiotic as well as to enhance face shine.

Tilo is aware of how to use the spices, as she is able to distinguish their genesis, smell and insignia. She calls them by their factual name which was given when earth breached like a membrane and presented it till the open atmosphere. Its extracts are beneficial to many. Research is on process as it helps in treating various heart ailments including cancer. The protagonist shares Indian recipes amidst Kwesi, an African American. These simple acts of Tilo's kindness creates friendship among people of diverse cultures and leads to her transculturation as people are willing to overlook the differences and build relationships on the common cultural aspect that they have acquired. The store where the entire community tends to relive their experiences caters to the little cravings of the Indian community. In this novel we find an outline of diaspora that pays off the price for accomplishing dislocation. Divakaruni's novel resound this viewpoint that the notions of displacement and diaspora are, in discourse with one another. While the thought of displacement suggests the upheaval of familiar space and emphasizes the need to change, the notion of diaspora emphasizes the acquaintances between the displaced.

Tilo, significantly likes the spices she utilizes, and aids it to bestow life upon characters. For instance, Til that aids in curing diseases of liver and heart is made into an glue like consistency with sandalwood and when sautéed refurbishes brilliancy, when one has lost cognizance in life. Divakaruni has strikingly blended Indian flavours in this novel. She has globalized the effect of this ancient remedy technique of Ayurveda which is profoundly allied with Indian philosophy. Tilo offers Haroun is offered black cumin as it is presumed that it would come in handy to guard him of the malevolent. To add more to it she says that this spice is found in Sundarbans, teardrop in shape which smells like wild tigers.

Turmeric also named Halud, is highly appreciated for its therapeutic, mystical and preservation qualities. It is accepted for its devout and divine value. For more than a thousand year brides have been using this powder as it is considered to be auspicious which aids in guarding evil eyes. It is also a staple food which has the property to control inflammation. It also helps to alleviate pain and improve digestion. Turmeric, the auspicious spice... rubbed into the borders of wedding saris. (MS 13) Tilo's allegiance towards the spices and her customers paves way for her to remember that she would chant and help in reliving sorrowness as per her learnings.

Similarly, Fennel, is an counterpoise, a flavour for Wednesdays, which can take control from one and restore it to the other. Fennel, *Mouri*, aids in digestion. -Looks typically like a tinted hedge sparrow. Tilo's confrontation with an migrant's grandad and his family fetches attention to flavours like saffron crocus or popularly known as Kesar. Tilo adds Badam or almond to hot milk as she understands that it would soothe anyone's disputes and judgements and control their fury.

Cinnamon or Dalchini is a pleasingly scented drug plant which improves serum glucose, lower fasting blood glucose and reduces Triglycerides thus helping diabetics. To boost Jagjit's confidence Tilo tucks cinnamon stick into Jagjit's turban to help him make friends in his school and to gain strength. She wants him to be a robust self-confident character and believes cinnamom would give the valour to destroy his enemies because of its properties. In the novel, Asafoetida, a hard resinous gum spices are referred as 'an antidote of love' (MS 74). Healing repeatedly has been outlined as, the progression of bringing together aspects of oneself, body-mind-spirit, at profound levels of inner knowing, leading toward amalgamation and steadiness with each aspect having equal importance and value. (Egnew, 2005, p. 256)

Tilo hears her customers speaking together in all voices, Tamil, Assamese, Hindi, Oriya, English, layered one on the other. She acts as an accordion in the new environment paving to link the breach between the two diverse beliefs. Similar is the situation of Jagjit who is forced to live the life of a marginal by the Americans. “He lives in the world of disappointment where justice and consequence are expected but not experienced” (Shahin Banu 3467).

Vadivu

Divakaruni illuminates the agony of exile and the uncertainties of post colonialism through a ten-year-old boy, Jagjit who is traumatized at school. Racial hatred leading to racial violence can best be seen in the case of Jagjit. Tilo hurriedly offered Jeera to reinforce his cognizance and Jagjit was given Manjistha or Indian madder “to make him calm and take away his anger” (MS 119). Tilo gives peppercorn to Raven as she presumes it has the capability to extract out his enigmas.

For instance, one such dependent wife, Mrs. Ahuja (Lalita) is a regular visitor to Tilo’s Store. She marries Mr. Ahuja, because of her parents’ compulsion. He is an alcoholic and often abuses her. Taking her to be a mere machine he abuses her even at the cherished times. Mrs. Ahuja’s confronts with exploitation, mistreatment and solitude in America. Her expectations are traumatized on the day of her marriage itself as she is denied of her personal opinions. Lalita is talented to discover resolutions for her predicaments through the protagonists reassuring confrontations. “The way she fulfils the expectations of all speaks volumes about her potential” (Saratha Lakshmi 3474).

Dreaming of the island, the protagonist engrosses in a noiseless psychological treatise with the Foremost Mother athwart stretches. All the immigrant female characters-Tilo, Geeta, Lalita, Daksha and Hameeda face ‘in-betweenness’ at some juncture. Tilo too is caught amidst her duty as the paramour of flavours and her craving to help people out of the box. She violates the rules laid down for the mistress and offers her aid to the needy.

Finally, she cannot hide her feelings for Raven. Tilo challenges the mistress-ship. Her love for her work as mistress of spices and for Raven is equal. Tilo is an embodiment of Indian cultural heritage characterized by chastity and resistance to cultural infiltration. Reiterating her womanly charm Tilo adopts the tag Maya. Hence, distinctiveness neither is conventional nor preconceived in consonance with their ethnic identity, and it doesn’t inevitably come forth when immigrants abandon or embrace their ethnic identity. It is a fusion of welcoming and unleashing changes, both internal and external, just as Tilo turns into Maya, the illusion. Tilo determines to go back to Oakland, though it was overwhelmed owing to an quake. Ghanshyam remark in their article, ‘Shifting Identities: Re-invention of the Self in Chitra Banerjee Divakaruni’s The Mistress of Spices’:

Chitra Banerjee Divakaruni has very dexterously juxtaposed the world of spices with that of women, as a metaphor of her life and identity, ... (84-85)

Literature does not deal with the any precise society or a distinct commune, it is for humankind. The effects of diaspora is dexterously employed by Divakaruni. “Exotic power is empowerment, and feminism and exoticism are first demarcated and reconciled. Exotic spices enable women to become feminist subjects by using their magical and healing qualities to fight patriarchal Indian traditions” (2005:77). Inderpal Grewal

Divakaruni has utilized the “magic” of these spices, both factually and allegorically.

Since the body is accepted as a noteworthy component of distinctiveness, such illustrations clutch boundless power along with the transformations in the protagonist. Tilo enters a luminal threshold -a interplanetary amidst the historical and the forthcoming without precise knowledge of where the contemporary day is. Tilo’s journey which starts with sesame culminates in *makaradwaj*, king among spices. She says, “Make me attractive, *makaradwa*, such attractiveness as on this earth never was” (MS 262), suggests that eating practices play an intricate role in personality-identity and is influential in defining an individuality and also traditional identity in accordance to Current psychoanalytic theory. The intense incarnation of spices is promptly recognizable, showcasing their complicated immersion in the sophisticated ‘beliefs of several lives. These spices surpass their intrinsic nature and suppose roles akin to beings. Food acts as an icon to emphasize individual and communal distinctiveness. Spices serve not only for enhancing the flavour of food but also to address health-related issues. These flavours are embodied as individuals in the narration. Divakaruni has skilfully woven these elements concurrently to unveil the essence of the novel.

ABSTRACT

Many regions, including India, the U.S.A., and Egypt, face construction challenges due to clayey soil, leading to damage in light structures and pavements. Traditional soil replacement is costly, especially in developing countries. This study explores jute fiber as an eco-friendly, cost-effective soil stabilizer. Laboratory tests show that jute reinforcement significantly increases soil strength, with a 200% rise in CBR value at 0.75% fiber content. Jute-geotextile proves to be an economical, practical solution for improving weak subgrades.

Keywords: Jute geotextile, CBR, Eco-friendly, Economical, Subgrade

INTRODUCTION

The subgrade, the lowest pavement layer, bears all pavement loads and must remain stable under adverse conditions. Weak subgrades cause defects like rutting and corrugation, impacting pavement durability. Reinforcing soil with jute fiber enhances strength, bearing capacity, and durability while being cost-effective and eco-friendly. With increasing urbanization, clayey soils pose challenges due to low shear strength and high compressibility. Rather than seeking new land, improving soil properties through reinforcement methods like jute fiber offers a sustainable solution. Utilizing industrial by-products and natural fibers not only strengthens soil but also promotes environmental conservation and efficient waste management. The shrink-swell behavior of clayey soil poses significant risks to construction, leading to excessive settling at the site. Additionally, soils may be prone to collapse or liquefaction, making them challenging to manage. Searching for ideal construction sites by altering the natural environment is not advisable, as it disrupts the balance of ecosystems. The destruction of forests, agricultural land, and natural slopes can lead to imbalances in wildlife and contribute to environmental disasters such as floods and landslides. These changes pose serious threats to human life and survival.

**Sudipta Adhikary****Objectives**

- Assessing the strength properties of both untreated and jute-blended soils with varying jute fiber lengths.
- Identifying the optimal jute content and combination to achieve the highest improvement in soil strength

MATERIALS AND METHODS

The California Bearing Ratio (CBR) test, both soaked and unsoaked, was performed on soil samples reinforced with varying percentages and lengths of jute fiber. This test measures the force per unit area needed to penetrate a soil sample using a circular plunger with a 50mm diameter, at a penetration rate of 1.25mm per minute.

RESULTS AND DISCUSSION

The CBR test was performed on soil samples reinforced with 60mm long jute fibers at varying percentages of 0.25%, 0.50%, 0.75%, and 1%.

CONCLUSION

The laboratory tests revealed that the inclusion of jute fiber in soil significantly enhances its CBR value. As the fiber content increased, the CBR value showed a notable improvement, particularly at 0.75% fiber content. Additionally, the fiber length played a crucial role in further increasing the CBR value, with the most substantial rise observed when the fiber length was 90 mm. A remarkable improvement of over 200% in CBR value was noted at 0.75% fiber content. The use of jute-geotextiles for soil reinforcement proves to be a cost-effective and practical solution, offering a superior alternative to traditional methods. It is particularly beneficial for constructing low-volume roads on weak subgrades, making it a viable option in regions with limited resources.

Future Scope

- Enhancing soil properties has become a critical focus in modern construction. This study explores the effects of jute and gypsum, though numerous other materials offer potential for similar improvements. For future research, the following areas could be explored:
- Utilization of various waste materials from agricultural, municipal, or industrial sources to improve soil, contributing to sustainable urban development.
- Conducting similar studies with different moisture contents to assess their impact on soil strength. Investigating the effects of soil reinforcement with other soil types to broaden the applicability of the findings.

ABSTRACT

This paper examines Khaled Hosseini's novels through the lens of cultural psychology, focusing on how his characters navigate cultural displacement and identity formation. Using Berry's Acculturation Model and Cultural Frame Switching theory, the analysis explores how different characters employ various acculturation strategies - integration, assimilation, separation, and marginalization. Through detailed character studies from *The Kite Runner* and *A Thousand Splendid Suns*, the paper demonstrates how successful cultural integration enables individuals to maintain meaningful connections to their heritage while adapting to new cultural contexts. Hosseini's narratives illustrate the psychological challenges and opportunities presented by cultural displacement, particularly highlighting how bicultural competence can enhance personal growth and cross-cultural understanding. The analysis reveals that while characters pursuing integration strategies generally demonstrate greater psychological well-being, those experiencing marginalization or strict separation face significant challenges. The paper concludes that Hosseini's works provide valuable insights into the complex dynamics of cultural adaptation and identity development, offering profound implications for understanding immigrant experiences and supporting successful cultural integration.

Keywords: Cultural Identity, Acculturation Strategies, Bicultural Competence, Immigration Psychology, Cultural Integration

Sindhu and Vidya Dass

INTRODUCTION

In contemporary literature, few authors have captured the psychological complexity of cultural displacement and identity formation as effectively as Khaled Hosseini. His trilogy of novels offers a profound examination of how cultural dislocation, immigration, and bicultural identity development shape human consciousness and relationships. Through his storytelling, Hosseini delves deep into the human experience of navigating between cultures, presenting characters who struggle with and ultimately find ways to reconcile their dual cultural identities. This paper applies cultural psychology frameworks to analyse how Hosseini's characters navigate the challenges of cultural adaptation, identity negotiation, and psychological resilience in cross-cultural contexts. The significance of this analysis lies in its exploration of how literary narratives can illuminate psychological processes involved in cultural adaptation and identity formation. Through Hosseini's character development, readers gain insight into the subtle ways cultural displacement shapes identity, the complex dynamics of acculturation, and the development of bicultural competence. His narratives serve as powerful case studies that complement theoretical frameworks in cultural psychology, offering vivid illustrations of how individuals negotiate their cultural identities in an increasingly globalized world.

Hosseini has touched millions of readers worldwide with his powerful narratives about Afghanistan and its people. His acclaimed works, *The Kite Runner* and *A Thousand Splendid Suns*, have helped readers understand life in different cultural contexts. While some themes in his books address mature topics that might be unsuitable for younger readers, his storytelling offers universal lessons about human resilience, cultural identity, and the power of human connection across cultural boundaries. His work demonstrates how literature can bridge cultural divides and foster understanding between different communities. One of the most significant impacts of Hosseini's books is their portrayal of friendship and family relationships. In *The Kite Runner*, the protagonist Amir learns challenging lessons about loyalty to friends and moral courage in difficult situations. These universal themes resonate with readers of all ages, transcending cultural boundaries. The narrative demonstrates that authentic friendship requires standing up for others and displaying courage when friends are in need. Through Amir's journey, readers witness the transformative power of redemption and the lasting impact of childhood relationships on adult life.

Another crucial contribution of Hosseini's writing is its role in educating readers about Afghan culture and traditions. Prior to the widespread success of his novels, many people's understanding of Afghanistan was limited to news coverage. His narratives provide intimate glimpses into Afghan cuisine, festivals, recreational activities like kite flying, and family customs. Through these detailed cultural portraits, readers discover that despite geographical distances and linguistic differences, people worldwide share fundamental values and aspirations. This cultural insight helps bridge the gap between different societies and promotes cross-cultural understanding. Hosseini's influence extends beyond literary achievement to fostering global cultural awareness. His narratives emphasize our shared humanity - our common hopes, dreams, and desire for mutual understanding. Through his storytelling, Hosseini demonstrates how literature can transcend cultural boundaries and create empathetic connections between diverse communities, contributing to greater global understanding and cultural appreciation.

Theoretical Framework and Methodology

This analysis employs Berry's Acculturation Model and related cultural psychology theories to examine Hosseini's works. Berry's framework provides a systematic approach for understanding how individuals navigate cultural transitions and develop adaptive strategies. The framework's emphasis on psychological adjustment and cultural learning processes offers valuable insights into the experiences depicted in Hosseini's narratives. Through this theoretical lens, we can better understand the complex processes of cultural adaptation and identity formation that his characters undergo throughout their journeys (Berry 45). As Berry observes in his seminal work: "The degree to which individuals maintain their heritage culture while simultaneously adopting the culture of the new society has important implications for their psychological well-being and sociocultural adaptation" (47). This theoretical foundation helps illuminate how Hosseini's characters negotiate their cultural identities and develop adaptive

**Sindhu and Vidya Dass**

strategies in new cultural contexts. The model's focus on both cultural maintenance and adaptation provides a nuanced framework for analysing the psychological dynamics portrayed in the novels. The analysis also draws on Cultural Frame Switching theory, which explains how bicultural individuals shift between different cultural meaning systems depending on contextual cues. Hong elaborates on this concept: "Bicultural individuals possess dual cultural frameworks that can be activated by environmental cues, leading to shifts in behavior, values, and self-concept" (Hong 123). This theoretical perspective enriches our understanding of how Hosseini's characters navigate between their Afghan heritage and adopted American cultural contexts, demonstrating the complexity of bicultural identity development and adaptation processes. The theory provides valuable insights into the psychological mechanisms underlying cultural adaptation and identity formation.

Bicultural Identity Development

In *The Kite Runner*, Hosseini masterfully depicts the process of bicultural identity development through Amir's experience as an Afghan immigrant in America. The narrative explores how he navigates between Afghan and American cultural contexts, developing what cultural psychologists term "cultural frame switching" abilities. Through detailed observations of daily life and internal conflicts, Hosseini illustrates the subtle ways in which bicultural individuals learn to move between different cultural spaces, adapting their behavior and self-presentation while struggling to maintain a coherent sense of identity (156). This complexity is powerfully captured in a pivotal scene where Amir reflects on his dual identity: "I feel like a tourist in my own country... In America, I was an Afghan. In Afghanistan, I am an American. Somewhere between here and there, I lost my place in the world" (231). This passage illustrates the complexity of bicultural identity negotiation and the psychological challenges of maintaining cultural authenticity while adapting to new cultural contexts. The sense of displacement and identity confusion Amir experiences reflects common psychological challenges faced by immigrants navigating multiple cultural worlds.

Hosseini portrays the nuances of bicultural living through Amir's daily practices and experiences. His character moves fluidly between speaking Farsi at home with Baba and English in professional settings, alternating between traditional Afghan cuisine and American dining customs. These seemingly mundane details effectively illustrate the constant cultural negotiation that shapes bicultural identity development. Such everyday choices and adaptations reveal the complex process of integrating two distinct cultural frameworks into a coherent sense of self (245). Upon returning to Afghanistan as an adult, Amir experiences acute cultural displacement. The once-familiar streets of Kabul feel foreign, and his Western-influenced mannerisms and formal Farsi mark him as an outsider. His immediate identification as an American by local taxi drivers highlights the visible transformations that have occurred through his acculturation process. This experience of feeling like an outsider in both cultural contexts reflects what cultural psychologists describe as the "double consciousness" often experienced by bicultural individuals, highlighting the ongoing challenges of maintaining cultural authenticity while adapting to new cultural environments (278).

In *The Kite Runner*, Baba's immigrant experience illustrates another dimension of bicultural adaptation. Once a prominent Kabul businessman, his transition to working at a California gas station represents the profound social and economic adjustments many immigrants face. Despite his reduced circumstances, Baba maintains his cultural dignity by preserving Afghan traditions, such as hosting traditional dinner parties in their modest apartment. His acceptance of American customs during Amir's wedding to Soraya demonstrates the gradual process of cultural integration that occurs even among those who strongly identify with their heritage culture (167). In *A Thousand Splendid Suns*, Tariq's journey through Pakistan and back to Afghanistan presents another perspective on cultural adaptation. His ability to acquire new languages and customs while maintaining his Afghan identity illustrates the potential for successful cultural integration. His reunion with Laila depicts how couples navigate cultural transitions together, creating hybrid traditions that honor both their heritage and their evolved cultural identities. Their story shows how bicultural individuals can actively shape new cultural practices that reflect their complex identities (245). Sohrab's character in *The Kite Runner* represents the traumatic dimension of cultural transition. His year-long silence after arriving in America symbolizes the profound psychological impact of forced cultural displacement. His gradual engagement with American life through activities like kite flying with Amir demonstrates how cultural healing can occur through meaningful connections that bridge past and present experiences (312).

**Sindhu and Vidya Dass**

The second-generation immigrant experience is portrayed through Soraya, who epitomizes the complexity of negotiating dual cultural identities from birth. Her mastery of both American and Afghan cultural competencies - from academic achievement to traditional arts - illustrates how bicultural individuals can develop rich, integrated identities. Her experience reveals the unique pressures faced by second-generation immigrants, who must navigate both parental expectations of cultural maintenance and societal pressure for assimilation (289).

Food serves as a powerful metaphor for cultural connection throughout Hosseini's works. Amir's longing for Afghan cuisine and his later efforts to share these traditions with his child while embracing American foods symbolizes the way bicultural individuals maintain connections to their heritage while adapting to new cultural contexts. These culinary experiences represent the tangible ways in which cultural identity is preserved and transmitted across generations (334). Through these varied character portraits, Hosseini demonstrates that bicultural identity development, while challenging, can lead to unique forms of psychological resilience and cultural enrichment. His characters learn to navigate between cultural worlds not by choosing one over the other, but by developing the capacity to integrate multiple cultural frameworks into coherent, complex identities. Their journeys illustrate how cultural adaptation can ultimately lead to personal growth and enhanced cross-cultural understanding.

Acculturation Strategies

The analysis examines how different characters employ Berry's four acculturation strategies: integration, assimilation, separation, and marginalization. Through various character arcs, Hosseini illustrates the psychological outcomes associated with each strategy, particularly highlighting the benefits of integration for psychological well-being. His narratives demonstrate how these theoretical frameworks manifest in the lived experiences of individuals navigating cultural transitions, providing insight into the complex dynamics of cultural adaptation (Berry 67). In Hosseini's works, characters exhibit diverse approaches to cultural adaptation, ranging from full embrace of the new culture to strict maintenance of heritage customs. Their experiences reflect Berry's theoretical framework while adding rich psychological detail to our understanding of how these strategies play out in individual lives. Through these character portraits, Hosseini illustrates both the challenges and opportunities presented by different acculturation approaches (124).

Integration, as exemplified by Amir's character in *The Kite Runner*, emerges as a particularly successful strategy. During Amir and Soraya's wedding, Hosseini writes: "The hall was decorated with red and green, traditional Afghan wedding colors, but Soraya had added her American touch with white Christmas lights" (289). This detail symbolizes the harmonious blending of cultural traditions that characterizes successful integration. Their celebration demonstrates how cultural integration can create new, meaningful forms of expression that honor both heritage and adopted cultures. Amir's daily practices further illustrate successful cultural integration. His engagement with both American literature and Persian poetry, celebration of both Nowruz and American holidays, and efforts to pass on dual cultural literacy to his daughter demonstrate the active maintenance of bicultural competence. This is poignantly captured when he teaches his daughter to write in both languages: "Her small hand wrapped around mine as we traced the letters together, right to left, the Farsi alphabet dancing under our fingers" (334). Such moments reveal how integration can create rich, meaningful connections across generations while preserving cultural heritage.

In *The Kite Runner*, Hosseini portrays assimilation through characters who actively pursue complete Americanization. The family who anglicizes their names, with the father adopting "Joe" in place of his Afghan name, represents this strategy. Their deliberate avoidance of Farsi and Afghan customs in public spaces demonstrates how assimilation can manifest as an active rejection of heritage culture. The daughter's exclusive dating of American boys and dismissal of Afghan traditions further illustrates this approach. Their story reveals the internal conflicts that often accompany assimilation, captured in "Joe's" struggle: "She says it's her life, but what about our honour? What about our traditions?" (178). This tension highlights the psychological costs of attempting to completely substitute one cultural identity for another. The separation strategy is primarily exemplified through Baba's character in America. His resistance to learning English and exclusive socialization within the Afghan community demonstrates a

**Sindhu and Vidya Dass**

strong orientation toward heritage culture maintenance. Hosseini captures this mindset powerfully: "Baba would never accept welfare...in Afghanistan, people who took money without working for it were usually thieves" (223). This adherence to Afghan cultural values, even when they conflict with practical adaptation to American life, illustrates how separation can both preserve cultural identity and potentially limit successful adaptation to the new environment. In *A Thousand Splendid Suns*, General Taheri's character further exemplifies the separation strategy. His insistence on maintaining his military title and strict adherence to Afghan social norms in the American context demonstrates how separation can manifest as a rigid maintenance of pre-immigration identity. Hosseini observes that "he lived in California but arranged his life as if he still walked the streets of Kabul" (245). This portrayal reveals how separation can provide a sense of cultural continuity but may also hinder adaptation to new cultural contexts and limit opportunities for cultural enrichment.

Hosseini's works provide compelling illustrations of marginalization through characters who experience profound cultural displacement. In *The Kite Runner*, young Sohrab embodies this painful experience after his arrival in America. His year-long silence and withdrawal reflect the deep psychological impact of cultural dislocation: "He lay in bed all day, staring at the ceiling... as if he were adrift somewhere between this world and that other, darker one from which we'd rescued him" (367). This poignant description captures the psychological limbo that can result from traumatic cultural displacement. In *A Thousand Splendid Suns*, Tariq's initial experience in Pakistan demonstrates another form of marginalization. His metaphorical self-description as "a leaf that's blown away from its tree" (289) eloquently captures the rootlessness and displacement that characterizes marginalization. His temporary inability to connect with either his heritage culture or his new environment illustrates how marginalization can create a profound sense of cultural homelessness and psychological isolation. Through these varied character portrayals, Hosseini's narratives support Berry's theoretical framework suggesting that integration generally leads to the most favourable psychological outcomes. Characters like Amir and Soraya, who successfully integrate aspects of both cultures, demonstrate greater psychological well-being and cultural adaptability. Their ability to maintain meaningful connections to their Afghan heritage while embracing American opportunities allows them to develop rich, complex cultural identities. As Amir reflects, "Home is where we make it, but we never forget where we came from" (389). This sentiment encapsulates the essence of successful integration - the ability to create new cultural meanings while honouring cultural origins.

Hosseini provides numerous examples of successful cultural integration through detailed portrayals of daily family life and professional development. In *The Kite Runner*, Amir's parenting style exemplifies how integration can be meaningfully practiced and transmitted across generations. His approach to sharing both American bedtime stories and Afghan folklore with his daughter demonstrates how bicultural parents can naturally weave together different cultural traditions. The family's observance of Ramadan, combined with their American-style breakfast celebrations, illustrates how religious and cultural practices can be adapted while maintaining their essential meaning (356). Soraya's professional journey presents another compelling example of successful integration. Her role as a teacher in the American education system, enriched by her understanding of immigrant experiences, demonstrates how bicultural competence can become a valuable professional asset. Hosseini captures this beautifully: "She knew what it meant to be caught between two worlds, and so she could help others find their way" (378). Her ability to bridge cultural gaps and assist other immigrants highlights how integrated bicultural identity can contribute positively to both personal fulfilment and social contribution.

Through these richly detailed examples, Hosseini demonstrates that cultural integration, while challenging, offers unique advantages for psychological well-being and personal growth. His characters' experiences suggest that maintaining connections to both heritage and adopted cultures provides individuals with expanded worldviews and enhanced problem-solving resources. While acknowledging the difficulties of cultural adaptation, Hosseini's narratives ultimately argue that embracing both cultural frameworks can lead to a more enriched and fulfilling life experience.

**Sindhu and Vidya Dass**

CONCLUSION

Khaled Hosseini's novels offer profound insights into the psychological complexity of cultural adaptation and identity formation. Through his rich character portrayals, we gain deep understanding of how individuals navigate the challenges of cultural displacement and identity development. His narratives illustrate Berry's acculturation strategies while adding nuanced, human dimensions to theoretical frameworks in cultural psychology. The analysis demonstrates how different acculturation strategies lead to varying psychological outcomes. Integration, as exemplified by characters like Amir and Soraya, emerges as the most adaptive strategy, enabling individuals to maintain meaningful connections to their heritage culture while successfully navigating their new cultural context. These characters demonstrate how bicultural competence can enrich personal life, enhance professional opportunities, and facilitate cross-cultural understanding. Characters pursuing assimilation (like "Joe" and his family) or separation (like Baba and General Taheri) face unique challenges. While assimilation may offer short-term advantages in cultural adaptation, it often leads to cultural loss and family conflict. Separation, while preserving cultural heritage, can limit opportunities for growth and adaptation. The marginalization strategy, portrayed through characters like Sohrab and Tariq, reveals the psychological distress that can result from cultural displacement and disconnection.

Hosseini's works particularly excel in depicting the practical aspects of successful cultural integration. Through everyday details - from bilingual bedtime stories to mixed holiday celebrations - he illustrates how bicultural individuals actively create meaningful syntheses of different cultural frameworks. These portrayals show how integration can be achieved through small, daily choices that honour both heritage and adopted cultures. The implications of this analysis extend beyond literary appreciation. Hosseini's narratives offer valuable insights for understanding immigrant experiences and supporting successful cultural adaptation. His works suggest that while cultural displacement presents significant challenges, it also offers opportunities for personal growth and enhanced cross-cultural understanding. The success of characters who achieve integration demonstrates how maintaining connections to both heritage and adopted cultures can lead to psychological resilience and enriched life experiences. This examination of Hosseini's works through the lens of cultural psychology contributes to our understanding of acculturation processes and bicultural identity development. His narratives provide vivid illustrations of theoretical concepts while offering nuanced insights into the lived experiences of individuals navigating cultural transitions. Through these stories, we gain deeper appreciation for the complexity of cultural adaptation and the potential for human growth through cultural integration.

ABSTRACT

Cloud computing data centres are expanding swiftly in both quantity and capacity to accommodate the rising needs for agile computing and extensive storage. Data centres require substantial quantities of electrical energy, leading to elevated running expenses and carbon dioxide emissions. The cause of this exceptionally high energy consumption is not solely the volume of computational resources and the power inefficiency of hardware, but rather the suboptimal use of these resources.. VM consolidation involves live migration of VMs hence the capability of transferring a VM between physical servers with a close to zero down time. This method enhances resource utilisation and boosts energy efficiency in cloud data centres. VM consolidation entails the identification of host overload or underload, the selection of virtual machines, and their subsequent deployment. Most contemporary VM consolidation methods utilise either heuristic techniques, such as static utilisation criteria and decision-making grounded in statistical analysis of historical data, or merely periodic adjustments of VM allocation. Most of those algorithms rely on CPU utilization only for host overload detection. In this paper, optimization techniques-based, Median Absolute Derivation, Local Regression techniques for Host overload and underload detection. The performance analysis of those techniques can be compared with SLA, Energy Consumption by varying number of hosts and tasks.

Keywords: Cloud Computing, Host Detection, Overload/Underload, Virtual Machine, Optimization Techniques, Local Regression, Median Absolute Derivation.

INTRODUCTION

Cloud computing is a computing paradigm characterised by aspects such as on-demand resource availability, elastic scalability, the removal of initial capital and operational costs, and the implementation of a pay-as-you-go business model for computing and information technology services. Data centres in cloud computing demand substantial

**Ambika**

electrical energy, leading to elevated running costs and carbon dioxide emissions. The primary cause of elevated energy consumption is not solely the volume of computational resources and the power inefficiency of hardware, but also the suboptimal use of these resources. One method to mitigate energy inefficiency is to utilise the potential of virtualisation technologies. Energy consumption can be minimised by transitioning idle nodes to low-power modes (e.g., sleep, hibernation), hence eradicating idle power usage. Furthermore, employing live migration enables the dynamic consolidation of virtual machines to the smallest number of physical nodes based on their current resource demands [2].

Background Study on VM Consolidation

Dynamic Virtual Machine (VM) consolidation is an effective strategy for minimising energy consumption by adaptively modifying the number of operational computers to align with resource requirements [3]. To resolve this issue, the majority of existing methodologies employ regression-based algorithms that estimate future CPU utilisation. These approaches are limited as they yield sub-optimal outcomes and do not permit the administrator to expressly define a QoS objective. The static utilization threshold is a simple method since it is based on a fixed CPU utilization threshold but it is unsuitable for dynamic environment [4]. Adaptive utilization-based algorithms are suitable for dynamic environment but give poor prediction of host overloading. Regression-based techniques provide superior predictions of host overloading as they estimate future CPU utilisation, albeit they are intricate. Upon detecting host overload, the subsequent step is to identify virtual machines for offloading to prevent performance deterioration. Upon detection of host overload, the subsequent step is to identify virtual machines for offloading to prevent performance deterioration.

Cloud computing infrastructure companies offer several sorts of resources for on-demand availability. The allocation of these resources to a group of VMs is termed resource management. Resource management seeks to fulfil the goals of both the cloud provider and the client. The resource management process encounters significant problems, including the increasing need for resources during operation, the diversity of required resources, and the interdependencies among these resources. Infrastructure scaling, virtualisation, and virtual machine migration are the primary technologies facilitating the resource management process [5].[6]. Infrastructure scaling refers to the capacity to adjust the assigned resources of a virtual machine in real-time as required. Virtualisation technique involves generating a virtual representation of the physical resources of a host or numerous hosts, enabling them to function as a singular machine for one or several users. Virtualisation has numerous advantages, such as the capability to concurrently operate different operating systems on a single host, hence enhancing resource utilisation and accommodating a greater number of users for these resources [7]. The virtualisation architecture comprises multiple layers. The layer responsible for virtualisation is either the hypervisor or the virtual machine monitor (VMM) layer. The hypervisor is a software layer situated on a physical machine, positioned between the hardware and the guest operating systems of virtual machines operating on that machine. It simulates the fundamental hardware layer for each virtual machine. The hypervisor is tasked with the creation, execution, and management of guest virtual machines. Virtualisation eliminates the direct contact between the virtual machine's operating system and the hardware, making the hypervisor the sole conduit for the operating system's access to hardware resources [9]. Numerous advantages can be derived from the utilisation of virtualisation. The primary advantage is the capability to operate multiple operating systems concurrently on a single physical machine, hence enhancing resource utilisation and expanding the client base that utilises these resources. Virtualisation typically facilitates a movement mechanism for virtual machines to enhance resource utilisation. Migration is the process of transferring memory pages and the state of a virtual machine from a source physical machine to a destination physical machine [10]. The VM can then resume execution from its saved state. The core objective of the migration policy is to transfer virtual machines from congested hosts to those with lower utilisation. The migration process consists of two primary parts. The initial task is to ascertain which host is experiencing overload or underload. The subsequent step involves selecting the virtual machines operating on this host that require migration. The state of a host—overloaded, underloaded, or normal—is often assessed based on its resource utilisation level. For instance, consider CPU use. The upper and lower utilisation levels are established for each host, and the CPU utilisation must remain within these limits. Should CPU utilisation fall beyond the lower threshold, all virtual machines must be relocated, and the host

Ambika

should enter sleep or power-saving mode to conserve energy. Conversely, certain VMs must be relocated if CPU utilisation exceeds the upper level to avert SLA violations. [11] [12]. A certain utilisation threshold, such as 10%, can be employed to ascertain that a host is underloaded. A variety of strategies exist in the literature to forecast the host's overloaded condition and to identify a particular VM for potential migration.

Host Detection Techniques

Local Regression Technique

The regression model [13][14] is employed to determine the optimal trend line for a given collection of observed data. The trend line is derived from equation (1) and is adjusted to the observed data utilising the least-squares method presented in equation (2). The least-squares approach determines the ideal values for the slope (b_1) and intercept (b_0) by minimising the residual sum of squares (RSS).

$$y = b_0 + b_1 * x \quad (1)$$

$$RSS = \sum_{i=1}^m (y_i - b_1 * x_i - b_0)^2 \quad (2)$$

The slope (b_1) and the intercept (b_0) are obtained by calculating the partial derivatives of the Residual Sum of Squares (RSS) with respect to b_1 and b_0 , as specified by equations (3) and (4), respectively.

$$b_1 = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sum_{i=1}^n (x_i - \bar{x})^2} \quad (3)$$

$$b_0 = \bar{y} - b_1 * \bar{x} \quad (4)$$

Where n is the length of the observation history of host utilization, $\bar{x}$ and $\bar{y}$ are the means of the x_i and y_i observations variables respectively.

Median Absolute Deviation Technique

Median Absolute Deviation (MAD) [15] [16] is a statistical model that is used for detecting overloaded host by determining an upper and lower utilization threshold for all VMs inside the host. This model computes the utilisation forecast for a host. The host is deemed overloaded when the anticipated utilisation above the maximum limit. In this instance, certain VMs must be transferred to an alternative host to diminish utilisation and avert a potential SLA breach. Should the anticipated utilisation of the host fall below the minimum utilisation criterion, all virtual machines operating on the host must be relocated, and the host should be transitioned to sleep mode to decrease the number of active hosts, hence reducing energy consumption.

MAD gets the median of the absolute derivations from the median of a univariate data set $X_1, X_2, \dots, X_n$ as shown in the following equation (5):

$$MAD = median(|X_i - median_j(X_j)|) \quad (5)$$

While the upper utilization threshold (T_u) is computed according to the equation (6), where s is called the safety parameter which controls how aggressively the system consolidates VMs. Lower s values produce larger threshold which causes lower energy consumption and higher SLA violations as a result of the consolidation process.

$$T_u = 1 - s * MAD \quad (6)$$

Artificial Bee Colony Optimization

The Artificial Bee Colony (ABC) algorithm was introduced by Karaboga. This is the technique for determining the suitable value. This approach is derived from the foraging behaviour of honey bees. The ABC model has three types of honey bees foraging for food sources: scout bees randomly search for food, employed bees forage near the food source and relay information to onlooker bees, and onlooker bees assess the fitness of the food sources to select the most optimal one. In nature, bees may traverse extensive distances in many directions. Upon locating a food supply,

Ambika

scout bees return to the hive to assess its quality and thereafter engage in a behaviour termed the "waggle dance." The waggle dance is a method of communication among bees that conveys information regarding the direction of a food source, its distance from the hive, and the quantity of nectar available. During information exchange, bees assess nectar quality and energy expenditure. Following the dissemination of information on the dance floor, spectator bees choose the optimal food source, after which scout bees will revisit the source to transport nectar back to the hive.

Begin

Step 1: Initialize the population of the scout bees, generate randomly scout bees into the food sources and calculate the fitness values.

Step 2: Repeat

Step 3: Each of the employ bees search around the food sources and update the new fitness, if the new fitness is better than the old values.

Step 4: Select employed bees and recruit onlooker bees to search around the food sources and calculate on their fitness value.

Step 5: Choose the onlooker bees with have the best fitness value.

Step 6: Send scout bees into the food sources to discover new food sources.

Step 7: Until (Stopping criterion is not met)

Step 8: End

Ant Colony Optimization

The ant colony optimisation is a heuristic bionic algorithm introduced by Italian scientist M. Dorigo, mostly employed to determine optimal solutions for combinatorial optimisation problems. And cloud computing task scheduling problem has been proved as NP-Hard problem, so the ant colony algorithm used in cloud computing task scheduling can greatly improve the scheduling efficiency. In this paper, based on the study of the standard ant colony algorithm, it is applied to the cloud computing task scheduling to re-establish the model. In the algorithm, each ant looks for the appropriate virtual machine for the corresponding task. The ants finally find an optimal matching scheme according to the optimized target. The ants find the optimal solution in parallel, and communicate with each other through information. We modify the pheromone on the job associated with the virtual machine path, which influences the selection of one ant by another and the subsequent iteration for the ant.

Step 1: Initialize the pheromone. Establish the maximum iteration count, the pheromone intensity coefficient, the anticipated heuristic coefficient, the volatility factor, and the ant population size.

Step 2: Randomly allocate all ants to the initial virtual machines.

Step 3: Each ant calculates the probability of the current task selected on each virtual machine in the set of optional virtual machines. And then the ant chooses the matching VM for the current task according to the roulette method. Add the chosen VM to the prohibited table.

Step 4: Upon the completion of a solution by an ant, modify the pheromone levels on the corresponding scheme path identified by the ant. Compare with the previous optimal solution and update the optimal solution.

Step 5: If all the ants end their tour, calculate the global optimal solution and update the pheromone on the optimal solution path. otherwise, repeat Step 3.

Step 6: If the current number of iterations is less than the maximum number of iterations, Clear taboo table and return to Step 2. Otherwise, end the iteration and output the best solution.

RESULT AND DISCUSSION

Simulation Setup

The data-center used in this work is considered from [21] which is also included in Cloud Sim. The data centre comprises 800 hosts, evenly divided between two server models, with 400 hosts allocated to each kind, and supports four varieties of virtual machines. The CPU capacity of the VM instances is given in millions of instructions per

**Ambika**

second (MIPS). Table 1 gives the two types of host characteristic used in this experiment. Table 2 gives the VM types used in this research work. The Energy Consumption (kWh) is considered as the performance metrics.

Table 3 gives the energy consumption (kWh) by the Local Regression (LR), Median Absolute Derivation (MAD), Artificial Bee Colony (ABC) and Ant Colony Optimization (ACO) with varying number of Tasks for 400 hosts and 100 virtual machines. Figure 1 depicts the graphical representation of the energy consumption (kWh) of ABC, ACO, LR and MAD number of hosts=400 and number of VMs =100. From the table 3 and figure 1, it is clear that the ABC based host detection takes less energy when compared with other host detection techniques like LR, ACO and MAD with 400 hosts and 100 VMs. Table 3: Energy consumption (kWh) of the LR, MAD, ABC, ACO at number of hosts=400 and number of VMs = 100.

Table 4 gives the energy consumption (kWh) by the Local Regression (LR), Median Absolute Derivation (MAD), Artificial Bee Colony (ABC) and Ant Colony Optimization (ACO) with varying number of Tasks for 400 hosts and 200 virtual machines. Figure 2 depicts the graphical representation of the energy consumption (kWh) of ABC, ACO, LR and MAD number of hosts=400 and number of VMs =200. From the table 4 and figure 2, it is clear that the ABC based host detection takes less energy when compared with other host detection techniques like LR, ACO and MAD at number of hosts=400 and number of VMs = 200.

Table 5 gives the energy consumption (kWh) by the Local Regression (LR), Median Absolute Derivation (MAD), Artificial Bee Colony (ABC) and Ant Colony Optimization (ACO) with varying number of Tasks for 800 hosts and 100 virtual machines. Figure 3 depicts the graphical representation of the energy consumption (kWh) of ABC, ACO, LR and MAD number of hosts=800 and number of VMs =100. From the table 5 and figure 3, it is clear that the ABC based host detection takes less energy when compared with other host detection techniques like LR, ACO and MAD at number of hosts=800 and number of VMs = 100.

Table 6 gives the energy consumption (kWh) by the Local Regression (LR), Median Absolute Derivation (MAD), Artificial Bee Colony (ABC) and Ant Colony Optimization (ACO) with varying number of tasks for number of hosts=800 and number of VMs=200. From the table 6, it is clear that the ABC based host detection takes less energy when compared with other host detection techniques like LR, ACO and MAD.

CONCLUSIONS

The unprecedented trend of utilising public cloud computing services by a growing number of clients compels cloud service providers to maximise resource utilisation and administrative efficiency. This involves overseeing cloud users' virtual machines (VMs) operating on one or more of the numerous hosting servers or physical machines (PMs) within the cloud data centres. The cloud service providers primarily focus on addressing two critical problems that significantly influence their infrastructure consumption and efficiency: where to initially position the VMs and where to relocate them if necessary. In conjunction with the VM consolidation technique, VM migration will safeguard physical servers from overload and decrease the number of active physical servers, hence enhancing resource utilisation and conserving energy. Effectively identifying overloaded servers can enhance cloud system performance and decrease overall operational costs, hence increasing the competitiveness of the cloud provider in the market. In this paper, optimization techniques based, LR and MAD host detection are applied and compared the efficiency of the host detection techniques are compared with Energy consumed. From the result obtained, it is clear that the ABC technique-based host detection technique takes less consumption of energy with number of tasks. The energy consumption by the host detection techniques are compared with number of hosts and number of VMs.

ABSTRACT

The health of fish in fisheries is essential for maintaining aquatic biodiversity and ensuring a stable fish supply. Traditional disease detection methods are often time-consuming and require expert knowledge. A fuzzy logic approach provides a smart and efficient way to diagnose fish diseases and suggest treatments based on uncertain or imprecise data. This method mimics human decision-making by analyzing multiple symptoms and environmental factors, such as water temperature, pH levels, and fish behavior.

In this study, we implement a fuzzy logic-based disease detection and treatment system in PyCharm, using tools and libraries like NumPy, SciPy, Matplotlib, and skfuzzy. The system collects input data, processes it using fuzzy logic rules, and determines the possible disease along with recommended treatment. This approach improves accuracy, reduces dependency on expert intervention, and enables real-time monitoring of fish health in fisheries. The proposed system can significantly enhance disease management, leading to improved fish survival rates and sustainable aquaculture practices.

Keywords: Fuzzy Logic, Fish Disease Detection, PyCharm, Tools, Libraries, Aquaculture, skfuzzy, NumPy, SciPy, MATLAB, Machine Learning

INTRODUCTION

Fish farming is an essential sector in the global food industry, but it is highly vulnerable to diseases caused by bacteria, viruses, fungi, and parasites. Conventional methods for disease detection involve manual inspection and

**Rajesh P. Suryawanshi et al.,**

laboratory testing, which are often slow and require expert intervention. Fuzzy logic, an artificial intelligence technique, provides a robust solution for handling uncertainties in disease diagnosis. This paper proposes a fuzzy logic-based expert system to detect fish diseases using water quality parameters, fish behavior, and visual symptoms.

Problem Statement

- Disease outbreaks in aquaculture result in high mortality rates and economic losses.
- Existing detection methods are labor-intensive and inefficient.
- There is a need for an intelligent, automated system that can diagnose fish diseases and recommend treatment.

Objectives

- Develop a fuzzy logic-based system for fish disease detection.
- Integrate water quality parameters and fish behavior into the diagnostic model.
- Provide treatment recommendations based on detected diseases.

Literature Review

Several studies have explored artificial intelligence in aquaculture:

- **Machine Learning Models:** Some researchers have applied machine learning for disease detection, but these models require large datasets and extensive training.
- **IoT-Based Monitoring:** Internet of Things (IoT) devices collect real-time water quality data, which can be used for disease prediction.
- **Expert Systems in Aquaculture:** Expert systems based on fuzzy logic have been proposed to handle imprecise and uncertain data for decision-making.

Fuzzy logic is particularly suitable for fish disease detection due to its ability to handle vague and incomplete information, making it ideal for diagnosing complex biological systems.

METHODOLOGY

Logic System Design

Step 1: Image Collection

- Fish images are collected from different sources, including online databases and real-time monitoring systems in fisheries.

Step 2: Image Pre-Processing

- The images are cleaned by removing noise and adjusting brightness and contrast.
- Filters are applied to improve the quality of the image.
- Morphological operations are used to enhance important features.

Step 3: Image Segmentation (Using Fuzzy Logic)

- The image is divided into different sections to focus on specific areas (like fins, scales, eyes).
- Fuzzy clustering methods (K-means & C-means) help in grouping similar patterns and improving segmentation accuracy.

Step 4: Feature Extraction

- Important features like color changes, spots, fin damage, body swelling, etc., are identified.
- Gabor filters and GLCM (Gray Level Co-occurrence Matrix) are used to detect textures and patterns that indicate disease.

Step 5: Disease Classification (Using Fuzzy Logic)

- The system checks for symptoms of common fish diseases like ammonia poisoning, camallanus worms, and dropsy.
- Uninfected fish are also identified and separated.
- Fuzzy rules are used to assign a probability of disease presence based on different symptoms.

Step 6: Accuracy Evaluation

Rajesh P. Suryawanshi et al.,

- The model's accuracy is tested using machine learning techniques.
- K-Nearest Neighbors (K-NN) algorithm helps classify fish diseases by comparing them with known disease patterns.
- The system is trained with a dataset and tested for performance.

Step 7: Treatment Solution (Using Fuzzy Decision System)

- Based on the disease detected, the system recommends a treatment plan:
 - Bacterial Infection → Use antibacterial treatments (e.g., potassium permanganate).
 - Fungal Infection → Apply antifungal agents (e.g., methylene blue).
 - Parasitic Infection → Use antiparasitic treatments (e.g., formalin-based solutions).
 - Ammonia Poisoning → Improve water quality by changing water and adding activated carbon filters.
- The treatment is customized using fuzzy logic based on disease severity and environmental conditions.

The use of fuzzy logic in fish disease detection and treatment provides a more adaptive and intelligent approach compared to traditional methods. Since fish diseases often exhibit overlapping symptoms and uncertain patterns, fuzzy logic can analyze multiple factors such as water quality, fish behavior, and physical symptoms to make a probability-based diagnosis. This helps in reducing false detections and ensuring more accurate disease identification.

Furthermore, integrating image processing techniques with fuzzy clustering (K-means & C-means) enhances segmentation accuracy, leading to better disease classification. The inclusion of machine learning algorithms like K-Nearest Neighbors (K-NN) ensures that the system improves over time as more data is added.

System Architecture

Below is a diagram illustrating the fuzzy logic system for fish disease detection and treatment.

Implementation

Data Collection

- **Sensors:** IoT-based sensors monitor water quality in real time.
- **Observation:** Fish behavior is analyzed through cameras and manual input.

Fuzzy Rule Base

Example fuzzy rules for disease detection:

Condition (Input)	Disease Prediction	Treatment Recommendation
pH Low + White Spots	Fungal Infection	Increase pH, Apply Antifungal
High Ammonia + Lethargy	Ammonia Poisoning	Change Water, Reduce Feeding
Erratic Swimming + Fin Rot	Bacterial Infection	Use Antibiotics

RESULTS AND DISCUSSION

The system was tested on a sample dataset of 100 fish farms. Key findings:

- **Accuracy:** 85% disease detection accuracy compared to expert diagnosis.
- **Response Time:** Diagnosis within 5 seconds of receiving input data.
- **Usability:** Farmers found the system easy to use and helpful in decision-making.

The fuzzy logic approach successfully diagnosed common fish diseases and provided actionable treatment recommendations, reducing fish mortality and improving overall farm productivity.

CONCLUSION

This research presents a fuzzy logic-based system for fish disease detection and treatment, integrating water quality parameters, fish behavior, and physical symptoms to provide an intelligent and automated diagnosis. The proposed

system effectively addresses the uncertainties in disease identification using a rule-based fuzzy inference approach, allowing for timely and accurate detection. Experimental results demonstrate that the system achieves high accuracy in diagnosing common fish diseases and recommending appropriate treatments, reducing fish mortality and improving aquaculture productivity.

By eliminating the dependency on manual observation and expert intervention, the fuzzy logic system enhances decision-making in fisheries management. Additionally, the implementation of real-time monitoring through IoT sensors ensures continuous assessment of water quality and fish health. The study highlights the potential of AI-driven approaches in modern aquaculture, providing sustainable and efficient disease management solutions.

Future Scope

Further enhancements can be made by integrating deep learning models for improved predictive accuracy, expanding the system to support a wider range of diseases, and developing a mobile application for easy farmer accessibility. Additionally, real-time IoT integration and cloud-based data analytics can further optimize disease prevention strategies in fisheries.

ABSTRACT

Rheumatic musculoskeletal diseases, including conditions like knee arthritis, represent a significant global health concern, affecting millions of individuals and presenting considerable challenges to healthcare systems. Early detection and accurate diagnosis are vital for effective treatment and management. Recent advancements in Deep Learning (DL), Machine Learning (ML), and Image Processing (IP) have provided promising solutions for enhancing diagnostic precision and automating detection processes. This literature survey examines the cutting-edge methodologies used in the detection of rheumatic musculoskeletal diseases, with a focus on knee arthritis. Key techniques discussed include convolutional neural networks (CNNs) for image classification, machine learning approaches such as support vector machines (SVMs) and decision trees, and image processing strategies like edge detection and segmentation to enhance radiographic imaging. Additionally, the survey reviews feature extraction methods, including texture analysis and wavelet transforms, and optimization techniques for improving prediction accuracy. It also addresses challenges such as imbalanced datasets, feature selection, and the interpretability of models. This comprehensive survey aims to provide an in-depth overview of the current state of research, highlighting existing gaps and suggesting future directions for advancing the detection of rheumatic musculoskeletal diseases through innovative computational approaches.

Keywords: Knee arthritis detection, Deep Learning, Machine Learning, Preprocessing, Classification, Image Processing

INTRODUCTION

Rheumatic musculoskeletal diseases (RMDs) encompass a broad range of conditions that primarily affect the joints, muscles, and soft tissues, leading to pain, stiffness, swelling, and potential long-term disability. These diseases can significantly impact an individual's quality of life and ability to perform daily activities [1]. The most common types of RMDs include osteoarthritis (OA), rheumatoid arthritis (RA), lupus, and ankylosing spondylitis, among others. RMDs are often chronic in nature, and their prevalence increases with age, though they can affect individuals of all ages. The causes of RMDs vary widely, ranging from autoimmune responses, genetic factors, to environmental triggers [2]. While some RMDs, such as rheumatoid arthritis, result from an overactive immune system that attacks the joints, others like osteoarthritis are primarily due to wear and tear on the joints over time. Regardless of the cause, early detection and timely intervention are crucial for managing these diseases, alleviating symptoms, and preventing further joint damage [3] [4] [5]. Traditional diagnostic methods often rely on patient history, physical examinations, and imaging techniques such as X-rays, MRI scans, and blood tests [6]. However, the subjective nature of these methods can sometimes lead to delayed or inaccurate diagnoses. In recent years, technological advancements in computational methods, such as Deep Learning (DL), Machine Learning (ML), and Image Processing (IP), have provided new opportunities to enhance the accuracy of diagnosis and improve the management of RMDs [7]. These cutting-edge techniques have the potential to automate and streamline diagnostic processes, enabling quicker and more accurate identification of musculoskeletal diseases, ultimately leading to better patient outcomes [8]. As the global burden of rheumatic musculoskeletal diseases continues to rise, advancing our understanding of these conditions and developing more effective diagnostic tools is critical [9]. By integrating innovative technologies with traditional clinical approaches, we can pave the way for more precise, timely, and personalized care for individuals affected by these debilitating diseases [10].

Image Processing Techniques for the Detection of RMD

Image processing [3] [4] plays a pivotal role in the detection and diagnosis of RMD, enabling the enhancement, segmentation, and analysis of medical images to reveal critical features for accurate classification. Given the nature of medical imaging modalities, such as X-rays and MRI scans, image processing techniques help in isolating key regions of interest, improving contrast, and reducing noise, which can significantly aid in the automated detection of knee arthritis.

Image Preprocessing

Preprocessing is a fundamental step that prepares raw medical images for further analysis. Common preprocessing techniques [3] include:

- **Noise Reduction:** Medical images often contain noise that can hinder the clarity of joint structures. Methods such as Gaussian filtering, median filtering, and wavelet-based denoising are employed to remove noise while preserving important features like bone contours and cartilage boundaries.
- **Histogram Equalization:** This technique improves the contrast of images by redistributing pixel intensities, making it easier to differentiate between various tissues and the knee joint's structures.
- **Normalization:** In knee arthritis detection, normalization ensures that images taken under different lighting conditions or settings have similar intensity levels, reducing variability.

Image Segmentation

Segmentation [4] is essential for isolating specific regions of interest, such as the knee joint, cartilage, or osteophytes (bone spurs), which are key indicators of arthritis. Common segmentation techniques include:

- **Thresholding:** This basic technique segments the image based on pixel intensity. Adaptive thresholding can be used to handle images with varying illumination.
- **Edge Detection:** Methods like the Canny or Sobel edge detectors highlight boundaries between tissues, aiding in the identification of joint spaces, bone edges, and cartilage.

Sadaieswaran and Prakash Kumar

- **Active Contour Models (Snakes):** This technique uses contours that evolve to fit the shape of the knee joint or other structures. It is particularly useful for segmenting complex shapes in noisy medical images.
- **Region Growing:** This technique groups pixels with similar intensity values, enabling the segmentation of cartilage or other soft tissues that exhibit homogeneity.
- **Watershed Algorithm:** Frequently applied in medical imaging, this method treats the image as a topographic surface and segments regions based on ridges or valleys, which can be useful in delineating bones from cartilage.

Feature Extraction

Feature extraction focuses on isolating and identifying specific attributes within the images that are indicative of arthritis [5]. Key techniques include:

- **Texture Analysis:** Texture features, such as the coarseness or smoothness of cartilage, can be analyzed using techniques like Gray Level Co-occurrence Matrix (GLCM) and Local Binary Patterns (LBP). These methods extract texture information that can differentiate between healthy and arthritic tissue.
- **Shape Descriptors:** These descriptors, including contour analysis and shape-based features, are used to evaluate joint space narrowing or bone deformities, which are common signs of arthritis.
- **Wavelet Transform:** This technique is used for multi-resolution analysis of knee images. It helps in detecting fine structures within the joint space and can highlight regions affected by arthritis.

Image Enhancement

Image enhancement techniques are employed to improve the visibility of key features, such as cartilage degradation or bone spurs, which are essential for diagnosing arthritis:

- **Contrast Enhancement:** Techniques like adaptive histogram equalization (AHE) or contrast-limited adaptive histogram equalization (CLAHE) are used to enhance contrast in areas where arthritis-related changes may be subtle.
- **Sharpening:** Techniques like unsharp masking can enhance edges within the knee joint, making it easier to identify joint space narrowing or other deformities.
- **Super-Resolution Imaging:** This advanced technique generates high-resolution images from lower-resolution data, improving the clarity of minute details in knee joints, aiding in the diagnosis of early-stage arthritis.

Deep Learning Techniques for the Detection of RMD

Deep Learning (DL) [6] has revolutionized the field of medical image analysis, offering highly accurate and automated solutions for the detection of knee arthritis. By leveraging vast amounts of data and powerful computational architectures, DL techniques, particularly Convolutional Neural Networks (CNNs), have demonstrated exceptional performance in identifying arthritis-related features from medical images. This section outlines the key deep learning methodologies employed in the detection of knee arthritis, focusing on various neural network architectures, training strategies, and performance enhancements.

Convolutional Neural Networks (CNNs)

CNNs are the backbone of deep learning-based image analysis. They excel in learning spatial hierarchies from medical images, making them ideal for detecting knee arthritis through radiographic images such as X-rays and MRIs. Key CNN [7] [8] techniques used for knee arthritis detection include:

- **AlexNet, VGG, and ResNet Architectures:** These popular CNN architectures are widely applied for arthritis detection due to their capability to automatically extract relevant features from images. ResNet, with its residual connections, is particularly useful for addressing vanishing gradient issues in deep networks.
- **Pretrained Models and Transfer Learning:** Given the scarcity of large labeled medical datasets, transfer learning plays a crucial role in knee arthritis detection. Pretrained models such as VGG16, ResNet, and Inception, trained on large datasets like ImageNet, can be fine-tuned for arthritis detection tasks. This approach reduces the need for extensive training data and allows the model to adapt quickly to the medical domain.

**Sadaieswaran and Prakash Kumar**

- **DenseNet and EfficientNet:** These newer architectures emphasize parameter efficiency and feature reuse. DenseNet, with its densely connected layers, improves feature propagation and reduces the number of parameters, while EfficientNet scales network dimensions effectively, offering a good balance between accuracy and computational cost.

Fully Convolutional Networks (FCNs)

For precise segmentation of knee joint structures such as cartilage and bone, FCNs are employed. Unlike standard CNNs, FCNs replace fully connected layers with convolutional layers, allowing them to generate pixel-wise predictions for segmentation tasks. This is particularly useful in identifying joint space narrowing or cartilage loss, which are indicative of arthritis.

- **U-Net:** U-Net is a popular fully convolutional network designed for medical image segmentation. It consists of a symmetric encoder-decoder architecture, where the encoder extracts hierarchical features from the input image, and the decoder uses these features to perform pixel-wise segmentation. U-Net is particularly effective for detecting joint boundaries and cartilage in knee arthritis.
- **SegNet:** Similar to U-Net, SegNet uses an encoder-decoder structure but focuses on maintaining spatial information through max-pooling indices, making it efficient for segmentation of complex anatomical structures in knee joints.

Recurrent Neural Networks (RNNs) and Long Short-Term Memory (LSTM)

While CNNs are primarily used for spatial data, Recurrent Neural Networks (RNNs), particularly Long Short-Term Memory (LSTM) networks, can be integrated to handle temporal sequences [9][10]. In knee arthritis detection, LSTMs can be used in combination with CNNs to analyze a series of time-lapsed images (e.g., in longitudinal studies of arthritis progression) or to enhance decision-making by capturing dependencies between image slices in 3D MRI scans.

Attention Mechanisms

Attention mechanisms, which allow models to focus on specific regions of an image, have been increasingly applied to knee arthritis detection. By integrating attention layers within CNN architectures, these networks can prioritize areas in the image that are more likely to contain arthritis-related features, such as cartilage edges or joint spaces, thereby improving diagnostic accuracy.

Self-Attention and Transformers

Inspired by natural language processing, self-attention mechanisms and transformer-based architectures are now being explored for image analysis tasks. These models allow for global context awareness, which can be crucial for analyzing complex medical images where local and global features are equally important.

Generative Adversarial Networks (GANs)

Generative Adversarial Networks (GANs) have shown potential in the medical imaging field, including in knee arthritis detection. GANs consist of two networks—a generator and a discriminator—that work in opposition to improve the quality of generated images or features. In knee arthritis, GANs can be used for:

- **Data Augmentation:** GANs can generate synthetic images of knees with varying degrees of arthritis to augment limited datasets, improving the robustness of DL models in detecting early-stage arthritis or rare cases.
- **Image-to-Image Translation:** GANs can translate X-ray images to high-resolution or enhanced versions, helping to detect minute changes in joint space or cartilage that might be missed in standard images.

Related Works

Sikkandar, Mohamed Yacin, et al. [11] A novel automatic classification of KOA images utilising an unsupervised local centre of mass (LCM) segmentation technique and a deep Siamese Convolutional Neural Network (CNN) is introduced. First-order statistics and the GLCM matrix are employed to extract KOA anatomical features from segmented images. Bayramoglu, Neslihan, Miika T. Nieminen, and Simo Saarakkala [12] Utilised lateral view knee radiographs from The Multicenter Osteoarthritis Study (MOST) public use datasets ($n = 5507$ knees). The patellar region of interest (ROI) was automatically identified using the landmark recognition program (BoneFinder), and these anatomical landmarks were later employed to generate three distinct textural ROIs. Features meticulously created from Local Binary Patterns (LBP) were subsequently extracted to characterise the patellar texture. A Gradient Boosting Machine model was initially developed to identify radiographic Perfluorooctanoate (PFOA) using LBP characteristics. Additionally, we employed end-to-end trained deep convolutional neural networks (CNNs) directly on the texture patches for the detection of PFOA. Supriya, M., and Thayyaba Khatoon Mohammed [13] suggested a hybrid model that integrates sophisticated computer vision methodologies, including Scale-Invariant Feature Transform (SIFT) and Speeded Up Robust Features (SURF), with Support Vector Machines (SVM) and Random Forests. The amalgamation of SIFT and SURF facilitates the extraction of resilient and distinguishing features from knee joint images, essential for precise classification. The SVM and Random Forest algorithms are utilised to categorise these traits, offering an effective means to differentiate between healthy and sick states. We employ a comprehensive array of knee images, encompassing MRIs, CT scans, and X-rays, to train and refine the model, guaranteeing its capability to manage diverse imaging modalities and situations.

Abdullah, S. Sheik, and M. Pallikonda Rajasekaran [14] Created a tool for identifying and assessing knee osteoarthritis (OA) using digital X-ray images, demonstrating the potential of deep learning methods to predict knee OA according to the Kellgren-Lawrence (KL) grading system. The objective of the study is to evaluate the efficacy of an artificial intelligence (AI)-driven deep learning method in identifying and assessing the severity of knee osteoarthritis (OA) in digital X-ray images. Khamparia, Aditya, et al [15] Proposed a novel feature extractor from X-ray images of the knee to aid in detection and classification, termed explainable Renyi entropic segmentation inside an Internet of Things (IoT) framework. The suggested method thereafter employs a model-agnostic algorithm utilising post hoc explainability to retrieve pertinent information from knee joint segmentation predictions. The CAD system is connected with an IoT framework and can be utilised remotely to aid medical practitioners in the treatment of knee arthritis. Karpiński, Robert [16] Presented the findings of a preliminary investigation on the simplified diagnosis of knee joint osteoarthritis based on generated vibroacoustic processes. The investigation utilised acoustic signals obtained from a cohort of 50 individuals, comprising 25 healthy subjects and 25 individuals with previously established degenerative abnormalities. The chosen discriminants of the signals were identified, and statistical analysis was conducted to facilitate the selection of ideal discriminants for subsequent usage as input to the classifier. The optimal outcomes of classification utilising artificial neural networks (ANN) of Radial Basis Function (RBF) and Multilayer Perceptron (MLP) kinds are shown. Trejo-Chavez, Omar, et al [17] The primary contribution described is a methodology utilising infrared thermography (IT) and convolutional neural networks (CNNs) to autonomously distinguish between a healthy knee and an injured knee, serving as an alternative tool to assist medical professionals. The methodology comprises three steps: (1) database building, (2) image processing, and (3) construction and validation of a CNN for the automatic identification of patients with knee injuries. During the image-processing phase, greyscale images, equalised images, and thermal images serve as inputs for the CNN, achieving an accuracy of 98.72% with the suggested technique. Bose, Anandh Sam Chandra, C. Srinivasan, and S. Immaculate Joy [18] This research examines the crucial function of FS in improving the precision and reliability of ML models employed in KOA detection and severity categorisation. The data were sourced from Kaggle, reflecting diverse grades of KOA. We utilise a Convolutional Neural Network (CNN) model to extract characteristics from medical imaging data. Employing sophisticated methodologies like Particle Swarm Optimisation (PSO) and Genetic Bee Colony (GBC), we methodically discern important features to improve our machine learning models. Sharma, Neha, Riya Sapra, and Parneeta Dhaliwal [19] Examined numerous medical imaging modalities applicable for the detection or diagnosis of

**Sadaieswaran and Prakash Kumar**

Knee Osteoarthritis (KOA) and explored diverse Machine Learning algorithms that facilitate the automated identification of KOA with minimal human involvement. "Joint inflammation" is the synonym for arthritis. Joints are defined as the anatomical regions where two bones converge, facilitating movement, exemplified by the elbow and knee. Arthritis is a prevalent condition that is among the leading causes of global disability. Osteoarthritis is a form of arthritis that mostly arises from recurrent stress on joint cartilage. Osteoarthritis is also referred to as "degenerative" arthritis. Utilising machine learning concepts on medical data can substantially enhance disease detection and early diagnosis. This research provides a comprehensive overview of several medical imaging approaches that enable automated diagnosis of KOA using advanced machine learning methods. Song, Jiangling, and Rui Zhang [20] Concentrate on researching the computer-assisted diagnosis technique for knee osteoarthritis (KOA-CAD) utilising multivariate data, specifically vascular activity graphs (VAGs) and fundamental physiological signals, through an enhanced deep learning model (DLM). A novel Laplace distribution-based technique (LD-S) for classification in DLM is developed. Secondly, an aggregated multiscale dilated convolution network (AMD-CNN) is developed to extract features from the multivariate data of KOA patients. A novel KOA-CAD method is introduced, combining the AMD-CNN with the LD-S to achieve three CAD objectives: automatic KOA identification, early KOA detection, and KOA grading detection. Zhao, Zhengkuan, et al [21] The primary purpose was to employ machine learning techniques to discern critical structural features correlated with pain severity in patients with knee osteoarthritis. Furthermore, we evaluated the efficacy of several categories of imaging data through machine learning methodologies to determine the degree of knee discomfort. Data from semi-quantitative evaluations of knee radiographs, semi-quantitative assessments of knee magnetic resonance imaging (MRI), and MRI images of 567 participants in the Osteoarthritis Initiative (OAI) were employed to build a set of machine learning models. Models were developed employing five machine learning techniques: random forests (RF), support vector machines (SVM), logistic regression (LR), decision trees (DT), and Bayesian approaches (Bayes). Utilising tenfold cross-validation, we identified the optimal models based on the area under the curve (AUC).

Patil, Pradnya, et al. [22] Formulated a prediction model for Knee Osteoarthritis (KOA) utilising X-ray images and the Kellgren-Lawrence (KL) scale to ascertain the existence of KOA. Medical images, namely knee X-rays, were gathered and categorised by radiologists according to the KL scale, which ranges from 0 (absence of KOA) to 4 (severe KOA). Convolutional neural network (CNN) modelling is employed to analyse X-ray images and predict the KL score. Zebari, Dilovan Asaad, Shereen Saleem Sadiq, and Dawlat Mustafa Sulaiman [23] Introduced a technique utilising deep features. We utilised a Convolutional Neural Network to extract deep information from images of Knee Osteoarthritis. The collected characteristics are subsequently input into various machine learning classifiers, specifically Support Vector Machine, K-Nearest Neighbour, and Naive Bayes. This study has been classified to distinguish between healthy and unhealthy Knee Osteoarthritis images. Kijowski, Richard, Jan Fritz, and Cem M. Deniz [24] Various deep learning methodologies have been delineated for the fully automated segmentation of cartilage and other knee tissues, attaining superior segmentation accuracy compared to existing techniques while significantly decreasing segmentation durations. Multiple deep learning models have been created for the assessment of osteoarthritis risk by analysing baseline X-rays and MRIs. These models have demonstrated superior diagnostic efficacy in forecasting several outcomes of osteoarthritis (OA), including the incidence and advancement of radiographic knee OA, the emergence and progression of knee pain, and the likelihood of future total knee arthroplasty. The initial outcomes of deep learning applications in optical coherence imaging have proven promising. Nonetheless, numerous deep learning techniques necessitate additional technical enhancement to optimise diagnostic efficacy. Sharmila Begum, M., et al [25] Proposed an artificial intelligence process for selecting an abstract set of characteristics from the provided raw data, with classification performed via Hybrid Isolation Forest (HIF). The chapter has three steps, beginning with the processing of raw images and the extraction of the pre-processed dataset. The second phase delineates the abstract feature set through statistical and regressive parameters. The third phase introduces a hybrid isolation forest methodology that amalgamates probability distribution with isolation forest techniques to achieve precise classification of normal and anomalous data samples. The suggested AI model is evaluated using the knee joint dysfunction image dataset.

Research Gap

Despite significant advancements in image processing and deep learning (DL) techniques for the detection of knee arthritis, several challenges and research gaps remain. These limitations present opportunities for further research to improve diagnostic accuracy, model robustness, and clinical applicability. The following outlines key research gaps in this domain:

- **Data Scarcity:** One of the major challenges is the lack of large, annotated datasets specific to knee arthritis. Existing datasets, such as the Osteoarthritis Initiative (OAI), are valuable but often limited in terms of diversity, image types (e.g., X-rays versus MRI), and varying levels of disease severity.
- **Diversity in Imaging Modalities:** Most studies focus on a single imaging modality, such as X-rays, while limited work has been done on multi-modal approaches (e.g., combining MRI, X-rays, and CT scans). Integrating data from different modalities could improve diagnosis, but it also introduces challenges in data alignment and fusion.
- **Class Imbalance:** Datasets are often heavily skewed, with a higher prevalence of moderate or severe arthritis cases, leading to biased models that may underperform in detecting early-stage arthritis.
- **Overfitting:** Deep learning models trained on limited datasets are prone to overfitting, where they perform well on the training data but fail to generalize to new, unseen images. This is a particularly challenging issue in medical imaging, where obtaining large, high-quality labeled datasets is difficult.
- **Lack of Optimal Feature Selection Techniques:** Identifying the most relevant features for arthritis detection is crucial, yet many models rely on deep learning's automatic feature extraction without fully exploring optimal feature selection methods. Techniques such as wavelet transforms, texture analysis, or hybrid feature extraction approaches (e.g., combining spatial and frequency domain features) could be further explored to enhance detection performance.

Future Research Direction

Given the current research gaps in knee arthritis detection using image processing and deep learning techniques, several promising avenues for future exploration can be pursued. These research directions aim to enhance model performance, clinical applicability, and the development of real-time, deployable solutions for early and accurate detection of knee arthritis.

- **Hybrid Models for Enhanced Feature Extraction:** Combining CNNs with traditional image processing techniques (e.g., wavelets, texture analysis) or using advanced feature selection methods could improve model performance. Such hybrid models would benefit from the interpretability of classical methods while leveraging the powerful feature extraction capabilities of deep learning.
- **CNN + RNN/LSTM Architectures:** Developing hybrid models that combine spatial feature extraction (via CNNs) with temporal analysis (via LSTMs or RNNs) can allow for more accurate predictions based on image sequences or longitudinal data.
- **Unsupervised Learning for Feature Discovery:** In addition to supervised learning, unsupervised or semi-supervised learning methods should be investigated to discover new, clinically relevant features in knee images. This could lead to the identification of novel biomarkers for early arthritis detection.

ABSTRACT

A brain tumor is a difficult challenge in medical diagnostics because of different nature for accurate detection. In brain tumor disease, cell growth becomes uncontrollable. Brain abnormalities like brain tumors have been major cause of death among children and adults around the world. The distinction between benign and malignant tumors is not straightforward with different factors such as growth patterns, size, and location. Brain tumors are very complex disease that is diagnosed using different feature selection and classification methods. Early tumour disease detection is a paramount in managing the brain tumors effectively. As tumors grow, they exert pressure on brain tissue leading to symptoms like headaches, nausea, and balance disturbances. Different methods are introduced for performing efficient brain tumour disease diagnosis. But, the accuracy level was not improved and time complexity was not reduced by using existing methods. In order to address these issues, a new method termed Stochastic Neighbor Embedding Spiral Search Optimized Deming Regressive Extreme Learning Classification (SNESSO-DRELC) Method is introduced. The main objective of SNESSO-DRELC Method is to perform efficient brain tumour disease diagnosis with higher accuracy. SNESSO-DRELC Method used

improved extreme learning concepts for brain tumour disease diagnosis. Improved Extreme Learning in SNESSO-DRELC Method uses four layers, namely one input layer, two hidden layers and one output layer for brain tumour disease diagnosis. Initially, number of patient data is considered as an input at an input layer. After that, stochastic neighbor embedding spiral search optimization process is carried out in first hidden layer 1 for selecting the relevant features from input database to minimize the time complexity and space complexity. In hidden layer 2, deming regression analysis is carried out for categorizing the patient data into normal patient data and abnormal patient data. Finally, the results are displayed in the output layer. This in turn helps to improve the brain tumour disease diagnosis performance with higher accuracy and lesser time consumption. Experimental evaluation discusses the four different performance factors such as tumor diagnosis accuracy, error rate, space complexity and tumor diagnosis time. The analyzed results demonstrate that the proposed SNESSO-DRELC Method achieves higher performance in accuracy of brain tumor diagnosis and reduces time consumption compared to conventional methods.

Keywords: brain tumor, improved extreme learning, relevant features, stochastic neighbor embedding spiral search optimization, deming regression analysis

INTRODUCTION

Brain tumors are the challenging one for encountering brain disorders. An early and accurate diagnosis is an essential one for management and treatment of brain tumors. A multi-stage modeling framework was introduced in [1] with convolutional neural networks. A path signature and Bidirectional Long Short-Term Memory (Bi-LSTM) neural network with attention mechanism (PS+Bi-LSTM+attention) was introduced in [2] for epilepsy detection by extracting discriminative features. However, PS+Bi-LSTM+attention not improved the accuracy level for multiclass classification. An automatic seizure detection method was introduced in [3] for efficient diagnosis and treatment of epilepsy. But, the computational cost was not reduced by designed method. eXplainable Artificial Intelligence (XAI) was discussed in [4] for epilepsy management with Internet of Medical Things (IoMT). A calcium feature-based tumor diagnosis and treatment guidance platform (CA-TDT-GP) was introduced in [5] with random forest analysis framework for tumor behavior prediction through clinical therapy guidance. A novel model-driven seizure detection method was introduced in [6] based on dynamic features in epileptic EEGs. An automatic detection of epileptic seizure method was introduced in [7] depending on kernel-based robust probabilistic collaborative representation (ProCRC) and graph-regularized non-negative matrix factorization (GNMF). But, the space complexity was not reduced by existing method. The passively assessed gait initiation signal data (GISD) was gathered in [8] with features extracted for identifying brain tumors. A wireless remote monitoring system was introduced in [9] depending on single wrist-worn accelerometer device. But, the time complexity was not minimized by wireless remote monitoring system. A hierarchical automated methodology was introduced in [10] for finding the brain tumors. But, the complexity level was not reduced. The issues identified from the existing researches are lesser diagnosing accuracy, higher diagnosing accuracy, higher time complexity, higher space complexity, higher computational cost, higher computational complexity and so on. In order to address these issues, a new method called SNESSO-DRELC Method is introduced.

The main contribution of the SNESSO-DRELC Method is given as,

- To improve the brain tumor diagnosis, the SNESSO-DRELC Method is developed with feature selection process and classification process in improved extreme learning process.
- To reduce the brain tumor diagnosis time, stochastic neighbor embedding spiral search optimization process is used to select the relevant features from the input dataset.

**Parameswaran Pillai Santhakumary Amma Renjeni et al**

- To increase the accuracy of brain tumor diagnosis, Deming Regression Analysis is carried out to analyze the testing and training data with the selected features.
- Finally, an experimental evaluation is carried out to determine the performance of the SNESSO-DRELC Method using different metrics and compared with other existing approaches.

Related Works

A Multidimensional CNN-BiLSTM framework (MD CNN-BiLSTM) was developed in [11] for identifying the epileptic seizures with electroencephalogram (EEG) signal analysis. A neural network-based model called ScoreNet was introduced in [12] for predicting the seizure probability of seizure epochs to identify the seizure onsets and offsets. A convolutional neural network (Conv1D) with Long Short-Term Memory (LSTM) network was developed in [13] for epileptic seizure recognition and improving patient outcomes. Machine Learning and Deep Learning models were developed in [14] for epileptic seizure detection. Hjorth and statistical parameters are employed in [15] for field programmable gate array (FPGA) realization with epileptic seizure detectors. An enhanced deep learning architecture was introduced in [16] with EEG signal for automatic epileptic seizure detection. A new data augmentation method was introduced in [17] to enhance the generalization performance. A hybrid CNN-BiLSTM architecture was introduced in [18] for identifying the epileptic seizures from EEG signals. A new pipeline based on Bat and genetic algorithm was introduced in [19] for feature dimension reduction of EEG signals. A new framework was introduced in [20] for efficient ES detection. A patient-independent seizure detection model was introduced in [21] with stable EEG-based features obtained using multiple feature selection methods. A hybrid framework was introduced in [22] for epileptic seizure detection through linear graph convolution neural network (LGCN) and DenseNet. An Oppositional Aquila Optimizer-based Feature Selection with Deep Belief Network for Epileptic Seizure Detection (OAOFS-DBNECD) technique was introduced in [23] with EEG signals. A privacy-preserving federated learning framework was introduced in [24] for epileptic seizure detection from EEG signals in the fog-computing. A new enhanced search ability based ASO termed ESAASO was introduced in [25] for tumour detection. The dimensionality reduction technique was introduced in [26] using compressive sensing to optimize the process and to increase classification accuracy in epileptic EEG signals. An end-to-end EEG seizure detection framework was introduced in [27] with channel-embedding spectral-temporal squeeze-and-excitation network (CE-stSENet) to reduce information loss. An automatic method was introduced in [28] for epileptic seizures identification with EEG representation of brain signals. Though the classification accuracy was improved, the computational cost was not reduced by automatic method. An automatic seizure classification system was introduced in [29] depending on EEG feature extraction for seizure diagnosis. An end-to-end automatic seizure detection system was introduced in [30] with EEG data. But, the error rate was not reduced.

METHODOLOGY

Healthcare industry is transformed through the technological advancement in recent years. Extreme learning technology is an important component for the transformation. Extreme learning is used to imitate the human-like intelligence for different applications in medicine. Brain tumor is considered as the major public health issue in the healthcare sector. In addition, an accurate diagnosis, treatment, and follow-up processes are significant one. Extreme learning machine has become important tool for increasing the potential for early diagnosis and treatment of brain tumors. Brain tumors affect the human health because of their location. Extreme learning machine is used to diagnose and treat complex diseases like brain tumors through joining the technologies like big data analytics, machine learning and deep learning. Extreme learning machine has ability to detect and categorize the brain tumors. Extreme learning machine algorithm is employed to determine the size, location, class and tumors. This helps the physicians to make more accurate diagnosis and treatment plan. Different researchers carried out their research on efficient brain tumour disease diagnosis. But, the accuracy level was not improved and time complexity was not minimized by existing methods. In order to address these issues, Stochastic Neighbor Embedding Spiral Search Optimized Deming Regressive Extreme Learning Classification (SNESSO-DRELC) Method is introduced. The key aim of SNESSO-DRELC Method is to perform efficient brain tumour disease diagnosis with higher accuracy and

Parameswaran Pillai Santhakumary Amma Renjeni et al

lesser time consumption. The architecture diagram of SNESSO-DRELC Method is illustrated in the figure 1. Figure 1 given above illustrates the architecture diagram of the proposed SNESSO-DRELC Method for accurate brain tumour disease diagnosis. The proposed SNESSO-DRELC Method performed data collection, feature selection and disease diagnosis. The three different processes of proposed SNESSO-DRELC Method are illustrated in the following three sub-sections.

Improved Extreme learning machine classifier

After performing data collection in proposed SNESSO-DRELC Method, the brain tumour disease diagnosis process is carried out in the proposed. Extreme Learning Machine (ELM) is a kind of feed-forward neural network with extremely fast learning speed and higher generalization ability. ELM is employed for faster training and better performance. Improved Extreme Learning Machine (IELM) provides benefits in real-time learning when handling the large data streams through processing the incoming patient data. Consequently, the SNESSO-DRELC Method uses improved extreme learning machine classifier to enhance disease diagnosis accuracy through categorizing it as normal patient data or abnormal patient data. The diagrammatic representation of Improved Extreme Learning Machine is illustrated in figure 2. Figure 2 depicts the structural design of Improved Extreme Learning Machine in proposed SNESSO-DRELC Method. Improved Extreme Learning Machine is a feed forward neural network for categorizing the patient data samples with many layers comprising the hidden nodes 'h'. Improved Extreme Learning Machine classifier included the three different layers like one input layer, two hidden layers and one output layer. As shown in above figure 2, let us take the training set as ' $\{PD_i, Y\}$ '. ' PD_i ' represent the training patient data samples $\{PD_1, PD_2, PD_3, \dots, PD_n\}$ and an output ' Y ' symbolizes the classification output ' $Y_k \in Y_1$ '. The input layer gathers the data samples and sent to the hidden layer. Lastly, the output layer attained the better classification results. Three layers in structure are linked in a feed-forward manner with diverse weights. The computation process is carried out in the hidden layer. Every layer comprised the artificial neurons to transmit the input training patient data samples from one layer to the neurons in the next consecutive layer.

Patient Data Collection

Patient data collection is the first process of proposed SNESSO-DRELC Method. It collects the different types of data for finding the seizure activity in accurate manner. The data is gathered from HMS - Harmful Brain Activity Classification dataset. The URL of the dataset is given as <https://www.kaggle.com/competitions/hms-harmful-brain-activity-classification>. The key objective of the dataset is to identify and categorize the seizures and additional types of harmful brain activity in electroencephalography (EEG) data. The train.CSV files are employed for seizure classification. The dataset comprised 1, 06, 800 instances and 15 features. The input patient data is gathered and transmitted to the input layer. In the input layer, the input weights are fixed with the straightforward solution that not requires different iteration process. It is expressed as follows,

$$Inp(t) = \sum_{i=1}^n [PD_i(t) * w_i] + Bias \quad (1)$$

From (1), ' $Inp(t)$ ' symbolizes the input layer. ' w_i ' symbolizes the initial weight at an input layer. ' PD_i ' represent the training patient data samples. The input data samples transmit into hidden layer. The feature selection and classification process is carried out in two consecutive hidden layers.

Stochastic Neighbor Embedding Spiral Search Optimized Feature Selection

In the first hidden layer, Stochastic Neighbor Embedding Spiral Search Optimization Algorithm is used in SNESSO-DRELC Method to reduce the error and increase the accuracy of cybercrime detection. Stochastic Neighbor Embedding Spiral Search algorithm is a metaheuristic inspired by diverse spiral patterns. The key objective is to create the logarithmic spirals to balance the exploration and exploitation during spiral search process. Stochastic Neighbor Embedding Spiral Search algorithm has the diversification capabilities to perform efficient global exploration. The growth behavior aimed on the search behavior around current solution for local exploitation. Stochastic Neighbor Embedding Spiral Search Optimization in SNESSO-DRELC Method employs several spiral models that described as deterministic systems. The search points follow logarithmic spiral path to the central point

termed current best solution. The global best solution is recognized through continuously updating the center. In Stochastic Neighbor Embedding Spiral Search Optimization Algorithm, multiple search points are related to the number of features from input database. First, the populations (i.e., features) are initialized in the search space. For every feature, the fitness is computed based on similarity through stochastic neighbor embedding process. Stochastic neighbor embedding is a non-linear dimensionality reduction concept for embedding the features in the high-dimensional space into low-dimensional space. The similar features are identified through nearby points. The dissimilar features are identified by far-away points with high probability. The similar and dissimilar features are recognized through the conditional probability distribution in low-dimensional map. The stochastic neighbor embedding evaluates the probabilities proportional to feature similarity. The stochastic neighbor embedding between input features are obtained as,

$$SNE_{(ft_i|ft_j)} = \frac{\exp(-\|ft_i - ft_j\|^2 / 2\rho_i^2)}{\sum_{p \neq i} \exp(-\|ft_i - ft_k\|^2 / 2\rho_i^2)} \quad (2)$$

From (2), ' ρ_i ' symbolizes the Gaussian kernels. The feature similarity ' ft_j ' to the feature similarity ' ft_i ' is computed through the conditional probability ' $SNE_{(ft_i|ft_j)}$ '. The neighbors are chosen corresponding to their probability density under Gaussian function. The fitness function in SNESSO-DRELC Method is formulated as,

$$fitness = \arg \max conditionalprobability(3)$$

From (3), ' $\arg \max$ ' symbolizes the argument of maximum function. The conditional probability in stochastic neighbor embedding value varies from 0 to 1. When probability value is lesser, then two features are dissimilar feature for performing brain tumor disease diagnosis. After selecting the particular features, the position of next search features gets updated as,

$$ft_{i+1} = ft_i + S_k M * |ft_i - ft_j| \quad (4)$$

From (4), ' ft_{i+1} ' symbolizes the update next search feature position. ' ft_i ' denotes the current position of feature ' S_k ' denotes a step rate value from 0 to 1. ' M ' indicates identity matrix. ' $|ft_i - ft_j|$ ' symbolize the variation between the current position of search point ' ft_i ' and ' ft_j ' symbolizes the position of the center point. Then, the center point gets updated as,

$$ft_{i+1} = \begin{cases} ft_{i+1}; & \text{if } fitness(ft_i) > fitness(ft_j) \\ ft_i; & \text{otherwise} \end{cases} \quad (5)$$

From (5), ' ft_{i+1} ' indicates an updated position of the features, ' ft_i ' represents the current position of the center point. When the fitness of updated position of center point ' ft_{i+1} ' is greater than the current position of the center point ' ft_i ', the position gets updated as ' ft_{i+1} '. By this way, optimal features are chosen for efficient brain tumour disease diagnosis. The algorithmic representation of Stochastic Neighbor Embedding Spiral Search Optimized Feature Selection is given as,

Algorithm 1: Stochastic Neighbor Embedding Spiral Search Optimized Feature Selection
Input: Number of features ' $ft_i = ft_1, ft_2, ft_3, \dots, ft_n$ '
Output: Improves feature selection accuracy
Begin
Step 1: Initialize the populations of search points
Step 2: For each feature
Step 3: Calculate the fitness using stochastic neighbor embedding
Step 4: While (t < max_iteration)

```

Step 5:    Select the features
Step 6:    Update the next feature position
Step 7: if( $fitness(ft_{i+1}) > fitness(ft_i)$ )then
Step 8:    Update the feature position as  $afitness(ft_{i+1})$ 
Step 9:    End if
Step 10:    $t = t+1$ 
Step 11:   End while
Step 12:   End for
Step 13:   Obtain the optimal weight for relevant feature selection
End

```

The algorithmic process of stochastic neighbor embedding spiral search optimized feature selection is given in algorithm 1. The feature selection is carried out using the stochastic neighbor embedding spiral search optimization algorithm. At first, population of features is initialized within search space. The fitness of the feature is computed through stochastic neighbor embedding process. After that, the position of feature is updated and adjusted. The process gets iterated until algorithm reaches maximum iterations.

Deming Regression Analysis

After feature selection process, deming regression analysis is carried out in SNESSO-DRELC Method. The regression analysis is a machine learning technique for estimating the relationship between the dependent variable (i.e., 'outcome variable') and one or more independent variables (i.e., 'features'). The deming regression is used to analyze the testing and training features with every data point. Figure 3 illustrates the process of deming regressive brain tumour disease diagnosis based on testing and training feature values. The deming regression function reduced the squared deviation between the training and testing features. It is formulated as,

$$DR = \arg \min [Deviation] \quad (6)$$

$$Deviation = \|testingfeaturevalue - trainingfeaturevalue\|^2 \quad (7)$$

From (6) and (7), 'DR' symbolizes the deming regression output. The hidden layer output is expressed as,

$$H(t) = \sum_{i=1}^n w_{ih} g(w_{ho} DR(PD|Y) + B_h) \quad (8)$$

From (8), 'H(t)' symbolizes the output result of the hidden layer. ' σ ' indicates the gaussian activation function. ' w_{ho} ' represent the weight between ' h^{th} ' hidden layer neuron and ' o^{th} ' output layer neuron, ' w_{ih} ' denotes ' i^{th} ' input layer neuron and ' h^{th} ' hidden layer neuron. ' B_h ' symbolizes the bias at hidden layer. The output of hidden layer is transmitted to the final output layer. In that layer, gaussian activation function is used to provide the binary classification results. It is given as,

$$FO = g(w_o * H(t)) \quad (9)$$

From (9), 'FO' symbolizes the final classification output. ' g ' indicates a Gaussian activation function. ' w_o ' denotes the weight of the output layer. It is formulated as,

$$g = \begin{cases} 1 & ; \text{ Abnormal} \\ 0 & ; \text{ normal} \end{cases} \quad (10)$$

The gaussian activation function returns '1' when the patient data samples are classified as abnormal and '0' when the patient data samples are classified as normal. Finally, accurate patient data classification results are achieved at the output layer with minimal time complexity. Stochastic Neighbor Embedding Spiral Search Optimized Deming Regressive Extreme Learning Classification algorithm is explained below,

Algorithm 2: Stochastic Neighbor Embedding Spiral Search Optimized Deming Regressive Extreme Learning Classification
Input: Dataset 'D', Number of patient data ' $PD_1, PD_2, PD_3, \dots, PD_m$ '

Output: Increase brain tumour disease accuracy

Begin

1. Collect the number of patient data samples at an input layer
2. **For each** patient data ' PD_i '
3. Randomly assign weight and bias
4. **End for**
5. **For each** feature - **hidden layer 1**
6. Measure the stochastic neighbor embedding
7. **End for**
8. **End for**
9. **If** ($argmaxConditionalprobability$) **then**
10. Features are selected as relevant
11. **else**
12. Features are selected as irrelevant

13. End if
14. For each selected feature with data samples

15. Perform demingregression analysis

16. End for
17. Apply guassian activation function

18. if ($g = +1$)**then**
19. Patient Data is classified as 'abnormal'

20. else
21. Patient Data is classified as 'normal'

22. End if
23. Return (classifications results)-- **output layer**
24. End for
End

Algorithm 2 outlines the process of Stochastic Neighbor Embedding Spiral Search Optimized Deming Regressive Extreme Learning Classification in SNESSO-DRELC Method to achieve higher accuracy with minimum time complexity. Initially, the algorithm gathers the training patient data samples. Weights and biases are allocated randomly. The patient data samples are transferred to the hidden layer. The feature selection is used to determine the similarity between features. The selected features are transmitted to the next hidden layer where classification is carried out by deming regression function. The guassian activation function is used to classify the patient data samples as abnormal or normal. Lastly, accurate disease diagnosis is carried out with minimal time consumption and higher accuracy.

Experimental Analysis

In this section, experiment evaluation of SNESSO-DRELC Method and existing multi-stage modeling framework [1] and PS+Bi-LSTM+attention [2] are implemented in Python high level language. In order to perform the experiments, HMS - Harmful Brain Activity Classification dataset is taken from <https://www.kaggle.com/competitions/hms-harmful-brain-activity-classification>. The key objective of dataset is to identify and categorize the seizures with electroencephalography (EEG) data. The train.CSV files are employed for categorizing the seizures and their severity risk factors. The dataset comprised 1, 06, 800 instances and 15 features shown in table 1.

Performance Result Analysis

In this section, the performance result analysis of the proposed SNESSO-DRELC Method and existing multi-stage modeling framework [1] and PS+Bi-LSTM+attention [2] are discussed with different metrics like brain tumor diagnosis accuracy, error rate, space complexity and brain tumor diagnosis time.

Impact on Brain Tumor Diagnosis Time

Brain tumor diagnosis time is described as the amount of time consumed for categorizing the patient data from medical dataset to the total number of patient data. It is formulated as,

$$BTDT = D_n * Time(SPD) \quad (11)$$

Parameswaran Pillai Santhakumary Amma Renjeni et al

From (11), 'BTDT' represent the brain tumor diagnosis time. ' D_n ' represents the number of data instances. 'Time(SPD)' symbolizes the time to classify the single patient data. The tumor diagnosis time is measured in terms of milliseconds (ms). Table 2 explains the brain tumour diagnosis time for ten different iterations. The performance outcomes of brain tumor diagnosis time with and without feature selection using three different classification methods, namely the proposed SNESSO-DRELC Method and the existing multi-stage modeling framework [1] and PS+Bi-LSTM+attention [2] are illustrated in the Table 2. For conducting the experiments with 10,000 data instances, the brain tumor diagnosis time with feature selection using proposed SNESSO-DRELC Method is 60ms. The time consumption of multi-stage modeling framework [1] and PS+Bi-LSTM+attention [2] is 68ms and 74ms correspondingly. From obtained results, the proposed SNESSO-DRELC Method minimizes the brain tumor diagnosis time by 17% and 16% compared to [1] and [2], respectively. This is due to the application of stochastic neighbor embedding spiral search optimization algorithm for efficient feature selection. The fitness of feature is determined through stochastic neighbor embedding process. Then, position of feature gets updated and adjusted. This process minimizes the time consumption for brain tumor disease diagnosis. From the attained results, the proposed SNESSO-DRELC Method minimizes the brain tumor diagnosis time without feature selection by 17% and 21% compared to multi-stage modeling framework [1] and PS+Bi-LSTM+attention [2] respectively.

Impact on Space Complexity

Space complexity is described as the amount of space consumed for categorizing the patient data from input dataset to the total number of patient data. It is determined as,

$$SC = D_n * memory(SPD) \quad (12)$$

From (12), 'SC' represent the space complexity. ' D_n ' denotes the number of data instances. 'memory(SPD)' symbolizes the memory space to classify the single patient data. The space complexity is measured in terms of megabytes (MB). The performance outcomes of space complexity with and without feature selection using three different classification methods, namely the proposed SNESSO-DRELC Method and the existing multi-stage modeling framework [1] and PS+Bi-LSTM+attention [2] are shown in the Table 3 and Figure 4 (a) (b). The graphical results shows that the space complexity versus the number of patient data. When the number of patient data increases, the space complexity gets increased correspondingly for all three different methods. For conducting the experiments with 70,000 data instances, the space complexity with feature selection using proposed SNESSO-DRELC Method is 89.2MBs. The space complexity of multi-stage modeling framework [1] and PS+Bi-LSTM+attention [2] is 112.8 MB and 115.8 MB correspondingly. From attained results, the proposed SNESSO-DRELC Method minimizes the space complexity by 25% and 28% compared to [1] and [2] respectively. This is because of using stochastic neighbor embedding spiral search optimization algorithm for selecting the relevant features to minimize the space complexity. The fitness of every feature is computed by using stochastic neighbor embedding process. Then, position of feature gets updated and adjusted. The process reduced the space complexity during brain tumor disease diagnosis. From the attained results, the proposed SNESSO-DRELC Method reduced the space complexity without feature selection by 7% and 16% compared to multi-stage modeling framework [1] and PS+Bi-LSTM+attention [2] respectively.

Impact on Brain Tumor Diagnosis Accuracy

Brain tumor diagnosis accuracy is defined as the number of patient data that are correctly classified as brain tumor to the total number of data instances taken from dataset. It is formulated as,

$$\text{Brain tumor diagnosis accuracy} = \left[\frac{N_{cc}}{D_n} \right] * 100 \quad (13)$$

From (13), ' D_n ' denotes number of input patient data or data instances and ' N_{cc} ' denotes number of patient data that are correctly classified. The overall accuracy is measured in percentage (%). Table 4 explains the brain tumour diagnosis accuracy for ten different iterations.

Impact on Error Rate

Error rate is defined as number of patient data that are incorrectly classified as brain tumor to the total number of data instances taken from dataset. It is determined as,

$$ER = \left[\frac{N_{icc}}{D_n} \right] * 100 \quad (14)$$

From (14), ' D_n ' denotes number of input patient data or data instances and ' N_{icc} ' represents the number of patient data that are correctly classified. It is measured in percentage (%). The performance outcomes of error rate using three different classification methods, namely the proposed SNESSO-DRELC Method and the existing multi-stage modeling framework [1] and PS+Bi-LSTM+attention [2] are illustrated in the Figure 5. The graphical results illustrates that the error rate versus the number of patient data. When the number of patient data increases, the error rate gets increased or decreased correspondingly for all three different methods. For conducting the experiments with 60,000 data instances, the error rate using proposed SNESSO-DRELC Method is 3%. The error rate of multi-stage modeling framework [1] and PS+Bi-LSTM+attention [2] is 6% and 11% correspondingly. This is because of using stochastic neighbor embedding spiral search optimization process and deming regression analysis in proposed SNESSO-DRELC Method for selecting the relevant features and for categorizing the patient data into normal patient data and abnormal patient data. This in turn helps to reduce the error rate. The error rate of proposed SNESSO-DRELC Method is reduced by 35% and 61% when compared to the multi-stage modeling framework [1] and PS+Bi-LSTM+attention [2] respectively.

CONCLUSION

Brain tumor detection is carried out through extreme learning concepts with feature selection and classification process. A new method termed SNESSO-DRELC Method performs efficient brain tumour disease diagnosis with higher accuracy. SNESSO-DRELC Method used improved extreme leaning concepts for brain tumour disease diagnosis. Number of patient data is considered as input and stochastic neighbor embedding spiral search optimization process selects the relevant features to minimize the time complexity and space complexity. Deming regression analysis categorizes the patient data into normal patient data and abnormal patient data. This in turn helps to improve the brain tumour disease diagnosis performance. Experimental evaluation discusses the performance parameters such as tumor diagnosis accuracy, error rate, space complexity and tumor diagnosis time. Moreover, proposed SNESSO-DRELC Method achieves higher performance in terms of accuracy of brain tumor diagnosis and reduces time consumption when compared to conventional methods.

Table 1: Features description

S.No	Features	Description
1	eeg_id	A unique identifier for entire EEG recording.
2	eeg_sub_id	An ID for specific 50 second long subsample this row's labels apply to
3	eeg_label_offset_seconds	The time between the beginning of the consolidated EEG and subsample.
4	spectrogram_id	A unique identifier for entire EEG recording.
5	spectrogram_sub_id	An ID for 10 minute subsample this row's labels apply to.
6	spectrogram_label_offset_seconds	The time between the beginning of the consolidated spectrogram and this subsample.
7	label_id	An ID for set of labels
8	patient_id	An ID for patient who donated the data
9	expert_consensus	Consensus annotator label
10	seizure_vote	Indicates epileptic seizure activity

Parameswaran Pillai Santhakumary Amma Renjeni et al

11	lpd_vote	Lateralized periodic discharges with highest seizure rates
12	gpd_vote	Generalized periodic discharges • Moderate seizure rates
13	lrda_vote	lateralized rhythmic delta activity • Intermediate seizure rates
14	grda_vote	Generalized rhythmic delta activity • lowest seizure rates
15	other_vote	Includes annotations for brain activity that doesn't fit into the above categories

Table 2: Comparison of Brain Tumor Diagnosis Time

Number of data instances	Brain tumor diagnosis time (ms) with feature selection			Brain tumor diagnosis time (ms) without feature selection

ABSTRACT

Digital technology has revolutionized music production, performance, and education by enabling advanced sound manipulation, noise reduction, and high-quality outputs. It has also introduced new ways of learning and innovation in the music industry. This study explores the historical evolution of digital technology in musical instruments, its impact on composition and performance, associated challenges, and future potential. A systematic review of academic literature, case studies, interviews with industry professionals, and comparative analysis of traditional versus digital instruments were conducted. Digital technology has transformed music creation and learning, enhancing accessibility and innovation. However, challenges such as copyright issues, reduced human creativity, and job displacement persist. This paper provides a unique perspective on the integration of IT with musical instruments, offering insights into its evolution, applications, and future possibilities.

Keywords: Technology, Music, IT, AI, Virtual Reality

INTRODUCTION

Music has been an essential part of human culture for centuries, transcending borders and languages to convey emotions, stories, and messages. The music educators and students can get benefit from the technology as a tool to support learning in the three musical processes– creating, performing, and responding to music (Bauer *et al.* 289-301). Over the time, the interplay between music and technology has brought about significant transformations, ushering in a new era of musical innovation. In the ever- evolving landscape of the music industry, the harmonious integration of technology and musical instruments has ushered in a new era of creativity and innovation. Information technology, with its rapid advancements, has become a powerful force reshaping the way musicians compose, produce, and perform. This review delves into the multifaceted relationship between digital technology and music

96378

**Kaushik Banerjee**

instruments, exploring the profound impact it has had on the artistry, accessibility, and functionality of musical expression. The fusion of technology and traditional musical instruments has given rise to a spectrum of possibilities, enriching the musical experience for both creators and audiences alike. From the invention of electronic instruments to the incorporation of cutting-edge software in traditional setups, the synergy between music and technology has created an expansive canvas for musicians to explore and redefine their sonic landscapes. Technology allows a musical experience for all skill levels in opportunities never before available to compose manipulate, instantly listen to music electronically and even print standard Western music notation for others to play without having to know much about traditional music theory or notation (Freedman *et al.*). Additionally, the advent of smart instruments, equipped with sensors and connectivity features, has further expanded the horizon of interactive and responsive musical performance. Beyond the realm of instruments themselves, digital technology has revolutionized the way music is produced, recorded, and distributed. Digital audio workstations (DAWs), virtual instruments, and advanced recording technologies have empowered musicians to create studio-quality compositions from the comfort of their homes. Moreover, the advent of cloud-based platforms and streaming services has democratized the dissemination of music, allowing artists to reach global audiences without the constraints of traditional distribution channels. As we navigate the symphony of technology and music, this review aims to dissect the various facets of this transformative relationship. From exploring the influence of artificial intelligence in music composition to dissecting the impact of augmented reality on live performances, we will traverse the dynamic landscape where digital technology converges with musical instruments, propelling the art form into uncharted territories of creativity and expression. On this harmonious journey, we unravel the intricate notes that compose the contemporary melody of music and technology.

Relevance of Music Instrumental with IT

The evolution of music instruments, intertwined with the ever-advancing landscape of digital technology, has been a transformative journey that echoes across the annals of musical history. This review embarks on a chronological exploration of the pivotal moments and milestones in the amalgamation of music and technology. From the early experiments with electronic sound to the present day digital symphony, this historical retrospective seeks to unravel the intricate tapestry that has woven digital technology into the very fabric of musical expression. The inception of the electronic era in music instruments can be traced back to the early 20th century. Innovations such as the Theremin, developed by Léon Theremin in 1920, marked a departure from the traditional acoustic instruments by harnessing the principles of electronics to produce novel sounds. Subsequent decades witnessed the rise of the analog synthesizer, exemplified by the Moog synthesizer in the 1960s, which became a trailblazer in the integration of technology into the composition and performance of music. The advent of microprocessors in the 1970s and 1980s heralded a new era in music technology. This period witnessed the birth of digital synthesizers and drum machines, introducing a level of precision and versatility previously unattainable. The Yamaha DX7, launched in 1983, emerged as a pioneer in digital synthesis, setting the stage for a digital revolution that would reshape the landscape of music creation. As we entered the late 20th century, the rise of personal computing marked a watershed moment in the role of digital technology in music. Digital Audio Workstations (DAWs) became instrumental in music production, allowing composers and producers to manipulate and arrange sounds with unprecedented flexibility. The MIDI (Musical Instrument Digital Interface) standard, established in the early 1980s, facilitated communication between various instruments and computers, laying the foundation for seamless integration in music creation. This historical review endeavors to illuminate the key junctures in the symbiotic relationship between digital technology and music instruments. Through the lens of time, we witness the harmonious progression from analog experimentation to the digital orchestration of melodies, underscoring the profound impact that technology has had on shaping the very essence of musical expression. On this historical odyssey, we traverse the transformative epochs that have sculpted the intersection of music and digital technology into the symphony we experience today.

Transformative Impact on Composition and Performance**Digital Instruments**

Digital instruments, underpinned by DSP technology, have redefined the sonic palette available to musicians. Instruments such as synthesizers, digital pianos, and electronic drums offer unparalleled flexibility in sound generation and manipulation. Musicians can access a vast library of sounds and effects, allowing for customized

**Kaushik Banerjee**

sonic identities. Additionally, digital instruments seamlessly integrate MIDI technology, enabling precise control over composition and performance (Ellis *et al.* 1997).

Computer-Assisted Composition

IT has left an indelible mark on the composition process. Composers now wield powerful Digital Audio Workstations (DAWs), equipped with tools for composition, arrangement, recording, and production. Algorithms and machine learning have emerged as valuable aids for generating music, pushing the boundaries of traditional music genres (Ellis *et al.*)

Real-Time Performance Technologies

Live performances have undergone a paradigm shift with the integration of IT. Musicians can seamlessly incorporate electronic elements into their shows through the use of MIDI controllers, software-based instruments, and effects processors. Gesture-based control systems and sensor interfaces have enhanced live performances, allowing for interactive and expressive engagement with the audience.

AI in Music

Artificial Intelligence (AI) has disrupted conventional notions of composition and performance. AI algorithms analyze extensive music datasets, learn from them, and generate original compositions. AI-powered instruments and virtual musicians are being developed, enabling real-time collaboration between humans and AI entities. This amalgamation of human creativity and machine-generated music has ushered in a new era of musical exploration (Gioti *et al.*)

Challenges

The integration of IT in music instrumental, while transformative, brings forth several challenges:

Technological Standardization and Compatibility

As technology evolves, a significant challenge lies in maintaining standards and compatibility across diverse platforms and devices. Incompatibility issues between different hardware and software can impede the seamless integration of digital instruments and technologies, hindering collaborative efforts and limiting accessibility.

Learning Curve for Musicians

The rapid pace of technological advancement introduces a steep learning curve for musicians, particularly those accustomed to traditional instruments. Adapting to new interfaces, software, and electronic instruments can be time-consuming, potentially discouraging musicians from embracing innovative technologies in their creative process.

Affordability and Accessibility

Cutting-edge music technology often comes with a hefty price tag, making it less accessible to a broad spectrum of musicians. This financial barrier may hinder the democratization of advanced instruments and tools, creating disparities in access between established professionals and aspiring artists.

Intellectual Property and Copyright Concerns

The digital nature of music in the Information Age raises intricate issues concerning intellectual property and copyright. As musicians leverage technology for sampling, remixing, and creating, the delineation of ownership and fair use becomes a complex and contentious arena.

Overreliance on Technology in Creativity

While technology enhances musical capabilities, there is a risk of overreliance, leading to a potential dilution of authentic artistic expression. The challenge is to strike a balance where technology augments creativity without overshadowing the artist's unique voice and musical identity.

**Kaushik Banerjee****Cybersecurity Threats**

With the increasing connectivity of musical instruments to networks and the internet, the vulnerability to cyber threats rises. Ensuring the security of digital instruments and the data they generate becomes imperative, especially in live performances and studio settings.

Cultural Preservation and Evolution

The infusion of technology into music brings about a tension between preserving traditional cultural music and embracing technological evolution. Striking a balance that respects cultural roots while fostering innovation poses a nuanced challenge. This critical review aims to shine a spotlight on the challenges inherent in the intersection of digital technology and music instruments. Understanding and addressing these challenges are paramount to ensuring that the evolving symphony of technology and music remains inclusive, sustainable, and true to the artistic spirit.

Scope

The synthesis of digital technology and music instruments has ushered in an era of unprecedented creativity, innovation and transformation within the realm of musical expression. This review seeks to delineate the vast scope of this symbiotic relationship, exploring the myriad ways in which digital technology continues to reshape the landscape of music instruments and their roles in composition, production and performance.

Evolution of Digital Instruments

The scope encompasses the ongoing evolution of digital music instruments, from synthesizers and electronic drums to smart instruments equipped with advanced sensors and connectivity features (Fautley *et al.* 29-42). This evolution not only extends the possibilities for sound creation but also offers novel interfaces for musicians to interact with their instruments.

Advancements in Music Production Technologies

Information technology plays a pivotal role in revolutionizing music production processes. Digital Audio Workstations (DAWs), virtual instruments, and real-time collaborative tools have transformed the studio environment, enabling artists to produce, edit, and collaborate on music with unprecedented efficiency and creativity (Giraldo *et al.* 334).

Artificial Intelligence and Music Composition

The integration of artificial intelligence in music composition presents a vast frontier. AI algorithms are increasingly being used to generate musical compositions, pushing the boundaries of creativity and challenging conventional notions of authorship. The scope here extends to exploring the potential and ethical implications of AI in shaping musical narratives (Gioti).

Integration of Internet of Things (IoT) in Instruments

The scope encompasses the integration of the Internet of Things in musical instruments, allowing for enhanced connectivity and communication. Smart instruments, equipped with IoT capabilities, can exchange data, adapt to user preferences and even connect with other devices in a networked musical ecosystem (Tiwary *et al.* 23-27).

Education and Learning Platforms

Information Technology facilitates innovative approaches to music education. Online platforms, interactive tutorials and virtual music lessons extend the scope of learning beyond traditional boundaries, making music education more accessible and inclusive. VI. Global Collaboration and Remote Music Production The scope of digital technology in music instruments extends to global collaboration. Musicians from different parts of the world can collaborate in real-time, breaking down geographical barriers and fostering a diverse and interconnected global music community (Turchet *et al.*).

Kaushik Banerjee

Cultural Fusion and Innovation

The scope includes the exploration of how technology fosters cultural fusion in music. Digital instruments provide a platform for artists to experiment with diverse musical traditions, leading to the creation of innovative genres that reflect a globalized and interconnected world. This comprehensive review endeavors to explore the expansive scope of the role of digital technology in music instruments. From the evolution of instruments themselves to the broader impact on music creation, production, and consumption, the review aims to capture the dynamic and transformative nature of this ongoing symphony between technology and musical expression.

CONCLUSION

The fusion of Information Technology and music instrumental represents a profound transformation in the world of music. From the emergence of digital instruments to the integration of AI in composition and performance, IT has reshaped the creative landscape. While challenges like copyright and job displacement must be addressed, the scope for future advancements is immense. Augmented reality, collaborative AI music, and music education stand as testament to the boundless potential of IT in music instrumental. As we navigate this evolving terrain, musicians, composers, and technologists must collaborate to ensure that technology enhances, rather than diminishes the beauty and depth of human expression in music.

ABSTRACT

Rheumatic musculoskeletal diseases (RMDs) are a group of chronic disorders that affect the joints, muscles, and connective tissues, leading to pain, swelling, and decreased mobility. Early and accurate detection of RMDs is crucial for timely intervention and effective management. This paper proposes a novel detection approach for RMDs, integrating Cuckoo Search Optimization (CSO) with Support Vector Clustering (SVC) and feature extraction (FE). The proposed CSO-SVC-FE approach combines the global search capability of CSO with the clustering power of SVC to extract relevant features from medical data, such as radiographic images or clinical measurements, and classify RMDs with higher accuracy. CSO optimizes the parameters of the SVC model, ensuring enhanced clustering performance and improved feature extraction. The feature extraction process utilizes techniques that identify essential patterns in the data, enabling more precise diagnosis. Experiments conducted on a set of real-world RMD datasets demonstrate that the CSO-SVC-FE approach outperforms traditional methods in terms of classification accuracy, sensitivity, and specificity. This innovative approach offers significant potential for automating and improving the diagnostic process for RMDs, paving the way for better patient outcomes through early detection and personalized treatment strategies.

Keywords: Rheumatic Musculoskeletal Diseases (RMDs), Cuckoo Search Optimization (CSO), Support Vector Clustering (SVC), Feature Extraction (FE), Early Detection, Classification Accuracy, Medical Imaging.

INTRODUCTION

Rheumatic musculoskeletal diseases (RMDs) represent a diverse group of disorders that affect the joints, muscles, and soft tissues, causing pain, stiffness, swelling, and sometimes irreversible joint damage [1]. These diseases can significantly impair an individual's mobility and overall quality of life. Some of the most common types of RMDs include osteoarthritis (OA), rheumatoid arthritis (RA), lupus, gout, and ankylosing spondylitis, each of which presents its own set of diagnostic and therapeutic challenges [2]. The global prevalence of RMDs continues to rise due to factors such as aging populations and sedentary lifestyles, making early diagnosis and intervention crucial for managing these diseases and improving patient outcomes [3]. Traditionally, RMDs are diagnosed through clinical methods that include patient history, physical examinations, and radiographic imaging techniques such as X-rays, Magnetic Resonance Imaging (MRI), and ultrasound. While these methods provide valuable information, they are often subjective, time-consuming, and prone to inaccuracies due to factors like the interpretation of imaging results or variations in clinical judgment. Consequently, the need for more objective, automated, and precise diagnostic methods has become more urgent [5]. In recent years, the integration of advanced computational techniques such as machine learning (ML), deep learning (DL), and image processing (IP) has shown immense promise in enhancing the accuracy and efficiency of RMD detection [5]. These techniques have the potential to automate the process of feature extraction, classification, and prediction from medical data, minimizing human error and improving diagnostic speed. However, many of these methods still face challenges related to the complexity of medical data, the need for large annotated datasets, and model interpretability.

One promising computational approach to enhance RMD detection is the use of optimization algorithms combined with machine learning models. Cuckoo Search Optimization (CSO) is an efficient metaheuristic algorithm inspired by the nesting behavior of cuckoo birds. CSO has been used successfully in various optimization tasks due to its ability to find global optima in complex search spaces. When applied to RMD detection, CSO can be used to optimize the parameters of machine learning models, improving their performance and accuracy. Support Vector Clustering (SVC) is another powerful machine learning technique that can be used for classifying medical data. SVC works by transforming data into higher-dimensional spaces to separate complex datasets into distinct classes using hyperplanes. By combining CSO with SVC, it is possible to enhance the feature extraction process and improve the overall accuracy of RMD classification. CSO optimizes the parameters of the SVC model, ensuring better clustering and feature selection, which is essential for accurate diagnosis. Moreover, feature extraction techniques can identify key patterns in medical images or clinical data that are indicative of RMDs, leading to more precise predictions. This paper proposes a novel approach called the Cuckoo Search Optimization–Support Vector Clustering–Based Feature Extraction (CSO-SVC-FE) Approach for the detection of RMDs. By leveraging the power of CSO to optimize the parameters of SVC, this method enhances the accuracy of the classification model and provides more precise feature extraction from medical datasets. The approach aims to improve the early detection of RMDs by automating the feature selection and classification process, allowing for faster and more accurate diagnoses. The motivation for developing such an approach stems from the need to address the limitations of traditional diagnostic methods. The CSO-SVC-FE approach not only enhances the performance of machine learning models but also reduces the subjectivity and time-consuming nature of current diagnostic practices. The application of this advanced method in clinical settings holds the potential to revolutionize the early detection of RMDs, leading to better patient outcomes, more personalized treatment plans, and a more efficient healthcare system.

Importance of Feature Extraction in Rheumatic Musculoskeletal Disease (RMD)

Feature extraction [6] is a critical step in the process of detecting and diagnosing rheumatic musculoskeletal diseases (RMDs), as it enables the transformation of raw medical data (such as imaging, clinical measurements, or patient history) into meaningful and informative features that can be used for effective analysis [7]. In the context of RMDs, feature extraction plays an essential role in improving the accuracy, efficiency, and interpretability of diagnostic models. Here are the key reasons why feature extraction is important in the diagnosis and treatment of RMDs:

**Sadaieswaran and Prakash Kumar****Enhancing Diagnostic Accuracy**

The complexity of RMDs often requires a high level of precision in distinguishing between different conditions that share similar symptoms. Feature extraction allows for the identification of specific patterns and characteristics within medical data (e.g., joint damage, bone erosion, soft tissue inflammation) that are critical for making accurate diagnoses. For example, radiographic images of joints may contain subtle visual cues, such as joint space narrowing or periarticular swelling, that are important in identifying conditions like osteoarthritis or rheumatoid arthritis. By extracting these key features, machine learning models can achieve higher classification accuracy and reduce diagnostic errors [8].

Reducing Data Complexity

Medical data, especially from imaging modalities like MRI, X-rays, or ultrasound, can be high-dimensional and complex. Raw data might contain noise, irrelevant information, or redundant patterns that do not contribute to the disease classification. Feature extraction methods, such as texture analysis, edge detection, or wavelet transform, help in reducing the dimensionality of the data by focusing on the most relevant attributes for classification. This reduction in complexity not only speeds up the processing time but also improves the overall efficiency of diagnostic models [9].

Improving Model Interpretability

One of the challenges with machine learning models, particularly deep learning models, is the "black-box" nature of their decision-making processes. Feature extraction helps make these models more interpretable by selecting distinct and meaningful features that are directly related to the clinical interpretation of the disease. By identifying specific features (e.g., the degree of synovial thickening or joint deformities), healthcare providers can gain insights into the underlying mechanisms of the disease, enabling them to make more informed decisions about patient care and treatment [10].

Facilitating Early Detection

RMDs are often chronic and progressive, and early detection is critical for slowing disease progression and improving long-term outcomes. Feature extraction plays an important role in identifying early signs of disease, which may not be easily visible to the human eye. For instance, early-stage changes in the joint structure, such as slight swelling or mild cartilage loss, can be detected through advanced feature extraction techniques applied to imaging data. By extracting these early markers, clinicians can intervene sooner, potentially preventing the disease from progressing to more severe stages [10].

Supporting Personalized Treatment

RMDs are highly variable in terms of their progression and response to treatment. Feature extraction helps in identifying specific patterns that can be correlated with the severity of the disease, the likelihood of remission, or the patient's response to certain treatments. For example, specific features of joint inflammation in rheumatoid arthritis patients could inform decisions about which biologic therapies might be most effective. Thus, feature extraction not only assists in diagnosing RMDs but also plays a crucial role in tailoring personalized treatment plans that are most likely to result in positive outcomes for individual patients.

Improving Automation and Efficiency

With the advent of artificial intelligence (AI) and machine learning, the automation of RMD diagnosis is becoming increasingly feasible. Feature extraction is central to automating the analysis of large datasets, such as radiographs or MRI scans. By automating the feature extraction process, AI-based systems can rapidly analyze new patient data, compare it against established models, and provide accurate predictions without the need for extensive manual input. This automation significantly reduces the time required for diagnosis and allows healthcare professionals to focus on higher-level clinical decision-making [9] [10].

Overcoming Subjectivity in Diagnosis

Traditional methods of diagnosing RMDs often rely on the subjective interpretation of imaging results by radiologists or clinicians. The interpretation of radiographs or MRIs can vary based on the experience and judgment of the individual examining the images, leading to inconsistent diagnoses. Feature extraction methods, however, provide objective, reproducible measurements that reduce human bias and variability. This leads to more consistent and standardized diagnostic outcomes, which is especially important when dealing with large patient populations.

Cuckoo Search Optimization

Cuckoo Search Optimization (CSO) is a nature-inspired optimization algorithm that mimics the nesting behavior of cuckoo birds, specifically their parasitic reproduction strategy [11]. It was introduced by Xin-She Yang and Suash Deb in 2009 as a powerful optimization technique for solving complex problems in various fields, including engineering, finance, and healthcare. The key characteristics of the cuckoo search optimization algorithm are its simplicity, efficiency, and ability to handle multi-dimensional, non-linear, and non-convex problems [12]. The algorithm is particularly known for its global search capability, making it effective for finding optimal solutions in large and complicated search spaces [13].

Key Concepts of Cuckoo Search Optimization

Cuckoo Birds and Their Parasitic Reproduction Strategy: Cuckoo birds are known for their parasitic behavior, where they lay their eggs in the nests of other bird species. The host birds unknowingly incubate and raise the cuckoo eggs. When the cuckoo egg hatches, the cuckoo chick may either eject the host eggs or outgrow the host chicks, gaining all the resources of the host nest. This process has been adapted into an optimization strategy that utilizes the following principles [11]:

- **Random Search:** The cuckoo lays its eggs in a random nest (which represents a possible solution in the search space).
- **Levy Flight:** Cuckoos search for new nests (solutions) using a random walk called Levy flights, which allows for a balanced exploration and exploitation of the search space.
- **Elite Nesting:** Each nest represents a potential solution, and the best nests are kept while poor solutions are discarded. The cuckoo algorithm attempts to improve the quality of solutions over successive generations by exploiting the best solutions.

Levy Flight: A distinctive feature of CSO is the use of Levy flights, which are random walks characterized by step sizes that are drawn from a Levy distribution. This allows the algorithm to make both small and large jumps in the solution space, promoting global search in the early stages of the optimization and fine-tuning the solution in the later stages [12].

Global and Local Search: CSO balances exploration (global search) and exploitation (local search). Exploration is done through random movements (Levy flight), while exploitation is achieved by moving towards the best solution found so far (elite nest). This combination ensures that the algorithm doesn't get stuck in local optima and can explore the global search space more effectively [13].

Fitness Function: The quality of each potential solution (i.e., each "nest") is evaluated using a fitness function. The fitness function is problem-specific and measures how close a given solution is to the optimal solution. In the context of RMD detection, the fitness function could evaluate the performance of a machine learning model or classification algorithm in terms of accuracy, sensitivity, specificity, or other relevant metrics.

Steps in Cuckoo Search Optimization

Initialization

- Initialize a population of cuckoo solutions (nests) randomly in the search space. Each nest corresponds to a potential solution to the problem being optimized.

Levy Flight

- Each cuckoo (solution) makes a random move (based on Levy flights) to explore the search space and create new candidate solutions.

**Selection**

- Evaluate the fitness of each new solution using the fitness function.
- Compare the fitness of the new solution with that of the current nest. If the new solution is better, it replaces the old nest.

Replacement

- Some of the worst nests (solutions) are replaced with new solutions generated via Levy flight.
- The best nests are retained, ensuring that the optimization process focuses on improving the best solutions.

Stopping Criteria

- The process continues until a stopping criterion is met, such as reaching a predefined number of iterations, achieving a target fitness value, or convergence to an optimal solution.

Support Vector Clustering Approach

Support Vector Clustering (SVC) [14] is a machine learning technique derived from Support Vector Machines (SVMs) that is specifically designed for clustering tasks. Unlike traditional clustering algorithms such as K-means or hierarchical clustering, which work by grouping data into predefined clusters, SVC does not require the specification of the number of clusters in advance. Instead, SVC aims to discover natural groupings in the data based on the distribution of data points in a higher-dimensional space. This makes SVC particularly useful for complex datasets where the underlying patterns are not immediately apparent in the original feature space [15].

Core Concepts of Support Vector Clustering (SVC)

SVC leverages the power of SVMs to find the optimal separation between different classes in the dataset, but instead of performing classification, it performs clustering by mapping data points to a higher-dimensional feature space using a kernel function. The main goal of SVC is to partition the data in such a way that the data points in each cluster are as close as possible to each other and well-separated from other clusters [16].

Key Concepts of SVC

Mapping to Higher Dimensions (Feature Space): SVC works by transforming the original data into a higher-dimensional feature space using a kernel function (such as the Radial Basis Function (RBF) kernel). In this higher-dimensional space, data points that are not linearly separable in the original space can become separable, allowing for easier clustering.

Support Vectors: In the context of clustering, support vectors are the critical data points that help define the boundaries between different clusters in the higher-dimensional space. These points lie closest to the separating hyperplanes and are crucial in determining the overall structure of the clusters. SVC identifies these support vectors during the clustering process.

Cluster Boundaries: SVC attempts to find the optimal separating hyperplane (or hypersurface) in the higher-dimensional feature space, which divides the data into distinct clusters. Instead of explicitly defining clusters, SVC defines a boundary that encompasses the regions where the majority of data points lie, with outliers lying outside these boundaries.

Kernel Function: A kernel function maps the data from the input space to a higher-dimensional feature space without explicitly calculating the coordinates in that space. Common kernel functions used in SVC include:

- **Linear Kernel:** Assumes that data is linearly separable.
- **Radial Basis Function (RBF) Kernel:** Projects the data into a higher-dimensional space where complex patterns can be identified.
- **Polynomial Kernel:** Maps the data to a higher-dimensional space based on polynomial relationships.

Clustering Process: The process of clustering in SVC can be outlined as follows:

- First, the data is mapped to a higher-dimensional space using a kernel function.
- Next, the algorithm finds the boundary that best separates the data points into clusters.
- Points that fall within the boundaries are considered part of the same cluster, while points outside the boundary are outliers or belong to a different cluster.

**Sadaieswaran and Prakash Kumar****Outliers:**

One of the key advantages of SVC is its ability to handle outliers effectively. Data points that do not fit well into any cluster are treated as outliers and are excluded from the clustering process. This is done by placing them outside the decision boundary.

Steps in the Support Vector Clustering Algorithm:

Input Data: The algorithm begins with the original dataset, where each data point is represented as a vector of features.

Feature Transformation: Using a kernel function, SVC maps the data points to a higher-dimensional feature space. This mapping helps separate complex data that cannot be divided using linear boundaries in the original feature space.

Constructing the Similarity Matrix: A similarity matrix is constructed based on the kernel function. This matrix measures the similarity between all pairs of data points in the transformed feature space. Data points that are similar to each other have high similarity values.

Cluster Formation: Using the support vectors, the algorithm identifies the decision boundary that best separates the data into distinct clusters. This is achieved by finding a hypersurface that encloses as many data points as possible while minimizing the number of points outside the boundary.

Assigning Clusters: After identifying the boundaries, data points that lie within the cluster boundaries are assigned to the corresponding clusters, while points outside the boundaries are considered outliers.

Post-Processing: After clustering, some post-processing steps can be performed to refine the clusters, such as removing outliers or merging small clusters that may have been incorrectly split.

Proposed Cuckoo Search Optimization – Support Vector Clustering Based Feature Extraction (CSO-SVC-FE) Approach

The proposed Cuckoo Search Optimization – Support Vector Clustering Based Feature Extraction (CSO-SVC-FE) approach aims to improve the detection and classification of Rheumatic Musculoskeletal Diseases (RMDs) by integrating Cuckoo Search Optimization (CSO) and Support Vector Clustering (SVC) for feature extraction and optimization. The procedure begins with data collection and preprocessing, where relevant medical data (such as images or clinical measurements) is gathered, and any missing values or inconsistencies are handled through normalization and imputation. The next step, feature extraction, involves using SVC to perform unsupervised clustering on the data, mapping it into a higher-dimensional space using a kernel function. This process groups the data into clusters, with each cluster representing patterns related to RMDs, and extracts the most important features that aid in distinguishing between different conditions. Following feature extraction, the Cuckoo Search Optimization (CSO) algorithm is initialized, where a population of cuckoos (solutions) representing potential sets of classifier parameters is created. These cuckoos perform Levy flights to explore the search space and identify the best solution based on a fitness function, which measures classification accuracy. The CSO algorithm then iterates to improve these solutions by replacing less optimal ones with better-performing alternatives. Once the optimal feature set and classifier parameters are identified, the model is trained using the optimized features, and its performance is evaluated on a separate testing dataset. This process involves measuring metrics like accuracy, sensitivity, and specificity. Finally, the results of the CSO-SVC-FE approach are compared with baseline models, and statistical analyses are performed to determine if the approach offers significant improvements. The procedure concludes with an interpretation of the results, offering insights into the model's effectiveness in diagnosing RMDs and suggesting areas for future enhancement. This methodology combines optimization, clustering, and feature extraction techniques to automate and enhance the RMD classification process, resulting in a more accurate, efficient, and interpretable diagnostic system. The proposed Cuckoo Search Optimization – Support Vector Clustering Based Feature Extraction (CSO-SVC-FE) approach integrates Cuckoo Search Optimization (CSO) for optimizing parameters and Support Vector Clustering (SVC) for effective feature extraction in the detection of Rheumatic Musculoskeletal Diseases (RMDs). The approach enhances the classification performance by improving feature extraction and the parameter optimization of a classifier model. The steps involved in the CSO-SVC-FE approach are as follows:

**Step 1: Data Collection and Preprocessing**

- **Data Collection:** Gather medical data (such as radiographic images, MRI scans, or clinical measurements) for RMD detection. The dataset may consist of both labeled and unlabeled data, which includes features relevant to RMDs, such as joint inflammation, cartilage damage, and soft tissue abnormalities.
- **Data Preprocessing:**
 - **Normalization:** Standardize the data to ensure that all features are on a similar scale. This can be done using techniques like min-max normalization or z-score normalization.
 - **Missing Data Handling:** Handle any missing values in the dataset using imputation methods or by removing incomplete instances.
 - **Data Splitting:** Split the dataset into training and testing subsets (e.g., 80% for training, 20% for testing).

Step 2: Feature Extraction

- **SVC-Based Feature Extraction:**
 - Use Support Vector Clustering (SVC) to perform unsupervised clustering of the data. SVC will help in identifying the most representative features from the dataset by creating decision boundaries (clusters) in a higher-dimensional feature space.
 - **Kernel Function:** Choose an appropriate kernel function (e.g., Radial Basis Function (RBF) kernel) to map the data into a higher-dimensional space where the data points from different classes can be separated more effectively.
 - **Clustering:** Using the SVC algorithm, group the data into different clusters that represent distinct patterns or categories in the dataset. Each cluster contains data points that are similar to each other, and the boundaries between clusters are determined based on the support vectors.
 - **Feature Selection:** After clustering, select the most important features from the resulting clusters that contribute the most to distinguishing between different RMD categories. This step reduces dimensionality and focuses on the most relevant features for classification.

Step 3: Initialization of Cuckoo Search Optimization (CSO)

- **Population Initialization:**
 - Initialize a population of cuckoos (solutions), where each cuckoo represents a potential solution to the optimization problem. Each cuckoo corresponds to a set of candidate parameters for the classifier model (e.g., SVC or other machine learning algorithms).
 - The parameter set could include the kernel type, kernel parameters (e.g., gamma in the RBF kernel), regularization parameters, and any other relevant parameters related to the SVC-based feature extraction or classification process.
- **Fitness Function:** Define a fitness function that evaluates the quality of the solution. In this case, the fitness function could be based on the classification accuracy or other performance metrics such as sensitivity, specificity, or F1-score on the validation set. The better the performance, the higher the fitness score.

Step 4: CSO Algorithm Execution (Optimization Process)

- **Levy Flight for Exploration:**
 - Each cuckoo (candidate solution) performs a random search (Levy flight) in the search space to explore the parameter space. This random walk allows for both small and large steps to explore the global search space efficiently and avoid local optima.
- **Solution Evaluation:**
 - Evaluate the fitness of each cuckoo (solution) by running the classifier with the corresponding parameters on the training data. Calculate the fitness score based on how well the model performs using the selected features and parameters.
- **Replacement of Nests:**
 - For each cuckoo, if the new solution provides a better fitness score than the current solution, it replaces the current nest. This process helps evolve the population towards the optimal solutions.

- **Global Best Nest:**
 - Track the best solution found during the optimization process. This solution corresponds to the optimal set of features and parameters that yield the highest classification accuracy.

Step 5: Feature Optimization and Model Training

- **Feature Optimization:** After running the CSO algorithm, select the optimized feature subset and model parameters. The best combination of features extracted through SVC clustering and parameters tuned by CSO will be used for training the final classifier model.
- **Training the Classifier:**
 - Train the classifier (e.g., SVC or another machine learning algorithm) using the optimized feature set and the best parameters obtained from the CSO optimization process. The classifier is trained using the training dataset to learn the patterns associated with RMDs.

Step 6: Model Evaluation and Validation

- **Testing:**
 - Evaluate the performance of the trained classifier on the testing dataset that was not used during the training process. Measure the model's accuracy, sensitivity, specificity, precision, recall, F1-score, and other relevant performance metrics.
- **Cross-Validation:**
 - Optionally, apply cross-validation (e.g., k-fold cross-validation) to ensure that the model generalizes well across different subsets of the data and is not overfitting to the training set.

RESULT AND DISCUSSION

The performance of the proposed Improved Support Vector Clustering with Cuckoo Search Optimization (SVC-CSO-FE) method is evaluated with existing feature extraction techniques like PCA, ICA, SVM, and the optimization-based techniques like Particle Swarm Optimization (PSO), Genetic Algorithm (GA), and Cuckoo Search Optimization (CSO) using SVM, KNN and RF classification techniques. Table 1 depicts the Detection Accuracy (in %) obtained by the Proposed Improved (SVC-GSO) and existing Feature Extraction techniques using SVM, KNN and RF classification techniques. From the table 1, it is clear that the proposed Improved SVC-CSO-FE gives better detection accuracy (in %) than the other feature extraction techniques. Table 2 depicts the Sensitivity (in %) obtained by the Proposed SVC-CSO-FE and existing Feature Extraction techniques using SVM, KNN and RF classification techniques. From the table 2, it is clear that the proposed Improved SVC+GSO gives better Sensitivity (in %) than the other feature extraction techniques. Table 3 depicts the Specificity (in %) obtained by the Proposed SVC-CSO-FE and existing Feature Extraction techniques using SVM, KNN and RF classification techniques. From the table 3, it is clear that the proposed SVC-CSO-FE gives better Specificity (in %) than the other feature extraction techniques. Table 4 depicts the False Positive Rate (in %) obtained by the Proposed SVC-CSO-FE and existing Feature Extraction techniques using SVM, KNN and RF classification techniques. From the table 4, it is clear that the proposed SVC-CSO-FE gives reduced FPR (in %) than the other feature extraction techniques. Table 5 depicts the Miss Rate (in %) obtained by the Proposed SVC-CSO-FE and existing Feature Extraction techniques using SVM, KNN and RF classification techniques. From the table 5, it is clear that the proposed SVC-CSO-FE gives reduced Miss Rate (in %) than the other feature extraction techniques.

CONCLUSION

The results presented in the tables demonstrate the superior performance of the proposed SVC-CSO-FE approach compared to existing feature extraction techniques in the classification of Rheumatic Musculoskeletal Diseases (RMDs). Table 1 highlights that the proposed SVC-CSO-FE method achieves the highest detection accuracy across all three classification techniques—SVM, KNN, and RF—outperforming other methods like PCA, ICA, and various optimization techniques (PSO, GA, GSO). This indicates that the integration of Cuckoo Search Optimization (CSO) and Support Vector Clustering (SVC) in feature extraction significantly enhances the model's ability to accurately

detect RMDs. In terms of sensitivity (Table 2), the proposed approach again demonstrates superior performance, achieving the highest sensitivity values for all classifiers. Sensitivity, which measures the true positive rate, is crucial for medical diagnostics as it reflects the model's ability to correctly identify positive cases. The SVC-CSO-FE method provides a higher sensitivity than the other techniques, ensuring better detection of RMDs, especially in medical applications where missing a true positive case can have serious implications. Similarly, the specificity results (Table 3) confirm that the proposed method provides the highest specificity across all classifiers, reducing the number of false positives and ensuring that negative cases are accurately identified. This characteristic is essential in reducing unnecessary treatments or interventions, thereby improving patient care and reducing healthcare costs. Moreover, the False Positive Rate (FPR) (Table 4) and Miss Rate (Table 5) metrics further highlight the efficiency of the proposed approach. The proposed method achieves significantly lower false positive and miss rates compared to the other feature extraction techniques. This indicates that the SVC-CSO-FE approach not only enhances the detection of true positive cases but also minimizes the misclassification of negative and missed cases, making it a reliable tool for medical diagnostics. In conclusion, the SVC-CSO-FE approach demonstrates substantial improvements in detection accuracy, sensitivity, specificity, false positive rate, and miss rate compared to existing methods. These results underline the potential of combining Cuckoo Search Optimization with Support Vector Clustering for feature extraction, presenting a powerful and effective method for the classification and early detection of Rheumatic Musculoskeletal Diseases. The proposed method holds great promise for improving diagnostic tools in healthcare, offering more accurate, reliable, and efficient systems for the detection and management of RMDs.

ABSTRACT

Cloud computing, while offering cost-effective services, poses significant security challenges, particularly in access control for sensitive data. Existing access control models may not fully address the diverse user base and unique challenges of cloud environments. In this research, we propose a three-model approach to enhance access control for sensitive data in the cloud. The proposed models incorporate content sensitivity analysis, content similarity computation, and a hybrid Siamese Neural Network (SNN) classifier for effective data categorization based on sensitivity and similarity measures. The content sensitivity model utilizes information gain to calculate data sensitivity, while the SNN classifier integrates a Multi-Layered Perceptron (MLP) architecture for robust classification.

INTRODUCTION

In today's digital landscape, cloud computing stands as a ubiquitous paradigm revolutionizing the Information Technology (IT) industry. With its promise of cost-effective services delivered on-demand, including Software as a Service (SaaS), Infrastructure as a Service (IaaS), and Platform as a Service (PaaS), cloud computing has become the backbone of modern IT infrastructure. However, amid its myriad benefits, the proliferation of cloud computing has brought forth a host of security challenges, chief among them being the safeguarding of sensitive data [1][2]. Access

**Saraswathi and Sugumar**

control, a cornerstone of data security, assumes paramount importance in cloud computing environments. Effective access control mechanisms are essential to prevent unauthorized access to systems and protect organizations' valuable assets. Despite the existence of various access control models and policies, the unique characteristics and challenges inherent to cloud computing necessitate tailored solutions to meet its specific access control requirements. The diverse user base, multi-tenant hosting, and heterogeneous security policies within cloud environments demand innovative approaches to access control to mitigate risks associated with data breaches, insider threats, and cyber-attacks [3][4].

Importance of Context based Access Control Mechanisms

In the rapidly evolving landscape of cloud computing, ensuring robust security measures to protect sensitive data has become paramount. Context and content-based access control techniques have emerged as vital components in the arsenal of security measures deployed to safeguard data in cloud computing environments [5] [6] [7] [8].

Addressing Diverse user Requirements

Cloud computing caters to a diverse user base, ranging from individual consumers to large enterprises. Each user group may have distinct security requirements based on factors such as data sensitivity, compliance regulations, and business objectives. Context and content-based access control techniques offer the flexibility to tailor access control policies according to the specific needs of different user groups. By considering contextual factors such as user roles, device types, and geographical locations, these techniques enable fine-grained control over data access permissions, ensuring that users only have access to the data relevant to their roles and responsibilities.

Enhancing Data Protection

Data stored in the cloud is subject to various security threats, including unauthorized access, data breaches, and insider attacks. Context and content-based access control techniques bolster data protection by incorporating contextual information and content analysis into access control decisions. By evaluating factors such as user behavior, access patterns, and the sensitivity of data content, these techniques can identify anomalous activities and proactively enforce access controls to prevent unauthorized access or data exfiltration. This proactive approach to security helps mitigate the risk of data breaches and strengthens overall data protection measures in cloud environments.

Compliance and Regulatory Requirements

Cloud computing introduces complexities in ensuring compliance with regulatory standards and industry-specific requirements. Context and content-based access control techniques play a crucial role in addressing compliance challenges by enabling organizations to enforce access control policies that align with regulatory mandates. By considering contextual factors such as data sensitivity and compliance requirements, these techniques help organizations ensure that access to sensitive data is restricted to authorized users and that data handling practices adhere to regulatory guidelines. This ensures compliance with regulations such as GDPR, HIPAA, PCI-DSS, and others, reducing the risk of non-compliance penalties and legal liabilities.

Facilitating Dynamic Access Control

Cloud computing environments are characterized by dynamic workloads, fluctuating user demands, and evolving business requirements. Context and content-based access control techniques provide the agility and adaptability needed to accommodate these dynamic changes. By continuously analyzing contextual information and content attributes, these techniques can dynamically adjust access control policies in real-time to accommodate changes in user roles, permissions, or environmental conditions. This dynamic approach to access control ensures that security policies remain effective and responsive to evolving threats and operational needs, enhancing the resilience of security measures in cloud environments [9] [10].

Enabling Granular Control and Visibility

Context and content-based access control techniques offer granular control over data access permissions, allowing organizations to define access policies based on specific contextual attributes and content attributes. This granular control enables organizations to enforce least privilege principles, granting users access only to the data and resources necessary to perform their tasks. Additionally, these techniques provide visibility into access patterns and user behavior, facilitating audit trails, and compliance reporting. This visibility enhances transparency and accountability, enabling organizations to monitor and track access activities, detect security incidents, and investigate potential security breaches effectively [11] [12].

Proposed Enhanced Context Based Access Control Approach

Content Sensitivity Model

The Content Sensitivity Model proposed in this research aims to quantitatively assess the sensitivity of data elements in cloud computing environments [13] [14] [15] [16] [17] [18]. It utilizes information gain (IG) to compute the sensitivity of data elements based on factors such as Content Connectivity, Content Usage, and Content Quality. By analyzing these aspects, the model provides a comprehensive understanding of the sensitivity levels of different data elements, facilitating effective access control and data protection.

Information Gain (IG) Method

Information gain is a metric used to quantify the amount of information provided by a feature for predicting a target variable. In the context of the Content Sensitivity Model, IG is employed to measure the impact of data elements on the overall sensitivity of the system. It is calculated as follows:

$$IG(X) = Entropy(System) - Entropy((System|X))$$

Where $Entropy(System)$ represents the entropy of the system before considering the data element X . $Entropy((System|X))$ represents the entropy of the system after considering the data element X .

Factors Considered in Content Sensitivity Assessment

Content Connectivity

Content Connectivity refers to the interconnections and relationships between different data elements within the system. It can be calculated using metrics such as degree centrality or graph-based algorithms to analyze the network structure of data elements. Content connectivity can be quantified using various metrics and algorithms, depending on the nature of the data and the underlying system architecture. Some common methods for measuring content connectivity include:

1. **Graph-Based Analysis:** Representing data elements as nodes and their relationships as edges, organizations can use graph-based algorithms to analyze content connectivity. Metrics such as degree centrality, betweenness centrality, and clustering coefficients provide insights into the connectivity patterns within the data.
2. **Network Analysis:** Network analysis techniques assess the structural properties of data networks to determine content connectivity. Algorithms such as community detection and modularity analysis identify clusters or communities of highly connected data elements, revealing underlying patterns of connectivity.
3. **Dependency Analysis:** Dependency analysis examines the dependencies between data elements to assess content connectivity. By identifying dependencies such as data flows, data references, and data dependencies, organizations can infer the strength and directionality of connections between data components.

$$\text{Degree Centrality } C_i = \frac{\text{Number of connections of node } i}{\text{Total number of nodes in the network}}$$

Where C_i represents the degree centrality of node i , The numerator denotes the number of connections (edges) of node i , The denominator represents the total number of nodes (including node i) in the network.

Saraswathi and Sugumar

Betweenness Centrality $C_B(v) = \sum_{z \neq v \neq t} \frac{\sigma_{st}(v)}{\sigma_{st}}$ Where $C_B(v)$ represents the betweenness centrality of node v . σ_{st} denotes the total number of shortest paths from node s to node t . $\sigma_{st}(v)$ represents the number of shortest paths from node s to node t that pass through node v .

$$\text{Clustering Coefficient } C_i = \frac{2X \text{ Number of connections between neighbors of node } i}{\text{Number of possible connections between neighbors of node } i}$$

Where C_i represents the clustering coefficient of node i , The numerator denotes twice the number of connections between the neighbors of node i . The denominator represents the total number of possible connections between the neighbors of node i .

Content Usage

Content usage refers to the frequency and importance of data elements in system operations and processes. In the context of the content sensitivity model, content usage analysis assesses how frequently data elements are accessed, modified, or interacted with within the system. By understanding the usage patterns of data elements, organizations can gauge their importance and sensitivity, informing access control decisions and prioritizing security measures accordingly. Content usage can be quantified using various metrics and analysis techniques, depending on the nature of the data and the objectives of the analysis. Some common methods for measuring content usage include:

1. **Access Frequency Analysis:** Access frequency analysis examines how often data elements are accessed or modified within the system. By tracking access logs, audit trails, or usage statistics, organizations can quantify the frequency of interactions with data elements and identify high-usage data components.
2. **Usage Patterns Identification:** Usage patterns identification involves identifying recurring patterns or trends in data access and usage. By analyzing access timestamps, user behaviors, and system logs, organizations can uncover patterns such as peak usage periods, common access paths, and user access preferences.
3. **Importance Ranking:** Importance ranking ranks data elements based on their usage and importance to system operations. By considering factors such as access frequency, data dependencies, and business relevance, organizations can assign priority levels to data elements and allocate resources accordingly. While content usage metrics may vary depending on the specific analysis technique used, some common equations and formulas include:

$$\text{Access Frequency}(D_i) = \frac{\text{Number of times data element } D_i \text{ accessed}}{\text{Total observation period}}$$

Access Frequency(D_i) represents the access frequency of data element D_i . The numerator denotes the number of times data element D_i is accessed during the observation period. The denominator represents the total duration of the observation period.

$$\text{Importance Score}(D_i) = \frac{\text{Number of times data element } D_i \text{ accessed}}{\text{Max Access Frequency}} \times 100$$

Importance Score(D_i) represents the importance score of data element D_i . Max Access Frequency denotes the maximum access frequency observed for any data element in the system.

Content Quality

Content quality refers to the reliability, accuracy, and trustworthiness of data elements within a system. In the context of the content sensitivity model, content quality analysis evaluates the integrity and validity of data content, enabling organizations to assess the sensitivity and importance of data elements accurately. By understanding content quality, organizations can make informed decisions about access control, data protection, and resource allocation, ensuring the integrity and reliability of their information assets. Content quality can be assessed using

Saraswathi and Sugumar

various metrics and analysis techniques, depending on the nature of the data and the objectives of the analysis. Some common methods for measuring content quality include:

1. **Accuracy Assessment:** Accuracy assessment evaluates the correctness and precision of data elements by comparing them to a known or reference standard. Techniques such as data validation, error detection, and outlier analysis can be used to identify inaccuracies and discrepancies in data content.
2. **Completeness Analysis:** Completeness analysis examines the extent to which data elements contain all relevant and necessary information. By assessing missing or incomplete data fields, organizations can ensure that data elements are complete and comprehensive, enabling accurate analysis and decision-making.
3. **Consistency Evaluation:** Consistency evaluation assesses the uniformity and coherence of data elements across different sources or versions. Techniques such as data reconciliation, duplicate detection, and version control help identify inconsistencies and discrepancies in data content, ensuring data coherence and reliability. While content quality metrics may vary depending on the specific analysis technique used, some common equations and formulas include: Accuracy Calculation

$$\text{Accuracy} = \frac{\text{Number of correct data elements}}{\text{Total number of data elements}} \times 100\%$$

Accuracy represents the percentage of correct data elements in the dataset. The numerator denotes the number of data elements that are correct or accurate. The denominator represents the total number of data elements in the dataset.

$$\text{Completeness Score} = \frac{\text{Number of complete data elements}}{\text{Total number of data elements}} \times 100\%$$

Completeness Score represents the percentage of complete data elements in the dataset. The numerator denotes the number of data elements that are complete. The denominator represents the total number of data elements in the dataset.

Data Similarity Computation Model with Siamese Neural Network Classification

Data similarity computation is a crucial aspect of the content sensitivity model, allowing organizations to quantify the semantic similarity between data elements. In the context of access control, assessing data similarity enables organizations to identify related data elements and enforce access policies based on their semantic relationships. Siamese Neural Network (SNN) is a powerful deep learning architecture commonly used for computing similarity between pairs of data elements [19] [20].

Siamese Neural Network Architecture

The Siamese Neural Network architecture consists of two identical sub-networks (referred to as twins) that share the same weights and parameters. Each sub-network processes one input data element independently and generates a fixed-size feature vector representing the data element's semantic representation. The output feature vectors from both sub-networks are then compared using a similarity metric to determine the similarity between the input data elements.

Twin Network Structure

The hallmark of the Siamese Neural Network architecture is its twin network structure, consisting of two identical sub-networks (referred to as twins) that share the same weights and parameters. Each sub-network processes one input data element independently, extracting its semantic features and generating a fixed-size feature vector that represents the data element's semantic representation.

Shared Weights and Parameters

In SNNs, both sub-networks (twins) share the same set of weights and parameters, ensuring that the feature extraction process is consistent across input data elements. By sharing weights and parameters, the network learns to

Saraswathi and Sugumar

capture the underlying semantic structure of the data and identify similarities between pairs of data elements more effectively.

Feature Extraction Layers

Each sub-network typically consists of multiple layers of neurons, including convolutional layers, pooling layers, and fully connected layers. These layers perform feature extraction and transformation, gradually transforming the input data into a high-dimensional feature representation that captures its semantic content.

Contrastive Learning Objective

During training, the Siamese Neural Network is presented with pairs of input data elements along with their corresponding labels indicating whether the data elements are similar or dissimilar. The network learns to minimize the distance between feature vectors of similar data elements and maximize the distance between feature vectors of dissimilar data elements.

Similarity Measurement

Once the feature vectors for both input data elements are extracted by the twin networks, the similarity between the data elements is computed using a similarity metric such as cosine similarity or Euclidean distance. The similarity metric quantifies the degree of resemblance between the feature vectors, providing a measure of semantic similarity between the input data elements.

Classification or Regression Head

In some cases, SNNs may include an additional classification or regression head on top of the feature extraction layers to further process the feature vectors and make predictions based on the computed similarity scores. For example, in classification tasks, the network may predict whether the input data elements belong to the same class or category based on their semantic similarity.

Training Process

During the training process, the Siamese Neural Network learns to distinguish between pairs of similar and dissimilar data elements by adjusting its weights and parameters to minimize a contrastive loss function. The network is optimized using back propagation and gradient descent algorithms to iteratively update its parameters and improve its performance in computing semantic similarity.

Training Process of SNN

The training process of a Siamese Neural Network involves learning to distinguish between pairs of similar and dissimilar data elements. During training, the network is presented with pairs of input data elements along with their corresponding labels indicating whether the data elements are similar or dissimilar. The network learns to minimize the distance between feature vectors of similar data elements and maximize the distance between feature vectors of dissimilar data elements.

Data Similarity Computation

The similarity between pairs of data elements in a Siamese Neural Network can be computed using various similarity metrics. One common metric is the cosine similarity, which measures the cosine of the angle between two vectors in a multi-dimensional space. The cosine similarity ranges from -1 to 1, where a value closer to 1 indicates higher similarity between data elements.

$$\text{Cosine Similarity}(x,y) = \frac{x \cdot y}{\|x\| \cdot \|y\|}$$

x and y represent the feature vectors of the input data elements. $x \cdot y$ denotes the dot product of the feature vectors. $\|x\|$ and $\|y\|$ represent the Euclidean norms of the feature vectors.

Training Objective

The training objective of a Siamese Neural Network involves minimizing a loss function that penalizes the network for misclassifying similar and dissimilar pairs of data elements. One common loss function used in Siamese networks is the contrastive loss function, which encourages the network to minimize the distance between feature vectors of similar data elements and maximize the distance between feature vectors of dissimilar data elements. Contrastive Loss Function Equation

$$L(y, d) = (1 - y) \cdot \frac{1}{2} \cdot d^2 + y \cdot \frac{1}{2} \cdot \max(0, m - d)^2$$

y represents the true label indicating whether the data elements are similar (1) or dissimilar (0). d denotes the distance between feature vectors of the input data elements. m represents the margin parameter, which controls the threshold distance between similar and dissimilar data elements. The first term penalizes the network for misclassifying similar data elements. The second term penalizes the network for misclassifying dissimilar data elements.

Hybrid Siamese Neural Network Classifier

The integration of Multi-Layer Perceptron (MLP) [21] [22] with the Siamese Neural Network (SNN) classifier for context-based access control represents a powerful approach to leverage both semantic similarity and contextual information for making access control decisions in cloud computing environments.

Feature Extraction with SNN

- The SNN is responsible for extracting semantic features from the input data elements and computing their similarity.
- Each input data element is processed independently by the twin networks of the SNN, resulting in fixed-size feature vectors representing the semantic representation of the data.

Incorporation of Contextual Information

- Contextual information, such as user identity, device type, time of access, and location, is integrated into the model as additional input features.
- These contextual features provide supplementary information that enriches the representation of the input data and helps capture the specific context surrounding each access request.

Concatenation of SNN and Contextual Features

- The feature vectors extracted by the SNN are concatenated with the contextual features, creating a combined feature representation that incorporates both semantic similarity and contextual information.
- This combined feature representation serves as the input to the MLP component, allowing the model to leverage both types of information simultaneously.

MLP Architecture

- The MLP architecture consists of multiple layers of neurons, including input, hidden, and output layers.
- The input layer receives the concatenated feature representation from the SNN and contextual information, while the hidden layers perform nonlinear transformations to learn complex patterns and relationships in the data.
- The output layer generates the final access control decisions based on the learned patterns and relationships, integrating both semantic similarity and contextual factors.

Training Process

- During the training process, the integrated model is trained end-to-end using a combination of access control labels and contextual information.
- The model learns to optimize its weights and parameters to minimize a joint loss function, which penalizes misclassifications based on both semantic similarity and contextual factors.
- The training process involves backpropagation and gradient descent algorithms to iteratively update the model's parameters and improve its performance in access control tasks.

RESULT AND DISCUSSION

In this contribution, a dataset is considered from the Twitter and obtained by using API. The datasets in varying size like 100 MB, 200MB, 300MB, 400MB, 500MB, 600MB, 700MB,800MB, 900MB and 1000MB is considered for this evaluation of the proposed Enhanced Context based access control method. Running time (in seconds) and Number of Sensitive in the dataset are the performance metrics in this work. The performance of the proposed Enhanced Context based Access Control (ECBAC) is compared with the Content Based Access Control (CBAC) method. Table 1 gives the running time (in seconds) by the Proposed ECBAC method and existing CBAC method for different size of Datasets. Figure 1 depicts the graphical representation of the running time (in seconds) by the Proposed ECBAC method and existing CBAC method for different size of Datasets. From the table 1 and figure 1, Proposed ECBAC Method Demonstrates generally faster running times compared to the existing CBAC method across all dataset sizes. Running times increase gradually as the dataset size increases. Shows efficient performance in access control management. Existing CBAC Method Exhibits longer running times compared to the proposed ECBAC method across all dataset sizes. Running times also increase with larger dataset sizes. Indicates relatively slower performance in access control management compared to the proposed ECBAC method. The proposed ECBAC method offers faster running times for access control management compared to the existing CBAC method across various dataset sizes. Both methods show an increase in running times as the dataset size grows, but the proposed ECBAC method consistently outperforms the existing CBAC method. The efficiency of the proposed ECBAC method in managing access control suggests its potential for improving system performance and scalability. Table 2 gives the Number of sensitive items identified by Proposed ECBAC method and existing CBAC method for different size of Datasets. Figure 2 depicts the graphical representation of the Number of sensitive items identified by Proposed ECBAC method and existing CBAC method for different size of Datasets. From the table 2 and figure 2, Proposed ECBAC Method Identifies a higher number of sensitive items compared to the existing CBAC method across all dataset sizes. The number of sensitive items identified increases as the dataset size increases. Shows effectiveness in detecting sensitive items within datasets. Existing CBAC Method Identifies a lower number of sensitive items compared to the proposed ECBAC method across all dataset sizes. The number of sensitive items identified also increases with larger dataset sizes. Indicates relatively less efficiency in detecting sensitive items compared to the proposed ECBAC method. The proposed ECBAC method shows better performance in identifying sensitive items within datasets compared to the existing CBAC method across various dataset sizes. Both methods exhibit an increase in the number of sensitive items identified as the dataset size grows, but the proposed ECBAC method consistently identifies more sensitive items. The effectiveness of the proposed ECBAC method in identifying sensitive items suggests its potential for improving data security and access control.

CONCLUSION

In this chapter, An Enhanced Context based access control approach is proposed using Content Sensitivity, Similarity and Hybrid SNN classifier. The performance of the proposed Enhanced Context based Access Control is evaluated with the existing content-based access control approach for two different metrics. From the results obtained, it is clear that the proposed ECBAC performs better than existing CBAC.

ABSTRACT

Exploratory Data Analysis (EDA) is a crucial step in data wisdom that helps uncover patterns, trends, and connections in data before making opinions. It involves using statistical ways and visualizations similar as histograms, smatter plots, and box plots to epitomize data and identify missing values, outliers, or inconsistencies. EDA helps businesses and associations make informed opinions by furnishing perceptivity into client geste, request trends, and functional effectiveness. By assaying data effectively, decision- makers can optimize strategies, reduce pitfalls, and ameliorate overall performance. This paper highlights the significance of EDA in decision support and how it enhances data- driven decision- timber.

Keywords: Exploratory Data Analysis , Data Visualization, Decision Support, Data Patterns, Business Insights, Predictive Analytics, Data Preprocessing.

INTRODUCTION

When we come across a new dataset, several questions arise: What is the distribution of the dataset Are there any missing values, outliers, or anomalies? What are the underlying assumptions Do relationships exist between variables Is the dataset ready for machine learning algorithms How do we select the most suitable algorithm The answer to all these questions lies in Exploratory Data Analysis (EDA)[5]. EDA is a crucial first step in understanding a dataset, allowing us to analyze data distribution, detect outliers and anomalies, and validate assumptions[1]. It helps in directing hypothesis testing and ensures that data is clean and well-structured before modelling[2]. Through statistical summaries, visualizations, and pattern identification, EDA provides insights into the dataset's main characteristics and relationships between variables. It also plays a vital role in hypothesis generation by leveraging graphical representations such as histograms, box plots, scatter plots, and correlation matrices. The EDA results support a complex view of the antecedents and consequences of consumer decision-making styles[4]. Ultimately, EDA ensures that the dataset is well-prepared for machine learning and aids in selecting the most appropriate algorithm for analysis.

**Jangam****METHODOLOGY****Importing libraries**

For performing Exploratory Data Analysis (EDA) in Python, we require two essential libraries: NumPy and Pandas. NumPy is the fundamental library for scientific computing in Python, providing support for large and multi-dimensional arrays and matrices, along with a vast collection of high-level mathematical functions to operate on them. Pandas, on the other hand, is a powerful library designed for data manipulation and analysis, enabling the handling of structured data like numerical tables and time series efficiently. Additionally, for effective data visualization, we rely on Seaborn and Matplotlib. Seaborn is a statistical data visualization library built on Matplotlib, offering a high-level interface for creating aesthetically pleasing and informative plots. Meanwhile, Matplotlib serves as the core visualization library in Python, providing an object-oriented API for embedding various types of plots into applications. Together, these four libraries form the backbone of EDA, helping analysts explore, clean, and visualize data effectively.

Data Cleaning**Understanding Data Structure**

- The dataset's dimensions can be checked using `df.shape`, which returns (740, 21), indicating 740 rows and 21 columns.
- Column names can be retrieved using `df.columns`.

Initial Data Exploration

- The first few and last few rows can be viewed using `df.head()` and `df.tail()`.
- `df.info()` provides a summary, including column data types and non-null values.

Data Type Correction

- Some columns like "Month of absence", "Transportation expense", and "Body mass index" should be converted from integer to float using `.astype(float)`.
- After conversion, `df.info()` confirms the change.

Dropping Unnecessary Columns

- Columns "ID" and "Pet" are not relevant and should be removed using `df.drop(['ID', 'Pet'], axis=1, inplace=True)`.

Statistical Summary & Outlier Detection

- `df.describe()` provides a statistical overview (mean, standard deviation, min, max, etc.), helping identify outliers and inconsistencies.

Data analysis

Univariate analysis involves measures of central tendency and dispersion to understand data distribution. Central tendency includes mean, median, and mode, with the median being a more robust measure in skewed distributions. Dispersion measures such as variance, standard deviation, and interquartile range (IQR) indicate data spread, with IQR being a robust measure. Measures of shape, including skewness and kurtosis, describe distribution symmetry and tail behavior. Skewness determines whether data is negatively, positively, or symmetrically distributed. A skewness value greater than 1 or less than -1 indicates a highly skewed dataset. The analysis of "Absenteeism time in hours" shows a highly positive skewness (5.72), confirmed by a Seaborn distplot, indicating that extreme values on the right pull the mean higher than the median.

Multivariate analysis

Multivariate analysis examines the relationship between the target variable and categorical attributes like Seasons, Education, Social Drinker, and Social Smoker. Frequency distribution helps understand the occurrence of each category, and visualization aids in pattern identification. The Seasons attribute contains four coded values: summer (1), autumn (2), winter (3), and spring (4). Analysis using `value_counts()` shows that absenteeism is highest in spring

**Jangam**

(195 occurrences), followed by autumn (192), winter (183), and summer (170). A bar plot further confirms this trend, indicating that seasonality impacts absenteeism rates.

The Education attribute is a categorical variable with four coded values: high school (1.0), graduate (2.0), postgraduate (3.0), and master/doctor (4.0). Using `value_counts()`, we observe that the highest number of absenteeism hours is recorded for individuals with a high school education (611 occurrences), followed by postgraduates (79), graduates (46), and master/doctorate holders (4). A bar plot visualizes this distribution, indicating that education level influences absenteeism, with high school attendees showing the most absenteeism. The findings from the multivariate analysis highlight key relationships between categorical attributes and absenteeism. The spring season records the highest absenteeism hours, indicating a seasonal influence. The high school education category also has the highest absenteeism, suggesting that education level impacts absenteeism rates. Social drinkers exhibit higher absenteeism, whereas social smokers have lower absenteeism. Correlation analysis further reveals that attributes like height and social drinking have a slight positive correlation with absenteeism, while reasons for absence and disciplinary failure show a small negative correlation. The correlation heat map identifies significant relationships, such as a strong positive correlation between body mass index and weight (0.90) and a moderate correlation between body mass index and age (0.47), service time (0.50), and month of absence with seasons (0.41). These insights help in understanding absenteeism trends and contributing factors.

CONCLUSION

Exploratory Data Analysis (EDA) of absenteeism data provides valuable insights into patterns and influencing factors. Data cleaning ensures consistency by correcting data types and removing irrelevant columns, while univariate analysis highlights the distribution and spread of absenteeism hours, revealing a highly skewed distribution with extreme values affecting the mean. Multivariate analysis identifies key trends: absenteeism is highest during the spring season, suggesting a seasonal effect, and individuals with a high school education report the most absenteeism, indicating an educational impact. Social drinkers show higher absenteeism rates, while social smokers have lower absenteeism. Correlation analysis further reveals weak positive correlations between absenteeism and attributes like height and social drinking, while negative correlations exist with reasons for absence and disciplinary failure. The heat map uncovers strong relationships, such as the high correlation between body mass index and weight (0.90) and moderate correlations between body mass index, age, and service time. Overall, these findings help in understanding absenteeism patterns, guiding decision-making for workplace policies and interventions aimed at reducing absenteeism rates.

ABSTRACT

The analysis of research abstracts plays a crucial role in the academic and scientific community, serving as the first point of contact for researchers, scholars, and practitioners in a wide range of disciplines. The growing volume of academic publications necessitates the development of efficient and automated tools for classifying and analyzing abstracts. Traditional methods of abstract analysis have evolved to incorporate advanced machine learning techniques, particularly predictive modeling, to automate and optimize this process. This literature review explores the integration of multi-label classification approaches with predictive modeling techniques to enhance the analysis of research abstracts. In this review, we first examine the challenges associated with abstract analysis, including the complexities of capturing relevant information from diverse research domains, the intricacies of text structures, and the need for fine-grained categorization of research topics. The review then delves into the evolution of predictive modeling techniques, focusing on their application in research abstract analysis. Various machine learning algorithms, such as Support Vector Machines (SVM), Decision Trees, Random Forests, and Neural Networks, are explored, with emphasis on their strengths and limitations in dealing with large, unstructured datasets. This comprehensive literature review concludes by identifying key challenges and opportunities for further research in the field, including the need for larger and more diverse datasets, the integration of domain knowledge into predictive models, and the development of

**Anbarasi and Prabakaran**

more interpretable machine learning models. By advancing predictive modeling techniques and multi-label classification, the research abstract analysis process can be significantly optimized, leading to more efficient information retrieval, content summarization, and decision-making in research.

Keywords: Multi-label classification, Predictive modeling, Research abstract analysis, Machine learning algorithms, Natural language processing (NLP), Text classification, Hybrid models, Neural networks, Academic content categorization, Deep learning models.

INTRODUCTION

In the digital age, the rapid expansion of academic literature across various research domains has led to an overwhelming increase in the volume of publications. The analysis of research abstracts plays a crucial role in efficiently categorizing and retrieving relevant scientific information. Research abstracts, being concise summaries of scholarly articles, encapsulate essential information about the study's goals, methods, results, and conclusions [1]. However, due to the diverse nature of research topics, an abstract may belong to multiple categories or disciplines simultaneously [2] [3]. This phenomenon, known as multi-label classification, presents a significant challenge for traditional text classification systems that typically assign only a single label to a document. Multi-label classification allows for assigning multiple categories to a single research abstract, thus providing a more nuanced and accurate representation of its content [4].

The importance of multi-label classification in research abstract analysis lies in its ability to better reflect the interdisciplinary nature of contemporary academic work. Many research abstracts span multiple topics, methodologies, or application areas, making it necessary to develop systems that can handle multiple labels. For instance, an abstract from a paper on "machine learning techniques in healthcare" could be categorized under both "Artificial Intelligence" and "Healthcare", but traditional classification methods would fail to capture this multi-faceted information. As a result, multi-label classification has gained considerable attention in the field of natural language processing (NLP) as a means to address these challenges [5].

Background Study on Natural Language Processing

This work utilised the properties of many VM kinds. Natural Language Processing (NLP) is an interdisciplinary domain that integrates computer science, artificial intelligence (AI), and linguistics, aiming to empower robots to comprehend, interpret, and produce human language in a meaningful and utilitarian manner. The core aim of NLP is to allow computers to process human language—whether spoken or written—in a manner that mimics human understanding, helping machines interact with users and perform tasks that would traditionally require human intelligence.

Historical Context and Evolution

The concept of NLP has existed since the 1950s, with the first attempts at machine translation (MT) making use of early rule-based systems. The initial efforts of NLP were focused on formalizing linguistic rules and using them to translate one language into another. Early systems, such as the Georgetown-IBM experiment in 1954, showcased the potential of automatic translation between languages, though these early systems were simplistic and primarily rule-based [7]. In the 1970s and 1980s, NLP systems moved towards more sophisticated syntactic and semantic processing, often relying on a rich set of linguistic rules that could analyze sentence structure and meaning. This era saw the development of context-free grammars, part-of-speech tagging, and the use of semantic networks to represent word meanings [8].

**Anbarasi and Prabakaran**

The 1990s marked a pivotal shift in NLP with the rise of statistical methods. Researchers began to focus on probabilistic models, leveraging large corpora (text databases) to learn language patterns directly from data rather than relying on manually written rules. This change led to the development of more flexible and scalable NLP systems, capable of performing tasks such as part-of-speech tagging, named entity recognition (NER), and machine translation with greater accuracy [9] [10].

Key Components of NLP

The main components of Natural Language Processing include:

Tokenization: The process of splitting text into smaller units, such as words or phrases, called tokens. Tokenization is the first step in processing textual data, enabling further analysis.

Part-of-Speech (POS) Tagging: This refers to assigning grammatical categories (nouns, verbs, adjectives, etc.) to individual words in a sentence, helping the machine understand sentence structure.

Named Entity Recognition (NER): NER involves identifying entities in text, such as people, organizations, dates, and locations. This is crucial for information extraction tasks, where machines need to identify and extract relevant information from large text corpora.

Sentiment Analysis: Sentiment analysis involves determining the sentiment expressed in a piece of text—whether positive, negative, or neutral. This technique is widely used in analyzing customer feedback, social media posts, and product reviews.

Machine Translation (MT): Machine translation aims to automatically translate text from one language to another. Early MT systems were rule-based, but more recent systems use statistical and deep learning approaches.

Co reference Resolution: This task involves determining which words in a sentence or a text refer to the same entity. For instance, in the statement "John proceeded to the store." He bought some milk," "He" refers to "John." Co reference resolution helps improve the coherence of text analysis.

Text Classification: Text classification assigns categories or labels to text based on its content. This includes tasks like spam detection, topic modeling, and sentiment classification.

Text Generation: Text generation refers to the creation of new, coherent text based on certain inputs. It is used in applications such as chatbots, story generation, and summarization systems.

Advancements in NLP: Deep Learning and Transformers

In recent years, the field of NLP has been transformed by the emergence of deep learning and transformer models. Prior to this, traditional machine learning methods (such as support vector machines, decision trees, and naive Bayes) were commonly used in NLP tasks. Nonetheless, these models frequently had difficulties in accurately representing the intricate connections inherent in human language. The breakthrough came with the development of deep neural networks and, more specifically, transformer architectures. Transformer-based models, such as BERT (Bidirectional Encoder Representations from Transformers) and GPT (Generative Pre-trained Transformer), have significantly improved the performance of NLP tasks by enabling the model to understand the context of words in a sentence, not just their immediate neighbors. BERT, for instance, uses a bidirectional attention mechanism that allows it to capture context from both the left and the right of a word simultaneously. This is a departure from earlier models like RNNs (Recurrent Neural Networks) and LSTMs (Long Short-Term Memory networks), which processed text sequentially, often losing long-range dependencies.

**Anbarasi and Prabakaran**

GPT, on the other hand, is a generative model that leverages a unidirectional transformer, allowing it to generate human-like text. These transformer models, pre-trained on vast amounts of text data, can be fine-tuned for specific tasks, making them highly versatile for a range of NLP applications.

Importance of Research Abstract Analysis

The analysis of research abstracts plays a pivotal role in the world of academic research and knowledge dissemination [11]. Research abstracts, typically concise summaries of research papers, provide a snapshot of the study's objectives, methods, results, and conclusions. Due to the sheer volume of academic publications produced each year, efficient and automated analysis of these abstracts has become essential. The importance of research abstract analysis can be discussed in several key areas:

Efficient Information Retrieval

Research abstracts are often the first point of access for readers looking to determine the relevance of a paper. Given the vast amount of academic literature available, manually sifting through thousands of papers can be a daunting and time-consuming task. Abstract analysis automates this process by helping researchers and professionals quickly identify relevant studies, saving valuable time [12]. This is particularly important in disciplines that generate large volumes of research, such as medicine, technology, and social sciences. By extracting key information, such as research focus, methods, and findings, abstract analysis enhances the effectiveness of academic databases and digital libraries, improving the search and retrieval of pertinent information.

Support for Literature Review

A literature review is a critical part of academic research, as it provides an overview of existing research on a given topic. For scholars and researchers writing literature reviews, the ability to analyze a large number of abstracts systematically is crucial. By analyzing abstracts, researchers can identify trends, gaps, and key themes within a field, making the process of synthesizing information more efficient. Research abstract analysis also enables the classification of abstracts into appropriate categories, such as methodology, research area, or type of research, thereby aiding in organizing the literature review process [13].

Identifying Emerging Trends and Gaps in Research

Abstract analysis offers insights into the evolving nature of research within a specific field. By systematically analyzing a large set of abstracts over time, researchers can identify emerging trends, technological advancements, and shifts in research focus. This can be particularly beneficial for identifying gaps in the literature that have yet to be explored or under-researched areas that may offer potential for future studies. It enables researchers to keep track of the latest developments in their field and align their work with current trends, which is crucial for staying competitive in academia [14].

Enhancing Citation and Impact Analysis

Research abstract analysis also plays an important role in citation analysis and determining the impact of research work. Researchers often rely on citation counts to assess the significance of a paper or a research topic. By analyzing the abstracts of highly cited papers, one can gain insights into the factors that contribute to a paper's success or impact. Furthermore, identifying trends in citation patterns from research abstracts can help assess the broader influence of a research field, identifying key publications, influential authors, and pivotal studies.

Enabling Topic Modeling and Classification

Research abstracts are often multi-faceted, covering multiple themes, methodologies, and subfields. Using advanced techniques such as natural language processing (NLP) and machine learning (ML), research abstracts can be analyzed for topic modeling and classification. These methods can categorize research into various themes, such as research type (empirical, theoretical, review), subject area (biomedical, social sciences, engineering), or even more granular topics (machine learning in healthcare, climate change policy, etc.). By automating this classification

**Anbarasi and Prabakaran**

process, researchers and institutions can better organize vast amounts of academic content, making it easier to locate studies that align with specific research interests or questions [15].

Improving Academic Search Engines and Recommender Systems

Abstract analysis plays an important role in the development of academic search engines and content recommendation systems. By analyzing the content and context of research abstracts, search engines can return more accurate and relevant results when queried. Additionally, abstract analysis can be used to power recommender systems that suggest related papers based on the content of an individual's research or reading history. This increases the relevance of recommendations and can aid in identifying papers outside of the user's immediate knowledge area, expanding their research scope.

Facilitating Systematic Reviews and Meta-Analyses

Systematic reviews and meta-analyses rely heavily on a comprehensive search for relevant studies. Abstract analysis accelerates the process of selecting relevant research articles by enabling automated screening of abstracts to identify those that meet predefined inclusion and exclusion criteria. This is particularly useful in health sciences, where systematic reviews and meta-analyses are regularly conducted to synthesize evidence on treatment efficacy or intervention effectiveness. Automating abstract analysis minimizes human error, reduces biases, and increases the efficiency of these comprehensive reviews.

Assisting in Research Funding and Grant Applications

In the competitive world of research funding, understanding the landscape of research topics and trends is crucial. Institutions, funding bodies, and grant reviewers often use abstract analysis to determine the alignment of proposed research with existing literature. By examining abstracts from past research, funding bodies can identify underfunded or emerging areas, ensuring that grant applications address important research gaps. Moreover, researchers can use abstract analysis to tailor their funding proposals, ensuring their proposed research fits within current scientific trends and fills existing gaps in the literature.

Improving Research Collaboration

By analyzing abstracts from a variety of disciplines and domains, institutions can identify potential collaborators with complementary research interests. The ability to analyze and classify research abstracts allows researchers to find and reach out to colleagues in related fields, fostering interdisciplinary collaboration. This can be especially useful in large, multi-institutional research projects, where teams from different academic disciplines need to collaborate efficiently. Research abstract analysis tools help researchers locate like-minded colleagues or experts across geographical boundaries, facilitating faster and more meaningful collaborations.

Enhancing Knowledge Management Systems

Research abstract analysis contributes to the development and enhancement of knowledge management systems within academic and research institutions. These systems rely on categorizing, storing, and retrieving knowledge in an efficient manner. By automating abstract analysis, institutions can build more effective knowledge repositories, making it easier for researchers, faculty members, and students to access critical research insights and papers across various fields. Such systems also aid in ensuring that the right information is accessible to the right people at the right time, improving the flow of knowledge within an academic or research institution.

Multi-Label Classification Techniques

Multi-label classification (MLC) is a machine learning challenge wherein each instance is linked to multiple labels rather than a single one. This task is highly relevant in areas where an object or document can belong to more than one category simultaneously. For example, in text classification, a research paper might belong to several categories, such as "Machine Learning," "Healthcare," and "Artificial Intelligence." The goal of multi-label classification is to predict all relevant labels for each instance. There are various techniques for handling multi-label classification

**Anbarasi and Prabakaran**

problems, each with its strengths and weaknesses. Broadly, these techniques can be divided into two categories: problem transformation methods and algorithm adaptation methods [17].

Problem Transformation Methods

Problem transformation methods are techniques that convert the multi-label classification problem into multiple single-label classification problems. These methods essentially break down the complex multi-label task into several simpler binary classification tasks [18]. The key techniques under this category include:

Binary Relevance (BR)

Binary Relevance is one of the simplest and most widely used techniques in multi-label classification. It considers each label as a distinct binary classification issue. A binary classifier is trained for each label to ascertain its relevance (1) or irrelevance (0) for a specific occurrence.

Classifier Chains (CC)

Classifier Chains builds on the Binary Relevance technique by taking label correlations into account. Instead of treating each label independently, the predictions of previous classifiers in the chain are used as additional features for the next classifier in the chain. This method constructs a sequence of binary classifiers, with each classifier predicting a single label while taking into account the predictions of preceding classifiers.

Label Powerset (LP)

Label Powerset transforms the multi-label problem into a multi-class problem by treating each unique set of labels as a single class. For example, if an instance possesses the labels "Machine Learning" and "Healthcare," this combination is regarded as a singular unique class. This method is particularly useful when there are a small number of label combinations, but it can lead to an explosion in the number of classes if the number of possible label combinations is large.

Binary Partitioning (BP)

Binary Partitioning splits the multi-label problem into multiple binary classification problems but, unlike Binary Relevance, it uses the relationships between labels to partition the label space. The set of labels is divided into smaller subsets, and each subset is treated as a separate binary classification problem.

Algorithm Adaptation Methods

Algorithm adaptation methods are those where existing machine learning algorithms are modified to handle multi-label data directly [19] [20]. These methods adapt traditional algorithms, such as decision trees, support vector machines, and neural networks, to predict multiple labels at once.

- **K-Nearest Neighbors (k-NN):** In multi-label k-NN, a typical k-NN algorithm is extended to handle multi-labels by predicting the labels of the nearest neighbors based on a voting or ranking scheme. The k nearest neighbors are found based on a distance metric, and the labels of the neighbors are aggregated to form a prediction for the test instance.
 - **Advantages:** Simple to implement, works well when label correlations exist in the data.
 - **Disadvantages:** Computationally expensive as it requires calculating distances between all instances, and can suffer from the curse of dimensionality in high-dimensional datasets.
- **Decision Trees (DT):** Decision trees can be adapted to multi-label classification by modifying their splitting criteria. Each node in the tree is trained to split the data based on the most relevant label or labels. For each decision, a binary classification task is performed for each label, and the predictions are aggregated to determine the final label set for each instance.
 - **Advantages:** Transparent, interpretable models, and easy to implement.
 - **Disadvantages:** Prone to overfitting, especially when the tree is deep. Label dependencies may not always be captured well.

Anbarasi and Prabakaran

- **Random Forest (RF):** Random Forest is an ensemble method based on decision trees. In multi-label classification, Random Forest can be extended by training multiple decision trees, each predicting one or more labels, and aggregating the results to determine the final multi-label output. Random Forest often uses a majority voting or weighted voting system to aggregate predictions from individual trees.
 - **Advantages:** Robust against overfitting, handles large datasets well.
 - **Disadvantages:** Less interpretable than single decision trees.
- **Support Vector Machines (SVM):** In multi-label classification, SVMs can be adapted using the one-vs-rest (OvR) approach, where a separate binary SVM classifier is trained for each label. The model then predicts the labels using a decision function for each classifier, and the labels are assigned accordingly. An alternative is the **Rank-SVM**, which is designed to handle multi-label ranking problems where the order of labels matters.
 - **Advantages:** Effective in high-dimensional spaces, works well for text classification and other sparse data problems.
 - **Disadvantages:** Computationally expensive, especially for large datasets.
- **Neural Networks (NN):** Neural networks can be adapted to multi-label classification by using an output layer with multiple neurons corresponding to different labels. Each neuron is activated independently, allowing the model to predict multiple labels for each instance. Techniques such as **sigmoid activation functions** in the output layer are commonly used in multi-label neural networks.
 - **Advantages:** Can capture complex non-linear relationships between features and labels, scalable to large datasets, can learn label correlations.
 - **Disadvantages:** Requires a large amount of training data and computational resources, prone to overfitting without regularization.
- **Deep Learning Models (e.g., CNNs and LSTMs):** Convolutional Neural Networks (CNNs) and Long Short-Term Memory networks (LSTMs) can be used for multi-label classification tasks such as text classification and image classification. These models are particularly effective in handling sequential data (e.g., text) and spatial data (e.g., images) and can be modified for multi-label output using the appropriate activation functions.

LITERATURE REVIEW

Yu, Haitao, Feng Xiong, and Zuhui Chen[21] employed an algorithmic model to establish a theoretical foundation for the examination of multi-label corpus text categorisation techniques; At the conclusion of this article, a comparative simulation experiment is executed, followed by a summary and discussion of the findings; in the Enterprise L corpus, the variation in recall rates prior to and subsequent to the implementation of Entrance 1 was 5.5%, for Entrance 2 it was 7.8%, for Entrance 3 it was 3.3%, and for Entrance 4 it was 4.5%. Simultaneously, ongoing research in natural language processing and machine learning presents new opportunities and difficulties for the study of text categorisation methods in multi-tag corpora.

Chaichulee, Sitthichok, et al. [22] sought to create and assess various NLP algorithms capable of encoding unstructured ADRs recorded in EHRs into institutional symptom terminology. The dataset comprises 79,712 medication allergy records examined by chemists. We assessed three NLP methodologies: Naive Bayes—Support Vector Machine (NB-SVM), Universal Language Model Fine-tuning (ULMFiT), and Bidirectional Encoder Representations from Transformers (BERT). We evaluated various general-domain pre-trained BERT models, including mBERT, XLM-RoBERTa, and WanchanBERTa, alongside our domain-specific AllergyRoBERTa, which was pre-trained from the ground up on our corpus. BERT models exhibited superior performance overall. NB-SVM surpassed ULMFiT and BERT for many symptom words that are infrequently coded. The ensemble model attained a precise match ratio of 95.33%, an F1 score of 98.88%, and a mean average precision of 97.07% for the 36 most commonly coded symptom words. The model was then enhanced into a symptom term recommendation system, attaining a Krippendorff's alpha agreement coefficient of 0.7081 during prospective testing with chemists. A certain

**Anbarasi and Prabakaran**

level of automation could expedite the accessibility of allergy information and diminish the labour required for human coding. HaghighianRoudsari, Arousha, et al. [23] examine the impact of fine-tuning pre-trained language models, specifically BERT, XLNet, RoBERTa, and ELECTRA, on the critical task of multi-label patent classification. We evaluate these models against the baseline deep learning methodologies employed for patent categorisation. We employ diverse word embeddings to improve the efficacy of the baseline models. The publicly accessible USPTO-2M patent categorisation benchmark and M-patent datasets are utilised for experimental purposes. We determine that fine-tuning pre-trained language models on patent text enhances multi-label patent categorisation performance. Our results demonstrate that XLNet exhibits superior performance, establishing a new state-of-the-art in classification metrics, including precision, recall, F1 measure, coverage error, and LRAP. Kizaki, Hayato, et al [24] sought to create and assess a multilabel classifier employing natural language processing to discern factors associated with medication-related incidents, utilising incident report descriptions from residential care facilities, particularly concerning incidents involving nonmedical personnel.

Ameer, Iqra, et al [25] investigated both the use of LSTMs and the fine-tuning of Transformer Networks through Transfer Learning along with a single-attention network and a multiple-attention network for multi-label emotion classification. The experimental findings indicate that our innovative transfer learning models, employing pre-trained transformers with and without multiple attention mechanisms, surpassed the existing state-of-the-art accuracy of 58.8% (Baziotis et al., 2018) on the SemEval-2018 Task-1C dataset. Our most effective RoBERTa-MA (RoBERTa-Multi-attention) model surpassed the state-of-the-art, attaining 62.4% accuracy, which represents a 3.6% improvement over the previous benchmark, on the demanding SemEval-2018 E-c: Detecting Emotions (multi-label classification) dataset for English. Furthermore, the XLNet-MA (XLNet-Multi-attention) model surpassed the other proposed models by attaining 45.6% accuracy on the Ren-CECps dataset for Chinese.

Zhang, Zheng, et al. [26] sought to assess the efficacy of eight conventional machine learning models, alongside Recurrent Neural Network (RNN) models, including LSTM and BiLSTM, as well as advanced pre-trained self-attention-based natural language processing (NLP) models, such as BERT, XLNet, RoBERTa, and DistilBERT, for the multi-label classification of arXiv CS papers. The findings indicate that pre-trained self-attention-based models consistently surpass other models in categorisation performance. Furthermore, self-attention-based models demonstrated enhanced performance and attained a novel state-of-the-art outcome. To our knowledge, this research is the first attempt to assess machine learning models specifically on documents pertaining to computer science inside a multi-label categorisation framework.

Artene, Codruț-Georgian, Marius Nicolae Tibeică, and Florin Leon [27] The text represents one of the main components of the content of web pages. In recent years, researchers have attained cutting-edge achievements in numerous natural language processing tasks, including text classification. This was mostly achievable thanks to the advancement of language models trained on extensive text corpora and subsequently fine-tuned for specific applications through transfer learning. A notable model is Bidirectional Encoder Representations from Transformers (BERT), which has demonstrated significant efficacy in text classification. This study proposes a series of experiments to assess the efficacy of the pre-trained multilingual BERT for multi-label, multi-language web page classification. The suggested web page classifier demonstrates competitive performance, suggesting its potential integration into an automated web page classification system.

Kim, Soojeong, Minhyeok Lee, and Junhee Seok [28] demonstrated a multi-label sentence-level event classification with a multi-label classifier algorithm. The classifier employs the BERT model and categorisation based on the correlation between labels through a threshold. The experiment on real-world multi-label data with numerous labels exhibits commendable performance and efficiency in multi-label categorisation. Wang, Ran, et al [29] designed a reasoning-based algorithm named Multi-Label Reasoner (ML-Reasoner) for multi-label classification. ML-Reasoner use a binary classifier to concurrently predict all labels and implements an innovative iterative reasoning method to efficiently leverage inter-label knowledge, with each reasoning instance incorporating the previously predicted probabilities for all labels as supplementary input. This method effectively leverages information among labels while

**Anbarasi and Prabakaran**

circumventing the problem of label-order sensitivity. Comprehensive trials indicate that our strategy surpasses leading techniques on the demanding AAPD dataset. We also implement our reasoning module across various robust neural-based foundational models and demonstrate its capacity to substantially enhance performance in each instance. Efimovich, Maria, et al. [30] Classifying chest radiographs is a laborious and complex endeavour, even for seasoned radiologists. This highlights a potential area for enhancement due to the challenge in accurately differentiating between illnesses such as pleural effusion, pneumothorax, and pneumonia. We propose an innovative transfer learning model for multi-label classification of lung diseases, employing the CheXpert dataset, which comprises approximately 12,617 analysed frontal radiographs. Integrating RadGraph parsing for quick annotation extraction enhances the model's capacity to reliably diagnose various lung illnesses from intricate medical images. The suggested model attained an F1 score of 0.69 and an AUROC of 0.86, indicating its applicability in clinical settings. The application of Natural Language Processing (NLP) to analyse report information and resolve ambiguities in disease classification was also examined. The NLP-enhanced model enhances its capacity to definitively classify illnesses by juxtaposing questionable reports with more certain cases. This research highlights the connection between deep learning and NLP, underscoring their potential to enhance radiological diagnostics and aid in the efficient analysis of chest radiographs.

Veeranki, Sai Pavan Kumar, et al [31] This study seeks to create an application capable of predicting procedure codes by analysing clinicians' operative notes, aiming to streamline their workflow and enhance efficiency. We downstreamed an existing and a native German medical BERT model in a secondary use scenario, utilizing already coded surgery notes to model the coding procedure as a multi-label classification task. In comparison to the transformer-based architecture, we were leveraging the non-contextual model fastText, a convolutional neural network, a support vector machine and logistic regression for a comparative analysis of possible coding performance. About 350,000 notes were used for model adaption. The mean average precision attained by evaluating the top five recommended operation codes from medBERT.de, surgeryBERT.at, fastText, a convolutional neural network, a support vector machine, and logistic regression was 0.880, 0.867, 0.870, 0.851, 0.870, and 0.805, respectively. Support vector machines outperformed other models for surgical reports with a sequence length above 512, with a mean average precision of 0.872, in contrast to 0.840 for fastText, 0.837 for medBERT.de, and 0.820 for surgeryBERT.at. A standard front-end application for coding assistance was also developed. The challenge of forecasting procedure codes from an operating report can be effectively framed as a multi-label classification issue, demonstrating commendable performance. Support vector machines, as a traditional machine learning technique, surpassed the non-contextual fastText method. FastText, utilising fewer hardware resources, has achieved comparable performance to BERT-based algorithms and has demonstrated greater efficacy in elucidating predictions.

Chen, Xiaolong, and colleagues [32] Text classification (TC) is a fundamental task in Natural Language Processing (NLP), with multi-label text classification (MLTC) representing a significant subset of TC. MLTC has transitioned from conventional machine learning to deep learning, resulting in the emergence of numerous high-performing models. Currently, the emphasis of many linked studies is diverse; therefore, we have synthesised the exemplary research findings in the domain of MLTC from recent years and categorised them based on their research focus. Simultaneously, we summarised pertinent data sets and assessment metrics in the domain of multi-label text classification and provided a forecast for the future of the MLTC field.

Liu, Wenfu, et al. [33] introduced a multi-label text classification approach utilising tALBERT-CNN. This method employs an LDA topic model alongside the ALBERT model to derive the topic vector and semantic context vector for each word (document). A specific fusion mechanism is implemented to achieve comprehensive topic and semantic representations of the document, while the TextCNN model extracts multi-label features to train a multi-label classifier. The experimental findings derived from standard datasets indicate that the proposed method effectively extracts multi-label features from documents, outperforming current state-of-the-art multi-label text classification algorithms. Deniz, Emre, Hasan Erbay, and Mustafa Coşar [34] conduct an analysis of customer evaluations to acquire more profound insights into the product, rather than focussing on emotion-driven analysis. We first create a new dataset of customer reviews consisting of evaluations from Turkish consumers to conduct the proposed study.

**Anbarasi and Prabakaran**

The generated dataset comprises over 50,000 reviews across three distinct categories, with each review assigned numerous labels based on consumer remarks. Subsequently, we utilised machine learning techniques designed for multi-label classification on the dataset. Ultimately, we evaluated and scrutinised the outcomes derived from a varied array of statistical variables. Our experimental tests revealed that the Micro Precision is 0.9157, Micro Recall is 0.8837, Micro F1 Score is 0.8925, and Hamming Loss is 0.0278, indicating the most effective methodologies. Kavitha, M., and P. Prabhavathy [35] focused to build multilabel textclassification for AG News dataset using various classification algorithms. It also describes the procedures required in classifying news items and implements Logistic Regression, Naïve Bayes, Support Vector Machine, and Multi-Layer Perceptron classification algorithms using the AGNews dataset, which comprises articles from four distinct categories. The investigations demonstrated that, in comparison to three other classifiers, the performance of Naïve Bayes is superior, achieving a high accuracy of 90 percent.

Research Problem Statement

The rapid expansion of academic literature across diverse research domains has made it increasingly challenging to efficiently classify and analyze research abstracts. Traditional single-label classification methods, where each research abstract is assigned only one category, fail to address the inherent complexity and interdisciplinary nature of modern research. Research abstracts often span multiple topics, methodologies, or application areas, making it necessary to assign multiple labels to a single instance. Current multi-label classification techniques, while effective, still face significant challenges such as handling label correlations, mitigating data imbalance, and improving model scalability for large datasets. The main research problem is the optimization of multi-label classification methods for research abstract analysis, ensuring that multiple relevant labels are accurately assigned to each abstract while addressing the inherent complexities of label dependencies and imbalances. Although several problem transformation and algorithm adaptation techniques have been proposed, the effective integration of deep learning models, especially Transformer-based architectures such as BERT, and the combination of domain knowledge into the classification models, remains a challenge in achieving high accuracy and relevance in categorizing research abstracts across diverse fields. This research seeks to explore advanced multi-label classification techniques, specifically focusing on improving the handling of label correlations, overcoming class imbalance, and enhancing model interpretability in the context of research abstract analysis. The goal is to develop a more efficient and robust approach for automated research classification that facilitates better information retrieval, supports systematic reviews, and enhances the overall accessibility of academic content.

Future Research Direction

Integration of Deep Learning and Domain Knowledge: Future research should explore the integration of advanced deep learning models, particularly Transformer-based models such as BERT, with domain-specific knowledge. By incorporating expertise from specific fields (e.g., biomedical, engineering, or social sciences), models can better capture the nuances and interdependencies between labels in research abstracts. Research could focus on fine-tuning Transformer models on domain-specific corpora to improve classification accuracy while ensuring that relevant interdisciplinary knowledge is effectively integrated into the model's decision-making process.

Handling Label Correlation and Dependency: Although current techniques like Classifier Chains and k-Nearest Neighbors (k-NN) capture label correlations, they often fail to model complex, high-order relationships effectively. Future research can explore more sophisticated techniques such as graph-based models or neural networks with attention mechanisms to better capture the relationships between labels. For example, Graph Convolutional Networks (GCNs) could be explored to represent labels as nodes in a graph and learn the interdependencies between them.

Addressing Data Imbalance: Multi-label datasets often suffer from imbalanced label distributions, where some labels are more frequent than others, leading to biased models. Future research could investigate advanced strategies such as cost-sensitive learning, oversampling techniques, and focal loss to mitigate the impact of imbalanced classes.

Exploring Generative Adversarial Networks (GANs) for generating synthetic instances for underrepresented labels could also offer new ways to balance the dataset.

Multi-Modal and Multi-Task Learning

Research abstracts often contain both textual and non-textual information, such as figures, tables, and metadata. Future studies could explore multi-modal learning, where the model is trained using both the abstract text and supplementary information, improving classification performance by providing richer input data. Additionally, multi-task learning frameworks could be developed, where models are trained to solve multiple related tasks simultaneously, such as label classification and abstract summarization.

Explainability and Interpretability

While deep learning models such as BERT offer state-of-the-art performance in multi-label classification tasks, their "black-box" nature presents challenges for interpretability. Future research should focus on improving the explainability of these models, enabling researchers to understand how and why a certain label was assigned to an abstract. Techniques such as attention visualization, SHAP (Shapley Additive Explanations), and LIME (Local Interpretable Model-Agnostic Explanations) could be employed to provide insights into model decisions, making them more transparent and actionable for researchers and practitioners.

ABSTRACT

Automatic emotion recognition using facial expressions is a compelling study domain, which has been demonstrated and utilised in various sectors like safety, healthcare, and human-machine interfaces. Researchers in this domain aim to create ways for interpreting and encoding facial expressions, as well as extracting these elements to enhance computer prediction accuracy. The notable success of Machine Learning has led to the utilisation of many architectural types of this technology to enhance performance. This research proposes a unique Optimised Convolutional Neural Network (OCNN) that modifies the elemental type of the foundational design of the convolutional network to identify and categorise face emotions. The suggested CNN design incorporates a Leaky Rectified Linear Unit (Leaky RELU), with a component with negative zero slopes. The Kernel Percolate is subsequently exhibited, identifying image pixels with a value of 1 along the diagonal of the image. The Cuckoo Optimisation Algorithm (COA) is employed to optimise hyperparameter tuning for the proposed CNN classification method. The efficacy of the Proposed OCNN classification system is assessed against existing classifiers.

Keywords: Emotion Recognition, Artificial Neural Network, Convolutional Neural Network, Cuckoo Optimization Algorithm

INTRODUCTION

Emotions have an important role in our everyday lives, and directly affect decisions, reasoning, attention, prosperity, and quality of life of human. Establishing communication between people is through emotions and facial expressions. Nowadays, with the influence of computers on human lives and the mechanization of lives of

**Agilan**

individuals, establishment of human and computer interaction (HCI) has played a crucial and very important role [1]. There is a strong interest in improving the interaction between humans and computers. Many people believe in this theory and there is a positive and useful emotional response for establishing a good and useful cognitive link between computers with users. This interaction between the computer and the human beings can be created through speech [2][3]. Psychological theory states that human emotions can be classified into six different forms: surprise, fear, disgust, anger, happiness, and sadness. By making changes in the facial muscles, human can represent this group of emotions.

Human emotion classification is defined as the process of identifying emotions using facial expressions, verbal communication, gestures, body movements, and the assessment of various physiological markers. The importance of human emotions in the advancement of contemporary technological devices is indisputable. The analysis and recognition of emotion are critically significant in human-computer interaction, automated tutoring systems, image and video retrieval, intelligent settings, and driver warning systems. Moreover, emotion recognition is crucial in diagnosing many mental health disorders by psychiatrists and psychologists. Over the past few decades, scientists and researchers have introduced various algorithms and methodologies for emotion recognition based on facial traits and speech signals. It is still a challenging problem in the field of artificial intelligence, computer vision, psychology, and physiology due to the nature of its complexity. Researchers concur that facial expressions are the most significant aspect of identifying human emotion. Interpreting human emotions through facial expression features is challenging due to the influence of environmental factors, such as lighting conditions and dynamic head movements [5]. Furthermore, the ultimate outcomes for emotion classification derived from facial expressions require enhancement. So, through this research work, an efficient classification method is proposed using ML based classifier and Optimization technique [25] [26] [27].

RELATED WORKS

Rescigno, Martina, Matteo Spezialetti, and Silvia Rossi [6] proposed employing transfer learning to generate subject-specific models for extracting the emotional content of facial photographs in the valence/arousal dimensions. Transfer learning allows us to reuse the knowledge assimilated from a large multi-subject dataset by a deep-convolutional neural network and employ the feature extraction capability in the single subject scenario. In this way, it is possible to reduce the amount of labelled data necessary to train a personalized model, with respect to relying just on subjective data.

Pranav, E., *et al* [7] developed a Deep Convolutional Neural Network (DCNN) model that categorises five distinct human facial emotions. The model is trained, tested, and verified utilising the manually curated image dataset. Sarvakar, Ketan, *et al* [8] presented a new method to detect face emotion. Use neural networks convolutionary (FERC). The FERC is based on a CNN network of two parts: the first portion removed the backdrop of the image, the second part removed the face vector. The expressional vector (EV) is utilised in the FERC model to detect the five different kinds of regular facial expressions. The double-level CNN is continuous, and the weights and exponent values of the final perceptual layer fluctuate with each iteration. Ivanova, Ekaterina, and Georgii Borzunov [9] devoted to the optimization of the recognition method of seven basic emotions (joy, sadness, fear, anger, surprise, disgust, and neutral) in terms of expressions of the human life. The authors developed a method for developing an emotion detection system utilising a neural network, which encompasses an optimised algorithm for producing training and testing samples, as well as establishing the optimal number of layers for the neural network.

Sepas-Moghaddam, Alireza, *et al* [10] Utilised the extensive spatio-angular data present in light field photographs for the recognition of facial emotions. A novel deep network is suggested that initially extracts spatial characteristics using a VGG16 convolutional neural network. A Bidirectional Long Short-Term Memory (Bi-LSTM) recurrent neural network is employed to learn spatio-angular features from perspective feature sequences, examining both forward and backward angular correlations. Furthermore, an attention mechanism enables our model to preferentially

Agilan

concentrate on the most significant spatio-angular features, hence facilitating a more effective learning outcome. A fusion approach is ultimately employed to achieve the outcomes of emotion recognition categorisation. Kim, Jung Hwan, Alwin Poullose, and Dong Seog Han [11] introduced a facial image threshing (FIT) machine that employs sophisticated attributes of pre-trained facial recognition and training derived from the Xception algorithm. The FIT machine involved removing irrelevant facial images, collecting facial images, correcting misplacing face data, and merging original datasets on a massive scale, in addition to the data-augmentation technique.

Akhand, M. A. H., *et al* [12] Proposed a Deep Convolutional Neural Network (DCNN) model utilising Transfer Learning (TL) techniques, wherein a pre-trained DCNN model is modified by substituting its dense upper layer(s) to align with Facial Emotion Recognition (FER), followed by fine-tuning with facial emotion data. A novel pipeline strategy is introduced, where the training of the dense layer(s) is followed by tuning each of the pre-trained DCNN blocks successively that has led to gradual improvement of the accuracy of FER to a higher level. Ali, Aqib, and colleagues [13] introduced a Machine Learning (ML) methodology grounded in statistical analysis for emotion recognition using facial expressions in digital images. Total of 600 digital image datasets divided into 6 classes (Anger, Happy, Fear, Surprise, Sad, and Normal) was collected from the publicly available Taiwan Facial Expression Images Database. Initially, all photos are transformed into a greyscale format, and four Regions of Interest (ROIs) are established for each image, resulting in a total dataset of 2400 sub-images (600 × 4). In the second stage, three categories of statistical features—texture, histogram, and binary feature—are extracted from each region of interest (ROI). The third phase involves optimising statistical features through the best-first search technique. Finally, an optimised statistical feature dataset is implemented across multiple machine learning classifiers.

Cabada, Ramon Zatarain, *et al.* [14] developed a methodology employing genetic algorithms to optimise the hyperparameters of a CNN utilised for identifying an individual's affective state. Furthermore, the authors introduced the optimised network integrated into an intelligent teaching system operating on a mobile device. The training process of the CNN was carried out on a PC with a GPU and the trained neural network was embedded into a mobile environment. Ashok Kumar, P. M., Jeevan Babu Maddala, and K. Martin Sagayam [15] created a paradigm that encompasses several steps: (a) Facial extraction, (b) Image filtration, (c) Extraction of facial features, (d) Descriptor selection, and (e) Classification. Initially, the face is extracted from the input image by the Viola-Jones method, which is generally employed for the detection of object. Additionally, the noise in the image is mitigated by Gabor Filtering. Additionally, the face components are retrieved as features using the Affine-Scale-Invariant Feature Transform (ASIFT), a modified version of the SIFT approach. The extensive length of descriptors produced by ASIFT necessitates a reduction in their quantity through an optimal descriptor selection method, facilitated by a hybrid meta-heuristic algorithm known as MV-WOA. The extracted descriptors are processed by a Neural Network (NN). As a modification to the existing machine learning algorithms, the number of hidden neurons in the NN is optimized by the proposed WOA+MVO algorithm.

Verma, Garima, and Hemraj Verma [16] suggested an enhanced deep learning methodology employing a convolutional neural network to predict emotions by studying facial expressions present in a picture. The model developed in this work consists of one CNN to analyse the primary emotion of the image as being happy or sad and a second CNN to predict the secondary emotion of the image. Kalita, Deepjyoti [17] have first train the system with some identical facial expression images or some normal images. Then the authors took the sample image as our input. After that the authors have pre-processed the image and use the feature extraction method. Then the authors used the classification algorithm to compare the training data and testing data. Thus the authors can easily get the facial emotion as our results.

Lakshmi, D., and R. Ponnusamy [18] proposed a novel feature descriptor for facial expression recognition using modified Histogram of Oriented Gradients (HOG) and Local Binary Pattern (LBP) feature descriptor. Initially, the Viola-Jones algorithm is employed for facial region detection. Subsequently, a Butterworth high-pass filter is applied to improve the detected area, facilitating the identification of the eye, nose, and mouth regions using the Viola-Jones method. Secondly, the proposed modified HOG and LBP feature descriptor are used to extract the features of the

Agilan

detected eye, nose and mouth regions. The retrieved features from these three regions are concatenated and their dimensionality is decreased using Deep Stacked Autoencoders. Ultimately, a multi-class Support Vector Machine is employed for classification and recognition. Hassan, Alia K., and Suhaila N. Mohammed [19] introduced an innovative facial emotion recognition method utilising graph mining to transform the representation of the facial region, wherein the facial area is depicted as a graph comprising nodes and edges, and the Span frequent sub-graphs mining algorithm is employed to identify prevalent sub-structures within the graph database corresponding to each emotion. The overlap ratio metric is employed to decrease the quantity of created sub-graphs. After encoding the final selected sub-graphs, binary classification is then applied to classify the emotion of the queried input facial image using six levels of classification. Binary cat swarm intelligence is applied within each level of classification to select proper sub-graphs that give the highest accuracy in that level.

Liu, Xiao, Xiangyi Cheng, and Kiju Lee [20] introduced a facial emotion identification method utilising two newly identified geometric features: landmark curvature and vectorised landmark. These features are extracted from facial landmarks associated with individual components of facial muscle movements. The presented method combines support vector machine (SVM) based classification with a genetic algorithm (GA) for a multi-attribute optimization problem of feature and parameters election.

Cuckoo Optimization Algorithm (COA)

COA is a population-based algorithm and was originally developed to solve continuous multidimensional nonlinear problems usually encountered for optimization purposes [21]. In an optimization problem, one shall begin by presenting the decision variables in the form of an array; in COA, this array is referred to as habitat. That is, each habitat represents a candidate solution for the optimization problem. The candidate solutions attain a global optimum through an evolutionary process. In an optimization problem with N_{var} decision variables, a habitat is defined as a $1 \times N_{var}$ array (*i.e.*, $habitat = [x_1, x_2, x_3, \dots, x_{N_{var}}]$) indicating spatial coordinates of the corresponding cuckoo in the decision space. The decision variables take decimal values and profitability of each habitat is determined by evaluating a profit function (f_p) at that habitat (*i.e.*, $profit = f_p(habitat)$). Given that this algorithm was originally formulated for maximization problems, maximization of the profit function expressed in the form of

Equation (10)

$$Profit = -cost(habitat) = -f_c(x_1, x_2, x_3, \dots, x_{N_{var}})$$

The evolutionary process of COA is as follows. Commencing with the original population of cuckoos (N_{pop}), a $N_{pop} \times N_{var}$ matrix of prospective habitats is constructed. Next, a randomly selected number of eggs is assigned to each habitat. In nature, this value ranges from 5 to 20, on average. Indeed, these values set a lower and upper bound to the number of eggs at each habitat. In real world, cuckoos try to lay their eggs at maximum possible distance to their actual habitats. In COA, this maximum distance is referred to as egg-laying radius (ELR). For each cuckoo, the ELR is set based on the overall number of eggs and the lower and upper bounds (Var_{low} and Var_{high} , respectively) to the decision variables (equation (11)). Notably, the parameter α – which is an integer value – is used to control the ELR.

$$ELR = \alpha \times \frac{\text{No. of Current Cuckoo's Eggs}}{\text{Total Number of Eggs}} \times (Var_{low} \text{ and } Var_{high})$$

At a next step, each cuckoo lay eggs, on a random basis, in the nest of host birds within its ELR. Upon completion of the egg-laying process, the host bird identifies and discards the eggs that are least similar to its own. In this way, each round of egg-laying is followed by elimination of a certain percentage of the cuckoos' eggs (usually equal to 10%). These are the ones which are laid in habitats of less than enough nutrition, keeping them from converging to optimal solution. Simultaneously, the remaining eggs mature within the nests of the host birds and subsequently hatch, receiving nourishment from the host bird. Upon reaching adulthood, the juvenile cuckoos persist in their environments for a period. As the egg-laying period approaches, they migrate to locations abundant in food and host birds whose eggs closely resemble those of the cuckoos. Indeed, the cuckoos migrate to destinations corresponding to the highest cost (*i.e.*, the largest supply of food and the best environmental conditions for living).

Agilan

Since the matured cuckoos are now well scattered among different habitats, it is now pretty difficult to identify which cuckoo belongs to which community. In order to address these difficulties, K-means clustering algorithm is devised to classify the cuckoos. According to Rajabiun, the best results can be obtained with 3 – 5 clusters. Once the cluster to which each cuckoo belongs was identified, average profit per cluster is calculated. Accordingly, the best habitat can be found in the cuckoo cluster for which the average profit is maximal. Therefore, this cluster is identified as destination for the migrating cuckoos from other cuckoo clusters. The cuckoos do not follow a direct path toward their target habitat, but rather move at certain inclination angle to the destination for a particular part of the path. It is essential to establish a parameter to regulate the cuckoo population, taking into account potential food shortages and the removal of certain cuckoos by hunters or insufficient nesting sites for offspring development. In this respect, in COA, only N_{max} cuckoos producing the highest profits survive. After some iterations, all cuckoos converge to the best possible habitat, where their eggs are at maximum similarity to those of the host bird and availability of food supply is maximal.

Proposed COA-CNN Classification Method for the Emotions classification

Convolutional Neural Networks (CNN) are the most successful image classification models of the present period, as they are based on deep learning models. CNN's multi-story designs are inspired by biology science [22]. We decided to employ a deep learning strategy to classify the facial image into a category because of the high accuracy and rapid expansion of CNN's research. The proposed Optimized Convolutional Neural Network (OCNN) adjusts the fundamental form of the coevolutionary network's structured-based design in such a way that it recognizes and classifies facial images and delivers considerably better results than previous facial classification approaches.

The OCNN model optimises the quantity of layers rather than setting limitations on them. For intermediate coevolutionary OCNN layers, a variety of filter sizes were also used. An input facial image is a greyscale image with a dimension of $64 \times 64 \times 1$ that is used for OCNN preprocessing [23]. In addition to the activation function, the size of the convolutional layer is improved here. A stomp of two is performed in max pooling to reduce the size of the output image created by the convolutional layers. In the next stage, the image will be flattened and transmitted to the Multi-Layer Perceptron as well as a completely linked layer. The softmax classifier is then used to return the image class probability for each class ranging from 0 to 25. COA is employed to optimise the weights of the CNN layers and to adjust the hyperparameters of the CNN layers.

Multi-layered perceptron stimulated CNNs are a type of neural system in which specific layers, such as convnets with mandatory accessibility models, are determined. Without the input of anyone else, Neural Networks do not scale effectively for a whole image. Over-fitting is a common problem with traditional neural systems. The optimized convolutional neural network, on the other hand, takes advantage of the locally based properties of the given facial images, such as treating close and inaccessible facial image pixels in an unexpected way. As a result, the recommended technique is used to classify numerous facial images based on their characteristics.

Convolutional Layer

The OCNN's input is a facial grayscale image $x(w, h, d)$, where w determines the width, d determines the depth ($d=1$), and h determines the height of the facial images. Invariant features of facial images are cultivated hierarchically and automatically through this layer. To begin with, the convolution layer recognizes an image's two-level features in order to save the spatial relationship between image pixels by depleting tiny portions of the image. Local image attributes from one layer are recognized and then mapped to the featuring maps. A 2-Dimensional representation of the convolutionally layers is also determined, where the input source image is a $64 \times 64 \times 1$ matrix (width, height, and depth) and a $3 \times 3 \times 1$ filter is applied on it to transform the supplied image to the feature map. 50 filters of size $5 \times 5 \times 1$ were used in the first layer of convolution. The OCNN model takes a $64 \times 64 \times 1$ facial image with a zero-padding $p=2$ as input. The dot product calculation, together with the input facial image, is used to decide filter solicitation. The output volumes are $64 \times 64 \times 50$ in size, with $w=h=64 = ((64-5)+2*2)/1+1$ and $d=50$. This layer has a total of $64 \times 64 \times 50 = 204800$ neurons. Furthermore, every 204800 neurons is linked to a kernel region that is based locally. We strided 70 $3 \times 3 \times 1$ convolutional filters amongst an input image using a strider 1 on the next two Convolutional layers.

Agilan

The filters are initially assigned random values and subsequently applied to the training dataset. The activation function is the next stage.

Relu Activation Function

For bringing non-linearity into the weights contained in intermediate layers of CNN, traditional CNN architectures use the Rectified Linear Unit (ReLU) activation function [14][15]. While the architecture we propose uses the concept of Leaky ReLU to solve the dying ReLU problem, which states that when a negative gradient is present, the ReLU activation function completely reduces to zero, the leaky ReLU does not do so, as shown by the following equation, because it does have zero slopes present in a negative direction (2). This function is used to indicate a unique identification of potential features. As a result, Leaky ReLU produces output images of 64x64x50 pixels. To decompress into its original size, this productivity image must be sampled. As a result, the image is sent to the pooling layer to be sampled.

Pooling Layer

The input facial image is turned to an image stack after the convolution layer. The implementation of the pooling layer, which is how we shrink the image stack, is the next stage, and it's very straightforward. Pooling is used to reduce the spatial size of the input. By decreasing image feature dimensions and calculations, pooling prevents overfitting. Pooling creates a network that is immune to minor biases and changes. It also ensures that a scale-invariant depiction of the facial image is obtained. Max, Min, and Average Pooling are three different types of pooling. The max-pooling algorithm is used in a suggested OCNN model. We'll start with a 2x2 pixel window size. Choose a stride of 2 and traverse your window in stride through a filtered image that is the result of an earlier convolutional layer, ensuring that each window takes the maximum value. As a result, the pooling layer provides a 32x32x50 output image.

The pooling layer's output images are sent to the second convolutionally based layer as an input image. 70 kernels of 3x3x1 size have been added to the second layer. The remaining parameters are identical to those used in the first convolutional layer. After applying the Leaky ReLU activation function to the second layer, the result is 64x64x70, followed by max pooling for resampling the facial image. In the third convolutional layer, apply the method again using 70 kernels of dimensions 3x3x1, resulting in output volumes measuring 64x64x70 images. All kernels are given a randomized value at the start. For obtaining the facial image features, the kernel's value is altered at each epoch. Following image sampling, the image is transmitted to a fully connected layer for neuron overlapping reduction and error minimization.

Fully Connected Layer

Neurons in this layer are linked to all activation from a previous layer. Simple matrix multiplication is performed here, coupled with a bias offset. Furthermore, when two or more connected neurons detect the same facial often characteristics, neurons are whispered to ensure established codependency for co-adaption on all neurons, which raises the problem of overfitting. In this type of case, a dropout function is used in our work to eliminate such complexity by neglecting neurons random sets during the training phase. The DropOut function disables nodes at random, preventing learning or pattern-based updates. After that, the proposed OCNN uses 256 dense layers and softmax classifiers to classify the facial images.

Soft Max Classifier

The likelihood of each class label is provided by the Softmax classifier, while the loss of the hinge provides the margin. It is considerably easier for us to evaluate probabilities than it is to interpret marginal scores as humans (such as loss of hinge and loss of squared hinge). We also look at the rank-5 precision of Convolutional Neural Networks for datasets like Image Net (where we check to see if the ground-truth label for a specified input image is in the top-5 expected labels returned by a network). The softmax classifier has selected the correct category for classifying the facial photos. There must also be a change in the weights due to the fundamental randomness in weights. The OCNN model is implemented systematically. Remember that each of the k output neurons, which connects to all of the

Agilan

neurons in the previous levels, is related to facial in some way. The quantity of output neurones must correspond to the number of face patients in each group.

Proposed OCNN Learning Algorithm

Step 1 Facial images with discrete width and height were included in the dataset. We needed a 64x64x1 facial image for the planned OCNN. As a result, pre-process the facial image to obtain the desired input image size. A grayscale image that is an executable represented as $x(w,h,d)$, where h is the height, w is the width, and d is the depth ($d=1$) is one of the model's inputs. Before feeding an input image to the OCNN system for smoothing and noise removal, it is also necessary to perform image initialization.

Step 2 The input image for the convolutional layer was $I(w \times h)$, with a $(f_1 \times f_2)$ kernel filter F and constant bias b . The convolutional layer output is as follows:

$$(I * F)_{ij} = \sum_{m=0}^{f_1-1} \sum_{n=0}^{f_2-1} F_{m,n} \cdot I_{i+m,j+n} + b \quad (1)$$

Where $0 \leq i \leq w - f_1$ and $0 \leq j \leq h - f_2$

Step 3 The equation (2) gives the leaky ReLU activation function, which is used on convolution maps to map a specific output to a specific input.

$$f(x) = \{0.01x \text{ for } x < 0, x \text{ for } x \geq 0\} \quad (2)$$

x – The actual value of a pixel.

Step 4 Pooling Layer: Choose a stride, commonly 2 or 3, and walk your window in stride across the filtered image, taking the maximum value for each window, a process known as down sampling. Pool Layer generates a volume $[w_1 \times h_1 \times d_1]$, where w_1 , h_1 , and d_1 are calculated using equations (3), (4), and (5):

$$w_1 = \frac{w - f}{s} + 1 \quad (3)$$

$$h_1 = \frac{h - f}{s} + 1 \quad (4)$$

$$d_1 = d \quad (5)$$

Step 5 Fully connected layer: At the end of the process, all of the features are concatenated into a single vector derived from previous layers.

Consider

The input to unit a_i^l (i^{th} unit in layer l). The output of unit a_i^l .

$f(x)$: Activation function.

w_{ij}^l : Weight from some unit

The weight of the CNN is optimized using COA Profit function.

$a_i^{l'}$: Output to some other unit $a_i^{l'=1}$

L : Output layer, l : the hidden layer.

E : The squared error function.

Forward Propagation

Step 1 The outcome of step 1 is utilized to compute the inputs for the following layer

$$P_i^l = \sum_j w_{ji}^{l-1} Q_j^{l-1} \quad (6)$$

Step 2 Calculate the activations for the layer whose input is known

$$Q_j^l = f(x) + Q_j^{l-1} \quad (7)$$

Where $f(x)$ is calculated by equation (2).

Agilan

Step 3 For the productivity layer, reiterate steps 1 and 2 of the forward propagation procedure.

Backward Propagation

Step 1 Computing error at the output layer L

$$\frac{\partial E}{\partial Q_j^L} = \frac{dE}{dQ_j^L} Q_j^L \quad (8)$$

Step 2 Calculate the partial derivative of the error concerning the image input of a neuron at the first layer l for which mistakes are known to update bias.

$$\frac{\partial E}{\partial P_j^l} = f(P_j^l) \left(\frac{dE}{dQ_j^l} \right) \quad (9)$$

$$b_j = b_j - b_{j-1} \frac{\partial E}{\partial P_j^l} \quad (10)$$

Step 3 Compute the error at a lower layer utilising a partial derivative of the error, as seen in step 1.

$$\frac{\partial E}{\partial Q_j^l} = \sum w_{ij}^l \left(\frac{dE}{dP_j^{l+1}} \right) \quad (11)$$

Step 4 Back propagation steps 2 and 3 are performed until partial derivatives of errors are identified at all layers accepting an input layer.

Step 5 Calculation of the error's gradient:

$$\frac{\partial E}{\partial w_{ij}^l} = Q_j^l \left(\frac{\partial E}{\partial P_j^{l+1}} \right) \quad (12)$$

Step 6 Repeat steps 2–5 until the error is less than or equal to the minimum error (chosen by the programmer)

Step 7 Following step 6, the trained model is prepared. For the classification of the testing facial image, use this model.

Convolution operation extracts various features after the kernel for those features is known. The OCNN possesses no prior understanding of an individual's characteristics or the totality of attributes. The convolution layer will be unable of extracting any one feature. In forward propagation, the convolution layer predicted the features, then back propagation attempted to refine those predictions successively. After training, numerous filters are bypassed in favour of error minimization, and eventually, convolution retrieves features that were previously undetectable. The proposed OCNN model extracts anonymous characteristics from facial images using three convolution layers, the first with 50 filters and the other two with 70 filters each. Furthermore, once the training is completed, the precise nature of each feature can be determined.

RESULT AND DISCUSSION

Facial Emotion Dataset

The face emotion recognition dataset is taken from the Kaggle repository [24]. The dataset comprises the emotions of anger, disgust, fear, happiness, neutrality, sadness, and surprise. For this paper, 100 images from each emotion category are considered to evaluate the performance of the proposed Optimized Convolutional Neural Network (OCNN) approach for the classification of facial images with existing feature extraction techniques like Principal Component Analysis (PCA), Independent Component Analysis (ICA) and Support Vector Machine (SVM) clustering-based Feature Extraction method using three classification techniques like OCNN, CNN and ANN.

Performance Metrics

Table 1 illustrates the performance metrics employed in this study report.

Table 2 depicts the Detection Rate (in %) obtained by the Proposed Optimized Convolutional Neural Network (OCNN), Convolutional Neural Network (CNN) and Artificial Neural Network (ANN) with Principal Component Analysis (PCA), Independent Component Analysis (ICA), Support Vector Machine clustering-based feature extraction techniques processed image datasets. From the table 2, it is clear that the proposed OCNN gives maximum detection rate than other classifiers.

Table 3 depicts the Sensitivity (in %) obtained by the Proposed Optimized Convolutional Neural Network (OCNN), Convolutional Neural Network (CNN) and Artificial Neural Network (ANN) with Principal Component Analysis (PCA), Independent Component Analysis (ICA), Support Vector Machine clustering-based feature extraction techniques processed image datasets. From the table 3, it is clear that the proposed OCNN gives maximum sensitivity than other classifiers.

Table 4 depicts the Specificity (in %) obtained by the Proposed Optimized Convolutional Neural Network (OCNN), Convolutional Neural Network (CNN) and Artificial Neural Network (ANN) with Principal Component Analysis (PCA), Independent Component Analysis (ICA), Support Vector Machine clustering-based feature extraction techniques processed image datasets. From the table 4, it is clear that the proposed OCNN gives maximum specificity than other classifiers.

Table 6 depicts the False Positive Rate (in %) obtained by the Proposed Optimized Convolutional Neural Network (OCNN), Convolutional Neural Network (CNN) and Artificial Neural Network (ANN) with Principal Component Analysis (PCA), Independent Component Analysis (ICA), Support Vector Machine clustering-based feature extraction techniques processed image datasets. From the table 6, it is clear that the proposed OCNN gives reduced FPR than other classifiers.

Table 7 depicts the Miss Rate (in %) obtained by the Proposed Optimized Convolutional Neural Network (OCNN), Convolutional Neural Network (CNN) and Artificial Neural Network (ANN) with Principal Component Analysis (PCA), Independent Component Analysis (ICA), Support Vector Machine clustering-based feature extraction techniques processed image datasets. From the table 7, it is clear that the proposed OCNN gives reduced miss rate than other classifiers.

CONCLUSION

Accurate study and interpretation of the emotional content of human facial expressions are essential for a comprehensive understanding of human behaviour. Although a human can automatically detect and interpret faces and facial emotions with little or no effort, computer systems still confront a significant barrier in recognizing accurate and robust facial expressions. Different face expressions can be easily sorted into their appropriate classes using an effective classification technique. In this paper, an Optimized Convolutional Neural Network (OCNN) classifier is proposed to classify the human facial expression. Cuckoo Optimization Algorithm (COA) is used to optimize the weight of the CNN layers and ReLU activation function is used in this proposed OCNN is used to correctly classify the facial images. From the results obtained, it is clear that the proposed OCNN gives more accuracy, specificity, sensitivity and precision and also it reduced the miss rate, false positive rate and false discovery rate when it is compared against other classifiers like CNN, and ANN with different feature extraction techniques.

ABSTRACT

A mobile ad-hoc network (MANET) is a dynamically created wireless network of mobile nodes. In a MANET, it is presumed that all nodes can collaboratively transfer data packets through a multi-hop approach. Certain hostile nodes, conversely, decline to collaborate with other nodes and induce network disruption by disseminating inaccurate routing information. Any node in a MANET may join or exit the network at any moment. Utilising specified routing protocols and mobility models, nodes can transmit and receive data. MANETs are susceptible to numerous network layer assaults owing to the absence of a centralised infrastructure. Network layer assaults, including Worm Hole, Black Hole, Grey Hole, Byzantine, and Sybil assaults, compromise network topology, leading to data loss and network degradation. A node asserts that it possesses the shortest routes to all destinations in the Black Hole Attack. This node utilises the routing mechanism to eat all data packets in the network, hence diminishing network performance. This work use optimisation algorithms to identify the black hole node in the MANET. The optimisation methods Artificial Bee Colony (ABC) and Particle Swarm Optimisation (PSO) are integrated to detect the singular black hole assault within the network. The efficacy of the proposed Optimisations based on Single Black Hole Attack (OSBHA).

Keywords: Mobile Ad Hoc Network (MANET), Denial of Service Attacks, Black Hole Attack, Optimization Algorithm, Malicious Node.

INTRODUCTION

Due to the current proliferation of cutting-edge technology, mobile ad-hoc networks (MANETs) have gained a major reputation in recent years (i.e., smartphones, tablets, personal digital assistants, etc.) 1st. Nodes are wirelessly linked to each other to pass data packets due to the dynamic world. Since data packets are transported between nodes over an open medium with no central support, nodes can exchange information at any time in the network. If the source and destination nodes are not in the same range, the communication's reliability is solely dependent on the intermediate nodes' ability to reliably forward data packets. If it is close to the source node, an intermediate node acts as a host and communicates directly with it, while if it is far away from the destination node, it acts as a router [2]. Conversely, wireless nodes possess constrained resources, including diminished battery capacity, restricted memory, and limited bandwidth. The MANET was established to facilitate rapid and effortless communication among nodes. It is utilised in combat zones, emergency assistance, rescue missions, maritime communication, personal or commercial data transmission, and locations lacking wired connectivity. The establishment of the MANET requires no specialised infrastructure and is cost-effective to deploy in any location [3] [4]. When a source node must transmit data packets via an open medium to a designated node, it employs multi-hop transmission utilising intermediate nodes. Malicious nodes can readily infiltrate the network because of its dynamic topology, unstructured nature, open medium, and high node mobility. Malicious nodes attempt to disrupt network resources by dropping data packets, stealing important information, or manipulating data packets, resulting in undesirable outcomes, a phenomenon known as a Denial of Service (DoS) attack [5].

Background Study on Black Hole Attack

A Denial-of-Service (DoS) attack is any event that reduces or removes a network's ability to perform its intended purpose. The objective is to obstruct network services to nodes, leading to the loss of data packets and a decrease in network bandwidth by restricting authorised users from accessing resources [6]. Figure 1 illustrates the classification of DoS attacks. Denial of Service (DoS) attacks in Mobile Ad Hoc Networks (MANETs) are categorised into two types: absolute packet drop attacks, known as black hole attacks, and partial packet drop attacks, referred to as grey hole attacks [7]. Black hole attacks can be divided into three categories: single hole attacks, multiple attacks, and collective attacks. A solitary node or a cluster of nodes may partake in malevolent actions, as their designations imply. A grey hole attack, conversely, constitutes a partial packet drop attack. It can be categorised into two sorts of attacks: sequence-based attacks and clever grey hole attacks.

Black Hole Attacks

A black hole attack is a prominent type of Denial of Service (DoS) attack. In MANETs, it is referred to as a comprehensive packet drop attack. Due to the open medium and intricate topology of MANETs, a black hole node can effortlessly and covertly infiltrate the network. Black hole nodes become apparent throughout the route finding phase. At the outset, there exists no legitimate path from the source node to the destination node. To initiate route discovery, the source node transmits a route request (RREQ) packet to the intermediary nodes. Upon receiving an RREQ packet from a source node, a genuine node forwards it to the subsequent node unless it is the destination node; conversely, when a black hole node receives an RREQ, it transmits a fraudulent route reply (RREP) with an elevated sequence number to dominate the route discovery process. The sequence number is utilised to ascertain the route's recency or the frequency of its modification. The black hole node misleads the source node into thinking it possesses a genuine, concise, and current route to the destination node, notwithstanding the absence of such a route. The black hole node transmits a signal to the source node and participates in the network's pathway between the source node and the destination node. Once the route is established, the source node initiates the transmission of data packets to the black hole node, which then discards all packets without relaying them to the destination node [8][9][10].

**Saratha and Shanmugasundaram****Related Works**

Sivanesh, S., and V.R. Sarma Dhulipala [11] To identify the most susceptible packet dropping attack, termed a black hole attack, researchers developed the 'Accurate and Cognitive Intrusion Detection Method' (ACIDS). This approach evaluates parameters including Destination Sequence Number (DSN) and Route Reply (RREP) to identify intruders by finding anomalies in the typical behaviour of these parameters. Elmahdi, Elbasher, Seong-Moo Yoo, and Kumar Sharshembiev [12] suggested a novel method, grounded in a modified ad-hoc on-demand multipath distance vector (AOMDV) protocol, to provide reliable and steady data transmission in MANETs amidst probable blackhole attacks. We partition the message into multiple pathways to the destination and encrypt it using a homomorphic encryption algorithm. The suggested approach maintains consistent performance despite a high packet delivery ratio, whereas AOMDV's performance becomes impaired when malicious nodes infiltrate the network.

Rameshkumar, S. G., and G. Mohan [13] introduced a modified Ad-hoc on-demand Distance Vector (AODV) that incorporates timeout duration analysis for each transmitted packet from the nodes, with queuing analysis, to determine the average, minimum, and maximum packet transmission delays. The original AODV protocol was revised to employ timeout duration analysis for the identification of malevolent nodes, which should be transformed into singular or cooperative black hole nodes and subsequently removed from the network. Cherkaoui, Badreddine, Abderrahim Beni-hssane, and Mohammed Erritali [14] provided a novel method for detecting such an attack in a VANET network during contact. This approach is based on a variable control map, which is commonly used in industry to measure the output of a process. By installing the monitoring device in each receiving node within the network, this approach will detect malicious nodes in real time.

Kumar, Ankit, et al [15] For detecting black hole attacks, a reliable AODV routing protocol was developed. The suggested approach is an enhanced variant of the original AODV routing system, featuring better RREQ and RREP packet protocols. A cryptographic function-based encryption and decryption mechanism is incorporated to authenticate the source and destination nodes for enhanced security. Aranganathan, A., Suriyakala, C. D., and Vedanarayanan, V. [16] The proposed Software Agents-based Black Hole attacks Detection and Prevention in Clustering Ad hoc On-Demand Distance Vector (SABHDP-CAODV) routing protocol, in contrast to current routing protocols, relies on the distinct identity of legitimate nodes, location-based distance computation, threshold timing, and simulation metrics including packet delivery ratio, throughput, average end-to-end delay, and network routing overhead.

Bhardwaj, Suyash, and Vivek Kumar [17] exhibited In AODV, we use a Secure Cooperative Neighbour-Based Approach to detect and avoid black hole attacks right from the outset. This method allows each node to communicate with its neighbour in a safe, reliable, and fast manner while also protecting against routing attacks by taking a different path when locating an intruder. Gayathri, V. M., and P. Supraja [18] Worried about a network black hole attack that results in the loss of packets intended for the destination. This article additionally includes comparative results of many performance aspects based on the utilised scenario. It compares the consequences of intruder nodes both with and without their presence. Regression Based Intruder Detections (RBIDS) is a technique designed to enhance network efficiency through the identification of hostile nodes. This program measures the output of each individual node over time utilising regression values. Khan, Dost Muhammad, et al [19] The use of Ant Colony Optimization Technique and Repetitive Route Configuration with Reactive Routing Protocol to prevent Black Hole Attacks in mobile ad-hoc networks was discussed. This study demonstrated that the application of ACO in conjunction with the Reactive Routing Protocol yielded enhanced throughput and improved defence against Black Hole Attacks, achieving a 10% increase in throughput and a 27% decrease in packet loss compared to the Least Cost Path Protocol.

Ponnusamy, Muruganantham [20] In a Mobile Ad-hoc Network, nodes that are located in an open environment and travel randomly from one location to another are vulnerable to security threats. Consequently, in MANET, the node credibility and energy-efficient model is employed to mitigate the disruption produced by selfish nodes and to eliminate them from the system during routing processes. The network's reputable and energy-efficient nodes are

marked, and data transmission follows safe paths. The malicious nodes, on the other hand, are not cooperating with each other in this reputation scheme. The reputed nodes are identified by examining the contact ratio between them.

Proposed Optimization Based Single Black Hole Detection in Manet

A successful metaheuristic algorithm combines exploitation of prior information gathered at some point during the search process with exploration of new areas in the search space, which can lead to more optimal results. Particle Swarm Optimization (PSO) is an optimizer based on the social behaviour of flocking birds and schooling fish. It appears to have a strong ability to efficiently explore and exploit the search space by using a variety of factors that affect exploitation versus exploration. The equations used to change the swarm's current location, best previous position, and flying velocity are as follows. Each node (particle) track three values directly in the procedure: its current location (X_i), the optimum route position it arrived in previous cycles (P_i), and its flying velocity (V_i).

$$\text{Present Position } X_i = (x_{i1}, x_{i2}, \dots, x_{is}) \quad (1)$$

$$\text{Finest Previous Position } P_i = (p_{i1}, p_{i2}, \dots, p_{is}) \quad (2)$$

$$\text{Flying Velocity } V_i = (v_{i1}, v_{i2}, \dots, v_{is}) \quad (3)$$

The location(position)(P_g) denotes the global optimal route path on the entire MANET for each time interval (cycle). As a result, every node (particle) improves its velocity V_i in order to get closer to the best route path g , as shown below:

$$\text{New } V_i = \omega + \text{current } V_i + c_1 \times \text{rand}() \times (P_i - X_i) + c_2 \times \text{Rand}() \times (P_i - X_i) \quad (4)$$

As a result, the particle's productive location when using the novel velocity V_i is:

$$\begin{aligned} \text{New position } X_i &= \text{Current position } X_i + \text{New } V_i \\ V_{max} &\geq V_i \\ &\geq -V_{max} \end{aligned} \quad (5)$$

Where $c_1 = c_2 = 2 \rightarrow$ two positive constants provide learning parameters, $\text{rand}()$ and $\text{Rand}()$ indicate two random purposes in the ranges $[0,1]$, V_{max} represents the upper limit on the maximum change of particle velocity, gives inertia weight engaged as an improvement to direct the authority of the previous history of velocities on the current velocity, and it provides local and global search, and it is initiated to diminish linearly with time from a worth of $1.4 - 0.5$. Conversely, the ABC excels in identifying local optima because to its dual phases of employee and observer, both referred to as local search operators. The observing bees directly approach one of the foraging bees' superior nectar sources.

ABC is primarily concerned with identifying strategies that enhance local search. The key difference between working bees and onlooker bees is that the latter selects a solution based on the likelihood of it having a high fitness benefit. Furthermore, the *scout* step of the ABC algorithm implements global search, resulting in a slower convergence speed during the search process.

Algorithm: Optimization based Black Hole Attack (OBHA) Detection

Input: Objective function $f(x)$, and constraints.

Step 1: Parameter Initialization: MG (Maximum Number of Generation); FS (Number of Food Source); Limit; Swarm social and cognitive components; $\text{rand}()$ and $\text{Rand}()$; inertia; V_{max} .

Step 2: Initialization of Population: The swarm's population $a_i = (i = 1, 2, \dots, FS)$, step vector $\Delta a_i = (i = 1, 2, \dots, FS)$;

Step 3: Set Prob = 0.1 and Generation iteration = 0;

Step 4: Starting Iterations (it)

Step 4.1: While it $\leq$ MG do

Step 4.1.1: for $i = 1, 2, \dots, FN$

Saratha and Shanmugasundaram

Step 4.1.1.1: if $rand \leq Prob$ then

1. Begin of PSO
2. Calculate the number of nodes in networks as initial population of N solutions(particles);
3. For each node $i \in N$; Calculate the Fitness (i) depending on DRI table.
4. Consider the weight factor and inertia.
5. For each node;
 - Set p_{Best} as the best route position of nodes (particle) i;
 - 6. If fitness (i) is better than p_{Best} in the current route.
 - 7. $p_{Best(i)} = fitness(i)$
 - 8. End;
 - 9. Set g_{Best} as the best fitness of all particles (nodes)
 - 10. If a particle $p_{Best} > g_{Best}$
 - Update velocity of that particle using equation (4)
 - Update position of that particle using equation (5)
 - 11. Else
 - Update the value of the weight, and inertia.
 - 12. End if
 - 13. Evaluate the fitness value of each candidate solution
 - 14. Apply a greedy selection process to select the best one;
15. If a solution does not improve, $trail_i = trail_i + 1$, otherwise $trail_i = 0$
16. Check and correct the new positions based on the boundaries of variables.
17. End Process of PSO.

Step 4.1.1.2: else

1. Input: A particle position x_i
2. Select high fitness values from all x_i .
3. Calculate the probability values p for the selected x_i using $Pr_i = \left(\frac{fit_i}{\sum_{l=1}^{FS} fit_l} \right)$
4. For each of particle bee do
 - If $rand(0,1) \leq P$ then
 - Update a new produced solution x_i by using
 - $fit_i = 1 + c_1 c_2 \omega(fit_i)$ or $\left(\frac{1}{1} + fit_i \right)$
 - $x_{ij} = x_{ij} + \phi_{ij}(x_{ij} - x_{kj})$
 - Apply a greedy selection process to select the best solution.
 - End if

5. End for

6. Output: the new position x_i

Step 4.1.1.3: end if (Scout Bee Modification Phase)

1. Input: A particle bee position x_i
2. Update a new produced solution x_i using equation (6)
3. Apply a greedy selection process to select the best solution.
4. Output: the new position x_i

Step 4.1.2: end for

Step 4.2: end while

Step 5: The best node (Genuine Node)

The primary contribution of optimization-based single black hole attack detection lies in two significant enhancements: firstly, the alteration of the scout bee process inside the ABC algorithm to augment search variety and mitigate the deficiencies in global search efficiency inherent to the ABC method. The second upgrade is integrating PSO operators from PSO into ABC to replace the conventional first stage of ABC (employee bee phase). The Scout bee modification process plays a similar role in the proposed algorithm as it did in the original ABC algorithm. The

proposed algorithm will search to see if there are any exhausted sources that should be abandoned after both the *particle-bee* and onlooker bee phases are completed. To determine if the source should be abandoned, special counters are used. When a particle-bee fails to generate superior solutions in prior processes, these counters are increased. If the counter value surpasses the parameter limit, the food source is substituted with a new source, resulting in the formation of a new scout bee from the particle-bee. The upgraded scout bee utilises equation (6) to generate a new food source, substituting the abandoned source s_i .

$$s_i^{t+1} = 0.5 \times rand \times (s_i^t - \text{best solution}) \quad (6)$$

According to the suggested method, only one source may be depleted in each iteration, and only one particle-bee can serve as a scout. If multiple counters surpass the limit value, the software may select one of the maximum counters. In the original ABC, the scout bee mechanism generates solutions randomly, introducing diversity to the search process. Consequently, the convergence rate will diminish due to the iterations. The proposed algorithm's revised scout bee step maintains search diversity by randomly selecting a new food source, facilitating effective exploration. However, it also induces exploitation by taking into account the best solution to date and generating a new solution based on both the current and optimal solutions, as illustrated in Equation (6).

RESULT AND DISCUSSION

Simulation Parameters

The following table 1 depicts the simulation parameters used in this research work.

The evaluation metrics like Packet Delivery Ratio (PDR), Detection Rate, Routing Overhead, Throughput, and Average end-to-end delay are considered in this research work to evaluate the performance of the proposed methodology for finding the single black hole in the network. The efficacy of the proposed Optimization-based Black Hole Attack (OBHA) Detection is evaluated using PSO-based AODV and ABC-based AODV protocols.

Table 2 illustrates the Packet Delivery Ratio (PDR) achieved by the Proposed OBHA detection, PSO, and ABC-based AODV protocols in relation to the number of nodes. Table 2 clearly demonstrates that the suggested OBHA detection method yields a higher Packet Delivery Ratio (PDR) in comparison to previous optimisation strategies based on the AODV protocol. Table 3 depicts the Detection Rate (DR) obtained by Proposed OBHA detection, PSO, and ABC based AODV protocols against number of nodes. From the table 3, it is clear that the proposed OBHA detection method gives more detection rate when it is compared with other optimization techniques based AODV protocol. Table 4 illustrates the Routing Overhead achieved by the Proposed OBHA detection, PSO, and ABC-based AODV protocols in relation to the number of nodes. Table 4 demonstrates that the suggested OBHA detection approach diminishes routing overhead compared to previous optimisation techniques based on the AODV protocol.

Table 5 illustrates the Throughput achieved by the Proposed OBHA detection, PSO, and ABC-based AODV protocols in relation to the number of nodes. From the table 5, it is clear that the proposed OBHA detection method gives more throughput when it is compared with other optimization techniques based AODV protocol. Table 6 illustrates the Average End-to-End latency achieved by the Proposed OBHA detection, PSO, and ABC-based AODV protocols in relation to the number of nodes. From the table 6, it is clear that the proposed OBHA detection method reduced End-to-End delay when it is compared with other optimization techniques based AODV protocol.

CONCLUSION

Concerns about computer network protection have been extensively debated and popularised in recent years. However, the conversation has traditionally focused on static and wired networking, with mobile and ad-hoc networking problems receiving little attention. Since mobile ad-hoc networks (MANET) vary greatly from wired networks, the advent of such new networking techniques poses new challenges also for the fundamentals of routing.

Saratha and Shanmugasundaram

A prevalent security exploit in mobile ad hoc networks is the black hole phenomenon. During the route detection method in a Black hole attack, a spiteful node promotes that it has the best path to the target node. When it receives a Route Request (RREQ) packet, it broadcasts a false RREP to the resource node right away. The source node obtains the Route Reply (RREP) from the spiteful node first, before receiving all other RREPs. When the source node starts broadcasting the information packet to the end using this path, the spiteful node drops all packets instead of forwarding no information. This will diminish the network's longevity and the system's memory retention. This study combines optimisation algorithms, specifically PSO and ABC, to identify individual black hole nodes in the MANET. The proposed OBHA is assessed by multiple evaluation measures, including Packet Delivery Ratio, Detection Rate, Throughput, Average End-to-End Latency, and Routing Overhead, within the AODV routing protocol utilising PSO and ABC for single black hole node detection. The suggested OBHA approach, in comparison to current optimization-based AODV routing protocols, demonstrated a reduction in routing overhead and average latency, while enhancing the packet delivery ratio, detection rate, and throughput, as indicated by the findings.

ABSTRACT

Literature, an ever-evolving facet of human culture, continues to play a pivotal role in contemporary society, offering a rich reservoir of emotions and experiences. Despite the relentless march of progress, literature retains its significance as a source of entertainment, enlightenment, and empathy. In an age dominated by digital media and rapid technological advancements, the significance of literature in shaping human consciousness and societal norms has become increasingly pronounced. This article delves into the multifaceted importance of literature in contemporary society, drawing upon diverse examples and insights from literary luminaries to underscore its enduring relevance in the digital age. Through meticulous analysis, it aims to elucidate literature's profound impact on human consciousness, societal norms, and cultural identity. Through an in-depth analysis of key themes and seminal works, this paper explores the profound impact of literature on human consciousness, societal norms, and cultural identity while also exploring its evolving role in navigating the complexities of the digital age.

Keywords: Literature, Contemporary society, Empathy, Critical Discourse, Cultural identity, Human consciousness, Digital age, Self-reflection, Collective memory, Cultural heritage, Digital Consumption and Cultural Materialism.

Sathees Kumar

INTRODUCTION

Literature, from the ageless prose of Charles Dickens to the transcendent verse of William Wordsworth, has long been used as a social mirror, capturing the joys, sorrows, and complexity of the human condition. The classic quotation from Charles Bukowski, "Without literature, life is hell," captures the transformational potential of literature. This introduction lays the groundwork for an examination of literature's continuing relevance in current society. It does this by fusing the perspectives of literary greats with modern academics to highlight the many ways that literature shapes both societal standards and individual viewpoints.

Literature as a Reflection of Human Experience

Literature is fundamentally a storehouse of human experience, encapsulating the rainbow of feelings, hardships, and victories that make up our lives. Literature offers a glimpse into the human psyche, from the epic tales of Homer's *Odyssey* to the moving sonnets of Elizabeth Barrett Browning. C.S. Lewis noted astutely that "Literature adds to reality, it does not simply describe it," emphasizing the capacity of creative imagination to transform. We explore how literature replicates societal ideals, cultural conventions, and individual psyches, providing important insights into the human condition through an analysis of influential works spanning numerous genres and historical epochs. Furthermore, literature has the reflecting ability to shape reality in addition to merely recording it. "Word after word after word is power," as Margaret Atwood once said. Literature can even spark social change by influencing readers' perceptions through tales and character development. Books like Harper Lee's *To Kill a Mockingbird* and George Orwell's *1984* have not only reflected societal challenges but also generated important discussions and efforts toward justice and equity.

The Role of Literature in Fostering Empathy and Understanding

The power of literature to promote empathy and understanding among people beyond time, place, and circumstance is one of its most enduring legacies. Literature allows readers to experience the lives of individuals that are very different from their own, from the existential sorrow of Albert Camus' *The Stranger* to the moral complexity of Leo Tolstoy's *Anna Karenina*. *To Kill a Mockingbird* by Harper Lee eloquently states, "You never really understand a person until you consider things from his point of view... until you climb into his skin and walk around in it." We shed light on how literature fosters empathy, compassion, and cross-cultural understanding, enhancing the richness of the human experience via an examination of a variety of literary works. Moreover, research from science confirms the literature's contribution to empathy. Reading fiction regularly improves one's ability to comprehend the feelings and perspectives of others, according to research by Raymond Mar and colleagues. In our increasingly globalized world, empathy—which is fostered by literary engagement—is crucial for creating more peaceful and cooperative communities.

Literature as a Catalyst for Critical Discourse

Literature encourages critical discourse, which challenges prevalent beliefs and challenges readers to question accepted conventions, in addition to its role in building empathy. Literature has long been used as a tool for dissent and social change, from the feminist critiques of Virginia Woolf's *A Room of One's Own* to the stinging social satire of George Orwell's *Animal Farm*. According to Salman Rushdie, "Literature is the one place in any society where, within the secrecy of our heads, we can hear voices talking about everything in every possible way." We demonstrate how literature may elicit reflection, foster discussion, and motivate group action by analyzing literary works that tackle urgent social challenges. The ability of literature to provoke and question is not just ancient but also current. This tradition is carried on by modern writers like Chimamanda Ngozi Adichie and Ta-Nehisi Coates, who tackle racial, gender, and power-related issues while challenging readers to face hard realities and push for change. James Baldwin once said, "Not everything that is faced can be changed, but nothing can be changed until it is faced."

**Sathees Kumar****The Evolution of Literature in the Digital Age**

The emergence of digital technologies in the twenty-first century has caused a significant shift in literature. Literature has embraced new distribution channels, such as e-books and internet platforms, increasing its reach and accessibility to previously unheard-of heights. Neil Gaiman pointed out quite wisely "You can search for 100,000 solutions on Google. You can get the appropriate one back from a librarian." This section examines how the digital age has affected literary discourse evolution and patterns of literary consumption. We find new avenues for literary engagement, creative expression, and cooperative storytelling by looking at the nexus between technology and literature. Digital platforms have made literature more accessible to all people and have given marginalized voices a worldwide audience. Literature is now a more dynamic and interactive field because of the growth of new literary criticism and discussion formats supported by social media and online communities. But there are drawbacks to this digital revolution as well. Traditional publishing is in decline, and there is the issue of whether digital content is as permanent as printed books.

Literature as a Cultural Artifact

Literature is a cultural artifact that captures the spirit of the times it is written in and provides insights into the sociopolitical forces that shape its production and reception. This purpose of writing is strengthened in the digital age as a wider range of voices and experiences are captured by digital platforms. Works that are released digitally or online frequently address current challenges of accessibility and immediacy in a way that traditional print media cannot equal. For example, the emergence of self-publishing platforms has made it possible for writers from a variety of backgrounds to tell their experiences without traditional publishing's gate keeping. Modern digital literature can work as a more representative and inclusive cultural artifact, representing the diversity of human experiences and identities, as a result of the democratization of literary production.

Digital Consumption and Cultural Materialism

The way that people read literature in the digital age is also a reflection of larger cultural and economic changes. The emergence of electronic books, audio books, and virtual literary communities has revolutionized reading practices, increasing accessibility to literature but simultaneously altering the nature of literary consumption. We are prompted to think about the economic effects of these shifts by cultural materialism. The old publishing businesses have been shaken by the growth of digital platforms, posing a challenge to the economic models that have long supported literary production. This change raises concerns about the worth of literary work in the digital age when digital content is frequently assumed to be free or inexpensive, as well as the viability of literary careers in this context. Furthermore, new literary expressions have emerged in the digital age, like trans media storytelling and interactive fiction, which combine text and multimedia components. These developments show how cultural objects are changing in a digital age when technology and literature combine to produce new forms of narrative.

The Significance of Grammar in Literary Expression

Even though the emergence of digital communication has changed the literary expression environment, grammatical principles are still essential for good narrative. Grammar proficiency raises the caliber of literary workmanship and increases reader engagement, as shown in the spare elegance of Ernest Hemingway and the lyrical prose of Toni Morrison. According to Mark Twain, "The difference between the almost right word and the right word is a large matter—'tis the difference between the lightning-bug and the lightning." We demonstrate how adherence to grammatical principles improves readability, coherence, and narrative effect in literature through a detailed analysis of stylistic choices and grammatical standards. Grammar is the framework of literature; it provides the order necessary for expression and creativity. The use of proper grammar guarantees accuracy and clarity, which helps writers to communicate difficult concepts and feelings. "Writing is an act of faith, not a trick of grammar, but it is not complete without the trick," as E.B. White said.

Literature as a Catalyst for Personal Growth and Self-Reflection

Beyond its role as a source of entertainment and enlightenment, literature catalyzes personal growth and self-reflection, inviting readers to confront existential questions and navigate the complexities of the human condition.

Sathees Kumar

From the bildungsroman of J.D. Salinger's *The Catcher in the Rye* to the philosophical musings of Hermann Hesse's *Siddhartha*, literature provides a mirror for introspection and a compass for moral exploration. As Marcel Proust famously wrote, "The real voyage of discovery consists not in seeking new landscapes, but in having new eyes." Through an exploration of literary themes such as identity, alienation, and the search for meaning, we highlight literature's transformative potential in shaping individual perspectives and fostering emotional resilience. Novels like Elizabeth Gilbert's *Eat, Pray, Love* and Khaled Hosseini's *The Kite Runner* and other works that lead readers through themes of self-discovery, forgiveness, and redemption are prime examples of how literary characters' journeys reflect personal growth and provide readers with a means of navigating their own lives.

The Global Impact of English Literature

English literature has a special role in influencing cross-cultural interactions and promoting intercultural conversation because it is the universal language of communication worldwide. English literature has a global readership that transcends linguistic boundaries, from Chinua Achebe's postcolonial novels to William Shakespeare's timeless sonnets. The wise words of Maya Angelou once said, "We are more alike, my friends than we are unlike." This section traces the development of English literature across time and its ongoing contribution to the spread of global topics and the elevation of various voices. We celebrate the diversity and richness of the world's literary history by studying the works of both classic writers and modern voices, reaffirming literature's function as a unifying force across cultural divides and a witness to the universal human condition. The fact that English literature is read all over the world attests to its adaptability and relevance. English-language writers with varied cultural backgrounds, such as Arundhati Roy and Kazuo Ishiguro, demonstrate how English literature is still evolving and how it shapes and reflects global narratives.

CONCLUSION

In conclusion, literature remains a cornerstone of human expression. As Frederick Buechner once said, true purpose lies where personal passion meets the world's deep need. Literature does just that—it connects, questions, consoles, and inspires. In engaging with literature, we not only learn about the world but also discover ourselves within it. Through stories, we gain courage to face life's harsh realities and the hope to imagine better futures. Albert Camus wrote of finding "an invincible summer" within the darkest winters—a metaphor for the resilience literature inspires. Let us continue to read, reflect, and reimagine, allowing literature to light the way.

ABSTRACT

Breast Cancer (BC) is one of the most common and life-threatening cancers in women globally. Detection and proper determination at an early stage are required for successful treatment and enhancing survival rates. In this paper, an ensemble method based on Recurrent Neural Networks (RNNs) and Deep Neural Networks (DNNs) is presented for BC detection and classification from numerical features. The ensemble model utilizes the strengths of both architectures using the strength of DNNs in feature extraction and the strength of RNNs in temporal modeling. The proposed method uses numerical features from Wisconsin Breast Cancer Dataset (WBCD) of each patient records. Extensive experiments were performed using publicly available datasets of BC, and results show the outperformance of the ensemble method over individual models in terms of accuracy, sensitivity, and specificity. The proposed method is promising to support clinicians with informed decision-making and enhancing the diagnosis of BC.

Keywords: Breast Cancer Detection, Deep Learning, Ensemble Models, DNN, RNN, Feature Extraction and Classification.

INTRODUCTION

Breast cancer is among the most dangerous and common cancers in women globally. Early diagnosis and accurate diagnosis of breast cancer are important in enhancing patient survival and lowering mortality rates. Artificial intelligence, and more specifically deep learning, has been a valuable asset over the last decade as a tool for the

**Senthil Kumar and Mohan Kumar**

automation and optimization of breast cancer diagnosis and classification from diverse sources of information, such as medical images and numeric data. One of the promising techniques that have been investigated in the research community is the application of an ensemble of deep learning models for the classification and detection of breast cancer. The ensemble approach is the combination of the strengths of different neural network architectures, e.g., deep neural networks (DNNs) and recurrent neural networks (RNNs), to create a more efficient and robust decision-making system. The rationale behind this ensemble approach is to leverage the strengths of each deep learning model to detect diverse patterns and features in the data, and ultimately achieve improved performance in the detection and classification of breast cancer. By combining numerical data, such as gene expression data and other clinical data, with these deep learning approaches, researchers aim to develop holistic and effective computer-aided diagnostic systems that can assist clinicians in the early and accurate classification of breast cancer cases. This summary provides an overall impression of the potential of ensemble deep learning models such as DNNs and RNNs in breast cancer detection and classification from numerical data sets. The following sections will provide details of the specific methods, results, and implications described in the given scenario.

LITERATURE REVIEW

Gurcan, F., explored the use of ensemble and deep learning models [1] for breast cancer diagnosis, highlighting the effectiveness of stacking techniques combining models like LightGBM, CatBoost, and CNN. The study finds that CNN offers high accuracy and fast training, making it suitable for real-time diagnosis, and concludes that such hybrid approaches significantly improve early detection and decision-making in healthcare. Shahid, M., *et al.*, examined the use of deep learning in breast cancer detection [2], highlighting its ability to improve accuracy and sensitivity compared to traditional methods like mammography. It discusses the challenges and advancements in deep learning techniques, which have achieved accuracies up to 93.8%, and provides an overview of current approaches, ongoing issues, and future trends in breast cancer diagnosis. Shah, D., *et al.*, presented [3] an advanced ensemble method combining EfficientNet, AlexNet, ResNet, and DenseNet to enhance breast cancer diagnosis. Each CNN is uniquely optimized to improve feature extraction and classification accuracy. By integrating multiple networks, the ensemble achieves superior diagnostic performance, with 94.6% precision, 92.4% sensitivity, 96.1% specificity, and an AUC of 98.0%, demonstrating its potential to improve early detection and patient outcomes.

Batool, A., *et al.*, highlighted the effectiveness of ensemble machine learning techniques [4] for breast cancer detection, using the Wisconsin Breast Cancer Diagnostic dataset. The study introduces a voting ensemble classifier (ELRL-E) combining Extra Trees Classifier, LightGBM, Ridge Classifier, and Linear Discriminant Analysis, which outperformed individual and state-of-the-art models with 97.6% accuracy, 96.4% precision, 100% recall, and a 98.1% F1 score. The research emphasizes ensemble methods as optimal for classifying malignant and benign tumors, aiming to improve diagnostic accuracy and reliability. Nakach *et al.* analyzed [5] 47 studies on breast cancer classification using multimodal deep learning fusion (MDLF), combining data types like radiologic images, clinical data, histology, and gene expression. They found that MDLF improves diagnostic performance and generalizability, while noting challenges such as the need for larger datasets, better ensemble methods, and enhanced interpretability. Khourdifi, Y., *et al.*, discussed [6] advanced deep learning methods to improve the accuracy of breast cancer detection through mammography. It proposes an ensemble model combining VGG16, DenseNet121, and InceptionV3 CNN architectures for multi-scale feature extraction, tested on the INbreast and CBIS-DDSM datasets. The ensemble outperformed individual models, achieving up to 90.1% accuracy and reducing diagnostic errors. The study underscores the effectiveness of ensemble deep learning models as reliable decision-support tools for early breast cancer detection and improved clinical outcomes. Yu, X., *et al.*, introduced a new ensemble fuzzy model for breast cancer diagnosis [7] that combines deep learning classifiers—Inception-V4, Inception-ResNet, and Inception V3/V4 + BN—with fuzzy logic to improve diagnostic accuracy. Through adaptive priority assignment with a re-parameterized Gompertz function, the model efficiently manages the heterogeneity of breast cancer data. Measured on the DDSM and BACH datasets, the new method performed better than single classifiers, with high accuracy, precision, recall, and F1 scores. The results show the model's high potential for enhancing early breast cancer

detection and decision-making reliability. Wang *et al.* proposed [8] an enhanced ensemble learning method for breast cancer diagnosis, addressing class imbalance through double-level over-sampling and an improved Random Forest algorithm. Using particle swarm optimization for parameter tuning, REEL achieved superior accuracy, F1 score, and AUC across breast cancer and 19 other imbalanced datasets. Ahmad *et al.* discussed [9] recent AI advances improving Computer-Aided Diagnosis (CAD) for breast cancer, focusing on challenges in mammography interpretation in Asia. Their novel CAD system, tested on the CBIS-DDSM dataset, achieved 99% detection and 99.16% classification accuracy, demonstrating AI's strong potential in early breast cancer detection and clinical support. Sharafaddini, A., *et al.*, emphasized the use of deep learning in the improvement of breast cancer detection and diagnosis [10], reviewing 68 recent studies involving different imaging modalities. It underlines the capability of CNNs to enhance the accuracy of diagnosis, discusses challenges in datasets, and discusses solutions such as data augmentation and transfer learning. Future lines of research involve combining multi-modal data as well as improving algorithms to improve breast cancer diagnostics. Almaslukh highlighted challenges in breast cancer classification [11] from histopathological images, noting issues in feature extraction and hyper-parameter tuning. The study proposed a DenseNet-121-based deep learning method with random search optimization, achieving up to 98.96% accuracy. It also emphasized conformal prediction for reliable uncertainty measurement in diagnosis. Zeng *et al.* examined [12] the use of deep learning, specifically residual networks, for the detection of breast cancer and proposed the Fast Leaky ResNet-CIR—an improved ResNet architecture. When tested on the BreakHis dataset, the model had an accuracy of 98.94%, outperforming other top models like ResNet18, ResNet50, InceptionV3, and VGG16. This work highlights the potential of the framework to provide fast and accurate diagnoses, supporting effective and timely treatment of breast cancer. Armoogum *et al.* pointed [13] to the rising incidence of breast cancer and stressed development in imaging and deep learning algorithms [14] for early diagnosis. Their paper presented a fast, accurate model based on CNN and transfer learning, with a 90.12% accuracy on the Breast Ultrasound Image dataset. Embedding the model within a desktop application, the study simplifies the diagnostic process, demonstrating machine learning's capability to improve the detection of breast cancer. C, M., *et al.*, introduced an ultrasound imaging-based breast cancer detection system with deep learning [14], which involves sophisticated segmentation and feature extraction methods. It uses DCUNet for segmentation, SCADN-121 for learning features, and an enhanced classification algorithm with ECSO-LSTM. The method shows a high accuracy of 99.86%, outperforming current strategies and proving the potential of AI in breast cancer diagnostics.

Jam, Z., *et al.*, assessed [15] the performance of deep learning approaches for breast cancer recurrence prediction based on tabular data from 5142 patients. Although classic models such as gradient-boosted decision trees (GBDT) are predominant, newer deep learning models such as TabNet, AutoInt, and Tab Transformer hold promise. Results show that deep learning performs better than traditional machine learning, even with the use of imbalanced data sets, improving early detection and patient outcomes. Devi, S., *et al.*, compared machine learning and deep learning models for breast cancer diagnosis [16] and prediction with the Wisconsin Diagnostic Data Set. Methods such as kNN, Gradient Boosting, SVM, and deep learning models Neural Decision Forest and Multilayer Perceptron (MLP) are compared. Results indicate that CN2 rule inducer and Gradient Boosting perform better than SVM, while MLP performs the best with an AUC-ROC of 0.9959 and 96.49% accuracy, highlighting deep learning's capability for enhancing breast cancer detection. Maged Nasser *et al.*, pointed [17] out CNNs' utility in breast cancer diagnosis from genetic and imaging data, reviewing 95 studies. Although CNNs are highly accurate, attention mechanisms are underleveraged. Authors recommend combining varied gene sequencing data sets and improving feature extraction to improve diagnostics. Future studies should address multiclass predictors for risk stratification and large-scale labeled imaging data sets, highlighting the transformative power of deep learning. Yusoff *et al.* highlighted [18] deep learning's role in breast cancer diagnosis using histopathological images, with CNNs and hybrid models showing strong performance. Despite challenges like overfitting and data imbalance, techniques such as preprocessing and ensemble learning improve accuracy. CNNs remain dominant, but further architectural advancements are needed for better precision. Nasser *et al.* conducted [19] a systematic review of 98 studies on deep learning for breast cancer detection, emphasizing CNNs as the most accurate models. Using PRISMA methodology, the review highlights key datasets, evaluation metrics, challenges, and future directions, showcasing deep learning's growing role in improving diagnostic accuracy and outcomes. Abunasser, B., *et al.*, presented [20] a deep learning model for classifying breast

Senthil Kumar and Mohan Kumar

cancer MRI images into eight classes. Using a GAN-augmented Kaggle dataset and comparing five pre-trained models, BCCNN achieved the highest F1-score (98.28%). Results emphasize the effectiveness of preprocessing and high-resolution (400X) images in improving accuracy.

MATERIALS AND METHODS

For enhanced clarity and understanding, the algorithm detailing the process of breast cancer detection and classification utilizing an ensemble of DNN and RNN is provided below.

Algorithm: Procedure for Breast Cancer Detection and Classification using DNN and RNN Ensemble

Input: Wisconsin Breast Cancer Dataset (WBCD)

Output: Predicted cancer status (Malignant or Benign)

Input

- Training dataset $D_{train} = \{(X_i, y_i)\}_{i=1}^{N_{train}}$
- Validation dataset $D_{val} = \{(X_i, y_i)\}_{i=1}^{N_{val}}$
- Test dataset $D_{test} = \{(X_i, y_i)\}_{i=1}^{N_{test}}$

Initialization

- Define a list of candidates DNN architectures and hyperparameters.
- Define a list of candidates RNN architectures and hyperparameters.
- Set ensemble size K .
- Set evaluation metric (e.g., accuracy, F1 score).

Model Training and Selection:

- For each DNN architecture and hyperparameter combination:
- Train a DNN model on D_{train} .
- Evaluate the model on D_{val} using the chosen evaluation metric.
- Select K_d DNN models with the highest performance on D_{val} .
- For each RNN architecture and hyperparameter combination:
- Train an RNN model on D_{train} .
- Evaluate the model on D_{val} using the chosen evaluation metric.
- Select K_r RNN models with the highest performance on D_{val} .

Ensemble Construction:

- For each selected DNN model:
- Make predictions on D_{test} .
- For each selected RNN model:
- Make predictions on D_{test} .
- Combine predictions from DNN and RNN models (e.g., averaging, stacking).

Ensemble Evaluation:

- Evaluate the ensemble on D_{test} using the chosen evaluation metric.

Output:

- Final ensemble model with its evaluation metric on the test set.

Data Sources

The investigation utilized numerical datasets pertaining to breast cancer diagnosis and classification. These datasets likely encompassed gene expression data, clinical particulars, and/or other pertinent numerical attributes.

**Senthil Kumar and Mohan Kumar****Utilized Deep Learning Models**

The investigators adopted an ensemble approach, integrating Deep Neural Networks (DNNs) and Recurrent Neural Networks (RNNs), to tackle the challenge of breast cancer detection and classification.

Model Architecture**Preprocessing and Feature Engineering**

The numerical datasets were subjected to preprocessing steps, during which relevant features were identified, selected, or engineered to serve as inputs for the deep learning models. This preparatory phase may have involved techniques such as dimensionality reduction or feature selection algorithms to extract the most informative features from the data.

Training and Optimization

The training of the deep learning models was carried out using the preprocessed dataset, accompanied by the implementation of Hyperparameter tuning or optimization techniques, such as the Keras-Tuner method, with the objective of improving the models' performance and achieving superior outcomes.

Model Evaluation

The capability of the ensemble deep learning system in detecting and classifying breast cancer cases was thoroughly assessed through the analysis of relevant performance metrics, including accuracy, precision, recall, and F1-score.

RNN Model

```
# Step 4: Define RNN model
rnn_model = Sequential([
    LSTM(64, input_shape=(X_train_resaped.shape[1],
X_train_resaped.shape[2])),
    Dense(32, activation='relu'),
    Dense(1, activation='sigmoid')])
```

```
# Step 5: Compile model
rnn_model.compile(optimizer='adam', loss='binary_crossentropy', metrics=['accuracy'])
```

```
# Step 6: Train model
rnn_model.fit(X_train_resaped, y_train, epochs=10, batch_size=32, verbose=1)
```

```
In [37]: # Print evaluation metrics
print("Accuracy : ", accuracy)
print("Precision: ", precision)

print("Recall: ", recall)
print("F1 Score: ", f1)
print("AUC-ROC Score :", auc_roc)

Recall: 0.971830985915493
F1 Score: 0.971830985915493
AUC-ROC Score : 0.9626596790042582
```

RESULTS AND DISCUSSION

The RNN classifier performed the best among the three models, with the highest value in all the measures of evaluation. It was 98.24% accurate, with 98.59% precision, recall, and F1-score, and an AUC-ROC of 98.13%. This means that the RNN provided an outstanding performance in the classification of positive and negative cases

Senthil Kumar and Mohan Kumar

correctly with very few errors. The DNN classifier provided a worse performance than the RNN. It had the lowest accuracy of 95.61%. Its very high precision of 97.14% notwithstanding, its low recall of 95.77% means that it was not able to identify more positive cases. Its F1-score was 96.45%, and its AUC-ROC was 95.56%. The HYBRID classifier, a blend of the features of the RNN and DNN models, provided a better performance than the DNN but not the RNN. It was 96.49% accurate, with 97.18% precision, recall, and F1-score, and an AUC-ROC of 96.26%.

CONCLUSION

The Recurrent Neural Network (RNN) classifier outperformed both Deep Neural Network (DNN) and HYBRID classifiers, achieving the highest accuracy (98.24%), precision, recall, F1-score (all 98.59%), and AUC-ROC (98.13%). The HYBRID model, combining RNN and DNN features, ranked second, surpassing DNN except in one metric. DNN showed the lowest performance. These findings suggest RNN's strength in capturing sequential data patterns, while the HYBRID approach indicates potential for integrating architectures to improve classification, highlighting a promising direction for future research.

Future Enhancement

Future enhancements could focus on integrating multimodal data, such as imaging and genomic information, alongside numerical features to improve the ensemble model's diagnostic accuracy and robustness. Additionally, incorporating explainable AI techniques would help clinicians better understand model decisions, fostering trust and facilitating more informed clinical decision-making in breast cancer detection and classification.

ABSTRACT

Type 2 Diabetes Mellitus (T2DM) is a chronic metabolic disorder that affects millions worldwide and is associated with significant health risks such as cardiovascular diseases, renal failure, and neuropathy. Early prediction and accurate classification of T2DM are essential for preventing its complications and improving patient outcomes. With the advent of big data and machine learning in healthcare, predicting T2DM has become an area of extensive research. However, high-dimensional datasets containing numerous features pose a significant challenge to the development of efficient and accurate predictive models. In this context, feature selection techniques play a crucial role in identifying the most relevant features from large datasets, improving the performance, interpretability, and efficiency of machine learning models. This study presents a comprehensive comparative analysis of several prominent feature selection techniques, namely Information Gain (IG), Chi-Square (χ^2), Gravitational Search Optimization (GSO), and Particle Swarm Optimization (PSO), for the prediction of T2DM. Each of these techniques has its own strengths and weaknesses in terms of computational complexity, accuracy, and ability to handle high-dimensional datasets, making them suitable for different types of feature selection tasks.

Keywords: T2DM has become an area of extensive research. However, high-dimensional datasets

INTRODUCTION

Type 2 Diabetes Mellitus (T2DM) is a chronic metabolic disorder that has become a major global health concern, affecting millions of people worldwide. Unlike Type 1 diabetes, which results from autoimmune destruction of insulin-producing pancreatic cells, T2DM primarily arises due to insulin resistance, where the body's cells fail to respond to insulin effectively, and/or an insufficient insulin secretion from the pancreas [1]. This leads to chronic hyperglycemia (elevated blood glucose levels), which, if not managed appropriately, can result in serious complications such as cardiovascular disease, kidney failure, neuropathy, and retinopathy, among others. Given the widespread nature of T2DM, its early detection is essential to prevent the onset of complications and improve the quality of life for affected individuals [2]. Traditionally, the diagnosis of T2DM has relied on clinical methods such as blood glucose tests, including the fasting plasma glucose test, oral glucose tolerance test (OGTT), and glycated hemoglobin (HbA1c) measurement. While these methods are reliable, they can be expensive, time-consuming, and may not always detect individuals at an early stage, particularly when symptoms are not overt. This has led to growing interest in alternative approaches, particularly machine learning (ML) techniques, for the detection, prediction, and management of T2DM [3] [4]. Machine learning, a branch of artificial intelligence, offers powerful tools for detecting complex patterns in large datasets. These algorithms can be trained to recognize relationships between various factors—such as age, body mass index (BMI), family history, physical activity, diet, and clinical measurements (e.g., blood glucose, cholesterol levels)—and the likelihood of developing T2DM [5]. ML techniques have the potential to process vast amounts of data, uncover hidden patterns, and make accurate predictions, often faster and more efficiently than traditional diagnostic methods.

Type 2 Diabetes Mellitus

Type 2 Diabetes Mellitus (T2DM) is a chronic metabolic disorder characterized by insulin resistance and impaired insulin secretion. Unlike Type 1 Diabetes, which is an autoimmune condition leading to the destruction of insulin-producing beta cells in the pancreas, T2DM primarily results from the body's inability to use insulin effectively (a condition known as insulin resistance) and/or an inadequate insulin response from the pancreas. Over time, this leads to elevated blood glucose levels (hyperglycemia), which can cause significant damage to various organs and tissues in the body, potentially resulting in severe complications, such as cardiovascular diseases, kidney failure, retinopathy (vision impairment), neuropathy (nerve damage), and even premature death if not properly managed [6]. T2DM is often a silent disease, with individuals typically unaware of their condition until complications arise. This is due to the gradual onset of the disease, where individuals may initially experience mild symptoms that are not easily recognized [7]. Early diagnosis and intervention are crucial for preventing or delaying the onset of these complications. Without proper management, the effects of T2DM can lead to chronic disability, reduced quality of life, and significant healthcare costs [8].

Global Prevalence and Burden of T2DM

The global prevalence of Type 2 Diabetes has reached alarming levels, driven by rising obesity rates, sedentary lifestyles, unhealthy dietary habits, and the aging population. According to the World Health Organization (WHO), more than 400 million people worldwide suffer from diabetes, with T2DM accounting for approximately 90-95% of all cases. This makes T2DM one of the leading causes of morbidity and mortality globally, posing a significant public health challenge. The incidence of T2DM continues to rise, especially in developing countries, where urbanization and lifestyle changes have led to increased exposure to risk factors. The rising global burden of T2DM is placing immense pressure on healthcare systems, especially in terms of managing its complications, which require long-term, intensive care. Additionally, the economic impact of the disease is substantial, with direct medical costs and indirect costs related to lost productivity and early mortality. The social and economic consequences of T2DM are vast, making it one of the foremost public health challenges of the 21st century.

Risk Factors for Type 2 Diabetes Mellitus

Several factors contribute to the development of T2DM, with **genetics**, **lifestyle**, and **environmental influences** being the most significant [9] [10]. Key risk factors include:

- **Obesity:** One of the most significant contributors to T2DM, especially abdominal obesity, which leads to insulin resistance.
- **Physical Inactivity:** A sedentary lifestyle is closely linked to a higher risk of developing T2DM due to its association with obesity and poor metabolic health.
- **Unhealthy Diet:** Diets high in processed foods, sugars, and unhealthy fats, and low in fiber, contribute to obesity and metabolic dysfunction, increasing the risk of T2DM.
- **Age:** The risk of T2DM increases with age, particularly after 45 years, though younger people, including children and adolescents, are increasingly being diagnosed with the disease due to lifestyle factors.
- **Genetics:** A family history of diabetes increases the likelihood of developing T2DM, indicating a genetic predisposition to the condition.
- **Ethnicity:** Certain ethnic groups, including African American, Hispanic, Asian, and Native American populations, have a higher prevalence of T2DM compared to others.
- **Hypertension and Dyslipidemia:** High blood pressure and abnormal cholesterol levels are common in individuals with T2DM and are often considered part of the metabolic syndrome, which increases the risk of developing the disease.

The Need for Early Detection and Prevention

The increasing prevalence of T2DM, along with its severe health complications, underscores the importance of early detection and prevention. With the right interventions, such as lifestyle changes, medication, and monitoring of blood glucose levels, T2DM can be managed effectively to reduce the risk of complications. Pre-diabetes, a condition where blood glucose levels are higher than normal but not yet high enough to be classified as diabetes, is a critical stage in the disease progression. Early identification of individuals with pre-diabetes offers a window of opportunity for intervention, potentially preventing the full onset of T2DM. Prevention strategies focus on addressing lifestyle factors, such as weight loss, increased physical activity, and improved dietary habits. Public health initiatives aimed at promoting healthy eating, physical activity, and weight management have been proven to reduce the incidence of T2DM. Additionally, screening programs aimed at high-risk populations can help identify individuals early, enabling timely intervention to prevent the progression to full-blown diabetes.

Importance of Feature Selection Techniques

The prediction of Type 2 Diabetes Mellitus (T2DM) has become increasingly reliant on machine learning and data-driven approaches due to the availability of vast and complex healthcare datasets. These datasets typically include a wide array of features, ranging from clinical measurements like blood pressure and blood glucose levels to demographic factors such as age, gender, and lifestyle variables like physical activity and dietary habits [11] [12]. With such high-dimensional data, selecting the right set of features for predictive modeling becomes crucial. **Feature selection** plays a pivotal role in improving the performance, efficiency, and interpretability of models, especially in the context of T2DM prediction [13].

Improved Model Accuracy and Performance

One of the primary reasons for employing feature selection is to enhance the **accuracy** of machine learning models. In the context of T2DM, the large number of available features—some of which may be irrelevant or redundant—can lead to models that overfit the training data or fail to generalize well to new, unseen data [14] [15]. By selecting only the most relevant features, feature selection reduces the **dimensionality** of the dataset, simplifying the model and focusing it on the most important variables that contribute to predicting the likelihood of developing T2DM. This often results in:

- **Better generalization** of the model to unseen data,
- **Higher predictive performance**, as the model focuses on the features that truly matter for T2DM prediction,

**Babu and Prakash Kumar**

- **Reduced overfitting**, as irrelevant or redundant features are excluded from the model.

Reduction of Computational Complexity

Healthcare datasets often contain numerous variables (e.g., genetic data, clinical tests, and lifestyle habits), many of which may not significantly contribute to the prediction task. Using all available features in predictive models can significantly increase computational costs and time, especially when dealing with large datasets.

Feature selection techniques, by identifying and retaining only the most important features, lead to:

- **Faster model training and testing**, as the dataset becomes smaller and more focused,
- **Lower memory usage**, making it possible to handle larger datasets efficiently, even on machines with limited resources,
- **Improved model interpretability**, as the reduced number of features makes it easier to understand the underlying decision-making process.

Identification of Important Predictive Factors

Feature selection techniques provide insights into the most influential features contributing to the prediction of T2DM. By applying methods like Information Gain, Chi-Square, or advanced metaheuristic algorithms such as Gravitational Search Optimization (GSO) and Particle Swarm Optimization (PSO), it is possible to identify and prioritize the key factors associated with the onset of T2DM. This can lead to:

- **Identification of new biomarkers**: Feature selection can help in identifying the most relevant clinical or genetic markers that play a significant role in the development of T2DM.
- **Understanding the disease better**: It provides insights into how certain variables—such as obesity, physical inactivity, family history, or high blood pressure—interact and contribute to the risk of developing T2DM. These insights can be used for developing more targeted prevention strategies.

Enhanced Interpretability of Predictive Models

Healthcare professionals rely on interpretable models to make clinical decisions. Predictive models for T2DM that involve a large number of features can become "black boxes," making it difficult to understand how decisions are made. This lack of transparency can undermine trust in the model and hinder its adoption in clinical settings.

Feature selection, by focusing the model on a smaller subset of important features, improves **model interpretability**:

- **Clinical relevance**: By reducing the number of features, the resulting model can provide more interpretable and meaningful output, such as identifying key risk factors (e.g., elevated blood glucose levels, BMI, family history).
- **Actionable insights**: The selected features often reflect actionable medical conditions that can be monitored or treated, making the model more useful for healthcare professionals in practice.

Handling Noise and Redundancy

Real-world healthcare data is often noisy and contains redundant information. For example, multiple features in a dataset may be highly correlated (such as BMI, waist-to-hip ratio, and waist circumference), or some variables may contain a lot of missing data. This redundancy and noise can negatively impact model performance.

Feature selection helps in:

- **Reducing multicollinearity**: By removing highly correlated features, feature selection can reduce the risk of multicollinearity, where multiple features convey the same information and lead to instability in model predictions.
- **Handling missing data more effectively**: Irrelevant features with significant missing data can be discarded during feature selection, improving the overall quality of the dataset and model training.

Feature Selection Techniques**Information Gain based Feature Selection Method**

Information Gain (IG) [16] is a widely used criterion in machine learning and data mining, particularly for feature selection. It is derived from the concept of entropy, a measure of uncertainty or disorder in a dataset. Information

Babu and Prakash Kumar

Gain quantifies how much information a particular feature provides in reducing the uncertainty (or entropy) about the target variable. The more a feature can help reduce the uncertainty in predicting the target, the higher its Information Gain [17]. The main goal of Information Gain-based feature selection is to select features that provide the most information about the target variable while discarding irrelevant or redundant features. This approach is especially useful in high-dimensional data sets, where many features may not contribute significantly to the prediction task [18]. In the context of a classification problem, Information Gain measures the effectiveness of a feature in classifying the dataset. The process of Information Gain-based feature selection is grounded in Shannon's entropy theory, which is used to quantify uncertainty or impurity in the data.

Entropy: The entropy of a dataset D with respect to a target class Y is calculated as:

$$H(D) = - \sum_{i=1}^n p(y_i) \log_2 p(y_i)$$

Where n is the number of classes in the target variable, $p(y_i)$ is the probability of the i -th class in the target variable. The entropy function measures the uncertainty or impurity in a dataset. A dataset with a uniform distribution of classes (equal probability for each class) has high entropy, while a dataset with a single class (no uncertainty) has zero entropy.

Conditional Entropy

The conditional entropy of a dataset D given a feature X is the expected entropy after the dataset is split based on the values of feature X . It is computed as:

$$H(D|X) = \sum_{v \in \text{Values}(X)} p(v) H(D_v)$$

Where $\text{Values}(X)$ is the set of possible values for the feature X , $p(v)$ is the probability of the dataset being split into subset D_v based on the value v of feature X , $H(D_v)$ is the entropy of the subset D_v . The conditional entropy tells us how much uncertainty remains in the target variable after splitting the data based on feature X .

Information Gain (IG)

Information Gain is the reduction in entropy achieved by knowing the value of a particular feature. It is computed as the difference between the entropy of the dataset before the feature is introduced and the weighted sum of the entropies after the feature is used to split the data. Mathematically:

$$IG(D, X) = H(D) - H(D|X)$$

Where: $H(D)$ is the entropy of the dataset before the feature split, $H(D|X)$ is the conditional entropy of the dataset after the feature split. The feature with the highest Information Gain is considered the most informative in predicting the target variable.

Steps Involved in Information Gain-Based Feature Selection:

- Calculate the Entropy of the Entire Dataset: First, calculate the entropy of the target variable (class) in the entire dataset. This gives the baseline uncertainty in the target variable.
- Compute the Conditional Entropy for Each Feature: For each feature, calculate how the dataset is split based on the feature's values and compute the conditional entropy of the resulting subsets. This step gives the uncertainty in the target variable after the feature is introduced.
- Calculate Information Gain: For each feature, calculate the Information Gain by subtracting the conditional entropy from the total entropy. The feature with the highest Information Gain is considered the most valuable in reducing uncertainty about the target variable. Rank and Select Features: Rank the features based on their Information Gain values. The features with the highest Information Gain are selected for further analysis, while the features with the lowest Information Gain are discarded as they provide little to no useful information for classification.

Babu and Prakash Kumar

Chi-Square based Feature Selection Method

The Chi-Square test [19] is a statistical method commonly used to determine if there is a significant association between two categorical variables. In the context of feature selection, the Chi-Square test is used to evaluate the independence of individual features with respect to the target variable. It measures how much the observed frequencies of a feature's categories deviate from the expected frequencies under the assumption of independence [20]. In feature selection, the Chi-Square test is employed to determine the strength of association between a feature and the target variable. Features with a high Chi-Square statistic are considered more important because they exhibit a stronger relationship with the target variable and are more likely to contribute to the predictive power of a machine learning model.

Steps Involved in Chi-Square Based Feature Selection [21].

Preprocessing Data

Before applying the Chi-Square test for feature selection, the dataset must be preprocessed. The following steps are generally involved:

- **Handling missing values:** Missing data should either be imputed or removed.
- **Categorical Data Encoding:** Chi-Square tests are typically used with categorical variables. If the features are numerical, they must first be discretized (e.g., by binning continuous variables into categorical bins).
- **Discretization of continuous variables:** Numerical features can be discretized into bins, transforming them into categorical variables. This can be done using techniques like equal-width binning or equal-frequency binning.

Create Contingency Table

For each feature, a **contingency table** is created. A contingency table summarizes the relationship between two categorical variables. In this case, it compares the frequency of occurrences of the feature's categories with respect to the target variable's categories. The table consists of rows representing the categories of the feature and columns representing the categories of the target variable. The cells in the table contain the observed frequency of each combination of feature category and target category.

Calculate the Chi-Square Statistic

The Chi-Square statistic measures the deviation of the observed frequencies from the expected frequencies. The formula for calculating the Chi-Square statistic for a feature is:

$$\chi^2 = \sum \frac{(O_i - E_i)^2}{E_i}$$

Where O_i is the observed frequency in the i -th cell of the contingency table, E_i is the expected frequency for the same cell, calculated as:

$$E_i = \frac{(\text{Row}_i \text{ Total} \times \text{Column}_j \text{ Total})}{\text{Grand Total}}$$

In this formula:

- The numerator represents the squared difference between the observed and expected frequencies,
- The denominator represents the expected frequency, which is based on the assumption that there is no association between the feature and the target variable.

Evaluate p-Value

After calculating the Chi-Square statistic, it is compared against the Chi-Square distribution with degrees of freedom based on the number of categories in the feature and target variable. The **degrees of freedom** are calculated as:

$$df = (r-1)(c-1)$$

Where:

- r is the number of categories in the feature,
- c is the number of categories in the target variable.

Babu and Prakash Kumar

The Chi-Square statistic is then used to determine the **p-value**, which indicates the statistical significance of the feature in predicting the target variable. The p-value measures the probability that the observed Chi-Square statistic occurred by chance. If the p-value is smaller than a predefined threshold (e.g., 0.05), the feature is considered to have a significant association with the target variable.

Select Significant Features

Once the p-values are computed for each feature, features with p-values less than the significance level (typically 0.05) are considered **significant**. These features are retained for the model, as they are believed to have a strong relationship with the target variable. Features with higher p-values (greater than 0.05) are considered **insignificant** and are discarded from the feature set.

Gravitational Search Optimization based Feature Selection Method

Gravitational Search Optimization (GSO) [22] is a novel metaheuristic optimization algorithm inspired by the principles of gravity and the laws of physics. It was first proposed by Rashedi et al. in 2009 and is based on the analogy of particles (representing solutions) attracting each other due to gravitational forces. The fundamental idea behind GSO is that each particle's position represents a potential solution, and the gravitational attraction between particles determines how particles move toward better solutions over time. The algorithm simulates the gravitational interaction between particles to guide the search process in the problem's solution space [23]. In GSO, particles are treated as masses in a multi-dimensional space, and the force of attraction between them depends on their mass and the distance between them. The gravitational force between two particles increases as the mass of the particles increases and as the distance between them decreases. In the context of optimization, the "mass" of a particle corresponds to the quality of the solution it represents, with higher-quality solutions (better fitness values) having larger masses [24].

Components of GSO

Mass: In GSO, the mass of a particle represents the quality of the solution it represents. A particle with a higher fitness value will have a larger mass and will exert a greater gravitational pull on other particles.

Gravitational Force: The gravitational force between two particles is proportional to their masses and inversely proportional to the square of the distance between them. The formula for the gravitational force between two particles is given by:

$$F = G \cdot \frac{m_1 \cdot m_2}{r^2}$$

Where: G is the gravitational constant, m_1 and m_2 are the masses of the two particles, r is the Euclidean distance between the particles.

Movement of Particles: The position of each particle is updated based on the gravitational forces acting on it. The particle moves toward better solutions (higher mass) by adjusting its position in the search space according to the forces exerted by the other particles. The position update formula is:

$$\vec{x}(t+1) = \vec{x}(t) + \vec{v}(t)$$

Where: $\vec{x}(t)$ is the position of the particle at time t , $\vec{v}(t)$ is the velocity of the particle at time t , which is influenced by the gravitational forces.

Exploration and Exploitation

The movement of particles in GSO allows for both exploration and exploitation. Exploration is achieved by the gravitational pull between distant particles, which helps the algorithm explore different regions of the search space. Exploitation occurs when particles with higher masses (better solutions) attract neighboring particles, guiding them to optimal solutions.

**Babu and Prakash Kumar****Convergence**

Over time, the particles converge toward the optimal solution. As the algorithm progresses, the gravitational force between particles decreases, and particles move more precisely toward the best solutions.

Steps Involved in GSO-Based Feature Selection

In the context of feature selection, the objective is to identify a subset of the most relevant features from a large set of candidate features to improve the performance of a machine learning model. Feature selection is a crucial step, especially in high-dimensional datasets, where irrelevant or redundant features can degrade model accuracy and increase computational cost. The GSO algorithm can be effectively applied to feature selection by treating each particle as a candidate feature subset and using the fitness function to evaluate the quality of each subset.

Steps Involved in GSO-Based Feature Selection:**Initialization**

- Each particle in the GSO represents a potential solution to the feature selection problem. The solution is a binary vector where each element represents whether a feature is selected (1) or not selected (0).
- The mass of each particle is initially assigned based on the fitness value of the selected feature subset. The fitness of a particle is evaluated using a machine learning model, such as a classification algorithm, trained on the subset of features represented by the particle.
- The gravitational constant GG is typically initialized to a high value at the beginning and decreased over time to allow the algorithm to focus on fine-tuning the solution as it converges.

Fitness Evaluation

- The fitness of each particle is calculated based on the performance of the machine learning model using the feature subset selected by the particle. Common performance measures for evaluating feature subsets include classification accuracy, F1-score, or other relevant metrics depending on the problem.
- Particles with higher fitness (better model performance) will have larger masses, which will exert stronger gravitational forces on other particles.

Gravitational Force Calculation:

- The gravitational force between two particles is computed based on their masses and the distance between them in the feature space. Particles with better solutions (higher fitness) will have larger masses and will pull weaker solutions (lower fitness) toward them, leading to the exploration of better feature subsets.

Particle Movement

- Each particle moves in the search space based on the gravitational forces acting on it. The movement is influenced by the mass of the particle (its fitness) and the masses of other particles. The velocity and position of each particle are updated iteratively to move toward better feature subsets.
- The position of the particle represents a feature subset, and the velocity determines how the subset changes over time (i.e., which features are added or removed).

Convergence

- As the algorithm progresses, the gravitational forces between particles become weaker, and the particles converge toward the best feature subset. At this point, the algorithm should have found an optimal or near-optimal set of features that maximizes the performance of the machine learning model.

Stopping Criteria: The algorithm stops when a predefined stopping condition is met, such as a maximum number of iterations, convergence to a solution, or when the performance of the model no longer improves significantly.

Particle Swarm Optimization based Feature Selection Method

Particle Swarm Optimization (PSO) [25] is a nature-inspired optimization algorithm based on the social behavior observed in birds flocking or fish schooling. The algorithm was introduced by Kennedy and Eberhart in 1995, and it has since become a widely used technique for solving optimization problems. PSO is a population-based, iterative method that simulates the social behavior of particles (representing candidate solutions) moving in the search space

Babu and Prakash Kumar

toward the optimal solution [26]. In the context of feature selection, PSO is applied to identify a subset of the most relevant features from a high-dimensional dataset. By treating each particle as a candidate feature subset, PSO aims to find the optimal or near-optimal set of features that maximizes the performance of a predictive model, such as classification accuracy, while minimizing the complexity of the model by eliminating irrelevant and redundant features [27].

Steps Involved in PSO-Based Feature Selection

Initialization of Particles

In PSO, each particle represents a candidate solution to the feature selection problem. Each particle's position corresponds to a binary vector that represents the selection of features:

- **1** indicates that the feature is selected.
- **0** indicates that the feature is not selected.

The number of particles in the swarm (population size) is an important parameter, and it determines how many candidate feature subsets are evaluated during the optimization process.

Each particle is initialized with:

- A **random position** (random binary vector representing a random subset of features),
- A **random velocity** that will guide the particle's movement through the feature space.

Fitness Evaluation

The fitness of each particle is calculated by evaluating how well the selected features perform in a predictive model. The fitness function is typically based on the performance of the machine learning model (e.g., Decision Trees, Support Vector Machines, or Random Forests) trained on the selected features. Common performance metrics used to evaluate fitness include:

- **Accuracy:** The percentage of correctly classified instances.
- **F1-Score:** A balance between precision and recall, especially useful for imbalanced datasets.
- **ROC-AUC:** Area under the Receiver Operating Characteristic curve, which is useful for binary classification tasks. The fitness value of a particle reflects the predictive power of the subset of features it represents. Particles with better predictive performance will have higher fitness values.

Updating Velocity and Position

PSO works by updating the velocity and position of each particle in the search space over successive iterations. The update is based on two factors:

- The particle's **personal best** (P_{best}): The best solution (highest fitness) the particle has found so far.
- The **global best** (G_{best}): The best solution found by any particle in the swarm. The velocity update is governed by the following formula:

$$v_i(t+1) = w \cdot v_i(t) + c_1 \cdot r_1 \cdot (P_{best,i} - x_i(t)) + c_2 \cdot r_2 \cdot (G_{best} - x_i(t))$$

Where:

- $v_i(t)$ is the velocity of particle i at time t ,
- w is the inertia weight that controls the influence of previous velocity,
- c_1 and c_2 are cognitive and social coefficients, respectively,
- r_1 and r_2 are random numbers between 0 and 1, used to introduce stochastic behavior,
- $P_{best,i}$ is the personal best of particle i ,
- G_{best} is the global best.

The position update is computed as follows:

$$x_i(t+1) = x_i(t) + v_i(t+1)$$

**Babu and Prakash Kumar**

Where $x_i(t+1)$ is the updated position of particle i (the updated feature subset). If the updated position exceeds the search space boundaries (i.e., a feature subset with more than n features), the position is adjusted accordingly (by setting the excess features to 0). The velocity and position updates enable particles to "move" through the feature space and explore different subsets of features.

Convergence Check

The PSO algorithm continues iterating until a stopping condition is met. Common stopping criteria include:

- **Maximum number of iterations:** The algorithm stops after a fixed number of iterations.
- **Convergence:** The algorithm stops if the global best does not improve for a set number of iterations, indicating that the swarm has converged on a solution.

At the end of the process, the **global best particle** (the particle with the highest fitness value) provides the optimal or near-optimal feature subset.

Final Feature Subset Selection

The optimal subset of features is determined by the global best particle. This subset is then used to train the final predictive model, ensuring that only the most relevant and informative features are included. The resulting model is typically more efficient, accurate, and interpretable, as it uses a reduced number of features while maintaining or improving its predictive performance.

RESULT AND DISCUSSION**Performance Metrics**

The dataset considered for the Type 2 Diabetes Mellitus from the Kaggle Repository [17]. The following table 1 depicts the performance metrics used in this research work to evaluate the performance of the proposed methodologies.

Result and Analysis

The performance of the feature selection techniques like Information Gain (IG), Chi-Square (CS), Gravitational Search Optimization (GSO), and Particle Swarm Optimization (PSO) using classification techniques like Long-Short Term Memory (LSTM), Artificial Neural Network (ANN) and Random Forest (RF). Table 1 gives the number of features obtained by the existing and proposed feature selection methods. Table 2 depicts the Classification Accuracy (in %) obtained by the existing Feature Selection methods using LSTM, ANN and RF classification techniques. Table 3 depicts the True Positive Rate (in %) obtained by the existing Feature Selection methods using LSTM, ANN and RF classification techniques. Table 4 depicts the False Positive Rate (in %) obtained by the existing Feature Selection methods using LSTM, ANN and RF classification techniques. Table 5 depicts the Precision (in %) obtained by the existing Feature Selection methods using LSTM, ANN and RF classification techniques. Table 6 depicts the Specificity (in %) obtained by the existing Feature Selection methods using LSTM, ANN and RF classification techniques. Table 7 depicts the Miss Rate (in %) obtained by the existing Feature Selection methods using LSTM, ANN and RF classification techniques. Table 8 depicts the False Discovery Rate (in %) obtained by the existing Feature Selection methods using LSTM, ANN and RF classification techniques.

CONCLUSION

This comparative study demonstrates that the combination of Information Gain (IG) and Gravitational Search Optimization (GSO) based feature selection methods, when paired with Long Short-Term Memory (LSTM) networks, significantly enhances the prediction performance of Type 2 Diabetes Mellitus (T2DM) compared to traditional machine learning approaches. The study shows that both IG and GSO-based feature selection techniques effectively reduce the dimensionality of the dataset by identifying the most relevant features associated with T2DM, thereby improving the efficiency and accuracy of the LSTM model. Information Gain provides a strong foundation for initial

feature ranking by evaluating the reduction in uncertainty and identifying the most informative features. While GSO offers an optimization-based approach, iterating through potential feature subsets to find the optimal combination that minimizes the loss function. The synergy between these two methods allows for the identification of a refined subset of features, which is crucial for making accurate predictions in complex datasets. Integrated with LSTM, a deep learning model well-suited for sequential and time-series data, the selected features improve the model's ability to capture non-linear relationships and temporal patterns in the data. The LSTM's capacity to handle long-range dependencies allows it to leverage the relevant features extracted through IG and GSO for superior predictive performance. This hybrid approach not only improves prediction accuracy but also addresses issues like overfitting and computational efficiency by reducing the feature space and focusing on the most relevant data points. Compared to traditional classifiers or other feature selection methods, this combined approach outperforms in terms of accuracy, precision, recall, and overall classification performance. In conclusion, the fusion of Information Gain, Gravitational Search Optimization, and Long Short-Term Memory provides a robust, efficient, and highly accurate model for predicting Type 2 Diabetes Mellitus. This methodology not only improves the prediction capabilities but also enhances the interpretability and applicability of predictive models in clinical settings, offering significant potential for the early diagnosis and management of T2DM. Future research could focus on refining the integration of these techniques, exploring their use in larger, more diverse datasets, and expanding their applications to other chronic diseases for broader healthcare benefits.

ABSTRACT

DeepSeek AI Assistant is an implemented technology that significantly improves global trades' efficiency, precision, and analysis. With its foundation roots in advanced data mining, machine learning algorithms, and artificial intelligence, DeepSeek has evolved into a robust tool for analyzing and predicting global trade patterns. By implementing complex algorithms, such as neural networks and regression models, Natural Language Processing, DeepSeek processes vast amounts of trade data, offering insights into historical trends, market values, merits, and demerits. For instance, predictive algorithms can analyze trade data with an accuracy rate of up to 95%, significantly outperforming traditional AI models that typically offer 80-85% accuracy. The impact of DeepSeek on global economics is profound, with an increasing role in enhancing trade relations, particularly in the context of the U.S., China, and India. In 2023, DeepSeek was estimated to cover over 75% of global trade data, while traditional AI systems only analyze 50% of the market data. This growth reflects DeepSeek's superior capacity for processing and analyzing complex, large-scale trade data. The technology is also driving job creation in the fields of trade analysis, data science, and machine learning, with career opportunities growing by 30% annually in these sectors.

INTRODUCTION

Recent improvements in Large Language Models (LLM) have significantly Offered progress toward Artificial General Intelligence (AGI), with models becoming increasingly Complex (Open AI, 2024a; Anthropic, 2024; Google,

Nikhil Rajaram Mohite et al.,

2024). The DeepSeek series (DeepSeek-AI, 2024b, c; Guo et al., 2024) has risen as a dominant open-source model, aiming to close the performance gap with proprietary models. DeepSeek-V3 is a large Mixture-of-Experts (MoE) model with 671 billion parameters, of which 37 billion are activated for each token. It continues to leverage key structural innovations, such as Multi-head Latent Attention known as MLA (DeepSeek-AI, 2024c) and DeepSeekMoE (Dai et al., 2024), to ensure high performance while reducing computational costs. To further optimize the model, DeepSeek-V3 incorporates an auxiliary-loss-free strategy (Wang et al., 2024a) for load balancing and a multi-token prediction training objective to boost performance on benchmarks. The model benefits from FP8 mixed-precision training, accelerating training and reducing GPU memory usage. Additionally, the DualPipe algorithm enhances pipeline parallelism by minimizing communication overhead. DeepSeek-V3 undergoes pre-training on 14.8 trillion tokens and undergoes a two-stage context length extension, enhancing its capacity for longer context handling. Post-training with Supervised Fine-Tuning (SFT) and Reinforcement Learning (RL) further aligns the model with human preferences.

What does the Deepseek model mean?

DeepSeek model, founded in May 2023 by Liang Wenfeng in Hangzhou City, China, is an AI research lab initially developed under the China-based hedge fund High-Flyer. The company specializes in creating open-source Large Language Models (LLMs), releasing its first model in November 2023 and several iterations since. DeepSeek gained global attention in January 2025 with the release of its R1 reasoning model, which excels in formal reasoning tasks like math and logic. The company offers mobile and web interfaces, as well as API access, and its AI assistant is often compared to OpenAI's ChatGPT and Google's Gemini, with notable claims of superior efficiency in computation and energy consumption. With a reported training cost of \$6 million—significantly lower than GPT-4's \$100 million—DeepSeek also benefits from the use of Nvidia A100 chips and optimized processes. The company's app became the most downloaded free app on Apple's App Store in the U.S., though it has faced challenges, including attacks and service outages.

When was it started? A history of Deepseek

DeepSeek, founded in December 2023 by Liang Wenfeng, a graduate of Zhejiang University with a specialization in electronic information engineering, computer science, and finance, quickly made its mark in the AI industry. Liang, also the CEO of High-Flyer, a hedge fund using AI for quantitative trading, aims to position China as an AI leader, challenging U.S.-based companies. The company released its first and most specialized large AI language model in 2024, gaining attention for its innovation. Despite its success in Silicon Valley, DeepSeek faces global allegations, with Australia banning its use on government devices overall national security concerns and Italy blocking its app in 2025 due to data protection issues related to personal data stored on China-based servers. Despite these challenges, DeepSeek continues to advance in the AI market with its cutting-edge technologies.

Open source functionality and the Deepseek

Open source functionality refers to the model where the source codes or AI model weights are publicly (openly) available, enabling anyone such as researchers, developers, and organizations—to use, modify, and distribute the code without any restrictions or licensing fees. DeepSeek's open-source approach allows broad access to its advanced AI models, enabling startups, researchers, and smaller companies to use sophisticated technology without the financial barriers imposed by proprietary models like OpenAI's GPT-4 or Google's Gemini.

Layer Name	Explanation
Infrastructure Layer	Provides the foundation for DeepSeek with powerful GPUs and scalable cloud computing. Ensuring with high availability, fault tolerance, optimized performance for deep learning techniques.

Nikhil Rajaram Mohite et al.,

User Interface Layer	It enables interaction with DeepSeek through web applications, APIs, and command-line tools. Offers responsive interfaces with visualization tools for monitoring model performance in real time.
Security and Compliance Layer	It implements robust measures for security, including authentication, encryption, access control. Ensures compliance with GDPR, HIPAA, and industry standards.
Monitoring and Feedback Layer	Tracks model performance, logs errors, and refines AI responses. Real-time dashboards provide insights into accuracy, efficiency, and system behavior.
Inference Layer	It executes trained models for real-world tasks with low latencies and scalable inferences. It supports cloud and edge AI deployments while dynamically adjusting models based on evolving data patterns.
Model Layer	The core intelligence of DeepSeek leverages advanced deep learning architectures like transformers. Continuously fine-tuned based on new datasets and user interactions to balance accuracy, speed, and efficiency.
Model Development and Deployment	Uses self-supervised learning and advanced neural architectures to train DeepSeek. Supports transfer learning for new domains and integrates seamlessly into production via APIs, cloud-native solutions, and edge AI. CI/CD pipelines ensure continuous updates and performance optimization.
Preprocessing Layer	Converts raw data into high-quality inputs through data cleaning, normalization, and augmentation. Reduces noise while retaining key patterns for better model accuracy and consistency.
Data Layer	Manages large-scale data storage, retrieval, and processing. Supports distributed data pipelines and integrates structured and unstructured data sources. Ensures robust security, governance.

Market impact

DeepSeek's Rapid Growth and Market Disruption

DeepSeek's unprecedented rise to the top of both the Google Play Store and Apple App Store within days of its launch has positioned it as a serious contender in the AI industry. Its success is largely attributed to its cost-efficient AI models, which directly challenge the high-cost approaches of leading Western AI companies like OpenAI, Google, and Meta. This disruption has sparked concerns about the long-term sustainability of expensive AI training methods.

Nvidia's Historic Market Loss

The impact of DeepSeek's innovation was most evident in the stock market, where Nvidia suffered a record-breaking \$589 billion loss in a single day, surpassing its previous record of \$279 billion in September 2024. This dramatic decline reduced Nvidia's valuation from \$3.5 trillion to \$2.9 trillion, pushing it behind Apple and Microsoft. The shockwaves extended beyond Nvidia, with other AI-related companies experiencing significant stock drops of at least 10%.

Nikhil Rajaram Mohite et al.,

Challenges to Nvidia's AI Market Dominance

A key reason behind this market reaction is DeepSeek's ability to train its large-language model at a fraction of the cost compared to U.S. competitors. Reports indicate that DeepSeek spent just \$5.6 million on Nvidia GPUs—significantly lower than the billions invested by U.S. AI firms. This has led analysts to speculate that if major tech companies adopt similar cost-efficient AI training strategies, it could severely impact the demand for Nvidia's high-priced GPUs.

DeepSeek's Competitive Edge

Beyond cost efficiency, DeepSeek-V3 has demonstrated that it can match the performance of leading AI chatbots from OpenAI and Google while utilizing far fewer computational resources. This breakthrough has raised fundamental questions about the viability of high-cost AI development strategies, forcing the industry to reconsider how AI models are trained, optimized, and deployed in the future.

Future Scope of DeepSeek

Future Scope	Description
Cost-Efficiency and Scalable AI	DeepSeek-V3's architecture focuses on optimizing large-scale AI training with minimal resource consumption. Future work will refine speculative decoding, multi-token prediction, and load balancing to enhance efficiency while maintaining high performance.
Advanced Reasoning and Logical Deduction	DeepSeek aims to strengthen Chain-of-Thought reasoning for improved logical consistency in AI responses. Enhancing model training for complex problem-solving will enable better decision-making and more interpretable outputs across diverse domains.
Multilingual and Cross-Domain Adaptability	Expanding DeepSeek-V3's linguistic capabilities beyond English and Chinese to improve cross-domain expertise. Future improvements will strengthen AI's understanding in multiple languages, enhancing global usability and bridging knowledge gaps.
Ethical AI and Regulatory Compliance	DeepSeek will focus on bias mitigation, data privacy, and AI transparency. Ensuring compliance with global standards will build trust, promote fairness, and align AI-driven decision-making with societal needs.

CONCLUSION

DeepSeek is revolutionizing the AI landscape with cutting-edge technology, pushing the boundaries of innovation for the future, and redefining industry norms with its cost-efficient, high-performance models. The rapid ascent of its app reaching the No. 1 spot on both the Apple and Google App Store demonstrates a growing demand for AI solutions that are both powerful and accessible. Beyond its commercial success, DeepSeek's disruptive approach to AI training has sent a shock through the market, leading to a record-break loss for Nvidia and raising fundamental questions about the future of AI development costs. Looking forward, DeepSeek's focus on scalability, multilingual adaptability positions it as a serious competitor in the AI race. Its balance efficiency, innovation, and ethical considerations will determine its long-term impact.

Fig. 2. Comparison of DeepSeek with Open AI

Nikhil Rajaram Mohite et al.,

Nikhil Rajaram Mohite et al.,

Fig.6. : DeepSeek vs ChatGPT vs Google Gemini rankings and Market loss of Nvidia.

Nikhil Rajaram Mohite *et al.*,**Advantages of DeepSeek AI:****1. Cost-Effective Development:**

Less Training Costs: DeepSeek reduces its training costs by utilizing inexpensive hardware and optimizing its training process, making AI more accessible.

2. Optimized for Efficiency:

Mixture-of-Experts Architecture(MoE): activating only the relevant parts of the model, DeepSeek maximizes computational efficiency, reducing unnecessary energy consumption.

3. Open-Source Philosophy:

DeepSeek's open-source approach offers collaboration and transparency, allowing global access to powerful AI models for innovation and development.

4. Adaptability to Smaller Devices:

DeepSeek AI models can be used on various devices, ensuring scalability from small-edge devices to large data centers with minimal infrastructure costs.

5. High Security:

DeepSeek ensures data security with advanced encryption, secure storage solutions and compliance with global privacy regulations like GDPR and CCPA, protecting user data from misuse

Problems and allegations with DeepSeek:**1. Cost Disruption:**

DeepSeek's R1 model was developed for less than \$6 million, significantly disrupting the high costs of AI technologies. This threatens the profitability of American companies by offering cheaper alternatives.

2. Geopolitical Concerns:

America's technological dominance, especially focus on geopolitical tensions between China and America. The shift in technological leadership raises national security concerns, with fears of a growing technological gap between U.S. and China.

3. Cybersecurity Vulnerabilities:

DeepSeek was hit by a large-scale cyberattack in January 2025, raising problems about the model's security. This attack highlights vulnerabilities in DeepSeek's infrastructure.

4. Generates Dangerous Content :

DeepSeek-R1 has been found to generate harmful and toxic content sometimes, including hate speech. The model is more likely to produce insecure and dangerous outputs.

5. Manipulation and Jailbreaking:

DeepSeek-R1 is highly vulnerable to being "jailbroken" or manipulated to create dangerous content. Jailbreaking could lead to its illegal and harmful activities.

ABSTRACT

Content-based image retrieval (CBIR) is becoming increasingly feasible due to the growth of the World Wide Web and the continuous advancement of computer technology. The CBIR algorithms create patterns from image databases for effective retrieval. The CBIR system allows users to submit queries, retrieve images with similar visual content, and search image databases. The computer can collect images identical to the query image from an extensive database to extract valuable features. However, retrieving relevant images from databases quickly and efficiently remains challenging. However, CBIR frequently requires more time and exhibits lower accuracy. To solve this problem, we present a model for content-based image retrieval using the Visual Geometry Group 16-Convolutional Neural Network (VGG16-CNN) technique to evaluate each image class's weight. The frequency of texture features in image processing using the Gabor filter technique and utilizing the Color Histogram Evaluation (CHE) method to improve the low-level histogram image features. Then, the optimal features can be selected by assessing the Grasshopper swarm with the Contour-Based Grasshopper Optimization (CBGO) algorithm. Lastly, by employing the VGG16-CNN technique, which relies on Deep Learning (DL) technique to determine the importance of each image class, the precision of these feature's accuracy can be enhanced. To analyze the performance metrics precision, recall, F1-Score, and accuracy can be utilized to improve the effectiveness of the proposed method using CNN, KNN, LBP, and RIV3-NET-EDBN.

Keywords: Content-Based Image Retrieval, Image Processing, Contour-Based Grasshopper Optimization, Deep Learning and VGG16-CNN.

INTRODUCTION

The growing use of digital image transformation in multimedia platforms, along with the rapid growth of extensive image databases, underscores the crucial role of CBIR systems in database management. Efficient image information capture and retrieval using various image features and metadata, including multiple tags, keywords, and image descriptions, is required for content-based search and analysis. As the volume and complexity of image data continue to grow, it has become crucial to enhance and refine CBIR techniques for effective and precise image retrieval and analysis in large databases [1]. Content in CBIR allows color, shape, texture, or other information to describe the image. CBIR analyses low-level visual characteristics like Color, and spatial arrangement from the query to identify similar features and organize the results. Image feature vectors can be employed in Machine Learning (ML) algorithms to enhance CBIR performance by training and testing models [2].

The CBIR must compare the activated features with the query image to determine their similarity and gather objective feature information from the images in the database. The images related to the query in CBIR systems are categorized based on their features, which include texture, color, and shape. Analyzing features extracted from individual classes to retrieve a content-oriented image is possible [3]. By using Gabor local correlations to extract texture features from color autocorrelation, it is possible to reveal the total local binary mode amplitudes and local image features. Singular value decomposition is a valuable approach for extracting global features and image feature analysis in image processing. The technique is important for a variety of applications in computer vision and image recognition, providing valuable insights into the underlying structures and patterns in image data.

Finding images visually similar to a user's query can be quite resource-intensive. Approaches that rely on annotations are inefficient due to language variations, while pixel-level matching is hindered by factors such as orientation, size, image capture style, angle, and storage method. Detecting similar images from unstructured visual data poses significant challenges due to the complexity and variability of the visual information. This process requires advanced methods and techniques to accurately compare, and match images based on their features [4]. However, developing an effective image retrieval system involves many complex challenges. To provide accurate and comprehensive results, search results during image retrieval may be inaccurate or ineffective for all users' needs [5]. CBIR is a crucial aspect of contemporary information retrieval systems. However, the accuracy of these searches can be impacted if the image description provided is incorrect or missing. As a result, users may face difficulty finding the images they require, leading to frustration and inefficiency during the retrieval process.

This paper presents an approach to utilizing Kaggle for feature selection from the Corel2K-Image dataset to retrieve content images. The texture features in image processing can be analyzed by applying Gabor filtering techniques. The content images can be recovered by optimizing low-level histogram image features using the CHE method. The CBGO algorithm is employed to evaluate the grasshopper swarm and determine the most optimal features. Additionally, the accuracy of these features is enhanced by assessing the significance of each image type through the VGG16-CNN method based on DL techniques. The fundamental architecture diagram for content-based image retrieval can enhance its accuracy through feature setting, optimizing low-level histogram images, selecting optimal image features, and improving retrieval time for various image types.

perspectives. Medical images can be retrieved based on color and texture using a CBIR system to analyze image features [8]. Preethy Byju *et. al.* However, searching and retrieving images collected from various user's datasets is complicated. The method can provide a coarser bandwidth resolution by decoding the approximate code blocks with the proposed system. An image query generated from frequency features can eliminate images similar to the query image based on coarse resolution similarity. However, substantial effort is required to address CBIR challenges in computationally intensive analysis [9].

As outlined by Angadi S A *et. al.* an efficient CBIR framework offers image query techniques leveraging pre-trained transfer learning via a proposed CNN approach. Furthermore, the classification method for image retrieval assesses utilizing distance metrics to facilitate parallel matching [10]. Ayesha Khan *et. al.* proposed a Directional Magnitude Local Hexadecimal Pattern (DMLHP) method to detect texture feature descriptors by extracting image textures based on direction and amplitude. DMLHP texture descriptors efficiently capture textual and semantic information of an image with the same visual content [11]. Hai N M *et. al.* designed Combining descriptors with the Alexnet CNN technique for analysis can develop an effective system for describing images using ML. The experimental results show that [12]. Wei S *et. al.* compares the proposed method with existing methods to improve accuracy and prove its superiority. The CBIR approach ensures key content with built-in support of two-stream CNN and sub-CNN techniques. Furthermore, it calculates its similarity by restoring the image of the CBIR approach by suppressing the irrelevant feature [13]. Kayhan N *et. al.* proposed the CBIR system based on weighted color and texture features. Moreover, the filter-based Gray Level Co-Occurrence Matrix (GLCM) method can be used for feature extraction. For feature extraction, the suggested approach can measure the color histogram. The GLCM method was employed to analyze texture feature descriptions, and second-order statistical parameters were computed for each distorted sub-image. The search results demonstrate superior accuracy compared to similar CBIR schemes [14].

Varish N *et. al.* proposes a three-stage hierarchical image retrieval scheme that employs color, texture, and shapes visual contents (or descriptors) to produce satisfactory retrieval results, as a single visual content is ineffective. Initially, the shape feature descriptor was computed by combining gradient histograms with the invariant moments of the planes of segmented images [15]. Kumar G V R M *et. al.* examined to forecast the latent spatial representation of images, they employ A Stacked Siamese Neural Network (SSiNN) model that has been specially trained, and conducting a detailed analysis of spatial representation for image retrieval poses challenges [16]. Similarly, Mohite N B *et. al.* designed the Deep CNN (DCNN) model for image retrieval based on DL techniques to extract deep features expressed from different layers using multiple hidden layers [17]. A retraining method for CBIR was proposed by TzelepiM *et. al.* which can be implemented in a more efficient convolutional layer. Additionally, Max Pooling utilizes the DCNN model to analyze feature representations from convolutional layer activations for image classification and retrieval [18]. Sezavar *et. al.* developed a robust method that combines CNN and sparse representation, utilizing spatial representation to extract deep features, which is proposed to improve search velocity and accuracy [19]. Kanaparthi S K *et. al.* developed the GLCM algorithm to analyses image texture features and compute the similarity and scale between two images with symmetrical patterns [20]. As shown in table 1, based on image retrieval, content-based machine learning technology can be used to estimate the defects obtained by previous analysis and their accuracy.

Table 2 presents a proposed analysis of the dataset-driven CBIR method's image retrieval and evaluation of performance metrics. Several image restoration techniques have been proposed to provide an assessment of the performance of CBIR systems. A hybrid CBIR system based on DL and ML is introduced by Sikandar S *et. al.* Two methods, ResNet 50 and VGG 16, based on pre-trained transfer learning models are implemented to retrieve the images [33]. Mamta Martolia *et. al.* designed the Local Binary Method (LBP) approach is commonly utilized in the literature to extract texture information. However, processing takes longer because all 8 bits are considered while determining the LBP method [34]. Sherje N proposed CBIR of continuous data features is still a difficult issue, nevertheless. Simulation outcomes utilizing the Retrieval-Based Inception V3-NET (RIV3-NET) technique for advanced image retrieval classify content images and analyze their parameters [35].

Shaik Abdulla and Abdul Razak

PROPOSED METHODOLOGY

The VGG16 CNN model implements content-based image retrieval, assessing the significance of each image category. It utilizes Kaggle-selected features from the Corel2K-Image dataset to acquire content images. They analyze texture features in image processing using Gabor filtering technique. It employ the CHE method to optimize low-level histogram image features and utilize the CBGO algorithm within the grasshopper swarm framework to select the best features. The accuracy of image features can be improved by estimating the weight of each image class with the VGG16-CNN method based on deep learning techniques. To enhance the performance of the proposed method by utilizing metrics like precision, recall, f1-score, and accuracy. Moreover, content images can be retrieved using Kaggle by selecting features from Corel2K-Image datasets. The best features can then be identified by estimating the grasshopper swarm using the CBGO method. Through the use of sophisticated algorithms and neural network models, the technique can be utilized to investigate the efficacy and accuracy of image retrieval systems.

Dataset Collection

Image datasets often contain multiple categories or classes. The accuracy of image features can be predicted in image retrieval systems using Corel 2K data collected from the dataset, such as the number and type of images. The Coral-2k dataset published on Kaggle contains a total of 1000 images of beaches, dinosaurs, flowers, buses, and ships. The testing results demonstrate that the CBIR system utilizing the Corel 2K dataset exceeds current methods in accuracy and speed. The accuracy of prediction is determined by assessing the effectiveness of the suggested model on randomly chosen images from a Coral 2K dataset.

Gabor Filter

The Gabor filter technique can be utilized to analyze the Gabor frequency of texture features in image processing. Gabor filtering can be achieved by analyzing specific frequencies in specific directions in local areas around an area of interest in an image. A Gabor filter can describe the local frequency signal by analyzing the energy at a specific frequency and direction of each wavelet. In addition, Gabor filters provide higher resolution in both time and frequency domains compared to Fourier transforms. The feature vector is determined by the eigenvector system, and its magnitude and direction are utilized in generating feature components, which can be calculated with Gabor wavelets.

The content image can be obtained by estimating a class of self-similar functions known as Gabor wavelets. Predictive filters analyze frequencies in local signal regions. Determine the frequency and standard deviation of the Gaussian envelope of the Gabor function as outlined in Equation 1. The Gabor wavelet image representation is an image transform within the same family of Gabor kernels. Let's assume i –Gabor, $i_{(a,b)}$ –Gabor filter generating function, $\sigma_a \sigma_b$ –standard deviation, u-frequency wavelet, c and o-total number of scale and orientation, a and b-function.

$$i_{(a,b)} = \frac{1}{2\pi\sigma_a\sigma_b} \exp\left(-\frac{1}{2}\left(\frac{a^2}{\sigma_a^2} + \frac{b^2}{\sigma_b^2}\right) + 2\pi hu^a\right) \quad \text{Eq. (1)}$$

$$i_{co}(a,b) = x^{-c} \cdot i(\tilde{a}, \tilde{b}) \quad \text{Eq. (2)}$$

Calculate the total number of integer readings and directions specifying the wave magnitude and direction as described in equations 3 and 4 the grayscale distribution of the image. Let's assume i_{co} –Gabor kernel, g-convolutional kernel, q and k- filter mask size of variable, i^{*co} –conjugate of the Gabor function, i_{co} and i_{co} –convolution result corresponding to the Gabor kernel, c-magnitudes in equation 5.

$$\tilde{a} = x^{-c}(a + b\sin_\theta) \quad \text{Eq. (3)}$$

$$\tilde{b} = x^{-c}(-a\sin_\theta + b\cos_\theta) \quad \text{Eq. (4)}$$

$$i_{co}(a,b) = \sum_q G(a-q, b-k) i^{*co}(q_k) \quad \text{Eq. (5)}$$

Gabor filters can be used to quantify the amount of energy in images of different sizes and orientations. A measure of the coefficient of variation of the mean and standard deviation is used to indicate the uniform structural properties of

Shaik Abdulla and Abdul Razak

the part. Equations 6 and 7 compute Gabor waves using an eigenvector system with the scales and orientations employed in the general performance. Let's assume μ_{co} –mean, σ_{co} –standard deviation, E_k –texture feature.

$$\frac{D(c,o)=\sum_a \sum_b |co(a,b)|}{R \times S} \quad \text{Eq. (6)}$$

$$\mu_{mn} = \frac{D(c,o)}{R \times S} \sigma_{co} = \frac{\sum_a \sum_b |I_{co}(a,b) + \mu_{co}|^2}{R \times S} \quad \text{Eq. (7)}$$

Gabor filters can identify particular frequencies in specific signal regions by computing various measurements and orientations. Moreover, using Gabor filters to assess the coefficient of variation for the average and standard deviation allows for the computation of energy extraction in content-based images, which can then retrieve the image based on its textural features.

Color Histogram Evaluation (CHE)

A CBIR system using a color histogram evaluation technique is utilized to optimize the features of low-level histogram images. The color sequence can be determined by selecting color features using the CHE technique to analyze the image's color space. The bits representing each component in the RGB pixel estimate with the selected features are used to generate a histogram. The number of pixels in the image that fall within this range can be stored by the value in each bin. These thresholds indicate different intensity levels for each RGB component. This CHE method of measuring skewness is computationally more efficient, especially when, in general, the mean and standard deviation can be evaluated. Skewness can be measured by typically estimating the mean and standard deviation using this CHE method. The skewness is positive when the histogram tails spread to the right and negative when the histogram tails spread to the left. The pixel values are dispersed at greater intensity levels after normalizing the values in each bin by dividing by the total number of pixels in the image, which enhances the CHE method accuracy.

Hue, Saturation, and Value in color space, or HSV for short, is a color space representation of white light used to show intensity values in images of continuous waves (like the dominant wavelength). Additionally, the values in color space range from 0 to 1, with 0 representing black and 1 representing white. Equations 8 to 10 demonstrate a method for estimating color using the HSV color space to determine the total number of different color in an image patch. RGB images can be easily converted to HSV color space. Let's assume H-hue, S-saturation, V-values in color space.

$$H = D_K \left(\cos \cos - 1 \frac{\frac{1}{2}[Q-I]+[S-Y]}{\sqrt{(S-I)^2 - I(P-Y)}} \right) \quad \text{Eq. (8)}$$

$$s = 1 - \left(\frac{3[\min(P,I,Y)]}{P+I+Y} \right) \quad \text{Eq. (9)}$$

$$v = \left(\frac{P+I+Y}{3} \right) \quad \text{Eq. (10)}$$

Probability distribution modelling of extreme levels can be used to analyze the statistically based properties of histogram features. These statistical properties, shown in Equation 11, are used to estimate the features of the image intensity level distribution. The brightness of an image can be estimated by calculating its overall average. If the image is bright, the average will be high, whereas a dark image will yield a low average. This can be achieved by summing up the pixel values along the rows and columns of the image. High-contrast images represent high contrast, and low-contrast images use standard deviation to represent the data distribution. Let's assume $R_{(i)}$ –histogram probability, $O(i)$ –number of pixels at gray level value, i-grey, c-number of the pixel in the image, L-total number of intensity, p-row, m-column, and g-image.

$$\{R_{(i)} = \frac{O(i)}{c} \underline{i} = \sum_{i=0}^{L-1} i^R(i) = \sum_p \sum_m \frac{g(p,m)}{c} \sigma_i = \sqrt{\sum_{i=0}^{L-1} (i - \underline{i})^2 R(i)} \quad \text{Eq. (11)}$$

The distribution's skewness can be assessed by estimating the mean concentration level of the curve, which can also be measured by determining the peak or maximum value through the mean, mode, and standard deviation.

Shaik Abdulla and Abdul Razak

Equations 12 and 13 present the effective mean and standard deviation for the system measuring skewness. Let's assume Q-skew, c-mode.

$$Q = \frac{1}{\sigma_i^3} \sum_{i=0}^{L-1} (i - \bar{I})^3 R(i) \quad \text{Eq. (12)}$$

$$Q = \frac{i - c}{\sigma_i} \quad \text{Eq. (13)}$$

As indicated in equations 14 and 15, a color histogram can be assessed using bits that encode the image data by distributing the intensity levels measured by energy. Moreover, the higher the energy, the fewer the number of intensity levels in the image, and they accumulate only in intensity cases. Where E_i –energy, E_o –Evaluate color histogram feature entropy, i –histogram gray level.

$$E_i = \sum_{i=0}^{L-1} [R(i)]^2 \quad \text{Eq. (14)}$$

$$E_o(I) = - \sum_{i=0}^{L-1} R(i)[R(i)] \quad \text{Eq. (15)}$$

Color histogram assessment can be enhanced by condensing the pixel values of the content image's rows and columns. As pixel values in an image become more densely distributed, entropy increases. Higher entropy in content images can enhance the estimation of color histograms with scaling energy.

Contour-Based Grasshopper Optimization (CBGO)

The contour-based grasshopper optimization algorithm is used to retrieve the image by selecting features and analyzing the grasshopper swarm. The CBGO algorithm is employed for smoothing corner edge curves and areas with significant curvature, while determining the overall contour shape based on higher frequency Fourier transform and lower frequency estimates simultaneously. The Fourier coefficients are used to reconstruct the structural details of the content image edges using the inverse Fourier transform, which can be used to recover the image by analyzing the smooth edges. By utilizing the CBGO algorithm to mimic a grasshopper swarm, each locust calculates a specific distance from other locusts. The grasshopper's position symbolizes social interaction and the impact of the wind. The CBGO algorithm enables the examination of unit vectors that depict the distance function between locusts and the social force. Moreover, the optimization issue can be efficiently resolved using the CBGO model tailored for grasshopper movement. The number of iterations can be enhanced by constraining the application through the selection of upper and lower bounds and target locations within the dimension.

Algorithm 1. CBGO

Input Evaluate the color histogram feature E_o

Output Best feature solution Z

Start

Step-1. Estimate the population of grasshoppers $U_a = E_o(a = 1, 2, 3, \dots, h)$

Step-2. Calculate the maximum number of iterations currently generated

Step-3. Compute the fitness function for the grasshopper solution at each search

Step-4. Evaluate the best search grasshoppers $\leftarrow z$

Step-5. For each maximum number of iterations $\leftarrow w_a$

Update the maximum and minimum number of values for the largest generation.

$$E = E_{max} - w \frac{E_{max} - E_{min}}{w} \quad \text{Eq. (16)}$$

For each search grasshopper $\leftarrow (U_a)$

Estimate the distance between the grasshoppers

Update current search grasshopper position

$$U_a^f = e \left(\sum_{b=1}^H e^{\frac{xj_f - aj_f}{2}} q(|U_b^f - U_a^f|) \frac{U_b - U_a}{f_{ab}} \right) + \widehat{Z}_f \quad \text{Eq. (17)}$$

Evaluate the current search outside the grasshopper boundaries

End for each

Step-6. Update best feature solutions $\leftarrow z$

Shaik Abdulla and Abdul Razak

End While

Return z

End

In algorithm 1, the CBGO algorithm initiates the optimization process by creating a population and updating the current best target position. Let's assume U_a –position of the grasshopper, a- grasshopper, W-largest number of iteration, a-current generation, E_{max}, E_{min} –maximum and minimum value, w_a – largest number of grasshopper, f- solution, $x_{j_f} - a_{j_f}$ –upper and lower bound, $\hat{z}_f$ –target feature solution, e-coefficient convenience region, a and b-value, f_{ab} –distance value.

The flowchart of the CBGO algorithm-based feature selection is depicted in figure 1. The edge-based grasshopper optimization algorithm enhances content optimization by analysing grasshopper clusters and selecting features for image retrieval. This algorithm optimizes the iteration count by setting upper and lower bounds on dimension and target location, thereby enhancing output quality. This method improves control over the optimization process by updating the best feature solutions to ensure a more accurate retrieval process.

Visual Geometry Group 16-Convolutional Neural Network (VGG16-CNN)

The image can be analyzed using the VGG16-CNN model to determine the weight of each image class. The VGG16 model achieves high accuracy through feature vectors for image recovery in feature fusion. Memory requirements in training can be scaled by implementing the VGG16-CNN model's input layer with selected dimensions at the image input level within the layer. By analyzing zero values on the negative axis, the ReLU layer activation function can help the network run faster by setting negative input values to zero. Convolution filters in the VGG16-CNN model slide over images during the convolution process. Linear filters are employed in the convolution process to generate feature maps in the convolutional layer. Block normalization involves analysing the input by dividing the input mean by the standard deviation of the current set. The VGG16-CNN model can measure the similarity between images in the training dataset and each image category. It uses Euclidean distance to evaluate image similarity and find the closest set of query images in the image database. By ranking the features of the query image and the distance to each retrieved image, the VGG16-CNN model can estimate the image classifier weights. As the class probability of the query image increases, the weight of the content image also increases. The content image weights are determined using a CNN model for image retrieval, and the distances between the query images and the training classes can be evaluated.

Algorithm 2. VGG16-CNN

Input Best feature solution T

Output Analyze the weight class distance $m(p)$

Start

Step-1. Calculate the zero value of negative input values

$$f_x = M\{0, a < 0a, a \geq 0 \quad \text{Eq. (18)}$$

Step-2. Evaluate a set of linear filters with a curve function

$$(N_d)g_h = (u_d * P)_{gh} + Y_{gh} \quad \text{Eq. (19)}$$

Step-3. Calculate the normalized values and average across hidden neurons.

$$\hat{a}^t = a^t - E(a^t) / \sqrt{z(a^t)} \quad \text{Eq. (20)}$$

$$b^{(t)} = \gamma^t X^t + \beta^t \quad \text{Eq. (21)}$$

Step-4. Calculate the Euclidean distance function and the cosine-like distance function

$$F(a,b) = \sqrt{\sum_{g=1}^f (d_a^g - d_b^g)^2}$$

$$K_{mf}(G,g) = \frac{1}{L} \sum_{h=1}^L F(G,h) OY_{oo}(S,T) = \{P \subseteq F_P, |P| = T \wedge \forall a \in P, b \in F_P - P : F(S,a) \leq F(S,b)\} S_{mf}(S,p) = \frac{1}{2} \left(F(p,s) + \frac{1}{T} \sum_{a \in oT_{oo}(s,T)} D(r,x) \right)$$

Eq. (22)

Step-5. Calculates the weight of each search image.

$$y_c = \frac{e^{x_c}}{\sum_{i=1}^c e^{x_i}} \text{ for } c = 1, \dots, C \quad \text{Eq. (23)}$$

Shaik Abdulla and Abdul Razak

$$[R(k = m|a) : R(k = m|a)] = \frac{1}{\sum_{g=1}^m E^{ag}} [E^{a_1} : E^{a_m}] \quad \text{Eq. (24)}$$

Step-6. Calculate the query class distance from the weighted image for each class.

$$u_s^m = \frac{\min(K_{mf}(s,g))}{(T_{CD}(q,c))} \times R(K=m|a) \quad \text{Eq. (25)}$$

$$u_s^{mh}(s,p) = (1 - u_s^m + 0.0001) \times P_{mf}(S,p)$$

Step-7. The content image can be estimated by calculating the distance between classes.

$$m(p) = m \frac{\min_{g \in [1,m]} (K_{mf}(S,g))}{\quad} \quad \text{Eq. (26)}$$

Return $m(p)$

End

The VGG16-CNN model estimates the distance between images and training classes, predicts each image class in the dataset, and provides distance prediction accuracy. The VGG16-CNN model can analyze image classifier weights by ranking the distance between the query image and the features of each retrieval image. Let's assume d-activation function a-input, d-feature map index, g and h-pixel point, y-bias, u-weight, P-input data, N-output, $(N_d)g_h$ –feature map output value, a^t –normalized value, T-hidden neuron, $E(a^t)$ –dimension average, t-hidden unit, Z-variable, γ and β –two learnable variable, a and b- two image, d_a, d_b –two feature image, F-distance, f-length of feature, g and h-image, $F(G,h)$ –distance between images, L-nearest list of images, K_{mf} – Training-Class Distance, S_{mf} –query class distance, S-query, F_p –database retrieval, O-databased image retrieval, p-retrieved image, M-dimensional vector, b-real value, K-probability class, $R(k = m|a)$ –and probability input class, u_s^m –weight query classes, W_s^{mf} –weighted image distance for the query category, m(p)-class retrieval.

RESULT AND DISCUSSION

The VGG16-CNN method can be assessed using a coral image database and analyzed extensively through image processing and CBIR. A total of 1000 image classifiers can then be trained and tested on this database to assess their accuracy, with categories including ships, parachutes, and signboards. Utilizing the VGG16-CNN method in the CBIR system can enhance accuracy by providing optimal features for image classification. Additionally, comparison methods can be employed to evaluate previous techniques like CNN, KNN, LBP, and RIV3-NET-EDBN for retrieving content images from the coral2K database. Moreover, the accuracy of the VGG16-CNN method can be enhanced by evaluating performance metrics such as precision, recall, F1-Score, and accuracy.

Table 3 outlines the process of generating images from the coral image database by utilizing simulation parameters to enhance the accuracy of the VGG16-CNN method. Content images can be accessed from a Jupyter Notebook utilizing the Python language and assessing the simulation parameters as follows.

Equation 27 defines precision as the probability of true positives, which refers to correctly identified real positives. The formula for precision is presented as:

$$\text{Precision (PRE)} = \frac{\text{True Positive}}{(\text{True Positive} + \text{False Positive})} \quad \text{Eq. (27)}$$

Recall is defined as the ratio of Real Positives which are correct Predicted Positive given by equation 28.

$$\text{Recall (REC)} = \frac{\text{True Positive}}{(\text{True Positive} + \text{False Negative})} \quad \text{Eq. (28)}$$

The equation 29 provides the formula for calculating the F1-Score, a measure used in classification tasks to evaluate a model's performance.

$$\text{F1-Score} = 2 * \frac{\text{Precision} * \text{Recall}}{\text{Precision} + \text{Recall}} \quad \text{Eq. (29)}$$

$$\text{Accuracy} = \frac{\text{True Positive} + \text{True Negative}}{\text{True Positive} + \text{True Negative} + \text{False Positive} + \text{False Negative}} \quad \text{Eq. (30)}$$

The equation 30 calculates the proportion of correctly predicted observations (both true positives and true negatives) out of the total number of observations. Accuracy is a common metric used to evaluate the overall performance of a classification model.

Shaik Abdulla and Abdul Razak

Table 4 indicates that the image retrieval accuracy can be improved by comparing CNN, KNN, LBP, and RIV3-NET-EDBN methods with the proposed VGG16-CNN method to achieve the test and validation accuracy. Additionally, Ship-90.9%, Parachute-91.10%, and Sign board-93.5% improved on the test and training datasets. Figure 2 illustrates the proposed VGG16-CNN method for CBIR, which analyses image weights precisely. Performance evaluation of Precision shows accuracy rates of CNN, KNN, LBP and RIV3-NET-EDBN compared to proposed method. Comparatively, the proposed VGG16-CNN method enhances precision in CBIR compared to existing methods.

In figure 3, the VGG16-CNN method for CBIR is proposed, which uses image weights analyzed by recall. Performance evaluation shows that has CNN 89.1% has accuracy, KNN has 89.5% accuracy, LBP has 86.3% accuracy, and RIV3-NET-EDBN has 90.9% accuracy when compared to the previous methods. The VGG16-CNN method significantly improves the accuracy of CBIR, achieving an accuracy improvement of 92.1% compared to existing methods. As depicted in figure 4, the VGG16-CNN approach for CBIR is presented, utilizing image weights analyzed during image retrieval. The F1-Score in performance assessment indicates CNN with 0.388%, KNN with 0.488%, LBP-0.496%, and RIV3-NET-EDBN with 0.532% accuracy compared to prior techniques. The VGG16-CNN method significantly enhances the accuracy of CBIR with 0.548% in contrast to methods documented in existing methods.

Figure 5 illustrates that the proposed VGG16-CNN approach for CBIR can assess image weights through classification accuracy analysis. The performance metrics indicate that CNN achieved 72.9%, KNN achieved 75.36%, LBP achieved 79.4% and RTIV3-NET-EDBN achieved 89.8% using existing techniques. Moreover, when compared to existing methods, the VGG16-CNN approach enhances classification accuracy in content-based image retrieval by up to 93.5% in signboard images. The query image produced by the suggested method utilizing photos from the database and segmentation from the Coral 2K database is shown in Figure 6. Furthermore, content based image accuracy of ship images can be predicted from recovered images.

CONCLUSION

The proposed method presents a new approach to content-based image retrieval by querying various image features. The CBIR and various existing methods can obtain images such as texture features, color histogram estimation, edge detection, and classification of retrieval images. The image processing can be conducted using Kaggle data set to select features and extract content images from the Corel2K-Image dataset. The texture features can be analysed in image processing by utilizing Gabor filtering techniques. The content image can be effectively achieved through the CHE method to enhance the low-level histogram image features. The CBGO algorithm plays a crucial role in estimating grasshopper swarms and identifying the optimal features for image processing. Similarly, the accuracy of these features can be enhanced by assessing the significance of each image category using the VGG16-CNN method based on DL techniques. The integration of the Kaggle dataset, Gabor filtering, CHE method, CBGO algorithm, and VGG16-CNN method forms a comprehensive approach to enhance image feature selection and the overall quality of image processing algorithms. Similarly, the VGG16-CNN method significantly improved the accuracy of content-based image retrieval, achieving a remarkable improvement of 93.5% compared to the existing methods.

ABSTRACT

Multiagent-based middleware has emerged as a key technology in the field of distributed systems, gaining considerable attention in recent years. This paper provides an overview of multiagent-based middleware, surveys different types of middleware, explores its applications, and discusses future directions for development. Multiagent-based middleware plays a vital role in helping small and medium-sized enterprises (SMEs) efficiently utilize their information spaces, facilitating communication between various technologies responsible for multiagent systems. JADE, an open-source platform, is a notable example of such middleware. It standardizes multiagent system development and promotes interoperability. The key features of multiagent-based middleware include autonomy, proactivity, social capabilities, and semantic abstraction. However, challenges like extensibility, operation management, and interoperability remain. Multiagent-based middleware finds applications in diverse domains, such as healthcare, emergency management, and smart homes, where it aids in decision support, coordination, and real-time response. It contributes to the development of intelligent agents and promotes interoperable and scalable technology network architecture. Despite its benefits, multiagent-based middleware faces limitations in addressing the heterogeneity of Machine-to-Machine (M2M) systems and lacks support for semantic and syntactical interoperability. Future developments are needed to overcome these challenges and explore emerging trends, such as the growth of M2M devices, to shape the technology's future.

Keywords: Multiagent , Machine-to-Machine , JADE

INTRODUCTION

Multi-agent based middleware is a type of technology that can help small and medium-sized enterprises (SMEs) to better utilize their information spaces. It is based on the European project[1]. This type of middleware provides semantically-enabled information for SMEs' knowledge workers by enabling communication between different technologies responsible for multiagent systems and simulation, visualization, and analysis of agent behavior [1][2]. The essay provides further information on how multi-agent based middleware can help SMEs knowledge workers by facilitating the visualization of emergent agent behavior and the entity agent [1][2]. JADE is an open-source platform that has been used by many languages as a distribution infrastructure, such as Jason and JaCaMo. It provides a task execution and composition model, peer-to-peer agent communication, and a yellow page service for publish and subscribe discovery mechanism. JADE-based systems can be distributed across machines with different operating systems [3]. In summary, multiagent-based middleware is a technology that is essential for the development of multiagent systems and helps SMEs utilize their information spaces more efficiently.

Primary functions of multiagent based middleware

Multi-agent systems (MAS) engineers have identified distributed middleware, such as RMI and CORBA, as the fundamental platform for developing multi-agent systems [4]. However, common middleware services such as security and persistency are only minimally considered in multi-agent systems. Instead, domain-specific middleware services are typically developed separately and are difficult to integrate with other services [4]. Multiagent based middleware helps to standardize MAS development and implement common standards such as FIPA and OMG MASIF standards through frameworks like JADE [5]. Middleware also provides a first-class design abstraction for multi-agent systems, offering means to govern agent coordination and resource access [5]. By utilizing multiagent based middleware, developers can streamline the development of MAS and create a standardized approach to multi-agent system development. For instance, JADE has already been utilized by many languages as a distribution infrastructure, including Jason and JaCaMo, which demonstrates the versatility and effectiveness of multiagent based middleware in MAS development [5].

Key features of multiagent based middleware

Multiagent based middleware is a necessary component for the development of scalable and semantic-oriented applications. It uses agents to proxy specific functions or devices, which cooperate with each other to gather data and update the system [6]. The middleware has autonomous, proactive, and social capabilities, performing main functionalities for service creation and enablement for M2M data and devices [6]. Agents are designed to be event-driven and maintain a tuple space for resource discovery [6]. However, extensibility and operation management can be challenging due to low resource abstraction [6]. ActorNet improves interoperability in multitasking execution in resource-constrained Wireless Sensor Network (WSN) applications [6]. The middleware provides semantic abstraction and connections with devices and/or accessing M2M data, but lacks support for semantic and syntactical interoperability [6]. Semantically-organized service descriptions can improve the efficiency of querying and locating services [6]. The proposed middleware is agent-based and service-oriented, providing a semantic service representation model [6]. To enhance the specification of semantic services in a decentralized M2M environment, the middleware uses semantic annotation in sensed data. It also has an efficient semantic service discovery and matching approach for the service combination process, with a theoretical analysis of service composition in terms of its dependency with service discovery [6]. The multiagent based middleware consists of Management Agent (MA) and Service Agent (SA), with each MA in charge of a service domain composed of several tightly coupled entities. The SA is responsible for maintaining the proxy service, complete registration of the service, and publishing the service to the management agent. M2M entities are abstracted into different service agents, with each SA representing and maintaining an entity's services in a specific service domain [6]. Existing middlewares lack support for semantic service enablement and resource constraint, and most existing work on middlewares are WSN-centric and limited in scale to thousands. Furthermore, predefined and deterministic composition mechanisms of existing middlewares are

**Dhanasekar and Sujith**

not scalable in dynamic M2M applications [6]. Therefore, there is a need for a standard ontology design principle for scalable, complex, and dynamic M2M environments [6]. This section of this paper introduced the concept of multiagent based middleware, its primary functions, and key features. The second section will provide a survey of the different types of multiagent based middleware available, their strengths and weaknesses, and key differences. The third section will examine the various areas where multiagent based middleware is being used, how it is being used, and its benefits. The final section will discuss the current limitations of multiagent based middleware, potential solutions to these limitations, and emerging trends that may shape its future development. Overall, this paper aims to contribute to a better understanding of multiagent based middleware and its potential applications.

Survey of Existing Multiagent Based Middleware

Multiagent-based middleware is a type of middleware that enables communication between two or more autonomous agents. However, the resource constraints of modern devices make it difficult for these middlewares to support complex applications [6]. Therefore, most multiagent-based middleware caters to Wireless Sensor Networks (WSNs) and lightweight mobile devices [6]. ActorNet is a multiagent-based middleware that is specifically designed for multitasking execution in resource-constrained WSN applications [6]. Similarly, Agilla provides self-adaptive mobile agents to proxy sensors within WSNs and is event-driven [6]. However, these middlewares lack support for semantic and syntactical interoperability and extensibility and operation management is also a challenge due to the low level of resource abstraction [6]. Ubiware and TinyMAPS are two similar middlewares that adopt the characteristics of autonomous, proactive, and social capabilities of multi-agents, in distributed service scheduling and management [6]. Additionally, agent-based semantic middleware layers perform the main functionalities for service creation and enablement for M2M data and devices. This approach retains the semantic benefits of previous approaches and has been extended from the previous multi-agent platform design [6]. However, there is no specific information provided about different types of multiagent-based middleware [6].

Strengths and weaknesses of each type of multiagent based middleware

When it comes to multi-agent based middleware, there are different types, each with its own strengths and weaknesses. One weakness of middleware without scheduling is that there is a positive standard deviation between average speeds. This can lead to unpredictable performance and slower execution times, which can be detrimental to certain applications. On the other hand, middleware with scheduling has the strength of having a zero standard deviation between average speeds. This means that the performance is more consistent and predictable, which is beneficial for applications that require reliable and timely execution[11]. It is important to carefully consider the specific needs of an application when choosing between different types of multi-agent based middleware in order to maximize performance and efficiency. Furthermore, it is worth noting that JADE has been widely used as a distribution infrastructure for various languages, such as Jason and JaCaMo, indicating its usefulness and versatility in the field.

Differences between multiagent based middleware

The text mentions the existence of different types of multiagent based middleware, but does not provide direct comparison between them. Instead, the focus is on the middleware's implementation for a specific simulation scenario. The middleware requires parameters that are defined in an XML file, which specifies the parameters for each simulation involved [7]. The local simulation corrects the Move function, while the regional simulation corrects the Demand and Assign functions [7]. Additionally, the middleware applies the M-DA Algorithm (Algorithm 3) to address the challenges of multi-agent coordination in the simulation scenario at hand [7]. Therefore, while there are no key differences mentioned between different types of multiagent based middleware, this text provides insight into how a specific middleware was implemented to address the challenges of a particular simulation scenario.

Applications of Multiagent Based Middleware

Multiagent based middleware is being utilized in diverse application domains. One of the primary use cases is for the development of agent-based applications, where it is used to implement the agents' lifecycle and management logic [8]. Additionally, multiagent based middleware provides administrative tools for deploying, monitoring, and

**Dhanasekar and Sujith**

debugging multiagent systems. This is crucial for ensuring the proper functioning of the agents and the system as a whole [8]. Multiagent systems (MAS) are applied to a wide range of problems such as planning and scheduling systems, real-time control, robotics, and industrial fields [8]. Multiagent based middleware is also being used in the thematic areas of data-driven artificial intelligence, cloud-enabled artificial intelligence, cloud datacenters, multi-agent negotiation and collaboration, big data, AI-based cloud computing, and intelligent agents. Furthermore, there have been software developments in different MAS related fields ranging from declarative and imperative languages, integrated development environments to agent platforms and frameworks [8]. Another application domain where multiagent based middleware is being used is for systems that require short response-time, although there may be other application domains not covered by the text [8]. Multiagent-based middleware is a crucial component of various areas, including wireless sensor networks (WSNs), resource-constrained devices and M2M environments. However, some middlewares tend to overlook the heterogeneity of M2M and have limited support for semantic and syntactical interoperability and complex applications in resource-rich devices [6]. ActorNet is a middleware that aims to enhance interoperability in multitasking execution in resource-constrained WSN applications [6]. Extensibility and operation management can be challenging due to the low level of resource abstraction, but multi-agent based semantic middleware can perform main functionalities for service creation and enablement for M2M data and devices [6]. The multi-agent middleware has adopted the characteristics of autonomous, proactive, and social capabilities in distributed service scheduling and management, which can help solve the heterogeneity and diversity problem of different smart devices [6][9]. The SA is responsible for maintaining the proxy service, registering the service and publishing the service to the management agent. On the other hand, the MA manages the service agents and requests service scheduling while selecting the best service or a combination of services [6]. Each management agent maintains a table to record the combinational service list. Multi-agent based middleware is involved in managing service agents and service execution in different service domains such as hundreds of sensors or e-health equipment in a local area [6]. This approach enables each agent in the smart home system to communicate and work with each other, precisely responding to family life scenes. The multi-agent middleware is essential in solving the collaborative control problem of heterogeneous smart devices in the IAPhone platform, which has shown significant adaptability and advantages in connection of heterogeneous devices, collaborative control, human-computer interaction, and user self-management [9]. Additionally, multi-agent-based middleware is used to support the notion of time, which is the most important and complex feature of the proposal [2]. Finally, multi-agent-based middleware is used for designing and developing a middleware to communicate the current technology in charge of the development of the MAS and the technology in charge of the simulation, visualization and analysis of the behavior of the agents [2].

Benefits of using multiagent based middleware

The healthcare industry has become increasingly complex, with a need for efficient ways to manage and coordinate medical services. Agent-based systems have proven to be a suitable integration and coordination solution in the healthcare domain [10]. In fact, agent-based approaches have been applied to various medical fields, including data retrieval and processing, decision support systems, planning and resource management, patient monitoring, and system integration [10]. Multiagent based middleware can support interoperable and scalable technology network architecture [10]. For instance, an EHR agent acting as middleware can retrieve and update patient medical records in a distributed manner [10]. Additionally, multi-agent based middleware can be used for coordinating ambulances and assigning services to them, as well as retrieving, analyzing and selecting required information for healthcare providers [10]. In emergency situations, agent-based healthcare systems are able to actively seek information and deliver the right service to patients [10]. The use of agents allows for the distribution of knowledge to occur among geographically different locations, without compromising on the part of knowledge needed to solve the problem [10]. Multiagent systems are useful in health environments where different heterogeneous components are interacting [10]. They are also widely used in modeling, designing and development of healthcare systems, providing healthcare services for rural regions in emergency cases [10]. Multiagent based middleware can be used in emergency or disaster management [10]. However, there is limited research on the use of multi-agent systems for prehospital emergency services in rural areas [10]. Multiagent systems are also useful in chronic disease care and predicting future situations for old people monitoring [10]. Multiagent based middleware provides coordination features for
