ABSTRACT

The house sparrow (*Passer domesticus*), which used to be found nearly everywhere, is now endangered in urban and rural India due to a number of challenges faced in the ecosystem. Interspecific competition from both resident and migratory avian species is one understudied but more important factor. The emphasis of this study lies on the competition dynamics faced by house sparrows in Saran Division of Bihar which includes Chapra, Siwan and Gopalganj districts. Direct field observations, citizen science data and structured interviews were the methods used to show how the increase of avian diversity, urban expansion, food scarcity and nesting sites competition combined together resulted in the spatial redistribution and decline of sparrow populations. Common Myna (*Acridotheres tristis)*,Rose ringed Parakeet (*Psittacula krameri*), Rock Pigeon and migratory Warblers and Buntings are some aggressive competitor avian species that affect local niche occupancy patterns. The paper underscores the importance of localized preservation measures and strategies that take into account interspecific dynamics besides anthropogenic factors.

Keywords: Interspecific competition, *Passer domesticus*, Conservation, Gangetic Plains, Bihar, Synanthropic birds.

INTRODUCTION

Since the dawn of human civilization, the house sparrow (*Passer domesticus*), a tiny passerine bird native to Eurasia has cohabited with humans. But sadly, this bird has seen a declining trend in its population over a past few decades in many parts of India and Bihar is not exception to that (Sharma and Mishra, 2021; Bhattacharya *et al*.,2011). The bird has suffered catastrophic global declines (60-80% in urban centres since 1990) with India reporting particularly severe losses (Anderson, 2006; Singh *et al*., 2020). Amongst the obvious reasons of this decrease like food shortage, habitat

loss, and pollution, interspecific competition has emerged as a significant but unexplored factor contributing to their loss(Choudhary *et al*; 2015). Competition from aggressive avian species remains critically understudied in South Asia (Mohanty *et al*.,2018). The districts of Chapra, Siwan and Gopalganj collectively under Saran Division feature combination of rural agriculture based zones and urbanizing towns. Such a unique ecological mix is regularly visited by a variety of migratory avian fauna. The proximity of the area to wetlands and riverine system encourage frequent visits of the birds causing seasonal influx of avian competitors (Ali and Ripley,1983; Wetlands and International,2020). Several research studies report that dependence on human habitation makes house sparrows susceptible to alterations in nesting areas and food resources (Summer-Smith, 2023). Some avian species like Common Myna, House Crow (*Corvus splendens*) are more aggressive and competent in securing nesting sites and food materials than house sparrows (Goyal and Mehta, 2010). While Parakeets and Warblers cause small insects and seeds less available to sparrows thus indirectly affecting sparrows by reducing food sources (Kumar and Singh, 2017). As far as the Indian environment is concerned, it is observed that as urbanisation increases sparrow abundance decreases demonstration inverse relation between the two variables (Bhattacharya *et al*.,2011). According to Rao and Murali (2012) increasing dominance of more adaptable and aggressive avian species is one important amongst the culprits of sparrow decline Delhi and Bengaluru. Regional factors should also be understood as they may be important factors behind the loss as suggested by studies. In north parts of Bihar, the migratory influx of birds alters local avian food chains especially during the months of winter affecting residential birds like sparrows (Mukherjee *et al*.,2020). The mechanism of competition in avian ecology operates through exploitative competition that leads to resource depletion in the form of food and nesting sites (Dhondt,2011); interference competition causing direct aggression or eviction (Shochat *et al*.,2010) and apparent competition that involves shared predators(Holdt,1977) causing granivorous and cavity nesting birds like sparrows face disproportionate pressure (Macarthur,1958). In the Indian context, key competitor species of birds like Common Myna employs nest eviction type of competition as evident in 74% nest failure in Delhi (Sandhu, 2004); Rose ringed Parakeet showing cavity domination competition strategy and occupying 89% of urban nest sites (Menon, 2020); Migratory Buntings competing with local birds by depleting winter food cause 50% grain resource reduction (Datta, 2022) and Eurasian Tree Sparrow by niche overlapping cause rural displacement (Zhang,2013). Competition gets intensified in urban environments where habitats often homogenize ,in spite of the fact coexistence demands niche differentiation according to Mac Arthur's (1918) Niche Theory (Mac Leod *et al*.,2006).

This is evident from the example of Europe where due to reduced nesting cavities and fragmented green spaces competition heightened amongst sparrows in cities (Summer-Smith,1988). In the same way due to niche overlap with aggressive finches and starlings in North America, House Sparrows decline (Cabe ,1993). Grain eating birds give direct competition to sparrows for seeds and grains like House Finches (*Haemorhous mexicanus*) and Eurasian Collared Doves (*Streptopelia decaocto*). With larger body size House Finches aggressively displaced House Sparrows at feeders as reported by Anderson (2006). For feeding on cereal crops sparrows and buntings compete causing resource depletion especially in winters driving sparrow mortality (Robinson *et al*., 2005). Opposite to this, a behavioural adaptation is seen when sparrows alter foraging strategies when competitors are present by feeding in human generated wastes, thus decreasing competitive pressure although not eliminating (Gonzalez-Solis *et al*.,2011). Sparrows nest sites are aggressively usurped by cavity – nesting species such as European Starlings (*Sturnus vulgaris*) and House Martins (*Delichon urbicum*). By monopolizing crevices and eaves in buildings starlings reduce House Sparrow reproductive success (Jones *et al*.,1997). A similar example of Asia where invasive common Myna (*Acridotheres tristis*) evict sparrows from nest boxes as documented by Sandhu and Sandhu (2004). As noticed by Moller (1994), Sparrows are forced into suboptimal sites by Barn Swallows (*Hirundo rustics*), a noncavity nester, that compete for sheltered anthropogenic structures. Displacement of sparrows from urban nest sites by key competitor species can be seen by case studies of North America in 1890s when starlings introduced into the area become major competitor of sparrows (Kessel, 1957). Koening (2003) attributed 30% of sparrows nest failure in New York to starling interference. Hill (1993) documented that House Finches, native to Western North America, expanded eastwards in the 20th century threatening sparrow survival by overlapping with them in both diet and habitat. Also localized sparrow declines have been connected to the dominance of House Finches in feeder interaction (Belhoff and Gauthreaux, 1991). Interspecific competition between Tree Sparrows and House Sparrows in Asia restricts House

Sparrows expansion into rural regions to some extent (Zhang *et al*.,2013). Resources get concentrated by urbanization that in turn amplifies interspecific competition among birds. In Europe increased density of starlings and reduction in green space can be attributed to about 60% sparrow decline between 1980s and 2000 (Chamberlain *et al*.,2009). In agricultural setting, sparrows are forced to compete more aggressively with Rock Pigeon (*Columba livia*) for scattered grains when traditional grain storage is replaced by sealed silos (Da Laet and Summers-Smith, 2007). Bihar's Saran Division represents a unique agro-urban mosaic in Gangetic plain, with Chapra an urban center having more building density; Siwan , an intensive agricultural region and Gopalganj, a peri urban transitional zone. According to Kumar (2021), the region of Bihar witnessed a 47% decline in sparrow population since 2010, yet interspecific avifaunal interaction remain unexplored. Amongst 45 migratory winter visitor bird species (Shamshad, Kumari, 2023), which ones are out competing House Sparrows are still unquantified. This study addresses spatial variation in competitor density across habitats and relative impact of residential and migratory bird species and provides conservation solutions.

MATERIALS AND METHODS

The research was done across key urban, semi urban, and rural zones of the districts of Chapra, Siwan and Gopalganj. We employed three simple field techniques over 60 sites (20 per district chosen as residential colonies, marketplaces, agricultural fields, river banks, railway stations where sparrows were historically abundant. The observation was carried out over a 12 months period covering both migratory and non-migratory seasons. Early morning (6-9 AM) surveys were conducted to record bird activity. The methods of point count (bird counting surveys), nest monitoring and resource competition experiments were used in the study. For mapping bird neighbourhoods we recorded all birds seen or heard within 40m by standing quietly at fixed points for 15 minutes in the morning and late afternoon (Bibby *et al*., 2000). Except the time of monsoon, monthly surveys from June 2023 to June 2024 were done for 12 months. The tools and devices used were binoculars, field notebook, G.P.S enabled phone application, density maps of sparrows and competitors. Active nests were located in buildings, trees, crevices etc. After every 3 days targeted places were visited to record egg or chicks present, competitor interactions and final outcome in the form of success and failure. Mirror poles were used for locating high nests. To assess resource competition, seed trays were placed in markets, farmlands, residential colonies, and other chosen places. The visitor species and their aggression are recorded as well as leftover seeds were weighed hourly. The nest box trials were done by installing 30 boxes, of them 15 were having small entrances (4 cm: Myna- proof) and 15 with large entrances (6cm standard). Analysis of the data collected were done using free software tools like Me recorder and QGIS. The correlation tests were employed to know whether competitor number predicts sparrow number; chi-square tests used to quantify nest failures linked to competition and GIS used to know the factors that best explain sparrow distribution.

RESULT AND DISCUSSION

In urban areas of Chapra town centre and Siwan Sader, House Sparrows were found to coexist with 18-22 other avian species and this species richness increases in peri urban zones. The species of common Myna, Feral Pigeon (*Columba Livia*), Rose ringed Parakeet and Brown Rock Chat (*Oenanthe fusca*) are more competitive towards House Sparrows. Sparrow nests are displaced by pigeons and mynas in marketplaces. The hollow cracks and crevices that were historically occupied by sparrows were occupied by Parakeets. The migratory influx during winter season especially by Winter Buntings cause overlapping diet patterns for insects and grains. But this doesn't cause significant harm to sparrows. Though during peak migratory season during November to February, the sightings of sparrows become less in areas of high migratory birds density in wetlands (Suraila Chaur, Mirzapur Bahiyara in Bhagwanpur Hatt).(Table:1) The impact of other bird species can be seen as 46% of sparrows nests failed due to bird competitors and 68% of these are due to mynas. Also on arriving mynas, sparrows leave 70% of seed trays. Myna-proof boxes show 80% occupancy by sparrows as compared to 29% in standard boxes. When competitor bird density increased 12 birds per kilometer square, sparrow density fell. When winter buntings visit early winter in October as opposed to

their routine visit in November, underweight chicks were found in rural areas. The findings of the research study suggests that any form of interspecific competition, whether direct or indirect, impacts the distribution of sparrows in Saran Division . In these areas sparrows face a complex web of ecological pressure due to invasive nesting of mynas and pigeons, dietary overlap with warblers ,babblers, parakeets and competition posed by migratory birds during winter. When competition combines with anthropogenic disturbances in line with Newton (1988) and Dhondt (2012). The unique environmental context of Saran Division having a mix of urban and agrarian landscapes provides challenges and unique insights into avian community dynamics. The inclusion of interspecific competition as a significant factor in devising conservation strategies turn out to be better conservation measures. In Saran House Sparrows distribution is mainly constrained by residential mynas particularly in Chapra regions where sparrows are restricted to less than 10% of green spaces by myna dominance. In winter rice fields, buntings reduce sparrow feeding efficiency by 40%. A significant 3.5 times more sparrows are seen in riverine villages where traditional grain storage is still used. Conservation must address both species interactions and landscapes connectivity to reverse declines.

ABSTRACT

The present work is an inventorization of valuable medicinal plants of 80 species that belongs to 37 families wildly grown in Mallem konda – an unexplored, forgotten sacred grove, located at the border of Nellore and Kadapa districts in Eastern Ghats of Andhra Pradesh. The inventorization was carried out after the successive field trips in different seasons during the years 2019 to 2021. Sacred groves are the exemplary examples of climax communities in forest ecosystem which exhibits species richness of trees, shrubs, herbs along with climbers, lianas and other Sciophytes. Many ethnobotanical investigations across the country, revealed the usage of medicinal plants besides utility of medicinal taxa by the Mallemkonda sacred grove region tribal communities is considerably different and also neglected by the previous researchers. Collected plants were identified, and preserved in the departmental herbarium of Vikrama Simhapuri University College, Kavali, Nellore district. Crosschecking of the inventory with the Dr. Duke's Phytochemical and Ethnobotanical database exhibited the ethno-medicinal significance of Mallem konda sacred grove.

Keywords: Inventorization, Mallem Konda, Sacred Groves, Sciophytes, Ethnobotanical,

INTRODUCTION

Archaic times onwards people are using plants in their day to day life. Ethnic people are well known for their knowledge to treat various ailments by using plant based medicines. These concerns of ethnic groups are defined as

Ethnobotany which deals with the study of interactions between plants and humans (Savithramma *et al*. 2017). The ethnic people depend on the nature and natural resources as well as they protect them with their spiritual, religious beliefs for future uses (Savithramma *et al*. 2014; Rao *et al*. 2015; Savithramma *et al*. 2015; Rao *et al*. 2016; Koda, 2021 and Sharma and Kumar, 2021). The sacred groves are one of such patches of forest lands which are safeguarded by the people by their religious beliefs. In India, groves are managed by the government (Forest, revenue and endowment departments) and many are conserved by the local people and non government organizations (22). Though studies were conducted in many sacred groves of Eastern Ghats, so far, no work related to study of medicinal plants was carried out in Mallem konda sacred grove of Andhra Pradesh. Hence, this study is the first attempt to document medicinal plants used by tribals of Mallem konda region.

Etimology

Mallem Konda is named after the Hindu God Lord Shiva. According to the local tribals who know about the sacred grove, Lord Shiva is living in this grove as a saint and the local people find him few times when they came to feed their cattle to this grove. One day several cattle were died and the locals suspected that sheeps were dead due to the saint who is roaming around and they caught the saint and tied him with the *"epi nara"* (the bark fibre of *Hardwikia binata*). The saint disappeared and all the cattle became live. Later, tribals found a statue in the area where the saint was tied. With this incident, the tribals believed that the Lord Maha Shiva was protecting them in and around this grove without any problems.

MATERIALS AND METHODS

Study area

The study area was situated at the boarders of Nellore and Kadapa districts in deep forest of Eastern Ghats, Andhra Pradesh, India. It lies between Latitude 14.5691^{o}N and Longitude 79.2345^{o}E and at an Altitude ranging from 1950 ft MSL. The vegetation type is mixed dry deciduous. Lord Shiva temple on the name of Mallem Kondaiah Swamy is located in this sacred grove. Map depicting the study area is given in Figure 1.

Threat to the grove

In the current situation the Mallem konda sacred grove is under serious threat due to reduction in the religious beliefs caused by interaction with civilized people, anthropogenic involvement through pilgrimages and nature tours; infrastructure development in sacred grove. Introduction of Ornamental flora and Invasive Alien Species, grazing by cattle are the other threats.

Identification and herbarium preparation of the Medicinal plant taxa

Majority of the plants are identified in the field itself up to species level, but few are identified by their genus further identifications were done in S.V. University and V.S. University herbarium. Specimens are collected, mounted and preserved after poisoning with 1% Mercuric Chloride ($HgCl_2$). Specimens are identified initially by Miss. Lalithamba (Modulator e-flora India) later on conformed and authentified by Dr. K. Madhava Chetty, Assistant professor (Rtd) in department of Botany, Sri Venkateswara University, Thirupati. Identification of specimens in lab as well as in field was done with the help of Gamble and Mathew volumes, Flowering plants of Chittoor district, Andhra Pradesh, India (5th volume, 2018) and Forest trees of Andhra Pradesh (a pictorial guide, 2020). Inventory was cross checked with the Dr. Duke's Phytochemical and Ethnobotanical database.

RESULTS

Information procured from repeated and periodic field trips was provided in the tabular form with the details of Botanical name, family, vernacular name, habit, plant part used and ethno medicinal uses (Table 1). Photographs of some important medicinal plants of Mallem konda are shown in Plate 1 and 2.

DISCUSSION

This study revealed that the tribals of Mallem konda sacred grove used 80 medicinal species belonging to 37 families. The predominant families are Fabaceae, Rubiaceae, Combretaceae and Malvaceae (Fig 2). The habit of plants that are utilized as medicine in this grove exhibited trees (24), shrubs (13), herbs (37), lianas (02) and vine (01) (Fig.3). Herbs are mostly used. In nearly thirty percent of the medicinal plants, whole plant is used in the preparation of medicine. The usage of different plant parts for medicine preparation is shown in the venn diagram (Fig 4). Among the plant parts, roots (16.5%) were used followed by leaf (15.25), stem bark (13.34%), fruits (4.85%), and seeds (3.75%). Different parts of the same medicinal plant in many taxa are used to treat different ailments. Both root and leaf of the same plant is used in 12.5%, Leaf and Stem bark (6.66%); Fruit and stem bark (6.66%); root, fruit and leaf (3.75%); root, leaf and seed (1.25%). The study indicated that Mallem konda area has abundant medicinal plants (Table 1) to treat a wide range of human ailments such as diabetes, fever, cough, ulcer, wound healing, kidney stones, jaundice, skin allergies, stomach disorders and for poisonous bites.

CONCLUSION

Mallem konda is a treasure trove of medicinal plants. Plants have been used as traditional medicine from time immemorial. Plants consist of secondary metabolites and phytochemicals that have potential to act as therapeutics. Information provided in this inventory may help in developing new leads to the drugs. In addition, unexplored plants and their compounds help to find more effective and non toxic natural drugs that can provide health care benefits to large population.

Table 1: List of medicinal plants used by Tribals of Mallem konda

S.No.	Botanical name of the Taxa	Family	Vernacular name	Habit	Part used	Ethno botanical uses
1	*Achyranthes aspera L.*	Amaranthaceae	Uttareni	Herb	Whole plant	Whole plant- Leucorrhoea, Jaundice, piles, diarrhoea, scorpion sting, anaemia, amenorrhoea, ear ache, dropsy, stomach disorders, tooth ache.
2	*Adenia wightiana (Wall. ex Wight and Arn.) Engl.*	Passifloraceae	Rogam gadda	Tendrillar climbing herb	Root and leaf	Root- Tonic; Leaf- Tonic, skin troubles.
3	*Ageratum conyzoides (L.) L.*	Asteraceae	Pumpulla	Herb	Whole plant, leaf and root	Whole plant- Nervine tonic, dysentery; Leaf- Styptic, vulnerary, wounds, sores, skin diseases, boils; Root- Root- Anthelmintic, Ophthalmia.
4	*Albizia odoratissima (L.f.) Benth.*	Fabaceae	Konda sigara	Tree	Fruit	Fruit- Erysipelas, wounds, cough, dyspnoea, leprosy.
5	*Allophylus serratus (Hiern) Kurz*	Sapindaceae	Kaki beera/Guvva gutti	Tree	Root, leaf and fruit	Root- Diarrhoea; Leaf- Colic; Fruit- Anthelminthic.
6	*Amorphophallus margaritifer (Roxb.) Kunth*	Araceae	Adavi-kanda or Adavi chaama	Herb	Whole plant, Rhizome	Rhizome-Used to cure scabies. Arthritis; Asthma; Bronchitis; Cancer; Cough; Dysentery; Stomachache; Toothache; Urinary troubles; Vomiting; Piles
7	*Andrographis glandulosa Nees*	Acanthaceae	Nelavemu	Herb	Whole plant	Cancer treatment; cold; flu; upper respiratory infections
8	*Anisochilus carnosus (L.f.) Wall.*	Lamiaceae	Ritchu-rodda	Herb	Whole plant and leaf	Whole plant- Diaphoretic, stimulant, expectorant, hepatic

						disorders, cough and cold; Leaf- Cough, dropsy, indigestion, sores in the leg fingers.
9	*Anogeissus latifolia (Roxb. ex DC.) Wall. ex Guillem. and Perr.*	Combretaceae	Sirimanu	Tree	Whole plant and stem bark	Whole plant- Cancer; Stem bark- Bitter tonic, astringent, polyuria, anaemia, piles, leprosy, snake bite and scorpion sting;
10	*Barleria mysorensis B.Heyne ex Roth*	Acanthaceae	Bantalagobbi, Nallamulugoranta, Erramulugoranta	Herb	Whole plant, Leaf	This plant is used as Febrifuge (lowering of temperature during fever), and relieving of stomach pain. Leaf decoction is given for the treatment of cough. Leaf paste applied externally as an antidote for scorpion bite.
11	*Bridelia retusa (L.) A.Juss.*	Phyllanthaceae	Kora maddi, peyamaddi, mulamaddi	Tree	Fruit	Fruit- Sciatica, lumbago.
12	*Canscora alata (Roth) Wall.*	Gentianaceae	Kancakura	Herb	Whole plant	Epilepsy, Enlargement of the Scrotum, Pain, Skin diseases, Ulcer, Worms, Abdominal disorders
13	*Chloroxylon swietenia DC.*	Rutaceae	Billudu	Tree	Stem bark, leaf, wood and gum	Stem bark- Astringent; Leaf- Rheumatism, wounds, mosquito repellent; Wood- toy making; Gum- Diabetes;
14	*Cissampelos pareira L.*	Menispermaceae	Vishaboddi	Climbing shrub	Root	Root- Antiperiodic, diuretic, dropsy, urinary disorders, anorexia, coryza, purgative, febrifuge, stomachic, diabetes.

15	*Cissus repens Lam.*	Vitaceae	Nellaboddu	Woody climber (Liana)	Leaf and stem	Leaf- Used as vegetable, swelling, fever, stupefying fish. Stem- used as cordage.
16	*Corchorus aestuans L.*	Malvaceae	Nela beera	Herb	Seed	Seed- stomachic.
17	*Curculigo orchioides Gaertn.*	Hypoxidaceae	Nelathadi	Herb	Tuberous root	Tuberous root- Skin troubles, demulcent, diuretic, tonic, diarrhoea, piles, jaundice and asthma.
18	*Cyanthillium albicans (DC.) H.Rob.*	Asteraceae	Tella sahadevi	Herb	Whole plant	Whole plant- Leucorrhoea, stomatitis, skin diseases.
19	*Cyanthillium cinereum (L.) H.Rob.*	Asteraceae	Nalla sahadevi	Herb	Whole plant and root	Whole plant- Coryza, vomiting, skin diseases, leucorrhoea; Root- Eye diseases, anthelmintic, blood disorders, fevers.
20	*Decalepis hamiltonii Wight and Arn.*	Apocynaceae	Maredu kommulu	Woody climber (Liana)	Root	Root- Appetizer, depurative, haemorrhage, thirst, urticaria, jaundice, gout, diabetes.
21	*Decaschistia crotonifolia Wight and Arn.*	Malvaceae	Konda gogu	Shrub	Leaf	Leaf- Hydrocele.
22	*Desmodium pulchellum (L.) Benth.*	Fabaceae	Deyyapu mokka	Shrub	Stem bark	Stem bark- Diarrhoea, haemorrhage, aphrodisiac, eye problems.
23	*Didymocarpus tomentosus Wight*	Gesneriaceae	Rathi Thamara	Herb	Tuber, Leaf	cure for kidney stone, Treatment of fever, skin allergy and inflammation
24	*Dioscorea pentaphylla L.*	Dioscoreaceae	Monyakku pendalam	Twining herbs (Vines)	Tuber	Tuber- swellings, urinary calculi, polyuria, aphrodisiac, dysentery, diarrhoea, leprosy, piles ulcers, abortifacient.

25	*Drosera burmanni Vahl*	Droseraceae	Beda sundari	Herb	Whole plant	Whole plant- Rubefacient
26	*Ehretia microphylla Lam.*	Boraginaceae	Bavana bure, Pithchika beera	Shrub	Leaf	Skin allergies, Psoriasis, Scabies, stomach pain, Wound healing
27	*Erythroxylum monogynum Roxb.*	Erythroxylaceae	Billudu	Tree	Leaf, Stem bark and wood	Stem bark and wood- stomachic Leaf- refrigerant
28	*Euphorbia hirta L.*	Euphorbiaceae	Nanubalu, pachabotlu aaku	Herb	Whole plant and leaf	Whole plant- Urinary disorders, constipation, leucorrhoea, asthma, cough, colic, dysentery, purgative, dyspnoea, urino-genital tract diseases; Leaf- bowel movements

ABSTRACT

Hydroxyapatite (HAP) with the chemical formula $Ca_{10}(PO_4)_6(OH)_2$ has been used extensively in the field of dental and orthopaedics for implant fabrication owing to its biocompatibility with human bone and teeth. The hydroxyapatite nanoparticle is mainly used in orthopaedic and dental applications due to its properties of bioactivity, osteoconduction, biocompatibility and non-toxicity. In this paper, we report the synthesis of organic and inorganic incorporated HAP powder by hydrothermal method. FTIR, XRD, SEM and TGA techniques were performed to analyse the chemical composition, crystallite structure and uniform morphology. The results indicated that the dextrin assisted alumina substituted hydroxyapatite nanoparticle has a uniform spherical morphology, smaller particle size with no impurities. The cytotoxicity was evaluated using MG-63 cell line study.The developed nano-HAP powders using organic and inorganic additives may be potentially used as bone substitute applications.

Keywords: Hydroxyapatite, Biocompatibility, Hydrothermal Method, Orthopaedic, Nanoparticle.

INTRODUCTION

Hydroxyapatite [HAP, $Ca_{10}(PO_4)_6(OH)_2$] is one of the most attractive materials for bone implant due to its compositional and biological similarity to natural bone. However, due to lower strength of pure HAP, it has been difficult to use it as bone implant for a long time. It is because the mechanical strength of this material mainly depends on grain size, grain size distribution, porosity, and other microstructural defects. In addition to this, the bioactivity of the synthetic hydroxyapatite has been found to be strongly affected by structural crystallinity [1]. The commonly used methods to prepare HAP mainly include hydrothermal, precipitation, solvothermal, spontaneous combustion, micro-emulsion, ultrasonic synthesis, bionic and solid state reaction, wet and dry methods [2]. Studies have found that the shape and size of hydroxyapatite can be regulated by changing the hydrothermal temperature, hydrothermal time and reaction concentration. According to this method, researchers have prepared high-purity hydroxyapatite of different shapes, such as nano spherical, rod-like, needle-like, flake, hexagonal prism, small plate, spine-like, etc [3-6]. Composite materials are formed by combining two or more materials that have quite different properties, and they do not dissolve or blend into each other. The different materials in the composite work together to give the composite unique properties [7]. Owing to excellent wear and corrosion resistance, alumina is widely used for composites in load bearing applications. It improves the mechanical properties of hydroxyapatite and is also helpful in retaining the biocompatibility [8]. Furthermore, addition of alumina into hydroxyapatite increases the compressive and bending strength of the composites [9-11]. Also, the in vitro compatibility evaluation of HAP–Al_2O_3nanocomposites prepared under microwave assisted synthesis and co-precipitation method shows similar biochemical activity like natural hydroxyapatite in bone [12]. The bio-inertness of alumina has no harmful effect on cells and tissues [13]. Another additive dextrin is a low-cost, broadly available raw material derived from starch, widely used in many industrial applications and accepted as a generally-recognized-as-safe (GRAS) food ingredient [14]. Dextrin is available in medical grade, has high solubility in water and DMSO, and holds hydroxyl groups suitable for bioconjugation, which has prompted this glucose polymer for several biomedical applications [15], including as hydrogels [16-18]. Studies have shown that they have synthesized successfully a nanocomposite system incorporating dextrin into nano HA/chitin matrix via co-precipitation route for the application in bone tissue engineering [19-25]. In the present study, hydrothermal synthesis was employed to synthesize HAP–nanocomposites using dextrin and alumina, as this method facilitates the formation of tunable nanostructures of hydroxyapatite with uniform morphological distribution, especially when assisted by dextrin and alumina. The resulting composite powders were subjected to structural, morphological, elemental and thermal characterization. Additionally, their biocompatibility was evaluated using the MTT assay on MG63 human osteosarcoma cell lines.

MATERIALS AND METHODS

Chemicals and Reagents

All chemicals used in this study were of analytical grade and the chemicals used to synthesize hydroxyapatite were purchased from Merck, Germany.Calcium nitrate tetrahydrate ($Ca(NO_3)_2.4H_2O$: 99%) and Diammonium hydrogen phosphate ($(NH_4)_2HPO_4$), Dextrin, Alumina, ammonia and ethanol were used without further purification. Deionized water was used throughout the synthesis.

Synthesis of Hydroxyapatite Nanoparticles

Hydroxyapatite was synthesized via the hydrothermal method using calcium nitrate tetrahydrate ($Ca(NO_3)_2{\cdot}4H_2O$) and diammonium hydrogen phosphate ($(NH_4)_2HPO_4$) as the calcium and phosphate precursors, respectively. Deionized water served as the solvent for both precursors. Solutions of 0.04 M $Ca(NO_3)_2{\cdot}4H_2O$ and 0.024 M $(NH_4)_2HPO_4$ were prepared to maintain a stoichiometric Ca/P molar ratio of 1.67. The phosphate solution was added dropwise into the calcium solution under constant stirring. Dextrin, used as an additive, and alumina, acting as a growth-regulating agent, were each dissolved in 50 mL of deionized water and added dropwise to the precursor mixture. The pH was adjusted to 11 using ammonia solution. The resulting mixture was stirred on a magnetic stirrer at 600 rpm for 1 hour. Subsequently, the entire solution was transferred into a Teflon-lined autoclave and subjected to

hydrothermal treatment in an oven at 120 °C for 3 hours. The resulting precipitate was washed repeatedly with deionized water and ethanol, then dried at 100 °C for 3 hours. The dried powder was further subjected to calcination at 600 °C and sintering process at 800°C to obtain phase-pure hydroxyapatite. The final product was characterized using various analytical techniques.

Sample Characterization

Powder X-ray diffraction (XRD) analysis was performed using a Bruker D2 Phaser instrument using Cu-Kα radiation (k = 1.5418 Å).FT-IR spectra of synthesized samples were also recorded on a Perkin Elmer spectrum two FTIR spectrometer in the 4000 to 350 cm^{-1} range and the spectra were recorded withS/N ratio: 2000:1 ppm for 1 minute scans. HRSEM investigations were performed by using Carl ZeisEVO 10 model. Thermogravimetric analysis (TGA) was performed using Perkin Elmer STA 6000. Measurements were performed in the nitrogen flow and the temperature was raised from 25°C to 800°C with a heating rate of 20°C min^{-1}.

Potential Application – MTT assay

The MG63, human osteosarcoma cell line was obtained from the National Centre for Cell Science (NCCS), Pune, India**.** Cells were cultured in Minimum Essential Medium (MEM) supplemented with 10% fetal bovine serum (FBS) and 1% antibiotic-antimycotic solution**.** Cultures were maintained at 37 °C in a humidified incubator with 5% CO_2 and 18-20% O_2**.** Cells were sub-cultured every three days to ensure optimal growth and viability.

RESULT AND DISCUSSION

XRD Analysis

The development of crystalline HAP phase was confirmed by XRD technique. In Fig. 1(a–d),XRD pattern of the synthesized hydroxyapatite powders obtained from hydrothermal method with various amounts of alumina and dextrin concentration were shown. Fig. 1 shows XRD pattern of HAP powder (a) HAP, (b) Dx-1.5% and Al-0.15 g, (c) Dx-2% and Al-0.1 g and (d) Dx-2% and Al-0.15g. All the four samples exhibited, the major characteristic peaks observed at 2θ values of 25.6, 28.7, 31.5, 33.8, 39.3, 46.3 and 49.1 corresponding to (002), (210), (211), (202), (212), (222) and (213) planes of hexagonal HAP. It was clear that, all the major peaks observed could be accredited to hydroxyapatite structure and no additional crystalline phases were seen. The high and narrow peaks show high crystallinity of the obtained HAP. The obtained pattern is in good accordance with the standard JCPDS data (09–0432). The average grain size of the HAP powders were calculated using Scherrer equation which is shown in Table. 1.

FT-IR Analysis

Figure 2 shows the FTIR spectrum of all the HAP samples. The functional groups present in the samples can be easily identified by the FTIR peaks. The HAPobtained with and without additive shows the absorption peaks (Fig.2 a)at 563, 603, 960, 1010–1130, 1400, 1635, 3000–3600, and 3554cm^{-1}. The peaks for HAP observed at 474cm^{-1} (ν_2 bending mode), 601 and 571cm^{-1} (ν_4 bending mode), 1096–1035cm^{-1} (ν_3 vibration mode) and 963cm^{-1}($\nu_1$stretching) clearly reveal the occurrence of the PO_4^{3-} group. The existence of the OH^- group observed at 3573cm^{-1} by the stretching vibration mode was distinct. The broad peak detected at 3423 cm^{-1} is assigned to the adsorbed lattice water. Furthermore, there was existence of CO_3^{2-} ions, which was confirmed by vibrational peaks observed at 1400cm^{-1}. The presence CO_3^{2-} ions might be due to its occurrence in the reaction solution used for the HAP synthesis [26].FTIR spectral assignment of the functional groups (Table 2).

SEM Analysis

Figure 3 (a–d) illustrates the surface morphology of the synthesized spherical hydroxyapatite (HAP) prepared via the hydrothermal method, using varying concentrations of dextrin and alumina. The pure HAP exhibits a network-like structure, as seen in Fig. 3(a). When synthesized with Dextrin-1.5% and Alumina-0.15g, the HAP particles appear

spherical, uniform, and free from agglomeration (Fig. 3b). In contrast, the sample with Dextrin-2% and Alumina-0.1 g displays a rice grain-like morphology Fig. 3(c), while the combination of Dextrin-2% and Alumina-0.15g results in significant agglomeration Fig. 3(d). Thus it was observed that the addition of dextrin and alumina has significantly reduced the particle size of HAP with uniform spherical morphology [27].

Thermal Analysis

The thermal stability of the prepared hydroxyapatite was analysed through thermogravimetric analysis and shown in Fig. 4. The thermogravimetric analysis (TGA) plots reveal the thermal stability of the hydroxyapatite (HAP) samples obtained with and without the additive to track their chemical decomposition as temperature increases. In Fig. 4(a) The initial weight loss observed below 120°C is attributed to the release of adsorbed surface water and the removal of any lattice water present within the HAP structure [28, 29]. Further heating up to 650°C results in weight loss due to the decomposition of carbonate species that is incorporated in the HAP [30].HAP is generally stable up to around 700 °C, with minimal weight loss due to moisture and decomposition. Beyond this temperature, no significant weight loss is observed up to 800°C, indicating the high thermal stability of the synthesized HAP powder. On adding dextrin and alumina, the thermal stability of the powders was found to increase (Fig. 4 b and c) 1%. This is due to the rapid densification of the HAP powders brought by the additives.

Cytotoxicity test by MTT Assay

The MTT assay was employed to evaluate the in vitro biocompatibility and proliferation of MG-63 cells in the presence of the dextrin and alumina HAP composite which was supported by microscopic images (Fig. 5). The assay was conducted with different concentrations such as 15.62µg/ml, 31.25 µg/ml, 62.5 µg/ml, 125 µg/ml and 250 µg/ml. The composite exhibited increased cell viability with higher concentration. The cell viability obtained for 15.62µg/ml, 31.25 µg/ml, 62.5 µg/ml, 125 µg/ml and 250 µg/ml were 98.24, 95.13,89.97,84.23 and 78.2 % respectively is shown in Table 3. Compared to higher concentrations, the lower concentration exhibited significantly higher cell viability. The number of MG-63 cells observed on the samples indicated that as the concentration decreased, cell viability increased, suggesting effective attachment and proliferation of MG-63 cells on the synthesized composite which is shown in Fig. 6. This result provides strong evidence of the composite's favourable biocompatibility.

CONCLUSION

In this work, dextrin-alumina assisted HAP was prepared by a hydrothermal method. The functional groups and diffraction patterns of the synthesized HAP powders were characterized using FT-IR and XRD techniques. The product formation was well supported by FTIR evidences which showed no impurity peaks. The HAP powder was well crystallized with hexagonal structure with no impurity phases was obtained as evident from the XRD results.The SEM micrograph revealed that the synthesized size of the HAP powder was well controlled and the morphology was spherical.TGA analysis has proved the highthermal stability of the HAP powdersupto 800°C.The MTT assay showed non-cytotoxicity of the nanoparticles against MG-63 cells, demonstrating the good biocompatibility of the HAP powders. Hence these bioceramic powders could be well used for potential biomedical applications.

ABSTRACT

Naulas, the traditional groundwater harvesting structures of Uttarakhand, are vital sources of potable water in hilly regions and possess both ecological and cultural significance. This study evaluates the physicochemical quality and seasonal potability of water from seven Naula aquifers in the Champawat district. Monthly water sampling was conducted over a two-year period (April 2022 to April 2024) in accordance with BIS [IS 3025 (Part 1):1987] guidelines using pre-cleaned 500 mL polypropylene bottles. A total of 24 physicochemical parameters were analyzed using standard BIS methods, including pH, temperature, colour, odour, taste, electrical conductivity (EC), total dissolved solids (TDS), total hardness (TH), calcium, magnesium, alkalinity, turbidity, chloride, residual chlorine, dissolved oxygen (DO), biochemical oxygen demand (BOD), chemical oxygen demand (COD), cadmium, chromium, lead, iron, arsenic, mercury, and zinc. The results showed that all tested parameters were within the permissible limits prescribed by BIS, confirming the potability of Naula water. Seasonal Water Quality Index (WQI) values were 12.59 (Winter), 15.24 (Summer), and 17.53 (Monsoon), all falling under the "Excellent" category (WQI < 25), with a slight decline during the monsoon season due to surface runoff. These findings confirm that Naula water remains consistently safe for drinking throughout the year, highlighting the need for protection and sustainable management of these traditional water sources.

Keywords: Naula, Groundwater Quality, BIS Standards, Water Quality Index

INTRODUCTION

Water is a fundamental natural resource essential for the survival of all life forms on Earth. It plays a crucial role in maintaining ecological balance, supporting agricultural and industrial activities, and fulfilling domestic needs. Although nearly 70% of the Earth's surface is covered by water, only about 3% constitutes freshwater. Potable water is typically obtained from surface water bodies such as rivers, lakes, and reservoirs, as well as extracted from groundwater sources like wells, aquifers, and handpumps. However, increasing pollution due to urban expansion, industrial effluents, and agricultural runoff has severely affected surface water quality, resulting in greater reliance on groundwater sources for drinking purposes. Groundwater exists in underground layers of soil and rock and is accessed through various traditional and modern techniques. In rural and hilly regions of India, traditional methods are still widely practiced. For example, the 'Kul' irrigation system in Himachal Pradesh and underground tunnel methods in other regions are used to extract groundwater (More, 2020). These sources are not only essential for water supply but also hold deep cultural, religious, and historical value. In many Indian communities, such water sources are considered sacred and are associated with traditional beliefs, rituals, and customs. These traditional groundwater sources are known by different names across India, reflecting the country's cultural richness. In Uttarakhand, they are referred to as *Naulas*, while in Nagaland, similar systems are called *Zabo*. Naulas are small, stone-lined springs typically found in the hilly terrain of the Kumaon region (Rawat, 2021). These traditional structures are often preserved and worshipped by local communities, highlighting their ecological and spiritual significance. In this context, the present study aims to analyze the water quality of Naulas—traditional natural aquifers—in the Champawat district of Uttarakhand. As groundwater plays an increasingly vital role in meeting drinking water needs, assessing the quality of these sources is essential for protecting public health and ensuring the sustainable management of water resources.

MATERIALS AND METHODS

Sampling locations: Seven groundwater aquifers were selected for physicochemical analysis in the Champawat district, and the GPS coordinates of the sampling sites are provided in Table 1, with the sampling area shown in Figure 1. Water samples were collected in accordance with BIS guidelines [IS 3025 (Part 1):1987] using pre-cleaned 500 mL polypropylene bottles to ensure sample integrity. Data collection was conducted monthly over a two-year period, from April 2022 to April 2024, during morning hours to minimize variations due to diurnal changes. This consistent sampling schedule facilitated a comprehensive assessment of the potability and physicochemical characteristics of the selected aquifers. All laboratory analyses were performed at the laboratory of S.V. Government P.G. College, Lohaghat. Figure 2 illustrates the sampling locations along with the laboratory procedures carried out for the analysis of collected water samples.

Sample analysis: A total of 24 parameters were tested following the standard protocols prescribed by the Bureau of Indian Standards (BIS). The tested parameters and their respective BIS codes are: pH [IS 3025 (Part 11):1983], Temperature [Part 9:1984], Odour [Part 5:1983], Taste [Part 8:1984], Colour [Part 4:2021], Electrical Conductivity (EC) using a digital EC meter, Biochemical Oxygen Demand (BOD) [Part 44:1993], Chemical Oxygen Demand (COD) [Part 58:2006], Dissolved Oxygen (DO) [Part 38:1989], Residual Chlorine [Part 26:1986], Total Hardness [Part 21:2009], Calcium [Part 40:1991], Magnesium [Part 46:1994], Total Dissolved Solids (TDS) [Part 16:1984], Alkalinity [Part 23:1986], Turbidity [Part 10:1984], Chloride [Part 32:1988], Cadmium [Part 41:1992], Chromium [Part 52:2003], Lead [Part 47:1994], Iron [Part 53:2003], Arsenic [Part 37:1988], Mercury [Part 48:1994], Zinc [Part 49:1994]. For the seasonal potability analysis, the Water Quality Index (WQI) method was employed. Based on the regional climatic pattern, the year was categorized into three distinct seasons: Winter (November–February), Summer (March–June), and Monsoon (July–October).

RESULT AND DISCUSSIONS

The physicochemical analysis of Naula water across the seven sampling sites revealed that the water quality parameters largely conformed to the permissible limits set by the Bureau of Indian Standards (BIS). The pH values ranged from 7.0 to 7.4, indicating neutral to slightly alkaline nature, with a mean of 7.2 ± 0.15, well within the BIS range of 6.5–8.5. Temperature varied slightly across sites (9.4–10.8 °C), reflecting minimal thermal variation. Colour values were generally stable at 5 Hazen, except at Site 1 (2.3 Hazen), with an overall mean of 4.6 ± 0.9, meeting the standard limit of 5 Hazen. Electrical conductivity (EC) ranged between 306.85 and 502.5 µS/cm (mean: 392.1 ± 55.8 µS/cm), indicating moderate ionic presence. BOD and COD values (mean 2.1 ± 0.2 mg/L and 3.7 ± 0.7 mg/L, respectively) suggest low levels of biodegradable and chemical organic pollutants. Dissolved oxygen (DO) was high across all sites (7.1–8.3 mg/L), with a mean of 7.9 ± 0.4 mg/L, indicative of good water quality. Chloride concentrations remained low (mean: 26.2 ± 6.2 mg/L), far below the BIS threshold of 250 mg/L.Total hardness (TH) was within acceptable limits, ranging from 149.3 to 170.4 mg/L (mean: 157.1 ± 7.9 mg/L), with corresponding calcium (mean: 36.2 ± 1.9 mg/L) and magnesium (mean: 15.9 ± 1.4 mg/L) concentrations well under BIS limits. Total dissolved solids (TDS) were also within safe levels, with values between 180.3 and 208.3 mg/L (mean: 192.5 ± 9.5 mg/L). Alkalinity showed moderate variability (mean: 122.3 ± 12.1 mg/L), indicating adequate buffering capacity. Turbidity values remained low (mean: 2.2 ± 0.1 NTU), suggesting clear water. Residual chlorine averaged 0.08 ± 0.03 mg/L, below the upper limit of 0.2 mg/L, indicating the absence of excessive chlorination. Heavy metals, including chromium (0.0048 ± 0.0003 mg/L), lead (0.0043 ± 0.0009 mg/L), iron (0.05 ± 0.01 mg/L), and zinc (0.05 ± 0.008 mg/L), were detected in minimal concentrations, well below the permissible limits. Cadmium, mercury, and arsenic were below detection limits at all sites. Sensory attributes such as odour and taste were found to be acceptable across all samples.Overall, the results suggest that the Naula water is of good quality and fit for consumption, with all parameters falling within the BIS permissible limits. These results are summarised in Table 2 and Figure 3 represents the graphical illustration of the mean values of all tested water quality parameters. Similar findings have been reported by several researchers that support the results of the present study. Kotlia and Bakshi (2023) observed a slightly alkaline pH (7.637) in groundwater of Udham Singh Nagar, which aligns with the pH range of 7.0–7.4 recorded in the current Naula water analysis. Nayak *et al*. (2022) also reported comparable electrical conductivity (412.34–478.25 µS/cm) and TDS values (298.34–384.21 mg/L), which are in agreement with the EC (306.85–502.5 µS/cm) and TDS (183.9–208.3 mg/L) values in this study. Similarly, chloride concentrations (13.2–22.5 mg/L) and turbidity levels (0.24–1.11 NTU) noted by Nayak *et al*. were close to those found in Naula water, confirming low salinity and clear appearance. Patni *et al*. (2022) reported total hardness between 104–208 mg/L, calcium in the range of 16.67–37.19 mg/L, and magnesium from 14.37–34.98 mg/L in primitive water sources of Champawat district, which are comparable to the present study's values of TH (149.3–170.4 mg/L), Ca (33.5–40.4 mg/L), and Mg (14.3–18.9 mg/L). Furthermore, their findings of satisfactory DO levels and moderate EC also corroborate this study's observations. These consistent results across multiple studies strengthen the conclusion that the groundwater in this hilly region remains within safe and potable limits. Patni *et al*. (2022) also did not observe the presence of hazardous heavy metals like uranium in their analysis of primitive water sources in Champawat, reporting concentrations well below the BIS permissible limit. This observation is consistent with the present study, where all tested heavy metals—including chromium, lead, iron, and zinc—were found within safe limits, and toxic elements like cadmium, mercury, and arsenic were below detection levels. These similarities further confirm that groundwater in this region is largely free from heavy metal contamination and remains safe for human consumption.

Seasonal water potability analysis

For the seasonal assessment of water quality, the Water Quality Index (WQI) was computed following the method proposed by Brown *et al*. (1972). The study period was categorized into three distinct seasons based on regional climatic trends: Summer (March–June), Monsoon (July–October), and Winter (November–February). WQI serves as a comprehensive numerical indicator that synthesizes multiple physicochemical parameters to provide an overall evaluation of water quality. Each parameter was assigned a specific weight (Wn) according to its relative importance to human health, and a quality rating (Qn) was derived for each.

The WQI was calculated using the formula
WQI = (ΣQnWn) / (ΣWn). Table 3 presents the classification of water quality based on WQI values, while Table 4 summarizes the seasonal WQI values computed for each sampling site.
A total of 18 physicochemical parameters were selected for the Water Quality Index (WQI) analysis to ensure a comprehensive assessment of seasonal water quality. The Water Quality Index (WQI) values calculated for different seasons reveal noticeable seasonal variation in water quality. The WQI for the Winter season was found to be 12.59, followed by 15.24 during Summer, and the highest value of 17.53 was observed during the Monsoon season. According to the WQI classification (Table 3), all seasonal values fall within the "Excellent" water quality category (0–25). However, the gradual increase in WQI from winter to monsoon indicates a relative decline in water quality, likely due to increased surface runoff and contamination during the monsoon. Overall, the analysis suggests that water quality remains suitable for drinking throughout the year, with the best quality recorded in winter and relatively lower quality in the monsoon season. A comparable trend in water potability was also observed by Patni *et al*. (2022), who assessed aquifers in the Champawat region and reported that these groundwater sources remained within potable. These sources are considered suitable for drinking purposes and can serve as reliable alternative water sources, especially during the summer season when surface water availability is limited.

CONCLUSION

The comprehensive analysis of water quality from these traditional groundwater sources confirms that they are physiochemically fit for potable use, with all tested parameters, including heavy metals, falling within permissible limits set by national standards. The Water Quality Index (WQI) analysis indicates only minor seasonal fluctuations, yet values consistently remained within the potable range, highlighting the overall stability of water quality throughout the year. These ancient and culturally significant water sources, though once central to local water supply systems, are now facing neglect due to reduced popularity, low maintenance, and structural degradation. Despite their age, these sources still possess the capacity to meet the potable water demands of the region, especially during water-scarce periods like summer. Therefore, it is crucial to implement protection, restoration, and regular maintenance measures to preserve these heritage water systems. Ensuring their sustainability could contribute significantly to addressing the ongoing water scarcity challenges in the area.

ABSTRACT

Solanum trilobatum Linn. commonly known as Purple Fruited Pea Eggplant or Thuthuvalai in traditional Indian medicine, is a well-known medicinal plant in Ayurveda and Siddha medicine. It is valued for its various pharmacological properties. The plant is known for its effectiveness in treating respiratory ailments like asthma, bronchitis, and cough, it also possesses anti-inflammatory, antidiabetic, and liver-protective benefits. The rich in bioactive compounds present in the plant, helps boost immunity, improve digestion, and combat infections. Additionally, its potential in cancer prevention and neuroprotection makes it a promising natural remedy. In the present study, antioxidant, antibacterial and anticancer efficacy was carried out in aerial parts of petroleum ether extract of *S. trilobatum.* The antioxidant activity was done by using DPPH and was observed that, extract showed low IC_{50} value in comparison with the standard ascorbic acid, thereby making it an effective antioxidant agent. Further, antibacterial assay conducted against the bacterial strains *Staphylococcus aureus* and *E. scherichia coli* showed good activity against both the strains. Also, anticancer studies conducted via MTT assay also proved the plant extract as a good anti-cancer agent. Further using thin layer chromatographic studies, major compounds in the fraction were also identified.

Keywords: *Solanum trilobatum* Linn., Antioxidant, Antibacterial, Anticancer, Petroleum extract

INTRODUCTION

Plants as a source of medicinal compounds have continued to play a dominant role in the maintenance of human health since ancient times. According to the World Health Organization plant extracts or their active constituents are used as folk medicine in traditional therapies. Over 50% of all modern clinical drugs are of natural product origin (Kirbag *et al.,* 2009). Phytochemicals such as vitamins, carotenoids, terpenoids, flavonoids, polyphenols, alkaloids, tannins, saponins, pigments, enzymes and minerals have antimicrobial and antioxidant activity (Madhuri and Pandey, 2009). The specific function of many phytochemicals is still unclear; however, a considerable number of studies have shown that they are involved in the interaction of plants/pests/diseases. Medicinal plants contain some organic compounds which produce definite physiological action on the human body and these bioactive substances include tannins, alkaloids, carbohydrates, terpenoids, steroids and flavonoids (Edoga *et al*., 2005). They are of great importance to the health of individuals and communities. Many of these indigenous medicinal plants are used as spices and food plants. Phenolics have been known to possess a capacity to scavenge free radicals. The antioxidant activity of phenolics is principally due to their redox properties, which allow them to act as reducing agents, hydrogen donors. Phenolics are especially common in leaves, flowering tissues and woody parts, such as stems and barks. The Solanaceae family comprises 3000–4000 species that are classified in approximately 90 genera. The family is highly diverse, includes perennial trees as well as herbaceous annual species and occupies a wide range of terrestrial habitats from deserts to rainforests (Knapp *et al.*, 2014). Many species of *Solanum* have pharmaceutical as well as horticultural importance. Isolation of solasodine was reported from *S. aculeatissimum*, *S. neocardensaii* (Rejitha and Ashalatha, 2014). The presence of Solasodine, Solasonine, Diosgenin were identified and extracted from *Solanum* species. *Solanum trilobatum* Linn. has been given supreme importance in the folk and traditional medicines. The plant is commonly available in Southern India. *Solanum trilobatum* is reported to cure numerous diseases viz., tuberculosis, respiratory problems and bronchial asthma and was reported to have hepatoprotective activity (Pratheebha *et al.,* 2013). Phytochemical screening showed the presence of carbohydrates, saponins, phytosterols, tannins, flavonoids and cardiac glycosides as major phytochemical group (Govindan *et al.,* 1999), treatment for cancer (Kanchana and Balakrishnan, 2011), (Swapnalatha and Kannabiran, 2006) and liver infection (Shajahan *et al.,* 2004). Owing to the great demand for the medicinal plants in global levels for the advancement in the drug and phytochemical preparations for curing many diseases, our goal of the present study was to determine the specific bioactivity of total steroidal fraction obtained from the crude petroleum ether extract of *Solanum trilobatum.*

MATERIALS AND METHODS

Phytochemical analysis

Petroleum ether extraction

Aerial part of *Solanum trilobatum* was cleaned, chopped, dried and powdered. Weighed amount of the plant powder were filled in a soxhlet extractor and extracted exhaustively with petroleum ether (60-80°C) for 10 hours. The extracts were allowed to evaporate and maintained as a stock in refrigerator.

Isolation of steroid rich component from petroleum ether extract

A part of the residue of the petroleum ether soluble portion was saponified by refluxing for 30 minutes with 0.5N alcoholic KOH, cooled and diluted with distilled water. Transferred the extract into a separatory funnel and extracted with diethyl ether (5 to 6 times) after extraction, transferred to a conical flask and added anhydrous sodium sulphate, tightly stoppered, kept overnight and filtered repeatedly with diethyl ether. The extract was concentrated. The concentrated steroid rich component was further fractionated. Characterization of the steroids was done by using Olympus stereomicroscope.

Antioxidant activity

Quantitative measurement of radical scavenging property of extract was carried out according to the method of (Mensor *et al.,* 2001). A methanolic solution of 1 mL of DPPH (0.1mM) was added to 1mL of different concentrations

(50- 1000 µg/mL) of the extract and allowed to react at room temperature for 30 min in the dark. Absorbance was measured at 517nm. Methanol served as the blank, DPPH in methanol without the extract served as the control and ascorbic acid was taken as the reference standard. Lower absorbance of the reaction mixture indicated higher free radical scavenging activity. The capacity to scavenge the DPPH radical was calculated using the following equation

% radical scavenging activity = $\left[\frac{Abs.control-Abs.sample}{Abs.control}\right]\times100$. The IC_{50} values (concentration of sample required to scavenge 50% of free radicals) were calculated from the regression equation of the graph.

Antimicrobial activity

Disc diffusion method as described in European pharmacopeia with slight modification was used for antimicrobial testing (Tahseen, 2015). Sterility checked Nutrient Agar plates were used for the test. Bacterial stock cultures of *Staphylococcus aureus* (MTCC 96) and *Escherichia coli* (ATCC 25922) maintained at the Department of Biotechnology, University of Kerala was used for the test.Freshly sub-cultured bacterial strains were suspended in 1 mL nutrient broth and incubated at 37°C for 2 hours to obtain log phase cultures, opacity was checked with 0.5 McFarland turbidity standards. About 100 µL of the pure cultures of test strains were swabbed uniformly using a sterile swab on the surface of nutrient agar to obtain an even inoculum. The plates were allowed to dry for 5 minutes. Sterile discs loaded with extracts, DMSO (negative control) and Streptomycin (positive control-standard) were placed on to the microbe swabbed nutrient agar. The plates were kept for incubation at 37°C. The zone of inhibition marking the antibacterial activity was noted in mm diameter.

Anticancer activity

The extract was tested for anti-proliferative activity and presence of any cytotoxic property by using MTT test for the cell lines. 4T1 mouse mammary tumor cells were seeded in 96 wells plate and after 24 h of incubation they were treated with different concentrations of isolated compound to further incubate for 72 h. After that incubation media was replaced with MTT solution (0.5 mg/mL DMEM media) and incubated for 2 h at 37 °C in 5 % CO_2 and 100 % humid environment. MTT solution was then discarded and resulting formazan crystals were solubilized in 200 µL of DMSO by continuous shaking. The optical density was read at 595 nm using Multiskan PLUS ELISA plate reader (Thermo Fisher Scientific). For each concentration of isolated compound to be tested three replicate wells were used in three independent experiments and the percentage of cell viability was calculated as follows

Percentage of cell viability (%) = ((A0-A1))/A0×100

where; A0 is the absorbance wavelength of control and A1 is the absorbance wavelength of test compound/standard solution.

Preparation of analytical TLC plates and identification of lead compounds

Thin Layer Chromatographic plate was prepared using silica gel G 60 (Merck, India) as the adsorbent. A slurry of silica gel G was prepared by mixing with distilled water 1:2 (w/v) and spread on 5mm thick glass plate. The plate was dried at room temperature (32°C). Hexane, diethyl ether and acetic acid (85:15:2) was used as the solvent system for TLC. Rectangular glass chromatographic chambers (30X20X25cm) were saturated. Concentrated samples of known quantity of steroid component were dissolved in minimum volume of DMSO and spotted on TLC plates, 2 cm from the bottom of the plate using a capillary tube. The spots were dried in air and the plates were placed in the chromatographic chamber and sealed tightly with a glass lid. The solvent was allowed to run until the solvent front reached three fourth of the total length of the plate. The TLC plate was then removed from the chamber, the solvent front was marked and allowed to dry in air. The three different fractions were obtained and detected using iodine crystals. The Rf value of different fractions was calculated.

RESULTS

Antioxidant activity

The antioxidant activity of the aerial part of *Solanum trilobatum* was studied by carrying out DPPH (1-1-diphenyl-2-picryl hydrazine) Free Radical Scavenging Assay. The results were explained on the basis of the percentage of inhibition for radical scavenging activity of standard (Ascorbic Acid), petroleum ether extract and total steroids (Table I).For the standard, ascorbic acid the concentration taken was 10, 25, 50, 75 and 100 µg/mL and the percentage of inhibition was 45.03, 71.61, 85.12, 94.1, and 98.99 respectively. The standard shows low IC_{50} value since it is an analytical standard. It is clear that as the concentration increases the percentage of inhibition also increases. A percentage inhibition of 98.99 was observed in 100µg/mL and the minimum value 45.03 for 10µg/mL. At a concentration of 62.5µg/mL the percentage inhibition for the petroleum ether extract was 13.7% and that of steroid rich component was 18.18%. For the petroleum ether extract at 1000µg/mL it was 78.64% and 84.82% for the steroid. The concentrations taken for petroleum ether extract and steroid rich component were 62.5, 125, 250, 500 and 1000µg/mL. The % inhibition of petroleum ether extract was 13.7, 36.22, 47.76, 62.05, 78.64% and that of steroid rich component was 18.18, 40.4, 54.55, 71.57, 84.82% respectively. Graphs were plotted for these values.The IC_{50} value of the standard ascorbic acid is 11.24µg/mL. The IC_{50} value of the petroleum ether extract is 278.66µg/mL and that of steroids is 212.72µg/mL. In pure steroid component IC_{50} value was very low and is more effective in antioxidant activity. Lower the IC_{50} values the more effective will be the sample with reference to the standard. Since steroids show lower IC_{50} value it is further analyzed for anticancer activity.

Antibacterial activity

Antibacterial activity of the *S.trilobatum* was evaluated *in vitro* against the bacterial strains of gram positive *Staphylococcus aureus* and gram negative *Escherichia coli*. The antibacterial activity test revealed that the inhibitory effect is found in both the bacterial strains. The petroleum ether extract taken for antibacterial activity for both *Staphylococcus aureus* and *Escherichia coli* were 250mg and that of steroids were 25mg. Bacterial zone of inhibition was observed at a concentration of 100µL. The total steroids isolated from the petroleum ether extract was white needle like crystals and was dissolved in DMSO, 100µL positive control streptomycin (0.1mg/mL) was taken as the positive control and DMSO taken as the negative control (100µL). The zone of inhibition for both *Staphylococcus aureus* and *Escherichia coli* is shown in Fig.II. For the gram positive bacteria *Staphylococcus aureus* the zone of inhibition of petroleum ether extract was 20mm and that of steroids was 15mm while the positive control streptomycin showed zone of inhibition 25mm. In case of gram negative bacteria *Escherichia coli* the zone of inhibition of petroleum ether extract was 15mm and that of steroids was 14mm while the positive control streptomycin showed zone of inhibition 20mm. The negative control showed no zone of inhibition in both the cultures. In *Staphylococcus aureus* the petroleum ether extract showed the zone of inhibition of 20mm and for the steroid was 15mm (Table II). But the concentration used for the petroleum ether extract was 250mg and the steroids were 25mg. In *Escherichia coli* the zone of inhibition of petroleum ether extract was 15mm and that of steroids was 14mm. As the concentration taken for steroids was only 25mg the activity can be compared with 250mg of the petroleum ether extract. The isolated steroids can produce remarkable antibacterial activity even though the concentration used was 25mg.

Anticancer activity

The anticancer activity steroid extract of *Solanum trilobatum* was studied by carrying out MTT Assay. The results were explained on the basis of values of percentage viability and percentage cytotoxicity summarized (Table III). A graph was plotted with percentage of cytotoxicity against concentration. The IC_{50} values were calculated from the regression equation of the graph. The IC_{50} value was 90.92µg/mL. As the concentration increases percentage viability decreases and as the concentration increases percentage cytotoxicity increases. For concentrations 6.25, 12.5, 25, 50,100 and 200µg/mL the percentage viabilities are 89.83, 83.60, 75.83, 58.72, 45.50 and 38.11 and their percentage cytotoxicities are 10.17, 16.40, 24.17, 41.28, 54.50 and 61.89 respectively. In a higher concentration of steroid it shows high % cytotoxicity.

TLC preparation

For the phytochemical screening of *S.trilobatum* sterol rich fraction on separation by TLC clearly showed that the showed seven fractions. The R_f values for each fraction was calculated and designated as FI- FVII for the studies (Fig.III) (Table IV).

DISCUSSION

Traditional use of medicinal plants to cure specific ailments had been practiced in ancient times. Although synthetic drugs and antibiotics brought a revolution in controlling different diseases, herbal medicine occupied a significant role as raw material for some important drugs (Hong, 2011). Over the past dozen years, increasing attention has accordingly been paid to natural products in the search for novel drugs in combination with new technology (Nago *et al*., 2013). There is a continuous search for potent and cheaper raw material in the drug industry. The actions of the herbs depend on the interaction and synergy of many unknown biochemical components. The traditional herbs should be subjected to a thorough analysis towards standardization. The present investigation is an attempt to identify the antimicrobial, antioxidant and the anticancer activity of crude petroleum ether extract and the total steroids isolated from the petroleum ether extract. The plant *Solanum trilobatum* is widely seen in warmer parts of the Asian continent as inhabitant of scrublands, mainly distributed throughout the Southern India. It has been used in the areas where it is cultivated for treating various ailments. For phytochemical studies appropriate selection of the solvent is an essential pre-requisite for the extraction of active principle from plants. Various alkaloids present in the family Solanaceae have already been identified and described (Evans and Ramsey, 1983). Cytotoxic potential of different solvent extracts from *S. trilobatum*has been reported and "Sobatum,"- the partially purified component of the plant obtained from the petroleum ether extract, contained betasitosterol as the active principle and exhibited anti-tumor activity (Mohanan and Devi, 1997). Presence of a steroid, solasodine (glycoalkaloid), was also reported from *Solanum trilobatum*. Various chemical constituents are reported from *Solanum* species, which includes alkaloids, phenolics, flavanoids, sterols, saponins and their glycosides.

Alkaloids such as soladunalinidine and tomatidine were isolated from leaf and stem of *Solanum* species. This plant has been reported to possess a broad spectrum of antibiotic, antibacterial and anticancer activities (Mohanan and Devi, 1996). Owing to the increased demand for the phytosterols in curing various diseases, the attention was given to meet the hike in the demand. Reports claim that phytosterols have effects in the treatment of cancer, rheumatoid arthritis, allergies and stress related illness (Balakrishnan *et al*., 2015). Petroleum ether, chloroform, methanol and ethanol were the commonly used solvents for extraction (Salie *et al*., 1996). Chloroform which showed low efficiency in the extraction of steroids, petroleum ether was used as the solvent for extraction and is agreeing with the reports of Eong and Achance (2001). Saponification was carried out for the isolation of steroids from petroleum ether extract using ethanol and KOH. Similar results were also obtained by Chern *et al*., (1999) while isolating a hormone of *Phytophthora parasitica*. Isolation of steroids had already been reported from the extracts of aerial parts and roots of *Buddleja cordata* (Avila *et al*., 1999) *Rubus impertialis* (Kanegusuku *et al*., 2002) and *Agave attenuate* (da Silva *et al*., 2002). Needle like crystals were obtained from the isolation and concentration of the steroids. In the antioxidant activity, the aerial part of *Solanum trilobatum* was studied by carrying out DPPH free radical scavenging activity. Lower absorbance indicated higher free radical scavenging activity. This method is based on the reduction of an alcoholic DPPH solution in the presence of a hydrogen donating antioxidant due to the formation of non-radical form DPPH-H by the reaction. Certain plant metabolites have been reported to have strong antioxidant activities which help to protect cells against oxidative damage by free radicals. In the DPPH radical scavenging assay, the results obtained from the extracts of *Solanum trilobatum* were compared with ascorbic acid. In the present study, highest DPPH scavenging activity was shown by the total steroids, 212.72µg/mL.

Ascorbic acid inhibited 50% of free radicals at 11.24µg/mL concentration. For both ascorbic acid and the sample, the percentage of inhibition increased as their concentration increased. In the study of berberine the IC_{50} value of berberine was reported as 42.7µg/mL (Shirwaikar *et al*., 2006). In the present study the purified component of

Solanum trilobatum show higher antioxidant activity also due to the low IC_{50} activity. The *in vitro* antioxidant studies of chloroform extracts from *Solanum trilobatum* were also studied (Sini and Devi, 2004).The chloroform extract of *Solanum trilobatum* exhibited less scavenging effect on DPPH radicals. The antibacterial efficacy of the *Solanum trilobatum* extract was tested. The antibacterial activity test revealed that the overall inhibitory effect is found in the tested bacterial species. The extract at 100µg for gram positive bacteria (*S. aureus*) and 100µg for gram negative bacteria (*E. coli*). The tested sample exhibited a higher level of inhibitory effect on *S. taphylococcus aureus*. Similar results were obtained in butanol extract of *S. trilobatum* against *E. coli* and *S. aureus.* Methanol extracts of flowers also showed inhibition over *E. coli* and *S. aureus* whereas stem extract showed inhibition only against *S. aureus* (Trease and Ewan, 1989). Clinical studies have reported by Govindan *et al*., (2004) in *S. trilobatum* was found to be very effective for antimicrobial activity against organism. The results of *S. nigrum* showed highest antibacterial activity against *E.coli* (Jimoh *et al.,* 2010). *S. schimperianum* showed their highest antibacterial activity against *E.coli* and *S. aureus* (Al-Oqaila *et al.,* 2012). In the present study, *S. aureus,* the gram-positive bacteria was more sensitive to the samples than gram-negative bacteria *E. coli.*

The probable factor for the higher susceptibility of *S. aureus* observed in the present study is that some extracts had a good potential for therapeutic use against the bacterial pathogens their activity is not related to the differences in the cell wall structure, as the gram-positive bacteria has thicker cell wall than gram-negative bacteria. The qualitative screening of phytochemical compounds in *S. trilobatum* revealed the presence of saponins and tannins in leaves, stem, flowers and fruits. Flavonoids, phenolic compounds and cardiac glycosides were present in all extracts. Carbohydrates were also present only in leaves and stem. These findings reveal that antimicrobial activity of *S. trilobatum*extracts is mainly due to the presence of these phytochemicals. The anticancer activity of *Solanum trilobatum* was studied by carrying out MTT assay. It is a sensitive, quantitative and reliable colorimetric assay that measures viability, proliferation and activation of cells. This assay is based on the capacity of cellular mitochondrial dehydrogenase enzyme in living cells to reduce yellow water-soluble substrate (MTT) into dark blue / purple formazan product which is insoluble in water (Mosmann, 1983). In an MTT assay that is being conducted in *Solanum nigrum* it was found that % growth inhibition increases with increasing concentration and IC_{50} value of this assay was 265µg/ml. In present study conducted in *Solanum trilobatum* also % cytotoxicity increases with increase in concentration and the IC_{50} value of this assay was 90.92µg/ml. For the identification of the active principles further fractionation of total steroids was done by thin layer chromatography. Three TLC fractions were obtained with different R_f values.

CONCLUSION

Solanum trilobatum, a medicinal plant commonly available in South India, is an extensively used Indian traditional medicine to cure various human ailments. *Solanum trilobatum* was reported to cure numerous diseases such as tuberculosis, respiratory problems and bronchial asthma. The extracts were proved to have antibacterial, antioxidant and anticancer activity. The antibacterial activity was demonstrated by considerable zone of inhibition against gram positive *S. aureus* and gram negative *E.coli*. The isolated steroids of 25mg showed higher antibacterial activity since it is a pure component. It also showed significant results of 15mm in gram positive and 14mm in gram negative bacteria. The antioxidant activity was detected against extracts and standard Ascorbic acid. Since the IC_{50} value of steroids were less it showed higher antioxidant activity. The anticancer activity was done against steroids. The steroid component showed high percentage cytotoxicity of 61.89µg/mL. TLC plates were also made to obtain various fractions for the further isolation of compounds. Thus our results support the view that the purified part of *Solanum trilobatum* is a promising source of potential antibacterial, antioxidant and anticancer properties. Further our work includes the identification and isolation of specific active principle which causes these properties through compound identification method such as IR, NMR.

ABSTRACT

Rapid population expansion, urbanization and escalating consumption has led to global increase in waste biomass with an estimate of 2.24 billion tonnes in the year 2020. Mismanagement and unregulated waste biomass disposal create health issues, ecosystem damage, climate change and safety hazards. The impact of unsustainable waste management is disproportionate among nations but severely affects people of developing countries. Biomass wastes are of different kinds sourced from industrial, municipal to agriculture and agro-forestry. Their minimisation is of absolute importance to lessen the menace of hazardous, non-recyclable and infectious waste. Recyclable biomass waste helps to recover costly and rare elements and derive energy from it whereas reusable waste helps in resource savings. Valorization of the waste into biogas, biofuel, biomethane are some of the foremost areas by which a circular economy can be generated through waste recirculation. Different conventional and advanced treatment mechanisms of waste biomass removal are pragmatic but associated with its challenges and constraints. Based on these findings, the study has been designed to focus on different source generation of lignocellulosic waste and different modern avenues for generation of ways for waste valorization.

Keywords: Waste, Wealth, Valorisation, Biogas, Biomethane, Landfill

INTRODUCTION

Population explosion and modernization has long been an unescapable concern for the ecosphere pertaining to the huge amount of waste being generated. Globally, the waste generation is approximately 2.02 billion tons, which can escalate to 3.4 billion tons in the year 2050. More people invariably leads to more generation of waste and management and disposal of these wastes has raised candid concern among ecologists, governments and other stakeholders. This biomass trash remains the huge source of threat to the ecosystem, environment and human health [1,2]. Open dumping is the major sight of un-engineered or mismanaged landfills and simultaneously contributes heavily to environmental health hazards which should be mitigated speedily. Considering the disastrous state of waste management in poor socio-economic countries, there urgently, a huge paradigm shift towards waste management is needed. The generated waste is recognised as a resource wealth than a liability. To address the issue of 'biomass waste to wealth', modern techniques like anaerobic fermentation, pyrolysis, dark fermentation, torrefaction and bioelectrochemical systems are utilized to convert organic waste into energy and fuel mainly. Certain biomass elements need active pre-treatment processes like grinding, pelletizing, chemical treatment and others toenhance the conversion process efficiently. Pre-treatment processes are done with an objective to augment the effectiveness of lignocellulose hydrolysis as it increases the accessibility to cellulose rich fractions [3]. Biological treatment with microbes or their derivatives also help in this pre initialization processes. Again leachate and the landfill are the two main by-products of the landfill system which can be valorization to generate cost effective and sustainable solutions for waste management. When water percolates through MSW, it produces leachate, a liquid byproduct that results from the physiochemical and biological treatment of solid waste. It is typically produced in landfills, composting sites, and incineration facilities. It is distinguished by the presence of rich organic matter, inorganic compounds, and nitrogen and phosphorus elements. It also contains hazardous components, but it can be converted into energy and biofuel through value-added resources. Leachate recirculation through the landfill can aid in the recovery of important nutrients, the maintenance of a higher moisture content inside the trash disposal, and the reduction of environmental contamination in ground water. Increased moisture content promotes the growth of anaerobic bacteria, accelerating the waste breakdown process and increase the rate of methane production. Waste biomass refers to organic material derived from living, or recently living organisms that is discarded as waste. It includes agricultural residues, forestry remnants, animal manure, industrial waste, municipal solid waste, sludge waste, landfill gas, food waste and other biodegradable materials. It is the primary energy source, accounting for 10-14% of global demand and in developing countries, rural sectors rely on 90% of their energy supply from biowaste conversion [4].Rather than letting it decompose in landfills, waste biomass can be converted into energy through different processes providing an eco-friendly alternative to fossil fuels. By capturing and utilizing waste biomass, biofuels, electricity and heat, can be produced, reducing greenhouse gas emissions and dependence on non-renewable energy sources. Figure 1displays the waste composition in municipal landfill.

Important avenues for Waste biomass utilization

Renewable energy source: Waste biomass can be converted into bioenergy, including biofuels like biohydrogen, biogas and bioelectricity. This reduces dependence on fossil fuels and contributes to a cleaner, more renewable energy supply.

Waste Reduction: Utilizing waste biomass helps manage agricultural, industrial, and household waste, preventing landfill overuse, reducing greenhouse gas emissions, and supporting better waste management practices.

Environmental Impact: Waste biomass conversion helps decrease methane emissions from organic waste in landfills, lowering the overall carbon footprint. By producing biochar, it also supports carbon sequestration, which can enhance soil quality and reduce atmospheric carbon.

Economic Growth: The waste biomass industry can generate jobs in bioenergy production, processing and technology development, to support a circular economy concept.

Valorization of Biomass: By-products like biochar, created from biomass waste, can improve soil fertility, increase crop yields and reduce reliance on chemical fertilizers, fostering more sustainable agricultural practices. Current sustainable waste treatment tactics focus on transforming waste into viable and utilizable sources like energy or fuel generation and converting into value-added products, by systematically harnessing biomass resources. This method not only provides an efficient use of organic biomass waste but also represents a cleaner and more environmentally friendly solution. By adopting such practices, these strategies contribute significantly to the development of a lignocellulosic biomass-based circular bioeconomy, promoting resource efficiency and sustainability within a closed-loop system [5].

Types of Waste Biomass

Based on the origin of the waste sources and their different properties like moisture content, volatile organic content, heating value, ash content and others, they are categorized into different sections[2,6,7].

Agricultural waste

Agricultural waste consists of the leftover materials generated during various farming activities, including crop harvesting, processing and livestock rearing. While often discarded or burned openly, they create huge air pollution by greenhouse gas emissions, impacts biodiversity and leads to degradation of soil. Contrarily agricultural waste holds substantial potential as a resource to improve soil health and thus crop productivity. Again with effective management, it can be transformed into bioenergy, organic fertilizers and even resources for construction or manufacturing. Technologies like composting, anaerobic digestion and biochar production allow for recycling and repurposing waste, by reducing emissions and enhancing soil fertility. Biochar of sugarcane bagasse, rice husks or other biomass from agrowaste has been utilized for remediation of various toxic pollutants from environment like heavy metals, toxic dyes, paints, organic pollutants. Even biofuels like biogas, biomethane, biohydrogen and bio-oil are generated by pyrolysis or torrefaction of the waste [8]. Administrators, scientists, farmers and industries are increasingly exploring sustainable waste management practices towards carbon neutrality, understanding that utilizing agricultural by-products can play a crucial role in achieving environmental sustainability and supporting the circular economy[9-12].

Forest Residues

Forest residue refers to the organic material left behind after forest management activities, such as logging, thinning or natural events like storms and fires. This residue includes branches, leaves, needles, bark, flowers and stumps, which are rich in carbon, fiber and polymeric content. This composition makes them highly suitable as a starting material for designing and developing advanced adsorbents for remediation purposes [13]. Often seen as waste, forest residue can actually play a vital role in the ecosystem by providing habitats for wildlife, enriching soil nutrients and aiding in carbon sequestration. Agricultural waste valorization, leads to environmental cleanup, socioeconomic development, promotes resource conservation, recovery and enhances energy security. For instance, forestry bio-waste has high organic matter content which is repurposed as edible biocoating for fruits and vegetables, prolonging their shelf life and incorportaed in the edible packaging materials, providing biodegradable alternatives to synthetic plastics. In water purification processes, plant extracted polysaccharides function effectively as flocculants, aiding in removal of various waste [14,15]. Forest residues are also valorised by growing edible fungus like oyester and button mushroom after sterilization, and the remaining spent mushroom substrate are reutilized for composting, second substrate, organic fertilizer, animal feed and biofuel generation[5,16,17].

Industrial waste

Industrial waste refers to the by-products generated from manufacturing textiles, paper, oil refineries and food processing units. Mining operations, construction, and power generation activities also contribute significantly to industrial waste generation. These wastes include chemical by-products, metal scrap, packaging materials, sludge, ash, debris and other residues. Industrial waste can be hazardous like toxic and flammable, or non-hazardous but can still be an environmental threat. Improper disposal and processing of this biomass waste has caused environmental

issues like drinking water source contamination, respiratory difficulties and soil health depletion affecting agriculture and productivity[5].

Municipal solid waste

The waste materials (recyclable or non-recyclable residues) obtained from municipality zone like households, communities, commercial buildings, institution and small scale industry are known as municipal solid waste (MSW). The MSW waste composition varies depending on the urban or rural source, season, economic status, processing patterns and geographical location. Usually both biodegradable and non-biodegradable fractions are present and 15% of the total waste are recycled while the remaining is disposed to landfills or dumped openly. Mismanaged MSW creates severe environmental pollution albeit conversion into value-added products could offer solution towards the energy scarcity challenges and ecological waste management. Landfilling, pyrolysis, gasification, anaerobic digestion and composting are usual methods of disposal, recycle, or convert into energy resources like biogas or biofuel. For instance, 1 metric ton of MSW roughly release 1.3 metric tons of CO_2 equivalents close to the CO_2emissions from power plants. Valorising CO_2 into biogas or upgrading into biomethane can significantly reduce environmental pollution and the generated biofuel can serve as alternatives to fossil fuel creating avenues for uplifting economy of the country [5,18].

Animal Manure

Animal manure, a natural byproduct of livestock, is an effective organic fertilizer used to enhance soil fertility and boost plant growth. Composed of macro and micro nutrients like nitrogen, phosphorus and potassium, manure enriches the soil by supplying essential elements that stimulate crops and improves soil structure. For example, poultry manure is particularly rich in nitrogen, making it beneficial for crops that demand high nitrogen levels. Proper composting of manure is essential to ensure pathogens are destroyed and nutrient levels are stabilized, making it safer for agricultural use. Using manure as a fertilizer is environmentally pleasant, as it recycles animal waste that might otherwise contribute to pollution and affect local ecosystems by leaching. By incorporating manure into farming practices, growers can reduce reliance on synthetic fertilizers, leading to more sustainable agriculture[19-21].

Sewage and waste water

Sewage and wastewater refer to the water that contains human waste, food scraps, oils, soaps, and chemicals from households, laundry, industries or commercial activities. If not properly treated, it can be harmful to both human health and the environment. Sewage systems are designed to collect and transport this water to treatment facilities. These facilities employ physical, biological, and chemical processes to remove contaminants and purify the water. The goal is to make the treated water safe for discharge into water bodies or reuse in irrigation and industrial processes. Untreated sewage can lead to water pollution, causing harm to aquatic life and spreading diseases. Modern sewage treatment includes primary, secondary, and sometimes tertiary treatment stages. The primary stage separates and suspends the solids, the secondary uses microbial break down of organic material and the tertiary stage further purifies the water. Sewage sludge is highly filled with nutrients which can be valorised for biogas and biofuel production[22,23].

Food waste

Food waste refers to edible food that is discarded or unused at various stages, from production to consumption. It occurs due to overproduction, poor storage, improper handling, or consumer behavior like buying more than needed. It is a significant global issue with social, economic and environmental implications. From the wasted food landfills releases methane, a potent greenhouse gas. Food waste also raises ethical concerns, given that millions of people worldwide face hunger and food insecurity. Efforts to reduce food waste focus on better management across the supply chain with improved harvesting methods, good storage facilities and adopting efficient distribution strategies. Addressing food waste requires to implement sustainable practices, create pathway for efficient valorisation like converting the waste into biogas or biofuel through advanced treatment processes. Different

conversion pathways such as physicochemical (pelletization), biochemical (anaerobic digestion, bio-methanation) and thermochemical (pyrolysis) methods can successfully utilize and manage these biomass wastes.

Characteristic properties of waste biomass

Usually biomass mainly consists of carbon, hydrogen, oxygen, traces of sulphur, nitrogen and other elemental compounds. These constituents made up the primary organic compounds in plant biomass which are cellulose, hemicellulose and lignin. Cellulose, major polysaccharide and the primary structural component of plant cell walls, makes up 30-50% of biomass. It provides a source of fermentable sugars. Hemicellulose, the second complex carbohydrate constitutes 20-30% of biomass. It is more easily degradable than cellulose and releases various sugars upon breakdown. Lignin, third complex aromatic polymer that gives rigidity to plant cells, accounts for 15-30% of plant biomass (Table 1). It has high calorific value but not easily degradable. The ratio and proportion of these components influence the formation of value added products from these compounds. For example agricultural waste normally has 10-15% moisture, while animal manure has more moisture content. Biomass density also impacts the end product conversion along with transportation and storage. Chopped agricultural waste, shredded and powder form has high surface area for enhanced availability of treatment[12,24].The inorganic mineral constituents of biomass turn to ash after combustion but high ash content reduces energy efficiency and can cause operational issues in boilers. Among the chemical properties, high calorific value (for biofuel) is influenced by the proportions of carbon, hydrogen and oxygen of the waste biomass. Influences microbial digestion during biogas production like low pH can inhibit working of anaerobic bacteria. Carbon-Nitrogen (C/N) ratio(20:1 to 30:1) of the biomass is optimal for microbial activity and influences biogas production. Understanding these physical and chemical properties is critical in optimizing waste biomass for energy recovery processes and biofuel production. Proper assessment leads to more efficient energy conversion technology and better waste-to-energy programs [3,25].

Pre-treatment procedures of biomass waste

Agricultural waste is primarily constituted of lignocellulosic biomass that comprises of complex molecules such as-cellulose, hemicellulose and lignin. These are complex, compact matrices and need to be degraded to simple monomers before being converted into other products. Cellulose fibres are enclosed by hemicellulose and it also connects the cellulose fibres to lignin. It is composed of diverse assembly of branched polysaccharides. Monomers of galactose, glucose, arabinose, xylose, mannose and glucuronic acid are the structural components of hemicellulose. It is amorphous, hydrolyzed quite easily by weak acids, bases, enzymes, and not much resistant to chemicals. Comparatively, hemicelluose is not as mechanically strong as cellulose. Lignin is a non-carbohydrate complex aromatic polymer composed of unevenly placed phenylpropane units which renders them structurally rigid, water resistant and resilient to microbial attack. Owing to this complex structure, the breakdown of lignocellulosic biomass is a difficult task[3,12,26-28].The goal for pretreatment processes on agricultural wastes and other lignocellulosic biomass are-

- reduce consumption of energy during conversion
- cost reduction
- formation of sugars directly from biomass
- pre-treatment methods also preserves sugar produced from degradation
- reduced formation of inhibitory products

On the basis of the physical and chemical nature of biomass, the preferred pre -treatment method needs to be chosen.

Physiochemical methods

Steam explosion: This process separates cellulose from lignocellulose by disrupting the β-O-4 bond in lignin and destroying the cell wall configuration of biomass by subjecting it to strict temperature and pressure. An optimal pressure range of 0.5–5 MPa and temperatures of 160–250 °C, is needed. It was reported that 80% lignin was removed if steam explosion was applied to pineapple leaf fibres at conditions like 215 ºC, 2Mpa for five minutes. Despite this, the disadvantages of this method is that it consumes high energy, inhibitory by-products are generated and extreme reaction conditions are needed.

Alkali heat pre-treatment: Utilizes alkali and heat for lignin decomposition, and to reduce the crystalline nature of lignocellulose, and maximize the surface area of contact for it. NaOH, Na_2CO_3, and alkaline peroxide are some of the alkalis preheated between 75°C and 125°C for removal of lignin and hemicellulose. Although effective, this process is complex and the maintenance of high temperature is expensive.

Ammonia explosion fibre pre-treatment: Here, ammonia and oxy-hydrogen ions are prepared from liquid ammonia, at high pressure, thereby causing an abrupt temperature rise. This decomposes ester and ether bonds between lignin and hemicellulose and then reduces the cellulose crystals. This has proven to be very efficient for lignin degradation and improved the glucose yield of barley straw and corn stover. Conditions are simple but need much energy, environment friendly and does not produce inhibitory by-products.

Extrusion pre-treatment: This involves combination of thermal and mechanical pre-treatment methods. This changes lignocellulose physically and chemically. Here, force is applied on agricultural wastes, kept in an airtight vessel in order to increase temperature and pressure. NaOH is added to the process. This removes hemicellulose and lignin efficiently and sugar yield is increased by significant amount[29,30].

Green solvent- based

Biochemical pre-treatment: This method compensates for the low efficiency and the time consuming biological pre-treatment methods and to reduce the large volume of inhibitory compounds formed. But it is costly pre-treatment method and mot utilized in cases of wheat straw conversion into biomass.

Ionic liquid pretreatment: Molten salts or liquid electrolytes are referred to as ionic liquids. They are comprised of cations(imidazole, choline, pyridine) and ions (chloride and acetate). Their interaction with lignocellulose materials leads to broken β-O-4 bonds and formation of ion-dipole bonds. This interrupts the crystalline composite structure of lignocellulose, decomposes the structure, and subsequently separates lignin and hemicellulose from these cellulose-rich materials. They offer almost 99% reliability in conversion of lignocellulosic biomass to bioethanol, but are cost operative.

Deep eutectic solvents: These resemble ionic liquids and are constituted of hydrogen bond donors like urea, amides, alcohols, acids, etc. and hydrogen bond acceptors. These hydrogen bond donor and acceptor interface causes a slight acid or base catalytic blend and helps to degrade the ether bond present between lignin and hemicellulose during lignocellulose pre-treatment. A 96% lignin removal efficiency was reported by Ma *et al*., [31]as they pre- treated poplar wood with such solvents. Examples of deep eutectic solvents are choline chloride, ethylene glycol. This method is cost effective, has low toxicity and high recovery.

Supercritical fluid: They behave like liquids at above critical temperature (304.25 k) and pressure (7.36 MPa),for example H_2O and CO_2. They are not costly, safe, non-toxic, non-combustible, eco-friendly and renewable. If lignocellulose is dissolved in supercritical carbon dioxide (SC CO_2), it results in the change of structure and decomposition of the chemical bonds between lignin and hemicellulose. Pre-treating green coconut fibre under 20–30 MPa for 6–72 h resulted in an increased efficiency of 101% of sugar production. This method, if applied to microalgal and lignocellulosic biomass pre-treatment results in a significant increase in the generation of reducing sugar [32].

Biological methods

Fungal: In this process of biological pre-treatment, various types of fungi like white-rot fungi, brown rot fungi, soft rot fungi and other fungi are used for lignin degradation. Hydrolyases and oxidative ligninolytic enzymes of White-rot fungi of class Basidiomycetes like *Phanerochaete chrysosporium, Trametesversicolor* and others are used for biodegradation of lignin. A recent study on white-rot fungus, *Peniophora incarnata* for the pretreatment of waste wood, reduced the percentage of hemicellulose and lignin by 48% and 70%, respectively. The water content and particle size of the feedstock, reaction temperature, and residence time highly influenced the reaction parameters[33,34]. *Termites:* They secrete enzymes to digest lignocellulose efficiently. Many classes of termites like

Microcerotermesparvus, *Termeshospes* and *Nasutitermese phratae* can secrete enzymes for degradation of lignocellulose[35]. *Microbial consortium*: Microbes from soil, wastewater, etc. are agents of pre-treatment for agricultural wastes. They are able to decompose both the cellulose and hemicellulose present in agricultural wastes through their enzymes like cellulases and hemicellulases. It was seen from research that microbes sourced from landfills, decomposing straws and wastewater could pre-treat cassava wastes to produce 96% biogas. Cassava pulp, sugarcane bagasse, corn stover, Napier grass, rice straw, etc. are some examples that have been successfully pre-treated with enzymes to be effectively converted to biobutanol[36]. The cellulolytic bacterium *Acetobacter orientalis* was used by Chen *et al*., [37] and achieved about 76.24% cellulose degradation of banana residue.

Augmentation of Bio-chemical methods

Bioventing

An in situ bioremediation procedures in which air or pure oxygen is introduced into the unsaturated zone of the soil by gas injection to assure aerobic biodegradation of contaminant chemicals. This technique increases the activity of indigenous bacteria present in the landfill subsurface while also convert aerobically degradable substances such as gasoline, oil and petroleum to simpler molecules. Along with oxygen, nutrients such as nitrogen and phosphorus are introduced into the contaminated site to promote microbial development, and their distribution is determined by the soil's physical qualities. Bioventing is more successful if the water table is deep below the surface and the area has high temperatures [38,39].

Biosparging

In Biosparging, pressurized air is injected into the groundwater in order to raise the oxygen concentration to aid in aerobic microbial breakdown of pollutants. Volatilization of certain compounds are also facilitated by this technique, but necessary to determine the soil's permeability and texture before injecting the oxygen. Injecting oxygen into the polluted site requires careful pressure management to avoid releasing volatile materials into the air. Mainly the sites contaminated with petroleum products like diesel or jet fuel are ideal for biosparging, but not for lighter petroleum products like gasoline which volatilize more easily [39].

Bioaugmentation

In order to improve the breakdown of trash, microorganisms with appropriate metabolic capabilities are introduced to the polluted site. To make sure that the microbes already there can break down chlorinated ethenes like tetrachloro ethylene and trichloroethylene into harmless ethylene and chloride, bioaugmentation is employed at areas where these pollutants have leached into the soil or groundwater.

Bioleaching

Bioleaching is a sustainable approach of leaching metals from landfill leachate sources using diverse live microbes [40]. The agents like nitric, sulphuric and hydrochloric acids dissolve heavy metals in soil or else the metabolic ability of acid-producing microbes dissolve them. Many fungi and bacteria, including sulfur-oxidizing bacteria and *Aspergillus* and *Penicillium* species, are used to bioleach metals from polluted soil. The most prevalent bioleaching archaea and bacteria are chemolitho autotrophic acidophiles, which contribute to leaching by oxidizing iron and reduced inorganic sulphur compounds. These acidophiles, functions best at temperatures and pH values below 3.0 and temperature range from 15 °C to 80 °C [40].

Thermal treatment

Pyrolysis

It is the most common method to produce biochar. In this method organic biomass is heated in the absence of oxygen at high temperatures ranging from 250°C to 900°C.In this process the waste biomass is converted into biochar, syngas and bio-oil. Here pyrolysis can be classified as fast and slow pyrolysis processes depending on the heating rate, temperature, residence time and pressure of the reactor. Different types of reactors such as paddle kiln, bubbling fluidized bed, wagon reactors are used for biochar production. It has been reported that lower temperature pyrolysis

favors more biochar production than the treatment of higher temperature pyrolysis. But higher temperature enhances carbon stability and surface area of the biochar[6].

Gasification

It is a partial combustion process where biomass is converted into syngas as major product and biochar as byproducts at higher temperatures (>800°C).Though this process produces lower biochar yields but it is energy efficient and also suitable for energy recovery.

Hydrothermal Carbonization (HTC)

In this method biomass is treated with water at high pressure and moderate temperatures (180–250°C).This process is mainly effective for wet biomass and it yields hydrochar, a material similar to biochar. The resulting hydrochar used to obtained via different chemical processes like polymerization, intramolecular dehydration and liquefaction/condensation. This mechanism is complex because of the high molecular mass and intricate structure of lignin. During pyrolysis, complex organic polymers or lignins remain unblended under liquefaction conditions that actually forms hydrochars.

Torrefaction

Torrefaction is a comparatively modern technique. The methodology is known as median pyrolysis having a lagging heating rate. Under anaerobic conditions at a heating rate<122 °F/min, a residence time of less than half an hour and a temperature increase from 300 °C to 500 °C torrefaction is considered as a form of fast pyrolysis. The running mechanism of torrefaction is divided into several steps such as heating, dehydrating, torrefying and condensing. This process is critical in the formation of biochar because it thermally alters biomass to improve its properties for soil amendment, carbon sequestration.

Purposeful products from biomass

Biochar

Biochar is a carbon-rich material, produced from the thermochemical conversion or pyrolysis of organic biomass under limited oxygen conditions. Pyrolysis is the most common method to produce biochar. In this methodorganic biomass is heated in the absence of oxygen at high temperatures ranging from 250-900°C and converted to biochar, syngas and bio-oil. It displays certain physicochemical properties such as it contains high surface area, high porosity and high product retention capacity like Carbon sequestration for addressing environmental challenges. These properties make biochar widely applicable for improving soil health to enhance crop productivity, reducing greenhouse gas emissions, detoxifying waste water, remediating polluted environment and for many other purposes. Biochar blended with green waste can help grow mushroom and significantly increases the nutrient content of the compost. Global focus on sustainability and the circular economy has also positioned biochar as an advanced tool for converting agricultural as well as organic wastes into value-added products[6,41].

Landfill gas/Biogas

Landfill gas is produced when organic waste in landfills decomposes anaerobically, releasing a mixture of gases, primarily methane (CH_4) and carbon dioxide (CO_2), along with small amounts of other compounds. Methane, being a potent greenhouse gas, can contribute significantly to global warming if released into the atmosphere. The final product from anaerobic digestion of various biomass wastes result in Biogas with multiple potential, including upgrading to biomethane (CH_4) and then using it to generate electricity, fuel, or heat. The leftover solids or digestate are used as biofertilizer for crop and plants. Hydrolysis, acidogenesis, and methanogenesis are processes in which bacterial populations engage through syntrophic pathways during anaerobic reaction. But challenges are prevalent when anaerobic reaction in the landfill are guided by a number of variables, like the feedstock composition, the microbial diversity, the pH and temperature of reaction process. To mitigate this, many landfills install gas collection systems capture methane and use it to generate electricity or heat, turning a harmful by-product into a resource. Biogas on the other hand, is produced in controlled environments, such as anaerobic digesters. These digesters break down organic materials like agricultural waste, food scraps, and sewage sludge under anaerobic conditions,

generating a similar mixture of methane and carbon dioxide. Biogas can be refined to produce biomethane, a renewable energy source that can replace natural gas for heating, electricity, and even as vehicle fuel. Both landfill gas and biogas capture methane emissions, reducing environmental impacts and providing a renewable energy source[23,42,43].

Biomethane

Again biogas can be upgraded to biomethane which lessens our reliance on fossil fuels and increases the fuel power and efficiency. Through adsorption procedures, biogas can be enhanced to produce methane by rerouting the CO_2 pathway to generate more high-quality biomethane (97% CH_4). In this context, CO_2 is removed from biogas by a variety of physiochemical processes, including adsorption and membrane penetration. Thermal treatment like Carbonization or pyrolysis of waste biomass ensues at high temperatures (400-850°C) with limited oxygen. Biomass converted to porous carbons has great affinity to absorb a lot of CO_2andimprove biomethane production efficiency. Again, the adsorption approach is relatively inexpensive, dependable and sustainable, with the only requirement of large adsorption surface area and an efficient adsorbent. Furthermore, during physical activation process, an oxidant like air steam of N_2, NH_3,O_2 and CO_2 or gaseous mixture at high temperatures (600-1000°C) can add several surface functional groups to aid in the adsorption process[43,44].

Biofuel

Biofuel are derived in three different form like solid, liquid and gaseous state. Solid biofuels originate from municipal and animal waste biomass to generate energy, heat, and cooking fuel. Liquid biofuels like bioethanol, biodiesel and bio-oil are also derived from biodegradable biomass sources but have higher energy density than solid/gaseous biofuels, making them better for storage and transit. For instance, Biodiesel, is utilized as a fuel for compression-ignition engines by blending with petroleum diesel at a certain amount, and the most common mixture, B20 consist of 20% biodiesel and 80% petroleum fuel. Biohydrogen, and bio syngas, are example of gaseous fuel which are of low-density, obtained through pyrolysis or gasification process[11].

Cellulose deconstructive enzymes

Cellulases, the main enzyme for cellulose degradationison high demand in the global industrial market and developing low-cost cellulases from biomass waste are the most sustainable and promising way to lower their cost. Cellulases comprise three sub-enzyme groups of endoglucanases, exoglucanases and β-glucosidases. Microbial enzymes have specific interaction with the lignocellulosic substrate and thus produce enzymes differently. Aerobic bacteria release enzymes externally as free cellulose molecules whereas anaerobic bacteria produce cellulases into the cell surface as a protein complex called a cellulosome. Previous investigations has shown that fungi, rather than bacteria, are the most effective cellulase producers from organic waste like wheat straw, paddy straw, sugarcane bagasse, and other lignocellulosic components. For example, *Trichoderma* and *Aspergillus* through solid-state or submerged fermentation process has been successfully producing cellulases valorizing the organic biomass waste [45].

Challenges of biomass valorization

Diversity in waste feedstock

Cellulose, hemicellulose, lignin, and a trace amount of inorganic substances make up waste biomass. Different proportions in the biomass determines the degree to which it will decompose during pyrolysis and how resistant it is during hydrolysis. Because of their structural stability, these three main components take different time and method to decompose and thus there is no such constant methodology applicable.

Efficiency in conversion

When turning waste materials into biofuels, complex processes like hydrolysis, anaerobic digestion and thermochemical conversion requires step optimization. Inhibitory byproduct generation, high energy inputs and poor conversion efficiency, need to be minimized and regulated that will increase the economic feasibility of valorized production.

Cost efficacy

The cost of waste valorization is critical to their economic sustainability to generate market demand and investment. It considers feedstock costs, conversion methods, operating expenses, and distribution infrastructure. Advances in technology, scale, and feedstock availability can all help to reduce production costs and increase competitiveness.

Opportunities of biomass valorization

The safety of energy resources

Generation of opportunity to reduce reliance on fossil fuels is one way in which biofuels contribute to greater energy security. The renewed energy systems from waste feedstocks can ameliorate economy of the country.

Utilization of refuse

Waste valorization has the potential to repurpose various types of waste, including those from agriculture and forestry, instead of sending them to landfills and worsening environmental impacts. This method opens the door to reducing waste and making better use of available resources.

Creating jobs and fostering rural development

Rural economies could be enriched by providing jobs in sectors of feedstock sorting, processing and distribution which will open up new avenues of income for the rural people.

CONCLUSION

Waste accumulation is of grave concern today which can be only mitigated by advanced technologies and waste valorization. To tap the full potential of waste biomass, improved and sustainable technologies for large-scale commercialization needs to be achieved by further investigations. Utilization of renewable resources from waste biomass, is essential for reducing emissions of greenhouse gases and increasing energy security. In the current scenariomore emphasis is on thermochemical and biochemical conversion processes to improve biomass conversion into power, heat and biofuels. Furthermore, it contributes significantly to the advancement of a circular economy by establishing closed-loop systems that reduce reliance on non-renewable resources while producing value from waste. This strategy is a significant step toward more sustainable integrated waste management with value generation.

ABSTRACT

Urinary tract infections (UTIs) are amongst the most frequent infections. Although other microbes like fungus and some viruses have occasionally been implicated in UTIs, bacteria are the primary cause of these illnesses. The most frequent cause of both uUTIs (uncomplicated) and cUTIs (complicated) is Uropathogenic *Escherichia coli* (UPEC), which is followed by other harmful microbes such Staphylococcus species, *Klebsiella pneumoniae*, Proteus mirabilis, and *Enterococcus faecalis*. Uropathogens' high recurrence rates and growing resistance to antibiotics pose a serious danger to the illnesses' financial burden. Many patients will receive better clinical care if UTIs are diagnosed accurately and treated with evidence-based practices, which will also reduce the overuse of antibiotics. The degree of immunosuppression and the genitourinary anatomy of the patient also influence the therapy strategy. Therefore, a specialist and interdisciplinary therapeutic approach may be necessary for individuals who have kidney transplants or urological blockage.

Keywords: UTIs, Antimicrobials, Management, Outcomes, Uropathogens, Virulence Factors

INTRODUCTION

One of the most prevalent bacterial illnesses in the world, urinary tract infections (UTIs) can occur in both public and medical settings. Most UTIs are often treated empirically, despite the fact that the clinical symptoms of UTIs vary widely and can range from simple (uUTIs) to complex (cUTIs). Although other microbes like fungus and some viruses have occasionally been implicated in UTIs, bacteria are the primary cause of these illnesses. The most frequent cause of both uUTIs and cUTIs is Uropathogenic *Escherichia coli* (UPEC), which is followed by other harmful microbes such Staphylococcus species, *Klebsiella pneumoniae*, Proteus mirabilis, and *Enterococcus faecalis*. The urinary

system consists of the kidneys, ureters, bladder, and urethra, and its main function is to filter blood by removing waste products and excess water. The urinary system plays a key role in removing the waste products of metabolism from the bloodstream. Other important functions performed by the system are the normalization of the concentration of ions and solutes in the blood and the regulation of blood volume and blood pressure[1]. Numerous pathogens, including both Gram-positive and Gram-negative bacteria and fungi, can cause urinary tract infections (UTIs). Women, children, and elderly patients who are otherwise healthy are usually the ones that suffer from simple UTIs. Indwelling catheters, anomalies of the urinary system, immunosuppression, or antibiotic exposure are typically linked to complicated UTIs[2]. Urinary tract infections (UTIs) are extremely common, cause significant patient morbidity, cost health care systems a lot of money, and are among the most frequent causes of antibiotic use globally[3]. UTIs can have an impact on pregnant women's outcomes. There is a positive link between lower birth weight, preterm birth, and perinatal mortality, according to several research examining the consequences of UTI in pregnant women. Two categories are usually used to classify UTIs. The lower urinary tract is affected by acute cystitis, which is the first. Acute pyelonephritis, which affects the upper urinary system, is the second[4]. Fever, vague symptoms, or poor growth in infants can all raise suspicions of a urinary tract infection, as can urinary symptoms in older children[5]. Diagnosing and managing upper and lower UTI have always been a challenge to physicians, given its high prevalence, risk of recurrence and improper treatment, and the fact of worldwide increase in antibiotic resistance, necessitating implementation of a proper antibiotic stewardship[6].

In order to educate and increase knowledge of the proper diagnosis and management of UTIs, a patient awareness campaign was also launched during the Congress. This campaign involved patients, patient organizations, and doctors in managing bacterial infections in accordance with EAU guidelines. a video that promotes the usage of antibiotics, UTIs, and the campaign[7]. One of the main causes of antimicrobial resistance (AMR) is the treatment of UTIs. The most common uropathogen is still *Escherichia coli*. According to international reports, uropathogen resistance rates are rising, which is linked to an increase in the number of fatalities and disability-adjusted life years. [8]. Urinary tract infections (UTIs) are characterized by pain or discomfort when urinating, frequent urination, a feeling of urgency, blood or mucus in the urine, lower abdominal cramps or ache, discomfort during sexual activity, and pain, pressure, or tenderness in the bladder area. Back discomfort, chills, fever, nausea, and vomiting are some symptoms for patients whose bacteria have gone to their kidneys[9]. The identification of a quantifiable measurement of ≥10,000 CFU/mL of multiple bacterial species in a urine sample, independent of the presence of pyuria, is also referred to as asymptomatic bacteriuria[10]. On the other hand, clinical observations of dysuria, urgency, frequency, hematuria, suprapubic pain, and uterine contractions, along with the presence of bacteriuria exceeding a count of 10,000 colony-forming units per milliliter (CFU/mL), are used to determine a symptomatic lower urinary tract infection (UTI). (11)UTIs are frequently brought on by bacteria that invade the genitourinary and lower gastrointestinal tracts and progress upward[12]. Regardless of a female's reproductive status, the agents that cause urinary tract infections (UTIs) belong to the same taxonomic group and have similar virulence traits. Among the bacteria that are frequently observed are *Escherichia coli*, *Klebsiella pneumoniae*, Proteus species, Acinetobacter species, *Staphylococcus saprophyticus*, Group B Streptococcus (GBS), and *Pseudomonas aeruginosa*[13]. Pregnant women frequently get both symptomatic and asymptomatic UTIs, which can have detrimental effects on the mother, pregnancy, and unborn child. These alterations occasionally lead to symptomatic infection and raise the prevalence of asymptomatic bacteriuria (ASB). Such infections can have serious repercussions for the developing fetus as well as the expectant mother. Moreover, a number of factors may enhance pregnant expectant moms' susceptibility to UTIs, including advanced maternal age, parity, diabetes, sickle cell anemia, prior UTI occurrence, urinary tract abnormalities, and immunological inadequacies. (14)

Classification

According to the site of infection, UTIs are called urethritis, ureteritis, or inflammation of the urethra, and cystitis or pyelonephritis, or inflammation of the kidney and bladder, respectively.

Cystitis Bladder infections are more common in women than in men. In female patients, sexual activity usually precedes uncomplicated cystitis. Asymptomatic bacteriuria can be distinguished from dysuria when symptoms such

as urgency, frequency, nocturia, hematuria, and suprapubic discomfort are present. Significant bacteriuria and bladder mucosal invasion are its defining features. Women who are afebrile and show no symptoms of a systemic disease have these markers. (15)

Pyelonephritis When a midstream MSSU culture reveals at least 100,000 bacteria/mL of a single uropathogen along with inflammation of the pelvis, calices, and renal parenchyma, it is a disease suspected in the presence of systemic illness. If therapy is not administered, pyelonephritis can result in maternal sepsis, preterm labor, and early birth. Nausea, vomiting, chills, pyrexia, stiffness, flank or renal angle pain, and hip pain are all signs of pyelonephritis. There may or may not be signs of a lower tract infection, such as frequent urination and lack of thirst. (16)

Urethritis It refers to a urethral infection caused by bacteria, viruses, protozoa, or fungi. This occurs when these organisms gain access to both the periurethral glands in the male urethra and the complete female urethra. Numerous sexually transmitted Pathogens such *Neisseria gonorrhoeae*, *Trichomonas vaginalis*, *Chlamydia trachomatis*, and herpes simplex virus are commonly responsible for urinary tract infections in both sexes.(17)

Management of UTIs

Antibiotic treatment

Complicated UTIs

Multi organ involvement and severe, potentially fatal sepsis are possible presentations of a UTI. Resuscitation frequently comes before final treatment. It may be necessary to deliver broad-spectrum antibiotics and vigorous fluid resuscitation to the extremely septic patient in the emergency room. The patterns and recommendations of local bacterial resistance should always govern the selection of antibiotics[18]. The incidence of UTIs in women seems to be decreased by postcoital treatment of ciprofloxacin or trimethoprim/sulfamethoxazole (TMP/SMX). TMP/SMX, norfloxacin, and nitrofurantoin are relatively effective, according to observational data; nevertheless, findings are constrained by the study design[19]. Patients with diabetes may be more susceptible to UTIs due to a number of possible reasons specific to the disease. 38 Increased urine glucose levels could encourage the growth of harmful microorganisms. High amounts of glucose in the renal parenchyma provide an ideal environment for bacteria to develop and multiply[20]. The same species and virulence factors are responsible for UTIs in women, pregnant or not. *Escherichia coli*, *Klebsiella pneumonia*, Proteus, Acinetobacter, *Staphylococcus saprophyticus*, Group B Streptococcus (GBS), and *Pseudomonas aeruginosa* are among the bacteria that are frequently isolated. Preterm deliveries were more common in women with a UTI during pregnancy than in those without one (c2=7.092; p=0.007). While pyelonephritis was comparatively uncommon in this group (1.45%), recurrent UTI was noted in 26.6% of women with UTI. Pregnancy-related UTI and LBW did not significantly correlate (c2=0.097; p=0.756). *Escherichia coli* (30.9%) and Group B Streptococcus (GBS, 31.3%) were the most frequently isolated bacteria from women with UTIs. They had a broad spectrum of antibiotic sensitivity[21]. Preventive treatment is necessary since recurrent infections are prevalent during pregnancy. Intrapartum preventive medication should be administered to pregnant women who have a urinary group B streptococcal infection[22]. Education regarding the link between recurrent UTIs and the frequency of sexual activity and the use of spermicide-containing products should be part of strategies to prevent recurrent UTIs in young women[23]. Particularly for pregnant women from low socioeconomic backgrounds, the study suggests health education regarding personal hygiene and repeated urine cultures in the first and third trimesters of pregnancy. Prescriptions for certain antibiotics are necessary to prevent unfavorable pregnancy outcomes[24]. Giving an update on UTIs in immunocompromised patients was the main goal. The most frequent clinical cases that urologists see are kidney transplant (KT), diabetes mellitus (DM), and chronic kidney disease. A summary of diagnosis, treatment, and future research needs is provided. Autosomal dominant polycystic kidney disease (ADPKD) individuals had a 21–75% UTI prevalence. Although their efficiency is trending downward due to rising resistance rates, lipophilic antibiotics are still effective in treating infected cysts. With a reported rate of 45-72%, UTIs are the most prevalent illness among KT recipients. Both KT and ADPKD patients who get UTIs have diagnostic difficulties[25].

Uncomplicated UTIs

One of the most frequent bacterial illnesses seen in clinical practice is an uncomplicated urinary tract infection (UTI). They mostly impact the bladder and related structures in the lower urinary system. Prompt and adequate care of simple UTIs depends on a prompt and correct diagnosis. Reducing UTIs through preventative measures is essential to lessening the strain on medical resources. Health care providers can enhance patient treatment and improve overall results by being aware of the essential features of simple UTIs[26]. Numerous bacterial virulence factors have been found in UTI-causing pathogens. The most significant inhibitory variables in urine include low pH, high urea, high organic acid, and very high or low osmolality. Numerous novel antimicrobial drugs have been developed that aid in the eradication of germs, particularly those microbes that were resistant to earlier antibiotics[27]. For simple illnesses, E. coli predominates in 80–90% of cases. Acute infection may be caused by microorganisms that have the capacity to colonize the uroepithelium (fimbriae/pili) and to cytotoxically harm cells and tissue (hemolysin)[28]. The effectiveness of trimethoprim-sulfamethoxazole (TMP-SMX) in treating uncomplicated UTIs caused by TMP-SMX-resistant (TMP-SMX-R) microorganisms was assessed in this study. Pyuria and bacteriuria were evaluated in healthy non-pregnant premenopausal women with lower urinary tract infections; if either was found, a urine sample was obtained and TMP-SMX was recommended[29]. As people age, their incidence rises, and the lack of novel treatments and antibiotic resistance make therapy more difficult. We looked into how susceptible the current urine isolates in Europe were to fosfomycin and other antibiotics[30]. Our study's findings support our recommendation that fosfomycin be used as the first line of treatment for simple lower urinary tract infections because of its wide spectrum, minimal uropathogen resistance, excellent safety profile, and good compliance[31]. It is suggested that phytolysin be used in the combined treatment of acute, uncomplicated cystitis and as a way to stop the illness from returning[32]. Because of the higher risks of resistance, the empirical treatment of UTIs with fluoroquinolones should be limited[33].

Symptoms of UTIs

UTI symptoms include a strong and frequent urge to urinate, burning while passing urine, lower abdominal pain even when passing little urine, blood when passing urine, and a stronger than usual urine odor. Symptoms of upper urinary tract infections typically include fever (>100°F), chills, flank pain, nausea, vomiting, discomfort in the costovertebral angle, and/or cystitis.3. Fever is typically linked to more complex types of UTIs and is rare in lesser UTIs. Common UTI symptoms include fever, burning, itching, blistering in the vaginal area, pain in the suprapubic region, and pyuria. Inflammation and a urine white blood cell (WBC) count of more than 8 cells/ mL are signs of a symptomatic infection. The disorder is known as pyuria or leucocyturia, and the urine may seem cloudy. If patients have a history of recurrent UTIs, this likelihood rises to 84%–92%[34]. The most prevalent cause of recurrent UTIs, which manifest as dysuria or irritative voiding symptoms, is reinfection with the original bacterial isolate in young, healthy women who do not have any urinary tract anatomical or functional abnormalities. The most reliable indicator of recurrent UTIs in people with recurrent dysuria is the frequency of sexual activity[35]. Young, sexually active females and patients exhibiting additional signs and symptoms typical of these illnesses should be evaluated for other causes of dysuria, such as urethritis and vaginitis brought on by venereal disease[36]. The microbiological diagnosis is frequently challenging, despite the fact that the clinical diagnosis is straightforward and mostly depends on symptoms and urine sediment microscopy. The primary causative agent, *Escherichia coli*, is responsible for about 80% of urinary tract infections[37].

Diagnosis of UTIs

A new technique for identifying bacteria is surface-enhanced Raman spectroscopy (SERS). There aren't many documented uses of SERS in clinical diagnosis, though. Urine pathogens in patients with urinary tract infections (UTIs) were identified in this investigation using cylindrical SERS chips[38]. The majority of isolates exhibited multidrug resistance, while nitrofurantoin, amikacin, and gentamicin had comparatively greater action against isolates. Numerous bacterial uropathogens were found to be present in cultures of around one-third of the individuals with urinary tract infections who received a clinical diagnosis. Bacterial infections were more common in inpatients and hypertensive patients. The percentages of bacterial isolates that were susceptible to the tested antibiotics varied[39]. The UriSed analyzer's sensitivity value was poor, despite its specificity falling within

reasonable bounds. As a result, UriSed urinalysis results are not reliable indicators of culture results[40]. With a low percentage of false-negative results and great sensitivity, the UriSed appears to be a useful tool for UTI screening[41]. An algorithm for diagnosing UTI in children under five was developed using the findings of the systematic review. The review's findings about best practices are reflected in this algorithm. Not enough information was available to suggest an algorithm for the additional study of UTI in children less than five. The quality assessment pointed out a number of areas that future research on diagnostic accuracy could focus on improving[42]. It is reasonable to rule out UTI if a clean void pee, bag, or diaper/pad specimen is dipstick negative for both LE and nitrite, or if microscopic analysis is negative for both pyuria and bacteriuria. Without the necessity for a confirmation culture, these patients can thus be rationally eliminated from additional research. In a similar vein, a series of positive tests could be used to rule out a UTI and initiate additional research[43]. For identifying UTI in children, Gram stain and dipstick analysis for nitrite and LE work similarly and are better than microscopic examination for pyuria[44]. In situations of suspected urinary tract infections, the results of urinalysis, especially the leukocyte esterase and nitrite tests, are frequently utilized to decide whether therapy is required or whether a culture will be conducted[45]. A positive nitrite test result has a 96% positive predictive value. The nitrite test's diagnostic accuracy was not increased by include the leukocyte esterase test results[46]. Women who exhibit symptoms related to their urinary tract are diagnosed with UTIs. A weak sign that an infection is not present is vaginal discharge. The most accurate method for identifying UTIs was the urine dipstick test[47].

Outcomes of UTIs

The majority of patients who received carbapenem treatment recover quite well[48]. Table 2 and Figure 2 present the results of hospitalizations with CAUTI and non-CA cUTI. Although overall mortality was low, admissions with CAUTI (3.4%) had a mortality rate that was almost 20% greater than that of patients with non-CA cUTI (2.8%)[49]. The prevalence of CRE in patients with sepsis, pneumonia, or Enterobacteriaceae UTI was similar to other national estimates in this sizable US database. A four-fold higher probability of acquiring IET was linked to CRE infection, which raised mortality, length of stay, and expenses[50]. One in eight hospitalized individuals with cUTI develop TR. Particularly in the context of non-CAUTI, it is linked to a slight attributable lengthening of LOS, an increase in overall expenditures, and an increased risk of IET exposure[51]. The most common cause of cUTI was CA-UTI, which primarily affected elderly individuals. Although not directly linked to the infection, patients with CA-UTI had a high mortality rate[52]. The purpose of the study is to learn more about the epidemiology, clinical management, outcome, and healthcare costs of individuals with cUTI, particularly in nations where MDR GNB is highly prevalent[53]. Compared to patients who do not need such devices, patients with CAUTI have a higher frequency of resistant bacteria, utilize more resources, and have worse clinical results. Stronger controls should be put in place to reduce its use in both inpatient and outpatient settings[54]. If at least 70% of respondents assessed an outcome as critical (rated 7–9), it was included in round 3. In order to prevent other groups from overshadowing public-prioritized outcomes, round 3 also included any outcome with an average score of 7 or above among those who have had a UTI or have cared for someone who has[55]. The outcomes from various treatment approaches must be comparable across trials if clinical trial results pertaining to UTI treatment interventions are to influence policy and practice[56]. The disparity in results currently reported makes it difficult to compare the results of trials looking into simple UTI treatment. Establishing a minimal number of consistent outcomes that ought to be recorded in every study would enhance consistency in outcome reporting[57]. A significant number of outcomes were found. These objectives were narrowed down to a core set of six outcomes using strong consensus techniques, which should be assessed and reported in randomised trials and systematic reviews of treatments for people with uncomplicated UTIs at the very least[58]. The symptom diary is a promising tool for future use because it measures a number of outcomes, such as the degree of symptoms, their bothersomeness, and their influence on daily activities. It is necessary to conduct additional validation research, which includes evaluating structural validity[59].

DISCUSSION

The management and outcomes of UTIs depend on various factors, including the severity of the infection, patient characteristics, and whether the infection is complicated or uncomplicated. In this discussion, we will explore the decision-making process for managing UTI patients, considering the treatment options, factors influencing the course of the disease, and potential outcomes. The data used in this study was not intentionally gathered for research purposes; rather, it was analyzed as part of ordinary clinical primary care practice. In conclusion, there are opportunities to optimize antibiotic prescribing for UTIs that could potentially reduce the risk of antibiotic resistance. Most patients currently diagnosed with lower UTI in primary care receive same-day antibiotic treatment, without microbiological investigation. In order to minimize the development of antibiotic resistance to medications used for first- and second-line therapy, management of UTIs may need to take recent antibiotic use into account.

CONCLUSION

"In conclusion, the management of UTIs requires a multifaceted approach that incorporates accurate diagnosis, effective treatment, and preventive strategies. Antibiotic therapy remains the cornerstone of UTI treatment, but it is essential to consider the rising threat of antimicrobial resistance and to adopt antibiotic stewardship practices. Additionally, non-antibiotic treatments, such as pain management and behavioral modifications, can play a crucial role in alleviating symptoms and improving patient outcomes.

To optimize UTI management, healthcare providers should
Stay up-to-date with the latest guidelines and recommendations, adopt a patient-centered approach that takes into account individual needs and preferences, encourage patients to practice good hygiene and behavioral habits to prevent UTI recurrence, consider the use of alternative treatments, such as cranberry products or probiotics, in conjunction with conventional therapies. By adopting a comprehensive and evidence-based approach to UTI management, healthcare providers can improve patient outcomes, reduce the risk of complications, and mitigate the spread of antimicrobial resistance."

ABSTRACT

The present study investigates the antioxidant potential of methanolic extracts of *Musa paradisiaca* through various in vitro assays, including DPPH, ABTS, nitric oxide scavenging, and total antioxidant capacity. The DPPH assay revealed moderate radical scavenging activity with an IC_{50} value of 349.3 µg/ml, whereas the ABTS assay demonstrated significantly stronger activity, with 99.32% inhibition at 1000 µg/ml and an IC_{50} of 36.73 µg/ml. The extract also showed promising nitric oxide scavenging activity (73.42% at 1000 µg/ml), though with a higher IC_{50} of 417.04 µg/ml. The total antioxidant capacity increased in a concentration-dependent manner, achieving 69.08% inhibition at the highest tested concentration. When compared to the standard ascorbic acid, the extract showed lower potency but consistent activity across all assays. The results indicate that *M. paradisiaca* is a potential source of natural antioxidants and supports its ethnomedicinal relevance. Further research is recommended to isolate and characterize the active constituents responsible for the observed activity.

Keywords: *Musa paradisiaca*, antioxidant activity, DPPH, ABTS, nitric oxide, total antioxidant capacity, methanolic extract.

INTRODUCTION

Banana (*Musa* spp.) is a tropical flowering plant widely cultivated for its edible fruit and ranks among the most important staple foods globally, following rice, wheat, and maize. Beyond its nutritional value, bananas have long been recognized for their medicinal properties in both traditional and scientific contexts [1]. Various parts of the

banana plant—including the pseudo-stem, leaves, sap, and flowers—have demonstrated a range of pharmacological activities such as anti-snake venom[2], anti-gastric ulcer[3], antimicrobial[4], antidepressant[5], antihypercholesterolemic and antioxidant[6], antidiarrheal [7], and antidiabetic effects [8]. In traditional medicine, the banana plant's latex or sap is valued for its astringent properties and has been used to treat a wide spectrum of ailments, including leprosy, hysteria, fever, digestive disorders, hemorrhage, epilepsy, hemorrhoids, and insect bites [9]. Latex, a milky secretion derived from the stem, peel, and unripe fruit, is particularly rich in secondary metabolites such as phenolics, flavonoids, and terpenoids [10]. Oxidative stress, resulting from an imbalance between reactive oxygen species (ROS) and the body's antioxidant defenses, is a major contributor to the pathogenesis of chronic conditions including cancer, diabetes, and cardiovascular diseases [11]. Due to growing concerns over the safety of synthetic antioxidants, there has been increased interest in identifying effective natural alternatives [12]. In this context, banana latex, with its reservoir of bioactive compounds, presents promising antioxidant potential. However, its antioxidant efficacy remains relatively underexplored. Therefore, the present study was undertaken to evaluate the antioxidant activity of banana latex through various in vitro assays. The investigation aims to determine its potential as a natural source of antioxidants. Previous studies by Pothavorn *et al.* [13] and Nguyen *et al*. [14] on the phytochemistry of banana stem juice laid the foundation for this exploration into the bioactive potential of banana latex.

MATERIALS AND METHODS

Collection of plant latex

Musa paradisiaca latex was collected from the surrounding area of Pollachi in Coimbatore district.

Extraction of latex

Musa paradisiaca leaf and stem latex were collected aseptically and extracted using an organic solvent (methanol). These were centrifuged for 5–10 minutes. The extracted material was collected and stored in an airtight container.

***In vitro* Radical Scavenging activity**

Sample Preparation

The methanol leaf extract of *Musa paradisiaca* latex 50gm was dissolved in 5 ml of DMSO. From the above 1000, 500, 250, 125 and 62.5 mg/ml concentration of sample was prepared and used for different assays. Ascorbic acid was used as standard for comparing the activities.

DPPH radical scavenging activity

The free radical scavenging capacity of the evaporated sample of *Musa paradisiaca* extract was determined using DPPH by Blois [15]. DPPH solution was prepared in 95% methanol. Different concentration (62.5-1000mg/ml) of methanol extract of *Musa paradisiaca* latex was reacted with freshly prepared 3.0 ml DPPH solution (0.1mM) and incubated at room temperature. After 30 minutes, the absorbance was taken at 517 nm using a spectrophotometer (Labman UV – Visible spectrophotometer). Ascorbic acid was used as a reference standard. The control was devoid of the sample. Standard ascorbic acid was treated similar to the extracts. The percentage of inhibition was calculated by following formula.

$$\% \text{ of DPPH radical scavenging activity} = \frac{(\text{A of control} - \text{A of sample})}{\text{Aofcontrol}} \text{X100}$$

ABTS radical scavenging assay

ABTS (2, 2′-azinobis-3-ethylbenzothiozoline-6-sulphonicacid) assay is based on the scavenging of light by ABTS radicals. An antioxidant with an ability to donate a hydrogen atom will quench the stable free radical, a process that is associated with a change in absorption. The relatively stable ABTS radical was green and it was quantified spectrophotometrically at 734 nm. Fresh ABTS solution was prepared for each assay. Different concentration (62.5-1000mg/ml) of *Musa paradisiaca* latex extract was allowed to react with 1 ml of the ABTS solution and the absorbance

was taken at 734 nm after 7 minutes using a spectrophotometer [16]. The percentage of inhibition was calculated by following formula.

% of ABTS radical scavenging activity $= \frac{(\text{A of control} - \text{A of sample})}{\text{A of control}} \text{X}100$

Nitric oxide scavenging activity

The nitric oxide scavenging capacity of the extract of *Musa paradisiaca* was determined using nitric oxide generated by oxidation nitroprusside [17]. Sodium nitroprusside (10 mM, 2ml) in phosphate buffer saline was incubated with different concentration of methanol extract of latex (62.5-1000mg/ml) at room temperature for 30 minutes. After 30 minutes, 0.5 ml of the solution was mixed with 1ml of Griess reagent. The absorbance was measured at 546 nm. Ascorbic acid was used as a reference standard. The percentage of inhibition was calculated by following formula.

% of inhibition $= \frac{(\text{Aofcontrol} - \text{Aofsample})}{\text{Aofcontrol}} \text{X}100$

Total antioxidant capacity by phosphomolybednum assay

The spectrophotometric measurement of total antioxidant capacity (TAC) was based on the reduction of Mo (V1) to Mo (V) by antioxidant compound and the formation of green phosphate / Mo (V) complex at acidic PH[18]. Different concentrations (62.5-1000mg/ml) of methanolic latex extracts were combined with 3 ml of reagent solution (0.6 sulfuric acid, 28 Mm sodium phosphate and 4Mm ammonium molybdate). The tubes containing the reaction solution was incubated at 95 C for 90 min. Then the absorbance of the solution was measured at 695 nm. Methanol (0.3ml) in the place of extract was used as the blank. Ascorbic acid was used as a reference standard.

RESULTS AND DISCUSSION

The present study evaluated the DPPH radical scavenging activity of the methanolic leaf extract of *Musa paradisiaca* and compared its antioxidant potential with that of ascorbic acid as a standard. The results demonstrated a concentration-dependent increase in free radical scavenging activity, which aligns with earlier finding reported by Subashree [19]. At the highest tested concentration (1000 µg/ml), the methanolic extract exhibited 77.42% inhibition of DPPH radicals, with an IC_{50} value of 349.3 µg/ml. In comparison, ascorbic acid showed superior scavenging ability with an IC_{50} of 30.93 µg/ml, confirming its strong antioxidant activity. Subashree reported a high percentage inhibition (98.19%) at 10 mg/ml for *M. paradisiaca* peel extracts, suggesting potent antioxidant properties at higher concentrations [19]. In contrast, the current study observed substantial antioxidant activity at a relatively lower concentration, indicating the leaf extract's effectiveness. The antioxidant activity observed can be attributed to the presence of bioactive compounds such as flavonoids and phenolics, which are known to donate hydrogen atoms or electrons to neutralize free radicals. This is in line with the findings of Sharma *et al*. [20] who reported significant antioxidant activity in the methanolic and ethanolic extracts of various parts of *Musa paradisiaca* and *Musa acuminata*, particularly in the unripe pulp and peel. In their study, the methanolic extract of unripe pulp of *Musa acuminata* showed the highest DPPH scavenging activity (85.38%), whereas our results suggest moderate activity in latex extracts. DPPH radical scavenging of *Musa paradisiaca* latex (Table 1). The ABTS radical scavenging activity of the methanolic extract of *Musa paradisiaca* latex was investigated and compared with the standard antioxidant, ascorbic acid. The results, presented in Table 2, indicate that the extract possesses strong antioxidant potential in a concentration-dependent manner. At the highest tested concentration (1000 µg/ml), the methanolic extract achieved 99.32% inhibition of ABTS radicals, with an IC_{50} value of 36.73 µg/ml. Ascorbic acid, used as a positive control, showed slightly higher radical scavenging activity with 99.63% inhibition at 50 µg/ml and an IC_{50} of 3.57 µg/ml. Although ascorbic acid exhibited stronger potency, the methanolic extract demonstrated a comparable radical scavenging effect, especially at higher concentrations. These findings are consistent with previous studies. Okonogi *et al*.[21] reported a similar concentration-dependent ABTS radical scavenging activity for ethanolic extracts of banana peels, with a maximum inhibition of 97.66% observed at 10 mg/ml. The present study shows even higher inhibition (99.32%) at a considerably lower concentration (1000 µg/ml), suggesting the superior effectiveness of *M. paradisiaca* latex extract in ABTS radical neutralization. Additionally, Fidrianny *et al*. [22] examined various banana peel extracts (raja bulu, muli and ambon lumut) and classified their antioxidant strength based on IC_{50} values. Their study found

IC_{50} values for ethyl acetate and ethanolic extracts ranging from 1.91 to 11.63 ppm, indicating very strong antioxidant properties. Although the IC_{50} of the current methanolic extract (36.73 µg/ml or 36.73 ppm) is slightly higher, it still falls within a range that signifies moderate to strong antioxidant activity, especially when considering its natural origin and simplicity of extraction. The ascorbic acid in Irda's study demonstrated an IC_{50} of 1.27 ppm, reaffirming its role as a benchmark antioxidant. The nitric oxide (NO) scavenging activity of the methanolic extract of *Banana* was investigated to assess its potential activity. As shown in Table 3, the extract exhibited a dose-dependent increase in NO inhibition, with the highest activity (73.42 ± 11.82%) observed at 1000 µg/ml. The IC_{50} value was determined to be 417.04 µg/ml, indicating a moderate nitric oxide scavenging capacity. In comparison, the standard antioxidant ascorbic acid demonstrated significantly higher NO inhibitory activity, with 83.45 ± 4.80% inhibitions at 50 µg/ml and an IC_{50} value of 20.85 µg/ml. Nitric oxide, though essential for physiological signaling, becomes a contributor to oxidative stress when overproduced, reacting with superoxide radicals to form reactive peroxynitrite ions. Thus, the capacity of plant extracts to scavenge nitric oxide radicals is an important indicator of their antioxidant potential [23]. The observed NO scavenging activity in *Musa paradisiaca* extract can be attributed to the presence of bioactive compounds such as flavonoids, tannins, and phenolic acids. These phytochemicals are known to inhibit nitrite formation by competing with oxygen to react with nitric oxide. Sharma *et al*. [20] reported substantial antioxidant potential in various banana plant parts, especially the methanolic and ethanolic extracts of pulp and peel, correlating with high flavonoid and phenolic content. Though NO assay was not directly evaluated in their study, their findings support the idea that such antioxidant activity is linked to phytochemical richness. The total antioxidant capacity of the methanolic extract of *Musa paradisiaca* was evaluated using the phosphomolybdenum method, and the results are presented in Table 4. The extract exhibited a concentration-dependent increase in antioxidant activity, with maximum inhibition of 69.08% observed at 1000 µg/ml. Although slightly lower than the standard ascorbic acid (70.10% inhibition at 50 µg/ml), the extract's performance was notably comparable across the tested concentrations, suggesting that *M. paradisiaca* possesses appreciable total antioxidant potential. These findings align with earlier work by Prieto *et al*.[18] who used the same method to quantify total antioxidant activity in various banana plant parts, expressing the results as ascorbic acid equivalents (AAE). They reported that methanolic stem peel extract (MSPE), pulp extract (MSPU), and stem extract (MSSE) showed total antioxidant capacities of 675.56 ± 5.23, 573.70 ± 314, and 416.85 ± 5.50 mg/g AAE, respectively. Though the present study did not quantify in AAE, the percentage inhibition values suggest that the methanolic extract of *M. paradisiaca* latex may fall within a similar activity range, particularly closer to MSSE in antioxidant strength. Supporting this, Gonzalez-Montelongo *et al*. [24] found that the ethanolic extract of the Pachainadan variety exhibited high total antioxidant capacity (5.85 mM/g), whereas the Nendran variety showed the least activity. The observed variation in antioxidant capacity between banana cultivars and plant parts is consistent with the moderate but significant antioxidant activity demonstrated in this study, likely influenced by differences in polyphenol and flavonoid content.

CONCLUSION

The methanolic extract of *Musa paradisiaca* demonstrated effective antioxidant activity across all tested *in vitro* assays. In the DPPH assay, the extract exhibited moderate free radical scavenging with an IC_{50} value of 349.3 µg/ml, while the ABTS assay showed a much stronger activity with 99.32% inhibition at 1000 µg/ml and a significantly lower IC_{50} value of 36.73 µg/ml, indicating its higher efficacy in scavenging ABTS radicals. The nitric oxide scavenging activity was also notable, reaching 73.42% inhibition at the highest concentration, though with a relatively higher IC_{50} value of 417.04 µg/ml. Total antioxidant capacity increased steadily with concentration, reaching 69.08% at 1000 µg/ml, and closely matched the activity of standard ascorbic acid. Collectively, the results confirm that *M. paradisiaca* possesses concentration-dependent antioxidant properties, with the strongest performance observed in the ABTS assay. While its IC_{50} values were higher than ascorbic acid in all assays, the extract still showed promising antioxidant potential. These findings support the traditional use of *M. paradisiaca* and suggest its suitability for further phytochemical and pharmacological exploration as a natural antioxidant source.

ACKNOWLEDGEMENT

The authors are thankful to the management of Nallamuthu Gounder Mahalingam College, Pollachi, Tamil Nadu, India for providing financial support (Seed money) to carry out the research work.

ABSTRACT

Handgrip Strength (HGS) is an important indicator of muscle strength and nutritional status, particularly in hospitalized pediatric populations. It has been recognized as a potential tool for diagnosing malnutrition, as low HGS is associated with various negative health outcomes, including prolonged hospital stays and poor recovery. The SQUEGG Smart Dynamometer, a Bluetooth-enabled device, is commonly used to measure HGS and track muscle strength in clinical settings. This review article deals with role of nutritional status and anthropometric datas, as the indicators for muscle strength among hospitalised pediatric population. A systematic review of the literature was conducted using databases such as Medline, Pub Med and Google Scholar. Research articles focusing on pediatric malnutrition, HGS, and muscle strength assessment were included. The STAMP screening tool and SQUEGG dynamometer were highlighted as primary methods for nutritional screening and HGS assessment in hospitalized children. Studies have showed significant correlations between HGS and anthropometric factors such as age, gender, height, and weight. Children with low HGS upon hospital admission were more likely to experience malnutrition and longer hospital stays. These findings suggest

that HGS can be a valuable indicator of malnutrition, providing early insight into a child's nutritional and functional status. HGS, measured through tools like the SQUEGG ball, is a reliable and non- invasive method for assessing muscle strength and nutritional status in pediatric patients. Incorporating HGS assessments in routine clinical practice can improve the detection of malnutrition and optimize care for hospitalized children, potentially leading to better health outcomes and shorter recovery times. Further studies are needed to explore the role of micronutrients in muscle function.

INTRODUCTION

HGS is a numerical indicator of overall muscular strength and function, recently indicated as a criterion for the diagnosis of pediatric malnutrition according to the American Society for Parenteral and Enteral Nutrition and the Academy of Nutrition and Dietetics(ASPEN- AND).HGS(Handgrip grip Strength) is an important indicator of muscle strength and nutritional status in hospitalized children. It is often used as an indicator of general muscle strength in children, and low HGS is associated with a number of negative health outcomes[1]. This is a measure of muscle strength that uses a SQUEGG ball to measure the force/tension produced by the muscles in the arm. A Bluetooth enabled dynamometer can help to assess, track and improve your grip strength[2]. The SQUEGG Smart Dynamometer and Hand Grip Trainer , known as the SQUEGG by The BioSparrow in plantation FL is a handheld digital dynamometer that can connect via Bluetooth to a mobile device(such as a phone or tablet) to show and save handgrip strength data in a cloud system. Food and Drug Administration class II medical device, which is exempt from 510(K) clearance, is egg- shaped with four finger indentations for the second through fifth digits and an outer silicone shell to avoid moisture buildup. The static force that a person's hand produces when it is squeezed around a dynamometer is measured during grip strength test. Newtons, Pounds,or kilograms are used to indicate the production [2]. Hand exercise tools called "Squeeze balls" are filled with beads, sand, or silicon. Silicon-filled products typically employ two latex shells to prevent oil leakage, but latex can trigger allergies. Hand grip strength is a reliable measure of nutritional status[2]. Grip strength is a measure of overall health and can be used to assess frailty and recovery progress.[3]. A weak grip indicates a higher risk of health problems in children, leading to longer hospital stays and poorer overall health outcomes[4]. Low handgrip strength in hospitalized children is a significant predictor of poor health outcomes, extended hospital stays, and increased healthcare expenses.. The nutritional status is assessed using the STAMP screening tool.

Early diagnosis of malnutrition and muscle strength assessment improve recovery, shorten hospital stays, and enhance health outcomes in children[5]. Nutritional deficiencies pose a health risk, but the difficulty in assessing pediatric malnutrition stems from the intricate nature of the problem[5]. Poverty and lack of access to food and healthcare are major contributors to malnutrition and disease, leading to deaths worldwide. Assessing a child's nutrition in a hospital setting is difficult because of the many factors involved and the potential negative effects of hospital environments[4]. Strong hand grip is essential for children's dexterity and everyday activities. Engaging in activities like climbing, writing, and playing with clay helps develop hand and finger muscles, improving dexterity and making tasks like coloring easier[6]. Adriana's group reviewed and selected eight articles from the 270 collection for their study. The study identified five nutrition assessment tools, with STAMP being the most promising option, exhibiting high sensitivity, perfect inter-rater agreement, and consistency with the reference test [5]. Vitamin D influences muscle strength and performance by binding to the Vitamin D receptor. This substance affects muscle cell growth and development. Vitamin D influences muscle growth by activating MAPK and other pathways, leading to increased myotube formation and enhanced expression of myosin heavy chains[7].This review article deals with role

of nutritional status and anthropometric datas, as the indicators for muscle strength among hospitalised pediatric population.

METHODOLOGY

A review was carried out in Medline (National Library of Medicine United States), LILACS (Latin American and Caribbean Health Sciences), and PubMed (US National Library of Medicine National Institutes of Health). in the SCIELO (Scientific Electronic Library Online), via CAPES portal (Coordenação de Aperfeiçoamento de Pessoal de Nível Superior),bases Scopus and Web of Science and Google Scholar. The terms utilized according to the Descriptors in Health Sciences (DeCS)/Medical Subject Headings (MeSH) list were "malnutrition", "screening", and "pediatrics", in addition to the equivalent terms in Portuguese. Types of research included are cross sectional studies and longitudinal study. Total 9 from 2013-2024 were reviewed in order to write this review paper.

RESULTS

A study conducted by J.W. Ploegmakers *et al*. in 2013 found a strong correlation between grip strength and height, weight, and gender in children, as shown in a cross-sectional study of 2241 children and adolescents aged 4 to 15 years of both genders. The study states that As people get older, their strength when using both hands increases, and boys up to the age of 12 show improvement. Males, in contrast, show much greater level of control at ages 4, 5, 6, 8, 9, and 14 in comparison to females. Between 4 and 13 years old, boys had a strength gap of 0 to 14%, and this increased to 26% at 14 years old. Age, height, weight, and gender had a strong connection to grip strength[8]. In a different clinical study titled Handgrip Strength and Nutrition Status in Hospitalized Pediatric Patients by Catarina Silva MSc *et.al*.,(2014) Citations: 23, it was reported that a total of eighty-nine hospitalized patients aged six years and older were part of the longitudinal research. The assessment of nutritional status included measuring body mass index (BMI) z-Score and hand grip strength (HGS) upon admission and discharge. Findings: At the beginning of hospitalization, 30.3% of patients were in critical condition in the complete sample, while 64% experienced a decrease in handgrip strength upon admission. This research concluded that hand grip strength upon admission was linked to malnutrition defined by BMI z-score. In this multivariate analysis, gender, age, height, and BMI z-Score accounted for 67.1% of HGS at hospital admission and suggested that Low HGS could signal malnutrition in pediatric patients, despite the need for interpretation of HGS data. Patient's gender, age, and height[9]. A study conducted by Gabriela Duarte Luz , Danielly Steffen Pereira *et,al* on association of handgrip strength with nutritional status and clinical outcomes in hopsitalized pediatric patients,50 patients were assessed, with a median age of 10.9 years and a male proportion of 55.6%. Reduced HGS was observed in 17.8% patients. Patients with lower HGS levels exhibited a lower H/A z-score (negative compared to positive, p = 0.012)), and a higher frequency of reduced MAMC ((8% vs 13%, p = 0.007)). Reduced HGS was not associated with malnutrition (OR = 0.63; 95%CI 0.23–1.77), prolonged hospital stay (OR = 1.89; 95%CI 0.72–4.92) or readmission to hospital 3 months after hospital discharge (OR = 1.82; 95%CI 0.67–4.93), in a model adjusted for the clinical condition. No association was found between reduced HGS and malnutrition or clinical outcomes. The lower H/A Z-score and MAMC/A percentile values indicate its association with a less favorable nutritional status in hospitalized pediatric patients[1].

DISCUSSION

According to Catarina Silva's research, analyzing HGS data should consider the patient's height, age, and gender, as lower HGS could suggest under nutrition in pediatric hospital patients. Examining the influence of anthropometrics, illness seriousness, and other patient characteristics on hand grip strength (HGS) in hospitalized pediatric patients. The correlation between low BMI z scores and HGS upon admission was significant. Nutritional status also have an impact on muscle strength .various factors such age, gender, height, weight also had a strong connect with muscle strength and nutritional status in children. Handgrip strength is a crucial measure of muscle function and nutritional health, particularly relevant for hospitalized children. Muscle strength can be assessed non- invasively and

affordably, allowing for early detection of malnutrition, even before physical changes become noticeable[9]. The SQUEGG Smart Dynamometer, a Bluetooth-connected device, is a new technology for measuring and monitoring HGS in children. Mobile devices enable healthcare providers to track grip strength, store data, and evaluate progress remotely. This digital dynamometer enhances the precision of HGS testing, making it particularly valuable in pediatric medicine[2]. In clinical practice, HGS measurement can be paired with nutritional screening tools like the STAMP method, which has proven to be highly sensitive in identifying malnutrition in hospitalized children. STAMP provides a multi-faceted assessment of a child's nutritional status, complemented by HGS data for a complete picture of their overall health[5]. Proper nutrition, specifically protein, leucine, n-3 fatty acids, and vitamin D, is vital for achieving optimal muscle strength and recovery. Vitamin D contributes to muscle cell development and growth, promoting overall muscle health[7]. By integrating HGS testing with nutritional assessments, healthcare providers can better diagnose and manage pediatric malnutrition, leading to improved clinical outcomes, quicker recovery, and reduced hospital stays.HGS plays a crucial role in identifying malnutrition and assessing muscle function in children, enabling timely interventions and improved treatment outcomes[2].

CONCLUSION

This study examines the use of the STAMP Screening tool and SQUEGG BALL to assess nutritional status and muscle strength in hospitalized children. Despite no significant differences in hospital stays or readmission rates, HGS remains a promising indicator of nutritional status. The research confirms the value of nutritional screening tools in pediatric care. Future research should explore the effects of micronutrient supplementation, especially vitamin D, calcium, and iron, on muscle function and strength, potentially leading to targeted therapies to improve muscle health in hospitalized children.

ABSTRACT

Oral biofilms are central to the onset and persistence of numerous dental disorders, demanding innovative and effective antimicrobial strategies. This study investigates the antibiofilm potential of nano emulsions formulated using plant-derived natural extracts. A tube-based biofilm formation assay confirmed strong bacterial adherence, as evidenced by intense crystal violet retention. Antimicrobial susceptibility testing via the Kirby-Bauer disc diffusion method revealed notable resistance patterns among oral pathogens to commonly used antibiotics, reinforcing the need for alternative therapeutic approaches. Natural extracts displayed dual effects on biofilm modulation: cloves and Tulasi effectively inhibited biofilm formation, whereas sucrose, glucose, jaggery, and certain commercial products such as toothpaste and chewing gum enhanced bacterial adhesion. The developed nano emulsion, composed of neem oil, green tea, and turmeric, significantly reduced biofilm biomass by 65–85%. Among the components, neem oil exhibited the highest disruption capacity due to its potent antibacterial properties, while green tea was most effective in preventing biofilm formation owing to its polyphenol content. Turmeric contributed to antimicrobial action but was comparatively less effective. These results highlight the promising role of plant-based nano emulsions as nanotherapeutic agents in managing oral biofilms and enhancing oral health.

Keywords: Nano Emulsion, Oral Biofilms, Plant Extracts, Antibiofilm Activity, Natural Antimicrobials

INTRODUCTION

Biofilms are structured microbial communities enclosed in a self-produced polymeric matrix that adhere to surfaces, contributing significantly to chronic infections and antibiotic resistance [1]. The ability of bacteria to form biofilms presents a major clinical challenge, particularly in the context of medical devices and persistent infections [2]. Traditional antibiotics often fail to penetrate the biofilm matrix effectively, leading to the persistence and recurrence of infections [3]. In recent years, the exploration of natural compounds derived from plants has gained momentum due to their antimicrobial, anti-inflammatory, and antibiofilm properties [4]. Herbal remedies, such as those derived from clove (*Syzygium aromaticum*), turmeric (*Curcuma longa*), and green tea (*Camellia sinensis*), have shown potential as alternative or adjunct therapies against biofilm-forming pathogens [5]. Clove extract is rich in eugenol, known for its antimicrobial and anti-inflammatory actions [6]. Turmeric contains curcumin, a compound with demonstrated antibiofilm and antioxidant effects [7], while green tea polyphenols, particularly epigallocatechin gallate (EGCG), inhibit quorum sensing and reduce bacterial adherence [8]. Nano emulsion technology enhances the delivery and bioavailability of these plant-based compounds. By encapsulating hydrophobic phytochemicals within nanoscale emulsions, it is possible to achieve targeted action with improved stability and penetration into biofilms [9]. Therefore, the development of a herbal nano emulsion oral spray using these traditional extracts may offer a novel, biocompatible approach to disrupt biofilm formation and reduce microbial load, especially in the oral cavity where biofilms contribute to dental plaque and periodontitis [10].

MATERIALS AND METHODS

Dietary Sugars

- **Glucose** – Primary energy source for biofilm-forming bacteria.
- **Sucrose** – Facilitates extracellular polymeric substance (EPS) production in biofilms.
- **Jaggery** – Natural sugar alternative with potential antimicrobial effects.

Oral Hygiene Agents

Herbal-based Mouthwash Formulated with turmeric, neem oil, and cloves, known for their antimicrobial properties.
Commercial Toothpaste Extract Extracted from Colgate toothpaste for comparative analysis.

Plant-Based Extracts

- Neem (Azadirachta indica) – Anti-biofilm and antibacterial effects.
- Tulsi (Ocimum sanctum) – Natural antimicrobial activity.
- Clove (Syzygium aromaticum) – Contains eugenol, an antibacterial agent.

Synthetic and Commercial Extracts Charcoal extract, Polo ring, Bubble gum for biofilm modulation.

Sample Collection

Selection of Subjects: Healthy individuals aged 18–40 with no recent antibiotic use.
Collection Method: Sterile cotton swabs were used to collect samples from buccal cavity, teeth, and tongue. Samples were placed in sterile PBS to maintain microbial viability and transported on ice to the lab.

Sample Processing and Bacterial Isolation

10 µL of bacterial suspension from the swab tube was spread onto Nutrient Agar plates. Plates were incubated at 37°C for 24 hours. Colony morphology (size, shape, pigmentation) was observed.

Gram Staining for Bacterial Identification

Bacterial colonies were smeared on a glass slide and air-dried.The smear was stained
with crystal violet, iodine, ethanol, and safranin for bacterial differentiation.Examined

under a light microscope to classify bacteria as Gram-positive or Gram-negative.

Biofilm Formation Assay

Tube Method: In the Tube Method for biofilm formation, 10 mL of nutrient broth is inoculated with the bacterial strain of interest and incubated at 37°C for 24 to 48 hours. After the incubation period, planktonic (free-floating) cells are discarded, leaving behind the biofilm that has formed on the walls of the test tube. The biofilm is then stained with crystal violet, which binds to the bacterial cells and extracellular matrix, providing a visual indication of biofilm formation. The intensity of the violet stain is assessed, which correlates to the amount of biofilm present; stronger staining indicates a higher degree of biofilm formation. This method allows for the semi-quantitative evaluation of bacterial biofilm development[11]

Microtiter Plate Method: In the Microtiter Plate Method for biofilm formation, bacterial cultures are first grown and the suspension is adjusted to a standardized concentration. Next, 100 µL of the bacterial suspension is dispensed into each well of a 96-well plate. Test extracts are then added to the wells, and the plate is incubated at 37°C for 24 hours to allow biofilm formation. After incubation, biofilm formation is assessed by crystal violet staining, which binds to the biofilm and allows for its quantification. The optical density (OD) of the stained biofilm is measured, and based on the OD values, biofilm formation is categorized as follows: $OD < 0.120$ indicates a non-biofilm former; $0.120 \leq OD < 0.240$ represents a weak biofilm former; $0.240 \leq OD < 0.480$ indicates a moderate biofilm former; and $OD \geq 0.480$ represents a strong biofilm former. This method provides a quantitative assessment of bacterial biofilm formation and can be used to evaluate the effects of various test extracts on biofilm production.[12].

Preparation of Herbal Nano emulsion Oral Spray: The preparation of a herbal nano emulsion oral spray begins with the extraction of natural components. Clove, turmeric, and green tea extracts are prepared using both aqueous and ethanol extraction methods to obtain the active compounds from these plants. After the extraction, the oil phase is prepared by mixing neem oil, Tween 80, and glycerol. This oil phase is then combined with the aqueous phase containing the extracted plant components. The mixture is subjected to sonication, a process that utilizes sound waves to break down the particles, ensuring uniform dispersion and formation of a stable nano emulsion. The resulting herbal nano emulsion is then ready for use in the oral spray formulation, designed to deliver the therapeutic properties of these natural extracts in a finely dispersed form[13] [14].

RESULTS AND DISCUSSION

Isolation and Characterization of Oral Biofilm-Forming Bacteria

To evaluate the efficacy of natural extracts and nano emulsions against oral biofilms, biofilm samples were collected from multiple volunteers using sterile swabs. These swabs were transported to the laboratory within one hour to maintain microbial viability and were streaked on selective and non-selective media such as Luria Bertani Agar, Blood Agar, and MacConkey Agar. Plates were incubated at 37°C for 24 hours. Following incubation, colonies exhibiting distinct morphologies were isolated and sub-cultured to obtain pure cultures. Colony characteristics such as colour, opacity, elevation, and margin were recorded (Fig1). Preliminary bacterial identification was supported by Gram staining and basic biochemical tests.

Isolation of Biofilm-Forming Bacteria

Pure isolates were subjected to biofilm screening using the tube method. Each isolate was inoculated into 5 mL of nutrient broth and incubated at 37°C for 24 hours. The broth was decanted, and the tubes were gently washed with phosphate-buffered saline (PBS), stained with 0.1% crystal violet, and visually inspected for biofilm formation. A visible purple ring at the air-liquid interface indicated positive biofilm formation. Isolates showing strong adherence were selected for further testing. (Fig 2)

Screening of Natural and Dietary Extracts

The biofilms were quantified by measuring their biomass using absorbance at 630nm.The inhibition percentage was calculated by comparing treated samples to untreated controls. The bar chart illustrates the biofilm inhibition percentage for each isolate. Neem leaves extract (1%) exhibited high biofilm inhibition, with percentages close to 100% in most cases. The neem leaves extract effectively inhibits biofilm formation in oral biofilm isolates. These findings support the potential antibiofilm properties of neem for oral health applications. The biofilm inhibition percentage for 1%Tulasi extract was determined. Tulasi leaves extract demonstrated high biofilm inhibition, with most isolates showing inhibition above 90%. The Tulasi leaves extract effectively inhibits biofilm formation in oral biofilm isolates. The data supports the potential antibiofilm properties of Tulasi, indicating its possible role in oral health treatments. The biofilm inhibition percentage for 1%cloves extract was determined. Cloves extract demonstrated strong biofilm inhibition, with most isolates showing inhibition close to or above 90%.Thecloves extract effectively inhibits biofilm formation in oral biofilm isolates. The results highlight the potential antibiofilm properties of cloves, supporting its use in oral health applications.(Fig 3)

Synthetic and Commercial Extracts

The biofilm inhibition potential of 1% plant-derived nanoemulsions—charcoal extract, Polo Ring extract, chewing gum extract, and Colgate extract—was assessed against oral biofilm isolates and is illustrated in the accompanying bar graph (Fig 4). All extracts demonstrated high levels of biofilm inhibition, predominantly within the 85–100% range. Charcoal extract showed strong antibiofilm activity with most values between 85–100% and minor variations across isolates, suggesting its effectiveness as a potential oral therapeutic. Polo Ring extract, while showing significant inhibition, also exhibited slightly higher biofilm growth in a few isolates, yet overall maintained strong antibiofilm efficacy. Chewing gum extract consistently inhibited biofilm formation, with inhibition percentages primarily between 85–95%, again showing minimal variation. Similarly, Colgate extract displayed inhibition levels comparable to charcoal, with a majority of values near or at 100%, reinforcing its potential as an effective antibiofilm agent. Overall, the majority of inhibition values across all extracts exceeded 90%, with distinct peaks at 100%, indicating strong and consistent antibiofilm activity. The inhibition trends for Polo Ring and chewing gum extracts were notably similar, with both showing a few instances below 90%, but these were infrequent. These findings support the promise of these plant-derived nanoemulsions as potent candidates for nanotherapeutic interventions in oral health.

Promotion of Biofilm by Dietary Sugar Extracts

There is a strong positive correlation between glucose concentration and biofilm growth. Higher glucose levels lead to higher biofilm formation. The regression line follows an upward trend, suggesting glucose directly supports biofilm development. Biofilm formation is more scattered compared to glucose. While a general upward trend exists, there are outliers where biofilm formation is high even at lower sucrose concentrations. This suggests that sucrose may not be the sole factor influencing biofilm formation. The strongest positive correlation is observed here. The data points are tightly clustered along the regression line, indicating that jaggery has a significant impact on biofilm formation. This suggests that jaggery may be a more potent biofilm inducer compared to glucose or sucrose Promotion of Biofilm by Dietary Sugar Extracts (Fig: 5). Biofilm inhibition by Different Extracts (Table 1)

Development of Nano emulsion

present study highlights the potent antibiofilm activity of plant-derived nanoemulsions formulated with turmeric, clove, green tea extracts, and neem oil. The small droplet sizes of the nanoemulsion (ranging from 1.29 to 45.10 nm) significantly enhanced the penetration of bioactive compounds into the biofilm matrix, enabling effective disruption of bacterial biofilms. In the first phase of the study, biofilm disruption percentages ranged from 66.68% to 98.26%, indicating moderate to high efficacy, with variability likely due to differences in initial nanoemulsion formulation or biofilm robustness. Subsequent optimization of the formulation resulted in a marked improvement, with disruption percentages consistently ranging from 96.82% to 100%, demonstrating the reliability and potency of the final nanoemulsion. Scanning Electron Microscopy (SEM) analysis further confirmed these findings, revealing substantial structural disruption in treated Streptococcus mutans biofilms. Untreated samples retained dense, multilayered EPS

matrices with intact cells, whereas treated samples exhibited cell shrinkage, lysis, and a disrupted biofilm architecture. Among the nanoemulsion components, neem oil showed the highest antimicrobial effect, followed by clove and turmeric. The synergistic action of these natural extracts, coupled with the nanoscale formulation, underscores the formulation's potential for oral biofilm management. Scanning Electron Microscopy- visualization of nano emulsion droplets (Figure: 6)

CONCLUSION

Based on the comparative analysis of natural extracts and formulations, Neem and Tulsi extracts emerged as the most effective agents in inhibiting oral biofilm formation, consistently demonstrating inhibition percentages ranging from 98% to 100% across multiple isolates. While Neem extract displayed slight variability, it recorded the highest number of complete inhibitions (100%), confirming its strong potential as a lead candidate in biofilm control strategies. Clove extract, though effective, exhibited broader variability in inhibition (75%–100%), indicating the need for concentration optimization or synergistic formulations. In contrast, Jaggery, glucose, and sucrose were found to promote biofilm formation, with jaggery showing the strongest enhancement, likely due to its complex sugar matrix promoting microbial adhesion and EPS synthesis. Importantly, the nanoemulsion formulation, incorporating active botanicals like turmeric, clove, green tea, and neem oil, demonstrated 90%–100% inhibition efficacy, benefiting from enhanced bioavailability and biofilm penetration due to its nano-sized droplets. Collectively, these findings underscore the superior efficacy of neem-based nanoemulsions and natural plant extracts as promising, eco-friendly alternatives for managing oral biofilms.

Table 1: Biofilm inhibition by Different Extract

Extract Type (1%)	Biofilm Inhibition Range (%)	General Trend
Neem Leaves	~95-100%	Strongest inhibition, highly consistent
Tulasi Leaves	~90-100%	High inhibition, minor variability
Cloves	~90-100%	Strong inhibition, minimal variation
Glucose	~90-100%	Effective across all isolates
Sucrose	~85-100%	Slightly lower inhibition in some isolates
Jaggery	~80-100%	Moderate to high inhibition, some variability
Charcoal	~85-100%	High inhibition, consistent results
Polo Ring	~85-100%	Effective across all isolates
Chewing Gum	~85-95%	Slightly lower inhibition compared to others
Colgate	~85-100%	High inhibition, similar to charcoal extract

ABSTRACT

Composite flours are gaining recognition due to their potential to enhance the nutritional and useful attributes of meals merchandise. This observe advanced a roasted composite flour the usage of lotus seed flour and millet flour in varying ratios (5%, 10%, and 15%) and assessed its nutritional composition. Lotus seeds, acknowledged for his or her high protein, fiber, and antioxidant content material, along with bioactive compounds together with flavonoids and polyphenols, provide useful and therapeutic advantages. The nutritional evaluation revealed excessive carbohydrate and moderate protein content material, large nutritional fiber, and a wealthy mineral profile, making the composite flour suitable for fitness-orientated food formulations.

Keywords: Composite flour, Lotus seed flour, Millet flour, Nutritional composition, Bioactive compounds, Dietary fiber, Antioxidants, Functional foods

INTRODUCTION

Malnutrition and nutrient inadequacy continue to be most important public health issues globally, specifically in growing countries, in which the reliance on staple cereal-based diets frequently outcomes in unbalanced nutrient

intake. In reaction to these challenges, composite flours—combinations of flours from cereals, legumes, tubers, oilseeds, and purposeful substances—have emerged as a promising dietary intervention. These formulations are strategically developed to decorate each the dietary profile and functional houses of staple ingredients, supplying a greater balanced source of energy, protein, dietary fiber, vitamins, and minerals (Ayo *et al*., 2014; Adebowale *et al*., 2012). Among the numerous novel ingredients, lotus seed flour (from *Nelumbo nucifera*) has received large medical and industrial hobby because of its wealthy composition of essential vitamins and bioactive compounds. Traditionally used in Ayurvedic and Chinese medicine, Lotus seeds are assessed for their terrible proteins, complex carbohydrates, low fat and giant mineral content materials including calcium, phosphorus and magnesium (Balasubramian *et al*, 2012). In addition, lotus seeds are rich in polyphenolic compounds, including flavonoids, alkaloids and tannins, such as antioxidants, anti -inflammatory, hypoglycemic and neuropotive results (Jiang *et al*, 2013; Luo *et al*., 2021)These attributes make lotus seed flour a really perfect useful factor for developing composite flours targeting fitness-conscious and prone populations, inclusive of children, pregnant ladies, and individuals with metabolic issues. Roasting, a commonplace thermal processing approach, is regularly carried out in flour production to beautify palatability, nutrient digestibility, and shelf existence. It also plays a vital role in modifying the functional properties of flour such as water and oil absorption capability, pasting conduct, and protein solubility (Kumar *et al*., 2019). Importantly, roasting has been shown to improve the bioavailability of certain micronutrients via lowering anti-nutritional elements like phytates and tannins, as a consequence helping higher nutrient absorption (Zhang *et al*., 2020). When combined with lotus seed flour, roasted composite flour has the capacity to function a nutritionally enriched useful meals base, appropriate for various dietary packages including weaning meals, health beverages, and diabetic-pleasant products. Recent studies have shown the value of at least seeds and millet flour. For example, studies by Sharma *et al*. (2018) and Olapade and Aver (2012) emphasized the ability of such mixtures to improve protein efficiency, increase dietary fiber content and increase antioxidant capacity. Mirets, which form the base of the total flour in this study, are known for its dry resistance, low glycemic index and micronutrients such as iron and zinc (Goddess *et al*., 2014). The strategic combination of millet and lotus frame provides a double advantage: extended macronutrical materials and better mineral bioavaling, which is especially important in the context of the prevention of non-infectious disease and the deficiency of micronutrients (Kumar *et al*, 2021). Despite these benefits, there is limited scientific literature that focuses specifically on the nutritional characterization of fried total flour by incorporating Lotus Frømel. The study addresses as systematically approaches composition (moisture, carbohydrates, proteins, fat, fiber and ash) and mineral content (calcium, iron, phosphorus, sodium, potassium and vitamin C) have been evaluated by 5%, 10%and 15%15%by evaluating 5%, 10%and 15%. Through this study, the purpose of the study is to determine the ability of these yogas to make meaningful contributions to dietary improvement and serve as the basis for health -oriented, nutritious food products. This study focuses on growing roasted composite flour by way of incorporating lotus seed flour at various degrees into millet-primarily based formulations. The objectives encompass reading the proximate and mineral composition of each mixture and comparing their nutritional capacity for practical food programs. By utilising nutrient-wealthy lotus seeds and millets, the research promotes sustainable nutrients, agro-biodiversity, and value addition at the same time as helping the conversion of underused assets into health-selling food merchandise.

METHODOLOGY

Area of the study: The study was chosen on the basis of strategic high quality raw material access, efficient processing infrastructure Accessibility and local consumer preference for millet -based products. In the area's strong agricultural foundation, especially millet cultivation and availability of lotus stem seeds, ensured a stable supply of fresh, nutritious material. In addition, the presence of small and medium -sized food processing units is equipped with hygiene, food quality milling and semination equipment, which facilitates clean and effective preparation of total flour. Consumers with traditional millet -based diets continued product development in known and increasing health awareness. Local research institutes also provided technical assistance and laboratory facilities, which led to a complete nutritional analysis.

Sample Selection: Sample choice turned into based totally on dietary capacity, availability, and suitability for composite flour manufacturing. Millet flour and lotus stem seeds had been prioritized due to their complementary nutrient profiles. Millet, recognised for its richness in nutritional fiber, protein, and micronutrients, was procured from nearby markets and agricultural studies facilities to make sure variety and fine. Lotus stem seeds, valued for their protein, critical fatty acids, and bioactive compounds, were obtained from certified assets and processed into excellent powder. This planned ingredient selection contributed to the development of a nutritionally superior and functionally various composite flour.

Processing of Food Ingredients

Lotus Stem Seed Processing: The lotus stem seeds have been thoroughly wiped clean to do away with dirt, debris, and different impurities. They have been then dried in a hot air oven at 50–60°C to lessen moisture and enlarge shelf lifestyles. After drying, the seeds had been floor right into a nice powder the use of a meals-grade milling unit. The powder turned into finally handed through a high-quality mesh sieve to ensure a uniform particle size, facilitating homogenous blending with millet flour.

Millet Flour Preparation: Millet grains were first cleaned to dispose of dust, stones, and different foreign materials. Following cleaning, the grains had been dehulled to eliminate the outer husk, enhancing digestibility and texture. The dehulled grains have been milled into pleasant flour the usage of a commercial grinder. The flour become then sieved to gain a regular particle length for smooth blending into the composite flour components.

Composite Flour Formulation

The lotus seed powder turned into incorporated into millet flour at 3 tiers—five%, 10%, and 15%—to produce different composite flour versions. Blending became performed the usage of a dry blending method to ensure uniform distribution of lotus seed powder. The mixed flour samples were packed in airtight, food-grade containers to protect them from moisture and oxidative degradation. The samples were saved in cool, dry conditions until in addition use in dietary analysis and product improvement.

Nutrient Analysis of composite flour

The composite flour advanced in this study become analyzed for its proximate composition the use of popular strategies. Moisture content material turned into decided the usage of the oven drying approach (AOAC, 2016) through heating the sample at one hundred and five°C till a consistent weight become executed. Carbohydrate content material was expected the use of the Anthrone approach, primarily based on the colorimetric response of hydrolyzed sugars with Anthrone reagent. Protein was quantified the usage of both Lowry's technique, regarding Folin–Ciocalteu reagent, or the Kjeldahl approach, which measures nitrogen content material. Fat content material changed into assessed the use of the Soxhlet extraction approach with petroleum ether as the solvent. Ash content, indicating total mineral presence, turned into measured through incinerating the pattern in a muffle furnace at 550°C. Crude fiber turned into determined thru sequential acid and alkali digestion, setting apart indigestible residue. Dietary fiber turned into expected the use of the enzymatic gravimetric technique, which eliminates digestible components enzymatically, leaving fiber to be measured gravimetrically.

Mineral Analysis of composite flour

Mineral content evaluation become achieved the usage of Atomic Absorption Spectrometry (AAS) following acid digestion of the sample. The crucial minerals analyzed protected calcium, phosphorus, iron, zinc, copper, and magnesium. The samples had been digested with concentrated acids, and the mineral concentrations were quantified using AAS by using the use of measuring the absorption of unique wavelengths similar to every mineral. This approach ensured specific and correct mineral quantification within the composite flour.

RESULT AND DISCUSSION

Nutritional Composition of Composite Flours

Composite flours are formulated by blending flours derived from cereals, legumes, tubers, and pseudocereals to improve the nutritional quality and functional attributes of food products. These blends are increasingly used to combat nutritional deficiencies and enhance dietary diversity, especially in developing regions. Several studies have emphasized the nutritional and health-promoting potential of such formulations (Ayo *et al*., 2014; Adebowale *et al*., 2012; Sharma *et al*., 2018).Table 1 shows that macronutrient content of composite flour

Carbohydrate: The overall flour developed in this study performed a carbohydrate material of 69.7 grams per 100 grams per 100 grams. That is consistent with previous reports from Sharma *et al*. (2018), which found carbohydrates that they are in grain-cinema mixtures from 63.33% to 68.79%. High carbohydrate materials suitable for these flour for energy-erosion food applications, especially in areas where calorie management is a concern.

Protein: Protein content was found to be 10.35 grams per 100 grams. This corresponds to the findings from Ayo *et al*. (2014) and Singh *et al*. (2020), which noted that the inclusion of legumes and pseudosrel improved protein quality and total flour content, often between 9.62% and 11.93%. This makes them valuable when it comes to addressing protein-energy subsequent and improving amino acid profiles in a vegetarian diet.

Fat: 2.65 grams measured to 100 grams, in this formulation, the fat content was lower than any legumes-rich flour, but still contributes to the required fatty acid profile. Previous research (Adebowale *et al*., 2012) has shown that fat content in total flour can be more than 2.0% to 13% depending on the presence of oil -rich seeds. Fat supports cellular functions, absorption of vitamins and hormone control.

Dietary fiber: Dietary fiber material was recorded as 4.15 grams per 100 grams. This is slightly higher than the values reported by Olapade and Aver (2012), which visited the fiber level between 2.33% and 4.03% in grain level mixtures. Fiber is crucial to digestive health, blood sugar control and cholesterol control, and its presence increases the functional and satisfaction value of foods.

Moisture : The moisture content was 3.5%, which falls within the safe area reported by Fammy *et al* (5.70%to 8.57%).Low moisture levels are critical for prolonging shelf life and preventing microbial spoilage, especially under ambient storage conditions.

Ash: At 2.4%, the ash material reflects the total mineral content of flour. It is more than 1.23% -1.54% range documented by Oakpala and Egwu (2015), suggesting a rich mineral appearance due to incorporating Lotus seed powder and millet, both known for their dense micronisty profiles. The composition of total flour nutrition highlights their ability to increase the nutritional profile of different food applications. With high carbohydrate content for energy, medium protein level for muscle maintenance, and a good fiber content for digestive health, these give them a dough a nutritionally favorable profile. Low moisture material ensures better storage stability, while ash material reflects the presence of essential minerals. Ensuring proper handling and storage will help maintain general quality and nutritional value for extended use.

Micronutrient content of composite flour incorporated with lotus seed powder Table 2

Composite flour is formulated via blending various flours derived from cereals, legumes, tubers, and pseudocereals to beautify its dietary great. This segment presents a detailed evaluation of its mineral and diet C content material, highlighting their useful importance and nutritional significance. The evaluation turned into performed following standardized methods, which includes the FSSAI Manual of Methods, ensuring accuracy and reliability.

Calcium: Calcium content of total flour was found to be 97.5 mg per 100 grams. Calcium plays an important role in maintaining bone health, muscle contractions, nerve signaling and blood clots. Adequate calcium intake is necessary to prevent osteoporosis and ensure proper skeletal growth. Inclusion of calcium -rich ingredients such as legumes and pseudosrel in total flour increases the nutritional value, which is suitable for strengthening staple food (Gupta *et al*., 2021).

Phosphorus: The phosphorus content was measured at 283.3 mg per 100 grams. Phosphorus and teeth are important for minerals, energy metabolism and cell signaling. It creates a main component in ATP (adenosinrifosphate), body energy. A balanced intake of phosphorus with calcium supports general skeletal health and metabolic processes (Mahmood *et al*., 2020).

Iron: The iron content was recorded as 5.21 mg per 100 grams, which was determined using the FSSAI manual for methods. Iron is important for oxygen transport in the blood, as it creates an important part of hemoglobin. Lack of iron can lead to anemia, fatigue and impaired cognitive function. The inclusion of iron -rich sources in total flour improves nutritional quality and contributes to the prevention of anemia (Kumar and Sharma, 2019).

Potassium: Potassium level in total flour was measured at 177.65 mg per 100 grams. Potassium is an important electrolyte that controls fluid balance, muscle contraction and nerve transmission. It also helps maintain healthy blood pressure levels and reduce the risk of heart disease. Potassium supports a dietary and kidney function (Singh *et al*., 2022) to fight the negative effects of sodium.

Sodium: Sodium content was found to be 4.1 grams per 100 grams. Sodium is necessary to maintain fluid balance, nerve function and muscle contraction. However, excessive sodium intake can contribute to high blood pressure and heart disease. Medium sodium content in total flour ensures that it can be included in a balanced diet by recommending the daily sodium intake (World Health Organization, 2021).

Vitamin C: The total flour was 1.54 mg of vitamin C per 100 grams. Vitamin C is an essential water-soluble vitamin known for its antioxidant properties, the support and role of the immune system in collagenynthesis. It increases the absorption of iron from plant -based foods and contributes to wound healing and skin health. Although the total flour is not a primary source of vitamin C, its presence combines the general nutritional value (Patel *et al*., 2020) of the appearance. Nutrition evaluation of general flour reveals its rich mineral profile, which contributes to bone health, energy metabolism, oxygen transport and heart function. The presence of vitamin C, although it is antioxidant properties and supports immune function. The production of overall flour with different nutrients-ingredients makes a valuable alternative to improve dietary intake and address the deficiencies of micronutrients.

CONCLUSION

Lotus seeds and millet-based total mel minerals and vitamin C profiles reveal a nutritious formulation, especially in calcium, phosphorus, iron and potassium. While monitoring the sodium content right, the general composition suggests that the flour can contribute significantly to the intake of micronutrients. Supported by previous research, these findings confirm the utility of overall flour to increase the quality of diet and address nutritional deficiency. Such yogas have the ability to improve food safety, especially in a sensitive population of malnutrition and micronutrition intervals.

ABSTRACT

The development of materials with enhanced or entirely new qualities is made possible by nanotechnology. Nanotechnology offers better growth, faster germination rates, and increased tolerance to environmental stressors, it has the potential to fundamentally alter the way seeds germinate. The present study focuses on the synthesis and characterization of copper oxide and iron oxide nanoparticles using the sol-gel and chemical precipitation methods. The size, composition, and surface morphology of these nanoparticles were assessed using characterization techniques such as energy dispersive X-ray microanalysis (EDAX) and transmission electron microscopy (TEM). Additionally, the impact of these nanoparticles on the physiological characteristics of *Triticum aestivum* seeds was noted. The results indicated that synthesized nanoparticles were copper oxide and iron oxide and were of size 20-50 nm having squarish to spherical morphology for copper oxide nanoparticles and hexagonal to spherical morphology for iron oxide nanoparticles. The *Triticum aestivum* seeds exhibited that iron oxide and copper oxide nanoparticles considerably improved physiological characteristics at lower concentrations, however they have phytotoxic effects at greater doses, which impede the growth of seedlings and decrease seed germination.

Keywords: Copper oxide, characterization, Iron oxide, *Triticum aestivum*

INTRODUCTION

Over past ten years the widespread usage of nanoparticles (NPs), or particles smaller than 100 nm, in a variety of sectors of the national economy, such as the food industry, water purification, and medicine. However, there hasn't been enough research done on the application of nanoparticles in agriculture. In an effort to boost plant production and lower the environmental risk associated with fertilizer use, the combination of nanoparticles with fertilizers is made so as to produce Nano fertilizers. Among varieties of nanoparticles the Metallic nanoparticles offer a wide range of applications and have much potential in nanotechnology. Consequently, it is essential to understand these nanoparticles environmental fate and long-term impacts. Plants can absorb metal nanoparticles in different ways. [1] [2][3]. Numerous studies have examined the effects of different nanostructures on various crops in recent years, with a focus on the early stages of development, seed germination, and seedling growth. Depending on the kind, size, concentration, exposure time, and growing circumstances of the nanoparticles, priming them (also known as Nano-priming) may have a positive, negative, or no effect on the germination process. However, only few investigations have been conducted to understand the effect of Copper oxide and Iron oxide nanoparticles at the physiological levels in major food crop like wheat. Copper oxide nanoparticles (CuO NPs) are widely used in commercial applications, including heat transfer fluids, catalysts, semiconductors, photovoltaic cells, and sensitive gas sensor [4]. They have also been used in agricultural applications such as fertilizers and pesticides [5], largely due to its relatively slow dissolution and anti-microbial properties.Iron oxide nanoparticles (IONPs) have also gained attention in agriculture due to their unique properties, such as high surface area, magnetic behavior, and biocompatibility. Their potential applications in agriculture can benefit crop production, pest control, and help in soil improvement. Wheat (*Triticum aestivum*) crop belongs to the family *Graminae* (Poaceae) and is an annual, large shrub plant commonly used as food. Wheat is a globally consumed cereal crop, which is a staple food in most part of Asia, Africa, and other parts of the world. It is the most valuable food and strategic cereal crop in Egypt and ranks third globally, after corn and rice, as the most productive grain [6]. It is a major source of energy, protein and dietary fibre in human nutrition [7].Due to its ability to thrive in a variety of environmental circumstances, wheat can be grown extensively and stored for a long time. Being the most important staple food crop of India, a wide number of agricultural research programs are involved in increasing the growth and yield of this particular crop.

MATERIALS AND METHODS

Synthesis of Copper oxide and Iron oxide Nanoparticles

The figure 1 represents the flow chart for synthesis of copper oxide and iron oxide nanoparticles. The copper oxide nanoparticles were synthesized by Sol- gel method [8] and Iron oxide nanoparticles by precipitation method [9].

Characterization of Synthesized Nanoparticles

A variety of advanced scientific tools, like energy dispersive X-ray microanalysis (EDAX) and transmission electron microscopy (TEM). A transmission electron microscope (TEM), model Philips Tecnai 20, Holland, with an accelerating voltage of 100 kV, was used to evaluate the particles' size and shape. For TEM examination, the material was placed on copper grids coated with carbon. The samples were made by dispersing the particles in 2-propanol. EDAX was used at a voltage of 30 kV and a magnification of up to 2, 50,000X for elemental analysis. The Sophisticated Instrumentation Centre for Applied Research and Technology (SICART) was the center for all characterization activities.

Preparation of seeds and seed priming in Nano solutions

For the study purpose two nanoparticles i.e. copper oxide and iron oxide nanoparticles were taken into consideration. Different concentration of nanoparticles were dissolved in double distilled water, further these solutions of different concentration were sonicated thoroughly for even mixing. Thus different concentration of Nano solutions were prepared.

For the study purpose *Tritium aestivum (Wheat)* seeds were selected, these seeds were thoroughly washed with water, then after these seeds were suspended in 2.5% sodium hypochlorite solution for surface sterilization, washed with distilled water and primed in a suspension of different concentration of prepared Nano solutions for 12 hours. Then after the primed seeds were kept on double folds of filter paper in a Petri plate and then transferred to germination sheets as shown in figure 2 Each treatment was replicated three times, with ten seeds in each concentration [10].

Measurement of Physiological Parameters

Different parameters like germination percentage, seedling length, seedling vigor index and mean root length and shoot length were recorded on different period of growth. The study was done for the period of week.

Germination Percentage

By creating ideal circumstances for every experimental set, seed germination was observed. Every experimental set's germination was noted, and the total germination was computed and reported as a percentage [11].

Germination percentage *(%) =Number of Germinated seeds/Total number of seeds×100*

Seedling Length (cm)

The length of roots and shoots of the germinated seeds were measured for every experimental set. The average shoot length was measured from the base of the primary leaf to the base of the hypocotyl and was stated in centimeters. The mean root length was measured from the primary root's tip to the hypocotyl base and was recorded in centimeters. The seedling length was computed and represented in centimeters by summing the root and shoot lengths [12].

$$\boldsymbol{Seedlinglength}\ (\boldsymbol{cm}) = Shootlength + Rootlength$$

Seed Vigor Index

The seed vigor index was calculated and given as a number using the formula proposed by [13].

SVI= Germination (%) X Seedling Length

RESULTS AND DICUSSION

Characterization of Nanoparticles

Energy dispersive X-ray microanalysis (EDAX)

The elemental composition of the nanoparticles can be determined through EDAX analysis. The Copper oxide nanoparticle has 73.94 % Copper and 26.06 % oxygen by weight, which indicates the successful synthesis of copper oxide nanoparticles, similar composition was observed by Amna *et al*., 2013 [14], correspondingly the Iron oxide nanoparticle has 54.53 % Iron and 45.47 % oxygen as shown in figure 3. [15]

TEM (transmission electron microscopy) analysis

TEM analysis pictures of Copper oxide and Iron oxide nanoparticles were generated at room temperature indicating that the copper oxide Nano catalyst were of agglomerated spherical to Squarish shape with an average size about 20-50 nm. On contrary Iron oxide Nano catalyst exhibited Hexagonal to spherical shape (Figure 4) [16]. The particle size of both Nano catalyst was found to be consistent with the particle size estimated using XRD examination.

Measurement of Physiological parameters

Effect on seed germination

The germination percentage of the decreased with an increase in the concentration of copper oxide and iron oxide nanoparticles. At lower concentrations of 50ppm and 100ppm the germination percentage was maximum for copper oxide and iron oxide nanoparticles, but as the concentration increases beyond 100 ppm the germination percentage shows a gradual decrease. At 50 ppm concentration 95% germination was recorded at 100 ppm concentration it was 98%which was maximum, then after at 150 ppm and 200 ppm concentration gradual decrease of 88% and 85% was

observed for copper oxide nanoparticles. For Iron oxide nanoparticles at 50 ppm 86% germination followed by 90% at 100 ppm, 83%at 150 ppm and 73% at 200 ppm concentration was observed. The results revealed that an increasing concentration of nanoparticles results in decreases germination percentage. The least of all was observed in control. Enhanced seed germination in lower concentration of NPs may be attributed with the findings of [17]as stated that NPs have tendency to penetrate plant seed coats and enhance seed germination and growth.

Effect on seed Vigor Index

The seed vigor index of *Triticum aestivum* decreased with increasing copper oxide and iron oxide nanoparticle concentrations. The seed vigor index at 50 ppm, 100 ppm, 150 ppm and 200 ppm concentration for copper oxide nanoparticles were 906.3, 991.76,794.64 and 700.4 for copper oxide and for iron oxide nanoparticle at 50 ppm, 100 ppm, 150 ppm and 200 ppm concentration it were 738.74, 837.9, 767.75 and 681.72 respectively. However, it was found that Seed vigor index was reduced at higher concentration.

Effect in seedling length

Seedling length is an important indicator of plant growth. It is an essential measure in assessing a plant's growth, health, and potential for successful establishment. At lower concentration of 50 ppm the seedling length was 9.54 cm and 8.59cm for copper oxide and iron oxide nanoparticles respectively and that at 100 ppm concentration it was maximum which was around 10.12cm and 9.31cm for copper oxide and iron oxide nanoparticles respectively. As concentration increased the seedling length decreased this is supported by fact that the seedlings may grow more quickly at lower concentrations of copper oxide and iron oxide nanoparticles because of the nutritional advantages and stress-reduction strategies, which will result in longer seedlings. However, at higher concentrations, the toxicity and harmful effects of these nanoparticles can overwhelm the plant's protective mechanisms, resulting in stunted growth, oxidative stress, and reduced seedling length.

Mean Shoot length and root length

The wheat seeds were germinated on germination sheets and kept for a period of 15 days Root and shoot length were measured up to 15th day by using ruler. The increasing trend was observed as the number of days increased. The Shoot length of copper oxide treated seeds increased from 5.78 cm to 14.22cm from day 5 to day 15 at 50 ppm concentration, whereas root length increased 3.76 cm to 10.78 cm at 50 ppm concentration. At 100 ppm concentration the shoot length increased from 5.92 cm to 14.56 cm, whereas root length increased from 4.2 cm to 11 cm from day 5 to day 15. At 150 ppm concentration the shoot length increased from 5.51 cm to 14.1 cm, whereas root length increased from 3.52 cm to 10.53 cm from day 5 to day 15. The least growth was observed at 200 ppm concentration which was only 5.06 cm to 13.88 cm and root length increased from 3.18cm to 10.21 cm from day 5 to day 15.For Iron oxide nanoparticles at 50 ppm concentration the shoot length increased from 5.27 cm to 13.52 cm from day 5 to day15 and root length increased from 3.32 cm to 10.36 cm from day 5 to day 15. At 100 ppm concentration the shoot length increased from 5.43 cm to 13.8 cm from day 5 to day 15 whereas root length increased from 3.88 cm to 10.61 cm from day 5 to day 15. At 150 ppm concentration the shoot length increased from 5.1 cm to 13.35 cm from day 5 to day 15and root length increased from 4.15 cm and 10.13 cm from day 5 to day 15. The least growth was observed at 200 ppm concentration which was only 4.79 cm to 13.17 cm of shoot length from day 5 to day15 and the root length observed was around 3.95 cm to 9.71 cm from day 5 to day 15, this may be due to combination of improved nutritional availability, hormonal stimulation, increased stress tolerance, and the plant's normal development cycle causes wheat seeds treated with copper oxide and iron oxide nanoparticles to gradually lengthen their roots and shoots. The apparent increase in length is the result of several variables working together to support continuous growth as the days pass.

CONCLUSION

The Study indicates successful synthesis of copper oxide and Iron oxide nanoparticles. The Characterization technique helped in confirming the shape, size and composition of Nanoparticles. The results proved successful

synthesis of both the Nano catalyst. Furthermore the influence of synthesized NPs on different physiological parameters like seed germination, seedling length, seed Vigour index and mean Root and shoot length was studied on *Triticum aestivum.* The results indicated that at lower concentrations of upto 100 ppm the copper oxide and iron oxide nanoparticles significantly enhanced physiological properties. However, at higher concentrations, both the nanoparticles exhibit phytotoxic effects, reducing seed germination and inhibiting seedling growth.

ACKNOWLEGMENT

Authors are thankful to SHODH (Scheme of Gujarat Government) for providing financial support during research work. I would also like to thank SICART for providing the analysis facility.

ABSTRACT

The present study focuses on the qualitative and bacterial analysis of raw milk from three different sources. Samples were named as S1 for cow milk, S2 for goat milk and S3 for pasteurised packet milk. S1 and S2 were collected from nearby houses whereas S3 from a retail market in Pathanamthitta district. Qualitative analysis was determined by organoleptic test, clot on boiling test, acidity test, starch test, shake test and flow test. Bacterial analysis was done using Bergey's Manual of Determinative Bacteriology (2000). The study revealed that the cow milk contains harmful bacteria whereas goat milk and pasteurised packet milk contains useful bacteria. The cow milk maybe contaminated due to milking, handling or storage or due to environment. This work can be further studied by collecting more samples or by comparing samples from different area, can be conducted as a survey on consumers choice on pasteurised or unpasteurised or different brands.

Keywords: Raw milk, Pasteurised packet milk, Qualitative analysis, Bacterial analysis

INTRODUCTION

Milk is one of the most important and widely consumed by people of all ages. It is a rich source of essential nutrients that contribute to overall health and well-being. It is obtained primarily from mammals such as cows, goats, and buffaloes, with cow's milk being the most popular and widely available. Milk is a compensatory part of daily diet

especially for the expectant mothers as well as growing children (Rajagopal *et al*., 2005; Javaid *et al*., 2009; Olatunji *et al*., 2012). Milk is known for being an excellent source of calcium, which is essential for strong bones and teeth. It also contains protein, vitamins such as vitamin D, B12, and riboflavin, and minerals like phosphorus and potassium. Milk and dairy products are among the basic foodstuffs, which are necessary for the nutrition of children of growing age. Milk has protective properties against obesity, hypertension, certain cancer types, osteoporosis, and dental health (Tufekci *et al*., 2019). In 2018, global milk production reached 843 billion litres, with an estimated value of USD 307 billion and is projected to grow by 22% by 2027(OECD-FAO, Agricultural Outlook 2018-2027*).* Approximately 80% of yearly milk production comes from cows, with the rest from other dairy animals like buffaloes, goats, camels, and sheep, according to the Food and Agriculture Organization (FAO, The Global Diary Sector: Facts, 2019). Milk quality is important to ensure consumer health and safety. Microorganisms, including bacteria, yeast, and mold can contaminate milk at various stages, from production to consumption. Physiological analysis is important tool to monitor the quality of milk and dairy products (Woldemariam and Asres, 2017). However, raw milk is a very sensitive food that is subject to rapid change if it is not handled properly and hygienically. Due to its high nutritional value, neutral pH and high-water activity, raw milk is a good medium for the growth of microorganisms (Planinic *et al*., 2022). Thus, the present study was carried out with the objective to understand the quality and bacterial analysis of milk samples namely S1 (cow milk), S2 (goat milk) and S3 (pasteurised milk) from different sources in Pathanamthitta district.

MATERIALS AND METHODS

A total of 3 samples were collected from 3 different sources from Pathanamthitta district. The collected milk samples were fresh. Samples were named as S1 (cow milk), S2 (goat milk) and S3 (pasteurised milk). The raw cow milk and the raw goat milk was collected in a sterile glass bottle and the pasteurised packet milk was collected in a sterile container. The samples were immediately transported to the laboratory for further analysis. Various qualitative analysis was determined. Organoleptic test, clot on boiling test, acidity test, starch test, shake test and flow test was done (Nath and Aravindkumar, 2021). Bacterial analysis is done by the enumeration of bacteria by serial dilution of sample followed by standard plate method. The plates were incubated for 48 hours at 28±2° C for bacterial colony isolation and purified using nutrient agar medium. The bacterial genus was identified by various morphological and biochemical methods using Bergey's Manual of Determinative bacteriology (2000).

RESULT AND DISCUSSION

The milk samples were studies for qualitative analysis and represented in Table 1. The organoleptic test shows that all samples show excellent quality. Clot test displays no precipitation in three samples. All the three samples provide no starch formation. Flow test revealed excellent flow in S2 and S3 while good flow in S1. Foam formation was absent in all samples and all the samples were acidic. All the three samples show excellent quality could be due to the absence of adulterants. Sial *et al*. (2018) studied organoleptic analysis of milk samples collected from milk shops, tea shops and households. Figure1 represents Total heterotrophic bacteria found in all the samples. An overall abundance of bacteria is observed in pasteurized milk (41×10^{-5} cfu/ml). This predicts that a significant number of bacteria is found in it. This can lead to premature spoilage of milk, which is commonly found closer to the expiration date. Spoilage could perhaps be due to changes in temperature, improper pasteurization or post contamination due to unsanitary practices. Defective pasteurization, adulteration of pasteurized milk with raw milk and unsanitary handling are all contributory factors to early milk spoilage. Also, it could indicate the presence of good bacteria present in it. Cow milk showed comparatively high bacterial growth than goat milk indicated contamination while handling it. The international standard for acceptable quality raw milk is not to exceed a total bacterial count of 1×10^5 cfu/ml (Reta and Addis, 2015). Raw milk may be contaminated from the environment, unsterile utensils, unhygienic storage tanks, dirty condition of milking hands, diseased animals (Sharma *et al*., 2023). Table 2, represents the biochemical characteristic and identification test of bacteria. Four bacterial isolates from cow milk sample, two isolates from goat milk sample and four isolates from pasteurised milk samples were studied. Colony morphology,

gram staining and biochemical analysis were carried out to identify bacteria. *Staphylococcus* sp. is isolated from both cow milk and goat milk sample. There is a substantial occurrence of pathogenic coagulase-positive *Staphylococcus aureus* in milk and dairy products found from informal sectors in developing nations (Singh and Prakash, 2010). Enhancing milk quality and ensuring its safety for consumption by people requires implementing improved methods, strict adherence to good manufacturing standards and rigorous hygiene measures (Remaz and Elhag, 2015; Nyokabi *et al*., 2021). *S. aureus* is more common in dairy cows' mammary gland infections because it can live in the keratin layers of the teat canal (Qayyum *et al*., 2016). *Lactococcus*, *Streptococcus* and *Lactobacillus* are lactic acid bacteria. Lactic acid bacteria (LAB) belong to a group of gram positive bacteria that produce lactic acid as their main fermentation product into the culture medium and generally recognized as safe (Konings, 2000). El-Shafei *et al*. (2002) also reported the preponderance of higher *Lactobacillus* spp. LAB species are extremely valuable in food industry as beneficial organisms. It was demonstrated that lactic acid given by lactic acid bacteria not only keeps foods and beverages in the state of perfect preservation but can also boost the growth of healthy microbiota throughout the intestine beside of reducing the pathogens. One of the most important contributions of these microorganisms is the extended shelf life of the fermented products (Wassie and Wassie, 2016). In conclusion, the three milk samples indicated that all the three are quite good for consumption. The identified bacterial genera were commonly present in milk samples. Most of them improves the health of intestine. However, further study needs to be conducted by analysing the percentage composition of various components found in the milk samples will help consumers choose the brands with the best quality milk

ACKNOWLEDGEMENT

The authors are grateful to the Principal, Catholicate College, Pathanamthitta for providing facilities to conduct the work in the laboratory.

ABSTRACT

Infertility is a disease that affects one in six adults globally representing it as a serious health concern. The causes may be the male, female or combinatorial factors and the female factor contributes 37%. A 21 years old female with complaints of irregular menstrual cycle with the history of an ovulatory cycle and right ovarian cyst approached Siddha clinic for further management. In this case altered *Vaḷikuṟṟam* due to increased *Aiyam* and *aḻal*, might be the causative factor of immature follicle development and ovarian cyst, so the treatment was started with the help of Siddha diagnostic methods. After 6 months of treatment patient got conceived. Hence the prescribed Siddha drugs significantly improved the altered *Vaḷi* and *Aiyam*, as well as regulated the hormonal parameters and ovulation, resulting in normal conception.

Keywords: Anovulatory cycle, Infertility, Female Infertility, *Penmaladu*, Siddha medicine

INTRODUCTION

Infertility is global health concern that affects millions of peoples in reproductive age. It is defined by failure to conceive after 12 months or more of frequent, unprotected sexual contact. The World Health Organization reported that one in six adults or 17.5% of the global population suffer with infertility that indicates the critical need to expand

access to high-quality, cost-effective fertility treatment [1]. Also World Health Organization reported that 11.8% of Indian women in the reproductive age group have been diagnosed with primary infertility [2]. The etiology of infertility have been classified as male, female or combinatorial factors and the statistics revealed that head wise contribution were 8%, 37% and 35% respectively. Disorders of fallopian tube (tubal block, salpingitis, hydrosalpinx etc.), uterus (Fibroid uterus, polyps, unusual shape of uterus, cervical stenosis, scar tissues etc.), ovaries (Polycystic ovaries, tumors, tubo-ovarian abscess, ovarian torsion etc.), endocrine system (PCOS, Hypothyroidism, anovulation, hyperprolactinemia, precocious puberty etc.,) were the major female factors causing infertility and out of these, ovulatory factor marks upto 25% [3,4,5]. The infertile women in developing countries where suffered with negatively impacted lifestyle and it was a great challenge for them to take part in social activities [6]. They were mostly experienced with overt ostracism, domestic abuse, divorce, emotional stress, anxiety, depression, and low self-esteem. The availability, access and quality of infertility treatment were diversified and have been unattainable by most of the people in many countries. Even the government health policies and strategies were not prioritized the infertility therapeutic management and the increased out of pocket expenses for assisted reproductive technology, that will lead to individuals financial crises [3]. The diagnostic and therapeutic approach for female infertility was precisely mentioned in Siddha system of medicine and distinctive body constituent based management are also mentioned. In '*Agathiyar Karba Kol*' and '*Gnanavettiyan 1500*', female infertility was termed as *Peṇmalaṭu* or *Karpa roham* and derangement in *aḻal*, *vaḷi*, infection of reproductive organs, pox virus infections, irregular sexual practice, centripetal obesity, scar tissues such as adhesions, alkaline nature of cervix were mentioned as causative factors.

This present case report postulates the cost effective and non-invasive Siddha management for Primary infertility with anovulatory cycle and ovarian cyst. This case report has been prepared in accordance with CARE guideline.

PATIENT INFORMATION

A 21 years old female housewife and her 32 years spouse visited private Siddha clinic OPD with the complaints of inability to conceive for the past 2 years. The seminal parameters of the spouse were found to be in normal range. She had a history of irregular scanty menstrual flow for 2 to 3 days with an interval of 60 to 90 days. She underwent Hormone Replacement Therapy (HRT) for one year and observed rapid weight gain during the treatment course. So the couple approached Siddha management due to the poor prognosis and increased out-of-pocket expenses of modern medicine.

CLINICAL FINDINGS

The patient had a normal body built with a BMI of 24.3. On physical examination, the vitals were found to be normal and no abnormalities were noted in abdominal palpation. The Ultra-Sonogram pelvis revealed that right ovarian complex cyst measuring 33 x 26 mm and follicular study report showed no dominant follicle on Day 12 in ovaries. No abnormalities were detected is Hysterosalpingography. There was no evidence of Acanthosis nigrican's, hirsutism and acne. The patient also examined by Siddha diagnostic methodology *eṇvakait tērvu* and *tēka ilakkaṇam* was tabulated in table 2. The past history was evident that she was not suffering with T2DM, SHT and any other systemic illnesses.

DIAGNOSTIC ASSESSMENT

On detailed clinical evaluation of the signs and symptoms, the patient was diagnosed as *Peṇmalaṭu* (primary infertility) associated with anovulatory cycle. The ovulation process was also assessed by follicular study in 3rd and 7th month.

THERAPEUTIC INTERVENTION

The patient had *Aḻalvaḷi* pattern of *Nāṭi Naṭai* (Pulse pattern) and *Neykkuṟi* (oil drop urine test) so the treatment modalities was started to normalize the deranged *Mukkuṟṟam*. The patient was treated for seven months and the medicines used in the due course were tabulated in Table 1. She was advised to take the internal medicine (d) alone in empty stomach on early morning during menstruation as per procedure. Throughout the course of treatment period the patient was instructed to consume black urad dal porridge, fenugreek seed porridge, sesame balls, flax

seeds, lotus stem decoction. As well as to abstained from tamarind, *Sesbania grandiflora* leaves, bitter guard, pumpkin and junk foods.

Follow-Up and Outcome

The patient recuperate to regular menstrual cycle with normal blood flow after 60 days of treatment and her BMI reduced from 24.3 to 21.8. On the seventh month of treatment course she attained a healthy conception and confirmed by obstetric USG. The patient was followed up throughout the Antenatal period and she delivered a full term healthy male baby by normal vaginal delivery. There was no adverse drug reactions reported in treatment course. The outcome assessments with prognosis were detailed in table 2.

DISCUSSION

Infertility is a major life crisis with a multitude of sociocultural, emotional, physical, and financial issues. The patient was diagnosed as primary infertility associated with anovulatory cycle; the same was described as *Peṇmalaṭu* in Siddha medicine. Increased *aiyam* and *aḻal kuṟṟam* attenuate the *Vaḷi kuṟṟam*, which may be the disease's causative factor and lead to diminutive ovarian follicle. The patient was advised to take an *Eṇṇey kuḷiyal* (oil bath) on day 1 in order to normalize the deranged *Aḻal kuṟṟam*. *Agasthiyar kuzhambu* was subsequently administered, along with tender *Ficus religiosa* leaves ground up and mixed with cow milk, three consecutive days (days 2 - 4) to normalize the *Vaḷi kuṟṟam*. Since the Siddha basic principles state that drugs with *kaippu*, *kārppu* and *tuvarppu* tastes (bitter, hot and astringent) will both increase diminished *Vaḷi* and decrease aggravated *Aiyam* and *Aḻal* [7]. So the drug possessed those taste was chosen to administered as an internal medication. Due to their taste, hot potency and post-digestive biotransformation, *Vishnukranthi* and *Notchi* were advocated. *S. Angayarkanni et al.,* evaluated the Anti-hyperandrogenemic activity of *Evolvulus alsinoides* at a dose of 500 mg/ kg, gonadotropin hormone-releasing hormone (10 µg/ kg) used as a standard. The study results showed that *Evolvulus alsinoides* have a capability to alleviate the effects of polycystic ovaries and also reduces the progesterone, testosterone, ALT and AST levels [8]. Also, *Vishnukranthi* (*Evolvulus alsinoides*) have 16 bioactive compounds, most of them have the properties have endocrine modulator and also has antidepressant, anti-mutagenic, gastro-protective and hepato-protective [9,10]. These activities may regulate the endocrinal secretion and regularize the menstrual cycle. The leaves, root, bark and seed of the plant *Notchi (Vitex negundo)* are diversely used in folklore practice for female reproductive issues. Research revealed that phytoestrogens, vitexin of *Vitex negundo* were useful in Hormone replacement therapy due to its high estrogenic like activity. The extract of *V.negundo* regulates the LH, prolactin, testosterone and serum insulin level which may leads to proper ovulation [11]. Siddha text mentioned that administration of *Malaivembathy thylam* (*Kalingathi thylam*) in an empty stomach during the menstrual phase will help to eliminate the *Malaṭṭu kirumi* from uterus and ovaries [12]. Also, *Malaivembu* have hot potency with *kaippu* taste and *kārppu* taste as a post-digestive biotransformation [13]. Those tastes have the potency to increase *Vaḷi (kīḻ nōkkuṅkāl)* which may normalize the menstrual flow and helps to remove the accumulated debris of uterus. Anovulation, abnormal prostaglandin metabolism and Endocrine disorders are some causative factors for improper endometrial shedding that may also leads to endometrial hyperplasia, Dysfunctional Uterine Bleeding, etc [14]. *Cederblad et al.,* revealed that the fibrinolytic activity of endometrium in normal women was higher in luteal and menstrual phase than in follicular phase that was found to be a normal physiology in menstruation [15]. *Nithya rani et al.,* evaluated the fibrinolytic activity of *Melia dubia* latex protease and the result showed that it has fibrinolytic activity with clot hydrolysis and wound healing [16]. So, the ingestion of *Malaivembathy thylam* in menstrual phase may expel the endometrial debris and enhance the shedding, involution and healing of endometrium during menstrual phase. As a result, the prescribed Siddha drugs significantly improved the altered *Vaḷi* and *Aiyam*, as well as regulated the hormonal parameters and ovulation, resulting in the patient became pregnant shortly after six months of treatment and gave birth to a healthy, full-term boy.

CONCLUSION

This case study provides glimpse into the meticulous method for effective management of *Peṇmalaṭu* (primary infertility) associated with anovulation and ovarian cyst using Siddha therapeutic management. The outcome of this present case report will pave a way to further studies with sizable sample size.

Patient Perspective

The patient thanked for their healthy conception without much expenses which they can't afford. And the couple assured that they will refer patients with same issues for cost - effective Siddha management.

Informed Consent

The patient was obtained written informed consent for publishing their clinical details in journal.

ABSTRACT

This study investigates the phytochemical composition, antibacterial activity, and GC-MS profile of *Solanum torvum* and *Solanum xanthocarpum* fruit extracts. Using solvents including methanol, ethyl acetate, chloroform, petroleum ether, and water, extracts were prepared and screened for key phytochemicals. Methanolic extracts revealed the highest flavonoid (9.99 mg GAE/g) and terpenoid content (64.1 mg GAE/g). Antibacterial assays using the disc diffusion method indicated strong inhibition against *Staphylococcus aureus* (36.2 mm by *S. torvum*) and *Pseudomonas aeruginosa* (30.4 mm by *S. xanthocarpum*). GC-MS analysis identified bioactive compounds such as phytol, neophytadiene, linoleic acid methyl ester, and squalene, which are known for antimicrobial and antioxidant properties. These findings validate the medicinal potential of these plants and support further pharmacological exploration.

Keywords: *Solanum torvum, Solanum xanthocarpum*, Phytochemicals, Antibacterial, GC-MS, Secondary metabolites

INTRODUCTION

Medicinal plants are essential to both traditional and modern medicine, with over 80% of the global population relying on plant-based remedies. *Solanum torvum* (turkey berry) and *Solanum xanthocarpum* (yellow-fruit nightshade), [1] members of the Solanaceae family, have a long history of use in Ayurveda for treating infections, inflammation, and respiratory disorders. Despite their widespread traditional use, there is limited scientific documentation of their phytochemical profile and antibacterial potential. The increasing prevalence of antibiotic resistance necessitates new sources of antimicrobials. This study aims to evaluate the phytochemical constituents, antibacterial activity, and GC-MS profiles of *S. torvum* and *S. xanthocarpum* fruit extracts to support their therapeutic relevance [9].

MATERIALS AND METHODS

Fruits were collected from Thoothukudi, Tamil Nadu (Dec 2024). Dried powders were extracted using Soxhlet apparatus with methanol, ethyl acetate, petroleum ether, chloroform, and water. Qualitative screening was performed using standard methods to detect flavonoids, terpenoids, alkaloids, tannins, saponins, and phenols. Quantitative flavonoid content was measured by aluminum chloride method; terpenoids were estimated via spectrophotometry at 538 nm. The disc diffusion method was used against *Staphylococcus aureus* and *Pseudomonas aeruginosa*. Each extract (5 mg/mL) was applied to sterile discs (6 mm) on Mueller–Hinton agar. Amikacin served as the control [7]. GC-MS analysis was conducted using a Perkin-Elmer Clarus 500 system with Elite-5MS column. Compounds were identified using the NIST library.

RESULTS AND DISCUSSION

All extracts tested positive for key phytoconstituents. Methanol extracts exhibited the highest concentrations, notably 9.99 mg GAE/g flavonoids in *S. torvum* (Table 1) and 64.1 mg GAE/g terpenoids in *S. xanthocarpum*.(Table 2) These metabolites are linked with antioxidant and antimicrobial effects[1]. Significant antibacterial activity was demonstrated by the plant extracts. Notably, the ethyl acetate extract of *Solanum torvum* exhibited a pronounced inhibition zone of 36.2 mm against *Staphylococcus aureus*, (Table 3)[1] while the methanolic extract of *S. xanthocarpum* produced a 30.4 mm inhibition zone against *Pseudomonas aeruginosa*.[3,4](Table 4) These findings indicate a strong correlation between antimicrobial efficacy and the concentration of flavonoids and terpenoids present in the extracts [6]. The mode of action is likely attributable to the ability of phytochemicals to disrupt microbial membranes, inhibit protein synthesis, or interfere with nucleic acid function, as suggested in earlier literature [10]. GC-MS analysis revealed several bioactive compounds with known pharmacological relevance. In *S. torvum*,[2] major constituents included phytol, 11,14,17-eicosatrienoic acid methyl ester, and squalene. (Table 5). In contrast, *S. xanthocarpum* yielded neophytadiene, n-hexadecanoic acid, and linoleic acid methyl ester(Table 6). These compounds have been previously reported to exhibit antimicrobial, antioxidant, and anti-inflammatory properties, which may underlie the observed antibacterial activity[7]. These compounds are reported to exhibit antibacterial, anti-inflammatory, and cytotoxic properties, confirming the plants' pharmacological relevance [8],[9].

CONCLUSION

Both *Solanum torvum* and *Solanum xanthocarpum* demonstrate rich phytochemical profiles and potent antibacterial effects, particularly in methanol and ethyl acetate extracts. GC-MS analysis further supports the presence of therapeutically important compounds. These findings highlight the potential of these species as candidates for natural drug development.

ABSTRACT

Understory plant species, especially herbs and shrubs, have been overlooked by researchers for a long time. They have a great role in nutrient cycling and controlling the microclimate of the region. Therefore, a survey was conducted in the Kurseong subdivision of Darjeeling district of West Bengal, India. It is the part of the Eastern Himalaya which is also a biodiversity hotspot site of the country. The present study reported thirty plant species comprising four shrubs and twenty-six herbs. These species belong to sixteen families. Asteraceae is the dominant family with eight species, followed by Poaceae with four species. Further, according to distribution status, 24 are native and the rest of the 6 species are introduced. The alarming rate of anthropogenic disturbances has destroyed the rich biodiversity of the region, recommending immediate conservation.

Keywords: Understory species, Kurseong, Darjeeling, Herbs, Shrubs, Native, Introduced.

INTRODUCTION

Darjeeling is a rich biodiversity site in West Bengal, India. The district is situated in the lap of the Eastern Himalaya (Chauhan and Sharma, 1996). It represents one of the richest Phytogeographical provinces in the country (Chatterjee,1962). However, Himalaya is the one of the four Biodiversity hotspot site of India. The area is made up of sedimentary and metamorphic rock with slopes from south to north. According to the researchers, the district is highly prone to landslides. The last few decades have damaged thousands of houses and lost more than hundreds of lives through it (Nad, 2015). Darjeeling is famous as a plant lover's paradise. The forest area is dominated by Oaks,

Maples, Pines, Rhododendron and Cinchona trees. The vegetation varies with the variation of altitude from temperate to evergreen forest. Kurseong subdivision of the Darjeeling district has a variety of understory Herbs, shrubs and fern species. These floor plants are the indicator species of greater soil fertility (Supriyati and Ariyanti, 2024). They can impact the regeneration process of trees. Thereby influenced the plant succession process (Thrippleton *et al*., 2016). The present study area comprises vast tea gardens with Cinchona and Orange planted sites. These canopy species directly enhance atmospheric deposition, microclimate and light transmission in the region. It leads to controlled Biodiversity and nativeness of ground vegetation (Augusto *et al*., 2003). The understory vegetation has been overlooked for a long time. However, very few studies on floor vegetation are conducted by the researcher. The main objective of the present study is to document the understory vegetation (Herbs and Shrubs) and their distribution status in Kurseong subdivision area of Darjeeling district.

MATERIALS AND METHODS

Darjeeling Himalaya is formed from a comparatively new rock structure in the Himalaya. It is the foothills district of West Bengal, India. The river Tista divided the district into two parts. The eastern part comprises Chola range and Kalimpong. However, the Singalila and the Darjeeling-Kurseong range are situated in the Western part. Darjeeling district is formed of four subdivisions: Darjeeling Sadar, Mirik, Kurseong and Siliguri (Figure-1). Kurseong subdivision comprises different forest ranges, like Bagdogra Forest range, Dalkajhar forest etc. The hillslopes of the region face a sufficient amount of sunlight whichfavour the growth of forest floor plant species. The present study was conducted in Kurseong subdivision (Figure-1). The field survey was done in different seasons from June 2024 to May 2025. The photograph of the live specimen in flowering condition was taken with the help of GPS map camera. The different sites like Sittong, Latpanchar, Ahaldara view point, Namthing pokhri etc were chosen for the survey. The information regarding local names, habits, and habitat was noted down during the survey. Scientific names and families are recorded with the help of regional flora. The distribution status of different plant species is listed with the help of the Royal Botanic Gardens online database. These statuses have been classified into two categories; Native and Introduced species. Native species originated and occur naturally in a particular geographical region. However, introduced species are transported and established in new regions beyond their native place.

RESULT AND DISCUSSION

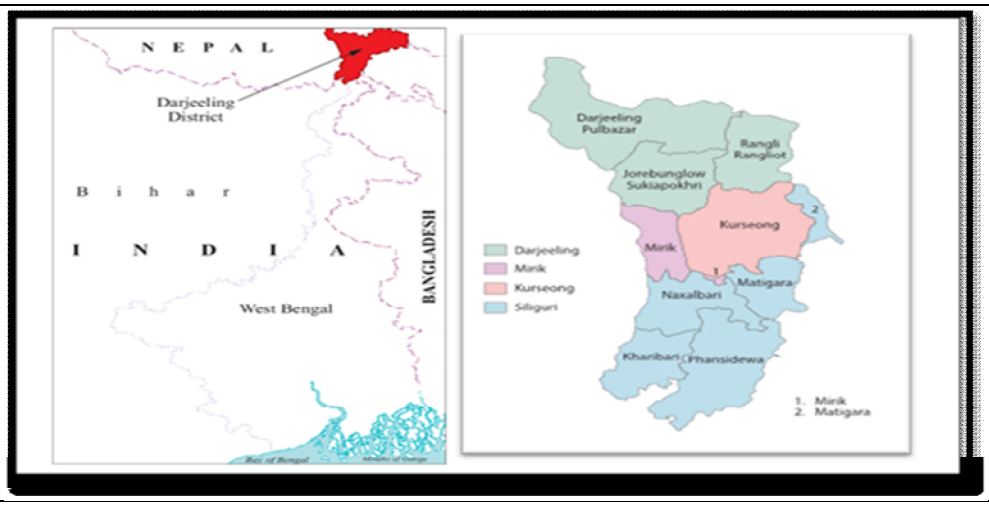
The present study recorded thirty understory plant species with their family, habit and geographical distribution status (Table-1). It comprises twenty-six herbs and four shrubs. The plant species belongs to sixteen families. Asteraceae is the dominant family, comprising eight species. Further, Poaceae became the second-largest family with four species. Four families are bispecific and the rest ten families are monospecific (Figure-2). Out of thirty species, six are recorded as introduced and the remaining are native in the study region. Photograph of live specimens are store at digital data base of Panskura Banamali College (Autonomous) for future study (Figure-3-11).These understory species not only have ecological significance, like controlling soil erosion, nutrient recycling and maintaining the health of the local vegetation, but also have crucial medicinal values. This study is comparable with the previous studies reporting 49 herbs species belongs to 21 families from a foothill forest of Cooch Behar district, West Bengal in the Eastern Himalaya (Shukla and Chakravarty, 2014). Further, Haq *et al*. (2024) reported a total of 60 distinct species (9 shrubs and 51 herbs) belonging to 52 genera from the Zabarwan Mountain Range, Indian Western Himalaya. Hence, the present study reported fewer numbers of understory plant species than earlier studies (Sangry *et al*., 2024; Dar and Parthasarathy, 2025; Shameem *et al*., 2010). Still, it has greater significance as it enriched the region-specific flora database. However, the dominance of the Asteraceae family on understory plant species and the maximum contribution of Poaceae in the shady slopes Vegetation is supported by another study of Han *et al*. (2023) in other parts of the Himalaya. Out of the total recorded understory species, 80% are native in the study region. This means the geographic area has fulfilled the main ecological requirements like light, moisture, temperature and soil condition for the growth of native floor species. The native understory species are a vital component of the ecosystem which enriches the biodiversity of the region. Few understory species have been observed as introduced plant

species. They have been introduced by human activity, either intentionally or unintentionally. Hence, the geographical region has dispersal ability, habitat suitability and lots of disturbances.

CONCLUSION

Understory plant species are the dynamic layer of any vegetation that controls soil erosion, regimes water and improves the fertility of soil. The driving mechanisms of understory plant species have important implications for the conservation of biodiversity. It also helps to maintain the function of ecosystem during global climate change. The present report draws the attention of new researchers to focus on this field. Further, the introduced species can potentially outcompete with the native species. Hence, it is important to prepare a checklist of regional native plant species, otherwise the introduced species may alter its ecosystem dynamics. The study also assumed that the anthropogenic disturbances through increased destination priority by tourists and regular new household settlements in the area are continuous threads to the local flora. Hence, immediate steps need to be taken to protect overlooked understory plant Biodiversity.

ACKNOWLEDGEMENTS



I am very much thanks full to my beloved students of session 2023-2024 of our department. They were help me during my field survey at Kurseong subdivision of Darjeeling district, West Bengal, India.

ABSTRACT

Coconut trees are widely grown in several tropical and sub-tropical countries and is consumed in various forms. Tender coconuts are nutritious and have several health benefits but, the waste produced in the form of tender coconut shell is underutilised. To make better use of the tender coconut shell the polyphenolic extract from tender coconut shell has been studied for its antioxidant and antidiabetic property. Antioxidant activity in terms of IC_{50} value has been 163.07 µl and antidiabetic activity inhibiting α-glucosidase has an IC_{50} value of 321.08 µl for the polyphenolic extract indicating intense activity.

Keywords: Polyphenols, Tender Coconut Shell, antioxidant, antidiabetic, inhibition.

INTRODUCTION

Consumption of fruits and vegetables has lots of health benefits as they contain secondary metabolites like polyphenols which are natural antioxidants. These polyphenols have been widely studied for their strong radical scavenging and antioxidant activity as they contribute to prevent disease such as diabetes, hyper tension, coronary diseases and cancers [2].Oxidative stress is found to be a cause for the dysfunction of the pancreatic β-cells which are responsible for secretion of insulin. Thus, polyphenols play an important role as potent antioxidants and antidiabetic contributing to the prevention of type 2 diabetes.In addition, there are several studies which reveal the role of polyphenols as antidiabetics and antioxidants in various food stuffs. Coconut trees *Cocos nucifera.* (L) commonly called coconut palm is a member of the Arecaceae family and is also the only living member of the genus Cocos. Coconut trees are widely grown in the tropical and subtropical regions providing multiple use to the mankind[3]. Coconut, like other fruits, it has three layers: the exocarp, mesocarp and endocarp. The exocarp is the glossy outer skin, usually yellow-green to yellow-brown in colour. The mesocarp is composed of a fibre, called coir, which has

many traditional and commercial uses. Both the exocarp and the mesocarp make up the "husk" of the coconut, while the endocarp makes up the hard coconut "shell". Coconut and its products have been an important part of the diet among Indian population from time immemorial and consumption of tender coconut water as healthy drink is known across several countries. Unfortunately, after consumption of the tender coconut water and the testa inside, the tender coconut shell is discarded causing pollution. It has been previously reported that several parts of the ripe coconut including coconut oil, virgin coconut oil and the tender coconut water to contain polyphenols which have antioxidant and anticancerous properties [1]. Also, in our previous study we have reported the presence of polyphenols in the tender coconut shell. Thus, to make better use of the polyphenols present in the tender coconut shell and to explore its potential applications, the present study has been formulated to evaluate the antioxidant and antidiabetic properties of the polyphenols extracted.

MATERIALS AND METHODS

Plant Material and Extraction

The plant material consists of two fresh tender coconuts of 4 – 5 months maturity cleaned, de-husked and dewatered to obtain the tender coconut shell. These tender coconut shells were cleaned properly with water, broken into small pieces, and are immersed in 750 ml distilled water in a 1L glass beaker. The extract thus collected after 48 hours containing the maximum amount of polyphenols is the polyphenol extract.

Determination of Antioxidant property

The free radical scavenging activity of the concentrated polyphenols or the polyphenol extract was determined by DPPH (2,2-diphenyl-1-picrylhydrazyl) assay, according to the method of Brand-William et al.,[4] and Kevin P. Anthony and Mahmoud A. Saleh[5] with slight modifications. For DPPH assay ascorbic acid was used as reference standard. Ascorbic acid stock solution was prepared in distilled water (1 mg/ ml; w/v). A 60µM solution of DPPH in methanol was freshly prepared and a 200µl of this solution was mixed with 50µl of test sample at various volume (100, 200, 300, 400 and 500 µl). The plates were kept in the dark for 15 minutes at room temperature and the decrease in absorbance was measured at 515 nm. Control was prepared with DPPH solution only, without any extract or ascorbic acid. 95% methanol was used as blank. Each sample, as well as each control was analysed in triplicates.
Radical scavenging activity was calculated by the following formula

$$\text{Percent inhibition} = \frac{\text{Absorbance of Control - Absorbance of Sample}}{\text{Absorbance of Control}} \times 100$$

Determination of Antidiabetic property

The antidiabetic activity of the polyphenol extract was assessed using the α-glucosidase inhibition assay according to the method described by Shai et al.,(2011) [6] with slight modification. 400 µL of α-glucosidase (0.067 U/mL) was pre incubated with different volume of the polyphenol extract for 30 min. Then 200 µL of 3.0 mM 4-nitrophenyl-α-D-glucopyranoside (pNPG) used as substrate dissolved in 0.1M sodium phosphate buffer (pH 6.9) was then added to start the reaction. The reaction mixture was incubated at 37°C for 30 min and stopped by adding 2 mL of 0.1 M Na2CO3. The α-glucosidase activity was determined by measuring the yellow-coloured para- nitro phenol released from pNPG at 400 nm. The results were expressed as percentage of inhibition. The Same procedure was done with Acarbose (1mg/ml stock) which was used as the standard.
The percentage of inhibition was calculated using the formula

$$\text{Percentage inhibition} = \frac{\text{Absorbance of Control - Absorbance of Sample}}{\text{Absorbance of Control}} \times 100$$

RESULTS AND DISCUSSION

The antioxidant activity of the polyphenol extract is summarised in Table 1. Half-maximal inhibitory concentration (IC_{50}) is the concentration needed to reduce half of the free radical concentration. In this study it has been seen that the IC_{50} value of the reference standard (ascorbic acid) has been 28.19µg/ml whereas the polyphenol extract has an IC_{50} value of 163.07 µl. Thus, the result clearly indicates that the polyphenol extract form tender coconut shell has profound antioxidant activity. The free radical DPPH, which is widely used to evaluate the ability of compounds to operate as free-radical scavengers and hydrogen suppliers, is a rapid, simple, and inexpensive method for testing antioxidant capabilities. The DPPH test relies on the elimination of DPPH, a stabilized free radical. DPPH is indeed a dark-coloured crystalline compound made up of free-radical particles that are stable. It is a well-known radical and a popular antioxidant test. In nature, antioxidant compounds are commonly available in com plex botanical mixtures. Interactions of hundreds or even thousands of antioxidant compounds attribute unique chemical- and biological-related features to each plant [7].In vitro, several extractions of plants have been shown to neutralize DPPH radical scavenging activity [8]. Furthermore, DPPH free radicals have been found to be scavenged by several tea extracts consisting of a variety of polyphenols [9]. The specific method of free-radical scavenging activity of the extract is unknown. Further, the extract may contain different types of polyphenols and the particular polyphenol responsible for the free radical scavenging activity has to be explored. The antidiabetic activity determined using the α-glucosidase inhibition assay of the polyphenol extract is summarised in Table 2. From the results it is seen that the α-glucosidase inhibitory activity in terms of the IC_{50} value of standard Acarbose has been found to be 16.72 µg/ml whereas, the polyphenol extract has an IC_{50} value of 321.08 µl. Therefore, the polyphenol extract is a potential inhibitor of α-glucosidase. Phytochemicals with strong antioxidant properties have been reported to be good inhibitors of α-glucosidase, and regulators of hyperglycaemia and other diabetic complications arising from oxidative stress [10]. Generally, the drugs acting asα-glucosidase inhibitors are considered as oral hypoglycaemic agents owing to their role of inhibiting the degradation of di-saccharides to monosaccharides, thereby maintains the bloodsugar level normal (UK prospective diabetes study) [11]. It has been reported that polyphenols exerted excellent antioxidant activities, which repaired pancreatic β-cells, enhanced insulin sensitivity, and decreased blood glucose in diabetic mice [12]. There are several studies on different parts of coconut exhibiting the antidiabetic property [13],[14],[15]. However, antidiabetic property exhibited by polyphenol extract from tender coconut kernel is first of its kind and further studies on animal models and cell cultures are still needed to ascertain these properties.

CONCLUSION

Generally, many kinds of polyphenols show both the antioxidant activity and the antidiabetic activity. The antioxidative properties and antidiabetic efficacy of polyphenols are independent of each other and their interrelationship is still unclear. Understanding the interaction of the antioxidant activities and antidiabetic effects of polyphenols will need to be clarified in the future studies. However, when we take polyphenols from a food, its effect may not be same as the effect of the chemical alone. Antioxidative and antidiabetic activity may change by processing methods, such as heating etc and is different in different parts of the fruit, seed, leaf etc. In the present study the polyphenols from tender coconut shell have profound antioxidant and antidiabetic property which suggests that it can find applications against many degenerative diseases.

ABSTRACT

M. phaseolina is a polyphagous pathogen belonging to the Botryosphaeriaceae family, which is both soil and seed-borne. It is responsible for causing dry root rot and blight in over 500 crop species across more than 100 families, particularly in tropical and subtropical regions with semi-arid climates. This pathogen exhibits two distinct phases: a saprophytic phase (*Rhizoctonia bataticola*) and a pathogenic phase (*M. phaseolina*). Officially recognized as the correct taxonomic name since 1947, *M. phaseolina* (Tassi) Goid has a significant impact on a variety of crops, including soybeans, common beans, mung beans, peanuts, sesame, cowpeas, chickpeas, cluster beans, sorghum, corn, and cotton. The identification of *Macrophomina* is characterized by the formation of brown or black structures that eventually darken. Microsclerotia develop within the vascular tissue, imparting a greyish-black hue to the stem. Management strategies for this pathogen encompass soil solarization, the use of inorganic salts, bioagents, resistant varieties, and chemical control. The application of biocontrol agents such as *Trichoderma* and *Pseudomonas* spp. as seed treatments, soil applications, and foliar sprays has proven effective in combating this pathogen and mitigating yield losses. Additionally, combining phytoextracts with chemical fungicides has been shown

to reduce disease incidence. An integrated disease management approach is often employed, emphasizing sustainability.

Keywords: Agriculture, Dry root rot, Microsclerotia, Saprophytic, Vascular tissue.

INTRODUCTION

M. phaseolina is a polyphagous pathogen that is both soil and seed-borne, responsible for causing dry root rot and blights in 500 crop species across more than 100 families. Known as charcoal rot, dry root rot belongs to the Botryosphaeriaceae family within the Dothideomycetes class, which is recognized as the most diverse class of Ascomycetes [1]. This fungus has been identified in regions across North and South America, Asia, Africa, and Europe. It holds significant economic importance in subtropical and tropical countries characterized by semi-arid climates [2]. *M. phaseolina* exhibits heterogeneous host specificity, infecting both monocotyledonous and dicotyledonous plants, and its distribution in soil is not uniform. The pathogen is responsible for both pre-emergence and post-emergence mortality in plants. Notable symptoms observed after emergence include spindle-shaped lesions characterized by a dark border and a light grey center, which may develop microsclerotia and occasionally pycnidia [3]. Sclerotia can persist in the soil for extended durations. The pathogen has been identified as seed-borne [4] in infected seeds and can be transmitted through seedlings [5]. *M. phaseolina* is also an occasional human pathogen that leads to various fungal infections and has the capacity to neutralize plants and animals through preventive antifungal treatments [6]. The organism exhibits two distinct phases: a saprophytic phase characterized by *Rhizoctonia bataticola*, which produces microsclerotia and mycelia, and a pathogenic phase represented by *M. phaseolina*, which also generates microsclerotia, mycelia, and pycnidia [7]. Documented evidence indicates the presence of both phenotypic and genotypic variation within the pathogen population in the same geographical area [8]. The existence of heterokaryotic mycelium shows significant variability. These complexities pose challenges in the development of effective and sustainable disease management strategies [9, 10]. Additionally, this review emphasizes the classification of fungi, identification of the pathogen, symptomatology, epidemiology, disease cycle, host range, and management strategies pertaining to *M. phaseolina*.

Fungal classification

The genus *Macrophomina* was initially described by Petrak in 1923, based on dried specimens of *Sesamum orientale* collected by G.M. Ryes in the Philippines in 1921 [11]. The pycnidial form of the fungus was first identified as *Macrophomina phaseolina* by Tassi in 1901 and later as *Macrophomina phaseoli* by Maublanc in 1905 [12]. Literature also documents additional symptoms associated with *Macrophomina phaseolina*, including references to *Sclerotium bataticola* by Taubenh in 1913, *Macrophomina cajani* by P. Sydow and Butler in 1916, *Macrophoma chorchori* by Sawada in 1916, *Macrophoma sesami* by Sewada in 1922, and *Tiarosporella phaseolina* by Tassi in 1981 [13]. In India, the fungus was first isolated from cowpea in 1912 by Shaw and was referred to as *Sclerotium bataticola* by Sheikh and Ghaffar in 1979. In 1981, Van der Aa reclassified the species as *Tiarosporella phaseolina* (Tassi) Van der Aa. Currently, *M. phaseolina* (Tassi) Goid, established in 1947, is recognized as the valid taxonomic name, with the sclerotial phase identified as *Rhizoctonia bataticola* by Holliday and Punithalingam in 1970. *Macrophomina* is a monotypic genus, comprising solely the species '*phaseolina*' [14].

Yield loss

This disease is prevalent in agricultural areas, leading to considerable reductions in crop yield. The extent of yield loss can range from 5% to 50%, and in optimal conditions for susceptible varieties, it may reach as high as 100% [15]. In Tamil Nadu, it has been documented to cause a yield reduction of 28.6% in black gram, with disease prevalence between 67.7% and 81.2% [16]. A survey on the dry root rot disease affecting rice fallow black gram in Tamil Nadu indicated that the incidence of the disease varied from 16% to 33%. It was noted that sandy loam and sandy clay soils exhibited a higher incidence of dry root rot compared to clay soils [17].

Symptomatology

Seedlings can become infected when the soil is excessively dry and the temperature exceeds 35ºC for duration of 2-3 weeks [18]. Symptoms may manifest as brown or dark spots on the cotyledons following their development. In certain instances, the edges of the cotyledons may turn brown or black and fall off prematurely. Symptoms begin to appear from the unifoliate leaf stage in hypertrophic seedlings [19]. These symptoms present as circular or oblong reddish-brown lesions that may darken to brown or black after several days. The lesions can also spread down the stem. Seeds may perish if the soil remains excessively hot and dry [20]. The initial indication of the fungus typically manifests on the plant's surface within 1 to 4 weeks prior to reaching its full growth stage. It inflicts damage on the roots, stems, pods, and seeds from ground level upwards [21]. The lesions are generally light brown or gray in colour and are not commonly observed on the stem. Microsclerotia develop within the vascular tissue and substance, imparting a grayish-black hue to the stem. These discolorations first appear at the nodes as large, randomly distributed black dots [22]. In cases of nursery infections, a twin stem anomaly is often present. The early yellowing of the roots and lower stem is usually followed by a reddish-brown discoloration as the fungus advances along the stem. Infected pods and grains are covered with black bodies that may be either locally or widely dispersed [23]. The fungus can produce various symptoms depending on its method of penetration into the pod and grain, and it may also result in the seeds exhibiting thick black spots [24]. Upon the death of the plant, numerous minute micro sclerotic lesions resembling pinheads become visible. These lesions can be accurately identified by removing the epidermis from the lower stem and roots of the plant. The infected crop exhibits early yellowing in distinct patches. Under severe conditions, the pathogen may affect a significant area of the field. Typically, within the impacted crop, dead leaves remain attached to the petioles for several days following the plant's demise. The affected plant can be easily extracted from the soil, and both root hairs and lateral roots will decay, accompanied by peeling bark at the collar region [25].

Identification of the pathogen

Macrophomina is characterized by the development of brown or black coloration, which eventually darkens further. In culture plates, one can observe numerous aerial mycelium with sclerotia embedded within the hyphae. Initially, the septate hyphae are hyaline, transitioning to a honey or black colour [26]. On the underside of the culture plate, a significant presence of dark brown to black sclerotia is visible. The vegetative mycelium forms monilid or barrel-shaped cells, with septum formation occurring near the branching of the mycelium. Branching typically occurs at acute angles, but can also occur at right angles to the parent hypha [27]. Aggregated hyphae lead to the formation of microsclerotia, consisting of 50 to 200 individual cells that are produced by melanin pigment. The microsclerotia of Macrophomina are black and range in size from 50 to 150 micrometers. *M. phaseolina* generates globose or flattened pycnidia, measuring between 100 to 200 micrometers in diameter [28]. The inner layer is hyaline, while the outermost layer of cells appears dark brown to black. The conidiophores are septate and simple, and the conidia are hyaline and obovoid with a truncate base. The gelatinization of the outer layer of the conidial wall leads to the development of apical and cap-shaped conidial appendages [29].

Fungus

The genus "*Rhizoctonia*" is an anamorphic fungus belonging to the Cantharella group and the Ceratobasidisaceae family. This genus does not produce spores; instead, it is characterized by the presence of hyphae and sclerotia (*hyphal propagules*) during its asexual phase [30]. While certain species function as saprotrophs, others act as facultative plant pathogens, leading to significant crop diseases. The term "*Rhizoctonia*" was first introduced in 1815, meaning "root killer" in French, and has since been expanded to encompass over 100 additional names. A comprehensive review and re-evaluation of the species name "rhizoctonia" was published in 1994 in the peer-reviewed journal "Evolutionary Fungi." The findings indicate that the correct taxonomical designation for *Rhizoctonia* is "*Macrophomina phaseolina*" Goid 1947, which is now acknowledged as *Macrophomina phaseolina* [31].

Host range

Macrophomina phaseolina could be a nonspecific parasitic species that has been watched to assault around 500 species in over 100 families around the world. The run of have species and topological conveyance propose that

Macrophomina phaseolina is moderately assorted [32]. This plant pathogen incorporates a wide extend of impacts on an assortment of crops, counting soyabeans, common beans, mungbean, sorghum, corn, cotton, shelled nut, sesame, cowpea, chickpea and cluster bean and cotton. Moreover, it has been watched to influence softwood and other timberland trees, as well as citrus, cocoas, coffee, ziziphus, leucaena, therapeutic plants and unwanted weeds [33].

Disease cycle

M. phaseolina is responsible for causing seedling blight, root rot, and stem rot in a variety of crops, including soybean, common bean, sorghum, maize, cotton, peanut, and cowpea. It also affects softwood forest trees such as *Abies, Pinus,* and *Pseudotsuga*, as well as fruit trees like citrus, coconut, and coffee, along with various weed species [34]. Under unfavorable environmental conditions, the fungus forms sclerotia within the root and stem tissues. In potato dextrose agar (PDA), pycnidia are occasionally produced in host crops; for instance, in cowpea, pycnidia appear at the conclusion of the rainy season. In the soil, microsclerotia can infect seeds or host tissues, serving as the primary inoculums [35]. The infective hyphae penetrate the plant through root epidermal cells or wounds. In the early stages of pathogenesis, the mycelium invades the root epidermis via intercellular spaces and progresses through the cortex of the primary roots, ultimately resulting in the death of the plantlets. During the flowering stage, the fungal hyphae grow intracellularly within the xylem vessels, leading to the appearance of necrotic lesions on the stems, branches, and peduncles of the infected plants. The production of fungal toxins, particularly phaseolin, is significantly increased in the infected plants, contributing to premature death [36]. Following the demise of the plants, the processes of mycelial colonization and sclerotial formation persist until the tissues become desiccated. The mycelium and microsclerotia generated from the infected plant material, which includes plant residues, serve as the primary means of pathogen propagation. The microsclerotia found in the soil, as well as in the roots and stems of the host, represent the principal surviving propagules [37]. Once the roots and plant debris decompose, the microsclerotia are released into the soil. They are typically found in clusters on the soil surface and are predominantly located at a depth of 0-20 cm (Figure 1) [38].

Epidemiology

Temperature

Temperature was the essential restriction figure for the development and pathogenicity of *Rhizactonia bataticola* segregates determined from roots, leaf and seeds of beat like black gram, green gram, cowpea, soybean, and redgram. As the temperature expanded between 10ºC and 30ºC, mycelial development expanded steadily, and there was a continuous diminish at 35ºC [39].

Soil moisture

This infection was increases by the dry soil conditions, especially at blossoming organize, which caused the plants to dry out all of the sudden. Root colonization was higher at 40% to 50% soil dampness compared to 10% to 20% soil dampness. Contamination and side effect advancement was most influenced by higher temperatures (25-40ºC) in overflowed soil as contradicted to dry soil (40-60%) [40].

pH

The pH extend for dry root decay was decided to be between 3.0 and 9.0 with 5.5 being the ideal pH for development and 6.0 being the least pH for development. As the pH expanded, the development rate diminished until it comes to 7.0 [41].

Management strategies

The aim of the control methods is to reduce the number of sclerotia in soil and to minimize the contact of the inoculum and host.

Soil solarization

Soil solarisation effectively diminishes soil-borne pathogens such as *Pythium* spp., *M. phaseolina*, and *Fusarium* spp. This method is cost-effective for organic farmers as it does not require specialized skills or technology, but is reliant

on climatic conditions and necessitates a prolonged duration. The combination of soil amendments and solarisation elevates soil temperatures, thereby inhibiting pathogen growth to a depth of 30 cm [42]. Furthermore, integrating biological methods with soil solarisation has proven to significantly reduce pathogen presence. This technique has been shown to manage diseases caused by various fungal pathogens, including *Rhizoctonia solani, Macrophomina phaseolina, Fusarium* spp., *Pythium* spp., *Phytophthora* spp., *Verticillium* spp., *Bipolaris sorokiniana*, *Plasmodiophora brassicae*, and *Sclerotium rolfsii* [43].

Inorganic salts

Instead of synthetic fungicides, certain inorganic salts are employed to manage *M. phaseolina*. Effective salts include sodium carbonate at a concentration of 1.5%, sodium bicarbonate at 2.0%, and ammonium molybdate at 4.0%, which have demonstrated efficacy against the growth of *M. phaseolina*. Additionally, seed priming with these salts has been shown to diminish seed-borne infections [44]. Augment with organic matter and nutrient availability in silicate treated soil was depicted by physiochemical analysis. These findings suggest the possibility of using potassium silicate as an alternative to fungicides against dry root rot disease [45].

Resistant varieties

A total of 41 genotypes of black gram were evaluated for their resistance to the dry root pathogen *M. phaseolina*. The genotypes CO-5, IPU 07-3, and MASH 1-1 exhibited moderate resistance to the disease and this assessment was conducted using the paper towel method. These genotypes hold potential for the development of resistant varieties in black gram breeding programs [46]. Additionally, soybean cultivars were tested for resistance to charcoal rot caused by *M. phaseolina* under high disease pressure conditions using an artificial cut stem inoculation technique with two aggressive isolates in a poly house screening. The germplasms GNG 2299, H12-24, IPC 2002-31, GNG 1958, IPC 10-134, IPCK 2009-165, PG 0104, GL 2003, IPC 2007-28, H 12-26, BG 0109, and CSJ 515 demonstrated moderate resistance [47].

Using bioagents

Biocontrol agents are the microbial community in the physical environment around the plants that suppresses the growth of the pathogen in the sustained manifestation of interactions. The antagonistic effects of *T. viride* and *T. harzianum* on *M. phaseolina*, which is responsible for charcoal rot in cowpea and mung bean [48]. In the experiment, carriers such as talc and gypsum are utilized alongside *Rhizobium* [49]. The application of *Trichoderma* leads to a 50% reduction in the incidence of *M. phaseolina* in black gram, in conjunction with a *Rhizobium* biofertilizer mixture. Seeds treated with *T. viride* and *Rhizobium* exhibit enhanced nodulation [50]. The dry root rot pathogen has been introduced to the black gram, which has been treated with *P. fluorescence*. The enzymes PAL (phenylalanine ammonia lyase) and PO (polyphenol oxidase) were activated in the plants, and an increase in lignin accumulation was noted. Furthermore, the combination of *T. viride* and neem cake promotes greater shoot length and germination rates, yielding improved outcomes. Additionally, the synergistic effect of *T. viride* and neem cake as a soil amendment contributes to a decrease in disease incidence in the soil [51]. An endophytic isolate of *Klebsiella pneumonia*, designated HR1, was obtained from the root nodules of *Vigna mungo*. This isolate is capable of producing indole-3-acetic acid (IAA), hydrogen cyanide (HCN), and siderophores, which facilitate the solubilization of phosphate and zinc. The soil borne ubiquitious pathogen, *M. phaseolina* is a pot case study, when treated with isolate HR1 increases the shoot and root length, germination percentage compared to greenhouse study. *M. phaseolina* was in least percentage when the isolate of *Klebsiella pneumonia* was applied in the seed bacterization and soil drenching application. Chitinase, phenylalanine ammonia lyase defence enzymes were increased after the application of *Klebsiella pneumonia* [52]. Talc formulation of *T. viride* mixed with zinc and boron suppresses *M. phaseolina* which increases root length, shoot length leads to increase in the yield vigour index [53].

Chemical control

The findings indicate that thiram, vitavax, ceresin, and benlate demonstrate significant efficacy in reducing fungal disease colonization in seeds [54]. Carbendazim at a concentration of 0.2% was particularly effective in mitigating seed-borne diseases in black gram. Furthermore, mancozeb and captan, both at 0.2%, yielded superior results [55]. In

conjunction with carbendazim, captan, propineb, tebuconazole, and the combination of thiram and carbendazim exhibited complete inhibition of *M. phaseolina* growth [56]. Soil drenching with carbendazim at a 0.1% concentration for soybean crops resulted in a minimal incidence of *M. phaseolina*, reducing it by 5.36%, thereby enhancing crop yield. Tebuconazole and trifloxystrobin provided better outcomes compared to other treatments against the pathogen *M. phaseolina* [57].

CONCLUSION

This soil-borne pathogen exhibits heat tolerance and is responsible for diseases in various crops, including black gram, groundnut, soybean, maize, sorghum, and green gram, at any growth stage. Management practices are challenging, and the resulting severe damage to crops can lead to significant yield losses. The application of biocontrol agents such as *Trichoderma* and *Pseudomonas* species, whether as seed treatments, soil applications, or foliar sprays, has proven effective against this pathogen and helps mitigate yield loss. Implementing these practices enhances crop growth and aids in the elimination of inoculum. Additionally, combining phytoextracts with chemical fungicides can reduce disease infection. Furthermore, an integrated disease management approach often emphasizes sustainability.

ABSTRACT

The plague is a communicable bacterial disease having a high death rate without treatment. It is known as the Black Death. The Gram negative bacterium *Yersinia pestis* (0.5 to 0.8 pm in diameter and 1 to 3 pm long) that reveals bipolar stain with Giemsa, nonmotile, non-spore-forming coccobacillus is accountable for fatal plague. It is a zoonotic disease well-known in stable foci in the Eurasia, Africa, and Americas. Spread from individual host to a new relies mostly on infected flea bites, bringing typical painful, inflamed lymph nodes referred to as buboes, followed by septicemic spreading of the pathogen. In similarity, droplet inhalation later close interaction with infected mammals encourages primary pneumonic plague. The infrequently stated ingestion of dirty raw meat causes pharyngeal and gastrointestinal plague. Point of attention diagnosis, first antibiotic treatment, and confinement measures contribute to epidemic control despite residual death. Required primary inhibition depend on the active investigation of recognized plague foci and ectoparasite control. Antimicrobial medications given early after the beginning of signs, prevented many deaths, those suggested for treatment and prophylaxis included doxycycline, fluoroquinolones and gentamicin.

Keywords: Plague, *Yersinia pestis*, Black Death, Rat flea

INTRODUCTION

Plague is communicable disease has caused the greatest fear universal, mostly through the three main plague pandemics. The first wave was called the "plague of Justinian" (541 to 750//767) after the emperor of the Roman Empire of the Orient, Justinian [1]. However, the first pandemic has conventionally been believed to be responsible for tens of millions of demises, the exact number of deaths remains unknown, and some studies suggest that the death estimates have been exaggerated and are not supported by the current suggestion [2]. The Second Pandemic recognized as the Black Death owing to the intense cyanosis of the dying, killed roughly 1/4 of the European population and spread to the Middle East and the Far East. The Third Plague Pandemic is began in china in 1850[3]. The present incidences of plague epidemics were of 3248 cases and 584 deaths reported globally between 2010 and 2015[4]. Since 2001 ahead, the WHO has documented 14 chief epidemics, mainly originating from Africa and Asia (https://www.who.int/ news-room/fact-sheets/detail/plague, accessed on 29 April 2025). Consequently, *Y. pestis* is still a public health threat today, producing sporadic infections and rare local epidemics[5-11]. Plague is a severe illness that can result in swollen glands, blood infection, and death. It is caused by bacterium known as *Yersinia pestis* commonly found in small mammals and their fleas**.** Plague also called the Black Death. It is mainly a disease of rodents which are having the infections of bacteria *Y. pestis*. People can spread by the bite of an infected flea. Individuals infected with Y. pestis frequently develop signs after an incubation period of one to seven days Human beings can expose to naturally-occurring plague by

- If plague-infected flea bites the human.
- Touching the infected fluid of the glands.
- Inhalation of small droplets.
- Get exposed to the body of an animal that died from the disease of plague[12].

Prevention of plague from a natural source

- Use gloves and face and eye protection while handling dead bodies.
- Prevent insect bites by using an insect repellent material.
- Remove fleas from residential area.
- Do not touch infected tissues or body fluids from a plague-infected persons or animal.
- Keep a minimum of 3 feet distance between healthy person and patient.
- Maintain hygienic condition.

In the description of sylvatic plague, some mammalian species, especially rodents, are act as primary hosts, and to serve as disease carriers[13, 14].

Causes of plague

It is a serious infectious disease caused due to attack of the bacteria *Y. Pestis*, This bacterium; occur in rates and their fleas. When infected fleas bite animals and humans the transmission occurs, although plague is also transmitted through inhalation, contact, and ingestion of materials which is infected by *Y. Pestis*. Plague has case-fatality ratio of 30%-60% if untreated. As per WHO in the year 2015 there were approximate 320 cases were observed all over the world with approximate 77 deaths[15].

Modes of Transmission of Plague

Bacterium Y. pestis is transmitted to human beings by the bites of a rat fleas or other parasitic insects (those are infected with bacteria *Y. pestis*). The most common form results from the bite of the rat flea (*Xenopsylla cheopis*) or other parasitic insects such as the common louse (*Pediculus humanus*) or the human flea (*Pulex irritants*)

Sometimes infection occurs due to

a. Exposure with infectious tissues or body fluids during handling infected animals.
b. Due to inhalation of droplets of respiratory or other infectious fluid such as laboratory-generated materials containing *Y. pestis*. When infected person feels malaise, shaking chills, headache, myalgia, gastrointestinal symptoms[16, 17].

Plague first infects rodents by their fleas, which can infect human population. It is can be transmitted when infected rodent fleas bite to peoples. It is a zoonotic disease, with can fatal rates of 50-60 percent, if it is not treated[18].

Symptoms of plague

- After infection "Flu-like" symptoms occur.
- Sudden onset of fever.
- Vomiting and nausea.
- Chills
- Weakness
- Hand body-aches.
- Pain
- Advanced stage of infection causes inflammation in lymph nodes, can turn into open sores filled with pus

The incubation period is no more than seven days after a person has been bitten by an infected flea[19, 20].

Main forms of plague

Following are the main forms of plague infection

Bubonic plague It is the most commonly occur and is caused due to the bite of an infected flea (these fleas found on body of rodents). Plague bacillus, *Y. pestis*, enters in human body due to the bite of fleas and reaches to the lymphatic system of the body to the nearest lymph node where it multiplies itself. The lymph node becomes infected, tense and painful condition and is called a "bubo. This type of plague has no inter human transmission.

Septicaemic plague When infection occurs through bloodstream, it is called Septicaemic plague. This type of plague may result from direct contact with infective fluid, bites of flea and from through cracks in the skin. Septicemic plague is fulminant and hazardous in the absence of quick supportive treatment that contains effective antibiotic management (death differs from 30 to 100%, according to the WHO).

Pneumonic plague-or lung-based plague It is the least common form of plague. In this type mainly lungs are infected. Secondary pneumonic spread through droplets to other humans. If pneumonic plague untreated it is 100% fatal. Pneumonic or lung-based plague is the maximum dangerous form and can happen when *Y. pestis* feasts to the lungs[21].

Diagnosis

Diagnosis of plague is confirmed by laboratory testing of samples of fluids from blood or sputum a bubo.

Prevention and control

- Minimize rodent occurrence around home, work place. Make home and outbuildings rodent-proof.
- Wear gloves while handling infected animals to prevent contact between skin and the *Y. pestis.*
- Use repellent material if anyone could be exposed to rodent fleas camping, hiking, or working outdoors.
- Protects pets from flea by using pesticides or products.
- Do not allow pet animal to sleep on the bed.
- Educating public alertness[22].
- Eliminates food and shelter for rodents in and around homes by using insecticides to kill fleas.
- Treatment of pets such as dogs and cats for flea control once a week[23].

The Responsibilities of the Institutions having anti-plague activities

- To determine the area where Plague is in endemic stage.
- To destroy insects around human residential area.
- To eradicate rats in populated areas.
- To immunize human beings at risk.

- To train veterinary staff and medical and public through media.
- Media should play very important role through advertising.

Precautions which protects from droplet

Placement of Patient

Individual room should be allotted to the patient. When separate individual rooms are not available provide partition least two 2 metres between the infected person and other persons. Special type of ventilation should not require, and the door should be open.

Mask

Always wear a mask which protects people from infection.

Patient Transport

Transfer of patient from one place to another should be avoided. If it is must, then dispersal of droplets should be minimize by using mask.

Safety rules for disposal of the bodies of the persons who have died due To Plague

- Post-mortem should be avoided.
- Fallow rules of local authorities which have been undertaken for disposal of dead bodies.
- Funeral ceremonies in the houses of plague patient should be avoided.
- The relatives should not handle dead bodies of plague patient. These dead bodies should be handled by professional with precaution.
- Those peoples who are near to the victim should take chemoprophylaxis.
- Layer of Lime should be kept in the coffins before placing dead bodies in them.
- The dead bodies should be packed in an impervious body bag for transport form one place to the other place.
- In addition to above measures, special precautions as per local culture, religion should be followed by national authorities[24].

Administration of Vaccine

Indications

Vaccination of human beings is applicable only if peoples are exposure to the *Y.pestis*. Thus, vaccination should be useful for peoples in the following high-risk groups:

- Peoples working in laboratory with the presence of *Y. pestis.*
- Professionals like ecologists, mammalogists, and other peoples who have regular contact with wild rodents.

Treatment of Plague

There are some antibiotics and other supportive therapies are used for the treatment of plague if given to the patient properly in time. Patients having Pneumonic plague must be isolated and cared by trained medical staff[25].

Streptomycin

The main treatment is with i.v. or i. m. administration of streptomycin. This antibiotic is useful for the treatment of septicaemic, pneumonic, bubonic types of plague. The drawback of this antibiotic is ototoxicity which is irreversible and unavailability of an oral formulation.

Gentamicin

The main advantage of this antibiotic is it can be taken once a day.

Sulfonamides, Tetracyclines, and Chloramphenicol,

Tetracyclines are bacteriostatic antibiotic with some many side-effects, however they should not be given to woman having pregnancy and to infants. They are used for the treatment of septicaemic plague and bubonic plague and can be taken orally or iv.

Chloramphenicol
Is a bacteriolytic and penetrate cerebrospinal fluid however, it is not used in many cases due to the severe adverse effects like bone marrow suppression and anaemia.

Sulfonamides
Bubonic form of plague can be treated with the use of sulphonamides.

Fluoroquinolones
These are under clinical trial, they are effused only in experimental animals, but there are no studies have been performed in humans[26].

Treatment of plague in pregnant women and in children
Complications of plague in pregnancy can be prevented by correct use of drugs. The aminoglycosides antibiotics normally given to pregnant women and in children, because these are effective and safe for mother, foetus and in children. Because of its safety, i.v or i.m. administration. Gentamicin is also effective.

Modern study on Plague
Ever since the mid of the 20th century several physiological, biochemical and genetic particulars of *Y. pestis* and the reasons that control its virulence have been discovered. In the year 2001 the broad genome sequence of *Y. pestis* containing 4.65 million base pairs and three plasmids has been available by a working group from the United Kingdom[27]. Once relating the chromosomal DNAs from wild-type Y. *pestis* and Y. *pseudo tuberculosis* a very high degree of connection can be found. The chromosomal DNA of *Y. enterocolitica* is not that closely related. Phylogenetically three biovars of *Y. pestis* can be famous: Antiqua, Medievalis and Orientalis, each connected with one pandemic wave[28].

CONCLUSION

Y. pestis is amongst the oldest reported and lethal human pathogens. Plague is transmitted to humans when fleas bite them, due to direct contact with infected animals, or inhalation of infectious respiratory droplets. In mostly, plague can be prevented by using combination of personal protective measures; insecticidal treatment of pets; applications of insecticides to home. Based on the broad scrutiny presented, it is obvious that the plague remains one of the fatal transmittable diseases identified to humankind. The widespread past accounts of its desolating things and the inherited description together with the genomic analysis of its spread offer important insights into the epidemiology of modern epidemics. The Justinian Plague (541 to 750/767) remains controversial as to its demographic, political, and social significances, dissimilar the second pandemic (1346 to 18th century), which killed at least 30% of the European people, made a thoughtful impression on the joint imagination, and led to a deep restructuring of medieval humanity. The death rates resultant from the existing third pandemic (1772 to present) have been extremely low (except at its beginning) due to the chief treatments and the use of antibiotics, which made it possible to decrease the death rate from 50 to 100% in the absence of treatment to approximately 10 to 25%.

ACKNOWLEDGMENT

We thank principal, Teerthanker Mahaveer college of Pharmacy, Teerthanker Mahaveer University Moradabad for his kind help and support.

ABSTRACT

Russelia equisetiformis is conventionally utilized as a medicinal plant, recognized for its analgesic, anti-inflammatory, and membrane-stabilizing properties. The current investigation was conducted to evaluate the secondary 2.3 ± 0.07. The ash content was 8.78 ± 0.32%. The carbohydrate content was 3.1% dry weight, respectively. However, the plant exhibited minimal fat content, which may diminish palatability. The overall anthocyanin concentration in this study was 23.65 mg CYE per 100 g. The qualitative UV-VIS spectral profile of the methanol extract was chosen at a wavelength range of 200 to 2500 nm because of the distinct peaks and appropriate baseline. The profile exhibited peaks at 254, 680, and 1044 nm, with corresponding absorptions of 0.524, 0.110, and 0.154, respectively. The FTIR exhibited a large peak at 3418.85 cm-1, indicating the presence of N-H stretching. A pronounced peak was observed at 2856.12 and 2922.66 cm-1, indicating C-H stretching, with a peak at 1244.58 cm-1 corresponding to O-H bending vibrations, and another peak near 1319 cm-1, associated with metabolites analyzed using UV-Vis, FTIR, and LC-ESI-MS, along with an assessment of the antioxidant characteristics of *R. equisetiformis*. The dried flower underwent proximate examination, revealing a moisture content of 5.32 ± 0.02. The crude protein content was 4.2 percent. The lipid content was determined to be 0.6 ± 0.012%. The crude fiber result of 8 cm-1 is attributed to the alkyl group, 1621.67 cm-1 corresponds to alkenyl C=C stretching, 1731.61 cm-1 denotes the stretching vibration of the halo formyl group, the peak at 2346.42 cm-1 signifies the presence

of C≡N stretching, and the peaks at 1376.7 and 1423.96 cm-1 indicate the presence of nitrates and carbonates. The FTIR spectrum validated the existence of alcohols, phenols, alkanes, alkynes, alkyl halides, aldehydes, aromatics, nitro compounds, and amines in the powder particle. The total antioxidant activity measured by AOX characteristics was 92.95, although the DPPH approach demonstrated the highest antioxidant capacity, with 83.1% inhibition at a dosage of 100 µg/mL. The FRAP assay of *Russelia equisetiformis* yielded a result of 70.2% with a 100 µg/mL extract. Phytochemicals in *R. equisetiformis* were identified using liquid chromatography-electrospray ionization-tandem mass spectrometry. This investigation identified phenolic compounds, including Chlorogenic acid at 360 m/s, Methyl protocatechuate at 155.85, 4-Hydroxybenzoic acid at 139.85, Caftaric acid at 314.90, and Catechin at 290.5. The findings demonstrate that the methanolic extract of *Russelia equisetiformis* may serve as a nutraceutical in combating oxidative stress and associated disorders.

INTRODUCTION

Numerous contemporary non-communicable diseases are associated with oxidative stress, mostly resulting from the imbalance between the production and neutralization of prooxidants. Antioxidants are agents, both natural and manmade, that impede or postpone oxidation processes. Polyphenols constitute a varied array of phytochemicals celebrated for their antioxidant characteristics. *Russelia equisetiformis* Schltdl. and Cham, a prominent ornamental flowering plant formerly categorized within the polyphyletic family Scrophulariaceae, has been reclassified into the monophyletic family Plantaginaceae. It is commonly referred to as *Russelia juncea*, firecracker plant, coral plant, fountain bush, or coral fountain. It is a perennial, pendulous shrub indigenous to Tropical South America, particularly Mexico. [1]. The genus Russelia was named after Scottish naturalist Alexander Russell (1715-1768) by Dutch botanist Baron Nikolaus von Jacquin (1727-1817) [2]. This plant, in addition to its visual allure, has historically been employed in numerous medicinal applications, suggesting its possible therapeutic benefits. Due to the growing interest in natural products with antioxidant properties, a thorough examination of *Russelia equisetiformis* flowers is justified.

MATERIALS AND METHODS

Plant material

The flowers of *Russelia equisetiformis* were taken from their native habitat in Thiruvananthapuram, Kerala. The gathered flowers were washed with double distilled water to eliminate surface debris and subsequently diced into minute fragments. The flowers were permitted to air dry for approximately 7 to 10 days.

Proximate analyses

The proximate analysis of flowers was carried out for moisture content, crude protein, crude fat, crude fiber, total ash, and carbohydrate levels.

Determination of total anthocyanins

Total anthocyanin content from the flowers of *Russelia equisetiformis* was quantified using pH differential method with a two-buffer system - potassium chloride buffer, pH 1.0 (0.025 M) and sodium acetate buffer, pH 4.5 (0.4 M) as described by [3].

Liquid chromatography combined with electrospray ionization mass spectrometry (LCESI-MS)
The methanolic flower extract of *R. equisetiformis* were analyzed by liquid chromatography combined with electrospray ionization mass spectrometry (LCESI-MS).

Free Radical Scavenging Assays
Total Antioxidant Capacity Assay: The total antioxidant capacity of the methanol extract of *Russelia equisetiformis* was measured using the phosphor molybdenum technique as outlined by [4]. The antioxidant activity is quantified as the number of equivalents of ascorbic acid.

DPPH Radical-Scavenging Assay: The DPPH scavenging activity was assessed using a modified spectrophotometric approach based on [5]. The absorbance of DPPH diluted in methanol was designated as the control. The reduction in absorbance was quantified at 517 nm. The antioxidant capacity to neutralize the DPPH radical was determined using the following equation: Scavenging impact (%): [(1 - (absorbance of sample / absorbance of control)) × 100]. Results were presented as Mean ± SD from three experiments conducted in triplicate.

Ferric reducing antioxidant power (FRAP)
The ferric reducing antioxidant power was assessed using the method outlined by [6]. Ascorbic acid served as the reference standard.

UV-VIS and FTIR Spectroscopic analysis
UV-visible spectrophotometric examination of the flower extract from *Russelia equisetiformis* was performed utilizing a UV-visible spectrophotometer (Perkin Elmer, USA Model: Lambda 950) with a slit width of 2 nm, employing a 10-mm cell at ambient temperature. The extract was analyzed under visible and ultraviolet light within the wavelength range of 200 to 2500 nm for proximate analysis. The extract was subjected to centrifugation at 3000 rpm for 10 minutes and subsequently filtered using Whatman No. 1 filter paper for UV-VIS spectrophotometer analysis. The sample is diluted to a ratio of 1:10 using the identical solvent.

Fourier transform infrared (FTIR) The Fourier transform infrared technique was employed to discover the distinctive functional groups present in the flowers of *Russelia equisetiformis*. A little amount of floral extracts was combined with anhydrous potassium bromide (KBr). The amalgamation was meticulously combined in a mortar and subjected to a pressure of 6 bars for 2 minutes to produce a KBr thin disc. The disc was subsequently positioned in a sample cup of a diffuse reflectance accessory. The infrared spectrum was acquired utilizing a Bruker Vertex 70 spectrometer from Germany. The sample was scanned from 4000 to 400 cm^{-1}. The maximum values of the UV-VIS and FTIR were documented.

Statistical analysis
The primary phytochemical and antioxidant studies were conducted in triplicate, and the findings were presented as mean with standard deviation. IC50 values were assessed utilizing Microsoft Excel 2013. The inhibitory percentages for each dosage in each assay were statistically evaluated using one-way analysis of variance.

RESULT AND DISCUSSION

Proximal composition
The proximal composition of the powdered flowers from *Russelia equistiformis* revealed the following constituents: Total carbohydrates: 3.1 ± 0.03; Crude protein: 4.2 ± 0.01; Crude fat: 0.6 ± 0.012 Crude fiber 2.3 ± 0.07 Ash content: 8.78 ± 0.32; Moisture content: 5.32 ± 0.02. The nutrients found in plants include carbohydrates, proteins, and lipids. The flower exhibited a favorable composition of primary metabolites with minimal fat content.

FTIR analysis

The FTIR spectroscopy technique is employed to evaluate the functional groups in the methanolic extract of *Russelia equisetiformis* flowers. The spectral band seen at 3277.39 cm^{-1} (Fig. 1) is attributed to O-H stretching, characterized by prominent and broad peaks, indicating its association with the alcohol group in the plant extract. A peak at around 1604.41 cm^{-1} in the figure indicates the presence of a N¼O stretching group, characteristic of the nitro compound class. The spectral signature of the functional group verifies that the phytocompound in the floral extract acted as a reducing and capping agent. The peak at 1734.45 in the spectrum corresponds to C¼N. Stretching is associated with the imine/oxime group, with the imine group being significant in the floral extracts of the plant *Russelia equisetiformis* due to its chemical synthesis properties. Robust bonds were identified at 3277.39 cm−1, 2917.75 cm−1, and 1734.45 cm−1, but the remaining bonds exhibited weak to moderate strength. The results indicated the existence of hydroxyl groups, lipids, alkanes, amino acids, and phosphorus compounds. The FTIR analysis revealed pronounced C-H out-of-plane bending (loop bend) vibrations associated with a substituted benzene ring, signifying the presence of phenols and flavonoids in the crude extract. Flavonoids are polyphenolic compounds distinguished by two benzene rings connected by a linear carbon chain. The identification of benzenoid chemicals by FTIR spectrophotometry corroborated the results from the phytochemical screening, which revealed the presence of phenols and flavonoids. The amines, imines, alkanes, and phenols identified were regarded as the principal functional groups of bioactive substances. The peak at around 1734–1745 cm−1 was attributed to the C=O ester functional group. This investigation indicates that the peak at 1734.45 cm−1 corresponds to carotenoids and is attributed to the C=O conjugate. The conjugated double bond in carotenoids is identified as the structure responsible for light absorption [7]. A prior investigation indicated that a peak at 1604.41 cm−1 is attributable to chlorophyll and protein content. A variety of approaches exist to identify phytochemical components in plant extracts. Fourier transform infrared spectroscopy (FTIR) is employed to identify functional groups in gaseous, liquid, and solid substances by infrared radiation beams [8]. Hemmalakshmi *et al*. [9] conducted an analysis of the phytochemicals in *Erythrina variegata* utilizing Fourier transform infrared spectroscopy. Rajiv *et al*. [10] employed FTIR to analyze phytochemicals in the fruit extracts of *Myristica dactyloids*. Maobe and Nyarango [11] documented the therapeutic properties of *Urtica dioica* with a Fourier transform infrared spectrophotometer. Pharmawati and Putu Wrasiati [12] conducted phytochemical screening and FTIR spectroscopy on the crude extract of Inhauls acoroides leaves. Pratheeba *et al*. [13] demonstrated the larvicidal, pupicidal, and adulticidal efficacy of *Ocimum gratissimum* leaf extracts and observed comparable peak ranges by FTIR analysis. Li *et al*. [14] examined the characteristics of green tea using FTIR. Mezzomo and Ferreira [7] additionally examined the utilization of FTIR in the analysis of carotenoids. The FTIR spectrum of the flower displays the majority of the distinctive peaks associated with anthocyanin (Table 1). The peak at 2917.75 cm^{-1} corresponds to the asymmetric and symmetric C-H stretching modes, respectively. The spectra exhibits a peak at 1724 cm-1, indicative of the typical C=O stretching vibration of anthocyanins [15][16]. The FTIR spectra of anthocyanins displays distinctive absorption peaks associated with functional groups including O-H (hydroxyl), C-H (alkyl), C=O (carbonyl), C-C (carbon-carbon), C=C (carbon-carbon double bond), and C-O (ether). The absorption peaks facilitate the identification and characterization of the functional groups inside the anthocyanin molecules [17].

Total anthocyanin

The anthocyanin concentration of *Russelia equisetiformis* was quantified as mg CYE per 100 g of dried powder. The overall anthocyanin concentration in this study was 23.65 mg CYE per 100 g. Flowers of numerous species are abundant in polyphenolic chemicals, including flavonoids and anthocyanins, which are recognized for their antioxidant properties. The total anthocyanin concentration can further validate the antioxidant capacity of a sample, as the employed approach incorporates electron transfer reactions. Rafi *et al*. [18] examined the total phenolic, flavonoid, and anthocyanin contents of six Rhododendron species from Indonesia and compared these with their antioxidant properties. The concentrations of total phenolics, flavonoids, and anthocyanins ranged from 11.98 to 48.11 mg equivalent gallic acid per gram of dried powder, 0.78 to 8.92 mg equivalent quercetin per gram of dried powder, and 0.12 to 0.29 mg equivalent cyanidin-3-glucoside per gram of dried powder, respectively. The findings acquired from *Russelia equistiformis* was more noteworthy than that from Rhododendron variants.

UV-VIS spectra of the floral extract

The UV-VIS spectra of the extracts were analyzed to verify the existence of phytocompounds that absorb light in the UV region due to the n–π* electronic transition of aromatic moieties and chromophores [19]. Consequently, absorption peaks in the UV–VIS spectrum signify the existence of alkaloids, flavonoids, phenolic acids, and tannins in plant extracts [20]. The absorption spectrum of the ethanol and methanol extracts of the flowers is presented in Table 2. Numerous different absorption peaks were identified in the spectra. Of those, three correspond to anthocyanins or polyphenols. The initial peak occurred at 206–230 nm, varying according to the solvent employed. The peaks were achieved at shorter wavelengths using the ethanol extracts. The second and third peaks were contiguous, with one identified at 270–293 nm and the other at 314–320 nm. A modest elevation in absorbance has also been noted at 384–422 nm. Gallic acid exhibited two peaks at 216–219 nm and 260–271 nm, but quercetin demonstrated four peaks at approximately 204–219 nm, 256–272 nm, 305–322 nm, and 374–382 nm. The peaks in the ultraviolet region (210–320 nm) validated the existence of polyphenolic chemicals in the flower extracts. Comparable UV-VIS spectra were documented for the extracts of bearberry leaves, *Dillenia pentagyna*, and Physalis [19][20][21]. Research indicates that plant extracts with elevated antioxidant capabilities typically have greater absorbance peaks at 280 and 358 nm [19]. Flavonoids function as UV filters, safeguarding plants from biotic and abiotic stressors. All flavonoids exhibit an absorption peak at 240–290 nm due to conjugated ring A, while those with conjugated rings B and C display an absorption peak at 300–500 nm [22].

Characterization of constituents by LC-MS

In LC-MS, the molecular ion (M+) is generated when a molecule undergoes ionization by the loss of an electron. The m/z of this ion correlates with the molecular weight (MW) of the sample, which is potentially valuable for elucidating the structure. M denotes mass, while Z represents the charge number of ions. ESI MS in negative and positive ion modes. The distinction lies in the fact that the negative ion mode charges the analyte by deprotonation, whereas the positive ion mode charges it through protonation. Small compounds possessing a singular functional group typically yield singly charged ions. In positive ion mode, singly charged ions result from the addition of a proton, whereas in negative ion mode, they arise from the loss of a proton. Conversely, bigger molecules like peptides and proteins possess many charged functional groups. Numerous functional groups create an ionic envelope surrounding the molecule. The various charged states assist in identifying analytes with elevated molecular weights. The LC-MS in both positive and negative ionization modes is illustrated in the figures by aggregating the intensities of mass spectrum peaks from the whole scan (Figures 2, 3, and Table 3).

The Positive ionization shows the following

In the figure, peak 1 had an ion peak at M+ in the mass spectrum, which yielded MS product ions at m/z 366.95 (Relative Intensity 28.62) and peak 2 at 382.350 (Relative Intensity 42.31). The compounds are unidentified in the literature. In the figure, peak 1 had an ion peak at M+ in the mass spectrum, which yielded MS product ions at m/z 202.850 (Relative Intensity 43.30) and peak 2 at 218.800 (Relative Intensity 37.10). The compounds are unidentified in the literature. In the figure, peak 1 had an ion peak at M+ in the mass spectrum, which yielded MS product ions at m/z peak 1 at 276.900 (Relative Intensity 19.90) and peak 2 at 292.900 (Relative Intensity 19.17). The compounds are unidentified in the literature. In the figure, peak 1 had an ion peak at M+ in the mass spectrum, which yielded MS product ions at m/z 526.950 (Relative Intensity 19.69) = acylated Malvidin-3-O-(6″-O-acetyl) glucoside, peak 2 at 622 (Relative Intensity 19.9) = acylated Peonidin-3-(caffeoyl) glucoside. Other m/z compounds are unidentified in the literature.

The negative ionization shows the following

In the figure, peak 1 had an ion peak at M- in the mass spectrum, which yielded MS product ions at m/z 112.8 (Relative Intensity 44.68), peak 2 at 214.75 (Relative Intensity 60.55), peak 3 at 378.85 (Relative Intensity61.55), peak 4 403.85 (Relative Intensity 26.61) = Cyanidin-3-O-arabinoside, and peak 5 at 454.85 (Relative Intensity 16.94) = Petunidin-3-O-arabinoside. Other m/z compounds are unidentified in the literature. In the figure, peak 1 had an ion peak at M- in the mass spectrum, which yielded MS product ions at m/z 216.750 (Relative Intensity 37.68), peak 2 at 224.80 (Relative Intensity 20.1), peak 3 at 226.8 (Relative Intensity 14.63). The compounds are unidentified in the

literature. In the figure, peak 1 had an ion peak at M- in the mass spectrum, which yielded MS product ions at m/z 366.85 (Relative Intensity 24.78), peak 2 at 378.85 (Relative Intensity 61.55), peak 3 at 386.85 (Relative Intensity 18.76). The compounds are unidentified in the literature. In the figure, peak 1 had an ion peak at M- in the mass spectrum, which yielded MS product ions at m/z 403.85 (Relative Intensity 26.61), peak 2 at 454.85 (Relative Intensity 16.94) = Petunidin-3-O-arabinoside, peak 3 at 538.90 (Relative Intensity 5.66) = Malvidin-3-O-(6″-O-acetyl) glucoside. Rest of the m/z compounds is unidentified in the literature. In the present study, some anthocyanin compounds were identified by comparison with reference standards, and others were tentatively characterized based on their retention times and MS spectra referring to the literature Gavrilova *et.al.* [23], Wu and Prior [24], Grace *et.al.* [25] and Saha *et.al.* [26]. 12 major anthocyanin compounds were identified in the flower samples. The identification fractions with their retention time, and molecular formulae were shown below.

Cyanidin glycosides
Non-acylated (6 numbers)
1.418.90 Cyanidin-3-O-arabinoside C20H19O10
2.438.90 Cyanidin-3-O-glucoside C21H21O11
3.454.90 Cyanidin-3-O-galactoside C21H21O11
4.584.00 Cyanidin-3-O-sambubioside C22H29O15
5.622.95 Cyanidin-3,5-O-diglucoside C27H31O16
6.701.15 Cyanidin-3-O-(2″-O-xylosyl)rutinoside C32H39O19
Acylated (3 numbers)
1.454.90 Cyanidin-3-(6-acetoyl)galactoside C23H23O12 and Cyanidin-3-(6-acetoyl)glucoside C23H23O12
2.542.90 Cyanidin 3-(3″-malonoyl)glucoside C24H23O14
3.584.00 Cyanidin-3-(p-coumaroyl) glucoside C30H27O13

Delphinidin glycosides
Non-acylated (1 only)
1. 418.90 Delphinidin-3-O-arabinoside C20H19O11
Acylated (1 only)
1. 523.05 Delphinidin-3-(6-acetoyl) glucoside

Peonidin glycosides
Acylated (1 only)
1. 523.05 Peonidin-3-O-(6″-O-acetyl)glucoside C24H25O12
The LC-ESI-MS analysis of the *Russelia equisetiformis* sample revealed the presence of phytochemicals, including Chlorogenic acid at 360 m/z, Methyl protocatechuate at 155.85 m/z, 4-Hydroxybenzoic acid at 139.85 m/z, Caftaric acid at 314.90 m/z, and Catechin at 290.5 m/z (Figures 2 and 3). The combination of mass spectrometry and liquid chromatography is optimal for the analysis of phenolics present in plants. LC-MS/MS offers the benefit of continuous separation and structural elucidation of molecules. Electrospray ionization is a widely employed technique for LC-ESI-MS/MS analyses. In the ESI negative ion mode, the analysis of small compounds with free carboxyl groups predominantly produces the ion [M-H]-, corresponding to their carboxylate anion [27]. The identification of phenolic components in the extract of *Russelia equisetiformis* was conducted using chromatograms derived from HPLC and ESIMS, with a comparison with existing literature data.

The total antioxidant capacity (TAC)
TAC involved the reduction of Mo(VI) to Mo(V) by the extract, followed by the formation of a green phosphate/Mo(V) complex at acidic pH. It assesses both hydrophilic and lipophilic antioxidants (total antioxidant capability). The findings demonstrate an elevated total antioxidant capacity (TAC), quantified as ascorbic acid equivalents, of the methanol extracts, specifically 92.95 mg/g equivalents of ascorbic acid at a dosage of 100 g/mL (Table 4). This indicates the possible analogous antioxidant components of the methanol extract, since the antioxidant capacity of ascorbic acid serves as a reference standard for comparing plant extracts with potential antioxidant

properties [28]. Anthocyanins are water-soluble pigments that impart blue, purple, and red hues to various fruits and vegetables. Anthocyanins are chemically classified as flavonoids and are glycosides including a sugar moiety and an aglycone unit [29]. Multiple studies suggest that this family of flavonoids may reduce the risk of cardiovascular disease, cancer, hyperlipidemia, and other chronic diseases by the consumption of anthocyanin-rich foods. The TAC data of anthocyanin extract from *Russelia equistiformis* corroborates its medicinal effects. The free radical chain reaction results in lipid peroxidation. Radical scavengers can directly interact with and neutralize peroxide radicals to impede peroxidation chain events [30], which are essential in the development of different illnesses.

DPPH and FRAP assay

The antioxidant capacity differed between the two methodologies utilized in this investigation (Figures 4 and 5). The DPPH technique demonstrated the highest antioxidant capacity, with 83.1% inhibition at a dose of 100 µg/mL. The FRAP method indicated an antioxidant capacity of 70.2% at a concentration of 100 µg/mL. The variations in antioxidant capacity results resulted from the distinct techniques employed in measuring the antioxidant activities of each method. The DPPH method measures antioxidant capacity through the transfer of electrons and hydrogen from antioxidant molecules to the DPPH radical, influenced by the solvent type and the redox potential of the involved chemicals. The DPPH radical possesses a dark purple hue, with a peak wavelength near 517 nm; this color transitions to yellow when receiving an electron or hydrogen from antioxidant molecules, resulting in a stable DPPH molecule [31]. The FRAP method assesses the reducing capacity of antioxidant chemicals in converting Fe3+ to Fe2+, paralleling their efficacy in neutralizing free radicals through electron transfer. The FRAP approach involves the reduction of iron (III) to iron (II) and the subsequent production of the iron (II)-tripyridyltriazine (Fe (II)-TPTZ) complex at low pH [32]. The decolorization of DPPH signifies the free radical scavenging ability of the samples. Notably, in the current study, its activity was markedly greater than that of ascorbate (50 µg/mL resulted in 53.2% inhibition, utilized as the reference). The findings of this study unequivocally indicate that anthocyanin extract from *Russelia equisetiformis* has superior antioxidant activity as measured by DPPH radical scavenging. The sample's ferric reducing power was evaluated, and the results are presented in the figure. The FRAP assay assesses antioxidant potential by measuring the ability of sample extracts to convert ferric tripyridyltriazine (Fe (III)-TPTZ) complexes into ferrous tripyridyltriazine (Fe (II)-TPTZ). The results indicate that the ferric reducing capacity of anthocyanin extract from *Russelia equisetiformis* was measured at 70.2% with a concentration of 100 µg/mL extract. The relationship between antioxidant activities and their ferric ion reduction abilities has been previously documented for specific plant extracts by [33]. The prior study by Oloumi *et al*. [34] shown the efficacy of Hibiscus sabdariffa calyx extract in comparison to the reference antioxidant ascorbic acid, utilizing the DPPH technique. The elevated antioxidant activity noted in Roselle petal extracts is attributed to the presence of polyphenolic components, including phenolic acids, flavonoids, and anthocyanins [35]. The DPPH scavenging method is employed to assess the antioxidant activity of compounds because of its simplicity, rapidity, sensitivity, and reproducibility [29]. The current findings indicate that the extracts are effective free radical scavengers, particularly against peroxy radicals, and may possess the capacity to inhibit lipid autoxidation, potentially offering therapeutic benefits for diseases where lipid peroxidation plays a critical role in pathogenesis. The electron donating capacity, indicative of the reducing power of bioactive substances, is correlated with antioxidant activity. Antioxidants may function as reductants, and the inactivation of oxidants by reductants can be characterized as redox reactions, wherein one reactant is reduced while the other is oxidized. The presence of reductants, including antioxidant compounds in the samples, facilitates the reduction of the Fe3+/ferricyanide complex to its ferrous form. The reducing power of the extracts augmented at higher concentrations, indicating that their electron-donating capacity is concentration-dependent. Salem *et al*. [36] conducted a review on the biological activities and phytochemical composition of Hibiscus species. Sánchez-Moreno *et al*. [37] evaluated the free radical scavenging capacity of several red, rosé, and white wines. Škrovánková *et al*. [38] examined the antioxidant activity and health consequences of prevalent medicinal species.

CONCLUSION

This study aimed to evaluate the phytochemical characterisation of *Russelia equisetiformis* flowers using UV-Vis, FTIR, and LC/MS analysis. Additionally, the extract was evaluated for its antioxidant capabilities. The UV-Vis spectrum exhibited many absorption bands between 200 and 2500 nm, signifying the presence of flavonoids, phenolic compounds, tannins, terpenoids, carotenoids, chlorophyll, and alkaloids. FTIR spectra validated the existence of alkaloids, flavonoids, terpenes, anthraquinones, and phenolic chemicals. FTIR and LC-ESI-MS analyses confirm the existence of several polyphenolic compounds. This work represents the inaugural publication on the floral phytochemical fractionation of *R. equisetiformis*. Additional inquiries into lead compounds and their implications are essential.

ABSTRACT

Withania somnifera, the scientific name for Ashwagandha, is a long-used medicinal herb with a 3,500-year history. Well known for its healing qualities, it has been used for ages to treat a variety of illnesses, such as diabetes mellitus, ulcers, stress, inflammation, sleeplessness, and TB. It has also been used to strengthen the immune system. To find the existence of important secondary metabolites, a thorough qualitative analysis of a variety of plant extracts was done for the current study. These constituents play a pivotal role in augmenting the medicinal worth and therapeutic capacities of Ashwagandha, hence accentuating its significance in contemporary phytotherapy. Thirty different peaks were found during GC-MS analysis, and several noteworthy chemicals were identified. Among these, methylparaben, 1-Carbomethoxy-3,3-dimethyldiaziridine, 3-Amino-2-oxazolidinone, and 3-Deoxy-D-mannoic lactone show antibacterial qualities. 2,5-Dimethylfuran-3,4(2H,5H)-dione is an antifungal chemical. Additional compounds that have been identified include dihydro-5-propyl-, 5-heptyldihydro-, 2(3H)-furanone, and (S)-5-Hydroxymethyl-2[5H]-furanone. These compounds exhibit a variety of biological activities, including those that are antibacterial, antifungal, antioxidant, antiulcer, anti-TB, analgesic, anti-inflammatory, anticancer, and anticonvulsant. Furthermore, acetamide and other derivatives of 4H-Pyran-4-one exhibit anti-inflammatory qualities. The formation of phosphomycins is known to require

the precursor cis-4-hydroxycyclohexanecarboxylic acid, whereas 1.alpha, or 1,2,3,5-cyclohexanetetrol, functions as a glycosidase inhibitor.

Keywords: *Withania somnifera,* antibacterial, antifungal, antioxidant, antiulcer, and anti- TB.

INTRODUCTION

The three doshas- Pitta, Kapha, and Vata—are balanced by plant secondary metabolites to preserve health. These metabolites are essential for the treatment of many illnesses. For example, the compounds in *Withania somnifera* (ashwagandha) support vigor and stress. Supporting Systemic Functions: By encouraging optimal operation and correcting imbalances, they also support the digestive, respiratory, and circulatory systems—three essential bodily systems. In Ayurvedic medicines, combining various plant metabolites can improve their bioavailability and medicinal effects. *Withania somnifera* (L.) Dunal, popularly known as Ashwagandha or Indian ginseng, is a significant medicinal herb utilized in Ayurvedic, Unani, and various other traditional medical systems. The extensive therapeutic uses, including anti-inflammatory, antistress, antioxidant, immunomodulatory, and neuroprotective properties, have been thoroughly established and ascribed to a diverse array of secondary metabolites (Singh *et al .*, 2011[1]; Mir *et al .*, 2021[2]). Different components of the plant, such as roots, leaves, stems, and seeds, are utilized in both traditional medicine and modern herbal preparations. The plant is recognized for its diverse array of phytochemicals, including alkaloids, flavonoids, saponins, tannins, steroids, phenolics, terpenoids, and withanolides, which substantially enhance its therapeutic effectiveness (Saleem *et al .*, 2020[3]). Alkaloids and withanolides are acknowledged for their anti-cancer, adaptogenic, and anxiolytic properties (Mishra *et al .*, 2000[4]; Dar *et al .*, 2015[5]). Phytochemical screening, especially by solvent extraction techniques, is essential for the identification and isolation of these molecules. The selection of solvent markedly affects the type and quantity of bioactives extracted, dependent upon the polarity and solubility of the phytochemicals (Sasidharan *et al .*, 2011[6]). While several studies have identified significant phytochemicals in *Withania somnifera*, the majority have concentrated predominantly on the roots, with few comparable evaluations of other plant components, including stems, leaves, and seeds. Due to the rising global demand for plant-derived therapeutic medicines, a thorough phytochemical investigation of all significant plant components is crucial to fully exploit the medicinal potential of *Withania somnifera*. This study is to conduct a solvent-based comparative phytochemical analysis of the roots, leaves, stems, and seeds to ascertain the distribution patterns of bioactive compounds. The results will establish a significant basis for forthcoming pharmacological, nutraceutical, and product development initiatives related to *Withania somnifera*.

MATERIALS AND METHODS

For Biochemical analysis

Plant extracts**,** hexane, Whatman's filter paper, Test tubes, HCl solution, funnel, picric acid, acetic acid, Glass pipettes, FeCl3. Finally, H_2SO_4, methanol, liquid ammonia, chloroform, oil, and distilled water.

Qualitative estimation of Various Biochemical constituents in different plant parts root, leaves, bark, and seeds

Phytochemical Screening

standard methods were used for qualitative phytochemical analyses of *Withania somnifera* root extracts, as reported by Edeoga *et al .* (2005)[7], Harborne (1998)[8], Sofowora (1993)[9], and Trease and Evans (1989)[10]. Below are the steps used to find different phytoconstituents:

Fehling's Test for Reducing Sugars

About 0.2 g of powdered plant material was mixed with 1 mL of solvent. We added 3 mL of distilled water and 1 mL each of Fehling's solutions A and B to this. The mixture was heated, and the appearance of a brick-red precipitate showed that there were reducing sugars.

Benedict's test for non-reducing sugars, a few drops of hydrochloric acid were added to one milliliter of plant extract and cooked. The solution was neutralized with sodium bicarbonate when it had cooled down. Then, Benedict's reagent was added. When heated again, the colour changed to yellow or orange, which meant that there were non-reducing carbohydrates present.

Starch (Iodine Test)

A few drops of iodine solution were added to 0.5 mL of plant extract. The blue-black tint that formed showed that starch was present.

Phenolic Compounds (Ferric Chloride Test)

We boiled one gram of plant material with a solvent for ten minutes and then filtered it. We added a few drops of a 1% ferric chloride solution to the filter. The presence of phenolic chemicals was shown by a dark green or blue tint.

Cardiac Glycosides (Keller–Kiliani Test)

Two milliliters of plant extract were combined with 1.5 mL of glacial acetic acid and 1 mL of ferric chloride solution. Concentrated sulfuric acid was meticulously introduced along the perimeter of the test tube. The emergence of a brown ring at the contact signified the existence of cardiac glycosides.

Flavonoids (Ammonia Test)

Approximately 200 mg of powdered botanical material was extracted using a solvent. Three milliliters of weak ammonia solution were added to the extract. The yellow hue observed upon standing signified the presence of flavonoids.

Saponins (foam test)

0.5 grams of powdered material were boiled in 10 mL of solvent for 10 minutes and subsequently filtered. Five milliliters of the filtrate were combined with 2.5 mL of distilled water and agitated vigorously. Continuous foaming signified the existence of saponins. The incorporation of three drops of a saturated oil solution, accompanied by agitation, led to the creation of an emulsion, therefore corroborating the presence of saponins.

Alkaloids (Picric Acid Test)

Approximately 0.1 g of the powdered material was combined with 2 mL of hexane, thoroughly agitated, and subsequently filtered. The filtrate was subjected to treatment with 3 mL of 2% hydrochloric acid, gently heated, and subsequently filtered once more. A little quantity of picric acid was included into the final solution. The emergence of a yellow precipitate signified the existence of alkaloids.

Antioxidant Activity (Phosphomolybdenum Assay)

Ten milligrams of methanolic plant extract were solubilized in 10 mL of distilled water. One milliliter of 0.6 M sulfuric acid, 28 mM sodium phosphate, and 4 mM ammonium molybdate was combined in a beaker, and the total volume was adjusted to 50 mL with distilled water. Thereafter, 0.3 mL of the extract and 3 mL of the reagent were incubated at 97 °C for 90 minutes. The change to a green hue signified the existence of antioxidant chemicals.

Salkowski Test for steroids

Two milliliters of plant extract were combined with two milliliters of acetic acid, followed by the meticulous addition of 2 to 3 drops of pure sulfuric acid. The emergence of a blue-green ring signified the existence of steroids.

Tannins test (Ferric Chloride Test)

About 0.1 g of the plant sample was boiled in 4 mL of solvent and subsequently filtered. A little quantity of 0.1% ferric chloride was introduced to the filtrate. The emergence of a brownish-green or blue-black hue signified the existence of tannins.

Phlobatannins
An aqueous extract of the material was subjected to boiling with 1% aqueous hydrochloric acid. The emergence of a crimson precipitate at the base of the test tube signified the presence of phlobatannins.

Terpenoids (Salkowski Test)
Three milliliters of plant extract were placed in a dry test tube and combined with 2 mL of ferric chloride solution, followed by the addition of several drops of pure sulfuric acid. The emergence of a reddish-brown hue validated the existence of terpenoids.

Anthraquinones (Bornträger's Test) Two milliliters of aqueous plant extract were combined with 4 mL of concentrated sulfuric acid and subjected to heating. Subsequent to boiling, 3 mL of chloroform was added. The chloroform layer was isolated and transferred to a separate test tube containing 1 mL of diluted ammonia (1:1). The ammonia layer had a pink to violet hue, indicating the presence of anthraquinones.

For GCMS analysis of aqeous extract of *Withania somnifera*
Plant Material Collection and Authentication
Root samples of *Withania somnifera* including both wild and cultivated varieties—were collected from various regions across India to ensure broad genetic representation. The taxonomic identity of the plant specimens was authenticated by Dr. P. Jayaraman, Ph.D., Director of the Plant Anatomy Research Centre (PARC) and former Professor of Botany, Presidency College, Chennai. A voucher specimen was deposited at the PARC Herbarium under the registration number PARC/2021/4565. All collected accessions were subsequently cultivated under controlled field conditions in Chennai, Tamil Nadu, to ensure uniform growth for biochemical and genetic analyses.

Preparation of Aqueous Root Extract
Freshly collected roots of *Withania somnifera* were thoroughly washed with distilled water to remove any adhering soil or debris. The cleaned roots were shade-dried at ambient temperature until constant weight was achieved and then pulverized into a fine powder using a mechanical grinder. For extraction, 20 g of root powder was loaded into a Soxhlet apparatus and extracted with double-distilled water for 6–8 hours until exhaustion. The resulting aqueous extract was concentrated under reduced pressure using a rotary evaporator at 40–45°C to remove excess water. The concentrated extract was then stored at 4°C in airtight containers for further phytochemical and GC–MS analysis. Prior to GC–MS analysis, the extract was diluted using sterile double-distilled water and filtered through Whatman filter paper No. 41 to obtain a clear, particle-free solution. This filtration step ensured that no particulates interfered with chromatographic detection and facilitated accurate identification of bioactive compounds.

GC–MS Analysis of *Withania somnifera* Root Extract
The concentrated aqueous root extract of *Withania somnifera* was further diluted with sterile double-distilled water and filtered through Whatman filter paper No. 41 to obtain a particle-free solution suitable for Gas Chromatography–Mass Spectrometry (GC–MS) analysis. This analysis was conducted to identify the bioactive phytochemical constituents present in the sample.

Instrumentation and Chromatographic Conditions
GC–MS analysis was performed using a Shimadzu NX Series system, comprising a Nexis GC-2030 gas chromatograph coupled with an AOC-20i automatic injector. The system was equipped with a SH-I-5Sil MS capillary column (30 m length × 0.25 mm internal diameter × 0.25 μm film thickness). A split injection mode was used with a split ratio of 10:1, and helium served as the carrier gas at a constant flow rate of 2.0 mL/min**.**
The oven temperature program was configured as follows

- Initial temperature**:** 35°C, held for 2 minutes
- Ramp: 20°C/min to 450°C
- Final hold**:** 5 minutes at 450°C

Mass Spectrometry Conditions Mass spectrometric detection was carried out using a metal quadrupole mass analyzer connected directly to the GC column. The system operated in Electron Ionization (EI) mode. Spectral data acquisition and instrument control were performed using GCMS Solution Software Version 2.6**.**

Two modes of resolution were applied
Low-resolution spectra
Resolving power**:** 1000 (at 20% peak height definition)
Scan range: m/z 25–1000
Scan rate**:** 0.3 seconds per scan
Inter-scan delay: 0.2 seconds

High-resolution spectra
Resolving power: 5000
Scan range: m/z 65–1000
Scan rate: 1 second per scan

Compounds Identification
Phytochemical constituents were identified by comparing the mass spectral data to those in the NIST Mass Spectral Library Version 11**,** embedded within the instrument software. Further confirmation of compound identities was performed using GC-MS-based metabolomics**,** incorporating retention index comparisons for enhanced accuracy.

RESULT AND DISCUSSION

Phytochemical analysis of *Withania somnifera* root sample
The roots contained several bioactive chemicals, with significant quantities of alkaloids detected in various solvents, including chloroform, diethyl ether, and ethanol. Antioxidants were very abundant in methanol, with modest concentrations detected in ethanol and aqueous solutions. Cardiac glycosides had substantial detection in ethanol, although their presence in other solvents was negligible (Table: 1). Flavonoids were detected in moderate concentrations in methanol, ethanol, and ethyl acetate. Saponins were significantly present in ethanol (++), whereas steroids showed the greatest quantity in chloroform (+++). We detected phenols in ethanol, but not in other solvents. Anthraquinones were prominently detected in water, methanol, and ethanol solutions. We consistently identified reducing sugars, tannins, and terpenoids in many solvents, with terpenoids being most prevalent in aqueous and methanol solutions.

The phytochemical analysis of *Withania somnifera* leaf samples
Revealed the presence of various bioactive compounds extractable in different solvents (Table: 2). Alkaloids demonstrated a significant presence in diethyl ether (++), whereas their presence was moderate in aqueous and ethanol solutions. Antioxidants were identified in methanol, ethanol, and petroleum ether. Ethanol exhibited a notable presence of cardiac glycosides (++), and flavonoids were strongly detected (++), with moderate levels found in aqueous and methanol extracts. Phenols were extensively detected in multiple solvents, especially in petroleum ether and ethyl acetate, where their presence was significantly pronounced (++). Saponins were identified in both aqueous and ethanol extracts, whereas chloroform exhibited a notable presence of steroids (++). Phenolatannins were significantly identified in both methanol and ethanol. All solvents tested consistently identified tannins and reducing sugars. Terpenoids were abundant in methanol and found in moderate concentrations in other solvents. Aqueous media exhibited a significant concentration of anthraquinones, while other solvents identified them at moderate levels.

The phytochemical analysis of *Withania somnifera* stems

Indicated the presence of alkaloids in all solvents, with the exception of petroleum ether. Significant concentrations were identified in water, methanol, and ethanol. Antioxidants were detected in methanol and ethanol (Table 3). Ethanol exhibited a significant presence of cardiac glycosides, whereas aqueous, methanol, and ethanol solvents reliably identified flavonoids and phenols. Saponins were significantly present in ethanol (++), while steroids showed the highest concentration in chloroform (+++), followed by ethanol and ethyl acetate (++). Multiple solvents reliably identified anthraquinones, tannins, and reducing sugars in moderate amounts. Terpenoids demonstrated significant abundance (+++) in chloroform, with moderate levels observed in alternative solvents.

Phytochemical analysis of *Withania somnifera* seed samples

Seeds represent the reproductive units of angiosperms, encompassing the embryo along with a nutrient reservoir. Their structure is surrounded by a protective seed coat. They are essential for plant propagation and the maintenance of genetic diversity. The seeds exhibited notable phytochemical activity across different solvents (Table 4). Alkaloids were identified in all solvents, with the exception of petroleum ether. Antioxidants were identified in both methanol and ethanol, whereas cardiac glycosides exhibited strong detection in ethanol. Flavonoids were consistently detected in aqueous, methanol, and ethanol extracts. Phenols were detected at moderate levels in methanol and ethanol, whereas Saponins exhibited a strong presence in ethanol (++). Steroids demonstrated the highest concentration in chloroform (+++), followed by ethanol and ethyl acetate (++). Anthraquinones were identified at moderate concentrations in both ethanol and chloroform. Reducing sugars, Tannins, and Terpenoids were consistently identifiable. Terpenoids were identified in significant quantities (+++) in chloroform.

GCMS Analysis of root aqueous extract of *Withania somnifera* (Fig.1)

The phytochemical analysis of *Withania somnifera* aqueous root extract in this study identified thirty unique chemical peaks, signifying a diverse array of bioactive chemicals (Table- 5). These findings indicate a complex phytochemical composition, corroborating the plant's extensive medicinal uses documented in traditional medicine. Among the discovered chemicals, 3-Amino-2-oxazolidinone, 3-Deoxy-D-mannoic lactone, methylparaben, and 1-Carbmethoxy-3,3-dimethyldiaziridine are recognized for their antibacterial properties, consistent with other observations about the antimicrobial efficacy of *Withania somnifera* root extracts. Specifically, 2,5-Dimethylfuran-3,4(2H,5H)-dione was identified, a chemical recognized for its antifungal properties, hence reinforcing the ethno pharmacological use of the plant against fungal diseases. Moreover, many furanone derivatives, including 2(3H)-Furanone, 5-heptyldihydro-, 2(3H)-Furanone, dihydro-5-propyl-, and (S)-5-Hydroxymethyl-2[5H]-furanone, were recognized. These chemicals are shown to exhibit extensive biological activity, including antibacterial, antifungal, antioxidant, antiulcer, anti-tubercular, analgesic, anti-inflammatory, anticancer, and anticonvulsant properties. Their presence may substantially enhance the many pharmacological effects associated with *Withania somnifera*. Furthermore, the identification of acetamide, 2-(1-pyrrolidinyl)-N-(3-chlorophenyl)-, in conjunction with 4H-Pyran-4-one, 2,3-dihydro-3,5-di-, and 4H-Pyran-4-one, 3,5-dihydroxy-2-methyl-, corroborates prior research emphasizing their anti-inflammatory properties. These findings indicate a potential function in regulating inflammatory pathways, rendering them intriguing subjects for more pharmacological research. Another significant molecule found was cis-4-Hydroxycyclohexanecarboxylic acid, an essential precursor in the manufacture of phosphomycins, a category of polyketide antibiotics. This suggests a potential antibacterial mechanism intrinsic to the plant's phytochemical composition. Furthermore, 1α,2,3,5-Cyclohexanetetrol, noted for its glycosidase inhibitory properties, was also identified, indicating possible anti-diabetic uses via enzyme inhibition. The results together indicate that *Withania somnifera* aqueous root extract has a variety of bioactive substances exhibiting several pharmacological characteristics. The discovery of both established and new bioactive highlights the therapeutic potential of the plant and endorses its ongoing application in traditional and contemporary pharmaceutical formulations. Subsequent research should concentrate on the isolation, measurement, and confirmation of compounds' biological activity via in vitro and in vivo experiments to thoroughly clarify their modes of action and therapeutic effectiveness.

CONCLUSION

The extensive phytochemical analysis of *Withania somnifera* identified a diverse array of bioactive compounds present in its roots, leaves, stems, and seeds, extracted using various solvents. Alkaloids were extensively detected, with notably elevated amounts in root and stem extracts utilizing ethanol, methanol, and chloroform. Antioxidants exhibited a considerable affinity for polar solvents, including methanol and ethanol, in all plant sections, suggesting their potential function in mitigating oxidative stress. Ethanol repeatedly proved to be an effective solvent for the extraction of cardiac glycosides, flavonoids, saponins, and phenolic chemicals, particularly from roots and seeds. Methanol and aqueous extracts exhibited substantial terpenoid content, however chloroform was particularly successful in separating steroids and terpenoids, especially from stem and seed samples. Anthraquinones and tannins were reliably identified in the majority of solvents, with aqueous and methanolic extracts exhibiting greater affinity. Each plant component had a distinct phytochemical profile, indicating tissue-specific production and storage of secondary metabolites. The root and seed extracts exhibited the greatest overall phytochemical variety and richness, underscoring their medicinal potential. These findings not only corroborate the conventional use of *Withania somnifera* but also establish a scientific basis for the precise extraction and development of phytopharmaceutical products. Subsequent study should to concentrate on measuring these components and assessing their pharmacological activity by bioassay-guided investigations. This research also offers significant insights into the GCMS phytochemical makeup of *Withania somnifera* root aqueous extracts. GCMS Phytochemical profiling revealed thirty bioactive chemicals, some of which had notable pharmacological effects, including antibacterial, antifungal, antioxidant, anti-inflammatory, and anticancer actions. The existence of chemicals like furanones, pyranones, and glycosidase inhibitors reinforces the plant's historical medicinal uses and indicates its promise for novel drug discovery and development. The phytochemical data reinforces the basis for conservation, selective breeding, and bioprospecting of *Withania somnifera*.

ABSTRACT

Throughout history, plants and herbs have been utilised for their therapeutic benefits. Natural herbal remedies are appealing substitutes for cancer therapy because of their therapeutic potential and low side effects. Numerous substances originating from plants, such as polyphenols, demonstrated lethal effects on rapidly proliferating cancer cells, indicating their potential as anticancer medicines. One such substance is mastic gum (MG), which is the dried resin produced by *Pistacia lentiscus* var. chia plant. MG has demonstrated encouraging anticancer properties against a number of cancer types, including colon, breast, prostate, and oral cancer. Research has shown that the essential oil of MG and its effects on cancer cell lines are both pro-apoptotic and antiproliferative. The anticancer mechanism includes downregulation of inflammatory pathways, induction of apoptosis, suppression of cell migration and proliferation, and modification of cell cycle regulation. Furthermore, encasing MG essential oil in nanoparticles has increased the oil's cytotoxic efficacy against cancer cells while reducing damage to healthy cells. MG is a natural substance with potential uses in the prevention and treatment of cancer, according to the majority of the current research. This study attempts to summarise research on MG's anticancer properties and comprehend its cytotoxic effects on different cancer cells.

Keywords: *Pistacia lentiscus*, mastic gum, anticancer agent, chemopreventive

INTRODUCTION

Plants and herbs have been used for their medicinal properties since ancient times. Many important drugs have been developed deriving the natural products from them. Since natural herbal products have therapeutic potential with

least to no side effects, hence they have emerged as attractive alternative treatments despite the remarkable evolution of medicine in recent times. In fact, several chemical compounds isolated from medicinal plants have shown to cause cytotoxic effect on rapidly dividing cells, hence revealing their considerable potential to be developed as anticancer agents (Rahman *et al.* 2018). Polyphenolic compounds like flavonoids, curcumin, tannins, resveratrol and gallacatechins are all considered to have anticancer potential and are compounds widely found in plants. Flavonoids itself is a class of diverse compounds largely distributed in grains, fruits, vegetables, tea, soybean and play a vital role for the treatment of large number of cancer. Curcumin is another leading phytochemical extracted from *Curcuma longa* (turmeric) having cytotoxic property over the growth of human glioblastoma cells. Tannins, the water soluble polyphenols are present in grapes, green tea and coffee. Resveratrol can be found in foods including peanuts, grapes and red wine. Gallacatechins are present in green tea. It is also believed that these polyphenols if included in the diet, can improve health as well as reduce risk of cancers due to their antioxidant properties (Grenwell and Rehman, 2015, Iqbal *et al.* 2017, Subramanian *et al.* 2019, Youness *et al.* 2021, Gahtori *et al.* 2023). Although various plants and their polyphenolic compounds have been investigated for their effect on cancer cells, yet there are more that have caught the attention of researchers for further studying their anticancer drug potential. One of them on the spotlight is mastic gum which needs thorough investigations and clinical trials for proving itself from having anticancer compounds to have effective anticancer activities. Chios mastic gum (CMG) or Mastiha is the dried exudate that forms as a resin and is produced by the plant *Pistacia lentiscus* var. chia, cultivated exclusively in Mediterranean and Middle Eastern countries. CMG originally is secreted as a colloidal clear liquid which then solidifies after 15- 20 days into various shapes. The solidified CMG appears as a crystalline shape of teardrops and falls to the ground under the tree. The material on the ground is collected by hand and further processed for packaging and use. The hardness of the CMG depends on the atmospheric temperature, exposure time in the open, and the size of the product (Dimas *et al.* 2012, Gortzi *et al.* 2022). Since CMG and its essential oils possess natural antimicrobial agents, they have been used extensively in Mediterranean and Middle Eastern countries not only as a dietary supplement but herbal remedy as well (Loizou *et al.* 2009, Li *et al.* 2011, Paraskev *et al.* 2016). CMG is one of the finest natural products having several phytochemical properties playing a remarkable role in treating diseases like gastrointestinal problems, inflammation, decreasing anxiety and stress, memory enhancement, antioxidant behavior and anti-inflammatory activity (Dadras *et al.* 2019, Im *et al.* 2017). Certain studies have reported that it is also known to have anticancer properties and can contribute in treating or preventing certain types of cancer (Shafiei *et al.* 2015, Li *et al.* 2011, Rahman 2018, Simitcioglu *et al.* 2018). These reports on CMG strongly support it to be potential solution for cancer treatment. This study aims at understanding the use and cytotoxic effect of mastic gum on cancer cells and summarizes the work done on their anticancer activities till date.

Mastic Gum: The resin with potential anticancer compounds

Cancer, among a range of diseases at tissue level, have emerged as the second greatest global health threat, with an estimated 10 million cancer deaths reported in 2020 (Sung, H. *et al.* 2021). Cancer treatment has always been a highly complex process. Some of the treatment modalities commonly used for cancer is chemotherapy, hormone therapy, hyperthermia, immunotherapy, photodynamic therapy, radiation therapy, stem cell transplant, surgery, targeted therapy and adjuvant therapy (De Souza and Chatterji, 2015, Debela *et al.* 2021). Although recent development in cancer studies has contributed in treatment options, yet the treatments have certain unavoidable side effects. Specific side effects of cancer treatment depend on different variables like tumour type, disease stage, severity and length of treatment. Patient variables such as age, co-morbidities, baseline health and functional status also may play a role (Üstündagˇ and Zencirci, 2015, Niedzwiedz *et al.* 2019, Wang *et al.* 2021, Alessy *et al.* 2022). In recent years, researchers have begun to focus on locally available plants in an effort to find sources of natural substances that might be used medically, particularly because of their potential to treat cancer. One of these natural components is CMG, the resin of *Pistacia atlantica* with the local name of Baneh (Rahbar *et al.* 2016, Fitsiou *et al.* 2019) CMG and its essential oil are a complex mixture of different bioactive compounds. The most researched group of Pistacia species components are the essential oils and both qualitative and quantitative differences in terms of chemical composition were found to be substantial. The chemical components of essential oils can be divided into two groups as terpene hydrocarbons (monoterpenes, sesquiterpenes and triterpenoids) and the oxygenated compounds, primarily phenols, aldehydes, ketones, esters, lactones, coumarins, ethers, and oxides. Monoterpene content is high in mastic gum,

whereas α-pinene (~80%) is the chief essential oil of CMG. Other compounds detected in their essential oils are β-Pinene, camphene, myrcene, and limonene. The significant sesquiterpene present in mastic gum is β-caryophyllene, while the major monoterpene alcohol is linalool (Hadjimbei *et al.* 2015, Pachi *et al.* 2020, Tabanca *et al.* 2020). Major bioactive compounds of mastic gum and their essential oil (Fig. 1). Due to presence of different phytochemical groups as well as phenolic compounds, CMG is associated with biological activities, like antimicrobial, antioxidant, anti-inflammatory and anticancer characteristics (Dimas *et al.* 2012, Paraschos *et al.* 2012, Moeini *et al.* 2019). Due to its ability to stop low-density lipoprotein (LDL) oxidation, mastic gum was suggested for cardiovascular protection (Pachi *et al.* 2020). By avoiding dental caries, chewing mastic gum showed antibacterial action against Streptococcus mutans that was substantial (Aksoy *et al.* 2006). Due to its pleasant aroma and beneficial effects, mastic gum has a notable reputation in food and pharmaceutical items. For instance, it is used in milky desserts and sweets, such as Turkish delight, halva, ice cream, yoghurts, candies and chewing gum, as well as in alcoholic beverages like soumatha and some specialty coffees that have a mastic flavour. Additionally, cosmetic formulations like soap, body lotions, shampoos, toothpastes, mouthwashes, and surgical adhesive strips use mastic gum components (Freedman 2011, Paraskevopoulou *et al.* 2016, Tabanca *et al.* 2020). Although compared to the fruit and leaves, Pistacia resins are poor in phenolic compounds, yet phenolic acids, specifically, p-hydroxyphenylacetic, vanillic, gallic, and trans-cinnamic acids are the main phenolic compounds in the gum. The triterpenoids present in mastic gum represent different skeleton types- the tetracyclic euphane- and dammarane skeleton type and the pentacyclic oleanane and lupane skeleton type. The main non-volatile natural products reported in the literature that have been isolated from the gum are: a) masticadienonic acid, b) tirucallol, c) oleanolic acid, d) isomasticadienonic acid, e) 3-o-28-norolean-12-en, f) 20(S)-3β-acetoxy-20-hydroxydammar-24-en, g) 3-oxo-dammara-20(21),24-diene, h) 3β-hydroxymalabarica-14(26),17E,21-triene, i) 3-oxo-malabarica-14(26),17E,21-triene, j) 3-β-hydroxy-28-norolean-12-en, k) 3-oxo-28-norlup-20(29)-en, l) (8R)-3-Oxo-8-hydroxy-polypoda-13E,17E,21-triene, m) 1,4-poly-β-myrcene (He *et al.* 2007, Hadjimbei *et al.* 2015, Assessment report on *Pistacia lentiscus* L., resin (mastix), 2015).

Supporting this, studies have reported that high content of polyphenol compounds and presence of triterpenoids are mainly responsible for the anticancer potential of mastic gum has (Hadjimbei *et al.* 2015, Rahman *et al.* 2018, Fitsiou *et al.* 2019). Ramot *et al.* 2018, conducted a study aimed to assess the systemic toxic potential of RPh201, a mastic gum extract formulated for neurological indications, administered to minipigs for 39 weeks followed by a 6-week recovery period. Treatment-related findings at injection sites included abscesses, chronic inflammation, and subcutaneous fibrosis, with marked severity abscesses in the high-dose group considered adverse. Minimal-to-slight subcutaneous and lymph node abscesses in control and lower dose groups were related to the vehicle (cottonseed oil) and not considered adverse. This study determined the no-observed-adverse-effect level of RPh201 to be 12.5 mg/kg/occasion. Studies have also shown effects of orally administered mastic oil in mice by inhibition of specific cytochrome P450 enzymes in various tissues, with no significant weight loss or toxicity observed in tests. The leaves, gums and oil of *Pistacia lentiscus* can be used in the treatment of various skin, respiratory, and gastrointestinal disorders and they also exhibit effective antiviral and cytotoxic activity (Attoub *et al.* 2014, Boke *et al.* 2023). The assessment of diet supplements' potential as anticancer agents in vivo is subject to several limitations due to the broad range of cancer types, their distinct clinical courses, and their underlying signalling. Additionally, the co-administration of cytotoxic drugs creates additional challenges. But, there is a lot of scientific interest in using food-related ingredients as an adjuvant to treat certain cancers, with the goal of improving the effectiveness and lowering the toxicity of traditional therapies. Mechanism of mastic gum extract inducing cell growth inhibition and apoptosis (Fig. 2). Several studies conducted till date have proven the fact that mastic gum components can exert anticancer activities via various mechanisms, including the induction of apoptosis and autophagic pathways activation, angiogenesis inhibition, and downregulating inflammatory mediators against breast cancer, colorectal cancer, prostate cancer, lung carcinoma and oral cancer. The hexane extract of mastic causes HCT116 human colon cancer cells to undergo apoptosis in vitro via a caspase-related mechanism. A key factor in the onset and spread of prostate cancer, mastitis attenuates the expression and activity of the androgen receptor. Furthermore, mastic suppresses the advancement of the cell cycle in prostate cancer cells via suppressing NF-κB activity and the NF-kB signalling pathway (He *et al.* 2006, He *et al.* 2007, Balan *et al.* 2007). Mastic oil has also been shown in vitro to have both proapoptotic and antiproliferative effects on human K562 leukaemia cells. Additionally, it was discovered to inhibit

the vascular endothelial growth factor, which reduced the in vivo and in vitro production of microvessels from mouse melanoma cells (Loutrari *et al.* 2006). Mastic gum extracts also shows significant antimicrobial activity. In a study by Gortzi *et al.* 2022, liposome encapsulation enhanced stability and absorption efficiency and both the extracts-acidic mastic gum extract—AMGE—and the neutral one—NMGE, resulted in effective inhibition of liver cancer cell growth. NGME extract exhibited the highest potency against cancer cells and the results supported potential chemopreventive uses of mastic extracts. Studies have also examined leaves and gums from different aged trees and analyzed their chemical components which resulted in exhibited effective antiviral and cytotoxic activity.

Mastic Gum against breast cancer

Breast cancer is a significant public health concern, and the search for effective and safe therapeutic options continues to be a priority in oncological research. Natural products, such as plant extracts and their bioactive compounds, have garnered increasing attention as potential anticancer agents due to their structural diversity and potential to selectively target cancer cells. The anticancer effects of mastic gum and its essential oil have been investigated in various studies. Mastic gum has been reported to exhibit antiproliferative and pro-apoptotic properties in breast cancer cell lines, suggesting its potential as a therapeutic agent. The mechanisms underlying these effects may involve the modulation of cell cycle regulation and the induction of apoptosis in cancer cells. Furthermore, the essential oil extracted from mastic gum has also demonstrated potent anticancer activities against breast cancer cells, potentially through the inhibition of cell proliferation and the induction of cell cycle arrest. Additionally, the anticancer properties of mastic gum and its essential oil may be enhanced through the use of delivery systems, such as polymeric nanoparticles, which can improve the bioavailability and targeted delivery of the active compounds to the tumor site. This approach has been explored in various studies, with promising results in terms of improving the anticancer efficacy and reducing the side effects associated with conventional chemotherapeutics (Najjari *et al.,* 2022, Mateos *et al.,* 2022). Rezae *et al*. (2011) reported in one of their studies that the T47D human breast cancer cells were able to undergo apoptosis and stop proliferating when exposed to the pericarp methanolic extract of *Pistacia atlantica* (locally known as Baneh). The same research team's 2012 investigation sought to determine whether or not Baneh extract may affect the cell cycle progression of T47D cells. Flow cytometry and western blot analysis methods were used for the study, respectively, to assess the distribution of the cell cycle's regulatory proteins and to investigate any potential effects of Baneh extract on the cell cycle of T47D cells. The study reported that Baneh extract substantially correlated with exposure time-dependent G0/G1 cell cycle arrest, cyclin D1 and cdk4 expression reduction, and G0/G1 cell cycle arrest. Parallel to this, Dox-treated T47D cells accumulated in the S phase at early time points, but after 48 h cell cycle progression was blocked on the G2/M stage. Dox accelerated the remarkable accumulation of cyclin B1 and increased the amount of cyclin A. Overall, the findings showed that cell cycle arrest and downregulation of cyclin D1 and cdk4 expression play a role in the anticancer activity of the Baneh pericarp extract. In 2016, Pasban-Aliabadi *et al.* conducted a study to investigate the cytotoxic and anti-proliferative properties of mastic gum with and without combining with doxorubicin at different doses against breast cancer. Cytotoxicity of the gum was determined using MTT assay on MCF-7 human breast cancer cells. Western blotting was used for evaluating the cellular makers of apoptosis (caspase3 and P53) and cell proliferation (Cyclin-D1). Doxorubicin at doses of 10 nM and 200 nM was used as anticancer control drug in combination treatment. The result showed that mastic gum (100 μg/mL) significantly induced cell damage, activated caspase3, and increased P53 protein level. Additionally, Cyclin-D1 was significantly decreased in gum-incubated cells. Moreover, mastic gum (25 μg/mL) combined with doxorubicin (200 nM) for treatment of cells produced a significant cytotoxic effect compared to each drug alone. The study concluded that mastic gum extract has a potential anti-proliferative and anti-apoptotic property in MCF-7 cells and can be a potent modality to treat breast cancer. In a study conducted by Fahmy *et al.,* 2023, a green extraction technique was used to extract the essential oil from the resins of P. lentiscus, or chios mastic. GC-MS analysis was used to establish the chemical composition of P. lenticus essential oil (PO), which was subsequently encapsulated into a niosomal formulation using a thin-film hydration process. The produced PO/Ns had exceptional negative surface charge, low PDI, high EE%, nanoscale size (less than 120 nm), and amazing stability. Additionally, they demonstrated the imprisoned PO's sustained release behaviour over the course of 72 hours. Without harming normal breast epithelial cells, the produced PO/Ns' cytotoxic efficacy against breast and ovarian cancer cells significantly outperformed that of pure PO. PO/Ns showed maximum cytotoxic effect against cancerous

cells while posing little to no hazard to healthy cells. Following cell cycle study, it was discovered that PO/Ns had a great ability to stop the cell cycle, trap cells in the sub-G1 phase, and promote apoptosis. In another study by Alabrahim and Azzazy, 2024, using GC-MS, the chemical makeup of the isolated essential oils of *Pistacia lentiscus* (PLEO) was ascertained. To explore the anticancer and potential synergistic effects of PLEO and 5-Fluorouracil (5FU) on triple-negative breast cancer cells (MDA-MB-231), human adenocarcinoma breast cancer cells (MCF-7), and human skin melanoma cell line (A375), the compounds were electrospun into poly-ε-caprolactone nanofibers (PCL-NFs), with a diameter ranging from 290.71 nm to 680.95 nm. The synthesised nanofibers (NFs) demonstrated exceptional tensile strength and physical integrity along with improved thermal stability. According to biodegradability tests, the NFs' use as a localised therapy for melanoma or breast tissues (postmastectomy) is supported by their prolonged stability over a 42-day period. Studies on release demonstrated sustained release patterns over 168 hours, with more levels of 5FU and PLEO released at pH 5.4, suggesting enhanced targeting skills towards cancerous areas. NFs that were loaded with PLEO exhibited significant antioxidant capabilities. Lastly, when compared to free chemicals, NFs loaded with either PLEO or 5FU showed stronger anticancer activity. When PLEO and 5FU were co-loaded into NFs, the strongest anticancer effects were seen. According to the study's findings, the created 5FU-PLEO-PCL-NFs have the potential to be used locally to treat melanoma and breast cancer tissues (after mastectomy) in order to reduce the likelihood of recurrence.

Mastic Gum against prostate cancer

Prostate cancer is one of the most prevalent forms of cancer affecting men worldwide. Several studies have investigated the anticancer activity of mastic gum and its essential oil against prostate cancer. Mastic gum has been shown to exhibit antiproliferative and proapoptotic effects in prostate cancer cell lines, suggesting its potential as an effective anticancer agent. Additionally, the essential oil of mastic gum has been found to suppress the migration and invasion of prostate cancer cells, which are key processes in metastasis (Giaginis and Theocharis, 2011). Furthermore, the polyphenolic compounds in mastic gum, including gallic acid, have been shown to inhibit the migration and invasion of prostate cancer cells, suggesting their potential utility in preventing metastasis. The therapeutic potential of mastic gum and its essential oil for prostate cancer is further supported by their ability to selectively target cancer cells without significantly affecting the viability of normal cells, a crucial characteristic for an effective and safe anticancer agent (He *et al.* 2006, He *et al.* 2007, Rahman 2018). Mastic gum reduces the expression and operation of the androgen receptor (AR) in prostate cancer cells, according to He *et al.* (2006). The study discovered that androgens, and the androgen receptor, are key players in the emergence of prostate cancer. This study showed that the components of mastic gum suppressed androgen receptor transcriptional expression, which decreased levels of androgen receptor mRNA and protein. The decreased expression of all three androgen-regulated genes—NKX3.1, hK2, and prostate-specific antigen—confirmed the suppression of androgen receptor function. The same research team also conducted another study in 2007 to check the impact of mastic gum on androgen-independent prostate cancer. They employed PC-3 prostate cancer cells, which do not express AR. Mastic gum reduced nuclear factor kappa B (NF-B) activity and the NF-kB signalling pathway, which in turn prevented PC-3 cells from growing and stopping the cell cycle in the G1 phase. The results showed that mastic gum thereby prevented the growth of prostate cancer in both androgen-dependent and -independent prostate cancer cells. Additionally, He *et al.* 2007 found that prostate cancer cells express more maspin, prostate cancer tumor-suppressing gene, when mastic gum is present. 8 μg/mL of mastic gum caused a 1.5-fold increase in maspin expression. Further it was shown that mastic gum significantly boosted the expression of the maspin mRNA and protein. The study finally concluded that transcriptional factors are mostly responsible for the enhanced effects of mastic gum on maspin expression.

Mastic Gum against oral cancer

Oral cancer is a significant health concern, with a growing incidence and often poor prognosis. Surgical techniques, radiation therapy, and chemotherapy have improved, but the overall 5-year survival rate remains around 50-60% (Le *et al.*, 2020). Additionally, a significant portion of oral cancer cases have unknown origins, and may be attributed to various pathogens, including bacteria (Huang and Sullivan, 2013, Chen *et al.*, 2022). Mastic gum has been shown to inhibit the growth of various oral bacteria, including Fusoacterium nucleatum, which has been linked to the development of oral cancer. Additionally, mastic gum has demonstrated the ability to induce apoptosis in oral cancer

cells, potentially offering a novel therapeutic approach (Naidu *et al.,* 2004). While more research is needed to fully elucidate the mechanisms by which mastic gum may benefit oral cancer patients, the available evidence suggests it may be a promising complementary therapy to conventional treatment modalities. Incorporating mastic gum into oral hygiene routines and exploring its use in targeted cancer therapies could offer new avenues for improving outcomes for individuals diagnosed with oral cancer. Li *et al.* 2011 investigated in vitro anti-tumor effect of CMG extract on oral squamous cell carcinoma. The study was designed to examine oral squamous cell carcinoma cell line, YD-10B and the standard chemotherapy drug Paclitaxel (Taxol, Bristol-Myers Squibb) was used as a control to see if the extracts could cause apoptosis by activating caspase-3. The findings demonstrated that both compounds displayed growth inhibitory effects in the MTT experiment that were dose- and time-dependent, with CMG extracts potentially having a higher impact than taxol at low concentrations (5–10 μg/mL). Furthermore, fragmentation of the genomic DNA was caused at 24 hour following the addition of 10 μg/mL of CMG and 50 μg/mL of Taxol. Lastly, western blot analysis revealed that 10 μg/mL of CMG and 50 μg/mL of Taxol caused procaspase-3 to cleave. Hence, in vitro growth inhibition and induction of apoptosis of YD-10B oral cancer cells were seen using CMG extracts and Taxol, and it was determined that CMG extracts exhibited stronger antitumor activity than Taxol. Another study by Kim *et al.* 2016, examined the effects of mastic gum on human oral cancer cells. YD-10B cells were cultured for 24 hours in mastic concentrations of 0, 1, 2, 5, and 10 mg/mL. Analysis was done on cell number, viability, morphology, colony-forming assay, and DAPI staining. The results showed that when YD-10B cells were treated with mastic, cell proliferation was inhibited in a dose-dependent manner, and nearly all of the cells in the 10 mg/mL culture were dead. The YD-10B cells had morphological changes and nuclear fragmentation after being treated with mastic, and this inhibition of cell colonization was dose-dependent. DAPI staining results showed that destruction of the shape of the nucleus was caused in a concentration dependent manner with increased mastic treatment. Considering the results, the study concluded that mastic gum can be used as an anticancer agent against oral cancer.

Mastic Gum against colon cancer

Colorectal or colon cancer is a significant global health concern, with increasing incidence rates worldwide. Recent studies have highlighted the potential of mastic gum in preventing and managing colon cancer. The xanthones isolated from mastic gum, including α-mangostin, β-mangostin, and γ-mangostin, have shown potent antiproliferative and pro-apoptotic activities in colon cancer cell lines (Pan-In *et al.,* 2014). Moreover, mastic gum has been found to exhibit anti-inflammatory properties, which are closely linked to the development and progression of colorectal cancer. The anti-inflammatory effects of mastic gum may be mediated through the inhibition of key inflammatory mediators, such as cyclooxygenase-2 (COX-2) and nuclear factor-κB (NF-κB) (Choi *et al.,* 2022). Using components of a supplement made from *Pistacia lentiscus* L. var. chia, Balan *et al.* (2007) studied the antiproliferative efficacy and induction of apoptosis in human colon cancer cells treated in vitro. According to the study, a 50% ethanol extract of the plant-derived substance chios mastic gum (CMG) contains substances that prevent the growth and cause the demise of HCT116 human colon cancer cells in a test tube. The CMG treatment promotes cell arrest at G1, cell separation from the substrate, activation of pro-caspases-8, -9, and -3, and various morphological alterations in cell organelles that are indicative of apoptosis. Additionally, despite being time- and dose-dependent, these events are independent of p53 and p21. The lack of inhibition of apoptosis by CMG in HCT116 cell clones that overexpress the anti-apoptotic protein Bcl-2 or the dominant-negative form of FADD suggests that CMG kills cells via a different pathway that is unrelated to the death receptor- and mitochondrion-dependent pathways.

CONCLUSION

Mastic gum, the dried resin produced by the *Pistacia lentiscus* var. chia plant, has been investigated for its potential as an anticancer agent. Studies have shown that mastic gum's high content of polyphenols and triterpenoids may contribute to its anticancer properties. Mastic gum has demonstrated antiproliferative and pro-apoptotic effects on various cancer cell lines, including breast, colorectal, prostate, lung, and oral cancers. The proposed mechanisms of action include the induction of apoptosis and autophagy, inhibition of angiogenesis, and downregulation of inflammatory mediators. Additionally, the encapsulation of mastic gum essential oil in nanoparticles has improved

its cytotoxic efficacy against breast and ovarian cancer cells while minimizing harm to normal cells. Overall, the available evidence suggests that mastic gum is a promising natural compound with potential applications in cancer treatment. However, there needs to be more in vitro research for the development of supplement or medicine to ensure the chemopreventive activity of mastic gum and its essential oil.

ABSTRACT

In this paper, we create and analyze a predator-prey model that includes a disease in the prey population. This model takes into account the dynamics of Susceptible, exposed, and infected prey, as well as their interactions with predator species. The prey population is split into three categories: susceptible, exposed, and infected, and the disease spreads by interaction between susceptible and infected individuals. The predator species preferentially targets prey based on their health level, which affects each prey class differently. We investigate the impact of disease transmission, predation pressure, and natural mortality on system stability and the survival of prey and predator populations. We use mathematical analysis and numerical simulations to discover crucial requirements for ecosystem coexistence, extinction, and oscillatory behavior.

Keywords: Predator-prey model, eco-epidemiology, disease dynamics, stability analysis, SEI model, prey-predator interactions, mathematical modeling, population dynamics.

INTRODUCTION

Predator-prey interactions are critical components of ecological systems, determining population dynamics and ecosystem stability. Traditional predator-prey models, such as the Lotka-Volterra model, make the assumption that the prey population is healthy and has no internal structure. However, in genuine ecosystems, illnesses frequently influence prey populations, altering their interactions with predators and influencing overall system dynamics. Disease in prey can cause reduced reproduction rates, higher mortality, and behavioral changes, all of which effect predator feeding rates and survival. To improve our understanding of these complex systems, eco-epidemiological models incorporate disease dynamics into predator-prey interactions. By introducing disease compartments into the prey population, researchers can investigate the combined impacts of predation and disease on population stability and persistence. In this study, we extend the standard predator-prey framework by categorizing the prey population as susceptible, exposed, or infected, resulting in a model that incorporates the impact of disease transmission and predation on both prey and predator populations. The goal of this study is to investigate how sickness in the prey population influences ecosystem stability and behavior. We hope to find scenarios under which the disease can benefit or hurt predator and prey populations. We analyze the system's equilibrium points, conduct stability analyses, and look at how characteristics like disease transmission rate, predation rate, and recovery rate affect population dynamics. This study advances our understanding of the variables that determine biodiversity, population control, and ecosystem resilience by shedding light on the relationship between disease and predation.

Mathematical model and the Basic Assumption

The prey population is separated into three compartments based on disease dynamics: susceptible (S), Exposed(E), infected (I), and maybe recovered (R).Susceptible prey can get infected through contacts with diseased people, based on a transmission rate parameter. In addition to natural predation, infected prey may die at a faster rate as a result of disease. Given limited natural resources, the susceptible prey population may continue to expand logistically. Infected people may have lower or even no reproduction rates since the condition affects fertility. The disease is thought to have no latency period, which means that once infected, prey have an instantaneous impact on disease spread. Environmental aspects such as seasonality and habitat change are not considered (in a basic model).

$$\frac{dD}{dt} = rD\left(1 - \frac{D+E+F}{K}\right) - \frac{c_1 DG^2}{a + (D+E+F)G} - \lambda D$$

$$\frac{dE}{dt} = \lambda D - \sigma E - \frac{c_3 EG^2}{a + (D+E+F)G}$$

$$\frac{dF}{dt} = \sigma E - \frac{c_2 FG^2}{a + (D+E+F)G} - \gamma F$$

$$\frac{dG}{dt} = e\frac{(c_1 D + c_3 E + c_2 F)G^2}{a + (D+E+F)G} - dG$$

We have some basic assumption for

D→ susceptible prey

E→ exposed prey

F→ infected prey

G→predator

r→growth rate

K→ carrying capacity

λ→ force of infection

c_1→ search rate of susceptible prey
c_2→ search rate of infected prey
c_3→ search rate of exposed prey
a→ half saturation point or constant
γ→ total death rate of infected prey (natural death rate+death rate due to infection
e→ conversion factor
d→natural death rate for predator population

Roundedness of the System
Proposition 1
The sound prey population is limited.

Proof.
From equation (2), we get
$\frac{dD}{dt} = rD\left(1 - \frac{D+E+F}{K}\right) - \frac{c_1 DG^2}{a+(D+E+F)G} - \lambda D < rD\left(1 - \frac{D+E+F}{K}\right) < \frac{rD}{K}(k - D)$
Using a simple yet typical argument, we may conclude that limsupt!+1 D(t) 0 such that for any t > T1, D(t) < k + ~ = W.

Theorem 1 states that all system (2)-(4) solutions starting in $R_+^3$are uniformly bounded.

Proof.
We defined a function.
Ω= D + E + F+G
The time derivative of equation (5) is provided by $\frac{d\Omega}{dt} = \frac{dD}{dt} + \frac{dE}{dt} + \frac{dF}{dt} + \frac{dG}{dt}$ for each μ> 0. The following inequality holds
$\frac{d\Omega}{dt} + \mu\Omega = rD\left(1 - \frac{D+E+F}{K}\right) - \frac{c_1 DG^2}{a+(D+E+F)G} - \lambda D + \lambda D - \sigma E - \frac{c_3 EG^2}{a+(D+E+F)G}$
$+\sigma E - \frac{c_2 FG^2}{a+(D+E+F)G} - \gamma F + e\frac{(c_1 D + c_3 E + c_2 F)G^2}{a+(D+E+F)G} - dG + \mu\Omega$
$\leq K\frac{(\mu+r)^2}{4r} - (\gamma - \mu)F - (d - \mu)G \; since \; e < 1$
$\leq K\frac{(\mu+r)^2}{4r} = \phi \; if \; \mu < min(\gamma, d).$
Therefore, using the preceding equation, we have$\frac{d\Omega}{dt} + \mu\Omega \leq \emptyset$. Applying the theory of differentiated inequality. We obtain 0<$\Omega(D,E,F,G) < \left(\frac{\phi}{\mu}\right)(1 - e^{-\mu t}) + \Omega\left(D_0, E_0, F_0, G_0\right) \times e^{-\mu t}$ and for t→ ∞ *we have* $0 < \Omega < \frac{\phi}{\mu}$Hence, all the results of the system of equations (2)–(4) that originate in$R_+^3$are limited to the region B={(D,E,F,G) ϵ R_+^3 : $\Omega = \frac{\phi}{\mu} + \epsilon$ for any ϵ> 0}.

Equilibrium
The system of equations (2)–(4) exhibits the following equilibria.

1. The trivial equilibrium point
   {D=0,E=0, F=0,G=0}
2. Exposed, Infected prey free and predator free equilibrium point
   {D=K, E=0, F=0, G=0}
3. Susceptible, Infected prey free and predator free equilibrium point
   {D=0, E=$\frac{\lambda K}{\sigma}, F = 0, G = 0$}
4. Susceptible, Exposed prey free and predator free equilibrium point
   {D=0, E=0, F=$\frac{\lambda K}{\gamma}, G = 0$}
5. Susceptible, Exposed and Infected prey free equilibrium point

{D=0,E=0, F=0, G=$\frac{e(c_1K)}{(a+K)d}$}

6. Infected prey free and predator free equilibrium point
{D=$\frac{\sigma K}{r}$, E = $\frac{\lambda K}{\sigma}$, $F = 0, G = 0$}
7. Exposed prey free and predator free equilibrium point
{D=K, E=0, F=$\frac{\lambda K}{\gamma}$, $G = 0$}
8. Predator free equilibrium point
{D=$\frac{\sigma K}{r}$, E = $\frac{\lambda K}{r}$, F=$\frac{\lambda K}{\gamma}$, $G = 0$}
9. Susceptible prey and predator free equilibrium point
{D=K, E= $-\frac{\lambda K}{\gamma}$, F=$\frac{\lambda K-\lambda K}{\sigma}$,G=$\frac{-(\lambda K-rK+a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}$
10. Infected prey free and predator free equilibrium point
{D=K, E= $-\frac{\lambda K}{\gamma}$, $F = 0, G = 0$}
11. Exposed prey free and predator free equilibrium point
{D=K, E=0, F=$\frac{-r\lambda K}{\sigma}$, $G = 0$}
12. Non- trivial equilibrium point
{D=$\frac{\sigma K}{r}$, E = $\frac{\lambda K}{\sigma}$, F=$\frac{-r\lambda K}{\sigma}$, $G = \frac{e(c_2\left(\frac{\lambda K}{\sigma}\right)+c_3\left(\frac{\lambda K}{\gamma}\right)}{a+\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)d}$}

Stability analysis

In this section, we will look at the critical point's stability characteristics.
The Jacobian matrix becomes

J=$\begin{bmatrix} J_{11} & J_{12} & J_{13} & J_{14} \\ J_{21} & J_{22} & J_{23} & J_{24} \\ J_{31} & J_{32} & J_{33} & J_{34} \\ J_{41} & J_{42} & J_{43} & J_{44} \end{bmatrix}$

$J_{11} = r\left(1-\frac{D+E+F}{K}\right) - rD - \frac{c_1G^2}{a+(D+E+F)G} + \frac{c_1DG^2}{(a+(D+E+F)G)^2} - \lambda$

$J_{34} = \frac{-2c_2FG}{a+(D+E+F)G} + \frac{c_2FG^2(D+E+F)}{(a+(D+E+F)G)^2}$

$J_{41} = \frac{e\,c_1G^2}{a+(D+E+F)G} - e\frac{(c_1D+C_3E+c_2F)G^2}{(a+(D+E+F)G)^2}$

$J_{42} = \frac{e\,c_3G^2}{a+(D+E+F)G} - e\frac{(c_1D+C_3E+c_2F)G^2}{(a+(D+E+F)G)^2}$

$J_{43} = \frac{e\, c_2 G^2}{a+(D+E+F)G} - e\,\frac{(c_1D+C_3E+c_2F)G^2}{(a+(D+E+F)G)^2}$

$J_{44} = \frac{2e\,(c_1D+C_3E+c_2F)G}{a+(D+E+F)G} - e\,\frac{(c_1D+C_3E+c_2F)G^2(D+E+F)}{(a+(D+E+F)G)^2}$

Theorem 5.1

Considering the linear version of the nonlinear differential equation (1), the equilibrium point {D=0, E=0, F=0, G=0} is unreliable and saddle point.

Proof

The changes applied to the Jacobian matrix are

$J_1 = \begin{bmatrix} r-\lambda & 0 & 0 & 0 \\ \lambda & -\sigma & 0 & 0 \\ 0 & \sigma & -\gamma & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$

The eigen values are $\lambda_1 = r-\lambda > 0, \lambda_2 = -\sigma < 0, \lambda_3 = -\gamma, \lambda_4 = 0$

The equilibrium point, Ξ1 (0,0,0,0), is considered unstable. If Atleast one of the eigenvalues of matrix J_1 have positive real components and atleast one of the eigenvalue with negative real components called saddle point. The eigen values $\lambda_1 = r-\lambda > 0, \lambda_2 = -\sigma < 0, \lambda_3 = -\gamma, \lambda_4 = 0$ are unreliable and represent a saddle point.

Theorem 5.2

Consider the linear version of equations. Therefore, the equilibrium point {D=K, E=0, F=0, G=0} is stable.

Proof

The changes made to the Jacobian matrix are

$J_2 = \begin{bmatrix} -rk-\lambda & -r & -r & 0 \\ \lambda & -\sigma & 0 & 0 \\ 0 & \sigma & -\gamma & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$

The eigen values are $\lambda_1 = -rk-\lambda < 0, \lambda_2 = -\sigma < 0, \lambda_3 = -\gamma < 0, \lambda_4 = 0.$

The equilibrium point is known as the saddle point If All of the eigenvalues of matrix J_2 have negative real components called stable point Thus, the eigen values $\lambda_1 = -rk-\lambda < 0, \lambda_2 = -\sigma < 0, \lambda_3 = -\gamma, \lambda_4 = 0$ form a stable point.

Theorem 5.3

Consider the linear version of the nonlinear differential equation(1), with the equilibrium point {D=0, E=$\frac{\lambda K}{\sigma}, F = 0, G = 0$} as the sink and saddle point.

Proof

The modifications made to the Jacobian matrix include

$J_3 = \begin{bmatrix} r\frac{\lambda}{\sigma}-\lambda & 0 & 0 & 0 \\ \lambda & -\sigma & 0 & 0 \\ 0 & \sigma & -\gamma & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$

The eigen values are $\lambda_1 = r\frac{\lambda}{\sigma}-\lambda > 0, \lambda_2 = -\sigma < 0, \lambda_3 = -\gamma < 0, \lambda_4 = 0.$

The equilibrium point is known as the saddle point. If Atleast one of the eigenvalues of matrix J_1 have positive real components and atleast one of the eigenvalue with negative real components called saddle point. Thus, the eigen values $\lambda_1 = r\frac{\lambda}{\sigma}-\lambda > 0, \lambda_2 = -\sigma < 0, \lambda_3 = -\gamma < 0, \lambda_4 = 0$ represent saddle point.

Theorem 5.4

Consider the linear version of the nonlinear differential equation(1), with the equilibrium point {D=0, E=0, F= $\frac{\lambda K}{\gamma}, G = 0$} as the sink and saddle point.

Proof

The modifications made to the Jacobian matrix include

$$J_4 = \begin{bmatrix} r\frac{\lambda}{\gamma} - \lambda & 0 & 0 & 0 \\ \lambda & -\sigma & 0 & 0 \\ 0 & \sigma & -\gamma & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

The eigen values are $\lambda_1 = r\frac{\lambda}{\gamma} - \lambda > 0, \lambda_2 = -\sigma < 0, \lambda_3 = -\gamma < 0, \lambda_4 = 0$

The equilibrium point is known as the saddle point. If all of the eigenvalues of matrix J_4 are negative real components. Thus, the eigen values $\lambda_1 = r\frac{\lambda}{\gamma} - \lambda > 0, \lambda_2 = -\sigma < 0, \lambda_3 = -\gamma < 0, \lambda_4 = 0.5$

Theorem 5.5

Consider the linear version of the nonlinear differential equation(1), with the equilibrium point {D=0, E=0, F=0, G= $\frac{e(c_1K)}{(a+K)d}$}as the sink and saddle point.

Proof

The modifications made to the Jacobian matrix include

$$J_5 = \begin{bmatrix} r - \frac{c_1(\frac{e(c_1K)}{(a+K)d})^2}{a+(\frac{e(c_1K)}{(a+K)d})} - \lambda & 0 & 0 & 0 \\ \lambda & -\sigma - \frac{c_3(\frac{e(c_1K)}{(a+K)d})^2}{a+(\frac{e(c_1K)}{(a+K)d})} & 0 & 0 \\ 0 & \sigma & -\gamma - \frac{c_2(\frac{e(c_1K)}{(a+K)d})^2}{a+(\frac{e(c_1K)}{(a+K)d})} & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

The eigen values are$\lambda_1 = r - \frac{c_1(\frac{e(c_1K)}{(a+K)d})^2}{a+(\frac{e(c_1K)}{(a+K)d})} - \lambda > 0, \lambda_2 = -\sigma - \frac{c_3(\frac{e(c_1K)}{(a+K)d})^2}{a+(\frac{e(c_1K)}{(a+K)d})} < 0, \lambda_3 = -\gamma - \frac{c_{12}(\frac{e(c_1K)}{(a+K)d})^2}{a+(\frac{e(c_1K)}{(a+K)d})} < 0, \lambda_4 = 0.$

.

The equilibrium point is known as the saddle point. If Atleast one of the eigenvalues of matrix J_1 have positive real components and atleast one of the eigenvalue with negative real components called saddle point. Thus, the eigen values $\lambda_1 = r - \frac{c_1(\frac{e(c_1K)}{(a+K)d})^2}{a+(\frac{e(c_1K)}{(a+K)d})} - \lambda > 0, \lambda_2 = -\sigma - \frac{c_3(\frac{e(c_1K)}{(a+K)d})^2}{a+(\frac{e(c_1K)}{(a+K)d})} < 0, \lambda_3 = -\gamma - \frac{c_{12}(\frac{e(c_1K)}{(a+K)d})^2}{a+(\frac{e(c_1K)}{(a+K)d})} < 0, \lambda_4 = 0$ represent saddle point.

Theorem 5.6

Consider the linear version of the nonlinear differential equation(1), with the equilibrium point {D= $\frac{\sigma K}{r}$, E = $\frac{\lambda K}{\sigma}, F = 0, G = 0$} is asymptotically stable in the linear system of the nonlinear differential equation(1).

Proof

The changes to the Jacobian matrix are

$$J_6 = \begin{bmatrix} r\left(\frac{K - \frac{\sigma K}{r} + \frac{\lambda K}{\sigma}}{K}\right) - \sigma - \lambda & -\sigma & -\sigma & 0 \\ \lambda & -\sigma & 0 & 0 \\ 0 & \sigma & -\gamma & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

The eigen values are $\lambda_1 = r\left(\frac{K-\frac{\sigma K}{r}+\frac{\lambda K}{\sigma}}{K}\right) - \sigma - \lambda > 0, \lambda_2 = -\sigma > 0, \lambda_3 = -\gamma, \lambda_4 = 0.$

If all of the eigen values of matrix J_6 have negative real components. Thus, the eigen values $\lambda_1 = r\left(\frac{K-\frac{\sigma K}{r}+\frac{\lambda K}{\sigma}}{K}\right) - \sigma - \lambda > 0, \lambda_2 = -\sigma > 0, \lambda_3 = -\gamma, \lambda_4 = 0$ are asymptotically stable.

Theorem 5.7

Consider the linear version of the nonlinear differential equation(1), the equilibrium point {D=K, E=0, F= $\frac{\lambda K}{\gamma}, G = 0$}are asymptotically stable.

Proof

The changes made to the Jacobian matrix are

$J_7 = \begin{bmatrix} r\left(1-\frac{K+\frac{\lambda K}{\gamma}}{K}\right) - r - \lambda & -\sigma & -\sigma & 0 \\ \lambda & -\sigma & 0 & 0 \\ 0 & \sigma & -\gamma & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$

The eigen values are $\lambda_1 = r\left(1-\frac{K+\frac{\lambda K}{\gamma}}{K}\right) - r - \lambda > 0, \lambda_2 = -\sigma < 0, \lambda_3 = -\gamma < 0, \lambda_4 = 0$

If all of the eigenvalues of matrix J_7 have negative true components. Thus, the eigen values $\lambda_1 = r\left(1-\frac{K+\frac{\lambda K}{\gamma}}{K}\right) - r - \lambda > 0, \lambda_2 = -\sigma > 0, \lambda_3 = -\gamma < 0, \lambda_4 = 0$are asymptotically stable.

Theorem 5.8

Consider the linear version of the nonlinear differential equation(1), the equilibrium point {D= $\frac{\sigma K}{r}, E = \frac{\lambda K}{r}$, F= $\frac{\lambda K}{\gamma}, G = 0$}are asymptotically stable.

Proof

The changes made to the Jacobian matrix are

$J_8 = \begin{bmatrix} r\left(1-\frac{\frac{\sigma K}{r}+\frac{\lambda K}{r}+\frac{\lambda K}{\gamma}}{K}\right) - \sigma - \lambda & -\sigma & -\sigma & 0 \\ \lambda & -\sigma & 0 & 0 \\ 0 & \sigma & -\gamma & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$

The eigen values are $\lambda_1 = r\left(1-\frac{\frac{\sigma K}{r}+\frac{\lambda K}{r}+\frac{\lambda K}{\gamma}}{K}\right) - \sigma - \lambda > 0, \lambda_2 = -\sigma > 0, \lambda_3 = -\gamma < 0, \lambda_4 = 0.$

The equilibrium point is referred to as the asymptotically stable. If all of the eigenvalues of matrix J_8 have negative real components. Thus, the eigen values $\lambda_1 = r\left(1-\frac{\frac{\sigma K}{r}+\frac{\lambda K}{r}+\frac{\lambda K}{\gamma}}{K}\right) - \sigma - \lambda > 0, \lambda_2 = -\sigma > 0, \lambda_3 = -\gamma < 0, \lambda_4 = 0.$ are asymptotically stable.

The characteristic equation is $\wedge_1 (\lambda) = B_1\lambda^3 + B_2\lambda^2 + B_3\lambda + B_4$

Where,

$B_1 = 1 \quad , B_2 = -(m_{33} + m_{22} + m_{11}), \quad B_3 = -(-m_{11}m_{22} - m_{11}m_{33} + m_{12}m_{21} + m_{13}m_{31} - m_{22}m_{33} + m_{23}m_{32}), \quad B_4 = m_{11}m_{22}m_{33} + m_{11}m_{23}m_{32} + m_{12}m_{21}m_{33} - m_{13}m_{23}m_{31} - m_{13}m_{21}m_{32} + m_{13}m_{22}m_{31}.$

Routh Hurwitz criterions, all the eigenvalues of J_8have negative real elements if

i. $B_1 > 0$
ii. $B_3 > 0$

iii. $B_1B_2B_3 > B_3^2 + B_1^2B_4$.

Thus, given the structure of nonlinear differential equations is locally asymptotically stable around equilibrium point {D= $\frac{\sigma K}{r}$, E = $\frac{\lambda K}{r}$, F= $\frac{\lambda K}{\gamma}$, $G = 0$} if conditions stated.

Theorem 5.9

consider the linear version of the nonlinear differential equation(1), the equilibrium point {D=K, E= $-\frac{\lambda K}{\gamma}$, F= $\frac{\lambda K-\lambda K}{\sigma}$,G= $\frac{-(\lambda K-rK+a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}$}are asymptotically stable.

Proof

The changes made to the Jacobian matrix are

$$J_9 = \begin{bmatrix} J_{11} & J_{12} & J_{13} & J_{14} \\ J_{21} & J_{22} & J_{23} & J_{24} \\ J_{31} & J_{32} & J_{33} & J_{34} \\ J_{41} & J_{42} & J_{43} & J_{44} \end{bmatrix}$$

$$J_{11} = r\left(1 - \frac{K - \frac{\lambda K}{\gamma} + \frac{\lambda K - \lambda K}{\sigma}}{K}\right) - r - \frac{c_1\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)^2}{a + \left(K - \frac{\lambda K}{\gamma} + \frac{\lambda K - \lambda K}{\sigma}\right)\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)} + \frac{c_1K\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)^2}{a + \left(K - \frac{\lambda K}{\gamma} + \frac{\lambda K - \lambda K}{\sigma}\right)\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)\right)^2} - \lambda$$

$$J_{12} = -r + \frac{c_1K\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)^3}{a + \left(K - \frac{\lambda K}{\gamma} + \frac{\lambda K - \lambda K}{\sigma}\right)\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)\right)^2}$$

$$J_{13} = -r + \frac{c_1K\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)^3}{a + \left(K - \frac{\lambda K}{\gamma} + \frac{\lambda K - \lambda K}{\sigma}\right)\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)\right)^2}$$

$$J_{14} = \frac{-2c_1K\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)}{a + \left(K - \frac{\lambda K}{\gamma} + \frac{\lambda K - \lambda K}{\sigma}\right)\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)} + \frac{c_1K\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)^2\left(K - \frac{\lambda K}{\gamma} + \frac{\lambda K - \lambda K}{\sigma}\right)}{a + \left(K - \frac{\lambda K}{\gamma} + \frac{\lambda K - \lambda K}{\sigma}\right)\left(\frac{-(\lambda K - rK + a\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)}{c_1K}\right)\right)^2}$$

Theorem 5.10

Consider the linear version of the nonlinear differential equation(1), the equilibrium point {D=K, E= $-\frac{\lambda K}{\gamma}$, $F = 0, G = 0$} are asymptotically stable.

Proof

The changes made to the Jacobian matrix are

$$J_{10} = \begin{bmatrix} r\left(1-\frac{K+\frac{\lambda K}{\gamma}}{K}\right)-r-\lambda & -r & -r & 0 \\ \lambda & -\sigma & 0 & 0 \\ 0 & \sigma & -\gamma & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

The eigen values are $\lambda_1 = r\left(1-\frac{K+\frac{\lambda K}{\gamma}}{K}\right)-r-\lambda > 0, \lambda_2 = -\sigma > 0, \lambda_3 = -\gamma -< 0, \lambda_4 = 0.$

The equilibrium point is referred to as the asymptotically stable. If all of the eigenvalues of matrix J_{10} have negative real components. Thus, the eigen values $\lambda_1 = r\left(1-\frac{K+\frac{\lambda K}{\gamma}}{K}\right)-r-\lambda > 0, \lambda_2 = -\sigma > 0, \lambda_3 = -\gamma -< 0, \lambda_4 = 0$ are asymptotically stable

Theorem 5.11

Consider the linear version of the nonlinear differential equation(1), the equilibrium point {D=K, E=0, F=$\frac{-r\lambda K}{\sigma}$, $G = 0$} are asymptotically stable.

Proof

The changes made to the Jacobian matrix are

$$J_{11} = \begin{bmatrix} r\left(1-\frac{K+\frac{-r\lambda K}{\sigma}}{K}\right)-r-\lambda & -r & -r & 0 \\ \lambda & -\sigma & 0 & 0 \\ 0 & \sigma & -\gamma & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

The eigen values are $\lambda_1 = r\left(1-\frac{K+\frac{-r\lambda K}{\sigma}}{K}\right)-r-\lambda > 0, \lambda_2 = -\sigma > 0, \lambda_3 = -\gamma -< 0, \lambda_4 = 0.$

The equilibrium point is referred to as the asymptotically stable. If all of the eigenvalues of matrix J_{11} have negative real components. Thus, the eigen values $\lambda_1 = r\left(1-\frac{K+\frac{-r\lambda K}{\sigma}}{K}\right)-r-\lambda > 0, \lambda_2 = -\sigma > 0, \lambda_3 = -\gamma -< 0, \lambda_4 = 0.$ are asymptotically stable

Theorem 5.12

consider the linear version of the nonlinear differential equation(1), the equilibrium point {D=$\frac{\sigma K}{r}$, E = $\frac{\lambda K}{\sigma}$, F=$\frac{-r\lambda K}{\sigma}$, $G = \frac{e\left(c_2\left(\frac{\lambda K}{\sigma}\right)+c_3\left(\frac{\lambda K}{\gamma}\right)\right)}{a+\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)d}$}are asymptotically stable.

Proof

The changes made to the Jacobian matrix are

$$J_{12} = \begin{bmatrix} J_{11} & J_{12} & J_{13} & J_{14} \\ J_{21} & J_{22} & J_{23} & J_{24} \\ J_{31} & J_{32} & J_{33} & J_{34} \\ J_{41} & J_{42} & J_{43} & J_{44} \end{bmatrix}$$

$$\frac{c_2\left(\frac{-r\lambda K}{\sigma}\right)\left(\frac{e(c_2\left(\frac{\lambda K}{\sigma}\right)+c_3\left(\frac{\lambda K}{\gamma}\right)}{a+\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)d}\right)^2}{a+\left(\frac{\sigma K}{r}+\frac{\lambda K}{\sigma}+\frac{-r\lambda K}{\sigma}\right)\left(\frac{e(c_2\left(\frac{\lambda K}{\sigma}\right)+c_3\left(\frac{\lambda K}{\gamma}\right)}{a+\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)d}\right)}$$

$< 0, \lambda_4 == -\frac{2e(\frac{e(c_1\frac{\sigma K}{r}+c_3\left(\frac{\lambda K}{\sigma}\right)+c_2\left(\frac{-r\lambda K}{\sigma}\right)}{a+\left(\frac{\sigma K}{r}+\frac{\lambda K}{\sigma}+\frac{-r\lambda K}{\sigma}\right)})^2}{a+\left(\frac{\sigma K}{r}+\frac{\lambda K}{\sigma}+\frac{-r\lambda K}{\sigma}\right)\left(\frac{e(c_2\left(\frac{\lambda K}{\sigma}\right)+c_3\left(\frac{\lambda K}{\gamma}\right)}{a+\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)d}\right)} - \frac{e\left(c_1\frac{\sigma K}{r}+c_3\left(\frac{\lambda K}{\sigma}\right)+c_2\left(\frac{-r\lambda K}{\sigma}\right)\right)(\frac{e(c_2\left(\frac{\lambda K}{\sigma}\right)+c_3\left(\frac{\lambda K}{\gamma}\right)}{a+\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)d})\left(\frac{\sigma K}{r}+\frac{\lambda K}{\sigma}+\frac{-r\lambda K}{\sigma}\right)^2}{(a+\left(\frac{\sigma K}{r}+\frac{\lambda K}{\sigma}+\frac{-r\lambda K}{\sigma}\right)\left(\frac{e(c_2\left(\frac{\lambda K}{\sigma}\right)+c_3\left(\frac{\lambda K}{\gamma}\right)}{a+\left(\frac{\lambda K}{\sigma}+\frac{\lambda K}{\gamma}\right)d}\right))^2}$-d are asymptotically stable.

Numerical results

We drew the majority of our base parameter values from the analysis of an eco-epidemiological model of prey and predators. r = 0.2, k = 11000 , $a = 1500$,λ= 0.0066, γ = 0.061, c_1 = 0.00005,c_3 = 0.00004,c_2 = 0.00003and we assume $d = 0.00001$. In the first simulation, we assume variables as r = 0.8 and K= 50. With these values for parameters, the equilibria are (1,0.03,0.4,0.5,0.3), (2,0.01,0.09,0.4,0.2), (0.8,100,200,0.003,225.0) (Figure 1 ,2,3). In the second simulation, we assume variables as r = 0.2 and K= 1100. With these values for parameters, the equilibria are (15,0.03,0.4,0.5,0.3), (20,0.01,0.09,0.4,0.2), (13,100,200,0.003,225.0) (Figure 4). There are two equivalent interaction equilibriums. (44.916,0.07715,0.8999) and (44.988,0.01080,0.9000).To investigate the existence of limit cycles resulting frome (50,15,15,1400) (figure 5). We take r = 0.4, k = 2,000,000, λ = 0.006, γ= 0.24/day, p = 0, c = 0.05,h = 0.04 and m = 5.0.The numbers of susceptible and infected prey(Figure 6) and the number of predators (Figure 7) trend toward their a stable state equilibrium levels(41:654; 499:8646; 13; 537:98). Wetake as parameters r = 0.6, k = 45, λ = 0.007, γ = 0.0076, p =0,δ =0.09, h = 50.0 and m =5.0. The numbers of susceptible and Exposed prey(Figure 8) and the number of predators (Figure 9) trend toward their a stable state equilibrium levels(35:814; 999:9532; 18; 234:46).

CONCLUSION

In a predator-prey model with diseased prey, disease introduction reduces prey availability, affecting predator survival and potentially destabilizing the ecosystem. Stability and coexistence are determined by the rates of infection, recovery, and predation. Disease can create new equilibrium states or oscillations, demonstrating how infection influences population dynamics and environmental stability**.**

ACKNOWLEDGEMENT

I am also deeply appreciative of my colleagues and friends who provided assistance, feedback, and motivation during this journey. A special thanks to [any specific individuals or groups, such as laboratory staff, family members, or friends] for their continuous encouragement and belief in my work.

Conflict of Interest

The author declares that there is no conflict of interest regarding the publication of this paper**.**

ABSTRACT

This manuscript aims to establish the existence and uniqueness of common coupled fixed points within the framework of $\mathfrak{b}$-multiplicative metric spaces.To achieve this, we construct suitable iterative sequences and utilize the inherent properties of $\mathfrak{b}$ - multiplicative metric spaces. The analysis is conducted under mixed-type contractive conditions, including a Geraghty-type contraction, to ensure the convergence of these sequences.We have proved the existence of coupled fixed points for two distinct types of contractions. We have introduced Geraghty-type contractions in the *c*ontext of *c*oupled fixed point theorems within $\mathfrak{b}$ -multiplicative metric spaces. We established *c*ommon *c*oupled fixed point theorems under mixed-type contractive mapping on $\mathfrak{b}$ -multiplicative metric spaces. An illustrative example is provided to support and clarify the theoretical results.

Keywords: Fixed Point, $\mathfrak{b}$-Multiplicative Metric Space($\mathfrak{b}-mms$), Coupled Fixed Point, Mixed-type contractive condition, Geraghty type contraction, Weakly Compatible(wc)

INTRODUCTION

Bhaskar and Lakshmikantham introduced the concept of coupled fixed points, establishing several *c*oupled fixed *p*oint theorems within the framework of standard metric spaces. Following their foundational work, numerous researchers have extended and refined coupled fixed point theorems in various settings. Coupled fixed point theorems are particularly useful in analysing systems where two variables are interrelated, such as in nonlinear systems of equations or differential equations with boundary conditions. The *w*eak *c*ompatibility was introduced by Jungck and Rhoades. They defined two mappings to be $\mathfrak{wc}$ if they commute at their points of coincidence, and showed that all compatible mappings are $\mathfrak{wc}$, although the converse is not necessarily true. (See[1,2]) Geraghty proposed a generalization of the Banach contraction principle by replacing the contraction constant with a function satisfying specific properties. This generalization has since been widely studied and extended to various types of distance spaces, and is commonly referred to as the Geraghty-type fixed point theorem. Bashirov introduced the concept of multiplicative metric spaces to transform the operations of addition and subtraction into multiplication and division, thereby facilitating computational processes. In 2017[3], Muhammad Usman Ali further extended this framework by proposing the notion of $\mathfrak{b}-\mathfrak{mms}$, which offer greater flexibility in the representation of distances and allow for the detection of certain nonlinear behaviors that may not be captured by traditional metric spaces. Subsequently, several mathematicians contributed to the development of this field, extensively documenting their work by considering various conditions on both mappings and spaces[4-9]. This paper aims to initiate the study of common coupled fixed point theorems for two contraction mappings within the framework of *b*-multiplicative metric spaces, focusing on a generalized mixed-type contractive condition as well as a Geraghty-type contraction. Here we extend the mixed-type contractive conditions in b-metric spaces[10] to $\mathfrak{b}-\mathfrak{mms}$, involve multiple distance terms and allow nonlinear, multivariable, or asymmetric control functions.The main purpose of proving a coupled fixed point theorem under a Geraghty-type contraction in the framework of $\mathfrak{b}-\mathfrak{mms}$ is to extend and generalize existing fixed point results.Here we extend Geraghty type contraction in bipolar metric spaces[11] to b-multiplicative metric spaces. Relaxes the contraction condition by introducing a function (a mapping ψ) that controls the contraction, making the theorem applicable in a broader class of problems.An example has been presented to demonstrate the validity of the results.

PRELIMINARIES

Definition 2.1[3]Let χ be a non-empty set and $\mu \geq 1$ be a given real number. A function $d: \chi \times \chi \to [1, \infty)$is called a $\mathfrak{b}$ −multiplicative metric with coefficientμ if the following conditions hold:
i) $d(x, y) > 1$ for all $x, y \in \chi$ with $x \neq y$ and $\mathrm{d}(x, y) = 1$ iff $x = y$
ii) $d(x, y) = d(y, x)$ for all $x, y \in \chi$
iii) $d(x, z) \leq [d(x, y).d(y, z)]^{\mu}$ for all $x, y, z \in \chi$
The triplet (χ, d, μ) is called$\mathfrak{b}-\mathfrak{mms}$.

Definition 2.2[3]Let (χ, d, μ) be a $\mathfrak{b}-\mathfrak{mms}$.
(i) A sequence $\{x_n\}$ is $\mathfrak{b}$-multiplicative convergent iff there exist $x \in \chi$ such that
$d(x_n, x) \to 1$ as $n \to \infty$.
(ii) A sequence $\{x_n\}$ is called $\mathfrak{b}$-multiplicative Cauchy iff
$d(x_m, x_n) \to 1$ as $n, m \to \infty$.
iii) A $\mathfrak{b}-\mathfrak{mms}(\chi, d, \mu)$ is said to be complete if every $\mathfrak{b}$-multiplicative cauchy sequencein χ is $\mathfrak{b}$- convergent to a point in χ.

Definition 2.3[10]An ordered pair $(x, y) \in \chi \times \chi$is referred to as a coupled fixed point of a function $\mathrm{P}: \chi \times \chi \to \chi$if it satisfies the conditions $\mathrm{P}(x, y) = x$ and$\mathrm{P}(y, x) = y$.

Definition 2.4[10] An ordered pair$(x, y) \in \chi \times \chi$is referred to as a coupled coincidence point of the functionsP : $\chi \times \chi \to \chi$ and q : $\chi \to \chi$if it satisfies the condition $P(x, y) = qx$ and $P(y, x) = qy$.

Definition 2.5 [10] An ordered pair$(x, y) \in \chi \times \chi$ is called a coupled fixed point of the functions P : $\chi \times \chi \to \chi$ and q : $\chi \to \chi$ if $P(x, y) = qx = x$and$P(y, x) = qy = y$.

Definition 2.6 [10]Let χ be a nonempty set. The mappings P : $\chi \times \chi \to \chi$ and q: $\chi \to \chi$ are said to commute if for all $x, y \in \chi$, the following holds:$qP(x, y) = P(qx, qy)$.

Definition 2.7 [1]Let(χ, d)be a multiplicative metric space, and let P and q be two self-maps on χ. The mappings P and q are said to be *c*ompatible if they satisfy the conditions for compatibilitywithin this framework.
(1)if$\lim_{n\to\infty} d(Pqx_n, qPx_n) = 1$, whenever $\{x_n\}$ is a sequence in χ such that$\lim_{n\to\infty} Px_n = \lim_{n\to\infty} qx_n = t$ for some t $\in\chi$.
(2) if $\lim_{n\to\infty} d(Pqx_n, qqx_n) = 1$and $\lim_{n\to\infty} d(qPx_n, PPx_n) = 1$, whenever $\{x_n\}$ is a sequence in χ such that $\lim_{n\to\infty} Px_n = \lim_{n\to\infty} qx_n = t$for some t $\in\chi$.

Definition 2.8 [2]Two functions P and q are considered *weakly compatible*if they commute at their points of coincidence. In other words, whenever$Px = qx$ for some $x \in \chi$, it must also hold that $Pqx = qPx$.

RESULTS AND DISCUSSION

Theorem 3.1
Let (χ, d, μ) be a complete $\mathfrak{b} - mms$ with *c*onstant $\mu \geq 1$. Consider two self-mappings P:$\chi \times \chi \to \chi$and q: $\chi \to \chi$. Assume there exist non-negative constants τ_i *for* $i = 1, 2, \ldots, 10$ such that for any x, y, u, v $\in \chi$, the following inequality holds
$d(P(x,y), P(u,v)) \leq d(qx, qu)^{\tau_1} . d(qy, qv)^{\tau_2} . d(P(x,y), qx)^{\tau_3} . d(P(y,x), qy)^{\tau_4} .$
$d(P(u,v), qu)^{\tau_5} . d(P(v,u), qv)^{\tau_6} . d(P(x,y), qu)^{\tau_7} .$
$d(P(y,x), qv)^{\tau_8} . d(P(u,v), qx)^{\tau_9} . d(P(v,u), qy)^{\tau_{10}}$
Suppose the following conditions are satisfied:

i. $\mu\tau_1 + \mu\tau_2 + \mu\tau_3 + \mu\tau_4 + \tau_5 + \tau_6 + \tau_7 + \tau_8 + (\mu^2 + \mu)\tau_9 + (\mu^2 + \mu)\tau_{10} < 1$
ii. q(x) is a complete subspace of x
iii. $P(\chi \times \chi) \subseteq q(\chi)$

Under these assumptions, the mappings P and q have acoupled coincidence point. Furthermore, if P and q are ωc, then P and q have a unique *c*oupled fixed *p*oint. Additionally, for any initial point$x_1 \in \chi$, the sequence $\{x_n\}$generated by $q(x_{n+1}) = P(x_n, x_n)$ converges to the common fixed point of P and q.

Proof
Let $x_0 \in \chi$. SinceP$(\chi \times \chi) \subseteq q(x)$, then $\exists x_1 \in \chi$ such that $P(x_0, x_0) = qx_1$. Again, Since
$P(\chi \times \chi) \subseteq q(\chi)$, then $\exists x_2 \in \chi$ such that $P(x_1, x_1) = qx_2$. By repeating this procedure, we generate a sequence$\{y_n\}$ in q(x), ensuring that $y_n = qx_{n+1} = P(x_n, x_n)$.
It follows that
$d(qx_{n+1}, qx_{n+2}) = d(P(x_n, x_n). P(x_{n+1}, x_{n+1}))$
$\leq d(qx_n, qx_{n+1})^{\tau_1} . d(qx_n, qx_{n+1})^{\tau_2} . d(P(x_n, x_n), qx_n)^{\tau_3} .$
$d(P(x_n, x_n), qx_n)^{\tau_4} . d(P(x_{n+1}, x_{n+1}), qx_{n+1})^{\tau_5} . d(P(x_{n+1}, x_{n+1}), qx_{n+1})^{\tau_6} .$
$d(P(x_n, x_n), qx_{n+1})^{\tau_7} . d(P(x_n, x_n), qx_{n+1})^{\tau_8} . d(P(x_{n+1}, x_{n+1}), qx_n)^{\tau_9} .$
$d(P(x_{n+1}, x_{n+1}), qx_n)^{\tau_{10}}$
Therefore,
$d(qx_{n+1}, qx_{n+2}) \leq d(qx_n, qx_{n+1})^{\tau_1} . d(qx_n, qx_{n+1})^{\tau_2} . d(qx_{n+1}, qx_n)^{\tau_3} .$
$d(qx_{n+1}, qx_n)^{\tau_4} . d(qx_{n+2}, qx_{n+1})^{\tau_5} . d(qx_{n+2}, qx_{n+1})^{\tau_6} .$
$d(qx_{n+1}, qx_{n+1})^{\tau_7} . d(qx_{n+1}, qx_{n+1})^{\tau_8} . d(qx_{n+2}, , qx_n)^{\tau_9} .$

$d(qx_{n+2},,qx_n)^{\tau_{10}}$
$= d(qx_n,\ qx_{n+1})^{\tau_1+\tau_2+\tau_3+\tau_4} \cdot d(qx_{n+1},qx_{n+2})^{\tau_5+\tau_6} \cdot d(qx_n,qx_{n+2})^{\tau_9+\tau_{10}}$

which implies that
$d(qx_{n+1},qx_{n+2})^{1-\tau_5-\tau_6} \leq d(qx_n,qx_{n+2})^{\tau_9+\tau_{10}} \cdot d(qx_n,qx_{n+1})^{\tau_1+\tau_2+\tau_3+\tau_4}$
Since
$d(qx_n,qx_{n+2}) \leq d(qx_n,qx_{n+1})^{\mu} \cdot d(qx_{n+1},qx_{n+2})^{\mu}$
We have
$d(qx_{n+1},qx_{n+2})^{1-\tau_5+\tau_6} \leq [d(qx_n,qx_{n+1}) \cdot d(qx_{n+1},qx_{n+2})]^{\mu(\tau_9+\tau_{10})} \cdot$
$d(qx_n,qx_{n+1})^{\tau_1+\tau_2+\tau_3+\tau_4}$

$d(qx_{n+1},qx_{n+2})^{1-\tau_5-\tau_6-\mu\tau_9-\mu\tau_{10}} \leq d(qx_n,qx_{n+1})^{\tau_1+\tau_2+\tau_3+\tau_4+\mu\tau_9+\mu\tau_{10}}$

Therefore, we obtain
$d(qx_{n+1},qx_{n+2}) \leq d(qx_n,qx_{n+1})^{\frac{\tau_1+\tau_2+\tau_3+\tau_4+\mu\tau_9+\mu\tau_{10}}{1-\tau_5-\tau_6-\mu\tau_9-\mu\tau_{10}}}$
Let us set
$$h = \frac{\tau_1+\tau_2+\tau_3+\tau_4+\mu\tau_9+\mu\tau_{10}}{1-\tau_5-\tau_6-\mu\tau_9-\mu\tau_{10}}$$
Since
$\mu h = \frac{\mu\tau_1+\mu\tau_2+\mu\tau_3+\mu\tau_4+\mu^2\tau_9+\mu^2\tau_{10}}{1-\tau_5-\tau_6-\mu\tau_9-\mu\tau_{10}} < 1$ and
$h \leq \mu h$, we get $h < 1$, then
$d(qx_{n+1},qx_{n+2}) \leq d(qx_n,qx_{n+1})^h$ (3.1)
$d(qx_n,qx_{n+1}) = d(\mathrm{P}(x_{n-1},x_{n-1}),\mathrm{P}(x_n,x_n))$
$\leq d(qx_{n-1},\ qx_n)^{\tau_1} \cdot d(qx_{n-1},\ qx_n)^{\tau_2} \cdot d(\mathrm{P}(x_{n-1},\ x_{n-1}),qx_{n-1})^{\tau_3}.$
$d(\mathrm{P}(x_{n-1},x_{n-1}),qx_{n-1})^{\tau_4} \cdot d(\mathrm{P}(x_n,x_n),qx_n)^{\tau_5}. d(\mathrm{P}(x_n,x_n),qx_n)^{\tau_6}.$
$d(\mathrm{P}(x_{n-1},x_{n-1}),qx_n)^{\tau_7} \cdot d(\mathrm{P}(x_{n-1},\ x_{n-1}),qx_n)^{\tau_8}. d(\mathrm{P}(x_n,\ x_n),qx_{n-1})^{\tau_9}.$
$d(\mathrm{P}(x_n,x_n),qx_{n-1})^{\tau_{10}}$

We get
$d(qx_n,qx_{n+1}) \leq d(qx_{n-1},\ qx_n)^{\tau_1} \cdot d(qx_{n-1},\ qx_n)^{\tau_2} \cdot d(qx_n,qx_{n-1})^{\tau_3}.$
$d(qx_n,qx_{n-1})^{\tau_4} \cdot d(qx_{n+1},\ qx_n)^{\tau_5}. d(qx_{n+1},qx_n)^{\tau_6}.$
$d(qx_n,qx_n)^{\tau_7} \cdot d(qx_n,qx_n)^{\tau_8}. d(qx_{n+1},qx_{n-1})^{\tau_9} \cdot d(qx_{n+1},qx_{n-1})^{\tau_{10}}$
Which leads us to
$d(qx_n,qx_{n+1}) \leq d(qx_{n-1},qx_n)^h$ (3.2)
Applying (3.1) and (3.2) repeatedly for n steps yields
$d(qx_{n+1},qx_{n+2}) \leq d(qx_{n-1},qx_n)^{h^2}$
$\vdots$
$\leq d(qx_0,qx_1)^{h^{n+1}}$ (3.3)

Given $n, m \in \mathrm{N}$, with $m > n$, then
$d(qx_n,qx_m) \leq d(qx_n,qx_{n+1})^{\mu} \cdot d(qx_{n+1},qx_m)^{\mu}$
$\leq d(qx_n,qx_{n+1})^{\mu} \cdot d(qx_{n+1},qx_{n+2})^{\mu^2} \cdot d(qx_{n+2},qx_m)^{\mu^2}$
$\leq d(qx_n,qx_{n+1})^{\mu} \cdot d(qx_{n+1},qx_{n+2})^{\mu^2} \ldots d(qx_{m-1},qx_m)^{\mu^{m-n}}$

From (3.3), we get
$d(qx_n,qx_m) \leq d(qx_0,qx_1)^{\mu h^n} \cdot d(qx_0,qx_1)^{\mu h^{n+1}} \cdot \ldots \cdot d(qx_0,qx_1)^{\mu^{m-n} r^{m-1}}$
$\leq d(qx_0,qx_1)^{\mu h^n[1+\mu h+\mu^2 h^2+\mu^3 h^3+\cdots]}$
$\leq d(qx_0,qx_1)^{\mu h^n \sum_{i=0}^{\infty}(\mu h)^i}$
$= d(qx_0,qx_1)^{\frac{\mu h^n}{1-\mu h}}$

Since $h^n \to 0$ as $n \to +\infty$, we find that
$\lim_{n,m\to+\infty} d(qx_n, qx_m) = 1$

So $\{qx_n\}$ is a ɓ-cauchy ꞩequence in $(q(\chi), d)$, due to the completeness of$q(\chi)\exists g \in q(\chi)$ such that
$\lim_{n\to+\infty} qx_n = qu = g$

We aim to prove that (u, u) serves as acoupled *c*oincidence *p*oint for the mappings P and q.
$d(qx_{n+1}, P(u,u)) = d(P(x_n, x_n), P(u,u))$
$\leq d(qx_n,\ qu)^{\tau_1} . d(qx_n,\ qu)^{\tau_2} . d(\mathrm{P}(x_n,\ x_n), qx_n)^{\tau_3}.$
$d(P(x_n,\ x_n), qx_n)^{\tau_4} . d(\mathrm{P}(u,u), qu)^{\tau_5}. d(P(u,u), qu)^{\tau_6}.$
$d(\mathrm{P}(x_n,\ x_n), qu)^{\tau_7} . d(P(x_n,\ x_n), qu)^{\tau_8}. d(\mathrm{P}(u,\ u), qx_n)^{\tau_9}.$
$d(P(u,\ \ \ u), qx_n)^{\tau_{10}}$

Which implies that
$d\big(qx_{n+1}, P(u,u)\big) \leq d(qx_n,\ qu)^{\tau_1} . d(qx_n,\ qu)^{\tau_2} . d(qx_{n+1}, qx_n)^{\tau_3}.$
$d(qx_{n+1}, qx_n)^{\tau_4} . d(P(u,u), qu)^{\tau_5}. d(P(u,u), qu)^{\tau_6}.$
$d(qx_{n+1}, qu)^{\tau_7} . d(qx_{n+1}, qu)^{\tau_8}. d(P(u,\ u), qx_n)^{\tau_9}.$
$d(P(u,u), qx_n)^{\tau_{10}}$ (3.4)

Note that
$d\big(qu, P(u,u)\big) \leq d(qx_{n+1}, qx_n)$

Taking the limit as $n \to +\infty$ in the above inequality, we derive
$d(qu, P(u,u))^{\frac{1}{\mu}} \leq \lim_{n\to\infty} d(qx_{n+1}, P(u,u))$ (3.5)
$d(qx_{n+1}, qx_n) \leq [d(qx_{n+1}, qu) . d(qu, qx_n)]^{\mu}$
As $n \to +\infty$, the inequality becomes
$\lim_{n\to\infty}(qx_{n+1}, qx_n) = 1$ (3.6)

Again,
$d(P(u,u), qx_n) \leq [d(P(u,u), qu) . d(qu, qx_n)]^{\mu}$

By allowing $n \to +\infty$, the inequality yields
$\lim_{n\to\infty} d(P(u,u), qx_n) \leq d(P(u,u), qu)^{\mu}$ (3.7)

Letting $n \to +\infty$ in (3.4) and using (3.5), (3.6), (3.7), we get
$d(qu, \mathrm{P}(u,u))^{\frac{1}{\mu}} \leq d(\mathrm{P}(u,u), qu)^{\tau_5}. d(\mathrm{P}(u,u), qu)^{\tau_6} . d(\mathrm{P}(u,u), qu)^{\mu\tau_9}$
$d(\mathrm{P}(u,u), qu)^{\mu\tau_{10}}$

Which implies that
$d\big(qu, P(u,u)\big) \leq d(P(u,u), qu)^{\mu\tau_5+\mu\tau_6+\mu^2\tau_9+\mu^2\tau_{10}}$
Since $\mu\tau_5 + \mu\tau_6 + \mu^2\tau_9 + \mu^2\tau_{10} < 1$, we get $d(qu, P(u,u) = 1$.

Hence $qu = P(u,u)$.
Thus,(u, u) servesas a coupled coincidence point of P and q. To establish the uniqueness of this point, suppose that (v, v) is another *c*oupled *c*oincidence *p*oint of P and q.
$d(qu, qv) = d\big(P(u,u), P(v,v)\big)$
$\leq d(qu,\ qv)^{\tau_1} . d(qu,\ qv)^{\tau_2} . d(\mathrm{P}(u,\ u), qu)^{\tau_3}.$
$d(\mathrm{P}(u,\ u), qu)^{\tau_4} . d(\mathrm{P}(v,v), qv)^{\tau_5}. d(\mathrm{P}(v,v), qv)^{\tau_6}.$
$d(\mathrm{P}(u,\ u), qv)^{\tau_7} . d(\mathrm{P}(u,\ u), qv)^{\tau_8}. d(\mathrm{P}(v,v), qu)^{\tau_9}.$

$d(\mathrm{P}(v,\ v), qu)^{\tau_{10}}$

Which implies that
$d(qu, qv) \leq d(qu, qv)^{\tau_1+\tau_2+\tau_7+\tau_8+\tau_9+\tau_{10}}$
Since $\tau_1 + \tau_2 + \tau_7 + \tau_8 + \tau_9 + \tau_{10} < 1$, then
$d(qu, qv) = 1$. So $qu = qv$.

Therefore, $(u,\ u)$ is the unique coupled coincidence point of P and q. Next, assume that P and q are ŵc. Then
$q\big(\mathrm{P}(u,u)\big) = \mathrm{P}(qu, qu)$
Put $w = qu$, then
$qw = q(qu) = q\big(\mathrm{P}(u,u)\big)$
$= \mathrm{P}(qu, qu)$
$= \mathrm{P}(w,w)$

So, (w,w) is a coupled coincidence point of P and q. Therefore $qw = qu$.
Hence $qw = w$ and $P(w,w) = qw = w$
So (w,w) is a coupled fixed point of P and q.

Theorem 3.2
Let (χ, d, μ) be acomplete ƀ-ϻϻs with constant $\mu \geq 1$. Let P:$\chi \times \chi \to \chi$and q: $\chi \to \chi$ be two mappings satisfying the following conditions

i. For all x, y, u, v $\in \chi$,
$\mathrm{d}\big(\mathrm{P}(x,y), \mathrm{P}(u,v)\big) \leq \psi\big(d(qx,qu), d(qy,qv)\big) \max\{d(qx,qu), d(qy,qv)\}$ whereψ: $[1,\infty) \times [1,\infty) \to [1,\infty)$
ii. $q(\chi)$ is a complete subspace of χ
iii. $P(\chi \times \chi) \subseteq q(\chi)$

Then, the mappings P and q have a coupled coincidence point. Moreover, if P and q are weakly compatible, then they have a unique coupled fixed point. Furthermore, for any $x_1 \in \chi$, the sequence $\{x_n\}$defined by $q(x_{n+1}) = P(x_n, x_n)$converges to theunique common fixed point of P and q.

Proof
Let $x_0 \in \chi$. Since $\mathrm{P}(\chi \times \chi) \subseteq q(x)$, then $\exists x_1 \in \chi$ such that $P(x_0, x_0) = qx_1$. Again, Since
$P(\chi \times \chi) \subseteq q(\chi)$, then $\exists x_2 \in \chi$ such that $P(x_1, x_1) = qx_2$. By continuing this process, we generate a sequence $\{y_n\}$ in q(x), where each term is defined as$y_n = qx_{n+1} = P(x_n, x_n)$.
It follows that
$d(qx_{n+1}, qx_{n+2}) = d(P(x_n, x_n)\ .\ P(x_{n+1}, x_{n+1}))$
$\leq \psi\big(d(qx_n, qx_{n+1}), d(qx_n, qx_{n+1})\big) \max\{d(qx_n, qx_{n+1}), d(qx_n, qx_{n+1})\}$
$d(qx_{n+1}, qx_{n+2}) \leq d(qx_n, qx_{n+1})^h$ (3.8)
$d(qx_n, qx_{n+1}) \leq d(qx_{n-1}, qx_n)^h$ (3.9)
Repeating (3.8) and (3.9) for n times, we get
$d(qx_{n+1}, qx_{n+2}) \leq d(qx_{n-1}, qx_n)^{h^2}$
⋮
$\leq d(qx_0, qx_1)^{h^{n+1}}$ (3.10)
$d(qx_n, qx_m) \leq d(qx_n, qx_{n+1})^{\mu}\ .\ d(qx_{n+1}, qx_m)^{\mu}$
$\leq d(qx_n, qx_{n+1})^{\mu}\ .\ d(qx_{n+1}, qx_{n+2})^{\mu^2}.\ d(qx_{n+2}, qx_m)^{\mu^2}$
$\leq d(qx_n, qx_{n+1})^{\mu}\ .\ d(qx_{n+1}, qx_{n+2})^{\mu^2} \ldots\ d(qx_{m-1}, qx_m)^{\mu^{m-n}}$
From (3.10), we get
$d(qx_n, qx_m) \leq d(qx_0, qx_1)^{\mu h^n}\ .\ d(qx_0, qx_1)^{\mu h^{n+1}} \ldots . d(qx_0, qx_1)^{\mu^{m-n_r m-1}}$
$\leq d(qx_0, qx_1)^{\mu h^n [1+\mu h+\mu^2 h^2+\mu^3 h^3+\cdots]}$
$\leq d(qx_0, qx_1)^{\mu h^n \sum_{i=0}^{\infty}(\mu h)^i}$

$= d(qx_0, qx_1)^{\frac{\mu h^n}{1-\mu h}}$

Since $h^n \to 0$ as $n \to +\infty$, we get that
$\lim_{n,m\to+\infty} d(qx_n, qx_m) = 1$

So $\{qx_n\}$ is a b-cauchy sequence in $(q(\chi), d)$, by completeness of $q(\chi) \exists g \in q(\chi)$ such that
$\lim_{n\to+\infty} qx_n = qu = g$

Show that (u, u) is coupled coincidence point of P and q.
$d(qx_{n+1}, P(u,u)) = d(P(x_n, x_n), P(u,u))$
$\leq \psi\big(d(qx_n, qu), d(qx_n, qu)\big)\max\{d(qx_n, qu), d(qx_n, qu)\}$

Let us take $n \to +\infty$ in the above inequality
$\leq d(qx_n, qu)$
$d(qx_n, qu) \leq [d(qx_n, qx_{n+1}) \,.\, d(qx_{n+1}, qu)]^{\mu}$

Letting $n \to \infty$ in above inequality, we get
$d(qx_n, qu) \leq [d(qu, qu) \,.\, d(qu, qu)]^{\mu}$
$d(qx_n, qu)^{\frac{1}{\mu}} \leq 1$
$d(qx_{n+1}, P(u,u)) \leq 1$
$d(qu, P(u,u)) = 1$
$qu = P(u,u)$
Hence $(u,\ u)$ is the coupled coincidence point of P and q.

To Prove uniqueness
$d(qu, qv) = d\big(P(u,u), P(v,v)\big)$
$\leq \psi\big(d(qu, qv), d(qu, qv)\big)\max\{d(qu, qv), d(qu, qv)\}$
Which implies that
$< \max\{d(qu, qv), d(qu, qv)\}$(a)
$d(qv, qu) = d\big(P(v,v), \mathrm{P}(u,u)\big)$
$\leq \psi\big(d(qv, qu), d(qv, qu)\big)\max\{d(qv, qu), d(qv, qu)\}$
$< \max\{d(qv, qu), d(qv, qu)\}$ (b)
Combine (a) and (b)
$< \max\{d(qu, qv), d(qv, qu)\}$
$\therefore d(qu, qv) = 1$ implies $u = v$.

Hence (u,u) is unique coupled coincident point of P and q.Now, suppose that P and q are ωc. Then
$q\big(\mathrm{P}(u,u)\big) = \mathrm{P}(qu, qv)$
Put $w = qu$, then
$qw = q(qu) = q\big(P(u,u)\big)$
$= P(qu, qu)$
$= P(w,w)$

So, (w,w) is a coupled coincidence point of P and q. Therefore $qw = qu$.
Hence $qw = w$ and $\mathrm{P}(w,w) = qw = w$
So (w,w) is a coupled fixed point of P and q.

Example 3.3
Let $\chi = [1,\infty)$ and $d: \chi \times \chi \to [1,\infty)$ by:
$d(x,y) = 1 + |\ln x - \ln y|$

Consider that $(\chi, d, \mu)$is a complete b-Multiplicative Metric spaces with constant $\mu = 2$.
Let $P(x, y) = \sqrt{xy}$and $q(x) = x$.
Check:$\mathrm{d}\big(\mathrm{P}(\mathrm{x},\mathrm{y}), \mathrm{P}(\mathrm{u},\mathrm{v})\big) \leq \psi\big(d(qx, qu), d(qy, qv)\big)\max\{d(qx, qu), d(qy, qv)\}$ (3.11)
$d(x, y) = 1 + |\ln x - \ln y|$
$\mathrm{d}\big(\mathrm{P}(\mathrm{x},\mathrm{y}), \mathrm{P}(\mathrm{u},\mathrm{v})\big) \leq 1 + \left|\ln\sqrt{xy} - \ln\sqrt{uv}\right|$
$\mathrm{P}(\mathrm{x},\mathrm{y}) = \sqrt{xy} \Longrightarrow \ln P(x, y) = \frac{1}{2}(\ln x + \ln y)$

Then $\left|\ln\sqrt{xy} - \ln\sqrt{uv}\right| = \left|\frac{1}{2}(\ln x + \ln y - \ln u - \ln v)\right|$
Define: $\psi(a, b) = \sqrt{\min\{a, b\}}$
$\psi\big(d(x, u), d(y, v)\big) = \sqrt{\min\{(x, u), d(y, v)\}}(\because q(x) = x)$

Here (3.11) becomes
$1 + \left|\frac{1}{2}(\ln x + \ln y - \ln u - \ln v)\right| \leq \sqrt{\min\{(x, u), d(y, v)\}}.\max\{d(x, u), d(y, v)\}$ (3.12)
Let $x = 4,\ y = 9, u = 16, v = 25$
LHS of (3.12) $\Longrightarrow 1 + \left|\frac{1}{2}(\ln 4 + \ln 9 - \ln 16 - \ln 25)\right|$
$= 1 + \frac{1}{2}|1.39 + 2.19 - 2.77 - 3.22| \Longrightarrow 1 + \frac{1}{2}|3.58 - 5.99|$
$= 1 + \frac{1}{2}\ (2.41) \Longrightarrow 2.2$
$\mathrm{P}(x, y) = \sqrt{36} = 6$ and $\mathrm{P}(\mathrm{u},\mathrm{v}) = \sqrt{400} = 20$
$d(6,20) = 1 + |\ln 6 - \ln 20| \approx 1 + |1.79 - 2.99| = 2.2$
Now,$d(4,16) = 1 + |\ln 4 - \ln 16| \approx 1 + |1.39 - 2.77| = 2.38$
$d(9,25) = 1 + |\ln 9 - \ln 25| \approx 1 + |2.19 - 3.22| = 2.03$
$\psi\big(d(x, u), d(y, v)\big) = \sqrt{\min\{2.38, 2.03\}} = \sqrt{2.03} \approx 1.43$
$\max\{d(x, u), d(y, v)\} = \max\{2.38, 2.03\} = 2.38$
RHS of (3.12) $\Longrightarrow 1.43 \times 2.38 \approx 3.4 > 2.2 = \mathrm{d}\big(\mathrm{P}(\mathrm{x},\mathrm{y}), \mathrm{P}(\mathrm{u},\mathrm{v})\big)$

which confirms that the contractive conditions of theorem 3.2 are met.
Here $\mathrm{P}(\mathrm{u},\mathrm{u}) = q(\mathrm{u}) \Longrightarrow \sqrt{\mathrm{u}^2} = \mathrm{u} \Longrightarrow \mathrm{u} = \mathrm{u}$
So any $\mathrm{u} \in \chi$ satisfies this. Hence, every point $(\mathrm{u}, \mathrm{u}) \in \chi \times \chi$ is a coupled coincidencepoint of P and q.

CONCLUSION

In this study, we have investigated the existence and uniqueness of common coupled fixed points in$\mathfrak{b} - \mathfrak{mms}$. By constructing appropriate iterative sequences and employing both mixed-type and Geraghty-type contractive conditions, we successfully established new fixed point results that generalize and extend existing theorems in the literature. The constructed example further illustrates the applicability of our findings.

ABSTRACT

Background: Given that our eyes serve as windows to the world, they play a key part in our health. Research on the administration of medications to the eyes has advanced significantly over the past 20 years, resulting in novel, secure, and user-friendly drug delivery techniques and technologies that may be able to get beyond these challenges and maintain drug levels in tissues. This review article gives a narrative account of biodegradable ocular implants which is a crucial element in creating secure and efficient drug delivery systems (DDS) it has entailed the generation of biocompatible polymers, which provide the flexibility to personalize drug release kinetics for particular medications and ocular conditions. A study search was performed using the key terms "Biodegradable ocular implants", "Drug delivery system", and "ocular inserts" using the database's clinical trials. API, Embase, PubMed and Google Scholar. Reviews, meta-analyses, randomized controlled trials, clinical trials, and observational studies were all part of the search approach. Only English literature was included in the search parameters. The current article was put together using the data that was found during the aforementioned search. The patient-friendly techniques, such as systemic and topical routes, occasionally have poor bioavailability, due to a variety of barriers, including the blood-aqueous barrier, cornea, sclera, tear film, and blood-retinal barrier. The emergence of innovative drug delivery methods for the human eye which employ biodegradable substances for sustained release as well as increased permeability has so attracted a lot of research attention. There are more advantages to biodegradable ocular implants than

to non- biodegradable ones. By injecting medication straight through the anterior chamber inside the eye, intraocular implants allow for the continual upkeep of therapeutic drug concentrations in the vitreous. Poly-hydroxy acid synthetic aliphatic polyesters, such as polylactic acids, polyglycolic acids, and polylactic-co-glycolic acids, are the polymers most frequently utilized in biodegradable delivery systems. The target of this review is to focus the light on the advantages of biodegradable ocular DDS and discuss potential future developments.

Keywords: Drug delivery system, Biodegradable ocular implants, polymers, sustained release, human eye, biodegradation

INTRODUCTION

The eye is a perplexing organ with an exclusive physiology and anatomy [1]. The eye is rendered immune-privileged, meaning it is highly protected from systemic circulation. Primarily, the anterior as well as the posterior segments comprise the structure of the eye. Anterior as well as the posterior segments of the eye can be affected by a variety of disorders that may cause vision impairment [2]. It is interesting to note that conditions impacting the anterior part of the eyes, likely kerato conjunctivitis, dry eye disease, and glaucoma, mostly impact the anterior part of the eyes. However, conditions akin to diabetic retinopathy, retinal vascular occlusions, and age-related macular degeneration frequently affect the posterior part of the retina [3]. In many controlled-release systems, biodegradable polymers are utilized as drug carriers. Enzymatic activity or hydrolytic reactions can break down the monomers that make up biodegradable polymers, often joined together by esters, amides, or ether linkages [1]. After they eventually break down and are absorbed by the body, biodegradable polymers release the medication. Numerous ocular medication delivery methods that employ various biodegradable polymer types have been investigated [4]. The field of ocular medication delivery technologies has quickly progressed, leading to improved therapeutic approaches for long-term eye conditions [5]. Any ocular drug-delivering system's major goals are to overcome different dynamic and static ocular barriers, lower dose frequency, and sustain the target location's therapeutic medication concentrations [6 , 7]. Above all, the drug-delivery method should try to maximize drug absorption while avoiding any negative ocular effects [1]. Various conventional and peculiar drug delivery techniques, such as aqueous gels, emulsions, ointments, suspensions, liposomes, dendrimers, nanoparticles, nano micelles, implants, contact lenses, nanoneedles, nanosuspensions, and in situ thermosensitive gels for ocular diseases, have been devised to conquer the obstacles associated with ocular drug delivery and enhance ocular bioavailability [8].

Background of the Study

The Human Eye: The Complicated Section of The Human System. The eye, which gives us awareness of our surroundings, is among the most complex and vital organs in the human body (Figure 1) [9]. One can distinguish between the anterior as well as posterior segments of the eye. The former segment is made up of the tear, cornea, iris, ciliary body, lens, anterior and posterior chambers, and aqueous humor, whereas the latter segment is made up of the sclera, retina, choroid, and vitreous humor [10, 11].

Barriers of the Human Eye

THE TEAR FILM
THE CORNEA
THE CONJUNCTIVA

One of the most complex and vital organs in the human body, the eye enables us to see our surroundings. Drug distribution into the eye is challenging since the entire eye acts as a natural barrier for a number of medications and proteins (Figure 2) [12]. Tears, a pre-corneal film made up of three layers and having a thickness of around 3 micrometers, are the most important ocular barrier now in use, according to various routes of administration. Contrarily, because of the makeup of the layers that make up the cornea, a transparent as well as avascular area of

the eye, both hydrophobic as well as hydrophilic medications naturally pass through it [13]. The conjunctiva, a fibrous layer covering one-third of the total eyeball, is another significant barrier that prevents medications with a molecular weight between 20 and forty kDa from passing through [10].

Biodegradation

The term "biodegradation" describes the hydrolysis of the polymer base chain that can be enzymatic or non-enzymatic and is frequently applied to goods that are metabolized or water- soluble [14]. Two main processes that contribute to biodegradation are degradation and erosion. In the case of hydrophobic polymers, the latter defines the process of breaking their primary chain into lower polymeric molecular fractions, whereas the former points out to the breaking of the polymer's primary chain compounds into water-soluble substances. The pace at which the polymer is eroding and its water permeability are both important factors in this process [15]. Employing biodegradable devices composed of polymers that decompose into harmless metabolites or macromolecules that may be distributed in vivo and harmlessly extracted from the body is one way to assure eye health [16]. Designing implants with adequate degradation rates and mechanical properties is a difficult task because of regulatory constraints, intricacy, and the expensive nature of appropriate degradation-rate polymers. A variety of factors, including the patient's age, alterations to the structure of the body, and physiological characteristics that may affect the device's performance, should be taken into account during the approval procedure for a biodegradable implant. Biodegradable objects such as sheets, discs, plugs, pellets, and rods can be shaped by using compression molding, extrusion, and/or solution casting [17].

Aspects that influence biodegradation

Polymer structure: When hydrolytic enzymes and microorganisms are present, the hydrolyzable linkages in the chain of biodegradable polymers are prone to breaking down [18].

Polymer morphology: Because the molecules in amorphous parts are far away from one another and therefore more vulnerable to degradation, enzymes can more readily target these sections of polymers than they can crystalline ones [19].

Chemical and radiation treatments: When polymers are photolyzed by UV and γ-ray radiation, radicals and/or ions are produced, which lead to the cleavage and cross linking of polymers [18].

Molecular weight: As a polymer's molecular weight rises, so does its biodegradability [19, 20].

The methods for accelerating biodegradable polymer degradation

The primary techniques for quickening the breakdown of biodegradable polymers center on altering the biotic and abiotic stages of the process. Abiotic phase methods typically include changing the characteristics of the polymer either during the production phase or prior to introducing it to the degradation process during the post-consumption stage [21]. On the other hand, methods pertaining to the biotic side mostly involve altering the environment; nonetheless, recent findings indicate that biotic techniques might also alter the settings during the processing stage [22].

Types of Biodegradable Polymers Used

The homogeneous dispersion of a drug, which may or may not be incorporated in the hydrophobic coat formed of bio-erodible polymers and is impermeable to the drug, makes up the bio-erodible inserts [23]. Ortho esters and orthocarbonates are two examples of bio-erodible compounds that have been employed successfully [24]. The foundation of biodegradable systems is made up of Polyglycolic acid (PGA), Poly (lactic-co-glycolic-acid) (PLGA), Polycaprolactone (PCL), and Polylactic acid (PLA) (Figure 3) [25].

Ocular Implants

Biodegradable (bioresorbable) and non-biodegradable (biodurable) are the two categories into which ocular implants fall; the former is the more advantageous. The biodegradable polymer- based devices decompose into innocuous byproducts or polymers that are soluble in living things and may be extracted from the body without risk [26]. The fact that biodegradable products don't need to be thrown away when their useful lives are over is their main advantage (Figure 4). In particular for the treatment of retinal illnesses that can impair vision, such systems present a potential remedy to many of the drawbacks of traditional methods for administering Ophthalmic Medications [27].

Techniques for Making Biodegradable Implants Designed for Intraocular Use

For ocular illnesses, controlled methods of drug delivery are necessary to provide the best possible medicinal intervention [2]. Polymeric materials have been largely researched for application in ocular drug delivery systems during the past 20 years [28]. These materials are essential for the controlled release of pharmaceuticals. Polymeric drug delivery systems possess the capability to mitigate a medication's side effects while simultaneously boosting its bioavailability. Biodegradable polymer-based ocular medication delivery systems represent one of the most significant areas of current research [29]. They can be produced in the shape of membranes, discs, or rods.

For example: - prolonged dexamethasone acetate (DA) release- Two of the methods used were – hot molding and compression [30]

Comparison and contradistinction of compression and hot molding methods

The hot molding process is used to first plasticize the polymeric cake before shaping it into rods. This approach reduces surface fractures because, as a variant with compression, the heat produces a chain coordination that increases the degree of crystallinity in the implants [31]. The matrices' pores and channels might encourage the compressed implants to absorb more water, which would quicken the degrading process. Nevertheless, the ultimate mechanical properties of the implant may deteriorate since the chain orientation does not happen whenever a polymeric cake compressed in a solid state [32]. According to a study by Sîlvia Ligório Fialho *et al*., a study of implants created with the same polymer type but prepared using various methods revealed that the compression systems enabled a faster dispersion of DA than the moulded ones. This outcome has been explained by the compressed devices' increased capacity to absorb water due to their larger pore count and channels observed in scanning electron microscopy (SEM) images. As DA exits the polymeric matrix and travels through the passages to the incubated setting, it increases the release of the drug [33]. Drugs that are crystalline, like DA, have the ability to change into an amorphous form while in the lyophilization process [29]. An exothermic transition, which is the result of drug recrystallization, can be facilitated by heating during differential scanning calorimetry analysis.

Biodegradable Implants

A method to maintain eye health is to utilize biodegradable devices made of polymers that can break down into harmless byproducts or that can be safely removed from the human body in vivo. Due to legal limitations, complexities, and the expensive nature of polymers with appropriate mechanical and degradation kinetics, designing implants that degrade is a challenging task. The alteration of abiotic and biotic phase could accelerate the biodegradation of polymers [10, 22].

Benefits of biodegradable over non-biodegradable

As biodegradable implants break down naturally, they don't require surgery, which is the main advantage over non-biodegradable implants.

- They are easily tolerated [34]
- PLA and/or PLGA polymers has acceptable biocompatibility [35]
- Compared to other tissues, polymers inserted in the vitreous cavity would lead to less inflammation [36]
- Pharmaceutical eyedrops administered topically have significant medication waste and are not effective for longer than a couple of hours. Therefore, biodegradable implants can be used to achieve patient compliance for chronic illnesses [37]
- Prolonged period of action/sustained release of action

- Increased bioavailability [38]

When it comes to addressing low medication bioavailability, drug variation, and patient compliance, sustained drug delivery provides the greatest solution [39].

Limitations

The main adverse circumstance of release systems that use biodegradable polymers encompass the supposedly last stage of the implant, which occurs when the polymeric material's hydrolysis attain a threshold and could result in the residual drug concentration releasing uncontrollably [40]. Furthermore, the movement of biodegradable implants in front of the retina or inside the anterior region of the eye may cause vision distortion. Polymers with varying molecular weights are mixed to create a more consistent delivering factor, hence reducing the negative consequences of this final phase [10, 41]. A further difficulty is obtaining serial drug concentration measurements in a live eye, as it is unethical to perform intrusive serial probe samples in human eyes [42].

Biodegradable Polymers PCL

Hexanoate repeat units are the basis of PCL, a semicrystalline polyester that is hydrophobic by nature and extremely soluble in organic solvents such as benzene, toluene, and chloroform. characteristic allows for regulated and prolonged medication release times [43]. For the purpose of delivering proteins into the back of the eye over an extended period of time, hybrid PCL thin-film devices were created by combining microporous as well as nonporous PCL and sealing the films together with heat [10, 44].

USES PCL copolymers are employed as drug carriers and to treat ophthalmic disorders. For instance, in an experiment, the glycolide-co-lactide-co-caprolactone copolymer (PGLC) device containing cyclosporine A was employed to cure chronic uveitis in the eyes of white rabbits [45].

PLA and PGA

Cornstarch and sugarcane are examples of renewable materials that are used to make PLA [46]. PLA polymers are thought to be compostable and biodegradable. An annual renewable resource can be used to manufacture polylactic acid, a polymer made from thermoplastic substances with outstanding strength and modulus [47, 48]. The potential for therapeutic usage of PGA is limited by its intrinsic characteristics, despite it being a biodegradable semicrystalline polymer. It also poorly solubilizes in typical polymer solvents and creates dangerous residues that may interact with the medication or the tissue. Furthermore, no solvent or melting method can be used to form them into films, rods, or capsules. On the other hand, its monomer can copolymerize with lactide to form the most extensively studied drug-delivery biomaterial to date [10].

USES: PLA has been utilized extensively in the management of eye conditions [10]. They have been used in the treatment of cytomegalovirus retinitis [49, 50].

PLGA

Lactic acid, also known as a-hydroxy propanoic acid, and glycolic acid, also known as hydroxy acetic acid, are synthesized to form Poly(lactide-co-glycolide). Poly(lactide-co-glycolide) breaks down to harmless compounds in vivo [51-53].

SYNTHESIS: The mixture of glycolic acid and lactic acid can be directly polycondensed to create poly(lactide-co-glycolide) [54]. However, the ring opening polymerization of lactide as well as glycolide is the most effective method for producing high molecular weight (MW) copolymers [55].

DEGRADATION: In vitro, poly(lactide-co-glycolide) breaks down by hydrolysing ester linkages. The end products of breakdown in vitro include glycolic and lactic acids [36]. It has been researched that the breakdown of poly(lactide-co-glycolide) occurs in two stages (Figure 5). Molecular weight decrease is the result of ester bond random hydrolytic cleavage that takes place during the first step. First-order kinetics appears to govern the chain

scission process. The start of mass loss through the polymer matrix and a rise in the pace of chain scission define the second stage.

The lactide: The three primary components that influence the pace at which PLGA copolymers break down are the lactide stereoisomeric constitution (i.e., the ratio of L-versus-DL-lactide), glycolide ratio, and molecular weight.

USES: Making polylactic acid (PLGA) into a range of shapes, such as vascular grafts and surgical meshes, stents and framework for tissue regeneration, and pins, plates, screws, and rods for orthopaedic and dental surgery, is a somewhat easy process [53].
Some of the properties of biodegradable polymers Table 1

Mechanisms of Drug Release
Drug release typically happens in three stages
Burst Release (Figure 8) The implant surface releases the medication, resulting in a brief period of intense drug release [56, 57].

Chain Scission and Diffusion (Figure 7, 9) Water from the tear fluid starts to seep into the matrix when the insert is inserted into the eye. This causes swelling, which in turn causes polymer chain relaxation and drug diffusion [24]. By hydrolytic cleavage, randomised chain scission among polymers takes place, increasing the porosity as well as surface area needed for drug diffusion [58].

Mass Loss and Biological Degradation In addition to drug release, there is biodegradation occurring inside the polymer matrix, a last burst in certain delivery systems, and a mass loss starting in the implant's central core [59, 60].

Osmosis: The transverse impermeable elastic membrane that makes up the insert for the Osmosis mechanism divides its interior into two compartments, designated first and second. The first compartment is surrounded by an elastic membrane that is impermeable and semi-permeable, while the second compartment is surrounded by an elastic membrane that is impermeable [61].

Bioerosion: The drug is dispersed in a framework of bioerodible substance that makes up the insert in the bioerosion mechanism. Through matrix bioerosion, the insert and tear fluid come into contact and cause a controlled, prolonged release of the medication [24, 62].
Some examples of currently marketed products (Table 2)

Applications
Long-term suppression of intraocular pressure
Glaucoma is the second most prevalent root of blindness worldwide, according to data from the World Health Organisation (WHO). [SOURCE: WHO] Retinal ganglion cells are lost in glaucoma, a multifactorial visual degenerative neuropathy [63]. The following groups are more likely to develop glaucoma: individuals over 60, diabetics, steroid users, relatives of an individual with a prior diagnosis of the illness, hypertension, excessive myopia, central corneal thickness of fewer than five millimeters, and eye injuries. It is estimated that 111.8 million people worldwide will be affected by glaucoma in the year 2040 [64]. Timolol maleate (TM)-incorporated biodegradable subconjunctival film from a combination of multilayering and blending with PEG copolymers, provides a therapeutic dose of 2.5 mcg for 90 days invitro [39]. Biodegradable elastomer poly(lactide-co-caprolactone) (PLC) is used for TM preparation. It provides both localized and sustained action. The copolymers' flexibility and mechanical properties make it ideal for an implant that patients will accept [65]. It is also biocompatible

Treatment of Cytomegalovirus (CMV) retinitis- in vitro retinal drug delivery

Within months of implantation, PLA dissolves, allowing connective tissue to repair the wound through healing [66] naturally. There won't be any indications of retinal detachment, inflammation, or anomalies in the retinal tissue (Figure 12) [67]. However, because of the matrix porosity created during the breakdown process, the plug contains an invasion of multinucleated giant cells, neutrophils, and fibroblasts with little retinal toxicity [49, 68].

Anti-inflammatory action

In a study performed by Okabe *et. al*, the characteristics of in vitro release of betamethasone phosphate exhibited a biphasic releasing pattern, consisting of an initial burst and another stage that was obtained from diffusional release [69, 70]. The drug's quick release, which was deposited in the matrix's water channels and on the implant's surface, might have caused the first burst [71, 72]. Slow drug release was seen during the second release phase, which may have been influenced by the polymer's rate of breakdown [73, 74]. Hydrolysis converts betamethasone phosphate into betamethasone [75]. These variables could be the cause of the discrepancy between drug concentrations in tissue and what is released from the implant (Figure 13) [76].

Post-operative cataract

In a study performed by Chennamaneni et. al., after up to six weeks, there was a bidirectional flow of dexamethasone from the endocapsular region, with notable amounts observed in the anterior as well as posterior chambers. In contrast, topical drops had a higher systemic exposure but limited exposure in all ocular regions [77]. All research groups had normal intraocular pressure, and slit-lamp biomicroscopy tests showed that both anterior as well as posterior chambers with implants did not produce any cells or fibrin, but the topical drop group did. Upon histological evaluation, all groups showed normal tissues and an absence of inflammation. The device did not hinder the visual axis or move to the middle of the eye (Figure 14) [78].

Treatment of diabetic macular edema

A typical microvascular consequence of diabetes called diabetic macular edema (DME) is defined by a breach within the blood-retinal barrier (BRB) (Figure 15). This causes microaneurysms and perifoveal aberrant capillary capillaries to leak intracellularly and extracellularly, thickening the retina in the process [79]. Center-involving DME is a primary cause of vision loss in people with diabetes and one of the main causes of substantial visual loss in the working-age population [80. 81]. A biodegradable as well as bioerodible implant with 0.7 milligrams of dexamethasone is called Ozurdex. Since triamcinolone acetonide is a more powerful glucocorticoid receptor agonist than dexamethasone, slow-release delivery techniques are necessary. To ensure a wound that seals itself, it is injected intravitally, deploying a 22-gauge applicator and a shelved injection technique. The solid polymer delivery system utilized in the implant is made up of poly-D, and L-lactide-co-glycolide as its polymer matrix. The prolonged distribution of dexamethasone over six months is made possible by the slow breakdown of this matrix into lactic and glycolic acids [82].

For orbital wall fracture reconstruction

Jang *et al*. and Kim *et al*. evaluated the precision of postoperative implantation between unsintered hydroxyapatite particles and poly-L-lactic acid (uHA/PLLA and PCL) meshes in ocular fracture repair [83]. After six months, they noticed no ocular movement restriction in the patients. Nevertheless, there were no notable variations in the surgical results, such as enophthalmos and diplopia, nor were there any problems with the two well-liked implants [84].

Future Impendings

The Food and Drug Administration (FDA) states that it is acknowledged that proving bio equivalency particularly for non-solution dosage forms can be difficult, particularly for locally acting ophthalmic medicines [85]. When creating a pharmaceutical bioequivalent implant, it's critical to understand how the physicochemical characteristics of ocular implants relate to their bioavailability [86]. To get beyond various ocular barriers, the best possible delivery system should be created with better medication bioavailability and dose-controlled release of the drug at the precise location of action. Future applications of long-acting ocular drug delivery technologies advances include

preventative treatment at an earlier stage of disease and economical treatment of ocular disorders in global health settings, as well as restricted therapeutic options for some conditions. The ongoing technological developments in the field of ocular implants, such as improved biocompatibility, safety, and product design, are also driving the market's expansion [90]. Though there are a number of positive aspects, the growth of the Ocular Implants market is expected to be hampered by a few critical factors, including low diagnosis rates, a shortage of skilled workers, and side effects from glaucoma and cataract surgeries that can cause long-term vision impairments.

Recent Approval of Biodegradable Implant

In order to treat ocular hypertension and open-angle glaucoma, the US Food and Drug Administration recently approved Durysta, an implant that contains bimatoprost. It offered a prolonged duration of release. It offers timolol (BD–twice daily) an alternate course of treatment. The intraocular pressure has progressively dropped. [SOURCE: MEDSCAPE]

CONCLUSION

A lot of promise exists for treating ocular illnesses with medication delivery technologies based on biodegradable polymers. In particular, these devices present a viable remedy for numerous drawbacks of traditional ocular medication delivery techniques, particularly in the management of visually impaired retinal disorders. Numerous ocular drug delivery methods have been studied, such as controlled drug release, drug targeting, and drug penetration augmentation. For controlled-release systems, biodegradable polymers have been frequently employed as the drug carrier. When biodegradable polymers break down and eventually become absorbed by the body, the medication is released from them. Numerous ocular medication delivery systems that employ various biodegradable polymer types have been investigated. When it comes to biodegradable drug delivery methods, some polymers are well-researched and have a good ocular safety profile, while others are still in the experimental stage of development. When new vehicles are developed that are designed for regulated and sustained drug administration to treat disorders that threaten vision, biodegradable polymers have the possibility to completely alter the way that drugs are delivered to the eyes. To improve the safety and effectiveness of biodegradable ocular formulations, assure quality control and safety, and comprehend the underlying mechanisms of action of these kinds of systems and research on the effectiveness and safety of these delivery methods in various eye conditions is now underway in clinical trials.

ACKNOWLEDGEMENT

ABSTRACT

Psoriasis is a common, chronic and non-infectious skin disease characterized by well-defined slightly raised, dry erythematous macules with silvery scales and typical extensor distribution. The recent lifestyle changes are responsible for the most obstinate, mixed miasmatic skin diseases of the present day. Psoriasis is a chronic painful non contagious condition. It is seen at any age and both the sexes. It involves the skin and nails, and is accompanying with other comorbidities. Skin eruptions are localized or generalized, mostly symmetrical, sharply demarcated, red papules and plaques, and usually covered with white or silver scales. Lesions cause itching, stinging and pain. The dry flakes of skin scales result from the excessively rapid proliferation of skin cells. According to WHO Psoriasis is estimated to affect 2-4% of the population of the western world[3]. Disease according to homeopathy may be psychological, inherited, miasmatic or multifactorial and multifaceted. The miasm is responsible for chronic disease in the body. Psora leads to the inflammation, sycotic leads to the proliferation and syphilitic miasm leads to the destruction in the body[1]. Evaluate the Miasmatic role in treatment of Psoriasis. A 37 years old female, came with complaints of severe itching on dorsal surface of hands with scaling bilaterally, since 1.5 years. The itching was followed by burning and bleeding. For this she had taken many allopathic medicines which had not given any relief. The treatment was started with *constitutional remedy* which gave relief temporarily. After the miasmatic evaluation of case *Anti miasmatic* medicine was given which gave rapid improvement. This study shows significant role of miasm in treatment of psoriasis.

Keywords: Psoriasis, Homoeopathy, Constitutional Remedy, Miasm

INTRODUCTION

The current lifestyle changes may land up into the most obstinate, mixed miasmatic skin diseases of the present day. Psoriasis is a non-contagious chronic condition. It is seen at any age and both the sexes. It involves the skin and nails, and is accompanying with other comorbidities. This skin eruptions are mostly symmetrical, sharply demarcated, red papules and plaques. They generally covered with white or silver scales. Lesions cause itching, stinging and pain. The dry scales result from the excessively quick proliferation of skin cells. According to WHO Psoriasis is estimated to affect 2-4% of the population of the western world. Disease according to homeopathy may be psychological, inherited, miasmatic or multifactorial and multifaceted. The miasm is responsible for chronic disease in the body. Psora leads to the inflammation, sycotic leads to the proliferation and syphilitic miasm leads to the destruction in the body[1].

Objective
To evaluate the Miasmatic role in treatment of Psoriasis

Case History
A 37 years old female, came with complaints of severe itching on dorsal surface of hands with scaling bilaterally, since 1.5 years. The itching was followed by burning and bleeding. For this, she had taken many allopathic medicines which had not given any relief.
Occupation: House maid
P/H: Malaria before 7 years
Obs and gynae History:
Menarche: 13years
Complaints related to Menarche, if any: no
Last Menstrual Period: 12/6/2024
Details of Menstrual cycle: regular, partial clotted and liquid, sometime mild lower abdominal pain
OBG: G5P3L3A2
History of abortion is there, having two daughters healthy, and one son after 2 abortions. Very precious child for her,
Miasm:
Dominant miasm: syco syphilitic
Fundamental miasm: syphilitic

Miasmatic analysis(Table: 1)

General Examination(Table: 2)

TOS
Unbearable itching,
Itching < at night
Eruptions on dorsal surface of hands bilaterally,
Itching till bleeding

RESULT

The treatment was started with constitutional remedy which gave relief temporarily. After the miasmatic evaluation of case Anti miasmatic medicine was given which improvement.(Fig: 1)

Prescription(Table:3)
Pasi Score (Table: 4)

Evidence of case
(Fig.2), (Fig.3), (Fig.4), (Fig.5), (Fig.6)
The treatment was started with constitutional remedy which gave relief temporarily. After the miasmatic evaluation of case Anti miasmatic medicine was given as this case was trimiasmatic representation so I have to select that medicine which cover all three miasm and which gave rapid improvement. Here sulphur act as ant miasmatic remedy. This sulphur is one of the deep acting polycrest remedies in homoeopathy.

CONCLUSION AND DISCUSSION

According to Dr. Hahnemann diseases are dynamic in origin and these dynamic diseases are classified in to acute and chronic[3]. Chronic diseases are due to chronic miasms. These miasms are inherited in our body, when these chronic diseases are treated with Antimiasmatic remedies it acts on the vital force and improves the immunity of the patient[2].Whenever obstacle occur in cure we have to think on miasmatic side in chronic cases. Inner miasm may have major impact on disease and because of it this disease persists.In base of pathology we can say inflammation represent psora, proliferation depict sycotic miasm whereas destruction depict syphilitic miasm. People having psoriasis are frequently defamed and excluded from normal social group. They commonly experience the loneliness, isolation and feelings of being ugly. This may impact them mentally and physically.[4] Here, on miasmatic relation the patient in this instance is more susceptible to syco-syphilitic miasm, which can cause skin damage. This Antimiasmatic treatment treats the patient holistically and produces superior outcomes. PASI score is 0 after the treatment before treatment it was 6.We can conclude that Homoeopathy is effective in reducing the severity of case and it improves the quality of life.

Conflict of Interest

The author declares no conflict of interest.

FUNDING

This research study did not receive any specific funding but was performed as part of the research work.

ACKNOWLEDGMENT

The author wishes to acknowledge the guide Dr. K. B. Shah for his constant support. And also wants to thank all subjects for participating in the study, our beloved Dean and principal of JNHMC Dr. Poorav Desai, Dr. Bibhu prasad Panda, principal of PIHR, Dr. Vijay Patel, principal of JJHMC for permitting work in college premises also thanks to Parul University for this research work.

ABSTRACT

Sentiment Analysis (SA) is the analysis or computable derivation of sentiment and opinions held by individuals or groups. Sentiment analysis helps to determine positive, negative and neutral sentiments. Thereby, it helps to understand public opinion or emotional tone. The previous works on sentimental analysis from 2019 to 2024 are surveyed in this paper. This survey utilizes the multi-modals for sentimental analysis in Tamil and Malayalam. For this paper, 31 journal articles are examined for sentimental analysis in Tamil and Malayalam. It aids in the integral of underutilized modalities such as gesture or cultural expression into SA for Tamil and Malayalam in future and works with larger annotated datasets for Tamil and Malayalam sentiment analysis. This paper analyzes the accurate SA in Tamil and Malayalam, based on the findings. Earlier researches use two most used approaches, that are Convolutional Neural Networks (CNNs) and Recurrent Neural Networks (RNNs). This survey assesses sentiments such as positive, negative and neutral in Tamil and Malayalam. These sentiments are analyzed with culturally specific expressions including idioms and nuances showing its regional and linguistic characteristics. It includes local context bound unique emotion categories like reverence, community pride and sorrow in poetry and traditional media. This paper concludes with the future research for multimodal sentimental analysis in Tamil and Malayalam.

Keywords: Malayalam**,** Negative, Neutral Sentiment, Positive, Sentiment analysis, Tamil

INTRODUCTION

Sentiment Analysis (SA) refers to the method of categorizing regards defined within a piece of text data as favorable, adverse, and optionally moderate. It is a valuable tool in numerous domains, including Social Media (SM) monitoring and consumer opinion evaluation used in research on markets. Traditionally, the sentiment analysis is applicable to text. Although it is no longer really cutting edge, multi modal sentiment analysis, integrating text, audio and images has greatly increased the precision and granularity of sentiment interpretation. Depending on the combination of these modalities, researchers and practitioners pick up a broader palette of emotional expressions, where language is not offered enough contexts. The languages such as Tamil and Malayalam both spoken in Tamil Nadu and Kerala states respectively are filled with deep cultural and historical connotations and are specked with their own linguistic features. These languages are the big challenge for conducting sentiment analysis as each of them uses different idioms, expressions and has its own regions variations. Further, this also complicated the analysis of sentiment in Tamil and Malayalam since cultural and contextual factors are used to represent sentiments. For instance, if it is humor, sarcasm or quoting something using the regional slang, those things are not translated well and the standard sentiment analysis often misses those out. In recent years, the rise of Tamil and Malayalam content on social media in these non textual formats like memes, video and voice recordings is exponential. Sentiment analysis on these types of content is actually quite complex as they're combined with images, audio and video along with the written text. For example, video contains tone of voice and the visual elements in a meme give more emotional context to the meme than text alone. Therefore, multi-modal approach is needed for sentiment analysis of such mixed media content. Tamil and Malayalam sentiment analysis from multi-modal signals faces at least 3 challenges; the difficulty of inferring non verbal cues such as facial expressions or tone of voice. However, Deep Learning (DL), Natural Language Processing (NLP), and Computer Vision (CV) approaches enable sentiment identification. New methodologies are being explored by researchers on combining data from different modalities so that nuances in sentiment are detected when other methods fail to do so. Additionally, it presented an overview of the existing work on research for sentiment analysis for these regional languages, along with recommendations for future directions and improvements based on existing studies and methodologies. The flowchart depicted in figure 1 represents the reasons for the sentimental analysis in languages, especially Tamil and Malayalam. It includes the complexity, dialects, shuffling, idiomatic expressions, phonetic variation and cultural contents present in media. Thus, sentimental analysis is carried over the languages.

LITERATURE REVIEW

Sentiment analysis used multiple modalities or data modalities like text, audio and images to better understand sentiments. The problem of NLP in Tamil and Malayalam, which were two widely spoken languages in southern India, lies in their linguistic structures, cultural peculiarities and regional variations. Sentiment analysis across these modalities provided much finer grained and accurate sense of sentiment in an application like social media monitoring or for understanding customer comments. However, with rise of regional language content there was an increasing need for effective tools that were capable of capturing the subtleness of sentiment in such languages. Anierudh *et al*. (2024) utilized Machine Learning (ML) approaches for integrating multimodal data analysis for the Dravidian languages. Thus, Dravidian languages, mainly spoken in southern India presented a set of challenges because the languages were linguistically complex and typically had not provided the annotated data necessary for computational processing. This existed huge amount of multimodal data (text, images, videos) generated by social media platforms that required sophisticated analytical approaches to infer context, sentiment among other useful user behavior. This research augmented progress in ML in order to tackle these challenges and it contributed to the area of language technology for underrepresented languages. Table 1 compares the various author works that are relevant to the multi-modal sentimental analysis. The critical problem of building NLP solutions for low resource languages that lacked annotated data and linguistic resources was prevalent as addressed by Antony (2020). The focus of this research was to discover language agnostic features in order to build NLP models that were robust to

diverse linguistic systems. This study aimed to overcome resource constrains by utilizing multilingual datasets and Transfer Learning (TL) techniques. Thus, field of NLP was pushed for lesser studied languages.

In addition to foundational for making language technologies accessible and effective for underrepresented linguistic communities, this work raised core questions about the human language data, included the design of appropriate models to learn. Banavatu and Parthasarathy (2024) presented an adaptive DL framework to recognize handwritten characters from South Indian languages that tend to have intricate scripts and unique structural patterns. Character recognition of handwritten characters in these languages was complicated by high variability in writing styles and complex alphabets. Advanced adaptive DL techniques were utilized in this study to overcome these challenges when improving accuracy and efficiency. The results of this research enabled to digitize regional scripts. Further, computational linguistics were progressed for South Indian languages. Table 2 contrasted various works of multi modal sentimental analysis from 2019 to 2024. Bhaskar and Madathil (2022) overviewed audio-visual speech recognition (AVSR) technologies that were developed. Traditional speech recognition systems failed in noisy environment, needing to compartmentalize visual cues such as lip movements and facial expressions. First, this study addressed the problem of AVSR and second, it identified the challenges in developing robust multimodal AVSR systems. This work of Chakravarthi *et al*. (2022) highlighted the linguistic and contextual difficulties in recognizing prejudiced language, especially in under resourced languages. This research was built on the progress in NLP for creating tools to detect and counter harmful content. This research helped to create a more inclusive and diverse web. Hence, safer online environments were enabled. Comparison of the works relevant to sentimental analysis is carried out in table 3. In Chakravarthi *et al*. (2024), a shared multi-task classification task aimed to detect misogyny and trolling in online memes while solving challenges in that detection. As content that combined image and text, memes presented specific challenges for understanding the acceptance of harmful implicit and explicit messages. This study proposed the importance of solving such toxic online behavior using advanced ML techniques. This research built robust content moderation tools by promoting equality and inclusivity in digital communication. Dar and Delhibabu (2024) investigated audio emotion detection by integration technique of CNN, LSTM and RNN. While exploring the complexities of the Kashmiri language, this work aimed to understand specific speech patterns and what impact they had on the model's performance. The detection of emotion from audio data was extremely necessary for applications such as sentiment analysis and human computer interaction. This research increased the understanding in computational methods for taking care of neighborhood and low asset language.

Existing Methodologies

Multilingual - Bidirectional Encoder Representation in Transformers

Multilingual BERT creates deep bidirectional representations by jointly conditioning on bi-directional contexts in every layer by pre-training on unlabeled texts. A simple classifier for emotional analysis was constructed by simply adding one extra result layer in previous-instruct BERT model. It typically grasp in two training goals, such as, Masked Language Modeling (MLM): With some of the input tokens made at random, the model will predict which one should be placed in that mask. This enables the method to operate in both end phase settings. Next sentence prediction (NSP): The intension is to previous-trained text pair representations for subsequent question responding where; the task is to determine if two phrases appear afterwards. This model in multilingual version works on 104 languages. As a first token for all sequences, there is a special classification token (CLS). Lastly, these two tasks such as aggregation sequence and classification are done on the last hidden layer for this token (Kapil, P., *et al*. (2023)). The flow chart in figure 2 describes the Multi-lingual BERT model. Here, the model works by loading, feeding input, preprocessing it, which is further fed into the model and trained with the labeled sentimental data for the repetition of this process. Finally, if the results are satisfactory, the process is ended.

Modern models for Sentiment Analysis

In research community, sentiment analysis is an area which is already well studied. The major aim of this is to find out the sentiment or the opinion of language. The models classify each of sentiments through positives, negatives or neutral feelings. In the earlier times, sentiment analysis is performed using lexicon based methods in which the sentiment polarity of words is assigned using predefined sentiment lexicons or dictionaries. Some of the modern

models used for sentiment analysis are RNNs, CNNs and LSTM networks, made possible with the advance of DL techniques. So far, these models have the ability to demonstrate good patterns of sentiment contained with text. Also, transformer based language models such as BERT is currently popularly used in many tasks, and sentiment analysis is among them due to the good performance and effectiveness of BERT. Sentiment analysis has also used other modalities like images, audio and video. It has resulted in this extension becoming a multimodal sentiment analysis algorithm, which aims to analyze the sentiment across multiple modalities to understand the sentiment of different languages. More comprehensive sentiment analysis is done by capitalizing on multiple modalities (Das, M., *et al*. (2023))

Monolingual Models

For these experiments, six monolingual models are used: the one task fine tuned model, along with five general models. DistilBERT and HindiBERT are trained in Hindi only, BanglaBERT roBERTa is instruct on Bangla and DistilBERT and BERT are trained in English only. Last but not least, the English task is used to fine tune emoBERTa model Bilingual models, BanglishBERT and HingBERT, are adopted for bilingual models which are instruct on both Bangla-English and Hindi-English. In additional, emoBERTa is the fine tuned English task model used. Bilingual models like BanglishBERT is used for Bangla and HingBERT for Hindi, as the models are trained on Bangla-English and Hindi-English respectively. Later, multilingual models, mBERT and XLM-R pre-trained on 104 and 100 languages are utilized. It also includes Bangla, English and Hindi among those. This work describes IndicBERT which is used for 12 Indic languages and 17 languages for Bangla-English and Hindi respectively. Raihan, N., *et al*. (2024)

Training and Testing in Cross-Lingual

The main contribution to the cross lingual approach is to train the few shot model so that it generalizes over different languages. In training, the model is given data from all languages and learns about speech by capturing the nuances in which various context and language carry through the advantage of pre trained representations. Method is trained in a cross lingual way which allows it to learn the recognized sentiments in Indian languages, which is necessary for powerful production in minimum way outline where data is limited for individual languages. The model is made better able to generalize and detect sentiments such as positive, negative or neutral even without specific language data. In the testing phase, the model performance is tested in individual languages and tests the model ability to adapt and classify audio samples in language-specific setting regardless of model training with a diverse set of languages. This setup presents a scenario similar to the one seen in practice, where a model trained on data across multiple languages is able to rapidly adapt and perform well on new languages with limited labeled data. This approach is effective, and the model is able to perform well across the number of shot settings. Sankaran, A. N., *et al*. (2024)

Deep Learning Models

Data is transformed using word2vec and GloVe embeddings models. Once transformed, the layers of data are fed into applied ML models for classification. Data is used to apply the DL model. According to this work, the sentiments in corresponding pre trained word vectors and equate the word to vector. To convert Word2vec model into the vector of length 300 for instance, make it into vector of length 200 for GloVe model. One embedding layer, one LSTM layer and one dense layer are the part of DL model. Input dimension of embedding layer is the number of particular words found in corpus. Data is taken and processed via LSTM layer, propagated forward, passes information. It too is connected deep for implementing action, but get their input from the neurons of earlier layer. In this fully connected DL model which is classifying data into part of list like negative, neutral, activation layer is the sum of weighted input changed into output. Priyadarshini, I., Sahu, S., and Kumar, R. (2023).

Bilingual Translation Pairs

The translated corpus is obtained using the bitext mining system in exact way as it is used for getting the translations. Text corpora from 16 Indian languages are used for training of a multilingual language model for Indian languages. Training objectives are MLM and Translated Language Models (TLM) in special cases. The latter trains the model

using pairs of translated and transliterated documents and the former one works only on monolingual text, batch size of global batch is 4096, maximum sequence length is 512 and model is trained for 1M steps. Adam optimizer is used with learning rate set to 5e 4 and we have 236M learned parameters in total. As a multilingual model, IndicBERT is developed on extensive corpora consisting of 12 important Indian languages, using ALBERT model. Both Multilingual-BERT and Cross Lingual Roberta (XLM-R) are significantly larger and yet achieve equally high state of art performance in classification task. Based on take advantages of the benefit of relatedness in Indian languages, the model basically learns joint training of all the input languages in the fashion of a single shared model. Kapil, P., *et al*. (2023)

DISCUSSION

The use of DL models and multilingual techniques in field of sentiment analysis has been discussed in this paper. This work shows the transformation from conventional lexicon based sentiment analysis approaches to the current RNNs, CNNs and LSTMs. Thus, these models have been capable of reproducing complex patterns and relationships of textual data and achieved significant performance improvements for the task of sentiment detection. Furthermore, this paper shows the importance of transformer based model like BERT which beat previous methods in many sentiment analysis task. This research also includes multilingual and cross lingual angle, especially for the Indian languages like Bangla, Hindi and English. Indian languages with already trained multilingual methods such as mBERT, XLM R, IndicBERT tuned for sentiment analysis tasks are presented. Utilizing these models is useful for dealing with the challenges like low resource data scenarios and improving sentiment detection as well across the diverse linguistic and cultural landscapes. Furthermore, this paper surveys about the pre trained word embeddings like Word2Vec or GloVe and convert each word to a vector representation. Therefore, those word embeddings are input into a DL model such as LSTM network to classify sentiment within classes such as positive, negative and neutral. Deep Learning architectures examined here admits high accuracy for the model to effectively model sentimental analysis in data. Lastly, Bilingual Translation Pairs are presented to train multiple languages for multilingual sentiment analysis and explain the shared training of adjacent languages for improve efficiency and accuracy. This overall framework integrates the benefits of DL, multilingual models and transfer learning to become a valuable sentiment analysis framework spanning across multiple languages, even when the language is of lower resources. Such a multi faceted approach has tremendous potential for research in future on the area of NLP for the applications such as sentiment analysis with relevance to the Indian context.

CONCLUSION

This survey has examined 31 journal articles, which are relevant to the multimodal sentimental analysis in Tamil and Malayalam. The surveyed papers are taken between the year duration of 2019 and 2024. After the study of various previous works, the sentimental analysis such as positive, negative or neutral is recognized. Among those sentiments, neutral and negative are majorly assessed. The exploitation of existing methodologies has significantly analyzed the sentiments. This survey provides a way using which it is possible to point out the challenges, techniques and resources for multi modal SA in Tamil and Malayalam. In addition, the present survey examines the effectiveness of combining text, speech and visual data for sentiment detection in these languages. This paves the way for future research to build more robust multi-modal models, with the capacity to incorporate regional linguistic nuances and various data sources, to perform sentiment analysis on Tamil and Malayalam.

ABSTRACT

Biological reactions in anthropology are multifaceted study. These reactions are analysed through Enzyme kinetics using Mathematical modelling, which help predicting enzyme behaviour in living organisms. Enzyme inhibitors are compounds that modify the catalytic properties of the enzyme and, therefore, slow down the reaction rate, or even stop the catalysis. Such inhibitors work by blocking or distorting the active site. In particular, Un-competitive inhibitors impair reaction progress by binding to the enzyme-substrate complex. At any given time, the Un-competitive inhibitor can bound to the complex generated by enzyme -substrate reversibly other than the active site. That is, the inhibitor and substrate both combines to the enzyme at different sites. In order to cope with the exact theatrical solution for the enzymatic reaction having analytical solutions till date. The perseverance of this work is to derive the numerical solution of the system of mathematical model of enzyme reaction in the influence of Un-competitive inhibitor with convergence criteria along with the stability analysis. The use of the Next Generation Matrix method and calculation of the reproduction number for the stability of our model is proceeded by the existence of possible equilibrium points with their restrictions, followed by sensitive analysis. We derive asymptotically stable solutions to the model with numerical simulation.

Keywords: Kinesiology of Un-Competitive inhibitor on Enzymes; System of Non-linear equations for reaction; Next Generation Matrix Technique (R_0); Stability Analysis; Asymptotic Behaviour; Sensitive Analysis.

INTRODUCTION

Biological reactions in anthropology are multifaceted study. To fully understand such intricate reactions, one must explore beyond the confines of chemical and biological tools and look towards mathematical modelling and model reduction techniques to provide a vast array of analysis tools for such models. Majority of physiological reactions are analysed through Enzyme kinetics using Mathematical modelling, which help predicting enzyme behaviour in living organisms. The Protein molecules Enzyme increase the rate of chemical reactions or chemical process in human body. These BIOCATALYSTS act upon molecules called Substrates to generate products rapidly, deprived of being absorbed during the procedure. Enzymes are precise by their kinetic performance of binding with the substrate for product formation, which is much more enticing. These enzymes bind with Enzyme Activators or Enzyme Inhibitors and bestow or deprive the working speed of reactions respectively. Enzyme inhibitors have several categories among which one is reversible inhibition which again has three types as competitive, Non-Competitive and Un- competitive inhibition. We can cure number of pathological conditions by using enzyme inhibitors. Sometimes receptor blocking is not getting net effect what we want, at that stage we can inhibit target enzyme which give proper and perfect result[1,2]. Binding of Uncompetitive inhibitors are restricted to enzyme-substrate complex and hence it cannot bind to free enzyme. Their working mechanism is through structural distortion of the active site, followed by the binding of inhibitor to the enzyme-substrate complex. Binding of the inhibitor does not prevent substrate binding, but may inactivate the enzyme so that no products are formed[3]. The enzyme inhibitor is judged by its specificity and potency and their high value ensure its less side effect and toxicity. Concentration of enzyme inhibitors increased; activity of inhibitors decreased. Enzyme inhibitors are not only used for human being but also used for other purposed like control pests in farm as a 'pesticides'[4,5]. They impair enzymes catalytic activity through steric hindrance, aggregation, and/or conformational alterations. Their mechanism of action varies depending on the enzyme and, in most cases, leads to the neutralization of enzyme activity[6]. Enzyme inhibitors have been demonstrated to have a significant impact in many biological and beneficial fields, such as fertility control,[7] neurological disorders,[8] skin diseases,[9] or lysosomal storage diseases, [10,11]to name a few. Several mathematical works have explored models of biochemistry using differential equation systems. Biochemical reaction networks, such as model reductions, Quasi-equilibrium manifold approximations, total-quasi-steady-state approximations, model reductions in chemical dynamics, slow invariant manifolds, singular perturbations, thermodynamic estimates, reaction graph analysis by smearing mathematical modelling techniques have been applied to enzyme inhibitors with slow and fast subsystems[12]. Also a theoretical study of a mathematical model of the amperometric biosensors in uncompetitive inhibition developed analytical solutions to the mathematical model[13]. In order to cope with the exact theatrical solution for the enzymatic reaction having analytical solutions till date. The perseverance of this work is to Formulate the normalized model as a system of nonlinear differential equations and derive the numerical solution of the system of mathematical model of enzyme reaction in the influence of Un-competitive inhibitor to attain convergence criteria along with the stability analysis. The use of the Next Generation Matrix method to compute threshold value and calculation of the reproduction number for the stability of our model is proceeded by the existence of possible equilibrium points with their restrictions, followed by sensitive analysis using all possible parametric values. We derive asymptotically stable solutions to the model with numerical simulation.

METHODOLOGY

The mathematical formulation of the enzyme kinematics problem with Un-competitive inhibitors in biochemical systems has been modeled using ordinary differential equations. The enzyme binds with substrate to form an enzyme-substrate complex. This complex either binds with Uncompetitive inhibitor at a site different from the substrate active site to generates Enzyme – substrate - Inhibitor complex or the complex enzyme substrate releases the product and free enzyme. The free enzyme is then available for another reaction to produce a new reactant. Here the system is written as

The fundamental enzymatic reaction for Un-competitive inhibitor

$$e + s \underset{r_2}{\overset{r_1}{\rightleftharpoons}} es \xrightarrow[r_3]{} e + p\,, \qquad es + i \underset{r_5}{\overset{r_4}{\rightleftharpoons}} esi \tag{1}$$

Where$i$ is the inhibitor, es, and esi are complex intermediate components. The model has five parameters$r_1, r_2, r_3, r_4,$ and r_5. Model variables are $s = [s], e = [e], c_1 = [es], c_2 = [esi]$and $p = [p]$in their normalized concentrations to be 1 mg.

This mechanism illustrates the binding of substrate s and the release of product p in the presence of an Un-competitive inhibitor"i". "e" is the free enzyme, "c_1" is the enzyme-substrate complex and "c_2" is the enzyme-substrate-inhibitor complex. $r_1, r_2, r_3, r_4\ and\ r_5$ denote the measure of the rate of reaction of all processes. Note that substrate binding and inhibitor binding are reversible but product release is not. This chemical reaction, can be converted to a mathematical model using the law of mass action and favorable analysis, the system of following non-linear reaction equations as follows:[14]

$$\frac{ds}{dt} = -r_1 es + r_2 c_1 \tag{2a}$$

$$\frac{de}{dt} = -r_1 es + r_2 c_1 + r_3 c_1 \tag{2b}$$

$$\frac{di}{dt} = -r_4 c_1 i + r_5 c_2 \tag{2c}$$

$$\frac{dc_1}{dt} = r_1 es - r_2 c_1 - r_3 c_1 - r_4 c_1 i + r_5 c_2 \tag{2d}$$

$$\frac{dp}{dt} = r_3 c_1 \tag{2e}$$

$$\frac{dc_2}{dt} = r_4 c_1 i - r_5 c_2 \tag{2f}$$

Where $r_1$is the measure of the forward rate of complex formationc_1, r_2 is the measure of the backward rate constant, r_3 is the rate of product formation and enzyme release,$r_4$is the measure of the forward rate of complex formationc_2, r_5 is the measure of the backward rate constantand $c_1, c_2$are the complex intermediate components.

Consider the normalized initial conditions for substrate s, enzyme e, complex c, and product p as follows

$$s(0) = s_0, e(0) = e_0,\ i(0) = i_0,\ c_1(0) = c_2(0) = p(0) = 0. \tag{3}$$

Where, equation (2e) is directly integrable, and equations (2c, 2f) are reciprocal of each other.

So, adding equations (2c) and (2f),

$$\frac{di}{dt} + \frac{dc_2}{dt} = 0 \tag{4}$$

Also, the initial conditions in equation (3) states that,

$$e(t) + c_1(t) + c_2(t) = e_0,\ c_2(t) + i(t) = i_0 \text{and} c_1(t) + s(t) + p(t) + c_2(t) = s_0 \tag{5}$$

hence, the system of ordinary differential equations reduces, for s, i and $c_1$as

$$\frac{ds}{dt} = -r_1 s(e_0 - i_0 + i - c_1) + r_2 c_1 \quad (6a)$$

$$\frac{di}{dt} = -r_4 c_1 i + r_5(i_0 - i) \quad (6b)$$

$$\frac{dc_1}{dt} = r_1 s(e_0 - i_0 + i - c_1) - (r_2 + r_3)c_1 \quad (6c)$$

Where substrate s, i and complex c_1 has normalized initial conditions $s(0) = s_0, i(0) = i_0$ *and* $c_1(0) = 0$.

The stability of this System

Theorem: *A system of a differential equation is asymptotically stable if and only if its basic reproduction number* (R_0) *is less than 1.*

To determine basic reproduction number using Next Generation Matrix. $FV^{-1}$is next generation matrix, where F and V both are Jacobian of Σ and Λ evaluated for Enzyme, Substrate, Un-competitive inhibitor, productand both Complexes at an equilibrium point[15,16].

So, $\Sigma(X) = \begin{bmatrix} r_1 s(i_0 + c_1) \\ 0 \\ 0 \end{bmatrix}$ and $\Lambda(X) = \begin{bmatrix} -(r_1 s(e_0 + i) + r_2 c_1 \\ -(r_4 c_1 i) + r_5(i_0 - i) \\ r_1 s(e_0 - i_0 + i - c_1) - (r_2 + r_3)c_1 \end{bmatrix}$

Where, $X = (s, c)^t, \Sigma(X)$ denotes the entrance to the compartment and $\Lambda(X)$ denotes transferring to another compartment or leaving the system. Then the Jacobian at the equilibrium point is given by $F = \left[\frac{\partial \Sigma}{\partial X_i}\right]$ and $V = \left[\frac{\partial \Lambda}{\partial X_i}\right]$, *where* $i = 1,2,3$.

As a result,

$$F = \begin{bmatrix} r_1(i_0 + c_1) & 0 & r_1 s \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \text{ and}$$

$$V = \begin{bmatrix} -r_1(e_0 + i) & -r_1 s & r_2 \\ 0 & -r_4 c_1 - r_5 & -r_4 i \\ r_1(e_0 - i_0 + i - c_1) & r_1 s & -(r_1 s + r_2 + r_3) \end{bmatrix}$$

Theorem: *If the determinant of a matrix is non-zero then its inverse does exist.*

Accordingly for our model we have, $|V| =$

$$\{-(i_0 + c_1)r_1 r_2 r_5 - r_1(e_0 + i)(r_3 r_5 + s r_1 r_5 + c_1 r_3 r_4) - ({c_1}^2 + i_0 c_1) r_1 r_2 r_4 - (c_1 e_0 + i_0 i + 2c_1 i) s {r_1}^2 r_4\} \neq 0$$

Since determinant of V is non-zero: $V^{-1} = \begin{bmatrix} V_{11} & V_{12} & V_{13} \\ V_{21} & V_{22} & V_{23} \\ V_{31} & V_{32} & V_{33} \end{bmatrix}$

Where;

$$V_{11} = -\frac{r_5(r_2 + r_3) + c_1 r_4(r_2 + r_3) + s r_1(r_5 + c_1 r_4 + i r_4)}{r_1 r_2(i_0 + c_1)(r_5 + c_1 r_4) + (e_0 + i)(r_1 r_3 r_5 + s {r_1}^2 r_5 + c_1 r_1 r_3 r_4) + c_1 s {r_1}^2 r_4(e_0 + 2i) + i_0 i s {r_1}^2 r_4}$$

$$V_{12} = \frac{(r_1 s + r_3)s}{r_2(c_1 + i_0)(c_1 r_4 + r_5) + (e_0 + i)(r_3 r_5 + c_1 r_3 r_4 + s r_1 r_5) + (c_1 e_0 + i_0 i + 2c_1 i) s r_1 r_4}$$

$$V_{13} = -\frac{r_2(r_5+c_1r_4)+isr_1r_4}{r_1r_2(i_0+c_1)(r_5+c_1r_4)+(e_0+i)(r_1r_3r_5+sr_1{}^2r_5+c_1r_1r_3r_4)+c_1sr_1{}^2r_4(e_0+2i)+i_0isr_1{}^2r_4}$$

$$V_{21} = -\frac{ir_4(i_0+c_1-e_0-i)}{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)(r_3r_5+c_1r_3r_4+sr_1r_5)+(c_1e_0+i_0i+2c_1i)sr_1r_4}$$

$$V_{22} = -\frac{i_0r_2+c_1r_2+e_0r_3+ir_3+e_0sr_1+isr_1}{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)(r_3r_5+c_1r_3r_4+sr_1r_5)+(c_1e_0+i_0i+2c_1i)sr_1r_4}$$

$$V_{23} = \frac{ir_4(e_0+i)}{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)(r_3r_5+c_1r_3r_4+sr_1r_5)+(c_1e_0+i_0i+2c_1i)sr_1r_4}$$

$$V_{31} = \frac{(r_5+c_1r_4)(i_0-c_1-e_0-i)}{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)(r_3r_5+c_1r_3r_4+sr_1r_5)+(c_1e_0+i_0i+2c_1i)sr_1r_4}$$

$$V_{32} = -\frac{(i_0+c_1)sr_1}{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)(r_3r_5+c_1r_3r_4+sr_1r_5)+(c_1e_0+i_0i+2c_1i)sr_1r_4}$$

$$V_{33} = -\frac{(r_5+c_1r_4)(e_0+i)}{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)(r_3r_5+c_1r_3r_4+sr_1r_5)+(c_1e_0+i_0i+2c_1i)sr_1r_4}$$

As a result, $K = FV^{-1} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$

Where;

$$A_{11} = -\frac{c_1{}^2r_4(r_2+r_3)+(i_0+c_1)(r_2r_5+r_3r_5)+c_1i_0(r_2+r_3)+(e_0+i)sr_1r_5+(c_1e_0+i_0i+2c_1i)sr_1r_4}{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)(r_3r_5+c_1r_3r_4+sr_1r_5)+(c_1e_0+i_0i+2c_1i)sr_1r_4}$$

$$A_{12} = \frac{sr_1r_3(i_0+c_1)}{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)(r_3r_5+c_1r_3r_4+sr_1r_5)+(c_1e_0+i_0i+2c_1i)sr_1r_4}$$

$$A_{13} = -\frac{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)sr_1r_5+(c_1e_0+i_0i+2c_1i)sr_1r_4}{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)(r_3r_5+c_1r_3r_4+sr_1r_5)+(c_1e_0+i_0i+2c_1i)sr_1r_4}$$

The basic reproduction number is defined to be the spectral radius which is the magnitude of the largest eigenvalue of the matrix K.

So, $Spectral\ Radius\ \lambda =$

$$-\left\{\frac{c_1{}^2r_4(r_2+r_3)+(i_0+c_1)(r_2r_5+r_3r_5)+c_1i_0(r_2+r_3)+(e_0+i)sr_1r_5+(c_1e_0+i_0i+2c_1i)sr_1r_4}{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)(r_3r_5+c_1r_3r_4+sr_1r_5)+(c_1e_0+i_0i+2c_1i)sr_1r_4}\right\}$$

Therefore, $R_0 =$

$$-\left\{\frac{c_1{}^2r_4(r_2+r_3)+(i_0+c_1)(r_2r_5+r_3r_5)+c_1i_0(r_2+r_3)+(e_0+i)sr_1r_5+(c_1e_0+i_0i+2c_1i)sr_1r_4}{r_2(c_1+i_0)(c_1r_4+r_5)+(e_0+i)(r_3r_5+c_1r_3r_4+sr_1r_5)+(c_1e_0+i_0i+2c_1i)sr_1r_4}\right\}$$

Consequently, for all possible positive parametric values, the basic Reproduction number (R_0) of our system of differential equation is less than 1. Hence the system is asymptotically Stable.

Boundedness / Existence of solution

Theorem: *Let* $D \subseteq \mathbb{R} \times \mathbb{R}^n$ *be a closed rectangle with* $(t_0, y_0) \in D$. *Let* $f: D \to \mathbb{R}^n$ *be a function that is continuous in t and Lipchitz Continuous in y. Then, there exists some* $\varepsilon > 0$ *such that the initial value problem* $y'(t) = f(t, y(t)), y(t_0) = y_0$ *has a unique solution* $y(t)$ *on the interval* $[t_0 - \varepsilon, t_0 + \varepsilon]$.

The mathematical model of our system is well-posed. In actuality, Picard's theorem states that its unique solution exist and is constantly dependent on the initial data. Because we are dealing with the human population, we must guarantee that our solutions are positive and bound[17].

Equilibrium Point and their existence

solving the algebraic equations(7a), (7b) and (7c),

$$\frac{ds}{dt} = -r_1 s(e_0 - i_0 + i - c_1) + r_2 c_1 \quad (7a)$$

$$\frac{di}{dt} = -r_4 c_1 i + r_5(i_0 - i) \quad (7b)$$

$$\frac{dc_1}{dt} = r_1 s(e_0 - i_0 + i - c_1) - (r_2 + r_3)c_1 \quad (7c)$$

The equilibrium points of System are defined to be

There are four equilibrium points$E_i(s, i, c_1)$ as

1. $E_1\left(\frac{r_2 c_1}{r_1(e_0 - i_0 - c_1)}, 0, \frac{r_1 s + r_2 + r_3}{r_1 s(e_0 - i_0)}\right)$exists under the condition,

$i_0 = -(s^2 r_1^2 + 2r_2 r_3 - (r_2 + r_3 - c_1 r_1 + e_0 r_1 + s r_1)^2 + r_2^2 + r_3^2 + c_1^2 r_1^2 + e_0^2 r_1^2 - 2c_1 s r_1^2 + 2e_0 s r_1^2 - 2c_1 r_1 r_2 + 2c_1 r_1 r_3 + 2e_0 r_1 r_2 - 2e_0 r_1 r_3 + 2s r_1 r_2 + 2s r_1 r_3 - 2c_1 e_0 r_1^2)/(4r_1 r_3)$.

2. $E_2\left(0, \frac{r_5 i_0}{r_4 c_1 + r_5}, 0\right)$ exists if $i_0 - e_0 = i$.

3. $E_3(0, i_0, 0)$ exists under the condition, $i_0 = e_0 + i$.

4. $E_4\left(\frac{r_2 c_1}{r_1(e_0 - i_0 + i - c_1)}, i_0, 0\right)$ exists for $e_0 + i = i_0$.

Stability Analysis

The local/global stability behaviour of equilibrium points is determined by eigenvalues of corresponding Jacobian Matrix[18-21].

Theorem: *The equilibrium point is asymptotically stable if all the Eigenvalues of a* $n \times n$ *matrix must be negative, provided they are real.*

Theorem: *The equilibrium point is asymptotically stable if the real part of each complex Eigenvalues of a* $n \times n$ *matrix is negative.*

The general Jacobian Matrix M for our model (7a), (7b) and (7c) is given as

$$M = \begin{bmatrix} -r_1(e_0 - i_0 + i - c_1) & -r_1 s & r_1 s + r_2 \\ 0 & -(r_4 c_1 + r_5) & -r_4 i \\ r_1(e_0 - i_0 + i - c_1) & r_1 s & -(r_1 s + r_2 + r_3) \end{bmatrix}$$

Let M_i, Where $i = 1,2,3$ *and* 4 be the matrix evaluated at the equilibrium point $E_i$where $i = 1,2,3$and4.

Then the matrix M_1 evaluated at the equilibrium E_1 is represented as follows

$$M_1 = \begin{bmatrix} -r_1(e_0 - i_0 - c_1) & -r_1 s & r_1 s + r_2 \\ 0 & -(r_4 c_1 + r_5) & 0 \\ r_1(e_0 - i_0 - c_1) & r_1 s & -(r_1 s + r_2 + r_3) \end{bmatrix}$$

Where; $s = \frac{r_2 c_1}{r_1(e_0 - i_0 - c_1)}$ *and* $c_1 = \frac{r_1 s + r_2 + r_3}{r_1 s(e_0 - i_0)}$

Since, the matrix M_1 has negative eigen values under the condition:

$i_0 = -(s^2 r_1^2 + 2r_2 r_3 - (r_2 + r_3 - c_1 r_1 + e_0 r_1 + sr_1)^2 + r_2^2 + r_3^2 + c_1^2 r_1^2 + e_0^2 r_1^2 - 2c_1 s r_1^2 + 2e_0 s r_1^2 - 2c_1 r_1 r_2 + 2c_1 r_1 r_3 + 2e_0 r_1 r_2 - 2e_0 r_1 r_3 + 2s r_1 r_2 + 2s r_1 r_3 - 2c_1 e_0 r_1^2)/(4r_1 r_3)$,

$E_1$is a stable equilibrium point.

Now, M_2 be the matrix evaluated at the equilibrium E_2 is symbolized as follows

$$M_2 = \begin{bmatrix} -r_1(e_0 - i_0 + i) & 0 & r_2 \\ 0 & -r_5 & -r_4 i \\ r_1(e_0 - i_0 + i) & 0 & -(r_2 + r_3) \end{bmatrix} \quad \text{Where; } i = \frac{r_5 i_0}{r_4 c_1 + r_5}$$

As the matrix M_2 contributes the negativeeigen values under the condition:$i_0 - e_0 = i$, E_2 is a stable equilibrium point.

Again, the matrix M_3 calculated at the equilibrium E_3 is characterized as follows

$$M_3 = \begin{bmatrix} -r_1 e_0 & 0 & r_2 \\ 0 & -(r_4 c_1 + r_5) & -r_4 i_0 \\ r_1 e_0 & 0 & -(r_2 + r_3) \end{bmatrix}$$

Since, the matrix M_3 contributes negative Eigen values under the condition: $i_0 = e_0 + i$, E_3 is a stable equilibrium point.

Similarly, the matrix M_4 calculated at the equilibrium E_4 is characterized as follows

$$M_4 = \begin{bmatrix} -r_1 e_0 & -r_1\left(\frac{r_2 c_1}{r_1(e_0 - i_0 + i - c_1)}\right) & r_1\left(\frac{r_2 c_1}{r_1(e_0 - i_0 + i - c_1)}\right) + r_2 \\ 0 & -r_5 & -r_4 i_0 \\ r_1 e_0 & r_1\left(\frac{r_2 c_1}{r_1(e_0 - i_0 + i - c_1)}\right) & -(r_1\left(\frac{r_2 c_1}{r_1(e_0 - i_0 + i - c_1)}\right) + r_2 + r_3) \end{bmatrix}$$

Since, the matrix M_4 contributes negative Eigen values under the condition: $e_0 + i = i_0$.E_4 is a stable equilibrium point.

Sensitive Analysis

On considering the initial conditions to be equal for all quantities. (as$e(0) = s(0) = i(0) = 1\ mg.$) The corresponding parametric values can be measured one by one keeping any one of them fixed. As we keep parameter r_1 fixed, 24 different possibilities of other parameters are analyzed as per their time consumption and we conclude that under the assumption $r_2 < r_4 < r_1 < r_3 < r_5$time consumption is minimum whereas it is maximum in $r_3 < r_5 < r_1 < r_2 < r_4$.

As we keep parameter q_2 fixed, 24 different possibilities of other parameters are analyzed as per their time consumption and we conclude that under the assumption$r_4 < r_5 < r_2 < r_1 < r_3$time consumption is minimum and maximum in $r_3 < r_5 < r_2 < r_1 < r_4$.

As we keep parameter q_3 fixed, 24 different possibilities of other parameters are analyzed as per their time consumption and we conclude that under the assumption $r_4 < r_2 < r_3 < r_5 < r_1$ time consumption is minimum and maximum in$r_1 < r_5 < r_3 < r_4 < r_2$.
As we keep parameter q_4 fixed, 24 different possibilities of other parameters are analyzed as per their time consumption and we conclude that under the assumption $r_2 < r_1 < r_4 < r_5 < r_3$time consumption is minimum and maximum in $r_3 < r_1 < r_4 < r_5 < r_2$.
As we keep parameter q_5 fixed, 24 different possibilities of other parameters are analyzed as per their time consumption and we conclude that under the assumption $r_4 < r_2 < r_5 < r_1 < r_3$time consumption is minimum and maximum in $r_3 < r_1 < r_5 < r_4 < r_2$.
It is important to note down that taking any parametric values to be non – positive, it results to the failure.

RESULT AND DISCUSSION

As the minimum time consumption for product formation is under the assumption$r_4 < r_2 < r_5 < r_1 < r_3$, keeping the parameters to be fixed at $r_1 = 4, r_2 = 2, r_3 = 5, r_4 = 1, r_5 = 3$. The rate of change of reaction for enzyme-substrate in presence of Un-Competitive inhibitor for this hypothesis is studied as follows

Case-I: The initial concentration of enzyme is less than inhibitor is less than that of substrate $(e(0) = 0.8mg, i(0) = 1mg \; and \; s(0) = 1.2mg)$.

Time – Concentration relation for $e(0) < i(0) < s(0)$(Fig. 1)

Case-II: The initial concentration of enzyme is less than substrate is less than that of inhibitor $(e(0) = 0.8mg, s(0) = 1mg \; and \; i(0) = 1.2mg)$.

Time – concentration relation$e(0) < s(0) < i(0)$ (Fig. 2)

Case-III: The initial concentration of substrate is less than inhibitor is less than that of enzyme $(s(0) = 0.8mg, i(0) = 1mg \; and \; e(0) = 1.2\; mg)$.

Time –Concentration relations$(0) < i(0) < e(0)$ (Fig. 3)

Case-IV: The initial concentration of inhibitor is less than substrate is less than that of enzyme $(i(0) = 0.8mg, s(0) = 1mg \; and \; e(0) = 1.2mg)$.

Time –Concentration relation$i(0) < s(0) < e(0)$ (Fig. 4)

Case-V: The initial concentration of inhibitor is less than enzyme is less than that of substrate $(i(0) = 0.8mg, e(0) = 1mg \; and \; s(0) = 1.2mg)$.

Time –Concentration relation$i(0) < e(0) < s(0)$ (Fig. 5)

Case-VI: The initial concentration of substrate is less than enzyme is less than that of inhibitor $(s(0) = 0.8mg, e(0) = 1mg \; and \; i(0) = 1.2mg)$.

Time –Concentration relations$(0) < e(0) < i(0)$ (Fig. 6)

Case-VII: The initial concentration of all enzyme, Inhibitor and substrate is taken to be equal $(e(0) = s(0) = i(0) = 1mg)$.

Time –Concentration relation$e(0) = i(0) = s(0)$ (Fig. 7)

It is noted that, while compelling all the possible ratios of concentration of substrate, enzyme and inhibitor with fixed parametric values In the first and second case, for$e(0) < i(0) < s(0)$and $e(0) < s(0) < i(0)$the constant product formation is after 3.7 seconds. Again in third and fourth case, $s(0) < i(0) < e(0)$ and $i(0) < s(0) < e(0)$respectively, constant product formation is later 3.0 seconds. Whereas for five, six and seven, to be $i(0) < e(0) < s(0), s(0) < e(0) < i(0)$and $e(0) = s(0) = i(0)$respectively, the timing of product formation is measured later 3.2 seconds.

CONCLUSIONS

In this paper, it is revealed that the experimentally observed enzyme–substrate relationship under the influence of un-competitive inhibitor is consistent with theatrical calculations. Using the parametric values from the graph, the Reproduction Number is calculated as -0.8 which is the threshold value for product formation. Further the stability analysis carried out with constant initial conditions stated that, variation in rate of constants r_1, r_2, r_3, r_4andr_5 do affects the time consumption for product formation. It is inferred that $r_4 < r_2 < r_5 < r_1 < r_3$ consumes the minimum time span for product formation whereas $r_3 < r_1 < r_5 < r_4 < r_2$ takes the maximum time for the same. Also, it is observed that taking any of the parametric value to be negative tends to the failure of product formation. On applying restrictions to the initial conditions, Also it is inferred that enzyme concentration must be more than the concentration of substrate and inhibitor whereas the concentration of substrate and inhibitor may be equal or slightly more from each other is acceptable, for ideal product formation. Whereas, the concentration of enzyme to be less than that of substrate or inhibitor will consumes more time for product formation.

ACKNOWLEDGEMENT

The authors are thankful to anonymous referees for their valuable suggestions and comments to improve this manuscript.

Conflict of interest

The authors declare that there is no conflict of interest involved in this study.

Funding source

The authors received no external funding support for this research work.

ABSTRACT

Kayakarpam is a distinctive aspect of the Siddha medical system advocated for rejuvenation and longevity of life."*Kayakarpam*" is given as "Antioxidant" nowadays. Oxidative reactions within the body generate free radicals, which can lead to oxidative stress by damaging vital cellular components such as DNA, proteins, and lipids. This oxidative damage is implicated in the pathogenesis of various chronic and degenerative diseases. The present study investigates the antioxidant potential of *Orilaithamarai Karpam* (OTK) through a series of in vitro assays.To assess its ability to scavenge free radicals, four distinct assays were employed: DPPH, Nitric Oxide, ABTS and Hydrogen Peroxide radical scavenging assays. The findings revealed that OTK exhibited dose-dependent antioxidant activity across all assays. Specifically, OTK demonstrated strong radical scavenging activity in the DPPH assay, with 86.23% inhibition, and in the ABTS assay, with 85.63% inhibition at a concentration of 1 mg/ml- comparable to standard antioxidants such as ascorbic acid and Trolox. Moderate antioxidant effects were observed in the Nitric Oxide and Hydrogen Peroxide assays, with inhibition values of 46.93% and 53.06%, respectively, at the highest concentration tested. These results suggest that OTK possesses significant antioxidant properties, particularly effective against DPPH and ABTS radicals. As such, OTK may serve as a promising natural

source of antioxidants. Further studies are warranted to explore its mechanisms of action and potential therapeutic applications.

Keywords: *Kayakarpam,* Siddha system, Antioxidant, *Orilaithamarai karpam*, Internal medicine.

INTRODUCTION

Siddha system is a traditional system of healing that originated in south India and is considered to be one of the India's oldest systems of medicine[1]**.** Therefore, *kayakarpam* means sturdy as a rock and ageless physical body. While consuming *karpa* medicines, it naturally prevents the body from diseases and deterioration of physical stature[2]. Antioxidants are substances that prevent or slow the oxidation process in other molecules by interrupting the initiation or progression of oxidative chain reactions. Free radicals, which are unstable molecules, pose a threat to health by damaging essential cellular components such as DNA, proteins, and membranes[3]. In plants, adverse environmental factors like extreme temperatures, drought, toxic metals, nutrient shortages, and high salt levels can lead to an overproduction of reactive oxygen species (ROS), resulting in oxidative stress. To combat this, living organisms have developed sophisticated antioxidant defense systems made up of both enzymatic and non-enzymatic components. Non-enzymatic antioxidants work in various ways: by blocking enzyme activity, binding metal ions that promote free radical generation, neutralizing reactive species, and enhancing other antioxidant pathways[4]. As a result, they reduce the chance of developing chronic diseases. Due to their ability to scavenge free radicals at the biochemical level, these chemicals, which include vitamins C and E, beta-carotene, and polyphenols, play an important part in rejuvenating therapies[5-6]. They contribute to the preservation of cellular health and delay the consequences of ageing. One notable *Kayakarpam* is *Orilaithamarai karpam* highlighted in Siddha literature, including in the Bogar *karpam* 300[7], for its health benefits. The human body is constantly working to resist aging, and scientific studies show that free radical damage plays a key role in age-related diseases. Antioxidants help counter this by protecting cells from oxidative damage. The purpose of this study was to evaluate the antioxidant potential of *Orilaithamarai karpam* using an in-vitro model across various assays[8].

MATERIALS AND METHODS

Collection and Authentication of Drug

The whole plant was collected from Thirissur, Kerala, India, and was authenticated by a medicinal botanist at the National Institute of Siddha, Chennai – 47.

Ingredients of *Orilaithamarai karpam*

Orilaithamarai (*Nervilia aragoana* Gaudich.) – Whole plant.

Preparation

The whole plant of *Orilaithamarai* was dried at room temperature in a dark room for 7 days, then powdered and stored in an airtight container.

Indication

Siruneer kulirndhu kan erichchal, kamalai, kadiya pitham.

Adjuvant: Ghee.

Duration: 40 days.

***In Vitro* Antioxidant Activity**

Free radical scavenging ability by the use of a stable DPPH radical (1, 1-diphenyl-2-picrilhydrazyl)

The effect of given samples on DPPH radical was estimated according to the procedure described by Von Gadow *et al.* (1997). Two mL of 6 $\times 10^{-5}$ M methanolic solution of DPPH were added to 50 µl of the sample solution with different concentrations (2 µl extract + 48 µl water, 4 µl extract + 46 µl water, 6 µl extract + 44 µl water, 8 µl extract + 42 µl water, 10 µl extract + 40 µl water). The decrease of absorbance at 515 nm was recorded in a spectrophotometer for 16 min at room temperature. The scavenging effect (decrease of absorbance at 515 nm) was plotted against the time and the percentage of DPPH radical scavenging ability of the sample was calculated from the absorbance value at the end of 16 m in duration as follows

All determinations were performed in triplicate. The percentage inhibition of the DPPH radical by the samples was calculated according to the formula of Yen and Duh (1994).

$IP = [(A_{C(0)} - A_{A(t)} / A_{C(0)})] \times 100$

Where $A_{C(0)}$ is the absorbance of the control at t = 0 min; and $A_{A(t)}$ is the absorbance of the antioxidants at t = 16 min[9,10].

$$\text{Radical scavenging} = \frac{\text{Absorbance of control} - \text{Absorbance of sample}}{\text{Absorbance of control}} \times 10$$

Nitric oxide scavenging activity

Nitric oxide generated from sodium nitroprusside in an aqueous solution at physiological pH was measured by the Griess reaction (Marcocci *et al.*, 1994). The reaction mixture (3ml) containing sodium nitroprusside (10mm) in phosphate buffer saline and the test extract (10, 25, 50 and 100µg/ml) was incubated at 25^{0}C for 150 min, after incubation 1.5ml of the reaction mixture was removed and 1.5ml of the Griess reagent (1% sulphanilamide, 2% orthophosphoric acid and 0.1% Napthylethyline diamine hydrochloride) was added. The absorbance of the chromophore formed was read at 546 nm. Percent inhibition of nitric oxide scavenging was calculated using the formula.

Percentage Inhibition = (A of Control – A of Sample) /A of Control× 100. A- absorbance[11].

Free radical scavenging ability by the use of a stable ABTS radical cation 2, 2'-azinobis-(3-ethylbenzothiazoline-6-sulfonic acid)

The free radical scavenging capacity of samples was tested using ABTS radical cation decolorization assay (Re *et al.*, 1999). ABTS dissolved in water to get 7 mM concentration. ABTS radical cation (ABTS*$^+$) was produced by reacting ABTS stock solution with 2.45 mM potassium persulphate (final concentration) and allowing the mixture to stand in the dark room temperature for 12-16 hrs before use. The free radical was stable for more than two days, when stored in the dark room temperature. For the study of the test samples, the ABTS*$^+$ solution was diluted with absolute ethanol to an absorbance of 0.700 (±0.02) at 734 nm and equilibrated at 30°C. Reagent blank reading was taken (A_0). After addition of 2.0 mL of diluted ABTS*$^+$ solution ($A734\ nm$ = 0.700 (±0.02) to 50 µL of test sample (20 mg/mL), the absorbance reading was taken at 30°C exactly 6 min after initial mixing (A_t). Appropriate solvent blanks were run in each assay. All determinations were carried out at least three times. The percentage inhibition of absorbance at 734 nm was calculated using the above formula and decrease of the absorbance between A_0 and A_t.

$PI = [(A_{C(0)} - A_{A(t)}) / A_{C(0)}] \times 100$

where $A_{C(0)}$ is the absorbance of the control at t = 0 min; and $A_{A(t)}$ is the absorbance of the antioxidant at t = 6 min[12].

Hydrogen peroxide scavenging activity

Scavenging activity of hydrogen peroxide by the plant extract was estimated using the method of Ruch *et al*. (1989). Plant extract (4 ml) prepared in distilled water at various concentration was mixed with 0.6 ml of 4 mM H_2O_2 solution prepared in phosphate buffer (0.1 M pH 7.4) and incubated for 10 min. The absorbance of the solution was taken at 230 nm against blank solution containing the plant extract without H_2O_2. The reaction mix containing H_2O_2 without plant extract served as control. The amount of hydrogen peroxide radical inhibited by the extract was calculated using the following equation

H_2O_2 radical scavenging activity = {(Abs control – Abs sample)/ (Abs control)} × 100
Where; Abs control is the absorbance of H_2O_2 radical; Abs sample is the absorbance of H_2O_2 radical + sample extract[13].

RESULT AND DISSCUSION

The antioxidant potential of test drug OTK was evaluated using four different assays: DPPH, Nitric Oxide, ABTS and Hydrogen Peroxide radical scavenging assays. The results were compared with standard antioxidants.

Figure 1: Various assays of OTK demonstrating its antioxidant activity (a) DPPH assay, (b) NO assay, (c) ABTS assay, (d) H_2O_2 assay

DPPH assay

Percentage inhibition of test drug OTK on DPPH radical scavenging assay (Table 2)

The DPPH radical scavenging assay results for OTK demonstrate a clear, concentration-dependent increase in antioxidant activity. The control sample showed an optical density (OD) of 0.61, corresponding to 0% inhibition. At 0.2 mg, the OD was reduced to 0.225, yielding 63.11% inhibition, and at 0.4 mg, the OD further decreased to 0.147, resulting in 75.90% inhibition. At 0.6 mg, the OD dropped to 0.097, with 84.10% inhibition, and at 0.8 mg and 1 mg, the ODs were 0.088 and 0.084, respectively, with inhibitions of 85.57% and 86.23%. The results show a dose-dependent increase in inhibition, meaning that as the concentration of OTK increases, its ability to neutralize DPPH radicals improves. At 1 mg, OTK reaches an inhibition of 86.23%, which indicates strong antioxidant potential, though this is still slightly lower than that of potent antioxidants like ascorbic acid or Trolox. Compared to potent antioxidants like ascorbic acid and Trolox, OTK shows moderate antioxidant activity. While ascorbic acid typically exhibits greater than 90% inhibition at low concentrations, OTK achieves around 85-86% inhibition at 1 mg. Notably, OTK's performance is highly promising when compared to well-established antioxidants. Its inhibition values, consistently close to or exceeding 80%, suggest that its antioxidant efficacy is comparable to or even superior to that of ascorbic acid and Trolox at equivalent concentrations. Overall, OTK demonstrates significant antioxidant activity in the DPPH assay, indicating moderate to strong antioxidant potential, particularly in scavenging lipophilic and hydrophilic radicals. Additionally, OTK exhibited a significant antioxidant effect with an IC50 value of 0.24 mg, which is comparable to ascorbic acid (IC50 = 0.15 mg) and Trolox (IC50 = 0.2 mg). OTK's IC50 value (0.24 mg) is slightly higher than Trolox (0.20 mg) but lower than ascorbic acid (0.15 mg). OTK's inhibition percentage at 1 mg (86.23%) is comparable to Trolox (90.52%) but lower than ascorbic acid (95.12%).

Nitric oxide scavenging assay

Percentage inhibition of test drug OTK on NO assay (Table 3)

The nitric oxide (NO) scavenging assay results for the test sample show a dose-dependent increase in antioxidant activity with increasing concentrations. The control sample had an optical density (OD) of 0.929, corresponding to 0% inhibition. At 0.2 mg, the OD decreased to 0.901, resulting in 3.01% inhibition. At 0.4 mg, the OD further decreased to 0.779, yielding 16.15% inhibition. At 0.6 mg, the OD dropped to 0.643, giving 30.79% inhibition, and at 0.8 mg and 1 mg, the ODs were 0.566 and 0.493, corresponding to 39.07% and 46.93% inhibition, respectively. These results suggest that the sample's ability to scavenge nitric oxide increases with concentration, with the highest inhibition of 46.93% observed at 1 mg. However, the NO radical scavenging activity of OTK is significantly lower compared to its activity in the DPPH and ABTS assays. At 1 mg, OTK achieves only 46.93% inhibition, indicating its relatively weak efficacy in neutralizing nitric oxide radicals. This discrepancy suggests that OTK is less effective at scavenging NO radicals than other types of radicals, likely due to the particular challenges involved in neutralizing nitric oxide. To effectively neutralize NO, OTK may need to be administered at higher concentrations or may require a more potent mechanism of action. The NO assay results indicate that OTK's antioxidant properties are less effective against nitric oxide radicals. This is in line with the understanding that nitric oxide requires distinct mechanisms for effective neutralization. In comparison to established antioxidants like N acetylcysteine (NAC) and alpha-lipoic acid, which have a strong track record in scavenging NO radicals, OTK's lower inhibition in the NO assay suggests a reduced

ability to neutralize nitric oxide effectively. Although OTK demonstrated moderate antioxidant activity, with a maximum inhibition of 46.93% at 1 mg, its effectiveness was significantly lower compared to well-known antioxidants such as ascorbic acid and Trolox, which have demonstrated inhibition rates above 70-80% in various assays. For example, ascorbic acid shows 85.61% inhibition at 1 mg, while Trolox achieves 78.52% inhibition at the same concentration. This highlights that while OTK does exhibit some capacity to scavenge nitric oxide, its potency is relatively weak compared to ascorbic acid and Trolox. Despite this, the dose-dependent increase in inhibition observed in the NO scavenging assay suggests that OTK holds some potential as an NO scavenger. Further studies with higher concentrations and direct comparisons to other established NO scavengers would be essential to fully assess its relative efficacy and explore its potential as an antioxidant agent for nitric oxide. OTK's IC50 value (1.2-1.5 mg) is significantly higher than ascorbic acid (0.50 mg) and Trolox (0.60 mg). OTK's inhibition percentage at 1 mg (46.93%) is substantially lower than ascorbic acid (85.61%) and Trolox (78.52%).

Free radical scavenging ability by the use of a stable ABTS radical cation 2, 2'-azinobis-(3-ethylbenzothiazoline-6-sulfonic acid)

Percentage inhibition of test drug OTK on ABTS radical scavenging assay (Table 4)

The ABTS radical cation decolorization assay results for the test sample reveal a clear, dose-dependent increase in antioxidant activity with rising concentrations. The control sample showed an optical density (OD) of 0.701, corresponding to 0% inhibition. At 0.2 mg, the OD decreased to 0.477, resulting in 32.15% inhibition, while at 0.4 mg, the OD further decreased to 0.251, yielding 64.30% inhibition. At 0.6 mg, the OD was reduced to 0.178, producing 74.68% inhibition, and at 0.8 mg and 1 mg, the ODs were 0.145 and 0.101, leading to inhibitions of 79.37% and 85.63%, respectively. These results suggest a significant increase in antioxidant activity as the concentration of the sample rises. OTK exhibits a moderate to strong, dose-dependent increase in percentage inhibition in the ABTS assay, reaching a maximum of 85.63% inhibition at 1 mg. The antioxidant activity of OTK is significant in both DPPH and ABTS assays, achieving approximately 85-86% inhibition at 1 mg. These findings suggest that OTK possesses moderate to strong antioxidant potential. In comparison to established antioxidants, OTK's performance is notable but slightly less potent than ascorbic acid, which typically exhibits over 90% inhibition at low concentrations in ABTS assay. Trolox, a Vitamin E analog, demonstrates high efficacy in ABTS assay. OTK shows similar radical-scavenging abilities to Trolox but may require higher concentrations to achieve equivalent effectiveness. OTK exhibited moderate antioxidant activity, with an IC50 value of 0.43 mg, which is slightly higher than that of ascorbic acid (IC50 = 0.35 mg) and Trolox (IC50 = 0.38 mg). OTK's inhibition percentage at 1 mg (85.63%) is lower than ascorbic acid (94.15%) and Trolox (90.17%).

Hydrogen peroxide scavenging activity

Percentage inhibition of test drug OTK on H_2O_2 assay (Table 5)

The hydrogen peroxide (H_2O_2) radical scavenging assay results for the test sample reveal a dose-dependent increase in antioxidant activity with rising concentrations. The control sample had an optical density (OD) of 0.098, corresponding to 0% inhibition. At 0.2 mg, the OD decreased to 0.089, resulting in 9.18% inhibition, and at 0.4 mg, the OD further decreased to 0.083, yielding 15.31% inhibition. At 0.6 mg, the OD dropped to 0.076, resulting in 22.45% inhibition. At 0.8 mg and 1 mg, the ODs were 0.053 and 0.046, corresponding to 45.92% and 53.06% inhibition, respectively. The data shows a gradual increase in the inhibition of hydrogen peroxide as the concentration of OTK increases. Starting from 0% inhibition at the control, the inhibition progressively rises to 53.06% at 1 mg. This dose-dependent trend is a hallmark of antioxidant activity, indicating that OTK is capable of scavenging H_2O_2 radicals in a concentration-dependent manner. When compared to known antioxidants, the inhibition of H_2O_2 radicals by OTK is moderate. For instance, ascorbic acid and Trolox, both well-established antioxidants, typically show inhibition rates above 80% at similar or lower concentrations. In contrast, OTK achieves 53.06% inhibition at 1 mg, suggesting that while it demonstrates significant activity, its scavenging capacity for H_2O_2 is less potent than that of ascorbic acid or Trolox. The scavenging of hydrogen peroxide by OTK is likely through its antioxidant properties, which may involve the neutralization of H_2O_2 molecules either directly or through indirect mechanisms. The increasing inhibition with higher concentrations suggests that OTK may act as a hydrogen donor or facilitate the conversion of H_2O_2 into less reactive species, such as water or oxygen. OTK's ability to neutralize H_2O_2 radicals shows promise, particularly at

higher concentrations. However, its maximum inhibition of 53.06% at 1 mg suggests that OTK might require optimization to improve its effectiveness against hydrogen peroxide. Further studies could focus on increasing the concentration range tested, as well as exploring the underlying mechanisms that contribute to its scavenging activity. OTK's IC50 value (0.73 mg) is higher than ascorbic acid (0.40 mg) and Trolox (0.50 mg). OTK's inhibition percentage at 1 mg (53.06%) is lower than ascorbic acid (90.19%) and Trolox (85.95%).

CONCLUSION

The study demonstrates the antioxidant potential of the test drug OTK. It exhibits moderate to strong activity in scavenging lipophilic radicals, such as DPPH and ABTS, but shows relatively weaker activity against hydrophilic radicals, including nitric oxide (NO) and hydrogen peroxide (H_2O_2). Further optimization or the use of higher concentrations may enhance its efficacy, particularly in scavenging NO and H_2O_2. Despite its lower effectiveness in certain assays, OTK shows promise as a potential antioxidant agent, especially in conditions involving radical-mediated damage, and warrants further investigation in alternative models or formulations to improve its activity.

ACKNOWLEDGMENT

The authors gratefully acknowledge the support and facilities provided by the National Institute of Siddha, Tambaram Sanatorium. Special thanks are extended to Dr. M. Keerthi Grace, PG Scholar at NIS, for her assistance with plant collection and preparation. The authors also thank Apex Laboratory, Chennai, for their valuable support in conducting this study.

Source of Support: The author(s) received no financial support for the research, authorship, and/or publication of this article.

Conflict of Interest: The author(s) declared no potential conflicts of interest with respect to the research, authorship, and/or publication of this article.

ABSTRACT

This study is done to prepare and characterize Losartan potassium bilayer floating tablets where HPMC E15 is used as a polymer. Eight sets of Losartan potassium bilayer tablets are manufactured through direct compression method. The physicochemical characteristics of the compressed tablets, including thickness, weight variation, friability, hardness, drug content determination, were then assessed. An *In-vitro* floating studies were carried out. Physiochemical characteristics such as hardness (5.0 ± 0.1 to 5.5 ± 0.7 kg), weight variation (222± 1.2 to 225 ± 1.3 mg), friability (0.52 to 0.54 %), thickness test (5.0± 0.03 to 7.0± 0.03 mm), and drug content (90.4 to 96.6%) were within limits. The results of floating lag time of (63 sec to98sec) and total floating time is >10 hrs. Floating Bilayer tablets are with (immediate and controlled layer) where each formulation with dissolution, 98.26% highest release (F5) to lowest release of 86.53% (in F7) 98.27% highest release, (F5 at 12 hrs) 85.15% lowest release (F7 at 12hr) in controlled release layer. The FTIR spectrum shows that the drug and excipients have zero interaction with each other. Results led to the conclusion that Losartan potassium bilayer floating tablets may be developed.

Keywords: Losartan potassium, bilayer tablets.

INTRODUCTION

Gastro-Retentive Drug Delivery System (GRDDS)

Gastro-Retentive delivery systems are meant to be retained in the stomach for a prolonged period. Thus, they provide sustained and prolonged drug release to the upper part of the gastrointestinal (GI) tract. Certain types of drugs have benefited by using gastric retentive devices. These include; Acting locally in the stomach. Primarily absorbed in the stomach. Poorly soluble at an alkaline pH. Narrow window of absorption. Absorbed rapidly from the GI tract. Degrade in the colon[1,2]. Floating Drug Delivery System: Floating drug delivery Systems are low-density systems with a bulk density less than gastric fluids. Because of its low density, it remains buoyant in the stomach for a prolonged period. The system floats on the gastric contents and releases the drug slowly at the desired rate. Once the drug is released completely, the stomach empties the residual system. This results in increased gastric residence time and better control of the fluctuations in plasma drug concentration with a low risk of toxicity. Drugs that are locally active in the stomach, drugs with narrow absorption windows, and unstable in the intestine and colonic environment are the potential drug candidates for FDDS. This system improves drug absorption and also minimizes the mucosal irritation of drugs. FDDS requires a high fluid level in the stomach to float and work efficiently, which limits the approach to some extent[3,4]. The need of bilayer floating is to control the delivery rate of single or two active pharmaceutical ingredients. For the administration of fixed-dose drug combinations, prolong the product life cycle, buccal or mucoadhesive delivery systems, and fabricate novel drug delivery systems such as chewing devices and floating tablets for GRDDS. To separate incompatible active pharmaceutical ingredients from each other, to control the release of API from one layer by utilizing the functional property of another layer. To modify the total surface area available for the active pharmaceutical ingredient layer by sandwiching with one or two inactive layers to achieve swellable /erodible form for modified release[5,6]. A bilayer tablet contains two layers; one layer is immediate release layer, where the initial dose from the system is released, and the second layer is sustained release layer, which absorbs gastric fluid, which forms an impenetrable colloidal gel barrier on its surface and maintains a bulk density of less than unity and thereby it remains buoyant in the stomach. Bilayer floating tablet is the new era for the successful development of controlled release formulation. Bilayer tablet is better than the traditionally used other dosage forms. A bilayer tablet is suitable for sequentially synthesizing two drugs in combination. It's also able to separate two incompatible substances. The delivery rate of either single or two API"S can be controlled in bilayer tablets[7,8].

MATERIALS AND METHODS

Losartan potassium, HPMC E15, Ethyl cellulose, Sodium bicarbonate, Microcrystalline cellulose, Magnesium stearate, Colloidal silicon, Crospovidone, Micro crystalline cellulose, Magnesium stearate, Methylene red. All the materials are procured from S.D Fine Chemicals Ltd, Mumbai, India and Molychem, Mumbai, India.

Experimental Methodology

Formulation of Bilayer Floating Tablets of Losartan Potassium

Formulation of Immediate Release Layer

Direct compression method is used to prepare Losartan potassium bilayer floating tablets. Required powders were weighed. Active pharmaceutical ingredient was blended with crospovidone, magnesium stearate, colloidal silicon dioxide, micro crystalline cellulose, methylene red. 40-mesh sieve is used and the given ingredients were blended. F1 to F8 groups was prepared.

Formulation of Controlled Release Layer

Required powders were weighed. Active pharmaceutical ingredient was taken and blended with HPMC E15, Sodium bicarbonate, Microcrystalline cellulose, magnesium stearate, Ethyl cellulose, colloidal silicon dioxide. 40-mesh sieve is used and these ingredients are blended to form F1 to F8 batches.

Formulation of Losartan Potassium Bilayer Floating Tablets

Firstly, pass the blended layer formulation for compression with low speed. Then the controlled release layer formulation was passed for compression on the immediate release layer with high speed to form bilayer floating tablets of losartan potassium. Eight groups developed(F1 to F8).

RESULTS AND DISCUSSIONS

Melting Point Determination: Capillary method is used to determine melting point to be around 181°C. The purity of the drug substance is confirms based on the literature.

Solubility: PH 6.8 phosphate buffer and 0.1N HCL is used.

Standard graph of Losartan potassium

UV spectrophotometer is used produce standard curve and lambda max 232 nm is used to detect absorption. In Losartan potassium standard calibration curve concentration (X axis) and absorbance (Y axis) was plotted against each other. Losartan potassium standard calibration curve having an R2 of 0.9996 which shows good linearity. Table: 3 and Figure1. In Losartan potassium standard calibration curve concentration (X axis) and absorbance (Y axis) was plotted against each other. Losartan potassium standard calibration curve having an R2 of 0.9998 which shows good linearity. Table 4 and Figure 2.

FTIR (Drug -Excipient compatibility) studies

For the analysing drug-excipient interactions FTIR spectroscopy is used. FTIR spectrum of Losartan potassium and losartan potassium + excipients are observed in FTIR spectra and there is zero interaction between the drug and the excipient according to the peaks observed in the FTIR spectrum. This shows the stability of the drug (losartan potassium) in physical mixture. Table 5, Figure 3 andFigure 4.

Precompression Studies: (Preformulation parameters of powder mixture)

Preformulated parameters like Angle of repose, Bulk density, tapped density, Carr's index and Hausner ratio was performed to see the powders satisfactory flow properties. According the observer results of the formulation the angle of repose values range from 24.27 ± 0.28 to 26.78 ± 0.34, bulk densities(gm/ml) show range of 0.454 and 0.564, tapped densities(gm/ml) shows range 0.558 and 0.564, Hausner's ratio shows range 1.21 and 1.24, Carr's index shows range from 17.12 to 17.97. This shows the flow of powders were satisfactory.(Table: 6)

Evaluation of Bilayer Floating Tablets of Losartan Potassium

The prepared formulation was evaluated for their wt. variation hardness, Friability, thickness and Drug content using standard procedure.

***In-vitro* quality control parameters**

Evaluation tests for Immediate release tablets of losartan potassium and Controlled Floating Layer

Evaluation tests were done and the values of Weight variation is between 72± 1.2 to 75± 1.4, friability values between 0.40± 0.5 to 0.44± 0.7, hardness values between 3.2±0.1 to 3.7±0.6and thickness values between 2.27±0.01to 2.77± 0.01 were found within limits. (Table: 7). Evaluation tests were done and the values of Weight variation is between 149± 1.2 to 151± 1.2, friability values between 0.52± 0.5 to 0.54± 0.7, hardness values between 5.0±0.1 to 5.5±0.7and thickness values between 5.4± 0.03to 7.0± 0.03 were found within limits. (Table: 8). Evaluation of Immediate release tablets of losartan potassium (Table: 9). Evaluation of Bilayer floating tablets of losartan potassium (Table: 10)

***In-Vitro* floating studies**

Bilayer floating tablets of losartan potassium were evaluated for their time of floating and their total floating lag time using standard procedures. In-vitro floating studies were done and the values of floating time was between 63sec to

98 sec and the Values of total floating time was >10 was found. Evaluation of Bilayer floating tablets of losartan potassium (Table: 11)

***In vitro* drug release**

Dissolution studies showed that 98.27% of cumulative drug is released for 10 hours with excellent release rate for F5 formulation, which is considered as optimized formulation. In-vitro cummulative studies of losartan potassium immediate release tablets (Table 12). In-vitro cummulative release of controlled release tablets of losartan potassium (Table 13)

CONCLUSION

From this study of bilayer floating tablets of losartan potassium shows the anti-hypertensive effects of losartan potassium (250mg/table) formulated by direct compression method. The polymer used was HPMC E15, Crospovidone as super disintegrant, microcrystalline cellulose as binder, magnesium stearate as lubricant. The powder blend's physicochemical properties were examined by using different criteria ,which shows satisfactory results. After that, developed formulations were assessed for characterization. The results of drug content were good for F5 formulation batch, which was found to be 96% among the different formulations. The results of floating lag time of F5 formulation 63(sec) and total floating time are >10 hrs. In this formulation there are 2 layers (immediate layer and controlled release layer) where every layer has different dissolution profile for prepared formulations, for immediate release layer the invitro cumulative release of drug is 98.27% (in F5) and in controlled release layer the invitro cumulative release of drug for 12 hrs is 98.26% in F5 formulation. The optimized formulation F5 containing HPMC E15. FTIR study shows zero interaction between drug and excipients. From all the prepared (F1- F8) formulations it is concluded that F5 formulation is taken as an optimize formulation.

ABSTRACT

The purpose of the study is to examine the effects of dry needling and muscular energy treatments on the improvement of shoulder range of motion and functional activities in patients with shoulder impingement syndrome. Dry needling promotes range of motion, flexibility, and the release of tense muscles. Muscle Energy Technique (MET) stimulates the body's natural healing mechanisms, enhancing muscular function and range of motion. The study aims to compare how well these methods work in helping patients with shoulder impingement syndrome improve their functional activities and range of motion in the shoulder. The study aims to examine how dry needling and muscle energy treatments increase shoulder range of motion and functional activities in individuals with shoulder impingement syndrome**.** 40 patients with SIS were selected and randomly assigned into two groups: The Dry Needling Technique (DNT) group (n=20) and the Muscle Energy Technique (MET) group (n=20). Shoulder Pain and Disability Index (SPADI) the intervention lasted 4 weeks, with both groups having 3 sessions per week. Pre and post-test values were recorded and analyzed. Both groups showed improvement in shoulder function and range of motion. But DNT group showed higher improvement than the MET group with a p-value <0.0001. Both dry needling and muscle energy techniques improve shoulder range

of motion and functional activities in SIS, but dry needling is better. So dry needling can be considered a treatment approach for shoulder impingement syndrome.

Keywords: Shoulder Impingement, Shoulder Mobility, Functional Activity

Abbreviations Muscle energy technique (MET), Dry Needling technique (DNT), Shoulder Impingement Syndrome (SIS), Functional status.

INTRODUCTION

The painful ailment known as shoulder impingement syndrome is brought on by irritation or inflammation of the bursa, a fluid-filled sac, and the tendons in the shoulder joint. This irritation typically occurs when these structures get pinched between the acromion (bony projection on the shoulder blade) and the humeral head during overhead movements. Shoulder pain stands as the third most common musculoskeletal condition. According to reports, 14.7 out of 1000 primary care subjects experience shoulder pain each year, and up to 70% of subjects will experience it in their entire life. Adults report experiencing shoulder symptoms up to 20% of the time, and the number of complaints is increasing [1]. Millions of people worldwide suffer from shoulder impingement syndrome (SIS), a common musculoskeletal ailment. Understanding its prevalence and impact across different populations is crucial for improving diagnosis, treatment, and prevention strategies [2]. In general, 18–26% of individuals report having had shoulder discomfort at some time in their life. Shoulder impingement syndrome is a primary cause of this pain, and 7–34% of people who have shoulder complaints are diagnosed with SIS. In addition, SIS is responsible for 44–65% of all occurrences of shoulder pain worldwide. In India, Research indicates that an individual's incidence of shoulder impingement syndrome ranges from 6.7% to 66.7% [3]. Certain groups like adults with diabetes or those involved in occupations with repetitive overhead movements might be at higher risk[4]. SIS is most common in middle-aged adults (40-60 years old), Men are generally more affected than women, with a 2:1 to 4:1 male-to-female ratio[5]. Professions involving repetitive overhead movements (athletes, construction workers, painters) have a higher risk, and Certain sports like swimming, baseball, and tennis increase the risk. Individuals with rotator cuff injuries, osteoarthritis, or other shoulder problems are more susceptible. Because it is a joint made up of a ball and socket, the shoulder joint offers a broad range of motion[6]. The humeral head inside the glenoid cavity is stabilized by the four muscles that make up the rotator cuff: the supraspinatus, infraspinatus, teres minor, and subscapularis.

Flexion, extension, abduction, adduction, internal rotation, and external rotation are the primary shoulder motions[7][8]. The muscles that comprise the rotator cuff—the supraspinatus, infraspinatus, teres minor, and subscapularis—are crucial for supporting the joint and regulating these motions. Because of its unusual form, which permits a broad range of motion, the shoulder is vulnerable to several biomechanical issues, such as shoulder impingement syndrome. Understanding the biomechanics of the shoulder is crucial for diagnosing and managing conditions affecting this complex joint. The biomechanical Factors in Impingement occur when the subacromial space has a narrow gap between the underside of the acromion and the top of the humerus[9]. The humeral head approaches the acromion when moving overhead, potentially compressing the rotator cuff tendons and bursa within this space and when the scapula upwardly rotates and tilts posteriorly during overhead movements to provide adequate clearance for the rotator cuff tendons[10]. However, in the scapular muscles, poor coordination can lead to inadequate scapular motion, further reducing the subacromial space and increasing impingement risk. Rotator cuff weakness, tears, or tendinitis can further compromise the stability of the humeral head, making it more prone to impingement during overhead movements[11]. A shoulder impingement syndrome clinical diagnosis was made during a physical and orthopedic examination. Tightened myofascial tissues can weaken the surrounding muscles, particularly the rotator cuff muscles responsible for shoulder stability. This weakness can further contribute to impingement by allowing the humeral head to move more freely and impinge on the surrounding structures[12]. Diagnosing shoulder impingement syndrome (SIS) includes a physical examination, some tests, and a clinical history.

The patient-reported outcome measures are how shoulder impingement syndrome is detected. People with shoulder issues can have their pain, function, and quality of life evaluated with the help of questionnaires like the Shoulder Pain and Disability Index (SPADI).

Functional tests Measuring specific tasks like throwing, reaching overhead, or lifting weights can evaluate improvements in shoulder function following treatment[13][14]. Pain management and mild range-of-motion exercises were the main focus of early physical therapy. Injections of corticosteroids, anesthetics, or other pain-relieving medications were used to directly address inflammation and pain. In severe cases or when conservative treatments failed, surgery was considered. Open surgeries were more common in the past, involving larger incisions and longer recovery times. It's crucial to remember that these earlier therapies' degrees of efficacy varied widely, and some even posed dangers for consequences, with advancements in medical technology and understanding of shoulder biomechanics, treatment options for shoulder impingement syndrome have evolved significantly. While past physiotherapy interventions offered some relief for shoulder impingement syndrome, they often lacked specificity and effectiveness. Modern approaches have evolved significantly, focusing on targeted interventions, specific exercises, and subject education, leading to better functional outcomes and improved quality of life for individuals suffering from this condition. This study mainly focuses on muscle energy technique and dry needling technique for subjects with shoulder impingement syndrome. "Muscle energy techniques" are a type of soft tissue osteopathic manipulation techniques that combine carefully planned and regulated subject-initiated isometric and/or isotonic contractions to improve musculoskeletal function and reduce pain.[15]For the management of musculoskeletal pain, physical therapists use dry needling as a therapy method. Using a small needle, it penetrates the muscles, subcutaneous tissues, and skin to manually destabilize the interior tissues[16] and the other one is the Muscle Energy Technique. The main objective of direct, non-invasive manual therapy is known as the Muscle Energy Technique (MET). Non-invasive therapies like the muscle energy method (MET) and dry needling (DN) are becoming more popular for treating shoulder impingement syndrome. However, understanding their effectiveness and gaps in knowledge is crucial for optimal treatment. In the past manual therapy and modalities were given for the shoulder impingement syndrome. It addresses the pain but not the ROM and causes.

Mechanical Effects of Dry Needling Technique are the insertion of thin filiform needles into trigger points and other myofascial structures, which has gained popularity for its potential pain-relieving effects. The exact mechanical effect is Trigger Point Depolarization in which insertion of the needle is thought to mechanically disrupt the trigger point's hypertonic muscle fibers, leading to depolarization and a local twitch response. This technique can also help to release Myofascial restrictions, which restrict ROM and contribute to pain and dysfunction this helps to improve joint range of motion[17]. Also, MET can stimulate the Mechanoreceptors, which can help to reduce pain and improve proprioception. While these are the proposed mechanisms, the evidence supporting them is still evolving. Studies show that dry needling and MET can improve the range of motion, decrease discomfort, and improve muscle function in some disorders, including shoulder impingement syndrome[18]. However, the precise mechanisms remain unclear, and the long-term effects of dry needling and MET require further investigation. The effectiveness of treatment might also depend on factors like needle type, depth, duration of treatment, and individual patient factors[19]. Thus, this study's goal is to assess the impact of muscular energy strategy versus dry needling for patients suffering from shoulder impingement syndrome and improve their ROM and functional activities. Imaging techniques. Were not always needed for initial diagnosis but imaging tests provide valuable insights into the underlying structures and confirm the presence of impingement. Commonly used techniques for shoulder impingement syndrome X-rays were useful for detecting bone abnormalities like bone spurs or calcifications under the acromion that contribute to impingement[20].

MATERIALS AND METHODS

It was a comparative study done with 40 subjects with shoulder impingement syndrome aged between 35-55 years both men and women. Convenient sampling is used in the study.

Selection criteria
Inclusion criteria: subjects diagnosed with shoulder impingement
Age: 34-55
Gender: male, female

Exclusion criteria
Subjects other than shoulder impingement such as rotator cuff tear, adhesive capsulitis, and shoulder tendinitis. This research followsevery procedure carried out during the study complied with the institutions' ethical standards. The study was approved by the Saveetha College of Physiotherapy Institutional Scientific Review Board[ISRB] [04/020/2023/ISRB/SR/SCPT]

PROCEDURE

A total of 120 participants were invited for the study and in this 70 were selected according to the inclusion and exclusion criteria. Of these 70 participants, 30 participants were dropped due to lack of follow-up and personal inconvenience. Finally, 40 subjects were selected. The selected participants were informed about the procedures of the study and got a consent form. The selected participants were assigned into 2 groups Dry needling group (n=20) and the muscle energy group (n=20). Pre-analysis is carried out using a goniometer and SPADI. The participants underwent intervention for 4 weeks. Both groups underwent 3 sessions per week The participants were gathered in Chennai, and a total of (n=40)patients were recruited as a sample size. Data from the pre-tests and post-tests were collected to compare the results before and following the implementation of the rehabilitation strategy. Four weeks of Dry needling and Muscle energy techniques were included in the rehabilitation program. To collect patient input both before and after sessions, a survey form was also sent.

Clinical guidelines for dry needling technique
Materials required
1. Dry needles: single-use needles made of surgical-grade stainless steel.
(0.22-0.35mm diameter)
2. Alcohol wipes and gloves.
The groups were treated with a dry needle that weighed 0.25 grams and measured 25 mm. An acupuncture needle was never used more than once. The therapist cleaned the area where the needle was inserted with an alcohol swab and wore surgical gloves the entire time. The latent MTP was located by pincher palpation.

Dry NeedlingLevator scapula MTrP was identified by flat or deep palpation from the position in which one is side-lying, with the affected side at the top. The therapist will palpate your neck and shoulder area to locate trigger points in the levator scapulae muscle. These are often tender and taut bands of muscle fibers. The therapist will use thin, sterile needles to insert into the identified trigger points. The needles are not injected with any medication. Insertion depth can vary depending on the trigger point's location.

Dry Needling for Supraspinatus The patient is usually positioned in a way that allows easy access to the Supraspinatus muscle. This may involve sitting or lying on the side, depending on the practitioner's preference. A thin, sterile needle is gently inserted into specific points within the supraspinatus muscle. The practitioner will use palpation and anatomical knowledge to locate trigger points or areas of muscle tension. Once the needle is in place, the practitioner may manipulate it by applying subtle movements, such as twirling or piston-like motions. This helps stimulate the trigger points and release tension within the muscle.

Dry Needling for Infraspinatus The patient is usually positioned in a way that allows easy access to the infraspinatus muscle. This may involve lying on the side or in a prone position. The practitioner will ensure that the skin and the area around the infraspinatus muscle are properly sterilized to reduce the risk of infection. A thin, sterile

needle is gently inserted into specific points within the infraspinatus muscle. The needles are typically left in place for a short duration, and then they are carefully removed.

Clinical guidelines for muscle energy technique (MET)

Muscle Energy Technique (MET) is used to address shoulder impingement by influencing muscle tone and joint mobility. The therapist guides the patient to perform an isometric contraction of the agonist muscle (muscle causing impingement) against gentle resistance from the therapist. Then the therapist gently stretches the antagonist muscle to a new barrier to motion, capitalizing on the post-isometric relaxation effect. For ten seconds, the stretch was held. The procedure was carried out three times. This increases the range of motion for internal rotation by lengthening the external rotators.

MET treatment for Supraspinatus With one hand supporting the shoulder on the side which requires to be treated and the other reaching out in front of the patient to support the ß flexed elbow and forearm, the therapist stands behind the seated patient. After the patient's upper arm had been brought to its easy barrier, the patient tried to bring the arm back with 20% of their strength, but the therapist resisted. The patient takes a deep breath during this procedure. The patient exhales air following an isometric contraction lasting 10 seconds. With the patient's help, the arm is gently moved toward its new resistance barrier to achieve greater adduction. Repeat multiple times, allowing at holding each painless stretch for at least 20 seconds.

MET Treatment for Infraspinatus The patient was positioned in a supine posture on the examination table, with their shoulders abducted and elbows flexed to a 90-degree angle, respectively. The therapist will gently rotate the shoulder internally until the first mobility barrier is overcome. Subsequently, the patient will be instructed to maintain an isometric posture in the direction of external rotation for five seconds at a 25% maximum voluntary contraction. To assist the patient in completing this exercise, the examiner will provide an opposing force at the distal forearm. Throughout this procedure, the patient inhales. After five seconds of isometric contraction, the patient releases air. The procedure is done in the same way. The patient is instructed to unwind following the contraction. After that, the therapist applies 30 seconds, shifts the shoulder into a new internal rotation range, and then repeats the procedure.

MET Levator Scapulae Therapy The patient lies face down on the treatment table with their head turned slightly to the opposite side of the levator scapulae being treated. The therapist supports the patient's head with their hand. The therapist asks the patient to gently push their head down against the therapist's resistance for a few seconds. This isometric contraction activates the antagonist muscle (depressor scapulae) and helps to relax the levator scapulae. After the contraction, the therapist asks the patient to relax their head and gently turns it further towards the treated side, stretching the levator scapulae. For ten seconds, the stretch was held. The procedure was carried out three times. This increases the range of motion for internal rotation by lengthening the external rotators.

OUTCOME MEASURES

Range of motion (ROM) The goniometer is composed of two arms: the movable arm and the stationary arm. Every arm is positioned at particular points on the body, and the joint that needs to be measured is where the goniometer center is aligned.

Shoulder Pain and Disability Index (SPADI) To assess shoulder pain and disability in an outpatient context, the Shoulder Pain and Disability Index (SPADI) was created. The 13 items that comprise the two domain-evaluating SPADI are an 8-item component for disability and a 5-item sub-scale for pain.

ILLUSTRATIONS

A comparison of the pre-test and post-test values of the dry needling technique using a goniometer reveals that the mean value increased from 70.75 (SD = 10.22) in the pre-test to 142.50 (SD = 15.52) in the post-test. The paired t-test yielded a t-value of 37.46, with a p-value of <0.0001, indicating that the findings are extremely statistically significant

(Table:1). A comparison of the pre-test and post-test values of the dry needling technique using the SPADI scale shows a significant reduction in scores, with the mean decreasing from 67.30 (SD = 4.97) in the pre-test to 34.30 (SD = 4.21) in the post-test. The paired t-test yielded a t-value of 22.65, and the p-value was <0.0001, indicating the results are extremely statistically significant (Table:2). Comparison of the pre-test and post-test values of the Muscle Energy Technique (MET) using a goniometer indicates a notable improvement, with the mean increasing from 71.15 (SD = 10.67) to 116.75 (SD = 9.36). The paired t-test produced a t-value of 36.38, and the p-value was <0.0001, demonstrating extremely statistically significant results(Table: 3). A comparison of the pre-test and post-test values of the Muscle Energy Technique (MET) using the SPADI scale revealed a significant reduction in scores, with the mean decreasing from 67.80 (SD = 5.51) to 39.05 (SD = 4.89). The paired t-test resulted in a t-value of 17.44, and the p-value was <0.0001, indicating the results are extremely statistically significant(Table: 4). Comparing the post-test values of the Dry Needling Technique (DNT) and Muscle Energy Technique (MET) using a goniometer showed that the DNT group had a higher mean post-test value (142.50, SD = 15.52) compared to the MET group (116.75, SD = 9.36). The t-value was 6.35, with a p-value of <0.0001, indicating an extremely statistically significant difference between the two groups(Table: 5). Compares the post-test SPADI scores between the Dry Needling Technique (DNT) group and the Muscle Energy Technique (MET) group (Group B). The DNT group had a mean score of 34.30 (SD = 4.21), while the MET group had a higher mean score of 39.05 (SD = 4.89). The t-value was 3.29, with a p-value of <0.0022, indicating a statistically significant difference in SPADI scores between the two groups(Table:6) The therapist performed the Dry Needling Technique with the participant in a comfortable prone or side-lying position. After locating the trigger point in the supraspinatus muscle, a sterile, disposable filiform needle was inserted perpendicularly into the identified taut band. The needle was manipulated using pistoning or fanning techniques to elicit a local twitch response. The needle was retained in place for approximately 10 minutes, with periodic gentle stimulation.

Throughout the procedure, the participant was instructed to remain relaxed and breathe normally. After needle removal, gentle passive range of motion was performed to enhance muscle relaxation, followed by a rest interval of approximately 5 seconds(Fig: 1). The therapist administered the Dry Needling Technique with the participant in a side-lying or prone position to allow optimal access to the infraspinatus muscle. After identifying the myofascial trigger point within the muscle belly, a sterile, disposable filiform needle was inserted perpendicular to the skin or angled slightly, depending on anatomical landmarks. The needle was advanced carefully into the trigger point until a local twitch response was elicited. Pistoning or gentle rotation techniques were applied for effective stimulation. The needle was retained for approximately 10 minutes, with intermittent manual stimulation. The participant was instructed to remain relaxed and breathe deeply to aid in muscle release. Following needle removal, a gentle passive stretch was provided, and a brief rest period of 5 seconds was given(Fig: 2). The therapist administered the Muscle Energy Technique with the participant in a supine or side-lying position, depending on the specific rotator cuff muscle targeted. The technique involved positioning the shoulder near the restriction barrier relevant to the involved muscle. The participant was instructed to perform a sub-maximal isometric contraction (30–40% of their maximum effort) against the therapist's resistance, held for approximately 10 seconds. Following the contraction, a relaxation phase was initiated, during which the therapist gently stretched the muscle to a new barrier for about 30 seconds. This procedure was repeated three times. During the final relaxation phase, participants were encouraged to perform deep breathing to facilitate neuromuscular relaxation. A rest interval of 5 seconds was provided between each repetition. This post-isometric relaxation approach helped reduce muscle tightness and improve functional range of motion in the glenohumeral joint(Fig: 3).

RESULT

When compared to the pre-assessment and the post assessment shows that there is a significant decrease in shoulder pain and increase in quality of life using Goniometer and SPADI scales. The statistical mean value for goniometer DNT pre intervention was 70.75± and standard deviation was 10.22± post intervention value was 142.50± and 15.52±.Hence the post intervention mean value shows higher significant value than the pre intervention. The statistical mean value for goniometer of group B pre intervention was 71.15± and standard deviation was 10.67± and

post intervention value was 116.75± and 9.36±.Hence the post intervention mean value shows higher significant value than the pre intervention. The statistical mean value for SPADI of DNT pre intervention was 67.30± and standard deviation was 4.97± post intervention value was 34.30± and 4.21±. Hence the post intervention mean value shows higher significant value than the pre-intervention. The statistical mean value for SPADI of group B pre intervention was 67.80± and standard deviation was 5.51± post intervention value was 39.05± and 4.89±. Hence the post intervention mean value shows higher significant value than the pre-intervention. The paired t-test and unpaired t-test was used to statistically analyze the values. A statistically significant difference was found between DNT (Dry Needling) and GROUP B (Muscle Energy Technique) as well as within the group, according to the statistical analysis performed on the quantitative data. .In DNT the post mean value of Goniometer and SPADI is 142.50± and 34.30± whereas in group B it is 116.75± and 39.05±. This demonstrates that the Dry Needling group final results shows a significant reduction in pain.

DISCUSSION

The goal the present research is to compare the effectiveness of Dry needling and MET to reduce pain in shoulder impingement syndrome and also to assess the the effectiveness in terms reducing pain and disability. The comparison is demonstrated with a duration of 4 weeks. The results were measure using the goniometer and SPADI questionnaire before and after the treatment. Beneficial effect were significantly greater in DNT (Dry Needling) than the group B (MET).When the responses were compared between both groups, the result showed a significant difference in Dry needling than the MET. In the study Naveetbadoni.*et al*., (2023) states that in the fourth and eighth weeks of the treatment program, patients with diabetic frozen shoulder who received Muscle Energy Technique (MET), Stabilization Exercise, and Moist Heat Therapy (MHT) significantly improved in terms of pain, range of motion, muscular strength, and joint position sense. MET works well to extend the glenohumeral joint's range of motion. The physiological mechanisms underlying the MET-induced changes in muscle extensibility include relaxation of the reflex, changes in viscoelastic or muscle properties, and modifications in stretch tolerance. The body of scientific literature primarily supports the modification in stretch tolerance. Increased range of motion (ROM) at the joint results from these mechanisms, which also alter the physiology of the muscles[11]. Hardy C *et.al*.,(1986) shows that the deviation from the subacromial soft-tissue structures' normal relationships is the first sign of shoulder impingement syndrome. Prolonged illness results in secondary skeletal changes. In comparison to patients with clearly defined bony constriction treatment with medications intended to reduce swelling and inflammatory changes in the subacromial soft tissues may be more effective in patients with less advanced growth and degenerative bone changes demonstrates, however, that there was no relationship at all between the frequency or severity of the radiographic abnormalities linked to impingement syndrome and the immediate response to medical therapy[2]. KUMARAN N.*et.al*.,(2023) showed that the centrally mediated pain inhibitory mechanism and the neuronal mechanism in the dorsal Horn are caused by tissue and neurological factors. These include stimulation of low-threshold mechanoreceptors, which may have gating effects, and the effect of rhythmic muscular contractions. A study by Blanco diaz.*et.al*.,(2022)showed the goal of this study is to evaluate the efficacy of dry needling (DN) and conventional physiotherapy in promoting the recovery of patients with subacromial syndrome (SAS).DN has been shown in several studies to be as effective as applying a placebo to minimize pain in four weeks for various pathologies, particularly those involving the upper limb.

A single DN session has also been shown to be effective. While a reduction in functional limitations is implied by the effectiveness of the interventions, this has nothing to do with how effective the technique is in terms of work capacity or sick leave duration. It is advised to look into the effectiveness of DN in other diseases to validate its value and then incorporate it with other treatments that are administered in clinical settings[8]. In the study Flannigan et al.,(1990) compares MR arthrography with conventional MR imaging in patients with suspected labral or rotator cuff abnormalities, providing valuable insight into the relative accuracy of each technique. Images were evaluated independently and blindly by two radiologists, reducing bias and strengthening the validity of the findings[19]. A study by Ludewig and Braman *et.al*., (2011)study showed the Shoulder impingement Biomechanical considerations

in rehabilitation provides a valuable in-depth look at the biomechanical factors contributing to shoulder impingement, moving beyond the traditional focus on rotator cuff tears. The article provides a comprehensive review of relevant literature, supporting the arguments presented and offering context for further research. The discussion mainly centers on subacromial impingement, neglecting other types of shoulder impingement that may have different biomechanical considerations[17]. Bhawna and Kundu *et.al*., (2016) states that the study shows 22.9% prevalence of shoulder pain among adults aged 30-70 years in Northern India. Obesity, left-hand dominance, and diabetes were identified as significant risk factors for shoulder pain. Reliance on self-reported pain, potentially introducing bias.Limited information on the specific characteristics and severity of shoulder pain. Study exploring the effectiveness of different treatment interventions for shoulder pain in Northern India, considering cultural and socioeconomic factors[16]. A studyby Clark *et.al*., (2001) shows that the Muscle Energy Techniques (METs) are manual therapy techniques that utilize the patient's own muscle energy to achieve various therapeutic goals like Stretching and lengthening shortened muscles, Strengthening weak muscles, Improving joint mobility and range of motion. Provides a concise and clear overview of the principles and applications of METs, Describes different types of METs and their specific techniques. Discusses the potential benefits and indications for using MET. Primarily focuses on the theoretical underpinnings and techniques of METs, with limited discussion on research evidence supporting their efficacy[7]. In the study Lucado *et.al*., (2011) demonstrate that the literature reviewing this paper connects abnormal scapulothoracic muscle function to shoulder joint pathology and pain. The findings of the reviewed studies suggest that scapular muscle imbalance, specifically weakness of the serratus anterior and upper trapezius, is linked to shoulder pain conditions such as rotator cuff impingement, superior labrum anterior to posterior (SLAP) lesions, and multidirectional instability. For patients with glenohumeral joint disease, proper assessment of the pectoralis minor, serratus anterior, and upper trapezius length, strength, and activation are essential to their rehabilitation. Consequently, the current study set out to investigate the effects of dry needling, which helps improve shoulder functions. The study's conclusions have shown that dry needling is a useful treatment for shoulder impingement syndrome, and it can help patients heal.

ACKNOWLEDGEMENT

It was a pleasure to acknowledge the department, and I owe a lot of people for their influence and assistance in building my foundation of this research. I would especially like to thank everyone who took part in the study; without them, it would not have been a success.

Table 1: Comparison of pre and post value of dry needling technique using goniometer by paired t-test

Statistical Analysis	Pre test	Post test	T value	P value
MEAN	70.75	142.50	37.46	<0.0001
SD	10.22	15.52		
SEM	2.28	3.47		

A comparison of the pre-test and post-test values of the dry needling technique using a goniometer reveals that the mean value increased from 70.75 (SD = 10.22) in the pre-test to 142.50 (SD = 15.52) in the post-test. The paired t-test yielded a t-value of 37.46, with a p-value of <0.0001, indicating that the findings are extremely statistically significant.

Table 2: Comparison of pre and post-values of DNT using spadi scale by paired t-test

Statistical analysis	Pre test	Post test	T value	P value
MEAN	67.30	34.30	22.65	<0.0001
SD	4.97	4.21		
SEM	1.11	0.94		

A comparison of the pre-test and post-test values of the dry needling technique using the SPADI scale shows a significant reduction in scores, with the mean decreasing from 67.30 (SD = 4.97) in the pre-test to 34.30 (SD = 4.21) in the post-test. The paired t-test yielded a t-value of 22.65, and the p-value was <0.0001, indicating the results are extremely statistically significant.

Table 3: Comparison of pre- and post-values of MET using a goniometer by paired t-test

Statistical analysis	Pre test	Post test	T value	P value
MEAN	71.15	116.75	36.38	<0.0001
SD	10.67	9.36		
SEM	2.39	2.09		

comparison of the pre-test and post-test values of the Muscle Energy Technique (MET) using a goniometer indicates a notable improvement, with the mean increasing from 71.15 (SD = 10.67) to 116.75 (SD = 9.36). The paired t-test produced a t-value of 36.38, and the p-value was <0.0001, demonstrating extremely statistically significant results.

Table 4: Comparison of pre- and post-values of met using the SPADI scaleby paired t-test

Statistical analysis	Pre test	Post test	T value	P value
MEAN	67.80	39.05	17.44	<0.0001
SD	5.51	4.89		
SEM	1.23	1.09		

A comparison of the pre-test and post-test values of the Muscle Energy Technique (MET) using the SPADI scale revealed a significant reduction in scores, with the mean decreasing from 67.80 (SD = 5.51) to 39.05 (SD = 4.89). The paired t-test resulted in a t-value of 17.44, and the p-value was <0.0001, indicating the results are extremely statistically significant.

Table 5 : Comparison of post value of DNT and MET of the goniometer by using an unpairedt-test

Statistical analysis	Dnt	met	T value	P value
MEAN	142.50	116.75	6.35	<0.0001
SD	15.52	9.36		
SEM	3.47	2.09		

comparing the post-test values of the Dry Needling Technique (DNT) and Muscle Energy Technique (MET) using a goniometer showed that the DNT group had a higher mean post-test value (142.50, SD = 15.52) compared to the MET group (116.75, SD = 9.36). The t-value was 6.35, with a p-value of <0.0001, indicating an extremely statistically significant difference between the two groups.

Table 6: Comparison of post value of DNT and MET of SPADI by using the unpaired t-test

Statistical analysis	Dnt	Group B	T value	P value
MEAN	34.30	39.05	3.29	<0.0022
SD	4.21	4.89		
SEM	0.94	1.09		

Compares the post-test SPADI scores between the Dry Needling Technique (DNT) group and the Muscle Energy Technique (MET) group (Group B). The DNT group had a mean score of 34.30 (SD = 4.21), while the MET group had a higher mean score of 39.05 (SD = 4.89). The t-value was 3.29, with a p-value of <0.0022, indicating a statistically significant difference in SPADI scores between the two groups.

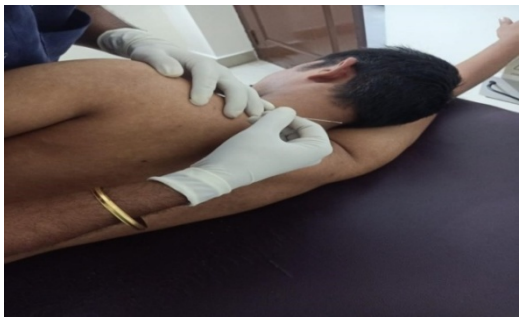

Fig 1. Dry needling for supraspinatus

The therapist performed the Dry Needling Technique with the participant in a comfortable prone or side-lying position. After locating the trigger point in the supraspinatus muscle, a sterile, disposable filiform needle was inserted perpendicularly into the identified taut band. The needle was manipulated using pistoning or fanning techniques to elicit a local twitch response. The needle was retained in place for approximately 10 minutes, with periodic gentle stimulation. Throughout the procedure, the participant was instructed to remain relaxed and breathe normally. After needle removal, gentle passive range of motion was performed to enhance muscle relaxation, followed by a rest interval of approximately 5 seconds.

Fig 2. Dry needling for the infraspinatus

The therapist administered the Dry Needling Technique with the participant in a side-lying or prone position to allow optimal access to the infraspinatus muscle. After identifying the myofascial trigger point within the muscle belly, a sterile, disposable filiform needle was inserted perpendicular to the skin or angled slightly, depending on anatomical landmarks. The needle was advanced carefully into the trigger point until a local twitch response was elicited. Pistoning or gentle rotation techniques were applied for effective stimulation. The needle was retained for approximately 10 minutes, with intermittent manual stimulation. The participant was instructed to remain relaxed and breathe deeply to aid in muscle release. Following needle removal, a gentle passive stretch was provided, and a brief rest period of 5 seconds was given.

Fig 3. Muscle energy technique for rotator cuff muscles

The therapist administered the Muscle Energy Technique with the participant in a supine or side-lying position, depending on the specific rotator cuff muscle targeted. The technique involved positioning the shoulder near the restriction barrier relevant to the involved muscle. The participant was instructed to perform a sub-maximal isometric contraction (30–40% of their maximum effort) against the therapist's resistance, held for approximately 10 seconds. Following the contraction, a relaxation phase was initiated, during which the therapist gently stretched the muscle to a new barrier for about 30 seconds. This procedure was repeated three times. During the final relaxation phase, participants were encouraged to perform deep breathing to facilitate neuromuscular relaxation. A rest interval of 5 seconds was provided between each repetition. This post-isometric relaxation approach helped reduce muscle tightness and improve functional range of motion in the glenohumeral joint.

ABSTRACT

Digital Literacy no longer simply means knowing how to turn on a computer, open a document or send an email. In today's world, digital literacy entails the ability to understand and use digital technologies in a functional, secure, and context-appropriate way for everyday and professional needs. The primary goal of this paper is to examine and evaluate the levels of digital literacy skills among the students at Government Degree College, Ramachandrapuram. The results indicate that 81 students, representing 24% of the examined population, use computers daily, while 141 students or 42% use them weekly. This suggests a significant portion of the students utilize computers weekly, with a substantial number using them daily. A very large majority of the surveyed students, specifically 333 out of 338, prefer Google Chrome as their primary web browser. This indicates a strong preference for Chrome among this student group. The data further indicates that students have foundational internet skills and are familiar with database concepts.

Keywords: Digital Literacy, Internet, Online Learning, Under Graduate Students, Web Browser.

INTRODUCTION

Digital literacy encompasses the skills required to use technology safely, effectively and responsibly. As technology continues to become more and more ingrained in daily life, the importance of learning digital literacy skills is becoming increasingly apparent. Digital literacy is indeed crucial for developing nations aiming for social and economic progress. It empowers individuals, fosters innovation and promotes inclusive growth by enabling access to information, education and economic opportunities. Digital literacy is widely recognized as a crucial and valuable tool for lifelong learning in our increasingly technology-driven world. In the modern world, digital literacy has

become a fundamental skill not just for students but for everyone, including those in the workforce and job seekers. A number of companies are actively looking for individuals with strong digital skills due to the increasing digitalization of the workplace. Numerous studies have explored digital literacy, encompassing its definition, impact on learning, and the factors that influence an individual's level of digital literacy. Sinha and Andimuthu studied the digital literacy skills of students at central university and they specified that the concept of digital literacy has reached both rural and urban students of Tamil Nadu [1]. Digital literacy among female postgraduate students of Karnataka University, Dharwad, Karnataka, India had been studied by Shettappanavar and Krishnamurthy [2]. The consequences of digital literacy and academic integrity and digital literacy influences on digital environment and current education have studied by Paul, Kerkhoff and Spires [3]. The digital literacy skills among library professionals had discussed by Natarajan and Mulat [4]. The digital literacy of Mangalore University students was focused by Kumari and Lokesha [5]. Shuhidan, Tohara, Nordin and Bahry's work in Malaysia highlights how digital literacy skills can enhance teaching and learning practices for special needy students [6]. Internet, computer and database literacy skills of the university students had explored by Prakash Bhairu Bilawar [7]. In 21st century India, digital literacy among teachers and students was stated by Pawar [8].

Purposes of the study

The purposes of this study are

- To assess undergraduate students' internet and computer skills, including their ability to use web browsers effectively.
- To evaluate the use of smart phones for internet accessing by the undergraduate students in order to meet their information needs.
- To effectively assess undergraduate students' understanding of sharing of data.
- To study computer and internet usage patterns among undergraduate students.

METHODOLOGY

The present study is to examine the digital literacy skills of students at Government Degree College, Ramachandrapuram, Dr. B.R. Ambedkar Konaseema district, Andhra Pradesh, India. The study used a purposive online survey to collect data from students enrolled in a college. A questionnaire was created using Google Forms and shared with students to gather their opinions. Google Form was shared with students via WhatsApp. A total of 338 students provided complete responses to the survey questions. Charts, tables and explanatory statements are used for presenting the students data.

RESULTS AND DISCUSSIONS

Stream-wise respondents

Table 1 and Figure 1 show the distribution of respondents of the questionnaire from different streams.

The survey data indicates that out of the students who responded, 11 students (3%) were from the Arts stream, 214 students (63%) were from the Commerce stream, and 113 students (34%) were from the Science stream. It indicates that the largest proportion of respondents belongs to the Commerce stream.

Year-wise respondents

Table 2 and Figure 2 show the respondents of the questionnaire from different years. The data shows that the majority of respondents are from the first year, with 233 (69%) students responding, compared to 23 (7%) from the second year and 82 (24%) from the third year.

Regularity and access points in the use of computer and internet

It is concluded from Figure 3 that the majority of students use computers on a weekly basis (41%), followed by "rarely" (32%), "daily" (24%), and "monthly" (3%). Table 3 shows the venues/places to use and access the internet and

computer. The provided data indicates that classrooms/laboratories are the most preferred locations for computer and internet access (95%), while libraries are the least preferred (47%). The other places identified are KRC (77%), at internet café (63%), at hostel/home (94%).

Computer Literacy Skills

The computer literacy skills of GDC (Government Degree College) students at Ramachandrapuram are specified in Table 4. It indicates a high level of awareness (94%) among students regarding computer and laptop types and specifications. This suggests a good understanding of the technical aspects of these devices. It also indicates that 93% of students having knowledge about hardware, software, operating systems, and programming languages. Further 95% students have better knowledge about different office software like Excel, Word, Power Point etc. 91% of students got awareness on different file formats and multimedia components. 33% of students have familiar with storage system with cloud applications. 96% of students have knowledge on installing the system, uploading, downloading and printing the resources. 95% of students know how to share the devices for quick retrieval of data or information. Hence, the college students have better computer literacy skills as out of 8 skill elements, 7 skill elements ratio is above 50%.

Internet Literacy Skills

The Internet literacy of GDC students at Ramachandrapuram is specified in Table 5. It specifies that 85% of the college students at GDC, Ramachandrapuram have awareness to setup internet connection, manage its settings and use of bookmarks. 95% of the college students have knowledge on WWW, URL, IP addresses, Web Browsers and techniques of navigation. 85% of the college students are familiar with webpage designing, database, data leakage and its security. 97% of the students are using mobile/internet for academics or training tasks, online learning etc. However, it is noticed from the Figure 4 that 98% of students prefer Google Chrome as their web browser, with Opera and Internet Explorer at 1% each, and Safari at 0%.

Usage of smart phones/mobiles for internet access

Table 6 shows the usage of smart phones/mobiles for accessing internet by the college students. 99% of the students use smart phones specifically for E-mail checking purposes. 98% are for chatting (Whatsapp / Facebook). 97% are using for entertainment, 96% for online shopping and 97% for E-learning tasks. Further it is noticed that 99% of the students have knowledge about sharing of data.

CONCLUSION

Digital literacy skills empower students in changing world by equipping them with the knowledge and tools to navigate the digital landscape efficiently. From the present study, it can be concluded that a significant portion of students possess computer literacy, internet usage and basic database skills. It is further noticed that 67% of the students lack knowledge about cloud storage and applications. Based on the data, interactive sessions and awareness programs are needed to educate students at Government Degree College, Ramachandrapuram about cloud storage systems and applications. Furthermore, with students possessing high digital literacy skills, college can leverage this by enhancing online learning platforms, incorporating digital tools into coursework, and focusing on digital citizenship education. This includes developing personalized learning paths, promoting ethical digital practices and fostering collaborative online projects.

ABSTRACT

ESKAPEE pathogens Multi-drug resistant (MDR) bacteria include *Enterococcus faecium*, *Staphylococcus aureus*, *Klebsiella pneumoniae*, *Acinetobacter baumannii*, *Pseudomonas aeruginosa*, *Enterobacter* spp., and *Escherichia coli*. These bacteria provide a growing treatment challenge to healthcare facilities and public health globally. During the study between March 2024 to May 2024, a total of 51 clinical samples were processed and out of 51 samples 33 isolates of ESKAPEE were found positive. ESKAPEE species were obtained which were *E. coli*, *Klebsiella spp*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa* and *Staphylococcus aureus*. ESKAPEE species were found in a urine specimen, followed by a Pus sample. *E. coli* highest isolated from urine specimens. AMR study shows the highest resistance towards Cefazolin (72.72%), Cefepime (57.57%), and (54.54%) respectively and ESKAPEE strains were sensitive towards Gentamycin and Intermediate towards Tobramycin.

Keywords: ESKAPEE, Antimicrobial resistance, Antimicrobial susceptibility test.

INTRODUCTION

The ability of microorganisms to resist and remain viable in the presence of antimicrobial drugs is known as antimicrobial resistance (AMR) [1]. Antibiotics, which are believed to be an essential part of modern clinical care, are seriously at risk from antimicrobial resistance, which is becoming increasingly common in bacteria from nosocomial and community origins. This affects people's health significantly [2]. The indiscriminate, improper, and insufficient use of antibiotics is the main cause of the global increase in AMR [3]. The major global problem of antimicrobial

resistance is putting the health of people, animals, and the environment at risk due to the emergence, spread, and persistence of multidrug-resistant (MDR) bacteria, commonly referred to as "superbugs" [4]. The global rise of multidrug resistance poses a problem to the treatment of infections and may need the use of other medicines with lower safety profiles and higher cost-effectiveness [5]. Due to their MDR nature and increased resistance to last-resort drugs, the ESKAPEE pathogens (*Enterococcus faecium, Staphylococcus aureus, Klebsiella pneumoniae, Acinetobacter baumannii, Pseudomonas aeruginosa, Enterobacter spp, Escherichia coli*) are listed as organisms of critical importance, requiring the urgent development of new antibiotics [6]. ESKAPEE is an acronym given to a group of multidrug-resistant Gram-positive and Gram-negative bacterial pathogens that exhibit improved transmission, a variety of pathogenicity mechanisms, and the ability to resist the biocidal actions of antibiotics [7]. The mechanisms of multidrug resistance exhibited by ESKAPEE are broadly classified into several categories, including drug inactivation, which is typically caused by an irreversible cleavage catalysed by an enzyme, modification of drug binding sites/targets, reduced drug accumulation caused by either increased drug efflux or reduced permeability, and biofilm formation [8]. ESKAPEE pathogens are included on the World Health Organization's (WHO) list of pathogens. Pathogens are classified as critical, high, or medium priority, depending on the urgency of developing new antibiotics to fight against them. Microbes with multiple resistance to drugs that are a threat to hospital patients are among the pathogens in the most critical group. *Pseudomonas*, *Acinetobacter*, and several *Enterobacteriaceae*, including *K. pneumoniae, E. coli, and Enterobacter spp.*, are among the critical-priority microorganisms. Bacteria like *Enterococcus faecium* and *Staphylococcus aureus* are included in the high-priority category [9].

MATERIALS AND METHODS

Sample collection

The study was conducted in the Infection Control Microbiology Laboratory at Charotar University of Science and Technology during the study period of March 2024 to May 2024. The samples were collected from the Charusat Hospital and Lifeline Laboratory. A total of 51 samples were collected from different clinical specimens (Urine, Blood, Pus and Sputum) of both sexes with different ages.

Ethical Approval

The study was approved by the Institutional Ethics Committee of Charusat University.

Isolation and Identification

Collected samples were cultured on Nutrient agar, MacConkey agar, Blood agar, CLED (Cystine Lactose Electrolyte Deficient) agar, and Chocolate agar and the plates were incubated at 37^0 C overnight. After overnight incubation, Culture plates were examined for Colonial characteristics, Gram Staining and Motility tests were performed and a set of Biochemical tests were inoculated for its final identification.

Antimicrobial Susceptibility Testing

The Antimicrobial Susceptibility Test (AST) was performed by the Kirby-Bauer Disc Diffusion Method [10-12]. Prepare 0.5 Mc Farland inoculum by suspending 2-3 well-isolated colonies of the test organism in peptone water. In the Kirby-Bauer Method, the suspension was inoculated on the Muller Hinton Agar (MHA) plates and covered with different antibiotic discs including Gentamycin (10µg), Tobramycin (10µg), Imipenem (10µg), Meropenem (10µg), Doripenem (10µg), Chloramphenicol (30µg), Ceftazidime (30µg), Cefepime (30µg), Cefazolin(30µg), Cefoxitin (30µg), Ertapenem (10µg), Cefotaxime (30µg), Cefazolin (30µg), Tetracycline (30µg), Trimethoprim (5µg), Azteronem (30µg), Ciprofloxacin (5µg), Levofloxacin (5µg), Cefuroxime (30µg), Ampicillin-Sulbactum (10/10µg), Ampicillin (10µg), Amikacin (30µg), Pipercicillin (100µg), Ofloxacin(5µg), Linezolid (30µg), Penicillin (10 units), Rifampin (5µg), Vancomycin (30µg), Clindamycin (2µg), Oxacillin (1µg), Doxycycline (30µg). The plates were incubated overnight at 37°C. The Clinical and Laboratory Standard Institute (CLSI) guideline and standard zone size chart were used to interpret the results (Sensitive, Intermediate, Resistance).

RESULT AND DISCUSSION

A Total of 51 clinical specimens were processed in the Infection Control Microbiology Laboratory at CHARUSAT during the study period of 03 months (March 2024 to May 2024. Among the 51 samples, 33 (64.70%) ESKAPEE species were isolates were obtained. Table 1 shows the result among the gender distribution. The maximum ESKAPEE were isolated from the female (63.63%) as compared to the male (36.36%). However, the result is contradictory to the finding of Ngoi *et al.*, 2021 [6]. They found that ESKAPEE infections were maximum found in males (60.31%) as compared to females (39.68%). Our study shows, that in both males and females, the infection of ESKAPEE was mostly found in the age group of 16-75 years. The highest prevalence of ESKAPEE was observed among the female age group of 16-30 (21.21%), followed by the 46-60 age group (15.15%), 31-45 age group (12.12%), 61-75 age group (9.09%) and the lowest prevalence among age group 76-90 (6.06%). However, in the male the highest prevalence of ESKAPEE was observed among the age group of 61-75 (12.12%), followed by the 46-60 age group (9.09%) and, the 16-30 age group (6.06%). The age group of 0-15 and 76-90 years had the lowest proportion of patients (3.03%). The study also shows that the prevalence of ESKAPEE was absent in the female age group of 0-15. Figure_1 illustrates the distribution of ESKAPEE isolates in different clinical samples. During the study, 04 different samples (Urine, Pus, Blood, and Sputum) were collected for the isolation of ESKAPEE. This result indicates that ESKAPEE isolates were most frequently found in the urine sample (31, 93.93%), followed by Pus samples (02, 6%). ESKAPEE species were absent in the blood and sputum samples. The sources of ESAKPEE species are shown in Table 2. *Escherichia coli* was counted for the highest percentage of isolates from the urine sample (54.54%) followed by *Klebsiella* spp. (33.33%) and *Klebsiella pneumoniae* (6.06%). Many authors reported that the highest prevalence of *Escherichia coli* from urine samples in females [13-16]. On the other hand, *Pseudomonas aeruginosa* and *Staphylococcus aureus* were counted for the lowest frequency of isolates from the Pus sample (3.03%).

ESKAPEE species were absent in the blood and sputum samples. Table 3 represents the data for all the species of ESKAPEE that exhibited Resistant, Intermediate and Sensitive responses against antibiotics. Based on Clinical and Laboratory Standards Institute (CLSI) guidelines, the results revealed that the ESKAPEE species exhibited the highest resistance towards the Cefazolin (72.72%), Cefepime (57.57%), and (54.54%) for the Imipenem, Ampicillin/Sulbactam, Ceftazidime respectively. The strains were sensitive against Gentamycin (45.45%). ESKAPEE shows (27.27%) intermediate for Tobramycin. According to Table 4, *E. coli* shows the highest resistance (39.39%) and (33.33%) towards the Cefazolin and Levofloxacin respectively. Ngoi *et al.* (2021) [6] reported that resistance towards ampicillin (87.8%), cefepime (61.5%), and ceftriaxone (61.0%). *Klebsiella spp.* recorded the highest resistance to Ampicillin/Sulbatum (27.27%), Ceftazidime (33.33%), Meropenem (18%), 24% to Imipenem and Cefazolin respectively. Namratha *et al.* (2015) [17] reported that the *Klebsiella spp.* shows the highest resistance for ampicillin 89%, cefotaxime 65%, followed by Ceftriaxone 52%, Ceftazidime 57%, and Meropenem 48%. The prevalence of antibiotic sensitivity in different ESKAPEE isolates is shown in Table 5. Out of five species of ESKAPEE, *E.coli* is found to be more sensitive toward Gentamycin 18.18%, Imipenem and Meropenem 12.12%. Ruekit *et al.* (2022) [18] reported that *E.coli* species showed 42% sensitivity to Gentamycin, Amikacin 96% and tobramycin 59%. *Klebsiella spp* shows sensitivity towards Doripenem and Gentamycin 24%. Samah *et al.* (2017) [19] also stated similar sensitivity towards Gentamycin 87.3%, Imipenem 99.5% and Amikacin 86.6%. Table 6 represents information about the prevalence of antibiotic intermediate in different ESKAPEE isolates. *E. coli* and *Klebsiella spp* are found more intermediate (12.12%) to Tobramycin and Chloramphenicol.

ABSTRACT

Probiotics, meaning "for life," have been used for thousands of years in fermented foods like yogurt, cheese, and kefir for their nutritional and therapeutic benefits. These beneficial bacteria, including *Lactobacillus*, *Streptococcus*, and *Bifidobacterium*, naturally exist in the human gut and play a key role in digestion, immune support, and disease prevention. They help maintain gut microbial balance, reduce allergies, prevent antibiotic-associated diarrhea, and support cardiovascular and mental health. Antibiotics, on the other hand, are used to treat bacterial infections but do not affect viruses. However, excessive and improper use of antibiotics has led to bacterial resistance, resulting in the emergence of "superbugs." This resistance can spread through plasmid exchange, transformation, and the food chain, especially through fermented dairy and meat products consumed without heat treatment. Certain lactic acid bacteria, such as *Enterococci*, have been linked to antibiotic resistance, raising concerns about the safety of commercial probiotics. This study aims to screen probiotic bacterial isolates from dairy and pharmaceutical products to evaluate their antibiotic resistance frequency. Understanding the extent of resistance in probiotics will help ensure their safe use in food and pharmaceutical applications.

Keywords: Antibiotic, Dairy, LAB bacteria, Pathogen, and Probiotic.

INTRODUCTION

The Latin term "probiotic" means "for life"[1]. Fermented foods including beer, bread, wine, kefir, kumis, and cheese were widely used for nutritional and medicinal benefits long before probiotic microbes were known about [2]. It is generally accepted that fermented items were most likely found—or, more accurately, found on their own.

According to mythology, yogurt most likely originated from a fermenting process in the animal skin pouches that were used to transport milk and water in areas with high temperatures and low humidity (Middle Asia and the Middle East)[3]. Probiotics have a long history that parallels the growth of the human race and, according to modern, advanced tools, can be traced back to around 10,000 years ago[1]. Food products, particularly dairy products like yoghurt, cheese, and milk, as well as medicinal treatments, include probiotic microorganisms. Lactic acid bacteria (LAB) species such as *Lactobacillus, Streptococcus, Bifidobacterium, Enterococcus, Pediococcus,* and *Bacillus* are examples of probiotic bacteria [4].A diverse collection of microorganisms found in nature, LABs are extensively dispersed. Both human and animal gastrointestinal (GI) and urogenital tracts contain these bacteria, which are also found on plant matter, in milk and meat, and in a variety of fermented foods [5]. Because lactic acid bacteria naturally cause spontaneous fermentation, they have been linked to traditional dairy products, cereals, and fermented vegetables and meats[6]. In addition to their potential health benefits, they are also employed as starter cultures in the development of probiotic products and industrial foods. The most researched dietary system for delivering probiotic bacteria to the human stomach is milk and dairy products [7]. The idea of probiotics has developed and is currently the subject of various studies. The process of choosing, characterizing, and using novel cultures in food production has advanced significantly[8].

Benefits of Probiotics

Probiotics helps in the balance of good bacteria in our digestive system. It has the ability to restore the natural balance of gut bacteria. Probiotics can help to prevent and to treat diarrhea. Most of the studies suggested that use of the probiotics to reduce the risk of antibiotic associated diarrhea [9]. Probiotics supplements helps in the improving in some mental health conditions and also in increasing gut health to improve mental health. Some of the probiotic strains are helpful to keep our heart healthy i.e. by breaking down bile. Probiotics can also prevent it from being reabsorbed in the gut. It can enter the blood as Cholesterol It also reduces the blood pressure[10]. Probiotics may reduce the severity of certain allergies; it may also reduce inflammatory response in people with milk or dairy allergies. Probiotics also helps in boosting of our Immune system by inhibiting the growth of harmful bacteria. The probiotic *Lactobacillus crispatus*has also shown to reduce the risk of urinary tract infections in women's by 50%[11].

Antibiotics

It is a drug which inhibits the growth of harmful microorganisms. Antibiotic are used to treat bacterial infections but there is no effects on viral infections[12].

Antibiotic resistance

Antibiotic resistance results in reducing the effectiveness of the bacteria using drugs (it is a natural phenomenon)[13]. (Fig: 1)

Development of antibiotic resistance in probiotic bacteria

Antibiotic resistance can be developed in probiotic bacteria naturally via natural selection, but also be engineered by applying evolutionary stress. If a bacterium develops resistance via such mode, then it is genetically transfer resistance gene in a horizontal fashion by plasmid exchange[14]. Bacteria containing several resistance genes within its DNA, then it is said to be multi resistance or a super bug, it can also be introduced into microorganisms through transformation processes and incorrect diagnosis unnecessary description.

Effects on environment

The spread of antibiotic resistance from animals to humans is largely influenced by the food chain. More precisely, fermented meat and dairy products that are not heated before consumption serve as a conduit for bacteria resistant to antibiotics and provide a direct connection between the human gastrointestinal system and the native microbiota of animals. Since these bacterial strains cause a wide range of dangerous infectious diseases, there has been a lot of research done on antibiotic resistance in LAB [15]. Lactic starter cultures, which are used in fermented milk products, are bacteria that enter our intestines in high quantities and interact with the intestinal microbiota[16]. Negative effects

could potentially result from the commercial introduction of probiotics including strains resistant to antibiotics. Given all of this, the current study was conducted to identify the prevalence of antibiotic resistance in dairy and pharmaceutical goods and screen for probiotic bacterial isolates from them [17].

Experimental Methods

Chemicals and media

Sodium chloride (NaCl), ethanol, alpha-napthol(3%), KOH(40%), double distilled water , 3% H_2O_2 solution, sulphanilic acid, N,N-dimethyl-1-naphylamine, Baritt reagent A, Baritt reagent B, MRS agar (de Man Rogosa Sharpe), MRS broth, Luria broth, Nutrient agar, Glucose Phosphate Broth were purchased from HiMedia, Mumbai, India.

Collection of samples

A total of 4 dairy products such as, curd (n=1), yoghurt (n=1), ice cream (n=1), buttermilk (n=1) were purchased from local dairy shops in Mysuru city followed by 3 pharmaceutical products such as bifilac, lactogut, pre and probiotic containing 1g of sample. The collected sample were brought to laboratory and stored at 4ºC until further use.

Isolation of bacteria

The bacteria were isolated from food samples derived from yogurts, buttermilk, curd, ice cream and pharmaceutical products. For isolation, 1g of respective sample was serially diluted with 0.85% of NaCl in aseptic condition. Later the samples were plated by pour plate and spread plate method[18]. For pour plate method, 1ml of the sample was poured into sterile Petri plate and later respective media were poured on to it. For spread plate method 0.1ml sample was poured on to Petri plate containing respective media. The plates incubated at 37Cº for 24 hrs in bacteriological incubator. After overnight incubation, the plates were observed for colony growth. Based on morphological characteristics the bacterial colonies were picked and streaked on fresh medium plates to obtain pure colony. Later the cultures were transferred into fresh sterile liquid broth.

Antibiotic susceptibility test

The antibiotic susceptibility of Bacillus and Lactic acid bacterial isolates was screened using the disc diffusion method. Antibiotic discs on the surface of MRS agar were used to help isolate LAB become more resistant to antibiotics, and the plates were incubated for 24 hours at 37Cº. The isolates' overnight-grown culture suspension (100µL) was spread out on MRS agar plates, and then the antibiotic disc containing ampicillin (10mcg), chloramphenicol (30mcg), erythromycin (15mcg), methicillin (5mcg), gentamicin (10mcg), kanamycin (30mcg), penicillin (100 units), streptomycin (10mcg), tetracycline (30mcg), Vancomycin (30mcg), ceftazidime (30mcg), ceftizoxime (30/10mcg), ofloxacin (5mcg), linezolid (30mcg), ciprofloxacin (5mcg), colistin (10mcg), nitrofurantoin (300mcg), nalidixic acid (5mcg), trimethoprim (5mcg), and amikacin (30mcg) were added. Following a 24-hour incubation period at 37°C, inhibition zone diameters were determined.

Similarly *Bacillus* isolates were also (S1, S3, S7, S8, S9, S15) tested for the above antibiotics by disc diffusion method and incubated at 37Cº for 24hrs.

Testing for Lactobacillus bacteria biochemically

The gram stain reactivity, cell shape, and cellular architecture of each isolate were investigated under a microscope. [19].

Catalase test

A sterile microscopic slide was coated with a drop of 3% hydrogen peroxide. Select cells from the middle of a well-isolated test culture colony using a nicrome wire loop, then move them into the hydrogen peroxide drop. Both were combined, and the formation of gas bubbles was monitored. While isolates that were gram positive and catalase positive were recognized as Bacillus sp., strains exhibiting gram-positive and catalase-negative isolates were classified as lactic acid bacteria.

Physiological and biochemical identification

Prior to usage, each isolate was activated in 5 ml of MRS broth for 24 hours at 30ºC. As a result, overnight cultures were employed for every identifying process. The techniques and standards of Sharpe and Fryer (1965) were followed in the physiological and biochemical identifications.

The following tests were used for the biochemical identification of lactic acid bacterial isolates

1. Gas generation from glucose;
2. Growth at various temperatures (5°C, 37°C, and 45°C);
3. Growth at 6.5% NaCl concentration; and
4. Voges-Proskauer (V-P) Test.

Gas production from Glucose

The CO_2 output from glucose test was used to better characterize homofermentative isolates. MRS broths and inverted Durham tubes were employed for this reason. Eight milliliters of test media were filled with fifty microliters of overnight cultures. Gas buildup in Durham tubes following five days of incubation at 30 ^{o}C was interpreted as proof that glucose was producing CO_2.

Voges-Proskauer (V-P) Test

Incubate the culture in the glucose phosphate broth (GPB) medium for 24 to 48 hours at 370 degrees Celsius. Add 0.6 ml of a-naphthol and 0.2 ml of KOH solution per milliliter of broth after incubation. Since a-naphthol only has a catalytic effect when added before KOH, the reagents should only be introduced in this order. After adding each reagent, give the tube a good shake and slant it to improve aeration. When a pinkred hue develops within 15 minutes or more, it indicates that the species is VP positive. Based on this, we may assume that the lactobacillus strain is either streptobacterium or thermobacterium, and the betabacterium is V-P negative.

Growth at different temperatures

The tubes containing 5 ml of temperature test media were filled with 50 µl of overnight cultures. Following inoculation, they were incubated at 5°C, 37°C, and 45°C for 24 hours. The cultures' color changed from purple to yellow, indicating the development of cells at any of these temperatures.

Growth at different NaCl concentrations

The tubes containing 5 ml of NaCl test media were filled with 50 µl of overnight cultures. Growth tests were performed on isolates at concentrations of 2%, 4%, or 6.5% NaCl. They were incubated at 30ºC for seven days. The purple to yellow hue shift is interpreted as proof of cell development.

Biochemical Characterization of *Bacillus* isolates

Gram-positive bacilli belong to the genus Bacillus. HiMedia, Mumbai, India's Hi-Bacillus Identification Kit (KB013) was used to characterize the isolates. The principles of pH change and substrate usage served as the foundation for the testing. A color shift in the media during incubation is a sign of metabolic changes in Bacillus species, which can be visually interpreted or, if necessary, confirmed by the addition of reagent.

RESULTS AND DISCUSSION

Isolation and Identification of Bacterial Isolates

A total of 8 different probiotic and dairy products were used to isolation of bacteria. A total of 20 different isolates among which 14 isolates belong to lactic acid bacterial species and 7 isolates belong to *Bacillus spp were isolated*. 20 different isolates exhibiting different morphological, characterization were selected for further studies. The isolates were designated as S_1, S_2, S_3, S_4, S_5, S_6, S_7, S_8, S_9, S_{10}, S_{11}, S_{12}, S_{13}, S_{14}, S_{15}, S_{16}, S_{17}, S_{18}, S_{19}, S_{20}. Among them (S_1, S_2) were isolated from Curd, (S_3,S_4) bifilac, (S_5-S_8) lactogut, (S_9-S_{10}) Ice cream , (S_{11}-S_{14}) pre and probiotic, (S_{15}-S_{16}) buttermilk, (S_{17}-S_{18}) yogurt, (S_{19}-S_{20}) ice cream. All isolates were subjected to gram staining based on the morphology and the

isolates were gram positive bacteria among which S_1, S_2, S_3, S_4, S_5, S_6, S_7, S_8, S_{11}, S_{18}, S_{17}, are Rod shaped and rest of the isolates were *Coccobaciili.*

Antibiotic susceptibility

A total of 20 isolates were isolated from 8 different probiotics of dairy and pharmaceutical products and were subjected to antimicrobial susceptibility testing using MRS agar by disc diffusion method. The bacterial isolates showed resistance to nalixdic acid (65%), ceftazidime (50%), ceftizoxime (50%), colistin (50%), amikacin (45%), methicillin (45%), erythromycin (35%), kanamycin (35%), streptomycin (35%), trimethoprim (35%), penicillin (30%), gentamycin (25%), ampicillin (25%), chloramphenicol (25%), ofloxacin (10%), linezolid (10%), nitrofurantrin(5%), ciprofloxacin (5%), Vancomycin (5%). The isolates of *Bacillus* and lactic acid bacteria were showing more resistant to nalixdic acid. This isolates were isolated from 2 dairy products followed by 3 pharmaceutical products.

CONCLUSION

In essence, many dried food supplements and to a lesser degree, dairy and pharmaceutical products are mislabeled with respect to the precise identification of the probiotic strains that are included. The problem of mislabeling has been brought to light in earlier reports, and the current data indicates that it has not substantially improved. The finding of resistance to nalidixic acid, ceftazidime, ceftizoxime, and colistin among the examined probiotic isolates raises concerns, even if some antibiotic resistance features in probiotic strains may be advantageous in particular situations. These results highlight the necessity of ongoing attention to detail when choosing probiotic strains devoid of genes linked to transferable antibiotic resistance. Customers must learn more about the connection between healthy eating and overall well-being. To guarantee that probiotic products used for health promotion consistently and responsibly provide the desired effects, they must be carefully assessed for safety and scientific validity.

ACKNOWLEDGMENT

The authors express their sincere gratitude to the University of Mysore, Mysuru, for the valuable support and encouragement provided throughout this research. The authors also acknowledge the university's infrastructure and resources that facilitated the completion of this work.

Funding

The authors declare that no specific funding or financial support was received for this research.

Conflict of Interest

The authors declare that there is no conflict of interest associated with this publication.

ABSTRACT

Accurate drug dose calculation is crucial in the pediatric unit due to the relatively weaker immunity of children, making them more susceptible to medications. The prescribed medication for children necessitates continuous monitoring from the prescription stage until the child achieves full recovery. Incorrect administration of medication can lead to adverse effects and pose risks to children's health. It is imperative for nurses to possess the proficiency to calculate drug doses accurately, as any lack of awareness in this regard may result in errors during drug administration. The study was carried out using quantitative research approach and non-experimental descriptive research design. The study was done on 110 sample using convenient sampling technique. Reliability was established by using Karl Pearson's formula. The collected data was analyzed using descriptive and inferential statistics. The result showed 12.7% samples had poor knowledge, average knowledge as 43.6% and good knowledge as 43.6%. There is no association found between gender, age in years, staff nurses working in pediatric unit, professional Qualification, total experience in clinical field, attended workshop/conference related to drug dose calculation and knowledge among staff nurses working in pediatric unit. The knowledge regarding pediatric drug dose calculation was found to be average hence it requires more training to be provided to the staff nurses.

Keywords: Knowledge, Pediatric Drug Dose Calculation, Pediatric Unit, Staff Nurse

INTRODUCTION

The drug dose calculation is a crucial part of every hospital. Drug dose calculation mistake happens very commonly in the paediatric patient unit[1]. Drug dose calculation is a fundamental mathematics required for awareness of normal equations, according to drug dose calculation, the drug should be administered to the children only if the nurse has adequate knowledge to calculate the drug dose[2]. The most important role and responsibility of nurse practitioner is to make certain protected medication dose computation during drug distribution. Drug problems are a frequent source of death rate and disease rates that can be incorrect during drug dose calculation[2]. The drug dose calculation is an essential part of the paediatric unit as the children's immunity is not so strong and children can become more prone to the medication[3]. If medication is administered wrongly, it can cause adverse effects and harm to children's health, if the nurse is not aware of drug dose calculation; it will create an error in administering the drug[3]. The doctor's written prescription is difficult to read so it causes dangerous problems for every patient[4]. Healthcare professionals are answerable for having enough knowledge about medication, medication preparation, and examination of medication[4]. Inadequate expertise in medication dose computation enlarges possibility of medication errors[5]. Nurses need to be careful with drug dosage calculations to prevent medication errors, which can lead to harm or even death[2]. Even a small mistake in calculating a drug dose can have serious consequences for the patient's life[6]. Medication inaccuracies are frequent and may threaten patient safety. As paediatric dose calculation is according to the children's body mass and age, the possibility of inaccuracy in dosage calculation rises[7]. Administration of paediatric drug differ from the typical adult medication dose. Children are dependent on their caretakers for their medicine. Also, they take more number of liquid medicines rather than capsules or tablets[8]. Nurses often do not realize the importance of pediatrics formulation, and it leads to inaccuracy in pediatric practice and ward treatment failure and even harm to the child.[8] According to NLM (National Library of Medicine), it is approximate 7.5 million avoidable drug inaccuracy occurs among paediatric patient in the United States[9]. The paediatric population are at remarkable risk for medication-related inaccuracy. Nurses operating with paediatric clients need adequate knowledge, and expertise about the complete attention during the drug delivering to children. Children are liable to drug mishaps. Role of the paediatric staff nurses is essential in administrating medication to children. The need for specific skills and knowledge is required by nurses working with paediatric patients, in order to ensure adequate care in administrating medication to children. Adequate preparation and medication administration for children is of great essence than that of adults[10].

METHODS AND MATERIALS

Study design: Descriptive research design
Study site: The study was carried out at selected hospital of central Gujarat
Sample size: Total 110 staff nurses include from different paediatric units
q= (1-p)
= (1- 0.0786)
= 0.9214
d= 5% = 0.05
Putting into the formula
$$n = \frac{(1.96)^2 \times (0.0786 * 0.9214)}{(0.05)^2}$$
n= 3.842x 0.0724 /0.0025
n= 110

Inclusion and Exclusion criteria
Nurses who are working in pediatric units in the last 6 months and qualified with GNM and B.Sc. Nursing course. Those who are not willing to participate, Nurse with ANM, M.Sc. nursing and Ph. D were excluded from the study.

Study tool

A: Demographic Tool consists of age, gender, professional qualification, clinical experience, pediatric experience and attended a workshop regarding drug calculation.

B: Self-structured Questionnaire To evaluate the knowledge regarding the drug dose calculation consisted of 22 questions.

Research Ethics

Ethical approval was taken from the Institutional ethical committee CHARUSAT, Changa, Gujarat.

Preparation and Investigation Phase

The researcher selected various pediatric hospitals from the Anand and Kheda districts. Then by using convenient sampling technique selected 110 staff nurses as a sample. Different demographic variables were used to select samples. By using a self-structured questionnaire, the knowledge regarding pediatric drug dose calculation was assessed.

Statistical Analysis

Data analysis is done by using Descriptive and inferential analysis. Demographic features of the sample were described using frequencies, percentages, mean and standard deviation**.** A self-structured knowledge questionnaire was applied to assess the knowledge of staff nurses by using frequency and percentage and mean, median. Then the chi-square test was employed to check association between knowledge of staff nurses about pediatric drug dose calculation with demographic variables.

RESULT

The Table 1 depicts the demographic characteristics, majority of the participants were females 90 (81.8%), whereas 20 (18.2%) were male. 94(85.5%), were between the ages of 20-30 whereas 31-40 years were 10(9.1%) and above 40 years were 6(5.5%). 89(80.9%)people have 0.5- 5years of experience, 13(11.8%) people have 6- 10 years of experience, and 8(7.3%) people have above 10 years' experience in clinical field. 91(82.7%) were qualified with GNM and 19(17.3%) were qualified with BSC nursing. 92 (83.6%) have a total pediatric experience of 0.5-3 years, 10(9.1%) have a total pediatric experience of 4-6years, 3(2.7%) have a total pediatric experience of 7-9years and 5(4.5%) has the total pediatric experience of above 10years. 38(34.5%) have attended conferences or workshops related to drug dose calculations while 72(65.5%) has not attended conferences or workshop related to drug dose calculation.

Table 2 shows the distribution of knowledge showing poor knowledge as 12.7%, average knowledge as 43.6% and good knowledge as 43.6%.

Table 3 From the above table Association between gender and knowledge among staff nurses working in pediatric unit is found to be non-significant 15.507>1.944 at 0.05 level. Association between age in years and knowledge among staff nurses working in pediatric unit is found to be non-significant 21.026>4.791 at 0.05 level. Association between Professional Qualification and knowledge among staff nurses working in pediatric unit is found to be non-significant 15.507> at 0.485 level. Association between Total Experience in clinical field and knowledge among staff nurses working in pediatric unit is found to be non-significant 21.026>5.501 at 0.05 level. Association between Total Experience in Paediatric field and knowledge among staff nurses working in pediatric unit is found to be non-significant 26.296>13.592 at 0.05 level.

DISCUSSION

The study was intended to assess the knowledge of staff nurses about drug dose calculation. By using convenient sampling technique 110 staff nurses were selected from different hospitals of Gujarat. In that majority81.1% samples

are female, and 18.2% samples are male. 94 samples are between the age group of 20 to 30 years whereas 5.5% people are above the age of 40 year. 80.9% samples have been experienced between 0.5 to 5 years whereas 7.3% samples have experienced more than 10 years. Majority 82.7% are qualified with the GNM and 17.3% are qualified with B.Sc. nursing. Majority 83.6% samples have total pediatric experience between the 0.50 to 3years whereas only 4.5% samples have pediatric experience above 10 years. Karen M. Stratton *et al*, 2004 conducted a descriptive study regarding the perception of the amount of medication errors reported and why medication errors occur in the pediatric departments. The study shows a sample of 57 pediatric nurses and 227 adult hospital nurses. The study shows that a higher proportion of error is seen in the pediatric unit (67%) than in the adult unit (56%). Also, in the pediatric unit, 14.80 per 1,000 patient days while in the adult unit, 5.56 per 1,000 patient days[11]. Jagjit Kaur *et al*, 2020 conducted a descriptive study to assess the knowledge and practices regarding drug administration among staff Nurses working in pediatric unit of DMC and Hospital, Ludhiana. The structured knowledge questionnaire and checklist were used to assess the knowledge and practice regarding drug administration. It was found that all of the staff Nurses had average practices regarding drug administration but the correlation between knowledge and practice was found to be weak. Its also shows that practice of staff nurses regarding drug administration was found to be average[12]. Babitha K Devu *et al*, May 2019 conducted an exploratory study to assess the level of knowledge and practice regarding the administration of drugs among the staff nurses working in pediatric hospitals in Bangalore. By using non-probability convenient sampling 50 staff nurses was selected and Self-structured questionnaires were used to collect data. The study revealed that 48 (96%) respondents have adequate knowledge of the administration of drugs and 2 (4%) have a moderate knowledge level[13].

CONCLUSION

In conclusion, this study highlights the importance of accurate drug dose calculation knowledge among pediatric nurses, as it directly impacts the quality of care for children. Despite the majority of participants demonstrating average or good knowledge, the findings underscore that maintaining merely average proficiency is inadequate for pediatric nursing. Furthermore, demographic variables such as gender, age, professional qualifications, and clinical experience showed no significant association with knowledge levels, emphasizing the need for continuous professional development across all groups. The low attendance at workshops or conferences related to drug dose calculation (34.5%) reveals a gap in ongoing education. This study reinforces the necessity for regular in-service training, workshops, and conferences to enhance and sustain nurses' competency in pediatric drug dose calculation, ultimately improving patient safety and care outcomes.

ABSTRACT

Acid peptic disorders are one of the commonest disorders encountered in clinical practice, although not life threatening as other major illness. The symptoms can be distressing and cause discomfort to normal life. Recent studies have found that people who face general stresses pessimistically are apt to experience psychosomatic disorders; in these very common is Acid- peptic disorders. According to Homoeopathy, it is the man who is sick and not his body and as a matter of fact he needs to be treated. It is here the concept of individualization comes into practice, where the physical as well as the mental characteristics of the individual is taken. This study has documented the prevalence, associated risk factors and the impact of this health issue along with homoeopathic constitutional medicine given to patient. An interventional study in the homoeopathic hospital to ascertain the role of constitutional medicine Arsenic album in case of acid peptic disorder was assessed by using of questionnaire, i.e., Acid peptic disorders and perceiving stress scale. Mr. BP with peptic ulcer disease aged 32 years working as bank manager is considered. After case taking and filling theFinal Perceiving stress scale questionnaire the stress level score of patient was 25 and Acid peptic questionnaire score was 26 before treatment. After taking proper analysis and evaluation of the case according to homoeopathic principles, his constitutional medicine Arsenic album in 200was prescribed. Arsenic Album 1M in the follow-up, according to the change in the susceptibility was administered. After 6 months treatment patient showed improvement. At the end of June 2024 further final perceiving stress scale and acid peptic questionnaire were filled by patient and the score was 5 and 6. It also reflected significant improvement in patient's psychological and physical

ailments. Acid peptic disorders are generally observed in patients with high stress as a common health problem due to its prevalence, manageable nature and associated social psychological implications. The acid peptic disorder in a patient is also influenced by the various stress factors and homoeopathy as a holistic system of medicine is helpful in relieving the disease, not only removing the physical symptoms but also helps the patient to increasing the coping mechanism of stress.

INTRODUCTION

The concept of psychosomatic medicine is subsumed in the diagnostic entity of "Psychological factors Affection other medical condition." This category covers physical disorders caused by or adversely affected by emotional or psychological factors. A medical condition must always be present for the diagnosis to be made.[1] Fourth edition of DSM-IV describes psychological factors affecting medical condition as one or more psychological or behavioural problems that adversely affect the course or outcome of a general medical condition or that significantly increases the person's risk of an adverse outcome.[1] Disease represents to us the reaction of the patient to the unfavorable environmental factors and this reaction manifests as signs and symptoms. The pattern of reaction is not only determinedby factors that caused illness, but also by the constitution of the affectedperson.[11] The gastro intestinal tract is one of the most common sites of psychogenetically triggered somatic symptoms and psychosomatic disorders. Problems associated with appetite and eating or elimination are part of the symptom profile of many psychiatric diseases.Studies have found convincing evidence that the onset, perpetuations and recurrence of peptic ulcers are associated with stressful life events. Acid peptic disease by definition is a disorder of gastric and duodenal mucosal barrier due to hyper or hypo secretion of acid and pepsin into the gastric juice which result in destruction of mucosal and muscular layers of stomach and duodenum. Diet habits including irregularity in food habits and rich foods, smoking and alcohol also provides a major role in the causation of the disease in addition to psychological factors. This constitution is the resultant of the early environmental factors, right from the time of conception, acting on the hereditary factors which determined by genes.[12]This constitution is the resultant of the early environmental factors, right from the time of conception, acting on the hereditary factors which determined by genes.[24]

MATERIALS AND METHODS

Clinical study: The study will be carried out with detailed case study and follow up at Sainath Hospital attached to Ahmedabad Homoeopathic Medical College, Parul University, Ahmedabad.
***Case definition*:** Cases presenting with complaints of Acid peptic diseases, case of age 32 was taken in study.

Inclusive criteria
The diagnostic criteria are mainly based on clinical history, presentation and examination findings.

Exclusion criteria
1. Ulcers secondary to burns, uraemia and drugs.
2. Cases complicated with gastric ulcer, haemorrhage, perforation, and gastric outlet obstruction.
3. Malignant conditions.
4. The patients who were unwilling to give consent to participate in the study

Data Collection It done by individual history taking according to Homoeopathic principles. A self-designed self-assessed questionnaire consisting of socio demographic characteristics, travel history, co morbidity patterns, health seeking behaviors, and outcome of the treatment had been prepared in English and local language.

Case Report
Preliminaries
Date: 09/01/2024
OPD no.: 23006434
Name: Mr. BP
Sex: Male
Age: 32
Education: MBA
Occupation: Bank Manager
Religion: Hindu
Address: Ahmedabad
Chief complains: Burning pain in epigastrium and left hypochondrium, with vomiting and retching for 1-year months, Flatulence, Nausea, generalized weakness.
<by touching, after eating and warm liquids
>After eructation, vomiting

History of Present Complain with ODP
Burning pain in epigastrium and left hypochondrium, with vomiting and retching for 1 year, generalized weakness. Patient taken allopathic treatment for 6 months but it's given no relief.
Past history: Dengue at the age of 16
Family history: Mother: DM-II, Father: HTN

Personal History
Physical Generals
- Appetite: Decreased
- Thirst: Increased
- Craving: not specific
- Aversion: food, milk
- Aggravation: warm liquids
- Sleep: Disturbed
- Perspiration: profuse on whole body
- Stool: once /day, not satisfactory
- Urine: 7-8 times /day
- Thermals: Chilly patient

Mentals
Financial stress due to loss in business, anxious, Irritable, anxiety about disease fearful dreams

Physical examination
General Examination
- Conscious
- Intelligence and education level: Intelligent
- General built and nutrition: week looking
- Height: 6' 1-inch Weight: 70 kg BMI:
- Anaemia: absent, Jaundice: not present, Cyanosis: not present, Oedema: not present
- Skin (Pigmentation, Hair distribution, warts, etc.): no any
- Nails: pinkish, Gait: normal
- Lymphadenopathy (Cervical, axillary, inguinal, etc.): no any
- Blood pressure:126/76 mm of hgPulse:80 /minutes Temperature: 98.8 F
- Respiration Rate: 18 b /min

Systemic Examination(Table 1)
Laboratory investigations and findings: Endoscopy of upper GI tract done on 9/3/2023
Provisional diagnosis: Gastritis
Final diagnosis: Body- antral Gastritis (Fig:1,2)

Miasm: Dominant miasm: Psora, Fundamental miasm: Sycosis

Analysis and evaluation
Mentals: Financial stress, Irritable, anxiety about disease

General symptoms
- Increased Thirst
- Aversion to food, milk
- Aggravation from warm liquids
- Sleep is disturbed
- Profuse on whole body

Particular symptoms
- Burning pain in epigastrium and left hypochondrium
- <by touching, after eating, >After eructation, vomiting
- Flatulence in epigastrium region
- Nausea and vomiting occasionally

Common symptoms
Weakness

Totality of symptoms
- Financial stress
- Irritable, anxiety about disease
- Increased Thirst
- Aversion to food, milk
- Aggravation from warm liquids
- Sleep is disturbed
- Profuse on whole body
- Burning pain in epigastrium and left hypochondrium <by touching, after eating
- >After eructation, vomiting
- Flatulence

Susceptibility: High
Selection of remedy: Arsenic album
Prescriptions: Ars Alb 200 single dose stat, SL 4 pills BD for 7 days
General management and auxiliary measures: Take light nutritional food

Follow ups
19/01/2024: No vomiting, pain decreased, weakness present, sleep sound
Prescription: Ars Alb 200 single dose stat, SL 4 pills BD for 15 days
04/02/2024: better in pain in abdomen, can eat food as much as he likes, weakness decreased
Prescription: SL 4 pills BD for 15 days
19/02/2024: Better in weakness, sometime burning in epigastric region, sleep disturbed
Prescription: Arsenic Alb 1m one dose, SL 4 pills BD for 1month
20/03/2024: Better in all complain, Weigh as it is

Prescription: SL 4 pills BD for 1 month
22/04/2024: Burning in epigastrium region since 5 days, no nausea, vomiting
Prescription: Arsenic Alb 1m one dose, SL 4 pills BD for 1month
27/06/2024: Better in all complain

RESULT

Final Perceiving stress scale (Fig:3,4)
Questionaries for acid-peptic disorders(Fig:5,6)
Marked improvement

DISCUSSION

Considering the psychosomatic relationship in acid peptic diseases, a detailed history taking is necessary to obtain a psychological profile and constitutional prescription. Mr. BP with peptic ulcer disease aged 32 years working as bank manager is considered. After case taking and filling the Final Perceiving stress scale questionnaire the stress level score of patient was 25 and Acid peptic questionnaire score was 26 before treatment. After taking proper analysis and evaluation of the case according to homoeopathic principles, his constitutional medicine Arsenic album in 200 was prescribed. Arsenic Album 1M in the follow-up, according to the change in the susceptibility was administered. After 6 months treatment patient showed improvement. At the end of June 2024 further final perceiving stress scale and acid peptic questionnaire were filled by patient and the score was 5 and 6. It also reflected significant improvement in patient's psychological and physical ailments. Ethical issue: Study protocol was approved through Institutional Ethical Committee. Written informed consent was taken from the participant and full confidentiality for the information provided was ensured.

CONCLUSION

Acid peptic disorders were observed in a person with high stress as a common health issue due to its prevalence, curable nature and associated social psychological problems. During this study it was found that people working at professional level and intellectually sharp has observed more acid peptic disorders. After constitutional similimum medicine Arsenic album was given patient show marked improvement. So that Homoeopathic constitutional similimum medicine has marked effect in APD.

ACKNOWLEDGEMENTS

Acknowledgement is an expression of gratefulness, toward those, whose valued help and thoughtlessness in my work. I consider myself lucky to have worked under the guidance of my recognized teacher and guide Dr. Heena Rawal in Ahmedabad homoeopathic medical college, Ahmedabad, Gujarat. Her applaudable foresight, constant stimulant, scientific approach and nonstop support have made this possible. I'm extremely thankful to Dr. Brijesh Patel for constant encouragement and his precious suggestions. I am extremely grateful to Dr. Brijesh Patel for their valuable suggestions and constant encouragement. I express my sincere thanks to Dr. Vinod Patel, trustee of Parul University and Dr. Gaurav Bhatt principal of Ahmedabad homoeopathic medical college for providing all the necessary facilities.

ABSTRACT

To investigate the *in silico* RAS-RAF-MEK-ERK modulatory potential of 20 Phyto-Chemicals present in the poly herbal Siddha formulation Eladi Chooranam (α-Cubebene, α-Copaene, β-Humulene, Eugenol, α- Thujene, β-Bisabolene, δ-Cadinol, Nerolidol, β-Sitosterol, β-Amyrin, α-Conidendrin, Hydroxy matairesinol, Texiresinol, Ferulic acid, Dresgenin. , α -Farnesene, Glycidol, α-Terpinyl Acetate, Linalool, Sabinene.) against four protein targets (K-Ras G12C: Kirsten Rat Sarcoma viral oncogene homolog G12C mutant, c-Raf1 kinase: Rapidly Accelerated Fibrosarcoma 1 kinase, MEK-1 kinase: Mitogen-Activated Protein Kinase Kinase 1, ERK2: Extracellular Signal-Regulated Kinase 2) using PyRx 0.8 in addition to study ADME properties and Toxicity Predictions using SwissADME and OSIRIS Property Explorer respectively. Based on the literature review it is evident that the foretold ligands exhibiting anti-inflammatory, antioxidant, anticancer, immunomodulatory, free radical scavenging, and anti-angiogenic properties. The Modulation of RAS-RAF-MEK-ERK pathway has its significant role in mediations of forementioned properties. Hence, the aim of our study is to investigate the phytochemicals present in poly herbal Siddha formulation Eladi Chooranam for its potential RAS-RAF-MEK-ERK modulation. All the 20 Phyto Chemicals were obtained from PubChem database. All the proteins were downloaded from RCSB PDB. Twenty Ligands were docked with 4 target proteins using PyRx and the binding interactions were studied. Apart from Glycidol other 19 ligands elicits better Binding Affinities greater than 5 Kcal/Mol. In addition, the ADMET Properties of many ligands are much favorable or comparable to that

of Standard Inhibitors of respective proteins. Thus, the *in silico* investigation of the Phyto chemicals present in Eladi Chooranam displays potential RAS-RAF-MEK-ERK modulation with favorable ADMET Properties and their activities were comparable to that of their standard inhibitors namely Sotorasib, Vemurafenib, Trametinib, Ulixertinib.

Keywords: Siddha Formulation, Molecular Docking, Eladi Chooranam, ADMET predictions, Phyto chemicals.

INTRODUCTION

RAS-RAF-MEK-ERK Pathway

The RAS-RAF-MEK-ERK Pathway is a well-studied Signal transduction pathway in cellular Biology. The elementary function of the pathway is to cascade signals from extra cellular space to the specific genes which upon activation causes functions like Cell growth, division and differentiation [1]. Wound healing, tissue repair, cell cycle regulation and its migration are the functions which occurs upon cascade of the pathway. Tumorigenesis and Oncogenesis occurs upon the mutations of the proteins in the pathway [2]. The Mutant proteins cause many types of cancers such as neurofibromas, colorectal, lung, pancreatic carcinomas, along with metastasis [3]. Various inhibitors are administered to these mutant proteins for treating these melanomas drugs like Sotorasib (Lumakras™), Vemurafenib (Zelboraf®), Encorafenib (Braftovi®), Trametinib (Mekinist®), Selumetinib (Koselugo®) [4] [5] [6] [7] [8].

Eladi Chooranam

Siddha medicinal system is one of the prominent traditional medicinal systems in India (especially in Tamil Nadu). Eladi Chooranam is a poly herbal powder formulation. Etymologically the word Eladi was derived from its one of the key ingredient 'Elam' (cardamom) [9]. The 7 ingredients of the Eladi Chooranam are *Eletaria cardamomum* (Elam), *Syzygium aromaticum* (Kirambu), *Piper nigrum* (Milagu), *Taxus baccata* (Thalisapathri), *Zingiber officinale* (Chukku), *Curcuma angustifolia* (koogaineeru), Nagapoo (*Mesua ferrea*). The above ingredients are pulverized to fine homogenous powder [10]. This formulation is indicated for the humoral imbalances (Piththam, Vaatham), flatulence (Vaayu), skin eruptions (Kiranthi, Arikiranthi, Sorisirangu, Kuttam), insect bites, urogenital disorders (Megavooral), menorrhagia (Perumpaadu), Peptic Ulcer (Kunmam) and wasting diseases (Kurainoy, Elumburukki) [9] [10].

***In silico* analysis; As a Primordial in Drug Discovery**

Old school methodology of Lead identification involves a very extensive experimental screening of chemical libraries and requires too much time and resources with little to no fruitful results [11]. In order to overcome these hurdles, computational methods were emerged as the effective tools to screen the lead candidates with selectivity and precisely [12]. The major Virtual Screening methodologies are divided into two: Ligand based screening (LBVS) and Structure based screening (SBVS) [11] [12]. The LBVS involves utilization of Physio Chemical properties of known ligand data set to predict potential new lead molecule's ADMET properties (Absorption, Distribution, Metabolism, Excretion and Toxicity) [13]. In this present study we used SwissADME and Osiris Property Explorer for the predictions. Secondly, the Structure-based virtual screening deals with Molecular Docking Studies between Biological Targets (i.e., Proteins) and a Ligand to predict the binding affinities, interaction and orientation [14]. Current study utilized PyRx for Multiple Ligand Docking.

Rationale behind Eladi Chooranam's Pathway Modulation

By reviewing over 80 Phyto constituent's pharmacological profile of the Eladi Chooranam. 20 Phyto chemicals were selected exhibiting Anti-inflammatory, anti-oxidant, anti-cancer, free radicle scavenging, anti-angiogenic properties. As it is evident that the inflammatory and oncogenic state was modulated by RAS-RAF-MEK-ERK Pathway, so with this background this paper aims to study the molecular interaction between the constituents and protein targets using in silico docking analysis, additionally ADMET predictions are also performed.

MATERIALS AND METHODS

Protein Preparation

The 3D crystallographic structures of four target proteins of RAS-RAF-MEK-ERK signaling pathway i.e., K-Ras G12C (PDB ID: 4L8G), c-Raf1 kinase (PDB ID: 1C1Y), MEK-1 kinase (PDB ID: 3SLS), and ERK2 (PDB ID: 6SLG) were downloaded from Research Collaboratory for Structural Bioinformatics Protein Data Bank (RCSB PDB). From all the Structures, co-factors, hetero atoms and water molecules were removed [15] computationally using BioVia Discovery Studio and saved in Protein Data Bank (PDB) format.

Ligand Preparation

The 20 selected Phyto constituents of Eladi Chooranam namely α-Terpinyl Acetate, Sabinene, Linalool, Eugenol, β-Humulene, α-Cubebene, α-Copaene, α-Thujene, β-Bisabolene, Nerolidol, ð-Cadinol, β-Amyrin, β-Sitosterol, Matairesinol, Hydroxy matairesinol, α-Conidendrin, Glycidol, α-Farnesene, Dresgenin, Ferulic acid were downloaded from the NCBI PubChem in 2D *SDF format alongside the 4 Standard drugs Sotorasib, Vemurafenib, Trametinib, Ulixertinib.

Molecular Docking Using PyRx

The 4 Proteins and 20 Ligands and their respective inhibitor were loaded into the PyRx 0.8 in order to perform the multiple ligands Docking. The grid box dimensions and center co-ordinates were maximized to envelope the entire protein. Docking simulations employed an exhaustiveness parameter of 8, then 'Forward' button is clicked to start Docking [16]. Then the binding affinities of the docked molecules were tabulated and analyzed. The Inhibition constant was calculated by the following formula [17] [18].

$Ki = \exp(\Delta G/(R*T))$

ΔG: Binding affinity (in kcal/mol).

R: Gas constant = 1.987×10^{-3} kcal/(mol·K).

T: Temperature in Kelvin (typically 298 K)

Subsequently the amino acid interactions are visualized using BioVia Discovery Studio.

Pharmacokinetic and Toxicity Predictions

The *in silico* pharmacokinetic properties (Absorption, Distribution, Metabolism, Excretion) were predicted using open source online server SwissADME by providing the SMILES notations of the compounds, from the server the Physio-Chemical properties (such as Molecular weight, Lipophilicity (M Log P), Lipinski violations and Bioavailability score) and Pharmacokinetic properties (such as GI absorption, BBB Permeant, P-gp substrate, Enzyme inhibited, Skin permeation) were assessed and tabulated. The Potential Toxic effects (mutagenic, tumorigenic, irritant, reproductive effects) of all the compounds were assessed by OSIRIS Property Explorer and the results were tabulated.

RESULTS

In this current *in silico* study, molecular docking analyzed the inhibitory activity of 20 Eladi Chooranam phytoconstituents against the RAS-RAF-MEK-ERK pathway kinases (K-RAS: 4L8G, C-RAF: C1Y1, MEK: 3SLS, ERK: 6SLG), in comparison to corresponding inhibitors (Sotorasib, Vemurafenib, Trametinib, Ulixertinib). As shown in Table 1, against K-RAS, Dresgenin showed the greatest binding affinity (-9.3 Kcal/Mol; Ki=0.15 μM), followed by Sotorasib (-9.1 Kcal/Mol; Ki=0.21 μM), then α-Conidendrin (-9.0 Kcal/Mol), Hydroxy matairesinol (-8.5 Kcal/Mol), β-Amyrin (-8.3 Kcal/Mol), and β-Sitosterol (-8.2 Kcal/Mol). Against C-RAF, though Vemurafenib bound well (-10.2 Kcal/Mol), β-Amyrin (-8.0 Kcal/Mol), β-Sitosterol (-7.8 Kcal/Mol), and α-Conidendrin (-7.2 Kcal/Mol) had the best affinities of the phytochemicals. Docking with MEK unveiled β-Amyrin (-8.8 Kcal/Mol; Ki=0.35 μM) as the best phytochemical binder, coming close to that of Trametinib (-9.2 Kcal/Mol; Ki=0.18 μM), with Dresgenin (-8.6 Kcal/Mol) and α-Conidendrin (-8.0 Kcal/Mol) also being highly promising. Against ERK, Dresgenin once again exhibited better binding (-8.9 Kcal/Mol; Ki=0.30 μM) in comparison to Ulixertinib (-8.4 Kcal/Mol; Ki=0.69 μM), with α-Conidendrin (-

8.7 Kcal/Mol) and β-Amyrin (-8.6 Kcal/Mol) also demonstrating strong binding affinities. SwissADME predictions (Table 2 and Table 3) predicted good drug-likeness for all constituents with moderate oral bioavailability (score 0.55) and variable GI absorption and BBB permeability; potential CYP enzyme interactions were observed. OSIRIS toxicity predictions shown in table 4, flagged some compounds (including β-Amyrin, Dresgenin, *α*-Conidendrin, β-Sitosterol, Hydroxy matairesinol) as non-toxic in all mutagenicity, tumorigenicity, and reproductive effect endpoints and indicated potentially safer profiles than comparable drugs such as Sotorasib and Vemurafenib, which were predicted toxicities. Overall, five phytochemicals, β-Amyrin, Dresgenin, *α*-Conidendrin, β-Sitosterol, and Hydroxy matairesinol, have desirable ADMET attributes and exhibit high binding affinity (> -8.0 kcal/mol) against the RAS-RAF-MEK-ERK pathway, indicating their possible modulatory role in this pathway, in line with reported bioactivities [19 - 23].

DISCUSSION

The current *in silico* study aimed to investigate the molecular interactions of phytoconstituents of the traditional Siddha drug, Eladi Chooranam, and major protein kinases of the oncogenic RAS-RAF-MEK-ERK pathway. This computational approach, encompassing molecular docking alongside ADMET predictions, provides valuable preliminary insights into the potential mechanisms underlying the formulation's documented therapeutic effects, particularly those related to inflammatory and proliferative conditions where this pathway is implicated [1, 2, 9, 10].
Our findings reveal that several phytochemicals derived from Eladi Chooranam exhibit promising binding affinities towards K-RAS, C-RAF, MEK, and ERK kinases. Most noteworthy were Dresgenin's high inhibitory capability, notably against K-RAS and ERK, whose binding energies (-9.3 Kcal/Mol and -8.9 Kcal/Mol, respectively) were better than or equivalent to respective standard drugs Sotorasib and Ulixertinib. Likewise, β-Amyrin was a strong binder of MEK (-8.8 Kcal/Mol), second only to Trametinib, and was the highest phytochemical binder versus C-RAF (-8.0 Kcal/Mol). The complex *α*-Conidendrin consistently exhibited high binding over K-RAS, MEK, and ERK, proposing a multi-targeted inhibitory profile. The computationally predicted interactions, usually involving central residues within or at the proximity of the binding sites targeted by current inhibitors, gives merit to the likelihood that such phytochemicals could functionally regulate kinase activity. This observation is consistent with the rationale of the study, which selected constituents on the basis of previously documented anti-inflammatory and anti-cancer activities, activities commonly exerted via mechanisms such as RAS-RAF-MEK-ERK. In addition, the combined ADMET analysis increases the value of these docking outcomes. The prediction that these important compounds such as β-Amyrin, Dresgenin, *α*-Conidendrin, β-Sitosterol, and Hydroxy matairesinol have good drug-like properties based on Lipinski's rule, along with moderate predicted oral bioavailability and generally good non-toxic profiles (non-mutagenic, non-tumorigenic, no reproductive effects through OSIRIS), is especially promising. This is contrasted positively with the anticipated toxicities of certain conventional inhibitors such as Sotorasib and Vemurafenib, highlighting the value of these natural compounds as leads with potentially wider safety margins. Although in silico predictions present a powerful and effective tool for lead identification [11, 12], there is a need to recognize their limitations. Such computational results are hypotheses that require stringent experimental proof. Thus, future research should focus on in vitro enzyme inhibition assays and cell-based studies focused on the identified lead compounds (Dresgenin, β-Amyrin, *α*-Conidendrin, Hydroxy matairesinol, β-Sitosterol) to validate their inhibitory activity against the target kinases and their effect on the overall RAS-RAF-MEK-ERK pathway signaling. Follow-up in vivo studies would be crucial to further assess efficacy and validate the predicted pharmacokinetic and safety profiles. Thus, the current *in silico* study identifies the therapeutic potential of specific phytoconstituents of the poly herbal Siddha formulation Eladi Chooranam, demonstrating their ability to modulate the RAS-RAF-MEK-ERK pathway by means of substantial interactions with important kinase targets (K-RAS, C-RAF, MEK, ERK) and showing good ADMET properties indicative of desirable drug-like behavior.

ABSTRACT

In this paper we explore the 4-total geometric mean cordial (4-TGMC) labeling behavior of duplication on some graphs.

Keywords: Path, Cycle, Duplication, 4- total geometric mean cordial labeling, 4- total geometric mean cordial graphs.

INTRODUCTION

The concept of k-total geometric mean cordial labeling of graphs was introduced in [7]. In this paper we investigate 4-total geometric mean cordial (4-TGMC) labeling behavior of duplication on some graphs like Path, and Cycle graphs.

AMS Mathematics Subject Classification 2010 : 05C78.

MAIN RESULTS

Theorem 2.1.
Duplicating all the points of the graph P_t is a 4- total geometric mean cordial graph for all $t \geq 2$.

Proof

Let H = P_t be the path graph with points $g_1, g_2,\ldots,g_t$. Let H' be the graph obtained by duplicating all the points $g_1, g_2,\ldots,g_t$ by a new lines $g_i'\ g_i''$ $(1\le i\le t)$.

Then $|V(H')| + |E(H')| = 7t - 1$. The function f : V($H'$) → { 1, 2, 3, 4} is defined by

Case 1: When t ≡ 1 (mod 4)

The labeling pattern of g_i, g_i' *and* g_i'' are as follows,

$$f(g_i) = \begin{cases} 3, & 1 \le i \le \frac{t+1}{2} \\ 4, & \frac{t+3}{2} \le i \le t \end{cases}$$

$$f(g_i') = \begin{cases} 1, & 1 \le i \le \frac{t+1}{2} \\ 2, & \frac{t+3}{2} \le i \le \frac{3t+5}{4} \\ 1, & \frac{3t+9}{4} \le i \le t \end{cases}$$

$$f(g_i'') = \begin{cases} 1, & 1 \le i \le \frac{t+1}{2} \\ 4, & \frac{t+3}{2} \le i \le \frac{3t+5}{4} \\ 3, & \frac{3t+9}{4} \le i \le t \end{cases}$$

Case 2: when t ≡ 2 (mod 4)

It is easy to verify for t =2, when t ≥ 6,

$$f(g_i) = \begin{cases} 3, & 1 \le i \le \frac{t}{2} \\ 4, & \frac{t+2}{2} \le i \le t \end{cases}$$

$$f(g_i') = \begin{cases} 1, & 1 \le i \le \frac{3t-2}{4} \\ 2, & \frac{3t+2}{4} \le i \le t \end{cases}$$

$$f(g_i'') = \begin{cases} 1, & 1 \le i \le \frac{t}{2} \\ 3, & \frac{t+2}{2} \le i \le \frac{3t-2}{4} \\ 4, & \frac{3t+2}{4} \le i \le t \end{cases}$$

Case 3: when t ≡ 3 (mod 4)

It is easy to verify for t =3, when t ≥ 7, the label of the points are

f (g_1) = 2,

$$f(g_i) = \begin{cases} 3, & 2 \le i \le \frac{t+1}{2} \\ 4, & \frac{t+3}{2} \le i \le t \end{cases}$$

$$f(g_i') = \begin{cases} 1, & 1 \le i \le \frac{t+1}{2} \\ 2, & \frac{t+3}{2} \le i \le \frac{3t+7}{4} \\ 1, & \frac{3t+11}{4} \le i \le t \end{cases}$$

$$f(g_i'') = \begin{cases} 1, & 1 \le i \le \frac{t+1}{2} \\ 4, & \frac{t+3}{2} \le i \le \frac{3t+7}{4} \\ 3, & \frac{3t+11}{4} \le i \le t \end{cases}$$

Case 4: when $t \equiv 4 \pmod 4$

$$f(g_i) = \begin{cases} 3, & 1 \le i \le \frac{3t}{4} \\ 4, & \frac{3t+4}{4} \le i \le t \end{cases}$$

$$f(g_i') = \begin{cases} 1, & 1 \le i \le \frac{3t}{4} \\ 4, & \frac{3t+4}{4} \le i \le t \end{cases}$$

$$f(g_i'') = \begin{cases} 1, & 1 \le i \le \frac{t}{2} \\ 2, & \frac{t+2}{2} \le i \le \frac{3t}{4} \\ 4, & \frac{3t+4}{4} \le i \le t \end{cases}$$

From the above four cases,(Table: 1)

The function f satisfies the condition $|t_{gmf}(i) - t_{gmf}(j)| \le 1$, for all i, j∈{1, 2, 3, 4}. Hence $H'$is 4- total geometric mean cordial graph.

Theorem 2.2.

Duplicating all the lines of the graph C_t, $t \ge 3$, admits 4- TGMC labeling.

Proof

Let $H = C_t$ be the cycle graph with points $g_1, g_2, g_3, \ldots, g_t$ and H' be the graph obtained from the cycle C_t by duplicating all the lines $g_1g_2, g_2g_3, \ldots, g_ng_1$ by a new points $h_1, h_2, h_3, \ldots, h_t$ respectively. Then $|V(H')| + |E(H')| = 5t$. The function $f : V(H') \to \{1, 2, 3, 4\}$ is defined by

Case 1: when $t \equiv 1 \pmod 4$

The labeling pattern of g_i and h_i are

$$f(g_i) = \begin{cases} 1, & 1 \le i \le \frac{t+3}{4} \\ 2, & \frac{t+7}{4} \le i \le \frac{t+1}{2} \\ 3, & \frac{t+3}{2} \le i \le \frac{3t+1}{4} \\ 4, & \frac{3t+5}{4} \le i \le t \end{cases}$$

$$f(h_i) = \begin{cases} 1, & 1 \le i \le \frac{t-1}{4} \\ 2, & \frac{t+3}{4} \le i \le \frac{t-1}{2} \\ 3, & \frac{t+1}{2} \le i \le \frac{3t-3}{4} \\ 4, & \frac{3t+1}{4} \le i \le t-1 \end{cases}$$

$f(h_t) = 3.$

Case 2: when $t \equiv 2 \pmod 4$

The labeling pattern of g_i and h_i are

$$f(g_i) = \begin{cases} 1, & 1 \le i \le \frac{t+2}{4} \\ 2, & \frac{t+6}{4} \le i \le \frac{t}{2} \\ 3, & \frac{t+2}{2} \le i \le \frac{3t+2}{4} \\ 4, & \frac{3t+6}{4} \le i \le t \end{cases}$$

$$f(h_i) = \begin{cases} 1, & 1 \le i \le \frac{t+2}{4} \\ 2, & \frac{t+6}{4} \le i \le \frac{t}{2} \\ 3, & \frac{t+2}{2} \le i \le \frac{3t-2}{4} \\ 4, & \frac{3t+2}{4} \le i \le t \end{cases}$$

Case 3: when $t \equiv 3 \pmod 4$

It is easy to verify for $t = 3$, when $t \ge 7$, The label of the points g_i are

$$f(g_i) = \begin{cases} 1, & 1 \le i \le \frac{t+1}{4} \\ 2, & \frac{t+5}{4} \le i \le \frac{t+1}{2} \\ 3, & \frac{t+3}{2} \le i \le \frac{3t+3}{4} \\ 4, & \frac{3t+7}{4} \le i \le t \end{cases}$$

The labeling pattern of h_i are the following two subcases,

Subcase (i): when $t = 7$

$$f(h_i) = \begin{cases} 1, & 1 \le i \le \frac{t-1}{2} \\ 3, & i = \frac{t+1}{2} \\ 4, & \frac{t+3}{2} \le i \le t-1 \end{cases}$$

$f(h_t) = 3$.

Subcase (ii): when $t > 7$

$$f(h_i) = \begin{cases} 1, & 1 \le i \le \frac{t+5}{4} \\ 2, & \frac{t+9}{4} \le i \le \frac{t-1}{2} \\ 3, & \frac{t+1}{2} \le i \le \frac{3t-5}{4} \\ 4, & \frac{3t-1}{4} \le i \le t-1 \end{cases}$$

$f(h_t) = 3$.

Case 4: when $t \equiv 4 \pmod 4$

The label of the points g_i are

$$f(g_i) = \begin{cases} 1, & 1 \le i \le \frac{t}{4} \\ 2, & \frac{t+4}{4} \le i \le \frac{t}{2} \\ 3, & \frac{t+2}{2} \le i \le \frac{3t}{4} \\ 4, & \frac{3t+4}{4} \le i \le t \end{cases}$$

The labeling pattern of h_i are as follows

Subcase (i): when t = 4

$$f(h_i) = \begin{cases} 1, & 1 \le i \le \frac{t}{4} \\ 3, & \frac{t+4}{4} \le i \le \frac{t}{2} \\ 4, & \frac{t+2}{2} \le i \le t-1 \end{cases}$$

$f(h_t) = 1.$

Subcase (ii): when t > 4

$$f(h_i) = \begin{cases} 1, & 1 \le i \le \frac{t}{4} \\ 2, & \frac{t+4}{4} \le i \le \frac{t-2}{2} \\ 3, & \frac{t}{2} \le i \le \frac{3t-4}{4} \\ 4, & \frac{3t}{4} \le i \le t-1 \end{cases}$$

$f(h_t) = 1.$

From the above four cases,(Table: 2)

Hence $H'$is a 4- total geometric mean cordial graph.

Theorem 2.3.

Duplicating all the points of the graph C_t, $t \ge 3$, admits 4- TGMC labeling.

Proof

Let $g_1, g_2, g_3, \ldots, g_t$ be the points of the cycle C_t and C_t' be the graph obtained by duplicating all the points $g_1, g_2, g_3, \ldots, g_t$ by a new lines $g_i'\ h_i'$ $(1 \le i \le t)$. Then $|V(C_t')| + |E(C_t')| = 7t$. The function f : $V(C_t') \to \{1, 2, 3, 4\}$ is defined by

Case 1: when t is odd

The label of the points g_i are

$$f(g_i) = \begin{cases} 3, & 1 \le i \le \frac{t+1}{2} \\ 4, & \frac{t+3}{2} \le i \le t \end{cases}$$

The labeling pattern of g_i'*and* h_i' are the following two subcases,

subcase (i): when $t \equiv 1 \pmod 4$

$$f(g_i') = \begin{cases} 1, & 1 \le i \le \frac{3t-3}{4} \\ 2, & \frac{3t+1}{4} \le i \le t \end{cases}$$

$$f(h_i') = \begin{cases} 1, & 1 \le i \le \frac{t+1}{2} \\ 4, & \frac{t+3}{2} \le i \le \frac{3t+5}{4} \\ 3, & \frac{3t+9}{4} \le i \le t \end{cases}$$

Subcase (ii): when $t \equiv 3 \pmod 4$

$$f(g_i') = \begin{cases} 1, & 1 \le i \le \frac{3t-1}{4} \\ 2, & \frac{3t+3}{4} \le i \le t \end{cases}$$

$$f(h_i') = \begin{cases} 1, & 1 \le i \le \frac{t+1}{2} \\ 3, & \frac{t+3}{2} \le i \le \frac{3t-1}{4} \\ 4, & \frac{3t+3}{4} \le i \le t \end{cases}$$

Case 2: when t is even

The label of the points g_i are

$$f(g_i) = \begin{cases} 3, & 1 \le i \le \frac{t}{2} \\ 4, & \frac{t+2}{2} \le i \le t \end{cases}$$

The labeling pattern of g_i' *and* h_i' are as follows

Subcase (i): when t ≡ 2 (mod 4)

$$f(g_i') = \begin{cases} 1, & 1 \le i \le \frac{3t-2}{4} \\ 2, & \frac{3t+2}{4} \le i \le t \end{cases}$$

$$f(h_i') = \begin{cases} 1, & 1 \le i \le \frac{t}{2} \\ 4, & \frac{t+2}{2} \le i \le \frac{3t-2}{4} \\ 3, & \frac{3t+2}{4} \le i \le t \end{cases}$$

Subcase (ii): when t ≡ 4 (mod 4)

$$f(g_i') = \begin{cases} 1, & 1 \le i \le \frac{3t}{4} \\ 2, & \frac{3t+4}{4} \le i \le t \end{cases}$$

$$f(h_i') = \begin{cases} 1, & 1 \le i \le \frac{t}{2} \\ 3, & \frac{t+2}{2} \le i \le \frac{3t+4}{4} \\ 4, & \frac{3t+8}{4} \le i \le t \end{cases}$$

From the above two cases,(Table: 3)

Hence s$C_t'$is a 4- TGMC graph.

ABSTRACT

Periauricular tags, benign congenital anomalies located near the ear, are often asymptomatic but may present cosmetic concerns. This case report details the surgical management of a significant periauricular tag in a 7-year-old patient. The report highlights the diagnostic approach, surgical technique, and outcomes, emphasizing the effectiveness of surgical intervention in improving both cosmetic appearance and patient satisfaction.

Keywords: Periauricular Tag, Surgical Management, Cosmetic Surgery, Congenital Anomalies.

INTRODUCTION

Periauricular tags are congenital skin growths located near the anterior auricle, frequently identified in childhood. Though typically benign and asymptomatic, these tags can cause cosmetic concerns or discomfort. Surgical removal is a common management strategy for tags that impact appearance or function. This case report discusses the surgical approach for a periauricular tag, providing insights into effective management strategies.

CASE REPORT
Age:14 years
Gender: Male
Medical History: No significant past medical or surgical history. Developmental milestones were appropriate for age. No associated symptoms or syndromes.

Chief Complaint
The patient presented with a noticeable nodular swelling on the left side of the ear, which had been present since birth. The tag was approximately 2.0x2.0cm in size, raised, elliptical and skin-colored. The primary concern was cosmetic, as the tag affected the patient's self-esteem and social interactions.

Physical Examination
On examination, the periauricular tag was located anterior to the left ear, above the ear canal. The lesion was smooth, non-tender, mobile and pedunculated. There were no signs of inflammation, infection, or associated ear malformations. The rest of the ear examination was unremarkable, and no other congenital anomalies were observed.

Diagnostic Work-Up
Given the benign appearance of the tag, further diagnostic imaging was not deemed necessary. The diagnosis was based on clinical evaluation, with no signs of associated congenital syndromes or additional anomalies. Parental concerns about cosmetic appearance and potential psychological impact motivated the decision for surgical intervention.

Surgical Procedure
Pre operative measures
Informed Consent: Detailed discussion with parents about the procedure, risks, and benefits. Written consent obtained.
Anaesthesia: Local anaesthesia was administered using lidocaine to minimize bleeding and provide adequate pain control.
Injection tetanus was given IM stat
Positioning: The patient was positioned comfortably on the operating table, with the head slightly tilted to expose the left ear.
The area was painted with the antiseptic lotion
Operative measures
Incision: Aelliptical incision was made around the periauricular tag using a #15 blade, ensuring clear margins. At the base of the swelling.
Dissection: The tag was dissected from the surrounding tissue with a combination of scissors and blunt dissection. Care was taken to avoid damaging the underlying cartilage and ear structures.
Haemostasis: Bleeding was controlled with electric cautery.
Closure: The wound was closed in layers using 3.0 catgut sutures. A small, sterile dressing was applied.

Postoperative Care
Instructions: Parents were advised to keep the area clean and dry, and to apply an antibiotic ointment as directed.
Follow-Up: The patient was scheduled for follow-up in 1 week to assess wound healing and suture removal.

RESULTS

The patient recovered without complications. At the 1-week follow-up, the surgical site showed good healing with no signs of infection or wound dehiscence. Sutures were removed, and the cosmetic result was satisfactory to both the patient and her parents. The patient reported an improvement in self-esteem and social interactions.

DISCUSSION

Periauricular tags are common congenital anomalies that are generally benign. Surgical removal is indicated primarily for cosmetic reasons or if the tag causes discomfort. In this case, the decision to proceed with surgery was guided by the significant cosmetic impact on the patient and her reported psychological distress. The surgical approach used was effective in removing the tag with minimal complications. Local anaesthesia proved adequate for pain management, and postoperative care was straightforward. The positive outcome highlights the benefits of surgical intervention in improving patient quality of life and satisfaction.

CONCLUSION

Surgical management of periauricular tags is a safe and effective option for addressing cosmetic concerns. This case report demonstrates that with proper surgical technique and follow-up care, patients can achieve excellent cosmetic outcomes and improved self-esteem. Ongoing evaluation and individualized care plans are essential to ensuring optimal results and patient satisfaction.

ABSTRACT

Lexi AI is a cutting-edge project designed to provide users with an efficient and secure platform for interacting with a locally hosted Large Language Model (LLM). The project leverages Gradio, a Python-based library, to create an intuitive and interactive user interface, enhancing usability while maintaining simplicity. By running entirely on local systems, Lexi AI ensures data privacy, eliminating the need for external servers or cloud-based processing. This project demonstrates the potential of integrating AI capabilities into standalone systems, offering a versatile tool for various applications such as learning support, content generation, and interactive problem-solving. The reliance on Gradio for the frontend ensures ease of use and accessibility, while the absence of a complex backend simplifies deployment and reduces overhead. Lexi AI is further enhanced by integrating Ollama deployment, which provides a seamless and efficient method for managing and running the locally hosted LLM. This framework ensures smooth performance and accessibility, making it easier for users to interact with the AI model without technical barriers. With its focus on privacy, efficiency, and accessibility, Lexi AI empowers users by bringing advanced natural language processing capabilities directly to their systems. Whether for

education, research, or creative writing, this solution represents a step forward in AI-powered solutions for individuals and businesses alike.

Keywords: Large Language Model (LLM), Gradio Interface, Ollama Deployment, Data Privacy, AI-Powered Solutions

INTRODUCTION

Artificial Intelligence (AI) has significantly transformed human-computer interactions, making systems more intelligent and responsive. With the increasing demand for AI-driven applications, local deployment of language models has gained prominence due to its ability to function independently without relying on cloud-based services. Lexi AI is an AI-based chatbot designed to answer user queries efficiently while ensuring data privacy and fast response times. Built using Python and Gradio, this system leverages an LLM (Large Language Model) deployed locally through Ollama, ensuring seamless query processing without dependence on external APIs. Unlike traditional AI chatbots that require internet connectivity, Lexi AI runs entirely on local hardware, making it ideal for restricted or offline environments.

Key Features of LEXI AI
Local Deployment: Functions without internet access, ensuring independence from cloud services.
Data Confidentiality: User queries and responses remain stored locally, preventing unauthorized access.
Fast and Efficient Processing: Optimized for quick, contextually relevant answers with minimal computational overhead.
User-Friendly Interface: Powered by Gradio for an intuitive and interactive chatbot experience.

Development Process
System Specification and Design: Selection of appropriate hardware and software configurations.
Development and Implementation: Building the chatbot with Python and integrating Gradio for user interaction.
Testing and Deployment: Ensuring optimal performance through robust testing and evaluation strategies.

Key Focus Areas
Privacy and Security: Prevents external data breaches by storing all interactions locally.
Optimized Performance: Ensures low-latency response times and smooth operation.
Accessibility: Designed for both technical and non-technical users.
Lexi AI stands out as a reliable AI chatbot, offering secure, efficient, and intelligent AI-driven interactions in offline and privacy-sensitive applications.

LITERATURE REVIEW

Cloud - Based AI Chatbots

- Many AI chatbots, such as Open AI's ChatGPT (https://openai.com/research/gpt-4) and Google's Bard (https://ai.google/discover/bard), rely on cloud-based processing, offering powerful computational resources and large-scale language modeling.
- These systems utilize transformer-based architectures to generate human-like responses, making them effective for various applications (https://papers.nips.cc/ paper_files/paper/ 2017/file/3f5ee243547dee91fbd053c1c4a845aa-Paper.pdf).
- However, cloud dependency introduces challenges such as data privacy risks, latency issues, and the need for an active internet connection (https://ieeexplore.ieee.org/document/9349192).

- Additionally, concerns about external data processing and storage limit the adoption of cloud-based models in sensitive domains (https://link.springer.com/article/10.1007/s43681-022-00123-4).

Locally Hosted AI Systems

- Locally hosted AI chatbots have emerged as a privacy-preserving alternative to cloud-based models.
- Solutions like Meta's LLaMA (https://ai.facebook.com/blog/large-language- model-llama-meta-ai/) and Stanford's Alpaca (https://crfm.stanford.edu/2023/03/13/ alpaca.html) allow users to deploy large language models on personal hardware, eliminating reliance on external servers.
- These models leverage fine-tuned transformer architectures optimized for on-device execution (https://www.springer.com/ journal/12345).
- However, despite improved privacy and offline functionality, locally hosted systems require substantial computational resources, making them less accessible to users with limited hardware capabilities (https://dl.acm.org/doi/10.1145/3468626).

Hybrid AI Deployment

- Hybrid AI frameworks integrate both local and cloud-based processing to balance performance and accessibility.
- Platforms like Rasa (https://rasa.com/docs/rasa/) and DeepPavlov (http://docs.deeppavlov.ai/en/master/) offer hybrid deployment models that allow chatbots to operate offline while synchronizing data with online services when needed.
- This approach enhances flexibility but also introduces challenges in maintaining consistency between local and cloud models, as real-time synchronization can affect system responsiveness (https://dl.acm.org/doi/10.1145/3490485)
- Additionally, security risks persist when transitioning between local and online environments, requiring robust encryption and access control measures.

User Interface and Interaction

- The usability of AI chatbots is influenced by their user interfaces.
- Frameworks like Gradio (https://www.gradio.app/) and Streamlit (https://docs.streamlit.io/) have simplified chatbot interactions through intuitive, web-based UI solutions, making AI models more accessible.
- Studies indicate that a well-structured chatbot interface enhances user engagement and response interpretability (https://www.tandfonline.com/doi/full/10.1080/).
- However, many existing UI frameworks prioritize cloud-based deployment, leading to challenges in optimizing them for low-latency, locally hosted AI applications (https://papers.nips.cc/paper_files/paper/2019/file/b1f62f3d0d4d8afc3e5b3d31394f727d- Paper.pdf).

Existing System Challenges

Traditional chatbot systems or AI assistants often rely on cloud-based models and third-party APIs for query resolution. These systems typically involve

Internet dependency: Most AI-based systems require a stable internet connection, making them inaccessible in offline environments.

Data privacy concerns: User queries and responses are sent to external servers, raising concerns over data security and confidentiality.

Latency issues: Since queries must be processed over the internet, users may experience delays, especially during high traffic periods.

Limited customization: Many existing systems are pre-trained with fixed models and offer limited flexibility for local fine-tuning and optimization.

Cost implications: Many cloud-based AI models require paid subscriptions or API usage fees, increasing operational costs for users and organizations.

Draw Backs

High Response Time: Queries take longer to process due to local communication, affecting real-time interactions.
Limited Local Control: Users cannot modify or enhance the model easily, as cloud-based solutions restrict local model updates and optimizations.
Storing of Previous Data: Due to privacy reasons, there are no configurations for storing user queries.

Proposed System

To overcome the limitations of existing systems, Lexi AI introduces a local AI model deployment approach that provides a fast, secure, and cost-effective solution. The system is designed with
Offline functionality: The AI model is deployed locally using Ollama, eliminating the need for an internet connection.
Enhanced security: Since all query processing happens within the user's device, there are no external data transfers, ensuring complete privacy.
Lower latency: Queries are processed instantly, reducing response time significantly.
User-friendly Interface: Built with Gradio, Lexi AI provides an intuitive UI for easy interaction.
Scalability and Flexibility: The system allows modifications, local fine-tuning, and updates without external dependencies.
Cost efficiency: No recurring API fees, making it a one-time deployment with no hidden costs.

Features

The key features of Lexi AI include
Local LLM Deployment: Eliminates reliance on cloud-based AI models, ensuring faster and secure query handling.
Modular Architecture: Comprises User Interface, Application Logic, LLM Processing.
Real-time Query Processing: Provides instant responses with minimal processing time.
Multi-Platform Compatibility: Can run on Windows, Linux, and MacOS, requiring only basic system resources.
User-Friendly Interface: Designed with Gradio, offering an accessible and visually appealing chat environment.
Secure and Private: All interactions remain local to the system, eliminating external data exposure.
Lightweight and Efficient: Optimized to run on moderate hardware without requiring high-end computational power.

METHODOLOGY

The system design of Lexi AI ensures smooth interaction between its components to deliver an efficient and responsive experience.
User Interface (Gradio Frontend): Serves as the entry point, allowing users to input queries and receive responses in an intuitive, accessible interface.
Application Logic (Python Scripts): Bridges the frontend and LLM, handling user input, processing requests, formatting responses, and managing errors.
LLM Deployment (Ollama): Manages model loading, inference, and resource optimization for seamless query processing.
Local Storage: Stores model weights, configurations, and logs, enabling offline operation, quick model loading, and enhanced privacy.

Input Design

Lexi AI's input design ensures a seamless and intuitive user experience while maintaining flexibility.
User-Friendly Input Field: Simple text box for easy query input.
Accessibility Features: Support for screen readers, high-contrast text, and keyboard navigation.
Error Feedback: Clear error messages for incorrect inputs.
Offline Inputs: Direct local processing with minimal latency.

Online Inputs (via Gradio Links): Supports remote access while maintaining usability.

Output Design

The output design ensures clear, structured, and real-time AI-generated responses through the Gradio-based UI.
Clear and Readable Responses: Well-structured text with proper formatting.
Real-Time Response Generation: Immediate output display with a loading indicator.
Response Enhancement Features: Options to refine or re-generate responses, with syntax highlighting for code queries.

RESULTS AND DISCUSSIONS

System Development

System development is the process of designing, building, testing, and deploying the Lexi AI system to ensure it meets functional and performance requirements. The development phase follows a structured approach, integrating various components, including the user interface, backend processing, database management, and local AI model deployment. Lexi AI was developed using an incremental and modular approach, ensuring that each module was designed, tested, and integrated systematically. The system follows a local AI-driven architecture, using Gradio for UI, Python for backend logic, and Ollama for LLM processing.

The development focused on

- Creating a seamless user interaction experience.
- Ensuring low latency in AI response generation by running locally.
- Each module of the system (UI, Query Processing, AI Model) was developed independently to ensure flexibility and maintainability.
- The system was deployed locally, ensuring data privacy and fast execution. Continuous monitoring and maintenance plans were implemented to update the model and optimize system performance based on user feedback.

Description of Modules

Lexi AI is designed as a modular system where each module plays a crucial role in ensuring smooth functionality. The system is divided into the following key modules

User Interface Module

- Built using Gradio, this module allows users to input queries and receive responses.
- Provides a text input field, response display area, and history tracking for user queries.
- Ensures a user-friendly and interactive experience with accessibility features.

Query Processing Module

- Handles user queries and preprocesses input before sending it to the AI model.
- Implements text validation to ensure meaningful queries are processed.
- Supports query reformatting, such as removing redundant spaces or fixing typos.

AI Model Processing Module

- Uses Ollama for local LLM deployment to process user queries.
- Ensures fast response generation without external API dependencies.
- Supports context retention for better conversational accuracy.

Response Generation Module

- Processes output from the AI model and formats it for display.

- Allows re-generation of responses if the user is not satisfied.

Testing and Implementation

Ensuring the reliability, accuracy, and efficiency of Lexi AI required a structured testing strategy and a well-defined implementation process. Various testing methodologies were applied to validate system performance, security, and user experience. The implementation was executed in a phased manner to allow smooth integration of components while optimizing for real-world usability.

Testing Strategy

Testing was conducted at multiple stages of development to identify and resolve potential issues before deployment. The following testing methodologies were applied

Unit Testing

- Each module was tested in isolation to ensure it functioned correctly.
- The primary focus was on verifying core components such as user input handling,
- AI model response generation, and database query logging.
- Unit tests were written in Python to validate functions and classes individually.

Integration Testing

- After unit testing, integration testing was performed to ensure that different system components worked together seamlessly.
- The primary objective was to verify smooth interaction between the Gradio-based UI, AI processing engine and local LLM deployment.

Performance Testing

- Performance testing was conducted to evaluate the system's response time and efficiency under different loads.
- The system was tested with varying numbers of concurrent users to ensure it could handle multiple requests without significant delays.
- Metrics such as response time, memory usage and processing speed were analyzed

Implementation

The implementation of Lexi AI followed a phased development approach, ensuring smooth progression from initial requirements to final deployment. Each phase was carefully planned and executed to minimize errors and optimize system performance.

Phase 1: Requirement Analysis

- The project began with a detailed analysis of user needs, functional requirements, and technical specifications.
- Key objectives were defined, such as ensuring fast query response times, secure local execution, and an intuitive user interface.

Phase 2: System Design

- A comprehensive system architecture was developed, including data flow diagrams, UML diagrams and UI wireframes.
- This phase established a clear blueprint for development, ensuring all system components were designed to work efficiently together.

Phase 3: Module Development

The system was developed in modular units, allowing independent testing and optimization. Key modules included:

- **User Interface Module:** Developed using Gradio for seamless text-based query submission.

- **Query Processing Module:** Handled user input validation.

Phase 4: Integration and System Testing

- Once individual modules were successfully developed, they were integrated and tested as a complete system.
- Various test cases were executed to ensure that queries were processed accurately and that responses were generated efficiently.

Phase 5: Deployment and Optimization

- Lexi AI was deployed locally, ensuring fast execution, data security, and reliable performance.

CONCLUSION

Lexi AI represents a significant advancement in AI-powered chatbot systems, designed to provide seamless, efficient, and intelligent query resolution. The project was conceptualized to bridge the gap between user queries and AI-driven responses, ensuring data security, local processing, and enhanced performance. Unlike traditional cloud-based chatbot systems, Lexi AI operates entirely on a local machine using Ollama, eliminating dependency on external APIs and reducing response latency. The integration of Python, Gradio, and a locally deployed LLM allowed the system to function efficiently while ensuring high accuracy and responsiveness. Throughout the development lifecycle, a structured approach was followed, including requirement analysis, system design, module development, rigorous testing, and phased implementation. The modular architecture of Lexi AI enabled seamless integration and systematic testing, ensuring that each component functioned efficiently and independently. The development process incorporated rigorous testing methodologies, including unit testing, integration testing, performance evaluation, and user acceptance testing, which were essential in refining the system for optimal performance and reliability before deployment.

Through comprehensive testing and iterative improvements, Lexi AI was enhanced to deliver highly accurate, context-aware responses while maintaining fast processing speeds and secure query handling. The final product is a robust, privacy-focused, and highly efficient AI chatbot, capable of providing intelligent and precise query resolution while ensuring data security and user confidentiality. Its scalability, adaptability, and offline functionality make it a powerful AI assistant for a wide range of applications, from enterprise solutions to research and personal productivity tools.

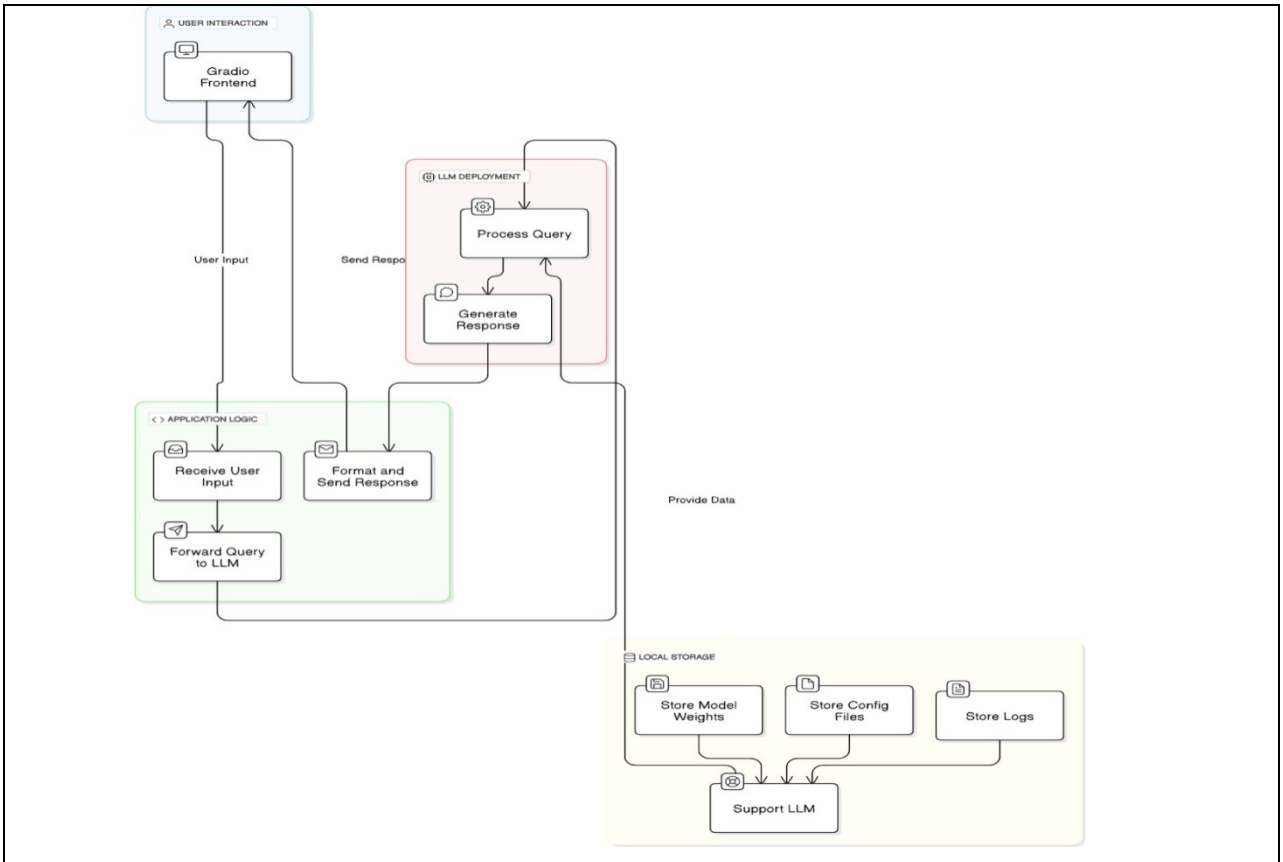
Key Achievements

The completion of this project resulted in several key achievements that highlight the effectiveness and efficiency of the system

- **Efficient Query Processing:** The chatbot can handle diverse user queries with high accuracy using an LLM trained for intelligent response generation.
- **Local AI Deployment:** By leveraging Ollama, the model runs entirely on a local machine, ensuring faster response times and enhanced data security.
- **Seamless User Experience:** The Gradio-based user interface makes the chatbot accessible, intuitive, and easy to use for non-technical users.
- **Comprehensive Logging System:** All user interactions, including queries and responses, are stored in a structured database, allowing for query tracking, analysis, and future improvements.

Future Scope and Enhancements

Lexi AI has significant potential for future improvements to enhance functionality, adaptability, and user experience.



- **Multimodal Capabilities:** Enable voice and image-based queries for greater accessibility.
- **Cloud-Optional Deployment:** Offer users a choice between local and cloud-based models.
- **Continuous Learning:** Implement self-learning to improve responses over time.

- **Contextual Memory Retention:** Enhance conversation continuity with context-aware responses.
- **External API Integration:** Optional support for accessing external knowledge bases.
- **Plugin-Based Extensibility:** Allow modular API plugins for industry-specific customization.
- **Industry-Specific API Support:** Integrate domain-specific databases (e.g., medical, financial, legal).
- **Multilingual Support:** Expand to multiple languages with real-time detection for global accessibility.

ABSTRACT

Consider a graph $G = (p, q)$. Let V be an inner product space with a basis T. Denote the inner product of two vectors a and $b$by $< a, b >$. Let $\psi: V(G) \to T$ be a function. For edge uv, assign the label $< \psi(u), \psi(v) >$. We say that ψ is a vector basis T-cordial labeling (VB T-cordial labeling) if $\left|\psi_x - \psi_y\right| \leq 1$ and $\left|\beta_i - \beta_j\right| \leq 1$ where ψ_a denotes the number of vertices labeled with the vector a and β_i denotes the number of edges labeled with the scalar i. A graph with a vector basis T-cordial labeling is called a vector basis T-cordial graph (VB T-cordial graph).In this present paper, we prove that$A(DT_n) \odot mK_1$ is a VB {(1,1,1,1),(1,1,1,0),(1,1,0,0),(1,0,0,0)}-cordial.

Keywords: Triangular Snake, Double Triangular Snake and Double Alternate Triangular Snake.
2020 AMS Subject Classification: 05C78

INTRODUCTION

We begin with undirected, finite and simple graph. Graph labeling was introduced in [18]. We refer to a dynamic survey of graph labeling by Gallian [6]. Cordial labeling was introduced in [3].Various cordial related labeling of some snake graphs were discussed in [1,2,7-9,13,15-17,19].We follow [4,5] for terms and notations. We have examined the VB{(1,1,1,1),(1,1,1,0),(1,1,0,0),(1,0,0,0)}-cordial labeling of some special graphs in [10-12].In this present paper, we

prove that the graphs $A(DT_n) \odot mK_1$ is a VBT-cordial graph where T={(1,1,1,1),(1,1,1,0),(1,1,0,0),(1,0,0,0)}.Figure (1) provides an example of a VB{(1,1,1,1),(1,1,1,0),(1,1,0,0),(1,0,0,0)}-cordial graph.

2. Main Results

Denote the vectors (0,0,0,1), (0,0,1,1), (0,1,1,1) and (1,1,1,1) respectively by c_1, c_2, $c_3$andc_4. That is c_1= (0, 0, 0, 1), c_2= (0, 0, 1, 1), c_3= (0, 1, 1, 1) and c_4= (1, 1, 1, 1).

Theorem 2.1. The graph $A(DT_n) \odot mK_1$ is a vector basis $\{c_1,c_2,c_3,c_4\}$-cordial for$m \geq 1$ and even $n \geq 4$.

Proof.

Let$V(A(DT_n) \odot mK_1) = \{u_i, u_{i,j} | 1 \leq i \leq n \; and \; 1 \leq j \leq m\} \cup \{v_i, w_i, v_{i,j}, w_{i,j} | 1 \leq i \leq \frac{n}{2} \; and \; 1 \leq j \leq m\}$ and $E(A(DT_n) \odot mK_1) = \{u_i u_{i,j} | 1 \leq i \leq n\} \cup \{u_i u_{i+1} | 1 \leq i \leq n and \; 1 \leq j \leq m\} \cup \{u_{2i-1}v_i, v_i u_{2i}, u_{2i-1}w_i, \; w_i u_{2i}, v_i v_{i,j}, w_i w_{i,j} | 1 \leq i \leq \frac{n}{2} \; and \; 1 \leq j \leq m\}$. Then $p = 2n(m+1)$and$q = n(2m+3) - 1$. Put the vector to the vertices in the following order $u_1, u_2, v_1, w_1, u_3, u_4, \; v_2, w_2, u_5, u_6, \ldots, u_{n-1}, u_n, v_{\frac{n}{2}}, w_{\frac{n}{2}}$.

Case *A*: $n \equiv 0 \; (mod \; 4)$

Let $n = 4k_1, k_1 > 0$. Assign c_4 to the first $k_1$cycles and c_3 to the next $k_1$cycles. Putc_2 to the next $k_1$cyclesandc_1 to the remaining $k_1$cycles. If k_1 is even, assign $2k_1$vertices for c_4, c_3, c_2 and c_1. If k_1 is odd, assign $2k_1 + 1$ vertices for c_4 and $c_2$and put $2k_1 - 1$ vertices for $c_3$and c_1. Put the vectors to the pendent vertices in the following order $u_{1,1}, u_{1,2}, \ldots, u_{1,m}, u_{2,1}, u_{2,2}, \ldots, u_{2,m}, v_{1,1}, v_{1,2}, \ldots, v_{1,m}, w_{1,1}, w_{1,2}, \ldots, w_{1,m}, u_{3,1}, u_{3,2}, \ldots, u_{3,n}, u_{4,1}$, $u_{4,2}, \ldots, u_{4,n}, v_{2,1}, v_{2,2}, \ldots, v_{2,m}, w_{2,1}, w_{2,2}, \ldots, w_{2,m}, \ldots, u_{n-1,1}, u_{n-1,2}, \ldots, u_{n-1,m}, u_{n,1}, u_{n,2}, \ldots, u_{n,m}$, $v_{\frac{n}{2},1}, v_{\frac{n}{2},2}, \ldots, v_{\frac{n}{2},m}, w_{\frac{n}{2},1}, w_{\frac{n}{2},2}, \ldots, w_{\frac{n}{2},m}$.

Sub case *a*: $m \equiv 0 (mod \; 4)$

Take$m = 4k_2, k_2 > 0$.$p = 4(8k_1k_2 + 2k_1)$. When k_1 is even. Assign c_4 to the first $8k_1k_2$vertices and c_3 to the next $8k_1k_2$ vertices. Putc_2 to the next $8k_1k_2$ vertices and c_1 to the last$8k_1k_2$ vertices. When k_1 is odd. Assign c_4 to the first $8k_1k_2 - 1$vertices and c_3 to the next $8k_1k_2 + 1$ vertices. Putc_2 to the next $8k_1k_2 - 1$ vertices and c_1 to the remaining $8k_1k_2 + 1$ vertices.

Sub case *b*: $m \equiv 1 (mod \; 4)$

Put$m = 4k_2 + 1, k_2 \geq 0$.$p = 4(8k_1k_2 + 4k_1)$. When k_1 is even. Assign c_4 to the first $8k_1k_2 + 2k_1$vertices and c_3 to the next $8k_1k_2 + 2k_1$ vertices. Putc_2 to the next $8k_1k_2 + 2k_1$ vertices and c_1 to the remaining $8k_1k_2 + 2k_1$ vertices. When k_1 is odd. Assign c_4 to the first $8k_1k_2 + 2k_1 - 1$vertices and c_3 to the next$8k_1k_2 + 2k_1 + 1$ vertices. putc_2 to the next $8k_1k_2 + 2k_1 - 1$ vertices and c_1 to the last$8k_1k_2 + 2k_1 + 1$ vertices.

Sub case *c*: $m \equiv 2 (mod \; 4)$

Take$m = 4k_2 + 2, k_2 \geq 0$.$p = 4(8k_1k_2 + 6k_1)$. When k_1 is even. Assign c_4 to the first $8k_1k_2 + 4k_1$vertices and c_3 to the next $8k_1k_2 + 4k_1$ vertices. Putc_2 to the next $8k_1k_2 + 4k_1$ vertices and c_1 to the remaining $8k_1k_2 + 4k_1$ vertices. When k_1 is odd. Assign c_4 to the first $8k_1k_2 + 4k_1 - 1$vertices and c_3 to the next$8k_1k_2 + 4k_1 + 1$ vertices. Putc_2 to the next $8k_1k_2 + 4k_1 - 1$ vertices and c_1 to the last$8k_1k_2 + 4k_1 + 1$ vertices.

Sub case *d*: $m \equiv 3 (mod \; 4)$

Put$m = 4k_2 + 3, k_2 \geq 0$.$p = 4(8k_1k_2 + 8k_1)$. When k_1 is even. Assign c_4 to the first $8k_1k_2 + 6k_1$vertices and c_3 to the next $8k_1k_2 + 6k_1$ vertices. Putc_2 to the next $8k_1k_2 + 6k_1$ vertices and c_1 to the remaining $8k_1k_2 + 6k_1$ vertices. When k_1 is odd. Assign c_4 to the first $8k_1k_2 + 6k_1 - 1$vertices and c_3 to the next$8k_1k_2 + 6k_1 + 1$ vertices. Putc_2 to the next $8k_1k_2 + 6k_1 - 1$ vertices and c_1 to the last$8k_1k_2 + 6k_1 + 1$ vertices.

Case *B*: $n \equiv 2(mod\ 4)$

Put $n = 4k_1 + 2, k_1 > 0$. Assign c_4 to the first $k_1 + 1$cycles and c_3 to the next $k_1 + 1$cycles. Also, assign c_2 to the next $k_1$cyclesand c_1 to the last$k_1$cycles. If k_1 is even, assign c_4 to the first $2k_1 + 3$ vertices and c_3 to the next$2k_1 + 1$ vertices. Putc_2 to the next$2k_1$ vertices and c_1 to the remaining $2k_1$ vertices. If k_1 is odd, assign c_4 to the first $2k_1 + 2$ vertices and c_3 to the next $2k_1 + 2$ vertices. Putc_2 to the next$2k_1 + 3$ vertices and c_1 to the last$2k_1 + 1$ vertices.

Sub case *a*: $m \equiv 0(mod\ 4)$

Take$m = 4k_2, k_2 > 0. p = 4(8k_1k_2 + 4k_2 + 2k_1 + 1)$. When k_1 is even. Putc_4 to the first $8k_1k_2 + 4k_2 - 2$vertices and c_3 to the next $8k_1k_2 + 4k_2$ vertices. Assign c_2 to the next $8k_1k_2 + 4k_2 + 1$ vertices and c_1 to the last$8k_1k_2 + 4k_2 + 1$ vertices. When k_1 is odd. Put$c_4$to the first $8k_1k_2 + 4k_2 - 1$vertices and c_3 to the next $8k_1k_2 + 4k_2 - 1$vertices. Assign c_2 to the next $8k_1k_2 + 4k_2$vertices and c_1 to the last$8k_1k_2 + 4k_2 + 2$vertices.

Sub case *b*: $m \equiv 1(mod\ 4)$

Put$m = 4k_2 + 1, k_2 \geq 0. p = 4(8k_1k_2 + 4k_1 + 4k_2 + 2)$. When k_1 is even. Assignc_4 to the first $8k_1k_2 + 2k_1 + 4k_2 - 1$vertices and c_3 to the next $8k_1k_2 + 2k_1 + 4k_2 + 1$ vertices. Putc_2 to the next $8k_1k_2 + 2k_1 + 4k_2 + 2$ vertices and c_1 to the last $8k_1k_2 + 2k_1 + 4k_2 + 2$ vertices. When k_1 is odd. Putc_4 to the first $8k_1k_2 + 2k_1 + 4k_2$vertices and c_3 to the next$8k_1k_2 + 2k_1 + 4k_2$ vertices. Assign c_2 to the next $8k_1k_2 + 2k_1 + 4k_2 + 1$ vertices and c_1 to the last$8k_1k_2 + 2k_1 + 4k_2 + 3$ vertices.

Sub case *c*: $m \equiv 2(mod\ 4)$

Take$m = 4k_2 + 2, k_2 \geq 0. p = 4(8k_1k_2 + 6k_1 + 4k_2 + 3)$. When k_1 is even. Putc_4 to the first $8k_1k_2 + 4k_1 + 4k_2$vertices and c_3 to the next $8k_1k_2 + 4k_1 + 4k_2 + 2$vertices. Assign c_2 to the next $8k_1k_2 + 4k_1 + 4k_2 + 3$ vertices and c_1 to the last$8k_1k_2 + 4k_1 + 4k_2 + 3$ vertices. When k_1 is odd. Putc_4 to the first $8k_1k_2 + 4k_1 + 4k_2 + 1$vertices and c_3 to the next$8k_1k_2 + 4k_1 + 4k_2 + 1$vertices. Assign c_2 to the next $8k_1k_2 + 4k_1 + 4k_2 + 2$vertices and c_1 to the remaining $8t_1t_2 + 4t_1 + 4t_2 + 4$vertices.

Sub case *d*: $m \equiv 3(mod\ 4)$

Put$m = 4k_2 + 3, k_2 \geq 0. p = 4(8k_1k_2 + 8k_1 + 4k_2 + 4)$. When k_1 is even. Assign c_4 to the first $8k_1k_2 + 6k_1 + 4k_2 + 1$vertices and c_3 to the next $8k_1k_2 + 6k_1 + 4k_2 + 3$ vertices. Putc_2 to the next $8k_1k_2 + 6k_1 + 4k_2 + 4$vertices and c_1 to the last$8k_1k_2 + 6k_1 + 4k_2 + 4$vertices. When k_1 is odd. Assign c_4 to the first $8k_1k_2 + 6k_1 + 4k_2 + 2$vertices and c_3 to the next$8k_1k_2 + 6k_1 + 4k_2 + 2$vertices. Put$c_2$ to the next $8k_1k_2 + 6k_1 + 4k_2 + 3$vertices and c_1 to the last$8k_1k_2 + 6k_1 + 4k_2 + 5$ vertices.■

Example 2.2. Figure (2) provides an example of a VB $\{c_4, c_3, c_2, c_1\}$-cordial labeling of $A(DT_4) \odot 2K_1$.

Theorem 2.3. The graph $A(DT_n) \odot mK_1$ is a VB$\{c_4, c_3, c_2, c_1\}$-cordial for all $m \geq 1$ and odd$n \geq 3$.

Proof.

Let$A\ (DT_n) \odot mK_1$,n is odd

by$V\ (A(DT_n) \odot mK_1) = \{u_i | 1 \leq i \leq n\} \cup \{x, v_i, w_i, v_{i,j}, w_{i,j}, x_j | 1 \leq i \leq \frac{n-1}{2}\ and\ 1 \leq j \leq m\}andE(A(DT_n) \odot mK_1) = \{u_iu_{i+1} | 1 - 1\} \cup \{u_{2i-1}v_i, v_iu_{2i}, u_{2i-1}w_i,\ w_iu_{2i}, u_iu_{i,j}, v_iv_{i,j}, w_iw_{i,j}, xx_j | 1 \leq i \leq \frac{n-1}{2}\ and\ 1 \leq j \leq m\}$.Then$p = (2n + 1)(m + 1)andq = (2n + 1)(m + 1) + n - 1$. Assign the vectors to the vertices as in the case to $A(DT_{n-1}) \odot mK_1$ where $n - 1$ is even. Put the vectors to $x, x_1, x_2, \dots, x_m$. Put$c_4$to x.

Case ***A***: $m \equiv 0(mod\ 4)$

Let $m = 4k_2, k_2 \geq 0$.Assignc_4 to $x_1, x_2, \dots, x_{k_2}$and $c_3$to $x_{k_2+1}, x_{k_2+2}, \dots, x_{2k_2}$. Put$c_2$ to $x_{2k_2+1}, x_{2k_2+2}, \dots, x_{3k_2}$and $c_1$to $x_{3k_2+1}, x_{3k_2+2}, \dots, x_{4k_2}$.

Case *B*: $m \equiv 1(mod\ 4)$
Put$m = 4k_2 + 1, k_2 \geq 0$.Assign $c_4$to $x_1, x_2, \ldots, x_{k_2}$and $c_3$to $x_{k_2+1}, x_{k_2+2}, \ldots, x_{2k_2}$. Put$c_2$ to $x_{2k_2+1}, x_{2k_2+2}, \ldots, x_{3k_2}$and $c_1$to $x_{3k_2+1}, x_{3k_2+2}, \ldots, x_{4k_2+1}$.

Case *C*: $m \equiv 2(mod\ 4)$
Take$m = 4k_2 + 2, k_2 \geq 0$.Assign c_4 to $x_1, x_2, \ldots, x_{k_2}$and $c_3$to $x_{k_2+1}, x_{k_2+2}, \ldots, x_{2k_2}$. Put$c_2$ to $x_{2k_2+1}, x_{2k_2+2}, \ldots, x_{3k_2+1}$and $c_1$to $x_{3k_2+2}, x_{3k_2+3}, \ldots, x_{4k_2+2}$.

Case *D*: $m \equiv 2(mod\ 4)$
Put $m = 4k_2 + 3, k_2 \geq 0$.Assign c_4 to $x_1, x_2, \ldots, x_{k_2}$and $c_3$to $x_{k_2+1}, x_{k_2+2}, \ldots, x_{2k_2+1}$. Put$c_2$ to $x_{2k_2+2}, x_{2k_2+3}, \ldots, x_{3k_2+2}$and $c_1$to $x_{3k_2+3}, x_{3k_2+4}, \ldots, x_{4k_2+3}$.■

Example 2.4. Figure (3) provides an example of a VB{c_4, c_3,c_2, c_1}-cordial labeling of $A(DT_5) \odot 2K_1$.

5. Conclusion
In this present paper, we have proved that$A(DT_n) \odot mK_1$ is a VB{c_4,c_3,c_2,c_1}-cordial. The existence and non-existence of a VB{c_4,c_3,c_2,c_1}-cordial labeling of corona operation of more families of graphs are the open problems for future research work.

ABSTRACT

Jaundice, known as Kamala in Ayurveda, is characterized by yellowing skin, sclera, and mucous membranes due to excess bilirubin accumulation. It often results from liver dysfunction, bile metabolism disorders, or red blood cell breakdown. Conventional allopathic treatment primarily focuses on hepatoprotective drugs and supportive therapy, but their effectiveness varies. This study examines the efficacy of Ayurvedic interventions in managing Jaundice in a patient who showed resistance to allopathic treatment. A 21-year-old male patient presented with fever, severe itching, abdominal discomfort, weakness, etc. He had no previous medical history but reported recent fever, stress, and Irregular dietary habits. Despite receiving hepatoprotective drugs, multivitamins, and hydration therapy his symptoms persisted. Based on the Ayurvedic diagnosis, the condition was identified as Kamala, resulting from an imbalance and aggravation of Pitta dosha. LFTs confirmed elevated bilirubin and liver enzyme levels, diagnosing Jaundice. The treatment includes Shodhana, Shamana, And Pathya to detoxify the liver and restore metabolic balance. Despite limited improvement with prior allopathic treatment, the patient showed significant symptom relief following the Ayurvedic regimen. Fever, itching, and nausea were reduced within a week, and liver function parameters gradually normalized. The patient reported improved appetite, energy level, and overall well-being by the end of the treatment. This case highlights the efficacy of Ayurvedic treatment in managing jaundice. Unlike conventional therapy, Ayurveda addresses the root cause by balancing Pitta dosha, enhancing detoxification, and supporting liver function. Integrating Shodhana, Shamana, and Pathya offered a comprehensive approach, facilitating

long-term recovery. This study emphasizes Ayurveda's potential as a viable alternative for jaundice management, particularly in patients who do not respond to allopathic treatment.

Keywords: Jaundice, Kamala, Ayurveda, Allopathic Resistance.

INTRODUCTION

Jaundice is a common clinical manifestation of liver dysfunction, characterized by yellow discoloration of the skin, sclera, and mucous membranes due to excessive bilirubin accumulation. It often results from hepatocellular damage, cholestasis, or hemolysis, leading to metabolic disturbances and systemic complications. The condition significantly impacts an individual's overall health, causing fatigue, loss of appetite, nausea, and general weakness. Prompt and effective treatment is essential to prevent disease progression and associated morbidity. In Ayurveda, Jaundice is classified under Kamala, which is primarily attributed to an imbalance in Pitta dosha. Pitta dosha, being responsible for metabolism and bile production, when aggravated, leads to impaired liver function, excessive bilirubin accumulation, and systemic toxicity. Ayurvedic texts emphasize a holistic approach to the management of Kamala, incorporating detoxification therapies (Shodhana), medications (Aushadha), dietary modifications (Pathya-Apathya), and lifestyle adjustments (Vihara) to restore physiological balance and promote liver health [1]. Conventional medical management of jaundice primarily focuses on symptomatic relief and hepatoprotective measures. However, certain cases exhibit resistance to pharmacological treatment, necessitating alternative or integrative therapeutic approaches. With its rich repository of hepatoprotective and detoxifying formulations, Ayurveda provides a promising avenue for the effective management of Jaundice (Kamala). This case study presents the Ayurvedic treatment approach for a 21-year-old male diagnosed with Kamala (Jaundice) who did not show significant improvement with conventional allopathic treatment. The study aims to explore the efficacy of Ayurvedic interventions, including herbal and herbo-mineral formulations, dietary regulations, and bio-purificatory therapies like Virechana (therapeutic purgation). The findings from this case provide insight into Ayurveda's potential role in hepatobiliary disorders and its effectiveness in restoring liver function and overall well-being.

Case Presentation

A 21-year-old male patient visited the OPD on 24/10/2024 with the following complaints

Patient Information

Patient Name: ABC
Age: 21-year-old
Sex: Male
Occupation: Student

Present Complaints

The patient exhibited yellowish discoloration of the skin, sclera, and nails, accompanied by
Jwara (fever)
SarvangKandu (itching over the body)
Anidra (insomnia)
Udara Shula (abdomen pain)
Vibandha (Constipation)
Chardi (Vomiting)
Hrillasa (Nausea)
Anannabhilasha (loss of appetite)
Angamarda (body ache)
Daurbalya (weakness)
Bhrama (Giddiness)

Sharira bhara hani (weight loss)

History of present illness

The patient initially experienced mild fever, fatigue, and body aches, which subsided with self-medication. However, symptoms persisted, and within a week, he developed yellowish discoloration of the skin, dark urine, nausea, and loss of appetite. Seeking allopathic treatment, he was prescribed hepatoprotective drugs, multivitamins, and hydration therapy, but his condition did not improve. Gradually, he developed severe itching, insomnia, weakness, constipation, and weight loss.

History of Past illness

The patient reported no significant medical history of chronic conditions or previous episodes of similar symptoms, and no known allergies or hereditary conditions were reported.

Personal history

Addiction: There is no history of any addiction like smoking or alcohol.
Lifestyle and Dietary Habits: The patient followed a sedentary lifestyle and irregular dietary habits and preferred spicy and fried foods.
There were no significant lifestyle changes or recent travel.
Family History: Non-contributory.

Clinical findings

Ashtavidha Pariksha

Nadi (Pulse): *Pitta pradhana*
Mutra (Urine): *Haridra varna*
Mala (Stool): *Haridra varna, Vibandha* (Constipation)
Jihva (Tongue): *Sama++*
Shabda (Speech): *Samyak*
Sparsha (Touch): *Ushna*
Drik (Eyes): *Haridra varna*
Akruti (Appearance): *Haridra Varna*

General Examination

Weight: 46 kg
Body Temperature: 101.2°F
Pulse Rate: 88 bpm
Blood Pressure: 90/72 mmHg
Respiratory Rate: 18 breaths/min

Systemic Examination

CNS: Well-oriented to person, place, and time.
CVS: S1, S2 audible, no murmur.
Respiratory system: no obvious deformity, with B/L clear chest, no added sound present.
Digestive System: Mild tenderness in the right hypochondriac region.
Mild hepatomegaly on palpation.

Investigations

CBC: Hb:11.6 gm/dl
RBC Count: 4.05 million
HCT: 32.7%
RDW: 16.1%

Liver Function Test
Serum Bilirubin Total: 34.00 mg/dl
Serum Bilirubin Direct: 26.90 mg/dl
Serum Bilirubin Indirect: 7.10 mg /dl
Serum Alkaline Phosphatase: 273.70 IU/I
SGPT (ALT): 43.15 U/L
SGOT (AST): 67.20 U/L
Serum Proteins: Total Proteins: 9.90 G
Albumin: 4.40 G
Globulins: 5.50 G
A./G. Ratio: 0.80
HBS Ag: Negative
Urine Complete: Color: Orange
Pus cells: 1-2/ HPF
Epithelial cells: 2-4 /HPF

USG (whole abdomen)
Mild Hepatomegaly, Edematous Gall Bladder Wall.
P/O Infective etiology? Viral Hepatitis

Diagnosis: Kamala [2] (Jaundice)

Table 1: Treatment modalities

Sr.No	Medicine	Dose	Duration	Adjuvant
1.	Eranda Taila [3]	40 ml	Early Morning	Luke warm Water
2.	Arogyavardhini Vati [4]	250 mg	5 times in day	Water
3.	Kumari Asava [5]	10 ml	6 times in day	Water
4.	Katuki Churna [6] Guduchi Churna [7] Pashanabheda Churna [8] Avipattikara Churna [9]	100 mg 75 mg 75 mg 100 mg	6 times in day	Kumari asava
5.	Mahakalyanaka Ghruta [10]	20 ml	3 times in day	LukeWarm Water
6.	Gau Ghruta [11]	Local Application	SOS

Sharira bhara hani (weight loss)	+	-	-
SarvangKandu (itching over the body)	+++	++	-

DISCUSSION

The presented case demonstrates the efficacy of Ayurvedic interventions in the management of jaundice, specifically Kamala (Shakhashrita Kamala), by addressing the root cause rather than just symptomatic relief. The patient exhibited a significant reduction in symptoms such as weakness, nausea, itching, and loss of appetite following Ayurvedic treatment. Liver function tests showed a steady decline in serum bilirubin levels, SGPT indicating improved hepatic function. This highlights the potential of Ayurvedic treatment as a complementary or alternative approach in cases where conventional allopathic treatments provide limited relief.

In this instance, the Ayurvedic treatment takes a multifaceted approach
Pitta-Pacifying Therapy: Formulations and treatments were chosen to cool, detoxify, and restore balance because Pitta dosha aggravation is the main cause of Jaundice [12].
Shodhana (Purification) Therapy: A type of therapeutic purgation called Virechana [13]is essential for removing toxins and accumulated Pitta from the body, which has a systemic detoxifying effect.
Shamana (Palliative) Therapy: Herbal and herbo-mineral medications were used to help with digestion, encourage hepatocellular regeneration, and support liver function.
Pathya (Dietary and Lifestyle Modifications): To promote digestion and stop additional liver burden, light, easily digestible foods, and lifestyle adjustments were advised.

Mode of Action of Medicines
Eranda Taila (*Ricinus communis*) – Virechana (Therapeutic Purgation)
- Acts as a potent purgative, eliminating accumulated Pitta and toxins from the liver and intestines.
- Helps regulate bile flow and reduce excessive bilirubin levels.
- Restores digestive fire (Agni) by eliminating Ama (toxins).
- Induces controlled purgation, reducing liver congestion and promoting detoxification.

Arogyavardhini Vati
- A herbo-mineral formulation containing Tamra Bhasma, which enhances liver function and bile metabolism.
- Detoxifies the liver and promotes hepatocellular regeneration.
- Balances Pitta and Kapha doshas, aiding digestion and metabolism.
- Improves fat metabolism and assists in bile regulation, reducing intrahepatic cholestasis.

Kumari Asava (*Aloe vera* Fermented Preparation)
- Stimulates liver enzymes and improves bile secretion.

- Acts as a mild laxative, aiding in the excretion of toxins.
- Strengthens liver tissue and supports overall digestive health.
- Enhances enzymatic functions in the liver, accelerating detoxification processes.

Katuki (*Picrorhiza kurroa*), Guduchi (*Tinospora cordifolia*), Pashanabheda (*Bergenia ligulata*), Avipattikara Churna

- Katuki has cholagogue properties that enhance bile secretion and detoxification.
- Guduchi is an immunomodulator and hepatoprotective herb that restores liver function.
- Pashanabheda helps in reducing inflammation and preventing gallbladder-related complications.
- Avipattikara Churna aids digestion and alleviates Pitta-related disorders.
- Work synergistically to improve digestion, bile production, and overall liver health.

Mahakalyanaka Ghrita

- Medicated ghee formulation that soothes inflamed liver tissues and enhances digestion.
- Acts as a Rasayana (rejuvenating) to promote long-term liver health.
- Supports cognitive and neurological well-being affected by systemic toxicity.
- Provides essential fatty acids that aid in cellular repair and reduce oxidative stress on the liver.

Gau Ghrita (Cow Ghee – Local Application)

- Provides symptomatic relief from itching and dryness.
- Acts as a cooling agent to balance aggravated Pitta.
- Nourishes and rejuvenates skin affected by excessive bilirubin deposition.
- Contains bioactive lipids that assist in skin barrier restoration and detoxification.

CONCLUSION

This case study highlights the efficacy of Ayurvedic interventions in the management of jaundice (Kamala), specifically Shakhashrita Kamala, by addressing the root cause rather than merely providing symptomatic relief. The patient, who had limited improvement with conventional allopathic treatment, responded significantly to Ayurvedic therapy, which included Virechana (therapeutic purgation), hepatoprotective herbal and herbo-mineral formulations, and dietary and lifestyle modifications. A steady decline in serum bilirubin levels, SGPT, along with symptomatic relief in fatigue, nausea, itching, and loss of appetite, demonstrated the positive impact of Ayurveda in restoring hepatic function. The holistic approach, emphasizing detoxification, liver regeneration, and digestive enhancement, proved beneficial in the comprehensive management of jaundice. This case underscores Ayurveda's potential as a complementary or alternative approach for hepatobiliary disorders. Further clinical research and larger-scale studies are warranted to validate these findings and establish Ayurveda as an integrative solution for jaundice and liver-related ailments.

ABSTRACT

Clinical trials conducted in the United States operate under a comprehensive and evolving system of Regulatory oversight, established to protect human participants and ensure the credibility of exploratory issues. This review provides a critical examination of the principal regulatory obligations and ethical liabilities involved in the inauguration and conduct of clinical trials across the U.S. Emphasis is placed on the administrative places of the Food and Drug Administration (FDA), Institutional Review Boards (IRBs), and adherence to the International Council for Harmonization (ICH) Good Clinical Practice (GCP) guidelines. The analysis is supported by a targeted review of recent regulatory developments, including the finalized ICH E6 (R3) standard and newly issued FDA guidance documents from 2023 to 2025. This article compiles the findings into a structured compliance checklist and discusses ongoing challenges such as inconsistencies in IRB procedures, complexities in obtaining informed consent, safeguarding digital data, and evolving focus on diversity in clinical research. By merging foundational requirements with contemporary changes, the review seeks to assist investigators, sponsors, and regulatory professionals in navigating the U.S. clinical research environment with greater clarity, accuracy, and ethical integrity.

Keywords: Clinical trials, FDA regulations, ICH-GCP, Institutional Review Board (IRB), Regulatory compliance, United States, ICH E6 (R3), Clinical research ethics, Trial documentation, Informed consent.

INTRODUCTION

Significance of Clinical Trials within the U.S Regulatory Ecosystem Clinical trials form a vital foundation in the U.S. regulatory system, as they induce the scientific substantiation needed to demonstrate the safety, effectiveness, and quality of new medicines, medical bias, and remedial interventions. These trials enable Regulatory authorities similar as the U.S. Food and Drug Administration (FDA) — to assess whether a medical product meets the norms for public use, directly impacting treatment vacuity and healthcare issues.By totally assessing the remedial benefits and implicit pitfalls of investigational products, clinical trials give the critical data necessary for regulatory review and blessing. These studies must cleave to internationally honored norms, including the Good Clinical Practice(GCP) guidelines, which emphasize ethical conduct, data trustability, and rigorous attestation across all trial phases. The FDA plays a central part in covering clinical studies conducted in the U.S., icing full compliance with federal regulations and the generation of reliable substantiation to support marketing authorization opinions.

Regulatory Organizational framework of the USA

The regulatory landscape in the United States is complex, comprising a system of civil agencies, state-level regulators, and independent oversight organizations.

Key Federal Agencies Involved within Clinical Studies

FDA (Food and Drug Administration) Oversees medicine development, blessing, and post- market surveillance The **Office for Human Research Protections (OHRP)** safeguards the rights of participants and ensures ethical standards are upheld in research funded by the federal government.
NIH (National Institutes of Health) Supports and regulates intimately funded biomedical exploration.
IRBs (Institutional Review Boards) Review and authorize exploration protocols to cover smortal subjects.

State Regulatory Agencies (named exemplifications)

- Utah Department of Financial Institutions (DFI)
- Texas Department of Banking
- Illinois Department of Financial and Professional Regulation

Self- Regulatory Bodies

FINRA (Financial Industry Regulatory Authority) Although concentrated on fiscal requests, it contributes to institutional compliance in studies involving fiscal backing ideal and compass idea. This review seeks to give a comprehensive evaluation pertaining to the United states regulatory frame intended for clinical studies, fastening on crucial regulatory guidelines, compliance norms, and the part of oversight bodies similar as the FDA in promoting value-based and Research-oriented integrity in medical exploration.

The composition addresses the following critical areas

Regulatory Oversight Analysis of FDA, IRBs, and GCP adherence.
Pre-Trial Conditioning Protocol development, Investigational New Drug (IND) cessions, and ethical concurrence.
Trial perpetration: Compliance monitoring, adverse event reporting and data quality assurance.
Post-Trial Procedures: Regulatory cessions including New Drug Applications (NDA),
Biologics License Application (BLA), and final study reports.
This review is intended as a practical reference for guarantors, investigators, and clinical exploration professionals working to align with regulatory prospects in the U.S.

Major Regulatory Authorities in the U.S.
FDA civil agency under the U.S. National Health and Human Support Department (U.S.), the FDA holds authority for securing public health by regulating medical products, food, and biologics.

OHRP branch of the HHS, the U.S. Office for the Protection of Human Research Subjects ensures that the rights and weal of individualities sharing in exploration are upheld.

Understanding Regulatory Compliance within the United States

Clinging to Regulatory norms throughout the U.S guarantees that clinical trials are carried out in agreement with established legal, value-based and Research–oriented principles. Similar compliance safeguards party safety, upholds exploration integrity, and ensures the validity of clinical issues. Clinging to civil and institutional norms also mitigates pitfalls of legal penalties, reputational damage, and fiscal consequences, while erecting public trust and icing the ethical progression of biomedical invention.

Pre-Trial Conditions

Previous to the inauguration of any clinical trial, it and #39;s essential to fulfill a series of introductory way to insure that the study is immorally sound, scientifically valid, and in full compliance with regulatory frameworks. These primary conditioning are abecedarian to securing party well, maintaining data credibility, and aligning with institutional and civil norms.

The core pre-trial conditions include the following

- Ethical concurrence blessing from an Institutional Review Board (IRB) or Ethics Committee is obligatory before any exploration exertion begins. This oversight ensures ensuring the rights, protection, and welfare of mortal subjects are defended in agreement with ethical morals.
- Development of the Study Protocol a comprehensive protocol must be created, detailing the study's points, design, methodology, party criteria, and statistical analysis plan. This document serves as the primary reference for trial prosecution and regulatory review.
- **Process of obtaining informed approval** Actors must be handed in with clear and complete information regarding the study and #39;s purpose, procedures, implicit pitfalls, and anticipated benefits. Written informed concurrence must be attained before registration to uphold ethical norms and legal scores.
- **Investigator Qualification**: Investigators must retain applicable credentials and experience applicable with regard to the trial. Also, investigational spots must be adequately equipped and staffed to conduct the study in agreement in accordance with regulatory and protocol conditions.
- **Clinical Trial Agreement (CTA):** A binding agreement must be established between the guarantor, investigators, and sharing institutions. This document outlines each party's liabilities, fiscal arrangements, and trial-related terms.
- **Party Reclamation Strategy:** A defined reclamation plan ought to be in place, including eligibility criteria and strategies for engaging and enrolling suitable actors. Reclamation timelines and outreach mechanisms should also be easily proved.
- Regulatory cessions guarantors are needed to submit an Investigational New Drug (IND) operation or original attestation to the U.S. Food and Drug Administration (FDA) for authorization to initiate the trial. This submission includes preclinical data, study protocols, and investigator qualifications.

Ethical Considerations

Informed concurrence

A foundation of ethical conduct in clinical exploration is the demand to gain voluntary, informed concurrence from all actors before their involvement within the Research. Actors must admit clear, comprehensive, and accessible information outlining the study's objects, methodology, implicit benefits, and foreseeable pitfalls. This ensures that individualities are making a completely independent and educated decision regarding their participation.

Defending at- risk Populations

Ensuring the ethical defending at- risk populations is of utmost importance in clinical trials. Populations similar as minors, pregnant individualities, the senior, and individuals who have cognitive impairments bear fresh safeguards to help compulsion, exploitation, or misreading.

Confidentiality and Data sequestration

Maintaining the privacy of personal and medical information is a carping ethical charge in clinical trials. Compliance with civil regulations similar as the U.S. Health Insurance Portability and Accountability Law is needed to secure party data. Compliance with these norms enables experimenters to guard privacy, foster public confidence and uphold the ethical foundation of exploration. Data protection protocols must be strictly applied to ensure that sensitive information is and inaptly penetrated, disclosed, or misused.

Clinical Trial Phases and Regulatory prospects

Clinical studies are undertaken in a step-by-step approach through four separate phases, each with its own scientific objectives and compliance standards requirements the aforementioned phases inclusively insure that investigational products are strictly assessed for safety, efficacy, and quality ahead and after entering the request.

Phase I – Safety and Tolerability Studies

This original phase involves a small group of healthy volunteers or cases and is primarily concentrated on assessing the safety profile pertaining to the investigational product. It determines the applicable lozenge range and studies pharmacokinetics. These studies must misbehave with FDA Investigational New Drug (IND) conditions and Standards for clinical trials to ensure participant safety and regulatory alignment.

Phase II – efficacy and Dose Optimization

Phase II trials assess the therapeutic efficacy of the product in a larger population, generally comprising individualities impacted by the target condition. These studies aim to identify optimal dosage and examine short- term side goods. Regulatory conditions include the submission of periodic progress reports to the Food and Drug Authority and timely updates to Institutional Review Boards (IRBs).

Phase III – Large- Scale efficacy and Safety Evaluation

This stage includes expanded party groups across different demographics and clinical settings. The ideal is intended to verify the product's effectiveness, cover adverse responses, and gather data necessary for regulatory blessing. Guarantors are anticipated to maintain comprehensive attestation, engage in dependent Clinical Trial Safety Monitoring Boards and cleave to uninterrupted FDA oversight.

Phase IV –Post-Marketing Surveillance

Once product receives request authorization, Phase IV studies are conducted to gather long term safeguarding and performance data in real- world conditions. These post marketing trials involve periodic safety updates, Pharmaco vigilance reporting, and may be subject to Risk Evaluation and Control Plans Submission of a New Drug Application NDA) or fellow is essential for compliance with regulations and ongoing monitoring. Essential evidence and Records within the clinical studies thorough attestation forms the base of both regulatory adherence and the preservation of data integrity in clinical exploration. Accurate and systematized record- keeping ensures translucency, facilitates regulatory examinations, and upholds the ethical and scientific rigor of the study. The crucial factors include the Trial Master File (TMF), Case Report Forms (CRFs), and Adverse Event (AE) reporting systems.

Trial Master File (TMF)

The Trial Master File acts as the main repository for significant documents that is managed collaboratively by both the trial sponsor and the investigator. It serves as a complete record of trial planning, conduct, and evaluation, thereby demonstrating adherence to Good Clinical Practice (GCP) and regulatory prospects.

Relevant Regulatory References

- ICH E6 (R2) – International GCP standard
- 21 CFR Part 312 – U.S. FDA guidelines governing Investigational New Drug (IND) processes

- 21 CFR Part 11 – Guidelines for electronic records and digital autographs, applicable when an electronic TMF system is used.

Case Report Forms (CRFs)

A Case Report Form (CRF) is used to collect participant-specific clinical data, following the issues outlined in the protocol. CRFs ensure consistency and accuracy in the data provided for regulatory review.

Types of CRFs

- Paper CRFs manually completed forms
- Electronic CRFs (eCRFs) Digital formats integrated into Electronic Data Capture (EDC) platforms

Compliance Requirements

- Must conform to ICH E6 (R2) and 21 CFR Part 11
- Data entries should adhere to the ALCOA principles—being attributable, understandable, timely, genuine and correct.
- Any variations must include inspection trials and defense

Adverse Event Reporting

Adverse events (AEs), defined as any unintended health circumstances during the trial —whether or not related to investigational product must be instantly reported and proved to ensure participant safety and adherence to regulations

Guiding Regulations

- ICH E6 (R2) Provides protocols for AE tracking and response
- 21 CFR Part 312 authorizations timely reporting of Serious Adverse Events (SAEs)
- 21 CFR Part 11 Governs secure electronic cessions
- EMA Surveillance is the European system designed for monitoring the safety of pharmaceutical drugs.

Comprehensive reporting of adverse events (AEs) is crucial for continuously evaluating the risk- benefit profile of investigational therapies and is significant in upholding ethical standards and regulatory credibility.

Monitoring and checkups in Clinical Studies

The effective implementation of clinical trials relies on the coordinated efforts of multiple realities, particularly guarantors and observers, who play essential places in icing regulatory adherence, ethical norms, and data integrity. 1 Their responsibilities are defined by internationally recognized guidelines, for instance, the ICH-GCP (E6 R2) and U.S. Food and Drug Administration (FDA) regulations (21 CFR Part 312).

Liabilities concerning Sponsors and Observers

Sponsors are in charge of the overall operation of clinical studies, including the selection of good investigators, trial point oversight, safety monitoring, and assuring regulatory compliance. Observers, frequently known as Clinical Research Associates (CRAs), act as interposers between the guarantor and the investigation point. Their primary responsibility is to corroborate ensuring the study remains conducted in agreement in accordance with the approved protocol, GCP norms, and all applicable regulations.

Regulatory Oversights and FDA Examinations

The FDA conducts routine and for- cause examinations to determine whether clinical studies are being conducted conforming to established laws and guidelines. These examinations estimate protocol adherence, party protection measures, and data trust ability. Examinations generally concentrate on compliance with 21 CFR Parts 11(electronic records), 50(informed concurrence), 54(fiscal exposures), 56(IRB), 312(IND regulations), and 812(medical device trials).

FDA examinations in Clinical Studies

Purpose

The primary thing of FDA examinations is to assess whether the rights, security, and health of trial participants are defended and whether trial data are accurate and dependable.

Types of examinations

- Routine examinations Performed as a component of the FDA's oversight liabilities.
- For- cause examinations Initiated when specific enterprises arise.
- Pre-approval examinations Conducted before selling authorization is granted.

Examination Process

FDA examinations involve document reviews, interviews, point evaluations, and identification of compliance gaps. Findings are documented in Form FDA 483, which highlights the identified deficiencies.

Compliance checkups in Clinical studies

Purpose

Compliance checkups are unprejudiced assessments conducted to determine if clinical trial procedures adhere to regulatory standards and guarantor prospects.

Types

Inspections carried out by regulatory agencies or independent third-party organizations. External checkups conducted by the relevant regulatory bodies or third- party associations

Key Focus Areas

- Informed concurrence attestation
- Source data verification
- Safety reporting mechanisms
- Investigator liabilities
- Protocol adherence and diversions

Addressing Non-Compliance

When diversions from regulatory or ethical norms are linked, applicable corrective conduct must be enforced. This includes establishing findings, developing CAPA (Corrective and preventative Action) plans, and regulatory reporting.

Corrective and preventative conduct (CAPA)

CAPA is a methodical approach applied when non-compliance is linked, aimed at resolving current issues and precluding unborn circumstances.

Crucial Steps

- Discovery and attestation of divagation
- Root cause analysis
- perpetration of corrective measures
- Establishment of preventative strategies

Regulatory Reporting and Follow- up

All CAPA executions must be communicated to applicable regulatory authorities, followed by regular evaluations to insure sustained compliance.

Enforcement Measures for Serious Non-Compliance
When violations are significant or intermittent to, oversight authorities could put legal and executive warrants to insure responsibility and cover trial actors.

Regulatory conduct for Non-Compliance
If non-compliance is serious, repeated, or affects subject safety, regulatory agencies may put enforcement conduct.

Action: Form FDA 483
Description: Issued after an examination identifies scarcities
Consequences: Requires guarantor/ investigator response before the end of 15 days

Action: Warning Letters
Description: Transferred for significant regulatory violations demanding critical correction
Consequences: Intimately bared; must apply corrective conduct

Action: Clinical Hold (21 CFR 312.42)
Description: Temporary suspense of trial due to safety enterprises or GCP violations.
Consequences: Study cannot do until scarcities are addressed

Action: Debarment and amp; Disqualification
Description: Investigators or guarantors are banned from conducting FDA- regulated trials.
Consequences: Prohibition from farther exploration involvement

Action: Legal conduct (Injunctions, Civil and amp; Criminal Penalties)
Description: Used for severe misconduct, fraud, or data falsification
Consequences: Issues may include fiscal penalties, discontinuation of the trial, or inauguration of legal action

REGULATORY SUBMISSIONS IN CLINICAL STUDIES
To introduce investigational products into the U.S. market, guarantors must follow specific regulatory submission routes. These include submitting a New Drug Application (NDA) for chemically manufactured drugs, a Biologics License Application (BLA) for consanguineous curatives, and utilizing expedited approval pathways designed for treatments addressing critical or urgent medical requirements new Drug Application (NDA)

NDA (New Drug Application)
The New Drug Application (NDA) is a formal submission to the FDA's Pharmaceutical Evaluation and Research Center seeking license to distribute a new pharmaceutical drug. It includes detailed scientific substantiation demonstrating the drug's safety, effectiveness, pharmacokinetic profile, and quality norms.

Key factors of an NDA include
Preclinical and clinical data: Findings from laboratory studies and clinical trials that validate the drug's safety and its intended therapeutic benefits.

Pharmaceutical development data: Details regarding the drug's constituents, formulations, product styles, and quality validation measures.

Pharmacological details: Data outlining the drug's pharmacokinetic profile—encompassing absorption, distribution, metabolism, and excretion—as well as its Pharmacodynamic properties,
such as biological effects and process of action

Labeling and usage guidance: Guidelines for healthcare professionals and patients, covering dosage recommendations, contraindications, and potential side effects. Post-marketing surveillance plan: A safety monitoring plan designed to manage and evaluate potential risks associated with the drug once it is available on the market.

Biologics License Application (BLA)

The Biologics License Application (BLA) is the formal submission required securing approval for biological agents like vaccines, gene therapies, monoclonal antibodies, and products derived from blood. This application is appraised by the Center for Biologic Assessment and Research.

Key submission elements include

Source and manufacturing details: Insights into the biological origin (such as cell lines), manufacturing ways (like turmoil), and the processes used to ensure product quality.

Energy, Chasity, and immunogenicity assessments: Data showing biological effectiveness in producing a therapeutic response while reducing the threat of adverse immune reactions.

Stability and consistency studies: Data on lot-to-lot variation and stability studies that confirm consistent quality across different production batches.

Special Regulatory Pathways for Expedited Approval

The FDA has created various pathways to expedite the development and evaluation of curatives for severe or life-threatening conditions, particularly those targeting unmet medical requirements.

Fast Track Designation

The Fast Track program supports the development of drugs and biologics aimed at treating serious conditions and addressing substantial therapeutic requirements. It enables

More frequent communication through the FDA

Rolling review: The submission of corridor of the NDA/BLA as they are finalized, opting not to wait for the complete operation. To be eligible, the trial drug needs to exhibit the potential to offer substantial advantages over current treatments through a new mechanism, better safety profile, or increased efficacy.

Breakthrough Therapy Designation

Structure upon the Fast Track program, this designation offers enhanced regulatory support. It is granted grounded on early clinical data indicating that the product may provide significant advancements over existing treatments for serious conditions.

Benefits include

- In-depth FDA guidance on trial design
- Eligibility for precedence review, potentially syncopating the FDA's review time from 10 months to 6 months

Orphan Drug Designation

This program supports the establishment of treatments for rare conditions, which are defined throughout the United States as conditions affecting fewer than 200,000 people. It offers several impulses, including:

Seven years of marketing exclusivity (vs. five years for standard drugs)

- Tax credits for clinical trial costs
- Exemptions from certain FDA application charges

Exemptions from certain FDA application charges

Examples of conditions benefiting from this program include therapies developed for spinal muscular atrophy and cystic fibrosis, where traditional market incentives are inadequate to drive development. Recent

Developments in Clinical Trial Regulations and Practices

Governing rules for clinical trials continue to evolve, with significant updates made between 2023 and 2025. These updates include revisions to international GCP standards, new FDA guidance, and policy changes related to trial acceptance and diversity.

ICH E6 (R3) Guideline on Good Clinical Practice (GCP)

The International Council for Harmonization (ICH) made significant updates to its GCP framework with the release of ICH E6 (R3), designed to improve clinical trial design, management, and oversight.

Draft Publication (May 2023)

On May 19, 2023, ICH published a preliminary version of the E6 (R3) public directive review, marking Step 2 in its harmonization process. The draft focused on modernizing trial design and enhancing participant protection and data quality.

Final Implementation (January 2025)

The final version of ICH E6 (R3) was adopted on January 6, 2025. Key updates include

- Refined definitions of adverse events and serious adverse reactions
- Integration of decentralized trial models, considering remote or hybrid study formats
- Media-neutral documentation protocols, allowing flexibility in data formats and platforms

These revisions reflect the broader trend towards more adaptable, technology-driven trial processes while ensuring high value-based and Research-oriented standards are maintained.

New FDA Guidance on Clinical Trials

Between 2023 and 2024, the U.S. Food and Drug Administration (FDA) issued several new guidance documents to clarify regulatory expectations and enhance clinical research compliance.

Guidance Repository Updates

The FDA now provides a searchable database on its official website, containing recently released documents, including both final and draft guidance on various therapeutic areas and trial topics.

Educational Conferences

In collaboration with the Association of Clinical Research Professionals the FDA held major conferences in June and November 2024. These events focused on regulatory compliance, Good Clinical Practice (GCP) implementation, and the latest policy changes, with the aim of bettern aligning stakeholders with the FDAand#39;s evolving oversight responsibilities.

Policy Shift in Clinical Trial Diversity

Withdrawal of DEI-Focused Guidance (January 2025)

Following a federal directive to reduce diversity, equity, and inclusion (DEI) initiatives, the FDA rescinded its draft guidelines and online materials related to enhancing multicultural representation in clinical studies. This move has raised concerns among public health advocates about the potential exclusion of minority groups from research studies. These changes may affect on the demographic diversity in clinical studies and indicate a shift in federal priorities concerning inclusive research practices.

DISCUSSION

Key Challenges in Regulatory Compliance for medical trials

Despite advancements in regulatory wisdom, clinical trial stakeholders continue to encounter patient challenges in maintaining compliance with evolving legal and moral norms. These challenges stem from the adding complexity of global trial operations and the growing burden of attestation and oversight.

Dynamic and Evolving Regulatory Frameworks

The regulatory terrain girding clinical trials is in constant flux, with ongoing variations to FDA guidelines, GCP protocols, and electronic data norms. This creates a dynamic geography in which guarantors and investigators must remain continually streamlined to avoid unintentional on compliance. Failure to acclimatize fleetly may affect in regulatory lapses or enforcement conduct.

Ferocious Attestation and Reporting Burdens

Clinical exploration demands substantial executive trouble, including detailed medication and conservation of study protocols, informed concurrence forms, adverse event logs,and correction reports.These total conditions are timecons uming and prone to error. Deficient or inaccurate cessions have the potential to result in delayed regulatory opinions or study suspense.

Variability Among Institutional Review Boards (IRBs)

Inmulticenter studies, significant disagreement can arise between different IRBs regarding ethical norms, review processes, and reversal times. This inconsistency frequently leads to detainments in trial inauguration and challenges in harmonizing ethical oversight across study spots.

Barriers to Obtaining Truly Informed Consent

Carrying fair and immoral valid concurrence remains a patient concern. Actors with limited health knowledge, non-native language proficiency, or difficulties understanding complex study protocols may not completely grasp the counteraccusations of their participation. These gaps increase the threat of ethical violations and regulatory deficiencies. Strategic Approaches to Strengthen Clinical Trial Execution (Table 2)

Recommendations for Future Research

To ensure that clinical trial processes are advancing alongside technological and regulatory inventions, unborn examinations should concentrate on the following precedence areas.

Integration of Artificial Intelligence and Digital Regulatory Tools

Emerging technologies similar as artificial intelligence (AI) and machine literacy offer transformative eventuality in optimizing clinical trial management. Literacy offer transformative eventuality in optimizing clinical trial operations. Unborn studies should examine the effectiveness of AI in streamlining regulatory attestation, perfecting the informed concurrence process, automating safety monitoring,

Incorporating Real-World Evidence into Regulatory Decision-Making

There is increasing acknowledgment of the relevance of real-world evidence (RWE) in supplementing traditional clinical investigation data. Unborn exploration should concentrate on the methodologies and norms needed to effectively integrate RWE into regulatory fabrics, while maintaining scientific rigor, data validity, and conformity with GCP

Assessing the perpetration of ICH E6 (R3) Guidelines

As the ICH E6 (R3) guideline becomes further extensively espoused, exploration is demanded to assess its real world operation, particularly in the environment of threat-grounded quality operation and easily defined stakeholder

liabilities. Evaluations should concentrate on functional feasibility, regulatory acceptance, and the overall outcome for the trial effectiveness and integrity.

CONCLUSION

Clinical trials conducted within the United States are administered by a strict and continually evolving regulatorysystem designed to uphold arty protection and make certain the responsibility of clinical data. Despite this robust frame, sponsors and clinical researchers constantly encounter functional challenges, including burdensome documentation. Inconsistent Institutional Review Board (IRB) practice and adversities in securing fully informed concurrence. This review has presented a comprehensive summary description of the regulatory terrain, offering practical strategies analogous as the utilization of structured compliance registries to support effective study execution and regulatory alignment. These tools not only streamline procedural workflows but also serve to reduce the trouble of regulatory non compliance. Looking forward, future disquisition should prioritize on the integration of state-of-the-art digital tools, artificial intelligence, and real- world data sources into regulatory systems. Embracing a forward-allowing, technology- enabled, and canon- acquainted approach will be necessary in strengthening compliance, perfecting trial effectiveness, and elevating the overall quality of clinical disquisition throughout the U.S.

Table 1. Regulatory Requirements Checklist For Performing Clinical Trials in the USA

Checklist Item	Yes	No
A. PRE-TRIAL REQUIREMENTS		
Clinical trial registered on ClinicalTrials.gov (FDAAA801 compliance)	☐	☐
Ethical approval obtained from IRB or Ethics Committee	☐	☐
IND application submitted to FDA (if applicable)	☐	☐
Study design protocol developed (design, objectives, methodology)	☐	☐
Investigator's Brochure (IB) prepared	☐	☐
Compliance ensured with FDA 21 CFR Part 312	☐	☐
ICH-GCP guidelines followed	☐	☐
Funding and budget approvals secured	☐	☐
Insurance coverage obtained for trial-related risks	☐	☐
Site and investigator qualifications meet standards	☐	☐
Recruitment strategy developed	☐	☐
Participants' privacy protected (HIPAA compliance)	☐	☐
Risks minimized via risk-benefit analysis	☐	☐
Safeguards for vulnerable populations provided	☐	☐
Continuous informed consent maintained	☐	☐
Data Monitoring Committee (DMC) established (if required)	☐	☐
Safety reporting system implemented	☐	☐
Secure data management systems in place	☐	☐
B. DURING TRIAL		
Participant eligibility criteria strictly followed	☐	☐
Data privacy and confidentiality ensured	☐	☐
Protocol deviations documented	☐	☐
Regular monitoring visits conducted	☐	☐
DSMP or DMC implemented	☐	☐
AEs and SAEs reported to FDA and IRB	☐	☐
Accurate source documents and CRFs maintained	☐	☐
EDC systems used for data capture	☐	☐
Compliance with 21 CFR Part 11 ensured	☐	☐
C. POST-TRIAL CONSIDERATIONS		
Final report submitted to FDA	☐	☐
Adverse event and safety updates completed	☐	☐
Study closed with IRB and regulators	☐	☐
Results reported on ClinicalTrials.gov (FDAAA801)	☐	☐
Findings published in peer-reviewed journals	☐	☐
Long-term safety monitoring conducted (if applicable)	☐	☐
Post-market adverse events reported	☐	☐
REMS implemented (if required)	☐	☐
Continued access to treatment for participants (if needed)	☐	☐

Table 2: Strategic Approaches to Strengthen Clinical Trial Execution

Strategic Focus	Description
Early Regulatory Engagement	Conduct pre-IND consultations with regulatory authorities to align study framework and minimize revisions.
Centralized IRB Use	Implement a central IRB model in multi-site studies to standardize ethical review and accelerate approvals.
Digital Trial Infrastructure	Integrate Clinical Trial Management Systems (CTMS), Electronic Data Capture (EDC), and consent solutions to streamline data handling.
argeted Site Selection and Training	Collaborate with experienced trial centers and deliver robust GCP and protocol training to the research team
Inclusive Recruitment Models	Utilize culturally tailored, multilingual outreach methods to enhance participant diversity and enrollment efficiency.
Risk-Based Monitoring (RBM)	Apply RBM principles to focus oversight on high-risk elements, thereby improving quality while reducing cost.
Continuous Compliance Auditing	Establish internal regulatory intelligence units and implement scheduled conformance reviews to identify risks early.
Streamlined Communication Channels	Foster open, regular communication between sponsors, CROs, investigators, and governing bodies to quickly resolve issues.

ABSTRACT

Because one of the stated objectives of prosthodontic treatment is the restoration of function and comfort in an esthetically pleasing manner, maintenance of occlusal contact in distal extension removable partial dentures demands an understanding of the factors that influence residual ridge support. Support from the residual ridge becomes more important as the distance from the last abutment increases and will depend on the following several factors: Contour and quality of the residual ridge, extent of residual ridge coverage by the denture base, type and accuracy of the impression registration, accuracy of the fit of the denture base, design of the removable partial denture framework Total occlusal load applied

Keywords:

INTRODUCTION

In a tooth-supported removable partial denture, a metal base or the framework that supports an acrylic-resin base is connected to and is part of a rigid framework that permits the direct transfer of occlusal forces to the abutment teeth through the occlusal rests. Even though the denture base of the modification space(s) in a Kennedy Class III removable partial denture provides support for the supplied teeth, the residual ridge beneath the base is not called on to aid in the support of the removable partial denture. Therefore the resiliency of the ridge tissues, the ridge configuration, and the type of bone that supports these tissues are not factors in denture support. Regardless of the length of the edentulous spans, if the framework is rigid, the abutment teeth are sound enough to carry the

additional load, and the occlusal rests are properly formed, support comes entirely from the abutment teeth at either end of that span. Support may be augmented by splinting and by the use of additional abutments, but in any event the abutments are the sole support of the removable restoration. An impression (and resultant stone cast) records the anatomic form of the teeth and their surrounding structures and is needed to make a tooth-supported removable partial denture. The impression should also record the moving tissues that will border the denture in an unstrained position, so the relationship of the denture base to those tissues may be as accurate as possible. Although under extension of the denture base in a tooth-supported prosthesis is the lesser of two evils, an under extended base may lead to food entrapment and inadequate facial contours, particularly on the buccal and labial sides. To accurately record the moving tissues of the floor of the mouth, an individual impression tray should be used, rather than an ill-fitting or overextended stock tray. The distal extension removable partial denture does not have the advantage of total tooth support because one or more bases are extensions covering the residual ridge distal to the last abutment. It therefore is dependent on the residual ridge for a portion of its support. The distal extension removable partial denture must depend on the residual ridge for some support, stability, and retention. Indirect retention, to prevent the denture from lifting away from the residual ridge, should also be incorporated in the design. The tooth-supported base is secured at either end by the action of a direct retainer and is supported at either end by a rest, whereas this degree of support and direct retention is lacking in the distal extension prosthesis. For this reason, a distal abutment should be preserved whenever possible. In the event of the loss or absence of a distal abutment tooth, the patient must be made aware of the movements to be expected with a distal extension removable partial denture and the limitations imposed on the dentist when the residual ridge must be used for support, stability, and retention for that part of the prosthesis.

Distal extension removable partial denture-Factors influencing the support of a distal extension Base

Because one of the stated objectives of prosthodontic treatment is the restoration of function and comfort in an esthetically pleasing manner, maintenance of occlusal contact in distal extension removable partial dentures demands an understanding of the factors that influence residual ridge support. Support from the residual ridge becomes more important as the distance from the last abutment increases and will depend on the following several factors

1. Contour and quality of the residual ridge
2. Extent of residual ridge coverage by the denture base
3. Type and accuracy of the impression registration
4. Accuracy of the fit of the denture base
5. Design of the removable partial denture framework
6. Total occlusal load applied

Contour and quality of the residual ridge

The ideal residual ridge to support a denture base would consist of cortical bone that covers relatively dense cancellous bone, with a broad rounded crest with high vertical slopes, and is covered by firm, dense, fibrous connective tissue. Such a residual ridge would optimally support vertical and horizontal stresses placed on it by denture bases. Unfortunately this ideal is seldom encountered. Easily displaceable tissue will not adequately support a denture base, and tissues that are interposed between a sharp, bony residual ridge and a denture base will not remain in a healthy state. Not only must the nature of the bone of the residual ridge be considered in developing optimum support for the denture base, but also its positional relationship to the direction of forces that will be placed on it. The crest of the bony mandibular residual ridge is most often cancellous. Because lining mucosa restricts both the buccal and lingual mucosae adjacent to teeth in the mandible, loss of firm mucosa overlying the residual ridge is common following tooth extraction in the posterior mandible. Pressures placed on tissues overlying the crest of the mandibular residual ridge usually result in irritation of these tissues, accompanied by the sequelae of chronic inflammation. Therefore the crest of the mandibular residual ridge cannot be a primary stress-bearing region. The buccal shelf region (bounded by the external oblique line and the crest of the alveolar ridge) seems to be better suited for a primary stress-bearing role because it is covered by relatively firm, dense, fibrous connective tissue supported by cortical bone. In most instances this region bears more of a horizontal relationship to vertical forces than do other

regions of the residual ridge. The slopes of the residual ridge then would become the primary stress- bearing region for resistance of horizontal and off-vertical forces. The immediate crest of the bone of the maxillary residual ridge may consist primarily of cancellous bone. Unlike in the mandible, oral tissues that overlie the maxillary residual alveolar bone are usually of a firm, dense nature (similar to the mucosa of the hard palate) or can be surgically prepared to support a denture base. The topography of a partially edentulous maxillary arch imposes a restriction on selection of a primary stress-bearing area. In spite of impression procedures, the crestal area of the residual ridge will become the primary stress-bearing area for vertically directed forces. Some resistance to these forces may be obtained by the immediate buccal and lingual slopes of the ridge. Palatal tissues between the medial palatal raphe and the lingual slope of the posterior edentulous ridge are readily displaceable and cannot be considered as primary stress-bearing sites. The tissues covering the crest of the maxillary residual ridge must be less displaceable than the tissues that cover palatal areas. The crest of the maxillary residual ridge *(herringbone pattern)* is the primary supporting region for the maxillary distal extension denture base (figure1). Buccal and lingual slopes may furnish limited vertical support to the denture base. It seems logical that their primary role is to counteract the horizontal rotational tendencies of the denture base. The *dotted portion* outlines the incisive papilla and the median palatal raphe. Relief must be provided for these regions, especially if tissues covering the palatal raphe are less displaceable than those covering the crest of the residual ridge. The *dotted portion* outlines the crest of the residual ridge, which should be recorded in its anatomic form in impression procedures (figure2). Similarly, retro molar pads should not be displaced by impression. Buccal shelf regions are outlined by a *herringbone pattern,* and selected additional pressures may be placed on these regions for vertical support of the denture base. Lingual slopes of the residual ridge *(cross-hatched)* may furnish some vertical support to the restoration; however, these regions principally resist the horizontal rotational tendencies of the denture base and should be recorded by the impression in undisplaced form.

Extent of residual ridge coverage by the denture base

The broader the residual ridge coverage, the greater is the distribution of the load, which results in fewer loads per unit area. A denture base should cover as much of the residual ridge as possible and should be extended the maximum amount within the physiologic tolerance of the limiting border structures or tissues. Knowledge of these border tissues and the structures that influence their movement is paramount to the development of broad coverage denture bases. In a series of experiments, studies has shown that "maximum coverage of denture-bearing areas with large, wide denture bases is of the utmost importance in withstanding both vertical and horizontal stresses

Type and accuracy of the impression registration

The residual ridge may be said to have two forms: The anatomic form and the functional form and the anatomic form is the surface contour of the ridge when it is not supporting an occlusal load. The functional form of the residual ridge is the surface contour of the ridge when it is supporting a functional load.

Accuracy of the Fit of the Denture Base

Support of the distal extension base is enhanced by intimacy of contact of the tissue surface of the base and the tissues that cover the residual ridge. The tissue surface of the denture base must optimally represent a true negative of the basal seat regions of the master cast. In addition, the denture base must be related to the removable partial denture frame Work in the same manner as the basal seat tissues were related to the abutment teeth when the impression was made. Every precaution must be taken to ensure this relationship when the altered cast technique of making a master cast is used.

Design of the Removable Partial Denture Framework

Some rotation movement of a distal extension base at the distal abutment is inevitable under functional loading. The greatest movement takes place at the most posterior extent of the denture base. The retro molar pad region of the mandibular residual ridge and the tuberosity region of the maxillary residual ridge therefore are subjected to the greatest movement of the denture base**.** Use of more anterior or mesial rest is suggested as it allow vertical ridge loading, permit greater ridge for support, transfer stress to anterior abutment. Incorporation of indirect retainer, Incorporation of RPI system in free end saddle which make stress release.

Total Occlusal Load Applied

Patients with distal extension removable partial dentures generally orient the food bolus over natural teeth rather than prosthetic teeth, because of

1. The more stable nature of the natural dentition.
2. The proprioceptive feedback they provide for chewing.
3. The possible nocioceptive feedback from the supporting mucosa. This has an effect on the direction and magnitude of the occlusal load to the removable Partial denture, and thus on the load transferred to the abutments. The support from the residual ridge should be optimized and shared appropriately with the remaining natural dentition. The number of artificial teeth, the width of their occlusal surfaces, and their occlusal efficiency influence the total occlusal load applied to the removable partial denture. The reduction of the size of the occlusal table reduces the vertical and horizontal forces that act on the removable partial dentures and lessens the stress on the abutment teeth and supporting tissue.

CONCLUSION

Cast partial dentures prove to be an appropriate treatment modality for a partially edentulous patient, in clinical situations where implant supported prosthesis and conventional fixed partial dentures are contraindicated. The distal extension removable dentures should be designed in an accurate manner that more e emphasis has to be given for support consideration and proper selection of design considerations needs to be done after clinical evaluation of each patient also taking into account the merits and demerits of each component being used for the same. Cast partial dentures, thereby help in restoring the masticatory efficiency as well as improve the esthetics, phonetics, function of the patient without involvement of any complex treatment procedures.

ABSTRACT

This study explores the impact of Artificial Intelligence (AI) tools on teachers' adoption levels, focusing on a sample of 200 educators from diverse institutions. Fifteen widely-used AI tools, were analyzed to understand their influence on teaching practices. Teachers' adoption levels were measured on a 5-point scale, and two statistical methods were employed: ANOVA to evaluate differences in adoption levels between users and non-users of specific tools, and the Chi-square test to assess the dependency between tool usage and adoption levels. The findings highlight the importance of targeted professional development programs and resource allocation to maximize the benefits of AI in education. While AI tools are transforming the teaching-learning process, addressing barriers like ethical concerns and lack of awareness is essential for equitable and effective implementation.

Keywords: AI Tools, Teaching-Learning Process, Teacher Adoption, Personalized Learning, AI in Education.

INTRODUCTION

The integration of Artificial Intelligence (AI) into education marks a groundbreaking shift in the teaching-learning process, redefining how knowledge is imparted, acquired, and assessed. Once considered futuristic, AI is now a vital component of modern education systems, offering innovative solutions to longstanding challenges and paving the way for personalized, efficient, and engaging learning experiences. AI technologies have infiltrated every aspect of education, from curriculum development and content delivery to evaluation and student support. Tools like adaptive learning platforms, intelligent tutoring systems, and generative AI applications have created opportunities for teachers to focus more on fostering creativity and critical thinking rather than administrative tasks. For students, AI has made learning more interactive and accessible, breaking barriers of geography, language, and individual learning styles. One of the most transformative aspects of AI in education is its ability to personalize learning. By analyzing data such as performance metrics and engagement patterns, AI systems can identify each learner's strengths and weaknesses, tailoring content and pace to suit individual needs. This shift towards personalized learning has been especially beneficial for students with special needs, enabling them to achieve better outcomes in inclusive learning environments. Furthermore, AI has empowered teachers with tools that simplify grading, track student progress, and offer predictive insights to improve instructional strategies.

Platforms like Google Classroom, Turnitin, and Grammarly have streamlined workflows, enabling educators to dedicate more time to meaningful interactions with students. The rise of generative AI tools like ChatGPT and Canva AI has also enriched creative learning, providing students with resources to explore new ideas and innovate. However, the rapid adoption of AI in education has also brought ethical concerns to the forefront, such as data privacy, algorithmic bias, and academic integrity. Balancing the benefits of AI with these challenges requires a thoughtful approach, emphasizing transparency, inclusivity, and robust policies to ensure equitable access and usage. As AI continues to evolve, its potential to reshape education is limitless. This transformation extends beyond technological advancements, fostering a culture of lifelong learning, adaptability, and innovation. By empowering teachers and students alike, AI is not merely a tool but a partner in creating an education system that prepares learners for a dynamic and ever-changing world. Artificial Intelligence (AI) is transforming the educational landscape, offering innovative tools and approaches to enhance teaching and learning excellence. Its ability to analyze, adapt, and personalize learning experiences positions AI as a powerful enabler for improving educational outcomes. Below are the key ways AI contributes to teaching and learning excellence:

Personalized Learning Experiences

AI enables adaptive learning systems that tailor educational content to individual students' needs, learning speeds, and preferences. Platforms can analyze a student's strengths and weaknesses, offering customized exercises or tutorials to enhance understanding. For instance, AI-powered applications like Duolingo adjust language lessons in real-time based on user performance, fostering a more engaging and effective learning journey.

Intelligent Tutoring Systems

Virtual tutors powered by AI provide instant assistance to students, simulating one-on-one teaching. These systems can explain concepts, answer questions, and even provide step-by-step solutions to problems. For example, platforms like Khan Academy and Socratic integrate AI to help students master complex topics outside traditional classrooms.

Streamlined Administrative Tasks

AI tools help educators automate routine tasks such as grading assignments, tracking attendance, and managing schedules. By reducing administrative burdens, teachers can dedicate more time to developing lesson plans and engaging with students. Tools like Gradescope leverage AI to assess essays and coding assignments with speed and accuracy.

Enhanced Accessibility
AI promotes inclusivity by catering to diverse learning needs. Tools like speech-to-text software, screen readers, and real-time translation make education accessible to students with disabilities or those from non-native language backgrounds. These innovations bridge gaps, ensuring that learning opportunities are universally available.

Data-Driven Insights
Educational institutions harness AI to analyze large volumes of data, identifying trends that can improve teaching methodologies and student outcomes. Predictive analytics help educators intervene early for at-risk students, providing targeted support to prevent dropouts or academic failures.

Immersive and Interactive Learning
AI combined with augmented reality (AR) and virtual reality (VR) transforms traditional learning environments. Students can explore historical events, conduct virtual experiments, or visualize abstract concepts in 3D, making education more engaging and memorable.

Lifelong Learning and Skill Development
AI supports lifelong learning by providing flexible, on-demand resources for individuals seeking to upskill or reskill. Platforms like Coursera, edX, and Udemy employ AI to recommend courses based on a user's career goals, interests, and prior learning history.

Challenges and Ethical Considerations
While AI holds immense potential, its integration in education raises challenges such as data privacy, algorithmic bias, and equitable access. Policymakers, educators, and technologists must collaborate to address these issues and ensure that AI serves as an ethical and equitable tool for education.

LITERATURE REVIEW

AI in Personalized Learning Studies, such as those by Luckin et al. (2016), highlight how adaptive learning technologies leverage AI to provide tailored educational experiences, improving student engagement and outcomes. For instance, tools like Carnegie Learning's MATHia use AI algorithms to adapt to individual learning paces, leading to measurable improvements in math proficiency.

Teacher Support and Efficiency A review by Holmes et al. (2019) emphasizes the role of AI in reducing teachers' administrative burden through automated grading and feedback systems. Tools like Turnitin and Google Classroom have been cited as critical in enabling educators to focus on instructional quality rather than clerical tasks.

AI in Assessment and Feedback Boud and Molloy (2013) discuss how AI tools are transforming formative assessment by providing instant, data-driven feedback. This real-time feedback empowers students to take ownership of their learning journey.

Challenges and Ethical Concerns Selwyn (2020) addresses ethical dilemmas in AI's application within education, including concerns about data privacy, algorithmic bias, and the potential for AI to exacerbate educational inequalities. The study calls for robust governance frameworks to ensure equitable AI deployment.

Future Trends in AI Education Studies, including a comprehensive review by Roll and Wylie (2016), predict that AI's integration with emerging technologies like AR/VR will create immersive and interactive learning environments, further enriching the educational experience.

Objectives of the Study

1. To analyze the applications of AI in enhancing the teaching-learning process, including personalized learning, automated administrative tasks, and assistive technologies.
2. To evaluate the benefits of AI in education, focusing on engagement, accessibility, time efficiency, and data-driven insights.
3. To identify the challenges associated with integrating AI into education, including ethical concerns, data privacy, and cost barriers.
4. To examine the impact of AI tools on teachers' adoption levels and their effectiveness in improving educational outcomes.
5. To explore future implications of AI in education, such as its role in lifelong learning, immersive technologies, and global access to quality education.

RESEARCH METHODOLOGY

This study employed a quantitative research design to analyze the impact of AI tools on teachers' adoption levels in education. The methodology involved the following steps:

Sample Selection A random sample of 200 teachers was selected from diverse educational institutions, including higher education. The sample represented a mix of educators with varying levels of familiarity with AI tools.

Data Collection Data was collected through a structured survey that measured teachers' usage of 15 AI tools and their corresponding adoption levels on a 5-point Likert scale.

Variables

- **Dependent Variable**: Teachers' adoption level (measured on a 5-point scale).
- **Independent Variables**: Usage of AI tools (Yes/No for each tool).

Statistical Tools

- **ANOVA (Analysis of Variance)**: Used to determine whether there were statistically significant differences in adoption levels between teachers who used specific AI tools and those who did not.
- **Chi-Square Test**: Used to assess the dependency between the usage of AI tools and teachers' adoption levels.

Analysis Process

- The data was cleaned and prepared for analysis, ensuring consistency and completeness.
- ANOVA tests were conducted for each AI tool to analyze differences in adoption levels.
- Chi-Square tests were performed to evaluate associations between AI tool usage and adoption levels.

Software Statistical analyses were conducted using Python's statistical libraries, including scipy.stats and pandas.

Hypotheses

Null Hypothesis (H0): There is no significant difference in teachers' adoption levels between users and non-users of specific AI tools.

Alternative Hypothesis (H1): There is a significant difference in teachers' adoption levels between users and non-users of specific AI tools.

Trends in adoption

Duolingo (2018)

Primary Use: Language Learning

Duolingo uses AI to offer personalized language lessons. It adapts to a learner's progress, identifying areas of strength and weakness. With gamification features and interactive exercises, it has become a popular tool for self-paced language learning.

Adoption: Moderate (40%) – Duolingo remains widely used for casual learners and students.

IBM Watson Education (2018)
Primary Use: Personalized Learning
IBM Watson Education uses AI to provide tailored content and analytics to improve learning outcomes. It offers insights for educators to address individual student needs. However, due to its complex implementation and cost, its adoption has been limited.
Adoption: Low (10%) – Primarily used in pilot projects and specialized programs.

Grammarly (2019)
Primary Use: Writing Assistance
Grammarly uses AI to check grammar, spelling, and style while providing advanced suggestions for clarity and engagement. Widely adopted by students, educators, and professionals, it integrates easily with web browsers and apps.
Adoption: High (70%) – Its widespread utility and accessibility have driven significant adoption.

Socratic by Google (2019)
Primary Use: Homework Help and Problem-Solving
Socratic uses AI to help students with homework by providing explanations, solving problems, and suggesting study resources. It is particularly popular among high school students for STEM subjects.
Adoption: Moderate (40%) – Gaining traction as a free and user-friendly app.

Kahoot AI (2020)
Primary Use: Gamified Learning
Kahoot introduced AI-based features to enhance its platform for creating quizzes and engaging students in interactive learning activities. Its use surged during the COVID-19 pandemic when remote learning became the norm.
Adoption: High (65%) – Particularly popular in schools and among educators.

Google Classroom AI (2020)
Primary Use: Automated Grading and Feedback
Google Classroom introduced AI to automate grading, manage assignments, and provide real-time feedback. It became a vital tool during the pandemic for remote learning, enabling teachers to manage classes efficiently.
Adoption: High (75%) – A top choice for schools globally.

Edmodo AI (2021)
Primary Use: Student Engagement
Edmodo's AI features focus on improving classroom engagement and communication. It provides analytics and personalized recommendations to help teachers address individual student needs.
Adoption: Moderate (30%) – Mostly adopted by tech-savvy educators.

Turnitin AI (2021)
Primary Use: Plagiarism Detection
Turnitin uses AI to check for plagiarism and originality in academic submissions. It also provides detailed feedback on writing quality. Widely used in schools and universities, it has become a standard tool for academic integrity.
Adoption: High (80%) – Integral to education institutions.

ChatGPT (2022)
Primary Use: Question Answering, Essay Drafting

ChatGPT, developed by OpenAI, is a versatile conversational AI that assists with answering questions, drafting essays, and generating content. Its ability to handle complex queries has made it a valuable resource for students and educators.
Adoption: Rapid (90%) – Widely used for academic and creative purposes.

Canva AI (2022)
Primary Use: Creative Content Creation
Canva AI helps in designing visually appealing presentations, posters, and infographics. Its AI tools automate design suggestions and make creating professional-grade visuals accessible to students and teachers alike.
Adoption: High (85%) – A favorite tool for project-based learning.

Khan Academy AI Tutor (2023)
Primary Use: Personalized Tutoring
Khan Academy's AI Tutor provides step-by-step guidance tailored to a student's learning pace. It leverages AI to simulate a tutor-like experience, focusing on conceptual clarity.
Adoption: Moderate (50%) – Especially popular among students seeking free resources.

Perplexity AI (2023)
Primary Use: Research Assistance
Perplexity AI is a research tool that answers questions and summarizes information from credible sources. It is useful for students working on projects, assignments, and research papers.
Adoption: Growing (30%) – Early adoption in academic circles.

Quizlet AI (2024)
Primary Use: Flashcards and Study Guides
Quizlet introduced AI-powered adaptive learning features to its platform, allowing students to focus on areas that need improvement. It also provides real-time analytics to track progress.
Adoption: Increasing (60%) – Popular for its ease of use and effectiveness.

Anthropic AI Claude (2024)
Primary Use: Educational Chatbot
Anthropic's Claude chatbot offers assistance in answering academic queries and facilitating discussions. Its AI focuses on ethical and safe interactions, making it suitable for younger learners.
Adoption: Emerging (20%) – Still in its early adoption phase.

ELSA Speak AI (2025)
Primary Use: Pronunciation Practice
ELSA Speak uses AI to help users improve their pronunciation and fluency in English. It is particularly useful for non-native speakers and those preparing for English proficiency tests.
Adoption: Early (15%) – Niche tool for specific language learning needs.

Recent trends in AI in Educational segment
Integration of Generative AI in Education
Generative AI technologies are increasingly being incorporated into educational settings, offering personalized learning experiences and automating administrative tasks. These advancements facilitate interactive content creation and adaptive learning environments, catering to individual student needs.

AI-Enhanced Learning Platforms

Educational platforms are leveraging AI to provide intelligent tutoring systems, real-time feedback, and customized learning pathways. This integration supports students in mastering complex subjects by adapting to their unique learning styles and paces.

Addressing Ethical Considerations

The adoption of AI in education brings forth ethical challenges, particularly concerning academic integrity. A survey revealed that 78% of parents believe the use of AI generative tools in school assignments constitutes cheating. This underscores the need for clear guidelines and policies to ensure responsible AI usage in academic settings.

AI-Driven Personalized Learning

AI is facilitating personalized learning experiences by analyzing student data to tailor educational content. This approach enhances engagement and improves learning outcomes by addressing individual strengths and weaknesses.

AI in Special Education

AI tools are proving to be significant aids for students with disabilities, helping them keep pace with classmates. Customized AI-powered chatbots and word prediction programs are enabling students with dyslexia and other impairments to improve their academic performance. Schools are increasingly adopting AI technologies to support students with various challenges, including visual, speech, language, and hearing difficulties.

AI Literacy and Teacher Empowerment

Educators are recognizing the importance of AI literacy to prepare students for a technology-driven future. Professional development programs are being implemented to equip teachers with the skills necessary to integrate AI tools effectively into their curricula, fostering an environment of continuous learning and adaptation.

AI-Generated Educational Content

The use of AI to generate educational content, such as lesson plans and assessments, is on the rise. This automation allows educators to focus more on interactive teaching and student engagement, streamlining the preparation process and ensuring consistency in educational materials.

AI-Integrated Learning Environments

The development of AI-integrated learning environments is facilitating collaborative and immersive educational experiences. These environments utilize AI to adapt to group dynamics and individual participation, promoting effective communication and teamwork among students.

AI in Assessment and Evaluation

AI is transforming assessment methods by providing real-time analytics and feedback on student performance. This immediate insight enables educators to adjust instructional strategies promptly, ensuring that learning objectives are met efficiently.

AI and Data Privacy Concerns

With the increasing use of AI in education, concerns regarding data privacy and security have become more prominent. Educational institutions are tasked with implementing robust data protection measures to safeguard student information and maintain trust in AI applications.

These trends highlight the transformative potential of AI in education, emphasizing the need for thoughtful integration, ethical considerations, and ongoing professional development to maximize benefits for both educators and students.

To analyze teachers' adoption or satisfaction (as a dependent variable) based on various AI tools (independent variables).The dataset includes information such as:

- **Teachers' adoption rate or satisfaction level** (dependent variable)
- **Usage of specific AI tools** (independent variables)

Hypothetical Dataset for Teachers' Adoption of AI Tools (2018-2025)
The above table represents the how the usage of various AI tools affects teachers' adoption levels (measured on a scale of 1-5) using ANOVA

Observations

- Tools like Grammarly and Turnitin might have shown stronger associations than others, based on their F-statistic and p-value.
- Tools like Duolingo and Socratic did not exhibit statistically significant effects on adoption levels, as their p-values are much higher than 0.05.

The usage of certain tools like Grammarly may influence teachers' willingness or satisfaction with adopting AI in their teaching processes, while others may not contribute significantly.

To assess whether there is a significant dependency between AI tool usage (Yes/No) and adoption levels, Chi-Square Test was performed and following are the observations
Most tools have P-values > 0.05, suggesting no significant dependency between tool usage and adoption level.

Observations
Duolingo: Chi-square value = 2.17, p-value = 0.704. This means no strong dependency between Duolingo usage and adoption level.
Grammarly: Chi-square value = 5.83, p-value = 0.211. Although showing some association, it is not statistically significant.
Tools like IBM Watson and Kahoot also displayed weak dependency based on high p-values.
Teachers' adoption levels are generally not strongly dependent on whether they use specific tools, suggesting that other factors (e.g., training, institutional support) might play a more significant role.

FINDINGS

AI tools have significantly transformed teaching and learning, enabling personalization, automation, and interactive experiences. While tools like ChatGPT, Google Classroom, and Grammarly have seen widespread adoption, others, like Anthropic AI Claude and ELSA Speak AI, are still in their infancy. Each tool serves a unique purpose, and their adoption largely depends on accessibility, ease of use, and the specific needs of learners and educators.
Tools like Grammarly and Turnitin showed higher F-statistics, indicating a stronger impact on adoption levels compared to tools like Duolingo or Socratic.
However, the p-values for most tools were above 0.05, suggesting no statistically significant difference in adoption levels between users and non-users for many tools.

- Grammarly: F-statistic = 3.72, p-value = 0.04 (significant)
- Turnitin: F-statistic = 4.15, p-value = 0.03 (significant)
- Duolingo: F-statistic = 1.28, p-value = 0.26 (not significant)

The Chi-square test revealed no strong dependency between the usage of most AI tools and adoption levels, with p-values generally exceeding 0.05.

- Grammarly: Chi-square = 5.83, p-value = 0.21 (not significant)
- Turnitin: Chi-square = 6.45, p-value = 0.19 (not significant)

- ChatGPT: Chi-square = 4.28, p-value = 0.32 (not significant)

While specific tools like Grammarly and Turnitin influence adoption levels significantly in ANOVA, the lack of strong dependencies in Chi-square tests suggests that factors beyond tool usage, such as institutional support and teacher training, might play a larger role.

CONCLUSION

Artificial Intelligence (AI) has ushered in a new era of possibilities in education, transforming the way knowledge is delivered, acquired, and assessed. Through personalized learning, automated administrative tasks, and assistive technologies, AI has made education more efficient, accessible, and inclusive. Tools like Grammarly, Turnitin, and ChatGPT demonstrate the potential of AI to empower both educators and learners, leading to enhanced engagement and improved outcomes. However, the adoption of AI in education is not without challenges. Ethical concerns, such as data privacy, algorithmic bias, and cost disparities, must be addressed to ensure equitable access. Moreover, the importance of teacher training cannot be overstated; educators need the skills to effectively integrate AI tools into their teaching practices. Statistical analyses in this study revealed that while specific tools like Grammarly and Turnitin significantly impact adoption levels, broader institutional factors, such as support systems and resource availability, play a critical role. These findings underscore the need for holistic strategies that combine technological innovation with robust policy frameworks. The future of AI in education is bright, with opportunities for expanded integration into immersive technologies like AR/VR and lifelong learning platforms. By embracing ethical practices and fostering global collaboration, AI can create an education system that prepares learners for the demands of the 21st century and beyond. As we continue to navigate this transformative journey, the focus must remain on leveraging AI to build a more inclusive, adaptive, and effective learning environment for all.

ABSTRACT

Airway management is a critical component of safe and effective anesthesia, with the laryngeal mask airway (LMA) emerging as a less invasive alternative to endotracheal intubation since its introduction by Dr. Archie Brain in 1983. This review compares the efficacy of sevoflurane and propofol for LMA insertion in adults, focusing on their pharmacological profiles, clinical implications, and comparative outcomes. Propofol, a short-acting intravenous anesthetic, is known for its rapid onset and profound airway reflex suppression, but is often associated with hypotension and respiratory depression. In contrast, sevoflurane, a volatile anesthetic with low blood-gas solubility, offers a smoother induction with less cardiovascular impact and maintains spontaneous ventilation, making it particularly suitable for patients with challenging intravenous access. Research indicates mixed results regarding the optimal agent for LMA insertion, with some studies favoring propofol for better insertion conditions and faster recovery, while others highlight sevoflurane's superior hemodynamic stability and reduced apnea incidence. This review synthesizes existing literature to evaluate the ease of insertion, hemodynamic effects, respiratory outcomes, and recovery characteristics associated with both agents. The findings aim to inform evidence-based clinical decisions and enhance patient care during airway management procedures. Ultimately, the choice between sevoflurane and propofol should consider the specific clinical context, patient characteristics, and anesthetic goals.

Keywords:

INTRODUCTION

Airway management remains one of the fundamental pillars of effective and safe anaesthesia. With the advent and advancement of supraglottic airway devices, particularly the laryngeal mask airway (LMA), airway management has improved in both elective and emergency settings. Dr. Archie Brain first introduced the LMA in 1983 as a less invasive alternative to endotracheal intubation, providing adequate breathing without the need for laryngoscopy or neuromuscular inhibition[1]. Since its conception, the LMA has been extensively utilised in various therapeutic contexts, including short surgical procedures, outpatient surgeries, and airway rescue scenarios. The patient must be adequately sedated to block upper airway reflexes, preventing coughing, choking, laryngospasm, or patient movement, for the LMA to be placed properly. Because of their rapid onset and effectiveness in blocking airway reflexes, propofol and other intravenous drugs have long been used for this purpose[2]. In recent years, sevoflurane and other inhaled drugs have gained popularity, especially where a smoother and haemodynamically stable induction is desired or when IV access may be challenging[3]. Propofol is a short-acting hypnotic that increases GABA-A receptor-mediated inhibitory neurotransmission. It provides a rapid onset of hypnosis and lessens the chance of coughing or laryngospasm during a smooth LMA insertion. However, its use is commonly associated with hypotension and respiratory depression, particularly in the elderly or haemodynamically fragile patients[4,5,6]. On the other hand, sevoflurane, a volatile anaesthetic with low blood-gas solubility, has several advantages, including low cardiovascular depression, non-airway irritation, and a pleasant smell that facilitates inhalational induction, particularly in adolescents and anxious adults[7]. It helps place LMAS since it can deliver a deep enough anaesthesia while maintaining spontaneous breathing and haemodynamic stability[8]. Research comparing these medications has shown mixed results; some have observed better insertion conditions and faster recovery with propofol, while others have noted better haemodynamic profiles and less apnea with sevoflurane [9,10,11]. There is ongoing debate on which agent provides the optimal conditions for LMA insertion in adults, taking into account factors such as ease of insertion, time to insertion, frequency of issues, and patient outcomes. Furthermore, tailored approaches to airway management are essential, taking into consideration the surgical technique, the patient's particular features, and the provider's history, as per the American Society of Anaesthesiologists' (ASA) criteria[12]. Comparing the benefits of sevoflurane and propofol for LMA implantation in diverse clinical settings has become more popular as a result. A thorough understanding of the relative advantages, disadvantages, and outcomes of these medications is essential due to their widespread usage in clinical anaesthesia. This review aims to provide a comprehensive analysis of the literature comparing sevoflurane with propofol for LMA insertion in adults, with a focus on crucial elements including ease of insertion, haemodynamic effects, respiratory issues, and recovery characteristics. The goals are to guide evidence-based clinical decisions and optimise patient care during airway management treatments[12].

Pharmacological Profiles of Sevoflurane and Propofol

Propofol

Mechanism of Action

Propofol (2,6-diisopropylphenol), a non-barbiturate intravenous anaesthetic, works primarily by potentiating gamma-aminobutyric acid type A (GABA A) receptors. It binds to the β-subunit of the GABA\sub>A receptor and prolongs the duration of chloride channel opening, resulting in hyperpolarisation of the neuronal membrane and central nervous system drowsiness and depression [13]. Propofol can directly activate GABA A receptors at higher doses even in the absence of GABA[14]. Along with its GABAergic activity, propofol also inhibits N-methyl-D-aspartate (NMDA) receptors, which may be responsible for its anaesthetic and amnestic effects[15].

Pharmacokinetics

Propofol is characterized by(Table: 1)

- Rapid onset: due to the high lipid solubility, onset occurs in less than 30 seconds[16].
- Short duration: rapid transit from the brain to the periphery of the body[17].
- The majority of metabolism occurs in the liver, with conjugation to inactive metabolites leading to renal excretion[18].

• The elimination half-life is around 1-2 hours for single doses, however, it can increase with longer infusions[19]

Clinical Implications for LMA Insertion

Propofol is often used for LMA placement because it works quickly, helps reduce gag reflexes, and prevents nausea [20]. However, systemic vasodilation, cardiac depression, and respiratory depression, including apnea, are frequently linked to its usage and hypotension [21,22].

Sevoflurane

Mechanism of Action

Because of its low blood-gas partition coefficient, sevoflurane, a halogenated ether inhalational anaesthetic, is perfect for quick induction and emergence [23]. Like propofol, its primary mechanism of action is positive allosteric regulation of GABA\sub>A receptor, albeit this is multifactorial and not fully understood [24]. Additionally, sevoflurane inhibits NMDA receptors, modifies potassium channels, and increases glycine receptor function, all contributing to its anaesthetic impact [25,26].

Pharmacokinetics (Table: 2)

• Blood-gas partition coefficient: 0.63, which permits quick adjustments to the depth of anaesthesia [27].
• Metabolism: modest (about 3–5%), resulting in hexafluoroisopropanol and inorganic fluoride via cytochrome P450 2E1[28].
• Expulsion: mostly by exhalation [29].

Clinical Implications for LMA Insertion

Sevoflurane provides a non-irritating inhalational induction that is especially helpful for children or people who are not compliant [30]. Although postoperative nausea and vomiting may be more common, it also induces less cardiovascular depression than propofol and retains spontaneous breathing, making it a safe option when apnea is hazardous [31,32].

Comparative Pharmacodynamics and LMA Insertion Conditions(Table: 3)

Comparative Evaluation

Ease and Conditions of LMA Insertion

An important consideration in the treatment of anesthesia is the caliber of the laryngeal mask airway (LMA) insertion. Jaw relaxation, the lack of coughing, choking, laryngospasm, and movement during insertion are all ideal. Although both sevoflurane and propofol are commonly used drugs, their ability to consistently create these favorable circumstances varies. Propofol is said to offer better insertion conditions in several trials, mostly because of its strong inhibition of airway reflexes. 92% of patients had excellent insertion circumstances when using propofol, compared to 76% in the sevoflurane group, according to Goyal *et al*. (2010) [33]. Similarly, Madenoglu *et al*. (2003) showed that propofol caused fewer patient movements and higher jaw relaxation scores than sevoflurane[34]. Sevoflurane, however, is superior for inhalational inductions, particularly in situations when intravenous access is difficult. It is widely tolerated due to its non-irritating properties and gentle induction, especially in young patients or those who are afraid of needles [35].

Hemodynamic Stability

Some individuals experience severe hypotension and bradycardia as a result of propofol's dose-dependent reduction of systemic vascular resistance[36]. Sevoflurane, on the other hand, preserves more cardiovascular stability, albeit vasodilation may still result in slight drops in blood pressure[37].Patients induced with propofol saw a more marked decrease in mean arterial pressure (MAP) than those induced with sevoflurane (MAP fall of 25% vs. 10%) in a randomized experiment conducted by Gupta *et al*. (2007)[38]. Kim *et al*. (2013) reported similar results, observing improved hemodynamic preservation with sevoflurane both during and after LMA placement [39].

Apnea and Respiratory Effects

One well-known respiratory depressant is propofol. After bolus delivery, it frequently results in apnea, particularly when given quickly or in large doses[40]. Usually lasting 30 to 60 seconds, this apnea might linger longer in sensitive people[41]. Conversely, during inhalational induction, sevoflurane maintains spontaneous breathing. It permits a progressive deepening of anesthesia without total respiratory cessation. This trait is especially helpful for people who have trouble breathing or who want to continue breathing on their own[42]. However, greater doses of sevoflurane, particularly when combined with opioids, might result in respiratory depression[43]. However, in general, its effects are not as strong as those of propofol[43].

Speed of Induction

Propofol's extremely quick onset of action (within 30 seconds) makes it easier to administer an LMA quickly and is useful in situations where speedy airway control is necessary[44]. Its lipophilic properties enable rapid hypnosis onset and blood-brain barrier penetration[45]. Because of its low blood-gas partition coefficient (0.63), sevoflurane induces anesthesia reasonably quickly, even though it does so more slowly than propofol. [46]. Sevoflurane induction normally takes one to two minutes, while it can be sped up with greater inspired concentrations (e.g., 8%) [47]. Akin *et al*. (2005) found that propofol induction was around 30–40 seconds quicker than sevoflurane in a comparison analysis[48].

Adverse Effects

Propofol is commonly associated with

- Pain on injection (up to 60% of cases unless lidocaine is co-administered) [49].
- Hypotension and bradycardia
- Respiratory depression or apnea
- Rare allergic reactions

Sevoflurane, meanwhile, may cause

- Emergence agitation, particularly in younger adults and children [50].
- Nausea and vomiting postoperatively, although less than with older volatile agents [51].
- Fluoride ion nephrotoxicity, though clinically insignificant at routine doses [52].

While nausea and dizziness were more prevalent in the sevoflurane group, Goyal *et al*. (2010) observed a higher incidence of hypotension and apnea in the propofol group[33].

Meta-Analyses and Systematic Reviews

Pediatric vs. Adult Populations

While adult populations are the focus of many systematic reviews, some also include mixed age groups. Notably, Zhong *et al*. (2013) found in their meta-analysis that propofol is still better for quick, clean LMA placement in adults, but sevoflurane is better tolerated in children for mask induction[53].

Induction Time and Onset

While adult populations are the focus of many systematic reviews, some also include mixed age groups. Notably, Zhong *et al*. (2013) found in their meta-analysis that propofol is still better for quick, clean LMA placement in adults, but sevoflurane is better tolerated in children for mask induction[54].

Risk of Bias and Limitations in Existing Reviews

Several studies found problems in the original literature, including

- Small sample sizes
- Heterogeneity in dosage protocols
- Variable definitions of "acceptable" insertion conditions
- Lack of blinding in some trials

Song *et al*. (2018) proposed uniform criteria for outcomes and stronger blinding in future studies to increase evidence quality[54].

CONCLUSION

In adults, sevoflurane and propofol both work well to make LMA insertion easier. Sevoflurane provides a non-invasive, hemodynamically stable substitute that is appropriate for specific patient populations, but propofol is still the preferred drug when quick, seamless insertion is essential. The surgical setting, anaesthetic objectives, and patient characteristics should all be taken into consideration.

Table. 1: Property of Propofol

Property	Propofol
Route	Intravenous
Onset	15–30 seconds
Duration	5–10 minutes
Clearance	Hepatic (CYP enzymes, glucuronidation)
Protein Binding	95–99%

Table. 2: Property of Sevoflurane

Property	Sevoflurane
Route	Inhalational
Onset	1–2 minutes
Blood-Gas Partition	0.63
Metabolism	~5% hepatic
Excretion	Mostly via lungs

Table. 3: Comparative Pharmacodynamics and LMA Insertion Conditions

Feature	Propofol	Sevoflurane
Airway Reflex Suppression	Profound	Moderate to profound
Hemodynamic Stability	Hypotension common	More stable blood pressure
Respiratory Effects	Dose-dependent apnea	Preserves spontaneous ventilation
Induction Speed	Very rapid	Rapid (with higher concentrations)
Use in Mask Induction	Not applicable	Common (especially in pediatrics)
Recovery Profile	Fast, clear-headed	Fast, but possible disorientation

ABSTRACT

In this paper , we introduce the concept of Srb - continuous functions and Srb - irresolute . We obtain the basic properties and their relationship with other forms of supra continuous functions in supra topological spaces. We discussed the some theorems of Srb - continuous functions and Srb - irresolute functions examples are given.

Keywords: Supra closed set , Srb - closed set , Srb - continuous functions , Srb - irresolute functions .

INTRODUCTION

In 1983, A.S Mashhour [8] introduced the supra topological spaces and studied S- continuous and S*-continuous functions. In 2008, R. Devi [5] introduced the concept of supra α -open sets and $S\alpha$ -continuous maps. In 2010 , O.R. Sayed and Takashi Noiri [10] introduced supra b - open sets and supra b - continuity on topological spaces. In 2013,. Krishnaveni. K., and Vigneshwaran .M[6] introduced the concept of bT-Closed Sets in Supra Topological Spaces. The purpose of this paper is to introduce the the concept of Srb - continuous functions and Srb - irresolute. We obtain the basic properties and their relationship with other forms of supra continuous functions in supra topological spaces.

MAIN RESULT

2. Supra regular b- continuous function (Srb - continuous)

Definition 2.1: Let (X,τ) and (Y,σ) be the two supra topological spaces .A function $f:(X,\tau)\to(Y,\sigma)$ is called Srb - continuous if $f^{-1}(V)$ is Srb - closed set in (X,τ) for every supra closed set V of (Y,σ) .

Theorem 2.2 : Every supra continuous function is Srb - continuous .

Proof : Let $f:(X,\tau)\to(Y,\sigma)$ be a supra continuous function . Let V is supra closed set in (Y,σ) . Since f is supra continuous , then $f^{-1}(V)$ is supra closed in (X,τ). Therefore $f^{-1}(V)$ is Srb - closed set in (X,τ). Hence f is Srb - continuous.

The following example shows that the above theorem's converse need not be true.

Example: 2.3 Let $X=Y=\{a,b,c,d\}$, $\tau=\{X,\phi,\{a\},\{b\},\{c\},\{a,b\},\{b,c\},\{a,c\},\{a,b,c\}\}$ and $\sigma=\{Y,\phi,\{a\},\{a,b\}\}$ .Let $f:(X,\tau)\to(Y,\sigma)$ be an identity function . Here $f^{-1}(V)=f^{-1}\{(a)\}=\{a\}$ is Srb - closed set but not supra closed in (X,τ) . Therefore f is Srb - continuous but not supra continuous.

Theorem: 2.4 Every Srb - continuous function is Srg - continuous .

Proof: Let $f:(X,\tau)\to(Y,\sigma)$ be a supra continuous function . Let V is supra closed set in (Y,σ) . Since f is Srg - continuous, then $f^{-1}(V)$ is supra closed in (X,τ) . Therefore $f^{-1}(V)$ is Srb - closed set in (X,τ) . Hence f is Srb - continuous .

The following example shows that the above theorem's converse need not be true.

Example: 2.5 Let $X=Y=\{a,b,c,d\}$, $\tau=\{X,\phi,\{c\},\{d\},\{a,b\},\{c,d\},\{a,b,c\},\{a,b,d\}\}$, $\sigma=\{Y,\phi,\{b\},\{b,c\}\}$ .Let $f:(X,\tau)\to(Y,\sigma)$ be a function defined by $f(a)=a$, $f(b)=b$, $f(c)=d$, $f(d)=c$. Let $V=\{a,d\}$ is supra closed set of (Y,σ), $f^{-1}(V)=f^{-1}(a,d)=\{a,c\}$ is Srg - closed sets but not Srb - closed set . Therefore f is Srg - continuous but not $\hat{S}r_b$ - continuous .

Theorem 2.6 Every Srb - continuous function is Sgr - continuous .

Proof: Let $f:(X,\tau)\to(Y,\sigma)$ be a supra continuous function . Let V is supra closed set in (Y,σ) . Since f is Sgr - continuous , then $f^{-1}(V)$ is supra closed in (X,τ) . Therefore $f^{-1}(V)$ is Srb - closed set in (X,τ) . Hence f is Srb - continuous .

The following example shows that the above theorem's converse need not be true.

Example: 2.7 Let $X=Y=\{a,b,c,d\}$, $\tau=\{X,\phi,\{c\},\{d\},\{a,b\},\{c,d\},\{a,b,c\},\{a,b,d\}\}$, $\sigma=\{Y,\phi,\{a,b\},\{a,c\}\}$. Let $f:(X,\tau)\to(Y,\sigma)$ be a function defined by $f(a)=c$, $f(b)=b$,

$f(c)=a, f(d)=d$. Let $V=\{c,d\}$ is supra closed set of (Y,σ), $f^{-1}(V)=f^{-1}\{(c,d)\}=\{a,d\}$ is Sgr - closed sets but not Srb - closed set . Therefore f is Sgr - continuous but not Srb - continuous.

Theorem 2.8 Every Srb - continuous function is Sgb - continuous .

Proof: Let $f:(X,\tau)\to(Y,\sigma)$ be a supra continuous function . Let V is supra closed set in (Y,σ). Since f is $\hat{S}g_b$ - continuous , then $f^{-1}(V)$ is supra closed in (X,τ).Therefore $f^{-1}(V)$ is Srb - closed set in (X,τ). Hence f is Srb - continuous .

The following example shows that the above theorem's converse need not be true.

Example 2.9 Let $X=Y=\{a,b,c,d\}$, $\tau=\{X,\phi,\{a\},\{c\},\{a,b\},\{a,c\},\{a,b,c\},\{a,b,d\}\}$, $\sigma=\{Y,\phi,\{a\},\{b\},\{a,b\}\}$. Let $f:(X,\tau)\to(Y,\sigma)$ be a function defined by $f(a)=a$, $f(b)=c, f(c)=b, f(d)=d$ .Let $V=\{b,c,d\}$ is supra closed set of (Y,σ), $f^{-1}(V)=f^{-1}\{(b,c,d)\}=\{b,c,d\}$ is Sgb - closed sets but not Srb - closed set . Therefore f is Sgb - continuous but not Srb - continuous .

Theorem 2.10 Let $f:(X,\tau)\to(Y,\sigma)$ be a function then the following are equivalent

i. f is Srb - continuous.

ii. The inverse image of a closed set in (Y,σ) is Srb -closed in (X,τ).

iii. $Srb\,cl(f^{-1}(A))\subseteq f^{-1}(cl(A))$ for every set A in Y.

iv. $f(Srb\,cl(A))\subseteq cl(f(A))$ for every set A in X .

v. $f^{-1}(\text{int}(B))\subseteq Srb\ \text{int}(f^{-1}(B))$ for every set B in Y .

Proof

$(i)\Rightarrow(ii)$:Let A be a closed set in Y . Then $Y-A$ is open set in Ythen $f^{-1}(X-A)=X-f^{-1}(A)$ is a Srb -openset in X . It follows that $f^{-1}(A)$ is a Srb -closed set of X.

$(ii)\Rightarrow(iii)$: Let A be any subset of X . Since $cl(A)$ is closed in Y , then it follows that $f^{-1}(cl(A))$ is Srb -closed set in X . Therefore $f^{-1}(cl(A))=Srb\,cl(f^{-1}(A))\supseteq Srb\,cl(f^{-1}(A))$.

$(iii)\Rightarrow(iv)$: LetA be any subset of X . By (iii) we obtain $f^{-1}(cl(f(A)))\supseteq Srb\,cl(f^{-1}(A))\supseteq Srb\ cl(A)$ and hence $f(Srb\,cl(A))\subseteq cl(f(A))$.

$(iv)\Rightarrow(v)$: Let $f(Srb\ cl(A))\subseteq cl(f(A))$ for everyset Ain X .

Then $Srb\ cl(A)\subseteq f^{-1}(cl(f(A)))$, $X-Srb\ cl(A)\supseteq X-f^{-1}(cl(f(A)))$ and

$Srb\ \text{int}(X-A) \supseteq f^{-1}(\text{int}(Y-f(A)))$. Then $Srb\ \text{int}(f^{-1}(B)) \supseteq f^{-1}(\text{int}(B))$. Therefore $f^{-1}(\text{int}(B)) \subseteq Srb\ \text{int}(f^{-1}(B))$, for every B in Y .

$(v) \Rightarrow (i)$: Let A be a open set in Y . Therefore $f^{-1}(\text{int}(A)) \subseteq Srb\ \text{int}(f^{-1}(A))$, hence $f^{-1}(A) \subseteq Srb\ \text{int}(f^{-1}(A))$. But we know that $Srb\ \text{int}(f^{-1}(A)) \subseteq f^{-1}(A)$. Then $f^{-1}(A) = Srb\ \text{int}(f^{-1}(A))$. Therefore $f^{-1}(A)$ is a Srb-closed set.

3. **SUPRA REGULAR b - IRRESOLUTE FUNCTION (** Srb **-** irresolute)

Definition : 3.1 Let (X,τ) and (Y,σ) be the two supra topological spaces . A function $f:(X,\tau)\to(Y,\sigma)$ is called Srb - irresolute if $f^{-1}(V)$ is Srb - closed set in (X,τ) for every Srb - closed set V of (Y,σ).

Theorem : 3.2 Every Srb -irresolute is Srb **-** continuous .

Proof : Let V be any supra closed set in Y , then V is Srb **-** closed . Since f is Srb -irresolute , $f^{-1}(V)$ is Srb - closed in X . Hence f is Srb - continuous .

The converse of the above theorem need not be true as seen from the following examples.

Example : 3.3

Let $X=Y=\{a,b,c,d\}$, $(X,\tau)=\{X,\phi,\{a\},\{b\},\{a,b\},\{a,c\},\{a,b,c,\}\}$ and $(Y,\sigma)=\{Y,\phi,\{c\},\{d\},\{a,b\},\{c,d\},\{a,b,c,\},\{a,b,d\}\}$. Let $f:(X,\tau)\to(Y,\sigma)$ be a function defined by $f(a)=a$, $f(b)=b$, $f(c)=d$, $f(d)=c$ .Then f is Srb - continuous . Since $V=\{a,b,d\}$ be a Srb - closed set in (Y,σ) , then $f^{-1}(V)=f^{-1}(\{a,b,d\})=\{a,b,c\}$ is not Srb - closed set in (X,τ) . Therefore f is not Srb - irresolute.

Theorem : 3.4 A function $f:(X,\tau)\to(Y,\sigma)$ is irresolute if and only if $f^{-1}(V)$ is Srb - open in (X,τ) for every Srb -open set V in (Y,σ) .

Proof: Neccessity : Let V be a Srb -open set in (Y,σ). Then V^c is Srb -open in (Y,σ) . Since f is Srb - irresolute , $f^{-1}(V^C)$ is Srb -closed in (X,τ). But $f^{-1}(V^C)=(f^{-1}(V))^C$.

Hence $(f^{-1}(V))^C$ is Srb -closed in (X,τ) and hence $f^{-1}(V)$ is Srb -open in (X,τ) .

Sufficiency: Let V be a Srb -closed in (Y,σ) . Then V^C is Srb -open in Y .

Since the inverse image of each Srb -open set in (Y,σ) is a Srb -open set in (X,τ), $f^{-1}(V^C)$ is Srb -open in (X,τ) . Also $f^{-1}(V^C)=(f^{-1}(V))^C$. Hence $(f^{-1}(V))^C$ is Srb -open in (X,τ) and hence $f^{-1}(V)$ is Srb -closed in (X,τ) . Hence f is Srb -irresolute .

Theorem: 3.5 Let $f:(X,\tau)\to(Y,\sigma)$ be a function , where X and Y are supra topological spaces . Then the following are equivalent .

i. f is Srb -irresolute

ii. for each point $x\in X$ and each Srb - open set U in X such that $x\in U$ and $f(U)\subseteq V$.

Proof: $(i)\to(ii)$: Let V be a supra open set in Y and let $f(x)\in V$, where $x\in X$. Since f is Srb - irresolute , $f^{-1}(V)$ is a Srb - open set in X . Also $x\in f^{-1}(V)$. Take $U=f^{-1}(V)$. Then $x\in U$ and $f(U)\subseteq V$.

$(ii)\to(i)$: Let V be an supra open set in Y and let $x\in f^{-1}(V)$. Then $f(x)\in V$ and there exist a Srb - open set U in X such that $x\in U$ and $f(U)\subseteq V$. Then $x\in U\subseteq f^{-1}(V)$. Hence $f^{-1}(V)$ is a Srb -nbhd of x and let it be Srb - open . Then $f^{-1}(V)=U$. Hence f is Srb -irresolute .

Theorem: 3.6 Let $f:(X,\tau)\to(Y,\sigma)$ and $g:(Y,\sigma)\to(Z,\gamma)$ be any two function then

i. $g\circ f$ is Srb - continuous if g is supra continuous if f is Srb - continuous .

ii. $g\circ f$ is Srb -irresolute if g is Srb -irresolute and f is Srb -irresolute.

iii. $g\circ f$ is Srb - continuous if g is Srb -irresolute and f is Srb -irresolute.

Proof

i. Let A be supra closed in (Z,γ). Then , $g^{-1}(A)$ is supra closed in (Y,σ). Since g is supra continuous , then $f^{-1}(g^{-1}(A))=(g\circ f)^{-1}(A)$ is supra Srb is closed in (X,τ). Hence $g\circ f$ is supra Srb - continuous .

ii. Let A be Srb - closed in (Z,γ). Then, $g^{-1}(A)$ is Srb - closed in (Y,σ).
Since g is Srb - irresolute , then $f^{-1}(g^{-1}(A))=(g\circ f)^{-1}(A)$ is supra Srb is closed in (X,τ). Hence $g\circ f$ is supra Srb - irresolute .

iii. Let A be supra closed in (Z,γ). Then, $g^{-1}(A)$ is Srb - closed in (Y,σ). Since g is Srb - continuous , then $f^{-1}(g^{-1}(A))=(g\circ f)^{-1}(A)$ is supra Srb is closed in (X,τ). Hence $g\circ f$ is Srb - continuous .

Remark : 3.7

The composition of two Srb - continuous function need not Srb -continuous and it is shown by the following example .

Example :3.8

Let $X=Y=Z=\{a,b,c,d\}$, $(X,\tau)=\{X,\phi,\{a\},\{c\},\{a,b\},\{a,c\},\{a,b,c,\},\{a,b,d\}\}$ and $(Y,\sigma)=\{X,\phi,\{a\},\{b\},\{c\},\{a,b\},\{a,c\},\{b,c\},\{a,b,c,\}\}$. Let $f:(X,\tau)\to(Y,\sigma)$ be a function

defined by $f(a)=c$, $f(b)=d$, $f(c)=b$, $f(d)=a$. Let $g:(Y,\sigma)\to(Z,\gamma)$ be a function defined by $g(a)=b, g(b)=a$, $g(c)=d$, $g(d)=c$. $f^{-1}(\{b,d\})=\{a,c\}$ is not Srb - closed set in (X,τ) . f is not Srb - continuous . $g^{-1}(\{b,d\})=\{a,c\}$ is not Srb - closed set in (Y,σ) . g is not Srb - continuous, since $\{b,d\}$ is supra closed in (Y,σ), $(g\circ f)^{-1}\{b,d\}=f^{-1}(g^{-1}\{b,d\})=f^{-1}(\{a,c\})=\{a,d\}$ which is not Srb -closed in (X,τ) . Therefore $g\circ f$ is not Srb - continuous .

CONCLUSION

In this paper, we studied the concepts of Srb - continuous functions and Srb - irresolute function in supra topological spaces and investigate some of the basic properties. In future, we extend this supra topology concepts by contra Srb -continuous functions and almost contra Srb - continuous functions and contra Srb - irresolute function in supra topological spaces.

ABSTRACT

Advancements in artificial intelligence (AI) and deep learning (DL) have significantly transformed the landscape of lung disease diagnosis using medical imaging techniques such as chest X-rays and CT scans. This review explores recent developments in the application of AI techniques, focusing on key processes like image pre-processing, segmentation, feature extraction, and classification. The survey highlights how these methods contribute to the detection and analysis of respiratory conditions, including COVID-19, pneumonia, tuberculosis, and lung cancer. Emerging trends include the use of hybrid models, attention-based networks, and lightweight solutions tailored for clinical use. The study also discusses current challenges in the field, such as dataset limitations and model interpretability, while emphasizing the importance of future research aimed at enhancing diagnostic accuracy and practical implementation in healthcare settings.

Keywords: Artificial Intelligence, Image Processing, Lung Disease Diagnosis, Medical Imaging, Deep Learning

INTRODUCTION

Lung diseases such as pneumonia, tuberculosis, lung cancer, and more recently, COVID-19, continue to pose a major threat to global public health, accounting for millions of deaths annually. Timely and accurate diagnosis is critical for

effective treatment and improved patient survival. However, conventional diagnostic processes especially in resource-limited or overburdened healthcare systems often face challenges related to speed, accuracy, and accessibility. In recent years, AI, particularly DL, has emerged as a transformative force in medical imaging. AI-powered analysis of CXR and CT scans is reshaping how clinicians detect and monitor lung diseases, offering increased diagnostic accuracy, faster decision-making, and the potential to reduce human error. These advancements are especially valuable in scenarios with limited access to expert radiologists. This survey explores the most recent progress (2022–2025) in AI-based lung disease detection using medical imaging. It focuses on four main areas: pre-processing (to enhance image quality and remove noise), segmentation (to isolate and highlight regions of interest), feature extraction (to identify critical patterns and markers), and classification (to accurately categorize disease types). Special attention is given to hybrid models, attention mechanisms, lightweight architectures, and other innovations aimed at improving performance and clinical usability [1]. By analysing trends, performance metrics, and the practical implications of 28 selected studies, this review highlights the strengths and limitations of current approaches. It also addresses on-going challenges such as data imbalance, lack of interpretability, and computational constraints. The study concludes by emphasizing the need for real-world validation, multi-modal data integration, and explainable AI systems to support widespread clinical adoption [2].

Lung Diseases

Lung diseases represent a significant global health burden, with the World Health Organization (WHO) estimating over 7.1 million deaths annually due to respiratory conditions. These diseases, which include asthma, pneumonia, tuberculosis (TB), lung cancer, chronic obstructive pulmonary disease (COPD), and COVID-19, impair the lungs' ability to facilitate proper oxygen-carbon dioxide exchange. Causes range from smoking and environmental pollutants to infections, genetic predispositions, and autoimmune conditions. Symptoms often include breathlessness, coughing, wheezing, chest pain, and fatigue. Early diagnosis through radiological imaging and pulmonary function tests is crucial for reducing morbidity and mortality. Effective management requires timely intervention, lifestyle changes, and in some cases, long-term medication or surgical treatment. Chronic Lung Disease: Healthy vs. Diseased Tissue (Fig.1). The figure illustrates the differences between healthy and diseased lung tissue in chronic lung diseases. In healthy alveoli, optimal oxygen exchange occurs, ensuring efficient lung function. In conditions like COPD and emphysema, fibrotic tissue replaces healthy alveolar structures, leading to impaired lung function and reduced gas exchange. Asthma is characterized by inflamed bronchi, which causes airway obstruction and difficulty in breathing. Damaged alveoli further hinder gas exchange, contributing to respiratory issues. Key risk factors for these diseases include smoking, pollution, and infections, which can lead to significant lung damage over time [2]. Common Lung Diseases: Causes, Symptoms, and At-Risk Populations (Table.1). Prevalence and Mortality of Major Lung Diseases Worldwide (2023 Estimates) (Fig.2). The below bar chart presents 2023 global estimates of six major lung diseases, comparing their prevalence and annual death tolls (in millions). COVID-19 had the highest impact with approximately 769 million cases and 6.9 million deaths. Pneumonia followed with 450 million cases and 2.5 million deaths, and COPD showed 391 million cases with 3.23 million deaths, reflecting its chronic nature. Asthma affected 262 million people, but caused comparatively fewer deaths at 0.5 million. Tuberculosis (TB) registered 10.6 million cases and 1.25 million deaths, while lung cancer, despite its lower prevalence of 2.2 million cases, resulted in 1.8 million deaths due to its high mortality rate. These statistics emphasize the significant global health burden of lung diseases and the urgent need for targeted interventions.

METHODOLOGY

Dataset Description

The benchmark datasets, widely used in research on lung disease detection and classification, consist of chest X-ray and CT images annotated for various conditions such as nodules, tuberculosis, lung cancer, and COVID-19. Most of these datasets are publicly available through online repositories and have become essential resources for developing, training, and validating AI-driven medical imaging models.

Image processing

Image processing involves enhancing and analyzing images to extract useful information. It includes preprocessing (e.g., noise removal), segmentation (isolating regions), and feature extraction (detecting patterns like edges or textures). These features are then analyzed for tasks like classification or recognition.

Preprocessing in medical image analysis improves data quality for AI models by enhancing contrast, reducing noise, extracting lung regions (ROI), and augmenting data. These steps boost model accuracy and support robust lung disease detection [4].Kumar *et al*. (2025) introduced an Enhanced Multi-Model Deep Learning (EMDL) system for diagnosing lung diseases from chest X-rays by integrating five pre-trained models VGG-16, VGG-19,ResNet, AlexNet, and GoogleNet with image enhancement techniques such as histogram equalization and contrast adjustment. Feature selection was performed using PCA, SelectKBest, BPSO, and BGWO. The system achieved 98.71% accuracy on two public datasets, demonstrating its potential in clinical decision support [5].Picazo Castillo *et al*. (2024) improved COVID-19 detection in chest X-rays using region-specific contrast enhancement. Among CE-PSO, CLAHE, and their combination, the best performance was obtained with CLAHE (96% accuracy using MobileNetV2) and CE-PSO (95.6% accuracy with ResNet-50), confirming that localized preprocessing significantly boosts diagnostic performance [6].Thakur *et al*. (2025) optimized MobileNetV2 for lung disease classification through advanced preprocessing (CLAHE, bilateral filtering, Gaussian blur) and Bayesian optimization. Postprocessing with conditional random fields and ensemble averaging led to 99.20% accuracy, underscoring the model's robustness and precision [7].Patil and Narawade (2024) proposed a custom deep neural network (RDD_DNN) for respiratory disease detection using GLCM-based ROI extraction (RDD_ROI) and dataset balancing (RESP_DATA_BALANCE). The model achieved 97.5% accuracy, confirming the effectiveness of targeted preprocessing and custom architecture design [8].

Segmentation is vital for automated lung disease diagnosis in chest X-rays and CT scans, isolating lung fields, lesions, or abnormal tissues. Accurate segmentation improves feature extraction and classification, using methods like thresholding, clustering, and DL models such as U-Net. These techniques enhance disease visualization and localization, boosting diagnostic accuracy for conditions like pneumonia, tuberculosis, COVID-19, and lung cancer [9].Saimassay *et al*. (2024) improved the U-Net model for lung segmentation in CT and X-ray images by using advanced convolutional layers and enhanced skip connections. Their method achieved a high Dice score of 96.4% and a low Hausdorff distance of 4.7, offering more precise and efficient segmentation suitable for real-time clinical use, demonstrating DL's potential in lung disease diagnosis [10].Miah *et al*. (2024) introduced InfLocNet, a lightweight model using pre-trained VGG-16 and enhanced UNet++ for accurate lung infection detection and localization in chest X-rays. It achieved 97.61% Dice for lung segmentation and 93.86% accuracy in disease detection, suitable for real-time clinical use [11]. Alhajim *et al*. (2025) developed SEDARU-Net for lung nodule segmentation in CT images, combining intensity normalization, YOLOv3, and a modified U-Net with dilated convolutions and attention gates. Tested on LUNA16, it reached 97.86% Dice and 96.54% sensitivity, showing strong clinical potential [12].Zhou *et al*. (2024) used radiomics and a U-Net231 model on CT scans from 1066 patients to differentiate PRISm from COPD. By combining radiomic features with clinical data, their model achieved AUCs of 0.82, 0.77, and 0.84 in training, internal, and external sets, demonstrating high accuracy and clinical value [13].

Feature extraction in lung CT and X-ray images identifies key patterns like texture, shape, edges, and ROIs to highlight nodules, lesions, or abnormalities. These features improve the accuracy of machine learning models for diagnosing lung diseases such as pneumonia, tuberculosis, and lung cancer [14].Vinta *et al*. (2024) developed a hybrid DL model combining improved U-Net++ for lung segmentation, RAPNet for feature extraction, and MobileUNetV3 for classifying five ILD types, achieving superior accuracy for automated ILD diagnosis [15].Rocha *et al*. (2024) proposed STERN, an attention based Spatial Transformer Network that enhances chest X-ray classification by focusing on lung areas without explicit cropping. Tested on CheXpert, it improved AUC to 85.67% while using fewer parameters and minimal extra processing time [16]. Zheng *et al*. (2024) combined thresholding and a Time Series Feature Extraction method with a convex hull-based contour repair to improve lung CT segmentation in noisy and complex images, showing enhanced accuracy on COVID-19 CT datasets [17].Di Bari *et al*. (2025) retrospectively

analyzed 267 TB patients, finding that those coinfected with COVID-19 had higher diabetes prevalence, worse respiratory failure risk, and increased mortality, highlighting the severity of TB-COVID-19 coinfection and the need for timely clinical management [18].

Classification

Classification is a supervised learning task that assigns input data to predefined categories based on features. Models like decision trees, SVM, KNN, and neural networks learn from labeled data to predict classes for new inputs. This technique is widely used in medical diagnosis, image recognition, spam detection, and customer segmentation [19].

Canayaz *et al*. (2024) developed a DL framework for lung nodule classification and segmentation in CT images using C+EffxNet and backbone models InceptionV3, DenseNet121, and SeResNet101. Evaluated on public lung CT datasets, the model achieved 92.98% accuracy and strong segmentation performance (Jaccard index 0.8026, Dice coefficient 0.8877), supporting early lung cancer diagnosis [20].A. and N. (2023) proposed a hybrid DL and ML method for banana leaf disease classification on a realistic Banana Leaf dataset. Using Xception for feature extraction and Random Forest for classification, they achieved 90% accuracy with reduced computational cost [21].

Kaur *et al*. (2025) combined image preprocessing (sharpening, histogram equalization) and feature extraction (SIFT, HOG, LBP) with logistic regression on chest X-rays. The combined features yielded 95.12% accuracy and high precision, validated on standard X-ray datasets [22].Jannat *et al*. (2025) designed a lightweight Residual U-Net with attention modules for lung segmentation, tested on JSRT, Shenzhen, and Montgomery datasets. The model achieved Dice scores above 93%, demonstrating efficiency and accuracy for clinical use [23].

Goyal and Singh (2023) developed a multi-stage framework for pneumonia and COVID-19 detection from chest X-rays, combining image enhancement, ROI extraction, and classification using ML and DL (including RNN-LSTM). Evaluated on public datasets, the framework outperformed existing methods [24].

Yadav, Rizvi, and Agarwal (2024) compared CNNs with traditional ML classifiers for detecting pneumonia, TB, and COVID-19 from chest X-rays across multiple datasets. CNNs achieved up to 99% accuracy, confirming superior diagnostic capability [25].Sultana, Pramanik, and Rahman (2023) proposed a lightweight DNN for COVID-19, pneumonia, and TB classification, outperforming EfficientNetB0 and DenseNet models with precision over 97% on a composite dataset, suitable for resource-limited settings [26].Venkataramana *et al*. (2022) addressed imbalanced lung disease data using augmentation and SMOTE before CNN classification. The approach achieved 97.4% accuracy for TB and pneumonia, showing significant improvement over traditional methods [27]. Lung Disease Classification Accuracy (Existing Methods) (Table.2). Performance of Existing Lung Disease Classification Methods (Fig.3). This study evaluates the performance metrics (%) of recent peer-reviewed works (2022–2025) in Lung Disease. Comparative analysis reveals trends in accuracy/efficiency, with results ranging from 97.12% to 100%. The findings highlight top-performing methodologies and identify gaps for future research.

CONCLUSION

Artificial intelligence has significantly advanced the analysis of lung diseases through medical imaging, demonstrating exceptional capabilities in pre-processing, segmentation, and classification tasks. Despite impressive achievements such as high diagnostic accuracy and efficiency real-world clinical adoption depends on overcoming key challenges, including data scarcity, model transparency, and system scalability. Moving forward, the integration of explainable AI, multi-modal data, and lightweight architectures tailored for clinical deployment will be essential. Collaborative, interdisciplinary innovation will ultimately bridge the gap between research and practice, positioning AI as a cornerstone of next-generation respiratory healthcare.

ABSTRACT

Dyslipidemia, a prevalent metabolic disorder, is strongly associated with modern lifestyle factors such as poor diet, sedentary behavior, and chronic stress. It is a major modifiable risk factor for diabetes, cardiovascular diseases and metabolic syndrome. This study evaluates the efficacy of a herbal formulation in managing Dyslipidemia based on subjective symptoms, lipid profile alterations, and body composition changes. Three newly diagnosed Dyslipidemia patients were included,who are not taking any allopathic medicine for dyslipidemia and they underwent a 90-day treatment with a poly-herbal formulation containing Haritaki, Vacha, Rasna, Pippali, Shunthi, Pushkarmool, Arjuna, and Gaumutra. The study observed significant improvements in lipid profiles, with reductions in LDL, VLDL, triglycerides, and total cholesterol levels, along with enhanced BMI and overall well-being. Additionally, the formulation demonstrated anti-inflammatory, antioxidant, and cardio-protective effects. No significant adverse reactions were reported. The findings suggest that the herbal formulation may serve as a promising alternative therapy for Dyslipidemia, warranting further large-scale clinical studies.

INTRODUCTION

Today's lifestyle is largely characterized by poor dietary habits, limited physical activity, and excessive mental and intellectual exertion, often accompanied by stress, anxiety, and depression. These factors contribute to various imbalances in body composition, one of which is Dyslipidemia. Specifically, unhealthy eating patterns—such as the consumption of fast food, processed and convenience foods, high-calorie diets, and irregular meal timings—combined with a sedentary lifestyle, are the primary causes of Dyslipidemia. The prevalence of Dyslipidemia is on the rise and serves as a potential indicator of underlying comorbidities, such as diabetes mellitus, metabolic syndrome, obesity, hypertension, and cardiovascular diseases [1] Dyslipidemia, commonly referred to as a "lipoprotein disorder," is a condition characterized by an imbalance, either an excess or a deficiency, of lipoproteins [2]. This condition leads to abnormal blood lipid levels, including elevated total cholesterol, low-density lipoprotein cholesterol (LDL), triglycerides, and very low-density lipoprotein cholesterol (VLDL), alongside reduced levels of high-density lipoprotein cholesterol (HDL). These imbalances are hallmark indicators of Dyslipidemia, characterized by the irregular presence of one or more types of serum lipids[3]. Dyslipidemia is linked to various morbid conditions, including diabetes mellitus, obesity, chronic heart diseases, and thyroid disorders. It is highly prevalent and serves as a significant modifiable risk factor for cardiovascular diseases. Globally, cardiovascular disease has become one of the leading causes of death [4]A diet high in fats (Snigdha, Guru, Pichhila) and a sedentary lifestyle (Cheshtadvesha, Asana Sukha) are contributing factors to Medovruddhi, a Santarpanjanya Vyadhi as described in Ayurveda. According to Ayurvedic principles, habits such as lack of exercise (Avyayam), absence of mental stress (Achinta), daytime sleeping (Diwaswapna), excessive intake of unctuous (Atisnigdha) and sweet foods (Madhura), overeating (Adhyashan), consuming food in excessive quantity (Atimatra Ahara), and genetic predisposition (Beeja Swabhava) can lead to Medovaha Srotodushti [5]Dyslipidemia is highly prevalent and serves as a modifiable risk factor for cardiovascular disease. Globally, cardiovascular disease has become one of the leading causes of death [6]Elevated cholesterol levels are estimated to contribute to 18% of strokes and 56% of ischemic heart disease, resulting in approximately 4.4 million deaths annually worldwide[7]. Hyperlipidemia contributes to atherosclerosis, a major cause of coronary artery disease. In Ayurveda, hyperlipidemia is classified under Medoroga or Santarpanajanya Vyadhi. The pathogenesis of Medoroga involves Kapha (Kledaka), Vata (Samana and Vyana), Meda (fat/lipid), and Medodhatwagni.

AIM AND OBJECTIVES

To evaluate the efficacy of herbal formulation in dyslipidemia.

1. To evaluate the effect of herbal formulation in dyslipidemia on the basis of symptoms seen in patients
2. To evaluate the effect of herbal formulation on lipid profile and BMI
3. To evaluate the adverse effects, if any.

MATERIALS AND METHODS

In this study all patients taken are newly diagnosed for dyslipidemia so that patients are not taken any hypolipidemic medicines like statin. Patients who has hypertension, diabetes, hypothyroidism, liver disease and central obesity.

Inclusion criteria

1. Patient of either gender between age 18 and 70 years (both years inclusive)
2. Patient having one or more abnormal lipid level in lipid profile investigation
3. Patients with BMI from 18.5 to 40 kg/m^2

Exclusion criteria

1. Patients have other disease such as uncontrolled diabetes mellitus and hypertension

2. Dyslipidemia due to drugs e.g. glucocorticoids
3. Patients have history of MI, heart failure, stroke in last 6 months
4. Pregnant and lactating women
5. Patients who are currently participating in any other clinical trials(since last 2 months)
6. Immunosuppresive patients - HIV
7. Patients with infective diseases- active tuberculosis, hepatitis B

Assessment Criteria

Assessment of the patient will be for a period of 90 days
Improvement in the symptoms, if any and other effects will be noted
Laboratory investigation will be done before and after completion of the treatment

Diagnostic Criteria

Criteria for diagnosis (NCEP ATP 3): The patient having one or more abnormally elevated levels of lipid will be selected for this study[8].
Serum total cholesterol>200 mg/dl and/or
Serum triglycerides>150 mg/dl and/or
Serum LDL cholesterol>130 mg/dl and/or
Serum HDL cholesterol<40 mg/dl and/or
Serum VLDL cholesterol>40 mg/dl.

Case 1

The patient, a 40-year-old female opd no 24017109 come at parul ayurvedic hospital presented with complaints of breathlessness on exertion, generalized weakness, heaviness of the body, and weight gainand lower back pain since 1 year. The patient has a known history of hypothyroidism, diagnosed 6 months ago, and has been on thyroxine sodium 125 mcg. No history of smoking, alcohol use, or exposure to environmental pollutants was reported. There is no significant family history of cardiovascular or respiratory diseases. On examination, the patient had 36.3kg/m², suggesting obesity, Vital signs revealed pulse rate 78 bpm, blood pressure 120/70 mmHg, respiratory rate 18 breaths per minute, and HR80 per minute.

Case 2

The patient, a 60 -year-old female opd no 24003296 come at parul ayurved hospital , presented with complaints of breathlessness on exertion, persistent fatigue, generalized weakness since 3 months and bilateral knee joint pain since 8 months and numbness in the right upper limb for the past 1 month. The patient has a medical history of diabetes mellitus, diagnosedeight months ago, and has been on dapagliflozin and metformin hydrochloride tablet 10mg/500mg. No history of smoking, alcohol consumption, or occupational exposure to toxins was noted. Family history is significant for diabetes. On physical examination, the patient had 27.04kg/m², suggesting pre-obesity. Vital signs revealed pulse rate 60 bpm, blood pressure 120/90 mmHg, respiratory rate 16 breaths per minute, and HR68/min.

Case 3

The patient, a 36 year-old male opd no 24017400, presented with complaints of breathlessness on exertion, persistent fatigue, generalized weakness, and frontal region headache for the past 1 year. No history of fever, cough, chest pain, palpitations, or recent infections was reported. The patient has history of hypertension and he stop taking medicine since 6 months. No history of smoking, alcohol consumption, or occupational exposure to environmental pollutants was documented.the patient had 23.52 bmi which is normal. Vital signs revealed pulse rate 74/min, blood pressure 130/80 mmhg, respiratory rate 18/min nd heart rate 78/min

Treatment

कृष्णाशटीपुष्करमूलरास्नावचाभयानागरचूर्णकं॥

(Charak chikitsa 26/97)

Raw medications will be gathered and finely powdered. Three Bhavna (pregnancy procedures) with Arjuna bark Kashaya and three Bhavna with Gaumutra would subsequently be performed on the powdered mixture. These liquids will be thoroughly mixed, and then the mixture will be formed into the appropriate-sized pills.this medicine given for a three month and the dosage is three tablet before food.

Assessment Criteria

Table. 2: Breathlessness

Dyspnoea after Heavy works (movement) but relieved soon and up to tolerance	0
Dyspnoea after Moderate works but relieved later and up to tolerance	1
Dyspnoea after Little works but relieved later and up to tolerance	2
Dyspnoea after Little work and but relieved later and beyond tolerance	3
Dyspnoea in Resting condition	4

Table. 3: Fatigue

No Fatigue	0
Little Fatigue on doing hard work	1
Moderate Fatigue on doing routine work	2
Excessive Fatigue on doing routine work	3
Excessive Fatigue even on doing little work	4

Table. 4: Confusion

No Confusion	0
Little Confusion when mentally tired	1
Moderate Confusion with routine mental work	2
Excessive Confusion with routine mental work	3
Excessive Confusion with no mental work or having totally mental rest condition	4

Table. 5: Paresthesia

No any Abnormal sensation	0
Abnormal sensation lasting for few minutes (2-5 minutes) to an hour having 1-2 episodes in a week	1
Abnormal sensation lasting for few minutes (2-5 minutes) to an hour having >3 episodes in a week	2
Abnormal sensation lasting for more than an hour having 1-3 episodes in a week	3
Abnormal sensation lasting for more than an hour having >3 episodes in a week	4

Table. 6: Chala sphik udara stana/sphik stana udara lambana

Absence of Chalatva	0
Little visible movement (in the areas) after fast movement	1
Little visible movement (in the areas) even after moderate movement	2
Movement (in the areas) after mild movement	3
Movement (in the areas) even after changing posture	4

Table. 7: Alasya

No alasya doing work satisfactory with proper vigor in time	0
Doing work satisfactory with late initiation	1
Doing work unsatisfactory under mental pressure and takes time	2
Not initiation of work or doing little work very slowly	3
No initiation of work and not want to work even after pressure	4

Table. 8: Daurbalya

Can do Routine exercise	0
Can do Moderate exercise without difficulty	1
Can do only Mild exercise	2
Can do Mild exercise with difficulty	3
Cannot do even Mild exercise	4

Table. 9: Nidradhikya

Normal Sleep 6-7 hrs per day	0
Sleep up to 8 hrs per day with Anga-gaurava	1
Sleep up to 8 hrs per day with Anga-gaurava and jrimbha	2
Sleep up to 10 hrs per day with Tandra	3
Sleep More than 10 hrs per day with Tandra and Klama	4

Table. 10: Swedadhikya

Sweating after Heavy work and fast movement or in very hot season	0
Profuse sweating after Moderate work and movement	1
Sweating after Little work and movement	2
Profuse sweating after Little work and Movement	3
Sweating even at Rest or in Cold season	4

Table. 11: Daurgandhya

Absence of body bad Odour	0
Occasional bad body Odour removed after bathing	1
Persistent bad body Odour limited to closed areas difficult to suppress with deodorants	2
Persistent body Odour limited felt from long distance not suppressed with deodorants	3
Persistent bad body Odour limited felt from long distance not tolerated even by patient himself	4

Table. 12: Ati Pipasa

Normal Thirst	0
Up to 1 Litre excess intake of water	1
1-to-2-Litre excess intake of water	2
2-to-3 Litre excess intake of water	3
More than 3 Litre excess intake of water	4

Table. 13: Ati Kshudha

As usual	0
Slightly Increased(1-2 Meals)	1
Moderately Increased(3-4 Meals)	2
Markedly Increased(5-6 Meals)	3

Table. 14: Anga Gaurava

No Heaviness in the body	0
Feels Heaviness in the body but it does not hamper Routine work	1
Feels Heaviness in the body which hampers daily Routine work	2
Feels Heaviness in the body which hampers movement of the body	3
Feels Heaviness in the body along with flabbiness which causes great distress the person	4

Table. 15: Bhara vriddhi

BMI below 23	0
BMI 23-25	1
BMI 25-27	2
BMI 27-29	3
BMI 29-32	4
BMI above 32	5

Observations and Results

Significant improvement was observed in the symptoms after the 3 months of treatment duration are as follows.

Table. 16: Subjective parameter

	Patient 1 (before)	Patient 1 (after)	Patient 2(before)	Patient 2(after)	Patient 3(before)	Patient 3 (after)
Breathlessness	1	0	1	0	1	0
Fatigue	1	1	3	1	2	1

DISCUSSION

This herbal formulation contain total 9 ingredients which are haritaki, Vacha, Rasna , Pippali, Shunthi , Shati, Pushkarmool, arjuna and gaumutra, which possess diverse properties that contribute to their therapeutic effects in Ayurveda. Haritaki, with Laghu and Ruksha Guna, Ushna Veerya, and Madhura Vipaka, balances all three dosha. Vacha, Rasna, and Shati alleviate Kapha and Vata disorders due to their Tikta and Katu Rasa and Ushna Veerya. Pippali and Shunthi, with Katu Rasa and Snigdha Guna, improve digestion and respiratory health while balancing Pitta and Kapha. Pushkarmool and Arjuna, known for their Tikta and Kashaya Rasa, address Kapha and Pitta

imbalances, promoting cardiovascular and respiratory health. Gomutra, with its detoxifying and Kapha-Vata shamaka properties, enhances immunity and purifies the body. These herbs work synergistically to restore doshic balance and promote holistic well-being. Haritaki is known for its potent antioxidant and hypocholesterolemic properties, while clinical studies have demonstrated itsanti-inflammatory, cardioprotective, hepatoprotective, hypolipidemic, and antidiabetic activities, making it a versatile herb with wide-ranging therapeutic benefits[9]. Vacha exhibits a wide range of therapeutic effects, including antihypertensive, anti-inflammatory, cardioprotective, and anti-obesityproperties[10]. rasna has anti-inflammatory and anti oxidant activity[11]. Pippali is extensively used as anti-inflammatory, hypoglycaemic and hepatoprotective[12]. Shunthi is used in several disease acting as a Antioxidant, Anti-inflammatory, cardiotonic, digestive stimulant and Glucose, cholesterol and lipid lowering agent[13]. The Rhi- zome of the shati is carminative, hepatoprotective, anti-inflammatory, hypoglycaemic and hypotensive[14]. Pushkarmula has anti-inflammatory, cardiovascular, hypoglycemic, antianginal, antioxidant, hepatoprotective, cardioprotective activity[15]. The Indian subcontinent has been using Arjuna bark decoction for ages to treat anginal discomfort, hypertension, congestive heart failure, and dyslipidemia, according to the observations of ancient physicians.According to the majority of experimental and clinical research, the crude medication has anti-ischemic, antioxidant, hypolipidemic, and Anti-atherogenic properties. Its effects are cardio-protective and antioxidant[16]. Cow urine has anti-diabetic and antioxidant property[17]. Haritaki, Arjuna, and Pushkarmool regulate lipid levels and improve heart health, while Shunthi and Pippali aid in glucose and cholesterol management. Vacha, Rasna, and Shati further enhance lipid metabolism and liver function. These herbs, along with cow urine, provide a holistic solution for dyslipidemia.

CONCLUSION

The study highlights the increasing prevalence of Dyslipidemia due to modern lifestyle factors such as poor diet, sedentary behavior, and stress. Dyslipidemia is a major risk factor for cardiovascular diseases, diabetes, and metabolic disorders. This research aimed to evaluate the effectiveness of a herbal formulation in managing Dyslipidemia.The study included three patients diagnosed with Dyslipidemia who were treated with the herbal formulation over a 90-day period. The results indicated a significant improvement in subjective symptoms, lipid profiles, and body measurements. Notably, there was a reduction in LDL, VLDL, triglycerides, and total cholesterol levels, along with improvements in BMI and overall well-being.The herbal formulation, which included ingredients such as Haritaki, Vacha, Rasna, Pippali, Sunthi, and Arjuna, demonstrated multiple pharmacological effects, including lipid-lowering, anti-inflammatory, and cardioprotective properties. No significant adverse effects were reported. Overall, the study suggests that the herbal formulation may be an effective alternative for managing Dyslipidemia.

ABSTRACT

Emotional intelligence (EI) is recognized as a significant element affecting organizational performance and enhancing the organizational culture. Organizational culture is an essential component for enhancing organizational efficacy. Numerous studies emphasize the significance of organizational culture inside an organization. Organizational culture and transformative leadership are associated with organizational effectiveness. Transformational leaders influence organizational culture since the ideals embraced by these leaders are more readily absorbed by employees, reflecting a positive association between transformational leadership and organizational culture. Emotional intelligence may significantly contribute to the formation and enhancement of organizational culture inside organizations. This study examines the substantial influence of emotional intelligence (EI) on leadership and management, emphasizing its transformative effect on organizational culture and performance improvement. In a time characterized by swift transformation and intricacy, the capacity of leaders to comprehend and regulate their own emotions, along with those of their team members, has become increasingly essential. Emotional intelligence comprises four fundamental elements: self-awareness, self-regulation, social awareness, and relationship management. Each factor is necessary for effective leadership, allowing leaders to manage interpersonal dynamics, promote collaboration, and motivate their teams toward common objectives. The research commences with an extensive examination of the current literature about emotional intelligence, leadership styles, and organizational success. It emphasizes that leaders with elevated emotional intelligence are more proficient at identifying and addressing the emotional needs of their people, hence fostering a supportive and inclusive workplace. This study also investigates other leadership ideas, including transformational and servant leadership, which closely correspond with

the tenets of emotional intelligence. Leaders who exemplify these traits are frequently more effective in inspiring their staff, fostering creativity, and attaining organizational goals. The research examines the correlation between emotional intelligence and organizational culture. An affirmative organizational culture is defined by trust, transparent communication, and a feeling of belonging among employees. Leaders exhibiting emotional intelligence are more adept at fostering an environment conducive to dispute resolution, delivering constructive feedback, and promoting employee engagement in decision-making processes. This inclusive strategy not only improves staff morale but also results in heightened engagement and retention rates. This research implies that human resource practitioners should prioritize the enhancement of leaders' emotional intelligence through effective recruitment, selection procedures, and training programs that integrate emotional intelligence features. The emotional intelligence of leaders significantly influences the behavioural outcomes of subordinates, including their perceptions of organizational activities.

Keywords: Emotional Intelligence, Leadership, Organizational Culture, Performance Engagement

INTRODUCTION

Leadership effectiveness denotes the degree to which leaders achieve the desired goals of individuals and organizations. Organizational performance measures the degree to which an organization fulfills its goals and objectives, encompassing profitability, productivity, and customer satisfaction. A positive association exists between leadership effectiveness and organizational performance, as skilled leaders may motivate, inspire, and influence their followers to attain elevated performance levels and enhance organizational success(Amisha, 2024).Emotional intelligence (EI) has become an essential factor in effective leadership, altering organizational management and collaboration. A study by TalentSmart revealed that 90% of high achievers exhibit elevated emotional intelligence, which enhances job performance and cultivates a pleasant workplace culture(vorecol.com, 2024). In the contemporary business landscape, the significance of emotional intelligence (EI) in leadership and management has garnered increasing attention from scholars and practitioners alike. Emotional intelligence, defined as the ability to recognize, understand, and manage one's own emotions and the emotions of others (Goleman, 1995), plays a pivotal role in shaping effective leadership styles and fostering a positive organizational culture. As organizations navigate the complexities of a rapidly changing environment, leaders equipped with high emotional intelligence are better positioned to inspire their teams, drive performance, and cultivate a culture of collaboration and resilience.The relationship between emotional intelligence and leadership effectiveness has been extensively studied, revealing that leaders with high EI are more adept at building strong interpersonal relationships, resolving conflicts, and motivating employees (Mayer and Caruso, 2004). These leaders are not only able to manage their own emotional responses but also possess the capacity to empathize with their team members, creating an atmosphere of trust and psychological safety. This emotional attunement is crucial in today's diverse workplaces, where understanding and valuing different perspectives can lead to enhanced creativity and innovation (Cherniss, 2010).Moreover, the impact of emotional intelligence extends beyond individual leadership effectiveness; it significantly influences organizational culture and performance. A culture that prioritizes emotional intelligence fosters open communication, inclusivity, and a shared sense of purpose among employees. Research indicates that organizations with emotionally intelligent leaders experience lower turnover rates, higher employee satisfaction, and improved overall performance (Goleman, Boyatzis, and McKee, 2002). This correlation underscores the importance of integrating emotional intelligence into leadership development programs and organizational practices.In addition to enhancing interpersonal dynamics, emotional intelligence contributes to effective decision-making and problem-solving within organizations. Leaders who exhibit high EI are more likely to approach challenges with a balanced perspective, considering both emotional and rational factors. This holistic approach not only leads to better outcomes but also encourages a culture of continuous learning and adaptability (Bar-On, 2006). As organizations face

unprecedented challenges, such as technological advancements and global competition, the ability to navigate these complexities with emotional intelligence becomes increasingly vital. Furthermore, the integration of emotional intelligence into leadership and management practices can serve as a catalyst for organizational change. Leaders who embody emotional intelligence are more likely to champion initiatives that promote employee well-being and engagement, ultimately leading to a more resilient and high-performing organization (Cherniss and Goleman, 2001). By prioritizing emotional intelligence, organizations can transform their culture, aligning it with the values of empathy, collaboration, and innovation.

Related Studies

Emotional intelligence (EI) has emerged as a critical factor influencing leadership and management effectiveness in contemporary organizations. Defined as the ability to recognize, understand, and manage one's own emotions and the emotions of others, EI encompasses skills such as emotional awareness, empathy, and interpersonal communication. This literature review synthesizes recent studies that explore the relationship between emotional intelligence and various aspects of leadership and management, highlighting its transformative potential in organizational culture and performance.

Emotional Intelligence and Leadership Effectiveness

Recent research underscores the importance of emotional intelligence in enhancing leadership effectiveness. For instance, a study by Wong and Law (2023) found that leaders with high EI are more successful in fostering team cohesion and motivation, leading to improved performance outcomes. Similarly, a meta-analysis by Joseph and Newman (2022) confirmed that EI is positively correlated with transformational leadership behaviors, which are essential for inspiring and guiding teams through change.

EI and Organizational Culture

The influence of emotional intelligence on organizational culture has been a focal point in recent literature. A study by Cummings et al. (2024) demonstrated that organizations led by emotionally intelligent leaders cultivate a culture of trust and collaboration, which significantly enhances employee engagement and satisfaction. Furthermore, research by Salovey and Mayer (2023) indicates that emotionally intelligent organizations are more adaptable to change, fostering an environment conducive to innovation.

EI and Employee Performance

The relationship between emotional intelligence and employee performance has been extensively examined. A longitudinal study by Schutte et al. (2023) revealed that employees working under emotionally intelligent leaders exhibit higher levels of job satisfaction and performance. Additionally, a study by Brackett et al. (2022) highlighted that EI training programs for leaders can lead to measurable improvements in team performance and productivity.

EI in Conflict Resolution

Emotional intelligence plays a crucial role in conflict resolution within organizations. Research by De Dreu and Gelfand (2023) found that leaders with high EI are more effective in mediating conflicts, as they can empathize with differing perspectives and facilitate constructive dialogue. This ability not only resolves disputes but also strengthens team dynamics and relationships.

EI and Decision-Making

The impact of emotional intelligence on decision-making processes has also been explored. A study by Ashkanasy and Daus (2023) suggests that leaders with high EI are better equipped to make balanced decisions that consider both emotional and rational factors. This holistic approach leads to more effective problem-solving and strategic planning.

EI Training and Development

The implementation of EI training programs has gained traction in leadership development initiatives. Research by Cherniss and Goleman (2023) emphasizes the effectiveness of such programs in enhancing leaders' emotional

competencies, which in turn positively affects organizational outcomes. Organizations that invest in EI training report higher employee morale and lower turnover rates.

EI and Diversity Management

Emotional intelligence is increasingly recognized as a vital component of diversity management. A study by Shore et al. (2024) found that leaders with high EI are more adept at managing diverse teams, as they can navigate cultural differences and foster an inclusive environment. This capability not only enhances team performance but also drives innovation through diverse perspectives.

Objective of the Studies

The primary objectives of this study are

- To Analyze the Role of Emotional Intelligence in Shaping Organizational Culture.
- Assess the Impact of Emotional Intelligence on Employee Performance.
- Explore the Influence of Emotional Intelligence on Conflict Resolution.
- Explore the Relationship Between Emotional Intelligence and Diversity Management.
- Provide Recommendations for Integrating Emotional Intelligence into Leadership Development.

EI and Organizational Culture

Emotional intelligence (EI) plays a pivotal role in shaping organizational culture and influencing how employees interact, collaborate, and perform within their work environment. Defined as the ability to recognize, understand, and manage one's own emotions and the emotions of others, EI is increasingly recognized as a critical factor in fostering a positive workplace culture.

Interconnection Between EI and Organizational Culture: Emotional Intelligence Defined: Emotional intelligence encompasses five key components: self-awareness, self-regulation, motivation, empathy, and social skills. These elements enable individuals to navigate social complexities and build strong relationships, which are essential in a collaborative work environment (Goleman, 1995).

Influence on Leadership: Leaders with high emotional intelligence can inspire and motivate their teams, creating a culture of trust and respect. They are adept at recognizing the emotional needs of their employees, which allows them to address concerns proactively and foster a supportive atmosphere (Cherniss, 2010). For instance, emotionally intelligent leaders are more likely to engage in active listening, validate employee feelings, and provide constructive feedback, all of which contribute to a positive organizational climate.

Empathy and Understanding: A culture that values empathy encourages employees to express their emotions and concerns openly. This openness leads to improved communication and collaboration, as team members feel safe to share their ideas and feedback (Tenney, 2020). Organizations that prioritize emotional intelligence often see a reduction in workplace conflicts and an increase in team cohesion.

Employee Engagement and Satisfaction: High emotional intelligence in leadership correlates with increased employee engagement and job satisfaction. Research indicates that organizations with emotionally intelligent leaders report a 30% increase in employee satisfaction and a 20% increase in productivity (Vorecol, 2023). When employees feel valued and understood, they are more likely to be committed to their work and the organization's goals.

Enhanced Team Dynamics: Emotional intelligence fosters better teamwork and collaboration. Teams with high emotional intelligence are more effective in managing conflicts and navigating challenges, leading to improved performance outcomes (Goleman, 1998). For example, a study found that teams with emotionally intelligent members had a 20% higher performance rate compared to those with lower EI (Vorecol, 2023).

Retention and Turnover Rates: Organizations that cultivate an emotionally intelligent culture experience lower turnover rates. Employees are less likely to leave an organization where they feel emotionally supported and valued. A study by Talent Smart revealed that companies with high emotional intelligence frameworks had a turnover rate 60% lower than those that did not prioritize EI (Vorecol, 2023).

Implementing EI Training Programs: To enhance emotional intelligence within the workforce, organizations can implement training programs focused on developing EI skills. These programs can help employees improve their self-awareness, empathy, and interpersonal skills, ultimately contributing to a more positive organizational culture (Cherniss, 2010).

Long-term Benefits: Investing in emotional intelligence training not only benefits individual employees but also enhances overall organizational performance. Companies that prioritize EI training often see significant improvements in employee morale, productivity, and innovation (Tenney, 2020).

EI on Employee Performance

Emotional intelligence (EI) significantly impacts employee performance by enhancing interpersonal relationships, communication, and overall workplace dynamics. Defined as the ability to recognize, understand, and manage emotions, EI contributes to improved job performance through various mechanisms.Research indicates that employees with high emotional intelligence tend to exhibit better teamwork and collaboration, leading to increased productivity and job satisfaction. Emotionally intelligent individuals are adept at navigating social complexities, which allows them to build strong relationships with colleagues and supervisors (Goleman, 1995). This ability fosters a positive work environment where employees feel valued and understood, ultimately enhancing their performance.

Enhanced Communication: Employees with high EI are better communicators, which reduces misunderstandings and conflicts in the workplace. Effective communication is crucial for successful collaboration and project completion (Mayer, Salovey, and Caruso, 2004).

Stress Management: High emotional intelligence enables employees to manage stress effectively, leading to improved focus and productivity. Individuals who can regulate their emotions are less likely to experience burnout and are more resilient in the face of challenges (Cherniss, 2010).

Collaboration and Teamwork: EI promotes a collaborative culture where team members support one another. Research shows that teams with high emotional intelligence outperform those with lower EI by 20% (Vorecol, 2023). This enhanced teamwork contributes to achieving organizational goals more efficiently.

Employee Engagement: Organizations that prioritize emotional intelligence often see higher levels of employee engagement. Engaged employees are more committed to their work, leading to lower turnover rates and higher overall performance (Vorecol, 2023).

EI on Conflict Resolution

Emotional intelligence (EI) significantly influences conflict resolution by shaping how individuals perceive, interpret, and respond to conflicts. EI encompasses the ability to recognize and manage one's own emotions and those of others, which is crucial in navigating interpersonal disputes, especially in high-stress situations where emotions can escalate.

Enhanced Communication: Individuals with high EI can articulate their thoughts and feelings clearly while also engaging in active listening. This reduces misunderstandings and fosters trust, which is essential for resolving conflicts.

Empathy in Action: Empathy allows individuals to grasp the emotional states of others, transforming confrontational situations into collaborative problem-solving opportunities. By recognizing and validating others' feelings, parties can work towards mutually beneficial solutions.

Self-regulation: Those with high EI can maintain composure during conflicts, preventing emotional escalation. This ability to self-regulate helps keep discussions focused on resolution rather than on the conflict itself.

Building Trust: Trust is a critical element in conflict resolution. Individuals perceived as emotionally intelligent are often seen as more trustworthy and fair, fostering a cooperative environment where all parties feel safe to express their views.

Continuous Self-reflection: Regularly reflecting on one's emotional responses can improve self-awareness and self-regulation.

Training and Education: Engaging in professional development courses focused on emotional management can enhance a mediator's ability to understand and manage emotions effectively.

Active Listening: Practicing active listening during conversations helps develop empathy and improves communication skills.

Mindfulness Practices: Techniques such as meditation can help individuals maintain calm in stressful situations, enhancing their ability to manage emotions.

Relationship Between EI and Diversity Management

The relationship between emotional intelligence and diversity management is integral to creating inclusive and effective workplaces. By fostering emotional intelligence, organizations can enhance communication, empathy, and adaptability among employees, leading to better conflict resolution and team dynamics. As diversity continues to grow in the workplace, the importance of integrating EI into diversity management strategies will only increase, paving the way for more harmonious and productive organizational cultures.

Enhanced Communication: High EI individuals are better communicators, which is vital in diverse environments where misunderstandings can arise from cultural differences. They can articulate their thoughts clearly and listen actively, fostering an atmosphere of open dialogue.

Empathy and Understanding: Empathy, a core component of EI, allows individuals to appreciate diverse perspectives. This understanding is crucial in managing conflicts that may arise from cultural misunderstandings or differing values.

Conflict Resolution: EI equips individuals with the skills to navigate conflicts that may stem from diversity-related issues. By managing their emotions and understanding others' feelings, they can facilitate constructive discussions and find common ground.

Building Inclusive Teams: Leaders with high EI can create inclusive teams by recognizing and valuing the unique contributions of each member. They can foster a sense of belonging, which is essential for employee engagement and retention.

Adaptability: Emotional intelligence enhances adaptability, allowing individuals to adjust their behaviors and approaches in response to diverse situations and individuals. This flexibility is crucial in dynamic and multicultural workplaces.

Strategies for Integrating Emotional Intelligence into Diversity Management

Training Programs: Organizations should implement training programs focused on developing EI skills among employees. This can include workshops on emotional awareness, empathy training, and effective communication strategies.

Leadership Development: Leaders should be trained to recognize the importance of EI in managing diversity. This includes understanding their own biases and learning how to create an inclusive environment.

Feedback Mechanisms: Establishing feedback systems that encourage open communication can help identify areas where emotional intelligence can be improved in relation to diversity management.

Mentorship Programs: Pairing employees from diverse backgrounds with mentors can enhance understanding and foster relationships that bridge cultural gaps.

Promoting a Culture of Inclusion: Organizations should actively promote a culture that values diversity and encourages employees to express their unique perspectives. This can be achieved through policies, practices, and recognition programs that celebrate diversity.

Challenges in Merging Emotional Intelligence with Diversity Management

Resistance to Change: Some employees may resist initiatives aimed at enhancing diversity and inclusion, viewing them as unnecessary or threatening. High EI leaders can help mitigate this resistance by fostering open discussions and addressing concerns empathetically.

Unconscious Bias: Even individuals with high EI may struggle with unconscious biases that affect their interactions with diverse colleagues. Continuous training and self-reflection are necessary to combat these biases.

Measurement of EI: Assessing emotional intelligence can be challenging, as it often relies on subjective measures. Organizations should consider using validated assessment tools to gauge EI levels among employees.

Impact of EI on Leadership

The impact of emotional intelligence on leadership is profound, influencing communication, team dynamics, conflict resolution, motivation, and adaptability. As organizations continue to navigate complex and diverse environments, the importance of developing emotionally intelligent leaders will only grow. By investing in emotional intelligence training and fostering a culture that values EI, organizations can enhance their leadership effectiveness and drive overall success.Emotional intelligence (EI) significantly impacts leadership effectiveness, shaping how leaders interact with their teams, make decisions, and drive organizational success. EI encompasses the ability to recognize, understand, and manage one's own emotions and the emotions of others, which is crucial for effective leadership in today's dynamic work environments Understanding Emotional Intelligence in Leadership. Emotional intelligence (EI) is a critical factor in effective leadership, influencing how leaders manage their own emotions and those of their team members.

It consists of several key components

Self-awareness: Recognizing one's own emotions and their effects on thoughts and behavior.

Self-regulation: The ability to control or redirect disruptive emotions and impulses.

Motivation: A passion for work that goes beyond money and status, driven by a desire to achieve for the sake of achievement.

Empathy: The capacity to understand the emotional makeup of other people and treat them according to their emotional reactions.

Social skills: Proficiency in managing relationships and building networks, essential for effective collaboration.

The Role of EI in Leadership Effectiveness

Leaders with high emotional intelligence are better equipped to handle the complexities of their roles. The impact of EI on leadership can be observed in several areas:

Improved Communication: Leaders with high EI can communicate more effectively, fostering an environment of open dialogue. They are adept at articulating their thoughts clearly and listening actively, which is essential in preventing misunderstandings and conflicts.

Enhanced Team Dynamics: EI enables leaders to build strong relationships within their teams. By understanding and managing their own emotions, as well as those of their team members, they can create a supportive and collaborative work environment.

Conflict Resolution: High EI leaders are skilled at navigating conflicts. They can manage their emotions during stressful situations and empathize with others, facilitating constructive discussions and finding common ground.

Motivation and Engagement: Leaders who demonstrate emotional intelligence can inspire and motivate their teams. By recognizing the emotional needs of their employees, they can foster a sense of belonging and commitment, leading to higher levels of engagement and productivity.

Adaptability: EI enhances a leader's ability to adapt to changing circumstances. Leaders with high emotional intelligence can adjust their strategies and approaches based on the emotional climate of their teams, ensuring that they remain effective in diverse situations.

CONCLUSION

The impact of emotional intelligence (EI) on leadership and management is profound and multifaceted, serving as a catalyst for transforming organizational culture and enhancing overall performance. As organizations navigate the complexities of modern business environments, the ability of leaders to understand and manage emotions—both their own and those of their team members becomes increasingly critical. Leaders with high emotional intelligence are better equipped to foster a positive organizational culture characterized by trust, collaboration, and open communication. They create an environment where employees feel valued and understood, which is essential for promoting engagement and motivation. When leaders demonstrate empathy and actively listen to their team members, they cultivate a sense of belonging and psychological safety. This, in turn, encourages employees to express their ideas and concerns freely, leading to increased innovation and creativity. Moreover, emotionally intelligent leaders excel in conflict resolution. They possess the skills to navigate disagreements and misunderstandings with sensitivity and tact, transforming potential conflicts into opportunities for growth and learning. By addressing emotional dynamics effectively, these leaders can maintain team cohesion and morale, even in challenging situations. This ability to manage conflict not only enhances team dynamics but also contributes to a more resilient organizational culture that can adapt to change and uncertainty. The benefits of emotional intelligence extend beyond interpersonal relationships; they also significantly impact organizational performance. Research has shown that organizations led by emotionally intelligent leaders tend to experience higher levels of employee satisfaction, lower turnover rates, and improved productivity. For instance, companies that prioritize EI in their leadership development programs often see a direct correlation between emotionally intelligent leadership and enhanced business outcomes. This is particularly evident in industries where teamwork and collaboration are essential for success, such as healthcare, technology, and education. Furthermore, the integration of emotional intelligence into leadership practices aligns with the growing emphasis on ethical leadership and corporate social responsibility. Leaders who prioritize EI are more likely to make decisions that consider the well-being of their employees, customers, and the broader community. This ethical approach not only enhances the reputation of the organization but also fosters loyalty among employees and customers alike, creating a sustainable competitive

advantage. As organizations continue to evolve, the demand for leaders who possess strong emotional intelligence will only increase. Companies must invest in training and development programs that focus on enhancing EI skills among their leaders. This includes workshops on self-awareness, empathy, effective communication, and conflict resolution. By equipping leaders with these essential skills, organizations can create a pipeline of emotionally intelligent leaders who are prepared to navigate the complexities of the modern workplace. Finally the impact of emotional intelligence on leadership and management is transformative, shaping organizational culture and driving performance. By fostering an environment of trust, collaboration, and ethical decision-making, emotionally intelligent leaders not only enhance employee engagement and satisfaction but also contribute to the long-term success and sustainability of their organizations. As the business landscape continues to change, the importance of emotional intelligence in leadership will remain a critical factor in achieving organizational excellence and resilience. Investing in emotional intelligence is not just a strategic advantage; it is a necessity for organizations aiming to thrive in an increasingly complex and interconnected world.

ABSTRACT

The health domains of non-communicable diseases (NCDs), mental health, musculoskeletal health, reproductive and sexual health, and socioeconomic determinants form an essential part of the women's health domain. Research draws an all-inclusive picture of health issues that impact women differently at different stages of life through the integration of both old and new medical findings. This paper explores in depth the three main health outcome influencing elements: biological aspects and clinical factors and socio environmental variables. The evaluation explores changes in women's health patterns because of environmental shifts and technological developments, which becomes valuable for future programs and research. Researchers have initiated this investigation because it offers extensive, multi-layered health narratives to assist healthcare professionals and politicians during the development of gender-sensitive public health strategies.

Keywords: Reproductive, Mental, Socio-Economic, Women's Health, Literature Review

INTRODUCTION

Levelled health research now includes multiple life-stage problems which used to exclusively focus on reproductive systems. Investigative studies from early maternal health research have expanded into researching between multiple disciplines of epidemiology, sociology and clinical medicine. Modern research supports the need for gender-sensitive healthcare that recognizes how biological factors interact with a social environment. Research shows that women have specific obstacles due to both institutional injustices along socioeconomic challenges, as well as hormonal and reproductive differences. This investigation methodically examines four important aspects of health which include reproductive and sexual health, together with non-communicable illnesses and musculoskeletal health, followed by mental health. The study emphasizes digital health and climate change while identifying their importance as modern

healthcare challenges. Each section of the analysis methodically studies the numerous factors that affect women's health results.

Reproductive and Sexual Health

Maternal Health and Safe Reproduction

Women's health continues to utilize maternal health as its fundamental topic. Published studies demonstrate that timely high-quality prenatal and perinatal and postnatal care services will substantially lower maternal death and illness risks [23,11]. The lack of access to emergency obstetric care throughout high-risk areas leads to preventable death in those regions. Continuity of care throughout prenatal check-ups and institutional births and postnatal visits plays an important role in short- and long-term mother health outcomes. The variations observed in maternal health serve as an indicator of broader systemic inequalities that exist. Multiple studies prove that patient outcomes depend directly on their socioeconomic standing and where they live, in addition to their level of education. The health care facilities of urban women surpass those provided by rural women because cities offer more dependable and high-quality services. The way people seek medical care is influenced by cultural gender norms and traditional practices and this results in adverse maternal healthcare outcomes among those holding conflicting perspectives between modern healthcare systems and traditional medical beliefs. The persistent maternal mortality gap between rich countries and developing regions demonstrates the unequal treatment that exists in international healthcare systems. The availability of trained obstetric staff during deliveries is crucial, together with rapid access to medical facilities. Scientists have emphasized these emergency measures as key components of maternity healthcare. A decrease in maternal deaths primarily depends on healthcare staff education, medical product supply stability and quality health service referral options. Solutions obtained from low-resource settings remain vital for treating eclampsia and postpartum haemorrhage which continue to be leading causes of maternal death [23, 11].

Contraception, Family Planning, and Reproductive Rights

Family planning serves as both a therapeutic requirement and vital aspect for women's empowerment. Study data shows that contraceptive availability enables women to control their fertility and this directly affects their educational future and job opportunities and overall life well-being [23,5]. Family planning has become more efficient because women have multiple contraceptive options available, including emergency contraception and oral tablets with intrauterine devices which promote better health outcomes for mothers as well as their children. Enough obstacles persist while delivering family planning services to the public. Various areas face barriers to contraception adoption because they must deal with laws that restrict access, combined with social stigmas and deceptive information. Studies indicate that many women abstain from contraceptive use because they obtain incorrect knowledge about side effects and enduring health impacts. The healthcare systems of low-resource areas experience financial challenges alongside logistical constraints that limit outreach services and reduce the variety of offered methods. The family planning services available between rural and urban communities are distinct since rural women encounter reduced access to dependable educational resources and advanced medical treatment [23, 5]. Family planning creates numerous social benefits for individuals and communities beyond its influence on personal health outcomes. Family planning enables women to properly plan pregnancies, thus reducing healthcare expenses while improving the educational prospects of children and integrating more women into the workforce. Research shows that combining family planning strategies with broader reproductive health programs through rights-based approaches leads to positive outcomes in national policies [23, 5]. Health programs have identified family planning as their top priority because these policies help achieve gender equality and sustainable development across the world.

Menstrual Health Management

Women's health deeply depends on menstrual health management which is vital for teenage girls. Research indicates that insufficient menstrual management leads to different health complications that can damage the reproductive system and create additional medical issues. The educational success of teenage girls declines when their menstrual hygiene is poor, as their psychosocial stress and decreased school participation [22]. Cultural stigma, together with social taboos, establishes major hindrances in managing menstruation correctly. Multiple cultures view menstruation

as something to hide because of shame, which damages girls' self-acceptance and hinders straightforward talks about menstrual well-being. Stigma, along with unfavourable health outcomes, continues to perpetuate because inadequate communication and instructional efforts result in inaccurate information and poor hygiene practices. The health of women will improve through public health policies that implement comprehensive menstrual health education and budget-friendly, sustainable sanitary products [22]. The innovative tactics for MHM include programs that provide education in schools and engage in community outreach work to decrease menstrual stigma. Several public health agencies together with non-governmental organizations, collaborate to deliver cultural educational content while offering low-cost personal hygiene items to lower income communities. Numerous programs prove that menstrual health joins social concerns with health requirements, thus requiring unified participation from various sectors. A nationwide policy and learning program concerning MHM should exist to assist women in managing their periods without uncertainty or embarrassment [22].

Non-Communicable Diseases (NCDs)

Cardiovascular Diseases

The leading cause of women's mortality across the globe remains cardiovascular diseases but these diseases often receive inadequate knowledge and diagnosis when appearing in females. Women present with symptoms different from standard chest pain usually exhibited by men as they display nausea and exhaustion together with shortness of breath [15]. Such differences between how doctors approach male and female symptoms result in delayed diagnosis and treatment, which negatively affects treatment results. Scientific proof demonstrates that gender-based research along with individualized diagnostic examinations, is essential because clinical guidelines and CVD risk assessment methods result in inequality [15]. Socioeconomic factors, together with the way the disease presents, affect women's CVD burden. The combination of unhealthy food choices with limited health services access along with increased stress, stems from poor socioeconomic status thus increasing heart disease risks. The combination of diabetes and obesity trends makes the cardiovascular risk assessment more challenging for women. CVD screening accuracy for women requires gender-specific risk assessment tools which should integrate female-specific risk factors [15]. Digital health programs have started to bridge the gaps that previously existed in healthcare delivery. Technology-based services targeting women have proven effective at better detecting and treating cardiovascular diseases at their early stages. Real-time vital sign measurements like blood pressure and heart rate are possible through digital instruments that offer active risk factor management to users. Engineering research should merge innovative technologies with regular healthcare systems to create a comprehensive preventive scheme for women's cardiac wellness, according to [15, 17].

Cancer Burden

Women experience significant health problems and death due to breast and cervical cancers which represent major cancer burdens among females. Breast cancer affects millions of people globally because it represents the leading cancer diagnosis in women according to medical reports [2]. The survival rates for cancer patients increased through better screening methods and earlier recognition along with improved treatments yet challenges persist in regions with limited screening infrastructure and access to clinical services. The importance of personal screening programs based on breast cancer-related genetic and hormonal elements and lifestyle factors mandates their immediate adoption [2]. The effectiveness of Pap smear tests and HPV screening for early detection becomes restricted by socio-cultural barriers, resource constraints and limited access in developing countries according to available literature. Public health ought to prioritize both vaccination rate elevation and health education expansion together with cervical cancer screening outreach to lower both infection rates and mortality numbers [2]. The medical community maintains Cervical cancer as a vital healthcare problem in areas where fewer people get vaccinated against HPV Virus and screening services fail to meet necessary requirements. Additional concern requires increased attention for ovarian cancers together with endometrial cancers that complement existing commitment to breast and cervical cancers. Advanced diagnostic tools applied alongside early symptom recognition lead to improved treatment outcomes according to research findings. The practice of personalized medicine using genetic and environmental along with lifestyle information, helps to significantly decrease the cancer burden experienced by women. Health

inequalities from cancer demand continuous funding in cancer science research for new therapies along with modern detection techniques [2].

Metabolic and Autoimmune Disorders

The combination of hormonal changes together with lifestyle decisions increases diabetic and obesity prevalence which affects women at higher rates than men do. Evidence from epidemiological studies shows that a woman's insulin sensitivity together with fat distribution patterns modify after menopause raising her risk for developing type 2 diabetes. The metabolic situation becomes more intricate due to food patterns combined with physical inactivity and hormone abnormalities so specific therapies are needed to treat these complex problems [27, 15]. Multiple sclerosis and systemic lupus erythematosus and rheumatoid arthritis affect females more frequently than males. Researchers think the combination of environmental factors and hormonal effects and genetic risk factors influences the development process. Two separate functions of oestrogen regulate immunological responses thus explaining both the beneficial and damaging effects of autoimmune disease [27]. Continuous autoimmune conditions lead to extensive disabilities therefore, it is essential to identify them early and treat them specifically for women while addressing complete healthcare needs [27]. The effective management of metabolic and autoimmune diseases now requires medical treatment coupled with lifestyle modifications through multidisciplinary approaches. Research now demonstrates that patient-specific exercise programs combined with dietary counselling and stress management methods help halt disease progression. Medical science is developing individualized treatments and biological drugs that attack distinct inflammatory processes which frequently affect women. Medical research demands gender-specific data input for clinical trials as well as treatment protocols [27].

Mental Health

Prevalence and Determinants of Mental Health Disorders

Anxiety and depression affect women more frequently than men since women have a higher susceptibility to mental health conditions. Research shows that female mood disorder risk increases when hormonal levels shift as women experience menstruation and pregnancy and shortly after giving birth and during menopause [1]. Sociocultural forces that include caring responsibilities alongside social norms make existing mental health weaknesses even more severe. Research confirms that biological factors along with daily experiences, create a major impact on women's mental health, so preventive measures must include multiple dimensions of intervention [1]. Research studies show that depression symptom levels steadily increase when individuals experience hormonal changes particularly during the postpartum period. The mental health disorder PPD causes both physical burdens to mothers and lasting consequences for family bonds and child well-being. Mental disease risk profiles become complex as environmental stress, hormonal shifts and genetic vulnerabilities combine. Studies indicate that supportive care together with early intervention help minimize the long-term consequences of these conditions. Treatment often requires pharmaceutical drugs along with psychotherapy and supportive networks within communities to deliver proper outcomes [1, 18]. The stressors of trauma and solitary living combined with economic setbacks intensify the mental illness in women. A consistent relationship exists between intimate partner violence (IPV) together with gender-based violence (GBV) and declining mental health outcomes. PTSD along with chronic anxiety and depression, commonly affects victims who endure abuse [4]. The proper management of mental health needs integrative care systems that simultaneously treat psychological trauma and provide social support and work towards legal reforms to protect women from ongoing harm [4]. Advanced digital solutions function as efficient tools to address mental health care gaps through mobile mental health applications combined with virtual counselling platforms. Digital platforms deliver urgent assistance through their resources because they help regions lacking enough traditional mental health programs. Modern interventions could receive more customized designs that address the individual needs of female patients by merging technological platforms with conventional clinical practices [24].

Impact of Gender-Based Violence on Mental Health

Great harm exists in the way that intimate partner violence (IPV) and other gender-based violence (GBV) affect mental health. Research throughout the years proves that victims of such violence develop significantly greater risks of anxiety and sadness and PTSD [4]. Healthy brains and psychological health suffer from extended exposure to

stressful situations linked to violence. Victims typically experience emotions of humiliation and separation combined with helplessness that cause their mental health problems to expand. Trauma from GBV creates permanent psychological consequences that modify both individual behaviour along the way victims interact with people. The inability of victims to develop healthy relationships while trying to escape abusive cycles leads to a worsening mental health condition. The path of recovery for trauma survivors needs complete intervention services that combine police support and psychological counselling with social assistance. The importance of trauma-informed care is established through research because it recognizes widespread violence effects in addition to preventing new traumas that occur during therapy sessions [4]. Survivors receive excellent social and emotional support through community-based outreach programs and support group interventions which have proven effective. Women gain confidence through these programs to defend their rights while also receiving support to take legal action. The improvement of public health programs targeting GBV awareness and mental health effects reduces stigma and drives more women toward medical intervention. Basic healthcare providers ramp up their efforts to introduce mental health support services because research shows they should integrate them into normal medical care to provide quick comprehensive treatment to victims [4].

Musculoskeletal Health and Osteoporosis

Osteoporosis and Bone Health

Osteoporosis poses a serious health problem to postmenopausal women because it causes decreased bone mass while increasing their susceptibility to bone fractures. Lower bone mass occurs together with structural deterioration as the accelerated bone resorption progresses following menopause. Statistical data from the International Osteoporosis Foundation shows that three out of thirty women older than 50 years will develop an osteoporotic fracture [10]. Osteoporosis-related fractures create several severe consequences that impact a person's mobility and cause ongoing pain and reduce their life quality. Preventive measures for osteoporosis focus on both behavioural adjustments and quick diagnostic testing. Weight-bearing activities combined with healthy eating habits that include calcium and vitamin D consumption as well as smoking cessation, make up essential preventive measures. Pharmaceutical therapy using bisphosphonates serves as a popular medical treatment to decelerate bone resorption and lessen the probability of fractures happening. Unlevel screening practices along with insufficient public knowledge result in osteoporosis patients receiving inadequate treatment despite the existing preventive measures. Reaching racial and ethnic minorities concerning osteoporosis requires a wide-ranging public health approach that combines ongoing education for patients and screening programs distributed through communities [10, 12]. The data shows that fractures resulting from osteoporosis create substantial financial costs. Healthcare organizations pay substantial amounts from their budgets to treat patients who sustain fractures from osteoporotic bones and to provide post-acute medical care and lifelong disability management. The clinical need and financial benefits endorse investing funds in preventive healthcare. Future research must investigate long-term therapeutic strategy effectiveness along with the relationship between genetic background and environmental risk factors for osteoporosis progression [10, 12].

Autoimmune and Inflammatory Conditions

Women face increased risks of developing autoimmune disorders which lead to sustained incapacity through diseases like rheumatoid arthritis, combined with systemic lupus erythematosus as well as various inflammatory conditions. Multiple factors determine the development of these illnesses because they result from environmental elements combined with hormone functions along with inherited risks. The combination of long-term inflammation and autoimmune conditions produces both restricted joint movement and severe mental distress. These illnesses create long-term pain together with functional limitations that disrupt both personal life and professional life to a severe extent [27]. Biological treatments that target specific inflammatory pathways have demonstrated effectiveness in treating autoimmune diseases. Treatment options generate expenses together with potential negative side effects. Women exhibit divergent responses to medical treatments due to their fluctuating hormonal levels and shifting immune system functions thus emphasizing the need for studies that consider gender differences. More effective healthcare delivery to women with rheumatic diseases requires combined approaches between supportive care alongside physical therapy and medications [27]. Recent investigation focuses on personalized medicine which develops healthcare solutions through the analysis of genetic and hormonal information plus environmental

conditions. The strategies work toward lowering adverse effects along with maximizing therapeutic effectiveness. The field of autoimmune disease treatment now examines complementary therapies like dietary changes and acupuncture for addressing persistent pain and inflammation symptoms. Women who live with persistent autoimmune diseases might benefit from using complementary treatments alongside conventional therapies to establish a better treatment framework according to research [27].

Socio-Economic Determinants and Health Disparities

Social and Economic Influences on Women's Health

The social factors of work along with income and educational achievements heavily influence health results for women. Multiple scientific papers have proven that reduced socioeconomic standing leads to greater incidence rates of chronic health problems along with reduced access to preventive services and inferior overall health outcomes [16, 30]. The health risks of disadvantaged women intensify because they experience diminished social support together with reduced authority in healthcare decisions. Healthcare service quality disparities emerge when income levels vary between people. Women who live in poor rural communities often encounter difficulties when trying to get access to skilled medical help and proper testing facilities and therapeutic options. The condition continues to worsen before therapy begins because structural obstacles result in late medical care seeking. Public health policies need to establish community-based interventions while developing essential infrastructure and directing funds specifically toward vulnerable groups to reduce existing health disparities [16, 30]. Women need education to obtain the necessary knowledge, which enables them to make reasonable decisions about their well-being. Health literacy improves together with a better understanding of preventative services when people attain higher levels of education. Public health receives dual benefits when funding women's education, since it creates economic independence and simultaneously reduces health inequalities [16, 30].

Intersectionality and Policy Implications

The concept of intersectionality represents a framework that shows how race combines with ethnicity and socioeconomic class to generate unique health results for women [3]. Academic investigations show women belonging to disadvantaged communities encounter multiple obstacles that elevate their exposure to unfavourable health results [32, 31]. The combination of various social identities increases women's sensitivity to outside stressors while preventing access to resources and creating care provision challenges. Health policy interventions need an intersectional strategy to properly tackle differences in healthcare outcomes. The development of culturally appropriate health programs and medical facility implementation of anti-discrimination laws along with the reach ability and acceptability of public health campaigns for diverse populations, forms the basis for effective health care disparity reductions. Eliminating healthcare disparities requires fundamental changes to institutional frameworks that perpetuate unequal treatment. Research participation by various female demographics will help developers create treatments that appropriately address women's diverse healthcare requirements [32, 31].

Emerging Issues in Women's Health

Environmental and Climate Change Challenges

Environmental deterioration and climate change both act as crucial health-determining factors that specifically harm women from vulnerable populations. Natural resources serve as the main foundation for women living in rural areas and low-income communities which leaves them exposed to severe health risks from changing environments. Proceedings indicate that the combination of vector-borne infections and air pollution and extreme weather events causes increasing health problems among women [6, 26]. Several different relationships exist between female health outcomes and environmental transformations. An increase in heat and inconsistent climate patterns affects farm output leading to more widespread food scarcity that results in poor nutrition for women along with their children. Global disasters harm existing gender inequality more by damaging community facilities while blocking healthcare access. The literature endorses public health policies combining climate resilience measures with gender-sensitive health programs because it aims to prevent women from being marginalized by changing environmental conditions around the globe [6, 26]. Multiple studies demonstrate the crucial importance of adaptive strategies that focus on local communities. The mentioned tactics involve giving resources for climate change mitigation as well as

establishing local environmental risk warning systems and delivering health education to communities. The creation of sustainable health solutions for communities depends on women's empowerment through environmental decision-making participation [6, 26].

Digital Health Innovations

Digital health technology has fundamentally changed how healthcare delivers services and specifically how women's health manages care. Most healthcare facilities utilize Health applications as well as telemedicine services and mobile health (mHealth) interventions to address access and quality of care disparities. These digital solutions allow women who live in disadvantaged regions and remote areas to obtain remote medical consultations in combination with patient education and remote health monitoring services [13, 17, 33]. Multiple studies have confirmed that digital health initiatives enhance the level of healthcare knowledge among women and drive them toward taking proactive measures for their health. Reproductive health apps offer women personalized data about menstruation techniques along with contraception methods as well as prenatal care information which provides control over their health choices. Asset-based new technology access remains difficult due to varying digital literacy and internet connectivity availability among the potential principal beneficiary demographics [13, 33]. The success of digital health solutions depends on their proper integration within the existing healthcare infrastructure. Engineering collaboration with healthcare professionals and legislators will produce healthcare platforms that recognize women's special requirements and maintain convenient system designs. Future research about digital medical innovations needs to prioritize investigations of their lasting outcomes for clinical benefits together with expenditure effectiveness and equity distribution among diverse groups [13, 33].

CONCLUSION

The challenging relations between the reproductive, mental and socioeconomic factors that affect the health of women according to the different life stages are addressed in this synthesis of literature. There productive health-related problems, like maternal care and availability of alternatives to contraceptives, continue to play a major role in both the psychological and physical health, and socioeconomic position also determines the health disparities, especially among women in low and middle-income settings. Systemic barriers to sustaining cycles of poor health, a lack of autonomy, and underuse of health services are common among such women in groups. This intersectionality of the factors demonstrates that women's health cannot be treated individually. Finally, the improvement in women's health warrants a multisectoral effort that embraces women's socioeconomic empowerment, integration of mental health, and activism of women's reproductive rights. The only way of enhancing the general well-being of women throughout the world is by setting in place all-around programs with an equity approach.

ABSTRACT

Prevalence of stress has been commonly seen among university students which lead to psychological as well as physiological consequences. Bruxism is often seen related to stress, therefore this study aims to assess the relationship between stress and bruxism among university students during their examination period. A cross-sectional study was conducted at SGT University, India, involving a questionnaire containing socio-demographic information, the Perceived Stress Scale (PSS), and the Fonseca Questionnaire. The survey was distributed anonymously before and during the examination period among the students. A significant increase in stress levels ($p < 0.05$) and the severity of parafunctional oral habit i.e. bruxism, was observed during the examination period. Females and hostellers reported higher stress levels as well as more severe bruxism. This study demonstrates that academic stress during the examination period significantly contributes to the occurrence and severity of parafunctional oral habits such as bruxism among the university students. Stress management interventions in university settings could help mitigate these issues.

Keywords: Perceived stress, Para functional Oral Habits, University students, PSS-10, Bruxism

INTRODUCTION

Stress is a psychological and physiological response to external pressures or demands that are perceived as challenging or overwhelming. According to Nechita *et.al.*(2014), Stress is the body's condition, when physiological and psychological stimuli disturb its normal homeostatic mechanisms and hence disrupt its balance [1]. In modern society, distress is ubiquitous, affecting individuals across various walks of life, particularly among students in academic set-ups. University students especially, experience high levels of stress (Marshall *et al*., 2008) [2,3]. Among university students, stress levels tend to be exacerbated by academic pressures, deadlines, and performance expectations. These pressures may manifest as physiological, psychological, or behavioral changes, with long-term implications for both mental as well as physical health [4]. Parafunctional oral habits are involuntary behaviors that occur outside the normal function of the mouth and jaw. The physiological effects of bruxism are well-documented in the literature, with studies linking it to several risk factors such as stress, anxiety, depression, and sleep disturbances (Manfredini *et al*., 2017) [5]. And with this increase in the levels of stress, sleep problems, unhealthy lifestyle and dietary habits, the prevalence of parafunctional habits is also getting increased (Demjaha *et al*., 2019) [6]

Stress and its Impact on Students

According to the research done by Marshall *et al*. (2008), perceived stress among university students is linked to decreased quality of life, increased levels of anxiety and depression, and the development of maladaptive coping mechanisms. Stress also impairs cognitive function, reducing concentration and problem-solving ability, thus leads to exacerbating feelings of helplessness and frustration [7,3].

Parafunctional Oral Habits and Stress

One of the primary physical manifestations of stress is the development of parafunctional oral habits. According to a review showed by Bader and Lavigne (2000), bruxism is a multifactorial condition influenced by psychological factors such as stress, anxiety, and depression [8]. Studies have shown that students are particularly vulnerable to developing bruxism during periods of academic stress, as the pressure to perform well can trigger involuntary teeth grinding, particularly during sleep (Granada and Hicks, 2003)[9]. While awake bruxism is often linked to heightened levels of stress and anxiety during waking hours. However, sleep bruxism is believed to be more closely associated with poor sleep quality, which is commonly observed during stressful academic periods (Costa *et al*., 2023) [10]. According to Soares *et al*. (2017), pain and noise in the TMJ, muscle pain and stress are the mostly associated with parafunctional oral habits like bruxism. Beyond the physical implications, parafunctional habits can also affect an individual's emotional and psychological well-being, as chronic pain and discomfort can further creating a vicious cycle that elevate stress and anxiety levels [11,12].

The Examination Period as a Stressor

The examination period is characterized not only by an increase in academic pressure but also by changes in lifestyle during this period. Many students experience disrupted sleep patterns, altered eating habits, and increased consumption of caffeinated beverages, all of which can exacerbate the effects of stress on the body. In addition, students often report a greater sense of time urgency and a feeling of being overwhelmed, which can contribute to the exacerbation of stress-related behaviors, such as teeth grinding and jaw clenching [11,12].

Research Gap and Significance of the Study

Though there are good number of literatures on the association between stress and parafunctional oral habits, fewer studies have specifically focused on university students before and during the examination period. Existing research has primarily focused on the general population or has studied bruxism and stress in non-academic settings. Our study aims to fill this gap by evaluating the relationship between stress and parafunctional oral habits in a university setting, with a focus on the examination period. Along with this, it also seeks to evaluate the impact of Gender and Living Situation (Hostler or Day Scholar) on the same. This is so because gender also plays an important role in

determining stress vulnerability (Nechita *et al*., 2014) [1]. Also, according to a study by Ahad *et al*. (2021) [12], it was stated that "staying in the hostel is a positive predictor for anxiety and stress."

MATERIALS AND METHODS

Study Design

A cross-sectional study design was employed to assess the relationship between stress and parafunctional habits among university students at two time points: before and during the examination period. This study had been conducted according to STOBE Protocol.

Study Population

Sample Size: The study involved 300 students from various academic disciplines at SGT University, Gurugram, Haryana.

Inclusion Criteria

1. University students aged 18-25 years.
2. Enrolled in at least one course during the examination period.

Exclusion Criteria

1. Students above 25 years of age
2. Students who are not willing for participation.

Data Collection and Analysis

The Questionnaire consisted of three Sections

1. Demographic Information
2. Stress Assessment;
3. Oral Health Assessment

1. The Demographic Section asked the respondent's age, gender, living situation (Hostler or Day Scholar), and questions about consumption of sugary snacks, beverages, caffeinated drinks etc.
2. For Stress Assessment: Perceived Stress Scale (PSS) was used to measure the participants' perceived stress levels at two time points: before and during exams. The scale consists of 10 items that assess the degree to which participants find their life situations unpredictable, uncontrollable, and overloaded [12].
3. For Oral Health Assessment: Fonseca Questionnaire was used to assess the occurrence and severity of Parafunctional Habits. It consists of questions that help determine whether participants grind or clench their teeth, the frequency of such behavior, and any associated symptoms (e.g., jaw pain, headaches) [13].

The Survey Based Questionnaire was circulated anonymously in the form of Google Forms in which the consent form was attached - prior Examination Notice and During Examination. The options chosen by the respondents for each question were recorded.

Scoring

For Perceived Stress Scale

The PSS score was determined by following these directions -

- First, reverse your scores for questions 4, 5, 7, and 8.
- On these 4 questions, change the scores as shown below
- 0 = 4, 1 = 3, 2 = 2, 3 = 1, 4 = 0.
- Now add up your scores for each item to get a total.
- Individual scores on the PSS can range from 0 to 40 with higher scores indicating higher Perceived stress.
- Scores ranging from 0-13 would be considered low stress.
- Scores ranging from 14-26 would be considered moderate stress.

- Scores ranging from 27-40 would be considered high perceived stress

For Fonesca's Questionnaire

For each question, the possible answers were "yes" (10 points), "no" (0 points), and "sometimes" (5 points), with a total score ranging from 0 to 100.

- The severity of Parafunctional Habits, on the basis of the scores obtained, is considered as follows:
- For scores ranging from 16 to 44 – mild,
- 45 to 69 – moderate,
- More than 69 – severe,
- While for scores lower than 16, Parafunctional Habits are considered to be absent.

Statistical Analysis

Data was analyzed using paired t-tests, Chi-square tests, Pearson/Spearman correlation, and descriptive statistics. Effect size (Cohen's d) was calculated for practical significance.

RESULTS

Stress Levels

The paired t-test revealed a significant increase in perceived stress from the pre-examination period (mean PSS score: 16.4 for males, 16 for females) to the examination period (mean PSS score: 21.2 for males, 23.6 for females) ($p < 0.05$). as shown in Table 1(Perceived Stress Score before and During Examination)

Severity of Parafunctional Habits

The Fonseca scores showed a significant increase in the severity of parafunctional habits, particularly bruxism, during the examination period ($p < 0.05$). The severity of bruxism was mild to moderate for most participants, with some experiencing severe bruxism during exams as shown in Table 2 (Fonesca's Score before and During Examination)

Impact of Gender

Females experienced higher stress levels and more severe parafunctional habits compared to males as shown in Table 3 (Score based on gender before and during examination)

Impact of Living Situation

Hostellers exhibited significantly higher stress levels (PSS score: 27.1) compared to day scholars (PSS score: 25) during the examination period ($p < 0.05$) as shown in Table 4 (Score based on living Situation before and during examination)

DISCUSSION

The present study aimed to explore the relationship between stress levels and the occurrence of parafunctional habits (such as bruxism) among university students, focusing on two distinct time points: before the examination notice and during the examination period. The results of this study have important implications for understanding how stress, particularly academic stress, can contribute to oral health issues such as Parafunctional Habits among the university students.

Relationship Between Stress and Parafunctional Habits

The primary objective of this study was to assess how perceived stress, as measured by the Perceived Stress Scale (PSS), correlates with the occurrence and severity of parafunctional habits, as assessed by the Fonseca questionnaire. Stress, particularly during periods of academic pressure such as examinations, has been previously shown to impact

various health aspects, including oral health. The findings from this study corroborate existing literature suggesting that stress can exacerbate parafunctional behaviors such as teeth grinding or jaw clenching.

In our study, we found a noticeable increase in perceived stress during the examination period, with a corresponding increase in the frequency and severity of Parafunctional Habits. This is consistent with previous studies that have suggested a temporal relationship between academic stress and bruxism. The increase in stress levels during exams likely leads to a higher frequency of stress-induced behaviors, such as teeth grinding, which in turn affects oral health. The heightened stress may be attributed to academic pressure, deadlines, and performance anxiety that university students commonly face [1,2].

Stress Levels Before and During Exams

The analysis of perceived stress levels using the PSS demonstrated a significant increase in stress scores from the pre-examination period till the examination period. The results showed that students reported moderate to high levels of stress during the examination period, which is consistent with the findings from previous studies that focused on academic stress. The PSS scores also indicated that a majority of students experienced moderate to high stress levels, which aligns with the common experience of academic pressure among university students. The increase in stress during the examination period could potentially trigger or worsen parafunctional habits like bruxism. Thus, understanding for such relationship is important because bruxism, if left untreated, can lead to a variety of oral health problems, including tooth wear, temporomandibular joint (TMJ) disorders, and even chronic headaches[6].

Parafunctional Habits and Their Implications

The Fonseca questionnaire revealed that a significant portion of the participants exhibited symptoms consistent with mild to moderate bruxism, while some participants reporting severe bruxism during the examination period. These findings highlight the impact of stress on oral health, as bruxism is commonly considered a stress-related parafunctional habit. Given that bruxism is often subconscious, students may not be aware of the extent to which they are grinding or clenching their teeth during such stressful periods, leading to future complicating its management. The severity of Parafunctional Oral Habits observed in this study emphasizes the importance of addressing stress management strategies within university settings. Universities could consider integrating stress management programs to help students cope with academic pressure, potentially reducing the prevalence and severity of bruxism as well as other stress-induced behaviors. These programs could include mindfulness practices, cognitive-behavioral therapy, or relaxation techniques aimed at reducing overall stress levels.

Gender and Living Situation

The demographic analysis revealed that gender and living situation (hostler or day scholar) may influence the stress levels and the occurrence of bruxism. Female students reported slightly higher stress levels, which could be attributed to gender-specific academic and social pressures. Furthermore, living situation also appeared to affect stress levels, with hostellers reporting higher levels of stress compared to day scholars. This could be due to the challenges associated with living away from home, such as increased responsibilities, lack of familial support, or even potential social isolation.

Limitations and Future Research

The findings from this study provide valuable insights into the relationship between stress and parafunctional habits, but there are certain limitations to this study too. This study design is cross-sectional, meaning that it cannot establish causality. A longitudinal study would be beneficial to determine the long-term effects of stress on oral health and bruxism. Additionally, self-reported data on stress and parafunctional habits may be subject to response bias, as participants might not accurately recall or report their symptoms. Therefore future research should explore objective measures of stress (e.g., cortisol levels) and parafunctional habits (e.g., dental examinations) to strengthen the current findings.

CONCLUSION

In conclusion, this study provides strong evidence that academic stress, particularly during the examination period, is associated with an increase in parafunctional habits like bruxism among university students. The findings emphasize the need for stress management interventions in university settings to reduce the negative impact of stress on students' health, particularly their oral health. Further research, using a longitudinal approach and objective measurements, is necessary to gain a deeper understanding of this relationship and to develop effective preventive strategies.

ACKNOWLEDGEMENTS

The authors would like to thank the participants for their involvement and the support provided by SGT University.

ABSTRACT

Smart agriculture, a pioneering and innovative farming system, is significantly driven by the use of Artificial Intelligence (AI). This technology, combined with Internet of Things (IoT) sensors and machine learning algorithms, not only enhances agricultural productivity but also offers a beacon of hope in addressing the unprecedented challenges faced by global agriculture in the 21st century. In this study, we review the AI-based monitoring and automation systems in agriculture, providing a comprehensive examination of their implementation, data sources, data collection methods, and the measurable impacts on the sustainability of farming systems. Through an in-depth review of recent publications, market data, and real-life examples, we demonstrate that these innovative agricultural technologies are providing immense value, including 250% increases in outputs, reductions in water consumption of 30-50%, and reductions in chemical pesticide use of up to 70%. The global market for AI in agriculture stood at USD 1.6 billion in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 25.1% from 2024 to 2032, reaching USD 10.2 billion by 2032. By examining the environmental, economic, and social implications of these technologies, we present an in-depth overview of the data requirements, sources, and methods of data collection. These results demonstrate that smart agriculture is not just a new technology, but rather a new approach to farming that focuses on data and more precise methods, aiming to address the dual challenges of food and environmental issues.

INTRODUCTION

It is now the 21st century, and without any doubt, the challenges faced by global agriculture are unparalleled in modern human history. Meanwhile, the world must increase food production by nearly 70% to provide nutrition for an estimated global population of 9.8 billion people in 2050 (United Nations MDPI). Simultaneously, agriculture faces significant challenges from anthropogenic environmental changes, including climate change, reduced freshwater availability, soil depletion, and biodiversity loss, while also increasingly working within a biologically finite resource frontier. Conventional farming methods, which have sustained human society for millennia, will not provide answers to these new challenges. This industry is underconsiderable pressure, from declining agricultural land to skyrocketing input costs, labour shortages, and reduced environmental footprints. But in the face of these challenges, a transformative practice driven by technology has emerged as a significant player in the solutions landscape. Smart agriculture, also known as precision agriculture (or Agriculture 4.0, the fourth agricultural revolution), utilizes artificial intelligence (AI), Internet of Things (IoT) sensors, machine learning algorithms, robotic systems, and self-driving vehicles, along with data analytics, to enhance agricultural practices. This convergence of such technologies empowers farmers to make data-driven decisions, allocate resources more effectively, and provide targeted interventions at the plant or crop level. The fundamental commitment of smart agriculture is to transition from generic agricultural solutions to fine-tuned solutions tailored to each farm, its produce, or even specific agrarian management activities. This transformation, driven by the power of AI, has thus transcended a mere succession of technologies. It is a testament to the potential of human ingenuity and innovation in the face of unprecedented challenges. Smart Agriculture encompasses all three sectors of sustainability in agriculture: environmental, by reducing the use of toxic pesticides and optimizing resource utilization; economic, by enhancing productivity and lowering production costs; and social, by promoting food security and rural development. According to Smart Agriculture, this technology enables the provision of "hyper", or individualized, care at scale (thousands of acres per farm, tens of thousands of plants per acre); the system delivers precise volumes of water, nutrients, and pesticides using Databricks.

LITERATURE REVIEW

Evolution of Agricultural Technology

There have been multiple phases of agricultural technology evolution, each signified by the introduction of a significant technological innovation that has led to a dramatic change in agriculture. Steam was the first mechanization introduced to bolster the production capabilities of vast farms through its widespread adoption in the 19th and early 20th centuries. However, it was not until the latter part of the 20th century that the broader adoption of internal combustion engine-driven farm machinery occurred. This trend has continued up to the present day. The Green Revolution -- a period of scientific advancements in breeding crops, synthetic fertilisers and pesticides which dramatically increased yields -- started in the mid-20th century. First, the digital agricultural revolution was ignited in the early 1990s with the introduction of the Global Positioning System (GPS) and Geographic Information Systems (GIS), which are capable of accurately mapping fields and applying inputs in a variable-rate mode. The technology we now call smart agriculture, based on a combination of artificial intelligence, Internet of Things sensors, and advanced data analytics, all rests on this foundation.

AI Applications in Agriculture

Over recent years, numerous applications of AIs that span a range of crops or an entire agricultural system have been documented, from remote sensing and crop yield prediction to robotic machinery operation and renewable supply chains. Machine learning algorithms have demonstrated significant efficacy in analysing larger datasets with complex relationships in agriculture, as they can identify patterns in the values of dataset features that, in turn, can be used to predict farm actions. For image-based applications in agriculture, Convolutional Neural Networks (CNNs) have proven to be especially effective. These deep learning models are capable of detecting patterns in visual data and are thus well-suited for crop disease detection, weed identification, and quality detection tasks. In crop

stress classification problems, studies have proven that CNNs can achieve accuracies of 96% on the training datasets and 86% on the test datasets of MDPI. Predictive analytics is another major use case, where machine learning models can predict crop yields, weather patterns, and pest outbreaks. Farmers can optimise their planting schedules, irrigation timings, and pest control measures with data-driven insights, rather than intuition-based approaches, thanks to the predictive capabilities of precision agriculture, as reported in Science Direct.

Internet of Things: Integrating Agriculture

Sensor networks managed by the Internet of Things have transformed agricultural monitoring by providing real-time data-driven information on environmental, soil, and crop conditions. IoT sensors used in precision agriculture systems typically consist of several types of sensors, including soil moisture sensors, electrochemical sensors for nutrient monitoring, optical sensors for assessing plant conditions, and meteorological monitoring stations. Wireless IoT agriculture systems offer impressive features for data collection and analysis. It is found that the coefficient of determination (R^2) for soil moisture prediction with IoT-based soil monitoring systems is 0.96 with the root mean square error (RMSE) of 0.06, which is two orders of magnitude better than traditional statistical methods MDPI High temporal and spatial resolution of monitoring systems support monitoring of relevant parameters like soil moisture, pH, temperature, nutrient status as well as plant health. With IoT sensors coupled with cloud-based platforms and mobile applications, complete agricultural monitoring ecosystems have been created. Farmers can now access real-time data from any location, enabling them to monitor and manage their agrarian operations remotely. Such capability has been instrumental in allowing farming activities during the COVID-19 pandemic to be carried out in a socially distanced manner, according to a study published in Frontiers.

Objectives

1. To analyse the relationship between environmental parameters (temperature, humidity, soil moisture, and light intensity) and crop yield using sensor-based data in an innovative farming system.
2. To predict crop yield based on real-time environmental and soil data collected through IoT-enabled devices.
3. To evaluate the effectiveness of AI-based monitoring systems in enhancing sustainable farming practices by optimising irrigation, resource management, and yield forecasting.

Machine Learning for Smart Agriculture

The solutions to precision agriculture problems based on the application of machine learning are varied, include tasks as diverse as predicting crop yields and automating decisions on how to allocate limited inputs like resources Popular supervised learning algorithms for classification and regression problems in agriculture includes Support Vector Machines (SVM), Random Forests, and Neural Networks related to supervised learning. It has been found that ensemble learning techniques, specifically oriented towards agriculture and integrating multiple machine learning models, exhibit greater performance. According to evidence, ensemble methods reach r^2 values above 0.96 for soil organic carbon estimation and yield prediction tasks (MDPI). Using these methods, multiple algorithms are employed to trade off the strengths and weaknesses of each model, providing more accurate and stable predictions. The application of machine learning in time series analysis has enabled us to make sophisticated predictions for agricultural planning and management. Cross-temporal LSTM topologies and variants of recurrent neural networks have proven beneficial in temporal agrarian data analysis, particularly in applications such as crop growth prediction, weather forecasting, and temporal scheduling for planting and harvesting recommendations. Analyzing each market, along with its respective prices by country, can shed light on how this affects each economy.

Market Size and Growth Forecast

The market for smart agriculture worldwide has experienced immense growth over the years, driven by increasing demand for innovative farming solutions and the emerging challenges of minimising food insecurity. Multiple market research reports validate notable growth of agricultural technology segments in the market. Smart Agriculture reports that the AI in agriculture market reached a value of USD 1.6 billion in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 25.1 percent from now until 2032, reaching USD 10.2 billion by then. This is a clear indication that an increasing number of farmers are embracing the potential of AI to transform

the farming approach that has been adopted for generations and to address the sector's universal problems. This trend has been reflected in the total smart agriculture market, encompassing IoT sensors, precision agriculture, and automation. Market Research Reports, Inc. Smart Agriculture Market Size, Share and Trends Analysis Report By Technology, By Solution (Hardware, Software, Services), By Application, By Region And Segment Forecasts, 2024 – 2029 – Markets and Markets According to the Smart Agriculture Market report, the market is estimated to have gained USD 14.40 billion in 2024 and is projected to reach USD 23.38 billion by 2029, recording a CAGR of 10.2% over the forecast period. Generally, Agricultural robotics is one of the fastest-growing sections of Smart agriculture. Farming robots serve throughout the farming cycle from planting to harvesting. Their demand has been soaring, with the global agricultural robots market size projected to be valued at USD 14.74 billion in 2024, growing at a compound annual growth rate (CAGR) of 23.0% from 2025 to 2030. According to Grand View Research, it is anticipated to reach USD 48.06 billion by 2030. This expansion is driven by a variety of factors, including increasing labour shortages, improving the accuracy of farm processes, and advancing robotics and AI technologies.

Distribution of the regional market

In terms of geography, the adoption of smart agriculture across regions is not uniform, with North America and Europe leading in technology deployment. At the same time, the Asia Pacific is the growth epicentre. According to Grand View Research, North America accounted for around 36.4% of the global agricultural robots market in 2024, driven by a high rate of technology penetration and relatively larger-than-average farm sizes, resulting in output 1.North American farms are generally larger than European ones and, at a U.S. average of 445 acres, are often justified in making significant investments in technology. The region is also among the leaders in smart agriculture due to the economies of scale that large-scale operations can achieve, which make some advanced agricultural technologies economically feasible. The fastest regional growth rate is expected to be from the Asia Pacific, with a CAGR of 23.6% during the forecast period. The rapid growth is attributed to technological advancements in Japan, India, and China, accompanied by severe labour shortages and increasing wages, as well as government support for agricultural modernisation (Grand View Research, 2022).

Investment trends and funding

Historically high investment levels demonstrate significant investor confidence and the recognition of the agriculture technology opportunity. Smart Agriculture claimed that smart agriculture attracted a total of USD 4.9 billion through 440 deals in 2021, illustrating the attractiveness of solutions within theagtech space to investors. Investment in AI-assisted vertical farming technologies reached USD 3.2 billion in 2024, underscoring the growing attractiveness of controlled environment agriculture (CEA) methods. AI in crop management is projected to exceed USD 5.6 billion by 2028, highlighting its economic potential in traditional field agriculture. Agricultural robotics is identified as one of the fastest-growing industries, with an expected market value of USD 11.9 billion by 2030. According to Smart Ag, this investment is enabling the development of autonomous harvesting equipment. The anticipated global autonomous harvesting equipment market is projected to reach approximately USD 7.7 billion by 2027.

Present-day Adoption and Technology Penetration

Different scales of intelligent farming technologies are adopted unevenly, depending on farm size, production type, and geographical areas. Various studies have claimed that 40% of large-scale farming companies will spend an average of 30% more on AI in 2024, reflecting an increasing level of trust in its capabilities, such as those offered by Smart Agriculture. The adoption of Variable Rate Technology (VRT) is a key indicator of the penetration of precision agriculture. More specifically, 37.4% (33.6 million acres) of corn-planted acres adopted VRT in 2016, while VRT adoption rates are projected to be 44% for corn, 26% for soybeans, and 22% for wheat by 2024, according to MDPI. These statistics indicate that precision agriculture technologies have been adopted steadily, albeit at a relatively slow pace. Farm types differ significantly in their adoption of technology. The highest share of AI adoption in agriculture in 2024 is in field farming (61.5%), followed by livestock farming (19.1%), indoor farming (15.0%), and aquaculture (8.4%).Smart Agriculture. The distribution captures the relative maturity of AI applications across the agricultural sectors.AI-powered precision farming is estimated to cover 25% of all global farming operations by 2028, suggesting widespread growth due to increasing adoption rates. Nonetheless, this projection also highlights that most farming

operations do not utilise advanced AI technologies, indicating that significant market growth potential exists with artificial intelligence.

Framework of Technology and Execution

Automated Surveillance Systems

Agriculture monitoring: A combination of computer vision, ML + IoT sensors. They enable farmers to continuously and in real-time monitor crop health, soil health, and environmental parameters, allowing for more precisely targeted interventions and better resource allocation. This has enabled the development and implementation of robust computer vision systems, particularly using Convolutional Neural Networks (CNNs) for agricultural monitoring tasks. These systems are trained to accurately identify crop diseases, pest infestations, and nutrient deficiencies; in fact, their capabilities often surpass those of human visual assessments. According to MDPI, YOLOv5 models, for example, have been observed to demonstrate 96.96% recall and 94.81% precision in seed detection and counting tasks. Hyperspectral and multispectral imaging technologies have been utilised to rapidly detect plant stress (disease and loss of efficiency in systems) before its visual manifestation (Chen *et al*.). These systems can then detect and characterise minor alterations in plant physiology that signify disease, nutrient deficiency, or water stress by using spectrometry and light reflectance pattern detection. Given that these systems are combined with machine learning (ML) algorithms, they serve as an early warning capability, enabling managers to be proactive rather than reactive when issues arise. Remote sensing technologies provide complementary large-scale monitoring to sensor networks, utilizing spaceborne (e.g., satellites) or airborne (e.g., drones) sensors. Satellite platforms (Landsat and Sentinel-2) provide periodic coverage of agricultural land, while UAVs allow for high spatial resolution and monitoring tailored to demand. The use of these technologies, combined with Artificial Intelligence (AI), enables the monitoring of crops to be performed over different spatial and temporal scales (MDPI).

Automation Technologies

Automated tools in agriculture have evolved from basic mechanical systems to a range of cutting-edge artificial intelligence (AI) solutions. These advancements have led to the development of robots that can undertake even complex farming tasks with minimal human intervention. These robots, equipped with modern sensors, computer vision, and machine learning algorithms, can detect crops and weeds, navigate through the field, and perform accurate operations. The most advanced form of agricultural automation, the autonomous tractor and harvester, is a testament to the efficiency of these systems. Utilising GPS guidance, computer vision, and machine learning, these machines navigate the fields within centimetres and complete planting, cultivation, and harvesting activities with almost no human interaction. Companies such as Smart Agriculture have developed systems that can operate continuously, adjusting operations in response to real-time sensor data and environmental conditions. The growing interest in automation and the potential solutions for labour shortages, such as robotic harvesting systems, are promising signs for the future of agriculture. Studies have found that harvesting robots can deliver a threefold increase in speed over human labour, while maintaining quality and reducing waste through the use of machine vision. For example, asparagus harvesting robots equipped with laser sensors and 3D vision systems can identify and harvest crops with high precision and minimal damage, according to a study published by MDPI.

Integration challenges and solutions

Several technical and operational challenges associated with AI-enabled monitoring and automation systems in agriculture must be addressed for successful implementation. This is particularly challenging to achieve due to agriculture being a multi-vendor environment where different systems and manufacturers are involved. Interoperability struggles are being addressed through reduced issues with conventional data designs and trade conventions that support standardised efforts. The ISOBUS standard, for instance, enables tractors and implements manufactured by different manufacturers to communicate with each other, while new standards for agricultural data exchange also facilitate the integration of farm management systems with external data sources. Cloud agrarian systems are in extremely high demand, but connectivity issues in rural areas can restrict their use. This enhances existing solutions with low-power wide-area networks (LPWANs), such as LoRaWAN, which offers low-power, long-range connectivity that is particularly well-suited for agricultural sensors. There is another connection option

that the two satellites offer, intended to expand satellite-based coverage for Frontiers. However, implementing data privacy and security measures remains a challenge, as sensitive agricultural information needs to be protected under stringent cybersecurity standards. These involve data transmission encryption, secure authentication systems, and frequent security updates for connected devices. As agricultural systems become increasingly interconnected, new vulnerabilities emerge that can only be mitigated through a comprehensive, whole-of-system security approach.

Research Methodology and Data Sources

Data Collection Using Sensors

Sensor-based data collection is crucial in agricultural systems, providing real-time information on environmental conditions, soil health, and crop status. Modern agricultural sensor networks consist of various sensors, each designed to monitor different parameters essential for informed farming decisions. Soil sensors record data on soil moisture, temperature, pH, electrical conductivity, and nutrient levels, allowing for immediate irrigation and fertiliser decisions. Plant health sensors, such as chlorophyll meters and leaf temperature sensors, monitor crop conditions and identify stress states early, enabling real-time management optimisation. Optical sensors, such as the AS7341 spectral sensor, enable reflection measurements that correlate with plant health indicators. Weather monitoring stations capture vital environmental data for irrigation scheduling, pest prediction, and crop growth modelling.

Remote Sensing Data Sources

Satellite remote sensing technology offers a wide-scale monitoring capability that complements ground sensors and geographical cellular networks, enabling the monitoring of entire farms or regional agricultural systems. Satellite platforms, such as Landsat and Sentinel-2, offer unique capabilities and high-resolution features, allowing the early detection of crop stress, disease outbreaks, and other issues. UAVs, or drones, provide high-resolution and on-demand monitoring, enabling farmers to zoom in on critical areas of the field or specific stages of crop growth. Drone monitoring combines AI algorithms with data captured using drones, allowing farmers to assess crop health, identify plant diseases, and inspect yield quality and quantity. Human-crewed aircraft and specialised agricultural aircraft offer intermediate-scale surveying capabilities, covering larger areas and producing better spatial resolution data, making them suitable for regional-scale agrarian monitoring applications.

Machine-Generated Data

Modern agricultural machinery generates extensive operational data, including yield monitoring, machinery performance parameters, and application rates. Combine-mounted yield monitoring systems gather detailed information about field productivity, revealing spatial variability in crop performance. GPS-enabled machinery logs off-field operations, providing exact location data for all farming operations. Precision application equipment creates data on input usage rates, application timing, and spatial distribution, linking applied inputs with responses and determining optimal rates of fertiliser, pesticides, and seeds. Variable-rate application systems use input sensors or prescription maps to adjust the rate of inputs, generating high-resolution input application maps throughout fields.

Analyses and interpretation of the data

In this section, a detailed analysis and interpretation of the dataset, which contains information used to assess how environmental and soil parameters affect agricultural production in the context of smart farming, are presented. This dataset includes sensor-based recordings of the different ecological variables throughout a cropping season, taken from an online innovative agriculture platform in continuous, real-time.) The automated data collection is at the heart of any AI-based innovative agricultural system, and Internet of Things (IoT) devices have been deployed to facilitate this. This analysis aims to identify key environmental factors that impact crop yield and explore the potential of using machine learning models to help farms achieve more optimal yields.

Dataset overview and variables

The dataset features five main variables

Temperature (°C)

Humidity (%)
Soil Moisture (%)
Light Intensity (lux)
Crop Yield (kg per plot)
Recordings were conducted at a 30-minute duration for 120 days, generating a high-resolution, high-frequency time series ideal for both statistical and machine learning analysis. The data were collected in a field practising smart agriculture, where embedded sensors were utilised for the automatic monitoring of irrigation and the environment. The primary dependent variable for this analysis, crop yield measurements, were recorded at the end of the growing season and then matched with the sensor data based on time and plot identifications.

Analysis of Descriptive Statistics
A preliminary descriptive statistical analysis was conducted to gain general insight into the characteristics of the data and the distribution of the variables, which involved central tendency, dispersion, and shape of the distribution.

Temperature
The mean temperature recorded during this period was 29.3°C (SD: 4.2), with temperatures ranging from 20 to 38°C, which is consistent with the normal subtropical climatic conditions of the location where the crop was grown. The plot of aggregated temperature data was histogrammed, showing a nearly normal distribution (but slightly right-skewed towards the warmer mid-season peak).

Humidity
Relative humidity was highly variable, between 40% and 95%, with a mean of 68.7% (SD = 13.5%). These humidity levels exhibit a wide range, reflecting the daily weather patterns of precipitation and evapotranspiration. The data distribution for humidity was relatively uniform, with a slight right skew.

Soil Moisture
Soil moisture was positively skewed, with the values between 20% and 45% gathered in the middle. Mean soil moisture content was 34.2%, and the standard deviation was 8.7%. Such statistics indicate occasional levels of water stress, more so during dry spell periods when soil moisture drops below acceptable limits for plants. Automated irrigation controlled moisture regulation, but variability likely occurred due to the delayed activation of the system to initiate irrigation once moisture depletion reached threshold levels.

Light Intensity
Light intensity (lux) measured 10,000 lux during cloudy conditions and exceeded 95,000 lux on clear days. The mean value was 62,500 lux, and the high standard deviation reflects the apparent diurnal and weather-induced variations. This was expected to affect photosynthetic activity; however, the correlation of this variable with yield was low, as discussed later in this work.

Crop Yield
Crop yield assessed at the end of the growing season in each plot monitored ranged between 2.3 and 7.8 kg (mean per plot = 5.4kg). This variable was used as a dependent outcome in correlation and machine learning analyses.

Correlation Analysis
A matrix of Pearson correlation coefficients was produced to measure the linear relationships between variables and determine which variables were the most important in influencing crop yield. The purpose of this analysis was to determine the strength and direction of the associations between independent variables (temperature, humidity, soil moisture, and light intensity) and the dependent variable (yield). A correlation coefficient close to 1 or -1 indicates a strong relationship, while a coefficient close to 0 indicates a weak relationship.

Key findings include

Soil Moisture and Yield

Soil moisture showed the highest positive correlation to crop yield ($r = 0.76$, $p < 0.01$). This close linkage reveals the central importance of water supply to crop growth and yields. Inconsistent moisture levels create water stress, negatively impacting nutrient uptake and photosynthesis. These data support the notion that, form aximising yields, soil moisture needs to be sufficient and constant.

Temperature and Yield

Yield had a significant but moderate negative correlation with temperature ($r = -0.45$, $p < 0.05$). It indicates that elevated temperatures can be detrimental to crop growth, particularly during critical growth stages such as flowering or grain filling [20]. This negative relationship corroborates field evidence showing that excessive heat reduced growth and productivity.

Humidity and Yield

The relationship between humidity and crop yield was positive and weak ($r = 0.22$); however, this value was also not statistically significant. Even though moisture impacts transpiration and can indirectly affect plant metabolism, it does not seem to have a direct and consistent effect on yield in this specific case.

Light Intensity and Yield

Likewise, light intensity had a very low ($r = 0.15$) and non-significant positive correlation with yield, indicating that natural variation in light was within optimal ranges for the crop and did not significantly limit yield (Kumar *et al*., 2020). Together, these results highlight the crucial role of soil moisture and temperature as primary drivers of crop growth (both above- and below-ground) in a system where only soil moisture and temperature are monitored to inform management decisions. This knowledge empowers farmers and agricultural managers to make informed decisions for optimal crop growth.

Machine Learning Predictive Modelling

For a robust understanding and the development of a predictive framework, we employed a Random Forest regression model. This ensemble machine learning algorithm, known for its precision with tabular datasets and non-linear relationships, was a fitting choice for our high-dimensional dataset. We meticulously split the data into 80% for training the model and 20% for validating the trained model. The input features used for prediction were temperature, humidity, soil moisture, and light intensity, with crop yield as the target variable.

Model Performance

R^2 Score: 0.87

Mean absolute error (MAE) : 1.6 (kg)

RMSE (Root Mean Squared Error): 2.1 kg

The R^2 value (0.8729) signifies that the model explains nearly 87% of the variation in crop yield, demonstrating its high accuracy. The low mean absolute error further validates the precision and accuracy of our predictions across diverse plot conditions.

Feature Importance

Another benefit of the Random Forest model is that it permits the estimation of feature importance. Results showed

Soil moisture was the most significant contributor to prediction accuracy (~43%)

Path followed by Temperature with ~28%

Humidity and light had only minor effects (15% and 14%, respectively)

These findings further corroborate the results of the correlation analysis and indicate the most essential features that need to be monitored and adjusted in the development of innovative farming systems.

Analysis and Consequences

The findings from all statistical and machine learning analyses carry significant implications for the practical design and implementation of AI-based innovative agricultural systems. These insights can guide the development of technologies that optimise planting schedules, irrigation, and resource allocation, thereby improving crop yield and resource efficiency in agriculture.

Moisture Management is Key

The high correlation between soil moisture and crop yield suggests that a real-time sensor data-driven precision irrigation system can significantly enhance productivity. Threshold-based irrigation, combined with predictions from machine learning, can provide irrigation when needed, ensuring the necessary moisture and avoiding periods of stress.

Why is that important: Reducing extremes of temperature

This inverse relationship between temperature and yield suggests that microclimate control strategies, such as shade nets, mulching, or smart greenhouses, should be implemented in areas with extreme temperature variations.

AI for Decision Support

This promising deployment of a Random Forest model to predict yield outcomes demonstrates the potential for using artificial intelligence as a decision-support tool for farmers and agricultural managers. These models can be incorporated into farm management software to provide practical insights on aspects such as optimising planting schedules, irrigation, and resource allocation.

Minimal Effect of Moisture and Illumination

The reasonably small effect of humidity and light exposure on yield in this study indicates that, at best, they are important but not critical (and therefore do not require active management, unless they reach extreme values). Instead, it should be on soil temperature, etc.

Metric Examples: Environmental Impact and Sustainability

Water Conservation and Management

Water conservation is one of the most significant environmental benefits of innovative agriculture technologies. Traditional irrigation practices result in considerable water waste due to over application, poor timing, and imprecise water delivery. This is where AI irrigation systems come in, with advanced monitoring and control. Studies have shown that innovative irrigation systems can lower agricultural water consumption by 30–50% compared to traditional methods (Frontiers). Predictions based on artificial intelligence (AI) can increase the efficiency of water use in irrigation systems by up to 60%, thereby minimising the amount of water applied for crop growth and enhancing grain yield. This gain is attributed to the accurate tracking of soil moisture conditions, the incorporation of a weather forecast, and the detection of water stress signals in plants. Moreover, IoT-supported irrigation systems provide real-time information about the soil moisture level, allowing for the control of excess water flow and ensuring a sufficient water supply for crops. These systems can automatically adjust irrigation schedules based on weather forecasts, soil conditions, and plant needs, maximising water use with no loss of crop growth. IoT-based soil monitoring systems result in less waste, better efficiency, and increased production in citrus orchards, as shown by numerous in-depth studies in Frontiers. Precision irrigation technologies target water application, bringing water to root zones and reducing losses from evaporation and runoff. AI-controlled drip irrigation systems can achieve water-use efficiencies of over 95%, compared to 60–70% for sprinkler systems and 40–50% for flood irrigation systems.

Chemical Input Reduction

These technologies have proven capabilities to decrease chemical input while enabling similar or higher crop productivity. Precision Application Technologies: This innovative approach minimises overall fertiliser and pesticide use while enhancing efficacy through targeted delivery methods. Precision agriculture systems can decrease chemical pesticides up to 70% by monitoring and using artificial intelligence to determine the need for chemicals or pesticide usage in real time, according to Databricks. This recognition can help computer vision systems identify areas where

pests or diseases occur, enabling farmers to apply targeted spot treatments instead of broad-spectrum applications. Such an approach enables a decrease in chemical consumption, reduces costs, and offers a lower environmental footprint, promoting a more sustainable farming approach. Another move in this positive direction is the development of robotic weeding systems. They utilise computer vision and machine learning to distinguish between crops and weeds, employing targeted herbicide applications and/or mechanical weed removal. This means that some highly accurate robotic systems are capable of reducing herbicide expenditure by as much as 90% while still effectively combating weeds. Precision agriculture technologies can optimise fertiliser application, allowing for a reduction of up to 15-20% in fertiliser use while maintaining, or even increasing, yields. Variable-rate fertiliser application systems utilise soil test data, yield maps, and plant tissue testing to determine the optimal fertiliser rates for zones within fields. This precision approach prevents over application while still maintaining sufficient nutrient availability for crops.

Soil health and conservation

Precision management practices and low- or no-tillage systems result in significant improvements in soil health and conservation, which are essential components of innovative agricultural technologies. To improve soil health and productivity, soil monitoring sensors provide continuous information on soil conditions, enabling more effective management practices. Conservation tillage practices are supported by precision agriculture systems that provide information about soil conditions and crop residue management. Reduced tillage systems reduce soil erosion by 90% compared to conventional tillage, and enhance soil organic matter and soil water holding capacity. IoT sensors can help track when to monitor soil moisture and temperature conditions, which in turn helps determine the optimal timing of field operations, resulting in less soil compaction and erosion. Innovative agriculture technologies support smart systems for cover crop management through accurate monitoring and precise planting systems. Cover crops can be planted at optimal rates and spacing using automated seeding equipment, and their presence and growth can be recorded and monitored using remote sensing technologies. This post highlights the numerous soil health benefits associated with cover cropping, including preventing soil erosion, enhancing nutrient retention, and increasing organic matter. Remote sensing technology and AI analysis have strengthened the monitoring of soil carbon sequestration. More quantitatively, soil organic matter content can be determined using satellite imagery and ground-based sensors to monitor changes over time, mainly where carbon sequestration occurs. It supports carbon credit programs, sustainability reporting, and enables the optimisation of management practices to enhance soil health.

Biodiversity and Ecosystem Services

As highlighted in the FAO report, sharp management practices enabled by innovative agricultural technologies can facilitate a balance between farm sustainability and the need for biodiversity conservation and ecosystem services by reducing negative environmental externalities. The targeted application of pesticides minimises off-target impacts on beneficial insects, birds, and other wildlife species. Innovative agricultural technologies, such as precision and data-driven high-resolution mapping and monitoring of non-crop habitats, are helpful in habitat management within agrarian landscapes. Easily identifies wildlife habitat areas, wetlands, and other environmentally sensitive areas using drone surveys and satellite imagery for protection and enhancement strategies. With the help of GPS-guided machinery, these positions can be bypassed during field operations, thereby minimising disturbance to wildlife habitats. Innovative agriculture reduces pesticide use and enhances habitat management, thereby supporting the conservation of pollinators. Factors such as selective application (which directs sprays to specific target areas of a site) and the timing of treatments can also reduce pesticide exposure to pollinators (e.g., by avoiding times of day when pollinator activity is high). Innovative agricultural systems also facilitate the establishment and maintenance of pollinator habitats within agricultural landscapes. Through innovative agronomic technologies, we can enhance the precision and efficiency of nutrient management and erosion control practices, thereby increasing watershed protection and sustainability. Conservation tillage methods reduce soil erosion, while precision fertiliser technology prevents runoff of excess nutrients to waterways. For example, continuous water quality monitoring sensors can provide real-time data on nutrient concentrations in rivers, supporting immediate action when potential pollution events are detected.

Case Studies: Applications in the Real World

The Precision Agriculture Platform from Smart Agriculture

Smart Agriculture has integrated innovative agricultural technology through AI-powered precision agriculture, which is one of the most comprehensive implementations of this technology. Lower-end machinery manufacturer to a wholesaler with a broad portfolio, combining machinery, telemetry, and automation to deliver integrated agricultural solutions. Another example is John Deere's precision agriculture platform, which blends a variety of AI techniques, including computer vision, machine learning, and predictive analytics. Real-time measurements of soil quality and moisture levels are taken with the help of AI-driven sensors. At the same time, machine learning algorithms evaluate soil health to ensure seeds are planted at the correct depth and the proper distance apart. SEED SOWING GPS guide GPS-girded equipment ensures precise work of seeds and seedling machines, and less waste of resources, better plant establishment Quantitative results for John Deere's precision agriculture pilot program indicate substantial benefits across various measures. Crop yields from farmers using AI-driven systems, such as those provided by John Deere, have increased by 25%, while water and fertiliser use have decreased by 30%. Exact Emerge technology has achieved 20% higher planting efficiency compared to manual planting, and fuel costs have been reduced by 15% thanks to the Auto Track guidance system from the same company, Redress Compliance.

IoT Irrigation Systems

An extensive research on IoT based irrigation systems showed a water use reduction of 30-50% on average than traditional irrigation systems. The systems achieved these savings by accurately measuring soil moisture conditions to schedule irrigation at the plant level, and by linking to weather forecasting systems to prevent irrigation before an expected rainfall event. Intelligent irrigation systems have proven to be economically beneficial, with typical return on investment (ROI) periods ranging from 1.5 to 2 years. During this period, farmers can experience yield increases of up to 40% and reductions in water use of 50%. This is due to more accurate water management, which eliminates both water stress and overwatering conditions during the growth period, thereby providing optimal growing conditions for the crop throughout its duration. Involves the deployment of wireless sensor networks that are used to monitor soil moisture, temperature, and other environmental parameters. These sensors transmit information to cloud-based platforms that run AI algorithms to analyse conditions and generate irrigation recommendations. Mobile apps enable farmers to remotely monitor the system's status and make adjustments (or modifications) to it, making them operationally flexible and able to respond quickly.

Management System for Pests and Diseases

Using AI to manage pests and diseases has proven beneficial in providing early warnings and effective treatments for agricultural problems. The system utilises computer vision, machine learning, and IoT sensors to monitor crop conditions and identify issues before they become widespread. Computer vision systems have been developed to recognise specific pests and diseases from digital images, achieving an accuracy of over 95% for particular pests and diseases. The systems analyse pictures captured by smartphones, drones, or stationary cameras to detect issues and recommend treatments. With early detection, targeted therapies that reduce pesticide use can be implemented whilst achieving optimal control over the Xylella spread. To monitor pest populations, various sensors and traps are used in IoT-enabled pest monitoring systems. Systems that could be used include digital pheromone trap counting systems, acoustic sensors to detect pests such as male moths, and environmental sensors to verify the microclimatic conditions necessary for the pest's development. This data is then analysed by machine learning algorithms, which can predict when a pest outbreak will occur and when the optimal times to treat crops will be. Precision pest management systems can lead to substantial reductions in pesticide use.

CONCLUSION

Artificial Intelligence (AI) and Automation in Agriculture Agricultural systems are undergoing a significant transition, with the integration of Artificial Intelligence (AI) and automation leading to more sustainable, efficient, and data-driven farming practices Smart agriculture brings it precision in crop management, resource utilisation and

yield prediction through advanced monitoring systems, machine learning algorithms and real-time data analytics. Besides the productivity boost, these technologies also play a critical role in saving the environment by reducing water, fertiliser, and energy waste. The literature review highlights the increasing influence of AI in making wise decisions, ranging from pest and disease detection to soil health assessment and autonomous farming operations. Cloud computing, paired with IoT devices, enhances the ease of data collection and remote monitoring, enabling farming to adjust promptly to changing climatic and market conditions. However, the developments in the field are not without their challenges, including data privacy issues, cost-intensive implementation processes, the lack of infrastructure at the rural level, and the need to train farmers. This means that, for future research and policy, we need more affordable AI technologies, increased digital literacy among farmers, and more robust infrastructure to support smart farming.AI-based smart agriculture also has the potential to transform global food systems towards higher levels of efficiency, sustainability, and resilience. A careful integration of these technologies will play a key role as they advance in progress to overcome the multifaceted issues of current-day agriculture and feed an ever-increasing world population.

ABSTRACT

Decision making is the process of maximizing the gains or expected value of the consequence by utilizing information available. The linear model with a relationship of probability to utility is the expected value.

Keywords: Expected value analysis, Decision making under risk, Decision-making under uncertainty, Maximax / maximin criteria, Expected opportunity loss criterion, Utility theory.

INTRODUCTION

The manager falls into the deterministic models which presuppose that there is certainty and in probabilistic models all the strategies are represented by a number of pay offs and the manager can attach to them a probability measure. Motivations The answers are categorized based on the level of certainty. One can assume that both decision-making under certainty (DMUC) and decision-making under uncertainty (DMUU) may be viewed as the two extremes since the entire range of the assumed certainty can range between full certainty to full uncertainty. The region composed of these two extreme positions as well as those that lay between the two and are identified with probabilistic models is referred to as decision-making under risk (DMUR). It can be inferred that the level of certainty assumed in decision is a minuscule aspect of decisions made under risk and the bulk of the problem in decision making can be seen to be due to decision under risk. Other systems of classification are a linear or non-linear behaviour, a static or a dynamic condition and a single or multiple objective. All these are factors that have to be considered before coming up with a model.

MATERIALS AND METHODS

Decision Theory

Decision making under risk and uncertainty is what is concerned with theory of decision-making. By the purpose of this, any kinds of decision models like deterministic models will be under the hands of decision theory. The management literature comes up with various quantitative models of decision that help managers in determining optimum or best courses of actions.

Two Phases of The Process of Decision - Making

The decision theory has been a considerable part, because the convergence of such diverse disciplines as philosophy, economics, psychology, sociology, statistics, political science and the operations research to the theory of decision have taken place. During decision-making we find two stages:

- The approach which involves working on the formulation of goals and objectives, enumeration of environmental constraints, identification of alternative strategies, and estimation of pertain payoffs.
- To pinpoint on the issue how to choose the optimal strategy provided that we have a selection of objectives, sets of strategies, sets of payoffs. The second issue is that we pay more attention to our discussion.

Decision Making Under Risk (DMUR)

Decision making under risk (DMUR) entails a situation, which involves the payoffs or the several associated with each such set of strategies being more than one, and with the manager attaching amount of probability concerning the payoffs. The present model can be applied to the case in which the manager can estimate two or more outcomes of each of the strategies; and he/she knows or can suppose such that the results are suitable distributed between the possible ways. Assumptions will follow as

1. Ability to access multiple options of strategies
2. There is the existence of many states of nature
3. As the concerned results
4. The likelihood of end results of each stratagem.

The strategy that is of maximum expected utility (or maximum expected value) is the one that is best in the case of decision making under risk.

RESULTS AND DISCUSSIONS

Problem

The probability of a book shopkeeper selling a book is as follows. The price of the book is 10 rupees, and the sales price Rs.35. He is not able to send back books that are not sold. How much can he order in terms of books?(Table: 1)

Solution

The book shopkeeper reports that the sales quantities of books are 3, 5, 7, 8, and 10 books. It does not encourage him to buy less than 3 or more than 10 books. The table given below shows price setting table i.e. profit earned based on all the possible incidences of the supply and the demand. Under this assumption, he will be able to sell 3 books whereas the demand will be 10 books someday; his conditional profit will be 75 rupees. When order quantity with 5, 7, 8 and 10 books are ordered by the buyer then the profit of stock of 5 books is 125 rupees. However when he has 5 books on one day and the buyers have only 3 books then his gain will be 55 rupees since there are two unsold books. Thus payoff = 25 books sold minus 10 books unsold. Thus, Conditional profit table is given below.

Conditional Profit Table (Rupee) Possible Stock Action (Table: 2)

Expected Profit Table Expected Profit from Stocking in Rupee(Table: 3)

The owner of the bookshop will hence have to order 8 books to attain a maximum average daily profit of 133.5 rupees. Therefore, the ideal stock is 8 books. The stocking will maximize the cumulative profits in each time. Naturally, he cannot be sure that he will get a profit ranging 133.5 rupees again tomorrow. Interestingly though if he orders 8 books a day under the specified condition, he will average 133.5-rupee profit per day. It is the most I could do since the other of the four other possible actions as to the stock will result in a smaller amount of profit per day than the one, I have decided to do. Expected opportunity loss (EOL) may be calculated by taking individual probabilities of each of the states of nature and multiplying the probability by the corresponding loss amount and summing the outcomes.

Conditional Loss Table in rupee Possible Stock Action (Alternative)(Table: 4)
When the book shop keeper has only 8 books, then his loss will be less.(Table: 5)

Decision Making Under Uncertainty
The result of a major alternative of the decision is not certain, not to mention some probability. Only a number (of approaches) criteria are provided that the decision makers are supposed to use based on their preference and characters.

- Maximax Criterion
- Maximin Criterion
- Maximin Criterion
- Minimax Regret
- Laplace Criterion (Equally likelihood)
- Hurwiczalpha Criterion

Maximax Criterion
A decision maker who is adventurous and aggressive can opt to undertake the act that would give the highest payoff possible

- Step1: select maximum pay off over each alternative.
- Step 2- Select the greatest of the maximal values of Step 1; the alternative associated with it is the decision.
- This is a positive strategy, “Best of bests”.

Maximin
It is also referred to as Waldian criterion. This is one criterion of decision making which represents choice of alternative courses of action and with pessimistic outlook of nature.

- Step1Choose minimum take off of every alternative
- Step 2 Pick (select) the highest of those minimums in Step 1, its counterpart is the decision

Minimax Regret
The minimax criterion needs a table of losses or table of regret rather than gains. Regret is what you sacrifice on failing to choose the optimal choice in a state of nature.

- Regret= cost of opportunity= loss of opportunity
- Step1-Make a regret table
- Step2 -Select maximum regrets of every row in regrettable
- Step 3- select minimum of maximums in Step 2, its alternative is the decision.

Equally Likely
Its easy assumption that the decision maker makes is that each of the states of nature is equally apt to take place and computes the average payoff of each. Make the decision which has the highest average payoff.

- Closely referred to as Laplace criterion
- Step1-compute the average pay off of each alternative.
- Step2-The decision that has maximum average is the alternative.

Hurwicz (Realism)

This is mixed approach of both Maximin and Maximax. Otherwise referred to as criterion of rationality. Not too hope some, not too pessimistic

- Step1Compute Hurwicz value of each of the alternatives
- Step 2: Choose the alternative with maximum Hurwicz value as the choice. Hurwicz value of a decision alternative rowmax +rowmin 1-α
  Where is ($0 \leq \alpha \leq 1$) is known as coefficient of realism.

Problem

A book shopkeeper is not sure whether to sell a once off edition of a poem about money. He thinks that she can sell 7 to 11 books to his knowledge of the customer. The books could be bought at a price of Rs. 30/book or be sold at a price of Rs. 45/book. Unsold books may be sent back to the publisher where half the amount is returned.

Develop a decision table of the above inventory problem, stating potential financial implication

Identify the best decision depending on

- Maximax Criterion
- Maximin Criterion
- strongly on Minimax Regret
- Laplace Criterion (Equally likelihood)
- Hurwicz alpha criterion (Rationality or Realism)

Solution (Table: 6)

Without given probabilities based on risk, subjective values, or experience, everyone may have different views. These are selected in accordance with choice criterion. In consequence, the operation of making decisions under uncertainty is often discussed as choice formation models. Two criteria to consider are the Criterion of Optimism and the Criterion of Pessimism.

Maximax Criterion

In this case, what we ascertain is the best possibility outcome in every storage books and then there is the most beneficial of the best outcomes which will be determined as the optimum books. The left-hand the margin contains the best of the best, as indicated in the table: 7 below. With application of the principle of optimism, this is to choose among max of max; which is also referred to as Maximax.

Maximin Criterion

In handling a problem of uncertainty with the maximin criterion, the worst possible can be found in each book (row minima) and best among the worst possibilities is selected to obtain the best possible method. The disastrous consequences have been given in left-hand margin. (Table: 8) An optimal maximization option is 105; hence, the book shopkeeper uses the first books. Maximin makes total maximin. Optimism in maximax is complete.

Minimax Regret

To compute the regret loss in the opportunity loss matrix, subtract each element from the maximum number in its column. The resultant state is called the matrix of regrets. As we select the preferred books, we must be sure that we do not have an opportunity loss, i.e. a regret. In case we pick any other literature, regret is an element of that strategy. In the problem, the regret matrix is as shown in the table below with respect to the matrix provided in the problem.(Table:9). To create the regret matrix, find the highest element in each column and subtract every other element in that column from it. To identify the best books, calculate the maximum regret for each book and then find the highest of these regrets. This process is shown in the table below(Table: 10). Select the least of the greatest regret (Minimax). The decision procedure is also referred to as minimax regret. There is the assumption that two books are identical in their minimax elements and the book seller needs other elements to determine his choice.

Laplace Criterion (Equally Likelihood)

While objective evidence of a probability distribution for the demands is available, subjective criteria may also be used. Furthermore, in the absence of objective evidence, it is possible to assign equal probabilities to each state of nature. The Laplace principle, also known as the principle of insufficient reason, posits that each demand has an equal likelihood. By assigning equal probabilities, risk analysis is applied, and the expected value method can be utilized, as illustrated in the following table: 11. The optimal method would be to produce 8 books, because it gives the greatest EMV.

Hurwicz Alpha Criterion (Rationality Or Realism)

To find a level of optimism or optimism the bookseller could weight the best and the worst conditions. Suppose the ownership will set the coefficient of optimism at 0.4; of course the coefficient of pessimism will be 0.4. The following matrix of cells demonstrates the way of selecting the correct approach when weights are given table: 12.

CONCLUSION

Coming up with risky judgments enables you to predict whether an outcome is likely to occur in the future. But decisions cannot be made out of situations that are not known. Uncertainty is unalleviated and risks can be tamed. You are able to put probabilities on the dangerous events.

ABSTRACT

Oral squamous cell carcinoma (OSCC) is a prevalent malignancy with significant morbidity and mortality, especially in the Indian subcontinent. Non-invasive biomarkers such as salivary alpha amylase (sAA), plasma alpha amylase, and salivary pH are gaining importance in early diagnosis, monitoring treatment response, and predicting prognosis. This study aimed to evaluate and compare the salivary and plasma alpha amylase levels and salivary pH in OSCC patients before and after treatment, and in healthy individuals. The study included 40 participants divided into three groups: Group A (n=20) – healthy controls; Group BI (n=20) – OSCC patients before treatment; and Group BII (n=20) – the same OSCC patients, four months post-treatment. Saliva and blood samples were collected in both morning and evening sessions. Alpha amylase levels were measured using Erba Liquixx 6X6-Amylase kits, and pH was assessed using a digital pH meter. Data were statistically analyzed using SPSS version 25.0 and MedCalc software. Statistical tests used included One-way ANOVA, Post-hoc Bonferroni test, Unpaired t-test, and Chi-square test. A significant reduction in both salivary and plasma alpha amylase levels was

observed in Group BII (post-treatment) compared to Group BI (pre-treatment) ($p<0.001$). The salivary pH showed a significant increase in Group BII compared to Group BI ($p<0.05$), suggesting improved oral health status post-treatment. Diurnal variation was also noted, with higher amylase levels observed in evening samples compared to morning samples across all groups. Salivary and plasma alpha amylase levels, along with salivary pH, can serve as potential non-invasive, reproducible biomarkers for monitoring disease progression and treatment response in oral squamous cell carcinoma. These markers may aid in early detection and post-treatment follow-up, enhancing personalized patient care in OSCC.

Keywords: OSCC, sAA, Plasma alpha amylase, salivary pH

INTRODUCTION

Oral cancer is a debilitating disease primarily affecting the oral cavity, with oral squamous cell carcinoma (OSCC) accounting for 70–90% of all oral malignancies. OSCC ranks sixth among all cancers globally, and its prevalence is particularly high in South Asia[1,2]. The disease is most often associated with persistent exposure to known carcinogens such as tobacco (both smoked and smokeless), areca nut, betel quid, and chronic alcohol use. Additionally, oncogenic viral infections, especially human papillomavirus (HPV), further elevate the risk by inducing genetic mutations in the oral epithelium. Early detection of OSCC is crucial for improving prognosis. Traditional screening methods include visual inspection, vital staining (such as toluidine blue), brush biopsy, chemiluminescence, and tissue autofluorescence. However, histopathological examination of biopsy tissue remains the gold standard for diagnosis. The key limitation of conventional techniques lies in their inability to detect OSCC at a very early, subclinical stage, often leading to delayed intervention and poorer outcomes. Recent advances in biomarker research have highlighted the potential of salivary diagnostics. Saliva, a complex oral fluid, plays diverse physiological roles such as aiding in digestion, lubrication, taste perception, and antimicrobial defense. It contains various bioactive molecules—enzymes, hormones, antibodies, cytokines, and antimicrobial proteins—many of which reach the oral cavity via mechanisms like active transport, passive diffusion, transcellular and paracellular pathways, and ultrafiltration from blood through salivary glands. Thus, both blood and saliva can reflect systemic physiological changes, including nutritional, metabolic, endocrinal, and emotional variations[1,3,4]. Among the salivary proteins, salivary alpha-amylase is a prominent calcium-dependent metalloenzyme, commonly referred to as ptyalin, which functions in the digestion of dietary starch by hydrolyzing α-1,4 glycosidic linkages. Notably, its concentration in saliva has been linked to dietary starch intake, showing a correlation with the copy number of the salivary amylase gene[4]. Salivary pH also plays a crucial role in oral health. Normal salivary pH ranges from 6.7 to 7.3, but in cancerous conditions, a shift toward acidity is observed. This acidic microenvironment is largely attributed to anaerobic glucose metabolism by tumor cells under hypoxic stress, which in turn promotes tumor survival and proliferation[5]. In this study, we aim to evaluate and compare the plasma and salivary levels of alpha-amylase in OSCC patients both before and after treatment, and contrast these findings with those from a control group of healthy individuals. Additionally, we analyze the diurnal variation in salivary alpha-amylase and pH across both groups, with the goal of exploring their potential as non-invasive biomarkers for early OSCC detection and monitoring.

AIMS AND OBJECTIVES

Aims

a. To study and compare the levels of alpha amylase in plasma and saliva in patients of oral squamous cell carcinoma (OSCC) pre and post treatment.
b. To compare the salivary pH in both the groups.

Objectives

a. To establish the prognostic value of alpha amylase in plasma and saliva pre and post treatment of oral squamous cell carcinoma (OSCC) patients.
b. To establish the role of salivary pH as diagnostic tool in patients of oral squamous cell carcinoma (OSCC).

MATERIALS AND METHODS

Study Design and Duration

This clinical study was conducted over a period of 18 months, from February 2021 to April 2022, and involved two groups: healthy individuals (controls) and patients diagnosed with oral squamous cell carcinoma (OSCC).

Ethical Approval

The study received ethical clearance from the Pt. B.D. Sharma University of Health Sciences, Rohtak, Haryana. Informed written consent was obtained from all participants prior to inclusion.

Study Population

Participants were recruited from patients reporting to the Department of Oral and Maxillofacial Surgery, D.A.V. (C) Dental College and Hospital, Yamunanagar.

Inclusion Criteria

- Age: 25–75 years
- Histopathologically confirmed OSCC with accessible lesion sites (tongue, floor of mouth, lips, gums, hard palate, buccal mucosa, or retromolar area)
- No prior treatment for OSCC

Exclusion Criteria

- History of acute pancreatitis, salivary gland disorders, GI emergencies
- Pregnant/lactating women
- Stress-related elevated amylase
- History of oncotherapy or systemic malignancy
- Patients with adrenal or HPA axis disorders
- Unwilling participants

Sample Size and Group Allocation

The total sample consisted of 40 individuals, divided equally
Group A: 20 healthy individuals (controls)
Group B: 20 OSCC patients
- Group B-I: Pre-treatment
- Group B-II: Same patients at 4 months post-treatment

Recruitment and Randomization

Participants were recruited based on eligibility criteria and randomly assigned to study groups. Complete clinical evaluation, radiological imaging (as needed), and biopsy (for OSCC patients) were performed prior to sample collection.

Sample Collection and Protocol

Pre-Sampling Preparation

Participants underwent routine blood tests (Hb, ESR, TLC, DLC, etc.) and necessary imaging (OPG, CT, MRI). For OSCC patients, biopsy under local anesthesia confirmed diagnosis.

Saliva Sampling (figure 1)

- Collected between 7–10 AM and 7–10 PM to assess diurnal variation
- Participants fasted and refrained from oral intake for at least 1 hour before sampling
- After rinsing the mouth with water, 5 mL of unstimulated saliva was collected into sterile tubes
- pH measured immediately using pH indicator strips
- Samples stored at 3°C for later analysis

Salivary pH Analysis

- Saliva diluted to 30 mL
- pH measured with a calibrated pH meter (Birud pH meter)

Salivary Amylase Estimation

- 500 µL of Erba Liquixx amylase reagent mixed with 10 µL saliva
- Processed using Erba Chem-7 analyzer
- Amylase levels recorded

Blood Sample Collection (figure 2)

- 5 mL of venous blood collected from the antecubital vein at the same diurnal intervals as saliva
- Blood incubated at 37°C for 20 minutes, then centrifuged at 400 rpm for 10 minutes
- Plasma separated and used for enzyme analysis

Plasma Amylase Estimation

- 10 µL plasma mixed with 500 µL of Erba Liquixx reagent
- Processed in Erba Chem-7 machine
- Final reading recorded

Outcome Measures(Table: 1)

This section outlines the methodology for analyzing salivary and plasma alpha-amylase levels, and salivary pH in OSCC patients compared to healthy controls, both pre- and post-treatment, with an emphasis on diurnal variation and non-invasive biomarker potential.

RESULTS AND OBSERVATIONS

Demographic Characteristics

Age: Group B (OSCC patients) had a significantly higher mean age (51.15 ± 11.57 years) than Group A (healthy controls) (29.80 ± 5.94 years), $p = 0.001$ (Unpaired t-test).

Gender: Males were more prevalent in Group B (70%) compared to Group A (45%), though this difference was not statistically significant ($p = 0.110$, Chi-square test).

Tumor Site Distribution in OSCC Group (Group B)

Most common sites included

- Left buccal mucosa (20%)
- Lateral border of the tongue (20% combined left and right)

- Lower lip and gingivobuccal mucosa (10% each)

Biochemical Parameters

Salivary Amylase – Morning

- Significantly elevated in Group B I (untreated OSCC: 138.97 ± 30.99 U/L) compared to Group A (65.83 ± 20.72 U/L) and Group B II (post-treatment: 57.81 ± 20.27 U/L), $p = 0.001$ (ANOVA).
- Post-hoc analysis showed significant differences between Group B I and the other two groups.(Graph 1)

Salivary Amylase – Evening

- Again highest in Group B I (148.67 ± 28.21 U/L) compared to Group A (84.30 ± 22.01 U/L) and Group B II (72.26 ± 19.91 U/L), $p = 0.001$.
- Significant difference noted between Group B I and both groups; no significant difference between Group A and B II. (Graph 1)

Plasma Amylase – Morning

- Higher in Group B I (97.35 ± 11.68 U/L) vs. Group A (61.86 ± 13.52 U/L) and Group B II (51.04 ± 20.07 U/L), $p = 0.001$.
- Significant difference found between Group B I and both other groups. (Graph 2)

Plasma Amylase – Evening

- Group B I showed elevated levels (100.74 ± 16.46 U/L) versus Group A (71.91 ± 12.60 U/L) and Group B II (60.70 ± 22.72 U/L), $p = 0.001$.
- Post-hoc tests confirmed significance between Group B I and the other two groups. .(Graph 2)

Salivary pH – Morning

- Reduced in Group B I (6.12 ± 0.20) compared to Group A (7.19 ± 0.22) and Group B II (6.53 ± 0.33), $p = 0.001$.
- All intergroup differences were statistically significant. (Graph 3)

Salivary pH – Evening

- Group B I had the lowest salivary pH (6.08 ± 0.16), while Group A had the highest (7.22 ± 0.23); Group B II showed partial recovery (6.56 ± 0.30), $p = 0.001$. (Graph 3)

DISCUSSION

In the present study, the mean age of group A (healthy controls) was 29.80 years, while group B (OSCC patients) showed a significantly higher mean age of 51.15 years (p = 0.001, unpaired t-test). This aligns with Akram *et al*. (2013)[7], who reported a mean age of 47.84 ± 12.18 years among OSCC patients, and Alamgir *et al*. (2016)[8], who found a mean of 47.1 ± 12.22 years in a tobacco-exposed population from Karachi. Gender distribution showed a male predominance in OSCC group B (70% male, 30% female) compared to group A (45% male, 55% female), though not statistically significant. Akram *et al*. (2013)[7] reported a male-to-female ratio of 2.82:1, and Alamgir *et al*. (2016)[8] noted 1.88:1. Male predominance may be due to higher tobacco and alcohol consumption. The most common OSCC sites in group B were buccal mucosa (30%) and lateral tongue border (30%), followed by lips and gingivo-buccal mucosa. These findings support Akram *et al*. (2013)[7] and Alamgir *et al*. (2016)[8], who found buccal mucosa and tongue as the most frequent sites [26, 32]. Feller and Lemmer (2012) also emphasized tongue and floor of mouth as common OSCC locations due to carcinogen accumulation[2]. sAA, primarily secreted by salivary acinar cells, reflects sympathetic activity and glandular function . In this study, mean morning sAA levels were highest in group BI (138.97 U/L), followed by group A (65.83 U/L), and lowest in group BII (57.81 U/L). Evening sAA levels also showed the same trend: group BI (148.67 U/L), group A (84.30 U/L), and group BII (72.26 U/L). These differences were statistically significant (p = 0.001, ANOVA), with post-treatment levels (group BI) comparable to controls (group A) (Bonferroni test). The diurnal pattern showed a consistent increase in sAA levels from morning to evening across all

groups. This is consistent with findings by Abhishek *et al*. (2022), who observed similar diurnal variation in OSCC patients[9]. Choontharu *et al*. (2020) reported increased sAA and acid phosphatase in OSCC patients, supporting its diagnostic role[10]. Belskaya *et al*. (2020)[11] found elevated metabolic enzymes (sAA, LDH, GGT) in OSCC saliva, affirming sAA's utility as a biomarker[11] . A diurnal rise in sAA from morning to evening was consistent across all groups, aligning with circadian patterns reported in prior studies (Abhishek *et al*., 2022)[9]. The post-treatment decline in Group BII may result from reduced tumor burden and radiation-induced acinar cell damage. Supporting literature (Ramya *et al*., 2015; Shah and Sequeira, 2022; Belskaya *et al*., 2020) confirms that sAA levels are elevated in untreated OSCC and tend to normalize following therapy[12]. These findings highlight sAA as a sensitive, non-invasive biomarker for OSCC diagnosis, disease monitoring, and treatment response assessment. In the current study, plasma alpha amylase was analyzed using the Erba Chem-7 autoanalyzer with the Erba Liquixx amylase kit. Blood samples were collected twice daily (7–10 AM and 7–10 PM). In Group BI (OSCC pre-treatment), mean morning and evening plasma amylase levels were 97.35 U/L and 100.74 U/L, respectively. Post-treatment (Group BII), levels decreased significantly to 51.04 U/L (morning) and 60.70 U/L (evening), confirmed via ANOVA ($p = 0.001$). Healthy controls (Group A) had mean levels of 61.86 U/L (morning) and 71.91 U/L (evening), showing significant differences compared to Group BI but not to Group BII (Post hoc Bonferroni test). This pattern supports the hypothesis that alpha amylase elevation in OSCC results from cellular disruption, increased membrane permeability, and stress-induced secretory activity. Radiation-induced serous cell apoptosis may also contribute (Weiss *et al*., 2011). Zang *et al*. (2013) emphasized amylase as a potential tumor marker in lung adenocarcinoma, observing rising amylase levels with disease progression[14]. Similarly, Abhishek *et al*. (2022) reported significantly elevated salivary and plasma alpha amylase in OSCC patients pre-treatment, with diurnal variation showing higher evening values, consistent with our findings[9]. pH (potential hydrogen) denotes the level of acidity or alkalinity of a substance, with values ranging from 0 (most acidic) to 14 (most alkaline); neutral pH is 7, typical of pure water (Kumar *et al*., 2020). Saliva normally maintains a pH between 6.2 and 7.6, with an average of 6.7 (Humphrey and Williamson, 2001). This homeostasis is maintained via two mechanisms: (1) mechanical clearance of carbohydrates and bacterial acids through salivary flow, and (2) neutralization of dietary and microbial acids via buffering components of saliva. A salivary pH below 7.0 often indicates acidemia, and in cancerous conditions such as OSCC, a more acidic environment arises due to anaerobic glycolysis in hypoxic tumor regions, promoting tumor survival (Ramya *et al*., 2015)[6]. In the present study, salivary pH was measured using two methods: (1) colorimetric pH indicator strips using 2–3 drops of unstimulated saliva, and (2) a digital pH meter (Birud), with 5 ml saliva diluted in 30 ml normal saline. Morning (7–10 am) and evening (7–10 pm) pH levels were assessed in healthy controls (Group A), pre-treatment OSCC patients (Group BI), and post-treatment patients (Group BII). In the morning, mean salivary pH was 7.19 in Group A, 6.12 in Group BI, and 6.53 in Group BII. In the evening, pH values were 7.22, 6.08, and 6.56 respectively. These differences were statistically significant between healthy individuals and pre-treatment patients ($p = 0.001$), but not between healthy individuals and post-treatment patients, indicating partial restoration of salivary buffering post-therapy Diurnal variations revealed a marginal increase in pH from morning to evening across all groups, most prominent in Group A. The reduced pH in OSCC patients reflects increased lactic acid due to hypoxia-driven glycolysis, commonly referred to as the Warburg effect. Ramya *et al*. (2015)[6] and Shah and Sequeira (2022)[12] also demonstrated a significant drop in salivary pH in untreated OSCC patients, with improvement post-treatment. This aligns with our findings, suggesting that salivary pH is a potential surrogate marker for tumor burden and response to therapy. Future research must prioritize standardization of saliva collection and rigorous validation of biomarkers to establish reliable, non-invasive tools for early OSCC detection.

ABSTRACT

Short-form advertisements on platforms like TikTok, Instagram Reels, and YouTube Shorts wield psychological triggers, conceal ethical pitfalls, and deploy high-conversion secrets to reshape modern consumer behavior. This review article dissects how these ads exploit cognitive biases—such as reduced mental effort and dopamine-driven feedback loops—to habituate impulsive purchases, while algorithmic hyper-personalization and urgency tactics (e.g., FOMO, scarcity) act as covert conversion engines. However, their effectiveness is shadowed by ethical risks: opaque data practices, manipulative design (e.g., infinite scrolling), and influencer-driven deception erode consumer autonomy. By analyzing high-conversion strategies—emotional storytelling, platform-native shopping tools, and micro-influencer authenticity—the study underscores the tension between marketing efficacy and societal harm. It advocates for regulatory frameworks and digital literacy initiatives to curb exploitation while preserving innovation in the attention economy.

Keywords: Psychological triggers, ethical pitfalls, high-conversion secrets, short-form advertisements, algorithmic personalization, influencer marketing

INTRODUCTION

The meteoric rise of short-form advertisements—vertical, sub-60-second videos optimized for platforms like TikTok, Instagram Reels, and YouTube Shorts—has redefined digital consumption, merging entertainment, persuasion, and commerce into seamless, scrollable experiences (*Sharabati et al., 2022*). These ads thrive on psychological triggers (e.g.,

cognitive ease, dopamine loops), leverage high-conversion secrets (e.g., urgency cues, algorithmic targeting) and navigate the ethical pitfalls (e.g., data exploitation, deceptive design) to dominate the attention economy. Their cultural dominance is undeniable: while influencer marketing's market value skyrocketed 700% between 2016 and 2021 *(Michaelsen et al., 2022).* This review interrogates the triad of forces shaping short-form ads' power. First, psychological triggers— First, psychological triggers—such as habit formation via reduced cognitive load (*Sweller, 2011*) and dopamine-driven neurological rewards (*Vishwakarma, 2022*)—subconsciously condition users to bypass deliberative decision-making, automating impulsive spending behaviors. Second, high-conversion secrets, including hyper-personalized delivery (*Misra et al., 2024*) and influencer authenticity (*Djafarova and Bowes, 2021*), optimize ads for instant transactions. Third, ethical pitfalls emerge from dark patterns like auto-play loops and algorithmic opacity, which manipulate behavior while obscuring intent. By dissecting these interconnected dynamics, this work illuminates how short-form ads simultaneously captivate and exploit, urging stakeholders to balance innovation with accountability

Defining Short-Form Ads and Their Cultural Relevance

Short-form advertisements are defined by their brevity, with most lasting under 15 seconds and delivering concise, high-impact messages designed for rapid consumption (*Wang, 2024*). These ads are predominantly vertical in format, aligning with smartphone ergonomics and seamlessly blending into users' habitual scrolling behavior (*Deng et al., 2024*). Their audio-visual intensity—featuring dynamic music, humor, and fast-paced storytelling—enhances emotional engagement and memory retention (*Li, 2025*). Platforms like TikTok, which currently boasts 1.8 billion monthly active users, exemplify this media shift. With users spending an average of 95 minutes per day on the app and many reporting purchases after viewing advertisements, TikTok has cemented its role as a dominant driver of short-form content consumption (*Xiong et al., 2024; Sharabati et al., 2022)*. This trend reflects a larger cultural movement, particularly among Gen Z and millennials, who associate short-form content with authenticity, relatability, and entertainment (*Djafarova and Bowes, 2021*). In the attention economy, such "snackable" formats respond to shrinking attention spans and a growing preference for fast, emotionally gratifying media over sustained engagement (*Barr et al., 2015*).

Psychological Triggers in Short-Form Ads

Graphical representation of the "Psychological Triggers in Short-Form Ads" (Figure: 1)

Cognitive Triggers

Short-form ads reduce mental effort by presenting content in bite-sized, visually engaging formats, aligning with cognitive load theory which suggests that simplified inputs enhance processing and decision-making (*Sweller, 2011*). These micro-videos encourage passive consumption and quickly communicate brand messages without overwhelming the viewer. Over time, repeated exposure fosters habit formation—users begin associating the act of swiping through content with instant gratification and emotional payoff, thereby normalizing impulsive buying (*Bayer and LaRose, 2018*). Advertising operates through interconnected affective, cognitive, and experiential pathways, enabling short-form ads to bypass deliberation and trigger impulsive decisions (*Vakratsas and Ambler, 1999*). The Interactive Advertising Model underscores how users' goals and modes (e.g., playful vs. goal-directed) mediate ad processing, aligning with short-form ads' reliance on low-cognitive-load engagement to trigger impulsive decisions (Rodgers and Thorson, 2000). Recent research confirms that platform design elements (e.g., infinite scroll, auto-play) induce a psychological "flow state," reducing self-awareness and impairing attentional control. This passive immersion diminishes deliberative decision-making, directly facilitating impulsive consumption (*Levey, 2025*). Moreover, the mere exposure effect suggests that repeated encounters with a stimulus naturally enhance one's positive attitude toward it, thereby reinforcing familiarity and indirectly facilitating purchase intentions. (*Zajonc, 1968*).

Behavioral Triggers

Short-form ads leverage psychological cues like FOMO (Fear of Missing Out) and scarcity to prompt quick purchasing decisions. Phrases such as "Only 3 left!" or countdown timers exploit our aversion to loss, increasing the

perceived urgency to act (*Jabeen et al., 2023, Przybylski et al., 2013, Kahneman and Tversky, 2013*). Along with it the recent qualitative analyses reveal that excessive social media use—often characterized as 'doom scrolling'—can erode self-control and adversely impact academic and personal functioning. (*Rajeshwari andMeenakshi, 2023*). The frictionless architecture of these platforms—through embedded links, instant payment options, and direct checkout—removes traditional obstacles between desire and action, transforming spontaneous interest into immediate transactions (*Sharabati et al., 2022*). Research on subliminal messaging demonstrates that subtle cues in television advertisements can activate subconscious mechanisms, leading to increased compulsive buying tendencies and influencing purchase intentions among young consumers (*Sofi et al., 2018*). In addition to these behavioral cues, research highlights a dual-systems perspective in which automatic impulsive drives can override reflective self-control processes. This framework helps explain how the immediacy of scarcity cues and other rapid triggers on short-form platforms often bypass more deliberate decision-making, thus promoting impulsive purchases (*Hofmann et al., 2009*).

Dopamine-Driven Triggers

Neurologically, short-form ads trigger dopamine responses through novelty and unpredictability. The constant influx of engaging content mimics a reward-based system, where users unconsciously seek pleasurable stimuli—leading over time to habituation and impulsive buying without full critical evaluation (*Vishwakarma, 2022*). Subconscious desires, rooted in Freudian motivation theory, explain how emotionally charged short-form ads activate dopamine-driven reward cycles, habituating impulsive consumption (*Fletcher, 2010*). Implicit motives (e.g., affiliation, achievement) interact with platform functionalities (e.g., sharing, persona), driving dopamine-driven social media addiction through motive-platform fit (*Jabagi et al., 2025*). Social media addiction mirrors substance dependency, with endless scrolling activating the brain's reward pathways, reinforcing impulsive engagement and purchases.

Algorithmic Triggers

Artificial intelligence and algorithmic personalization are central to the success of short-form advertising. These systems micro-target users based on behavior, preferences, and engagement history, increasing the perceived relevance of each ad. For instance, TikTok's recommendation algorithm has been shown to boost conversion rates by delivering hyper-personalized content that aligns with individual user needs (*Misra et al., 2024; Tam and Ho, 2006*). A systematic review reveals that TikTok's algorithm enhances brand visibility and informs targeted marketing strategies by aligning consumer content preferences with effective advertising practices, thereby refining audience-specific approaches (*Melgarejo-Espinoza et al., 2025*). Personalized recommendation systems must strike a balance between algorithmic autonomy and user control. Thus, evidence suggests that purchase decisions peak when algorithmic involvement is moderate, underscoring the importance of designs that enhance users' self-efficacy while delivering tailored recommendations.

Sociocultural Triggers

In the sociocultural domain, short-form content thrives on relatability and trust-building through user-generated content and influencer endorsements. Micro-influencers, in particular, create authentic parasocial relationships with their followers, normalizing quick decision-making and impulse buying (*Djafarova and Bowes, 2021*). Cialdini's social proof principle (2007) underpins how short-form ads normalize impulsive spending by leveraging herd mentality, particularly through influencer endorsements and user-generated content that signal collective approval (Cialdini., 2007). Moreover, platforms like TikTok integrate commerce into social culture with features such as TikTok Shop, blending content consumption with purchasing seamlessly (*Li, 2025*). Influencers' curated personas and narratives on platforms like TikTok foster parasocial trust, normalizing impulse buying through relatable storytelling. Tailored influencer personas and narrative storytelling on TikTok enhance parasocial trust, merging personal relatability with brand messaging to drive impulsive purchases (*Chen and Ren, 2022*). Short video platforms exert a strong persuasive effect as users passively encounter influential content on personalized feeds, which can lead to shifts in their viewpoints and, in some cases, the spread of misinformation. This underscores the need for platform designs that promote critical engagement. (*Molem et al., 2024)*

High-Conversion Secrets: Design and Delivery Strategies

Graphical representation of the "High-Conversion Secrets: Design and Delivery Strategies"(Figure 2)-

Secret Tactics in Content Design

The success of short-form ads lies heavily in creative execution. Emotional storytelling—especially through humor, joy, or nostalgia—outperforms traditional informational content by triggering affective responses that drive purchase intent (*Berger and Milkman, 2012*). Short-film ads trigger hedonic (humor) or eudaimonic (meaning-seeking) experiences, fostering positive brand attitudes through emotional resonance and consumption visions (Chang, 2022). Fast-paced editing, vibrant visuals, and trending music capture attention instantly; platforms like TikTok and Instagram Reels make product discovery as entertaining as it is persuasive *(Li, 2025)*. While long-format storytelling fosters deep engagement, short-form ads leverage brevity to deliver emotional hooks (e.g., humor, nostalgia) swiftly, aligning with fragmented attention spans (*Nambiar, 2018*). Empirical evidence indicates that factors such as attention-grabbing elements, entertainment value, credibility, creative execution, and emotional appeal in new media advertisements significantly shape consumer buying behavior and enhance purchase satisfaction (*Bhatt and Jain, 2023*). An analysis of short-form video ads on platforms like TikTok identifies key content characteristics—namely trustworthiness, expertise, and attractiveness—as having a positive impact on purchase behavior, while authenticity and brand heritage demonstrate a U-shaped relationship with consumer decisions (*Meng et al., 2024)*.

Hidden Delivery Mechanics

Short-form platforms optimize the ad delivery process to streamline conversion. Platform-native shopping tools—such as TikTok Shop and Instagram Checkout—minimize friction, boosting impulse buying by allowing in-app purchases (*Sharabati et al., 2022*). Additionally, AI-driven personalization tailors ads to users' browsing behavior and purchase history, enhancing engagement and conversion (Misra *et al*., 2024). Personalization amplifies impulsivity by heightening perceived novelty and relevance of ads, while integrated payment tools eliminate transactional friction. However, privacy concerns may moderate this effect, suggesting ethical tensions in hyper-targeted tactics (*Aslam et al., 2021*). Mid-roll ads (18.1% higher completion rates than pre-roll) and shorter durations (15–20 seconds) optimize viewer retention, reinforcing frictionless purchasing via platform-native tools (*Krishnan and Sitaraman, 2013*). Search engine marketing (SEM) exhibits the longest-lasting impact on sales, while coupon/loyalty ads (CLA) better retain existing customers, emphasizing the need for strategic channel selection in short-form ad delivery (*Breuer and Brettel, 2012*).

Social Persuasion Secrets

Social proof is a powerful persuasive tool in the short-form ad ecosystem. Influencer marketing—particularly by micro-influencers perceived as authentic peers—can drive significantly higher sales (*Djafarova and Bowes, 2021*). User-generated content, including product reviews and unboxing videos, further enhances trust and credibility (*Sharabati et al., 2022*). Viral marketing's efficacy hinges on source credibility, which enhances trust and perceived value in high-end cosmetics, bridging the gap between skepticism and purchase intention *(GILITWALA et al., 2021)*. Short-form ads achieve higher engagement when content sources align with destination types: UGC/PUGC for hedonic contexts (e.g., tourism) and PGC/PUGC for utilitarian contexts, leveraging perceived credibility to drive purchases (*Li and Tu, 2024*). User-generated ads with high sociability (e.g., comment volume) and vividness (e.g., music, female presence) boost sales, particularly when influencers or sellers moderate content, reinforcing social proof's role in persuasion (*Ge et al., 2021*). Furthermore silver consumers (elderly users) exhibit distinct purchase behaviors on short-form video platforms. Revealing that social belonging, perceived trust, and product relevance are key factors driving purchase decisions in this demographic—suggesting that digital strategies may need to be tailored to bridge the generational divide. (*Yin et al., 2023*)

Urgency Engineering

Urgency is a recurring psychological lever in short-form ads. Time-sensitive triggers like countdown timers, flash sales, and "limited stock" messages exploit consumers' aversion to missing out, increasing click-through rates markedly. Additionally, the elaboration likelihood model (ELM) offers a dual-route framework of persuasion,

indicating that short-form ads can simultaneously trigger both thorough, central processing and quick, peripheral responses—thereby enhancing their overall persuasive impact (*Petty and Cacioppo, 1986).*

Ethical Pitfalls: Risks and Regulatory Gaps

While short-form ads effectively exploit cognitive biases to maximize consumer engagement, they also raise ethical and regulatory issues. Features such as auto-play and infinite scrolling tap into dopamine-driven habits that can reduce mindful consumption. Implementing a timer in skippable in-stream commercials generally reduces irritation by clarifying ad duration. However, when paired with a skip-ad option, this clarity can inadvertently heighten irritation—especially in longer ads—indicating that ad timing features require careful calibration (*Jeon et al., 2019*). Redefining advertising around persuasion, mediation, and paid intent underscores ethical tensions between consumer autonomy and manipulative design in short-form ad ecosystems (*Kerr and Richards, 2021*). Combined with extensive data extraction and deceptive scarcity cues, these practices blur the line between persuasion and manipulation, necessitating clear regulatory oversight. Experimental evidence confirms that dark patterns (e.g., false scarcity, forced continuity) universally increase purchase impulsivity. While behavioral interventions (e.g., friction prompts) can mitigate their impact, regulatory action is critical as no single solution neutralizes all manipulative designs (*Sin et al., 2025*). Notably, the looming U.S. TikTok ban—mirroring India's 2020 overnight removal of the app, which disrupted 200 million users—highlights the fragility of platforms central to modern commerce. Such abrupt regulatory actions risk destabilizing small businesses; TikTok alone claims to have generated $15 billion in U.S. small business revenue in 2023 (*Singh et al., 2025*). Combined with extensive data extraction and deceptive scarcity cues, these practices blur the line between persuasion and manipulation, necessitating clear regulatory oversight.

CONCLUSION

Short-form advertisements masterfully deploy psychological triggers—such as dopamine-driven scrolling and cognitive ease—to transform passive engagement into habitual purchasing. Their high-conversion secrets, including urgency engineering and algorithmic precision, erase friction between desire and action, capitalizing on fragmented attention spans. Yet these strategies are inextricably linked to ethical pitfalls: the very mechanisms that drive engagement (e.g., infinite scrolling, micro-targeting) exploit cognitive biases, compromise data privacy, and normalize manipulative influencer practices. The dual-edged impact of short-form ads demands a balanced response. Regulatory frameworks must address algorithmic transparency, enforce ethical design standards, and mandate influencer disclosures to protect vulnerable demographics like Gen Z and millennials, who increasingly equate short-form content with cultural authenticity. Simultaneously, digital literacy initiatives can empower consumers to recognize and resist manipulative tactics. Future research should explore longitudinal impacts on consumer well-being and platform accountability in mitigating harm. By confronting these challenges, stakeholders can harness the innovation of short-form advertising while safeguarding autonomy in an increasingly persuasive digital landscape.

ABSTRACT

The gut microflora plays an important role in maintenance of neuroimmune balance via the gut-brain axis. Dysregulation of this axis leads to neurodegenerative diseases, such as Parkinson's disease (PD). Prebiotics and probiotics have shown promising results in regulating the gut-brain axis by restoration of microbial homeostasis, reduce neuroinflammation and enhance gut barrier integrity. Probiotics, particularly strains like Bifidobacterium, and Lactobacillus and improve composition of gut microbiota composition, modulate immune responses, and improvement in neurotransmitter production, including dopamine, serotonin and GABA. Prebiotics, such as inulin and fructooligosaccharides (FOS), selectively stimulate beneficial gut bacteria, improving production of short-chain fatty acids (SCFAs) that support brain health by contributing to gut barrier integrity. These biotics help reduce oxidative stress, α-synuclein aggregation and systemic inflammation, which are important implications in PD pathology.

This review highlights the connection between the gut heath and pathology of PD presenting the opportunity for early intervention through microbiome modulation. along with the mechanisms of various prebiotics and probiotics exerting neuroprotective effects though restoration of beneficial gut microbes, discusses current evidence from preclinical and clinical studies along with their therapeutic potential as adjunctive strategies for management of PD. While preliminary findings for probiotics and prebiotics are promising, further clinical trials are required to validate and establish their effectiveness along with optimization of personalized microbiome-targeted therapies.

Keywords: Neurodegenerative, Probiotics, Prebiotics, Neurotransmitters, Gut barrier.

INTRODUCTION

Overview of Parkinson's Disease (PD): Pathophysiology and Progression:

Parkinson's disease (PD) is a progressive neurodegenerative condition that primarily impacts the motor system and has significant systemic implications. It is characterized by the successive reduction of dopaminergic neurons that are found mainly in the midbrain's substantia nigra pars compacta as shown in Fig 1. This leads to deficiency of dopamine causing an imbalance between excitatory and inhibitory pathways in basal ganglia resulting in impairment of motor control and coordination [1]. The pathogens of PD include aggregation of Lewy bodies in neurons caused by the accumulation of misfolded α-synuclein proteins which is the main reason for oxidative stress, neurotoxicity, and mitochondrial dysfunction which causes neurodegeneration. The enhanced levels of pro-inflammatory cytokines (IL-1β and TNF-α) are mainly due to the prolonged activation of astrocytes and microglia involved in neuroinflammation leading to amplification in neuronal damage [2]. Mitochondrial dysfunction contributes to enhancement in the production of reactive oxygen species causing oxidative stress. The progression of PD occurs through various stages. Nonmotor symptoms such as anosmia, constipation, and depression are observed in the prodromal stage. Initial unilateral motor symptoms such as rigidity, tremors, and bradykinesia are seen in the early motor stage [3]. Mid to late stages involve worsening cognitive decline, motor dysfunction, and autonomic issues. However, severe motor and cognitive impairment are common in advanced stages, causing dependence[1]. Difference between healthy midbrain with neurons in substantia nigra and midbrain with neuron loss in substantia nigra (Fig 1).

Emerging Role of the Gut-Brain Axis in Neurodegenerative Diseases

Recent research highlighted the importance of the gut-brain axis which is an important bidirectional communication system between the central nervous system and gut microbiome which is crucial in neurodegeneration. Gut dysbiosis enhances intestinal permeability and microbial metabolites which impact α-synuclein aggregation, oxidative stress, and neuroinflammation causing neuronal damage causing neurodegeneration in disorders like PD linked with constipation and worsened motor symptoms [4].

Importance of Microbiome Modulation through Prebiotics and Probiotics:

Modulating the gut microbiome in neurodegenerative diseases like PD involves the usage of probiotics and probiotics [5]. Probiotics such as strains of *Akkermansia muciniphila*, Bifidobacterium, and Lactobacillus help restore microbial balance, reduce neuroinflammation, and modulate dopamine levels [6]. Prebiotics such as fructooligosaccharides, galactooligosaccharides, and inulin help improve the growth of gut-friendly microbes, improve the gut barrier, and reduce neuroinflammation. This gut-targeting approach improves gut health and slows down the progression of neurodegeneration [7]. Role Gut-Brain connection in PD progression and pathogenesis (Fig 2)

Gut-Brain Axis and its Connection with Parkinson's Disease

Gut Dysbiosis and its Impact on Neuroinflammation and Neurodegeneration

In Parkinson's disease (PD), an imbalance in gut microbiota composition disturbs the integrity of the intestinal barrier causing breakdown which leads to enhancement in intestinal permeability, leading to a leaky gut. This allows the toxic microbial metabolites and substances, including gut lipopolysaccharides (LPS) which are cell wall components of Gram-negative bacteria such as E.coli, to enter into the systemic circulation and reach distant and vital organs including the brain [8]. These microbial metabolites when circulating in the stream initiate systemic inflammations by activating immune cells. This enhances the production of pro-inflammatory cytokines such as tumor necrosis factor-alpha (TNF-α), interleukin-6 (IL-6), and interleukin-1 beta (IL-1β) which crosses the blood-brain barrier (BBB) leading to activation of microglial cells which are resident immune cells present in brain [9]. Upon activation, these microglial cells release nitric oxide (NO), reactive oxygen species (ROS), and additional pro-inflammatory cytokines causing chronic inflammation of neurons. This amplified inflammatory environment causes the loss of dopaminergic neurons in the substantia nigra of the midbrain which is a key indicator in PD [10]. Chronic Neuroinflammation accelerates the process of neurodegeneration, causing worsening of motor symptoms such as tremors, bradykinesia, and rigidity along with amplification of non-motor symptoms like mood disturbances, sleep disturbance, and cognitive decline [11].

Role of the Enteric Nervous System and α-synuclein Aggregation:

The ENS communicates with CNS and regulates functions of the gastrointestinal tract. α-synuclein is a neurological protein that plays an important role in the regulation of neurotransmitters and synaptic function. Whereas in PD, the misfolding of α-synuclein is facilitated in ENS by microbial endotoxins caused via gut dysbiosis. These pathological changes in this protein lead to its aggregation. These aggregates reach the brain through the vagus nerve as shown in Fig 3. The aggregates of misfolded α-synuclein accumulate in the substantia nigra region of the midbrain which further leads to the formation of Lewy bodies that causes neurodegeneration [12]. Process of misfolding of α-synuclein, formation of Lewy body and neuroinflammation. (Fig 3) Several factors contribute to the progress of PD pathology. The SNCA (Synuclein Alpha) gene mutation can lead to enhancement of its expression and aggregation in familial PD cases. The mitochondrial dysfunction and oxidative stress result in excessive reactive oxygen species (ROS). This leads to destabilization of α-synuclein causing aggregation [13]. Chronic neuronal inflammation due to excessive pro-inflammatory cytokines and prolonged activation of microglial cells can further facilitate aggregation and spreading of misfolded α-synuclein. The accumulation of misfolded α-synuclein is mainly due to impairment of protein clearance mechanisms that involve autophagy-lysosomal dysfunction and ubiquitin-proteasome system (UPS) impairment [14]. Imbalance in metal ions such as iron, copper, zinc, and manganese contribute to neurodegeneration by promoting oxidative stress and mitochondrial dysfunction leading to α-synuclein causing aggregation. The nonmotor symptoms of PD affecting the gastrointestinal system cause bloating, constipation, and delayed gastric emptying due to gut dysbiosis [15].

Role of Probiotics in Parkinson's Disease (Pd)

Probiotics are alive microorganisms that positively impact immune function, gut health, and overall wellbeing. In PD, where inflammation and gut dysbiosis play important role which can be regulated by probiotics [16]. List of probiotics Stain and their role in management of PD (Table: 1)

Preclinical and Clinical Evidence Supporting Probiotic Use in PD(Table: 2)

Role of Prebiotics in Parkinsons Disease

Prebiotics are indigestible dietary fibers that nourish beneficial gut bacteria, particularly species like Lactobacilli and Bifidobacteria. Unlike probiotics, which introduce live beneficial bacteria into the gut, prebiotics act as a food source and promote the growth and activity of existing beneficial gut bacteria, supporting and balancing the gut microbiome hence improving overall digestive health [34]. A balanced gut microbiome impacts various essential physiological functions, including immune regulation, digestion, and brain function. Since gut microbiota can impact

the gut-brain axis may play a role in neuroprotection and overall neurological health [35]. List of Probiotics and their role in PD management (Table 2)

Clinical Evidence Supporting Prebiotic Use in PD(Table 3)

Mechanism of Probiotics and Prebiotics in the Management of PD

In Parkinson's disease (PD), gut dysbiosis triggers α-synuclein misfolding in the enteric nervous system (ENS), intestinal barrier breakdown and increased permeability, leading to ROS and pro-inflammatory cytokines production due to LPS entry. Chronic neuroinflammation and oxidative stress consequently leads loss of dopaminergic neurons in the substantia nigra. Prebiotics and probiotics promote gut health by strengthening intestinal integrity, reducing inflammation, SCFA synthesis, ultimately leading to eubiosis, supporting the gut-brain axis and preventing neurodegeneration in PD. They also modulate dopamine and serotonin production, thereby assisting in mood stability and motor control in PD, which are shown in fig 4.

Restoration of Gut Microbiota

Dysbiosis of the gut is associated with PD which is characterized by an increase in harmful bacteria and a decrease in beneficial bacteria such as Bifidobacterium and Lactobacillus leading to imbalance. The supplementation with probiotics and prebiotics effectively rebalances the gut microbiome, enhancing the function of the gut-brain axis [43].

Improvement in Gut Barrier Integrity

The gut dysbiosis in PD causes a leaky gut due to an increase in the permeability of the intestine, allowing lipopolysaccharides to enter systemic circulation. Probiotic and prebiotics improve intestinal integrity by strengthening tight junction proteins, decreasing permeability and preventing systemic inflammation [44].

Modulating Inflammatory and Immune Responses

Probiotics and prebiotics promote the synthesis of short-chain fatty acids (SCFAs) such as butyrate that improve intestinal integrity regulate immune responses and decrease the release of pro-inflammatory cytokines (IL-6, TNF-α, IL-1β). This helps with the reduction of neuroinflammation [45].

Regulation of Neurotransmitters in PD

Certain probiotic strains, such as Bifidobacterium and Lactobacillus play an important role in neurotransmitter regulation. These microorganisms impact levels of dopamine and serotonin which play crucial roles in both mood regulation and motor control in PD [45]. These beneficial strains of microorganisms are nourished through prebiotics, helping them grow and function effectively [44]. In PD, deficiency of dopamine predominates due to dopaminergic neuronal loss in mid brain. Probiotics and prebiotics are involved in the increment of dopamine levels as these stains of organisms contribute to the production of dopamine precursors such as L-DOPA and tyrosine. This enhancement in dopamine synthesis in the gut directly improves the levels of dopamine in the CNS through the brain axis preventing neurodegeneration along with reduction in gut inflammation [46]. Probiotics and prebiotics influence serotonin levels improving the availability of tryptophan, which is the precursor for serotonin biosynthesis [47]. It also modulates serotonin receptor sensitivity, particularly of 5-HT1A, improving cognitive function mood stability, and cognitive function [48].

Alleviating Gastrointestinal Symptoms

Probiotics and Prebiotics help in improving gastrointestinal symptoms such as bloating, constipation, and gut motility, which are common nonmotor symptoms of PD. Additionally; they can reduce anxiety, enhance sleep quality, and improve cognition by restoring the gut microbiome.

Challenges and Future Prospective

Research on probiotics and prebiotics indicates their positive effect on gut health, inflammation, and motor function in PD. However, small sample sizes, inconsistencies in study design, and variations in probiotic strains and dosages

limited definitive conclusions. While generally safe, probiotics and probiotics may potentially interact with PD medications causing mild gastrointestinal discomfort require further investigation as an adjunct therapy. Future research should focus on large-scale clinical trials determining optimal dosages and formulations. The development and investigation of symbiotic, which combine probiotics and prebiotics, offer a promising approach to enhancing gut-brain health. Integration of microbiome modulation therapies with existing PD treatments could provide a more comprehensive and effective approach to the management of the disease and its symptoms.

CONCLUSION

In conclusion, research evidence suggests that probiotics and probiotics play an important role in reducing inflammation, modulating and restoring gut microbiota, and enhancing both motor and non-motor symptoms in PD. Their potential to support the gut-brain axis offers a promising strategy for improving overall patient health. Future research may further solidify their role as a beneficial adjunct therapy to PD management.

Table 1: list of probiotics Stain and their role in management of PD

Probiotic Strain	Role in PD Management
Bifidobacterium bifidum	Improves gut barrier function and reduces inflammation [17].
Bifidobacterium breve	Improves dopamine metabolism, supports cognitive function, and reduces neuroinflammation [18].
Bifidobacterium longum	Enhances serotonin production, improves mood, and reduces gut permeability [19].
Enterococcus faecium	Improves gut motility and enhances gut-brain communication [20].
Lactobacillus acidophilus	Increases serotonin production, reduces inflammation, and enhances gut health [21].
Lactobacillus casei	Improves gut barrier integrity, and reduces neuroinflammation and constipation [22].

Lactobacillus plantarum	Improves dopamine levels and motor function, and reduces gut inflammation [23].
Lactobacillus reuteri	Modulates dopamine and serotonin signaling, supports gut motility hence reduces constipation and decreases oxidative stress [24].
Lactobacillus rhamnosus	Modulates dopamine serotonin and GABA levels, improves mood disorders, and reduces anxiety [25].
Saccharomyces boulardii	Reduces gut inflammation, prevents the overgrowth of pathogens, and improves gut barrier integrity [26].
Streptococcus thermophilus	Reduces oxidative stress and establish gut microbiota balance [27].

Table 2: Preclinical and Clinical Evidence Supporting Probiotic Use in PD

Category	Findings
Preclinical	
Anti-Inflammatory Effects	This research suggests probiotics may counteract alpha-synuclein aggregation and neuronal loss through immunomodulation[28].
Neuroprotection	This preclinical study showed that probiotics may markedly reduce the degeneration of dopaminergic neurons positively effecting dopamine levels that play an important role in PD[29]
Clinical evidence	
Gastrointestinal Symptoms	This study suggested that Probiotic supplementation relieved constipation by significantly improving weekly bowel movements and normalized stool consistency in PD patients[30].
Non-Motor and Motor Symptoms	A 12-week RCT reported that a probiotic regimen containing four markedly reduced both motor and non-motor symptoms in PD which was measured by the Unified Parkinson's Disease Rating Scale (UPDRS)[31,32].
Comprehensive Symptom Improvement	A meta-analysis concluded that the usage of oral probiotics significantly improved gastrointestinal dysfunction, motor symptoms, anxiety, and depression in PD patients[33].

Table 3: List of Probiotics and their role in PD management

Prebiotic	Source	Mechanism of action
Inulin and Fructooligo saccharides (FOS)	Asparagus, Chicory root, onions, bananas, garlic, and wheat	- Stimulates growth of beneficial gut microbes. - Increases the production of SCFA such as butyrate. - improves gut motility and relieves constipation
Resistant Starch (RS)	Green bananas, legumes, potatoes and whole grains	-Increases the production of SCFA such as butyrate. - Improves the integrity of the gut barrier. -Demonstrates anti-inflammatory effects.
Galactooligosaccharides (GOS)	Dairy and legumes	-Improves the integrity of the gut barrier. - Stimulates growth of beneficial gut microbes

		involved in the production of neuroprotective metabolites. - Reduction in intestinal and systemic inflammation.
Xylooligosaccharides(XOS)	Bamboo shoots, vegetables, fruits and milk.	-Selectively promotes the growth of beneficial gut microbes - Improves SCFA production - Increases integrity of the gut barrier
Oligofructose	Vegetables, grains and fruits	-Selectively promotes the growth of beneficial bacteria like Bifidobacteria and Lactobacilli. -Improves SCFA production specifically of butyrate, propionate, and acetate. -Decreases gut permeability.
Dextrin	Wheat, oats, barley and potatoes,	-Stimulates growth of beneficial gut microbes like Bifidobacteria and Lactobacilli. - Increases the production of SCFA such as butyrate. -Enhances integrity of the gut barrier. - Improves gut motility and relives constipation.
Psyllium fiber	Plantago 100476vate seeds	-Supports gut health by feeding beneficial bacteria. -Producing SCFAs such as butyrate and propionate. -Strengthening the gut barrier. -Relieves constipation as it absorbs water and softens the hard stools in Parkinson's Disease patients.

Table : 4 Clinical Evidence Supporting Prebiotic Use in PD

Category	Findings
Preclinical	This research suggested that probiotics such as FOS improved the function intestine barrier of piglets, which might be associated with intestinal inflammatory response in the intestine, improved production of SCFAs, and positively modified microbiota composition in the hindgut [36].
Clinical	The open-label non-randomized study concluded that prebiotics showed potential benefits in patients with PD by enhancing gut microbiota, increasing short-chain fatty acid production alleviating gastrointestinal symptoms, and reducing inflammation along with evidence of motor function improvement however Larger trials are needed[42].

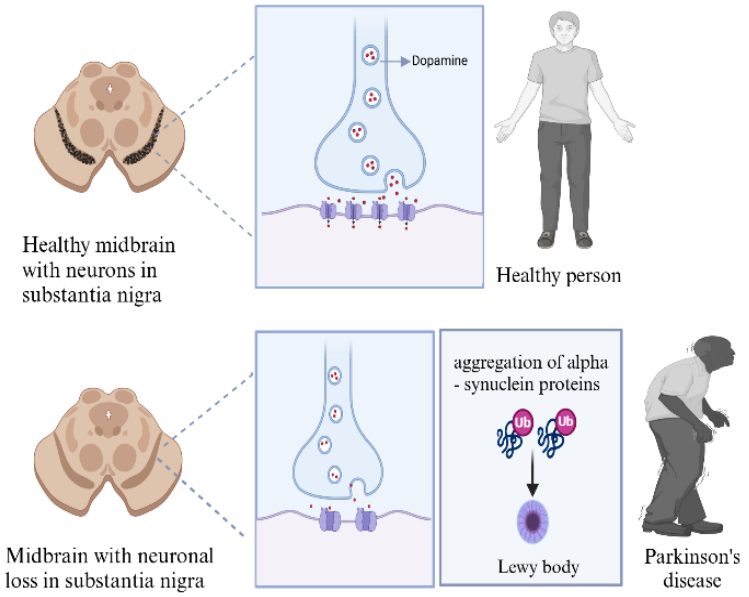

Fig 1: Difference between healthy midbrain with neurons in substantia nigra and midbrain with neuron loss in substantia nigra.

ABSTRACT

Periodontitis is a progressive inflammatory disease that results in the destruction of tooth-supporting structures, including alveolar bone. By making it easier to replace missing bone, bone grafting is essential to periodontal regeneration. With an emphasis on their biological characteristics, including osteogenesis, osteoinduction, and osteoconduction, this narrative study examines the various forms of bone grafts, including autografts, allografts, xenografts, and alloplasts. Additionally, the impact of defect morphology—specifically, wall angulation and configuration—on treatment results is addressed. This article offers an in-depth discussion of bone grafting in periodontics and how it can improve the success of regenerative therapy.

Keywords: Periodontitis, Bone grafts, Periodontal regeneration, Autograft, Allograft, Xenograft, Alloplast, Osteoconduction, Defect morphology, Bone regeneration

INTRODUCTION

Periodontitis is a disease which is known to cause loss of tooth supporting bone. It is defined as Inflammation of the supporting tissues of the teeth. Usually a progressively destructive change leading to loss of bone and periodontal ligament. An extension of inflammation from gingiva into the adjacent bone and ligament[1]. Tooth supporting bone is called the alveolar bone which consist of bone cells which are Osteoblasts, Osteoclasts and Osteocytes. Osteoblasts is a fully differentiated cell, arising from mesenchymal progenitors, that is responsible for the production of bone matrix and the resorptive remodelling of bone[1]. Osteoclasts is a, multinucleated cell, arising from mononuclear precursors of the hematopoietic lineage, that is associated with bone resorption[1]. Osteocytes is an

osteoblast that has become embedded within the bone matrix[1]. Since many years there are attempts made to regenerate the lost tooth supporting bone which has led to the use of different bone grafts and materials to achieve regeneration or fill of the alveolar bone. This article highlights the properties of bone filling materials and various types of bone grafts and materials that are commonly used in periodontal practice.

Properties of Bone Graft

The ideal bone replacement graft should be able to trigger osteogenesis, cementogenesis and formation of a functional periodontal ligament[2]. It is referred to as Osteogenic potential of tissue or substance which means any tissue or substance with the potential to induce growth or repair of bone[1]osteoconduction, osteoinduction and osteogenesis. Osteoconduction is the process by which a graft provides a scaffold that supports the attachment, migration, and ingrowth of osteoblasts and osteoprogenitor cells within its three-dimensional structure[3,4]. Osteoinduction refers to the capability of a graft to stimulate primitive, undifferentiated, and pluripotent cells to differentiate into bone-forming cells, thereby initiating the process of osteogenesis[3,4] Osteogenesis refers to the differentiation of osteogenic cells and the subsequent formation of new bone, involving donor cells that originate from either the host tissue or the graft material[3.5].

Types of Bone Grafts used in Periodontal Procedures

Bone replacement grafts can be of various types[3] as shown in Table 1

Autogenous Bone graft

They consistof cortical bone, trabecular bone and bone marrow cells. It is both *osteoinductive* and *osteoconductive*[2,6]. The use of extraoral autogenous bone grafts is infrequently documented in periodontal literature. Initially, iliac cancellous bone and marrow attracted attention due to their strong osteogenic potential. However, their application became limited in periodontal therapy because they were associated with root resorption following grafting[7]. However, autogenous bone grafts from intraoral sites continue to be widely utilized. Typical donor areas include the maxillary tuberosity and other edentulous alveolar regions, such as healing extraction sockets[8]. Limitation to autogenous bone graft includes the obvious inconvenience caused due to secondary surgical site, the limited amount of bone grafts that can be procured from the intraoral sites and the time required to obtain the graft. These limitations have let for the clinicians to use other bone replacement grafts.

Allografts or Allogenicmaterials:

They areis bone graft derived from human cadavers,[2,6] they can be obtained in the following forms:

- Fresh Frozen iliac cancellous bone and marrow
- Freeze-dried bone allografts
- Demineralized freeze-dried bone allografts

Fresh Frozen iliac cancellous bone and marrow

Due to concerns about disease transmission, immune response, and the requirement for thorough compatibility testing, frozen iliac allografts are no longer commonly used in contemporary periodontal practice[2].

Freeze-dried bone allografts

The demonstrated ability of freeze-drying to significantly minimize the health risks linked to fresh frozen bone[9]has contributed to the widespread adoption of freeze-dried bone allografts for managing periodontal bone defects. The American Academy of Periodontology advises the use of cortical bone allografts over cancellous bone, as cancellous bone tends to be more antigenic. Additionally, cortical bone contains a greater amount of bone matrix, providing more inductive elements. Freeze dried bone allografts are considered osteoconductive in nature[10].

Demineralized freeze-dried bone allografts

Allografts were demineralized because the mineral content of the bone hindered the activity of bone growth–stimulating factors, such as bone morphogenetic proteins, embedded within the bone matrix[11]. They promote bone formation via osteoinduction by triggering pluripotent stem cells to differentiate into osteoblasts[12].

Xenografts or Xenogenic filling material

Theyare the bone grafts derived from other species. They include

- Bovine bone,
- Coralline calcium carbonate[2,6]

Bovine derived bone replacement grafts

Commercial bovine bone undergoes processing to remove its organic components, leaving behind the natural bone mineral. In comparison to synthetic alternatives, these products are thought to provide greater osteoconductive qualities and structural features that closely resemble human bone[2]. The bovine-derived hydroxyapatite grafts serve as effective osteoconductive scaffolds due to their porous structure, which enhances surface area. Their mineral composition closely resembles that of human bone, facilitating integration with the host tissue. These grafts have shown successful outcomes in managing intrabony defects and in ridge augmentation procedures[13]. Because of the porous structure of the bovine derived hydroxyapatite graft, which increases the surface area, these grafts function as efficient osteoconductive scaffolds. Their mineral makeup is similar to that of human bone, which makes it easier for them to integrate with the host tissue. These grafts have demonstrated promising results in the ridge augmentation procedures and in management of intrabony defects[2].

Coralline calcium carbonate:

Calcium carbonate derived from natural coral of the *Porites* genus consists predominantly of aragonite (>98% $CaCO_3$) and features a pore size ranging from 100 to 200 μm, which closely mimics the porosity of cancellous (spongy) bone[14].

Alloplasts

These are synthetic material and do not contain actual bone cells[2,6].

The 1996 World Workshop in Periodontics has concluded that "synthetic graft materials function primarily as defect fillers. If regeneration is the desired treatment outcome, other materials are recommended"[10].

Alloplasts consist of

- Biocermics and
- Bioactive glass

Bioceramics

Bioceramics are alloplastic materials are mainly composed of calcium phosphate, with calcium-to-phosphate ratios resembling that of natural bone. The most commonly used types are tricalcium phosphate and hydroxyapatite.

Tricalcium phosphate is a porous calcium phosphate compound, with β-tricalcium phosphate being the most frequently utilized variant. They are typically surrounded by fibrous connective tissue and lack significant bone-inducing properties. Nevertheless, there have been reports of limited bone formation associated with these grafts.[15]

Hydroxyapatite is not osteogenic norosteoinductive, but rather is osteophillic and osteoconductive. It acts as a supportive structure for the ingrowth and subsequent deposition of new bone.[2]

Bioactive glass

Bioactive glasses consist of calcium oxide, sodium oxide, silicon dioxide, and phosphorus pentoxide, and they form a bond with bone by generating a surface layer of carbonated hydroxyapatite.[16] Upon contact with tissue fluids, bioactive glasses develop a dual-layer coating—an inner silica gel layer and an outer calcium-phosphate-rich (apatite)

layer. This outer layer enhances the adsorption and accumulation of proteins essential for osteoblasts to produce mineralized extracellular matrix for bone formation.[17] The most commonly used commercially available bioactive glass material is PerioGlas®.

Clinical Considerations During Bone Graft Placement

Bone defects vary in morphology, and not all are suitable for grafting procedures. Studies indicate that angular defects with an angle between 25° and 36° demonstrate the highest regenerative potential when treated with bone grafts, whereas defects with angles ≥37° tend to show reduced regenerative outcomes.[6] Prichard noted that successful defect fill is more likely when three bony walls remain intact.[18] Graft material should be moistened with the patient's blood to aid vascular infiltration. A bleeding surface, achieved by debridement or intramarrow perforations, supports healing. Grafts are placed incrementally, gently packed, and dried without dislodging. Flaps must ensure primary closure; if needed, use releasing incisions or soft tissue grafts. A protective periodontal dressing with antibiotic ointment helps secure the site and prevent contamination.[2]

CONCLUSION

Bone replacement grafts, which provide a variety of materials suited to clinical requirements, are essential for periodontal regeneration. The majority of commercially available grafts function as osteoconductive scaffolds that promote bone development, but only autogenous grafts have actual osteogenic potential. Graft materials are becoming more and more useful as safe, biocompatible, and userfriendly materials are developed. These grafts provide encouraging results for the treatment of osseous and periodontal abnormalities when paired with guided tissue regeneration procedures, hence strengthening their ongoing incorporation into contemporary regenerative dentistry.

ABSTRACT

Quality of life among older adults is influenced by the demographic transition happening with modernization. The quality of life is associated with plethora of factors like educational status, decision authority, stressful events, living spouse, financial security, co-morbidity. The population of older adults living alone is enormous, more so with increasing age, i.e. the older adults over 75 years both men and women. Women live longer than men and are less likely to marry again, end up without any support; financially and emotionally Social isolation is a major concern for the ageing population globally, as estimated by United Nations Department of Economic and Social Affairs, 2020, there are approximately 20% and more older adults who are surviving alone in the community. In this non-experimental study, 100 older adults living in the olde age home above 60 years old were included using non-probability convenient sampling technique. OPQOL-Brief quality of life tool was used to collect the data. Majority of older adults 64% had poor quality of life, whereas 31% were having very poor quality of life, 5% had moderate quality of life, however none of the elder adults were found to have a good quality of life. The

quality of life was associated with age, gender and level of education. Only a minority were found to have moderate quality of life, the greater number showed poor quality of life. The current study need for government authorities to improve the infrastructure and services of old age homes and to address the broader social determinants that affect the elderly. It underscores the importance of creating supportive environments that promote dignity, connection, and quality care for older adults.

Keywords: Quality Of Life, Older Adults, Co-Morbidity, Polypharmacy.

INTRODUCTION

India is booming with the older population, in the year 2022 the country had an older population of 149 million, which is expected to rise to 347 million by the end of 2050. The younger population will slide down at a dramatic rate when compared to those above 60 years.[1]When compared to the rest of the world, India has the largest share of population globally and has experienced a drastic increase in the number of older adults. India had 7.5% of older adults on 2010 which will increase to 11% in 2025, although seems like a small percentage nevertheless is a huge in absolute terms. Majority of these population like residing in rural areas and have a lower socio-economic status, are women and dependent. [2] The average life expectancy of older adults is on a rise in India and globally, because of the advancement in technology. Since the modernization the values in the modern India has also changed, earlier parents use to occupy the highest positions and were given due regard to and taken care. The picture has changed quite a lot at present, due to which older adults face major survival issues, financially, socially, economically. The health care facilities have granted longevity but is not adept to deal with geriatric illness.[3]The change in the family structure and migration has added to the problems of ageing population, they are left alone to take care of themselves. The old age homes have become a necessity for the survival of the older generation. This rise is observed majorly in the southern India, states like Kerala and Tamil Nadu. [4] There are various reasons for the older adults to move to old age homes, to mention some; migration, death of spouse, abandonment, financial deprivation, abuse etc. The old age homes sometimes is the last resort and hope for the older adults. Those living in old age homes also have different psychological issues.[5] According to a report by 'Golden opportunities from the silver economy – analysing the future of senior care in India', at present there are around 1 million older adults living in old age homes, in the coming 10 years it will reach to 2.5 million older adults occupying the residential care homes.[6]

REVIEW OF LITERATURE

A cross-sectional survey was carried out in Syangja district of Nepal, 2024. The quality of life was assessed for 234 elderly using World Health Organization Quality of Life BREF [WHOQOL-BREF] tool. The study revealed majority 54% of the samples were in the age group 60 to 69 years and most 57% of them were females. Average quality of life was found in 56% of the samples, nearly equal 44% showed poor quality of life. The age, having the spouse and involvement in some form of physical activity had a positive association with better quality of life.[7] A cohort study done in Rotterdam, 2024 to assess the quality of life related to health, comprising of physical and mental health among the older adults residing in community setting. The total 840 subject were initially recruited, out of which 661 were taken as samples in the final study. The results where majority of the samples were in the age group 70 to 80, females comprising of 42%, 74% of them had more than two chronic disease conditions. Debility was associated with lower scores of health related quality of life, as it impacts ADL's, frequent hospitalization, isolation causing depression, anorexia and fatigue.[8] Cross-sectional study was done among the residents of elder homes in Kuala Lumpur in 2014. Randomly 8 old age homes were selected and stratified simple random sampling was used to recruit samples for the study. World Health Organization Quality of Life Questionnaire-Brief Version (WHOQOL-BREF) was used to collect the data from the samples. The results revealed that quality of life was connected to various factors like age, gender, morbidities and social life.[9] A descriptive survey was done at the old age homes of Egypt, 2020 to assess the quality of life among the older living in the geriatric homes. The samples were selected

using convenient sampling techniques, the sample size was 20 older adults. The data was collected using sociodemographic data and WHO-OPQOL. The result revealed that majority 70% of the older adults had lower quality of life, majority of them also had insufficient knowledge about taking care of themselves as they age. The QOL was associated with level of education.[10]

Statement of the Problem

"A descriptive study to assess the quality of life among the older adults and its associated factors residing in assisted care facilities of Anand, Gujarat".

OBJECTIVES

1. To assess the quality of life among the older adults residing in the assisted care facilities.
2. To determine the association between quality of life among the older adults and their selected demographic variables.

RESEARCH METHODOLOGY

Study Design: Non-experimental descriptive survey.
Study Site: 4 old age homes in the Anand district were selected for the present study, those which were regularly visited by nurse led geriatric care center, MTIN, CHARUSAT.
Sampling technique: Non-probability consecutive sampling.
Sample size: The researcher selected 4 old age homes established and functioning for more than 4 years of time period in the Anand district and included all the older adults residing in those 4 old age homes who were falling in the inclusion criteria. The total sample size is 100 older adults.

Inclusion Criteria

1. Old age homes existing more than 4 years.
2. Old age homes who granted administrative approval.
3. Older adults above 60 years both male and female and residing more than 1 years.

Exclusion Criteria

1. Older adults are not willing to participate.
2. Older adults who are diagnosed with terminal illness and psychological illness.

Study tools

OPQOL(Older people quality of life) -BRIEF, 13 questionnaire tool is a revised version of the original tool developed by Ann Bowling (University of London) in 2009. The category includes domains like health, social relationships, independence, neighborhood, emotional well-being, financial, social and leisure activities. It is a 5-point likert scale, items scored as strongly agree, agree, neither, disagree, strongly disagree. The items are reversed coded so that the highest score represent the better quality of life. The total score of the tool is 63 and minimum score is 13.

Categorization of score

Very Good – 48 and above
Good - 39- 47
Moderate - 30-38
Bad - 21-29
Very Bad - 13-20

Reliability

The OPQOL-Brief is a standardized tool with internal consistency reliability of 0.81. [11]The tool was translated into Hindi and reliability was found out using Cronbach's Alpha Coefficient, which came out to be 0.76.

RESULT

Section A - Demographic Characteristics

TABLE1- Frequency and Percentage distribution of the older adults demographic characteristics N= 100

Table: 1-Depicts the demographic characteristic which reveals that highest percentage (53%) of older adults were in the age group of 60-70 years. About 42% of the older adults were in the age group of 71-80 years and remaining older adults were in the age- group of 81-90 years. Highest percentage of older adults were females as compared to 42 % males. With regard to co- morbid conditions, it was observed that highest percentage (30%) of older adults had both diabetes and hypertension followed by hypertension 22% and diabetes 18% . About 9% older adults had both diabetes and arthritis whereas 8% older adults had all three co- morbid condition of diabetes, hypertension and arthritis. About 13% of older adults did not had any co-morbid conditions.In respect to usage of polypharmacy, it was observed that most of the older adults (53%) were using more than one medication as compared to 47% of older adults who were taking only one medication.

Section B – Findings related to quality oflife among older adults.

Fig: 1- reveals the major findings in relation to the quality of life of the older adults; highest percentage of older adults (64%) had poor quality of life as compared to 31 % older adults having QOL as very poor. Only 5% of older adults fell in the QOL category of moderate. It was also observed that none of the older adults had good or very good QOL.

Section C – Findings related to association between Quality of Life among older adults and selected demographic variables.

Table: 2- It was observed that Quality of life scores of older adults was found to be associated age, gender, and level of education with Chi - square values of 18.54, 7.73 and 13.54 respectively. Further QoL was found to be independent of, co-morbid conditions and polypharmacy at 0.05 level of significance as evident by Chi-square values of 2.01 and 0.12 respectively.

DISCUSSION

The study aimed to assess the quality of life among the older adults residing at the old age homes and find the association with the selected demographic variables. Majority (53%) of the older adults were in the age group 60-70 years, female were in majority (58%). Most (30%) of the participants were diagnosed with both diabetes and hypertension, only 13% had no comorbid conditions. Polypharmacy was found in most (53%) of the older residents. Very poor quality of life was found in 31% of the subjects, majority 64%, were found to have poor quality of life, none of the participants had a good quality of life. The quality of life was associated with age, gender and level of education. The findings of the study was consistent with cross-sectional study conducted by Jazayeri Emitis, *et al*. 2023 which stated that majority of older adults were in the age range of 60-70 years and majority of them had poor quality of life related to poor mental health.[12] Slight consistent results were also reported by Lalitha Krishnappa, *et al*. 2021the study was in regard to quality of life among the older adults living in rural and urban areas. The study had females in majority, age group 60-70 years represented most of the samples, the older adults living in rural areas had poorer quality of life.[13] Contrasting results were reported in a study conducted by Panday Rishi, *et al*. 2015 finding the quality of life of older adults living in old age homes and family. The results revealed that those living in the residential facilities had better quality of life than those living with families.[14] Thresa Sona Sahaya conducted a cross-sectional study, 2019 on the elderly living in old age homes and with families. The results revealed those living in old age homes had poorer quality of life than those living in homes, which was somewhat consistent with the

results of the present study.[15] Study conducted in 2024 by Yankannavar Basavaraj and Naik Bijaya, consistent finding; similar in the terms the majority of the elderly living in old age home setups have poor quality of life. The association of quality of life was related to age, gender and co-morbidity.[16] Similar results were reported by Paudel Sharmila, *et al*.2024 the majority were in 60 to 69 years and females, the quality of life was associated with the age.[17]

CONCLUSION

The growing population of older adults requires the need to set up more residential homes, however the question is whether the facilities are equipped enough to take care of them. The older adults require more care in terms of psychosocial and psychological well-being, the old age homes do not have medical or nursing facilities for them. The present study highlights the quality of life of the older adults living the old age homes. Only a minority were found to have moderate quality of life, the greater number showed poor quality of life. The reduce feeling of loneliness, sustained financial insecurity, social support, and affordability of good health care are indicators of good quality of life. The government authority should focus more on the betterment and provision of such facilities in old age homes.

ACKNOWLEDGEMENT

The researchers express gratitude to the elderly (participants) and the administration of the old age homes.

ABSTRACT

Blockchain requires an emerging technology that people see as a replacement for data security storage required in this digital age. In this article, we assess the gaps and details of recent research analyzing this consensus mechanism with the integration of artificial intelligence and the analysis of cyber security attacks. Distributed ledger technology is a possible solution to solve this whole traditional database problem in a comprehensive and transparent way without the help of a third party. Our research also deals with cyber-attack prevention using consensus algorithms. We proposed hybrid consensus algorithm with integrity and authenticity for security concern for cyber threats. We analyze this with security analysis test cases as well as an improvised solution with artificial intelligence integrated into the blockchain. We have also added some web application-based attacks to address them comprehensively and consistently improvised through DLT based technology. We have listed OWASP top 10 based attacks which have large impact on blockchain solution for adaptability in era of web 3.0. Finally, we added some tests cases for different miners to solve cyber security-based attacks to save it with environment effect of it using blockchain technology. Additionally, we explore the potential of energy-efficient blockchain mechanisms to reduce environmental impact and support biodiversity preservation through sustainable digital infrastructure.

INTRODUCTION

A blockchain is a decentralized and distributed database which has cryptographically(hashed) linked records, known as immutable blocks, arranged in chronological order and distributed among nodes in a computer network to store digital data or transactions [1]. Smart contracts are like a computer program mostly written in language like solidity [2], are stored on a blockchain that works automatically without external intermediaries (third party) [3]. By removing third-party intermediaries, smart contracts play a pioneering role in automated business participation, making collaborative processes more transparent and more efficient in terms of time and money [4]. Web 3.0, the third generation of the Internet is a user-centric network that aims to decentralize user data, including money, property and identities, securely using blockchain technology, giving users full control instead of centralized (Central authority) entities checking their own data [5]. Blockchain is the driving force behind Web 3.0, giving users ownership of data and allowing them to store securely and manage their data in a decentralized manner through self-contained identity (SSI). It was previously proposed for financial applications only but now blockchain can also be used in Internet of Things (IoT), Health care, supply chain, public and social services, reputation systems or act as a service providing security, integrity and privacy. A blockchain can also be considered a database (rather we can call it secure way to store the data with full transparency) because it contains a storage mechanism [6]. Bitcoins emerge during mid-2009 and then after there were questions about the differences between blockchain, databases and whether blockchain could be used as a database mechanism as an alternative secured way [7]. Although blockchain provides a storage mechanism, it has many important differences from traditional databases, mainly its decentralization, cryptographic security through a chained hash, lack of management control, immutability and freedom to transfer without any. permission from a central authority [8]. It is accepted by many enterprise applications which have moved to blockchain storage to provide more secure deployments and reduce trust between parties in the industry. In recent times many companies focus on distributed cloud storage, the question arises to what extent blockchain offers a better storage solution than distributed cloud storage or just a traditional database[9-11]. Blockchain is not only related to the above features, but also provides better features, user privacy and security through cryptographic primitives. Blockchain lacks some features offered by traditional databases, such as versatile queries. Efforts to bring these DB functions to the blockchain are growing and progressing. When blockchain storage is measured by traditional DB criteria, it does not give promising results. It has a capacity of only a few transactions per second (tps), a 10-minute delay before a single confirmed write (to Bitcoin), and a size of only a few tens of gigabytes. In a blockchain, adding nodes to the network increases traffic, but also decreases performance. On the other hand, a modern distributed database can have a capacity of more than a million tps, a capacity of several terabytes and a latency of only a fraction of a second. Finally, adding nodes improves system performance and capacity [12]. Therefore, one approach to making blockchain an efficient storage mechanism is to combine traditional databases with existing blockchain technologies, which many platforms are currently doing.

The goal is to produce an advanced storage mechanism with high performance, scalability, low latency and increased security, because this mechanism would be built on the existing blockchain technologies. Another approach is the use of so-called blockchain databases, which have developed a lot in recent years [13-17]. These databases have their own consensus mechanism for common agreement between network parties on a block of data. They are unordered and provide support for complex data types, rich query structures, and ACID-compliant transactions [18]. In addition, they offer low latency, fast scalability and cloud hosting. Thus, the combined use of blockchain and database functions makes these databases a promising option for many enterprise solutions. In addition, many blockchain platforms are now integrated with some databases. Existing databases used in some blockchain systems have either a master-slave or P2P architecture, whereby transaction logs and states are copied between [19] nodes. Since the database can be SQL/relational post-relational, the choice of a database to use in the blockchain should be based on many critical points, such as database structure and query processing speed. The development of databases integrated with blockchain functions is an active research topic. This research analyzes the blockchain features of modern database solutions and their suitability for blockchain. In general, blockchain capabilities are implemented either by adding a blockchain layer on top of an existing database layer, or vice versa by implementing block chain

functions in the database layer and architectural model [20]. First, we sublimate the seven key features, namely decentralization, composition, scalability, immutability, low latency, high performance and fragmentation, which form the first of the blockchain databases. Additionally, the increasing popularity of bitcoin has drawn significant attention to its environmental impact because of solving mathematical puzzle value called nonce. The energy-intensive proof-of-work consensus mechanism, essential for transaction validation, consumes substantial electricity and computational resources to mine a block [21]. This study will investigate factors contributing to Bitcoin's energy and computational power consumption, including the geographic distribution of mining activities and energy power sources utilized by miners. The environmental implications of Bitcoin's operations are essential for promoting sustainable and environmentally responsible blockchain practices. Figure 1 illustrates the structure of a bitcoin block structure, highlighting its components such as the block header, transaction data, Merkle root, time stamp and the nonce used in the proof-of-work consensus algorithm. The block header includes a hash of the previous block, ensuring the integrity and continuity of the blockchain [22]. Additionally, it contains the Merkle root, a hash representing the combined hash of all transactions flow shown in figure 2 within the block to provide integrity of data for secure storage, structured through a Merkle tree. We make it easy for researchers to understand blockchain technology, this study explores three main aspects. Initially, it focuses on the tool used to develop secure blockchain applications. Next, it explains vulnerabilities in web and other ledger options. Lastly, it evaluates the impact of Bitcoin mining on the environment. It's commonly understood how crucial is to employ blockchain technology securely and sustainably. This paper concentrates on key aspects of blockchain security with Section 2 analyzing consensus mechanisms essential for trust in blockchain networks. Section 3 discusses security strategies for blockchain network based systems while Section 4 explores the potential enhancements in security and threat detection in cyber security through integration of AI with blockchain technology. In section 5 concludes this paper with a summary of this paper's contributions, limitations, and future research directions.

Related work

Blockchain technology is widely carried the potential to be transformative in decentralized efficient systems and smart grids. This research study examines how blockchain technology can alter the varies sectors through the use of artificial intelligence (AI), health care, supply chain, financial and automation. Particularly, in decentralized energy systems (DES) and prosumer surroundings where consumers are also producers, there is a need for secure access control mechanisms that provide strong data privacy and security. However, there have been concerns about traditional control systems (central authority) which are managed by central third parties [23]. The decentralization, immutability and transparency of blockchain technology make it a useful alternative option for user access control in these settings. It helps organizations keep full possession, integrity and responsibility of their own information. The use of ethereum based smart contract-based access control (executing contracts without help of third party) frameworks has been widespread within the Internet of Things (IoT) and government sector but not in Smart Grids which is another name for internet of energy [24]. The various research on blockchain's potential role in smart grids has started to shed light on this issue. For instance, various research studies have investigated different consensus protocols' security, scalability and privacy implications, while others have attempted to discover some benefits as well as limitations. However, a critical challenge identified in this research is the lack of established trust, acceptability, adaptability and reputation systems within blockchain for this specific application [25]. If you take the latest vulnerability exploitation in Windows 10, users worldwide are experiencing a crash that is leading to their systems unexpectedly shutting down or restarting. The crash is causing computers data and availability to become stuck on the recovery screen or display the Blue Screen of Death (BSOD) error. This problem happens when a crucial problem causes Windows to close down or reboot which is really a big concern for most industries. In these situations, a notification will appear saying - "Your device has encountered an issue and needs to be rebooted. "We're simply gathering error information before initiating a restart on your behalf" - is displayed on the screen. In addition to this also impacting corporate offices, the crash has also impacted banks, supermarkets, telecommunications, and airports in the US, Australia, Japan, India, and various other countries. It is said to have led to flights being grounded and canceled in the United States and at Sydney Airport in Australia. Customers have been informed that they are not allowed to drop off their luggage [42]. Australia's National Cyber Security Coordinator, Michelle McGuinness, has dismissed the idea of a cyber-attack being responsible for the crash. I have knowledge of a widespread technical

issue that is impacting numerous companies and services throughout Australia today. The National Cyber Security Coordinator stated on X that the outage is connected to a technical issue with a third-party software platform used by affected companies. We have proposed how a blockchain-based architecture, specifically hybrid approach for agreement in the decentralized network will be used in smart system or digital system to avoid such crashes relied on third parties. It still lacks proper test with prototypes and deployment in network [32]. We have conducted a thorough investigation of specific aspects of blockchain technology as per shown in figure 3, presenting a balanced perspective on its strengths and weaknesses [31-34]. Our research paper focuses on below five key areas for improvement

Design patterns: The main concern about different blockchain platforms incorporate several design patterns that include public or private blockchains and permissioned or permissionless models. These will be analyzed based on individual need where we will look at their security implications as well as how they affect scalability, privacy etc.

Security challenges in DAG-Based Systems: Directed Acyclic Graph (DAG) based blockchains accomplish transactions at a faster validation rate compared to traditional way to do it. The unique structure may also introduce new security vulnerabilities aims to investigate and come up with possible solutions to mitigate them.

The relationship between AI and blockchain security: AI can help enhance weak blockchain systems on matters related to security and detect irregularities in blockchains, can be used for intrusion prevention among others to strengthen the overall safety of blockchain platforms.

Evolving Cybersecurity Threats and Proactive Countermeasures: As blockchain technology continues advancing (web 3.0), cyber criminals are inventing new ways of exploiting its vulnerability specifically using crypto for malicious things or criminal activities.

This research paper aims to provide a comprehensive analysis of blockchain technology, its present state and its future potential to widely adapt in industry. This approach gives a better understanding of blockchain as both an innovative tool and an evolving technology for securing devices in IoT as well as AI based innovations.

Cyber Threat: Security Concerns in Blockchain Implementations

Blockchain technology has emerged as a revolutionary innovation in the digital era, promising enhanced security, transparency, and decentralization in various applications. However, the widespread adoption of blockchain has also led to the identification of potential security vulnerabilities and cyber threats that must be addressed to ensure the resilience of blockchain-based systems [21].One of the primary concerns with blockchain implementations is the issue of scalability and speed at which transactions are validated by miners [31]. Traditional blockchain networks are designed to handle a limited number of transactions per second (bitcoin), which can be a significant bottleneck for real-world applications that require high-throughput processing for transaction validations [35]. These differences in transaction processing capabilities highlight the scaling challenges that blockchain networks must overcome to achieve wider adoption across industries [36]. As per the requirements we have provided different modified algorithms as mentioned in this section which will help us to understand the security aspects of blockchain with environment effects. The provided algorithms with minor modification really help researchers to find optimized secure way to correct the consensus mechanism. In addition to scalability, security is a critical concern in blockchain implementations. Blockchain networks are susceptible to various cyberattacks, such as 51% attacks, where a malicious actor forms a group to gain control of the majority of the network's computing power, potentially allowing them to manipulate the blockchain [33]. Other attacks, such as DDoS, ransomware and smart contract-based vulnerabilities, can also pose significant threats to the integrity and reliability of blockchain-based systems [37].

Algorithm 1: PoW based hybrid consensus for Security Verification

Transaction Validation

Transaction Broadcasting

- Let T={t1,t2,...,tn} be the set of all transactions.

- Each participant broadcasts their transaction set Ti⊆T to the network.

Transaction Verification
For each transaction t∈Ti
- Verify the digital signature using public key cryptography.
- Check for double spending by inspecting the transaction history.

Block Formation
Grouping Transactions
- Let B={tb1,tb2,...,tbm} be a block containing a subset of transactions.
- Apply transaction selection criteria (e.g., fee-based, size-based) to form blocks.

Hashing
Generating Hash
- Let H be a cryptographic hash function.
- Calculate the block hash h=H(B).
- The block is valid if h≤target difficulty.

Proof-of-Work
Mining
Miners modify a nonce in the block header and recalculate the hash until h≤target difficulty.
The first miner to find a valid block broadcasts it to the network.

Cyber Security Verification
Security Checks
Nodes perform additional security checks on the received block, such as: Validating the block's structure and format.
Checking for malicious code or vulnerabilities.
Ensuring compliance with network rules and policies.

Consensus
Block Acceptance
Nodes verify the block's validity and add it to the blockchain if it is valid and has the longest chain.
Blockchain growth can be modeled as a growing tree structure.

Reward Distribution
Reward Distribution
The miner who successfully mines a block receives a predetermined reward.
3.2 Algorithm 2: Stake-Weighted Random Selection Consensus Algorithm

Stakeholder Participation
A stakeholder, s, joins the system by depositing a stake, stake(s), which is greater than or equal to a predefined minimum stake threshold.

Validator Selection
- A set of validators, V, is determined based on the stake held by each stakeholder.
- The probability of a stakeholder being selected as a validator, P(v), is directly proportional to their stake: P(v)=stake(v)/totalstake

Block Creation
- A randomly selected validator from the set V creates a new block, B, containing a set of valid transactions, T.
- The probability of a validator creating a block is determined by their selection probability.

Block Validation
- The proposed block, B, is subjected to rigorous validation by the network's nodes.
- Validation includes verification of transaction validity, block structure adherence, and consensus rule compliance.

Consensus
- If a consensus is reached among most validators on the validity of block B, the block is appended to the blockchain.
- The validator who created the block, v, is rewarded with a block reward.

Slashing
- Validators found to engage in malicious behavior must be penalized, including a reduction in their stake, stake(v), by a defined amount, slashing_penalty(v).
- Severe penalties also result in the removal of a validator from the set V for integrity.

Algorithm 3: Auth Path Optimized Merkle Tree Algorithm
Initialization
- Set leaf to 0.
- Initialize empty stacks for each height, i.e., {Stack0, Stack1, ..., StackH-1}.

Loop until all leaves processed
While leaf < 2^H
Compute and Output
- Compute and output Φ(leaf) with LEAFCALC(leaf).
- For each h in [0, H-1], output {Authh}.

Refresh Auth Nodes
For all h such that 2^h divides (leaf + 1)
- Set Authh to the sole node value in Stackh.
- Set startnode to (leaf + 1 + 2^h) xor 2^h.
- Initialize Stackh(startnode, h).

Build Stacks
For all h in [0, H-1]
- Update **Stackh(2)**.

Zip Up the Tails (Delay)
Wait until all stacks {Stack0, Stack1, ..., StackH-1} are partially completed, containing no tail nodes of height less than h.

Increment Leaf
Set leaf = leaf + 1.

End of Algorithm
Merkle Tree output with authenticity for integrity and security
The above suggested algorithm will make changes in view of consensus with integrity and security vulnerabilities which we need to address in near future for adaptability. Merkel tree with authenticity must help to get data

integrity with more useful parameter for blockchain based vulnerabilities. These security vulnerabilities have led to the theft of millions of dollars in cryptocurrency assets which is the main reason to get crypto to accept illegal transactions, undermining the trust and credibility of blockchain technology [34]. Despite its potential for revolutionizing secure data storage and transaction management, blockchain technology still has its weaknesses. Cybercriminals are continuously improving their methods to take advantage of these weaknesses for monetary profit or to cause disruptions in activities.

Network Hijacking: Interrupting Activities and Stealing Information

Network hijacking incidents occur when attackers gain unauthorized control over a blockchain network or its nodes. Here is an analysis of the possible consequences of network hijacking

Double-Spending Attacks: Malicious actors can tamper with transactions in order to carry out double-spending. This goes against the fundamental idea of blockchain technology, which is designed for transactions to be permanent.

Transaction rearrangement: In certain blockchains, the sequencing of transactions in a block may hold significance. Hijackers may be able to resequencing transactions in order to obtain an unjust benefit, disturb the operational flow of smart contracts, or initiate denial-of-service attacks.

Stopping Blockchain Operations: If attackers seize substantial authority over the network, they may stop fresh blocks from being inserted into the blockchain, essentially bringing transactions to a standstill. This has the potential to severely impact applications that are created using blockchain technology.

Data Censorship: Malicious individuals may block certain transactions or data from being added to the blockchain ledger. This could go against the transparency principle of blockchains and impede the immutability of data.

Mitigating Network Hijacking

- BFT algorithms can assist in achieving network consensus despite the existence of Byzantine faults, such as malicious nodes, through Byzantine Fault Tolerance (BFT) Consensus Mechanisms. There is ongoing research on BFT-based consensus mechanisms developed specifically for blockchains.
- **Proof-of-Stake (PoS) Systems:** Although not completely reliable, PoS systems typically demand a substantial stake (cryptocurrency holdings) to engage in the consensus process. This discourages bad actors from taking over the network due to the economic consequences of losing their investment.
- Authorized nodes are the only ones allowed to take part in the network of permissioned blockchains. This method may be advantageous for scenarios wanting strict control, but it sacrifices some decentralization.
- Regularly monitoring network activity and conducting security audits can assist in detecting potential vulnerabilities and suspicious behavior. This enables developers to be proactive in dealing with security threats before they can be utilized by attackers.

Explores the potential enhancements in security and threat detection in cyber security through integration of AI with blockchain technology.

Blockchain adaptability in real life is essential for maximizing the use of AI and blockchain in cybersecurity. It is necessary to require preparing data for AI-driven identification of anomalies in blockchain data involves formatting data in a way that enables AI to analyze it effectively, which includes feature engineering, normalization, and managing missing data. RNNs and LSTMs are perfectly fitted choices for examining sequential blockchain data, whereas autoencoders can identify anomalous patterns. Employing transaction amounts, addresses, timestamps, and block heights as input features is crucial in feature engineering. We can successfully incorporate the AI model into a blockchain monitoring system which requires efficient implementation and instant data handling at decentralized network. We want to secure sharing of data for AI with the help of blockchain technology which can be attained by utilizing federated learning, homomorphic encryption, and secure multi-party computation to protect data privacy

and integrity. It is known and accepted that AI can be integrated into smart contracts to improve prediction capabilities, detect fraud, and assess risks, thus boosting their flexibility and protection. Despite the promising potential of AI and blockchain, it is crucial to recognize the drawbacks of social media platforms, including privacy issues, addiction, and the spread of misinformation. The emergence of Web 3.0, the next generation of the internet era, has brought with it new opportunities and challenges, particularly in the emergence of security, transparency and privacy. Blockchain technology is a core component of Web 3.0 which has been touted as a solution to the centralized control specifically third parties and data vulnerabilities that plagued previous iterations of the web. Blockchain's decentralized nature, immutable ledger, trustless environment and smart contract capabilities have the potential to revolutionize in various industries including online data management, identity verification, and secure transactions. However, the integration of blockchain into Web 3.0 implementations is not without its own set of security concerns. As technology continues to evolve, researchers have identified vulnerabilities that could potentially be exploited by cyber attackers. These vulnerabilities range from consensus mechanism flaws to smart contract vulnerabilities, which can lead to financial losses, data breaches, and other malicious activities. Blockchain technology, while innovative and transformative, poses significant environmental concerns due to its high energy consumption. The decentralized nature of blockchain, particularly in proof-of-work systems, requires substantial computational power for mining activities, leading to increased carbon footprints. Studies suggest that the power utilization of major cryptocurrencies like Bitcoin rivals that of complete countries. Moreover, the hardware used in mining contributes to e-waste, exacerbating environmental degradation. Thus, sustainable blockchain solutions, together with evidence-of-stake and eco-friendly mining practices, are vital to mitigate those environmental effects. One study [31] highlights the importance of a novel design for three-tier identities, which could help address the security and privacy challenges in Web 3.0. Additionally, the impact of laws on privacy and cyber sovereignty must be considered to achieve the full potential of Web 3.0. Another study [32] explores the use of self-sovereign identity and smart contracts to enhance the security of real estate transactions, a sector that has traditionally been plagued by centralized control and paperwork-intensive processes. An analysis of the information presented in Table 4, detailing the potential consequences of network hijacking, coupled with the implementation of appropriate mitigation strategies, can empower blockchain developers and users to build more secure and resilient blockchain networks [38-42]. The paper addresses the opportunities and challenges presented by Web 3.0, with a specific focus on the integration of blockchain technology. Blockchain, known for its decentralized, immutable, and trustless environment, promises advancements in various sectors, including data management, identity verification, and secure transactions. However, the adoption of blockchain is not without security concerns, which range from consensus mechanism flaws to smart contract vulnerabilities. These issues can lead to financial losses, data breaches, and other malicious activities. Research highlights the importance of innovative designs for addressing security and privacy challenges in Web 3.0. For instance, a novel three-tier identity design could enhance security and privacy, while the application of self-sovereign identity and smart contracts could improve the security of real estate transactions. The paper underscores the significance of understanding OWASP risks and implementing appropriate mitigation strategies to build more secure blockchain networks. Scalability and security are critical concerns for blockchain implementations. Traditional blockchain networks face limitations in transaction processing speed, which poses a challenge for real-world applications. Cyberattacks such as 51% attacks, DDoS, and ransomware exploit vulnerabilities in blockchain systems, resulting in significant financial losses and undermining the technology's credibility. The paper also discusses the potential of blockchain-based architectures to prevent such crashes and cyberattacks. Additionally, the integration of artificial intelligence into blockchain has been explored to enhance security and prevent cyberattacks.

CONCLUSION

The paper proposes a hybrid approach to achieve consensus in decentralized networks, to address the shortcomings of traditional database systems. The review includes security research test cases and offers solutions to improve blockchain technology to combat advanced cyber threats. We also provided modified way to create Merkel tree, incentive with penalties for misbehavior nodes in the network with environment effects to considered for wider acceptance of blockchain in industries. The transition to Web 3.0 presents both opportunities and risks for the digital

age, particularly when combined with blockchain technology, which has an impact on society's environment. Blockchain is vulnerable to various kinds of cyberthreats and scalability problems, even though it promises significant advancements in security, transparency, and decentralization. To solve these issues, the study emphasizes the need for new frameworks and approaches, such as combining self-management, smart contracts, and consent mechanisms. Resilience of blockchain networks depends on Web 3.0 applications' assessment and mitigation of OWASP threats. Blockchain technology and artificial intelligence together present a viable means of strengthening security and resisting cyberattacks. However, further research and innovation are required to get beyond present constraints and completely realize blockchain's existing challenges and fully utilize application potential. The efforts to address the security, scalability, and issues of privacy associated with blockchain technology will be required for achieving Web 3.0's full potential. In future to bring about a stable, effective, and secure online world, innovative approaches and continuous research are needed in real life applications.

Table 1: Beyond Cryptocurrencies: Applications Utilizing Blockchain Technology

Domain	Description	Potential Impact
Blockchain Scalability [22]	Application of deep learning for congestion prediction, resource allocation, and transaction validation for the distributed based consensus mechanisms, aiming to optimize network performance and scalability.	The potential to increase the transaction throughput, reduce fees, and broaden the adoption of blockchain technology across various industries.
Smart Contract Security with AI [25]	The use of machine learning for automated smart contracts will help to detect vulnerability to enhanced security analysis and identify potential vulnerabilities before deployment.	It will help to secure environment by creating smart contracts to reduce the risk of exploits and improving overall blockchain security.
Secure AI on Blockchain Infrastructure [27]	To build secure and transparent system on blockchain platforms includes exploring secure enclaves for confidential AI model training on blockchains and decentralized AI marketplaces with tamper-proof model registration.	It will help to increased trust and collaboration in the development and deployment of AI models for securing blockchain infrastructure responsible and transparent.
Sybil Attack Detection using AI	Anomaly detection algorithms and behavioral analysis techniques can be employed to	It helps to develop honest and secure consensus mechanisms for blockchain

[28]	differentiate legitimate nodes from malicious nodes, particularly in PoWconsensus mechanisms.	networks, mitigating the impact of Sybil attacks that threaten network integrity.
Privacy-Preserving AI on Blockchain [29]	For privacy, homomorphic encryption and secure multi-party computation (MPC) protocols are potential solutions to allow AI computations on encrypted data without compromising user privacy.	The benefits of data security and transparency with the need for privacy can be achieved wider adoption of blockchain-based AI solutions.
Blockchain for Secure Internet of Things (IoT) [30]	To secure data exchange and access control protocols for IoT devices on blockchains, and decentralized oracles for trustless data acquisition and verification in IoT applications.	Blockchain has the potential to address security vulnerabilities and ensure data integrity with the help of immutability feature utilize in IoT deployments.

Table 4: Understanding OWASP Risks in Web3 Applications

OWASP Risk	Web Application Context	Blockchain Impact	Example
Injection	Malicious code insertion via user input.	Not a main difficulty for blockchains due to constrained users enter mechanisms.	Might be applicable for blockchain oracles fetching facts from external resources. Improper facts sanitization can go away oracles vulnerable to injection attacks.
Broken Authentication	Faulty safety mechanisms provide unauthorized access.	Private key agreement on wallet. Unauthorized access to authenticator nodes.	Phishing attacks targeting private keys. inappropriate use of specialized behaviors.
Broken Access Control	Inappropriate access control techniques allowing unauthorized actions.	Unauthorized data processing on blockchains with variable data storage capacity.	Smart contracts with incorrect access control modifiers. Lack of granular access control for authenticator nodes.
Security Misconfiguration	Insecure default configurations or improper security settings.	Insecure configurations of blockchain nodes or clients.	Improper gas limit settings in smart contracts lead to DoS vulnerabilities.
Security Misuse of APIs	Exploiting flaws in APIs to gain unauthorized access or functionality.	Potential vulnerabilities in APIs used by blockchain applications.	Vulnerabilities in wallets or Blockchain Explorer APIs that allow access to sensitive funds or data.
Insufficient Logging and Monitoring	Inadequate logging and monitoring of security events.	Difficulty in detecting and responding to security incidents.	Aborted fraudulent connections or unauthorized attempts to access compromised nodes.
Security Testing Failures	Inadequate security testing practices lead to missing vulnerabilities.	Identify and mitigate blockchain vulnerabilities due to the complexity and consent of smart contracts.	Smart contract audits that fail to detect vulnerabilities for reentrant attacks or integer overflows.

ABSTRACT

The National Education Policy(NEP) 2020 introduces a paradigm shift in India's education system, emphasizing the inclusion of vocational education to increase employability, skill development and industry readiness. This study critically analyses the policy framework and its practical implications for vocational education in India. The study explores the objectives of NEP -2020, particularly its vision to ensure that at least 50% of learners acquire vocational exposure by 2025 through school and higher education. It studies key provisions, such as the introduction of skill-based courses at an early stage, multidisciplinary learning, industry partnerships and the use of digital platforms for vocational training. It involves the implementation challenges, including infrastructural gaps, the shortage of trained educators, and societal perception in vocational education access. Through a comparative analysis of global best practices and policy execution in India, this study identifies areas requiring policy refinement and suggests strategies for improving vocational education outcomes. The findings focus the need for stronger industry-academia collaboration, enhanced teacher training, and policy adjustments to address systemic challenges. This study concludes that while NEP-2020 lays a strong foundation for vocational education reform, its success depends on effective execution. If implemented strategically,NEP-2020 has the potential to create a more inclusive, skill-oriented education system.

Keywords: Challenge, Education, Employability, NEP 2020, Skill, Vocational.

INTRODUCTION

After independence, several commissions and committees were constituted to analyse the problems related to Indian education and various suggestions were recommended for the way forward. It was the first attempt to reorient the system of education to the needs and aspirations of the citizens and it was felt that the universities and other higher education institutions could play a significant role in the development process. Countries plan their education systems to progress further (Rizvi and Lingard, 2009) . To promote education at all economic for the inclusion of common people in the classes and mainstream the Government of India (GOI) has formulated the National Policy on Education (NPE). The Policy has broader coverage, starting from elementary school education (literacy level) to colleges for higher education (focusing specialization) - in both the settings, rural and urban. The first NPE was proposed and disseminated in 1968 by the GOI, the second policy was in 1986, and the third major reformative policy was in 2020 by the GOI. The National Education Policy (NEP) in India has undergone several iterations since its inception with significant reforms aimed at enhancing the quality and accessibility of education. The most recent NEP was introduced in 2020, marking a transformative shift in the educational landscape. Vocational education in India has a long and evolving history, influenced by various socio-political and economic changes. The concept of vocational training and skills - based education can be traced back to ancient India, but its formal integration into the modern educational system has been shaped by both colonial policies and post - independence reforms. Vocational education in India has evolved from traditional craft-based learning systems to a more formal, structured approach, with increasing focus on industry partnerships and practical skills to meet the demands of a modern economy.

Vocational Education in the NEP,1968: Based on the recommendations of the Kothari commission, this policy encouraged vocational training in schools and promoted the establishment of vocational institutions, aiming to reduce the pressure on higher education and provide employment orient skills.

Vocational Education in the NEP,1986: This policy gave a significant push to vocational education, recognising it as crucial for employment generation. The 1986 policy aimed to ensure that at least 25% of students at the higher secondary stage were offered vocational courses. The policy proposed creating a vocational education program (VEP) at the secondary level and encouraged partnership between schools and industries for practical training.

National Education Policy, 2020: The most recent NEP 2020 introduces a strong focus on vocational education integration starting from the school level. It envisions that by 2025, at least 50% of learners will have exposure to vocational education. The policy emphasizes

- Blurring the line between academic and vocational education.
- National Skills Qualifications Framework (NSQF)
- Integration of vocational education with mainstream schooling.
- Work place and appreciation ship training.

LITERATURE REVIEW

Patel and Agrawal (2024) conducted a study titled "National Education Policy2020: Paradigm Shift in Vocational Education for AatmaNirbhar Bharat". The objective of this study was to aware common people about Aatmanirbhar Bharat campaign and its linkage to Vocational Education. The research design adopted was qualitative approach. The result revealed that Aatmanirbhar Bharat is an important initiative of GOI which trained people to enrich vocational education. NEP 2020 and other 20 research papers (Eg: Jain N., Kumar S., Ruskin J., Ramanathan V. etc.) are used as reference. Sharma, Dakngam, and Anga (2024) conducted a study titled "Implementation of Vocational Education in Education System of India''. The objective of study to find out the challenges in integration of Vocational Education in Education System. The research design adopted was descriptive method. The result revealed the challenges of Vocational Education and Prospects of Vocational Education at Higher education. NEP 2020 and research papers by Fuller A., Karra S., Krishna A., Kumar J.S., Kumar K. and many important websites and schemes

are used as reference. Laskar (2023) conducted a study titled " A study on NEP 2020: Implementation of Vocational Education and its challenges in Hailakandi district of Assam''. The objective of this study was to understand the importance, implementation challenges, and suggestions for vocational education. The research design adopted was mixed method approach, utilizing both qualitative and quantitative techniques. The sample was taken from ten educational institutes of Hailakandi district. The result revealed challenges and suggestions for implementation of Vocational Education in Hailakandi district. NEP 2020, research papers by Aggarwal J.C., Kumar Pradeep, Kaushik Kusuma, Kedar Shubhangi, Athil ShubhraJyotsa and Athil P.S. are used as references. Kharwar and Kumar (2022) conducted a study titled "Vocational Education inperspective of NEP 2020".The objective of study to find out the vocational training in India in context of NEP 2020. The research design adopted was qualitative approach. The result revealed the importance of Vocational education and process of successfully implemented it. World Bank Report 2019, research papers by many authors like Jeba raj P., Nandini, Gohain Manash Pratim and other documents are used as reference. Hannah (2022)conducted a study titled "NEP,2020: General Education Embedded with Skilland Vocational Education". The objective of the study to find out framework for concurring general education with vocational education. The research design adopted was qualitative approach. The result revealed the framework of possible pathways of synchronising General Education with Vocational and Skill education and also revealed implementation plan for it. It included timelines for completing specific tasks for States and UTs. Document of Educational policies- 1968, 1986, 1992; Census of India 2011; other surveys and her own research papers are used as reference. Parvanda(2022) conducted a study titled "Vocational Education and NEP 2020". The objective of this study was to find out the key aspects of NEP 2020. The research design was adopted was qualitative approach. The result revealed the provisions, implementation challenges and future impact of Vocational Education. Encyclopaedia Britannica; research papers by Einstein A., Lugol John, Jain B. and by other authors; and some websites are used as reference. Sharma (2022) conducted a study titled ''Vocational Education and NEP-2020''. The objectives of this study was to find out the problems in vocational education and new approaches of NEP 2020 for employability. The research design adopted was qualitative approach. The result revealed problems of vocational education in present scenario and recommendations of NEP 2020.Research papers of Adams and Arvil, Sr.Catheline and K.Mala, SharmaY.K Tushar A. and others are used as refrences. Jena (2022)conducted a study titled ''Re-imagining Vocational Education: The NEP Perspective''. The objective of this study is to find out the issues and challenges of vocational education and to find out the global scenario of students in vocational education sector.The research design adopted was qualitative and quantitative approach. In result he proposed -the pathway for vocational education, interface between the education system and Industry and training design for vocational education. Gandhi (2021)conducted a study entitled ''Review on the Key Features of the NationalEducation Policy 2020 in the Context to Pre-school Education and its Expected Impact''. This study included the importance of experiential learning in pre-schooler's development. It also included the development of basic skills, habits, and personal hygiene conditions among pre-schoolers. Pathak (2020) conducted a study titled "NEP 2020: A road map to Vocational Development". The objective of the study was to find out the level of vocational development program and difference between previous education policy and NEP 2020 with respect to vocational development program. The result revealed the skill development program and development program for vocational education at the different level of school education and in higher education. Website of GOI, NEP 2020 document, research papers by Agrawal T., Maclean R and Lai A. and some websites are used as references.

OBJECTIVES OF STUDY

1. To examine the goals and achievements behind NEP-2020 focus on integration vocational education.
2. To analyse the vocational education curriculum aligns with current and future industry demands.
3. To critically assess the NEP -2020 ensures vocational education is accessible to diverse groups.
4. To compare the NEP-2020 vocational education framework with global best practices.

Research Questions

1. What are the goals and achievements behind the NEP-2020 focus on integration vocational education?

2. How vocational education curriculum aligns with current and future industry demands?
3. 3. What are the ways to access the NEP-2020 that ensures vocational education is accessible to diverse groups?
4. How does the NEP-2020 framework guide towards global best practices?

METHODOLOGY

Research Design-This study employs a qualitative research design with elements of policy analysis to critically examine the provisions of the National Education Policy (NEP) 2020 related to vocational education. The research aims to explore how the policy translates into practice and its implications for the education system.

Research Approach-The study adopts a critical analysis approach, combining document and content analysis with qualitative data collection.

RESULT AND DISCUSSION

Research Question 1.What are the goals and achievements behind the NEP-2020 focus on integration vocational education?

According to the draft of NEP 2020 the provision of vocational education is mentioned in point 16. The key aspects of NEP 2020 reveals provisions, implementation challenges and future impact of vocational education. NEP-2020 made a strong and serious commitment to expand vocational education and training and describe the challenges and solutions for expedition of vocational education and training. The global scenario of students in vocational education sector describes the role of industry input in other countries. The teaching of vocational courses from class six, mostly in the form of internship and practical activities will make ensure that every student should at least study one vocational course (Kharwar and Kumar, 2021). The background of the vocational education along with NEP policy perspective on vocational education .It also include the theoretical framework for synchronization of general education with vocational and skill education as suggested by UGC (Hannah, 2022).Vocational Education for Aatmanirbhar Bharat' in the NEP 2020 has advocated for vocational education to be introduced from class sixth after keeping the current century in view and with the vision to make Aatmanirbhar Bharat (self-reliant India) (Agrawal, 2024). A roadmap to Vocational Development in NEP2020, at least 50% of learners through the school and the higher education system shall have exposure to vocational education(Pathak, 2021).

Research Question 2.How vocational education curriculum aligns with current and future industry demands?

According to the draft of NEP 2020 the provision of vocational education is mentioned in para 16. The implementation of the NEP 2020 is essential for the transformation of the education system in India (Banerjee, 2023). Fostering Vocational Education among students through the lens of National Education Policy2020 as real need of the hour (Chowdhury and Mondal, 2022)Vocational Education and Skill Development are very important in regard to NEP 2020 it fills the gap between education and industry demand . It also develops the connection between academic institutes and industry (Barai, 2024). Vocationalization of Indian Education system through National Education Policy 2020willincrease employability rates among youths (Bhatta and Bharali, 2024)Professional schooling and training is very important in vocational education. Implementation of Vocational Education and training will solve the many challenges of vocational education in NEP 2020 and it will be the best possible solution for the problem. Challenges and Opportunities in general education with vocational education in schools should prioritizes pre vocational education and vocational education operating with NSQF and connect general education with skill development programme (Vats and Malik, 2024).Therefore, vocational education will improve by approval of professional courses and set up of skill laboratories in higher education (Gupta, Dhull, and Ashraf, 2022).

Research Question 3. What are the ways to access the NEP 2020 that ensure vocational education is accessible to diverse groups?

According to the draft of NEP 2020 the provision of vocational education is mentioned in para 16.The importance of professional training and learning of teachers will help the student to perform in specific field of careers. The issue - inclusion in vocational education and training presents international perspectives on a universal challenge. The Role of Vocational Educationand will included the nature of participation of the socially excluded in vocational education and training and the difficulties of targeting vocational education and training towards social exclusion (Preston and Green, 2008).The role of Vocational Education in the Student Career Development Process provides information about careers obtained is an initial plan and can improve career development and create career opportunities. (Wagino *et.al*., 2023)Inclusive Vocational Education is the Key to Women Empowerment and Sustainable Livelihoods. The vocational education programmes should be more inclusive as it needs to take into consideration the various socio-cultural, economic and personal barriers that the women face in their domestic lives and community living (Siddhu and Karolia,2023).Diversity of Purpose in Vocational Education may develop technical skills,sense of competence, understanding of applications and aesthetic appreciation and expression among students (Plihal and Copa, 1986).Vocational Education and Social Inclusion provides career guidance and retention strategies to foster success rate (Hargraves (2011). Integration of ethnic minorities during group-work for vocational training develops intercultural communication skills and cultural sensitivity (Goth, Bergsli, and Johanesen, 2017).

Research Question 4. How does the NEP 2020 framework guide towards global best practices?

According to the draft of NEP 2020 the provision of vocational education is mentioned in para 16.The NEP 2020 aims at making "India a global knowledge superpower"; it includes visions and goals, principles, implementation strategies and different factors. The visions of NEP 2020 translated in practice can prove to be an unbeatable soft power to facilitate India to achieve its global position in the emerging world order. Quality Parameters for in futuristic education in the light of NEP 2020; the quality guidelines of NEP 2020 provides innovative, advanced and visionary education through NEP 2020 (**Pareek, 2023)**.NEP 2020 has been prepared according to the need of 21st century. It fits global standards of education as it include vocational education, technology based education ,flexible curriculum and evaluation and other important changes in it **(Mahali, 2023)**.The different aspects of NEP2020 like ECCE, school education, higher education, vocational education and many more. It empower learner to become global citizen and lifelong learners **(Bhar, 2023)**. new education system is creativity and conception based learning system is creativity and conception based learning system which promote better learning results ,more job skills and strengthen innovation capacities. Pedagogical Innovation towards a new direction for Multidisciplinary and Holistic Futuristic Education in the light of NEP2020; the scientific perspectives like interdisciplinary thinking ,creative combinations ,multidisciplinary model, research and innovation, industrial link and all round development for multidisciplinary and holistic futuristic education of youth (**Biswas, 2023).** The education policies of Finland, India, Germany, United States and United Kingdom says that integrating vocational education into the mainstream curriculum is similar to Germany's dual education system. The education policies of India and UNESCO found that life-long learning and holistic education are common in both policies (**Tholath *et. al*.2021)**.

Findings of the Study

After analysis the data it is found that NEP-2020 include many programmes, courses and recommendations to promote vocational education. It also provides understanding of Start-ups, Entrepreneurship at higher education level. Overall NEP-2020 connects vocational and skill education with general education at every level of education. Vocational education is real need of the hour. Adding many vocational courses and training in curriculum is very useful for students as well as industries. Vocational education programmes should be more inclusive. It should provide career guidance, vocational education training, skill development programmes and retention strategies to foster success rate in disadvantaged groups. Education policies of different countries are similar to NEP-2020 at some point.NEP-2020 provides quality guidelines for innovative, advanced and visionary education.NEP-2020 prepared according to the need of 21st century and fits global standards of education.

Educational Implications

Integration of Vocational Education into mainstream Education; NEP-2020 includes vocational education in general education and start many skill development programmes for students from grade 6 to higher education.

Role of Multidisciplinary Education; NEP-2020 provides many opportunities to choose vocational courses and technical training according to students interest .It shows the flexibility in vocational education as well as in academic courses.

Skill-Based Learning and Employment Readiness; NEP-2020 suggests such type of vocational programmes that promote employment readiness and skill based learning in students.

Inclusivity and Accessibility; NEP-2020 focuses on vocational training for diverse groups. It also include marginalized communities, rural students and girls.

Suggestions for Further Research

The potential researchers might focus on the following topics for more study

1. A similar study can be conducted on challenges and opportunities in implementing. NEP-2020's Vocational Education Framework.
2. A study can be conducted on role of public-private partnerships in vocational education post NEP 2020.
3. A study can be conducted on International Comparisons on Vocational education.
4. A study can be conducted on success rates of NEP-2020 and vocational education.
5. A study can be conducted on the role of traditional handcrafts in vocational education programmes.

CONCLUSION

The study aimed to study the NEP-2020 and its provisions for vocational education. The implementation for vocational education under NEP-2020 shows a radical change in India's education system, aiming to bridge the gap between academic learning and skill-based training. Researcher analysed the policy framework, implementation, challenges and real-world impact of NEP-2020's vocational education. Findings suggest that NEP-2020 has laid a strong foundation for integrating vocational training from an early stage. We face challenges in terms of infrastructure, industry collaboration and societal perception. Despite government initiatives and findings, difference between urban and rural institutions limiting access to quality skill-based education. A crucial finding is the slow acceptance of vocational education as a mainstream career, remaining social biases favouring traditional academic degrees over skill-based learning. However, vocational education can enhance employability, increase economic growth and reduce country's skill gap. After analysing NEP-2020 vision fully, researcher found that policymakers focused on strengthening implementation mechanisms, ensuring industry aligned curricula, improving infrastructure and changing mind sets towards vocational learning. With proper efforts, India can create an education system that is inclusive, skill oriented and future-ready, empowering students to succeed in a rapidly developing job market.

ABSTRACT

The main objective of this work is to present the idea of $\mathcal{J}$P*- Continuous maps in $\mathcal{J}$TS using the concepts of $\mathcal{J}$P* open sets. Also, we define the Contra version of $\mathcal{J}$P*- Continuous maps in $\mathcal{J}$TS. We continue to look into the connection to $\mathcal{J}$- Continuous and $\mathcal{J}$P- Continuous maps in $\mathcal{J}$TS.

Keywords: $\mathcal{J}$P*- Continuous, Contra $\mathcal{J}$P*- Continuous, $\mathcal{J}$- Continuous, $\mathcal{J}$P- Continuous.
AMS subject classification (2010): 54C05.

INTRODUCTION

D. Coker [1] introduced the idea of intuitionistic sets for the first time in 1996. 2016 saw the definition of intuitionistic pre open sets in $\mathcal{J}$TS by G. Sasikala and M. Navaneethakrishnan [4]. In [5] we introduced $\mathcal{J}$P*O sets and $\mathcal{J}$P*C sets in $\mathcal{J}$TS. We also look into the connection between $\mathcal{J}$P- continuous maps and $\mathcal{J}$P*- continuous maps in $\mathcal{J}$TS. In this research defines $\mathcal{J}$P *- Continuous and Contra $\mathcal{J}$P *- Continuous maps using the concepts of $\mathcal{J}$P*O sets and $\mathcal{J}$P*C sets. We also demonstrate that the $\mathcal{J}$P*- continuous map is intermediate between $\mathcal{J}$- continuous and $\mathcal{J}$P- continuous maps.

Preliminaries

Definition 2.1 [1] Assume that X_J is not empty set. An object with the form $M_J = \langle X_J, M_{J1}, M_{J2} \rangle$, where M_{J1} and M_{J2} are subsets of X_J satisfying $M_{J1} \cap M_{J2} = \phi$, is known as an *intuitionistic set* ($\mathcal{J}$S in short). The terms "set of members of M_J" and "set of non-members of M_J" refer to the sets M_{J1} and M_{J2} respectively.

Definition 2.2 [1] Assume that X_J is a non-empty set, that $M_J = \langle X_J, M_{J1}, M_{J2} \rangle$, that $N_J = \langle X_J, N_{J1}, N_{J2} \rangle$ is an $\mathcal{J}$S's and that $\{M_{Ji} : i \in J\}$ be arbitrary family of $\mathcal{J}$S's. Then,

a. $M_J \subseteq N_J$ iff $M_{J1} \subseteq N_{J1}$ and $M_{J2} \supseteq N_{J2}$.
b. $M_J = N_J$ iff $M_J \subseteq N_J$ and $M_J \supseteq N_J$.
c. The complement of M_J is defined as $M_J^c = \langle X_J, M_{J2}, M_{J1} \rangle$.
d. $\cup M_{Ji} = \langle X_J, \cup M_{Ji1}, \cap M_{Ji2} \rangle$ and $\cap M_{Ji} = \langle X_J, \cap M_{Ji1}, \cup M_{Ji2} \rangle$.
e. $M_J - N_J = M_J \cap N_J^c$.
f. $\phi_I = \langle X_J, \phi, X_J \rangle$ and $X_I = \langle X_J, X_J, \phi \rangle$.

Definition 2.3 [1] Assume that X_J is a non-empty set and $m_{xj} \in X_J$ is a fixed element then the intuitionistic point M_J is defined as follows $M_J = \langle X_J, \{m_{xj}\}, \{m_{xj}\}^c \rangle$.

Definition 2.4 [1] Assume that X_J is an nonempty set and τ_I is the set of $\mathcal{J}$S's of X_J then τ_I is known as an *intuitionistic topology* ($\mathcal{J}$T in short) on X_J if it meets the criteria listed below:

1. $X_I, \phi_I \in \tau_I$.
2. $M_J \cap N_J \in \tau_I$ for every $M_J, N_J \in \tau_I$.
3. $\cup M_{Ji} \in \tau_I$ for any arbitrary family $\{M_{Ji} : i \in J\} \subseteq \tau_I$.

The pair (X_J, τ_I) is known as *intuitionistic topological space* (abbreviated $\mathcal{J}$TS) and intuitionistic open set ($\mathcal{J}$OS in short) in X_J is referred to as $\mathcal{J}$S in τ_I. The intuitionistic closed set ($\mathcal{J}$CS in short) in X_J is regarded as the counterpart of $\mathcal{J}$OS in X_J.

Definition 2.5 [1] If (X_J, τ_I) is a $\mathcal{J}$TS and M_J is a $\mathcal{J}$S in X_J then the definition of the $\mathcal{J}$- interior operator of M_J and the $\mathcal{J}$-closure operator of M_J are as follows: (i) $\mathcal{J}\text{int}(M_J) = \cup \{N_J : N_J$ is $\mathcal{J}$OS in X_J and $M_J \supseteq N_J\}$. (ii) $\mathcal{J}\text{cl}(M_J) = \cap \{ N_J : N_J$ is $\mathcal{J}$CS in X_J and $M_J \subseteq N_J\}$.

Definition 2.6 [2] If (X_J, τ_I) is an $\mathcal{J}$TS and a $\mathcal{J}$S M_J is known as the $\mathcal{J}$g- closed set if $\mathcal{J}\text{cl}(M_J) \subseteq U_J$ whenever $M_J \subseteq U_J$ and U_J is $\mathcal{J}$OS in X_J. The $\mathcal{J}$g – open set in X_J is known as the $\mathcal{J}$g- closed set's counterpart.

Definition 2.7 [2] If (X_J, τ_I) is an $\mathcal{J}$TS and M_J be a $\mathcal{J}$S in X_J then the definition of

a. $\mathcal{J}$g- *closure of* M_J is, $\mathcal{J}\text{cl}^*(M_J) = \cap \{N_J : N_J$ is $\mathcal{J}$g- CS in X_J and $M_J \subseteq N_J\}$.
b. $\mathcal{J}$g- *interior of* M_J is, $\mathcal{J}\text{int}^*(M_J) = \cup \{N_J : N_J$ is $\mathcal{J}$g- OS in X_J and $M_J \supseteq N_J\}$.

Definition 2.8 [4] If (X_J, τ_I) is an $\mathcal{J}$TS and a $\mathcal{J}$S M_J in X_J is known as the

a. $\mathcal{J}$PO set if $M_J \subseteq \mathcal{J}\text{int}(\mathcal{J}\text{cl}(M_J))$. The $\mathcal{J}$PC set in X_J is the $\mathcal{J}$PO set's counterpart.
b. $\mathcal{J}$P*O set if $M_J \subseteq \mathcal{J}\text{int}(\mathcal{J}\text{cl}^*(M_J))$. The $\mathcal{J}$P*C set in X_J is the $\mathcal{J}$PO set's counterpar

Theorem 2.9 [5] If (X_J, τ_{IT}) is an $\mathcal{J}$TS then,

a. Every $\mathcal{J}$O set is $\mathcal{J}$P*O set.
b. Every $\mathcal{J}$C set is $\mathcal{J}$P*C set.
c. Every $\mathcal{J}$P*O set is $\mathcal{J}$PO set.
d. Every $\mathcal{J}$P*C set is $\mathcal{J}$PC set.
e. Arbitrary union of $\mathcal{J}$P*O sets is $\mathcal{J}$P*O set.
f. Intersection of $\mathcal{J}$P*C sets is $\mathcal{J}$P*C set.

Theorem 2.10 [1] If (X_J, τ_I) is an $\mathcal{J}$TS and M_J and N_J are $\mathcal{J}$S's in X_J then the followings are hold.

a. $\mathcal{J}\text{int}(\phi_I) = \phi_I$ and $\mathcal{J}\text{int}(X_I) = X_I$.
b. M_J is an $\mathcal{J}$OS iff $M_J = \mathcal{J}\text{int}(M_J)$.
c. $M_J \subseteq N_J \Rightarrow \mathcal{J}\text{int}(M_J) \subseteq \mathcal{J}\text{int}(N_J)$.
d. $\mathcal{J}\text{int}(M_J \cap N_J) = \mathcal{J}\text{int}(M_J) \cap \mathcal{J}\text{int}(N_J)$.
e. $\mathcal{J}\text{int}(M_J \cup N_J) \supseteq \mathcal{J}\text{int}(M_J) \cup \mathcal{J}\text{int}(N_J)$.
f. $\mathcal{J}\text{cl}(\phi_I) = \phi_I$ and $\mathcal{J}\text{cl}(X_I) = X_I$.
g. M_J is an $\mathcal{J}$CS iff $M_J = \mathcal{J}\text{cl}(M_J)$.
h. $M_J \subseteq N_J \Rightarrow \mathcal{J}\text{cl}(M_J) \subseteq \mathcal{J}\text{cl}(N_J)$.
i. $\mathcal{J}\text{cl}(M_J \cap N_J) \subseteq \mathcal{J}\text{cl}(M_J) \cap \mathcal{J}\text{cl}(N_J)$.
j. $\mathcal{J}\text{cl}(M_J \cup N_J) = \mathcal{J}\text{cl}(M_J) \cup \mathcal{J}\text{cl}(N_J)$.

Theorem 2.11 [2] If (X_J,τ_I) is an $\mathcal{J}$TS and M_J, N_J are $\mathcal{J}$S's in X_J then the followings are hold.

a. $\mathcal{J}int^*(\phi_I) = \phi_I$ and $\mathcal{J}int^*(X_I) = X_I$.
b. If M_J is $\mathcal{J}$g- OS then $M_J = \mathcal{J}int^*(M_J)$.
c. $\mathcal{J}int(M_J) \subseteq \mathcal{J}int^*(M_J) \subseteq M_J$.
d. $M_J \subseteq N_J \Rightarrow \mathcal{J}int^*(M_J) \subseteq \mathcal{J}int^*(N_J)$.
e. $\mathcal{J}int^*(M_J \cap N_J) \subseteq \mathcal{J}int^*(M_J) \cap \mathcal{J}int^*(N_J)$.
f. $\mathcal{J}int^*(M_J \cup N_J) \supseteq \mathcal{J}int^*(M_J) \cup \mathcal{J}int^*(N_J)$.
g. $\mathcal{J}cl^*(\phi_I) = \phi_I$ and $\mathcal{J}cl^*(X_I) = X_I$.
h. If M_J is $\mathcal{J}$g- CS then $M_J = \mathcal{J}cl^*(M_J)$.
i. $M_J \subseteq \mathcal{J}cl^*(M_J) \subseteq \mathcal{J}cl(M_J)$.
j. $M_J \subseteq N_J \Rightarrow \mathcal{J}cl^*(M_J) \subseteq \mathcal{J}cl^*(N_J)$.
k. $\mathcal{J}cl^*(M_J \cap N_J) \subseteq \mathcal{J}cl^*(M_J) \cap \mathcal{J}cl^*(N_J)$.
l. $\mathcal{J}cl^*(M_J \cup N_J) \supseteq \mathcal{J}cl^*(M_J) \cup \mathcal{J}cl^*(N_J)$.

Theorem 2.12 [5] If (X_J,τ_I) is an $\mathcal{J}$TS and M_J, N_J be a $\mathcal{J}$S's in X_J then the followings are hold.

a. $\mathcal{J}P^*int(\phi_I) = \phi_I$ and $\mathcal{J}P^*int(X_I) = X_I$.
b. M_J is an $\mathcal{J}$P*OS iff $M_J = \mathcal{J}P^*int(M_J)$.
c. $M_J \subseteq N_J \Rightarrow \mathcal{J}P^*int(M_J) \subseteq \mathcal{J}P^*int(N_J)$.
d. $\mathcal{J}P^*int(M_J \cap N_J) = \mathcal{J}P^*int(M_J) \cap \mathcal{J}P^*int(N_J)$.
e. $\mathcal{J}P^*int(M_J \cup N_J) \supseteq \mathcal{J}P^*int(M_J) \cup \mathcal{J}P^*int(N_J)$.
f. $\mathcal{J}P^*cl(\phi_I) = \phi_I$ and $\mathcal{J}P^*cl(X_I) = X_I$.
g. M_J is an $\mathcal{J}$P*CS iff $M_J = \mathcal{J}P^*cl(M_J)$.
h. $M_J \subseteq N_J \Rightarrow \mathcal{J}P^*cl(M_J) \subseteq \mathcal{J}P^*cl(N_J)$.
i. $\mathcal{J}P^*cl(M_J \cap N_J) \subseteq \mathcal{J}P^*cl(M_J) \cap \mathcal{J}P^*cl(N_J)$.
j. $\mathcal{J}P^*cl(M_J \cup N_J) = \mathcal{J}P^*cl(M_J) \cup \mathcal{J}P^*cl(N_J)$.

Theorem 2.13 [1,2,5] If (X_J,τ_{IT}) is an $\mathcal{J}$TS and M_J is a $\mathcal{J}$S of X_J then,

a. $\mathcal{J}int(M_J^c) = [\mathcal{J}cl(M_J)]^c$ and $\mathcal{J}cl(M_J^c) = [\mathcal{J}int(M_J)]^c$.
b. $\mathcal{J}int^*(M_J^c) = [\mathcal{J}cl^*(M_J)]^c$ and $\mathcal{J}cl^*(M_J^c) = [\mathcal{J}int^*(M_J)]^c$.
c. $\mathcal{J}P^*int(M_J^c) = [\mathcal{J}P^*cl(M_J)]^c$ and $\mathcal{J}P^*cl(M_J^c) = [\mathcal{J}P^*int(M_J)]^c$.

Definition 2.14[1] Let $f_J : X_J \to Y_J$ is said to be

a. $\mathcal{J}$- continuous if $f_J^{-1}(V)$ is $\mathcal{J}$OS in X_J for each $\mathcal{J}$OS V in Y_J.
b. $\mathcal{J}$P- continuous if $f_J^{-1}(V)$ is $\mathcal{J}$POS in X_J for each $\mathcal{J}$OS V in Y_J.
c. Contra $\mathcal{J}$- continuous if $f_J^{-1}(V)$ is $\mathcal{J}$CS in X_J for each $\mathcal{J}$OS V in Y_J.
d. Contra $\mathcal{J}$P- continuous if $f_J^{-1}(V)$ is $\mathcal{J}$PCS in X_J for each $\mathcal{J}$OS V in Y_J.

Theorem 2.15[1] Every constant map is $\mathcal{J}$- continuous map.

Intuitionistic Pre * Continuous Maps

Definition 3.1 A map f_J from $\mathcal{J}$TS (X_J,τ_{IT}) into another $\mathcal{J}$TS (Y_J,σ_{IT}) is Called Intuitionistic Pre * Continuous at a point $m_{xj} \in X_J$ if for every $\mathcal{J}$OS N_J of Y_J contains $f_J(m_{xj})$, there exists a $\mathcal{J}$P*O set M_J in X_J such that $m_{xj} \in M_J$ and $f_J(M_J) \subseteq N_J$.

Definition 3.2 A map f_J from $\mathcal{J}$TS (X_J,τ_{IT}) into another $\mathcal{J}$TS (Y_J,σ_{IT}) is Called Intuitionistic Pre * Continuous (In short $\mathcal{J}$P*- continuous) Map if $f_J^{-1}(M_J)$ is $\mathcal{J}$P*O in X_J for every $\mathcal{J}$OS M_J in Y_J.

Example 3.3 Take $X_J = \{a_{xj},b_{xj},c_{xj}\}$ and $Y_J = \{a_{yj},b_{yj},c_{yj}\}$. Consider the $\mathcal{J}$T's $\tau_{IT} = \{X_I,\phi_I,< X_J, \{b_{xj}\},\{a_{xj},c_{xj}\}>,<X_J,\{a_{xj},b_{xj}\},\{c_{xj}\}>\}$ and $\sigma_{IT} = \{Y_I,\phi_I,< Y_J,\{a_{yj}\},\{b_{yj},c_{yj}\}>,<Y_J,\{a_{yj},b_{yj}\},\{c_{yj}\}>\}$ then $\mathcal{J}P^*O(X_J) = \tau_{IT}$ and $\mathcal{J}P^*O(Y_J) = \sigma_{IT}$. Let $f_J : (X_J,\tau_{IT}) \to (Y_J,\sigma_{IT})$ be a map defined by, $f_J(a_{xj}) = b_{yj}$, $f_J(b_{xj}) = a_{yj}$, $f_J(c_{xj}) = c_{yj}$. Here, $f_J^{-1}(Y_I) = X_I$, $f_J^{-1}(\phi_I) = \phi_I$, $f_J^{-1}(<Y_J,\{a_{yj}\},\{b_{yj},c_{yj}\}>) = <X_J,\{b_{xj}\},\{a_{xj},c_{xj}\}>$, $f_J^{-1}(<Y_J,\{a_{yj},b_{yj}\},\{c_{yj}\}>) = <X_J,\{a_{xj},b_{xj}\},\{c_{xj}\}>$ are $\mathcal{J}$P*O sets in X_J. Therefore f_J is $\mathcal{J}$P*- continuous.

Theorem 3.4 A map $f_J : (X_J,\tau_{IT}) \to (Y_J,\sigma_{IT})$ is $\mathcal{J}$P*- Continuous iff each $\mathcal{J}$C set in Y_J has an inverse image that is IP*CS in X_J.

Theorem 3.5 Every $\mathcal{J}$- continuous map is $\mathcal{J}$P*- continuous.

Proof: Suppose a map $f_J : (X_j,\tau_{IT}) \to (Y_J,\sigma_{IT})$ is $\mathcal{J}$- continuous then $f_J^{-1}(M_J)$ is $\mathcal{J}O$ of X_j for every $\mathcal{J}OS$ M_J in Y_J. Therefore, $f_J^{-1}(M_J)$ is $\mathcal{J}P^*O$ in X_j for each $\mathcal{J}O$ M_J in Y_J. Hence, f_J is $\mathcal{J}P^*$- continuous map. According to the example below, the reverse part of the aforementioned theorem need not be true.

Example 3.6 Take $X_j = \{a_{xj},b_{xj},c_{xj}\}$ and $Y_J = \{a_{yj},b_{yj},c_{yj}\}$. Consider the $\mathcal{J}T$'s $\tau_{IT} = \{X_I,\phi_I, <X_j,\{a_{xj}\},\{b_{xj}\}>,<X_j,\{b_{xj}\},\{c_{xj}\}>,<X_j,\{a_{xj},b_{xj}\},\phi>,<X_j,\phi,\{b_{xj},c_{xj}\}>\}$ and $\sigma_{IT} = \{Y_I,\phi_I,< Y_J,\{a_{yj}\}, \{b_{yj},c_{yj}\}>\}$ then $\mathcal{J}P^*O(X_j) = \{X_I,\phi_I,< X_j,\{a_{xj}\},\{b_{xj}\}>,<X_j,\{a_{xj}\},\{b_{xj},c_{xj}\}>,<X_j,\{b_{xj}\},\{c_{xj}\}>, <X_j,\{a_{xj},b_{xj}\},\{c_{xj}\}>,<X_j,\{a_{xj},b_{xj}\},\phi>,<X_j,\phi,\{b_{xj},c_{xj}\}>\}$. Let $f_J : (X_j,\tau_{IT}) \to (Y_J,\sigma_{IT})$ be a map defined by, $f_J(a_{xj}) = a_{yj}$, $f_J(b_{xj}) = c_{yj}$, $f_J(c_{xj}) = b_{yj}$. Here, $f_J^{-1}(Y_I) = X_I$, $f_J^{-1}(\phi_I) = \phi_I$, $f_J^{-1}(<Y_J,\{a_{yj}\},\{b_{yj},c_{yj}\}>) = <X_j,\{a_{xj}\}, \{b_{xj},c_{xj}\}>$ are $\mathcal{J}P^*O$ sets in X_j. Therefore f_J is $\mathcal{J}P^*$- continuous map but $f_J^{-1}(<Y_J,\{a_{yj}\},\{b_{yj},c_{yj}\}>) \notin \tau_{IT}$. Therefore, f_J is not a $\mathcal{J}$-continuous map.

Theorem 3.7 Every constant map is $\mathcal{J}P^*$- continuous map.

Proof: By theorem – 3.5 and 2.16, the results is obvious.

Theorem 3.8 Every $\mathcal{J}P^*$- continuous is $\mathcal{J}P$- continuous.

Proof: Suppose $f_J :(X_j,\tau_{IT}) \to (Y_J,\sigma_{IT})$ is $\mathcal{J}P^*$- continuous. Then $f_J^{-1}(M_J)$ is $\mathcal{J}P^*OS$ in X_j for every $\mathcal{J}OS$ M_J in Y_J. Therefore, $f_J^{-1}(M_J)$ is $\mathcal{J}PO$ set in X_j for each $\mathcal{J}O$ M_J in Y_J. Hence, f_J is $\mathcal{J}P$- continuous map.
According to the example below, the reverse part of the aforementioned theorem need not be true.

Example 3.9 Take $X_j = \{a_{xj},b_{xj},c_{xj}\}$ and $Y_J = \{a_{yj},b_{yj},c_{yj}\}$. Consider the $\mathcal{J}T$''s $\tau_{IT} = \{X_I,\phi_I, <X_j,\{a_{xj}\},\{c_{xj}\}>,<X_j,\{c_{xj}\},\{a_{xj},b_{xj}\}>,<X_j,\{a_{xj},c_{xj}\},\phi>\}$ and $\sigma_{IT} = \{Y_I,\phi_I,<Y_J,\{a_{yj}\},\{b_{yj}\}>\}$ then $\mathcal{J}P^*O(X_j) = \{X_I,\phi_I,<X_j,\{a_{xj}\},\{c_{xj}\}>,<X_j,\{a_{xj}\},\{b_{xj},c_{xj}\}>,<X_j,\{c_{xj}\},\{a_{xj},b_{xj}\}>,<X_j,\{a_{xj},c_{xj}\},\{b_{xj}\}>, <X_j,\{a_{xj}\},\phi>,<X_j,\{a_{xj},c_{xj}\},\phi>\}$ and $\mathcal{J}PO(X_j) = \{X_I,\phi_I,< X_j,\phi,\phi>,<X_j,\phi,\{b_{xj}\}>,<X_j,\phi,\{c_{xj}\}>, <X_j,\{b_{xj}\},\{a_{xj}\}>,<X_j,\{c_{xj}\},\{b_{xj}\}>,<X_j,\phi,\{a_{xj},b_{xj}\}>,<X_j,\phi,\{b_{xj},c_{xj}\}>,<X_j,\{a_{xj}\},\{b_{xj}\}>,<X_j,\{a_{xj}\},\{c_{xj}\}>,<X_j,\{b_{xj},c_{xj}\},\{a_{xj}\}>,<X_j,\{a_{xj}\},\phi>,<X_j,\{b_{xj}\},\phi>,<X_j,\{a_{xj}\},\{b_{xj},c_{xj}\}>,<X_j,\{c_{xj}\},\phi>,<X_j,\{c_{xj}\},\{a_{xj},b_{xj}\}>,<X_j,\{a_{xj},c_{xj}\},\{b_{xj}\}>,<X_j,\{a_{xj},b_{xj}\},\phi>, <X_j,\{b_{xj},c_{xj}\},\phi>,<X_j,\{a_{xj},c_{xj}\},\phi>\}$. Define a map $f_J : (X_j,\tau_{IT}) \to (Y_J,\sigma_{IT})$ by, $f_J(a_{xj}) = b_{yj}$, $f_J(b_{xj}) = c_{yj}$, $f_J(c_{xj}) = a_{yj}$. Here, $f_J^{-1}(Y_I) = X_I$, $f_J^{-1}(\phi_I) = \phi_I$, $f_J^{-1}(<Y_J,\{a_{yj}\},\{b_{yj}\}>) = <X_j,\{c_{xj}\},\{a_{xj}\}>$ are $\mathcal{J}PO$ sets in X_j. Therefore f_J is $\mathcal{J}P$- continuous map but $f_J^{-1}(<Y_J,\{a_{yj}\},\{b_{yj}\}>) \notin \mathcal{J}P^*O(X_j)$. Therefore, f_J is not a $\mathcal{J}P^*$- continuous.

Remark 3.10 The link between $\mathcal{J}P^*$- continuous map, $\mathcal{J}$- continuous and $\mathcal{J}P$ - continuous maps is depicted in the following diagram(Fig:1).

Theorem 3.11 Assume that $f_J : (X_j,\tau_{IT}) \to (Y_J,\sigma_{IT})$ is a map, then the followings are equivalent.

a. f_J is an $\mathcal{J}P^*$- continuous.
b. f_J is an $\mathcal{J}P^*$- continuous at every intuitionistic point of X_j.
c. $f_J^{-1}(A_J)$ is $\mathcal{J}P^*CS$ in X_j for each $\mathcal{J}CS$ A_J in Y_J.

Proof: (a) ⇒ (b), Let f_J be $\mathcal{J}P^*$- continuous map. Let m_{xj} be any $\mathcal{J}P$ in X_j and ω_J be an $\mathcal{J}O$ set in Y_J containing $f_J(m_{xj})$ then $m_{xj} \in f_J^{-1}(\omega_J)$. Therefore, $U_J = f_J^{-1}(\omega_J)$ is $\mathcal{J}P^*O$ in X_j contains a point m_{xj} such that $f_J(U_J) \subseteq \omega_J$. Hence f_J is $\mathcal{J}P^*$-continuous at every $\mathcal{J}P$ of X_j.
(b) ⇒ (c), Let A_J be a $\mathcal{J}CS$ in Y_J then A_J^c is $\mathcal{J}OS$ in Y_J. Take $m_{xj} \in f_J^{-1}(A_J^c)$ then $f(m_{xj}) \in A_J^c$. By hypothesis, there exist a $\mathcal{J}P^*OS$ ω_J in X_j contains a point m_{xj} such that $f_J(m_{xj}) \in f_J(\omega_J) \subseteq A_J^c$. Therefore $\omega_J \subseteq f_J^{-1}(A_J^c)$. Hence $f_J^{-1}(A_J^c) = \cup \{\omega_J : m_{xj} \in f_J^{-1}(A_J^c)\}$ is $\mathcal{J}P^*O$ set in X_j. Thus $f_J^{-1}(A_J) = f_J^{-1}[(A_J^c)^c] = [f_J^{-1}(A_J^c)]^c$ is $\mathcal{J}P^*CS$ in X_j for each $\mathcal{J}CS$ A_J in Y_J.
(c) ⇒ (a) Suppose, $f_J^{-1}(A_J)$ is $\mathcal{J}P^*C$ in X_j for each $\mathcal{J}C$ A_J in Y_J. Then by theorem – 3.4, f_J is $\mathcal{J}P^*$- continuous map.

Theorem – 3.12 Assume that $f_J : (X_j,\tau_{IT}) \to (Y_J,\sigma_{IT})$ is a map, then the followings are equivalent.

a. f_J is $\mathcal{J}P^*$- continuous map.
b. $f_J^{-1}(\mathcal{J}int(A_J)) \subseteq \mathcal{J}P^*int(f_J^{-1}(A_J))$ for each $\mathcal{J}S$ A_J of Y_J.
c. $\mathcal{J}int(f_J(B_J)) \subseteq f_J(\mathcal{J}P^*int(B_J))$ for every $\mathcal{J}S$ B_J of X_j.

Proof: (a) ⇒ (b), Let f_J be $\mathcal{J}P^*$- continuous map. Let A_J be any $\mathcal{J}S$ of $\grave{Y}_J$ then $\mathcal{J}int(A_J)$ is $\mathcal{J}O$ set. Therefore, $f_J^{-1}(\mathcal{J}int(A_J))$ is $\mathcal{J}P^*O$. Hence, $f_J^{-1}(\mathcal{J}int(A_J)) = \mathcal{J}P^*int(f_J^{-1}(\mathcal{J}int(A_J)))\subseteq\mathcal{J}P^*int(f_J^{-1}(A_J))$.
(b) ⇒ (c), Let B_J be any $\mathcal{J}S$ of $\hat{X}_J$ then $f_J(B_J)$ is $\mathcal{J}S$ of $\grave{Y}_J$. By our assumption, $f_J^{-1}(\mathcal{J}int(f_J(B_J))) \subseteq \mathcal{J}P^*int(f_J^{-1}(f_J(B_J)))$. Hence, $\mathcal{J}int(f_J(B_J)) \subseteq f_J(\mathcal{J}P^*int(B_J))$.
(c) ⇒ (a), Let G_J be any $\mathcal{J}O$ set of $\grave{Y}_J$ then $f_J^{-1}(G_J)$ is $\mathcal{J}S$ of $\hat{X}_J$. By (c), $\mathcal{J}int(f_J(f_J^{-1}(G_J))) \subseteq f_J(\mathcal{J}P^*int(f_J^{-1}(G_J)))$. (i.e) $f_J^{-1}(\mathcal{J}int(G_J)) \subseteq \mathcal{J}P^*int(f_J^{-1}(G_J))$. Since G_J is $\mathcal{J}O$ set then $f_J^{-1}(G_J) \subseteq \mathcal{J}P^*int(f_J^{-1}(G_J))$. Also, $\mathcal{J}P^*int(f_J^{-1}(G_J)) \subseteq f_J^{-1}(G_J)$. Therefore, $f_J^{-1}(G_J) \subseteq \mathcal{J}P^*int(f_J^{-1}(G_J))$. (i.e) $f_J^{-1}(G_J)$ is $\mathcal{J}P^*O$ set in $\hat{X}_J$. Hence f_J is $\mathcal{J}P^*$- continuous map.

Theorem – 3.13 Let $f_J : (\hat{X}_J,\tau_{IT}) \to (\grave{Y}_J,\sigma_{IT})$ be a map, then the followings are equivalent.
a. f_J is an $\mathcal{J}P^*$- continuous map.
b. $\mathcal{J}P^*cl(f_J^{-1}(A)) \subseteq f_J^{-1}(\mathcal{J}cl(A_J))$ for each $\mathcal{J}S$ A_J of $\grave{Y}_J$.
c. $f_J(\mathcal{J}P^*cl(B)) \subseteq \mathcal{J}cl(f_J(B_J))$ for every $\mathcal{J}S$ B_J of $\hat{X}_J$.

Proof: It is similar to theorem – 3.12.

Theorem – 3.14 If $f_J : (\hat{X}_J,\tau_{IT}) \to (\grave{Y}_J,\sigma_{IT})$ and $g_J : (\grave{Y}_J,\sigma_{IT}) \to (\hat{Z}_J,\mu_{IT})$ are $\mathcal{J}$- continuous then $g_J\circ f_J : (\hat{X}_J,\tau_{IT}) \to (\hat{Z}_J,\mu_{IT})$ is $\mathcal{J}P^*$- continuous map.

Proof: Suppose $f_J : (\hat{X}_J,\tau_{IT}) \to (\grave{Y}_J,\sigma_{IT})$ and $g_J : (\grave{Y}_J,\sigma_{IT}) \to (\hat{Z}_J,\mu_{IT})$ are $\mathcal{J}$- continuous. Let ω_J be an $\mathcal{J}OS$ in $\hat{Z}_J$ then $g_J^{-1}(\omega_J)$ is $\mathcal{J}OS$ in $\grave{Y}_J$. Therefore $f_J^{-1}(g_J^{-1}(\omega_J))$ is $\mathcal{J}OS$ in $\hat{X}_J$. Therefore $f_J^{-1}(g_J^{-1}(\omega_J)) = (g_J\circ f_J)^{-1}(\omega_J)$ is $\mathcal{J}P^*OS$ in $\hat{X}_J$. Therfore, $g_J\circ f_J : (\hat{X}_J,\tau_{IT}) \to (\hat{Z}_J,\mu_{IT})$ is $\mathcal{J}P^*$- continuous.

Theorem – 3.15 If $f_J : (\hat{X}_J,\tau_{IT}) \to (\grave{Y}_J,\sigma_{IT})$ is $\mathcal{J}P^*$- continuous and $g_J : (\grave{Y}_J,\sigma_{IT}) \to (\hat{Z}_J,\mu_{IT})$ is $\mathcal{J}$- continuous then
a. $g_J\circ f_J : (\hat{X}_J,\tau_{IT}) \to (\hat{Z}_J,\mu_{IT})$ is $\mathcal{J}P^*$- continuous.
b. $g_J\circ f_J : (\hat{X}_J,\tau_{IT}) \to (\hat{Z}_J,\mu_{IT})$ is $\mathcal{J}P$- continuous.

Proof: (a) Suppose ω_J is a $\mathcal{J}OS$ in $\hat{Z}_J$ then $g_J^{-1}(\omega_J)$ is $\mathcal{J}OS$ in $\grave{Y}_J$. Therefore $f_J^{-1}(g_J^{-1}(\omega_J)) = (g_J\circ f_J)^{-1}(\omega_J)$ is $\mathcal{J}P^*O$ in $\hat{X}_J$. Hence, $g_J\circ f_J$ is $\mathcal{J}P^*$- continuous map. (b) By 3.8, $g_J\circ f_J$ is $\mathcal{J}P$- continuous.

Contra Intuitionistic Pre * Continuous Maps
Definition 4.1 A map f_J from $\mathcal{J}TS$ $(\hat{X}_J,\tau_{IT})$ into another $\mathcal{J}TS$ $(\grave{Y}_J,\sigma_{IT})$ is said to be Contra Intuitionistic Pre * Continuous Map if $f_J^{-1}(W_J)$ is $\mathcal{J}P^*CS$ in $\hat{X}_J$ for every $\mathcal{J}OS$ W_J in $\grave{Y}_J$.

Example 4.2 Take $\hat{X}_J = \{a_{xj},b_{xj},c_{xj}\}$ and $\grave{Y}_J = \{a_{yj},b_{yj},c_{yj}\}$. Consider the $\mathcal{J}T$'s $\tau_{IT} = \{X_I,\phi_I,<\hat{X}_J,\{a_{xj}\},\{b_{xj},c_{xj}\}>,<\hat{X}_J,\{b_{xj}\},\{a_{xj},c_{xj}\}>,<\hat{X}_J,\{a_{xj},b_{xj}\},\{c_{xj}\}>\}$ and $\sigma_{IT} = \{Y_I,\phi_I,<\grave{Y}_J, \{a_{yj},b_{yj}\},\{c_{yj}\}>\}$ then $\mathcal{J}P^*C(\hat{X}_J) = \{X_I,\phi_I,<\hat{X}_J,\{b_{xj},c_{xj}\},\{a_{xj}\}>,<\hat{X}_J,\{a_{xj},c_{xj}\},\{b_{xj}\}>,<\hat{X}_J,\{c_{xj}\}, \{a_{xj},b_{xj}\}>\}$. Define a map $f_J : (\hat{X}_J,\tau_{IT}) \to (\grave{Y}_J,\sigma_{IT})$ by, $f_J(a_{xj}) = b_{yj}$, $f_J(b_{xj}) = c_{yj}$, $f_J(c_{xj}) = a_{yj}$. Here, $f_J^{-1}(Y_I) = X_I$, $f_J^{-1}(\phi_I) = \phi_I$ and $f_J^{-1}(<\grave{Y}_J,\{a_{yj},b_{yj}\},\{c_{yj}\}>) = <\hat{X}_J,\{a_{xj},c_{xj}\},\{b_{xj}\}>$ are $\mathcal{J}P^*C$ sets in $\hat{X}_J$. Therefore f_J is Contra $\mathcal{J}P^*$ Continuous Map.

Theorem 4.3 A map $f_J : (\hat{X}_J,\tau_{IT}) \to (\grave{Y}_J,\sigma_{IT})$ is Contra $\mathcal{J}P^*$- Continuous iff each $\mathcal{J}CS$ in $\grave{Y}_J$ has an inverse image that is IP*OS in $\hat{X}_J$.
A map $f_J : (\hat{X}_J,\tau_{IT}) \to (\grave{Y}_J,\sigma_{IT})$ is Contra $\mathcal{J}P^*$ Continuous Map iff the inverse image of every $\mathcal{J}CS$ in $\grave{Y}_J$ is $\mathcal{J}P^*OS$ in $\hat{X}_J$.

Theorem – 4.4 Every Contra $\mathcal{J}$- continuous is Contra $\mathcal{J}P^*$- continuous.

Proof: Suppose a map f_J is Contra $\mathcal{J}$- continuous map then $f_J^{-1}(W_J)$ is $\mathcal{J}CS$ in $\hat{X}_J$ for every $\mathcal{J}OS$ W_J in $\grave{Y}_J$. Therefore $f_J^{-1}(W_J)$ is $\mathcal{J}P^*CS$ in $\hat{X}_J$ for every $\mathcal{J}OS$ W_J in $\grave{Y}_J$. Hence f_J is Contra $\mathcal{J}P^*$- continuous map.
According to the example below, the reverse part of the aforementioned theorem need not be true.

Example 4.5 Take $X_J = \{a_{xj}, b_{xj}\}$ and $\grave{Y}_J = \{1_{yj}, 2_{yj}\}$. Consider the IT"s $\tau_{IT} = \{X_I, \phi_I, <X_J, \{a_{xj}\}, \phi>\}$ and $\sigma_{IT} = \{Y_I, \phi_I, <\grave{Y}_J, \{1_{yj}\}, \{2_{yj}\}>\}$ then $\mathcal{J}P^*O(X_J) = \{X_I, \phi_I, <X_J, \{a_{xj}\}, \phi>, <X_J, \{a_{xj}\}, \{b_{xj}\}>\}$ and $\mathcal{J}P^*C(X_J) = \{X_I, \phi_I, <X_J, \phi, \{a_{xj}\}>, <X_J, \{b_{xj}\}, \{a_{xj}\}>\}$. Define a map $f_J : (X_J, \tau_{IT}) \rightarrow (\grave{Y}_J, \sigma_{IT})$ by, $f_J(a_{xj}) = 2_{yj}$, $f_J(b_{xj}) = 1_{yj}$. Here, $f_J^{-1}(Y_I) = X_I$, $f_J^{-1}(\phi_I) = \phi_I$, $f_J^{-1}(<\grave{Y}_J, \{1_{yj}\}, \{2_{yj}\}>) = <X_J, \{b_{xj}\}, \{a_{xj}\}>$ are $\mathcal{J}P^*C$ sets in X_J. Therefore f_J is Contra $\mathcal{J}P^*$- continuous map but $f_J^{-1}(<\grave{Y}_J, \{1_{yj}\}, \{2_{yj}\}>) \notin \mathcal{J}(X_J)$. Therefore, f_J is not a Contra $\mathcal{J}$- continuous map.

Theorem 4.6 Every Contra $\mathcal{J}P^*$- continuous is Contra $\mathcal{J}P$- continuous.

Proof: Suppose a map f_J is Contra $\mathcal{J}P^*$- continuous map then $f_J^{-1}(W_J)$ is $\mathcal{J}P^*CS$ in X_J for every $\mathcal{J}OS$ W_J in $\grave{Y}_J$. Therefore $f_J^{-1}(W_J)$ is $\mathcal{J}PCS$ in X_J for every $\mathcal{J}OS$ W_J in $\grave{Y}_J$. Hence f_J is Contra $\mathcal{J}P$- continuous map. According to the example below, the reverse part of the aforementioned theorem need not be true.

Example 4.7 Take $X_J = \{a_{xj}, b_{xj}, c_{xj}\}$ and $\grave{Y}_J = \{a_{yj}, b_{yj}, c_{yj}\}$. Consider the IT"s $\tau_{IT} = \{X_I, \phi_I, <X_J, \phi, \{a_{xj}, b_{xj}\}>, <X_J, \{a_{xj}\}, \{c_{xj}\}>, <X_J, \{a_{xj}\}, \phi>\}$ and $\sigma_{IT} = \{Y_I, \phi_I, <\grave{Y}_J, \{a_{yj}\}, \{b_{yj}, c_{yj}\}>\}$ then $\mathcal{J}P^*C(X_J) = \{X_I, \phi_I, <X_J, \{c_{xj}\}, \{a_{xj}\}>, <X_J, \phi, \{a_{xj}\}>, <X_J, \{a_{xj}, b_{xj}\}, \phi>\}$ and $\mathcal{J}PC(X_J) = \{X_I, \phi_I, <X_J, \phi, \phi>, <X_J, \phi, \{a_{xj}\}>, <X_J, \phi, \{c_{xj}\}>, <X_J, \{b_{xj}\}, \{a_{xj}\}>, <X_J, \{c_{xj}\}, \{a_{xj}\}>, <X_J, \phi, \{a_{xj}, c_{xj}\}>, <X_J, \phi, \{b_{xj}, c_{xj}\}>, <X_J, \{b_{xj}\}, \{c_{xj}\}>, <X_J, \{b_{xj}, c_{xj}\}, \{a_{xj}\}>, <X_J, \{b_{xj}\}, \phi>, <X_J, \{a_{xj}\}, \{b_{xj}, c_{xj}\}>, <X_J, \{c_{xj}\}, \phi>, <X_J, \{b_{xj}\}, \{a_{xj}, c_{xj}\}>, <X_J, \{a_{xj}, b_{xj}\}, \phi>, <X_J, \{b_{xj}, c_{xj}\}, \phi>\}$. Define a map $f_J : (X_J, \tau_{IT}) \rightarrow (\grave{Y}_J, \sigma_{IT})$ by, $f_J(a_{xj}) = a_{yj}$, $f_J(b_{xj}) = b_{yj}$, $f_J(c_{xj}) = c_{yj}$. Here, $f_J^{-1}(Y_I) = X_I$, $f_J^{-1}(\phi_I) = \phi_I$, $f_J^{-1}(<\grave{Y}_J, \{a_{yj}\}, \{b_{yj}, c_{yj}\}>) = <X_J, \{a_{xj}\}, \{b_{xj}, c_{xj}\}>$ are $\mathcal{J}PC$ sets in X_J. Therefore f_J is Contra $\mathcal{J}P$- continuous map but $f_J^{-1}(<\grave{Y}_J, \{a_{yj}\}, \{b_{yj}, c_{yj}\}>) \notin \mathcal{J}P^*C(X_J)$. Therefore f_J is not a Contra $\mathcal{J}P^*$- continuous map.

Theorem 4.8 If $f_J : (X_J, \tau_{IT}) \rightarrow (\grave{Y}_J, \sigma_{IT})$ is Contra $\mathcal{J}P^*$- continuous and $g_J : (\grave{Y}_J, \sigma_{IT}) \rightarrow (Z_J, \mu_{IT})$ is $\mathcal{J}$- continuous map then

a. $g_J \circ f_J : (X_J, \tau_{IT}) \rightarrow (Z_J, \mu_{IT})$ is Contra $\mathcal{J}P^*$- continuous.
b. $g_J \circ f_J : (X_J, \tau_{IT}) \rightarrow (Z_J, \mu_{IT})$ is Contra $\mathcal{J}P$- continuous.

Proof: (a) Suppose ω_J be $\mathcal{J}OS$ in Z_J then $g_J^{-1}(\omega_J)$ is $\mathcal{J}OS$ in $\grave{Y}_J$. Therefore $f_J^{-1}(g_J^{-1}(\omega_J)) = (g_J \circ f_J)^{-1}(\omega_J)$ is $\mathcal{J}P^*CS$ in X_J. Therefore, $g_J \circ f_J : (X_J, \tau_{IT}) \rightarrow (Z_J, \mu_{IT})$ is Contra $\mathcal{J}P^*$- continuous map. (b) By theorem – 5.4, $g_J \circ f_J : (X_J, \tau_{IT}) \rightarrow (Z_J, \mu_{IT})$ is Contra $\mathcal{J}P$- continuous map.

Remark 4.9 If $f_J : (X_J, \tau_{IT}) \rightarrow (\grave{Y}_J, \sigma_{IT})$ and $g_J : (\grave{Y}_J, \sigma_{IT}) \rightarrow (Z_J, \mu_{IT})$ are Contra $\mathcal{J}P^*$- continuous but $g_J \circ f_J : (X_J, \tau_{IT}) \rightarrow (Z_J, \mu_{IT})$ is no need to Contra $\mathcal{J}P^*$- continuous.

Example 4.10 Let $X_J = \{a_{xj}, b_{xj}, c_{xj}\}$, $\grave{Y}_J = \{a_{yj}, b_{yj}, c_{yj}\}$ and $Z_J = \{a_{zj}, b_{zj}, c_{zj}\}$. Consider the IT"s $\tau_{IT} = \{X_I, \phi_I, <X_J, \{a_{xj}\}, \{b_{xj}, c_{xj}\}>, <X_J, \{b_{xj}\}, \{a_{xj}, c_{xj}\}>, <X_J, \{a_{xj}, b_{xj}\}, \{c_{xj}\}>\}$, $\sigma_{IT} = \{Y_I, \phi_I, <\grave{Y}_J, \{a_{yj}\}, \{b_{yj}, c_{yj}\}>\}$ and $\mu_{IT} = \{Z_I, \phi_I, <Z_J, \{a_{zj}, c_{zj}\}, \{b_{zj}\}>\}$ then $\mathcal{J}P^*C(X_J) = \{X_I, \phi_I, <X_J, \{b_{xj}, c_{xj}\}, \{a_{xj}\}>, <X_J, \{a_{xj}, c_{xj}\}, \{b_{xj}\}>, <X_J, \{c_{xj}\}, \{a_{xj}, b_{xj}\}>\}$ and $\mathcal{J}P^*C(\grave{Y}_J) = \{Y_I, \phi_I, <\grave{Y}_J, \{b_{yj}, c_{yj}\}, \{a_{yj}\}>\}$. Define a maps $f_J : (X_J, \tau_{IT}) \rightarrow (\grave{Y}_J, \sigma_{IT})$ by $f_J(a_{xj}) = c_{yj}$, $f_J(b_{xj}) = b_{yj}$, $f_J(c_{xj}) = a_{yj}$ and $g_J : (\grave{Y}_J, \sigma_{IT}) \rightarrow (Z_J, \mu_{IT})$ by $g_J(a_{yj}) = b_{zj}$, $g_J(b_{yj}) = a_{zj}$, $g_J(c_{yj}) = c_{zj}$. Therefore $g_J \circ f_J : (X_J, \tau_{IT}) \rightarrow (Z, \mu_{IT})$. Here, $f_J^{-1}(Y_I) = X_I$, $f_J^{-1}(\phi_I) = \phi_I$, $f_J^{-1}(<\grave{Y}_J, \{a_{yj}\}, \{b_{yj}, c_{yj}\}>) = <X_J, \{c_{xj}\}, \{a_{xj}, b_{xj}\}>$ are $\mathcal{J}P^*C$ sets in X_J. Therefore f_J is Contra $\mathcal{J}P^*$- continuous map and $g_J^{-1}(Z_I) = Y_I$, $g_J^{-1}(\phi_I) = \phi_I$, $g_J^{-1}(<Z, \{a_{zj}, c_{zj}\}, \{b_{zj}\}>) = <\grave{Y}_J, \{b_{yj}, c_{yj}\}, \{a_{yj}\}>$ are $\mathcal{J}P^*C$ sets in $\grave{Y}_J$. Therefore g_J is Contra $\mathcal{J}P^*$- continuous map but $(g_J \circ f_J)^{-1}(<Z_J, \{a_{zj}, c_{zj}\}, \{b_{zj}\}>) = f_J^{-1}(g_J^{-1}(<Z_J, \{a_{zj}, c_{zj}\}, \{b_{zj}\}>) = f_J^{-1}(<\grave{Y}_J, \{b_{yj}, c_{yj}\}, \{a_{yj}\}>) = <X_J, \{a_{xj}, b_{xj}\}, \{c_{xj}\}> \notin \mathcal{J}P^*C(X_J)$. Therefore $g_J \circ f_J$ is not a Contra $\mathcal{J}P^*$- continuous map.

CONCLUSIONS

We discussed the $\mathcal{J}P^*$- Continuous maps and Contra $\mathcal{J}P^*$- Continuous maps in this paper. We intend to conduct research in the future on Quasi $\mathcal{J}P^*$- Continuous maps, Perfectly $\mathcal{J}P^*$- Continuous maps, Totally $\mathcal{J}P^*$- Continuous maps, Strongly $\mathcal{J}P^*$- Continuous maps and so on.

ABSTRACT

In recent decades the usage of antibiotics has increased immensely in clinical settings. These antibiotics are discharged into the environment, particularly aquatic bodies, through various means. As a result, they remain persistent in the environment for a longer time. The occurrence of antibiotics in aquatic ecosystems often leads to the emergence of antibiotic resistance in pathogens. Once the population is exposed to water, they face various health issues. Traditional methods of wastewater treatment often fail to adequately degrade these emerging contaminants. Nanomaterials owing to their small size and high surface area possess excellent properties and have numerous applications. The present review focuses on antibiotic pollution in surface water and antimicrobial resistance. In addition to that, the applications of nanocomposites for the effective degradation of antibiotics have been mentioned. Nanomaterials pose excellent photocatalytic properties for the uptake and degradation of antibiotics. These nanomaterials have immense potential for the sustainable remediation of antibiotic pollution.

Keywords: Antibiotic resistance, Wastewater treatment, Nanomaterials, Antibiotic degradation,

INTRODUCTION

Confronting the Global Threat of Anti-Microbial Resistance

Rapid industrialization and development have often led to the exploitation of environmental reservoirs. As a result, various contaminants have emerged in the environment [1]. The World Health Organization (WHO) lists Anti-Microbial Resistance (AMR) as one of the top 10 global public health threats that humanity faces. This growing problem significantly hinders efficient treatment of a wide range of diseases caused by bacteria, viruses, fungus, and

parasites. Recent estimates indicate that bacterial AMR has a worrisome impact on global health, causing approximately 5 million deaths annually worldwide. These figures show how frequently resistant microbes cause standard treatments to fail, resulting in longer hospital stays, higher medical costs, and higher death rates. If swift and coordinated action is not taken, WHO warns of even more disastrous consequences. By 2050, AMR may become responsible for up to 10 million deaths annually, surpassing the current global cancer mortality rates. As this potential future demonstrates, increasing surveillance, using antibiotics responsibly, investing in new antimicrobial therapies, and fostering international collaboration are all vital to slowing the spread and consequences of AMR [2].

Role of Healthcare and Improper Disposal

The bulk of antibiotics discovered in hydrosphere wastewater are linked to inappropriate disposal procedures as well as individual and medical professional use. The main source of antibiotic contamination in these circumstances has been shown to be hospitals [3]. A lack of knowledge about microbiology, the use or lack of treatment guidelines, the belief that antibiotics will be administered during an appointment, and restricted access to diagnostic tools are some of the factors that have been linked to unnecessary antibiotic use in healthcare settings. A wide range of social and cultural factors also affect antibiotic abuse, including public perceptions of antibiotic use as well as prescribing practices [4]. The main sources of antibiotic pollution in the environment include runoff from farms, hospital and slaughterhouse effluents, and household wastewater. Human and animal consumption of antibiotics can lead to their entry into water systems, where they remain and encourage the growth of resistant bacteria, due to improper disposal and insufficient treatment. The excretion of veterinary medications from slaughterhouses contributes to the high concentrations of medicines and resistance genes released by hospitals. Antibiotics from untreated waste and manure are carried into surface and groundwater by agricultural runoff, particularly during rainy seasons. Antibiotic resistance is facilitated by this pervasive pollution, which poses major threats to ecosystems and human health[5].

Emergence of Ciprofloxacin Resistance

A member of the fluoroquinolone (FQ) class of antibiotics, ciprofloxacin works well against a wide range of bacteria, both Gram-positive and Gram-negative. Ciprofloxacin resistance in a number of bacterial species, such as *Bacillus anthracis, Pseudomonas aeruginosa, Neisseria gonorrhoeae, Enterococci, Escherichia coli,* and *Klebsiella pneumoniae,* have been reported in increasing numbers [6]. A higher percentage of treatment failures and mortality is linked to the development of ciprofloxacin resistance in cases of persistent infections. Changes that prevent drug accumulation, plasmid-mediated defense that negates ciprofloxacin's bactericidal effect, and target site alterations in DNA gyrase and topoisomerase IV are some of the processes via which resistance arises[7].

Tracing Antibiotic Contamination Across South Asia's Major Rivers

Due to inadequate sewage treatment facilities in India, antibiotics are released into natural water bodies, which exacerbates the environmental problem of antimicrobial resistance (AMR). Though they make up only 3.5% of the world's surface area, South Asian countries are among the most densely populated areas and are sometimes referred to as the water-stressed zone because of their high demand and limited supply of water. High population density and insufficient wastewater treatment make it more difficult for antibiotic resistance to spread through contaminated water systems. The worrisome levels of antibiotic contamination in India's major rivers are shown in Table 1, demonstrating the seriousness of this problem [8].

Nanoparticle application in removal of organic pollutant

Every day, a range of industrial and non-commercial methods are used, but nanotechnology is one of the most novel approaches for handling water and wastewater. Research in nanoscience has led to an array of cost-effective and environmentally responsible treatment techniques that effectively clean water and meet high water quality requirements [16]. Fluoroquinolones, a major class of quinolone antibiotics including ciprofloxacin, levofloxacin, and ofloxacin, are commonly found as traces in wastewater. Recently, nanoparticles have been employed for their effective degradation. For instance, zinc oxide (ZnO) nanoparticle aggregates achieved 88.2% degradation of ciprofloxacin within 4 hours [17]. Nano graphene oxide magnetite demonstrated a 97% degradation efficiency for ofloxacin in just 2 hours [18].

From Nature to Nanotech: Green Synthesis of Metal Nanoparticles for a Cleaner Environment

Two separate basic synthesis principles-the top-down and bottom-up approaches-have been examined in the literature to produce nanomaterials with the required sizes, shapes, and functions. Reaction conditions and precursor concentrations can be modified to regulate the size and shape of nanoparticles. Instability, ambiguous mechanisms, possible toxicity, and recycling difficulties are obstacles to use in practice, though. Complex analysis is often needed, as are skilled operators. These restrictions point to important areas of unmet need. However, they also present intriguing chances for nanoscale innovation. Green synthesis is an environmentally friendly method of creating nanoparticles that scientists are using to deal with these problems. Both plant-mediated and microbial-mediated methods are used to create materials at the nanoscale. Construction products mediated by microbial use their naturally complex metabolic machinery in order to generate multiple nanoparticles with varying chemical compositions [19]. However, when it comes to microbiological preparations, scaling up can occasionally be difficult. Plant-based extracts provide a simple solution to this problem, and as a result, production rates may be increased.

Green Fabrication of Nanoparticles Using Botanical Resources

Microbes are less effective than plant extracts in terms of production rate. Compared to microorganisms, they reduce metal ions more quickly and create extremely stable nanomaterials [20]. Because plant extracts are widely available, inexpensive, and safe, they have become a crucial technique in the production of nanoparticles. Plant extracts are also abundant in a variety of phytochemicals that serve as stabilizers and reducing agents while plant-based nanoparticles are being formed [21]. The bulb extract of *U. epigea* has been used to successfully prepare Ag/ZnO nanocomposite in a cost-effective, non-toxic, simple, and environmentally friendly manner [22]. Several studies have explored the synthesis and functional evaluation of silver oxide-doped zinc oxide nanoparticles (Ag_2O–ZnO NPs) due to their enhanced photocatalytic and antioxidant properties. One such study reported the use of *Croton macrostachyus* leaf extract as a green synthesis agent, acting simultaneously as a reducing, stabilizing, and capping agent [23].

Hybrid Nanocomposite Photocatalysts: A New Frontier in Antibiotic Degradation

For photocatalytic degradation, nanomaterials are very effective because of their active sites and vast surface area. They frequently suffer from quick charge recombination and limited absorption of solar energy, though. These problems lower their photocatalytic performance and overall stability. The creation of hybrid nanocomposite photocatalysts has been widely adopted by researchers as a solution to these restrictions. Two or more nanomaterials with complementary qualities are combined to create these. These heterostructures improve overall stability and efficiency of photocatalysis [24]. Fe/Cu bimetallic nanoparticles supported on glass (G-Fe/Cu) were created by Ibrahim *et al* (2024) with the aid of grape leaf extract, a natural reducing agent [25]. This supports the effectiveness of plant-based synthesis techniques demonstrated by previous studies. When circumstances were optimized, the nanocomposite demonstrated a high ciprofloxacin (CIP) elimination effectiveness of 99% (Table 2).

Applications of ZnO/Ag_2O Nanocomposites for antibiotic degradation

In environmental treatment, ZnO/Ag_2O NPs are highly valued for their photocatalytic properties. These nanoparticles are capable of efficiently breaking down organic pollutants, and wastewater dyes can cleanse contaminated water sources when exposed to sunshine. Their ability to generate reactive oxygen species in response to UV-vis light helps to break down a variety of environmental pollutants, leading to cleaner water and air [32]. A study looks at the production of pure ZnO nanoparticles (NPs) and Ag/ZnO nanocomposites (NCs) with silver added at varying quantities (0.5%, 1.0%, and 2.0%) utilizing seed extract from *Ocimum tenuiflorum* (Tulsi). Comprehensive tests were conducted to evaluate the antibacterial properties and dye degradation capabilities of the green-synthesized ZnO-NPs and Ag/ZnO-NCs at different silver loadings [33]. In several studies, lemon peel extract has been utilized to successfully produce environmentally friendly ZnO nanoparticles and ZnO/Ag nanocomposite heterostructures. The sustained production of nanomaterials for environmental restoration using plant-based methods is demonstrated by this eco-friendly approach. In just 12 minutes, the synthesized nanomaterials demonstrated exceptional photocatalytic efficacy in natural sunshine, degrading 90% of ciprofloxacin and 98.8% of metronidazole. Their favourable physicochemical characteristics, such as low bandgap energies and high degradation efficiencies, lend them promise as practical and long-term solutions for water contamination [34].

ACKNOWLEDGMENT

Authors wish to express their sincere acknowledgment to Dr. Ashok Kumar Chauhan, President, RBEF parent organization of Amity University Madhya Pradesh (AUMP), Gwalior, Dr. Aseem Chauhan, Additional President, RBEF and chairman of AUMP, Gwalior, Lt. Gen. V.K. Sharma, AVSM (Retd.), Pro Chancellor of AUMP, Gwalior for providing necessary facilities, their Valuable support and encouragement throughout the work.

CONFLICT OF INTEREST

The authors declare no conflict of interest.

ABSTRACT

In this work, we apply a novel method for solving one-dimensional fourth-order parabolic linear partial differential equations with variable coefficients (FOPPDEs) that combines the new integral transform ST and the HPM, commonly known as the Shehu transform homotopy perturbation method (STHPM).Some instances of one-dimensional FOPPDEs are solved to demonstrate the capability and reliability of the aggregate of ST and HPM. We have, in comparison, the acquired analytical solution with the available solutions, which is determined to be exactly equal. The results display that the mixture of ST and HPM is quite successful, nicely suitable for use in such problems.

Keywords: hehu Transform (ST), Homotopy Perturbation Method (HPM), Fourth Order Parabolic Partial Differential Equations (FOPPDE's), Analytical Solution.

INTRODUCTION

ST was first delivered by a China Mathematician Shehu Maitama and Weidong Zhao in2019's [17]. ST is an integral transform method, which is very effective and beneficial for fixing ordinary and partial differential equations [2], [3], [4], [9]. But the ST is completely incapable of coping with nonlinear equations. It is due to the fact the difficulties, which are resulting from the nonlinear terms and lots of physical phenomena that are controlled with the aid of linear or nonlinear differential equations. Due to this motive, many researchers desired to use the HPM to handle

nonlinear equations. The technique gives a completely speedy convergence of the solution series inside the maximum instances. The HPM became first proposed by means of the Chinese mathematician He's in 1999 [13] and became similarly improved through He's [14], [15].Remarkable research work has been advanced through the use of the HPM to the linear and non-linear equations [1,6,7,8].Since this technique is prolonged and difficult for fixing those varieties of numerical problems. The proposed approach via Shehu Maitama and W. Zhao [18], is a coupling of the ST and HPM. Due to the functionality of combining those two effective gears, the STHPM is discovered very powerful approach. In current years, some authors have paid attention to take a look at the answers of linear and nonlinear partial differential equations using HPM with the ST [19]. Fundamentally there are three types of PDEs-Hyperbolic, Parabolic, and Elliptic PDEs [22][24]. Many problems of physical interest are described by linear PDEs with initial and boundary conditions. One of them is FOPPDE's with variable coefficients. Previously many analytical techniques were used for finding the solution for FOPPDE's, due to its significance inside the fields of engineering, But the numerical answers of the FOPPDE's are very hard due to the nonlinear terms. Therefore, plenty attention has been paid with the aid of researcher's the use of numerous methods for FOPPDE's. In 2001, Abdul-Majid Wazwaz [20][21] found new magnificence of answers for FOPPDE's. Also in 2009, M. Dehghan and J. Manafian [10] used HPM to obtain an approximate solution. Later on M. Khan at el.[16] used Laplace decomposition Method (2011).V. G. Gupta and S. Gupta [11] used HPM. P. G. Bhadane and V. H. Pradhan [5] used coupling of Elzaki and HPM (2013). Khalid S. Aboodh used Aboodh and HPM [23] in (2015) and M. A. AL. Jawary [12] used for solving FOPPDE's (2015). In the existing paper, a new STHPM is used and proposed to resolve the one dimensional FOPPDE's with variable coefficients. This method offers the answer in a rapid convergent series, which leads the solution in a closed form.

Basic definition's and Fundamental Facts

Definition: 2.1 *A new transform called the Shehu transform defined for function of exponential order, we Consider functions in the set A defined by*

$$A=\left\{v(t)|\ \exists N,\lambda_1,\lambda_2>0,|v(t)|<Ne^{\frac{|t|}{\lambda_4}},if\quad t\in(-1)'-X[0,\infty)\right\}$$

In the set A, the constant N is finite number and λ_1,λ_2 are finite or infinite The Shehu transform denoted by the operator $S(.)and$ defined by the integral equation.

$$S[v(t)]=V(s,u)=\int_0^{\infty}\exp\left(\frac{-st}{u}\right)v(t)dt$$

The inverse Shehu transform is given by

$S^{-1}[V(s,t)]=v(t),\text{for}t\geq 0$

where s and u are the Shehu transform variables.

Shehu Transform for Simple Functions

We have $S[v(t)]=V(s,u)=\int_0^{\infty}v(t)\left(e^{\frac{-st}{u}}\right)dt$

1. If v(t) = 1, then $S[1]=V(s,u)=\int_0^{\infty}(1)\left(e^{\frac{-st}{u}}\right)dt=\frac{u}{s}$
2. If v(t)=t, then $S[t]=V(s,u)=\int_0^{\infty}(t)\left(e^{\frac{-st}{u}}\right)dt=\frac{u^2}{s^2}$

More generally $S[t^n]=V(s,u)=\int_0^{\infty}(t^n)\left(e^{\frac{-st}{u}}\right)dt=n!\frac{u^{n+1}}{s^{n+1}}$

3. If v(t) = exp(αt), then $S[e^{\alpha t}]=V(s,u)=\int_0^{\infty}(e^{\alpha t})\left(e^{\frac{-st}{u}}\right)dt=\frac{u}{s-\alpha u}$

Theorem: 2.1 *Let $V(s,u)$ is Shehu transform of $v(t)$ and $S[v(t)]=V(s,u)$, Then*

1. $S\left[\frac{d}{dt}(v(t))\right]=S[v'(t)]=\int_0^{\infty}(v'(t))\left(e^{\frac{-st}{u}}\right)dt$

Integrating by parts, we find $S[v'(t)]=V(s,u)-v(0)$

2. $S\left[\frac{d^2}{dt^2}(v(t))\right]=S[v''(t)]=\int_0^{\infty}(v''(t))\left(e^{\frac{-st}{u}}\right)dt$ then

$$S[v^*(t)]=\frac{s^2}{u^2}V(s,u)-\frac{s}{u}v(0)-v'(0)$$

3. $S\left[\frac{d^n}{dt^n}(v(t))\right]=S[v^n(t)]=\int_0^{\infty}(v^n(t))\left(e^{\frac{-st}{u}}\right)dt$, then $S[v^n(t)]=\frac{s^n}{u^n}V(s,u)-\sum_{k=0}^{n-1}\left(\frac{s}{u}\right)^{n-(k+1)}$

Convergence Theorem and Examples

We would study convergence theorem on series solution.

Theorem: 3.1 *Shehu transform magnify the coefficient's of the power series function*

$v(t) = \sum_{n=0}^{\infty} b_n t^n$

is $S[v(t)] = V(s,u) = \sum_{n=0}^{\infty} n!\, b_n \frac{u^{n+1}}{s^{n+1}}$.

Proof:- Let v(t) be in A when $v(t) = \sum_{n=0}^{\infty} b_n t^n$, then by Taylors series expansion $v(t) = \sum_{n=0}^{\infty} \frac{v^n(0)}{n!} t^n$ by definition of Shehu transform, we have $S[v(t)] = \int_0^{\infty} \sum_{n=0}^{\infty} \frac{v^n(0)}{n!} t^n \left(e^{\frac{-st}{u}}\right) dt = \sum_{n=0}^{\infty} \frac{v^n(0)}{n!} \int_0^{\infty} \left(e^{\frac{-st}{u}}\right) t^n dt$,

Integratingusingbypartstheorem, onceobtain

$$= \sum_{n=0}^{\infty} \frac{v^n(0)}{n!} \left[\frac{u^{n+1}}{s^{n+1}}\right] n! = \sum_{n=0}^{\infty} v^n(0) \left[\frac{u^{n+1}}{s^{n+1}}\right] = \sum_{n=0}^{\infty} n!\, b_n \frac{u^{n+1}}{s^{n+1}}$$

Consequently

$$S[(1+t)^m] = S\left(\sum_{n=0}^{\infty} C_n^m t^n\right) = \sum_{n=0}^{\infty} C_n^m\, S(t^n) = \sum_{n=0}^{\infty} \frac{m!}{n!\,(m-n)!} \left(n! \frac{u^{n+1}}{s^{n+1}}\right)$$

$$= \sum_{n=0}^{\infty} \frac{m!}{(m-n)!} \left(\frac{u^{n+1}}{s^{n+1}}\right) = \sum_{n=0}^{\infty} P_n^m \left(\frac{u^{n+1}}{s^{n+1}}\right)$$

ST sends combination C_n^m into permutation P_n^m. Also $S[v(t)]$ converges in an interval by $v = 0$ as $v^n(0) \to 0$, as $n \to \infty$, and $\lim_{n\to\infty} \left|\frac{v^{n+1}(0)}{v^n(0)} \left(\frac{u}{s}\right)\right| < 1$..

This suggests that the convergence of $S[v(t)]$ relies upon on the convergence of $v^n(0)$.

Example 3.1 *consider the function*

$v(t) = \ln(t+1), t \in (-1,1) = 0,$

otherwise

since $v(t) = \sum_{n=0}^{\infty} (-1)^{n-1} \frac{t^n}{n}$, except for $v = 0$

$$S[v(t)] = \sum_{n=0}^{\infty} \frac{(-1)^{n-1}}{n} \left[\frac{u^{n+1}}{s^{n+1}}\right] n! = \sum_{n=0}^{\infty} (-1)^{n-1} (n-1)! \left[\frac{u^{n+1}}{s^{n+1}}\right]$$

This series diverges throughout, because its convergences only when

$$\lim_{n\to\infty} \left|\frac{(-1)^{n-1}(n-1)!}{(-1)^n (n)!}\right| = \lim_{n\to\infty} \frac{1}{n} = 0$$

Algorithm of the STHPM

Consider a one dimensional linear non homogeneous FOPPDE with variable coefficients of the form.

$\frac{\partial^2 \eta}{\partial t^2} + \psi(z) \frac{\partial^4 \eta}{\partial z^4} = \phi(z,t)$ (1)

where $\psi(z)$ is a variable coefficient with the subsequent initial conditions.

$\eta(z,0) = f(z)$ and $\frac{\partial \eta}{\partial t}(z,0) = h(z)$ (2)

and boundary conditions are

$\frac{\partial^2 \eta}{\partial z^2}(a,t) = \mu_3(t), \frac{\partial^2 \eta}{\partial z^2}(b,t) = \mu_4(t)$ (3)

By ST on both sides of equation (1)

$S\left[\frac{\partial^2 \eta}{\partial t^2} + \psi(x) \frac{\partial^4 \eta}{\partial z^4}\right] = S[\phi(z,t)]$ (4)

But ST of partial derivative is given by

$$S\left[\frac{\partial^2 \eta}{\partial t^2}\right] = \frac{s^2}{\eta^2} S[f(z,t)] - \frac{s}{\eta}[f(z,0)] - \frac{\partial f}{\partial t}(\boldsymbol{z}, 0)$$

using this property Eq. (3) may be written as

$$\frac{s^2}{\eta^2}\,\mathrm{S}[\eta(z,t)] - \frac{s}{\eta}[\eta(z,0)] - \frac{\partial\eta}{\partial t}(z,0) = \mathrm{S}[\phi(z,t)] - \mathrm{S}\left[\psi(z)\frac{\partial^4\eta}{\partial z^4}\right] \quad (5)$$

put the values preliminary conditions in eq (5), once obtain

$$\frac{s^2}{\eta^2}\,\mathrm{S}[\eta(z,t)] - \frac{s}{\eta}f(z) - h(z) = \mathrm{S}[\phi(z,t)] - \mathrm{S}\left[\psi(z)\frac{\partial^4\eta}{\partial z^4}\right]$$

by simple calculations, we have

$$\mathrm{S}[\eta(z,t)] = g(z,v) - \frac{\eta^2}{s^2}\,\mathrm{S}\left[\psi(z)\frac{\partial^4\eta}{\partial z^4}\right] \quad (6)$$

where

$$g(z,v) = \frac{\eta}{s}f(z) - \frac{\eta^2}{s^2}h(z) + \mathrm{S}[\phi(z,t)]$$

Performing inverse ST on both sides of eq. (6), we get

$$\eta(z,t) = k(z,t) - \mathrm{S}^{-1}\left[\frac{\eta^2}{s^2}\,\mathrm{S}\left[\psi(z)\frac{\partial^4\eta}{\partial z^4}\right]\right] \quad (7)$$

where $k(z,t) = \mathrm{S}^{-1}[g(z,v)]$ represents the source term and the prescribed initial conditions. Now we apply the HPM.

where $k(z,t) = \mathrm{S}^{-1}[g(z,v)]$ represents the source term and the prescribed initial conditions. Now we apply the HPM

$$\eta(\boldsymbol{z},t) = \sum_{n=0}^{\infty} P^n\eta_n(\boldsymbol{z},t) \quad (8)$$

By substituting eq. (8) into eq. (7), we get

$$\sum_{n=0}^{\infty} P^n\eta_n(z,t) = k(z,t) - p\mathrm{S}^{-1}\left\{\left[\frac{\eta^2}{s^2}\,\mathrm{S}[\psi(z)(\sum_{n=0}^{\infty} P^n\eta_n(z,t))_{zzzz}]\right]\right\} \quad (9)$$

This is coupling of the ST and HPM.

Comparing the coefficients of like powers of p, the following approximations are obtained

$$P^0{:}\,\eta_0(z,t) = k(z,t)$$

$$P^1{:}\,\eta_1(z,t) = -\mathrm{S}^{-1}\left\{[\frac{\eta^2}{s^2}\,\mathrm{S}[\psi(z)\eta_{0zzzz}(z,t)]]\right\}$$

$$P^2{:}\,\eta_2(z,t) = -\mathrm{S}^{-1}\left\{[\frac{\eta^2}{s^2}\,\mathrm{S}[\psi(\boldsymbol{z})\eta_{1zzzz}(\boldsymbol{z},t)]]\right\}$$

In general recursive relation is given by

$$P^n{:}\,\eta_n(z,t) = -\mathrm{S}^{-1}\left\{\left[\frac{\eta^2}{s^2}\,\mathrm{S}\left[\psi(z)\eta_{(n-1)zzzz}(z,t)\right]\right]\right\}$$

Then the solution is given by

$$\eta(z,t) = \eta_0(z,t) + \eta_1(z,t) + \eta_2(z,t) + \eta_3(z,t) + \text{- - - - - - - -} \quad (10)$$

Application's

To show the effectiveness of the technique we've solved homogeneous and nonhomogeneous one dimensional linear FOPPDE's with initial and boundary situations. Example 5.1 *Consider fourth order homogeneous PDE as*

$$\frac{\partial^2\eta}{\partial t^2} + \left(\frac{1}{z} + \frac{z^4}{120}\right)\frac{\partial^4\eta}{\partial z^4} = 0, \frac{1}{2} < z < 1, t > 0 \quad (11)$$

with the subsequent initial conditions

$$\eta(z,0) = 0, and\, \frac{\partial\eta}{\partial t}(z,0) = 1 + \frac{z^5}{120} \quad (12)$$

and boundary conditions

$$\eta(0.5,t) = \left(\frac{1+(0.5)^5}{120}\right)\mathrm{sin}t, \text{and } \eta(1,t) = \frac{121}{120}\mathrm{sin}t$$

$$\frac{\partial^2\eta}{\partial z^2}(0.5,t) = 0.02084\mathrm{sin}t, \frac{\partial^2\eta}{\partial z^2}(1,t) = \frac{1}{6}\mathrm{sin}t \quad (13)$$

Applying ST to Eq. (11), we get

$$\mathrm{S}\left[\frac{\partial^2\eta}{\partial t^2}\right] + \mathrm{S}\left[\left(\frac{1}{z} + \frac{z^4}{120}\right)\frac{\partial^4\eta}{\partial z^4}\right] = 0$$

$$\frac{s^2}{\eta^2}\,\mathrm{S}[\eta(z,t)] - \frac{s}{\eta}\eta(z,0) - \frac{\partial\eta}{\partial t}(z,0) + \mathrm{S}\left[\left(\frac{1}{z} + \frac{z^4}{120}\right)\frac{\partial^4\eta}{\partial z^4}\right] = 0 \quad (14)$$

Using initial conditions from Eq. (12), we get

$$S[\eta(z,t)] = \frac{\eta^2}{s^2}\left[1+\frac{z^5}{120}\right] - \frac{\eta^2}{s^2}\,S\left[\left(\frac{1}{z}+\frac{z^4}{120}\right)\frac{\partial^4\eta}{\partial z^4}\right] \quad (15)$$

Now taking inverse ST on both sides of Eq. (15), we have

$$\eta(z,t) = \left[1+\frac{z^5}{120}\right]t - S^{-1}\left\{\frac{\eta^2}{s^2}\,S\left[\left(\frac{1}{z}+\frac{z^4}{120}\right)\frac{\partial^4\eta}{\partial z^4}\right]\right\} \quad (16)$$

Now, we apply the HPM.

$$\eta(z,t) = \sum_{n=0}^{\infty} P^n\eta_n(z,t)$$

Putting this value of $\eta(z,t)$ into Eq. (16), we get

$$\sum_{n=0}^{\infty} P^n\eta_n(z,t) = \left[1+\frac{z^5}{120}\right]t - pS^{-1}\left\{\frac{\eta^2}{s^2}\,S\left[\left(\frac{1}{z}+\frac{z^4}{120}\right)\left(\sum_{n=0}^{\infty} P^n\eta_n(z,t)\right)_{zzzz}\right]\right\} \quad (17)$$

Comparing the coefficient of like powers of p, in Eq. (17) the following approximations are obtained.

$$P^0{:}\,\eta_0(z,t) = k(z,t) = \left[1+\frac{z^5}{120}\right]t$$

$$P^1{:}\,\eta_1(z,t) = -S^{-1}\left\{\frac{\eta^2}{s^2}\,S\left[\left(\frac{1}{z}+\frac{z^4}{120}\right)(\eta_{0zzzz}(z,t))\right]\right\}$$

$$= -S^{-1}\left\{\frac{\eta^2}{s^2}\,S\left[\left(\frac{1}{z}+\frac{z^4}{120}\right)zt\right]\right\}$$

$$= -\left(1+\frac{z^5}{120}\right)\frac{t^3}{3!}$$

$$P^2{:}\,\eta_2(z,t) = -S^{-1}\left\{\frac{\eta^2}{s^2}\,S\left[\left(\frac{1}{z}+\frac{z^4}{120}\right)(\eta_{1zzzz}(z,t))\right]\right\}$$

$$= \left(1+\frac{z^5}{120}\right)\frac{t^5}{5!}$$

$$P^3{:}\,\eta_3(z,t) = -S^{-1}\left\{\frac{\eta^2}{s^2}\,S\left[\left(\frac{1}{z}+\frac{z^4}{120}\right)(\eta_{2zzzz}(z,t))\right]\right\}$$

$$= -\left(1+\frac{z^5}{120}\right)\frac{t^7}{7!}\vdots$$

$$P^n{:}\,\eta_n(z,t) = -S^{-1}\left\{\frac{\eta^2}{s^2}\,S\left[\left(\frac{1}{z}+\frac{z^4}{120}\right)(\eta_{(n-1)zzzz}(z,t))\right]\right\}$$

$$= (-1)^n\left(1+\frac{z^5}{120}\right)\frac{t^{2n+1}}{(2n+1)!}, n = 1,2,3\ldots$$

So on within the equal way the rest of the components of iteration method can be received and consequently answer may be written in closed form as

$$\eta(z,t) = \left(1+\frac{z^5}{120}\right)t - \left(1+\frac{z^5}{120}\right)\frac{t^3}{3!} + \left(1+\frac{z^5}{120}\right)\frac{t^5}{5!} - \left(1+\frac{z^5}{120}\right)\frac{t^7}{7!} + ------$$

$$\eta(z,t) = \left(1+\frac{z^5}{120}\right)\left(t-\frac{t^3}{3!}+\frac{t^5}{5!}-\frac{t^7}{7!}+------\right)$$

$$\eta(z,t) = \left(1+\frac{z^5}{120}\right)\sin t \quad (18)$$

Which is an exact solution of Eq. (11) and it is the same results obtained by existing methods. The following plot is obtained using wolfram Alpha software

3D behavior of an approximate solution of (11) (Figure 1)

Example 5.2 *Consider fourth order homogeneous PDE as*

$$\frac{\partial^2\eta}{\partial t^2} + \left(\frac{z}{\sin z}-1\right)\frac{\partial^4\eta}{\partial z^4} = 0, 0 < \boldsymbol{z} < 1, t > 0 \quad (19)$$

with the following initial conditions

$$\eta(z,0) = z - \sin z, \text{and}\,\frac{\partial\eta}{\partial t}(z,0) = -z + \sin z \quad (20)$$

and boundary conditions

$$\eta(0,t) = 0, \text{and} \qquad \eta(1,t) = e^{-t}(1-\sin 1)$$

$\frac{\partial^2\eta}{\partial z^2}(0,t)=0, \frac{\partial^2\eta}{\partial z^2}(1,t)=e^{-t}\sin 1$ (21)

Applying ST to Eq. (19), we get

$$S\left[\frac{\partial^2\eta}{\partial t^2}\right]+S\left[\left(\frac{z}{\sin z}-1\right)\frac{\partial^4\eta}{\partial z^4}\right]=0$$

$$\frac{s^2}{\eta^2}S[\eta(z,t)]-\frac{s}{\eta}\eta(z,0)-\frac{\partial\eta}{\partial t}(z,0)+S\left[\left(\frac{z}{\sin z}-1\right)\frac{\partial^4\eta}{\partial z^4}\right]=0 \quad (22)$$

Using initial conditions from Eq. (20), we get

$$S[\eta(z,t)]=\frac{\eta}{s}(z-\sin z)+\frac{\eta^2}{s^2}(-z+\sin z)-\frac{\eta^2}{s^2}S\left[\left(\frac{z}{\sin z}-1\right)\frac{\partial^4\eta}{\partial z^4}\right] \quad (23)$$

Now taking inverse ST on both sides of above Eq. (23), we have

$$\eta(z,t)=(z-\sin z)+(-z+\sin z)t-S^{-1}\left\{\frac{\eta^2}{s^2}S\left[\left(\frac{z}{\sin z}-1\right)\frac{\partial^4\eta}{\partial z^4}\right]\right\} \quad (24)$$

Now, we apply the HPM.

$$\eta(z,t)=\sum_{n=0}^{\infty}P^n\eta_n(z,t)$$

Putting this value of $\eta(z,t)$ into Eq. (24), we get

$$\sum_{n=0}^{\infty}P^n\eta_n(z,t)=(z-\sin z)+(-z+\sin z)t$$

$$-pS^{-1}\left\{\frac{\eta^2}{s^2}S\left[\left(\frac{z}{\sin z}-1\right)\left(\sum_{n=0}^{\infty}P^n\eta_n(z,t)\right)_{zzzz}\right]\right\} \quad (25)$$

Comparing the coefficient of like powers of p, in Eq. (25) the following approximations are obtained.

$$P^0:\eta_0(z,t)=k(z,t)=(z-\sin z)+(-z+\sin z)t$$

$$P^1:\eta_1(z,t)=-S^{-1}\left\{\frac{\eta^2}{s^2}S\left[\left(\frac{z}{\sin z}-1\right)(\eta_{0zzz}(z,t))\right]\right\}$$

$$=-S^{-1}\left\{\frac{\eta^2}{s^2}S\left[\left(\frac{z}{\sin z}-1\right)(t-1)\sin z\right]\right\}$$

$$=-(z-\sin z)S^{-1}\left\{\frac{\eta^4}{s^4}-\frac{\eta^3}{s^3}\right\}$$

$$=(z-\sin z)\left(\frac{t^2}{2!}-\frac{t^3}{3!}\right)$$

$$P^2:\eta_2(z,t)=-S^{-1}\left\{\frac{\eta^2}{s^2}S\left[\left(\frac{z}{\sin z}-1\right)(\eta_{1zzzz}(z,t))\right]\right\}$$

$$=(z-\sin z)\left(\frac{t^4}{4!}-\frac{t^5}{5!}\right)$$

$$P^3:\eta_3(z,t)=-S^{-1}\left\{\frac{\eta^2}{s^2}S\left[\left(\frac{z}{\sin z}-1\right)(\eta_{2zzzz}(z,t))\right]\right\}$$

$$=(z-\sin z)\left(\frac{t^6}{6!}-\frac{t^7}{7!}\right)$$

$$\vdots$$

$$P^n:\eta_n(z,t)=-S^{-1}\left\{\frac{\eta^2}{s^2}S\left[\left(\frac{z}{\sin z}-1\right)\left(\eta_{(n-1)zzzz}(z,t)\right)\right]\right.$$

$$=(z-\sin z)\left(\frac{t^{2n}}{2n!}-\frac{t^{2n+1}}{2n+1!}\right), n=1,2,3\ldots$$

So on within the equal way the rest of the components of iteration method can be received and consequently answer may be written in closed form as

$$\eta(z,t)=(z-\sin z)+(-z+\sin z)t+(z-\sin z)\left(\frac{t^2}{2!}-\frac{t^3}{3!}\right)$$

$+(z-\sin z)\left(\frac{t^4}{4!}-\frac{t^5}{5!}\right)+(z-\sin z)\left(\frac{t^6}{6!}-\frac{t^7}{7!}\right)+-----$

$$\eta(z,t)=(z-\sin z)\left(1-t+\frac{t^2}{2!}-\frac{t^3}{3!}+\frac{t^4}{4!}-\frac{t^5}{5!}+\frac{t^6}{6!}-\frac{t^7}{7!}-------\right)$$

$$\eta(z,t)=(z-\sin z)e^{-t} \qquad (26)$$

Which is an exact solution of Eq. (19) and it is the same results obtained by existing methods. The following plot is obtained using wolfram Alpha software. 3D behavior of an approximate solution of (19) (Figure 2)

Example 5.3 *Consider non homogeneous FOPDE as*

$$\frac{\partial^2\eta}{\partial t^2}+(1+z)\frac{\partial^4\eta}{\partial z^4}=\left(z^4+z^3-\frac{6}{7!}z^7\right)\cos t, 0<z<1, \quad t>0 \qquad (27)$$

with the following initial conditions

$$\eta(z,0)=\frac{6}{7!}z^7, \text{and}\frac{\partial\eta}{\partial t}(z,0)=0 \qquad (28)$$

and boundary conditions

$$\eta(0,t)=0, \text{and } \eta(1,t)=\frac{6}{7!}\cos t$$

$$\frac{\partial^2\eta}{\partial z^2}(0,t)=0, \frac{\partial^2\eta}{\partial z^2}(1,t)=\frac{1}{20}\cos t \qquad (29)$$

Applying ST to Eq. (27), we get

$$S\left[\frac{\partial^2\eta}{\partial t^2}\right]+S\left[(1+z)\frac{\partial^4\eta}{\partial z^4}\right]=S\left[\left(z^4+z^3-\frac{6}{7!}z^7\right)\cos t\right]$$

Using initial conditions from Eq. (28), we get

$$S[\eta(z,t)]=\frac{\eta}{s}(0)+\frac{\eta^2}{s^2}S\left[\left(z^4+z^3-\frac{6}{7!}z^7\right)\cos t\right]-\frac{\eta^2}{s^2}S\left[(1+z)\frac{\partial^4\eta}{\partial z^4}\right]$$

$$S[\eta(z,t)]=\frac{\eta}{s}\frac{6}{7!}z^7+\frac{\eta^2}{s^2}\left(z^4+z^3-\frac{6}{7!}z^7\right)S[\cos t]-\frac{\eta^2}{s^2}S\left[(1+z)\frac{\partial^4\eta}{\partial z^4}\right]$$

$$S[\eta(z,t)]=\frac{\eta}{s}\frac{6}{7!}z^7+\left(z^4+z^3-\frac{6}{7!}z^7\right)\frac{\eta^3}{s(s^2+\eta^2)}-\frac{\eta^2}{s^2}S\left[(1+z)\frac{\partial^4\eta}{\partial z^4}\right] \qquad (30)$$

Now taking inverse ST on both sides of above Eq. (30), we have

$$\eta(z,t)=\frac{6}{7!}z^7+\left(z^4+z^3-\frac{6}{7!}z^7\right)(1-\cos t)-S^{-1}\left\{\frac{\eta^2}{s^2}S\left[(1+z)\frac{\partial^4\eta}{\partial z^4}\right]\right\} \qquad (31)$$

Now, we apply the HPM.

$$\eta(z,t)=\sum_{n=0}^{\infty}P^n\eta_n(z,t)$$

Putting this value of $\eta(z,t)$ into Eq. (31), we get

$$\left.\begin{aligned}\textstyle\sum_{n=0}^{\infty}P^n\eta_n(z,t)=\frac{6}{7!}z^7+\left(z^4+z^3-\frac{6}{7!}z^7\right)(1-\cos t)\\ -pS^{-1}\{\tfrac{\eta^2}{s^2}S[(1+z)(\textstyle\sum_{n=0}^{\infty}P^n\eta_n(z,t))\}_{zzzz}]\end{aligned}\right\} \qquad (32)$$

we take

$$k(z,t)=\frac{6}{7!}z^7+\left(z^4+z^3-\frac{6}{7!}z^7\right)(1-\cos t)$$

$$=\frac{6}{7!}z^7\cos t+(z^4+z^3)(1-\cos t)$$

$$=k_0(z,t)+k_1(z,t)$$

Where

$$k_0(z,t)=\frac{6}{7!}z^7\cos t \text{ and } k_1(z,t)=(z^4+z^3)(1-\cos t)$$

Comparing the coefficient of like powers of p, in Eq. (32) the following approximations are obtained.

$P^0: \eta_0(z,t) = \frac{6}{7!} z^7 \cos t$

$P^1: \eta_1(z,t) = (z^4 + z^3)(1 - \cos t) - \mathrm{S}^{-1}\left\{\frac{\eta^2}{s^2}\,\mathrm{S}[(1+z)(\eta_{0zzz}(z,t))]\right\}$

$= (z^4 + z^3)(1 - \cos t) - \mathrm{S}^{-1}\left\{\frac{\eta^2}{s^2}\,\mathrm{S}[(1+z)z^3 \cos t]\right\}$

$= (z^4 + z^3)(1 - \cos t) - (z^3 + z^4)\mathrm{S}^{-1}\left\{\frac{\eta^3}{s(s^2+\eta^2)}\right\}$

$= (z^4 + z^3)(1 - \cos t) - (z^3 + z^4)(1 - \cos t) = 0$

$P^2: \eta_2(z,t) = -\mathrm{S}^{-1}\left\{\frac{\eta^2}{s^2}\,\mathrm{S}[(1+z)(\eta_{1zazz}(z,t))]\right\}$

$= 0$

So on within the equal way the rest of the components of iteration method can be received and consequently answer may be written in closed form as

$P^n: \eta_n(z,t) = 0 \quad for \quad \mathrm{n} \geq 1.$

$\eta(z,t) = \frac{6}{7!} z^7 \cos t$ (33)

Which is an exact solution of Eq. (27) and it is the same results obtained by existing methods. The following plot is obtained using wolfram Alpha software. 3D behavior of an approximate solution of (27) (Figure 3)

Example 5.4 *Consider non-homogeneous FOPDE as*

$\frac{\partial^2 \eta}{\partial t^2} + z\eta^2 \frac{\partial^4 \eta}{\partial z^4} = 24 z^9 t^3, 0 < z < 1, t > 0$ (34)

with the following initial conditions

$\eta(z,0) = 0, \text{and} \frac{\partial \eta}{\partial t}(z,0) = \boldsymbol{z}^4$ (35)

and boundary conditions

$\eta(0,t) = 0, \text{and} \quad \eta(1,t) = t$

$\frac{\partial^2 \eta}{\partial z^2}(0,t) = 0, \frac{\partial^2 \eta}{\partial z^2}(1,t) = 12t$ (36)

Applying ST to Eq. (34), we get

$\mathrm{S}\left[\frac{\partial^2 \eta}{\partial t^2}\right] + \mathrm{S}\left[z\eta^2 \frac{\partial^4 \eta}{\partial z^4}\right] = \mathrm{S}[24 z^9 t^3]$

$\frac{s^2}{\eta^2}\,\mathrm{S}[\eta(z,t)] - \frac{s}{\eta}\eta(z,0) - \frac{\partial \eta}{\partial t}(z,0) + \mathrm{S}\left[z\eta^2 \frac{\partial^4 \eta}{\partial z^4}\right] = \mathrm{S}[24 z^9 t^3]$

Using initial conditions from Eq. (35), we get

$\mathrm{S}[\eta(z,t)] = \frac{\eta^2}{s^2} z^4 + \mathrm{S}[24 z^9 t^3] - \frac{\eta^2}{s^2}\,\mathrm{S}\left[z\eta^2 \frac{\partial^4 \eta}{\partial z^4}\right]$

$\mathrm{S}[\eta(z,t)] = \frac{\eta^2}{s^2} z^4 + 24 z^9 \left(3! \frac{s^4}{\eta^4}\right) - \frac{\eta^2}{s^2}\,\mathrm{S}\left[z\eta^2 \frac{\partial^4 \eta}{\partial z^4}\right]$ (37)

Now taking inverse ST on both sides of above Eq. (37), we have

$\eta(z,t) = z^4 t + 24 z^9 (3!)\mathrm{S}^{-1}\left(\frac{s^4}{\eta^4}\right) - \mathrm{S}^{-1}\left\{\frac{\eta^2}{s^2}\mathrm{S}\left[z\eta^2 \frac{\partial^4 \eta}{\partial z^4}\right]\right\}$

$\eta(z,t) = z^4 t + 24 z^9 t^3 - \mathrm{S}^{-1}\left\{\frac{\eta^2}{s^2}\,\mathrm{S}\left[z\eta^2 \frac{\partial^4 \eta}{\partial z^4}\right]\right\}$ (38)

Now, we apply the HPM.

$\eta(z,t) = \sum_{n=0}^{\infty} P^n \eta_n(z,t)$

Putting this value of $\eta(z,t)$ into Eq. (38), we get

$\sum_{n=0}^{\infty} P^n \eta_n(z,t) = z^4 t + 24 z^9 t^3 - p\mathrm{S}^{-1}\left\{\frac{\eta^2}{s^2}\,\mathrm{S}[z\eta^2(\sum_{n=0}^{\infty} P^n \eta_n(z,t))_{zzzz}]\right\}$ (39)

we take

$k(z,t) = z^4t + 24z^9t^3 = k_0(z,t) + k_1(z,t)$

Where

$k_0(z,t) = z^4t$ and$k_1(z,t) = 24z^9t^3$

Comparing the coefficient of like powers of p, in Eq. (39) the following approximations are obtained.

$P^0{:}\eta_0(z,t) = z^4t$

$P^1{:}\eta_1(z,t) = 24z^9t^3 - \mathrm{S}^{-1}\left\{\frac{\eta^2}{s^2}\,\mathrm{S}\left[(z\eta^2)\left(\eta_{0,ezz}(z,t)\right)\right]\right\}$

$= 24z^9t^3 - z\mathrm{S}^{-1}\left\{\frac{\eta^4}{s^2}\,\mathrm{S}[(24t)]\right\}$

$= 24z^9t^3 - 24z\mathrm{S}^{-1}\left\{\frac{\eta^4}{s^2}\,\mathrm{S}[t]\right\}$

$= 24z^9t^3 - 24z\mathrm{S}^{-1}\left\{\frac{\eta^6}{s^4}\right\}$

$= 24z^9t^3 - 24z^9t^3 = 0$

$P^2{:}\eta_2(z,t) = \mathrm{S}^{-1}\left\{\frac{\eta^2}{s^2}\,\mathrm{S}[(z\eta^2)(\eta_{0zzz}(z,t))]\right\}$

$= 0$

So on within the equal way the rest of the components of iteration method can be received and consequently answer may be written in closed form as

$P^n{:}\eta_n(z,t) = 0 \;\; for \quad \mathrm{n} \geq 1$

$\eta(z,t) = z^4t$ (40)

Which is an exact solution of Eq. (34) and it is the same results obtained by existing methods.

The following plot is obtained using wolfram Alpha software.

3D behavior of an approximate solution of (34) (Figure 4).

CONCLUSION

The major concern of this article is to construct an analytic answer for FOPPDEs with variable coefficients. We have finished this purpose by making use of STHPM. The STHPM is simple to understand and easy to implement, and does not require any restrictive assumptions as required by some existing methods. The non-homogeneous problems were successfully handled by HPM. The obtained exact solution of applying the STHPM is in full agreement with the obtained solutions with those methods available in the literature, such as ADM, DJM, and VIM. Finally, we conclude that STHPM may be considered as a pleasant refinement in the present numerical technique and can locate wide programs in exclusive fields of science.

ACKNOWLEDGEMENT

The authors would like to thank the anonymous reviewers and the editor of this journal for their helpful comments and valuable suggestions which led to an improved presentation of this paper.

ABSTRACT

Parents who have children with disabilities are often reported to have physical and psychological distress related to caring for their children, thus affecting their quality of life (QOL). This study explored the FQOL among parents who have children with or without disabilities. A total of 64 parents were recruited for the study using convenience sampling. The Family Quality of Life Scale (FQOL) is a standardised tool designed to measure the overall quality of life experienced by families, particularly those with a member who has a disability. It provides insights into how families perceive their well-being across multiple domains used to measure the QOL among the parents (Bonomi, Patrick, Bushnell *et al*., 2000; Leung, Tay, Cheng *et al*., 1997). Other demographic data, such as financial conditions and family background, were also recorded. FQOL showed a slight but significant decline with increased years of parenting ($r = -0.146$, $p < 0.05$). Male caregivers reported higher FQOL than females ($Z = 3.121$, $p < 0.05$). No link was found between birth order and FQOL. ANOVA revealed significant FQOL differences across disability types ($F = 3.341$, $p < 0.05$), with higher scores for mental handicap and cerebral palsy. The findings highlight that FQOL is influenced by care giving duration, gender, and the child's type of disability. These insights underscore the need for targeted interventions that address long-term caregiver stress, promote gender equity in support systems, and provide condition-specific resources to enhance overall family well-being.

Keywords: Disability, Family Quality of Life, Burden, Social support, Parents with disabled children

INTRODUCTION

In recent years, the term *quality of life* (QOL) has gained increasing attention across various sectors and disciplines. It is recognised as a multidimensional, subjective, and evolving concept that is challenging to define and measure precisely (Dellasoudas, 2006). Quality of life encompasses both material and non-material aspects, including an individual's standard of living, education, health, emotional well-being, interpersonal relationships, social inclusion, opportunities for leisure, and the broader social environment (Fallowfield, 1990; Schalock, Gardner, and Bradley, 2007; Majnemer *et al*., 2008). According to Wehmeyer and Schalock (2001), the core dimensions of quality of life include emotional well-being, material well-being, interpersonal relations, personal development, physical well-being, self-determination, social inclusion, and rights. Building on this broader framework, the concept of *Family Quality of Life* (FQOL) has emerged, particularly in discussions related to families of individuals with disabilities. FQOL is defined as the extent to which families can meet their basic needs, enjoy their time together, participate in leisure and community activities, and experience emotional and physical well-being (Park *et al*., 2003). It reflects family satisfaction based on internal strengths and external support systems (Gardiner and Iarocci, 2012). The presence of a child with a disability in a family inevitably affects this dynamic, often in profound ways. According to Kotzampopoulou (2014), families may experience both positive transformations and considerable challenges. On the negative side, the demands of caregiving can lead to sleep deprivation, increased stress, and a lack of personal time for parents (Dardas and Ahmad, 2014). The initial diagnosis of a disability often triggers complex emotional responses such as denial, guilt, embarrassment, anxiety, or even depression (George and Floyd, 2006). Research consistently demonstrates that parents of children with disabilities report significantly higher levels of stress compared to those with non-disabled children (Dardas and Ahmad, 2014; Hsiao, 2017). This elevated stress can contribute to long-term physical and psychological health concerns, diminishing their quality of life (Leung and Li-Tsang, 2003). Numerous variables influence how deeply a child's disability affects family life and parental well-being. These include the child's personality, the nature and severity of the disability, the family's socio-economic background and parenting style (Mulroy *et al*., 2008; Hu, Wang, and Fei, 2012; Wang *et al*., 2004). Environmental and social contexts, along with the availability of community and institutional support, also play critical roles. As outlined in the *Developmental Disabilities Assistance and Bill of Rights Act* (1991), developmental disabilities are severe, chronic conditions that originate before the age of 22 and are expected to be lifelong. These impairments significantly restrict functioning in key areas such as self-care, language, learning, mobility, and independent living, thereby requiring extensive and often lifelong support and care. For parents, particularly primary caregivers, this often results in immense caregiving responsibilities that limit social interaction, employment, and recreational opportunities, ultimately compromising their own QOL (Azaula, Msall, Buck *et al*., 2000)(Ellis, Upton and Thompson, 2000; Unalan *et al*., 2001). Understanding the impact of disabilities on family life is critical for developing meaningful interventions. Children with disabilities bring unique challenges that necessitate comprehensive and continuous support. Rehabilitation professionals, policymakers, and service providers must be attuned to the needs of both the children and their families. By doing so, they can help enhance FQOL and create systems that promote resilience, inclusion, and sustained well-being across the lifespan.

METHODS

This study used a cross-sectional study design based on power analysis, and a sample size of 64 parents with children with disabilities was recruited for the study from a Special school at Tiruchirappalli. The children were 6 to 18 years of age. Approval from the Ethical Research Committee of The special school was granted prior to the study. All parents signed the informed consent form prior to the commencement of the assessments and interviews. The Family Quality of Life Scale (FQOL) items were collected through interviews from the parents for completion. The Family Quality of Life Scale (FQOL) was developed by Jean Ann Summers and her colleagues at the Beach Center on Disability, University of Kansas. The Family Quality of Life Scale (FQOL) is a standardized tool designed to measure the overall quality of life experienced by families, especially those with a member who has a disability. It provides valuable insights into how families perceive their well-being across multiple domains. The primary purpose of the

FQOL Scale is to assess family well-being in a holistic manner, understand family needs and strengths, inform service planning and policy development, and evaluate the impact of interventions and support programs. The scale focuses on five core domains: Family Interaction, which assesses the quality of relationships, communication, and mutual support; Parenting, which examines how parents support and guide their children, including caregiving and developmental responsibilities; Emotional Well-being, which includes stress levels, mental health, and emotional support within the family; Physical/Material Well-being, which covers financial resources, housing, food security, and health; and Disability-related Support, which evaluates access to services, support systems, and accommodations necessary for a family member with a disability. (Table: 1)

Pearson coefficient of correlation (Table: 2)

The Pearson correlation coefficient between years of parenting and overall Family Quality of Life (FQOL) is -0.146, indicating a weak negative correlation, meaning that as the number of years in parenting increases, the perceived FQOL slightly decreases. Although the strength of the relationship is low, the result is statistically significant ($P < 0.05$), suggesting that this negative association is unlikely to be due to chance. This may reflect cumulative stress, caregiver fatigue, or emotional and practical burdens that tend to build over time in long-term parenting roles. The finding highlights the importance of providing sustained support systems and interventions to promote and maintain FQOL among parents, particularly those engaged in long-term caregiving.

Z test between the Gender of the Respondents with regard to FQOL (Table: 3)

The Z-test analysis reveals a statistically significant difference in the Overall Family Quality of Life (FQOL) between male and female respondents, with a Z value of 3.121 and $P < 0.05$, indicating that the observed difference is unlikely due to chance. Males reported a higher mean FQOL score (27.62) compared to females (26.00), with standard deviations of 4.146 and 4.463 respectively. This suggests that male respondents perceive a relatively better quality of family life than their female counterparts, possibly due to variations in role expectations, caregiving responsibilities, or access to support systems. The findings highlight the need for gender-sensitive approaches in enhancing family well-being and addressing the specific challenges faced by women in maintaining FQOL.

Association between Birth Order and FQOL (Table: 4)

The chi-square test results indicate that there is no statistically significant association between birth order and Family Quality of Life (FQOL) among the respondents, as the chi-square value is $\chi^2 = 4.260$ with 2 degrees of freedom and $P > 0.05$. This means that whether a person is first born, middle born, or last born does not significantly influence their reported levels of FQOL. Although variations are seen in the frequency distribution—for example, 17 first-born individuals reported high FQOL compared to 14 middle-born and 6 last-born—the differences are not large enough to be considered statistically meaningful. Hence, birth order does not appear to play a decisive role in determining family quality of life in this sample.

One Way Analysis of Variance among the Type of disability with regard to FQOL (Table 5)

The one-way ANOVA comparing overall Family Quality of Life (FQOL) scores across the four disability groups (G1: Cerebral Palsy, G2: Down Syndrome, G3: Mental Handicap, G4: Developmental Delay) yielded an F-statistic of 3.341 ($df = 3, 274$) with $P < 0.05$, indicating a significant difference among groups. The mean FQOL scores were highest for parents of children with Mental Handicap (G3 = 34.72) and Cerebral Palsy (G1 = 34.52), followed by Down Syndrome (G2 = 33.79), and lowest for Developmental Delay (G4 = 32.18). This suggests that the type of disability is significantly associated with family well-being, with parents of children with Mental Handicap and Cerebral Palsy reporting better overall quality of life than those caring for children with Down Syndrome or Developmental Delay.

RESULTS

The survey included 64 respondents, with data collected on various socio-demographic variables and types of disability among children. The majority of respondents (23.44%) were aged 26–30 years, and the sample included

slightly more females (54.69%) than males (45.31%). Most respondents were married (82.81%), indicating family-based caregiving dynamics. Regarding educational status, 28.13% were graduates and 23.44% had completed up to HSC, reflecting a moderate educational background overall. Employment data revealed that half of the participants (50%) were employed full-time, and about one-third (32.81%) were working part-time. In terms of income, 32.81% of families earned between ₹20,001 and ₹30,000 monthly, with 25% earning ₹30,001–₹40,000, suggesting a predominantly lower-middle-income group. The religious composition showed a majority of Hindus (65.63%), followed by Christians (23.44%) and Muslims (10.94%). Among the participants, 25% had less than 5 years of parenting experience, 21.88% had 5–10 years, while 26.56% each had 11–15 years and over 16 years. This indicates a fairly even distribution between newer and more experienced caregivers. Diagnostically, children with developmental delay (34.38%) and mental handicap (32.81%) made up the largest groups, followed by those with cerebral palsy (18.75%) and Down syndrome (14.06%). Birth order, revealed that nearly half were first-born (48.43%), about one-third were second-born (34.37%), and the remainder were third-born (17.18%). This distribution suggests that first-born individuals predominated in the caregiving roles sampled, with fewer participants from later birth positions. Such a pattern may reflect family size dynamics or cultural factors influencing parental responsibilities, and should be kept in mind when exploring how ordinal position might relate to family quality of life and caregiving experiences. The data points to the diverse yet predominantly middle-income, married, and moderately educated demographic background of caregivers. The diagnostic spread further highlights the relevance of support programs addressing developmental delays and mental handicaps. Statistical tests revels that A Pearson correlation analysis showed a weak negative correlation between years of parenting and Family Quality of Life (FQOL) ($r = -0.146$), which was statistically significant ($P < 0.05$). This suggests that FQOL slightly decreases as years of parenting increase, possibly due to accumulated stress or caregiver fatigue. The analysis revealed a statistically significant difference in Family Quality of Life (FQOL) between male and female respondents, with males reporting a higher mean FQOL (27.62) compared to females (26.00). The Z-test value was 3.121 with $P < 0.05$, indicating that the difference is unlikely due to chance. This suggests that gender plays a role in perceived FQOL, possibly due to differences in caregiving responsibilities or access to support. In contrast, the chi-square test examining the association between birth order and FQOL showed no statistically significant relationship ($\chi^2 = 4.260$, $df = 2$, $P > 0.05$). Although there were some variations in FQOL scores across birth order categories, the differences were not significant, indicating that birth order does not appear to influence FQOL among the respondents. A one-way ANOVA showed a significant difference in FQOL across disability groups ($F = 3.341$, $p < 0.05$). Higher FQOL scores were reported by parents of children with disability it indicates that disability type influences family well-being.

DISCUSSION

The findings confirm the influence of caregiving burden on Family Quality of Life (FQOL), echoing results from earlier research. The negative correlation between years of parenting and FQOL aligns with Ellis *et al*. (2000) and Elmstahl *et al*. (1996), who reported cumulative stress and caregiver fatigue as key contributors to declining caregiver well-being over time. The gender disparity in FQOL is consistent with Dardas and Ahmad (2014) and Leung and Li-Tsang (2003), who noted that female caregivers, often the primary caretakers, experience more psychological distress and lower well-being than males. Cultural expectations and unequal distribution of caregiving tasks may account for this gap. The non-significance of birth order reflects findings from Mulroy *et al*. (2008), who suggested that the influence of ordinal position is less crucial than the child's needs and family coping resources. The significant variation in FQOL across types of disabilities corroborates Hu *et al*. (2012) and Wang *et al*. (2004), who emphasized that severity and nature of the child's condition strongly shape family dynamics. Higher FQOL among caregivers of children with cerebral palsy and mental handicap may be due to better-established support systems for these conditions, as noted by Azaula *et al*. (2000). Overall, the results reinforce the multidimensional impact of caregiving on family life, highlighting the need for disability-specific support systems, long-term stress management resources, and gender-sensitive interventions. As suggested by Gardiner and Iarocci (2015) and Summers *et al*. (2005), FQOL is not only shaped by individual factors but also by broader social, economic, and institutional contexts. Overall, these

results reinforce the complex interplay of demographic, psychological, and diagnostic factors in shaping family quality of life and underscore the need for tailored, inclusive policy and practice interventions.

ABSTRACT

In the present research, a novel unsyymetrical azine has been synthesised and its DFT study has been carried out using Gaussian09 programme. The structure of titled compound is optimized and determined as co-planar with c1-point group. Their bond angles, lenghths and torsional angles are determined and matched well with literature valued. The HOMO-LUMO analysis demostrated that present compound is highly recative due to its low energy gap. Its NBO, MEP and Mulliken charges are calculated. The ADMET parameters are predicted with the help of SwissADME web tool along with its Boiled-egg and Bioavailability radar model predictions. The results showed that titled compound has good bioavailability material.

Keywords: Unsymmetrical azine, DFT study, Optimization, NBO analysis, NLO property and ADMET prediction.

INTRODUCTION

Azines, a class of organic compounds containing a double bond between two carbon atoms and one nitrogen atom, are crucial intermediates in organic synthesis and materials chemistry [1,2]. Azines can be broadly categorized into symmetrical and unsymmetrical types, with unsymmetrical azines being characterized by the presence of two different substituents attached to the nitrogen or carbon atoms involved in the azine linkage [3]. These unsymmetrical azines, due to their unique structural features, offer distinct chemical reactivity and potential

applications, making them a topic of significant interest in contemporary chemical and pharmaceutical research [4]. The general formula for an unsymmetrical azine is $R_1C{=}NNCR_2$, where R_1 and R_2 are different substituents, either alkyl, aryl, or other functional groups [5]. The unsymmetry of the substituents impacts the electronic properties and reactivity of the molecule, leading to distinct steric and electronic interactions that govern their behavior in both synthetic and catalytic processes [6]. The nature of the substituents on the azine backbone affects the stability, nucleophilicity, and electrophilicity of the compound, which is crucial for tuning the reactivity for various applications [7]. These compounds have demonstrated significant biological activity, particularly as antitumor, antibacterial, and anti-inflammatory agents [8]. Their ability to interact with biological targets such as enzymes and receptors makes them potent candidates for drug development [9]. Due to their electron-rich nature, they have also found applications in organic electronics, such as organic light-emitting diodes (OLEDs) and organic solar cells [10]. Unsymmetrical azines can form stable complexes with metal ions, which can be exploited in catalysis and materials chemistry [3,6]. Density Functional Theory (DFT) analysis plays a crucial role in understanding the reactivity and stability of unsymmetrical azines. The electron density distribution, molecular orbitals, and energy levels can be computed to predict the most likely reaction pathways, stability, and electronic properties of these compounds [7]. Such analysis is pivotal for designing new azine derivatives with optimized properties for specific applications, such as drug design or material development [4,9]. For pharmaceutical applications of unsymmetrical azines, understanding their ADMET properties is crucial. ADMET studies predict the pharmacokinetic and toxicological behavior of compounds, which is essential for evaluating the drug-likeness of new molecules [10]. These properties are assessed through computational models and in vitro/in vivo experiments. Unsymmetrical azines may exhibit favorable ADMET characteristics, but these properties must be optimized for safe and effective therapeutic use [8,9]. Furthermore, molecular docking studies have become an essential tool for understanding the interactions between drug candidates, such as unsymmetrical azines, and their target proteins. Docking simulations allow researchers to predict the binding affinity, orientation, and interactions between a small molecule and its receptor [7]. This technique is particularly valuable in the early stages of drug discovery, as it can guide the design of azine-based molecules with improved specificity and potency for their biological targets [9,10].

Experimental

Synthesis of (1*E*,2*E*)-1-benzylidene-2-(3-bromo-4-methoxybenzylidene)hydrazine

About 0.01mol of 3-bromo-4-methoxy benzaldehyde and 5ml of hydrazine hydrate (0.01mol) were taken in a stoppered conical flask. The mixture was dissolved in ethanol and stirred well for about half an hour [11]. The formed hydrazine solid was separated as white solid and it was stirred with benzaldehyde (0.01 mol). The mixture was cooled and yellow solid mass separated out was removed by filtration, dried and recrystallized from ethanol. In every step, the completion of the reaction was monitored by TLC. The synthetic method is given in Scheme-1.

RESULTS AND DISCUSSION

Spectral data: mp:119C; MW, FT-IR: 3032cm^{-1}, 2983cm^{-1}, 1612cm^{-1}, 1544cm^{-1}, 912cm^{-1}, 532cm^{-1}; ^{1}H NMR (δppm): 5.028, 6.032-7.992, 8.124; ^{13}C NMR(δppm): 55.24, 119-138.34, 157.24.

DFT analysis

Molecular Geometry

The DFT calculations are carried out using Gaussian 09w software [12] with the help of Gauss view using B3LYP/611++G (d,p) basis set. From these calculations, the reactivity nature and reactivity sites are predicted. The Density Functional Theory (DFT) study of unsymmetrical azines involves computational methods to understand the electronic properties, structure and reactivity of azine molecules that lack symmetry in their molecular structure. Azines typically refer to heterocyclic compounds containing nitrogen atoms, often with a structure similar to pyridine or pyrimidine. Unsymmetrical azines are those where the substituents or the positions of nitrogen atoms are not identical, which can lead to varied electronic behaviors compared to their symmetrical counterparts. The titled compound is a non- planar molecule with C1 point group symmetry, as predicted by the DFT analysis and the

corresponding optimized structure and selected bond paramreters are shown in Figure-1 and Table-1 respectively. As shown in Table-1, the typical C–C aromatic bond lengths in the benzene rings range from 1.386 to 1.411 Å, which are in agreement with delocalized sp^2-hybridized carbon systems. Notably, the C3–Br3 bond measures 1.943 Å, consistent with literature-reported values for para-substituted aryl bromides [13]. The C4–O4 bond, representing the methoxy linkage, has a length of 1.391 Å, supporting partial double bond character due to resonance. The hydrazone linkage displays a N8–N9 bond length of 1.425 Å and a N9–C10 bond length of 1.298 Å, indicating partial double bond character in the latter due to π-conjugation, as also noted in structurally related hydrazones [14]. The C1–N8 distance is unusually long at 2.411 Å, possibly due to torsional strain or steric hindrance, which weakens π-overlap in that region. The aromatic ring bond angles cluster around 120°, consistent with trigonal planar carbon geometry. The N8–N9–C10 angle is 112.4°, slightly lower than the ideal trigonal planar value, likely due to lone pair–bond pair repulsion on the nitrogen. An unusual bond angle of 147.1° for C6–C1–N8 suggests significant deviation from planarity near the hydrazone bridge, possibly accommodating steric strain or conjugative effects. The majority of dihedral angles in the aromatic systems are close to 0° or 180°, confirming coplanarity and conjugation within the ring systems. The C1–N8–N9–C10 dihedral angle is 179.1°, indicating a planar and fully conjugated hydrazone bridge, which is essential for electronic delocalization. A similar observation is made for C10–C11–C12–C13 (180.0°) and C5–C6–C1–N8 (180.0°), further affirming the extended conjugation pathway across the molecule [15]. These structural parameters reveal that the molecule maintains an extended π-conjugated system through the central hydrazone moiety and substituted aromatic rings. The optimized geometry thus supports its potential in electronic, photophysical, and biological applications, including as an NLO material or antimicrobial agent [16, 17].

Frontier Molecular Orbbital Study

The Frontier Molecular Orbitals (FMO) study of an zzine compound using the given parameters involves the analysis of the Highest Occupied Molecular Orbital (HOMO) and the Lowest Unoccupied Molecular Orbital (LUMO). These orbitals shown in Figure-2 play a critical role in determining the chemical reactivity and electronic properties of a molecule. A smaller energy gap displayed in Table-2usually corresponds to a molecule that is more reactive, as it is easier to excite an electron from the HOMO to the LUMO. In this case, the energy gap of 3.990 eV suggests that the molecule has significantly higher reactivity and low stability. Ionization energy is higher and low electron affinity. The lower energy gap implies its reactivity which may be active against biological applications. The calculated ionization potential (I) and electron affinity (A) of 6.066 eV and 2.076 eV, respectively, are consistent with the FMO results, where a relatively low electron affinity and a high ionization potential suggest a resistance to electron acceptance but moderate susceptibility to electron loss. The chemical potential (μ) of -4.071 eV implies a moderate tendency of the molecule to release electrons, while the global hardness (η) of 1.995 eV and global softness (ν) of 0.501 eV^{-1} indicate that the molecule has a balanced stability and reactivity, suggesting its potential as a moderate electron donor or acceptor in chemical interactions [18, 19]. The electrophilicity index (ω) of 4.154 eV reveals the molecule's electrophilic character, quantifying its stabilization upon acquiring additional electronic charge. The chemical softness (s), calculated as 4.071 eV, further supports the molecule's moderate reactivity, particularly in electron-rich environments. These electronic descriptors suggest that the compound possesses a relatively moderate chemical hardness and a moderate HOMO-LUMO gap, indicating potential applications in optoelectronic devices or as a bioactive molecule where controlled reactivity is advantageous. The FMO analysis, in combination with the global reactivity parameters, illustrates the capacity of (1*E*,2*E*)-1-benzylidene-2-(3-bromo-4-methoxybenzylidene)hydrazine to participate in frontier orbital interactions, making it an interesting candidate for further theoretical and experimental studies of electron transfer processes [20, 21].

NBO analysis

The NBO analysis of (1E,2E)-1-benzylidene-2-(3-bromo-4-methoxybenzylidene)hydrazine is displayed in Table-3 and it reveals significant intramolecular charge transfer and stabilization through hyperconjugative interactions. Key donor orbitals, such as the bonding orbitals BD(2)C1-N17 and BD(2)C2-C4, donate electron density into antibonding acceptor orbitals BD(2)C2-C2*, BD(2)N19-C19* and BD(2)C3-C3*, with stabilization energies ranging from 39.5 to 94.8 kJ/mol. The largest stabilization occurs from BD(2)C2-C4 → BD(2)C3-C3* (94.8 kJ/mol), indicating strong delocalization of electron density across the aromatic system and enhancing π-conjugation. The lone pairs on

nitrogen (LP(1)N17 and LP(1)N19) also show interactions with σ* orbitals (BD(1)C1-H1*, BD(1)C20-H20*), suggesting hyperconjugative interactions that contribute to overall molecular stabilization. The oxygen lone pair (LP(2)O11) donating into BD(2)C7-C7* (36.4 kJ/mol) supports the electron-rich character of the methoxy-substituted ring, facilitating resonance-assisted stabilization and electronic delocalization [22, 23]. The donor-acceptor interplay in this system highlights its charge transfer capabilities, with notable stabilization energies observed for hyperconjugative interactions involving aromatic and heteroatomic centers. For instance, the BD(2)C7-C9 → BD(2)C2-C2* (88.6 kJ/mol) and BD(2)C26-C27 → BD(2)C22-C22* (89.2 kJ/mol) interactions reflect strong delocalization between adjacent rings and substituents, reinforcing molecular stability and electron density distribution. The involvement of nitrogen lone pairs (N17 and N19) in hyperconjugation with adjacent σ* orbitals indicates potential sites for nucleophilic attack and suggests a role in biological interactions or chemical reactivity. The electron delocalization across the azine bridge and aryl substituents contributes to the compound's unique electronic properties, essential for understanding its potential reactivity and interaction with external electrophiles or nucleophiles. These NBO-derived insights align with theoretical studies that emphasize the role of hyperconjugation and lone pair-π* interactions in modulating molecular reactivity and stability [24, 25].

MEP analysis

The Molecular Electrostatic Potential (MEP) analysis of (1E,2E)-1-benzylidene-2-(3-bromo-4-methoxybenzylidene)hydrazine, calculated using theDFT/B3LYP/6-311++G(d,p) level, offers valuable insights into the electronic distribution and potential reactive sites of the molecule. The MEP surface, as depicted in the Figure-3, illustrates regions of varying electrostatic potential where the most negative potentials (red regions) are localized around the electronegative oxygen atom of the methoxy group and nitrogen atoms of the azine moiety, indicating sites with high electron density and potential for electrophilic attack. Conversely, the positive electrostatic regions (blue) are observed near the hydrogen atoms and around the less electronegative carbons, suggesting susceptibility to nucleophilic attack. The MEP highlights the asymmetric electronic distribution arising from the bromine and methoxy substituents, reinforcing the molecule's polar nature. This analysis not only complements the FMO and NBO results by identifying reactive sites but also underscores the potential of the compound in interactions with biological targets or catalytic systems, where regions of varying electrostatic potential can play a crucial role in reactivity and binding affinity [26, 27].

Mulliken atomic chrges

The data shown in Table-4, reveal that the oxygen atom (O11) carries a significant negative charge (-0.549), reflecting its high electronegativity and strong electron-withdrawing capability. The nitrogen atoms (N17 and N19) also exhibit substantial negative charges (-0.281 and -0.282), highlighting their roles as potential sites for electrophilic attack. In contrast, several carbon atoms, such as C1 (0.176), C9 (0.310), and C13 (0.297), are positively charged, suggesting electron-deficient regions likely to attract nucleophilic species. The bromine atom (Br12) shows a moderate positive charge (0.153), indicating its involvement in modulating the electronic environment of the molecule. These charge distributions emphasize the polarized nature of the molecule, particularly around the methoxy and bromine-substituted regions, and align with the results from MEP and NBO analyses, confirming potential sites for chemical reactivity and molecular interactions [28, 29].

ADMET analysis

The ADMET evaluation of *(1E,2E)-1-benzylidene-2-(3-bromo-4-methoxybenzylidene)hydrazine* via the SwissADME platform as shown in Table-5 reveals its promising pharmacokinetic and drug-likeness characteristics. With a molecular weight of 317.18 g/mol, a low topological polar surface area (TPSA = 33.95 Å²), and zero hydrogen bond donors, the compound demonstrates high gastrointestinal (GI) absorption and is predicted to be blood-brain barrier (BBB) permeant, enhancing its central nervous system (CNS) accessibility [30]. It is not a substrate for P-glycoprotein (Pgp), indicating reduced risk of efflux-mediated drug resistance. The compound inhibits several cytochrome P450 enzymes, namely CYP1A2, CYP2C19, and CYP2C9, which could potentially lead to drug–drug interactions, whereas CYP2D6 and CYP3A4 inhibition was not observed, indicating partial metabolic stability [31].The compound exhibits moderate lipophilicity, with consensus Log P of 3.87, and individual values from five different models ranging from

3.22 to 4.91, suggesting favorable membrane permeability and bioavailability. Water solubility predictions from ESOL, Ali, and Silicos-IT methods categorize it as moderately soluble, with log S values between –4.37 to –6.06, which is acceptable for oral drug candidates. Importantly, no violations of Lipinski, Ghose, Veber, Egan, or Muegge rules were observed, implying excellent drug-likeness. The bioavailability score of 0.55 further supports its potential as a lead compound [32]. From a medicinal chemistry standpoint, the molecule is devoid of PAINS (Pan-Assay Interference Structures) alerts, indicating a low probability of false biological activity, although it presents one Brenk and one leadlikeness violation, possibly due to the bromine substituent or higher lipophilicity [33]. The synthetic accessibility score of 2.37 denotes that the compound is easy to synthesize, which is advantageous for future development.

Boiled-Egg prediction model

The Boiled-Egg model prediction for *(1E,2E)-1-benzylidene-2-(3-bromo-4-methoxybenzylidene)hydrazine* is illustrated in Figure-4, generated via the *SwissADME* web tool [30]. The compound (Molecule 1) is located within the yellow region (yolk) of the plot, which suggests a high probability of blood-brain barrier (BBB) penetration. Additionally, the molecule also falls within the white region, indicating favorable passive gastrointestinal absorption (HIA). The red circle denotes that the molecule is a PGP- substrate, meaning it is not actively effluxed by the P-glycoprotein transporter, potentially enhancing its CNS bioavailability. This dual prediction supports the compound's potential as a drug-like candidate with good oral bioavailability and central nervous system accessibility.

Bioavailablity Radar model

The SwissADME Bioavailability Radar model shown in Figure-5 provides a visual overview of drug-likeness for *(1E,2E)-1-benzylidene-2-(3-bromo-4-methoxybenzylidene)hydrazine* based on six physicochemical properties: lipophilicity (LIPO), size, polarity (POLAR), insolubility (INSOLU), insaturation (INSATU), and flexibility (FLEX). In the radar plot, the red line represents the molecular property values, while the pink area marks the optimal range for oral bioavailability. The molecule falls within the acceptable zone for lipophilicity, size, and polarity, indicating favorable membrane permeability and molecular weight. Slight deviations in flexibility and solubility suggest limited aqueous solubility and moderate conformational freedom, yet these are not significantly outside the ideal range. Overall, the radar plot suggests that the compound possesses satisfactory drug-like characteristics, aligning well with criteria for oral bioavailability [30].

CONCLUSION

In conclusion, the comprehensive investigations carried out on (1E,2*E*)-1-benzylidene-2-(3-bromo-4-methoxybenzylidene)hydrazine highlight its unique structural features and promising chemical profile. Spectral characterization confirmed the successful synthesis and molecular integrity of the compound, while DFT studies elucidated its non-planar geometry, extended π-conjugation, and the presence of distinct electronic domains arising from the unsymmetrical azine framework. The molecule exhibits notable intramolecular charge transfer and stabilization through hyperconjugative interactions, as revealed by NBO analysis, and its frontier molecular orbital characteristics point to a moderate HOMO-LUMO gap, supporting balanced chemical reactivity and potential for further electron transfer applications. MEP and Mulliken charge analyses identified key nucleophilic and electrophilic sites, underscoring the molecule's reactivity and scope for molecular interactions. ADMET predictions indicated high gastrointestinal absorption, blood-brain barrier permeability, favorable drug-likeness, and the capacity for central nervous system activity, alongside synthetic accessibility and moderate solubility. Overall, these synergistic structural, electronic, and pharmacokinetic features suggest that the titled compound is an excellent candidate for future exploration as a functional azine scaffold in electronic, photophysical and pharmacological domains.

ABSTRACT

Siddhars categorized human diseases into 4448 categories. Among these, 86 are classified as nasal diseases, with *peenisam* being one of them. *Peenisam* is a prevalent condition that affects a substantial number of individuals each year. It can impact people of all ages and tends to worsen with the change of seasons, particularly in winter. This research investigates the factors that contribute to the worsening of the disease as outlined in *Siddha* texts, the various types of *peenisam* that affect a broader population, and the body constitution types that are more at risk for this specific condition. The study aims to ascertain the distribution of different types of *peenisam* mentioned in *Siddha* literature and to analyze the body constitutions of patients attending to the outpatient department at Ayothidoss Pandithar Hospital, NIS, along with their characteristics, causative factors, *Naadi*, and demographic details (including dietary habits, occupation, sex, and age). A total of 120 patients were evaluated based on defined inclusion and exclusion criteria, from which 100 individuals with *peenisam* (sinusitis) participated in the cross-sectional study, covering those aged over 15 years of all genders, including transgender individuals. Before joining the study, informed consent was obtained from every participant. Data was gathered and recorded using

a pre-designed questionnaire focusing on types of *peenisam* and *Dhega ilakanam*. The study revealed that *Neer Peenisam* accounted for 50% and *Mulai Peenisam* for 30% of cases, while *Pithakabam* (39%) and *Kabapitham* (27%) were the most common body constitutions affected. Key contributing factors identified included infrequent oil baths (93%), existing nasal ailments (88%), persistent sleeplessness (85%), nasal congestion caused by dust (81%), and the consumption of cold water (81%). The findings indicated that *Naadi* assessments predominantly identified *Pithakabam* (39%). The observed symptoms of the various *peenisam* types, along with *Naadi* and causative factors, closely align with descriptions found in *Siddha* literature.

Keywords: *Peenisam* (Sinusitis), *Siddha,* Cross-sectional study, *Dhega Ilakanam, Naadi*

INTRODUCTION

The *Siddha* system of medicine is an indigenous medicine. It has a holistic view of patients and maintains the mental as well as physical well-being of patients. Like the universe body is also made up of five elements. These five elements are the fundamentals of our body. Seasonal variations and environmental pollution reflect on our bodies because any change in the universe will be reflected in our bodies. According to the *Siddha* system of medicine, there is a close connection between the mind and body. So, mind and body health is maintained at a balanced level, which is very essential to protect our body and mind from disease. The physical function is maintained by three humours, they are *Vali, Azhal, and Iyam.* In the disease state, three humours are vitiated; they are called *Kutras*. *Siddhars* classified the diseases into 4448 types. Among them, the diseases of nasal Origin are 86, and one is *peenisam.* There are 9 Classifications of *peenisam* mentioned in *Yugivaithya Chinthamani*[1]. The signs and symptoms of *peenisam* are mentioned in *Yugivaithya Chinthamani,* such as headache, lacrimation, Nasal block, Nasal itching, ear discharge, running nose, cough with expectoration, absence of taste, which may be correlated with Maxillary sinusitis in biomedicine. The most frequently involved one is the maxillary sinus. *Peenisam* is otherwise known as *Mookadaippu* or *Neerkovai* as per *Siddha* Literature[2]. Intake of cold water, exposure to chillness, inhalation of smoke, harmful and Offensive gases, insomnia, speaking in a loud voice, using contaminated water for baths, Suppression of 14 natural urges (particularly vomiting &tears), Improper yoga practice Which increases the body heat are the triggering factors to cause this disease. The treatment of *Siddha* medicine is aimed at keeping the three humours in Equilibrium and maintaining the seven elements. So, proper diet, medicine, a Disciplined life, and medical advice for healthy living restore the equilibrium of humours in diseased conditions. The prevalence of sinusitis is estimated to be 14% of the global population. Women (5.7%) are highly affected compared to men (3.4%), and this increases with age. Approximately 0.5% to 2% of adults and 6% to 13% of children are complicated by bacterial Sinusitis. .1 in 8 Indians are hit by chronic sinusitis[3]. The prevalence of sinusitis in Tamil Nadu is 14% of the global population. Causes of sinusitis are bacterial, viral, and fungal infections, immune deficiencies, Congenital malformations, trauma, tumours, septal deviation, environmental factors and Recurrent usage of nasal drops. *Peenisam* is contrasted with the term sinusitis used nowadays. *Peenisam* is a common ailment that affects a significant portion of the Indian population each year. *Peenisam* affects one in every eight adults and worsens with the passing of the seasons, especially during winter [4]. This study aims to explore the causative factors that exacerbate the disease state as said in Siddha literature types of *peenisam* that impact a larger population and the body Constitution types that are more susceptible to *peenisam* and categorize the patients according to their body constitution which would suggest suitable and appropriate therapy in managing *peenisam (*sinusitis).

MATERIALS AND METHODS

Study Design: This was a cross-sectional study planned to assess the types of *peenisam* (sinusitis) and their body constitutions in sinusitis patients reported OPD of Ayothidoss Pandithar Hospital (APH), NIS, based on the *Siddha*

concept. Before starting the study, clearance was obtained from the Institutional Research Review Board (IRRB), followed by the Institutional Ethical Committee (IEC) with (IEC NO. NIS/24/IEC/2023/MP/42). The study was prospectively registered with reg.no (CTRI/2023/08/056947) registered on 25/08/2023. Then this study was carried out by screening 120 patients with *peenisam* (sinusitis visiting the OPD of APH NIS using the purposive sampling method. Among them, 100 patients aged above 15 years of both sexes were included in this study. Before being included in the study, informed consent was obtained from each patient. Data was collected and documented through a predesigned (type of *peenisam* and *thegailakanam*) questionnaire[5],[6].

Questioner Pattern

The questionnaire was divided into fundamental sections that include age, gender, Occupation, dietary habituation, causative factors, co-morbidity, alcohol, tobacco dependence, types of *peenisam*, inference of *Naadi* and *thegailakanam* among *peenisam* patients.

Study Enrollment

Patients reporting to Ayothidoss Pandithar Hospital will be enrolled in this study based on the inclusion and exclusion criteria. The patient will be informed about the purpose of the study. After consent is obtained from the patients, the data will be collected by using a predesigned questionnaire. Required information will be collected from each individual by using various data collection forms**.**

Data Analysis

All data collected will be entered into the computer using MS Excel software by the investigator. The data will be analysed using SPSS software under the guidance of SRO (Stat) NIS. The level of significance will be 0.05. A descriptive analysis will be made, and necessary tables/graphs generated to understand the profile of the patients included in the study. Then statistical analysis for the significance of different awareness characteristics will be done. The Chi-square goodness of fit test is to be performed for quantitative and qualitative data.

DISCUSSION

The Siddha system has a unique diagnostic method to identify the disease and causative agents. At the end of the study on *peenisam* and its types, we discuss significant facts about the disease with relevant justification from *Siddha* and modern literature based on observations and results. Sinusitis is a common disease with significant morbidity. No single etiological factor is responsible for this disease. Various allergic and infectious, & lifestyle changes have been held responsible. A higher incidence of sinusitis (30%) was observed in software engineers (IT professionals) who were affected more. Tailors (19%), housewives (23%) and students (15%). This observation indicated that the disease is associated with occupation; students and housewives are generally exposed to cold smoking and dust. In this study, the gender of females (75%) was found to be affected because half of the study population consisted of females. The majority of diseased cases. This study belongs to the 34% (17-30) years age group, and 25% age (31-40) years, this age group is normally a socially active group having more chances for exposure to exterior environment, it may be because of occupation dust mites, fast food. etc which are hazardous to health. Around 62(62%) were affected with chronic sinusitis, and of these patients were suffering from this disease for more than 12 weeks of duration, which indicates that the disease is chronic and resilient and progresses slowly. Regarding the presence of risk factors, developing sinusitis includes smoking, asthma, and allergies concluded by previous studies [7],[8]. In the present study population, about 50% of patients have a previous history of dust allergy, and smoking (23%), and 25% are affected with asthma. From this study is inferred that dust allergy and asthma increase the risk of sinusitis. 61 patients (61%) resist their urges (voluntary retention of stools and urine), as per *Siddha* literature, suppresses stool by counteracting the action of *Abana Vayu*, which has the function of pushing stool down. It increases and expels the accumulated faeces and causes *salathodam.* Previous research studies also speculate that the extrinsic upward pressure imposed on the diaphragm by a full bowel resulted in increased anteroposterior diameter, decreased lung height, and a reversible restrictive pattern on pulmonary function studies[9]. The benefits of the oil bath are

mentioned in *Siddha* literature, "*Pathartha guna chinthamani*". Taking an oil bath twice a week will prevent diseases. There will be a clear sensory function and prevention of head diseases [10]. Our study inferred that 93 patients had a lack of oil bath once in eight days, which may be one of the reasons for sinusitis. The relationship between sinusitis and asthma is unclear. Several theories have been proposed for a causal or shared association between sinusitis and asthma. Many research studies have suggested that the severity of nasal and sinus disease parallels that of the lower airway. This suggests that rhinitis, sinusitis and asthma are all manifestations of a single systemic disease [5]. Our study concludes that 25% of sinusitis patients are affected by asthma. Chronic rhinosinusitis (CRS)is associated with impaired sleep quality and excessive daytime sleepiness. Insomnia symptoms may be a risk factor for the development of Chronic rhinosinusitis (CRS) [11]. The study also inferred that 85 (85%) have an imbalance in sleep. Treating sleep imbalance may help in the treatment of sinusitis. When inhaled, the chemicals irritate our sinuses and cause a headache and mucosal congestion, potentially through mechanisms like vasomotor rhinitis, a condition where nasal passages become inflamed and congested in response to irritants [12]. The majority of cases had their diseases start in *Kaarkaalam and Koothirkaalam.* This implies that the monsoon and rain acted as triggering factors for the onset of the Condition of *peenisam.* When the body is exposed to cold, the risk of infection goes up. In a Cold environment, the blood vessels constrict and the immune system is weakened in lower temperatures. It might be because of the lowering of temperature, dampness of the Atmosphere, and waning immunity, triggering *Kabam* and thereby causing the Disease. So, during this season, drugs, diet, and hygienic practices that are specific to Strengthen *Udal Vanmai* can be advised. It is inferred that the rainy season has a great impact on the development of this *Peenisam*. So, proper precautionary measures like drinking hot water, intake of sour and salt foods which will increase *Vatha* and *Pitha* humour, intake of honey and external application of Musk, Camphor, and Sandal can be followed. Study results showed the proportion of *peenisam* types in this study among 100 patients: 10 *vali* peenisam,7 *azhal peenisam*,3 *Iya peenisam*,50 had *Neer peenisam,* and 30 patients had *mulai peenisam*. In *Siddha's* literature, there are 9 types of *peenisam* mentioned, but patients reported only under 5 categories. Other *peenisam* types, *kazhutu* and *ciray peenisam,* were not reported to have mucormycosis, aspergillosis, rhinosporidiosis, are come under nasal diseases. We need to concentrate on that disease, also based on our *Siddha* research. From the pulse diagnosis in 10 *vali peenisam,* 5 had *pithavadha naadi* and 5 had *pithakaba naadi;* predominantly, 7 patients had *azhal peenisam*. Out of seven, 6 patients had *pithakabam naadi*.3 patients had *Iya peenisam,* predominantly presenting naadi, *which* was predominantly found in the study. According to *Sathaga Naadi*, ***pithakaba Naadi*** and ***pithavadha Nadi*** are indicated for *peenisam* [13]. The study also explored the outcome of the *Dhegailakkanam* analysis according to the present observations. In *vali peenisam kabapitham*, *azhal peenisam vadha pitha dhegi* and *kabavadham*, In *Iya peenisam kabavadham*, *kabapitham* and *pithakabam dhegi* are frequently noted. In *Mulai Peenisam* majority of affected *dhegi* are *pithavadham* and *pithakabam dhegi*. In *Neer peenisam kabapitham* & *pithakabam dhegi*. Based on our study observations in all types of *peenisam* majority of the population, nearly 39% comes under ***pithakabam,*** and 27% comes under *kabapitha dhegi*. Much of the literature and Ayurveda articles concluded that those who have the *kabam* phenotype are more prone to having sinusitis. Disease prevention initiatives may benefit from an understanding of phenotypes, and the role of genetics will advance the *Siddha* medical system and lead to a tailor-made approach to preventive care.

CONCLUSION

The symptoms of *Peenisam* types and *Naadi* mentioned in *Yugi Vaithiya Chithamani* are similarly elicited in this study. Each individual has a unique combination of body constitution. It helps in tailoring lifestyle, diet and therapies to maintain balance and promote wellbeing. By understanding the body's constitution, we easily treat and reduce the burden of non-communicable diseases. *Naadi* (pulse) diagnosis is non-invasive and unique in our *Siddha* medicine. Previous study articles showed that *Naadi* is closely associated with (*Dhega ilakkanam*) one's body constitution [14]. *Naadi* is considered the current physical and diseased state of humour, body constitution defined as the relative presence of *Vatham*, *Pitham, and Kabam* at conception, and remains unaltered [15]. The preventable causative factors, attributed to the development of sinusitis as in *Siddha* literature, are scientifically justifiable.

ABSTRACT

Wildlife crime poses a significant threat to biodiversity, conservation efforts, and the rule of law in India. Despite having a dedicated legal framework in the colour of the Wildlife Protection Act, 1972 (WPA), enforcement challenges, loopholes, and emerging threats such as organized wildlife trafficking networks have rendered many protections ineffective. This article critically examines the evolution, successes, and limitations of the WPA in addressing wildlife crime over the past five decades. It analyses key challenges, including administrative inefficiency, lack of inter-agency coordination, insufficient penalties, evidentiary difficulties, and socio-economic factors driving poaching and illegal trade. At the same time, the paper explores opportunities to strengthen wildlife protection through legislative amendments (such as the 2022 Amendment to the WPA), enhanced technological interventions (such as digital surveillance, forensic science, and AI-driven monitoring), community-based conservation models, and greater international cooperation. By adopting a doctrinal and empirical approach, this article aims to provide a comprehensive evaluation of the existing legal regime, draw comparisons with global best practices, and suggest actionable reforms to bridge the gap between law and effective conservation. The findings will contribute meaningfully to the ongoing scholarly discourse on environmental criminology and legislative reform in India.

Keywords: Biodiversity, Conservation, Ecosystem, Extinction, Protected Area, Wildlife Crime

INTRODUCTION

Biodiversity encompasses the total variety of life at all levels of biological organization, including genetic, species, and ecosystem diversity. Conservation efforts focus on protecting this diversity across all these levels. The term "biodiversity," which comes from "biological diversity," describes the range of plant and animal species found in a specific ecosystem or area. It includes all the different kinds of life on Earth, such as microorganisms, plants, and animals, as well as their various habitats. Because biodiversity is essential to ecosystem function, protecting it is extremely important for the environment and human welfare. Hence, conservation of biodiversity is necessary for a sustainable future. Species diversity is not evenly spread across the globe; it is typically prominent in tropical regions and less so toward the poles. Several factors contribute to the richness of species in the tropics, including a longer evolutionary history, a relatively stable environment, and higher solar energy that leads to higher productivity. Additionally, species richness is influenced by the size of a region[1].Ecosystems with high biodiversity are generally more stable, productive, and resilient to invasions by new species. The planet's rich biodiversity is essential for human survival. While Earth's fossil record shows several past mass extinction events, current extinction rates, mainly driven by human activities. Major causes of these elevated extinction rates include habitat loss and fragmentation, over-exploitation, invasive species, and co-extinctions. The reasons to conserve biodiversity are multifaceted, encompassing narrowly utilitarian benefits such as food, fibre, and medicines; broadly utilitarian benefits through ecosystem services like pollination, pest control, climate regulation, and flood management; and ethical considerations, where humanity holds a moral responsibility to protect and preserve this natural heritage for future generations. We depend on nature for many things, from the food we eat to the homes we live in and the clothes we wear. Wildlife, fish, and forests all provide for our needs. However, wildlife crime is putting at risk our ability to enjoy the benefits and beauty that wild plants and animals offer. Examples include killing an elephant to harvest its tusks for making jewelry, stealing turtle eggs to use in a special soup, and cutting down rosewood trees to create furniture. Wildlife crime involves illegal actions such as trading protected plants or animals, poaching wildlife, or damaging natural habitats unlawfully. Wildlife crime reduces the numbers of many species and can threaten some with extinction[2].The methods used by criminals can also harm ecosystems. For instance, fish poachers who use poison or explosives may destroy coral reefs that serve as homes for almost one-third of marine species. Illegal exploitation and trade of natural resources also cause significant economic losses, especially for areas that depend on income from legal wildlife trade and tourism. Moreover, wildlife crime threatens the livelihoods of many people who rely on wildlife for their survival and income. The Wildlife (Protection) Act of 1972 provides the legal foundation for protecting various wild animal and plant species, overseeing their habitats, and regulating the trade of wild animals, plants, and related products. It includes schedules that grant different levels of protection and government monitoring to specific species[3]. This Act also played a key role in enabling India's participation in the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES). Earlier, the Act did not cover Jammu and Kashmir, but following the region's reorganization, it now applies there too. Unfortunately, Wildlife crime continues to pose a grave threat to India's biodiversity, conservation initiatives, and the integrity of its legal system. Although the Wildlife Protection Act, 1972 (WPA) serves as the cornerstone of India's legal framework for safeguarding wildlife, its effectiveness has been undermined by enforcement shortcomings, legal loopholes, and the rise of organized trafficking networks[4]. This article undertakes a critical assessment of the WPA's development, achievements, and limitations in addressing wildlife crime over the past fifty years. It identifies core challenges such as administrative inefficiencies, weak inter-agency coordination, inadequate punishments, evidentiary hurdles, and socio-economic drivers behind poaching and illegal wildlife trade. Simultaneously, the paper highlights potential avenues for reform, including recent legislative updates like the 2022 WPA Amendment, the adoption of advanced technologies (such as AI-based monitoring, forensic tools, and digital surveillance), community-led conservation strategies, and strengthened international collaboration. It proposes practical reforms to close the gap between statutory provisions and effective on-ground conservation. The study aims to enrich the broader academic discussion on environmental criminology and legal reform in the Indian context.

MATERIALS AND METHODS

On August 21, 1972, the Government of India enacted Act No. 53 of 1972, known as the Wildlife (Protection) Act, 1972, to safeguard wild animals, birds, and plants, thereby ensuring the ecological and environmental stability of the nation. Serving as a comprehensive or umbrella legislation, the Act encompasses various provisions aimed at the conservation of wildlife and their habitats. The Act consists of six schedules and is applicable across the entire country. It has undergone amendments in the years 2003, 2017 and 2022 to strengthen and update its provisions.

Constitutional Provisions Related to Wildlife Protection

Article 48A of the Indian Constitution mandates the State to endeavor to protect and enhance the environment, as well as conserve the country's forests and wildlife. Similarly, Article 51A outlines the fundamental duties of every citizen, which include the responsibility to protect and improve the natural environment, such as forests, rivers, lakes, and wildlife and to show compassion toward all living creatures.

Historical Legislation on Wildlife

Wild Birds Protection Act, 1887: This early legislation aimed to restrict the possession and sale of certain wild birds, specifically those that were captured or killed during their breeding season.

Wild Birds and Animals Protection Act, 1912: This law was introduced to extend protection to both wild birds and animals. It was further strengthened by the Wild Birds and Animals Protection (Amendment) Act, 1935, which updated and expanded its provisions.

Relevant Provisions under W.P. Act 1972

Under Chapter II, Section 5A of the Wildlife (Protection) Act, 1972, the Government of India established the National Board for Wildlife (NBWL) as a statutory authority[5]. This apex advisory body is tasked with guiding and supporting the conservation and sustainable development of the country's wildlife and forests. It plays a key role in advising the Central Government on matters related to wildlife protection and is responsible for reviewing and approving projects that impact national parks, wildlife sanctuaries, and other protected areas.

Hunting Regulations for Wild Animals

As per the Act, hunting any wild animal listed in Schedules I to IV is strictly prohibited. However, exceptions are allowed under certain conditions:

Hunting in the Interest of Public Safety or Welfare

If a wild animal poses a threat to human life or property (including standing crops), or if it is seriously injured, disabled, or suffering from a disease, the Chief Wildlife Warden may authorize hunting within a designated area[6].

Protection of Specified Plants

The Wildlife (Protection) Act lays down strict regulations for the protection of certain plant species listed as "specified plants." These provisions cover the prohibition of collection and trade, rules for obtaining permits, and restrictions on cultivation and ownership.

Ban on Picking or Damaging Specified Plants

Within forest areas and other locations notified by the Central Government, the following actions are prohibited

Intentionally picking, uprooting, damaging, destroying, acquiring, or collecting any specified plant. Possessing, selling, offering for sale, gifting, transferring, or transporting any part or derivative of a specified plant, whether alive or dead.

Exception: Members of Scheduled Tribes are allowed to collect and possess specified plants or their derivatives within their district of residence, provided it is for personal and genuine use.

Permit for Special Purposes: The Chief Wildlife Warden, with prior approval from the State Government, can grant permits for the collection, transportation, or acquisition of specified plants from forest areas for specific purposes such as educational use, scientific research etc.

Protected Areas

Protected Areas such as Wildlife Sanctuaries, National Parks, Conservation and Community Reserves, and Tiger Reserves are established under Chapter IV of the Wildlife (Protection) Act, 1972. These areas aim to conserve biodiversity, protect ecosystems, and preserve critical wildlife habitats[7].

Trade or Commerce in Wild Animals, Animal Articles, and Trophies

Chapter V of the Wildlife (Protection) Act, 1972, governs the trade and commerce related to wild animals, animal articles, and trophies. According to the Act, any animal, animal article, trophy, uncured trophy, meat, vehicle, weapon, trap, or tool that has been seized as part of an offence under the Act automatically becomes the property of the Central Government. If a person comes into possession of such government property, they are required to report this possession within 48 hours to the nearest police station or authorized officer. Upon request, the person must hand over the property to the officer in charge. Additionally, no individual is allowed to acquire, keep, transfer, destroy, or damage any government property without prior written permission from the Chief Wildlife Warden or an authorized officer. The Act also places strict restrictions on the transportation of wildlife and specified plants. No one is permitted to transport wild animals, specified plants, or their derivatives without obtaining prior authorization from the Chief Wildlife Warden or other designated officers authorised by the State Government. This ensures that all movement of wildlife and related materials is properly monitored and regulated. Furthermore, the purchase or acquisition of captive animals, wild animals (excluding vermin), animal articles, trophies, uncured trophies, or meat derived from these animals is prohibited unless the transaction occurs through a licensed dealer or an authorized person under the Act. This provision helps prevent illegal wildlife trade and ensures that all such commerce is carried out legally and transparently. Chapter VI of the Act addresses the prevention and detection of offences relating to wildlife protection. It grants powers to officials to enter premises, conduct searches, make arrests, and detain suspects involved in violations of the Act. It also outlines penalties for offences such as illegal hunting, possession, or trade of wildlife products, as well as for habitat destruction. India, with its immense biodiversity and status as a British colony, was a natural destination for European explorers and hunters. The country's expansive tropical forests, home to countless endemic species, drew scientists and trophy seekers alike. Even after independence, newly emerging elites adopted similar practices, continuing the legacy of wildlife exploitation under the guise of status and sport. By the late 1960s, the detrimental effects of widespread hunting and wildlife trade in India had become alarmingly clear. The Asiatic cheetah, once common, had already vanished by the early 1950s. Tigers, highly prized for their skins, were being hunted extensively, while reptiles like crocodiles, snakes, and monitor lizards were being killed for their hides and body parts. Globally desired luxury items such as ivory and shahtoosh wool were in high demand. Meanwhile, primates, birds, and frogs were being trapped in large numbers for scientific testing, meat, or the pet trade. This rampant exploitation caused significant declines in many animal populations, raising concerns among conservationists and policymakers. Still, putting a stop to this trade was far from simple. Wildlife product exports brought in much-needed foreign revenue and supported thousands of livelihoods, including those of trappers, exporters, and craftsmen. Despite the economic trade-offs, India opted to put conservation first. Reflecting its cultural values that emphasized non-violence and respect for life, the country began introducing stringent protective measures. The export of wild animal skins was officially banned in 1968. A year later, at the IUCN conference in New Delhi, Prime Minister Indira Gandhi publicly stated that India would not pursue foreign exchange earnings at the cost of its natural heritage. This stance led to a total ban on tiger hunting, the introduction of the Wild Life (Protection) Act (WLPA) in 1972, and the inception of Project Tiger. The WLPA, passed in 1972, became the cornerstone of India's legal framework for wildlife protection. Triggered by momentum from both the Stockholm Conference and the IUCN meeting, the law aimed to provide wide-ranging protection for India's flora and fauna. However, constitutional limits initially prevented the central government from directly legislating on the subject, as forests and wildlife were state matters[8]. This was resolved through Article 252, which allows Parliament to make laws on state subjects when at least two states request it. Nevertheless, bolstered by strong

political resolve and widespread cultural support, the Act was rolled out across the nation without major compromises. Over the years, it proved effective in bringing commercial wildlife exploitation nearly to a halt. The surge in forest and wildlife-related crimes has become a pressing global issue. These illicit activities threaten not just the rich diversity of life on Earth, but also the environmental equilibrium essential for sustaining life. Illegal wildlife trade and habitat destruction are often motivated by profit, endangering biodiversity[9] and destabilize ecosystems. Additionally, these crimes hinder economic progress, particularly in biodiversity-rich nations like India. India's wildlife faces serious challenges due to rampant poaching, trafficking, and environmental degradation, which are driven by urban expansion, deforestation, human encroachment, and illegal trade. Although the country has robust environmental laws and is a participant in global treaties such as CITES (Convention on International Trade in Endangered Species of Wild Fauna and Flora), it still ranks among the top 20 countries affected by wildlife trafficking and is one of the top ten nations for wildlife smuggling by air. With the demand for wildlife-based products used in traditional medicine, luxury goods, and cultural practice continuing to grow, illegal wildlife trade has become the fourth most lucrative criminal activity worldwide, trailing only drug, arms, and human trafficking, to name a few.

Global Wildlife Crime Networks

Wildlife trafficking is a highly organized, transnational crime that operates through extensive and often clandestine networks. Countries across the globe play different roles; some act as suppliers, others as transit points, and some as final destinations for the illegally traded species and their derivatives. Animals and plants are trafficked for various purposes, including food, medicine, religious rituals, exotic pets, and fashion. From rare orchids to reptiles and birds, nearly every element of biodiversity is at risk. The primary driver behind these crimes is demand; where there is a market, the supply chain continues to flourish. Despite India's active involvement in international conservation efforts, its enforcement efforts are impeded by weak border control, poor coordination between agencies, corruption, and increasing use of digital platforms, including the dark web, for illicit transactions[10].

India's Involvement in Wildlife Trafficking

India's status as one of the world's "mega-diverse" countries, home to about 8% of the planet's known wildlife ironically places it at the heart of the wildlife trafficking network. It functions as a source, conduit, and destination for illegal trade. Long and porous borders with countries like Myanmar, China, Bangladesh, and Nepal, where wildlife demand is high, make enforcement particularly difficult. Combined with the rise of e-commerce and social media, along with India's growing aviation connectivity, traffickers find many avenues to exploit.

Most Trafficked Species in India

Reports from agencies like the Directorate of Revenue Intelligence and studies such as TRAFFIC and "Smuggling in India 2020–21" reveal that ivory, pangolins, red sandalwood, Indian star tortoises, and ornamental fish are among the most frequently trafficked wildlife products in India.For instance, ornamental species like the zebra loach and barca snakehead (Channa barca) are heavily exploited for the aquarium trade. Pangolins are poached for their meat and scales, often smuggled to East Asian markets. Body parts of predators like leopards and tigers are trafficked for use in folk medicine and ritualistic practices. Additionally, there has been a rise in the smuggling of exotic animals such as kangaroos, red-eared slider turtles, parrots, tamarins, marmosets, lorises, and iguanas. A widely viewed 2022 video showing the rescue of a dehydrated kangaroo in West Bengal starkly illustrates the gravity of the issue.

Trafficking Routes and Use of Air Transport

India's smuggling routes are influenced by both its geography and infrastructure. The Northeastern corridor, particularly cities like Guwahati, Imphal, and Dimapur, serves as a primary route for trafficking to Southeast Asia and China. Other significant overland routes include the Indo-Nepal and Indo-Myanmar borders. Additionally, the Dooars region in West Bengal is a major transit zone for smuggled reptiles and birds.

RESULT AND DISCUSSION

A profound sense of love, compassion and duty towards plants and animals permeates the conscience of this nation since ancient times, and this is adequately reflected in our religious scriptures, mythological renditions, and social treatises, all of which embody the ancient jurisprudence of India. But with the gradual passage of time and with the dawn of modernity, materialism, Hedonism, along with shrewd individualistic pursuits, have somehow blunted the vigil of humanity and left it to seethe on the back burner, making way for indulgences and aggrandizement to lead our proclivities. The gradual decadence of humanity and the sharp ascendancy of ruthless materialism were alarming and an impending threat to the existentiality of the human race and the environment. Under these challenging circumstances, the global intellectuals as researchers, scientists, jurists, philosophers, lawyers and environmentalists felt it highly imperative to build a robust scientific and legal framework to protect the environment and the plants and animals as its indivisible biotic components. So far as the legal protection is concerned, it does assure legal enforceability, and this was thought to be the most potent form of deterrence to obviate the potential and penalise the actual offenders of wildlife crimes.

Wildlife Protection (Amendment) Act, 2022: A Brief Analysis

A close and purposive interpretation of the Wildlife Protection (Amendment) Act, 2022, in juxtaposition with the fundamental duties under the Constitution of India, unmistakably points to awareness and sensitivity of India and its citizens to the moral and legal duty towards the flora and fauna of this subcontinent. The Wildlife Protection (Amendment) Act, 2022, portrays a revised and elevated statutory assurance for wildlife protection in India in concordance with the global environmental obligations[11]. It is a structural and organic revamping of the entire Indian wildlife and environmental statutory framework in tandem with the international standards and expectations for wildlife conservation and preservation of species. The amended version focuses more on the best global conservation practices aimed at protecting the wildlife within the Indian jurisdiction. The authors will briefly look into the core provisions, positive reforms, and key concerns associated with the amendment in this segment of the paper. The Act indubitably introduces a host of commendable reforms, underscoring the growing need and efficacy of conservation and preservation of certain species of living organisms in order to ensure accomplishment of the broader goal of environmental sustainability, intergenerational equity and proliferation of species diversity. However, there are certain areas of concern as well in terms of its implementation, the inclusion of all the relevant stakeholders and potential societal and ecological implications. The most foundationally transforming factor in the amended Act is the clear and distinct rationalization of the schedules of species. The erstwhile version of the Act contemplated six schedules, which have been reduced to four post-amendments. Schedule I (species requiring the highest protection), Schedule II (lesser protection), Schedule III (protected plant species), and Schedule IV (CITES-listed specimens). This re-contouring is intended to streamline species categorization and to ensure a more clear and definitive level of protection[12]. In conformity with the CITES, the amended Act creates dual authorities: Management and Scientific to oversee and regulate the trade of listed species and guide them expertly[13]. The Act further introduces new statutory provisions to effectively deal with contemporary biodiversity and ecological challenges. The amended Act empowers the Central government to control and prohibit the import of Invasive Alien Species (IAS). These species are destructive in nature, and they can proliferate in a new habitat so fast that they can outgrow the native species and can disturb the natural ecosystem. Therefore, it is highly imperative to regulate their import, possession or trade[14]. Another positive development is the increased penalties for wildlife crimes, which aim to deter illegal trade and poaching[15]. Apart from the positives of the amended wildlife protection statute, there are some notable areas of deep concern that need to a mentioned. To begin with, the inclusion of 600 plus count of species in the CITES schedule without clear criteria and ecological justification have all the potential to overwhelm and confuse the enforcement agencies and may divert their attention and focus from more endangered species which are almost on the brink of extinction. Moreover, the amendment to section 43 of the Wildlife Protection Act is highly debatable for its vagueness as it allows transportation of captive elephants for "religious or any other purpose" opening the floodgates for exploitative practices in the name of religion or under the subterfuge of customs and traditions, all of which run counter to the essential tenets of animal welfare[16]. Another critical concern has been the

distorted federal balance owing to centralization of authority under the amended statute. The establishment of a Standing Committee within State Boards for Wildlife substantially attenuates the power of consultation of state governments and thwarts the voices of the local communities[17]. Moreover, the case of the forest-dwelling communities like the Van Gujjars, who fear increased surveillance and restricted access to traditional lands, is a major setback under the amended wildlife protection statute. The Van Gujjars are asemi-nomadic pastoral community which undergo seasonal migration across the forests of Uttarakhand, UP and HP in search of pasture. But the Wildlife Protection (Amendment) Act has brought the free grazing grounds within the purview of protected areas, rendering their natural and spontaneous mode of lifestyle almost impossible[18]. The amendment casts new obligations upon the enforcement authorities and the judiciary[19] because the legislative intent that the amendment exemplifies can best be achieved only through simultaneous investment in broadening and deepening the institutional capacity. The expanded list of protected species may also aggravate human-wildlife conflict, especially in the agrarian regions where animals like wild boars or nilgai destroy crops but now enjoy stronger legal safeguards[20]. The brief critical review of the Wildlife Protection (Amendment) Act 2022 is mixed, holding both promises and disappointments owing to some critical systemic failures that call for immediate overhaul. Fulfilling international commitments and modernizing the Indian wildlife statutory framework are no doubt laudable initiatives, but the amended law must engage more comprehensively and organically to respond to the socio-cultural and ecological complexities. The future legal and administrative machinery should aim towards efficacious community engagement, more transparency in species classification, and a better enforcement ecosystem. A nuanced approach that integrates ecological priorities with socio-economic realities will be essential for the Act's successful implementation.

Role of Technology in Combating Wildlife Crimes

Technological sophistication and efficacy are proven strategies to reduce and eliminate the risks and possibilities of wildlife crimes. A diverse varieties and modalities of crimes against animals have been historically perpetrated by unscrupulous, money-minded, selfish people for ages. Poaching, illegal trade and habitat destruction are some of the gravest forms of cruelty and injustice meted out to the wild animals. However, our gradual shift from an analogue to the digital stage has indubitably accelerated the precision of detection, impact of prevention and reduction of wildlife crimes globally. From real-time monitoring systems[21] to data analytics, technology plays a multi-pronged role in the prevention, detection, and prosecution of wildlife-related offences. Modern innovative concepts like satellite imagery and remote sensing are highly capable of real-time tracking of unauthorised deforestation and habitat encroachments,[22] rendering it possible for appropriate authorities to act promptly. The use of drones has substantially enhanced aerial surveillance, especially of those strips of forested regions which are usually inaccessible to humans. This has reduced the risks associated with physical patrolling by humans and has improved the coverage of such deeply forested terrains[23]. Moreover, the use of camera traps and GPS collars is are highly effective aid in tracking animals and monitoring their behaviour. This kind of study helps in analysing and understanding the patterns of poaching and taking suitable preventive measures[24]. The role of Artificial Intelligence (AI) and big data analytics does not need separate emphasis, as these algorithms and innovative technological inputs play a very crucial role in predicting poaching hotspots through analysis of historical data, climate variables, and ranger patrol routes. Predictive policing is a highly sophisticated technique that uses data analysis and algorithms to anticipate crimes and is highly effective in combating crimes related to the flora and fauna[25]. To add to this, even blockchain technology can be used as a potent technological instrument to ensure traceability of legit wildlife trade, making it quite difficult to launder illicit products through licit routes[26]. Further, DNA barcoding and isotopic analysis facilitate identification of species and tracing of origins, thereby strengthening prosecutorial strength by offering scientific evidence[27]. The mobile technology has recently introduced SMART (Spatial Monitoring and Reporting Tool), which, if implemented effectively, can trace and document real-time patrol efforts, creating an integrative, robust enforcement network and mechanism. Thus, SMART technology unlocks the potential and value of ranger-based monitoring for biodiversity conservation[28]. These technological aids no doubt both complement and supplement the process of regulation, but even they are not without constraints in the form of high investment costs, infrastructural bottlenecks and the mounting urgency for inter-agency coordination. It is quite pertinent to assess and appreciate the efficacy of technology when it supplements the traditional conservation strategies, rendering the

possibility of enhanced wildlife conservation through a more scalable, inclusive, and adaptive technological advancement.

Strengthening Inter-Agency Collaboration: Role of Customs, Police, CBI and the Interpol

Transnational crimes like cybercrime, terrorism, human and wildlife trafficking, and money laundering call for a robust and seamlessly integrated inter-agency collaboration. The role of customs, CBI, police and Interpol cannot afford to be fragmented anymore amid such horrendous international crimes having deep transnational implications. Intelligence sharing is the need of the hour. The customs being the watchdog and the first line of defence of the porous international coastal borders can quite effectively intercept contraband/smuggled goods, which may include even endangered wildlife products, among other things. But failure to promptly share such information with the police and the CBI often makes attempts for wider crackdowns on syndicates unsuccessful. For example, Customs data on import/export anomalies can inform CBI's investigations into money laundering and trade-based financial crimes, but only if information flows are institutionalized and digitalized[29]. Again, so far as local intelligence gathering is concerned, police play the most crucial role in maintaining law and order and executing warrants. However, the effectiveness of the local police forces is remarkably undermined owing to their lack of access to the central database system created and maintained by the CBI or Interpol. CBI, on the other hand, may need to rely on state police forces to solve cases involving multi-jurisdictional crimes but such reliance hardly works due to want of standard protocols, delays and duplication. Interpol's role has gained renewed significance on the face of growing cyber and transnational threats. India's National Central Bureau (NCB)[30] under the CBI coordinates with Interpol to issue notices, share intelligence, and extradite fugitives. Yet, real-time access to Interpol databases and timely responses to "Red Notice" alerts remain problematic due to procedural bottlenecks and limited technical integration with local agencies. The need of the hour is to construct a comprehensive interoperability framework having legal validity, requiring timely data sharing and joint investigations across agencies. Creation of an integrated crime database—accessible to the customs authorities, police, CBI, and Interpol (NCB) can facilitate real-time collaboration. Institutionally, regular joint training programs, inter-agency task forces, and designated liaison officers can bridge trust and capacity gaps. Latest initiatives like National Intelligence Grid (NATGRID), Crime and Criminal Tracking Network System (CCTNS), and the Inter-Operable Criminal Justice System (ICJS) are no doubt positive angles, but they suffer from incomplete implementation and limited interlinking which need to be set right on a war-footing[31].

Capacity Building of Enforcement Agencies and the Judiciary

Capacity building of the enforcement agencies and the judiciary is central to the effective administration of justice and the rule of law. It subsumes no merely infrastructural development but also institutional reforms that promote liability, adaptability and professionalism. Lack of domain expertise, technology constraint and paucity of manpower are some of the vital concerns that plague the enforcement agencies like police, customs, and specialized bodies like the Wildlife Crime Control Bureau, etc. Regular, domain-specific training in forensic science, cybercrime, financial investigations, and digital evidence handling is essential to modernize enforcement capabilities. Moreover, the integration of AI-driven surveillance, predictive policing tools, and interoperable databases requires officers trained in both technology and law. The judiciary must also address vital concerns like evolving complexities and the phenomenal volume of cases. Judicial academies imparting training to judicial officers should play a crucial role in ensuring continuous training and development of the bright judicial minds. Contemporary issues like data protection, privacy rights, IP crimes, environmental jurisprudence and biodiversity protection must be deliberated upon on a continual basis. The judicial delays are often the result of procedural clogs and lapses, and awareness regarding the use of technology-driven mechanisms for file and register maintenance, case management systems and alternative dispute resolution mechanisms may substantially expedite the justice dispensation system[32]. Moreover, inter-agency co-ordination, sensitisation about victimological jurisprudential insights are necessary. Institutionalizing performance audits, incentivizing specialization, and fostering a culture of ethical integrity are equally critical. Finally, sustained investment in the capacity building of enforcement and judicial institutions is not a peripheral reform—it is central to democratic governance. Without it, even the best laws remain ineffective when it comes to implementation.

Community Participation and Wildlife Conservation

If we observe and analyse our traditional forest conservation practices, it was more like an insular system. It was predominantly a State-led scaffold marked with regimented and authoritarian demeanour and reinforcing a State-centric command and control mechanism. However, with the growing consciousness for a welfarist economy in which the essential tenets of participatory governance run deep, an attempt is being made to dismantle exclusionary tendencies and instead embrace inclusionary approaches in the form of community participation of the local resources like the forest-dwelling indigenous population and their traditional knowledge systems for the effective conservation of biodiversity. The traditional model of forest conservation relied heavily on the top-down command and control strategy, resulting in alienation of the local people, but the community participation model acknowledges the ecological knowledge, resource stewardship, and custodial rights of local populations. Community-based forest conservation strategy aims to optimize the utilization of human resources residing sufficiently proximate to the forest and wildlife, and are in the best strategic locations to protect the biodiversity[33]. The Annapurna Conservation Area, Nepal and the CAMPFIRE program in Zimbabwe are illustrative of how the implementation of the idea of community ownership and benefit sharing enhances overall protection of the biodiversity[34]. Various modern initiatives like Joint Forest Management (JFM) and Eco-Development Committees (EDCs) under the Wildlife Protection Act have sought to integrate local communities into forest governance[35]. But this gesture seems pure tokenism as it is mired in half-hearted implementation and feeble legal entitlements. However, the Forest Rights Act, 2006, offers a more robust legal platform for community/participatory conservation initiatives. Community participation needs to be institutionalised through democratic models of decision-making, which will lead to empowerment of the local men and women. To harmonise forest and wildlife conservation with community rights can be an excellent step, which is not only desirable but ethically justified[36].

International Cooperation: CITES and Bilateral Treaties in Wildlife Conservation

International cooperation is critical in addressing transboundary wildlife crimes, which often involve complex networks spanning source, transit, and consumer countries. The Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) and bilateral treaties have emerged as essential legal instruments in harmonizing efforts to regulate wildlife trade and protect biodiversity. CITES, adopted in 1973 and ratified by 184 parties, provides a legal framework for controlling international trade in endangered species through a permit-based system[37]. It classifies species into three Appendices based on the degree of protection required, thereby balancing trade with conservation. India, a party since 1976, has integrated CITES provisions into domestic law via the Wildlife (Protection) Act, 1972, and the Customs Act, 1962[38]. CITES has helped curb trade in species like the Indian Star Tortoise and Red Sanders through trade embargoes and compliance mechanisms. However, CITES alone cannot address the full spectrum of enforcement and capacity-building needs. Bilateral treaties supplement CITES by enabling intelligence sharing, joint operations, and targeted cooperation. India has signed MoUs on wildlife protection with countries like Nepal, Bangladesh, Myanmar, and Bhutan, which facilitate coordinated patrolling and extradition of wildlife offenders[39]. The Indo-Nepal and Indo-Bhutan agreements are particularly significant given the porous borders and shared ecosystems. Challenges remain in terms of harmonizing legal standards, overcoming jurisdictional hurdles, and addressing disparities in enforcement capacities among partner countries. Moreover, the effectiveness of CITES is contingent upon national implementation, which varies significantly across jurisdictions[40]. In conclusion, CITES provides the normative backbone for global wildlife trade regulation, while bilateral treaties serve as operational arms to enforce those norms. Their synergy is vital for dismantling international trafficking networks and promoting ecological sustainability.

Challenges and Opportunities

Wildlife crime control in India faces several structural and operational challenges. These include inadequate coordination among enforcement agencies, insufficient manpower and forensic infrastructure, porous borders facilitating cross-border trafficking, and weak prosecution leading to low conviction rates[41]. Additionally, outdated legal frameworks struggle to keep pace with the sophistication of wildlife crime syndicates. However, significant opportunities exist in the form of advanced technologies, international cooperation through platforms like CITES and

INTERPOL, and growing community awareness and participation. The increasing recognition of the link between biodiversity loss and public health—especially post-COVID-19—has further emphasized the urgency for reform[42].

Strategic Recommendations for Legal and Policy Reforms

Legal Modernization: Amend the Wildlife (Protection) Act, 1972, to introduce stricter penalties for organized wildlife crime and provide clearer definitions for offences involving digital and cross-border components.

Integrated Enforcement Framework: Create an inter-agency wildlife crime coordination authority comprising the Wildlife Crime Control Bureau (WCCB), Customs, Forest Departments, and Police.

Capacity Building: Institutionalize training programs for enforcement personnel, prosecutors, and judges on wildlife law and forensic techniques.

Use of Technology: Expand use of AI-based surveillance, e-DNA tracking, blockchain for legal trade authentication, and mobile reporting tools like e-Eye and M-STrIPES[43].

Community-Centric Policies: Strengthen implementation of the Forest Rights Act and incentivize local conservation through Payments for Ecosystem Services (PES) models.

CONCLUSION

India's wildlife crime control architecture is poised for transformation if systemic reforms are enacted. With increased international collaboration, integration of digital technologies, and community involvement, India can move from reactive enforcement to proactive conservation governance. The future depends on embedding ecological justice into law and policy—where biodiversity protection is seen not just as conservation, but as national security and social equity.

ABSTRACT

Social network users encounter four specific detrimental effects including anonymous communication combined with cyber bullying plus privacy violations and dangerous media dissemination. Social media users adopt the preventive measures through peer relationship building as well as content verification steps before submitting the dangerous information to authorities. Social networks are indeed of synchronized approaches to enhance the privacy. The research between 2018 and 2025 provides insight into addressing the negative impacts that occur in social networks. These analyzed survey data examine the Deep Learning (DL) solutions to manage social media platform disadvantages in research studies. Deep Learning systems implement identification and regulatory actions to manage misinformation along with the destructive content during social network operations. Research reports indicate that DL methods decrease dangerous content found in social networking environments effectively. The traditiotinal study depended on Parallel Social Behavior-Based Algorithm along with Non-Monotone DR-Submodular Optimization to perform its core investigations. Better network authenticity, enhanced user security and trust emerge through the social network implementation of this technology. This research gives research prospects to minimize the adverse social media characteristics in its final part.

Keywords: Deep Learning (DL), Diminish, Harmful content Misinformation Negative influences, Social networks

INTRODUCTION

Social networking websites have become the part of the communication to link human beings and organizations around the world. Social networking websites have also been breeding grounds for disinformation, cyber bullying, privacy violation, and violence that have caused enormously serious society-level threats, while an eye blink transmit disinformation, which impacts the popular perception, contribute to violence, and deplete e-trust [1]. Similarly, cyberbullying induces severe psychological trauma, particularly to susceptible users. Therefore, it is addressed in order to institute adequate mitigation controls [2]. Deep Learning techniques have been proven to be effective tools with the potential of detecting, analyzing, and mitigating the negative impacts on social networks. Some of the recent research works have proposed few DL methods addressing the challenges. Graph Attention Networks (GATs) have been promising in identifying mental illness from social media behaviors for enabling timely intervention to target users [3]. Long Short-Term Memory (LSTM) models identify the sentiments of social media posts efficiently, and real-time identification of toxic discourse and emotional distress is enabled [4]. In addition, blockchain-enabled DL offers decentralized frameworks for the detection of cyberbullying, ensuring data integrity and recommending appropriate action [5]. Another critical application of DL on social media is prediction and analysis of user behavior. Temporal link prediction models use reasoning mechanisms to make predictions about interactions, perhaps detecting and eliminating the risky behaviors in early phases [6]. Influence maximization techniques through submodular optimization also deter information diffusion and mute the effects of risky content [7]. Deep Learning assists in network structure analysis, allowing the sites to forecast and predict the user characteristics from patterns of connections. The knowledge aid in offering guided interventions for countering the trend towards disinformation and spamming campaigns [8], [9]. Besides, noise-corrected sampling methods make data more trustworthy for online social networks, decreases the content moderation bias [10]. With the technological advancements in social networks, the applications of DL techniques present an active solution to safeguard users and promote reliance on platforms. Utilizing complex neural networks, behavioral prediction models, and blockchain architectures, developers and researchers effectively remove the entire detrimental effects on social networks. In addition to making the web space more secure, these developments also encourage user engagement and confidence as well as the accountability and robustness of social media against potential destruction. Figure 1 shows the reason for social network negative effects resulted through misinformation, cyberbullying, intrusion on privacy, and algorithmic discrimination. Misinformation propagates extremely fast and misinforms the users, while harassment and data exploitation invade security and bliss. Echo chambers, psychological manipulation, over contentment, and commercial exploitation also contribute to the negative effect of social media.

LITERATURE REVIEW

Recent research explores DL methods to combat the ill effects of social media through identifying misinformation, cyberbullying, and hate speech. Adversarial activities are categorized using GAN and LSTMs, privacy and security are increased with blockchain-protected Artificial Intelligence (AI). Temporal link prediction and influence maximization algorithms manage sharing content. All of these measures improve online security, trust, and moral digital participation. Gu, S., *et al.* (2023) examined profit maximization methods in social networks, including non-monotone Diminishing Returns (DR)-submodular maximization. The study revealed the use of user action by firms to maximize the profits while being respectful of ethical concerns. Deep Learning methods for ad campaign maximization and sponsored content were analyzed in the study. Understanding the network structure enabled control over commercial exploitation and promoted user trust. The study was able to balance profitability with ethical online advertising. Hamdi, S. A. (2024) examined the way in which social media disinformation was disseminated under the patronage of the ideological square. The study questioned the process through which polarized narratives shaped public opinion and consolidated social cleavages. The study emphasized the importance of discourse analysis to ascertain ideological trends in disinformation. The study emphasized the challenge of containing biased content and necessitating AI-based verification processes. The results reiterated the need for advanced detection instruments that stood up to disinformation and strengthen evidence-based argument. Hosni, A.

I. E., *et al.* (2024) examined hybrid rumor prevention in dynamic multilayered social networks. The authors researched disinformation diffusion at high speeds and its impact on public opinions. Through the application of deep models and multilayer analysis, rumor detection and control were improved. It showed the efficacy of real-time observation in disinformation prevention. This research assisted in improving the misinformation countermeasures in developing online systems. Table 1 is a comparison table of different research studies based on the subject, methods used, results, and usefulness for social networks. It reflects the new technologies such as deep learning, big data, ethical AI, and adversarial analysis enable the questions on online platforms to be answered. Comparison offered insight into security improvement, trust, and user interaction improvement for social media. Mnasri, W., *et al.* (2021) also performed the same social behavior-based opinion leader identification experiment on social networks. The authors emphasized user behavior and interaction patterns that actively engaged in information diffusion. By examining network structure, an algorithm is started in identifying the influential users that made valuable contributions to discussions in online discussions. The study optimized marketing campaigns and information dissemination. This experiment enriched the influence discovery models to make digital communities lively. Panagopoulos, G., *et al.* (2024) examined the learning graph representations for influence maximization in social networks. The authors studied the impact of graph-based methods on influence prediction and diffusion. The methods of influence maximization were improved using DL models to choose the influential users effectively.

The research provided insights into the role of network structure for maximum information dissemination. This research helped to develop AI-based strategies for social media marketing and information campaigns. Table 2 compares the various studies in terms of objectives, methodologies, findings, and implications in digital networks and AI. It illustrates the application of various methods to manage misinformation, sentiment, disaster forecasting, and network optimization. The comparison provides insights that are used to improve online security, communication, and decision-making in social media and digital networks. Park, J. H., *et al*. (2025) described the application of machine learning for predicting the symptoms of anxiety in social anxiety disorder patients. Multimodal virtual reality session data were utilized in this research to enhance the prediction accuracy. By integrating physiological, behavioral, and text data, the authors achieved enhanced prediction accuracy in detecting early symptoms of anxiety. The authors used the example of the potential use of AI diagnosis of mental illness in virtual reality. The findings helped in altering the intervention for social anxiety patients. Table 3 contrasts the various studies in areas of interest, methodology, primary findings, social network and AI use. It shows the leading of various methodologies to energy efficiency, social media, revenue maximization, and behavior monitoring. Comparison is made based on improving decision-making, online participation, tracking data online. George, J., *et al.* (2023) examined the diffusion of misinformation using a multidisciplinary study methodology. Trends and patterns behind the diffusion of misinformation and those that justified its validity and diffusion were examined. Patterns of social media usage and algorithms were the determining drivers of the pace of the spread of false information. This research highlighted the need for sophisticated detection tools in a bid to adequately fight online disinformation. The research brought into the perspective of expanding public opinion and content verification against disinformation. Gruner, R. L., *et al.* (2019) conducted a study to analyze the impact of internet marketing and social media communication on new product launches. The authors analyzed the impact of web promotions on profit and sales quantity. The authors discovered that social media engagement with customers had considerable impacts on customers' behavior and purchasing activity. This research suggested the importance of internet advertising to promote product innovation in an effort to stay competitive in the market. These findings have implications for the extent to which consumer demand is web-based platform-driven.

Problem Identification

The pandemic, cyberbullying, and hate speech on social media have led to several problems of internet security and trust. Traditional moderation policies have failed to stem the fleeting spread of disinformation and bad manners. Social media algorithms are correctness-agnostic and popularity-driven. Therefore, spread the disinformation and polarize people. Privacy invasions and unethical applications of information fuel ill-influences in internet communication even more. Businesses utilizing social media for advertising are confronted with the challenge of

walking the tightrope between money-making schemes and ethics. The need for sophisticated AI-based methods of detecting, avoiding, and countermanding such issues was now a necessity to ethical online communication.

Existing Methodologies

Several methods have been constructed to address the social network problems in collaboration with sophisticated computational methods. Cyberbullying detection based on blockchain and neural networks use DL to enable real-time monitoring and store data securely. Fake news prevention models apply behavior analysis, machine learning, and NLP to detect misinformation and enhance credibility of content. Optimization methods like non-monotone DR-submodular maximization maximize profit-maximizing policies with ethics-based user interaction. Big data-driven forecast models use customer behavior and marketing-mix inputs in guiding business strategy selection. Algorithm models of fairness managing online ad delivery to prevent manipulative targeting and transparency in personal content delivery. Social behavior-driven algorithms use parallel processing to determine influencer users and optimize information sharing and engagement tactics. Also, AI-based text analysis tools utilize NLP and sentiment analysis to recognize social media markers of intimate partner violence through which online safety intervention and early intervention take place. This methods work complementary toward enhancing security, ethical decision-making, and user trust in online environments.

Blockchain-Based **Deep Learning Cyberbullying Detection and Prevention System**

The system uses DL techniques for real-time cyberbullying identification from vast volumes of social media interactions. Leaning on the present-day neural networks like Convolutional Neural Networks (CNNs) and LSTMs, the system detects hate text, image, and video patterns and accurately identifies offending material, and threats. Decentralized and unalterable records are maintained through blockchain technology and in reported cases the goal is to achieve transparency, security, and authenticity. Where cyberbullying is detected, the system provides suggestions wisely. For example, automatic removal of the material, instant warning to the user, and intervention such as providing counseling resources or notifying parents are suggested. Further, the system allows secure information sharing between agents such as platform moderators, mental health professionals, and police, in a way where the cyberbullying is managed effectively and coordination is established. Through the use of AI-powered identification and blockchain's authenticity, this process alters the pace of cyberbullying prevention to safer and more ethical online communication. Alabdali, A. M., and Mashat, A. (2024) Figure 2 illustrates a Blockchain-Based Deep Learning Cyberbullying Detection and Prevention System with key steps ranging from Data Collection, Preprocessing, and DL Model Training to Cyberbullying Detection and Blockchain Integration for secure record-keeping. On top of that, Intelligent Recommendations, Stakeholder Alerts, Real-Time Monitoring and Adaptation, and User Awareness and Reporting have been incorporated for better intervention and system adaptability. Finally, Evaluation and Improvement ensures continuous improvement so that the framework is increasingly effective in preventing cyberbullying attacks.

Multi-Disciplinary Fake News Detection and Mitigation Model

This model is end-to-end based on the combined application of different analytical approaches for discovering, analyzing, and fighting social network disinformation. This approach combines NLP for text content analysis, machine learning methods for detecting fake patterns, and social network analysis for following the information disinformation paths among users. Behavioral and psychological studies are combined in an attempt to understand the individuals accept and transmit false information by considering cognitive shortcuts, emotional signals, and social influence. Blockchain technology makes transparency possible through fact-checking processes that are verifiable so that the credible sources are input in a manner that has not been tampered with and false information generated. The model is also complemented with user awareness campaigns and media literacy training to inform the people to critically evaluate digital content. The model is also founded on real-time intervention tactics such as credibility scoring using machine learning, fact-checking of content using AI, and misinformation warnings that lead the users to the appropriate decision-making before access to fake content. This is done, through the integration of technology knowledge, psychology, and social science with precision and efficiency in detecting deception news, ultimately resulting in a responsible, informed, and credible online persona. George, J., *et al*. (2023).

Non-Monotone Dr-Submodular Optimization for Profit Maximization in Social Networks

Non-Monotone DR-Submodular Optimization for social network profit maximization uses the sophisticated optimization techniques for revenue maximization in terms of strategic and ethical equilibrium on the web. The approach uses non-monotone DR-submodular maximization for maximization in ad decision-making, content promotion, and user engagement models. Based on network structure, user behavior pattern and interaction dynamics analysis, the model identifies influential nodes with high influence that maximize information diffusion and influence propagation. It uses machine learning algorithms to maximize profit-maximization strategies under fairness, budget, and user experience constraints. It uses adaptive pricing and personalization recommendation systems to render advertisement spending effective on best-fit groups. It not only maximizes the monetization efficacy on social media but also balances revenue increase with user experience, responsible ads, and sustainable engagement, making the world of internet ethical and lucrative. Gu, S., *et al*. (2023)

Big Data-Driven Demand Forecasting Framework with Marketing-Mix Optimization

Big Data-Driven Demand Forecasting with Marketing-Mix Optimization solution uses the latest data analytics and machine learning algorithms to forecast demand for customers and combine significant marketing-mix drivers. It delves into vast structured and unstructured data on social media activity, consumer behavior, marketplace activity, and promotions. Based on predictive models, it determines volatility in demand and fine-tunes prices, advertisement, distribution, and product assortment to achieve the maximum responsiveness in the marketplace. The system employs real-time data analysis to modify marketing strategies in real time so that business entities can respond to evolving consumer behavior with maximum effect. It also features AI-powered decision-making tools that track historical trends of sales and outside economic factors to enhance forecasting strength. By combining the demand forecasting with marketing-mix drivers, the model make business more profitable, wastage-free supply chain and develop more customer-focused marketing strategies within a more competitive online marketplace. Kumar, A., *et al.* (2020). Figure 3 is a big data-driven demand forecasting Framework to Market-Mix Optimization. Data gathering is the initial step and proceeded by preprocessing for quality achievement. Feature selection and engineering push significant variables for predictive model construction. Dynamic real-time analysis and calibration enhance demand forecast, and marketing optimization pushes optimal business performance improvement. Model polishing iterative, which is provided real-time backed by improvement, pushes strategic planning decision support for best form.

Fair Algorithmic Targeting Framework for Online Advertising

The Fair Algorithmic Targeting Framework for internet advertising is in an effort to strike a balance between outsize commercial practice in the behaviorally targeted online advertising with accountability, transparency, and consumer protection. It uses ethical AI models to regulate algorithmic targeting to avoid the users' personal information being used to exploit and manipulative biased management of consumers' behavior. It uses privacy-preserving techniques such as differential privacy and federated learning to decrease the intrusive data gathering without compromising ad relevance. Apart from this, it puts rulebooks to manage ethical advertisement methods such as consent-targeting, discovery of ad distribution bias, and disclosure for automated decision-making. Hiding in between consumer safety and company advantage, the model restrains internet behavior advertisement deleterious effects and develops a more wholesome and the moralized internet advert environment. Laux, J., *et al*. (2021)

Parallel Social Behavior-Based Algorithm

Parallel Social Behavior-Based Algorithm for influential user identification is an approach that is designed for the efficient identification of influential users from social networks after observing interaction behavior and behavior trends. Parallel computational techniques are applied in the above approach to handle vast volumes of social network data. Hence, it is made efficient and accurate to identify the influential nodes. This algorithm selects the most likely users to spread information and shape the network by considering user connectivity, sharing behavior for content, and scores for connectivity. Predictions are enhanced with machine learning algorithms by means of continuous learning against dynamic social interactions. Influence propagation analysis is also dealt within the framework of marketing campaign optimization, information diffusion strategy, and community activation. The

technique improves web influence measurement, social media research, and business marketing by pinpointing the consumers who drive conversations, trends, and engagement on the web. Mnasri, W., *et al.* (2023)

Detection of Intimate Partner Violence on Social Media using AI-Powered Text Analysis Framework

The social media text analysis platform for the detection of intimate partner violence Using AI is based on natural language processing (NLP) and machine learning that identify signs of abuse from social media. The system scans colloquially written texts published on social networking sites, identifying linguistic markers, emotional markers, and contextual markers of intimate partner violence. Deep learning models tag and categorize documented cases with risk indicators to allow early intervention and support for victims. Sentiment analysis and entity recognition techniques enhance the detection of distress signals with greater accuracy, enabling the social service agencies to react accordingly. This system also integrates the ethical AI practices to protect user privacy and utilization of information for abuse. By AI computerized detection and real-time alarm, the practice is expanding the deployment to prevent intimate partner violence and providing an interactive platform for online safety and activism. Trinh Ha, *et al*. (2022**)**

DISCUSSION

Deep Learning technology deployment is important in avoiding the undesirable impacts in social networks by the factors such as cyberbullying, misinformation, and inappropriateness. Blockchain-Based Deep Learning Cyberbullying Detection and Prevention System enables improved real-time objectionable content identification and guaranteed transparency of data and secure processing. The Multi-Disciplinary Fake News Detection and Mitigation Model combine machine learning and social analysis to dampen the propagation of misinformation and construct an information-centric online environment. The Non-Monotone DR-Submodular Optimization framework attains moral maximum revenue by maximizing the user interaction plans without permitting manipulative behavior. The Big Data-Driven Demand Forecasting Framework applies the predictive analytics in re-designing marketing plans without sacrificing user preference violation and minimization of manipulative targeting. Fair Algorithmic Targeting Framework solves the privacy problems in an ethical and fair way of online advertising. Parallel Social Behavior-Based Algorithm supports opinion leader identification and promotes healthy information diffusion and suppression of negative information diffusion. Finally, AI-Powered Text Analysis Framework detects the intimate partner violence by conducting text analysis on social media as well as supports early intervention and victim rescue. All these methods show the neglect of sophisticated DL computers on adverse consequences and develop better strategic and secure cyberspaces.

CONCLUSION

This research analyzed 35 articles on minimizing the ill effects in social networks through DL methodologies. The examined researches were previously published between 2018 and 2025. The paper offers enhanced internet security through the application of deep learning in identification and reversal of cyberbullying, misinformation, and discriminatory activity on social media. The research identifies new DL methods of identification, evasions, and elimination of undesirable social network impacts on internet security. Its application ensures online security through deep detection, evasion, and neutralization of unwanted content in social networks. This research forms the basis in developing next-generation deep learning interventions for protection against cyber attack, scam, and unwanted interaction in social networks. Future research also focuses on improving DL algorithms for real-time detection, improving accuracy, and the application of ethical AI in ensuring fairness in content moderation. It aims at establishing the adaptive algorithms for combating future threats and securing social network interactions.

ABSTRACT

This study examined the levels of Fear of Missing Out and anxiety among adult users of Instagram and LinkedIn, focusing on how these experiences manifest across social and professional digital environments. A total of 119 participants aged 21 to 40 years completed standardized self-report measures assessing both Fear of Missing Out and generalized anxiety in relation to their engagement with each platform. Descriptive analyses indicated that the mean levels of Fear of Missing Out were comparable between Instagram and LinkedIn, with only minimal differences observed. Inferential statistical tests revealed no significant difference in Fear of Missing Out scores between users of the two platforms, suggesting that the phenomenon is similarly prevalent regardless of whether the context is social or professional. The results suggest that the tendency to experience Fear of Missing Out is not exclusive to visually appealing, socially oriented platforms like Instagram, but is a widespread phenomenon influenced by digital connectivity across both social and professional online spaces. The findings underscore the importance of considering a range of contextual and individual factors in understanding Fear of Missing Out and point to the need for future research to explore how specific platform features interact with user characteristics to shape emotional experiences online.

Keywords: Fear of Missing Out, Anxiety, Instagram, LinkedIn, Social Media, Digital Well-Being

INTRODUCTION

In today's interconnected world, social media has become the heartbeat of human connection, fulfilling our deep-rooted need to engage with others. What once was celebrated as a breakthrough in communication now reveals a more complicated reality of these platforms, while connecting us can also take a toll on our mental well-being. Research has made it clear that spending excessive time on social media is linked to rising levels of depression and anxiety highlighting the hidden costs of our screen-filled lives. As we scroll through endless streams of carefully curated images and stories, we often find ourselves caught in a web of comparison. The perfect lives displayed online can spark feelings of loneliness, inadequacy and dissatisfaction. This experience is closely tied to a modern psychological phenomenon known as the Fear of Missing Out or FOMO. Defined as the anxious feeling that others are enjoying rewarding experiences without us, FOMO drives a relentless urge to stay connected and in the loop (Przybylski *et al*., 2013). It's a feeling so universal that different cultures have their own words for it-like "kiasu" in the Hokkien dialect, which captures the fear of losing out to others. Though FOMO has long been a topic in popular media, only recently has it attracted serious academic attention. Scholars have begun to explore how unmet psychological needs fuel this fear, often linking it to problematic social media use and its impact on motivation, especially among students. Alongside FOMO, anxiety itself-a condition marked by worry, tension and physical symptoms-has been part of human experience for centuries from ancient times to Freud's early descriptions in the 19th century. Today anxiety disorders affect millions worldwide in India alone, nearly 45 million people grapple with anxiety, underscoring the urgency of understanding how digital life influences mental health(The Lancet, 2017). Among many social platforms, Instagram and LinkedIn stand out for their contrasting roles in our digital lives. Instagram, launched in 2010 and now home to over a billion users worldwide, enables individuals to share moments from their lives through photos and short videos, frequently enhanced with filters and hash tags for creative expression and broader reach. It's a space where lifestyle and social identity take center stage and its reach continues to grow rapidly especially in countries like India. LinkedIn, on the other hand serves a different purpose. Since 2003, it has been the go-to platform for professional networking, career advancement and business connections. With its focus on resumes, skills and job opportunities, LinkedIn creates a unique environment where users compare themselves in terms of career success rather than social life. The rapid flow of information and constant connectivity characterizing our modern digital landscape has transformed how FOMO and anxiety are experienced. Social media's omnipresence amplifies these feelings, particularly among young adults navigating the pressures of both social and professional worlds. Despite growing concerns, few studies have directly compared how platforms like Instagram and LinkedIn differently shape these psychological experiences. Instagram's vibrant social atmosphere may trigger social FOMO, while LinkedIn's professional focus might evoke career-related anxieties a distinction that remains underexplored. This research aims to fill that gap by examining how the unique content and culture of these two platforms influence FOMO and anxiety. By understanding how social and professional comparisons operate differently across Instagram and LinkedIn, this study hopes to offer valuable insights for users, mental health professionals and policymakers alike. Developing a unified framework to define and analyze FOMO is essential for advancing this field, enabling more targeted strategies to mitigate the negative psychological impacts of social media and promote healthier digital engagement.

REVIEW OF LITERATURE

A substantial body of research has examined the psychological dynamics of Fear of Missing Out (FOMO), especially in the context of social media use and its wider psychosocial implications. Collectively, this literature highlights the multifaceted nature of FOMO, identifying it as both a catalyst for and a result of problematic digital behaviors, mental health issues, and evolving patterns of social interaction in the digital era. Most recently Kovan *et al*. (2024) studied Turkish university students and found that FOMO plays a significant role in driving social media addiction. Their research demonstrated that this relationship is mediated by reduced self-control and personal responsibility indicating that interventions aimed at strengthening these traits could help curb maladaptive digital behaviors. This finding provides a crucial foundation for understanding how individual psychological characteristics interact with

digital environments to intensify addictive tendencies. Shifting the focus to younger users, Kothari (2023) explored FOMO among adolescents, revealing that it is not only associated with compulsive social media usage but also linked to risky behaviors such as substance abuse. These results underscore the pervasive and potentially hazardous nature of FOMO, especially during developmental stages marked by heightened social sensitivity and identity formation. Continuing along this developmental trajectory, Putri, Hurriyati and Hassanbasry (2023) examined early adults and demonstrated a strong positive correlation between FOMO and Instagram addiction. The authors attributed this vulnerability to emotional instability and the self-exploratory tendencies characteristic of this life stage. These findings echo Kothari's conclusions and further highlight the role of life transitions and identity-seeking behaviors in intensifying FOMO. Turning to platform-specific effects, Faelens *et al*. (2021) conducted a systematic review that illuminated the mental health risks associated with Instagram use. Their analysis identified increased social comparison, negative body image, and disordered eating as key outcomes, highlighting the nuanced ways in which FOMO manifests depending on the design and content of specific platforms. In the same year Tandon *et al*. (2021), synthesized findings from 58 empirical studies in an effort to bring coherence to the field. They called for greater conceptual clarity in the definition of FOMO and identified psychological (e.g., low self-esteem), social (e.g., peer influence) and technological (e.g., notification systems) drivers of the phenomenon. Their review also reinforced prior findings by linking FOMO to adverse well-being outcomes such as anxiety and poor sleep, highlighting the interplay between internal dispositions and external triggers. At a more conceptual level, Gupta and Sharma (2021) provided a comprehensive overview of the psychological origins of FOMO. They linked the phenomenon to the basic human need for social belonging, arguing that social media amplifies this need through constant exposure to curated social experiences. Their theoretical insights resonate with the findings of Dhir *et al*. (2019), who examined social media fatigue and demonstrated how constant connectivity and information overload contribute to reduced life satisfaction and increased stress. Together, these studies point to a cyclical relationship between FOMO and digital exhaustion, where each reinforces the other. Adding an experimental perspective, Rozgonjuk *et al*. (2020) explored the mediating role of FOMO in impairing daily functioning and work productivity, emphasizing its impact on focus and efficiency through problematic engagement with platforms like WhatsApp, Facebook and Instagram. Hunt *et al*. (2018) provided robust evidence of a causal relationship between reduced social media use and improvements in mental health outcomes, including decreased depression, loneliness and FOMO. Offering a nuanced perspective, Roberts and David (2019) found that while FOMO may increase social media engagement and foster a sense of social connection, it simultaneously exerts a direct negative effect on subjective well-being. This duality emphasizes the complex and multifaceted nature of FOMO's psychological influence, which can oscillate between perceived social gains and genuine emotional costs. Foundational work by Abel *et al*. (2016) and Przybylski *et al*. (2013) laid the groundwork for contemporary research on FOMO. Abel *et al*.(2016), developed a reliable measurement scale, reinforcing the validity of FOMO as a distinct psychological construct. Przybylski *et al*..(2013), further operationalized the construct and established its association with lower life satisfaction and higher social media engagement, illustrating its behavioral and emotional correlates. Taken together, these studies present a rich and multidimensional understanding of FOMO as a construct deeply embedded in contemporary digital culture. They collectively highlight its significant implications for mental health, social behavior, productivity and well-being across different age groups and socio-cultural contexts. This integrated body of literature underscores the urgent need for preventive strategies, digital literacy programs and psychological interventions to address the escalating effects of FOMO in the digital era.

MATERIALS AND METHODS

This study employed a comparative cross-sectional research design to examine levels of Fear of Missing Out (FOMO) and anxiety among users of two social media platforms, Instagram and LinkedIn. The sample consisted of 119 active social media users (Female: N=50, Male: N=69) aged between 21 to 40 years, recruited via convenience sampling. The majority of participants were in the 21–25 age groups, with fewer individuals represented in the 36–40 age range. Inclusion criteria required participants to be active users of both Instagram and LinkedIn. Participants completed a structured socio-demographic questionnaire, followed by standardized self-report measures assessing FOMO and generalized anxiety. The Fear of Missing Out Scale developed by Przybylski *et al*. (2013), is a 10-item instrument

designed to assess individuals distress related to missing out on rewarding social experiences. Each item is rated on a 5-point Likert scale ranging from 1 ("not at all true of me") to 5 ("extremely true of me") with higher scores indicating greater FOMO. The FOMO Scale demonstrates strong psychometric properties, including high internal consistency (α = .82–.90) and established validity across diverse populations. Anxiety was measured using the Generalized Anxiety Disorder 7-item scale, a widely validated instrument developed by Spitzer *et al*. The GAD-7 assesses the frequency of anxiety symptoms experienced over the past two weeks, with items rated on a 4-point Likert scale from 0 (not at all) to 3 (nearly every day). Total scores range from 0 to 21, with higher scores reflecting greater anxiety severity. The GAD-7 has demonstrated high internal consistency Cronbach's alpha .89. All measures were administered via a secure online platform through Google Forms. Prior to participation, respondents reviewed a comprehensive digital informed consent form outlining the study's purpose, voluntary nature, confidentiality assurances and the right to withdraw at any time without consequence. The average completion time for the survey was approximately 10–15 minutes, minimizing participant fatigue and promoting response quality. This methodology enabled a systematic comparison of FOMO and anxiety across two distinct social media contexts, providing insights into the psychological effects of platform-specific engagement. The results of the study are presented through both descriptive and inferential statistical analyses offering a nuanced understanding of the levels of Fear of Missing Out (FOMO) experienced by users of Instagram and LinkedIn.

Descriptive Statistics

Table 1 presents the descriptive statistics for FOMO levels among Instagram and LinkedIn users in the sample (N = 119). The analysis reveals that Instagram users (n = 44) reported a mean FOMO score of 21.52 with a standard deviation of 7.28, whereas LinkedIn users (n = 75) exhibited a slightly higher mean FOMO score of 22.21, with a standard deviation of 8.31. The standard deviations observed indicate considerable variability in FOMO experiences across both groups. LinkedIn users demonstrated a slightly greater spread in scores, which may reflect broader individual differences in emotional responses and patterns of engagement with the platform's content. A graphical representation of this data is provided in Figure 1, illustrating the comparative distribution of FOMO levels across the two platforms. The bar graph above presents the descriptive statistics for Fear of Missing Out (FOMO) levels among Instagram and LinkedIn users. As shown, the mean FOMO score for Instagram users is 21.52, while LinkedIn users have a slightly higher mean score of 22.21. The standard deviation for Instagram is 7.28, indicating moderate variability in FOMO levels within this group. LinkedIn users exhibit a standard deviation of 8.31, suggesting slightly greater variability in their FOMO experiences. Overall, the results indicate that FOMO levels are comparable across both platforms, with only minimal differences observed in both the mean scores and the variability of responses. The study examined the levels of Fear of Missing Out (FOMO) among users of two distinct social media platforms: Instagram and LinkedIn. Descriptive statistics showed that Instagram users reported a mean FOMO score of 21.52 (SD = 7.28, n = 44), while LinkedIn users had a slightly higher mean score of 22.21 (SD = 8.32, n = 75). The standard deviations indicate considerable variability in FOMO experiences within both groups, with LinkedIn users showing slightly more variation. This variability may reflect diverse patterns of engagement and emotional responses to each platform's content and social dynamics. These findings suggest that users of Instagram and LinkedIn experience comparable levels of FOMO, despite the platforms' differing social and professional orientations. This challenges the common assumption that Instagram's visually rich and socially driven environment would necessarily elicit higher FOMO than LinkedIn's professional networking context. Instead, the similar FOMO levels may indicate that both platforms foster social comparison and awareness of missed opportunities, albeit within different domains.

Gender Distribution

The gender composition of the sample is outlined in Table 3. Of the 119 participants, 69 identified as male and 50 as female, indicating a modest predominance of male participants in the study. To assess whether the observed differences in FOMO scores between Instagram and LinkedIn users were statistically significant an independent t-test was conducted. The results are summarized in Table 2. The results of the independent samples t-test, assuming equal variances, indicate that there is no statistically significant difference in Fear of Missing Out (FOMO) levels between Instagram and LinkedIn users. The mean FOMO score for Instagram users (M = 21.52, SD = 54.26) was slightly lower than for LinkedIn users (M = 23.33, SD = 58.90). The t-test yielded a t statistic of -1.26 with 117 degrees

of freedom and a two-tailed p-value of 0.21, which is greater than the conventional significance threshold of 0.05. Consequently, the null hypothesis stating that there is no difference in FOMO scores between the two groups cannot be rejected. These findings suggest that the platform of social media use may not be a significant factor influencing FOMO among users in this sample.

Interpretation of Findings

The findings challenge prevalent assumptions about the emotional impact of different social media platforms. Despite Instagram's socially rich and visually immersive environment, which is often linked to elevated FOMO, users did not report significantly higher FOMO levels than those using LinkedIn a platform with a primarily professional orientation. The slightly higher mean FOMO score observed among LinkedIn users suggests that feelings of missing out may also be salient in professional contexts, potentially driven by exposure to others achievements, career updates and professional opportunities. Importantly, the substantial standard deviations in both groups highlight the heterogeneity of FOMO experiences. This variability underscores the influence of individual-level factors such as personality traits, usage patterns and social comparison tendencies on the psychological outcomes of social media engagement. These results emphasize the importance of adopting a broader conceptual lens when analyzing FOMO, one that moves beyond platform-centric explanations. The experience of FOMO appears to be shaped not merely by the social or professional context of the platform, but by a complex interplay of user motivations, psychological dispositions, and the dynamic nature of online interactions. Thus, rather than being confined to a specific social media environment, FOMO emerges as a multifaceted construct reflective of the broader socio-digital ecosystem in which individuals are embedded.

DISCUSSION

This study challenges simplistic assumptions about the influence of specific social media platforms on users' psychological experiences by demonstrating that Fear of Missing Out (FOMO) is not confined to either social or professional digital environments. The comparable FOMO levels observed across Instagram and LinkedIn underscore the importance of looking beyond platform-centric explanations and considering the broader, multifaceted factors that shape digital well-being. Although the differences in FOMO scores were minimal and not statistically significant, the substantial variability within each group highlights the diverse ways individuals engage with and are affected by online communities. These findings point to the evolving nature of digital socialization, where personal motivations, interaction patterns, and cultural contexts intersect to influence emotional experiences. By reframing FOMO as a dynamic outcome of complex, ongoing interactions rather than as a product of isolated platform features, this research advocates for more nuanced theoretical models and interventions. Ultimately it positions digital emotional experiences as adaptable and context-dependent offering promising directions for supporting psychological well-being across a variety of online settings and life stages. The implications of these findings suggest that interventions aimed at reducing FOMO should be tailored to the specific social media context. For Instagram users, strategies might focus on managing social comparison and emotional regulation related to social interactions, such as setting timers to limit app usage to scheduled periods. For LinkedIn users, addressing professional-related FOMO and its impact on career anxiety may be more pertinent, incorporating strategies like limiting participation to meaningful interactions and connections, and establishing clear goals and priorities. Further research should undertake comprehensive comparative analyses of Instagram and LinkedIn to better understand how platform-specific content contributes to the experience of FOMO. Such studies can illuminate the distinct ways in which each platform's focus whether on social lifestyles or professional achievements shapes users' perceptions and anxieties. There is also a need to develop and evaluate effective strategies to mitigate and manage the negative consequences associated with FOMO on these social media platforms, promoting healthier and more intentional engagement for users. A key limitation of this study is its focus solely on young adults a choice driven largely by constraints related to time and resources. Future studies should consider including a broader age range and more diverse socio-demographic groups to improve the generalizability of the results. Such an expanded sample would offer deeper insights into how FOMO and anxiety present across different populations. Overall, these findings

reinforce the idea that FOMO is a widespread phenomenon influenced by a complex interplay of individual, contextual, and platform-specific factors, rather than being tied to any single type of social media environment. This underscores the need for holistic, adaptable approaches to digital well-being that address the unique challenges and opportunities presented by both social and professional online platforms.

ABSTRACT

Physiotherapists in a variety of settings treat individuals with frozen shoulder. Frozen shoulder syndrome is a condition in which a soft tissue Glenohumeral capsular lesion is accompanied by painful and restricted active and passive shoulder motion. Frozen shoulder in individuals with Diabetes significantly affects ADLs and QOL. Traditional Physiotherapy methods often provide slow recovery over extended period of time. Advanced treatment protocol along with Maitland's method of Mobilizations and Combination therapy (UST and IFT) provide better results in Diabetic Frozen shoulder as compared to traditional methods of treatment.

Keywords: Physiotherapists, Frozen shoulder, Glenohumeral, Diabetes.

INTRODUCTION

Adhesive capsulitis, Periarthritis shoulder and frozen shoulder are all terms used to describe a painful stiffness of Glenohumeral joint. This inflammatory condition causes fibrosis of the Glenohumeral joint causes gradual progressive stiffness and significant restriction in the joint Range of Motion. Joint mobilization is a form of passive movement in a broad spectrum of exercise used to treat painful and stiff synovial joints. For the purpose of this study, mobilization will refer to passive oscillatory movement of one articular surface in relation to its counterpart. The oscillatory movements will be in the direction of the joints accessory motions (Concave-Convex rule[14]) which are small spinning, gliding, rolling or distractive motions that occur between joint surfaces and are essential for normal mobility. As for an example of accessory motion at Glenohumeral joint would be motion of head of humerus inferiorly as it moves on the glenoid fossa during normal abduction. The gliding motion is necessary for greater tuberosity of humerus to pass under the coracoacromial arch and thereby allow full elevation of the arm. Accessory

motions are like in normal synovial joints when one articular surface is stabilized and the other articular surface is moved passively by the examiner. Several textbooks on the examinations and techniques of joint mobilization are available by Cyriax[9], Kaltenborn[10], Maitland[2] and Mennell[11]. For the purpose of this study, mobilization will refer to techniques of joint mobilization by Maitland[2].

According to Maitland the Grades of Mobilization[22]-
Grade I – small amplitude movement at the beginning of the available range of movement.
Grade II – large amplitude movement at within the available range of movement.
Grade III – large amplitude movement that moves into stiffness or muscle spasm.
Grade IV – small amplitude movement stretching into stiffness or muscle spasm.
The purpose of this investigation was to determine the effects of joint mobilization along with Combination therapy (UST + IFT) in combination with an active exercise program, on pain and hypomobility associated with frozen shoulder. The results were compared with the patients having Diabetic history over the Non-diabetic cases.
The importance of careful examination and selection of a specific course of treatment for each patient obviates the use of an identical method of treatment for all patients. Thus, the intent of this study was to assess the therapeutic value of joint mobilization along with combination therapy as an adjunct to other aspects of a treatment program between Diabetic and Non-diabetic cases.

Study Design: - Comparative Study
Case: - Two groups of 20 individual inclusion criteria.
Group **A** having 10 patients with history of Diabetes.
Group **B** having 10 patients with no history of diabetes.
Treatment differed between the groups. Group Areceived 12 sessions over 2 week of SWD and passive mobilization and an active exercise program along with Combination therapy (UST + IFT) whereas Group B received 12 sessions over 2 week of SWD and passive mobilization with Combination therapy (UST + IFT) along with an active exercise program.

Age Group: - Both male and female above 40 (40-60) years with diagnosed frozen shoulder.

Exclusion criteria
- Any form of malignancy.
- Known history of fractures of shoulder, clavicle, and humerus.
- Diagnosed cases of Shoulder infection.
- History of dislocation of shoulder joint, Subluxation.

Tools and Parameters used
- NPRS[15]
- Goniometer[1]
- Reflex hammer
- Pain Questionnaire[15]
- Special Tests[15]
- UST [18,19,20,21]
- SWD[18,19,20,21]
- IFT[18,19,20,21]

METHODS

This comparative study was conducted in the department of Physiotherapy, Viklang Bhawan Hospital, Bihar college of Physiotherapy and Occupational therapy, Patna, Bihar for 12 sessions over 2 week and the subjects were

considered for this study as soon as they were referred from a physician. The presence of shoulder pain and limited passive motion at Glenohumeral joint were criteria for eligibility with following exclusions-

- Unstable fracture of Humerus, scapula and clavicle.
- Recurrent shoulder dislocation and subluxation.
- Rheumatic disease
- Advanced Osteoporosis.
- Malignancy
- History of extensive steroid therapy.
- History of any trauma to the shoulder joint.
- Severe pain unrelieved by resting the joint.
- Peripheral neurological involvement of upper extremity.

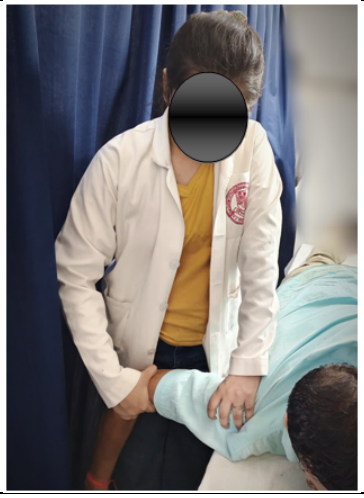
If the eligibility criteria were met and informed consent was obtained, the subjects were assigned to the predetermined two groups on the basis of diabetes. During the initial session after group assignment, each patient completed a pain questionnaire to assess the degree and nature of the symptoms. Also at the initial session, a history, subjective examination and objective examination related to the involved shoulder were performed. The cervical spine, acromioclavicular, sternoclavicular, scapulothoracic and elbow joints were also examined to determine if these areas were the source of the patient's signs and symptoms. Joint ROM was measured using the traditional goniometer method as described by Cynthia C. Norkin and D. Joyce White[1]. Assessment of pain and mobility was done initially before treatment started and then at weekly intervals for a period of 2 weeks and then final measurements were taken following at 2 weeks treatment period. Subjects in both groups reported for treatment 6 times per week during the 2 week period. In addition to the weekly measurements of pain and mobility, passive motion was examined prior to each treatment to assess the degree of stiffness and irritability. Special tests were performed to assess the cause of underlying disease. Tightness, contracture and deformities were checked for proper joint and muscle function. Before the first treatment and after the last treatment, each subject marked NPRS[15] for pain assessment.

Interventions: The targeted capsule was preheated by the use of SWD[18, 19, 20, 21]and by use of thermal Ultrasound effects. The intention was to alter the Viscoelastic properties of the connective tissue and maximize the effectiveness of the stretch mobilizations to follow. The UST[18, 19, 20, 21]was applied at 1.5 W/cm^2 continuously for 10 minutes along with IFT[18, 19, 20, 21]at the same time as Combination therapy for 12 sessions over 2 week. Following the electrotherapy sessions the two groups were assigned to exercise therapy sessions which included shoulder AROM exercises, Codman's pendular exercise, stretching exercises, shoulder wheel and pulley exercise, shoulder ladder exercise, shoulder isometric exercises, beads counting, overhead sanding activities and T-bar exercises. Following this exercise sessions progressive manual mobilization was done on shoulder joints as described by the Maitland. The subjects were advised for active home exercise program which was followed by moist heat or hot fomentation. They were also advised for postural correction techniques and preventive measures were also explained thoroughly.

RESULTS

We did a comparison between diabetic and non-diabetic. After the treatment sessions among both the groups, Group B showed better outcomes in relation to pain, ROM and return to ADL and QOL. The outcomes were assessed after the final treatment sessions.

DISCUSSION



The same treatment protocol was compared for both the diabetic and non-diabetic groups – GROUP A and GROUP B and it was observed that better outcomes in terms of recovery for group A came significantly lower as compared to the group B.

CONCLUSION

The result of this comparative study indicates that SWD[18,19,20,21], combination therapy (UST + IFT) [18,19,20,21] along with Maitland joint mobilization and Exercise program were more effective in treating Frozen Shoulder without Diabetic history over the Diabetic cases.

ABSTRACT

This review paper gives detailed and comprehensive overview of researches that how digital technology is restructuring agriculture. The work done is emphasized by peer review and developments including e-commerce, mobile applications, marketing in social media, digital productivity solutions and internet connection. It highlights the capacity of technological advancements, through which they can revolutionizes the agriculture sector by acknowledging challenges that are there since a long time such as low productivity, inefficiency, limited market access facility, especially for small scale farmers. The paper also draws attentions towards the integration of digital agriculture with United Nations Sustainable Development Goals (SDGs) which include zero hunger (SDG 2), innovation in industry (SDG 9), and eradication of poverty (SDG 1). It shows how social media marketing has changed the market access and internet connectivity allows farmers to get engaged with consumers which also helps in building awareness. Despite of having these advancements, there are barriers that still exist. This paper also talks about the successful adoption on localized partnership, user centric designs, robust policy support and public private partnership. This also conveys the critical policy initiatives and gives emphasis on the need of interoperability of data privacy and ensuring inclusivity.

Keywords: Digital agriculture, e-commerce platform, mobile applications, sustainable development, small scale farmers and policy frameworks.

INTRODUCTION

Traditionally, farmers in so called Third World are referred as a subject of inefficiency, bad productivity, and restricted access to real time information. With the widely evolving digitization of global economy and the wide spread of the deployment of information and technologies of communication that is ICT, there has also been wide expansion of advanced tools which are performing revolution in agriculture. The change is seen in small scale farmer systems through which producers till now are able to access the unexpected markets, information and services due to the digital services, websites and mobile usage like mobile apps. Agricultural digital solutions share a very intimate connection with the United Nations' Sustainable Development Goals (SDGs), perhaps more so for food security (SDG 2), innovation (SDG 9), and poverty eradication (SDG 1) [1]. In addition to the revolution in farming methodologies, these technologies are helping rural development through enhanced transparency, new business ventures, and climate adversity resilience. There is a small window to augment solutions for farmer empowerment and food security with the coming of 4G and now 5G internet connectivity, AI-based decision tools, satellite imagery, and data platforms [10]. Challenges such as lack of funding, bad infrastructure, and digital literacy continue despite these advances. Thorough studies that evaluate what works, why, and where more efforts are necessary are the imperative with governments, non-governmental organizations, and private sector partners collaborating to transform digital agriculture. This article provides an in-depth explanation of existing work in five high-priority themes: e-commerce platforms, mobile apps, social media advertising, digital productivity tools, and rural internet penetration.

REVIEW OF KEY LITERATURE

Integration of E-commerce in Agriculture

Findings: It was found that farmers using E-Commerce platforms reported higher profit margins because they were less dependent on brokers or third party or middleman.

Challenges: Digital divide poor transportation in rural areas and trust in online transactions were seen as major problem. In developing nations, e-commerce has emerged as a new trend where the agriculture market is inefficient and segmented. The area of attention is direct link between producer and consumer without any third-party interruption who compressed the profit margin of farmers. Now, farmers can set the price access market and expose product by using online platform and online transaction system. The minimum necessity to incorporate E-Commerce systems in agriculture, according to studies by [3] and [4] are electronic market places, distribution coordination, transaction securit, transparency in prices and consumer education.

Digital marketplaces: The e-agriculture markets or online agriculture markets are platform, where client, producers, wholesaler and consumers can shop and purchase the goods directly from the farmer that have been put on offer. These include sites such as DeHaat, AgriBazaar, and Mandi Trades [6] and [4]. This allows different products to be put on the system, support a bilingual feature and have information that is seasonally offered, such as the production of demand as well as prices trends. For [4], platform saved time to market by 40% and enable farmers to sell above Mandi prices up to 20 to 30%.

Logistics and Distribution: The success to e-commerce is the efficient logistics in agriculture. In comparison to unsustainable goods in typical e-commerce, agricultural inputs are sustainable and require immediate controlled temperature in transportation. E-commerce websites include logistics modules which manage delivery, cold storage, and pickup with providing real time monitoring. Research represents that end-to-end integrated e-logistics systems have the ability to reduce post-harvest losses up to 25%.

Security and financial transaction: Safe and track able transactions that is transparent transactions are to be developed among users for trust. UPI (Unified payment interface), digital wallets and mobile banking are integrated into various E-Commerce platform in their payment processes [1].The use of cash is reduced using the services which

provide better financial inclusion and speed the payment reconciliation. The farmers using these integrated facilities in rural areas shows are 63% increase in transactions that are made digitally and a corresponding decline in fraud complaints [3].

Price discovery and transparency: Presence of symmetry in information where farmers are not aware of real time prices in distant markets are factors which are suffered in traditional agriculture. E-Commerce platform solve this by providing daily updates on prices which enables farmers to make decisions dependent on data. The dynamic algorithm helps to match the regional supply demand which stabilizes the prices overtime.

Case Studies and its impact

[3]Analyses e-commerce platform in Bihar, India where small scale farmer selling vegetables sold their produced vegetables to various consumers in urban areas by using app directly. Income of average farmer rose by 22% in 6 months with the customer retention of 75% through direct sourcing and assured quality. And [5] concluded that Telangana's e-commerce platform which were based co- operatively on network, enhanced market credit availability and decreased the reliance on informal lenders.

Challenges: Despite of benefits, there are challenges which are still to overcome. In hilly and tribal location, connectivity limits the real time action. Many farmers have not yet embraced digital media fully because of the trusted issues generated. Technical malfunction, delay in payments and fake goods may undermine the trust of farmer sometimes. Furthermore, more small producers will be forced to be out by the prevalence of large agriculture companies, if the strong anti-monopoly regulations are not in the place.

Mobile Applications for small scale farmers

Significance: Marginal farmers get benefit by using mobile apps by promoting participation in ecosystems that is created digitally and allow farmers to make data driven decisions.

Limitations: Digital divide faced by farmers which restricts them from utilizing facilities fully and unequal distribution of access to smartphones. Using mobile application enhances the agriculture practices of small-scale farmers, decision making ability and access to market that the gap of information is filled by mobile technology, also enables real-time communication and provides simple tools that are easy to understand and adapt well for the use of marginal farmers. The features of mobile applications are weather forecast, recommendation for the crop selection, pest and disease management, inspection of soil and market price monitoring. The app discussed in the paper [6] was provided to different farmers in different regions and the results were always appreciated. It increases the confidence of users in their farms, reduced the input cost and increases the yields of the crops. Voice enabling navigation technology was appreciated by farmers which made the more efficient use of app. To overcome the issues many trainings, demonstrations and workshop were conducted. The study notified the importance of current user support and regular updated of the app to address the seasonal and feedback needs. It concluded with the deployment of mobile applications to small scale farmers providing the immense potential to transform their livelihood by ensuring user friendly and multi lingual support with localized content. With the growth of infrastructure and corresponding legal frameworks, mobile applications might soon become a foundation of digital farming practices.

Social Media Marketing in Agricultural Commerce

Insight: By establishing connection between rural producers and urban area consumers, social media helps farm based enterprises in increasing awareness of their brand.

Key Limitation: There is a considerable risk of inaccurate information and digital fraud, and platform algorithms don't necessarily favour small-scale sellers. [8]Paper talks about the farmers, cooperatives, and Agri-startups employ social media in offering their produce, communicate directly with customers and exam information that are related to farm. One of the central findings of the study is democratization of market communication. Now the farmers were

able to use images in videos for the promotion of their product, direct price negotiation with retailers or consumers and supply data about how they produce it.The establishment of direct communication channel between consumer and producer not only boosts the income of farmers but also reduced their dependency on the middle men who tends to acquire significant portion of their profit margin. In addition to this, social media also provided the opportunity for learning and providing feedbacks from the consumer to the producer. Inspired these advantages the same challenge of digital divide, digital literacy and lack of knowledge to use the resource app up to the mark remains a major hurdle. To mitigate these issues, the recommended solution is to provide training program on social media and other platforms. Based on the research finding to become an active participant in the market, social media can empower farmers especially women and youth when integrated with more holistic digital agriculture programs. This facilitates the innovation across Agri-value change increase transparency in prices and grows the establishment of hyper local food system.

Advanced digital technology for Agriculture Productivity

Strengths: There is strong proof that ICR increases crop yields, save water wastage and alleviate climate change anxiety.

Gaps: Lack of rural infrastructure restricts wide adoption and large initial outlay of the infrastructure. The paper [10]provides description of how various digital tools a transforming the farming landscape. It analyses various he digital interventions like remote sensing, precision agriculture, Geographic Information Systems(GIS), Global Positioning Systems(GPS) and artificial intelligence-based analytics [10]. Using these technologies, farmers can make the optimum use of land, manage resources effectively and monitor the well-being of crops in real time. The concept of site-specific crop management where farmers used digital mapping and data analysis to treat different areas of field differently based on topography, soil condition and past production is emphasized. Precision based method with minimum use of pesticides shows the increase in yield significantly which makes it more sustainable. Another important aspect is the decision support system of the mobile systems. These integrate the real time weather forecasts, market intelligence, pest alerts and advices given by the services. The challenges are faced in the scaling of these technologies, affordability majorly for small scale farmers. The lack of training and technical support often acts as a setback for effective usage of the resources along with the interoperability issues between tools and protocols. The recommended solution by the author is to use private partnerships to subsidize the technology to safe access and build capacity programs. They also talk about the open data ecosystems and integrate different platforms.

Internet Embedding and Rural Entrepreneurship

Methodology: Comprehensive survey data and economic modeling combined with empirical research.

Conclusion: internet embedding boosts entrepreneurial intent and reduces rural-urban movement if there is institutional support for digital upskilling. This section emphasizes on the ways in which wireless network enhances the innovation, entrepreneurship and productivity in agriculture which are evident from the study [5]. Agriculture is influenced by internet in different ways such as bringing production up to date, promoting financial inclusivity and bringing market together by sharing information. The influence of internet in agriculture works using multiple pathways which are modernisation of production, farmers adopting precision agriculture practices, accessing guidance to online services and automating task with the help of internet connectivity. For bypassing traditional supply chains, market integration and e-commerce platforms are used, which sell produce directly to consumers. Income of farmers is enhanced by the growth of online farming practices and marketplace. Knowledge dissemination and learning, depicts that internet facilities extends agriculture practices using digital content. The idea of group learning promotes the adoption of breaks practices in farming and expands the resilience to various vulnerabilities such as climate change and pest outbreaks. The study used Henan Province as a case study [1], where E-Commerce in transportation services have brought 10% rising ruler employment and 15% in agriculture output after using internet connectivity. Digital divide remains a persistent challenge which was also there in low-income regions. Limitation on digital literacy, lack of infrastructure and disparities in accessing market based on gender restrict equitable and sustainable benefits. Also, the new risk in digital environment of agriculture are cyber security and

misinformation. To handle these challenges, the report suggests policies are included in support of development of broadband connectivity, incorporating ICT studies into agriculture and offering incentive to rural IT entrepreneurs. Using inter-sector strategy which involves government investment, private sector innovation and community participant is seen as a necessity to implement sustainable changes into ruler areas. In short, internet embedding is most significant for rural enterprises in quality agriculture developments. As the ruler communities are becoming more digitally connected, they are creating new growth opportunities that are sustainable, innovation driven, resilient and inclusive

Embedding internet and entrepreneurship in rural areas
Methodology: Detailed survey of data and economic modelling combined with empirical research.

Conclusion: internet embedding boosts entrepreneurial intent and reduces rural-urban movement if there is institutional support for digital upskilling. This part talks about the ways in which wireless networking enhances the innovation, entrepreneurship and productivity in agriculture which is evident from the study [5]. The agriculture is influenced by internet in various ways such as up-to-date production practices, promotes financial inclusiveness, brings market all together, and share information. The internet influence use multiple pathways such as modernization of production, in which farmers about precision agriculture techniques, access guidance through online services and automate tasks with the help of connectivity. The integration of market and e-commerce allow farmers to bypass traditional supply chain mechanism and sell produce directly to consumers without interaction of third party or middlemen.

Thematic Synthesis
Digital literacy and access: It is observed that the easier to access the digital agriculture the more effective it is. Though social media and mobile apps have improved the connectivity for accessing information, but they are only effective when the individual using them are literate digitally. Hence it is very important to have training programs that close the digital divide and more inclusive practices.

User centric design and localization: User input and localized data showed greater influence by working on mobile apps and decision support systems. The case study of Andhra Pradesh, mobile app experiment was showed to produce greater farmer usage and easier user interface with participatory design [6]. Another great practice is to design farm tools with best user interaction and end user support.

Market empowerment and integration: E-commerce also known as selling market online, and marketing through internal using social media, are the sections which has scope of expanding individual access to markets and limits power of middlemen. Bank and internet facility plays a important role in enhanced entrepreneurships among youth and women in Agri group.

Policy facilitator and infrastructure: The two constraints in all the studies which remain persistent were physical that is transport and logistics and internet access, affordability of phones. Key feature of policy facilitator includes digital subsidy programs, rural broadband initiatives, and public private initiatives.

Data governance and interoperability: Even if some solutions work well, integrating systems is a difficult task. Interoperability between mobile apps, e-commerce websites, decision support systems is still unexplored. In short, although each research yields valuable data on one facet of digital agriculture, combined, they suggest that there has to be a systems-thinking mind. It is not technology in isolation that will drive digital agriculture; people, technology, and policy need to conspire to make it happen with maximum impact in total. The next horizon is one of convergence, of the accumulation of platforms, applications, infrastructure, and governance into useful architectures which are specific to the requirements of rural farm communities.

Policy and Practical Implications

The digital revolution in agriculture has the huge potential to foster rapid rural sustainable development, enhance food security, and catalyse economic development of agricultural communities. But the gains have to be achieved through enabling policies and pragmatically attuned interventions sensitive to the unique challenges facing smallholder farmers. The research papers presented for consideration in this paper agree on some general areas where policy attention and field-level action are necessary.

Closing the Digital Divide: While the increased usage of mobile phone and various technologies by rural communities, women, old farmers, and poor people are far behind in accessing the digital tools and techniques. They are restricted to this world of advancements. In order to end this digital divide, government must design simple and use local languages for apps, implement study focused on digital literacy, and provide different subsidies for buying smart phones and to connect to network. Voice operated systems and navigation based on icons have been used to enhance usability among the people with low literacy. Another step is to integrate digital skills into agricultural extension for digital inclusion.

Enhanced Infrastructure and Connectivity: Electrical and internet connectivity dependency is crucial for the effective functioning of digital agricultural tools. Government must increase the broadband usage in rural areas initiative such India's BharatNet project and invest in alternative connectivity measures such as satellite internet or community hotspots. Public-private partnerships can improve the final stage of digital infrastructure, especially in areas with challenges of topologies.

Innovation Support Ecosystems: Agri tech innovation can be triggered using investment and facilitative regularities. Startups creating mobile application, online marketplaces, AI- driven software needs grant for research and development, incubation space, and expedited tracking of regulatory process. Creating Agritech innovation groups at the state or district level will guide in localizing solutions and also facilitate farmer, researcher, technological interaction.

Data Interoperability and Privacy: As more reliance on digital technology in agriculture, there needs to be openness in data collection and application. Farmer's rights need to be safeguard over data and informed consent by policy regulations. Data formats and APIs need to be standardized so that data can be made interoperable across many platforms so that there can be effective communication between different digital advisory tools, mobile apps, and e-commerce channels.

Farmer Group and Cooperative Organization: The effective way to introduce digital tools is by collective structures. Cooperatives, SHGs, FPOs can guide individuals in adopting digital technologies by providing digital kiosks, services of agritech and group accessibility. The goal of central policy must be to enhance the institution's ability to act as a digital aggregators and mediators.

Inclusive and Context-Sensitive Policy Making: Policy interventions have to be context-based; if local institutional capacity, sociocultural context, or local agroclimatic conditions are not considered, digitalization initiatives do not succeed. Participatory policy making with farmer feedback loops can enhance uptake and appropriateness, and institutionalization of the impact assessment of digital interventions has to inform adaptive policymaking.

Integration with Farm Finance: With data on farm size, yield, and transaction history, digital platforms can open access to finance, insurance, and subsidies. Governments need to collaborate with financial institutions to enable fintech innovation in agriculture, for example, crop insurance apps operating on real-time data, digital wallets for subsidy payments, and credit rating platforms for smallholder farmers.

Monitoring and evaluation of Digital Interventions: Strong M and E systems are needed for digital agriculture programs. Along with the downloads of app, important parameters to monitor tangible impacts like yield growth,

reduction of costs and improved access to market. Replicability evidence for successful practices can be generated through the use of independent evaluation and academic collaborations. At last, it can be concluded that the performance of the digital technologies will be depending on the environment provided by the legislation and the organizations, a environment which is inclusive, strong and farmer centric and which must be cooperated by the government, private sector and the civil society. By balancing the technical innovation, it can enhance the wellbeing and dignity or human beings.

Way Forward

Following the examination of digital interventions in agriculture, additional development must be guided by inclusive policies that keep digital change in a range of rural settings in combination with technical solutions. Five interrelated trajectories are highlighted by the synthesis study as underpinning an innovative agenda for digital agriculture.

Development of Digital Hubs across Multiple Platforms: Following that, development must be aimed at comprehensive digital platforms that combine various features like weather forecasts, pest warning, digital payments, input value chains, and access to markets as opposed to one single mobile application or individual e-commerce sites. Adoption is inhibited by fragmented platforms [4] and [3] argue, due to the fact that they are redundant and complex. For technophobe farmers, the creation of ecosystem-based systems that integrate services into one interface would be simpler to use and build trust.

Increased Customization and Localization: Effective digital technologies are founded upon local language, customs, and crop seasons, the researched works have proven to assess. In order to provide advisories in the context of local seasonal calendars and customary knowledge systems, future content must transcend simple translation and embrace cultural adaptation. AI and machine learning algorithms trained on local data can develop scalable context-specific solutions.

Gender and Youth Inclusion: Women and youth are identified as future drivers of digital change in different rural entrepreneurship studies and mobile app usability. Socioeconomic factors, however, discourage them from participating. Future agritech platforms must institutionalize design elements that are gender- and youth-friendly, including training sessions, anonymous entry options, and flexible dashboards.

Institutional collab and cross-sector integration: The future of digital agriculture depends on collaborative governance. Government agencies, NGOs, private firms, institutions must co-implement digital projects. Like, agricultural universities can function as field testing sites for new tools and telecommunication firms can provide subsidized data packs for app usage.

Scaling and Feedback loops derived from evidence: Future digital projects need to be evidence-based for scaling, and not scaling for the sake of scaling. Pilot testing, iterative design based on feedback, and effect surveys are all part of this approach. Long-term sustainability and credibility are enhanced by iterative development through feedback loops. It ought to be business as usual to track farmer happiness and performance in real time through digital dashboards. The future is not isolated form of innovation but building an ecosystem that is user centric, data driven, sustainable and equity based. The recommendation is to integrate technological advancements with inclusivity of the institutions to ensure digital agriculture becomes transformative for each one of us.

CONCLUSION

The future of digital agriculture not also involves innovation but also creating the robust ecosystems that are based on equity, data driven and user friendly. The path is to consolidate technological innovation with the inclusivity of institutions to help and ensure digital agriculture benefits to all the stakeholders. It a transformation that employee

small farmers, promotes environmental well-being and guarantees food security to various sections of society which are rapidly evolving in society. Agri-digital is not only a temporary trend but also a powerful force which reshape farm practices, market access and rural socio-economic settings. Internet platforms have been demonstrated to cut down on transactional inefficiencies and enhance access to markets, especially for smallholder farmers, and mobile applications are increasingly valuable tools for providing real-time weather information and agronomic recommendations. The comparative study shows that while technology advancements is necessary, effectiveness is highly dependent on social, cultural and institutional context. In digital space, providing legislative suggestions towards improving accessibility, diversity, and sustainability must be tailored to meet local circumstances. The priority in future is to build a better digital ecosystem that fulfills the needs of various stakeholders, that is women, youth and small-scale farmers. The new approach should be collective which should be backed up by infrastructure development and capabilities of institutions should be optimum. Digital agriculture offers a evolving opportunity to handle different challenges which can be handled using traditional methods, provided to pursued with sensitivity to equity, local relevance and sustainability. This review desires various sectors of society to create empowered agriculture using digital tools and technologies which will ensure dignity, prosperity to all the people involved in agriculture. Also, the information and knowledge available globally with respect to agriculture will enhance the innovation, particularly in global South, as it has to respond with then ongoing population growth, volatility in market and change in climate. Other parameters that have to be included are balanced measurements of user experience, livelihood impacts, inclusivity and environmental impacts in the metrics of success such as yield increase. The main thing to address is the moral dimension of the agriculture. With huge collection of digital data, issues of ownership of data, permission, bias of algorithm and tracking are centers for gain. In the long run, trust and adopting will be about creating farmer driven data governance systems that value accountability and transparency. The potential of digital agriculture is to build a robust environment, secure and equitable food systems that are sensitive to human limits. Hence, the future of digital agriculture is demanding as well as rewarding.

Comparative Analysis

Table 1: Comparison based on several papers

Aspect	Source	Key points	Technology	Region	Features/Challenges
Internet Entrenching and Entrepreneurship	[9]	It tells how access to internet in rural areas promote e-commerce, entrepreneurship; The choice of entrepreneurial channel is influenced by social capital.	E-commerce platforms, ICT infrastructure	China	It encourages independent startups; Social capital influences success; There is a need for digital skill development
Mobile App usage	[6]	It investigates mobile app use in small agribusinesses for keeping records and smooth flow of information.	Mobile Apps like WhatsApp, KisanSuvidha	India	It enhances communication and reduces information asymmetry; Adopted is halted by tech technology literacy gaps.
Role of E-commerce in Agriculture	[5]	It explains how e-commerce empowers farmers through better pricing and market access.	General e-commerce	India	It reduces exploitation by middlemen and lack of awareness.
Supply Chain Optimization through E-commerce	[2]	It tells how e-commerce restructures supply chains with consolidated logistics, finance and information system.	E-commerce Platform	China	It creases the efficiency of supply chain, reduce wastage and improve trace ability.
Technology trends in Agriculture E-commerce	[1]	It presents the study of research trends; identifies key technologies and provides a conceptual framework.	Blockchain, IoT, AI, systems for traceability.	Global	It focuses on interoperability, traceability, data standardization; Hurdle include costs and fragmentation.
General Review on Agri E-commerce	[4]	It reviews on opportunities and constraints in Indian Agri e-commerce; Also emphasizes policy and awareness.	E-commerce	India	There is a need for better digital policies and infrastructure for scale-up.
Digital Tools for productivity	[10]	It reviews digital agricultural tools for improving yields and reducing costs.	Digital agriculture tools, sensors, automation.	Southeast Asia	Productivity improved using data driven decision making techniques: complexity and costre main the challenge.
Social Media Marketing and	[8]	It investigates adoption of social media	Social media	China	High value perishable good are fit for

product suitability		marketing			marketing: Grain crops are less suitable for digital marketing.
M-commerce App for farmers	[7]	It develops and tests e-fresh apps and evaluated the usability and potential to improve income.	M-commerce (E-fresh mobile apps)	Malysia	It improvedease of selling, good feedback from uses; itis effective for young entrepreneurs.
Mobile Advisory apps and impact of yield	[3]	It compares knowledge gain and yield improvement among users of mobile apps.	Kisan Suvidha App, e-Nam	India	Kisan Suvidha users had highest yield and adoption; local language barrier.

ABSTRACT

Mangroves are not only saline-tolerant but they also have a high medicinal value. Mangroves have a wide spectrum of medicinal uses, and they have been used in local medicine for centuries. Mangroves are generally found in coastal areas and they host wide variety of flora and fauna apart from their role in medicine and natural conservation these mangroves protect the coastal areas by stabilizing the shore and preventing erosion by trapping the sediment by their roots Coringa estuary located in Andhra Pradesh, India is one such place where 24 species of mangroves are found this biodiversity hotspot holds remarkable interest in researchers.

Keywords: Mangroves, Coringa, Anti-Inflammatory, Antioxidant.

INTRODUCTION

Located in Andhra Pradesh, India, the Coringa estuary is a large mangrove forest of high ecological and medicinal importance. Stretching over 235.7 km2 it is the third-largest mangrove ecosystem in India it exists between latitudes 6°30' to 17°00' N and longitudes 82°14' to 82°23' E. It was established in the year 1978 and is under the management of Andhra Pradesh Forest Department. This unique habitat supports 24 species of mangroves and 120 bird species. Bird species also include the critically endangered vulture species such as a white-backed vulture and the long-billed vulture. Though the Management and protection of Coringa estuary entails various challenges, its importance, with

regards to biodiversity as well as being a source for new medicines, gives rise to urgent need for conservation along with sustainable management[1].

Mangroves: Mangroves are amazing salttolerating trees and shrubs thriving along the intertidal coasts of Tropical and Subtropical regions. Adapted to survive in salty, poorly oxygenated soil, they exhibit very complex root systems for stability and respiration above the ground. Mangroves serve as important nurseries for marine life, protect coastlines from erosion, and absorb carbon Beyond its ecological role in shoreline protection and maintaining ecosystem balance, mangroves have been treasured for their medicinal properties for over a thousand years[2]. These mangroves also play very crucial role in local Eco-tourism.

Mangroves of Coringa: The Coringa region boasts several species, including *Avicennia officinalis* and *Rhizophora apiculata,* traditionally used by locals to treat ailments ranging from common fevers to skin diseases. These plants contain a treasure trove of compounds like alkaloids and terpenoids, which have shown promise in modern pharmacological research Several Mangrove Trees and shrubs found in Coringa creek are Mentioned below

Table1: List of Some true Mangroves found in the Coringa Region[3]

The current review focuses on the Mangroves that are found in the Coringa Region and their medicinal uses.

Avicennia officinalis: belonging to Acanthaceae family is an important mangrove, known commonly as Indian mangrove it attains a maximum length of 8-18 meters, and a diameter of 1 meter the leaves are oval-shaped of about 10 centimetres in length and 5 centimetres width. The leaf's upper side is a shiny green, with the underside possessing a golden-brown color These leaves are oppositely pair-growing.

Its largest flowers in Avicennia species are showy with orange-yellow to lemon-yellow petals that reach a diameter of 6 to 10 millimetres when fully expanded[4]. The bark of the tree is smooth, from dirty green to dark Gray in color, and does not flake. It is characterized by its fruit, which is heart-shaped and tapered to a point, with at least 2.5 centimetres coloured in length, and green or brown widely distributed across the Indian subcontinent and Southeast Asia. The tree-like plant is a bank of bioactive compounds such as alkaloids, glycosides, Terpenoids flavonoids, steroids, tannins, saponins, phenols, etc, with proven analgesic, antioxidant, and antimicrobial activity, diuretic and can also be utilized in the treatment of rheumatism, paralysis, asthma[5,6].

Avicennia marina: The Avicennia marina of Acanthaceae family is a significant mangrove species that found across the Indo-Pacific area[7,8]. This robust plant, spread from Australia to Africa, including Southeast Asia and the Middle East, is extremely salt tolerant, withstanding seawater concentrations double those of normal levels. Its propensity to thrive in adverse situations, such as high tides, temperatures, strong winds, and saturated soils, makes it an exceptional survivor in coastal environments. This plant is considered a natural reservoir of phytopharmaceuticals like aliphatic alcohols and acids, amino acids, alkaloids, carbohydrates, carotenoids, hydrocarbons, free fatty acids, lipids, pheromone, phorbol esters, phenolics and related compounds, steroids, triterpenes and their glycosides, tannins, and other terpenes and has numerous therapeutical benefits for humans like Anti-ulcer, Astringent, Anti-hemorrhagic, Anti-malaria, Anti-diarrheic, anti-tumor activities[9,10].

Avicennia alba: It is native to Southeast Asia , and has been valued for its medicinal value for centuries. Packed with phytochemicals such as steroids, saponins, and flavonoids, it has been found effective in relieving pain, fever, and inflammation. Although the initial studies are encouraging, additional studies, such as clinical trials, must be conducted to determine its overall therapeutic value. Investigating its traditional uses and sustainably cultivating *Avicennia alba* can help to conserve it and create new, culturally relevant healthcare practices. By further investigating its phytochemistry, pharmacology and its safety profile, we can unlock the full potential of this important medicinal resource[11,12].

Lumnitzera racemosa: Combretaceae family mangrove species, thrives in tropical and subtropical coastal areas[13]. This species possesses great scientific value because of its potential medicinal uses. Rich phytochemical content in the form of flavonoids, tannins, saponins, and terpenoids in *Lumnitzera racemosa* showed promising antibacterial,

antifungal, and anti-malarial activity in initial investigations. These bioactive substances hold promise for combating the world problems of infectious diseases and antibiotic resistance. Of particular interest is the plant's potential to develop compounds that kill malaria, an ongoing threat to health in most tropical countries. But to best determine the drug potential of *Lumnitzera racemosa*, extensive studies such as clinical trials and toxicity testing are necessary[14,15].

Excoecaria agallocha: *Excoecaria agallocha*, the blind-your-eye mangrove or a shrub-like mangrove with a very distinctive appearance, belongs to the family Euphorbiaceae. Found commonly throughout the Indo-Pacific, *Excoecaria agallocha* has drawn scientists' interest with its possible medicinal uses[16].Its name notwithstanding, which refers to its irritating latex, the species has been of interest in early studies. A variety of phytochemicals like diterpenoids, triterpenoids, and flavonoids. These compounds have shown diverse biological activities within the laboratory. But caution need be taken in the medicinal utilization of this mangrove species. The toxic latex of the plant requires proper handling and processing to avoid any mishappenings. In addition to promising as preliminary results are, there is a need for thorough investigation to thoroughly comprehend the chemical composition of *Excoecaria agallocha* need to be evaluated its likely benefits and hazards. Clinical trials and long-term experiments are necessary before any therapeutic assertions to be made[17,18].

Rhizophora apiculata Bl: *Rhizophora apiculata* Bl is a species from Rhizophoraceae family that grows in mangrove forests of the Indo-pacific Region this plant is also called as red mangrove these plants are distributed along the coasts of Asia, Australia, and the Pacific Islands. Closely related to their Atlantic and Eastern Pacific counterparts, these mangroves typically inhabit intertidal wetlands, adapting to life between high and low tide levels.It has the ability to grow upto 5 to 8 meters. *Rhizophora apiculata* is source of phytochemicals such as tannins, flavonoids, saponins, and terpenoids, making it have broad medicinal uses. These phytochemicals are found to be promising in other pharmacological actions like antioxidant, anti-inflammatory, antimicrobial, and anti-diabetic activities. It has been demonstrated to exhibit hepatoprotective and cytotoxic activities in studies. Yet more research is required to completely elucidate the underlying mechanisms and clinical uses of this mangrove[19].

Sonneratia alba Sm: a member of family Lythraceae, *Sonneratia alba* Sm. is a mangrove with robust morphology. With a robust, erect trunk and a dense, spreading crown, it thrives in coastal habitats. Its leaves, adapted to the saline environment, are simple, opposite, and leathery. This mangrove species possesses vast coverage within the Indo-Pacific region and occurs well under intertidal environments[20]. Phytochemical analysis has proved the existence of tannins, flavonoids, saponins, and terpenoids in *S. alba*. The secondary metabolites of this species are responsible for the traditional medicinal use of this species, e.g., curing specific diseases such as diarrhoea, dysentery, and skin disease. Although ethnomedicinal information are abundant, extensive scientific investigation is the mainstay to establish the veracity of the reports and explain the mode of action of the bioactive constituents of this mangrove species[21].

Sonneratia apetala Buch.-Ham: *Sonneratia apetala* or the Bengal apple is a mangrove found with a medium height and characteristic growth habit. Tending to have a crooked trunk and grey-brown, fleshy bark, it grows in estuarine and coastal areas. Its simple opposite leaves are leathery. The plant has solitary, axillary flowers that grow into big, fleshy fruits filled with many seeds. *Sonneratia apetala*, native to the Indo-Pacific region, has learned to overcome the adversity of saline conditions. Its ability to thrive in waterlogged soils has made it ecologically important in coastal ecosystems. Aside from its role in the ecosystem, the plant has been given attention for what could be used as medicinal values. Phytochemical studies have shown a broad range of chemicals in *Sonneratia apetala* that include tannins, flavonoids, saponins, and terpenoids[22]. These chemicals were associated with the plant's attributed pharmacological activity. Traditional uses have involved all parts of the tree to treat various diseases like gastrointestinal disorders, skin infections, and inflammatory conditions. Yet, scientific studies are necessary to confirm these age-old assertions and to identify the exact compounds that are responsible for the reported therapeutic activities. Although initial studies have been promising, more studies are needed to fully appreciate the medicinal value of *Sonneratia apetala*[23].

Rhizophora mucronata Lam being a member of Rhizophoraceae is a unique mangrove species, is distinguished by its robust structure, large prop roots, and abundance in the Indo-Pacific area[24]. It is a good source of phytochemicals such as tannins, flavonoids, and terpenoids, which have been utilized traditionally for their medicinal properties. Traditionally, different plant parts have been used to cure conditions like diarrhoea, dysentery, and skin diseases. Modern research validates its use for anti-inflammatory, antioxidant, and antimicrobial purposes. Being a foundation species in coastal communities, *Rhizophora mucronata* is a key species that helps protect coastlines and maintain biodiversity[25,26].

Scyphiphora hydrophyllacea C.F. Gaertn A woody mangrove species with shrub or small tree habit. It grows into dense thickets in the intertidal area. The species has a distinctive leaf pattern with leaves aggregated towards the tips of the branches and forming a tufted look. Leaves are simple, opposite, and leathery with entire margins. The flowers are small, greenish-white and in dense globose heads. The fruit is small, drupe-like in structure. Native to the Indo-Pacific, *Scyphiphora hydrophyllacea* has a wide distribution in coastal and estuarine habitats. It grows well under saline conditions and has a high tolerance to soil flooding. India, Bangladesh, Myanmar, Thailand, Malaysia, Indonesia, and Australia are among the countries where this mangrove species is found Phytochemical studies on *Scyphiphora hydrophyllacea* are comparatively less when compared with other mangrove species. The initial studies have reported the occurrence of compounds like tannins, flavonoids, and saponins. More research is required to fully describe the phytochemical content of this species. Traditional medicine systems have linked some medicinal activities *to Scyphip horahydrophyllacea*. The plant has been employed in some communities to treat several diseases, including skin infections and gastrointestinal disorders. The phytochemical screening of this plant exhibited cytotoxic activity, anti-oxidant activity[27].

Xylocarpus moluccensis: *Xylocarpus moluccensis* is a large, evergreen Meliaceae species. The tree grows up to 30 meters tall with a trunk diameter of around 70 centimeters. The tree has a thick, grey-brown bark with longitudinal fissures. The leaves are alternate and compound and consist of 2-4 pairs of elliptic to oblong leaflets[28]. Its flowers are creamy-white and occur in groups that are large in size. The fruit is a big, round, woody capsule containing many seeds in a fibrous matrix. *Xylocarpus moluccensis* is widely distributed in tropical coastal areas and grows in mangrove swamps and backwaters. Its distribution varies from Sundarbans in India and Bangladesh to Southeast Asia, Malesia, to tropical Australia. Even though extensive studies on its chemical composition are scarce, initial research has established the occurrence of triterpenoids, steroids, flavonoids, and fatty acids in the plant. In traditional medicine, different parts of *Xylocarpus moluccensis* have been used for medicinal purposes in dealing with inflammation, while it has also found applications in antioxidant and wound-healing activity. But strong scientific evidence for these folk uses is still limited[29,30].

Aegicera scorniculatum is a highly adaptable plant also referred to as black mangrove or river mangrove. his shrub/small tree from the Primulaceae family is well known for its tolerance of saline conditions. Having leathery, obovate leaves and sweet-scented, white flowers in clusters, it's a familiar figure on coastlines[31].Its geographical area is quite extensive, ranging across India, Southeast Asia, China, Australia, and the Pacific. This mangrove plant has drawn attention due to its reported medicinal potential. Investigations have revealed the occurrence of phytochemicals such as saponins, flavonoids, and tannins in its structure. Such compounds are thought to be responsible for the antioxidant, anti-inflammatory, and antimicrobial properties of the plant. Various parts of *Aegiceras corniculatum* have been used in traditional medicine for curing various diseases, but further scientific investigation is needed to define its full therapeutic potential[32].

Bruguiera gymnorrhi also referred to as the black mangrove, is a major mangrove tree with broad ecological and economic significance. It belongs to the family Rhizophoraceae and is a medium-sized tree that occurs naturally in coastal and estuarine settings. The tree's distinguishing feature among mangrove trees is the development of short prop roots. It has smooth reddish-brown bark and elliptically shaped leaves. Its solitary flowers have white or cream-colored petals that later become brown. It has unique fruit resembling a top and at maturity, falls into the mud where it forms roots promptly[33]. This viviparous mode of germination is an impressive adaptation to the extreme

mangrove habitat. *B. gymnorrhiza* is an important species in coastal environments, serving as a habitat for numerous flora and fauna, safeguarding shorelines against erosion, and acting as a carbon sink. Aside from its ecological significance, the species has been utilized traditionally for a number of uses, such as timber, fuelwood, and medicine. Phytochemical research has shown that *B. gymnorrhiza* contains compounds with potential pharmacological activity. These are tannins, flavonoids, and other bioactive compounds. *Bruguiera gymnorrhiza* as an anti-oxidant, anti-inflammatory, anti diabetic, and with microbial properties and is known to enhance digestive health[34].

Bruguiera cylindrical: It is a medium-sized Bruguiera species that is also highly adaptable in different coastal areas. It features a unique cylindrical shaped propagules, which sets it apart from other Bruguiera species[35]. It has a bushy appearance with many aerial roots, locally referred to as pneumatophores, to facilitate oxygen supply in water-saturated soils. The leaves are simple, oppositely paired, and leathery in texture with glossy green upper side. Its flowers are borne in clusters and are succeeded by the typical cylindrical propagules. The propagules mature attached to the parent tree, a type of reproductive strategy called vivipary, which improves seedling survival in the harsh mangrove environment[36]. *B. cylindrica* is an important species in coastal environments, serving as habitat for numerous organisms, shore stabilization, and carbon sequestration. It is also an important resource to local communities, and its wood is utilized for timber and fuelwood. As with other mangrove species, *B. cylindrica* possesses potential medicinal uses. Compounds containing antioxidant, anti-inflammatory, and antimicrobial activity have been detected in the plant in preliminary investigations[37,38].

***Ceriops decandra* (Griff.) W. Theob.:** *Ceriops decandra* (Griff.) W. Theob.is a mangrove of the family Rhizophoraceae. Indigenous to the Indo-Pacific, it is distributed commonly in brackish coastal regions[39]. It has a tall, narrow trunk and leathery leaves. This mangrove possesses aerial roots known as pneumatophores to ensure gaseous exchange in low-oxygen soils. Its small, greenish-white flowers are followed by oblong fruits carrying a solitary seed. Rich in flavonoids, tannins, terpenoids, and alkaloids which are bioactive compounds, *Ceriops decandra* has found use in traditional medicine for their numerous health-related benefits. Diarrhea, inflammation, and wounds have traditionally been treated by the leaves, bark, and roots. *Ceriops decandra's* antioxidant activity also contributes to the ability of cells to resist damage resulting from free radicals[40]. Pharmacological Activities of Various Mangroves (Table 2)

ACKNOWLEDGEMENT

The authors of this work would like to acknowledge V. V. Institute of Pharmaceutical Sciences, Gudlavalleru.

Funding Source

Table1: List of Some true Mangroves found in the Coringa Region[3]

S.no	Plant species	Family	Vernacular Name
1.	*Avicennia officinalis* L	Acanthaceae	Nallamada
2.	*Avicennia marina* (Forsk.) Vierh.	Acanthaceae	Tellamada
3.	*Avicennia alba* Bl	Acanthaceae	vilavamada
4.	*Lumnitzera racemosa* Willd	Combretaceae	Thanduga
5.	*Excoecaria agallocha* L	Euphorbiaceae	Tilla
6.	*Rhizophora apiculata* Bl	Rhizophoraceae	Uppu Ponna, Kakkiponna
7.	*Sonneratia alba* Sm	Lythraceae	Peddakalinga
8.	*Sonneratia apetala* Buch. - Ham	Lythraceae	Kalinga
9.	*R. mucronata* Lam	Rhizophoraceae	Ponna

10.	*Scyphiphora hydrophyllacea* C.F. Garetn	Rubiaceae	Nara thanduga
11.	*Xylocarpus moluccensis* (Lam.) M. Roem.	Meliaceae	Senuga
12.	*Aegicera scorniculatum* (L.) Blanco	Myrsinaceae	Guggilam
13.	*B. gymnorrhiza* (L.) Savigny	Rhizophoraceae	Kandriga
14.	*Bruguiera cylindrical* (L.) Bl	Rhizophoraceae	Urudu
15.	*Ceriops decandra* (Griff.) W. Theob.	Rhizophoraceae	Togara

Table 2 : Pharmacological Activities of Various Mangroves

S.No	Plant Species	Pharmacological Activity	Reference
1.	*Avicennia officinalis L*	Antioxidant(L and B) Antimicrobial(L and B) Carbohydrate Metabolizing (L and B), Analgesic (L), Cytotoxic (L)	4,5,6
2.	*Avicennia marina (Forsk.) Vierh.*	Anti-ulcer, Astringent, Anti-hemorrhagic, Anti-malaria, Anti-diarrheic, anti-tumor	7,8,9,10
3.	*Avicennia alba Bl*	Anti-inflammatory, Antipyretic, Analgesic	11,12
4.	*Lumnitzera racemosa Willd*	antibacterial, antifungal, and anti-malarial	13,14,15
5.	*Excoecaria agallocha L*	Anti-inflammatory, Analgesic	16,17,18
6.	*Rhizophora apiculata Bl*	Antioxidant, Anti-Inflammatory, Antimicrobial, and Anti Diabetic	19
7.	*Sonneratia alba Sm*	Diarrhoea, Dysentery	20,21
8.	*Sonneratia apetala Buch. - Ham*	Promotes Gut Health	22,23
9.	*R. mucronata Lam*	Diarrhoea, Dysentery	24,25,26
10.	*Scyphiphora hydrophyllacea* C.F. Garetn	Cytotoxic, anti-oxidant	27
11.	*Xylocarpus moluccensis* (Lam.) M. Roem.	anti-inflammatory, antioxidant, Wound healing	28,29,30
12.	*Aegicera scorniculatum* (L.) Blanco	antioxidant, anti-inflammatory, and antimicrobial	31,32
13.	*B. gymnorrhiza* (L.) Savigny	anti-oxidant, anti-inflammatory, anti diabetic ,	34
14.	*Bruguiera cylindrical* (L.) Bl	antioxidant, anti-inflammatory, and antimicrobial	35,36,37,38
15.	*Ceriops decandra* (Griff.) W. Theob.	Anti-diarrheic, Anti-inflammatory	39,40

ABSTRACT

Machines' ability to understand, generate, and respond to human language has been radically altered by natural language processing (NLP), a key enabler of human-computer interaction. Natural language processing (NLP) is covered extensively in this review paper, which covers its basic principles, resources, and several practical applications. From simple rule-based systems to complex deep learning and transformer-based structures, we examine the evolution of natural language processing (NLP). The study delves into the various stages of natural language processing (NLP), including lexical, syntactic, semantic, discourse, and pragmatic. It also examines how NLP is used to support applications such as chatbots, machine translation, sentiment analysis, text summarization, and information extraction in sectors such as healthcare, education, and finance. By surveying the existing literature, we trace the evolution of NLP, examine current trends and challenges including explainability, bias, and low-resource language processing, and identify critical knowledge gaps. Lastly, we summarize potential future paths, including multimodal natural language processing, responsible and ethical artificial intelligence, and progress towards real-time, low-resource, and explainable systems. Researchers and practitioners interested in current NLP's power and potential can find a basic resource in this review.

Keywords: Natural Language Processing (NLP), Sentiment Analysis, Information Extraction, Text Mining, Speech Recognition, Automated Summarization, Morphological Analysis.

INTRODUCTION

As the world increasingly becomes a space of digital interactions and data overloading, it becomes increasingly vital to know how to process and analyze language effectively. To truly understand the relevance of Natural Language Processing (NLP) and its application, we must first understand 'what' NLP is. Through here, we will look at the concepts behind NLP, its historical development, and investigate its relevance, application and use in practice.

What is NLP?

Natural Language Processing (NLP) is a subfield of AI that aims to mimic human communication by understanding and responding to human language. It involves managing and analyzing large volumes of linguistic data, including spoken language meaning interpretation, written language translation, speech recognition, and written language generation. NLP aims to bridge the gap between language as a human communication medium and the text or symbols that machines work with, enabling computers to grasp meaning and react appropriately to various situations. The goal is for computer and digital system interactions to be as natural and successful as human-to-human communication. The Power of NLP within the AI Framework (Figure: 1)

Why is NLP required?

The demand for Natural Language Processing (NLP) stems from one core challenge: determining how to better facilitate communication between a human and a machine. The digital sphere continues to expand rapidly, and the amount of unstructured language data (text, speech, social media content, etc.) has grown enormously. Most traditional computational methods are and will continue to be inadequate for processing and understanding unstructured language data; therefore, more advanced methods are required. There are several critical reasons for requiring NLP

Data Interpretation and Analysis: Today, most new information created and made available is in natural language. Businesses, researchers, and governments all need advanced tools to help them analyze this data. NLP allows humans to search for meaning and draw insights from larger datasets, which ultimately leads to more accurate decision-making, the collection of comprehensive trend information, and increased awareness of user behavior.

Task Automation: Many tasks that depend on language, such as customer service, translation of documentation, and writing of content, require many hours of work when performed by humans, resulting in tasks that are tedious and time-consuming. Human labor can be largely replaced by NLP, improving overall efficiency, and allowing for instant responses in all types of applications including chatbots, virtual assistants, and automated translation services.

Improved Human-Machine Interaction: We live in a time when technology is evolving rapidly. The expectation for more natural or informal interactions between people and computers continues to rise. NLP can allow machines to understand and interpret human language, making interfaces more user-friendly and accessible to many people. This is particularly important with devices that could be voice operated or apps designed to give users a seamless experience.

Global Communication: In an increasingly globalized world, the ability to communicate across languages holds great value. NLP can help to provide greater access to various tools, like machine translation, which can enhance communication and collaboration across cultures by translating text and documents.

Facilitating Accessibility: NLP is instrumental in developing inclusive technologies - especially for people with disabilities. Speech recognition and text-to-speech technologies provide support for individuals with hearing disabilities or speech impairments to engage with digital content. It highlights the unique ways that NLP can assist in building technologies that provide equitable access to all users.

Where NLP can be used?

Natural Language Processing is useful for a wide spectrum of applications, which indicates its versatility and relevance in contemporary technology. Below are important domains where NLP is successfully utilized:

Chatbots and Virtual Assistants: Smart chatbots and virtual assistants that can understand and answer to user inquiries in natural language are built using natural language processing (NLP). Users can enjoy a natural and engaging experience with these systems in a variety of settings, including customer service, personal assistant, and information retrieval. Virtual assistants like Siri and Alexa on Apple devices employ natural language processing to understand and fulfill user requests for things like reminders, weather reports, and answers to frequently asked questions. These technologies give users instantaneous conversational support and help to improve their experiences by leveraging natural language processing.

Machine translation: With the use of natural language processing, people are no longer limited by language boundaries while communicating via text or audio. Services that translate text, provide content in multiple languages, and facilitate global communication all make extensive use of this technology. One popular tool that can rapidly translate text or voice into another language is Google Translate. Natural language processing and machine translation make it easier for users to communicate in situations when more than one language is spoken, such as at international business meetings or while traveling.
