In a competitive market driven by sustainability and cost-efficiency, the tyre retreading industry has emerged as a vital component of modern fleet management. This study focuses on understanding customer attitudes and demand patterns toward pre-cured tread rubber manufactured by Midas Treads Pvt. Ltd., a leading player in the Indian retreading sector based in Kottayam, Kerala. The primary objective is to analyse customer satisfaction, assess perceptions of product quality, and identify key factors influencing buying behaviour in the context of increasing environmental awareness and operational challenges. To collect quantitative and qualitative data, a structured survey was conducted among selected dealers and end-users within the Kottayam region. Findings reveal that while Midas has built strong brand loyalty through consistent product performance, there are evolving expectations in innovation, after-sales service, and digital engagement. The study provides actionable insights to help the company align its marketing, product development, and customer service strategies with current market dynamics. This research contributes to the broader understanding of consumer behaviour in the industrial goods sector. It offers a foundation for future strategic decisions by Midas and similar firms in the tread rubber industry.

Keywords: Environmental Awareness, Innovation, Product Quality, Sustainability, Vehicular Mobility.

INTRODUCTION

The invention of the tyre stands as one of humanity's significant achievements, revolutionizing transportation by making it faster and more efficient. In the 19th century, tyres evolved from solid rubber to more advanced forms, enhancing vehicular mobility. The Indian tyre industry's origins trace back to 1926 when Dunlop Rubber Limited established the first tyre company in West Bengal, followed by MRF in 1946. Since then, the industry has experienced substantial growth, closely tied to the transportation sector's expansion. As of 2023, the Indian tyre market reached a volume of 196.3 million units and is projected to grow at a CAGR of 2.9%, reaching 253.9 million units by 2032. In revenue terms, the market was valued at USD 13.4 billion in 2024 and is expected to nearly double to USD 27.6 billion by 2033, exhibiting a CAGR of 7.6%. This growth is driven by rising vehicle ownership, infrastructure development, and demand for durable tyres. The tyre industry is a significant consumer of domestic rubber production, with natural rubber constituting 80% of the material content in Indian tyres, compared to a global average of 30%. Synthetic rubber makes up the remaining 20%. The sector is raw material-intensive, with raw materials accounting for 70% of total production costs. The Indian tyre market is segmented into Original Equipment Manufacturers (OEMs) and the Replacement Market. OEMs, including automobile manufacturers like Maruti Suzuki and Tata Motors, account for approximately 40-45% of total tyre sales. The Replacement Market, comprising end customers replacing old tyres, accounts for 45-50% of sales and is generally a higher-margin business for manufacturers.

Statement of The Problem

The primary challenge lies in designing and validating market models incorporating consumer responsiveness, whether in electricity or product markets, without introducing inefficiencies or instability. How can operators ensure stable market operations in the presence of volatile, price-sensitive demand in DR? Similarly, how can we quantify the actual causal impact of subjective expert opinions on demand in product markets, separating them from signals of inherent quality?

Need For The Study

In today's competitive business environment, understanding customer behaviour and demand patterns is crucial for a company's long-term success. Midas Treads Pvt. Ltd. operates in a niche market of pre-cured tread rubber, and understanding customer attitudes towards the brand is vital for maintaining its market leadership. With increasing competition and fluctuating demand in the rubber and retreading industry, it has become essential for the company to assess customer satisfaction, loyalty, and expectations from its products. This study is needed to analyse how customers perceive Midas Pre-cured Treads, how satisfied they are with the product, and the key factors that drive their purchasing decisions. It will also provide insights into the demand trends for the product and help the company identify areas for improvement in both product quality and customer service. By studying customer attitudes and the demand patterns of Midas Pre-cured Treads, the company can make informed decisions to improve its product offerings, enhance customer satisfaction, and ensure sustained growth and profitability. Moreover, the study will help to evaluate how Midas Treads fares against competitors in the market and identify potential strategies for increasing its market share.

Objectives of The Study

The primary objectives of this study are as follows

- To understand and analyse the customer's attitude towards Midas Pre-cured Treads.
- To identify the attributes that influence customer preference for Midas Pre-cured Treads.
- To analyse the demand pattern of customers for Midas Pre-cured Treads.
- To evaluate the customer expectations from Midas Pre-cured Treads.
- To assess the level of satisfaction of customers with Midas Pre-cured Treads.

**Antu Punnen and Leena Jeneffa****Scope of The Study**

The scope of this study primarily focuses on the customers of Midas Pre-cured Treads, specifically the retreaders who play a significant role in driving the demand for these products.

The study covers the following areas

Customer Attitude and Satisfaction: The study will focus on customers' attitude towards the Midas Pre-cured Treads, including their satisfaction with product quality, pricing, and after-sales services. It will also explore customer loyalty and their overall experience with the company.

Demand Analysis: The study will examine the demand pattern for Midas Pre-cured Treads, including factors influencing the demand, such as seasonality, price fluctuations, and market trends.

Geographical Focus: While the study focuses primarily on domestic customers within India, it will also touch upon international markets, particularly where Midas Treads products are exported.

Product Range: The scope includes various products under Midas Treads Pvt. Ltd., such as pre-cured treads, curing bags, envelopes, and other rubber compounds used in tyre retreading.

Competitor Analysis: The study will also provide a brief overview of the competitive landscape in the pre-cured tread rubber market, identifying key competitors and their strategies to stay relevant in the market.

Limitations of The Study

While this study aims to provide valuable insights into customer attitudes and demand patterns, it does come with certain limitations:

Geographical Limitation: The study primarily focuses on customers within India and does not delve deeply into customer attitudes from all international markets. Therefore, insights into global customer trends may be limited.

Time Constraints: The data collection for this study is conducted within a limited timeframe, which might restrict the ability to capture long-term customer trends and perceptions.

Subjectivity in Responses: Since the study relies on customer surveys and interviews, the responses may be subjective and influenced by individual perceptions, biases, or experiences with the product, which could impact the accuracy of the findings.

Sampling Limitations: The study may not include all possible segments of customers, such as end-users who do not directly engage with the product. This might limit the comprehensiveness of the customer feedback.

Data Availability: The study depends on the availability of relevant and accurate data from customers, and there could be instances where customers are unwilling to share information or where data from secondary sources is limited.

RESEARCH METHODOLOGY**Methodology Adopted**

This research follows a Descriptive Research Design aimed at understanding and analysing customer attitudes and demand patterns for Midas Pre-Cured Treads in Kottayam. Descriptive research is used in this context to gather information on prevailing customer opinions, preferences, and behaviours. The study collected first-hand data through structured questionnaires and personal interviews with customers and vehicle owners. The survey method

**Antu Punnen and Leena Jenefa**

was adopted for primary data collection, allowing the researcher to interact directly with the respondents. The objective was to gain insights into customers' satisfaction levels, demand trends, and the various factors influencing their purchasing decisions regarding Midas products.

Sources of Data Collection

To ensure the reliability and comprehensiveness of the data, both primary and secondary data sources were utilized:

Primary Data

- Primary data was collected through random sampling using structured questionnaires and personal interviews.
- A total of 50 respondents were interviewed, comprising retailers and vehicle owners in Kottayam.
- The survey was conducted face-to-face from 1st March to 30th April 2025.

Secondary Data

- Secondary data was collected from company reports, brochures, previous research papers, websites, and industry publications.
- This data helped provide background information on the tread rubber industry and Midas Treads Pvt. Ltd.

Sampling Methods

Due to the large population in Kottayam and practical constraints, including every customer in the study was not feasible. Hence, the following sampling strategy was adopted:

Sampling Technique: *Random Sampling* was used to ensure an unbiased selection of respondents. It enabled the researcher to generalize findings from a smaller group to a larger population.

Sample Unit: Customers of Midas Treads and vehicle owners in Kottayam who purchase or use pre-cured tread rubber.

Sample Size: 50 respondents were selected for the study. However, only those who were willing to participate provided valid responses.

Sampling Area: The study was confined to Kottayam city, where Midas Treads has a strong presence and a significant customer base.

HYPOTHESIS – I

H0: There is no significant relationship between factors influencing use and their level of satisfaction with Midas Precured Treads.

H1: There is a significant relationship between factors influencing the use and their level of satisfaction with Midas Precured Treads

Regression

The statistical test regression gives a significance value of 0.111, greater than the cut-off value of 0.05. Given the alternate hypothesis that 'There is a significant relationship between factors influencing use and their level of satisfaction with Midas Precured Treads' can be rejected. So, it is found that there is no significant relationship between the factors influencing use and their level of satisfaction with Midas Precured Treads. The total number of respondents in the study is 50. Since the p-value is greater than 0.05, the null hypothesis is accepted.

Hypothesis – II

H0: There is no significant relationship between the quality of the product and consumer satisfaction

H1: There is a significant relationship between the quality of and consumer satisfaction

**Antu Punnen and Leena Jenefa****Interpretation**

The statistical test regression gives a significance value of 0.027, less than the cutoff value of 0.05. Given the null hypothesis that 'There is no significant relationship between quality of product and consumer satisfaction', the null hypothesis can be rejected. So, it is found that there is a significant relationship between the quality of the product and consumer satisfaction. The total number of respondents in the study is 50. The null hypothesis should be rejected since the p-value is less than 0.05.

Hypothesis - III

H0: There is no significant relationship between price and product demand. **H1:** There is a significant relationship between price and demand for the product

Interpretation

The statistical test regression gives a significance value of 0.838, greater than the cutoff value 0.05. Given the alternate hypothesis that 'There is no significant relationship between price and demand of the product', it can be rejected. So, it is found that there is no significant relationship between price and demand for the product. The total number of respondents in the study is 50. Since the p-value is greater than 0.05, the null hypothesis is accepted.

FINDINGS

- 58% of the customers are satisfied, and 40% are delighted with the product.
- Most customers prefer Midas Precured Treads because of its quality.
- 74% of customers purchased based on the brand name and quality.
- Most of the customers are satisfied with the dealers' communication level.
- Most customers believe that the price of Midas Precured Treads is high.
- Only a few customers get various discounts from the company.
- Most of the customers are satisfied with the availability of the product.
- All customers strongly agree to the extent of purchase of Midas precured treads.
- 54% of the respondents are satisfied with Midas' complaint-solving and after-sales service.
- All the respondents said they do not face any problem purchasing Midas Precured Treads.
- From the table in the questionnaire and response, it is clear that Midas Precured Treads has the highest price in the market.
- Most retailers consume between 500 and 1000 tons of Midas treads.

SUGGESTIONS

- The demand for retreading is increasing daily, so the company should fix the prices to keep its position safer.
- The products should be advertised on the regional TV channels and leading newspapers.
- The dealers should open depots in all towns so that the retreaders can access the product easily. As a result, this company can reduce the lead time.
- The company service engineers should visit the retreading centres. This will help to rectify their doubts and solve problems
- The company should go for new tyres of a different design and shape, especially in the case of radial tyres.
- The company should encourage a credit policy to facilitate better sales and satisfy the retreads.
- The company should provide the retreaders with relevant information about the new types of designs and sizes.
- To improve the market share of convenient treads, the research and development department should undergo intensive research in this field.
- Retreaders think that a high gauge of conventional tread will reduce the curing of the treads, leading to lower mileage. So, optimizing the gauge of treads will increase the mileage.
- As the number of small-scale retreads increases, the company should provide packages of small lots for conventional treads, procured treads, cushion gum, and vulcanization solution.

Antu Punnen and Leena Jenefa

CONCLUSION

According to the study, the MIDAS PRECURED TREADS company satisfies the customer need and demand pattern. With the development of the automobile industry, the demand for retread tyres also increased. Hence, it is essential to study customer attitudes towards retreads. The study used the proper methodology to solve the identified problem. The data collected were thoroughly analysed, based on which interpretations, findings, and suggestions were made in the light of this background. The study has attempted to shed more light on issues of concern and also given valuable suggestions. According to Kottayam, the market is vast, almost all districts' customers and other new people purchase the Midas Precured Treads because it is a quality brand name. Nearly all people demand the Midas Precure Treads more than others.

ABSTRACT

Cyber Security is the protection of computing assets against specified risks through the use of shields and other mechanisms. It embraces technology, implements and best practices for keeping information secure, accurate and readily accessible. This paper aims to identifying the components of networks which are needed to enhance the overall Machine Learning (ML) based Cyber Security for software-defined UAV relay networks, which cover issues using intrusion identification and securing data. In this paper, recent research articles are examined for the fining the issue of prognostication of network measures. Future studies address the issues of identifying improved real-time detection of threat, dynamic security implementation and optimal distribution of resources in SDRN UAV relay networks. Consequently, this paper aims to analyze the accurate prediction of the advanced network metric determining the higher-level network. Through this survey, important network parameters are identified that is related to Unmanned Aerial Vehicles (UAV) network for ML-based Cyber Security are the traffic pattern and end-to-end latency. Therefore, this paper concludes by laying out future research for the better prediction of enhanced network metrics.

Keywords: Cyber Security, Machine Learning (ML), Network Metrics, Prediction, Unmanned Aerial Vehicle (UAV) Network

Geetha and SureshBabu

INTRODUCTION

Unmanned Aerial Vehicles (UAVs) are rapidly becoming a popular tool across logistics, reconnaissance, disaster relief, changing industries and systems. UAVs are more commonly used in relay networks because these networks offer a boost in signal connectivity and provide communication networks in areas that lack infrastructure. However, these networks bear a rising number of threats that endanger their efficacy, availability and reliability. This greatly propels concerns over Cyber Security issues. The incorporation of Software-Defined Networking (SDN) into UAV relay networks has been proposed recently to help UAV relay networks become more flexible, scalable and manageable. Software-Defined Networking separates the control plane from the data plane so that it has centralized control in combination with elastic reconfiguration, which is required in UAV relay networks for efficient resource management and security threats Abir, M. A. B. S., *et al.* (2023). Nevertheless, several benefits enabled by SDN and relay UAV networks are very sensitive to cyber threats such as spoofing, eavesdropping and Denial-of-Service (DoS) attacks. These attacks are the result of the fact that SDN is centralized, it distorts interaction between nodes and data leakage occurs. In dealing with these challenges, various methods of modern Cyber Security have been developed more actively, primarily based on data analysis and Machine Learning (ML) Adil, M., *et al.* (2023). Algorithms driven approaches such as ML techniques provide the potential to identify and prevent cyber threats before the occurrence of attacks. Of these, the prediction of network metrics is particularly crucial in improving the security of SDN based UAV relay networks as it enables real-time monitoring of the network in a manner that potential threats can be easily discerned.

The studies published in the recent past have pointed out the significance of implementing ML for secure communication in relay networks using UAVs. The work of Agnew, D., *et al.* (2023) involved an approach adopted for the identification of cyberattacks in software-defined UAV relay networks while asserting that more effective threat identification can be achieved by better metric prediction. Likewise, the use of machine learning-based algorithms for RF-based UAV detection and identification improves the general security of UAV networks Ahirrao, Y. V., *et al.* (2024). Both of these developments point to the further suitability of applying ML to overcome the difficulties inherent in UAV relay networks, especially in the context of dynamic and limited resources. Enhanced network metric prediction primarily deals with the use of higher forms of ML to estimate and develop network metrics like delay, bandwidth and packet loss. In addition, the use of Reinforcement Learning (RL) and Deep Learning (DL) in multiple connected UAVs has shown great potential in optimizing communication trajectory design, resource scheduling and energy consumption. Thereby, the reliability and survivability of multiple-connected UAV networks are increased Chang, Z., *et al.* (2022). If applied to emerging technologies such as 5G and beyond, UAV network's progress make use of improved network metric prediction integration becomes increasingly important. Alrefaei, F. (2024) has also pointed out that the fulfillment of ML use for the Intrusion Detection Systems (IDS) of 6G-enabled UAV networks is a potential future research direction as it completely transforms UAV Cyber Security. This is the background upon which this research outlines the accurate prediction of network metrics help in achieving the security of SDN-based UAV relays. This method proposes the integration of advanced ML algorithms and predictive analytics to meet modern security threats existing in UAV networks that affect their reliability and operational efficiency in increasingly adverse conditions. In figure 1, the problems relevant to Cyber Security such as data poisoning, adversarial manipulation, model inversion attacks as well as incorrect feature selection, biased training dataset and overfitting are depicted. It focuses on threats and limitations concerning security systems.

Literature Review

This survey examines the application of ML methods for improved network metric prediction in a software-defined UAV relay network. If it is more specific, it centers on enhancing the accuracy of threat detection and consolidating the network. It helps to search for threats in terms of cyber attacks. At the same time, it enhances the performance of data relay hacking exposure such as data manipulation attacks and intrusion attacks.

**Geetha and SureshBabu**

Elleuch, I., *et al.* 2024 encompassed the development of transformer models for countering jamming attacks that were rife in damaged UAV scenarios. This method was implemented to mitigate jamming signals using Deep Learning (DL) models termed transformers that excelled at the processing of sequential data. The authors proposed an anti-jamming mechanism that improved the communication reliability under the jamming environment by applying a highly accurate classifying and eliminating of the jamming type. These findings suggested that the transformer models were more accurate and faster than the conventional methods in the system. The proposed work's primary concern was the utilization of contemporary backward DL strategies to enhance UAV networks against intended jamming attacks. Li, H., *et al.* (2024) intended to design an effective Federated Deep Reinforcement Learning (F-DRL) to solve the anti-jamming transmission problem in softwarized UAV networks. In federated learning, training occurs over UAV nodes to preserve the sensitive data whereas in RL, the transmission strategies were made adaptable in the face of possible jammers. The proposed F-DRL algorithm effectively managed the timing slots and the communication links within the network. Experimental results described the enhanced signal to interference ratios and overall throughputs under the jamming environment. This paper focused on privacy concerns and cooperation schemes during common learning, a data-driven approach to resource management for access to dependable communication of UAVs. Table 1 compares the improvement of UAV network security and performance focusing on machine learning, reinforcement learning, and optimization techniques concerning network mismanagement, jamming and synchronization errors.

Li, Y., *et al.* (2022) focused on the subject of jamming detection and classification in Orthogonal Frequency-Division Multiplexing (OFDM)-based UAV systems using the feature and spectrogram-adaptive ML. The bottlenecks of those algorithms were approached using SVM and Convolutional Neural Networks (CNN) to perform the classification of different types of jamming according to the spectrogram features. As a result of using SVM, this method guaranteed high classification accuracy. Thus, earlier identification of jamming attacks was allowed. This work illustrated the suitability of the proposed ML-based feature extraction and the classification algorithm in enhancing the jamming vulnerability of UAV communication systems. In this case, the primary interest lies in radio features as well as the accuracy of the algorithms used to detect jamming. Nakayima, O., *et al.* (2024) focused on the integration of Software-Defined Networking (SDN) and Delay-Tolerant Networking (DTN) together with Deep Reinforcement Learning (DRL) to improve the performance of the vehicular network. The integration of SDN centralized control with DTN reliable routing in sparse connectivity and DRL for decision making to accommodate vehicular dynamics was proposed. In this work, the authors provided an enhanced model of SDN-DTN-DRL hybrid architecture that had higher delivery rates of data and less delay. The simulation results indicated that the performance and robustness had improved considerably in the simulation results. This work underlined the feasibility of integrating networking paradigms with Artificial Intelligence (AI) to create adaptive real-time vehicular communication. As presented in Table 2, the focus of all the studies is on enhancing data communication, decreasing delay and securely managing networks using ML, DL and network-based optimization.

Olowononi, F. O., *et al.* (2022) examined the application of DRL for deception techniques in Intelligent Reflecting Surfaces (IRS)-aided UAV communication system. Intelligent Reflecting Surface is used to control the signal paths and DRL to dynamically change the deceptions for harder opponent trapping and to improve security. To increase network security under adversarial circumstances, the authors put forward a DRL scheme for efficient signal reflection and deceive attackers. Performance analysis proved that the application of the proposed method improved communication reliability and minimized the efficiencies that the attackers had detected. Therefore, this paper concentrated on the interaction between IRS and DRL for safe UAV communication. Prasad, K. V., & Periyasamy, S. (2024) presented the development of an adaptive quorum-based scheduling and interference-free routing protocol for edge-enabled UAV-assisted Software-Defined Wireless Sensor Networks (SDWSNs). The proposed algorithm provided a dynamic solution for the UAV task scheduling as well as data forwarding to avoid interference and improve the performance of the network. With the integration of AI in decision making of the protocol, the communication process optimally consumed the available resources and achieved the dependable along with the timely delivery of information. With the use of simulation, there was an improved network lifetime and overall lower latency than the available existing techniques. Adaptive scheduling and interference management were the

**Geetha and SureshBabu**

most important concepts for the enhancement of SDWSNs in a UAV-aided context. Table 3 gives a representation of the various UAV network optimization strategies the key algorithms used, the output methods and the various security issues faced by the authors of the referred works. Prasad, S. V. R. V et. Al., (2024) presented a novel approach used through SVM-SFL algorithm for identifying the malicious UAVs attacking Wireless Sensor Networks (WSNs). Unsupported Vector Machine was used along with Shuffled Frog Leaping (SFL), a metaheuristic optimization method to improve the UAV Intrusion Detection System (IDS). The proposed method performed a commendable job of categorizing UAV behaviors as either malicious or benign. At the same time, very high detection rates were exhibited but lower false alarm rates. Therefore, the existing work focused on the use of the proposed ML algorithm in combination with various optimization methods to defend WSNs against UAV threats. Qureshi, K. I., et al. (2023) investigated the Asynchronous Federated Learning (AFL) to allocate the resources in the Software-Defined Internet of Unmanned Aerial Vehicles (SDIoUAV). Asynchronous Federated Learning refers that UAV nodes built the models collectively without necessarily updating at the same time. The authors submit a federated learning system design that can adapt to the network conditions and UAV facility. Metric analysis as well as simulation outcomes indicated that the proposed approach achieved more efficient use of resources and convergent models. The primary interest was the management of resources in SDIoUAV systems to optimize system design for large scale and low cost through the use of federated learning techniques.

Existing Methodologies

This survey utilizes the existing classifier methods adopted for the predicting network metrics and security of Software-Defined UAV Relay Networks (SDRNs): Predictive Queuing Analysis is used in forecasting network traffic and delay occurrence. Deep Reinforcement Learning helps to better understand UAV behavior in terms of network quality, whereas Support Vector Machine with Shuffled Frog Leaping makes proper classification of the network states. Asynchronous Federated Learning helps in reducing the communication complexity of training models at client-side and Transformer Models capture the dependency patterns of time-series data. Federated Deep Reinforcement Learning approach combines decentralized learning with dynamic decision-making and improves both the key performance indicators and Cyber Security of the network.

Predictive Queuing Analysis

This paper proposes a software-defined UAV network architecture utilizing a queuing model for the improvement of data transmission in UAV networks. Predictive Queuing Analysis (PQA) being mathematical in its approach is utilized for assessing and predicting the capability of a network by modeling data on the flow characteristics and queuing profiles in the system. The study deals with the analysis of data packet arrival, service rate and the overall control of the queue lengths so that enhanced data transfer is possible and delays are restricted. When applied in a software-defined UAV relay network environment, PQA has very important functions of improving the accuracy of the network metric prediction, especially for Cyber Security use. Unmanned Aerial Vehicle relay network supports the data relay between UAV nodes, which feature oscillating traffic characteristics. Structurally, PQA allows the simulation of these traffic patterns because it estimates the arrival rates of data packets and predicts possible bottleneck areas. Since the network management through the use of PQA, the network readily makes priorities for resource quantities and channeling which in turn hinders packet drop, throughput, and latency. This proactive management is important to assure the dependability of ML based Cyber Security solutions that are used on such networks. This methodology improves the identification of anomalies and cyber threats as well as helps keep data integrity and data flow metrics that are accurately predicted. In addition, PQA emanates the practicable queuing policies along UAV security requirements where essential security data is prioritized over routine data traffic. Such prioritization is essential for fast detection and response to threats in conditions of UAV relay technology and application where the network stability determines the effectiveness of the cyber security system. Abir, M. A. B. S., et al. (2023)

Deep Reinforcement Learning (DRL)

Chang, Z., et al. (2022) apply DRL to the trajectory design and resource allocation system in multi-UAV networks, intending to enhance the network's overall performance. Data on the performance of the method to multiple UAV

**Geetha and SureshBabu**

networks is provided. Deep Reinforcement Learning is an ML approach that uses DNN to incorporate RL concepts in decision making. While it comes to improve network metric prediction for analyzing and protecting a software-defined UAV relay network using only ML, DRL is used to dynamically train models that recognize and provide possible responses to different network traffic patterns and possibly incipient cyber threats. DRL works by letting an agent engage with the network environment, receive feedback in the form of reward or penalty and continually refine its decisional policy. In the Cyber Security of software-defined UAV relay networks, the metrics including latency, packet loss, throughputs and anomaly patterns are measured. When applied to the network, DRL helps the network to view around the corners to proactively identify new risks and optimally allocate resources. For instance, DRL algorithms have been trained to learn the signatures of other behavior types that are symptomatic of attacks such as Distributed Denial of Service (DDoS) or jamming attempts but at the same time facilitating the best data transfer. In addition, DRL also cooperates with UAV relay networks to automatically deal with the management of the network topology to sustain the performance and security of the network. This adaptive learning feature makes DRL a highly effective approach in protecting software-defined UAV networks against new threats and guarantees effective real-time data transfer.

Support Vector Machine (SVM) with Shuffled Frog Leaping (SFL):

The method to incorporate both SVM and SFL algorithms to detect malicious UAVs in WSN has been discussed by Prasad, S. V. R. V et. al., (2024). Support Vector Machine with SFL algorithm is established as a sturdy classification technique that improves the application of SVM algorithm combined with the optimization efficiency of the SFL algorithm. This hybrid model is useful in the context of improved network metric prediction for ML-based Cyber Security of a software-defined UAV relay network to increase the accuracy and efficiency of anomaly detection and threat elimination. Support vector machines are one of the most used supervised learning algorithms for classification and it intends to discover a hyperplane that separates the different classes. This model is mostly applied to binary classification and in detail, it is used in supervised classification to observe and detect malicious activities on the network traffic by using activities such as packet loss, network delay and throughput that have normal and suspicious differences. Shuffled Frog Leaping is a metaheuristic population optimization technique based on its searching strategy on frogs hunting for food. This is better than SVM in a way that it assists in selecting some of its parameters including the kernel function and the regularization parameter to attain a high classification rate. This algorithm works in the way that it separates the population of solutions into memplexes as separate populations mutate independently to exchange data to optimize globally. SVM with SFL has been implemented in the software-defined UAV relay network through the observation and forecasts of the metrics of the network for real time intrusion detection. To reduce the false positive and enhance the level of detection of this improved SVM model, SFL component is used for enhancing to attain better Cyber Security defense. The integration of these components enhances the general system dependability of UAV networks besides enhancing the ability to detect threats and make the networks more resilient.

Asynchronous Federated Learning

Qureshi, K. I., et al. (2023) improved the scalability and efficiency of learning in software-defined UAV networks by integrating resource allocation in AFL based on the proposed architecture. Asynchronous Federated Learning is a distribution learning paradigm that trains a single model across multiple collaborative and independent devices without sharing data. Specifically in the context of improving network metric prediction for ML based Cyber Security in a software-defined UAV relay network (SDRN), AFL provides the value-added benefits. In SDRNs, UAVs are utilized to act as intermediate nodes to support consistent network connectivity in constantly altering complex environments. The security of these networks is important as these networks are very easy and advantageous targets for attack and take hostage. Several familiar methods in conventional ML inevitably accumulate the data centrally, which adds delay, privacy issues and a large communication load. To handle these challenges, AFL proposes to train local models separately on each UAV or device, without utilizing the data from other sources. Occasionally the models contribute to a global model by transferring only the model parameters such as weights and gradients to a coordinator or a center. This asynchronous approach makes it possible for each UAV to train its model independently of others and without interference with other UAVs. Thus, the model is asynchronously trained

**Geetha and SureshBabu**

without the time synchronization bottlenecks that are considered in the case of the network dynamics. In the CyberSecurity area, AFL is utilized to improve the prediction of network metrics such as signal strength, latency and throughput by reformulating the models in realtime conditions of a UAV relay network. Incorporating the advantages of decentralized training together with the capacity to gather various local data points, AFL assists with the creation of improved and superior models of threats and anomalies for SDRNs as well as decision-making. Moreover, this method also minimizes large scale data exchanges. Hence, communication is reduced overhead. This is important in UAV-based networks since communication bandwidth is restricted.

Transformer Models

Elleuch, I., *et al.* (2024) use transformer models to design anti-jamming strategies in UAVs and enhance the communication resistance during attacks. Transformer models initially used for Natural Language Processing (NLP) tasks, attracted much attention in other applications including the prediction of the network metric for ML based Cyber Security system in SDRNs. These models are highly effective since learning long-range dependencies in data is usually more fitting while designing the data models for complex environments such as SDRNs. Hence, these models are usually scalable. While UAVs are used as relay nodes in SDRNs to enable communication between different nodes in the network, the performance of the network is unpredictable due to influential parameters such as signal strength, UAV mobility as well as interferences. It is also possible to use Transformer models to predict network parameters, including throughput, delay and packet loss from the history of network configurations and UAVs interactions. Figure 2 depicts the Transformer model development process from data input and the choice of model architecture through to training, testing and implementation. It shows decision-making points for accuracy in the model, security level and the final validating point. The self-attention functionality within a Transformer model lets the model concentrate on important parts of the input sequence to make the model learn patterns from time series information efficiently, vitally important for real-time anticipation of network metrics. The capacity to manage and model data has sequential characteristics over long timelines and improves accuracy, which contributes to the optimization of resources for UAV relay networks along with consequential decision making. In addition, Transformer models capture the potential Cyber Security threats through finding a pattern that is not quite normal in the traffic flow. This capability enables SDRN to detect and minimize adverse cyber-attacks to uphold the requisite robustness and security. Thus, the overall performance of SDRNs is been improved with transformer models mainly because of the improved predictive functions.

Federated Deep Reinforcement Learning (FDRL)

Li, H., *et al.* (2024) use FDRL to prevent jamming attacks on software-defined UAV networks improving the secure data transfer. It is one of the sophisticated approaches that super impose federated learning on top of DRL to facilitate distributed decision making in difficult settings like SDRNs. In SDRNs, UAVs are intermediaries providing links for keeping the connection inside a potentially large and unstable space. Hence, optimization and protection are needed for the network. This existing method enables multiple UAVs to train individual models based on local observations without the need for exchanging raw data. Thus, privacy is preserved and the required number of messages is minimized between UAVs. Each UAV manages its environment. Hence, it explores the proper action to improve the network metrics such as throughputs, end-to-end delay, signal strength, and others. Then, these local models are updated periodically to provide updates to a global model so that every UAV learns from each other without giving up its data. Deep Reinforcement Learning increases UAV adaptation in a dynamic and complex network environment. Unmanned Aerial Vehicles improve network security and efficiency by learning from and adjusting the relay behavior. In Cyber Security, UAVs outfitted with FDRL learn to recognize the suspicious patterns in network data, which indicate attacks such as jamming or illegal access and respond autonomously. Training is decentralized with FDRL due to its federated structure, which makes the system more resilient to failure points by eliminating the requirement for a central server. Thus, FDRL improves network metric prediction while also strengthening SDRN security and resilience, making it more responsive to performance concerns and emerging cyber threats.

Geetha and Suresh Babu

DISCUSSION

Software-defined UAV Relay Networks (SDRNs) benefit from several methods for improving Cyber Security and network metric prediction. Effective traffic pattern and flow characterization models use PQA to identify pre-emptive risks and maintain data integrity. Deep Reinforcement Learning enables real time resource optimization and cyber threat detection. The hybrid approach of SVM and SFL optimizes SVM parameters for increased classification. Hence, anomaly detection accuracy is improved. Asynchronous Federated Learning decentralizes training, which improves privacy and reduces communication costs, allowing real-time anomaly detection. Transformer models thrive in two fields with their self-attention techniques such as time-series network metrics prediction and anomaly detection that suggests an attack. Federated Deep Reinforcement Learning enables UAVs to collaborate to train models for better danger detection without sharing raw data by combining decentralized learning and dynamic decision making. Together, these strategies boost network speed, reduce latency and strengthen defense mechanisms against ever-changing cyber threats, resulting in a safer and more effective SDRN environment.

CONCLUSION

For this survey, recent research papers published on improved network metrics prediction were examined. The findings show that the network's security and performance have been significantly improved. Using advanced ML algorithms such as Federated Learning and DRL, the system detects potential cyber attacks and consistently predicts critical properties such as signal strength, throughput and latency. This ensures an adaptive and robust network. Existing methodologies have significantly improved network metric analysis and prediction. Researchers discovered that adding ML approaches in SDRNs improved CyberSecurity by allowing for more efficient identification and mitigation of potential dangers as well as much more accurate network metric estimates. Future work in Cyber Security focus on enhancing real time threat detection capabilities and making ML models more scalable for bigger UAV relay networks.

ABSTRACT

Foxtail millet is a small-grain cereal crop, which is widely grown in Asia and Africa. Different types of millets are Sorghum millet (Jowar), Proso millet (Chena/ Barri), Pearl millet (Bajra), Foxtail millet (Kakum/ Kangni/ Konidhan), Finger millet (Ragi), Brownstop millet (Korle), Banyard millet (Sanwa), Little millet (Moraiyo), Buckwheat millet (Kuttu), Amaranth millet (Rajgira) and Kodo millet. Foxtail millet being indigenous to Assam and named 'Konidhan' by the native people, was popularly used for the preparation of healthy desserts like kheer, but with time, the consumption of 'konidhan' has received the least importance in the present-day diet of the people. Recently, the World Millet Mission in association with the Assam Millet Mission conducted in a total of 15 districts covering lower, central, upper, and hilly areas of Assam, worked to increase the millet production all over the state, out of which Chirang district was recorded with the highest millet productivity of 1,500 kg per hectare, followed by Dhubri and Baksa districts with 1,422 and 1,042 kg per hectare respectively. To make any food popular among consumers, it is very important to know its nutritional benefits. Hence, we aim to carry out proximate composition, minerals, antioxidant activity, bioactive compounds, and the glycaemic index analysis of the indigenous foxtail millet, following standard protocols. Besides that, parents for their children and the working people prefer to have readymade food that is tasty and healthy at the same time, saving their time to prepare a nutritious meal. So, we aim to prepare cookies out of foxtail millet, replacing wheat flour, so that people can have nutrients at easy access. We believe this would be helpful

Sanchari Das et al.,

to popularize our indigenous millet, to increase the economic growth of the farmers, entrepreneurship development as well as employment generation.

Keywords: Antioxidant, Bioactive compounds, Cookies, Foxtail Millet, Glycaemic Index.

INTRODUCTION

Millets are small-seeded grasses, widely grown worldwide as cereal or grain crops for human food and fodder. Generally, they are the warm-weather and annual cereals that belong to the family of grasses. They have a high tolerance against extreme weather conditions, like drought, with a nutrient content compatible with other major cereals[1]. Foxtail millet, scientifically known as *Setaria italica*, is a cereal crop that has been cultivated for the last 8000 years in China and is presently cultivated in the countries of Africa, Asia, Australia, and South America with tropical and semi-arid areas, specifically in India, China, Nigeria, Mali and Niger[2]. In India, it is primarily grown in states such as Andhra Pradesh, Telangana, Maharashtra, Tamil Nadu, Karnataka, Rajasthan, Madhya Pradesh, Uttar Pradesh, and northeast India[3]. Before the Green Revolution, in 1965-66, millets were grown in 36.90 million hectares of land. However, in 2016-17, the area under millet cultivation decreased to 14.72 million hectares, which is a 60 percent reduction in coverage area. This decline is due to several reasons, such as changes in consumption patterns and dietary habits, unavailability of millets, low yield, less demand, and conversion of irrigated areas for rice and wheat cultivation. Thus, a government meeting held on July 18, 2017, decided to distribute millet throughout the country under the supervision of the Public Distribution System (PDS) to ensure improved nutritional security[4]. The execution of the above-mentioned distribution law started mainly in 2018, hence, The Government of India declared 2018 as the 'National Year of Millets', and from then the cultivation of millets flourished again just like the earlier times. Among other millets, Foxtail millet is the only crop with abundant genetic and genomic resources and is the second most cultivated millet in the world after pearl millet[5]. It is called a 'foxtail' millet because the grain plant resembles a foxtail. The most unique feature of this millet is its ability to quickly adapt to bad weather conditions, agricultural and ecological conditions, and situations where other crops cannot grow adequately. They require very little water and grow in hot summers, accounting for about 25-30% of the annual rainfall required for crops such as rice. Additionally, millet is a trouble-free crop and does not need commercial fertilizers to survive in the fields. Therefore, it saves farmers from spending more money on expensive pesticides that farmers cannot afford[5]. Millets are "future crops" as they are resistant to most pests and diseases and adapt well to the harsh environment[6]. *Konidhan*, an indigenous foxtail millet to the state of Assam, was often used by the native people as a part of desserts. With time, the diminishing use of foxtail millet triggered the World Millet Mission to initiate the worldwide production of millets all over the world, including Assam, cooperated by the Assam Millet Mission. To make people focus on the beneficial side of foxtail millet solo, rather than examining it in a mixture with other value-based food commodities, the present study focuses on the estimation of Nutritional parameters like- Total carbohydrate, Crude protein, Crude lipid, Crude fiber, ash and moisture content, mineral content (Iron, Zinc, Manganese, Magnesium, Calcium, and Copper), Bioactive compounds, Calorific value (Energy), Antioxidant activity and Glycaemic Index of the foxtail millet sample, collected from Krishi Vigyan Kendra (KVK), Kamrup, and making nutritional cookies out of it. Since very few research works individually focus only on foxtail millet, despite their easy availability throughout the country, and indigeneity to states like Assam, the present study is expected to fulfill the following aspects of preservation of the indigenous millet variety of Assam, evaluation of the nutritional value of the indigenous millet, empowerment of the economic growth of poor farmers, development of entrepreneurship and generation of employment in the state.

METHODOLOGY

Sample Collection

The foxtail millet sample was collected from Krishi Vigyan Kendra (KVK), Kamrup.

Sanchari Das *et al.*,

Morphological Study

Physical observation of color by spreading the sample on a black chart paper was performed. The dimensions of the sample were studied with the help of a microscale plate and observed under the microscope.

Proximate analysis

Each experiment was conducted three times (n=3), to avoid any experimental error.

Estimation of Moisture content

The moisture content was calculated based on the standard AOAC guidelines (St. John, 1939). The moisture content is analyzed via a thermogravimetric approach, i.e., the sample weight was taken at first, then it was heated or dried in the oven, and then the weight loss due to the evaporation of the moisture of the sample was calculated.

5gm of sample was weighted in a porcelain basin, also the weight of the basin was recorded along with that (W1). The oven temperature was kept at 105°C for 24 hours. After 24 hours, the final weight of the sample (W2) was taken.

Calculation of Moisture content -

$$\text{Moisture content} = \frac{w_1 - w_2}{w_2} \times 100$$

Estimation of the Ash content

The principle is based on burning off the organic matter to determine the remaining inorganic matter. Here, the heating is carried out in two stages-Firstly, to remove the water, Secondly, ashing the sample at a high temperature of 550-600°C in a muffle furnace.

$$\text{Calculation of \% Ash} = \frac{(\text{Ashed weight} - \text{Crucible weight})}{(\text{Crucible weight} + \text{Sample weight}) - \text{Crucible weight}} \times 100$$

Estimation of Total Carbohydrates

The carbohydrate content was estimated by the Anthrone method (Trevelyan and Harrison, 1952). Carbohydrates were dehydrated with concentrated H₂SO₄ to form "Furfural", which condensed with Anthrone to form a green color complex that can be measured by colorimeter at 620 nm.

Estimation of protein content

Protein content was estimated by the Kjeldahl method (Johan Kjeldahl, 1883), as per AOAC (1990, 15th ed.) The protocol is based on the principle that strong acids help in the digestion of food by releasing an amount of nitrogen, which can be measured by using a titration technique.

Calculation of the protein content:

$$\% \text{ Crude Protein} = \% \text{ Nitrogen} \times \text{Protein factor,}$$

Protein factor mostly used is 6.25

Determination of Crude lipid

Crude Lipid content estimation was carried out as per AOAC (1990, 15thed), with the help of crude ether extract of the sample. Lipids are soluble in non-polar organic solvents. Here, lipid was extracted by petroleum ether by repeated extraction procedure. The ether extract contained not only lipids but also other substances such as pigments and fat-soluble vitamins. The lipid was then collected by evaporating the solvent and then weighted to give the percent oil content of the sample.

Sanchari Das *et al.*,

Calculation of the crude lipid content:

$$\text{Crude fat content} = \frac{\text{weight of oil}}{\text{weight of sample}} \times 100$$

Estimation of Crude Fiber Content

Crude fiber content was determined by methods described in IS:10226-1 (Bureau of Indian Standards, 1982). The sample was treated with acid and subsequently with alkali. Oxidative hydrolysis degradation of native cellulose and lignin thus occurs. The residue was further obtained after the final filtration was weighed, then incinerated, and then cooled and weighed again. The weight lost gives the crude fiber content. The crucible weight (W1) and the ashed sample weight (W2) were taken.

Calculation of Crude Fiber %:

$$\text{Crude fibre \%} = \frac{(W1-W2)}{\text{Sample weight}} \times 100$$

Mineral Content Analysis

Mineral analysis was done using the method described in FSSAI Manual-9 (2015), by Atomic Absorption Spectroscopy (AAS). AAS quantitatively measures the concentration of elements present in a liquid sample. It is based on the principle that elements in a gas phase absorb light at specific wavelengths. Light of a specific wavelength is drawn into a flame after the liquid sample has been ionized into a gas phase. Here, the absorption is proportional to the concentration of the element. Quantification is done by preparing the standards of the elements.

Estimation of Calorific Value (Energy)

The Energy content was estimated with the help of a Bomb Calorimeter (Paul Vieille, 1878). The major component of a bomb calorimeter is a copper shell called the calorimeter that is closed from the top using a copper lid, the inner shell is made of stainless steel, where the fuel burns called the bomb which is enclosed inside the calorimeter, two fuse wires made of magnesium, fixed to a 6V battery, at the channel for the supply of oxygen an oxygen valve is fused with the bomb. The space between the bomb and the calorimeter is filled with water, a mechanical stirrer is placed and opposite to the stirrer, a thermometer is installed. The calorimeter is enclosed inside a capsule with an air jacket between the inner shell and the calorimeter and a water jacket between the inner and outer shell. The calorific value is calculated based on the temperature of the water. 1gm of the powdered sample was added to a holder, and the holder was placed inside the bomb and ignited. The bomb was filled with excess oxygen at 25-30 atmospheric pressure. The heat generated in the process was dissipated to water present in the calorimeter chain. The mechanical stirrer was used to maintain a uniform temperature of the water. The amount of temperature rise in the water was noted using the induced thermometer.

Calculation of the calorific value:

Step 1 – Mass of water (W) + Water equivalent of the instrument (w)

Step 2 – Initial temperature of water (t1) – Maximum temperature of water (t2)

Step 3 – Heat absorbed by apparatus = (W-w) (t1-t2)

Step 4 – Gross Calorific Value = $\frac{(W-w)(t1-t2)}{\text{Total fuel taken in bomb}}$

Sanchari Das *et al.*,

Estimation of Antioxidant Activity

DPPH assay (2,2-diphenyl-picrylhydrazyl), according to Chang *et al.*, 2001 was performed to estimate the antioxidant scavenging activity. 1,1Diphenyl 2- picrylHydrazyl is a stable (in powdered form) free radical with a red color that turns yellow when scavenged. The DPPH assay uses this character to show free radical scavenging activity. The scavenging reaction between DPPH and antioxidants (H-A) can be written as,

Different volumes (20-100 ul) of the sample extracts were made up to 3 ml and 1 ml DPPH (0.1 mM) solution was added. The reaction mixture was incubated at room temperature for 20 minutes in dark conditions. After 20 min, the absorbance of the mixture was read at 517 nm. In different sets of test tubes, the same arrangement was done, except that instead of the sample extract a standard antioxidant (Ascorbic acid) was added. This was done to compare the antioxidant activity of the millet with that of a standard antioxidant. 3 ml of solvent and 1 ml of DPPH was taken as control.

Calculation

$$\% \text{ RSA} = \frac{\text{Absorbance of control} - \text{Absorbance of sample}}{\text{Absorbance of control}} \times 100$$

Where, RSA = Radical Scavenging Activity

Detection of Bioactive Compounds

GC-MS (Gas Chromatography-Mass Spectrometry) was conducted to analyze the presence of different bioactive compounds.

Calculation: The percentage of bioactive compounds can be detected through the GC-MS peak.

Evaluation of Glycaemic Index

The Glycaemic Index (GI) is evaluated by postprandial blood glucose level (Jenkins *et al.*, 1981) after feeding dosa made of whole wheat flour and Foxtail millet flour and comparing the blood glucose level accordingly. The glycaemic index refers to the increment of the blood sugar level, within two hours of food consumption, which primarily depends on the amount and type of carbohydrate present in the food. It is denoted by a number between 0 to 100, where 55 or less is considered a low GI, 56-69 is the mid-range, and 70 or above is a high Glycaemic Index. The blood glucose level was recorded with the help of an Accu-check Glucometer.

Subjects from three age groups of 20-30, 30-40, and 40-50 years were taken. On the first day, each subject's blood sugar count was taken on an empty stomach. Then they were fed foxtail millet dosa, and the blood sugar level was checked after 15 minutes, 30 minutes, 1 hour, 1 ½ hours, and 2 hours. The same was repeated with white bread, which is taken as the standard or reference food in this case. After about 1 week, the same procedure was repeated by feeding rice dosa, and the blood glucose increment was recorded by a glucometer.

Calculation:

$$\text{Glycaemic Index (GI)} = \frac{\text{Incremental Blood Sugar Level after Test Food}}{\text{Incremental Blood Sugar Level after Standard Food}}$$

(White Bread was the standard food used here)

Preparation of the foxtail millet cookies

The grains were cleaned well and dried under sunlight. After being dried up completely, they were ground very finely in a mixture grinder. The millet flour, date palm jaggery (powdered), Butter, Curd, and Dry fruits were added in the ratio of 70%: 13%:10%: 4%:3%. The butter was beaten along with the jaggery powder, and curd until a creamy texture appeared. Crushed dry fruits were added. Foxtail millet flour was added accordingly to the above mixture and kneaded, not too hard nor too soft. The oven was preheated to 180°C and, the baking tray was greased with melted butter. The kneaded mixture was set in the shape of cookies in the oven tray. The cookies are baked for about eight minutes.

**Sanchari Das et al.,****Nutritional Analysis of the Konidhan Cookies**

All the standard protocols and methods listed above were performed to carry out the analysis. The Parameters studied are-

i. Total Carbohydrate ii. Crude Protein iii. Crude Fat iv. Dietary Fibre v. Cholesterol vi. Sugar

vii. Energy viii. Calcium ix. Iron

Statistical Analysis

The results were confirmed by statistical methods (mean and standard deviation) and the analysis was done using MS Excel

RESULT AND DISCUSSION**Dimension and Color of the sample**

Foxtail millet grains are approximately 2mm in length and 1.8 mm in breadth and generally appear in a light shade of yellow color.

Moisture Content

The total moisture content in the foxtail millet sample was estimated at 10.29 %.

Ash Content

The ash content in the foxtail millet sample was quantified as 1.54 ± 0.03 g per 100 g of the grounded sample.

Carbohydrate Content

The further estimation of the carbohydrate content in the foxtail millet sample was found to be 58 ± 0.82 g per 100 g of the grounded sample.

Protein Content

The estimation of protein content in the millet sample was quantified as 12.84 ± 7.77 g per 100 g of the grounded sample.

Crude Lipid Content

The total amount of crude lipid in the foxtail millet sample was quantified as 4.9 ± 0.1 g per 100 g of the grounded sample

Crude Fiber Content

The total fiber content in the millet sample was estimated as 19.8 ± 0.051 g per 100 g of sample.

Calorific Value (Energy)

The total energy content or calorific value in the foxtail millet was estimated as 397.4219 Kcal per 100 g of the grounded sample.

Antioxidant Activity

Performing the DPPH assay for the Radical Scavenging Activity of foxtail millet, it was evaluated that the methanolic extract of the sample showed the highest antioxidant activity of 49.19%, whereas the Ethanolic extract showed 41% of the radical scavenging activity.

Glycaemic Index

The glycaemic index was evaluated taking into consideration the post-prandial evaluation of ten members, each of three age groups of 20-30, 30-40, and 40-50 years. The Glycaemic Index of Foxtail Millet Dosa was evaluated as 58-59 mg/dl and that of Rice Dosa was evaluated as 77-78 mg/dl, for each age group.

Sanchari Das *et al.*,**Nutritional Parameters of the Cookies**

The nutritional parameters of the Foxtail Millet Cookies were evaluated as follows:

DISCUSSION

Konidhan is the indigenous Foxtail millet of Assam, with the least spotlight on its importance. However, nowadays, it is widely used throughout the world. Hence, it is important to know the health benefits associated with its consumption. Therefore, this nutritional study shall help establish a database of nutritive characteristics of the traditional foxtail millet of Assam. The moisture content in the foxtail millet sample was found to be 10.29 g per 100 g, which can be compared with that of the Pearl and Finger millet, reported at a range of 12.4 g and 7.15–13.1 g per 100 g respectively of the sample¹⁶. A moderate amount of moisture is important to maintain the taste, appearance, texture, shape, weight, and freshness of the sample. Preparation of foxtail millet cookies with such a moderate scale of moisture helps the cookies to maintain their desired shape and weight. The ash content in the foxtail millet sample is 1.54 g/100 g, which is relevant to the ash content in finger millets reported as 2.72 g/100g¹⁷. In a food commodity, the total ash content depicts the total mineral content. Even though it is present in very small amounts, but plays a bigger role from a physiochemical, technological, and nutritional standpoint¹⁸. The carbohydrate content in foxtail millet is 58 g per 100 g, which is less as compared to the carbohydrate content of other millet varieties including Pearl, Finger, Proso, Kodo, and, the Little millets which are reported to contain a carbohydrate range of 61.6 - 67 g per 100 g, whereas barnyard millet was reported with about 49 g per 100 g of carbohydrate¹⁹, which is less as compared to the foxtail millet. The high carbohydrate content is due to more starch, which is slowly digested and resistible, and provides energy to the body through glucose, after breaking down²⁰.

The carbohydrates in the Foxtail millet sample are lente carbohydrates²¹, which are slowly absorbed in the body due to their high dietary fiber content²². The protein content of foxtail millet is found to be 12.84 g per 100 g, which is much more compared to the other types of millet, whose protein contents are reported at a range of 6.0 - 12.5 g per 100 g. The Protein content is one of the main attributes of foxtail millet, which helps in variety breeding, rating of a commodity, and food processing²³. Moreover, any bakery food must have a desirable foaming property to maintain its structure and texture at the time of processing and storage. Protein is the main factor responsible for the property of foaming²⁴. The crude lipid or fat content is found to be 4.9 g per 100 g, almost the same as the pearl millet containing 4.8 g of lipid per 100 g of the sample as per¹⁹. The content of crude lipid accounts for important fatty acids such as Palmitic acid, Linoleic acid, and Oleic acid, as detected by the GC-MS analysis. Moreover, it provides the highest calorific value of 397.4219 Kcal per 100 g which is higher than the range of 300-363 Kcal per 100 g in other types of millets¹⁹. Foxtail millet is found to be high in mineral contents of Iron, Zinc, Copper, Calcium, Magnesium and Manganese, with 20.85 mg, 3 mg, 1.13 mg, 12.14 mg, 134.58 mg, 7.68 mg per 100 g respectively, which can be compared to the range of 1.8 – 19 mg of iron, 2.4 – 60.6 mg of zinc, and 15 – 352 mg of calcium in all millet variety¹⁹. The pearl and finger millets were reported to contain 1.06 and 0.47 mg/100 g of copper, 137 mg, and 78–201mg/100g of magnesium, and 1.15 mg and 17.61–48.43mg/100 g respectively²⁷. The radical scavenging activity of foxtail millet in the methanolic and ethanolic extract was 49.19% and 41% respectively, which can be compared to that reported by Jandacek et al., 2017²⁸ with 51.8% in methanolic and 42.9% in ethanolic sample extract. This shows that the millet has a high antioxidant potential to fight against free radicals. On performing the GC-MS, linoleic acid was detected in the highest amount of 23.12%. It is an omega-6 fatty acid and functions as an apoptosis inducer, anti-neoplastic, anti-inflammatory, anti-atherogenic, and anti-cancerous [29]. Also, palmitic acid was detected at 10.62%, is a fatty acid with anti-inflammatory, and anti-diabetic properties. The palmitic acid is also believed to relieve cardiovascular diseases¹¹. Thus, bioactive compounds in the foxtail millet have high medicinal value and are reported to act against vital disorders like cancer, diabetes, cardiovascular disorders, etc. In a work conducted by Narayanan et al., 2016³⁰, it was reported that even pearl millets have palmitic and linoleic acids in them. The Glycaemic Index of foxtail millet dosa was evaluated in a range of 58-59 mg/dl in the three age groups of 20-30 years, 30-40 years, and 40-50 years. Whereas, that of rice dosa was evaluated in the range of 77-78 mg/dl in all the three respective age groups. Sambavi, 2016 reported the glycaemic index of foxtail millet and rice dosa to be 59.25 and 77.96 mg/dl respectively. Thus,

Sanchari Das *et al.*,

foxtail millet is highly recommended for conditions like hyperglycaemia. In the previous studies, foxtail millet was studied in a combination setup with other valuable food commodities[31,32,33,] so in the present study, we focused on preparing cookies only made of foxtail millet flour as the main binding agent, along with the other ingredients that are generally used in making cookies. The total Carbohydrate, Crude Protein, Crude Fat, Dietary Fiber, Cholesterol, Sugar, Energy, Calcium, and Iron content in the cookies are 62.95 g, 19.48 g, 6.72 g, 14 g, 1.3 mg, 0.2 mg, 501.57 Kcal, 37.19 mg and 4.84 mg respectively, which can be compared to the maida cookies with parameters of 76 g carbohydrates, 10.3 g protein, 1.1 g fat, 2.7 g dietary fiber, 0.4 g sugar, 364 Kcal energy, 15 mg calcium and 4.3 mg Iron per 100 g and 5.1 mg cholesterol per 34 g[34]. The nutritional parameters of the Konidhan cookies show that they are more nutritious than maida cookies and fulfil a person's daily nutritional requirements. Moreover, it is found that all other foxtail millet cookies available in the market are made in combination with wheat flour, thus, compromising the nutritional profile of the millet.

CONCLUSION

Thus, it can be said that the prepared cookies have a lot more carbohydrates, crude protein, crude fat content, and calorific value than the raw *Konidhan* sample which is the energy source for a longer period and is more nutritious. In today's busy world, it is hard to find nutritious foodstuffs without wasting much time to prepare them. In such cases, the foxtail millet cookies would be an easy source of nutrition. Moreover, Children nowadays suffer from malnutrition, since they always pick attractive foodstuffs that are tasty but not healthy always. So, the nutritional aspects of foxtail millet, when infused into a cookie form, would be consumed by children, fulfilling their daily nutritional needs. Foxtail millets have been used from early times in the form of desserts like 'kheer,' which takes time to prepare and cannot be cooked every day. Thus, the cookies make it easier to have them as a nutritional source daily. Moreover, it also tastes good, providing people with a healthy and tasty supplement to their daily requirement for nutrition. Thus, the above nutritional analysis was performed and gluten-free cookies were prepared. It is believed that this will encourage people to consume *Konidhan* more, increasing demand for its production. This will ultimately help in the economic growth of farmers of the state and thus, the preparation of cookies shall further support entrepreneurship among the population of Assam.

ACKNOWLEDGMENT

The authors would like to thank Cotton University for providing the laboratory facilities for conducting the study and Guwahati Biotech Park, IIT Guwahati, NIPER Guwahati, Tezpur University, and EREC (Environmental Research and Evaluation Center) Guwahati for providing the outsourcing facilities for proximate analysis and quality analysis of the cookies for the study.

Funding Sources

The author(s) received no financial support for the research, authorship, and/or publication of this article.

Conflict of Interests

The authors declare no conflict of interest

Author's Contribution

Each of the aforementioned authors has approved of the project's publishing and made a substantial, direct intellectual contribution. Sanchari Das: Conceptualization of the project, drafting the original manuscript, collection of data, and conducting experiments; Tarali Kalita: conceptualization and designing of the project, analysis of data, and review of the manuscript; Priyanku Sarma: Editing and review of the manuscript, designing the illustrations of the manuscript

ABSTRACT

This research represents an experimental study of the energy absorption behavior of the encased cold-formed steel which can be observed with two different beam depths. By encasing the two beams with concrete improves structural integrity and efficiency in applications. With different depths in beams of the encased cold-formed steel without a lip, we can observe a reduction in the local stiffness, improvement in buckling and interaction between concrete and steel. This experiment comprises static loading conditions which is used to observe, analyze and record the energy absorption, load displacement, ductility, and stiffness of the beam with varying depths. From the experimental observation, it is understood that the increase in beam depth improves the load-bearing capacity, for instance, the 250mm beam depth shows more energy absorption than the 200mm depth beam. So, by altering the beam depth it is observed that the reach in ideal energy absorption can be enhanced and the feasibility of encased cold-formed steel beams in various structural applications. Eventually, the results of the experiment conclude that the performance of the beam can be optimized with the combined application of the beam depth and material properties by efficiently balancing them. Like this cold-formed encasement, in the future researchers can explore the impact and behavior of different encasement materials with different beam depth configurations and further enhance the structural

**Thanya Gayathri et al.,**

integrity. By investigating and observing the variables of the steel, engineers can develop more robust solutions that will be more cost-effective and enhancement in engineering efficiency.

Keywords: Energy absorption, Load- Displacement, Ductility, Cold-formed steel, composite beam

INTRODUCTION

Cold-formed steel is also known as light gauge steel section or cold rolled steel sections, the Process involves bending, Rolling, or stamping without using heat, the stages depend on the complexity of the cross-sectional shape, and this fabrication technique permits a high level of tensile strength. The interaction between cold-formed steel and concrete improves the ductility and ability to resist higher deformation before failure. Energy absorption increases due to composite action between CFS and Concrete, allowing it to yield more gradually and energy absorption throughout the loading cycle. In recent construction, cold-form steel gained popularity owing to its excellent strength-to-weight ratio, and ease of fabrication, and they are vulnerable to local or torsional buckling because of the high slenderness ratio and small thickness. To overcome this drawback encasing cold-form steel sections are versatile and optimal solution by combining the benefits of CFS and encasement materials like concrete or other composites to attain structural performance and safety. These composite beams augment their load-bearing capacity, stiffness, and energy absorption abilities, which makes them appropriate for certain applications for durability, structural resilience and dynamic loads. The encased cold form steel section is an adaptable and competent key for currently. This composite action advances the energy absorption capacity A novel composite beam positioning a box-shaped cross section entailing a lipped C-channel cold-formed steel members facing each other and reinforced with steel advances it stiffness, flexural strength, and shear resistance, when cast on the top profile metal decking with Self compacting concrete supports as a slab arrangement the reinforced bars turns as shear connectors between slab and the beam and numerical analysis method proposed by EC4, is used to predict the flexural strength because of the elastoplastic behaviour in cross section the concrete internment laterally with the increased stiffness of the beam expected to decrease local buckling, enhancing the usage of cold form steel and addressing constraint of non-composite CFS beam.(1) The encased light cold formed steel joist with and without web openings. the study on experimental analysis of two groups of composite beams, one without web openings and the other with circular web openings. each group consists of three beams with different steel profiles-concrete ratios while sustaining reliable parameters such as cross-sectional area, web opening measures, and compressive strength of concrete.

Test under two similar concentrated loads, and compare the beam's strength, stiffness, ductility, energy absorption, and failure methods within and between the groups. The result shows that composite beam without web opening exhibits an increase in load capacity and stiffness compared to those with openings, while beams with web openings increase ductility and energy absorption. The steel ratio significantly improves ultimate load capacity and cold-form steel I – joists ease ductile flexural failure in composite beams. (2) The behaviour of a beam with a multi-web cold-formed section encased in reinforced concrete,11 full-scale specimens were tested under mid-span concentrated loads, with a difference in cold-form steel section features such as the web number, the web height, and the length of the section. The study concluded that the number of webs in the steel section influences the beam load capacity, deflection, and stress distribution. The multi-web steel section not only improves load capacity but decreases deflection and stress, avoiding shear splitting failure. The main cause of failure is local buckling of the steel section, shortening the multi-web section length while enhancing load capacity outcome in brittle shear failure, in the same way, decreasing deflections related to full length beams.(3) The use of polystyrene aggregate concrete (PAC) as a stimulating material for cold-form steel structures offers both insulating and fire-resistant properties, ideal for residential buildings. Experimental analysis was done to scrutinize the flexural behaviour and axial behaviour of PAC bracing CFS elements, the study shows that the improved stability of CFS beams improved load bearing capacity by 30 – 190%. The bracing effect rather than the composite properties of the materials was liable for the increased load capacity. Post-ultimate performance and local buckling behaviour of the steel show a beneficial impact of the bracing of the PAC allowing the steel core to increase its yield strength. This study shows that a cost-

Thanya Gayathri et al.,

efficient and current structural solution is offered by a composite of cold-form steel and polystyrene aggregate concrete combined.(4) The Additional study delves into the behaviour of PAC Encased from Cold Form Steel Sections under axial load, with 57 tests on both conventional concrete and non-conventional concrete beam to increase the constancy of Cold form steel columns, increasing load bearing capacity by 10 -110%. PAC effectually controls both global and distortional buckling modes and allows steel to influence maximum load and full composite performance, which discreetly increases axial stiffness. Full-scale panel test exposed that the main mode occurred in the load transition zone (5). The construction industry strives for cost-effective, eco-friendly structural solutions. Built up cold formed steel section with minimal thickness providing a cost-effective option for casting beams, the study considers the performance of CFS composite beams reinforced with diagonal rebars. Plate buckling in slender web CFS beams can be eased by using the thicker web, additional stiffeners, or diagonal rebars. To address challenges connected with heavy load design. Experimental and numerical analysis was conducted on twelve built-up CFS beams, where 6 without web encasement and six with fly ash concrete encased web, the study concluded that encased CFS beams showed twice the moment resistance of plain CFS beam, moreover diagonal rebars increased the ultimate load capacity and ductility of both plain and composite beams. (6) The study explored the effects of the indenter dimension on the deformation and energy absorption of composite sandwich beams under quasi-static and low-velocity impact three-point bending. Distinct ductile metal face sheets and composite face sheets exhibit brittle failure with fiber breakage. Study shows that strain rate sensitivity in the composite beam. The interaction between different indenter sizes and composite face sheets reveals that a 10mm dia indenter yields the most and the analytical forecast for collapse and a 38 dia indenter size on the highest specific energy absorption of 611 J/kg.(7)

The article reports the design of cold-formed steel lipped channel beams showing local distortional buckling interface, the study is about post-buckling behaviour, ultimate strength, and direct strength method quarter point loading, was done experimentally and numerical tests were conducted, two finite element models were developed a variable model simulating simply supported beams under uniform bending,12 beams designed as per AISI S100 - 2007 were conducted. An improved strength curve contributes conservative yet moment estimates, DSM distortional strength curve results in local distortional interaction often expecting unconservative results. (8) Cold-formed steel beams are thin-walled channels with lipped channels they are liable to different buckling modes and embrace local, distortional, and lateral torsional buckling, which influences their failure behaviour. This study introduces LTB-DSMB, a novel method that accurately examines the strength of lipped channel beams under combined buckling effects. Abaqus is used in numerical analysis to study the interface of these buckling modes. After analyzing experimental and numerical evaluation the strength and behaviour of these beams under different conditions such as Eurocode and AISI code. All three Buckling interfaces remain inadequate for beams using the direct strength method (DSM), a simpler method.(9) The Experimental study is on the flexural behaviour of a novel cold formed U-shaped steel section confine prestressed RC beam (CUSCPC). 5- 10% load-bearing capacity improved when U- shaped cold steel girder provides internment stress to the concrete and studs are used to safeguard the connection between the steel and the concrete enhancing structural performance on four with shear studs and four without CUSCPC Beam. to enhance structural performance, efficiently confines concrete delaying local buckling and decreasing brittleness. (10)

EXPERIMENTAL METHODOLOGY

Fabrication of Specimens

The two encased cold-formed steel beams with varying depths that is encased cold-formed steel section of 250mm depth [ECFS-250] and an encased cold-formed steel section of 200mm [ECFS-200] were taken for experimental study. The cross-section of the first beam section is 3200mm×150mm×250mm, and the second beam is 3200mm×150mm×200mm. A C-channel cold-form steel [CFS] beam was utilized as the primary structural element. Three main bars were provided for main tensile reinforcement and three hanger bars were provided for load distribution and stability. Stirrups are used throughout the beam with 200mm spacing. Formwork is properly inspected before use. The Cold-form steel section is 150mm×60mm the thickness is 2.5mm. Reinforcement steel bars

**Thanya Gayathri et al.,**

and cold-formed steel sections are tied properly using stirrups. Forming a cohesive reinforcement cage. M25 grade of concrete is used, and after casting and 28 days of curing beams were kept at ambient temperature to dry, later specimens were taken for a test.

Test Setup

The beam specimens were tested under simple support consisting of roller and hinge supports with a span of 3000mm, a two-point loading system was adapted to induce pure bending at one-third the distance from the supports, ensuring a vertical loading, the flexural performance of the encased CFS section was assessed, the applied force was measured by a load cell and strain gauges were attached to the encased CFS beams to measure composite action. Three dial gauges were placed, one at mid-span and two at below two-point loads then lateral deflection was measured.

RESULT

The deeper beam CFSWOL-250 has confirmed significantly increased load-carrying capacity than CFSWOL-200. Energy absorption capacity is measured as the area under the load-deflection curve decreases for the deeper beam signifying better ductility and resistance to sudden failure. The depth 250 mm beam and 200 mm beam exhibit tension zone concrete cracking developing to yielding.

Load Deflection

The encasement of concrete increases the ultimate load capacity. The geometry of steel sections the concrete encasement thickness and the applied load affect the deflection.

a) Load -deflection curve of the encased cold-formed steel without lip C- section beam of 250mm depth and 200mm depth beams. The ultimate load of 250mm depth beam increases to withstand the higher bending moment, if the depth increases it leads to an increase in moment of inertia before it starts to deflect.

Energy Absorption

The energy absorption ability of encased cold-form steel is an important characteristic where the beam experiences static load. The composite materials work together with the cold form steel section to improve energy absorption through a combination of mechanisms. Plastic deformation is attained by the steel section allowing it to dissipate energy through the yielding process. While the encasement absorbs energy by cracking and crushing when the load is applied. The encasement specimens offer lateral support to steel sections, enhance energy absorption, and prevent initial buckling. It is based on the bonding of encased beams, the thickness and grade of steel. The beams have to sustain loading conditions, and strain hardening dominant geometry of the beam includes failure. More energy-absorbing structures generally involve ductile material. The areas under the energy absorption curve were computed using the Simpson rule (14). In the energy absorption process that involves fracture mechanics related to concrete cracking, alongside elastic and plastic deformation (13).

Ductility Factor and Stiffness

For the deeper beam ductility factor of the beam was 1.2 for ECFSWOL-250 for ultimate load 137.3 kN and ECFSWOL-200 for ultimate load 117.6kN due to stress distribution and vulnerability to brittle failure, the beam can no longer withstand substantial deformation before failing. The beams with higher depth are more susceptible to shear modes of failure, which are highly brittle and the geometry, material of the beams increase the stiffness of the C-channel section beams with deeper beam increases stiffness for composite beam with higher depth.

Thanya Gayathri et al.,

CONCLUSION

The experimental study for energy absorption was carried out for varying depths of beam, ECFSWOL-250 and ECFSWOL-200 with 2.5mm thickness of C-section cold-formed steel beam. The load-deflection curve, ductility and stiffness for both specimens were recorded.

1. The ECFSWOL-250 beam had 18.13% more energy absorption capacity compared to the ECFSWOL-200 beam, the 250mm depth beam limits its ability to undergo huge deformation before failure.
2. ECFSWOL -250 maintains ductility factor and increases energy capacity before failure. The 250mm depth beams lower the span-to-depth ratio. The deeper beam distributes internal stress.
3. The yield load of the ECFSWOL-250 beam is 109.84kN and yield deflection is 32.71mm the ductility factor is 1.25 and for the ECFSWOL-200 the yield load is 94.06kN and yield deflection is 28.89mm the ductility factor is 1.25
4. Encasement of concrete significantly increases both the ultimate load and stiffness. The encased cold-formed steel (ECFSWOL-250) with increased depth beam increases ultimate load capacity, stiffness and lower deflection moreover lower energy absorption than ECFSWOL-200.
5. For enhancing performance, the beam depth and material properties are important to enhance additional structural integrity. The energy absorption characteristics increase by adaptable design efficiency and geometrical variations.

ABSTRACT

A field experiment was conducted during 2023-24 at the Horticulture Research Block, School of Agricultural Sciences, SGRRU, Dehradun, Uttarakhand, to investigate the "Role of Organic Amendments in Improving Growth and Fruit Attributes of Capsicum (*Capsicum annuum* L.) in Polyhouse System". The experiment was laid out in a completely randomized design with three replications and nine treatments. The treatments consisted of different levels of organic manures, with Vermicompost applied manually across all treatments. The treatment concentrations were as follows: T1 (control), T2 (FYM @ 20 t/ha), T3 (Cow urine @ 50%), T4 (Humic acid @ 2%), T5 (Biostimulants @ 5%), T6 (Bonemeal @ 2 kg/ha), T7 (Neem cake @ 5 kg/ha), T8 (FYM @ 10 t/ha + Cow urine @ 25% + Humic acid @ 1% + Biostimulants @ 2.5% + Bonemeal @ 1 kg/ha + Neem cake @ 2.5 kg/ha), and T9 (FYM @ 20 t/ha + Cow urine @ 50% + Humic acid @ 2% + Biostimulants @ 5% + Bonemeal @ 2 kg/ha + Neem cake @ 5 kg/ha). The capsicum cultivar "Bomby" was sown on 10/02/2023, and the final harvest took place on 12/06/2023. Observations were recorded on various growth and fruit attributes. The results revealed that treatment T9 (FYM @ 20 t/ha + Cow urine @ 50% + Humic acid @ 2% + Biostimulants @ 5% + Bonemeal @ 2 kg/ha + Neem cake @ 5 kg/ha) was the most effective in promoting growth attributes such as plant height (100.06 cm), number of leaves (84.30), number of flowers (6.93), days to first flowering (49.83), and days to 50% flowering (53.90). Fruit attributes under T9 included fruit weight (96.03 g), fruit length (7.78 cm), fruit diameter (7.40 cm), fruit

**Anil Kumar Saxena and Suneeta Singh**

volume (35.93 cm³), rind thickness (3.45 cm), number of fruits per plant (6.30), number of seeds per fruit (102.50) and number of chambers per fruit (4.0) were recorded maximum.

Keywords: Capsicum, organic fertilizers, cow urine, humic acid, biostimulant, bonemeal, neem cake

INTRODUCTION

Capsicum annuum L., commonly known as Shimla Mirch, belongs to botanical family Solanaceae and genus capsicum. It is believed to be the native of tropical South America, especially Brazil is thought to be the original home of pepper. The genus Capsicum originated in the new world of tropics and sub tropics. The most cultivated species among the capsicum species was domesticated in Mexico. Capsicum was unknown in the old world until sixteenth century has been introduced into Spain by Columbus on his return trip in 1493. Cultivation spread from the Mediterranean Europe to England by 1548 and central Europe by close of the sixteenth century. The Portuguese brought Capsicum from Brazil to India during 1584. However, based on the distinct type of variability available on the North-eastern States, it can be presumed that spread of Capsicum in those regions is independent from elsewhere in India. It is thought that Christian missionaries directly introduced Capsicum from South America (Thamburaj, 2022). According to 2021-2022 Statistical data, the total production of Capsicum is 519.16 MT (NHB, 2022). As such capsicum growing around cities like Bangalore, Belgaum, Mysore (Karnataka), Nilgiris (Tamil Nadu), Pune, Thane (Maharashtra), Ranchi (Bihar), Darjeeling (West Bengal), Himachal Pradesh, Jammu and Kashmir and Hills of Uttar Pradesh. The Major countries producing bell peppers are China, Indonesia, Sri Lanka, Pakistan, Turkey, Korea, Hungary, Spain, Bulgaria, Romania, Italy, Yugoslavia, Nigeria, Ghana, Tunisia, Mexico, USA, Central America, Argentina and Peru. Capsicum has higher concentration of biologically natural ingredients like Niacin (mg), Pyridoxine (mg), Vitamin A, C, K and E, dietary fiber and Protein as well as some minerals also found in capsicum in small amounts. The cultivation of capsicum under different protected structures are the most suitable solutions to the challenging environmental factors as it prevents spreading of insects, pests and other viral diseases. The growing trend of protected cultivation is associated with high yield, good quality, improved shelf life and year around availability of capsicum fruit. This technology can be utilized for controlling the environmental parameters such as temperature, relative humidity, light intensity and duration, CO₂ level, irrigation supply and root development (Dharani, 2019). The farmer needs to using organic fertilizers or being certified by the organic department so they get high value of their produce by using less or cheap input like FYM (farm yard manure), vermicompost or other organic product i.e.; bone meal, neem cake so they get high or qualitative yield (Gill,2018).

Organic fertilizers improve the soil structure, provide a wide range of plant nutrients, and add beneficial microorganism to the soil. Farm Yard Manure contains a high proportion of organic material, which feeds soil organisms and is necessary for maintaining active soil life, and it is high in nutrients. On an average well decomposed farmyard manure contains 0.5% N, 0.2% P₂O₅, 0.5% K₂O (Grover, 2022). Cow urine is considered as a better alternative to synthetic chemicals which are expensive and pose potential danger to the farmers, marketers, consumers and environment. It is a natural disinfectant and pest repellent and forms the main component of Panchagavya, an organic booster, prepared and sprayed by the farmers (Donga, 2022). It contains 95% water, 2.5% urea, minerals, Hormones and 25% enzymes. It also contains iron, calcium, phosphorus, carbonic acid, Potash, nitrogen, ammonia, manganese (Randhawa, 2015). Bio-stimulants are the substances or microorganisms applied to plants, soils or seeds with the aim of enhancing crop yield, quality traits, plant tolerance to a wide range of biotic and abiotic stresses and or nutrient use efficiency. An important source of bio-stimulants is waste streams, which places these products in the spotlights for agricultural innovations directed towards achieving a circular economy (Kumar, 2020). Humic acid is an organic compound derived from plant and animal matter decomposition. It is a major humus component, the dark organic matter that forms in soils and other environments. It contains approximately 70 to 90% of soil organic matter. It plays a role in soil fertility and plant growth. It helps to improve the soil structure, increase moisture retention and increase nutrient uptake by plants (Jagdish, 2020). Bone meal is also known as organic bone meal, is a type of organic fertilizer made from animal bones. The NPK rating of bone meal is typically 3-15-0, with a

**Anil Kumar Saxena and Suneeta Singh**

calcium content of around 12%. Neem cake is an organic manure of by-product obtained in the process of cold pressing of neem tree fruits and kernels and the solvent extraction process for neem oil cake. Neem cake has an adequate quantity of NPK in organic form for plant growth. It contains 100% natural NPK content and other essential micro nutrients as N (Nitrogen 2.0% to 5.0%), P (Phosphorus 0.5% to 1.0%), K (Potassium 1.0% to 2.0%) (Gupta, 2022).

MATERIALS AND METHOD

The present research work was carried out at Horticulture Research Block, Department of Horticulture, School of Agricultural Sciences, Shri Guru Ram Rai University, Dehradun, Uttarakhand during the rabi season of 2022–23. The experiment was laid out in Completely Randomized Design (CRD) and replicated thrice. Total nine treatments were tried namely T₁ (control), T₂ (Farm Yard manure @20t/ha), T₃ (Cow urine @ 50%), T₄ (Humic acid @2%), T₅ (Biostimulant @5%), T₆ (Bone meal @2kg/ha), T₇ (Neem cake @5kg/ha), T₈ ((FYM@ 10 t/ha + Cow urine @25 % + Humic acid @ 1% + Bio-stimulants @ 2.5% + Bonemeal @1kg/ha + Neem cake 2.5kg/ha), T₉ (FYM@ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha). The soil of the research field was sandy loam in texture having pH of 7.12 with available nitrogen (220.04%), available phosphorus (9.1 kg ha⁻¹) and available potassium (18.1 kg ha). The Capsicum cultivar “Bomby” was chosen for research purpose. Organic fertilizers i.e., FYM, Cow urine, Humic acid, Biostimulants, Bonemeal and Neem cake were incorporated in experimental field as per the treatments at the time of Transplanting. The seedlings were transplanted on 10/02/2023. All the cultural practices were done at regular intervals as per the requirement of crop during the course of research work. During the experimentation, from each replication, randomly selected one plants were used for recording various observations on growth and yield characters during whole of the cropping period at 30, 60, 90, and at final harvest. The obtained data were statistically analyzed with using standard statistical method as suggested by Gomez and Gomez (1996).

RESULT AND DISCUSSION

The various growth and fruit attributes were significantly influenced by different doses of organic fertilizers as compared to control during the course of investigation. The data presented in Table-1, 2 and 3 were showed that the significant improvement was noticed when applied different combinations of organic fertilizers as compared to control. The findings of the present investigation were recorded and are thoroughly discussed below:

Plant height (cm)

The observation data of plants height recorded at 30 DAT, 60 DAT, 90 DAT and at Final harvest was presented in Table 2 and Fig.1 revealed significant differences among the treatments. At 30 DAT, the maximum plant height (19.30cm) was recorded in T₉ (FYM@ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha) and the minimum plant height (7.86cm) was recorded in T₁ (control@100% soil). Whereas, The Plant height in T₅ (10.33cm) and T₃ (10.40cm) was at par with each other. However significant difference was observed in plant height T₈ (18.40cm) FYM@ 10 t/ha + Cow urine @25 % + Humic acid @ 1% + Bio-stimulants @ 2.5% + Bonemeal @1kg/ha + Neem cake 2.5kg/ha, T₇ (11.06cm) Neem cake @5kg/ha, T₆ (16.20cm) Bonemeal @ 2kg/ha, T₄ (14.10cm) Humic acid @ 2% and T₂ (9.20cm) FYM@ 20t/ha. At 60 DAT, the maximum plant height (41.0cm) was recorded in T₉ (FYM@ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha) and the minimum plant height (9.96cm) was recorded in T₁ (control@100% soil). The Plant height in T₂ (21.73cm) and T₃ (21.33cm) was at par with each other. The Plant height in T₆ (26.20cm) and T₇ (26.33cm) was also at par with each other. The significant difference was observed in plant height of T₄ (34.66cm) Humic acid @ 2%, T₅ (27.50cm) Biostimulants @ 5% and T₈ (37.66cm) FYM@ 10 t/ha + Cow urine @25 % + Humic acid @ 1% + Bio-stimulants @ 2.5% + Bonemeal @1kg/ha + Neem cake 2.5kg/ha. At 90 DAT the maximum plant height (92.86cm) was recorded in T₉ FYM@ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha with and minimum (21.40cm) was recorded in T₁ (control @100% soil). The significant difference was recorded with treatment T₆ (57.16cm) Bonemeal @2kg/ha, T₈ (88.66cm) FYM@ 10 t/ha + Cow urine @25 % + Humic acid @ 1% +

**Anil Kumar Saxena and Suneeta Singh**

Bio-stimulants @ 2.5% + Bonemeal @1kg/ha + Neem cake 2.5kg/ha, T₇ (48.96cm) neem cake@5kg/ha, T₂ (33.53cm) FYM @ 20t/ha, T₃ (40.76cm) Cow urine@ 50%. T₄ (81.83cm) Humic acid @ 2%, and T₅ (66.53cm) Biostimulants @ 5%. At final harvest the maximum plant height was recorded in T₉ (100.06cm) FYM@ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha with and the minimum plant height (23.76cm) was recorded in T₁ (control @100% soil). This might be due to the improvement in soil physical condition for the plant growth along with increased availability of N, P and K at the early stage of crop growth. Nitrogen, phosphorus and potassium contained in organic fertilizer have great effects in plant growth and development. The findings are in agreement with (Khandekar *et al.*; 2017) in capsicum.

Number of leaves per plant

The observation of number of leaves per plant, recorded at 30 DAT, 60 DAT, 90 DAT and at Final harvest was presented in Table 2 and Fig.2 revealed significant differences among the treatments. At 30 DAT, number of leaves per plant ranged from (7.63) to (17.10). The maximum number of leaves (17.10) was recorded in treatment T₉ FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum number of leaves per plant (7.63) was recorded in T₁ (control @100% soil). Whereas, the result of the treatment T₂ (8.96) and T₃ (8.10) shows number of leaves per plant are par at each other. At 60 DAT, the maximum number of leaves (42.20) was recorded in T₉ with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum number of leaves per plant (17.43) was recorded in T₁ (control @100%). At 90 DAT, the maximum number of leaves (71.66) was recorded in T₉ with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha. The minimum number of leaves per plant (38.63) was recorded in T₁ (control @100% soil). At final harvest the maximum no. of leaves was recorded in T₉ (84.30) FYM@ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha with and the minimum no. of leaves (50.83) was recorded in T₁ (control @100% soil). The good plant growth, number of leaves and higher number branches may be due to higher level of vermicompost and FYM which might have number of Transformation of energy rich and complex organic substances into bio-stabilized composed products. (Reddy *et al.*; 2017).

Number of days for first flowering

The observation of number of days for first flowering was recorded and presented in Table 2 and fig.3 revealed differences among the treatments. The minimum time was obtained in treatment T₉ (49.83) FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the maximum time was obtained in T₁ (63.50) control @100% soil. The treatment T₇ (62.23), T₃ (62.13) and T₂ (62.50) were par with each other. The significant difference was observed with treatment T₆ (60.96), T₅ (55.46), T₈ (51.06) and T₄ (53.93). Similar findings were also reported by Bhattarai & Maharjan (2012).

Number of days for 50% flowering

The observation of number of days for 50% flowering was recorded and presented in Table 2 and fig.4 revealed differences among the treatments. The minimum time was obtained in treatment T₉ (53.90) FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the maximum time was obtained in T₁ (69.63) control @100% soil. The treatment T₄ (59.0) and T₅ (59.36) were par with each other. The significant difference were observed with treatments T₂ (67.56) T₆ (62.06), T₃ (65.90), T₈ (57.70) and T₇ (64.36). Humic acid is a substance which can affect plants in two ways such as directly and indirectly. In direct way it improves chlorophyll content, fasten the respiration of plants and also improve the response of hormonal growth which lead early flowering of plants. The indirect effect is improving all the properties of the soil which also increase the plant performance. Similar, results were obtained by (Sakthivel *et al.*, 2021).

Number of Flower per plant

The observation of number of flowers per plant, recorded at 60 DAT, 90 DAT and at Final harvest was presented in Table 2 and Fig.5 revealed significant differences among the treatments. At 60 DAT, the maximum number of flower per plant (6.10) was recorded in treatment T₉ FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants

Anil Kumar Saxena and Suneeta Singh

@ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum number of Flower per plant (0.76) was recorded in T₁ (control @100% soil). Whereas, the result of the treatment T₂ (1.26), T₃ (1.70), T₆ (2.90), T₇ (2.53), T₄ (4.03) and T₈ (4.63) shows number of Flower per plant were significantly varies with at each other. At 90 DAT, the maximum number of Flower (6.93) was recorded in T₉ with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum number of Flower per plant (1.36) was recorded in T₁ (control @100%). The significant difference were observed with treatments T₂ (1.56), T₆ (3.73) and T₇ (3.26). Whereas, T₄ (4.86) and T₅ (4.63) shows number of Flower per plant are par at each other. At final harvest, the maximum number of Flower (5.93) was recorded in T₉ with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum number of Flower per plant (0.83) was recorded in T₁ (control @100% soil).

Fruit weight (g)

The observation of fruit weight (g), recorded at Final harvest was presented in Table 3 and Fig.6 revealed significant differences among the treatments. At Final harvest, fruit weight ranged from 96.03g to 27.41g. The maximum fruit weight (96.03g) was recorded in treatment T₉ with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha. and the minimum fruit weight (27.41g) was recorded in treatment T₁ with control @ 100%. Whereas, significant difference was observed in treatment T₂ (35.10g), T₄ (88.90g), T₃ (52.56g), T₆ (79.43g), T₈ (91.92g), T₅ (85.56g) and T₇ (75.73g) for the fruit weight. This might be due to the increase in yield parameters may be due to better root proliferation, more uptake of nutrients and water, higher plant growth, more photosynthesis and enhanced food accumulation. This result was confirmed the findings of by Reddy *et al.* (2017) and Yassin *et al.*, (2017).

Fruit volume (ml)

The observation of fruit volume (ml), recorded at Final harvest was presented in Table 3 and Fig.7 revealed significant differences among the treatments. At Final harvest, fruit volume ranged from 35.93ml to 8.06ml. The maximum fruit volume (35.93ml) was recorded in treatment T₉ with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha and the minimum fruit volume (8.06ml) was recorded in treatment T₁ with control @ 100%. Whereas, significant difference was observed in treatment T₂ (9.33ml), T₄ (29.82ml), T₃ (14.70ml), T₆ (21.76ml), T₈ (34.60ml), T₅ (27.64ml) and T₇ (18.73ml) for the fruit volume. This might be due to humic acid application significantly improved the fruit volume and increase the health of soil, plant nutrients uptake, and mineral availability as a result of which plant produce fruit having maximum weight, diameter and volume. This result was confirmed the findings of by Jan *et al.* (2020).

Fruit Length (cm)

The observation of fruit length (cm), recorded at Final harvest was presented in Table 3 and Fig.8 revealed significant differences among the treatments. At Final harvest, fruit length ranged from 7.78cm to 3.10cm. The maximum fruit length (7.78cm) was recorded in treatment T₉ with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha. Which was par with T₈ (7.56cm) and the minimum fruit length (3.10cm) was recorded in treatment with T₁ control @ 100% which was at par with T₂ (3.76cm) and T₃ (3.98cm). The treatment T₄ (6.63cm) and T₅ (6.0cm); T₆ (4.85cm) and T₇ (4.63) was at par with each other. This might be due to the increase in fruit length is possibly due to application of vermicompost that releases essential macro major nutrients such as nitrogen, phosphorous and potassium that was readily available to the plant. Ample and efficient supply of readily available nutrients from the rhizosphere relatively lesser holding in the roots and more transformation to the above ground parts for protoplasmic protein and synthesis of plant growth related compounds Kumar *et al.* (2020) and Panda *et al.*, (2020).

Fruit diameter (cm)

The observation of fruit diameter (cm), recorded at Final harvest was presented in Table 3 and Fig.9 revealed significant differences among the treatments. At Final harvest, fruit length ranged from 7.40cm to 3.10cm. The maximum fruit length (7.40cm) was recorded in treatment T₉ with FYM @ 20 t/ha + Cow urine @50% + Humic acid @

**Anil Kumar Saxena and Suneeta Singh**

2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha which was at par with T₈ (7.10cm) and the minimum fruit length (3.10cm) was recorded in treatment with T₁ control @ 100% which was at par with T₂ (3.46cm) and T₃ (3.76cm). The treatment T₅ (5.76cm) and T₆ (5.05cm) was also at par with each other. The treatment T₄ (6.40cm) and T₇ (4.15cm) are significant with each other. This might be due to the application of humic acid significantly increased the rate of photosynthesis, root development and plant nutrients content of the plant and thus increased the fruit diameter Jan *et al.*, (2020).

Rind thickness (cm)

The observation of fruit diameter (cm), recorded at Final harvest was presented in Table 3 and Fig.10 revealed significant differences among the treatments. At Final harvest, rind thickness ranged from 3.45cm to 1.63cm. The maximum rind thickness (3.45cm) was recorded in treatment T₉ with FYM @ 20 t/ha + Cow urine @50% + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @2kg/ha + Neem cake 5kg/ha which was at par with T₈ (3.06cm) and the minimum rind thickness (1.63cm) was recorded in treatment with T₁ control @ 100%. The treatment T₅ (2.73cm), T₆ (2.51cm), T₂ (2.0cm), T₃ (2.14cm), T₄ (2.86cm) and T₇ (2.40cm) were at par with each other. This might be due to the positive effect of this organic manure may be due to the better availability of soil nutrients that produced healthy plants with large vegetative growth which reflected in head diameter. This result agreed with previous findings obtained by Panda *et al.*, (2020); Chakravarthy *et al.*, (2023) and Maraai *et al.*, (2019).

Number of fruits per plant

The observation of number of fruit per plant, recorded at Final harvest was presented in Table 3 and Fig.11 revealed significant differences among the treatments. At Final harvest, the number of fruit per plant (6.30) was maximum with the treatment T₉ (FYM@ 20 t/ha + Cow urine @50 % + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @ 2kg/ha + Neem cake 5kg/ha), which was significant and superior over other rest of the treatments, which helped crop to respond well. This might be due to the reason of the improved root development, increased water and nutrient intake, increased plant growth, increased photosynthesis, and improved food accumulation may be the causes of the rise in yield metrics. The minimum number of fruit per plant (3.20) was observed in treatment T₂ (FYM @20t/ha) which was at par with T₁ (Control 100%). Similar, results were obtained by Reddy *et al.* (2017); Panda *et al.*, (2020); Paramasian *et al.*, (2021) and Chakravarthy *et al.*, (2023).

Number of seeds per fruit

The observation of number of seeds per fruit, recorded at Final harvest was presented in Table 3 and Fig.12 revealed significant differences among the treatments. At Final harvest, The number of seeds per fruit (102.50) was maximum with the treatment T₉ (FYM@ 20 t/ha + Cow urine @50 % + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @ 2kg/ha + Neem cake 5kg/ha), which was significant and superior over other rest of the treatments. However, the minimum number of seeds per fruit (41.46) was observed in treatment T₁ (Control 100%).

Number of chambers per fruit

The observation of number of chambers per fruit, recorded at Final harvest was presented in Table 3 and Fig.13 revealed significant differences among the treatments. At Final harvest, the number of chambers per fruit (4.00) was maximum with the treatment T₉ (FYM@ 20 t/ha + Cow urine @50 % + Humic acid @ 2% + Bio-stimulants @ 5% + Bonemeal @ 2kg/ha + Neem cake 5kg/ha) which was similar with (4.00) T₈ (FYM@ 10 t/ha + Cow urine @25 % + Humic acid @ 1% + Bio-stimulants @ 2.5% + Bonemeal @ 1kg/ha + Neem cake 2.5kg/ha), which was significant and superior over other rest of the treatments. The minimum number of chambers per fruit (2.0) was observed in treatment T₁ (Control 100%). Similar result was also reported by Patel *et al.*, (2014).

CONCLUSION

Based on current experimental research on the "Role of organic amendments in improving growth and fruit attributes of capsicum (*Capsicum annuum* L.) in Polyhouse system" for the cultivar Bomby, it can be concluded that

Anil Kumar Saxena and Suneeta Singh

among the various organic manure treatments, the combination of FYM @ 20 t/ha, cow urine @ 50%, humic acid @ 2%, bio-stimulants @ 5%, bonemeal @ 2 kg/ha, and neem cake @ 5 kg/ha (i.e., T9) was found to be the most effective. This combination significantly increased plant height, number of leaves, days to first flower initiation, days to 50% flowering, number of flowers per plant, number of fruits, fruit diameter and weight, fruit length and volume, rind thickness, number of chambers per fruit, and number of seeds per fruit.

ABSTRACT

Payroll processing is an elaborate process involving much more than salary calculations. The process can be intimidating if you do not know how to go about it, which is precisely why this handy guide will navigate you through the intricacies of payroll processing. Payroll processing is an essential business function that involves arriving at the 'net pay' of the employees after the adjustment of necessary taxes and deductions. For an efficient payroll management process, the administrator needs to plan the payroll process step-by-step. Earnings are the amount given to the employee in the name of VDA, CA, and so on, including the Basic pay and stated as Total Payable. Deductions are the amount deducted from the total payable and given to the companies or taken for the management; the rest would be given to employees as Net Payable. The remittance process is to recover money from the employees through deductions and pay it to the companies. Many Payroll Processors have specific skills that help them accomplish their responsibilities. By taking a look through resumes, we were able to narrow down the most common skills for a person in this position. We discovered that many resumes listed Communication, Math, and Organizational skills.

Keywords: Automation, Communication, Payroll Processing, Payroll Taxes, Social Security.

INTRODUCTION

Payroll compensates a company's employees for work done in a specific period. It is a critical business function that involves multiple departments, like finance and HR. The payroll process involves managing employee information, tracking working hours, and making timely salary payments. The payroll process can be handled internally with

Jenenee and Usha

automation and software or outsourced to specialized firms. Payroll is when a business pays its employees for work performed during a specific period. A payroll system allows businesses to follow a set series of processes to make timely, correct payments in compliance with government regulations. A payroll system may be manual or computerized and handled in-house or outsourced to another provider. The payroll process typically includes calculating employee pay, recording transactions, and determining and paying payroll taxes. A company must have a timekeeping system that accurately reflects the hours put in by nonexempt employees and the regular salary payments for exempt workers. Employers typically withhold federal income tax from employee earnings; at the end of the year, they must report all wages, tips, and other compensation paid. Companies also must withhold Social Security and Medicare contributions from employees' salaries and pay a matching amount.

Problem of The Study

A smooth-running payroll system requires overcoming daunting challenges throughout human resources. Often, the responsibility of finding solutions for the payroll problems lies with a few people, which makes it difficult. Payroll has to comply with company guidelines and labor laws. Also, since a company will have potentially complex in-house salary packages, payroll problems become even more challenging. A proper strategy can make even the most complicated payroll problems easier and less time-consuming. We have listed the most commonly encountered payroll problems and practical solutions. This is a helpful guide for any accounting managers, HRs, and CEOs looking to streamline payroll at their organizations.

Need of The Study

The human resources department manager is responsible for ensuring that department employees are well-versed in their areas of expertise in compensation, benefits, safety, payroll, recruiting, and training. Payroll management is how an employer can manage their employees' salaries. It also deals with the generation of payslips. Complicated computations that are performed manually can be automated using the payroll system. The payroll system linked with HR activity is called payroll management software. Payroll management software is beneficial for any kind of business enterprise. Payroll is calculating the salaries and wages of permanent and temporary employees of an organisation. Payroll calculation considers an employee's attendance, bonus, overtime, tax rules, and other information to generate the pay slip of that employee. Payroll can be run daily, weekly, bi-weekly, and monthly, depending on the salary cycles of the organization. A payroll management system makes your task easier. It processes tasks faster because payroll HR software has all the employee data. Easy to evaluate employee performance using payroll software. Hence, the performance review of an employee becomes faster. Payroll software helps reduce the number of employees working in a slower manual process. Accurate information can be obtained from the payroll system in real time.

Objective of The Study

- The Payroll Management System is a set of processes that help manage payroll, bonuses, deductions, taxes, and other related aspects of the net pay of all employees within an organization.
- The Payroll Management System in India has two main aims: one is a macro goal related to sales, strategy, profit, etc., and another is a micro goal related to day-to-day business operations.
- The Purpose of creating a payroll management system is to automate and streamline micro tasks so that hr departments have time to focus on macro tasks
- Analyze different types of earnings given to employees and how they are calculated.
- To analyze the different Types of deduction as well as to explain why they are deducted and how they are calculated

Scope of The Study

Payroll Management System Project in PHP with Source Code. This system is meant to supply the power to line up all the tasks of employee payment. At first, the user has to go through the login system to gain access, and then the user can add, list, update, and delete the employee's record. This system deals with the financial aspects of employees' salaries, Deductions, allowances, and net pay. The user can view the accounts of every employee and

**Jenenee and Usha**

update their payments, and the user can also manage deductions, modify overtime, and salary rates. Every detail about an employee's payment is displayed: Name with deduction, overtime, bonus, and net pay. This system makes it easier for the user to manage payroll as it is not time-consuming.

RESEARCH METHODOLOGY

Research methodology is a way to show the research problem systematically. It may be understood as a science of studying how research is done scientifically. The researcher must know not only the research methods but also the methodology. This Section includes the methodology, which provides for the research design, objectives, scope of the study, research methodology, study limitations, etc.

Research Design

After formulating the problem, the research design has to be prepared. Preparation of research design involves selecting the means of obtaining information, the time available for research, and choosing the tabulation method and data presentation.

I have obtained information from the organization's employees and with the help of search engines.

Sample Size: The number of observations or replicates to include in a statistical sample.

The sample size for the study is 100 employees across all technology sectors.

Sampling Technique

A stratified random sampling technique was used in the survey conducted.

Stratified Random Sampling is a population sampling method that can be partitioned into subpopulations. In statistics surveys, when subpopulations within an overall population vary, it could be advantageous to sample each subpopulation independently.

Method of Data Collection

Data Collection is one of the most critical aspects of research. For the success of any project, accurate data is vital. The information collected through research methodology must be accurate and relevant.

Primary Data

Primary Data is the first-hand data the researcher collects for the first time. There are several methods in which the data is compiled. In this project, the data was obtained and collected through questionnaires. A questionnaire was prepared and distributed to the employees of all the SEC technologies.

The following are a few ways in which the primary data are collected

Questionnaire: It includes a set of questions the employee was given to fill out, based on which data was interpreted.

Secondary data

Secondary data for the project were collected from company websites and search engines.

Sample Technique: The data collection is done through a convenience sample through questionnaires.

Data Source

The source of data may be classified into

- Primary source.
- Secondary source.

**Jenenee and Usha****Primary sources**

Primary sources are sources from which the researcher directly collects data that have not been previously collected. Primary data are first-hand information collected through questionnaires by company employees and employers. In this study, the primary data source is collected through a questionnaire.

Secondary sources

Data collected is edited and coded by using the tabular columns. This helps in converting the gathered data into tabulated, grouped data.

- Percentage Analysis is applied to create a contingency table from the frequency distribution and represent the collected data for better understanding.
- Chart Analysis is applied to understand the percentage analysis better, and is done via pie, bar charts, etc.

Limitations of the Study

- Respondents might not give proper answers as they might fear that responses will be held against them.
- The result would vary according to the individuals and the time.
- Some respondents hesitated to give the actual situation; they feared management would take any action against them.
- It took time for their response due to their busy schedule.
- In many cases, respondents just filled out the questionnaire hastily without giving proper thought to the questions to save their time; therefore, the information provided might be biased.

DATA ANALYSIS AND INTERPRETATION (Table: 1)

There is a negative correlation (-.205) between the satisfaction of deduction and the employee increment.

FINDINGS

- Here, the Majority of Respondents are from the Category of above 45 (56%)
- Here, the Majority of Respondents are from the Category of MINE – I & T.P.S – II (38%)
- Here, the Majority of Respondents are from the Category of MALE (97%)
- Here, the Majority of Respondents are from the Category of HSC (52%)
- Here, the Majority of Respondents are from the Category of yes (100%)
- Here, the Majority of Respondents are from the Category of 20 to 30 (55%)
- Here, the Majority of Respondents are from the Category of yes (97%)
- Here, the Majority of Respondents are from the Category of Worker (81%)
- Here, the Majority of Respondents are from the Category of 91,000 -1,66,000 (56%)
- Here, the Majority of Respondents are from the Category of Direct Deposit (100%)
- Here, the Majority of Respondents are from the Category of yes (98%)
- Here, the Majority of Respondents are from the Category of 5 (51%)
- Here, the Majority of Respondents are from the Category of 5 (40%)
- Here, the Majority of Respondents are from the Category of 5 (41%)
- Here, the Majority of Respondents are from the Category of 5 (43%)
- Here, the Majority of Respondents are from the Category of 5 (60%)
- Here, the Majority of Respondents are from the Category of 5 (54%)
- Here, the Majority of Respondents are from the Category of yes (91%)
- Here, the Majority of Respondents are from the Category of yes (56%)
- Here, the Majority of Respondents are from the Category of yes (79%)
- Here, the Majority of Respondents are from the Category of yes (95%)
- Here, the Majority of Respondents are from the Category of yes (87%)
- Here, the Majority of Respondents are from the Category of Strongly Agree (41%)
- Here, the Majority of Respondents are from the Category of yes (76%)

Jenenee and Usha

Suggestion

- To keep employees motivated and efficient on their work, pay employees on time every time
- Using software for payroll helps by creating multiple pay slabs for your staff, leads, and managers.
- Automatic payroll calculation in a few clicks and automatically generate a pay slip online with a thorough breakdown of taxes, allowances, and deductions.
- Transfer employees' salaries directly to their bank accounts with timely online transfers and readily available bank advice.

CONCLUSION

Based on many summaries from previous chapters, certain conclusions can be drawn relating to the payroll processing in Aavin. The general conclusion is more emphasized in the wide description of the company. Based on many summaries from the previous chapters, Aavin is a company that is engaged in Mining. The company's activities consist of mining and electric utility. It set its departmentalization based on its function. The overall Aavin system is perfect. The company is quite profitable. Policies and procedures that Aavin Limited uses are good. The company has never gotten any complaints from the employees and labourers about the management's payroll process. "Payroll Management System" software developed for a company has been designed to achieve maximum efficiency and reduce the time needed to handle payroll activity. It is intended to replace an existing manual record system, reducing the time required to calculate and store data. The system is strong enough to withstand regressive daily operations under conditions where the database is maintained and cleared over a specific period. Implementing the system in the organization will considerably reduce data entry and time and provide readily calculated reports.

ABSTRACT

Low back pain is a common healthcare problem existing in the Society. It is often associated with Pain, Disability and Kinesiophobia. TLF dysfunction is a common aetiology of low back pain. Fascia release technique is beneficial in reducing pain and disability in chronic low back pain patients. There is paucity of research to find the influence of fascia release on Kinesiophobia. The aim of this study is to find the impact of thoracolumbar fascia (TLF) release technique on Kinesiophobia, Pain and Disability chronic non-specific low back pain (CNLBP). In this research, total number of 268 patients with non-specific low back pain and Kinesiophobia were randomly divided into two groups. Group A (n=134) received TLF release with motor control exercises (MCE) and neuromuscular electrical stimulation (NMES). And Group B (n=134) received only MCE and NMES. Duration of treatment was for two weeks. Outcome measures and tools considered were pain (NPRS scale), kinesiophobia (TAMPA scale), and disability (ODI scale). Results declared by statistical analysis using paired t-test and ANOVA that there were significant improvements in all outcome measures for both groups ($p < 0.001$). Group A showed better results compared to Group B. The mean improvement was found to be VAS score was -3.66 ± 0.80 for Group A and -2.23 ± 0.73 for Group B. TAMPA score improved by -10.16 ± 3.28 in Group A and -5.95 ± 3.31 in Group B. ODI improved by -11.93 ± 4.34 in Group A and -7.13 ± 4.36 in Group B. The study concludes that integrating TLF release with other interventions reduces Kinesiophobia in chronic low back pain patients. Clinicians can now formulate target-based protocols safely to treat Kinesiophobia in low back pain considering the role of TLF.

INTRODUCTION

Overview

Low back pain (LBP) is the most prevalent musculoskeletal disorder, affecting individuals across all socioeconomic group of people globally. Among individuals over 45years of age, LBP is the primary cause of exclusion from work.[1] Low back pain without any known aetiology is non-specific low back pain and is the most common form of pain.[2] Pain in the lower back persisting for more than 3 months is chronic pain.[3]Occurrence of LBP is affected by various elements related to biology and social conditions.[4]

Kinesiophobia

Apart from other factors, chronic low back pain is also affected by psychological factors such as cognitions, emotions and Kinesiophobia. [5]Kinesiophobia can be defined as intense fear of movement [6]often showing signs of excessive negative reaction to actual pain. This phenomenon is known as pain catastrophising. Kinesiophobia restricts from performing movement and physical activities as there is increased fear of reinjury. [5,7]This perception of pain refrains individuals from participating in physical and social activities and in due course of time leads to disability. [5]It not only impacts physical health but also affects psychological state resulting in depression and anxiety.[8] It is reported that patients with chronic non-specific low back pain have higher levels of Kinesiophobia.[9] Therefore, in clinical practice, the treatment of Kinesiophobia should be incorporated into the process of rehabilitation of chronic LBP for better results. After discussing the significant impact of psychological factors like Kinesiophobia on chronic low back pain there comes the need to analyse various treatment approaches for the same. Various physical therapy interventions have given beneficial results. The current research focusses on the effectiveness of myofascial release therapy on non-specific chronic low back pain. [10,11]This release technique has shown promising results in improving both physical and psychological outcomes of chronic low back pain.

Thoracolumbar Fascia Release Technique

This technique is directly applied on the fascia over the lumbar area. It is a short duration continuous stretch to releases pressure on the deep fascia and connective tissue and restores movement. MFR technique also relaxes the mechanoreceptors that causes pain and discomfort. [12] Studies reveal that fascia release technique reduces pain and increases functional mobility, by applying low load and long duration stretch to the fascia. [13] The current study clearly highlights that fascia release technique focuses on fascial manipulation for treating low back pain and improve mobility. There are also other treatment approaches that target various factors of spinal structures. Recent studies states that one complementary treatment is Motor Control Exercises (MCE) that shifts the focus from manipulation to muscular stabilization. The shift from manipulation technique to motor control exercises clearly indicates that low back pain treatment emphasizes on both soft tissue restrictions and neuromuscular control in framing a tailored rehabilitation protocol.

Motor Control Exercises

These exercises proven for coordination and control of the spine and pelvic muscles.[14] MCE is mainly designed targeting isolated contraction of Transversus abdominis (TA)and multifidus, the muscles mainly responsible for stability of the spine. [15] It has been observed that Motor Control Exercises (MCE) have also demonstrated effectiveness in reducing pain and disability in patients with non-specific chronic low back pain. [16] Another treatment approach to addressing low back pain is “Neuromuscular Electrical Stimulation (NMES)

(NMES)

Studies have revealed that patients with recurrent LBP have lumbar multifidus activation deficits. [17,18] In active voluntary contraction, if not all the motor units of the LM are recruited, it causes recurrent low back pain. NMES

**Ankita Kalita and Dapkupar Wankhar**

have positive effects on improving muscle functions in Chronic LBP patients.[19] Current literature reveals that fascia release technique have benefitted results in the management of pain and disability. There is lack of studies to find the influence of these techniques on Kinesiophobia. Hence, this study hypothesizes that could thoracolumbar release technique significantly reduce Kinesiophobia.

Literature Review**Chronic low Back Pain**

Prevalence of acute LBP over an individual's lifetime stands at 84%, and chronic LBP at 23%. [20] In work environment, LBP leads to disability due to injuries caused in work place, reduces work productivity and is an economic burden for the current population.[21] LBP limits functional activities in older adult population and causes disability in adults of 60 years and above. [22] Research reveals that females have higher prevalence of LBP than men. [23] Studies highlights that chronic LBP is associated with altered thoracolumbar fascia mechanics and reduced trunk flexibility. There appeared reduced shear strain of the fascia causing changes in movement pattern of the connective layers.[24] Findings reveal that alteration in the fascial structure activates mechanoreceptors causing pain and hampers movement, causing dysfunction of TLF.[25] This dysfunction in TLF results in lack of mobility and restriction in performing physical exercises. In the long run the physical condition deteriorates ultimately causing disability. [26] TLF dysfunction plays a major role in the contribution of low back pain.[27] As TLF is composed of layers of connective tissue, degenerative changes results in adhesions and fibrosis within the layers causing low back pain, associated with Kinesiophobia.[25] Understanding these mechanisms is important for developing treatment approaches that addresses fascial components, particularly the TLF, in managing Kinesiophobia. Research suggests broad management strategies for treating low back pain that includes pharmacological and non-pharmacological agents. Among non-pharmacological agents such as patient education, physical therapy, psychological therapy, electrotherapy, exercises, dry needling and manual therapy have proved effectiveness in management of low back pain. [28], [29], [30]. Management of the associated factors are also recommended to be highly beneficial in this process.

Evaluation of Kinesiophobia

The exaggerated sensation of pain and potential fear of pain plays a crucial role in the management of chronic low back pain. Assessment and management of Kinesiophobia is important in the rehabilitation of LBP. [31] It can be assessed using TAMPA scale, which shows strong validity and reliability It is a 17-item questionnaire that is widely used to check the presence and rate of Kinesiophobia in low back pain. [32]

Fascia Release Technique

Manual therapies break down tissue adhesions and improve circulation.[33] Recent researches have confirmed the presence of Hyaluronan (HA) in fascia which promotes gliding and allows normal functional movement between the deeper layers of fascia and muscles. Changes in the concentration of HA and its viscoelastic properties affects the sliding function and results in myofascial pain.[34] Several studies have confirmed that lack of mobility reduces gliding of the fascial layers and is presented as stiffness.[35] Hence the patient suffers from functional disability.

The MFR technique has shown significant results in the field of pain management and treatment of various conditions.[36] Several studies have demonstrated its effectiveness in reducing pain and improving functional capacity. [37] The techniques potential to reduce discomfort and improve mobility concentrates on its focus to release tension on the connective tissue. This potential benefits of MFR proves it to be an effective intervention in treating chronic low back pain and mobility enhancement. Even single set of an isolated MFR sessions improves pain intensity, reduces level of disability and increases lumbar range of motion. [38] Further, research indicates that benefit of MFR is amplified when combined with other means of therapeutic interventions. It has been demonstrated that MFR can give better results when given with physical therapy and exercise therapy individually, serving as beneficial supplementary treatment. [39] The adaptability of MFR both as an individual therapy and combined treatment has highlighted its potential advantages in improving patient outcomes in clinical settings.

**Ankita Kalita and Dapkupar Wankhar****Motor control exercises**

MCE also known as core stabilization exercises have significant effect on reducing non-specific chronic low back pain. These exercises work by targeting specific muscle groups to improve neuromuscular control and enhance functional outcome. MCE retrains the targeted muscles to work more efficiently and set coordination with other trunk muscles to bring restore proper movement pattern and improve quality of life. Research reveals these exercises reduce excessive load on the spine. Beyond musculoskeletal benefits, MCE can also improve proprioception and even remap the brain.[40] Research has demonstrated that MCE when incorporated with tailored rehabilitation protocol yields better results that can be practiced in a holistic approach of treating non- specific chronic low back pain. A systematic review and meta-analysis confirmed that MCE is more effective than general exercises in reducing pain and disability for both short- and long-term duration. [41]

Combined treatment approaches for chronic low back pain

Some studies have suggested that MCE alone is not sufficient for LM activation. Thus, the combined treatment of MCE and NMES has resulted in improved activation of LM fibres.[42] Therefore, this study is conducted to find the combined effect of fascia release technique, MCE and NMES on Kinesiophobia, along with pain and disability.

Technique of Application**MFR**

The fascia release technique began with the patient seated. The therapist then applied a manual release using a defined pressure and motion pattern to target the thoracolumbar fascia for 90 seconds. The therapist used his metacarpophalangeal joints to stretch the lumbar fascia from the mid thoracic till the pelvis. This was done for 5 times. After that the patient bent forwards while placing his elbows on knees. The therapist applied pressure with his fingertips on the Thoracolumbar fascia and Quadratus Lumborum muscle at three positions after 30 seconds of rest period. At first step the patient was made to bent forward while performing the manoeuvre, at second step the patient bent forward and also turned to the right. And at last step patient bent forward while turning left. This process was repeated five times, each lasting 90 s. The total time was 45 min. [43]

Motor Control Exercises

Patient was in quadruped position. The hands and legs were shoulder or hip wide apart, and the knees were flexed to 90-degree flexion. The therapist began the session by placing the lower back and pelvis in a neutral position. Therapist palpates ASIS and PSIS of the patient with his hands and asked the patient to rock backward until the pelvis moved posteriorly. The therapist felt the front and back of the pelvis and asked the patient to rock backward until the pelvis moved back. The therapist watched the pelvis move back and gave verbal instructions. Rocking backward increased knee flexion, improving control of the lower back muscle. This was done 15 times for one set. Patients did 8 to 12 sets. This exercise lasted 30 minutes with a one-minute rest. [42]

Neuromuscular Electrical Stimulation:[42]

The Lumbar Multifidus muscle of the patients was stimulated using Electrical muscle stimulator. The electrodes were placed on the lumbar area, at L3 and L5 levels 3cm laterally from the vertebra. The intensity was progressively increased till a point when muscle contraction was observed. The other parameters were set as previously described [39] Frequency: 20–50 pulses per second, pulse duration:200–300 μ s, ON: OFF time was set at a 1:3 ratio.

METHODOLOGY**Design overview**

Is an interventional study with simple random classification.

**Ankita Kalita and Dapkupar Wankhar****Study settings**

The study was conducted in Physiotherapy department of Jorhat Medical College and Hospital, located in Assam. A total sample of 268 patients, including both males and females, participated in the study. Individuals age between 18–65 years old were included with non-specific chronic low back pain were included. And those with Kinesiophobia were considered. Those with Back pain related to infection, cancer, fracture, visceral disease, spondylarthrosis, disc herniation or cauda equina syndrome were excluded from the study. Also, with previous history of spinal pain, surgical intervention, cognitive impairment, nerve root compromise and current pregnancy.

Randomization

Patients were randomly divided into two groups using simple random technique Group A (134 participants) and Group B (134 participants).

Method

In Group A patients received thoracolumbar fascia release in addition to Motor Control Exercises (MCE) and Neuromuscular Electrical Stimulation (NMES). The treatment lasted for two weeks. Group B received only MCE and NMES. Upon completion of the two-week period, statistical analysis was conducted using the Paired t-test and ANOVA.

Outcome Measures and Tools

The outcome measures were pain, Kinesiophobia, and disability. These measures were evaluated using the NPRS scale, TAMPA scale, and ODI scale, respectively. This allows for a focused examination of the treatment's effects in the current research.

RESULT

In the current study. Statistical analysis was done using SPSS software and Paired t Test. The Table No. 1 and Figure No. 1 represents the age wise distribution of the study participants in two groups. In the present study a total of 268 individuals are considered. It may be observed from the above table and figure that the mean age of the study participants in the Group A and Group B are 41.5 ± 9.8 years and 44.3 ± 7.9 years respectively. In Group A and B, the age ranged from 19 to 65 years and 21 to 65 years respectively. Using Chi Square test, statistically no significant difference is observed in the gender wise distribution of the study participants in two groups ($p > 0.05$). The Table No.3 and Figure no.4 represents the comparison of pre and post-test outcome measures among patients in Group A. The Table No.4 and Figure no.5 represents the comparison of pre and post-test outcome measures among patients in Group B. Our analysis demonstrates significant findings that patients in Group A experienced significantly better outcomes than those in Group B. A total of 268 patients participated in the study. The analysis was done based on the outcome measures of Pain assessed with VAS scale, Kinesiophobia with Tampa Scale and Disability with ODI between Groups A and B. Table 3 and Fig 4 shows the result of pre and post intervention analysis of Pain, Kinesiophobia and Disability in Group A. VAS score is 5.62 ± 1.27 and 1.96 ± 1.00 , TAMPA score is 42.37 ± 4.63 and 32.22 ± 2.15 , ODI is 24.5 ± 6.95 and 12.61 ± 4.30 respectively. Table 4 and Fig 5 shows the result of pre and post intervention analysis of the same outcome measures in Group B. VAS score is 5.63 ± 1.18 and 3.40 ± 1.041 , TAMPA score is 42.23 ± 4.403 and 36.28 ± 1.983 , ODI is 24.61 ± 6.141 and 17.48 ± 2.6 respectively with $P < 0.001$. In Table 5 and Fig 6 shows the comparison between the groups A and B where it clearly signifies that Group A is more effective than Group B. This statistical analysis was done using Paired t test and ANOVA. The pre- and post-test differences in all outcome measures were highly statistically significant ($p < 0.001$).

DISCUSSION

The current study found that the TLF release technique had a positive effect in reducing Kinesiophobia. By applying pressure to elongate and stretch tight fascia, the technique releases tension on nociceptors and thus reduces pain

**Ankita Kalita and Dapkupar Wankhar**

intensity. This reduction in pain, added with improved functional movement and core muscle stabilization, positively uplifts patients' mental state and quality of life. Consequently, patients experience a decrease in their negative perception of pain and fear of movement, leading to reduced levels of Kinesiophobia. This results in performing better physical activity for improving stability and strength. While MCE and NMES alone showed some benefits in the control group, the addition of TLF release technique significantly enhances the outcomes. MCE and NMES likely contributed to improved core muscle activation and overall strength, but the TLF release technique addressed the fascial restrictions that may have been limiting the effectiveness of these interventions. The combination of these approaches appears to create a synergistic effect, leading to better overall outcomes in pain reduction, functional improvement, and decreased Kinesiophobia. Tamartash H et al, in his study significantly reported that MFR treatment can reduce lumbar muscle thickness and low back pain. [43] Lumbar muscle thickness was tested with ultrasound, and a decrease in thickness after MFR and reduced pain intensity were reported. Ozóg P et al, revealed that a single session of MFR can reduce resting activity of multifidus and erector spinae muscles in cases of chronic low back pain. The results were analysed immediately after the treatment session and one month after the intervention to see the lasting effect. However, there was no difference, suggesting that the effect lasted for long. [38] Bhosale SV et al. reported that MFR treatment when combined with other manual therapy techniques such as muscle energy technique and stretching of the Quadratus Lumborum showed positive results in reducing pain, disability, and increased lumbar range of motion. The pre- and post-test analyses showed that the mean lumbar range values increased significantly. [44] Bhat PV *et al.* stated that MFR along with other exercises showed improvement in terms of pain, restricted function, and disability related to chronic nonspecific low back pain.

Pain was assessed using VAS, Disability with ODI and Functional ability with PSFS and lumbar flexion ROM. [45]Taise BA et al. reported that MFR combined with spinal manipulation was not more effective than spinal manipulation alone in CNLBP. [46] Thus, MFR depends on many other factors, such as the technique and site of application. In a systematic review by Wu *et al.*, only MFR treatment was found to be effective in improving pain and physical function but had no effect on improving balance function, pain pressure threshold, trunk mobility, mental health, and quality of life. This may be due to limited number of literatures that were included in the study.[47] The current findings reveal the importance of addressing fascial restrictions in the management of CNLBP. The TLF release technique offers a non-invasive, manual therapy approach that can effectively complement existing treatment modalities. Breakage of adhesions and fibrosis between muscles and deep fascia, increasing hyaluronic acid (HA) mobility, and improving fascial gliding, this technique addresses multiple aspects of CNLBP pathology. This results in improvements in lumbar range of motion, core muscle stabilization, and overall functional movement that contributes to a comprehensive approach to CNLBP management. In conclusion, the integration of TLF release technique with MCE and NMES presents a promising approach for managing CNLBP. This brings not only the physical aspects of the condition but also psychological factors, such as Kinesiophobia.

Future Recommendations

In the current study, the measures were analysed two weeks after the intervention program and did not show any results on the long-term effect of fascia release on Pain, Kinesiophobia and Disability. So future researches are recommended to see results of the long term follow up effect of these measures on low back pain patients. Future recommendations can also include application of different frequencies of TLF technique or TLF compared with other electrotherapeutic modalities can be seen in future. The conclusion of the study reveals the effects of the thoracolumbar fascia release technique in improving non-specific chronic low back pain, Kinesiophobia, and disability. This study proves the distinguished evidence for combining both treatment strategies of Motor control exercises and neuromuscular electrical stimulation (NMES) that could be used in clinical application for treating low back pain. The fascial release technique improved fascial tissue mobility and reduced inflammatory markers. Overall, the combined approach could potentially increase patients' mobility and reduce pain perception that resulted in reduced Kinesiophobia. Patients became more confident in performing the activities and could better adhere to the treatment plan. Further the conclusion highlighted the importance of focussing TLF dysfunction in cases of non-specific chronic low back pain. By addressing TLF release technique patients' stiffness of the lumbar muscles was reduced and patient performed better exercises to improve trunk stability. This resulted in a positive outcome in both

**Ankita Kalita and Dapkupar Wankhar**

physical and psychological components of chronic low back pain patients. Current findings influence the clinicians to include fascial release techniques to formulate and integrate into rehabilitation protocol along with existing evidence-based interventions for low back pain. Moreover, the treatment of the current research diminishes the usage of other modalities and pharmacological substances. This emphasizes the need for a holistic approach to low back pain management, that targets not only physical symptoms but also psychosocial factors such as Kinesiophobia. Therapists can now educate the patients about the benefits of fascia release techniques in relieving Kinesiophobia and encourage them to adhere to the treatment protocol with a positive mindset.

ACKNOWLEDGEMENT

The authors would like to thank the corresponding author Dr. Dapkupar Wankhar (PhD) Dean of Paramedical Sciences of Assam downtown University for his support and guidance throughout the study.

ABSTRACT

The intricate process of total coloring a graph $G = (V, E)$ involves the refined assignment of colors to its vertices and edges, ensuring that no neighboring vertices share a color, nor do neighboring edges. Moreover, the colors chosen for the end-points of any edge must be different from the color of the edge itself. The total chromatic number of a graph G , symbolized as $\chi''(G)$, indicates a minimal set of colors sufficient to get a proper total coloring. The conjecture posited by the esteemed mathematicians Behzad and Vizing asserts that for any graph G , the inequality $\Delta(G) + 1 \leq \chi''(G) \leq \Delta(G) + 2$ holds true, where $\Delta(G)$ signifies the graph's maximum degree. If the total chromatic number is $\Delta(G) + 1$, the graph is termed *Type - 1*. In this research, we put forth that odd complete graphs of even line graphs $\mathcal{L}(\mathcal{K}_n)$, where $n=2p+1$ and $p \geq 2$ (with p being even), possess a total coloring requiring $\Delta(\mathcal{L}(\mathcal{K}_n)) + 1$ colors.

2020 Mathematics Subject Classification: 05C15, 05C70, 05C76

Keywords: Total coloring; total coloring conjecture; complete graphs; line graphs.

INTRODUCTION

Envision the graph $G = (\mathcal{V}, \mathcal{E})$, as a distinctly correlated graph. The κ - vertex coloring of G is determined by the assignation of κ colors to its vertices. This ensures that neighboring vertices do not have the same color. Similar to the preceding case, the κ -edge coloring of G requires assigning κ colors to the edges, with the restriction that neighboring edges must be colored in a way that is distinguishable from one another. The minimal value of κ , that allows a legitimate κ -edge coloring of the structure G has been indicated to as the edge chromatic value of G , signified as $\chi'(G)$. Vizing's theorem delineates the relation between $\chi'(G)$, and the highest vertex degree $\Delta(G)$ of a graph is asserting that $\Delta(G) \leq \chi'(G) \leq \Delta(G) + 1$. If $\chi'(G) = \Delta(G)$, the graph requires only as many colors as its maximum degree for edge coloring, called Class-1 graphs. If so, $\chi'(G) = \Delta(G) + 1$, the graph requires one additional color beyond its maximum degree, which is characteristic of Class-2 graphs. A total coloring for the graph G is encapsulated by a function $\varphi: \mathcal{T} \rightarrow \Psi$, where $\mathcal{T} = \mathcal{V}(G) \cup \mathcal{E}(G)$ and Ψ is a distinguished assortment of colors that satisfy the established criteria.

- The function φ demonstrates unique values for each pair of neighboring vertices $a, b \in \mathcal{V}(G)$, thereby ensuring that $\varphi(a) \neq \varphi(b)$.
- The function φ , applied to any two neighboring edges $e_1, e_2 \in \mathcal{E}(G)$, yields result that are distinct, thereby affirming that $\varphi(e_1) \neq \varphi(e_2)$.
- The function $\varphi(a)$ is distinctly different from $\varphi(e)$, as it pertains to each edge in the ensemble $\mathcal{E}(G)$ that corresponds to any vertex $a \in \mathcal{V}(G)$.

The total chromatic number, symbolized $\chi_{\mathcal{T}}(G)$ is the least natural number κ that enables the graph G to be adorned with a κ -total coloring. The profound Total Coloring Conjecture has been substantiated for complete graphs and complete multipartite graphs as articulated by the distinguished works of Behzad et al. [2] and Yap et al. [12]. It is abundantly clear that the total chromatic value $\chi_{\mathcal{T}}(G) \geq \Delta(G) + 1$. In instances where $\chi_{\mathcal{T}}(G) = \Delta(G) + 1$, G is classified as a *Type – 1* graph. In contrast, should $\chi_{\mathcal{T}}(G) = \Delta(G) + 2$, G is categorized as a *Type – 2* graph. McDiarmind and Sánchez-Arroyo [7] made a pivotal discovery in 1989 establishing that the calculation of the total chromatic number for any arbitrary graph is an \mathcal{NP} -hard problem. This intricate nature of the problem extends to line graphs, where the determination of the total chromatic number in total coloring remains equally \mathcal{NP} -hard. Line graphs have an intriguing history. Harary and Norman [4] introduced the term "line graph" in 1960, heralding its significant influence across diverse fields. These sophisticated mathematical entities have since become indispensable in cutting-edge domain such as quantum computing, bioinformatics, and the ever-evolving stock market. Despite the extensive inquiries and remarkable advancements made in comprehending the various dimensions of line graphs, the discipline remains rife with unanswered questions, presenting a promising avenue for further investigation. In a remarkable contribution, Vignesh et al. proposed the intriguing hypothesis that all line graphs $\mathcal{L}(\mathcal{K}_n)$ inherently embody the characteristic of *Type – 1*, delving into this enthralling subject.

In this treatise, we unveil substantial evidence that supports the conjecture set forth by Vignesh et al. [10] in 2018, which asserts that all line graphs of complete graphs, $\mathcal{L}(\mathcal{K}_n)$, belong to *Type – 1*. We establish that for odd line graphs of odd complete graphs $\mathcal{L}(\mathcal{K}_n)$, specifically when $n=2p+1$ and p is even integer with $p \geq 2$, a total coloring can be accomplished with $\Delta(\mathcal{L}(\mathcal{K}_n)) + 1$ colors. This finding further substantiates the thesis proved by Luerbio et al. [6] that all line graphs $\mathcal{L}(\mathcal{K}_n)$ exhibit conformability. It is worth noting that, the instance of $\mathcal{L}(\mathcal{K}_3) \cong \mathcal{K}_3$ stands as a trivial case of *Type – 1* graphs.

PRELIMINARIES

Definition 2.1

Color Class A color class refers to the set of all vertices or edges that are assigned the same color in a proper coloring of a graph. The elements within a color class are structured such that they do not violate the coloring constraints.

Thatchayani et al.,

Definition 2.2

Vertex Coloring In an acceptable vertex coloring of a graph $G = (\mathcal{V}, \mathcal{E})$: A color class is a subset of vertices $\mathcal{V}_i \subseteq \mathcal{V}$ such that all vertices in \mathcal{V}_i share the same color, and no two vertices in \mathcal{V}_i are adjacent. Thus, \mathcal{V}_i forms an independent set in G .

Definition 2.3

Edge Coloring In a well-defined edge coloring of a graph $G = (\mathcal{V}, \mathcal{E})$: A color class is a subset of edges $\mathcal{E}_i \subseteq \mathcal{E}$ such that all edges in \mathcal{E}_i share the same color, and no two vertices in \mathcal{E}_i are incident on the same vertex. Thus, \mathcal{E}_i forms a matching in G .

Definition 2.4

Chromatic number : The chromatic number of a graph G is denoted by $\chi(G)$, is the minimum number of distinct colors required to color the vertices of G . The total chromatic number of G is denoted by $\chi''(G)$.

Definition 2.5

Complete graph A graph $G = (\mathcal{V}, \mathcal{E})$ is categorized as complete graph if

- $|\mathcal{E}| = \binom{|\mathcal{V}|}{2}$,
- An edge is present for every combination of vertices.

Definition 2.6

Line graph The sophisticated structure of a line graph $\mathcal{L}(G)$, comprises a vertex for each edge found in the graph (G). In the set $\mathcal{L}(G)$, an edge is said to exist between two vertices if the edges that belong to those vertices in the set G converge at a common vertex. Consequently, edges e_1 and e_2 are deemed adjacent in $\mathcal{L}(G)$ if they intersect, indicating they share a vertex in G , as indicated by the condition $e_1 \cap e_2 \neq \emptyset$.

Conjecture 2.7 [1] The inequality $\Delta(G)+1 \leq \chi_T(G) \leq \Delta(G) + 2$ holds regardless of graphs G .

Conjecture 2.8 [11] For each complete graph \mathcal{K}_α , $\chi''(\mathcal{L}(\mathcal{K}_\alpha)) = 2\alpha-3$.

Conjecture 2.9 [6] In instances where i is an odd integer and $k \geq i$, then G is 1-factorable. Similarly, if i is even and $k \geq i-1$ then G is 1-factorable.

Proposition 2.10 [3] A graph G qualifies as Type – 1 when its chromatic number, $\chi_T(G) = \Delta(G) + 1$. It is classified as Type – 2, if $\chi_T(G) = \Delta(G) + 2$.

Theorem 2.11 [12] For any complete graph,

- (i) $\chi(K_m) = m$;
- (ii) $\chi'(K_m) = \begin{cases} m & \text{for odd } m \geq 3 \\ m - 1 & \text{for } m \text{ even;} \end{cases}$
- (iii) $\chi''(K_m) = \begin{cases} m & \text{for } m \text{ odd} \\ m + 1 & \text{for } m \text{ even.} \end{cases}$

Theorem 2.12 [6] Let G be defined as a k -regular graph. Should G be classified as class-1, it implies that the line graph $\mathcal{L}(G)$ possesses the property of conformability.

Lemma 2.13 [6] In the case where G is a regular graph with degree t , it follows that the line graph $\mathcal{L}(G)$ will be regular with a degree of $2t-2$.

Thatchayani et al.,

MAIN RESULTS AND DISCUSSION

In this segment, we embark on an exploration of a recursive methodology to construct $\mathcal{L}(\mathcal{K}_n)$. The complete graph is represented as \mathcal{K}_n , characterized by its vertex set $\{v_0, v_1, \dots, v_{n-1}\}$. The edges of \mathcal{K}_n , represented as $\{e_0, e_1, \dots, e_{n-1}\}$, constitute the vertices of $\mathcal{L}(\mathcal{K}_n)$. A connection is established between two vertices in $\mathcal{L}(\mathcal{K}_n)$ if their corresponding edges in \mathcal{K}_n converge at a common vertex. For instance, if edges e_0 and e_1 in \mathcal{K}_n converge at vertex $v_{m,n}$, then the vertices in $\mathcal{L}(\mathcal{K}_n)$ corresponding to these edges are interconnected by an edge. We proceed to add edges between the vertices of $\mathcal{L}(\mathcal{K}_n)$ in accordance with the adjacency rule. The line graph $\mathcal{L}(\mathcal{K}_n)$ derived from the complete graph \mathcal{K}_n will be a strongly connected graph, reflecting the underlying structure of \mathcal{K}_n . Our focus in this section is to demonstrate that even line graphs of odd complete graphs are classified as *Type – 1* graphs, and notably, they possess $\Delta + 1$ colors.

Theorem 3.1 For the line graph $\mathcal{L}(\mathcal{K}_n)$ of the complete graph (\mathcal{K}_n) , when $n=2p + 1$, $p \geq 2$ and p is an even integer, $\mathcal{L}(\mathcal{K}_n)$ is Type-I graph. Then its total chromatic number is $\Delta(\mathcal{L}(\mathcal{K}_n)) + 1$.

Proof Let \mathcal{K}_n represent a complete graph, characterized by its vertex set $\{V_i \mid 0 \leq i \leq n - 1\}$, where each vertex is exquisitely interconnected with every other vertex. The line graph derived from this complete graph, referred to as $\mathcal{L}(\mathcal{K}_n)$, exhibits a striking regularity. In the formation of the line graph $\mathcal{L}(\mathcal{K}_n)$, n signifies the total number of vertices present in the complete graph. The newly formed vertices are articulated as $\{V_i V_{[i+j]} \mid 0 \leq i \leq n - 1, 1 \leq j \leq \frac{n-1}{2}\} \pmod{n}$. The total number of vertices in $\mathcal{L}(\mathcal{K}_n)$ can be determined as $\mathcal{V}(\mathcal{L}(\mathcal{K}_n)) = \binom{n}{2}$, while the number of edges is given by $\mathcal{E}(\mathcal{L}(\mathcal{K}_n)) = \binom{n}{2}(n - 2)$. Each vertex in $\mathcal{L}(\mathcal{K}_n)$ corresponds to an edge in \mathcal{K}_n , and two vertices in the line graph are interconnected if their corresponding edges in the complete graph share a common vertex. If $\Delta(\mathcal{K}_n) = n - 1$, then the degree of a vertex in the line graph is $\Delta(\mathcal{L}(\mathcal{K}_n)) = 2(n - 2)$, where Δ signifies the maximum degree within the graph.

In this analysis, explores the complexities of the graph characterized by the equation $n=2p + 1$, where p is an even integer. This configuration results in $\mathcal{L}(\mathcal{K}_n)$ containing an even number of vertices and edges when p is an even integer. We proceed to define a total coloring function $\varphi: \mathcal{L} \rightarrow \mathcal{C}$, with \mathcal{L} encompassing both the vertices $\mathcal{V}(\mathcal{L}(\mathcal{K}_n))$ and the edges $\mathcal{E}(\mathcal{L}(\mathcal{K}_n))$. Initially, the edges of $\mathcal{L}(\mathcal{K}_n)$ are assigned colors from a color class of n distinct colors. Let \mathcal{C} represent the set of colors, where \mathcal{L}_c consists of $\Delta + 1$ colors. We subsequently execute the total coloring on the even line graph of the odd complete graph as follows: For the range $0 \leq c \leq n - 1$, \mathcal{L}_c is formulated as $\mathcal{L}_c = \{p_{[\alpha+c],[\alpha+\beta+c]}, q_{[n-\alpha-\beta+c],[\alpha+c]}\}$, with the stipulations $0 \leq \alpha \leq \frac{(n-1)}{2}$ and $1 \leq \beta \leq \frac{(n-1)}{2}$, while the indices of the vertices are interpreted modulo n .

The pertinence of this technique can be aptly illustrated through the following discussion points

- \mathcal{L}_c is the set of edges colored with color c .
- The points p and q serve as the terminal ends of each edge.
- $\mathcal{L}_c = \{p_{[\alpha+c],[\alpha+\beta+c]}, q_{[\alpha+\beta+c],[n-\alpha+c]}\} \pmod{n}$
- The vertices that lie perpendicularly between points p and q are unconnected, while also demonstrating the same color parity.
- Establish points p and q on opposite sides of the perpendicular vertices, making certain that they do not occupy vertices that are adjacent to one another.

In cases where neighboring vertices share the same color, it is essential to revise the formulas accordingly. In relation to these particular points, we utilize the equation $\mathcal{L}_c = \{p_{[n-a+c],[a+b+c]}, q_{[n-a-b+c],[n-a+c]}\} \pmod{n}$ through the technique of perfect matching. Here we can see that, $[a + c] = [a + \beta + c]$ or $[a + \beta + c] = [n - \alpha + c]$. In the event that the vertex indices exhibit identical values, we can utilize the formula $\mathcal{L}_c = \{p_{[n-a+c],[a+b+c]}\} \cup \{q_{[n-a-b+c],[n-a+c]}\} \pmod{n}$ to assign colors to the remaining edges. In this case, 'a' denotes the number of uncolored α values, and 'b'

Thatchayani et al.,

indicates the number of uncolored β values, with both α and β taken from the mostrecent α value. The comprehensive calculation encompasses the missing α values, while the absent β values are assessed separately for each α . Consequently, \mathcal{L}_c is identified as a perfect matching in $\mathcal{L}(\mathcal{K}_n)$.

Illustration 3.2 The visual representation in Figure 1 highlights the selection of n colors of \mathcal{L}_c that pertain to $\mathcal{L}(\mathcal{K}_9)$.

The subsequent step involves the identification of remaining $n - 3$ color classes, each of which will be designated a unique color. This assignment can be established through the computation $\mathcal{S}_{\varepsilon, \varepsilon'} \pmod n$. Initially, it is essential to analyze the indexes $\mathcal{S}_{\varepsilon, \varepsilon'}$ as illustrated in Figure 2. In Figure 2(a), the criteria for the set $\{(\varepsilon, \varepsilon') | \varepsilon = 0, 1 \leq \varepsilon' \leq \frac{n-1}{2}\}$ are exquisitely illustrated, structured into $\frac{n-3}{2}$ rows. The perfect matching technique emerge as a pivotal approach for color assignment to the edges of an even line graph derived from an odd complete graph, adhering to a specific pattern. Subsequently, the remaining edges are colored according to the relation $\mathcal{L}_c = \mathcal{S}_{[\varepsilon, \varepsilon']}, \mathcal{S}_{[\varepsilon, \varepsilon'+i]} \pmod n$, which must comply with the constraints $\varepsilon = 0, 1 \leq \varepsilon' \leq \frac{(n-1)}{4}$ and $i = \varepsilon', \varepsilon' + 1, \varepsilon' + 2, \dots$. Should the sum of the indexes exceed $\frac{n-1}{2}$, we adapt ε' and continue the computation, until the process is complete. Then remaining uncolored indexes of $\mathcal{S}_{\varepsilon, \varepsilon'}$ are consequently connected by an edge using a 1-factor. In Figure 2(b), we enhance the values of ε and ε' by $n - 1$ times.

Illustration 3.3 The visual representation in Figure 2 highlights the selection of $n - 3$ colors to $\mathcal{S}_{\varepsilon, \varepsilon'}$ that pertain to $\mathcal{L}(\mathcal{K}_9)$ for $1 \leq \varepsilon' \leq \frac{n-1}{2}$.

At this juncture, we must proceed to color the uncolored edges by leveraging the indices $\mathcal{S}_{\varepsilon, \varepsilon'}$ in a meticulous manner: As depicted in Figure 3(a), we delve into the expression $\{(\varepsilon, \varepsilon') | \varepsilon' = 1, n \leq \varepsilon \leq \frac{n+3}{2}\}$. This is structured into $\frac{n-3}{2}$ rows. Following this stage, the remaining edges are colored according to the relation $\mathcal{L}_c = \mathcal{S}_{[\varepsilon, \varepsilon']}, \mathcal{S}_{[\varepsilon-1, \varepsilon']} \pmod n$. This process must adhere to the stipulations $\varepsilon' = 1, n \leq \varepsilon \leq n - 1$, and $i = \varepsilon', \varepsilon' + 1, \varepsilon' + 2, \dots$, ensuring that the sum of the indices does not exceed $\frac{n-1}{2}$. Subsequently, the uncolored indices of $\mathcal{S}_{\varepsilon, \varepsilon'}$ are seamlessly connected through a 1-factor methodology, enhancing the overall structure and coherence of the graph. In Figure 3(b), we reduce the values of ε and ε' by $n - 1$ times.

Illustration 3.4 The visual representation in Figure 3 highlights the selection of $n - 3$ colors to $\mathcal{S}_{\varepsilon, \varepsilon'}$ that pertain to $\mathcal{L}(\mathcal{K}_9)$ for $n \leq \varepsilon \leq \frac{n+3}{2}$.

It is pertinent to mention that the criteria necessitate distinct color assignments for both adjacent vertices and the edges incident to the vertex, ensuring that no two connected elements are of the same color. Consequently, $\mathcal{L}(\mathcal{K}_n)$ is total colored with $\Delta + 1$ colors, which categorizes it as a *Type - 1* graphs.

CONCLUSION

This research elucidates that all line graphs of complete graphs $\mathcal{L}(\mathcal{K}_n)$, particularly for $n=2p+1$ and $p \geq 2$ (with p being even), necessitate a total coloring that requires $\Delta(\mathcal{L}(\mathcal{K}_n)) + 1$ colors. As depicted in Figure 3, the total coloring of $\mathcal{L}(\mathcal{K}_9)$ (where $p=4$) is designated as *Type - 1*. This revelation substantiates the theorem proposed by Luerbio Faria et al. [6], and we aspire to explore additional cases in depth. Furthermore, we validate the accuracy of the hypothesis proposed by Vignesh et al. [10] concerning the threshold for the total coloring of the line graph of the complete graph.

ABSTRACT

Cerebral palsy (CP), a prevalent cause of persistent motor impairments in children, was the focus of a single case study investigating the potential of a holistic Ayurvedic treatment approach.¹ This comprehensive protocol integrated traditional Panchakarma detoxification therapies alongside internal herbal medications in the management of a 5-year-old male child diagnosed with spastic quadriplegic cerebral palsy. To objectively assess the impact of the Ayurvedic interventions, clinicians utilized several standardized evaluation tools both before and after the treatment period. These scales included the Modified Ashworth Scale (MAS) to measure muscle spasticity, the Gross Motor Function Classification System (GMFCS) to categorize gross motor abilities, the Modified Rankin Scale (mRS) to assess overall disability, the Manual Ability Classification System (MACS) to evaluate hand function, and a Speech and Drooling Severity Scale to quantify speech difficulties and drooling. The observed improvements across a range of these standardized clinical assessments suggest a promising role for Ayurvedic interventions as a complementary strategy in addressing the multifaceted challenges of spastic CP. However, the authors emphasize that these findings from a single case necessitate further in-depth and rigorous scientific research to validate the efficacy of such Ayurvedic treatment protocols in a larger population of children with cerebral palsy

INTRODUCTION

Cerebral palsy (CP) represents a diverse group of persistent, non-progressive motor impairments stemming from developmental disturbances within the brain. The "Surveillance of Cerebral Palsy in Europe" (SCPE) defines CP as an overarching term encompassing disorders of movement and posture attributed to non-progressive abnormalities occurring in the developing brain [1]. Spastic cerebral palsy, the most frequently encountered subtype, is distinguished by heightened muscle tone, leading to stiffness and difficulties with voluntary movement. Current conventional management strategies for CP predominantly focus on alleviating symptoms through therapeutic interventions such as physiotherapy and occupational therapy, alongside pharmacological agents like botulinum toxin and muscle relaxants. While these approaches aim to improve functional abilities and manage associated symptoms, they often do not directly target the underlying neurological dysfunction. Ayurveda, a traditional and comprehensive system of medicine originating in India, offers an alternative and holistic approach to managing CP. This system posits that health is maintained by a dynamic equilibrium of fundamental bio-energies known as Doshas (Vata, Pitta, and Kapha). In the context of neurological disorders like CP, Ayurvedic principles emphasize the role of imbalances, particularly within Vata Dosha, which governs movement and the nervous system. Ayurvedic therapeutic strategies aim to restore this equilibrium and nourish the nervous system, with the potential to positively influence neuroplasticity and functional outcomes [2]. This single case study was undertaken to investigate the effects of a personalized Ayurvedic treatment protocol on a child diagnosed with spastic quadriplegic cerebral palsy, exploring its potential to complement conventional management approaches.

Ayurvedic Perspective On Neurological Disorders In Children

Within the framework of Ayurvedic medicine, neurological disorders, including those characterized by hypertonicity, are understood as manifestations of imbalances in the fundamental bio-energies, particularly Vata Dosha. Classical Ayurvedic texts employ specific terminologies such as Kubjata (deformity/contracture), Stabdhatta (stiffness/rigidity), and Kunitwa (abnormality of limbs) to describe the various clinical features associated with increased muscle tone and restricted movement. The pathogenesis of these conditions is believed to involve not only the Doshas but also the fundamental bodily tissues (Dhatus) such as muscle (Mamsa), fat (Medas), bone (Asthi), and nerve tissue/bone marrow (Majja), along with their respective subsidiary tissues (Upadhatus) like blood vessels (Sira) and ligaments/tendons (Snayu). This intricate interplay contributes to the diverse range of clinical presentations observed in neurological disorders, including Vaksanga (speech impairment), Akshepaka (convulsions), and Dourbalya (weakness) [2]. The primary therapeutic objective in Ayurvedic management of such conditions is the pacification of aggravated Vata Dosha (Vata Shamana). This is achieved through a multi-faceted approach encompassing specialized detoxification and rejuvenation procedures collectively known as Panchakarma. Additionally, internal medications categorized as intellect-promoting and neuroprotective agents (MedhyaRasayana) are administered to support cognitive function and nervous system health. Recognizing the head (Shira) as a critical center for neurological function and regulation, Ayurvedic treatment protocols often emphasize therapies directed towards this vital anatomical region to exert a more direct influence on the nervous system.

Case study

A 5-year-old male child, with a confirmed diagnosis of spastic quadriplegic cerebral palsy, was referred for evaluation of a comprehensive Ayurvedic treatment protocol. The patient exhibited significant motor and developmental delays evident since early childhood. At the time of presentation, the primary clinical manifestations included a complete inability to achieve independent standing or ambulation, severely limited and dysarthric speech, persistent excessive drooling, chronic constipation, and frequent involuntary tongue protrusion.

Anjali Parmar et al.,

History of present illness

The child was born from a non-consanguineous marriage via Lower Segment Cesarean Section (LSCS), due to non-progression and meconium-stained amniotic fluid, at the end of a full-term pregnancy, weighing 3.5 kg. The baby cried after providing advanced resuscitation for less than 1 min and had a hospital stay of 15 days due to the onset of neonatal sepsis. Parents noticed mild hypotonia and delay in developmental milestones at the age of 6 months, for which they took allopathic consultation and started physiotherapy, which was discontinued in between due to financial issues. Recently, for 2 months, they have restarted physiotherapy. Since then, they have continued treatment there. Now, at the age of 5 years, they sought further management at our hospital.

Developmental Milestones

Personal History

- Sleep
The child has restful sleep, with 2–3 hours during the daytime and 9–10 hours at night.
- Appetite
Appetite is satisfactory. The child is entirely dependent on assistance for feeding and consumes only semi-solid foods.
- Urination
Urinate approximately 8–9 times daily. Bladder control has not yet been established.
- stool
Passes hard stools every two days. Bowel control has not yet developed.

Anjali Parmar et al.,

Treatment History

- **Physiotherapy**

Physiotherapy was initiated at 3 years of age and continued for one and a half years. However, due to a lack of noticeable improvement, the therapy was discontinued.

Examination

- **Vital signs**

All vitals were within normal limits.

- **Systemic Examination**

- **Cardiovascular, Respiratory, and Abdominal Systems**

No structural abnormalities or deformities were noted.

Central Nervous System (CNS) Examination

- **Higher Mental Functions**

- **General Appearance** The child appeared calm and cooperative.

- **Behaviour** Displayed a pleasant demeanour and remained attentive.

- **Consciousness** Fully conscious and alert.

- **Delusions, Amnesia, Hallucinations, Illusions, Dementia**

Assessment could not be performed.

- **Sleep Pattern** Sleep is adequate and undisturbed.

- **Orientation:** The child is oriented to place and person.

- **Memory** Could not be evaluated.

- **Cognitive Ability** Assessment of intellectual functioning could not be performed.

- **Speech** The child speaks in bi-syllabic words, though speech clarity is reduced.

- **Voice Quality (Dysphonia)** No vocal abnormalities were detected.

- **Writing Ability (Dysgraphia)** Could not be evaluated.

- **Repetitive Speech (Echolalia)** Not present.

- **Gait Pattern** Walking is abnormal, characterized by a scissoring gait.

- **Motor System Assessment**

- **Muscle Tone**

Increased muscle tone was observed in both upper and lower limbs, with greater severity on the left side.

- **Deep Tendon Reflexes**

Reflex responses are heightened, graded at 3+.

- **Muscle Strength**

Muscle power in both lower limbs is moderately reduced, assessed at 3/5.

- **Investigation**

- **MRI Brain**

Imaging shows signal changes in the bilateral corona radiata and the periventricular white matter of the right occipital region. There is also significant thinning noted in the corpus callosum.

- **BERA**

Brainstem auditory pathways function normally, but a mild elevation in hearing thresholds is observed on both sides.

- **EEG**

The electroencephalogram is abnormal, indicating focal epileptiform discharges originating from the fronto-central and parietal areas on both hemispheres.

Anjali Parmar et al.,

Ayurvedic Intervention

Ayurvedic Assessment and Intervention

Based on Ayurvedic diagnostic principles, the child's clinical presentation was consistent with a significant aggravation of VataDosha (*VataPrakopa*) affecting the neurological and musculoskeletal systems. Consequently, a personalized and comprehensive Ayurvedic treatment protocol was implemented. The treatment regimen comprised a combination of external therapies, nasal administration of medication (*Nasya Karma*), therapeutic enemas (*Basti Therapy*), and internal herbal medications, tailored to the child's specific clinical features and individual constitution (*Prakriti*). The detailed components of the administered protocol are as follows

External Therapies

- **Udvaltana** Dry powder massage utilizing *Yava Kulattha Churna* (a formulation of barley and horse gram powders) was administered for a duration of 5 days. This therapy is traditionally indicated to reduce Kapha Dosha accumulation and enhance peripheral circulation.
- **Abhyanga followed by Nadi Sweda** Full-body oleation (*Abhyanga*) was performed daily for 7 days using *Bala Taila*, a classical Ayurvedic oil known for its Vata-pacifying and strengthening properties. This was immediately followed by *Nadi Sweda*, a localized steam therapy, to promote relaxation and further enhance the penetration of the medicated oil.

Nasya Karma (Nasal Administration)

- **Pradhamana Nasya** A higher dose nasal administration (*Pradhamana Nasya*) was performed in the morning using *ShuntiChoorna* (ginger powder) at a dosage of 35 mg for 7 days. This type of Nasya is intended to clear nasal passages and influence the central nervous system.
- **Pratimarsha Nasya** A low-dose daily nasal administration (*Pratimarsha Nasya*) was administered in the evening using *Panchendriyavardhana Taila*, a medicated oil formulated to strengthen the sensory organs, for 7 days.

Basti Therapy (Therapeutic Enemas)

- **Shodhana Basti** A cleansing enema (*Shodhana Basti*) was administered using 140 ml of *Dashamoola Kwath*, a decoction of ten roots known for their Vata-alleviating and anti-inflammatory properties. A single administration was performed.
- **Matra Basti** An oil enema (*Matra Basti*) was administered daily for 14 days using 15 ml of *Bala Taila*. This type of Basti is typically used for nourishing and Vata-pacifying effects.

The aforementioned sequence of external therapies, Nasya Karma, and Basti Therapy constituted one treatment session. A total of three such treatment sessions were conducted, with an intersession gap of 7 days to allow for the body's recuperation and to observe the effects of the interventions.

Internal Medications

- **Medhya Churna** A powdered herbal formulation (*Churna*) with intellect-promoting (*Medhya*) and neuroprotective (*Rasayana*) properties was administered orally. The administered dose was 3grams, taken twice daily after meals (*Pashchatbhakta*), along with honey (*Madhu*) as an adjuvant (*Sahapana*).

Throughout the Ayurvedic treatment protocol, the child's clinical condition was closely monitored for any changes and potential adverse effects by the Ayurvedic practitioners. Importantly, the child continued to receive conventional therapies, including physiotherapy and occupational therapy, as recommended and supervised by the child's paediatrician, ensuring an integrated approach to care.

Assessment and Outcomes

The child's condition was assessed before and after the Ayurvedic treatment protocol using the following standardized scales

Anjali Parmar et al.,

Modified Ashworth Scale (MAS) [3]

Joint	Muscle Group	Right (Before)	Right (After)	Left (Before)	Left (After)
Elbow	Flexors	1	0	2	1
	Extensors	1	0	2	1
Wrist	Flexors	0	0	0	0
	Extensors	0	0	0	0
Knee	Flexors	1	0	2	1
	Extensors	1	0	2	1
Ankle	Dorsiflexors	1	1	3	2
	Plantar flexors	0	0	0	0

Scale	Pre-Treatment Score	Post-Treatment Score	Description
Modified Ashworth Scale (MAS)	3	2	Reduced muscle spasticity
Gross Motor Function Classification System (GMFCS)	IV	III	Improved movement ability (child now able to sit with minimal support) [4]
Modified Rankin Scale (mRS)	4	3	Increased functional independence (less reliance on constant assistance) [5]
Manual Ability Classification System (MACS)	IV	III	Improved voluntary hand movements (able to grasp larger objects more effectively) [6]
Speech and Drooling Severity Scale4	4	2	Reduction in drooling and improved oral-motor control (more controlled swallowing) [7]

The post-treatment assessment revealed clinically significant improvements across all measured parameters. There was a notable reduction in muscle spasticity (MAS), improved gross motor function (GMFCS), increased functional independence (mRS), enhanced manual abilities (MACS), and a reduction in drooling with better oral-motor control. No adverse effects related to the Ayurvedic treatments were observed during the study period.

DISCUSSION

The positive changes observed in this single case study are consistent with the Ayurvedic understanding of cerebral palsy as a condition primarily characterized by an imbalance of Vata Dosha impacting the nervous and musculoskeletal systems. The selection and application of therapeutic interventions were strategically guided by the principles of Ayurveda to address these specific imbalances and potentially promote neuroplasticity. The external therapies, namely *Udvardana* with *Yava Kulattha Churna* and *Abhyanga* with *Bala Taila* followed by *Nadi Sweda*, likely contributed to the observed improvements in motor function. *Udvardana's* *Rukshana* (drying and scraping) action may have helped in reducing tissue stiffness and improving circulation. *Abhyanga* with *Bala Taila*, renowned in Ayurveda for its Vata-suppressing and strengthening properties, is believed to nourish the nervous system and enhance muscle strength. The subsequent *Nadi Sweda* likely facilitated deeper tissue relaxation and improved the absorption of the medicated oil. *Nasya Karma*, the nasal administration of medicated substances, holds a significant role in Ayurvedic neurology due to the direct access to the brain and cranial nerves via the nasal passages. The sequential administration of *Pradhamana Nasya* with *Shunti Choorna*, acting as a *Srotoshodhana* (channel cleanser), may have optimized the subsequent effects of *Pratimarsha Nasya* with *Panchendriyavardhana Taila*. The latter is traditionally indicated for nourishing the sensory and motor functions. This combined approach may have contributed to the

**Anjali Parmar et al.,**

observed improvements in oral-motor control, potentially impacting speech clarity and reducing drooling. Furthermore, the influence of Nasya on the central nervous system could have indirectly contributed to enhanced overall responsiveness. Basti Therapy, particularly the administration of *Shodhana Basti* with *Dashamoola Kwath* and the prolonged use of *Matra Basti* with *Bala Taila*, is considered paramount in Ayurvedic management of Vata disorders, as the colon is regarded as a primary site of Vata Dosha. These therapies are believed to pacify systemic Vata, strengthen the gut-brain axis, and exert a positive influence on the central nervous system. The observed improvements in motor function and overall well-being in this case could be partially attributed to the impact of Basti on neural regulation through the enteric nervous system [17]. The nourishing and Vata-pacifying properties of *Bala Taila* in *Matra Basti* likely played a significant role in this regard. The internal administration of *Medhya Churna*, a formulation comprising *Medhya Rasayana* herbs, is aimed at enhancing cognitive functions, memory, and neuroplasticity by potentially modulating neurotransmitter activity and mitigating oxidative stress in the brain. While formal cognitive assessments were not conducted in this single case study, the reported improvements in speech and overall responsiveness may indirectly suggest the beneficial effects of these formulations on neurological function. Existing preclinical and clinical research provides support for the neuroprotective and cognitive-enhancing potential of individual herbs often found in *Medhya Rasayana* formulations, such as *Brahmi (Bacopamonnieri)* and *Ashwagandha (Withania somnifera)* [10][12][13]. The encouraging outcomes observed in this single case study are consistent with findings from other preliminary investigations that have suggested the potential efficacy of Ayurvedic interventions in reducing spasticity and improving motor function in children diagnosed with cerebral palsy [14]. Furthermore, systematic reviews have highlighted the neuroprotective potential of Panchakarma therapies [15] and the beneficial role of *Medhya Rasayana* in managing neurodevelopmental disorders [16]. Notably, innovative Ayurvedic therapies like *Shirodhara* have also demonstrated preliminary promise in the management of spastic cerebral palsy [18]. These converging lines of evidence warrant further rigorous scientific investigation into the role of comprehensive Ayurvedic treatment protocols as an adjunct therapy for cerebral palsy.

Limitations

This study is limited by its single-case design, which restricts the generalizability of the findings. The lack of a control group makes it difficult to definitively attribute the observed improvements solely to the Ayurvedic interventions, as spontaneous improvement or the ongoing effects of conventional therapies cannot be entirely ruled out. Further, the subjective nature of some assessment scales introduces a potential for bias.

CONCLUSION

The significant improvements observed in this 5-year-old child with spastic quadriplegic cerebral palsy following a comprehensive Ayurvedic treatment protocol, as evidenced by standardized clinical scales, suggest the potential of Ayurveda as a valuable adjunct therapy in the management of this challenging condition. The reduction in spasticity, improved motor function, enhanced manual abilities, and better oral-motor control indicate that Ayurvedic interventions, focusing on Vata pacification, nervous system nourishment, and potential enhancement of neuroplasticity, may contribute to improved quality of life and reduced dependency in children with CP. While these findings are encouraging, they underscore the critical need for well-designed, large-scale randomized controlled trials to rigorously evaluate the efficacy and long-term impact of specific Ayurvedic treatment protocols in the management of various subtypes of cerebral palsy. Such studies would provide stronger scientific validation and pave the way for the integration of evidence-based Ayurvedic interventions into the multidisciplinary care of children with cerebral palsy.

Assent

Informed consent was obtained from the patient's parents/legal guardians for the documentation and publication of this case study, ensuring the anonymity of the child.

ABSTRACT

In this article, we present the idea of the vague WI-ideal of the lattice Wajsberg algebra (W-algebra) and examine a few pertinent features using examples. Additionally, we derive a vague WI-ideal of the lattice Wajsberg algebra and get some characterisation.

Keywords: Wajsberg algebra; Lattice W-algebra; WI-ideal; Vague set; Vague WI-ideal.

INTRODUCTION

MordchajWajsberg [9] first proposed the idea of Wajsberg algebras, often known as W-algebras, in 1935. W-algebras were expanded in 1984 by Font, Rodriguez, and Torrens [4] as a substitute model for the infinite valued The Wajsberg algebra's lattice structure was introduced by Łukasiewicz logic. They also proposed the idea of an implicative filter of lattice W-algebras and talked about several of its features. They defined the lattice structure of W-algebras [4]. Zadeh [10] first presented fuzzy sets in 1965. Many different algebraic structures, including rings, modules, topologies, groups, and semi groups, have been connected to the concept of fuzzy sets, which is frequently used in many disciplines. Gau and Buehrer [5] presented the ambiguous set and looked at some of its fundamental characteristics in 1993. The idea of the hazy WI-ideal of the lattice W-algebra is presented in this study along with several features that are derived and illustrated. Additionally, we acquire several descriptions of the uncertain WI-ideal of the lattice W-algebra.

Ibrahim and Mohamed Rajik

2.Preliminaries

Here, we recollect few definitions and results which aid to progress our main outcomes.

Definition 2.1[4]:

Let $(\mathcal{W}, \rightarrow, *, 1)$ be binary operation algebra. " \rightarrow " and a quasi complement " $*$ ". When all of the following axioms are true, algebra is referred to as Wajsberg algebra $\vartheta_3, \mu_3, \pi_3 \in \mathcal{W}$,

- i $1 \rightarrow \vartheta_3 = \vartheta_3$
- ii $(\vartheta_3 \rightarrow \mu_3) \rightarrow ((\mu_3 \rightarrow \pi_3) \rightarrow (\vartheta_3 \rightarrow \pi_3)) = 1$
- iii $(\vartheta_3 \rightarrow \mu_3) \rightarrow \mu_3 = (\mu_3 \rightarrow \vartheta_3) \rightarrow \vartheta_3$
- iv $(\pi_3^* \rightarrow \mu_3^*) \rightarrow (\mu_3^* \rightarrow \pi_3^*) = 1$.

Proposition 2.2[4]: A Wajsberg algebra $(\mathcal{W}, \rightarrow, *, 1)$ assures the following for all $\vartheta_3, \mu_3, \pi_3 \in \mathcal{W}$,

- i $\vartheta_3 \rightarrow \vartheta_3 = 1$
- ii If $(\vartheta_3 \rightarrow \mu_3) = (\mu_3 \rightarrow \vartheta_3) = 1$ then $\vartheta_3 = \mu_3$
- iii $\vartheta_3 \rightarrow 1 = 1$
- iv $(\vartheta_3 \rightarrow (\mu_3 \rightarrow \vartheta_3)) = 1$
- v If $(\vartheta_3 \rightarrow \mu_3) = (\mu_3 \rightarrow \pi_3) = 1$ then $\vartheta_3 \rightarrow \pi_3 = 1$
- vi $(\vartheta_3 \rightarrow \mu_3) \rightarrow ((\pi_3 \rightarrow \vartheta_3) \rightarrow (\pi_3 \rightarrow \mu_3)) = 1$
- vii $\vartheta_3 \rightarrow (\mu_3 \rightarrow \pi_3) = \mu_3 \rightarrow (\vartheta_3 \rightarrow \pi_3)$
- viii $\vartheta_3 \rightarrow 0 = \vartheta_3 \rightarrow 1^* = \gamma_3^*$
- ix $(\gamma_3^*)^* = \vartheta_3$
- x $(\gamma_3^* \rightarrow \mu_3^*) = \mu_3 \rightarrow \vartheta_3$.

Definition 2.3[4]: Let $(\mathcal{W}, \rightarrow, *, 1)$ be called a lattice Wajsberg algebra, if the following requirements are met for all $\vartheta_3, \mu_3 \in \mathcal{W}$,

- i $\vartheta_3 \leq \mu_3$ if and only if $\vartheta_3 \rightarrow \mu_3 = 1$
- ii $(\vartheta_3 \vee \mu_3) = (\vartheta_3 \rightarrow \mu_3) \rightarrow \mu_3$
- iii $(\vartheta_3 \wedge \mu_3) = ((\vartheta_3^* \rightarrow \mu_3^*) \rightarrow \mu_3^*)^*$. Thus the lower bound is 0 and and upper bound is 1.

Proposition 2.4[4]: Let $(\mathcal{W}, \rightarrow, *, 1)$ be lattice Wajsberg algebra. Then for all $\vartheta_3, \mu_3, \pi_3 \in \mathcal{W}$,

- i If $\vartheta_3 \leq \mu_3$ then $\vartheta_3 \rightarrow \pi_3 \geq \mu_3 \rightarrow \pi_3$ and $\pi_3 \rightarrow \vartheta_3 \leq \pi_3 \rightarrow \mu_3$
- ii $\vartheta_3 \leq \mu_3 \rightarrow \pi_3$ if and only if $\mu_3 \leq \vartheta_3 \rightarrow \pi_3$
- iii $(\vartheta_3 \vee \mu_3)^* = (\vartheta_3 \wedge \mu_3^*)$
- iv $(\vartheta_3 \wedge \mu_3)^* = (\vartheta_3 \vee \mu_3^*)$
- v $(\vartheta_3 \vee \mu_3) \rightarrow \pi_3 = (\vartheta_3 \rightarrow \pi_3) \wedge (\mu_3 \rightarrow \pi_3)$
- vi $\vartheta_3 \rightarrow (\mu_3 \wedge \pi_3) = (\vartheta_3 \rightarrow \mu_3) \wedge (\vartheta_3 \rightarrow \pi_3)$
- vii $(\vartheta_3 \rightarrow \mu_3) \vee (\mu_3 \rightarrow \vartheta_3) = 1$
- viii $\vartheta_3 \rightarrow (\mu_3 \vee \pi_3) = (\vartheta_3 \rightarrow \mu_3) \vee (\vartheta_3 \rightarrow \pi_3)$
- ix $(\vartheta_3 \wedge \mu_3) \rightarrow \pi_3 = (\vartheta_3 \rightarrow \pi_3) \vee (\mu_3 \rightarrow \pi_3)$
- x $(\vartheta_3 \wedge \mu_3) \vee \pi_3 = (\vartheta_3 \vee \pi_3) \wedge (\mu_3 \vee \pi_3)$
- xi $(\vartheta_3 \wedge \mu_3) \rightarrow \pi_3 = (\vartheta_3 \rightarrow \mu_3) \wedge (\vartheta_3 \rightarrow \pi_3)$.

Definition 2.5[4]: Let $(\mathcal{W}, \rightarrow, *, 1)$ be called lattice H-Wajsberg algebra, if $(\vartheta_3 \vee \mu_3) \vee (((\vartheta_3 \wedge \mu_3) \rightarrow \pi_3) = 1$ for all $\vartheta_3, \mu_3, \pi_3 \in \mathcal{W}$.

Definition 2.6[4]: The subset F of \mathcal{W} is called an implicative filter, if the following axioms are satisfied for all $\vartheta_3, \mu_3 \in \mathcal{W}$,

- i $1 \in F$
- ii $\vartheta_3 \in F$ and $(\vartheta_3 \rightarrow \mu_3) \in F$ imply $\mu_3 \in F$.

Ibrahim and Mohamed Rajik

Definition 2.7[4]: An ideal I of L is a non-empty subset of L is called a lattice ideal, if the below requirements hold for all $\vartheta_3, \mu_3 \in I$,

i) $\vartheta_3 \in I$ and $\mu_3 \leq \vartheta_3$ imply $\mu_3 \in I$

ii) $\vartheta_3, \mu_3 \in I$ implies $\vartheta_3 \vee \mu_3 \in I$.

Definition 2.8[7]: Let I be a non-empty subset of \mathcal{W} . Then I is called a WI-ideal of \mathcal{W} , if the below requirements hold for all $\vartheta_3, \mu_3 \in \mathcal{W}$,

i) $0 \in I$

ii) $(\vartheta_3 \rightarrow \mu_3)^* \in I$ and $\mu_3 \in I$ imply $\vartheta_3 \in I$.

Definition 2.9[7]: A vague set Q is characterized by, truth and false membership functions $t_Q: U \rightarrow [0,1]$ and $f_Q: U \rightarrow [0,1]$ respectively.

Thus the grade of membership of ϑ_3 in the vague set Q is bounded by subinterval $[t_Q(\vartheta_3), 1 - f_Q(\vartheta_3)]$ of $[0, 1]$.

Definition 2.10[7]: Let Q be a vague set of U with the t_Q and f_Q . For any $\alpha, \beta \in [0,1]$ with $\alpha \leq \beta$, the (α, β) – cut of Q is a crisp subset $Q_{(\alpha,\beta)}$ of the set U given by $Q_{(\alpha,\beta)} = \{\vartheta_3 \in \mathcal{W} / V_Q(\vartheta_3) \geq [\alpha, \beta]\}$.

3. Vague Wajsberg implicative ideal (VWI-ideal)

In this division, the notion of vague WI-ideal (VWI-ideal) of lattice Wajsberg algebra is investigated with related properties.

Definition 3.1. Let Q be a vague set of a lattice Wajsberg algebra \mathcal{W} . Then Q is called a vague WI- ideal (VWI-ideal) if for all $\vartheta_3, \mu_3 \in \mathcal{W}$,

i) $V_Q(0) \geq V_Q(\vartheta_3)$,

ii) $V_Q(\vartheta_3) \geq \text{rmin}\{V_Q((\vartheta_3 \rightarrow \mu_3)^*), V_Q(\mu_3)\}$.

By the definition 3.1 and the definition of V_Q , the following theorem is obviously.

Theorem 3.2. Vague set Q of \mathcal{W} is a vague WI-ideal of \mathcal{W} if and only if for all

$\vartheta_3, \mu_3 \in \mathcal{W}$,

i) $t_Q(0) \geq t_Q(\vartheta_3); 1 - f_Q(0) \geq 1 - f_Q(\vartheta_3)$

ii) $t_Q(\vartheta_3) \geq \min \{t_Q((\vartheta_3 \rightarrow \mu_3)^*), t_Q(\mu_3)\};$

$1 - f_Q(\vartheta_3) \geq \min \{1 - f_Q((\vartheta_3 \rightarrow \mu_3)^*), 1 - f_Q(\mu_3)\}$.

Example 3.3. Let $\mathcal{W} = \{0, a, b, c, d, 1\}$ be the set with Figure 3.1 as a partial ordering. Define “*” and “→” from the Tables 3.1 and 3.2.

Define

$$(\vartheta_3 \vee \mu_3) = (\vartheta_3 \rightarrow \mu_3) \rightarrow \mu_3; (\vartheta_3 \wedge \mu_3) = ((\vartheta_3^* \rightarrow \mu_3^*) \rightarrow \mu_3^*)^* \text{ for all } \vartheta_3, \mu_3 \in \mathcal{W}.$$

Then, $(\mathcal{W}, \vee, \wedge, \rightarrow, *, 0, 1)$ is a lattice Wajsberg Algebra.

Consider a vague set Q of \mathcal{W}

$$Q = \{\langle 0, [0.6, 0.3] \rangle, \langle a, [0.5, 0.2] \rangle, \langle b, [0.6, 0.2] \rangle, \langle c, [0.7, 0.2] \rangle, \langle d, [0.7, 0.3] \rangle,$$

$$\langle 1, [0.7, 0.3] \rangle\}. \text{ Then } Q \text{ is a vague WI-ideal of } \mathcal{W}.$$

Example 3.4. Let $\mathcal{W} = \{0, a, b, c, 1\}$ be the set with Figure 3.2 as a partial ordering. Define a quasi-complement “*” and a binary operation “→” on \mathcal{W} Tables 3.3 and 3.4.

$$\text{Define } (\vartheta_3 \vee \mu_3) = (\vartheta_3 \rightarrow \mu_3) \rightarrow \mu_3; (\vartheta_3 \wedge \mu_3) = ((\vartheta_3^* \rightarrow \mu_3^*) \rightarrow \mu_3^*)^* \text{ for all } \vartheta_3, \mu_3 \in \mathcal{W}.$$

Then, $(\mathcal{W}, \vee, \wedge, \rightarrow, *, 0, 1)$ is a lattice Wajsberg algebra.

Consider a vague set Q of \mathcal{W}

$$Q = \{\langle 0, [0.5, 0.3] \rangle, \langle a, [0.7, 0.2] \rangle, \langle b, [0.6, 0.2] \rangle, \langle c, [0.7, 0.2] \rangle, \langle 1, [0.5, 0.3] \rangle\}$$

Then, Q is a vague WI-ideal of \mathcal{W} .

Ibrahim and Mohamed Rajik

Example 3.5. Let $\mathcal{W} = \{0, a, b, c, 1\}$ be the set with Figure 3.3 as a partial ordering. Define a quasi-complement “ $*$ ” and “ \rightarrow ” on \mathcal{W} Tables 3.5 and 3.6.

Define “ \vee ” and “ \wedge ” operations on \mathcal{W} as follows:

$$(\vartheta_3 \vee \mu_3) = (\vartheta_3 \rightarrow \mu_3) \rightarrow \mu_3; (\vartheta_3 \wedge \mu_3) = ((\vartheta_3^* \rightarrow \mu_3^*) \rightarrow \mu_3^*)^* \text{ for all } \vartheta_3, \mu_3 \in \mathcal{W}.$$

Then, $(\mathcal{W}, \vee, \wedge, \rightarrow, *, 0, 1)$ is lattice Wajsberg algebra.

Consider a vague set Q of \mathcal{W}

$$Q = \{ \langle 0, [0.7, 0.3] \rangle, \langle a, [0.5, 0.2] \rangle, \langle b, [0.6, 0.2] \rangle, \langle c, [0.7, 0.2] \rangle, \langle 1, [0.5, 0.3] \rangle$$

Then, Q is a vague WI-ideal of \mathcal{W} .

Proposition 3.6. Every Vague WI-ideal Q of a lattice Wajsberg algebra \mathcal{W} is order reversing.

Proof. Let Q be a vague WI-ideal of \mathcal{W} .

Then, from (i) of Definition 3.1, we have $V_Q(0) \geq V_Q(\vartheta_3)$ for all $\vartheta_3 \in \mathcal{W}$.

If $\vartheta_3 \leq \mu_3$, then $(\vartheta_3 \rightarrow \mu_3)^* = I^* = 0$, for all $\vartheta_3, \mu_3 \in \mathcal{W}$ [from (i) definition 2.3]

$$\text{Now, } t_Q(\vartheta_3) \geq \min \{t_Q((\vartheta_3 \rightarrow \mu_3)^*), t_Q(\mu_3)\} = \min \{t_Q(0), t_Q(\mu_3)\} = t_Q(\mu_3)$$

$$\begin{aligned} \text{And } 1 - f_Q(\vartheta_3) &\geq \min \{1 - f_Q((\vartheta_3 \rightarrow \mu_3)^*), 1 - f_Q(\mu_3)\} \\ &= \min \{1 - f_Q(0), 1 - f_Q(\mu_3)\} \\ &= 1 - f_Q(\mu_3). \end{aligned}$$

$$\text{So, } V_Q(\vartheta_3) = [t_Q(\vartheta_3), 1 - f_Q(\vartheta_3)] \geq [t_Q(\mu_3), 1 - f_Q(\mu_3)] = V_Q(\mu_3).$$

Thus, Q is a order reversing.

Definition 3.7. Let Q be a vague set of a lattice Wajsberg algebra \mathcal{W} . Then Q is called a vague lattice ideal of \mathcal{W} , if the below axioms hold for $\vartheta_3, \mu_3, \pi_3 \in \mathcal{W}$.

$$\text{i} \mu_3 \leq \vartheta_3 \text{ then } V_Q(\mu_3) \geq V_Q(\vartheta_3)$$

$$\text{ii } V_Q(\vartheta_3 \vee \mu_3) \geq \text{rmin}\{V_Q(\vartheta_3), V_Q(\mu_3)\}.$$

Example 3.8. Let \mathcal{W} be a lattice Wajsberg algebra in example 3.3, Define a vague set Q of \mathcal{W} by

$$Q = \{ \langle 0, [0.6, 0.3] \rangle, \langle a, [0.5, 0.2] \rangle, \langle b, [0.6, 0.2] \rangle, \langle c, [0.7, 0.2] \rangle, \langle d, [0.7, 0.3] \rangle, \langle 1, [0.7, 0.3] \rangle$$

Then Q is a vague lattice ideal of \mathcal{W} .

Theorem 3.9. Every vague WI-ideal of a lattice Wajsberg algebra \mathcal{W} is a vague lattice ideal of \mathcal{W} .

Proof. Let Q be a vague WI-ideal of a lattice Wajsberg algebra \mathcal{W} .

From the Proposition 3.6 shows that $V_Q(\vartheta_3) \geq V_Q(\mu_3)$ if $\mu_3 \leq \vartheta_3$.

$$\begin{aligned} \text{By } ((\vartheta_3 \vee \mu_3) \rightarrow \mu_3)^* &= ((\vartheta_3 \rightarrow \mu_3) \wedge (\mu_3 \rightarrow \mu_3))^* \text{ (Since by using the proposition 2.4)} \\ &= (\vartheta_3 \rightarrow \mu_3)^* \leq \vartheta_3 \end{aligned}$$

$$\text{We get } V_Q(((\vartheta_3 \vee \mu_3) \rightarrow \mu_3)^*) \geq V_Q(\vartheta_3).$$

From the definition of vague WI-ideal, we have

$$\begin{aligned} V_Q(\vartheta_3 \vee \mu_3) &\geq \text{rmin}\{V_Q(((\vartheta_3 \vee \mu_3) \rightarrow \mu_3)^*), V_Q(\mu_3)\} \\ &\geq \text{rmin}\{V_Q(\vartheta_3), V_Q(\mu_3)\}. \end{aligned}$$

Hence, every vague WI-ideal of a lattice Wajsberg algebra \mathcal{W} is a vague lattice ideal of \mathcal{W} .

Remark 3.10. Converse of the theorem 3.9 need not to be true

Let Q be defined in the Example 3.8 is a vague lattice ideal of \mathcal{W} , but not a vague WI-ideal for $V_Q(\vartheta_3) \geq \text{rmin}\{V_Q((\vartheta_3 \rightarrow \pi_3)^*), V_Q(\pi_3)\}$.

Theorem 3.11. In a lattice H -Wajsberg algebra \mathcal{W} , every vague lattice ideal is a vague WI-ideal.

Proof. Let Q be a vague lattice ideal of a lattice H -Wajsberg algebra \mathcal{W} .

Since $0 \leq \vartheta_3$, it follows that $V_Q(0) \geq V_Q(\vartheta_3)$ for any $\vartheta_3 \in \mathcal{W}$.

Since \mathcal{W} is a lattice H -Wajsberg algebra, we have

Ibrahim and Mohamed Rajik

$\mu_3 \vee (\vartheta_3 \rightarrow \mu_3)^* = \mu_3^* \rightarrow (\vartheta_3 \rightarrow \mu_3)^* = (\vartheta_3 \rightarrow \mu_3) \rightarrow \mu_3 = \vartheta_3 \vee \mu_3 \geq \vartheta_3$, we have
 $V_Q(\vartheta_3) \geq V_Q(\mu_3 \vee (\vartheta_3 \rightarrow \mu_3)^*) \geq \text{rmin}\{V_Q((\vartheta_3 \rightarrow \mu_3)^*), V_Q(\mu_3)\}$ [from (ii) definition 3.1]
 Hence, Q is a vague WI – ideal of \mathcal{W} .

Example 3.12. Let $\mathcal{W} = \{0, a, b, 1\}$. Define “*” and “→” on \mathcal{W} Tables 3.7 and 3.8.

Define “∨” and “∧” operations on \mathcal{W} as follows:

$$\vartheta_3^* = \vartheta_3 \rightarrow 0,$$

$$\vartheta_3 \vee \mu_3 = (\vartheta_3 \rightarrow \mu_3) \rightarrow \mu_3; (\vartheta_3 \wedge \mu_3) = ((\vartheta_3^* \rightarrow \mu_3^*) \rightarrow \mu_3^*) \text{ for all } \vartheta_3, \mu_3 \in \mathcal{W}.$$

Then, $(\mathcal{W}, \vee, \wedge, \rightarrow, *, 0, 1)$ is Lattice- H Wajsberg Algebra.

Consider a vague set Q of \mathcal{W}

$$Q = \{ \langle 0, [0.7, 0.2] \rangle, \langle a, [0.5, 0.3] \rangle, \langle b, [0.6, 0.3] \rangle, \langle 1, [0.5, 0.3] \rangle \}$$

Then Q is both vague WI-ideal and vague lattice ideal of \mathcal{W} .

Theorem 3.13. Let Q be a vague set of a lattice Wajsberg algebra \mathcal{W} . Then Q is a vague WI – ideal if and only if $Q_{(\alpha, \beta)}$ is an WI – ideal when $Q_{(\alpha, \beta)} \neq \emptyset, \alpha, \beta \in [0, 1]$.

Proof: Let Q be a vague WI – ideal of \mathcal{W} and $\alpha, \beta \in [0, 1]$, such that $Q_{(\alpha, \beta)} \neq \emptyset$.

Then, $0 \in Q_{(\alpha, \beta)}$. Suppose $\vartheta_3, \mu_3 \in \mathcal{W}, (\vartheta_3 \rightarrow \mu_3)^* \in Q_{(\alpha, \beta)}$ and $\mu_3 \in Q_{(\alpha, \beta)}$.

Then, $V_Q((\vartheta_3 \rightarrow \mu_3)^*) \geq [\alpha, \beta]$ and $V_Q(\mu_3) \geq [\alpha, \beta]$ [from definition 2.10]

It follows that, $V_Q(\vartheta_3) \geq \text{rmin}\{V_Q((\vartheta_3 \rightarrow \mu_3)^*), V_Q(\mu_3)\} \geq [\alpha, \beta]$ [from (ii) definition 3.1]

So that $\mu_3 \in Q_{(\alpha, \beta)}$. Hence $Q_{(\alpha, \beta)}$ WI-ideal of \mathcal{W} .

Conversely, If $Q_{(\alpha, \beta)} \neq \emptyset$ is an WI-ideal of W where $\alpha, \beta \in [0, 1]$.

For any $\vartheta_3 \in \mathcal{W}, \vartheta_3 \in Q_Q(\vartheta_3)$, it follows that $Q_Q(\vartheta_3)$ is an WI – ideal of \mathcal{W} .

Hence, $0 \in Q_Q(\vartheta_3)$, that is $V_Q(0) \geq V_Q(\vartheta_3)$ [from (i) definition 3.1]

Let $[\alpha, \beta] = \text{rmin}\{V_Q((\vartheta_3 \rightarrow \mu_3)^*), V_Q(\mu_3)\}$ for all $\vartheta_3, \mu_3 \in \mathcal{W}, Q_{(\alpha, \beta)}$ is an

WI-ideal and $(\vartheta_3 \rightarrow \mu_3)^* \in Q_{(\alpha, \beta)}, \mu_3 \in Q_{(\alpha, \beta)}$, implies $\vartheta_3 \in Q_{(\alpha, \beta)}$.

So $V_Q(\vartheta_3) \geq [\alpha, \beta] = \text{rmin}\{V_Q((\vartheta_3 \rightarrow \mu_3)^*), V_Q(\mu_3)\}$.

Hence, Q is vague WI-ideal of \mathcal{W} .

ABSTRACT

Due to its importance in influencing gene expression by changing the structure of chromatin without altering the DNA sequence, "Histone Methylation" is a major focus in modern biomedical research, particularly in relation to cancer, neurodegenerative disorders, aging, and regenerative medicine. This study employs a scientometric approach to analyse global research trends in 'histone methylation' using bibliometric data from the Web of Science Core Collection since its inception and the data analytical tool used in this research is SPSS software. The analysis identifies prominent authors, leading research institutions & funding agencies and key contributing countries in 'histone methylation' research. The research evaluates the applicability of Lotka's Law of author productivity through statistical regression analysis, revealing a power-law distribution in scientific authorship. The findings confirm that a small group of researchers contributes disproportionately to the field, with a strong correlation between publication count and author productivity. The study Emphasizes the growing impact of histone methylation research and its potential for future therapeutic innovations.

Keywords: Histone Methylation, Epigenetic Therapy, Gene Activation, Scientometrics, Lotka's Law.

Jaya Suriya Dheva et al.,

INTRODUCTION

Histone Methylation is a key epigenetic modification that involves the addition of methyl groups to histone proteins, which help regulate gene expression without altering the underlying DNA sequence. This process occurs on lysine (K) and arginine (R) residues of histone tails, primarily on histones H3 and H4, and is catalyzed by histone methyltransferases (HMTs). The methyl groups can be removed by histone demethylases (HDMs).

Key functions of the Histone Methylation

Gene Activation or Repression Depending on the specific site and degree of methylation, histone methylation either activates or represses gene expression. H₃K₄me₃ (trimethylation of lysine 4 on histone H3) is associated with transcriptional active genes.

Chromatin Structure Regulation Methylation influences whether chromatin is in an open (euchromatin) or closed (heterochromatin) state

Cell Differentiation and Development Histone methylation plays a crucial role in cellular differentiation, embryonic development, and maintenance of cell identity.

DNA Repair and Genome Stability Some histone methylation marks such as H3K36me₃ are involved in DNA damage repair and maintain genomic integrity.

Histone Methylation Relevance in Present Day Context

Histone methylation remains highly relevant today due to its role in epigenetics, disease research, and therapeutic development. It is a crucial factor in understanding cancer, neurodegenerative diseases, aging, and regenerative medicine. Histone methylation is employed in Cancer Research and Epigenetic Therapy for tumor suppression in abnormal methylation patterns like over-expression of H3K27me₃ in tumor suppressor genes. Drugs targeting histone methyltransferases (HMTs) and demethylases (HDMs) are being developed and inhibitors targeting H3K27 methylation are used in treating lymphomas and other cancers. Histone Methylation has an affluent role in neurodegenerative diseases such as Alzheimer's, Parkinson's and ALS. Its dysregulation affects genes involved in brain function and neuro-degeneration as H3K9me₂/H3K9me₃ accumulation is linked to cognitive decline. In such scenario, potential therapies involving Histone methylation modulation to restore gene expression in neurons is greatly opted.

The longevity of human life span and aging is coherent with histone methylation as loss of H3K27me₃ in stem cells leads to reduced regenerative potential and epigenetic reprogramming strategies aim to reverse aging-related changes. Stem Cell fate and regenerative medicines are influenced by histone methylation patterns as H3K4me₃ and H3K27me₃ dynamics regulate pluripotency and differentiation. CRISPR based epigenetic engineering tools are being explored to control cell fate for regenerative therapies and tools like dCas9 fused with histone methyltransferases/demethylases allow precise epigenetic modifications. It can also be used to reactivate silenced genes in diseases like Fragile X syndrome and Rett syndrome. The pattern of histone methylation represents as biomarkers for diseases and epigenetic therapies aim to modify histone marks for customized tailored treatment.

Histone methylation is a cutting-edge area of research with therapeutic potential in cancer, neuro-degeneration, aging, and regenerative medicine. Advances in epigenetic drugs and CRISPR-based epigenome editing make it a powerful tool in modern medicine. Following the significance of histone methylation, the present study attempts to address the publication outcomes indexed in the Web of Science database concerning the authorship pattern, countries involved, leading funders/sponsors and testing of validity through the application of lotka's law using regression analysis in the histone methylation research.

Jaya Suriya Dheva et al.,

REVIEW OF LITERATURE

Xu, S. Y. & et. al. (2025) analysed the bibliometric analysis on epigenetic modifications in neurology from the Web of Science database for the period of twenty years (2004-2024). R studio and VOS viewer are used for the data visualizations. The data is analysed on the basis of year-wise publication, country-wise and organization-wise publication, keyword analysis, and citation and co-citation analyses. The study concluded with the role of pathophysiological processes such as DNA methylation, oxidative stress and synaptic plasticity have impact in neurological epigenetic alterations. Zhang, Y., & et. al. (2025) has analysed the scientometrics on DNA methylation data from Web of Science database. CiteSpace 5.7 and VoS viewer 1.6.15 were used for bibliometric and knowledge mapping. The research focused on the parameters of authors, institutions and countries, co-citations, keyword cluster and research hotspots such as epigenetic clock, obesity, smoking, gaining and DNA methylations, biomarker, epigenome wide association study.

Li, S. & et. al. (2024) studied on the research outcome epigenetic therapy using bibliometric analysis for the period of twenty years (2004-2023). The research was retrieved the publication data from Web of Science Core Collection and applied co-occurrence analysis using VoS viewer and Citespace. The results revealed that epigenetic therapy is significant in the last two decades and the future studies would further explore the sequencing and scheduling of therapies, designs and dosing regimens to improve clinical efficacy. Zeng, Y. & et. al. (2024) evaluated bibliometric analysis on epigenetics and glioma for the period of 15 years (2009-2024). For the study, the research has adopted the data retrieval from Web of Science Core Collection database and for the visualization, tools such as CiteSpace and VOS viewer were considered for mapping of countries, author co-citations, institutions and funding organizations, cited literature and keywords were systematically analysed.

Objectives of the Study

To discover the prominent researchers, funding and research organizations and the countries involving in Histone Methylation research.

To determine the relevance of Lotka's Law of author productivity in scientific publications on 'Histone Methylation' in its general form and in Inverse Square and goodness of fit test in accordance with the law.

Applying regression analysis statistical tool to validate the strength of relation and law reliability in Lotka's Law of Author Productivity in 'Histone Methylation' research.

Hypothesis

H₀: Lotka's Law of Author Productivity fit to the Histone Methylation research dataset.

METHODOLOGY

Data Retrieval and Search Strategy

This scientometric study focuses on "Histone Methylation" research using bibliometric data retrieved from the *Web of Science Core Collection (WoSCC)* database. The WoS was selected due to its comprehensive coverage of high-impact scientific literature across various disciplines. The search was conducted on December 2024, ensuring the inclusion of the most recent publications and within the time period. A systematic search was performed using "Histone Methylation" and relevant filters applied to include all type of documents indexed in Web of Science. These terms were searched in all fields to ensure broad yet relevant coverage and only publications with complete bibliographic metadata (e.g., title, authors, abstract, citations) were retained for analysis.

Data Processing and Cleaning

The retrieved records were exported in Plain Text formats for further analysis. Duplicates and irrelevant articles were removed manually and through automated scripts using bibliometric software such as Bibliometrix (R package) and statistical software SPSS latest version.

Jaya Suriya Dheva et al.,

Bibliometric Analysis

The following scientometric parameters were analysed: Prolific Authors and Authors Productivity, Journal Impact Analysis, application of Lotka's Law and Bradford's Law and using regression statistical analysis.

Limitations

The study relies solely on the publications indexed in Web of Science (WoS), which may exclude relevant articles indexed in other databases. Citation metrics and publication trends are subject to change over time, impacting long-term conclusions.

Ethical Considerations

Since this study analyses publicly available bibliometric data, no ethical approval was required. All extracted data were used for academic purposes and analysed in accordance with ethical research standards.

RESULTS AND DISCUSSION

Most Prolific Authors in Histone Methylation Research

The Bar Chart 1 represents the number of publications by different authors. A total of 4,298 publications were scrutinized for the analysis. Of which, Zhang Y has the highest number of publications, significantly leading with 113 publications. This infers that Zhang Y is a prolific author in the dataset. Liu Y and Wang J follow in second and third positions, with approximately 60 and 55 publications, respectively. Li L, Liu J, and Wang Y have similar publication counts, around the 50-mark. Li Y, Zhang L, Shi Y, and Zhang J have the lowest publication numbers, all below 50. While they have contributed significantly, their publication counts are noticeably lower than Zhang Y's. It is inferred from the data that they exhibit a descending pattern in terms of publication count. Zhang Y stands out as the prolific author and Maverick with more than double the publications compared to other authors. The remaining authors have relatively similar publication counts, indicating a more balanced contribution among them.

Funding Agencies sponsored in Histone Methylation Research

The Table 1 presents the number of publications associated with different funding organizations. The United States Department of Health and Human Services (HHS) leads with the highest number of 1,477 funded publications (25.3%). The second organization is the National Institutes of Health (NIH) USA, contributing to 1,465 publications (25%). The National Natural Science Foundation of China (NSFC) is the third-largest funding body, supporting 965 publications (16.5%). Funding organizations like NIH National Cancer Institute (NCI), Japan's Ministry of Education, Culture, Sports, Science and Technology, NIH National Institute of General Medical Sciences (NIGMS) and Japan Society for the Promotion of Science sponsors the benchmark of more than 220 publications in the histone methylation field. While Grants-in-Aid for Scientific Research (KAKENHI) in Japan, UK Research and Innovation (UKRI) and the National Science Foundation (NSF), United States are lower in the top 10 ranks category but contributed notable number of 206, 187 and 156 publications respectively. It is inferred from the analyses that the NIH and its affiliated organizations play a dominant role in biomedical funding research, making up a large portion of the total publications. The NSFC in China stands out as a significant player in research funding. Japan has multiple funding sources, including MEXT, KAKENHI, and the Japan Society for the Promotion of Science. There is a clear disparity between top contributors and smaller funding organizations, highlighting the concentration of research funding in a few major institutions.

Contribution of Countries to Histone Methylation Research

The Tree Map 1 visualization represents the number of research publications on histone methylation contributed by different countries. The size of each block corresponds to the number of publications, indicating the relative contribution of each country to this research field. United States is the most significant contributor with 2,388 publications highlighting its dominant role in epigenetics research and well-funded scientific institutions. China follows as the second-largest contributor with 1,542 publications, reflecting its rapidly growing research output and

Jaya Suriya Dheva et al.,

investments in molecular biology and genetics. Germany with 427 publications, Japan with 398 publications, and England with 356 publications are among the top contributors from Europe and Asia. These countries have well-established research institutions and funding agencies supporting epigenetics research. So as France (298 publications) and Canada (287 publications) also have a strong presence with a respective contribution of 298 publications and 287 publications significantly to the field. South Korea, Italy, and India contribute a moderate number of 201, 198 and 159 publications individually. It can be inferred from the tree map that Histone methylation research is a globally collaborative effort, with the U.S., China, and Japan leading the way. European countries collectively together contribute a significant share, demonstrating regional strength in molecular biology and genetics. Asia-Pacific countries, including Japan, South Korea, and India, are increasingly active, impacts the expansion of histone methylation research beyond traditional western scientific powerhouses.

Lotka's Law

Lotka's Law describes the distribution of scientific productivity among authors, stating that the number of authors producing n papers is inversely proportional to n^2 . In simpler terms, a few authors publish a large number of papers, while many authors publish only a few. The number of authors producing N papers is inversely proportional to N^2 . This means:

$$f(n) \propto \frac{1}{n^c}$$

where

- $f(n)$ is the number of authors with n publications.
- n is the number of publications contributed.
- c is typically close to 2 in scientific productivity studies.

The below Table 2 presents the values of Lotka's Law exhibiting the productivity pattern of authors in Histone Methylation Research Publications. It shows the number of contributions (n) made by authors, the frequency of authors $f(n)$ making that many contributions, and their respective logarithmic transformations (\log_n and $\log_f(n)$) for better trend visualization.

The data from the Table 2 clearly exhibits that the majority of the authors have few publications. For example, the highest number of publications i.e., 182 publications have only one author. The number of authors increases as their publications count decreases. There is also increase in author frequency with decrease in publications that is 4 publications have 29 authors and 3 publications have 28 authors. The trend continues with only one publication contributed by 375 authors, showing an extreme case of high productivity. It is inferred from the table 2 that Lotka's Law is true in histone methylation research, where most authors contribute a small number of papers, and a few authors contribute a large number of papers.

Inverse Relationship between Contributions and Authors

In scientific publishing, Power law distribution is commonly used to describe phenomena where a small number of elements contribute disproportionately to a given outcome. The data follows Lotka's Law, where the number of authors decreases as the number of contributions increases. The frequency of single author in histone methylation research is 182 publications while 1 publication has been jointly contributed by 375 authors. This indicates that most researchers contribute only a few publications, while a small number of authors produce a large volume of research. The majority of contributing authors have published between 1-5 papers. A small number of authors have contributed a disproportionately large number of publications, which indicate prominent researchers or collaborative research groups. The dataset records 28,523 authors and 4,298 publications reveals that most contributors are occasional authors.

Jaya Suriya Dheva et al.,

Power Law Distribution

The power-law distribution is confirmed as the data follows Lotka's Law with an exponent of -1.909, close to the expected value of -2. This ensures a power-law distribution, affecting that as the number of publications per author increases, the number of such highly productive authors declines exponentially. This pattern is characteristic of scientific authorship distribution, endorsing that few prolific researchers drive a significant portion of the research output.

Goodness of fit of Lotka's Law using Regression Statistics

The regression analysis examines the relationship between the number of publications (n) and the number of authors ($f(n)$) following Lotka's Law in author productivity. By transforming the data using logarithms and applying regression techniques could assess how well the power-law model fits the dataset. To analyze the dataset using regression statistics, the data should ensure a log-log transformation and fit the data to a linear model:

$$\log f(n) = a + b \log n$$

Where

$\log f(n)$ is the dependent variable (*logarithm of the number of authors*),

$\log n$ is the independent variable (*logarithm of the number of publications*),

b represents the *power-law exponent*, and

a is the intercept.

From the Table 3, it indicates a strong correlation between the log-transformed number of publications and the log-transformed number of authors. R-Square is 74.86% of the variability in the number of authors by the number of publications confirming a strong power-law relationship. Since the difference between R^2 and adjusted R^2 is small, the model is not over fitting and is a good fit for the data. From the ANOVA analysis for model significance test, a high F-value of 122.0943 implies that the regression model is statistically significant. The significance of F is far below the standard 0.05 threshold indicating the relationship is highly significant.

Regression Coefficients and Interpretation

The regression equation is

$$\log f(n) = 3.5649 - 1.9091 \log n$$

The coefficients of Intercept 3.5619 represents the expected log value of $f(n)$ when the number of publications is 1. The slope of X variable 1 is -1.9091 confirms the negative coefficient of Lotka's Law in essence with number of authors decreases as the number of publications increases. Since this exponent is close to the theoretical value of -2, the data is slightly less steep than expected. The p-value for slope is 7.24×10^{-14} which is highly significant and that n has a strong negative impact on $f(n)$. The 95% confidence interval confirms that the true exponent of the power-law falls within this range and so the negative relationship is statistically significant.

From the analysis, it is inferred that the model is a strong fit as the R^2 is nearly 75% of the variation in author productivity. Further statistical significance confirms that the relationship is between publications' and authors' is valid. The result is consistent with scientific productivity trends. Thus, Lotka's Law of author productivity in Histone Methylation research through Regression Statistics is fit to the dataset.

Major Findings

The major findings of the study revealed the following inferences.

- i) Zhang Y is the prolific author and significantly highest contributor in Histone Methylation research with 113 publications.

**Jaya Suriya Dheva et al.,**

- ii) The United States Department of Health and Human Services is the predominant funding sponsor with 1,477 publications and with a slight difference by National Institutes of Health (NIH), USA with 1,465 publications. Funding organizations from China, Japan and UK have contributed significantly to this research getting hold of top 10 funding organizations in histone methylation research.
- iii) In terms of country wise contribution of publication, US, China and Japan lead in histone methylation research while Asian Pacific countries like Japan, South Korea and India are increasingly active in this research. India is in the 10th place in terms of publishing histone methylation.
- iv) From the results discussed, it is evident that the Lotka's Law fits to the dataset as most authors contribute a small number of papers, and a few authors contribute a large number of papers and the reliability of Lotka's law has been corroborated through regression statistics. Thus the hypothesis is true to the dataset.

CONCLUSION

The study attempted to analyse the histone methylation dataset in the Web of Science Core Collection database by validating with Lotka's Law of author productivity and goodness of fit to the dataset using regression analysis. The study unveiled that regression analysis yielded a strong inverse relationship ($R^2 = 0.749$) between the number of publications (n) and the number of authors ($f(n)$), with an exponent of -1.909 – closely aligning with Lotka's theoretical value of -2. The statistical significance ($p < 0.05$) further validates the strength of this relationship. The results and discussion highlights the highly skewed nature of scientific authorship emphasizing the dominance of a small group of prolific researchers. There is a necessity to understand this trend due to its prominence over the years for evaluating research impact, author collaboration patterns and publication dynamics in Histone Methylation research. Future research could extend this analysis across different scientific domains to assess the universality of Lotka's Law in biomedical literature.

ABSTRACT

The study aims to analyze the effect of performance appraisal on employee performance in the IT sector. To achieve the aim, the researcher studied the literature on the related issues extensively and conducted a survey questionnaire among IT sector employees. It was found that the employees were fair about the performance appraisal. The employees are satisfied with their last performance rating. Fairness of performance appraisal and satisfaction with previous performance rating positively affect employees' work attitude and skill improvement. Hence, it is concluded that organizations and human resources practitioners view performance appraisal policy as an effective tool for human resources management.

Keywords: Cloud Computing, Digital Transformation Services, ERP Solutions, Performance Appraisal, Web and Mobile App Development

INTRODUCTION

The Software Development and IT Services industry in India is one of the economy's largest and most dynamic sectors. It includes various services such as custom software development, enterprise application development, web and mobile app development, ERP solutions, digital transformation services, cloud computing, and IT consulting. India is a global hub for IT services, known for its skilled workforce, cost-effectiveness, and growing technological infrastructure. The industry caters to domestic and international clients across various domains, including logistics, education, healthcare, banking, real estate, and retail.

**Ajay Krishnan and Sathish Kumar****Need For Study**

In recent years, Human Resource (HR) analytics has emerged as a transformative force in HR, attracting increasing attention from academics and practitioners. However, despite its growing importance, HR analytics has only recently gained traction in research circles. As a result, there is a noticeable gap in the literature, particularly when understanding the adoption of HR analytics at the individual level, specifically among HR professionals. While technology adoption is essentially universal, as highlighted by Wejnert (2002), it is essential to recognize that the factors influencing this adoption vary significantly across different national and cultural contexts. Much of the existing research on HR technologies and information systems has been centered around developed countries, with a notable focus on Western economies (Panayotopoulou, Vakola, and Galanaki, 2007). In contrast, countries in the Asian region, including India, have not been the subject of extensive scholarly investigation in this area. The Indian context lacks comprehensive empirical studies exploring HR technologies' integration and practical application, especially HR analytics. This gap highlights a significant opportunity for region-specific research that accounts for local challenges, organizational cultures, technological infrastructure, and skill development frameworks. Scholars reviewing the future directions of HR analytics research have emphasized the necessity of conducting large-scale, rigorous studies to understand the landscape better. For instance, Wall and Wood (2005) called for expansive and ambitious sample surveys, while Guest (2011) underlined the importance of longitudinal quantitative studies to track trends and measure progress over time. These recommendations point to a critical need for more structured and data-driven exploration into how HR analytics is perceived, adopted, and implemented across organizations. Against this backdrop, the present effort aims to bridge some of these research gaps. The study examines the current state of analytical competency among HR professionals and their readiness to adopt and engage with HR analytics tools and practices. It also seeks to understand how HR analytics is integrated into organizational processes and decision-making. By assessing these dimensions, the study contributes to academic literature. It provides practical insights for policymakers, corporate leaders, and HR practitioners navigating the shift toward data-driven human resource management.

Objectives of The Study

The primary aim of this study is to gain a comprehensive understanding of how HR professionals are adopting and applying HR analytics in the Indian context. As the field of HR analytics grows in strategic importance, particularly with its ability to enhance data-driven decision-making in HR functions, it becomes crucial to explore the readiness and competencies of the professionals expected to implement it. This study sets out to address the following key objectives:

- To conceptualize the core analytical competencies essential for HR professionals in today's data-driven work environment, focusing on how these skills contribute to strategic HR decision-making.
- To assess the current level of analytical competencies among HR professionals in India, identifying gaps between the required and existing skill sets.
- To determine the level of adoption of HR analytics tools and practices among HR professionals, including factors that influence their willingness and ability to embrace analytics in their daily roles.
- To investigate the extent to which HR analytics is practically applied within organizations, exploring how frequently and in what contexts these tools and techniques are being used.

Through these objectives, the study aims to shed light on the practical landscape of HR analytics in India and contribute valuable insights for HR leaders, educators, and policymakers.

Scope of The Study

This study is designed with a focused yet practical approach, considering the objectives, time availability, and ease of access to relevant participants. As a result, the scope has been carefully defined to ensure meaningful insights can be drawn within the given limitations. Firstly, the research concentrates on HR professionals currently active in their roles. These individuals influence how HR analytics are adopted and applied within their organizations. Their hands-on experience and perspectives are crucial for understanding the real-world application of HR analytics. Furthermore, the study is limited to organizations employing at least 500 people. This threshold was established because HR analytics frameworks tend to be more relevant and impactful in larger organizations, where the volume

**Ajay Krishnan and Sathish Kumar**

and complexity of HR data necessitate analytical tools. Smaller organizations may not yet have the scale or infrastructure to leverage such frameworks fully and hence were excluded from the study. The study adopts the Unified Theory of Acceptance and Use of Technology (UTAUT) as the primary framework for theoretical grounding. UTAUT has been widely recognized and validated for explaining user behavior in the context of technology adoption. By applying this framework, the study aims to provide a structured understanding of how and why HR professionals embrace or resist HR analytics in their respective organizations. Lastly, the exploration of HR professionals' analytical skills and their practical application of HR analytics is based on a synthesis of expert opinions, established research variables, and existing literature. This approach ensures that the study builds on a solid foundation of credible and widely accepted knowledge, thereby enhancing the reliability and relevance of the findings.

Limitations of The Study

While this study aims to provide meaningful insights into the adoption and application of HR analytics among HR professionals in India, it is essential to acknowledge certain limitations that may influence the interpretation and generalizability of the findings.

Geographical and Demographic Constraints: The study is focused on the Indian context and may not fully capture the diversity within the country, especially across regions, sectors, and organizational sizes. Therefore, findings may not be entirely generalizable to other countries or even to all organizations within India.

Sample Representation: The insights are drawn from a specific sample of HR professionals, which may not represent the entire population. Differences in exposure to technology, access to resources, or varying roles within the HR function may lead to biased or uneven responses.

Self-Reported Data: The study relies on self-reported data through surveys or interviews, which can be subject to social desirability bias or inaccurate self-assessment. Respondents may overstate or understate their competencies or actual usage of HR analytics.

Evolving Nature of HR Analytics: As HR analytics is still an emerging field, the tools, practices, and organizational approaches are rapidly evolving. Hence, the findings of this study may become outdated quickly and may not reflect future developments in the field.

Limited Longitudinal Insight: This study adopts a cross-sectional approach due to time and resource constraints. It does not track changes in HR analytics adoption or competencies over time, which limits the understanding of trends and long-term patterns.

Technological Variation across Organizations: The level of digital maturity and the adoption of HR technologies can vary significantly between organizations. The study may not fully account for this disparity, affecting how HR analytics is perceived and applied.

RESEARCH METHODOLOGY**Research Design**

The research design adopted for this study is a Descriptive Research Design. This type of research is primarily concerned with describing the characteristics or behaviors of the subjects involved in the study. It aims to accurately represent the participants' perceptions, opinions, and responses toward the subject under investigation. In the context of this project, descriptive research is used to examine and portray the responses of employees working in the IT sector regarding performance appraisal systems and their impact on employee performance. This design allows the researcher to collect detailed data from the respondents through a structured questionnaire and to analyze that

**Ajay Krishnan and Sathish Kumar**

data to identify trends, patterns, and relationships among the variables studied. The study is structured to enable the researcher to explore the link between performance appraisal processes, perceptions of fairness, satisfaction with past reviews, and employee outcomes such as work attitude and skill improvement.

Sources of Data Collection

This project collected data primarily through questionnaires distributed to IT employees. The study relies on primary data from the respondents by asking them a structured set of questions designed to assess their views and experiences with performance appraisal systems. The questionnaire was administered to employees in various roles across the IT sector, and their responses formed the core data set for the study. This direct data collection method ensured that the researcher could capture authentic, firsthand insights into how performance appraisal systems are perceived and how they impact employee performance.

Sampling Methods

The sampling technique used for this study is the Convenience Sampling Method, a type of non-probability sampling. In this method, the sample is drawn from a group of people who are easy to access and willing to participate. The respondents were selected based on their availability and proximity to the researcher, making it a practical approach for collecting data within a limited timeframe and resource constraints. Convenience sampling is beneficial in exploratory research where the goal is to gather preliminary insights quickly. In this study, the researcher efficiently collected responses from IT sector employees to understand their perceptions of performance appraisal systems and how these impact their work performance.

Tools For Analysis

A combination of statistical tools was employed to analyze the data collected through the structured questionnaire. These tools helped the researcher draw meaningful conclusions regarding the effect of performance appraisal on employee performance in the IT sector. The analysis was carried out using SPSS (Statistical Package for the Social Sciences), which provided a reliable platform for conducting various statistical tests and ensuring accurate interpretation of the data. One of the primary tools used in the study was the one-sample t-test, which was applied to determine whether the average response from the sample significantly differed from a hypothesized or expected value. This test helped assess employee perceptions about specific aspects of the performance appraisal system, such as fairness, satisfaction, and impact on skill development. The Chi-Square Test was also employed to examine relationships between categorical variables, such as demographic factors (e.g., age, experience, designation) and employee opinions about performance appraisal practices. This test helped to identify whether there were significant associations between employee characteristics and their views on the appraisal process. The study used One-Way Analysis of Variance (ANOVA) to compare employee responses across various groups. This statistical tool allowed the researcher to test whether employees from different departments or experience levels had significantly different views on how performance appraisal influenced their performance and motivation. In addition to these inferential tools, Percentage Analysis was used to summarize and interpret the distribution of responses for each survey question. This method provided insights into general trends and patterns among the respondents, such as the percentage of employees satisfied with their most recent appraisal or those who believed it contributed to their career growth. These analytical tools provided a comprehensive approach to examining the collected data. They enabled the researcher to evaluate the impact of performance appraisal practices on various performance outcomes while ensuring that the findings were statistically valid and applicable to the broader IT sector.

Data Analysis And Interpretation**One-Way Anova Test****Question**

The two questions used in one-way ANOVA are receiving an increment after performance appraisal and level of satisfaction.

**Ajay Krishnan and Sathish Kumar****Hypothesis**

Null hypothesis (H0): There is no significant difference between the receiving increment after performance appraisal and the level of satisfaction.

Alternate Hypothesis (H1): There is a significant difference between receiving an increment after performance appraisal and the level of satisfaction.

Output one-way ANOVA

Since the p-value (0.908) is greater than 0.05 at the 5 percent significance level, the null hypothesis is accepted and the alternative hypothesis is rejected. Hence, we can conclude that the receiving increment after performance appraisal is generally related to satisfaction.

One-Sampletest

The two questions used in one sample test are about employees' opinions on performance appraisal and receiving an increment after performance appraisal.

Hypothesis: Hypothesis

Null hypothesis (H0): There is no significant difference between the opinion of employees' performance appraisal and receiving an increment after performance appraisal.

Alternate Hypothesis (H1): There is no significant difference between the opinion of employees' performance appraisal and receiving an increment after performance appraisal.

Since the p-value (0.00) is greater than 0.05 at the 5 percent significance level, the null hypothesis is rejected and the alternative hypothesis is accepted. Hence, we can conclude that generally, employees' performance appraisal results in receiving an increment after the performance appraisal.

DISCUSSIONS AND INFERENCES

The data collected from 175 IT employees reveals significant insights into the effectiveness and perception of performance appraisal systems. The majority of respondents indicated that performance appraisals are closely linked to employee retention (47.7%), recruitment systems (42.5%), and organizational culture (36.2%). This suggests that employees view the appraisal process as more than just a performance review; it is seen as a mechanism that influences broader HR functions. When asked about the basis for performance appraisal, 39.9% of respondents reported that appraisals were based on total output. In comparison, 37% stated that behavioral efficiency was the key metric, and 23.1% believed it was a combination. This indicates a diverse understanding of measuring performance, with some organizations focusing more on quantifiable results and others on qualitative behavior. In terms of behavior change, only 9.8% of employees reported that performance appraisal "always" led to behavioral change, while 30.5% said "occasionally," and 28.7% said "sometimes." This reflects a moderate impact of appraisals on employee behavior, highlighting a possible gap between appraisal outcomes and actionable feedback or follow-up support. Satisfaction with performance appraisal ratings was largely positive, with 56.3% rating their last appraisal as "excellent" and 30.5% as "good." This suggests that most employees were satisfied with how their performance was evaluated. However, a small percentage remained neutral or less enthusiastic, indicating potential room for improvement in communication or fairness. A chi-square test was conducted to test the relationship between educational qualification and job designation. The test result showed a p-value of 0.144, greater than the standard significance level of 0.05. Hence, the null hypothesis was accepted, indicating no significant association between an employee's qualification and job designation. Furthermore, a one-way ANOVA was applied to assess whether there was a significant difference between employees receiving increments after appraisal and their satisfaction levels. The result indicated no statistically significant difference ($p = 0.908$), suggesting that increments alone may not significantly influence overall satisfaction with the appraisal system. Overall, the findings indicate that while

Ajay Krishnan and Sathish Kumar

performance appraisal is generally seen positively by employees and contributes to job satisfaction and organizational alignment, its impact on behavior and motivation is moderate. Moreover, there is a need to ensure that appraisal systems are transparent, development-focused, and consistently linked to outcomes that matter to employees, such as growth opportunities and skill development.

Diagrammatic Representation

Interpretation: From the above table, it is interpreted that 47.7% of respondents are in favor of retention of employees, 42.5% of them belong to the recruitment system, 36.2% of them belong to organizational culture, and 34.5% of them belong to motivation.

Inference: The majority (47.7%) of the respondents in my questionnaire hold the opinion on employee retention.

Interpretation: From the above table, it is interpreted that 0% of respondents are poor, 1.1% of them belong to not good, 12.1% of them belong to neutral, 30.5% of them belong to good, and 56.3% of them belong to excellent.

Inference: The majority (56.3%) of the respondents in my questionnaire were of Excellent.

Deliverables

The primary deliverables of this study include insights and empirical evidence on the effectiveness of performance appraisal systems as perceived by IT sector employees. The study comprehensively analyzes how performance appraisals influence employee attitudes, motivation, job satisfaction, and skill development. It also highlights the methods used in performance appraisal, employee satisfaction with these methods, and their perceived fairness. Additionally, the project offers valuable data through statistical tools such as Chi-square tests, ANOVA, and T-tests that support evidence-based conclusions. These findings are presented through detailed charts and tables, enabling clear interpretation and aiding HR decision-makers in refining their appraisal strategies. Another key deliverable is the identification of gaps in current appraisal systems, especially in linking appraisal outcomes to employee development and organizational goals. Recommendations for improvement based on employee feedback are also provided, making this study a practical resource for HR managers aiming to enhance performance management systems in the IT sector. Overall, this project contributes academically and serves as a guide for practitioners to improve the effectiveness and fairness of performance appraisal processes within their organizations.

Findings

From the questionnaire, the following points are noted

- The majority, 72.6% of the respondents of my questionnaire, are Male.
- Majority 70.9% of the respondents of my questionnaire belong to the age group of 20-35 years.
- The majority, 63.8% of the respondents of my questionnaire, belong to the qualified UG.
- The majority, 46.9% of the respondents of my questionnaire, belong to the middle level designation.
- The majority, 67.2% of the respondents to my questionnaire, belong to the technical departments.
- The majority, 37.4% of the respondents to my questionnaire, earn a salary of 2.5 – 5 lakhs.
- The majority, 47.4% of the respondents in my questionnaire, have 3-8 years of experience.
- The majority, 43.7% of the respondents of my questionnaire, hold the opinion on promoting employees.
- The majority, 56.7% of the respondents of my questionnaire, belong to the implementing grading method.
- Majority 69.1% of the respondents of my questionnaire belong to the receiving increment, yes.
- The majority, 40% of the respondents of my questionnaire, agree with the goals.
- The majority, 47.7% of the respondents to my questionnaire, hold the opinion on employee retention.
- Majority, 40.2% of the respondents of my questionnaire, strongly agree with the improvement of motivation and job satisfaction.
- The majority, 39.9% of the respondents of my questionnaire, belong to the basis of the total output
- The majority, 39.2% of my questionnaire respondents, blame supervisors' lack of communication.
- The majority, 66.1% of the respondents of my questionnaire, belong to Yes.
- The majority, 31% of my questionnaire respondents, belong to the partially neutral.
- The majority, 30.5% of the respondents of my questionnaire, belong to the occasional category.
- The majority, 33.1% of my questionnaire respondents, are somewhat satisfied.

**Ajay Krishnan and Sathish Kumar**

- The majority, 56.3% of the respondents to my questionnaire, are of Excellent.

Suggestions And Recommendations

From the above inference, the following things can be suggested

- The performance standards should be set in the planning session according to the employees' performance expectations, even though the employees' work changes.
- The organization should assign a qualified rater who should know what the employees are supposed to do.
- The rater in the organization should clearly explain how the employees can improve their performance.
- The rater in the organization should routinely provide feedback about the employees' work to improve their performance.
- The performance rating accuracy should reflect how much work the employees have done. The rater should help the employees understand how to evaluate and rate their performance.
- The employees should be allowed to seek an appeal for their performance rating if it is shown to be incorrect or unfair. Supervisors should give the same PPR ratings to all their subordinates to avoid resentment and rivalries.
- The rater in the organization should treat the employees with dignity.
- The supervisor in the organization should treat the employees with kindness.
- The employees are not satisfied with the most recent performance rating. Hence, the most recent performance rating should reflect how the employees did the job.
- The performance planning review process should help employees improve their job performance.
- The employees are not very satisfied with the support given by the supervisor, so the supervisor should provide more support and guidance to the employees.
- The employees have the lowest level of efficiency and effectiveness towards organizational commitment, hence the organization should provide training to improve the efficiency and effectiveness in their work.
- The employees lack leadership skills; hence, the organization should frequently conduct a training programme to improve their leadership skills. The fairness of performance appraisal and satisfaction with performance appraisal are related to the employees' skills and Commitment. Hence, it is recommended that the committed, skilled employees should invest additional efforts towards enhancing the company's position.

CONCLUSION

The study aims to analyze the effect of performance appraisal on employee performance in the IT sector. To achieve the aim, the researcher studied the literature on the related issues extensively and conducted a survey questionnaire among IT sector employees. It was found that the employees were fair about the performance appraisal. The employees are satisfied with their last performance rating. Fairness of performance appraisal and satisfaction with previous performance rating positively affect employees' work attitude and skill improvement. Hence, it is concluded that organizations and human resources practitioners view performance appraisal policy as an effective tool for human resources management. However, effective performance appraisal policy remains a practical challenge to managers and employees because of cognitive, motivational, and behavioural factors. At an organizational level, the performance appraisal policy impacts other human resources policies and organizational strategy. An organization's performance appraisal policy's effectiveness is a prerequisite for ensuring the success of its selection, training, and employee performance. In today's dynamic, social, economic, and political environment, there is a need for a rapid and effective performance appraisal system for the IT sector employees and their performance, and it will face the organizational changes at the strategic level.

ABSTRACT

Bioenhancers are the agents that can promote the efficacy and bioavailability of drugs atop accompanying administration. Gymnemic acid is a most important bioactive principle present in *Gymnema sylvestre* leaves. It has a wide range of pharmacological activities like antioxidant, anti-diabetic, hypolipidemic, helps in weight loss, used as cough remedy and also used in the treatment of various problems like malaria, laxative and stimulant. The potential gymnemic acid is having such poor bioavailability because of its poor water solubility. So these kinds of problems can be encountered by the smart combination of active principles with natural bioenhancers such as piperine, curcumin quercetin, glycyrrhizin, naringin, sinomenine, and genistein etc. So the display was arranged to develop the nanoparticles of isolated Gymnemic corrosive from *Gymnema sylvestre* takes off combined with the common bioenhancer piperine utilizing PLGA polymer by the Nanoprecipitation strategy. Gymnemic corrosive consolidated in PLGA nanoparticles utilizing Pluronic F-68 was found to have higher embodiment. For that detailing advancement reason the different parameters was considered such as concentration of gymnemic corrosive division, piperine and PLGA additionally we have considered the different arrangement parameters. Advance the orchestrated nanoparticles were characterised by their molecule estimate, morphology, shapes with the assistance of Transmission

electron microscopy pictures and invitro medicate discharge considers. It was watched that succeeded within the arrangement of gymnemic acid and piperine stacked PLGA nanoparticles having the cruel molecule measure is 174nm roughly and appeared the great efficiencies in embodiment 85%.

Keywords: Antidiabetic, bioenhancer, bioavailability, Piperine, Gymnemic acid.

INTRODUCTION

Ultramodern technology is a multidisciplinary field that has recently raised awareness of nanoscale drugs medications. Numerous ways that nanotechnology affects our lives are becoming more and clearer today. To better understand how the effects are appropriate to operate at a Nano position, many fields of inquiry have been reformulated with a nano perspective [1]. Agreeing to this point of view, inquire about into pharmaceutical legend and therapeutic revelations are reformulating to survey the probability of dispersion as a nanosystem. The effort of Paul Ehrlich (1854- 1915) presented the idea of nanoparticles through his difficult and longtime work on the recoloring of microscopic organisms and napkins. His endeavors and his reliefs gave rise to the thought that centered conveyance may progress restorative treatment. Undoubtedly the morning he considered product like antibodies, but with pacing with the considers he proposed both nanoparticles and medication focusing on. He alluded to the medicine conveyance instrument utilized within the treatment as "enchantment pellets [2]. Numerous investigations conducted as of late appeared an increment in novel particles with troublesome physicochemical and biopharmaceutical components, such as constrained bioavailability, tall dependence on nourishment, destitute water solvency, or wavering tube conditions. These factors made it obvious that progress in medical treatment cannot be assured by the creation of a single new drug. Astronomically, organic and inorganic nanoparticles can be distinguished by their carbon basis. There are several ways to arrange the entirely carbon-based grounded nanoparticles, such as wastes, rods, and tubes. Fullerenes and carbon nanotubes are two of the most important types of carbon grounded Nanoparticles. Lipid- grounded NPs, Polymeric NPs, Semiconductor NPs, Pottery NPs; Essence NPs are the other types of nanoparticles [3]. Diverse styles can be utilized for the conflation of Nanoparticles, which are cosmically classified into two primary sorts comparable as

1. Foot- up methodology.
2. top-down methodology.

Based on the operation, response state, and accepted norms, these groups are encouraged to be divided into different types [4]. A variety of physicochemical techniques, including X-ray diffraction (XRD), X-ray photoelectron spectroscopy (XPS), infrared (IR), SEM, TEM, Brunauer – Emmett – Teller (Wagered), and flyspeck measurement analysis, are used to characterise nanoparticles. Nanoparticles produced in factories are widely employed in biomedical procedures. The primary sources of diverse phytoconstituents with several biomedical applications are stores. A rapidly expanding science, nanotechnology is crucial to nearly every aspect of modern knowledge, medicine, and technology. The industrial sources used for nanoparticle conflation, characterisation, and their activities are outlined in this chapter. Colourful shapes of nanoparticles are blended with plant components like takes off, natural products, seeds, stalks, blossoms, roots, dinghies, and natural product peels. The high-tech, eco-friendly, low-cost stores are really useful to human activities [5].

MATERIALS AND METHODS

Materials

Gymnema sylvestre leaves were used to isolate the gymnemic acid fraction, piperine isolated from black pepper, which was collected as a gift sample from the Himalayas, Bangalore. Methanol, acetone, pluronic F 68 were purchased from Merck. PLGA was purchased from Sigma-Aldrich.

Preformulation studies

Creation of a gymnemic acid calibration curve in buffer solutions with pH values of 1.2, 6.8, and 7.4

In all three 100 ml volumetric measuring utensils, a precisely measured quantity of gymnemic acid (100 mg) was broken down in a small volume of methanol. The volume was then acclimated to 100 ml using 1.2 pH buffer in the volumetric beaker, 7.4 pH buffer in the substitute volumetric measuring utensil, and 6.8 pH buffer in the third one. Absorbance was measured at 290 nm, and an estimation chart was created using concentration versus absorbance. A standard result arrangement with 10 to 50 µg/ml of gymnemic corrosive was used for the 1.2 pH buffer result, 7.4 pH buffer result, and 6.8 pH buffer result independently [6].

Compatibility analysis between drug and excipient by DSC

Differential scanning calorimetry (DSC)

DSC analyses were performed on pure PLGA and separated GAF from *Gymnema sylvestre* leaves to identify the melting point peak and determine the physical state of Gymnemic acid in the generated NPs. NPs that had been loaded with the drug were then analysed. Shimadzu's DSC-60 Instrument, located in Tokyo, Japan, was used to determine the tests' warm research. Under nitrogen environment, the experiments were heated at an average of 10 °C per minute from room temp to 35 °C [7].

METHOD OF PREPARATION

GAF-P-PLGA Nanoparticles Using the Method of Nanoprecipitation

100, 150, and 200 mg of gymnemic acid, piperine, and PLGA were dissolved in 20 millilitres of acetone in order to create coloured attention. At room temperature, 20 millilitres in water containing Pluronic F-68 (2 outcomes) were mixed with the following gymnemic acid-piperine & PLGA findings at a rate of 10 millilitres per minute. Acetone faded at low pressure, as shown in the findings below. A centrifuge was used to separate the waterless colloidal combination of piperine and gymnemic acid nanoparticles. Gymnemic acid-piperine-filled PLGA nanoparticles were obtained by lyophilising the colloidal medication. The impact of polymer concentration on drug loading capacity and encapsulation efficiency was examined. Different batches of videlicet (GNP1, GNP2, and GNP3) were produced by altering the polymeric rate and medication [8].

Characterization Studies

Particle size and Surface charge

Flyspeck adhesion and cell commerce depend on surface charge. The cell face charged viscosity is ultimately measured using the zeta-potential. The Malveran-master sizer may be used to measure it. Photon correlation spectroscopy (PCS) and a The Zeta sizers were used to measure the set of nanoparticles' surface charges and particle size. To obtain an appropriate kg counts per second (kcps), the phrasings were corrupted to 11000 using the waterless part of the phrase. The analysis was conducted at a 90° angle of discovery and at 25°C. Six separate measurements were taken for this dimension in this trial. The findings were presented in the section titled " Discussion& Results." [9].

Drug content

Nanoparticles of gymnemic acid and piperine were weighed out at 1 g were put into a 25 ml volumetric standard beaker after being directly counted. 5 ml of pH6.8 phosphate buffer were used to dissolve the material A 25 ml beaker was prepared by adding 1g of gymnemic acid-piperine nanoparticles. 5 ml of pH 6.8 phosphate buffer were used to dissolve the substance, and the buffer's volume was increased to 25 millilitres. By mixing 1 millilitre of buffer solution with 25 millilitres, this result was polluted. Additionally, a UV-Visible spectrophotometer was used to measure the absorbances of the standard as well as sample at 290 nm. It was calculated how likely it was to have medication [10].

Nirmala et al.,

$$\text{Drug content (\%)} = \frac{\text{Weight of drug in nanoparticles} \times 100}{\text{Weight of nanoparticles}}$$

The findings were presented in the section titled " Discussion & Results."

Entrapment efficiency

The drug-loaded nanoparticles were centrifuged at 15,000 rpm for 30 minutes. After contaminating one millilitre of the liquid leftover with water, the absorbance was determined at 290 nanometres. It was measured how much gymnemic acid-piperine was lost to the supernatant. The amount of entangled gymnemic acid-piperine was determined by deducting the value for free, unentrapped gymnemic acid-piperine from the total amount of gymnemic acid-piperine taken for the therapy [11].

The following formula was used to determine usage effectiveness.

$$\text{Drug entrapment(\%)} = \frac{\text{mass of drug in nanoparticles} \times 100}{\text{mass of drug used in formulation}}$$

The findings were presented in the section titled " Discussion & Results."

In vitro release

Using the Franz prolixity cell, the generated gymnemic acid-piperine nanoparticle formulations were positioned in a dialysis membrane for a whole day. The produced formulations of gymnemic acid-piperine nanoparticles were submerged in a dialysis membrane containing a pH 6.8 phosphate buffer. A UV-Visible spectrophotometer was used to measure the absorbance at 290 nm following sample extraction at predetermined intervals in order to determine the amount of liberated gymnemic acid-piperine. To determine the accretive probability of drug release, absorbance measurements were employed [12]. The findings were presented in the section titled " Discussion & Results."

RESULTS

Creation of a calibration graph for piperine-gymnemic acid nanoparticles.

Use the usual estimation values for gymnemic acid. A stock solution of the separated gymnemic acid fraction was prepared to be measured at 290 nm after a precise amount of the sample was diluted in pH 1.2, 7.4, and 6.8 buffers to generate the calibration curve. The linearity of the calibration curve was performed by the correlation coefficient.

DSC analysis

DSC assessed the possibility of physical interaction between the PLGA, piperine, and GAF included in the NP formulation (Figure 2). The medication may be in a crystalline form, as evidenced by the endothermic peak in the thermogram of isolated GAF at 198.88 °C, which corresponds to its melting point and disintegration. The lack of a distinct peak in the loaded NPs' thermogram may indicate that the NP formulation included no crystalline medication. This shows that the drug is now in its amorphous form¹³ after its crystal form was decreased in the prepared NP. FurthermoreThe lack of a melting point verified that the pure PLGA polymer was amorphous.

Accelerated compatibility research of drugs and excipients, physical observation, and test

No colour change was noticed when the physical parameters of the pharmaceutical excipient admixture were analysed. The chemical analysis revealed that there was no appreciable change, indicating that the drug is compatible with the extra constituents. Table 2-5 presented the study's findings.

**Nirmala et al.,****Physical attributes of specific medications and excipients**

No colour change was noticed when the physical parameters of the pharmaceutical excipient admixture were analysed. Based on the chemical examination, it was determined that no discernible change occurred, suggesting that the medication is compatible with the additional ingredients.

Particle Size, Zeta Potential and Entrapment efficiency

The findings of entrapment efficiency, zeta potential, and particle size were shown in a table. Entrapment efficiencies are thought to be as important a factor as the medications' initial burst release, which contributes to their persistent release characteristic. With loading capacities, gymnemic acid nanoparticles have demonstrated entrapment efficiencies of $58.34 \pm 0.65\%$, $70.76 \pm 0.71\%$, and 85.64 ± 0.35 .

The results were tabulated in table 6.

mean \pm S.D, n=3

The results indicated that -18.7 ± 0.43 mV was the maximum zeta potential value for GNP3. It was also once found that no considerable interchange of particle sizes occurred.

In vitro drug Release Study

The effects of the formulations of gymnemic acid-piperine nanoparticles (GNP1-GNP3) on drug release were examined in vitro. With a drug release rate of 99.840.29 at the end of 24 hours, experiment GNP3, which contains 200 mg of PLGA and 100 mg of piperine, had the highest rate. The results of the 24 hours showed that the in vitro drug launches for GNP1, GNP2, and GNP3 were 99.820.86, 99.820.88, and 99.840.29, respectively. The different PLGA concentrations used for the experimental batches GNP1, GNP2, and GNP3 were 100, 150, and 200 mg, respectively. The different PLGA concentrations used for the experimental batches GNP1, GNP2, and GNP3 were 100, 150, and 200 mg, respectively. According to findings on the in vitro drug release of GNP1 to GNP3, PLGA awareness is necessary for the proportional release of coordinated Gymnemic acid-piperine nanoparticles. Out of all the experimental batches, gymnemic acid-piperine nanoparticles GNP3 were selected as the best system for comparison comparative analysis because of their best particle size, zeta practicable and good entrapment efficacy, and greatest drug release.

SUMMARY AND CONCLUSION

To move forward understanding compliance and anticipate dreary organization, phytotherapeutics requires a modern logical procedure to disseminate the home grown solutions over an expanded period of time. This may be fulfilled by making inventive sedate conveyance frameworks. 14, 15 One such method that lowers toxicity and increases bioavailability in addition to lowering the need for repeated dosages is nanotechnology. The drug therapeutic index was improved by delivered the drug only at the specific sites uniform distribution through the blood stream. Because nanomaterials are similar in size to most biological molecules and structures, they can be useful for biomedical study and use both in vitro and in vivo. The primary active components of *Gymnema sylvestre*, a well-known antidiabetic plant, are gymnemic acid, gymnemagenin, stigmaterol, betaine, and choline. 16 Type II diabetes is one of the most common types of the condition, and it is well known that fat arises when the body's insulin is unable to absorb glucose [17]. This work aims to synthesise and produce gymnemic acids using the natural bioenhancer Piperine nanoparticle using PLGA polymer in order to improve the bioavailability and therapeutic effectiveness. Preformulation investigations, including physicochemical characteristics and drug excipient compatibility tests employing differential scanning calorimetry, were first finished for this formulation. According to the DSC analysis, the medication, bioenhancer, and polymer are all compatible. The gymnemic acid fraction and bioenhancer piperine-loaded PLGA nanoparticles were made using the nanoprecipitation technique [18, 19]. The produced nanoparticles' physicochemical characteristics were noted. Zeta sizer was used to estimate the particle size and surface charge. The particles size was observed from 175.65 ± 1.02 , 178.84 ± 0.78 and 174.78 ± 0.56 respectively GNP 1, GNP 2 and GNP3 respectively. The zetapotential of the GNP1, GNP2 and GNP 3 were observed as -18.7 ± 0.43 , -17.8 ± 0.98 and -17.6 ± 0.56 respectively. Gymnemic acid nanoparticles GNP1, GNP2 and GNP 3 have shown entrapment

**Nirmala et al.,**

efficiency $58.34 \pm 0.65\%$, $70.76 \pm 0.71\%$ and 85.64 ± 0.35 with high loading capacities. Further the synthesised nanoparticles were subjected for HR TEM analysis. Based on the above observations GNP 3 was selected for the studies.

ACKNOWLEDGEMENT

The authors are very much thankful to the Vels institute of science, technology and advanced studies for providing the support to carryout this research work for my PhD Degree.

ABSTRACT

In this paper, we introduce a R -cubic e -continuous mapping in R order cubic topological spaces. Also, we discuss about nearby open sets, their properties and examples of it. Moreover, we look into some of their primary properties and examples of R -cubic e -continuous in a R order cubic topological space.

Keywords: R -cubic e -continuous, R -cubic $\delta\mathcal{S}$ -continuous, R -cubic $\delta\mathcal{P}$ -continuous, R -cubic e^* -continuous, R -cubic a -continuous

AMS (2000) subject classification: 03E72, 54A10, 54A40

INTRODUCTION

Fuzzy set was developed by Zadeh in 1965 [14]. After introduction of fuzzy set, The theory of fuzzy has explored in many applied branches of sciences. i.e, Information science, Decision making theory, Artificial intelligence etc. In 1975 [15], Zadeh made an extension of the concept of a fuzzy set by an interval-valued fuzzy set. Interval-valued fuzzy sets have been actually used in real-life applications. For example, Sambuc [13] in Medical diagnosis in thyroid pathology, Kohout [10] also in Medicine, Fuzzy set has many extensions i.e, Intuitionistic fuzzy set (in brief, IFS) [2], Bipolar fuzzy set (in brief, BFS) [16], Cubic set (in brief, CS) [9]. Cubic set has applied to many branches of mathematics. Cubic set and operation on cubic sets was introduced by Y.B.Jun in 2012 [9] and Fuzzy topological spaces was introduced by C. L. Chang in 1968 [3].

Vijayalakshmi et al.,

2 Preliminaries

The basic definitions and the properties of neutrosophic soft topological spaces are discussed in this section.

Definition 2.1 [15] A closed sub-interval of $I = [0,1]$ is called interval number. $a = [a^-, a^+]$ where $0 \leq a^- \leq a^+ \leq 1$. $[I]$ denotes the set of all interval numbers.

Definition 2.2 [15] Let X be a non-empty set. A function $A: X \rightarrow [I]$, from X to all interval number is called interval valued fuzzy set (IVFS) in X . $[I]^X$ denotes the set of all IVFS in X . $\forall A \in [I]^X$ and $x \in X$, $A(x) = [A^-(x), A^+(x)]$ is called degree of membership of x in A . individually $A^-: X \rightarrow I$ and $A^+: X \rightarrow I$ is Fuzzy set in X . Simply A^- is called lower fuzzy set and A^+ is called upper fuzzy set.

Definition 2.3 [9] Let X be a non-empty set, Then a structure $A = \{ \langle x, \mu(x), \lambda(x) \rangle / x \in X \}$ is cubic set in X in which μ is interval valued fuzzy set (IVFS) in X and λ is fuzzy set in X . Simply a cubic set is denoted by $A = \langle \mu, \lambda \rangle$ and C^X denotes the collection of all cubic sets in X .

Definition 2.4 [9] Let $X \neq \emptyset$, Then a cubic set $A = \langle \mu, \lambda \rangle$ is said to be internal cubic set (ICS) if $\mu^-(x) \leq \lambda(x) \leq \mu^+(x) \forall x \in X$.

Definition 2.5 [9] Let $X \neq \emptyset$, Then a cubic set $A = \langle \mu, \lambda \rangle$ is said to be an external cubic set (ECS) if $\lambda(x) \notin (\mu^-(x), \mu^+(x)) \forall x \in X$.

1. A cubic set $A = \langle \mu, \lambda \rangle$ in which $\mu(x) = 0$ and $\lambda(x) = 1$ (resp. $\mu(x) = 1$ and $\lambda(x) = 0$) $\forall x \in X$ is denoted by $\check{0}$ (resp. $\check{1}$).
2. A cubic set $A = \langle \mu, \lambda \rangle$ in which $\mu(x) = 0$ and $\lambda(x) = 0$ (resp. $\mu(x) = 1$ and $\lambda(x) = 1$) $\forall x \in X$ is denoted by $\hat{0}$ (resp. $\hat{1}$).

Let $A = \langle \mu, \lambda \rangle$ and $B = \langle \beta, \eta \rangle$ be two cubic sets in X , Then we define;

1. $A = B \Leftrightarrow \mu = \beta$ and $\lambda = \eta$
2. $A \subseteq_R B \Leftrightarrow \mu \subseteq \beta$ and $\lambda \geq \eta$
3. $A^c = \langle \mu^c, 1 - \lambda \rangle = \{ \langle x, \mu^c(x), 1 - \lambda(x) \rangle / x \in X \}$
4. $(A^c)^c = A$
5. $\check{0}^c = \check{1}$ and $\check{1}^c = \check{0}$
6. $\hat{0}^c = \hat{1}$ and $\hat{1}^c = \hat{0}$
7. R-Union $\bigcup_{i \in \mathbb{N}} A = \{ \langle x, (\bigcup_{i \in \mathbb{N}} \mu_i)(x), (\bigwedge_{i \in \mathbb{N}} \lambda_i)(x) \rangle / x \in X \}$
8. R-Intersection $\bigcap_{i \in \mathbb{N}} A = \{ \langle x, (\bigcap_{i \in \mathbb{N}} \mu_i)(x), (\bigvee_{i \in \mathbb{N}} \lambda_i)(x) \rangle / x \in X \}$

Definition 2.6 [1] A R-cubic topology is the family \mathcal{F}_R of cubic sets in X which satisfies the following conditions;

1. $\check{0}, \hat{0}, \check{1}, \hat{1} \in \mathcal{F}_R$.
2. Let $A_i \in \mathcal{F}_R$, Then $\bigcup_R A_i \in \mathcal{F}_R, i \in \mathbb{N}$
3. Let $A, B \in \mathcal{F}_R$, Then $A \cap_R B \in \mathcal{F}_R$.

The pair (X, \mathcal{F}_R) is called R-cubic topological space (in brief, $Rcts$).

Definition 2.7 [11] A set R is said to be a R-order Cubic set (in brief, CS_R)

1. regular open set (briefly, $CS_R \delta ros$) if $R = CS_R int(CS_R clR)$.
2. regular closed set (briefly, $CS_R \delta rcs$) if $R = CS_R cl(CS_R intR)$.

Definition 2.8 [11] A set R is said to be a R-order Cubic set

1. interior (resp. δ interior) of R (briefly, $CS_R intR$ (resp. $CS_R \delta int$)) is defined by $CS_R intR$ (resp. $CS_R \delta int$) = $\bigcup \{ \tilde{G} : \tilde{G} \subseteq R \text{ \& } \tilde{G} \text{ is a } CS_R os \text{ (resp. } CS_R \delta os) \text{ in } X \}$.
2. closure (resp. δ closure) of R (briefly, $CS_R clR$ (resp. $CS_R \delta cl$)) is defined by $CS_R clR$ (resp. $CS_R \delta cl$) = $\bigcap \{ \tilde{G} : \tilde{G} \supseteq R \text{ \& } \tilde{G} \text{ is a } CS_R cs \text{ (resp. } CS_R \delta cs) \text{ in } X \}$.

Definition 2.9[11] A set R is said to be a R-order Cubic set

1. β open set (briefly, $CS_R \beta os$) if $R \subseteq CS_R cl(CS_R int(CS_R clR))$.

Vijayalakshmi et al.,

Definition 2.10[12] A set R is said to be a CS_R

1. δ -pre open set (briefly, $CS_R\delta\mathcal{P}os$) if $R \subseteq CS_R int(CS_R\delta clR)$.
2. δ -semi open set (briefly, $CS_R\delta\mathcal{S}os$) if $R \subseteq CS_R cl(CS_R\delta intR)$.
3. e -open set (briefly, CS_Reos) if $R \subseteq CS_R cl(CS_R\delta intR) \cup CS_R int(CS_R\delta clR)$.
4. e^* -open set (briefly, CS_Re^*os) if $R \subseteq CS_R cl(CS_R int(CS_R\delta clR))$.
5. a -open set (briefly, CS_Raos) if $R \subseteq CS_R int(CS_R cl(CS_R\delta intR))$.

The complement of a CS_Re -open set (resp. $CS_R\delta os$, $CS_R\delta\mathcal{P}os$, $CS_R\delta\mathcal{S}os$ & CS_Re^*os) is called a cubic e - (resp. δ , δ -pre, δ -semi & e^*) closed set (briefly, CS_Recs (resp. $CS_R\delta cs$, $CS_R\delta\mathcal{P}cs$, $CS_R\delta\mathcal{S}cs$ & CS_Re^*cs)) in X .

The family of all $CS_R\delta\mathcal{P}os$ (resp. $CS_R\delta\mathcal{P}cs$, $CS_R\delta\mathcal{S}os$, $CS_R\delta\mathcal{S}cs$, CS_Reos , CS_Recs , CS_Re^*os & CS_Re^*cs) of X is denoted by $CS_R\delta\mathcal{P}OS(X)$ (resp. $CS_R\delta\mathcal{P}CS(X)$, $CS_R\delta\mathcal{S}OS(X)$, $CS_R\delta\mathcal{S}CS(X)$, $CS_ReOS(X)$, $CS_ReCS(X)$, $CS_Re^*OS(X)$ & $CS_Re^*CS(X)$).

Definition 2.11 [12] A set R is said to be a CS_R

1. e interior (resp. δ pre interior & δ semi interior) of R (briefly, CS_ReintR (resp. $CS_R\delta\mathcal{P}int$ & $CS_R\delta\mathcal{S}int$)) is defined by CS_ReintR (resp. $CS_R\delta\mathcal{P}int$ & $CS_R\delta\mathcal{S}int$) = $\cup \{ \tilde{G} : \tilde{G} \subseteq R \text{ \& } \tilde{G} \text{ is a } CS_Reos \text{ (resp. } CS_R\delta\mathcal{P}os \text{ \& } CS_R\delta\mathcal{S}os) \text{ in } X \}$.
2. e closure (resp. δ pre closure & δ semi closure) of R (briefly, CS_ReclR (resp. $CS_R\delta\mathcal{P}cl$ & $CS_R\delta\mathcal{S}cl$)) is defined by CS_ReclR (resp. $CS_R\delta\mathcal{P}cl$ & $CS_R\delta\mathcal{S}cl$) = $\cap \{ \tilde{G} : R \subseteq \tilde{G} \text{ \& } R \text{ is a } CS_Recs \text{ (resp. } CS_R\delta\mathcal{P}cs \text{ \& } CS_R\delta\mathcal{S}cs) \text{ in } X \}$.

Definition 2.12 [11] Let (X, \mathcal{F}_R) and (Y, \mathcal{G}_p) be any two cubic topological spaces. A map $f: (X, \mathcal{F}_R) \rightarrow (Y, \mathcal{G}_p)$ is said to be CS_R

1. continuous (briefly, $CS_R\mathcal{C}ts$) if the inverse image of every CS_Ros in (Y, \mathcal{G}_p) is a CS_Ros in (X, \mathcal{F}_R) .
2. β -continuous (briefly, $CS_R\beta\mathcal{C}ts$) if the inverse image of every CS_Ros in (Y, \mathcal{G}_p) is a $CS_R\beta os$ in (X, \mathcal{F}_R) .

3 R-order e-open Continuous in Cubic Topological Spaces

In this section we introduce neutrosophic soft e -continuous maps and study some of its properties.

Definition 3.1 Let (X, \mathcal{F}_R) and (Y, \mathcal{F}'_p) be any two $NSts$'s. A map $f: (X, \mathcal{F}_R) \rightarrow (Y, \mathcal{G}_p)$ is said to be CS_R

1. $\delta\mathcal{S}$ -continuous (briefly, $CS_R\delta\mathcal{S}\mathcal{C}ts$) if the inverse image of every CS_Ros in (Y, \mathcal{G}_p) is a $CS_R\delta\mathcal{S}os$ in (X, \mathcal{F}_R) .
2. $\delta\mathcal{P}$ -continuous (briefly, $CS_R\delta\mathcal{P}\mathcal{C}ts$) if the inverse image of every CS_Ros in (Y, \mathcal{G}_p) is a $CS_R\delta\mathcal{P}os$ in (X, \mathcal{F}_R) .
3. e -continuous (briefly, $CS_Re\mathcal{C}ts$) if the inverse image of every CS_Ros in (Y, \mathcal{G}_p) is a CS_Reos in (X, \mathcal{F}_R) .
4. e^* -continuous (briefly, $CS_Re^*\mathcal{C}ts$) if the inverse image of every CS_Ros in (Y, \mathcal{G}_p) is a CS_Re^*os in (X, \mathcal{F}_R) .
5. a -continuous (briefly, $CS_Ra\mathcal{C}ts$) if the inverse image of every CS_Ros in (Y, \mathcal{G}_p) is a CS_Raos in (X, \mathcal{F}_R) .

Proposition 3.1 The statements are hold but the converse does not true. Every

1. $CS_R\mathcal{C}ts$ is a $CS_R\delta\mathcal{S}\mathcal{C}ts$.
2. $CS_R\mathcal{C}ts$ is a $CS_R\delta\mathcal{P}\mathcal{C}ts$.
3. $CS_R\delta\mathcal{S}\mathcal{C}ts$ is a $CS_Re\mathcal{C}ts$.
4. $CS_R\delta\mathcal{P}\mathcal{C}ts$ is a $CS_Re\mathcal{C}ts$.
5. $CS_Re\mathcal{C}ts$ is a $CS_Re^*\mathcal{C}ts$.
6. $CS_Re\mathcal{C}ts$ is a $CS_Ra\mathcal{C}ts$.
7. $CS_Ra\mathcal{C}ts$ is a $CS_R\beta\mathcal{C}ts$.
8. $CS_R\beta\mathcal{C}ts$ is a $CS_Re^*\mathcal{C}ts$.

Proof.

1. Let \mathfrak{M} be a CS_Ros in Y . Since f is $CS_R\mathcal{C}ts$, $f^{-1}(\mathfrak{M})$ is CS_Ros in X . Since all CS_Ros are $CS_R\delta\mathcal{S}os$, $f^{-1}(\mathfrak{M})$ is $CS_R\delta\mathcal{S}os$ in X . Hence f is a $CS_R\delta\mathcal{S}\mathcal{C}ts$.
2. Let \mathfrak{M} be a CS_Ros in Y . Since f is $CS_R\mathcal{C}ts$, $f^{-1}(\mathfrak{M})$ is CS_Ros in X . Since all CS_Ros are $CS_R\delta\mathcal{P}os$, $f^{-1}(\mathfrak{M})$ is $CS_R\delta\mathcal{P}os$ in X . Hence f is a $CS_R\delta\mathcal{P}\mathcal{C}ts$.
3. Let \mathfrak{M} be a CS_Ros in Y . Since f is $CS_R\delta\mathcal{S}\mathcal{C}ts$, $f^{-1}(\mathfrak{M})$ is a $CS_R\delta\mathcal{S}os$ in X . Since every $CS_R\delta os$ is a CS_Reos , $f^{-1}(\mathfrak{M})$ is a CS_Reos in X . Hence f is a $CS_Re\mathcal{C}ts$.

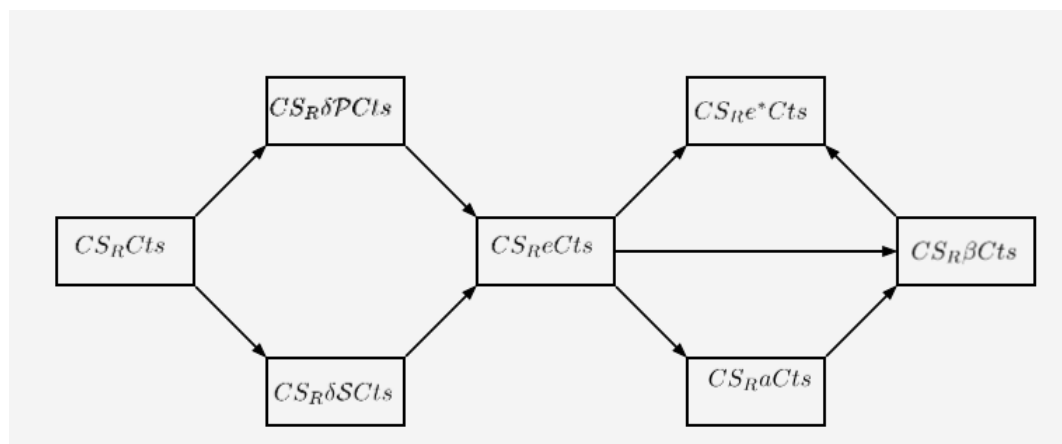

Vijayalakshmi et al.,

4. Let \mathfrak{M} be a $CS_{R}os$ in Y . Since f is $CS_{R}\delta PCts$, $f^{-1}(\mathfrak{M})$ is a $CS_{R}\delta P os$ in X . Since every $CS_{R}\delta P os$ is a $CS_{R}eos$, $f^{-1}(\mathfrak{M})$ is a $CS_{R}eos$ in X . Hence f is a $CS_{R}eCts$.
5. Let \mathfrak{M} be a $CS_{R}os$ in Y . Since f is $CS_{R}eCts$, $f^{-1}(\mathfrak{M})$ is a $CS_{R}eos$ in X . Since every $CS_{R}eos$ is a $CS_{R}e^*os$, $f^{-1}(\mathfrak{M})$ is a $CS_{R}e^*os$ in X . Hence f is a $CS_{R}e^*Cts$.
6. Let \mathfrak{M} be a $CS_{R}os$ in Y . Since f is $CS_{R}eCts$, $f^{-1}(\mathfrak{M})$ is a $CS_{R}aos$ in X . Since every $CS_{R}eos$ is a $CS_{R}aos$, $f^{-1}(\mathfrak{M})$ is a $CS_{R}aos$ in X . Hence f is a $CS_{R}aCts$.
7. Let \mathfrak{M} be a $CS_{R}os$ in Y . Since f is $CS_{R}aCts$, $f^{-1}(\mathfrak{M})$ is a $CS_{R}\beta os$ in X . Since every $CS_{R}aos$ is a $CS_{R}\beta os$, $f^{-1}(\mathfrak{M})$ is a $CS_{R}\beta os$ in X . Hence f is a $CS_{R}\beta Cts$.
8. Let \mathfrak{M} be a $CS_{R}os$ in Y . Since f is $CS_{R}\beta Cts$, $f^{-1}(\mathfrak{M})$ is a $CS_{R}e^*os$ in X . Since every $CS_{R}\beta os$ is a $CS_{R}e^*os$, $f^{-1}(\mathfrak{M})$ is a $CS_{R}e^*os$ in X . Hence f is a $CS_{R}e^*Cts$.

Remark 3.1 We obtain the following diagram from the results we discussed above and justified from the following examples.

Example 3.1 Let X be a non-empty set and let $\mathcal{F}_R = \{\check{0}, \hat{0}, \check{1}, \hat{1}, \mu_1, \mu_2, \mu_3, \mu_4, \mu_5, \mu_6, \mu_7, \mu_8, \mu_9, \mu_{10}\}, \mathcal{F}'_R = \{\check{0}, \hat{0}, \check{1}, \hat{1}, \mu_{11}, \mu_{12}, \mu_{13}, \mu_{14}, \mu_{15}, \mu_{16}\}$ be two P -cubic topologies on X where $\mu_1 = \langle [0,0], 0.4 \rangle, \mu_2 = \langle [0,0], 0.7 \rangle, \mu_3 = \langle [0.2, 0.3], 0 \rangle, \mu_4 = \langle [0.2, 0.3], 0.4 \rangle, \mu_5 = \langle [0.2, 0.3], 1 \rangle, \mu_6 = \langle [0.5, 0.6], 0 \rangle, \mu_7 = \langle [0.5, 0.6], 0.7 \rangle, \mu_8 = \langle [0.5, 0.6], 1 \rangle, \mu_9 = \langle [1, 1], 0.4 \rangle, \mu_{10} = \langle [1, 1], 0.1 \rangle, \mu_{11} = \langle [0.4, 0.6], 0.8 \rangle, \mu_{12} = \langle [0.3, 0.5], 1 \rangle, \mu_{13} = \langle [0.4, 0.5], 0.3 \rangle, \mu_{14} = \langle [0.8, 0.9], 0.6 \rangle, \mu_{15} = \langle [0.1, 0.4], 0.5 \rangle, \mu_{16} = \langle [0.2, 0.5], 0.1 \rangle$. Define an identity mapping $f_R: (X, \mathcal{F}_R) \rightarrow (X, \mathcal{F}'_R)$. Here f_R is $CS_{R}\delta PCts$ but not a $CS_{R}Cts$, since μ_{11} is $CS_{R}\delta S os$ but not $CS_{R}os$ in (X, \mathcal{F}_R) .

Example 3.2 Let X be a non-empty set and let $\mathcal{F}_R = \{\check{0}, \hat{0}, \check{1}, \hat{1}, \mu_1, \mu_2, \mu_3, \mu_4, \mu_5, \mu_6, \mu_7, \mu_8, \mu_9, \mu_{10}\}, \mathcal{F}'_R = \{\check{0}, \hat{0}, \check{1}, \hat{1}, \mu_{11}, \mu_{12}, \mu_{13}, \mu_{14}, \mu_{15}, \mu_{16}\}$ be two P -cubic topologies on X where $\mu_1 = \langle [0,0], 0.4 \rangle, \mu_2 = \langle [0,0], 0.7 \rangle, \mu_3 = \langle [0.2, 0.3], 0 \rangle, \mu_4 = \langle [0.2, 0.3], 0.4 \rangle, \mu_5 = \langle [0.2, 0.3], 1 \rangle, \mu_6 = \langle [0.5, 0.6], 0 \rangle, \mu_7 = \langle [0.5, 0.6], 0.7 \rangle, \mu_8 = \langle [0.5, 0.6], 1 \rangle, \mu_9 = \langle [1, 1], 0.4 \rangle, \mu_{10} = \langle [1, 1], 0.1 \rangle, \mu_{11} = \langle [0.4, 0.6], 0.8 \rangle, \mu_{12} = \langle [0.3, 0.5], 1 \rangle, \mu_{13} = \langle [0.4, 0.5], 0.3 \rangle, \mu_{14} = \langle [0.8, 0.9], 0.6 \rangle, \mu_{15} = \langle [0.1, 0.4], 0.5 \rangle, \mu_{16} = \langle [0.2, 0.5], 0.1 \rangle$. Define an identity mapping $f_R: (X, \mathcal{F}_R) \rightarrow (X, \mathcal{F}'_R)$. Here f_R is $CS_{R}\delta SCts$ but not a $CS_{R}Cts$, since μ_{12} is $CS_{R}\delta S os$ but not $CS_{R}os$ in (X, \mathcal{F}_R) .

Example 3.3 Let X be a non-empty set and let $\mathcal{F}_R = \{\check{0}, \hat{0}, \check{1}, \hat{1}, \mu_1, \mu_2, \mu_3, \mu_4, \mu_5, \mu_6, \mu_7, \mu_8, \mu_9, \mu_{10}\}, \mathcal{F}'_R = \{\check{0}, \hat{0}, \check{1}, \hat{1}, \mu_{11}, \mu_{12}, \mu_{13}, \mu_{14}, \mu_{15}, \mu_{16}\}$ be two P -cubic topologies on X where $\mu_1 = \langle [0,0], 0.4 \rangle, \mu_2 = \langle [0,0], 0.7 \rangle, \mu_3 = \langle [0.2, 0.3], 0 \rangle, \mu_4 = \langle [0.2, 0.3], 0.4 \rangle, \mu_5 = \langle [0.2, 0.3], 1 \rangle, \mu_6 = \langle [0.5, 0.6], 0 \rangle, \mu_7 = \langle [0.5, 0.6], 0.7 \rangle, \mu_8 = \langle [0.5, 0.6], 1 \rangle, \mu_9 = \langle [1, 1], 0.4 \rangle, \mu_{10} = \langle [1, 1], 0.1 \rangle, \mu_{11} = \langle [0.4, 0.6], 0.8 \rangle, \mu_{12} = \langle [0.3, 0.5], 1 \rangle, \mu_{13} = \langle [0.4, 0.5], 0.3 \rangle, \mu_{14} = \langle [0.8, 0.9], 0.6 \rangle, \mu_{15} = \langle [0.1, 0.4], 0.5 \rangle, \mu_{16} = \langle [0.2, 0.5], 0.1 \rangle$. Define an identity mapping $f_R: (X, \mathcal{F}_R) \rightarrow (X, \mathcal{F}'_R)$. Here f_R is $CS_{R}eCts$ but not a $CS_{R}\delta PCts$, since μ_{13} is $CS_{R}eos$ but not $CS_{R}\delta P os$ in (X, \mathcal{F}_R) .

Vijayalakshmi et al.,

Example 3.4 Let X be a non-empty set and let $\mathcal{F}_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_1, \mu_2, \mu_3, \mu_4, \mu_5, \mu_6, \mu_7, \mu_8, \mu_9, \mu_{10}\}, \mathcal{F}'_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_{11}, \mu_{12}, \mu_{13}, \mu_{14}, \mu_{15}, \mu_{16}\}$ be two P -cubic topologies on X $\mu_1 = \langle [0,0], 0.4 \rangle, \mu_2 = \langle [0,0], 0.7 \rangle, \mu_3 = \langle [0.2, 0.3], 0 \rangle, \mu_4 = \langle [0.2, 0.3], 0.4 \rangle, \mu_5 = \langle [0.2, 0.3], 1 \rangle, \mu_6 = \langle [0.5, 0.6], 0 \rangle, \mu_7 = \langle [0.5, 0.6], 0.7 \rangle, \mu_8 = \langle [0.5, 0.6], 1 \rangle, \mu_9 = \langle [1, 1], 0.4 \rangle, \mu_{10} = \langle [1, 1], 0.1 \rangle, \mu_{11} = \langle [0.4, 0.6], 0.8 \rangle, \mu_{12} = \langle [0.3, 0.5], 1 \rangle, \mu_{13} = \langle [0.4, 0.5], 0.3 \rangle, \mu_{14} = \langle [0.8, 0.9], 0.6 \rangle, \mu_{15} = \langle [0.1, 0.4], 0.5 \rangle, \mu_{16} = \langle [0.2, 0.5], 0.1 \rangle$. Define an identity mapping $f_R: (X, \mathcal{F}_R) \rightarrow (X, \mathcal{F}'_R)$. Here f_R is $CS_R eCts$ but not a $CS_R \delta S Cts$, since μ_{14} is $CS_R eos$ but not $CS_R \delta S os$ in (X, \mathcal{F}_R) .

Example 3.5 Let X be a non-empty set and let $\mathcal{F}_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_1, \mu_2, \mu_3, \mu_4, \mu_5, \mu_6, \mu_7, \mu_8, \mu_9, \mu_{10}\}, \mathcal{F}'_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_{11}, \mu_{12}, \mu_{13}, \mu_{14}, \mu_{15}, \mu_{16}\}$ be two P -cubic topologies on X $\mu_1 = \langle [0,0], 0.4 \rangle, \mu_2 = \langle [0,0], 0.7 \rangle, \mu_3 = \langle [0.2, 0.3], 0 \rangle, \mu_4 = \langle [0.2, 0.3], 0.4 \rangle, \mu_5 = \langle [0.2, 0.3], 1 \rangle, \mu_6 = \langle [0.5, 0.6], 0 \rangle, \mu_7 = \langle [0.5, 0.6], 0.7 \rangle, \mu_8 = \langle [0.5, 0.6], 1 \rangle, \mu_9 = \langle [1, 1], 0.4 \rangle, \mu_{10} = \langle [1, 1], 0.1 \rangle, \mu_{11} = \langle [0.4, 0.6], 0.8 \rangle, \mu_{12} = \langle [0.3, 0.5], 1 \rangle, \mu_{13} = \langle [0.4, 0.5], 0.3 \rangle, \mu_{14} = \langle [0.8, 0.9], 0.6 \rangle, \mu_{15} = \langle [0.1, 0.4], 0.5 \rangle, \mu_{16} = \langle [0.2, 0.5], 0.1 \rangle$. Define an identity mapping $f_R: (X, \mathcal{F}_R) \rightarrow (X, \mathcal{F}'_R)$. Here f_R is $CS_R e^* Cts$ but not a $CS_R eCts$, since μ_{13} is $CS_R e^* os$ but not $CS_R eos$ in (X, \mathcal{F}_R) .

Example 3.6 Let X be a non-empty set and let $\mathcal{F}_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_1, \mu_2, \mu_3, \mu_4, \mu_5, \mu_6, \mu_7, \mu_8, \mu_9, \mu_{10}\}, \mathcal{F}'_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_{11}, \mu_{12}, \mu_{13}, \mu_{14}, \mu_{15}, \mu_{16}\}$ be two P -cubic topologies on X $\mu_1 = \langle [0,0], 0.4 \rangle, \mu_2 = \langle [0,0], 0.7 \rangle, \mu_3 = \langle [0.2, 0.3], 0 \rangle, \mu_4 = \langle [0.2, 0.3], 0.4 \rangle, \mu_5 = \langle [0.2, 0.3], 1 \rangle, \mu_6 = \langle [0.5, 0.6], 0 \rangle, \mu_7 = \langle [0.5, 0.6], 0.7 \rangle, \mu_8 = \langle [0.5, 0.6], 1 \rangle, \mu_9 = \langle [1, 1], 0.4 \rangle, \mu_{10} = \langle [1, 1], 0.1 \rangle, \mu_{11} = \langle [0.4, 0.6], 0.8 \rangle, \mu_{12} = \langle [0.3, 0.5], 1 \rangle, \mu_{13} = \langle [0.4, 0.5], 0.3 \rangle, \mu_{14} = \langle [0.8, 0.9], 0.6 \rangle, \mu_{15} = \langle [0.1, 0.4], 0.5 \rangle, \mu_{16} = \langle [0.2, 0.5], 0.1 \rangle$. Define an identity mapping $f_R: (X, \mathcal{F}_R) \rightarrow (X, \mathcal{F}'_R)$. Here f_R is $CS_R e^* Cts$ but not a $CS_R \beta Cts$, since μ_{16} is $CS_R e^* os$ but not $CS_R \beta os$ in (X, \mathcal{F}_R) .

Example 3.7 Let X be a non-empty set and let $\mathcal{F}_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_1, \mu_2, \mu_3, \mu_4, \mu_5, \mu_6, \mu_7, \mu_8, \mu_9, \mu_{10}\}, \mathcal{F}'_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_{11}, \mu_{12}, \mu_{13}, \mu_{14}, \mu_{15}, \mu_{16}\}$ be two P -cubic topologies on X $\mu_1 = \langle [0,0], 0.4 \rangle, \mu_2 = \langle [0,0], 0.7 \rangle, \mu_3 = \langle [0.2, 0.3], 0 \rangle, \mu_4 = \langle [0.2, 0.3], 0.4 \rangle, \mu_5 = \langle [0.2, 0.3], 1 \rangle, \mu_6 = \langle [0.5, 0.6], 0 \rangle, \mu_7 = \langle [0.5, 0.6], 0.7 \rangle, \mu_8 = \langle [0.5, 0.6], 1 \rangle, \mu_9 = \langle [1, 1], 0.4 \rangle, \mu_{10} = \langle [1, 1], 0.1 \rangle, \mu_{11} = \langle [0.4, 0.6], 0.8 \rangle, \mu_{12} = \langle [0.3, 0.5], 1 \rangle, \mu_{13} = \langle [0.4, 0.5], 0.3 \rangle, \mu_{14} = \langle [0.8, 0.9], 0.6 \rangle, \mu_{15} = \langle [0.1, 0.4], 0.5 \rangle, \mu_{16} = \langle [0.2, 0.5], 0.1 \rangle$. Define an identity mapping $f_R: (X, \mathcal{F}_R) \rightarrow (X, \mathcal{F}'_R)$. Here f_R is $CS_R \beta Cts$ but not a $CS_R eCts$, since μ_{15} is $CS_R \beta os$ but not $CS_R eos$ in (X, \mathcal{F}_R) .

Example 3.8 Let X be a non-empty set and let $\mathcal{F}_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_1, \mu_2, \mu_3, \mu_4, \mu_5, \mu_6, \mu_7, \mu_8, \mu_9, \mu_{10}\}, \mathcal{F}'_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_{11}, \mu_{12}, \mu_{13}, \mu_{14}, \mu_{15}, \mu_{16}\}$ be two P -cubic topologies on X $\mu_1 = \langle [0,0], 0.4 \rangle, \mu_2 = \langle [0,0], 0.7 \rangle, \mu_3 = \langle [0.2, 0.3], 0 \rangle, \mu_4 = \langle [0.2, 0.3], 0.4 \rangle, \mu_5 = \langle [0.2, 0.3], 1 \rangle, \mu_6 = \langle [0.5, 0.6], 0 \rangle, \mu_7 = \langle [0.5, 0.6], 0.7 \rangle, \mu_8 = \langle [0.5, 0.6], 1 \rangle, \mu_9 = \langle [1, 1], 0.4 \rangle, \mu_{10} = \langle [1, 1], 0.1 \rangle, \mu_{11} = \langle [0.4, 0.6], 0.8 \rangle, \mu_{12} = \langle [0.3, 0.5], 1 \rangle, \mu_{13} = \langle [0.4, 0.5], 0.3 \rangle, \mu_{14} = \langle [0.8, 0.9], 0.6 \rangle, \mu_{15} = \langle [0.1, 0.4], 0.5 \rangle, \mu_{16} = \langle [0.2, 0.5], 0.1 \rangle$. Define an identity mapping $f_R: (X, \mathcal{F}_R) \rightarrow (X, \mathcal{F}'_R)$. Here f_R is $CS_R \beta Cts$ but not a $CS_R \alpha Cts$, since μ_{13} is $CS_R \beta os$ but not $CS_R \alpha os$ in (X, \mathcal{F}_R) .

Example 3.9 Let X be a non-empty set and let $\mathcal{F}_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_1, \mu_2, \mu_3, \mu_4, \mu_5, \mu_6, \mu_7, \mu_8, \mu_9, \mu_{10}\}, \mathcal{F}'_R = \{\tilde{0}, \tilde{0}, \hat{1}, \mu_{11}, \mu_{12}, \mu_{13}, \mu_{14}, \mu_{15}, \mu_{16}\}$ be two P -cubic topologies on X $\mu_1 = \langle [0,0], 0.4 \rangle, \mu_2 = \langle [0,0], 0.7 \rangle, \mu_3 = \langle [0.2, 0.3], 0 \rangle, \mu_4 = \langle [0.2, 0.3], 0.4 \rangle, \mu_5 = \langle [0.2, 0.3], 1 \rangle, \mu_6 = \langle [0.5, 0.6], 0 \rangle, \mu_7 = \langle [0.5, 0.6], 0.7 \rangle, \mu_8 = \langle [0.5, 0.6], 1 \rangle, \mu_9 = \langle [1, 1], 0.4 \rangle, \mu_{10} = \langle [1, 1], 0.1 \rangle, \mu_{11} = \langle [0.4, 0.6], 0.8 \rangle, \mu_{12} = \langle [0.3, 0.5], 1 \rangle, \mu_{13} = \langle [0.4, 0.5], 0.3 \rangle, \mu_{14} = \langle [0.8, 0.9], 0.6 \rangle, \mu_{15} = \langle [0.1, 0.4], 0.5 \rangle, \mu_{16} = \langle [0.2, 0.5], 0.1 \rangle$. Define an identity mapping $f_R: (X, \mathcal{F}_R) \rightarrow (X, \mathcal{F}'_R)$. Here f_R is $CS_R eCts$ but not a $CS_R \alpha Cts$, since μ_{13} is $CS_R eos$ but not $CS_R \alpha os$ in (X, \mathcal{F}_R) .

Theorem 3.1 A map $f: (X, \mathcal{F}_R) \rightarrow (Y, \mathcal{G}_p)$ is $CS_R eCts$ iff the inverse image of each $CS_R cs$ in Y is $CS_R ecs$ in X .
Proof. Let \mathfrak{M} be a $CS_R cs$ in Y . This implies \mathfrak{M}^c is $CS_R os$ in Y . Since f is $CS_R eCts$, $f^{-1}(\mathfrak{M}^c)$ is $CS_R eos$ in X . Since $f^{-1}(\mathfrak{M}^c) = ((f^{-1}\mathfrak{M}))^c$, $f^{-1}(\mathfrak{M})$ is a $CS_R ecs$ in X .
 Conversely, let \mathfrak{M} be a $CS_R cs$ in Y . Then \mathfrak{M}^c is a $CS_R os$ in Y . By hypothesis $f^{-1}(\mathfrak{M}^c)$ is $CS_R eos$ in X . Since $f^{-1}(\mathfrak{M}^c) = ((f^{-1}\mathfrak{M}))^c$, $(f^{-1}\mathfrak{M})^c$ is a $CS_R eos$ in X . Therefore $f^{-1}(\mathfrak{M})$ is a $CS_R ecs$ in X . Hence f is $CS_R eCts$.

Definition 3.2 A $CS_{Rt}(X, \mathcal{F}_R)$ is said to be $CS_R eU_{\frac{1}{2}}$ (in short $CS_R eU_{\frac{1}{2}}$)-space, if every $CS_R eos$ in X is a $CS_R os$ in X .

Vijayalakshmi et al.,

Theorem 3.2 Let $f: (X, \mathcal{F}_R) \rightarrow (Y, \mathcal{G}_p)$ be a $CS_R eCts$, then f is a $CS_R Cts$ if X is a $CS_R eU_{\frac{1}{2}}$ -space.

Proof. Let \mathfrak{M} be a $CS_R os$ in Y . Then $f^{-1}(\mathfrak{M})$ is a $CS_R eos$ in X , by hypothesis. Since X is a $CS_R eU_{\frac{1}{2}}$ -space, $f^{-1}(\mathfrak{M})$ is a $CS_R os$ in X . Hence f is a $CS_R eCts$.

Theorem 3.3 Let $f: (X, \mathcal{F}_R) \rightarrow (Y, \mathcal{G}_p)$ be a $CS_R eCts$ map and $g: (Y, \mathcal{G}_p) \rightarrow (Z, \mathcal{E}_p)$ be a $CS_R Cts$, then $g \circ f: (X, \mathcal{F}_R) \rightarrow (Z, \mathcal{E}_p)$ is a $CS_R eCts$.

Proof. Let \mathfrak{M} be a $CS_R os$ in Z . Then $g^{-1}(\mathfrak{M})$ is a $CS_R os$ in Y , by hypothesis. Since f is a $CS_R eCts$ map, $f^{-1}(g^{-1}(\mathfrak{M}))$ is a $CS_R eos$ in X . Hence $g \circ f$ is a $CS_R eCts$ map.

Theorem 3.4 Let $f: (X, \mathcal{F}_R) \rightarrow (Y, \mathcal{G}_p)$ be a $CS_R eCts$ map. Then the following conditions are hold. [(i)]

1. $f(CS_R ecl(\mathfrak{M})) \leq CS_R cl(f(\mathfrak{M}))$, for all $CS_R cs \mathfrak{M}$ in X .
2. $CS_R ecl(f^{-1}\mathfrak{M}) \leq f^{-1}(CS_R cl\mathfrak{M})$, for all $CS_R cs \mathfrak{M}$ in Y .

Proof. (i) Since $CS_R ecl(f(\mathfrak{M}))$ is a $CS_R ecs$ in Y and f is $CS_R eCts$, then $f^{-1}(CS_R ecl(f(\mathfrak{M})))$ is $CS_R ec$ in Y . Now, since $\mathfrak{M} \leq f^{-1}(CS_R cl(f(\mathfrak{M})))$, $CS_R ecl(\mathfrak{M}) \leq f^{-1}(CS_R ecl(f(\mathfrak{M})))$. Therefore, $f(CS_R ecl(\mathfrak{M})) \leq CS_R cl(f(\mathfrak{M}))$.

(ii) By replacing \mathfrak{M} with $f^{-1}(\mathfrak{M})$ in (i), we obtain $f(CS_R ecl(f^{-1}\mathfrak{M})) \leq CS_R cl(f(f^{-1}\mathfrak{M})) \leq CS_R cl\mathfrak{M}$. Hence, $CS_R ecl(f^{-1}\mathfrak{M}) \leq f^{-1}(CS_R cl\mathfrak{M})$.

Remark 3.2 If f is $CS_R eCts$, then [(i)]

1. $f(CS_R ecl(\mathfrak{M}))$ is not necessarily equal to $CS_R cl(f(\mathfrak{M}))$ where $(\mathfrak{M}) \in X$.
2. $CS_R ecl(f^{-1}\mathfrak{M})$ is not necessarily equal to $f^{-1}(CS_R cl\mathfrak{M})$ where $\mathfrak{M} \in Y$.

Theorem 3.5 f is $CS_R eCts$ iff $f^{-1}(CS_R int(\mathfrak{M})) \leq CS_R eint(f^{-1}(\mathfrak{M}))$, for all $CS_R cs \mathfrak{M}$ in Y .

Proof. If f is $CS_R eCts$ and $\mathfrak{M} \in Y$. $CS_R int(\mathfrak{M})$ is $CS_R os$ in Y and hence, $f^{-1}(CS_R int(\mathfrak{M}))$ is $CS_R eos$ in X . Therefore $CS_R eint(f^{-1}(CS_R int(\mathfrak{M}))) = f^{-1}(CS_R int(\mathfrak{M}))$. Also, $CS_R int(\mathfrak{M}) \leq \mathfrak{M}$, implies that $f^{-1}(CS_R int(\mathfrak{M})) \leq f^{-1}(\mathfrak{M})$. Therefore $CS_R eint(f^{-1}(CS_R int(\mathfrak{M}))) \leq CS_R eint(f^{-1}(\mathfrak{M}))$. That is $f^{-1}(CS_R int(\mathfrak{M})) \leq CS_R eint(f^{-1}(\mathfrak{M}))$.

Conversely, let $f^{-1}(CS_R int(\mathfrak{M})) \leq CS_R eint(f^{-1}(\mathfrak{M}))$ for all subset \mathfrak{M} of Y . If \mathfrak{M} is $CS_R os$ in Y , then $CS_R int(\mathfrak{M}) = \mathfrak{M}$. By assumption, $f^{-1}(CS_R int(\mathfrak{M})) \leq CS_R eint(f^{-1}(\mathfrak{M}))$. Thus $f^{-1}(\mathfrak{M}) \leq CS_R eint(f^{-1}(\mathfrak{M}))$. But $CS_R eint(f^{-1}(\mathfrak{M})) \leq f^{-1}(\mathfrak{M})$. Therefore $CS_R eint(f^{-1}(\mathfrak{M})) = f^{-1}(\mathfrak{M})$. That is, $f^{-1}(\mathfrak{M})$ is $CS_R eos$ in X , for all $CS_R os \mathfrak{M}$ in Y . Therefore f is $CS_R eCts$ on X .

Remark 3.3 If f is $CS_R eCts$, then $CS_R eint(f^{-1}(A))$ is not necessarily equal to $f^{-1}(CS_R int(A))$ where $A \in Y$.

ABSTRACT

The Siddha system of medicine, one of the oldest healing traditions, emphasizes the holistic connection between food and medicine, encapsulated in the principle "*Unave Marunthu, Marunthe Unavu.*" This study focuses on the preclinical standardization of *Azhinjil Vithai Kuzhi Thailam*, a traditional medicated oil indicated for various ailments including *Kuttam*, *Kurai noi* and premature greying of hair. The raw materials were procured at Rajendra Herbals and authenticated and processed at the National Institute of Siddha. The preparation method involved soaking the raw drugs in cow's urine and extracting the oil through a traditional *Kuzhi thailam* extraction process. Comprehensive organoleptic evaluations and physicochemical analyses were conducted, adhering to the guidelines established by the Pharmacopeia Laboratory of Indian Medicine. The results indicated a brownish-black oil with favourable attributes: low acid value (2.75), low peroxide value (27.86), and absence of mineral oil, confirming quality and stability. Heavy metal content was within WHO safety limits, with no detectable pesticide residues or pathogens, ensuring sterility. HPTLC analysis revealed seven distinct phytochemical peaks, indicating the oil's rich composition. The findings affirm the identity, purity, and safety of *Azhinjil Vithai Kuzhi Thailam*, supporting its recommendation for clinical trials. This standardization process establishes a vital reference for future formulations within the Siddha medicinal framework.

**Kowsalya et al.,****Keywords:** Standardization, Physicochemical analysis, *Azhinjil Vithai Kuzhi Thailam*, Siddha.

INTRODUCTION

Siddha system of medicine is one of the oldest and foremost of all other medical systems of the world. The word “Siddha” comes from the word “Siddhi” which means an object to attain perfection and heavenly bliss. The system of medicine has a basic principle of “Unave Marunthu, Marunthe Unavu” along with concepts of Vali, Azhal, Iyyam. Siddhars classified diseases into 4448 and they are treated by 32 types of internal medicines and 32 types of external medicines. The therapeutic drugs used by Siddhars were incorporating the herbs, minerals and animal sources as the main ingredients of the drug. Traditional beliefs suggest that herbal preparations are safe, and their global consumption is on the rise. Kuzhi Thailam is a medicated oil prepared by a specific method as mentioned in Siddha textbooks. According to the Siddha literature “Aathmarakshamirtham Ennum Vaithya Saarasangirakam”, *Azhinjil Vithai Kuzhi Thailam* is indicated for Venkuttam, Puzhuvettu, Kandamaalai, etc. The Siddha texts specify that the herbs should be grown in fertile and congenial land, unaffected by injury or predators. Standardization of these herbal formula is vital for Ensuring the safety and effectiveness of herbal drugs involves quality monitoring throughout the entire process, from collection to processing and final packaging. Hence, Standardization was carried out following the standard procedure as per the Protocol for Testing of Ayush medicine published by PLIM [Pharmacopeia Laboratory of Indian Medicine], Ministry of Ayush, Ghaziabad.

MATERIALS AND METHODS

Collection of Raw Drugs

The drugs used in the preparation of *Azhinjil Vithai Kuzhi Thailam* were purchased from a reputed raw drug store at Rajendra Herbals, Thakkalai, Kanyakumari district and was authenticated by the medicinal botanist of National Institute of Siddha, Chennai-47.

Preparation of the Trial Drug *Azhinjil Vithai Kuzhi Thailam*

Purification of raw drugs and preparation of drug was done at the Department of Gunapadam [Pharmaceutical Laboratory], National Institute of Siddha, Chennai-47. *Azhinjil Vithai Kuzhi Thailam* was prepared with the ratio mentioned in Table 1. Purification of raw drugs was done as mentioned in Table 2.

Method of Preparation

All purified drugs were taken in equal ratio and soaked in cow’s urine for 20 days. Then a pot with a small opening at the base was taken. The pot was filled with the soaked content and was placed inside a pit filled with the dried cow’s dung. It was then burnt and left overnight. A ceramic beaker was placed at the basal opening of the pot, so as to collect the oil drops. The oil drops into the container overnight and was collected on the next day morning.

Dosage: 2 to 7 years: 100 mg[bid]; 8 to 12 years: 200 mg[bid]

Dosation: 1 Mandalam [48 days]

Indication: *Kuttam, Kurai noi, Kandamaalai, Pilavai, Putru, Ranam, Thalai Puzhuvettu, Vishakadikal* and the Grey hair turns into Black.

Drug storage: Prepared medicine was stored in a clean and dry airtight container

**Kowsalya et al.,****Organoleptic characters**

Colour, Odour, Taste and Texture were noted. Organoleptic evaluation of *Azhinjil Vithai Kuzhi Thailam* was carried out using standard techniques.

All the following studies were accomplished at Interstellar testing Centre Pvt Limited, Haryana.

Physicochemical Analysis

The physico chemical analysis of the trial drug *Azhinjil Vithai Kuzhi Thailam* was carried out as per the PLIM guidelines. The test procedures were done at Interstellar testing Centre Pvt Limited, Haryana.

Determination of Weight Per Millilitre

The weight per millilitre of a liquid is the weight in g of 1 ml of a liquid when weighed in air at 25°C, unless otherwise specified.

Method

Select a clean, dry pycnometer and calibrate it by filling it with freshly boiled and cooled water maintained at 25°C. Weigh the pycnometer filled with this water. Given that 1 mL of water at 25°C weighs 0.99602 g in air with a density of 0.0012 g/mL, use this value to calculate the volume capacity of the pycnometer. Next, bring the test liquid to about 20°C and fill the pycnometer with it. Allow the filled pycnometer to equilibrate to 25°C, remove any excess liquid, and weigh it. Determine the mass of the liquid by subtracting the weight of the empty pycnometer from the weight of the filled one. Finally, compute the liquid's weight per milliliter by dividing its mass in grams by the pycnometer's volume in milliliters at 25°C.

Determination of pH

The pH of an aqueous solution is defined as the base-10 logarithm of the inverse of the hydrogen ion concentration, measured in grams per liter. Although this definition provides a practical means to express the acidity or basicity of a solution, it falls short from a strictly theoretical perspective. In fact, no definition of pH can be both completely precise and straightforward at the same time. In practice, pH is most commonly measured using a potentiometric method involving a glass electrode, a reference electrode, and a pH meter, which can be either analog or digital.

Loss on drying at 105°C/ Moisture content

Begin by weighing a shallow, glass-stoppered weighing bottle that has been dried under the same conditions required for the test. Add the specified quantity of the sample to the bottle, cover it, and record the exact weight. Spread the sample evenly, making sure its depth does not exceed 10 mm. Remove the stopper and place the bottle in the drying chamber as described in the monograph. Dry the sample until a consistent weight is reached, or until two successive weighings differ by no more than ±0.5 mg. After drying, seal the bottle, allow it to cool to room temperature in a desiccator, and then weigh it again with the dried sample inside.

Calculation

$$\text{Loss on drying}(\%w/w) = \frac{\text{Loss in weight(g)} \times 100}{\text{Weight of the sample (g)}}$$

Refractive Index at RT

The refractive index (n) of a substance with respect to air is defined as the ratio between the sine of the angle of incidence and the sine of the angle of refraction when light passes from air into the material. This measurement depends on the wavelength of the light used. Unless stated otherwise, the refractive index is measured at 25°C (±0.5°C) using light at the wavelength of the sodium D line (589.3 nm). Because refractive index is highly sensitive to temperature variations, it is crucial to precisely control and maintain the temperature during testing.

Note

Reference index value for the D line of sodium, measured at 20°.

**Kowsalya et al.,**

Abbe's refractometer is commonly used for measuring refractive index due to its convenience, although other refractometers with similar or greater accuracy may also be employed. Most commercial refractometers are intended for use with white light but are calibrated to yield refractive index values corresponding to the sodium D line. To maintain accuracy, the device should be calibrated with distilled water, which has a refractive index of 1.3325 at 25°C. It's important to routinely verify the instrument's cleanliness by measuring the refractive index of distilled water, which should consistently read 1.3325 at 25°C.

Determination of Congealing point

The congealing temperature is the point at which a substance begins to transition from a liquid (molten) state to a solid, with both phases present simultaneously and the solid portion gradually increasing. This is distinct from the freezing point, which refers to the temperature at which the liquid and solid phases are in complete equilibrium. In some instances, this equilibrium may occur across a temperature range. The temperature at which a substance solidifies during cooling can be a useful measure of its purity, especially if the process releases heat. This method is suitable for substances with melting points between 20°C and 150°C.

Apparatus

A 150 mm × 25 mm test tube is inserted into a larger 160 mm × 40 mm test tube. The smaller, inner tube is sealed with a stopper that holds both a thermometer and a stirrer. The thermometer, about 175 mm in length and marked in 0.2°C increments, is positioned so that its bulb sits approximately 15 mm from the bottom of the inner tube. The stirrer, made from glass or another suitable material, features a looped end with an overall diameter of roughly 18 mm, set at a right angle to the rod. This assembly is then placed in the center of a 1-liter beaker filled with a suitable cooling liquid, with the liquid level reaching about 20 mm below the top of the beaker. The thermometer is also supported within this cooling bath.

Method

If the substance is solid, first melt it at a temperature no more than 20°C higher than its expected congealing point. Then, pour the molten substance into the inner test tube until it reaches a height of 50 to 57 mm. Assemble the apparatus, making sure the thermometer bulb is positioned halfway between the top and bottom of the sample inside the tube. Fill the cooling bath with a suitable liquid so that its level is about 20 mm below the top of the test tube. Set the bath temperature to be 4°C to 5°C below the anticipated congealing point. If the substance is already liquid at room temperature, carry out the test with the cooling bath set approximately 15°C below the expected congealing point. When the sample cools to roughly 5°C above its expected congealing point, begin stirring it continuously by moving the looped stirrer up and down between the top and bottom of the sample at a consistent pace of 20 cycles per minute. If the sample does not begin to solidify on its own, you can trigger crystallization by lightly scratching the inside walls of the test tube with the thermometer or by adding a small amount of previously solidified material. Excessive super cooling may lead to erratic temperature behavior. If this happens, repeat the procedure, this time adding small pieces of the solid sample at 1°C intervals as the temperature approaches the expected congealing point. Take thermometer readings every 30 seconds, and continue stirring only while the temperature is decreasing. Stop stirring once the temperature either levels off or begins to rise slightly. Keep recording the temperature for at least three more minutes after it has stayed steady and then starts to fall again. The congealing point is identified as the average of at least four consecutive temperature readings that are within a 0.2°C range.

Determination of Viscosity value

The test liquid is introduced into a U-tube viscometer chosen according to its anticipated viscosity. Once the capillary is positioned vertically and the liquid has reached the required test temperature, the fluid level must be within 0.2 mm of the fill mark. The liquid is then moved—either by suction or by blowing—to a specific starting point in the viscometer. The time it takes for the meniscus to pass between two predefined marks is then measured. The kinematic viscosity in centistokes is calculated from the following equation:

Kowsalya et al.,

Kinematic viscosity = kt

Where k = the constant of the viscometer tube determined by observation on liquids of known kinematic viscosity; t = time in seconds for meniscus to pass through the two specified marks.

Determination of Iodine value

Accurately weigh the test sample and place it into a clean, dry iodine flask. Add 10 mL of carbon tetrachloride to the flask and allow the sample to fully dissolve. Using a pipette, introduce 25 mL of pyridine bromide solution into the flask, then let the mixture stand in the dark at a temperature between 15°C and 25°C for 10 minutes. After this period, add 15 mL of potassium iodide solution into the neck of the flask. Carefully unstopper the flask, rinse both the stopper and the inner walls with 100 mL of water, and shake the contents thoroughly. Immediately titrate the solution with 0.1 M sodium thiosulfate, using 0.5 mL of starch solution as an indicator. Continue the titration, shaking the flask vigorously, until the blue color completely disappears. Note the volume of sodium thiosulfate used (a). Then, perform the same procedure without the test substance to serve as a blank, and record that volume (b). Iodine value was calculated from the expression,

$$\text{Iodine value} = \frac{1.269(b-a)}{w}$$

Where, 'w' is the weight in 'g' of the substance; 'b' is blank titre value and 'a' is sample titre value.

Determination of saponification value

Weigh about 2 grams of the test substance and place it into a 250 mL borosilicate flask fitted with a reflux condenser. Add 25.0 mL of 0.5 M ethanolic potassium hydroxide along with a small quantity of pumice powder. Heat the mixture in a water bath under reflux for 30 minutes. After heating, add 1 mL of phenolphthalein solution and immediately titrate with 0.5 M hydrochloric acid, noting the volume used as 'a' mL. The titration endpoint is indicated by the disappearance of the pink color. Repeat the entire process without the test substance as a blank and record the volume of hydrochloric acid used as 'b' mL. The saponification value is then calculated using the following formula:

$$\text{Saponification value} = \frac{28.05(b-a)}{W}$$

Where w=weight in g of the substance.

Unsaponifiable matter (percentage of)

The unsaponifiable matter consists of substances present in oils and fats, which are not saponifiable by alkali hydroxides and are determined by extraction with an organic solvent of a solution of the saponified substance being examined.

Method

Unless stated otherwise in the specific monograph, accurately weigh approximately 5 grams of the sample and place it into a 250 mL flask equipped with a reflux condenser. Add a solution prepared by dissolving 2 grams of potassium hydroxide in 40 mL of 95% ethanol. Heat the mixture in a water bath for 1 hour, shaking it occasionally. Once the heating is complete, transfer the mixture to a separating funnel using 100 mL of hot water. While the solution remains warm, extract it with three separate 100 mL portions of peroxide-free ether. Combine the ether extracts in another separating funnel containing 40 mL of water, swirl gently, allow the layers to separate, and discard the lower aqueous phase. Wash the ether layer successively with two 40 mL portions of water, then with three 40 mL portions of 3% w/v potassium hydroxide solution, each followed by a 40 mL water wash. Continue washing with additional 40 mL portions of water until the aqueous layer no longer shows alkalinity with phenolphthalein. Transfer the ether layer to a pre-weighed flask, rinsing the funnel with peroxide-free ether to ensure full transfer. Evaporate the ether, then add 6 mL of acetone to the residue and completely remove the solvent using a gentle air stream. Dry the remaining residue at 100–105°C for 30 minutes, cool in a desiccator, and weigh. Determine the percentage of unsaponifiable matter based on weight. Dissolve the residue in 20 mL of 95% ethanol that has been pre-neutralized using phenolphthalein as an indicator, then titrate the solution with 0.1 M ethanolic potassium hydroxide. If more

**Kowsalya et al.,**

than 0.2 mL of the titrant is required, the weighed residue cannot be considered unsaponifiable matter, and the test must be repeated.

Rancidity

Shake 1ml of a 10%v/v solution in ether with 1ml of hydrochloric acid. Add 1ml of a 0.1% w/v solution of phloroglucinol in ether. No red or pink color is produced.

Acid Value

Weigh out approximately 10 grams of the sample and transfer it into a clean conical flask. Add 50 mL of a solvent mixture composed of equal parts 95% ethanol and ether, which has been pre-neutralized with 0.1 M potassium hydroxide using phenolphthalein as an indicator. If the sample does not dissolve at room temperature, attach a reflux condenser to the flask and gently heat the mixture, shaking it frequently until dissolution is complete. Next, add 1 mL of phenolphthalein solution and titrate with 0.1 M potassium hydroxide until a faint pink color persists for 30 seconds after shaking. The acid value is calculated by the following expression,

$$\text{Acid value} = 5.61 \times (n/w)$$

Where n= the number of mL of 0.1M Potassium hydroxide required, w= the weight in g of the substance

Peroxide value

Accurately weigh 5 grams of the test substance and place it in a 250 mL conical flask with a glass stopper. Add 30 mL of a solvent mixture consisting of three parts glacial acetic acid to two parts chloroform, and swirl the flask until the substance is fully dissolved. Then, add 0.5 mL of saturated potassium iodide solution and let the mixture stand for exactly one minute, shaking it occasionally. Afterward, add 30 mL of water and begin titrating slowly with 0.01 M sodium thiosulfate, shaking the flask continuously and thoroughly until the yellow coloration is nearly gone. Add 0.5 mL of starch solution and continue titration, shaking well, until the blue color just disappears. Record the volume of sodium thiosulfate used as "a" mL. Repeat the entire procedure without the substance to perform a blank test, and record this volume as "b" mL. Ensure that the volume of 0.01 M sodium thiosulfate used in the blank does not exceed 0.1 mL. Peroxide value was calculated from the expression,

$$\text{Peroxide value} = \frac{10(a-b)}{W}$$

Where, 'a' is sample titre value; 'b' is blank titre value and 'w' is weight in g of the substance.

Mineral oil test

Measure 22 mL of alcoholic potassium hydroxide solution into a conical flask, then add 1 mL of the oil sample to be analyzed. Heat the mixture in a water bath while using an air- or water-cooled condenser, continuing until the solution turns clear and no oily droplets remain on the inner walls of the flask. After heating, remove the flask from the water bath and pour the contents into a wide-mouthed test tube that has been pre-warmed. Gently add 25 mL of boiling distilled water by allowing it to flow down the side of the test tube, shaking the tube gently from side to side during the process. The formation of turbidity indicates the presence of mineral oil, with the degree of cloudiness reflecting the concentration of mineral oil in the sample.

High Performance Thin Layer Chromatography Analysis

T1 & T2-5, 10µl of hexane extract of *Azhinjil Vithai Kuzhi Thailam*.

Identity Test

Test Solution: About 100mg of *Azhinjil Vithai Kuzhi Thailam* was dissolved in hexane used for TLC analysis.

Stationary phase: Silica Gel 60 F₂₅₄

Mobile phase: Hexane: Ethyl acetate (8.5:1.5)

**Kowsalya et al.,**

Procedure: Applied 5.10 µl of test solutions (T1,T2) spotted on a precoated silica gel 60 F₂₅₄ HPTLC plate (E.Merck) of uniform thickness 0.2mm using Linomat 5 sample applicator. Developed the plate in the solvent system to a distance of 8cm. Scanned the plate densitometrically at 585nm using TLC Scanner 3. Observed the plate under visible light at using CAMAG REPROSTAR 3.

Derivatisation: Anisaldehyde Sulphuric acid reagent

Wavelength:585nm

BIOLOGICAL EVALUATION

Heavy metal analysis:

Standard

Hg, As, Pb and Cd–Sigma

Methodology

Atomic Absorption Spectrometry (AAS) is a very common and reliable technique for detecting metals and metalloids in environmental samples. The total heavy metal content of the sample was performed by Atomic Absorption Spectrometry (AAS) Model AA 240 Series. In order to determination the heavy metals such as mercury, arsenic, lead and cadmium concentrations in the test item.

Sample Digestion

Test sample was digested with 1mol/L HCl for determination of arsenic and mercury. Similarly, for the determination of lead and cadmium the sample were digested with 1 mol/L of HNO₃.

Standard preparation

As & Hg- 100 ppm sample in 1 mol/L HCl Cd & Pb- 100 ppm sample in 1 mol/L HNO₃.

Pesticide residue

Extraction

The test sample was first extracted with acetone and briefly homogenized. The mixture was then filtered, and additional acetone was added. This solution was heated using a rotary evaporator at a temperature not exceeding 40°C to remove the majority of the solvent. A small amount of toluene was added to the remaining residue, and the mixture was reheated to ensure complete removal of any residual acetone. The final residue was dissolved in toluene and passed through a membrane filter for filtration.

Test for specific pathogen:

Methodology

The test sample was directly inoculated into the specific pathogen medium (EMB, DCC, Mannitol, Cetrimide) using the pour plate method. The plates were then incubated at 37°C for 24 to 72 hours for observation. The presence of the specific pathogen was identified by the characteristic color and pattern of colony formation on each differential medium.

Detail of Specific Medium and their abbreviation

Organism

- *E-coli*
- *Salmonella*
- *Staphylococcus Aureus*
- *Pseudomonas Aeruginosa*

Abbreviation

- EC
- ST

**Kowsalya et al.,**

- Pa

Medium

- EMBAgar
- Deoxycholate Agar
- Mannitolsaltagar
- CetrimideAgar

Aflatoxins (B1, B2, G1, G2)

A standard aflatoxin solution was applied to the surface of a pre-coated TLC plate in volumes of 2.5 μ L, 5 μ L, 7.5 μ L, and 10 μ L. The test sample was also applied to the plate. After allowing the spots to dry, the chromatogram was developed in an unsaturated chamber containing a solvent mixture of chloroform, acetone, and isopropyl alcohol (85:10:5), until the solvent front had moved at least 15 cm from the origin. Once the plate was removed from the chamber, the solvent front was marked, and the plate was left to air dry. The spots were then located by examining the plate under UV light at 365 nm.

RESULTS AND DISCUSSIONS

From the Physicochemical analysis of *Azhinjil Vithai Kuzhi Thailam* as mentioned in Siddha textbook shows that the drug was brownish black coloured smooth and shiny liquid with Characteristic odour and bitter taste[Table 3].The acid value is found to be 2.75 , which is comparatively very low shows that the oil has long shelf life.The sample drug *Azhinjil Vithai Kuzhi Thailam* passes the Rancidity test.The Peroxide value is found to be 27.86, which is comparatively low and proves the good quality of the oil.The presence of high percentage of short chain fatty acids (SCFA) in the oil helps in easy digestion and absorption and it may also helps in improving colonic health.The Oil is rich in Poly Unsaturated Fatty Acids (PUFA) which is very much helpful in reducing LDL cholesterol.No mineral oil is present in the sample.Since the Refractive Index is 1.445°C , it interprets that there is no adulteration in the sample[Table 5].HPTLC finger printing reveals that the presence of seven prominent peaks corresponds to presence of seven phytochemicals[Table 6]. The heavy metals (Arsenic,lead,cadmium) present in the sample seems to be Below the maximum concentration range as per WHO guidelines[Table 7].The results showed that there were no traces of pesticides residues such as Organo chlorine, Organo phosphorus, Organo carbamates and pyrethroids in the sample provided for analysis.The sample drug *Azhinjil Vithai Kuzhi Thailam* is sterile and free from bacteria, fungi specific pathogens and aflatoxins [Table 8,9 &10].

CONCLUSIONS

The results obtained from Physicochemical analysis of the siddha poly-herbal drug formulation *Azhinjil Vithai Kuzhi Thailam* ensures the identity, purity and quality of the prepared medicine. The drug *Azhinjil Vithai Kuzhi Thailam* is very safe in recommending for the clinical trial. The results obtained could be utilized as reference for developing standard formulation of greater efficacy.

ACKNOWLEDGEMENT

The authors are deeply grateful to the Director, Hod, and all of the faculty members of the Department of Kuzhandhai Maruthuvam, National Institute of Siddha, Chennai, for their excellent recommendations and valuable assistance. We'd also like to thank Interstellar testing Centre Pvt Limited, Haryana for their technical support.

ABSTRACT

This study presents an econometric analysis of energy consumption in Bangalore district, Karnataka, utilizing primary data collected from households, businesses, and industrial sectors. The research aims to identify and assess the key economic and demographic factors influencing energy consumption patterns in the district. By employing advanced econometric methods such as multiple regression analysis and panel data models, the study investigates the impact of variables like income levels, energy prices, household size, climate conditions, and government policies on energy demand. The findings reveal significant determinants of energy consumption, with income levels and energy prices being the most influential factors across different sectors. Additionally, the study highlights the role of energy efficiency measures and suggests targeted policy interventions to promote sustainable energy consumption. This research contributes to the understanding of urban energy dynamics in India and offers practical recommendations for improving energy management in Bangalore, with broader implications for similar urban centers in the country.

Keywords: Energy Consumption, Econometric Analysis, Bangalore, Karnataka, Energy Policy, Primary Data, Regression Analysis, Energy Efficiency.

INTRODUCTION

Bangalore, the capital city of Karnataka, is one of the fastest-growing metropolitan areas in India (Bruyns, 2021). As the economic hub of the southern region, it has witnessed rapid urbanization, industrialization, and a significant rise in population over the past few decades (Kumar & Rao, 2020). This growth has brought about an increased demand for energy, with energy consumption becoming a key issue for policymakers, businesses, and households (Bhattacharya & Chakraborty, 2019). The city's energy consumption patterns are influenced by a complex interplay of economic, demographic, and policy-related factors (Reddy & Balachandra, 2018). Understanding these factors is crucial for developing sustainable energy solutions and managing the growing demand for power in an increasingly urbanized setting (Sharma et al., 2022). Energy consumption plays a central role in the economic development of a region (World Bank, 2021). In Bangalore, energy demand spans residential, commercial, and industrial sectors, each with unique consumption behaviors (Patel & Singh, 2020). The increased reliance on energy for residential heating, air conditioning, and transportation, coupled with industrial growth, places substantial pressure on the city's power infrastructure (Mukherjee, 2019). In this context, energy efficiency, affordability, and accessibility become critical challenges for policymakers (Government of Karnataka, 2023).

Statement of the Problem

Despite the growing importance of energy consumption patterns in shaping urban sustainability, limited research exists that systematically analyzes the economic determinants of energy consumption in Bangalore, particularly using econometric techniques and primary data. While there is some understanding of energy supply and demand dynamics, less attention has been given to how economic variables such as income, energy prices, and government policies influence energy consumption behavior in Bangalore's diverse sectors. Without such insights, it is difficult to formulate targeted, effective policies for energy conservation and efficient usage in the city.

Objectives of the study

1. To identify and quantify the key economic and demographic factors influencing energy consumption in Bangalore.
2. To explore the relationship between energy consumption and factors such as income, household size, climate conditions, and energy prices.

Significance of the Study

This research holds significant implications for energy policy, urban planning, and sustainable development in Bangalore. As the city continues to expand, understanding the economic drivers of energy consumption will enable policymakers to design strategies that promote efficient energy use and reduce dependency on non-renewable resources. By incorporating primary data and econometric analysis, this study provides a comprehensive, evidence-based approach to addressing energy challenges in Bangalore. The findings will inform both government and industry stakeholders, helping them make data-driven decisions to enhance energy efficiency, minimize waste, and ensure long-term energy sustainability in the district. The results of this study may be relevant for other rapidly growing urban areas in India and other developing countries, where energy consumption patterns are evolving as a result of similar economic and demographic transformations. The approach can be extended to other cities, providing valuable insights for broader energy policy reforms.

Overview of Reviewed Literature

The literature on Energy Consumption reveals that significant studies which convey the research gap. This paper explores the relationship between energy consumption and economic growth in India. Using time series data, the authors investigate the bidirectional causality between energy consumption and GDP, finding a strong positive correlation between the two. The study suggests that economic growth in urban areas like Bangalore contributes significantly to energy demand, necessitating energy efficiency policies tailored to fast-growing metropolitan areas. The authors conclude that energy consumption is both a driver and a consequence of economic growth in India,

**Arunkumar and Mathavan**

which has significant implications for urban energy management policies (Reddy, A. K. N. & Reddy, S. M. 2018). This study analyzed the link between economic growth and energy consumption in India from 2005 to 2022, finding a strong positive correlation using OLS and Granger Causality tests. The study highlights that energy use fuels economic expansion and vice versa, stressing the need for energy efficiency, renewable investments, and reduced regional disparities. It advocates for balanced and resilient energy policies to support India's sustainable development goals (Sarkar and Mathavan, 2024). This study examines how urbanization influences energy demand in Bangalore. Using a cross-sectional analysis of residential and commercial sectors, the authors find that population growth, household income, and urban sprawl significantly contribute to increased energy consumption in the city. The paper suggests that policy measures should focus on integrating energy-efficient technologies in buildings and transportation systems to meet the growing demand for energy. The research also highlights the importance of energy conservation programs in urban settings like Bangalore, where energy demand is increasing rapidly (Singh, S. & Prakash, S. 2020). This research investigates energy consumption patterns at the household level across different income groups in India. The authors utilize primary data from urban households and employ regression models to analyze the impact of income, household size, and appliance usage on energy consumption. The study found that higher-income households in urban areas, such as Bangalore, tend to consume more energy, primarily due to the use of energy-intensive appliances. It emphasizes the need for targeted energy efficiency programs for different income groups to address the growing energy consumption in urban centers (Kumar, P., & Suresh, S. 2019). This paper explores the effect of energy pricing on consumption behavior in urban India. Using econometric analysis, the authors assess how changes in electricity tariffs influence energy consumption patterns in major cities, including Bangalore. The study reveals that price elasticity of demand for electricity is relatively inelastic for households but more elastic for industrial users. The authors suggest that while price-based interventions may not significantly reduce household consumption, they could be effective for commercial and industrial sectors. Additionally, they highlight the role of government subsidies and their impact on energy consumption (Shah, H. & Agarwal, R. 2017).

This research evaluates the impact of government policies on energy efficiency in urban India, specifically focusing on Bangalore. The authors analyze the effect of energy efficiency programs, such as subsidies for energy-efficient appliances and the promotion of solar energy, on household and commercial energy use. Their findings suggest that policy interventions have led to modest improvements in energy efficiency, but the widespread adoption of renewable energy technologies is still lagging. The paper calls for stronger incentives and regulatory frameworks to accelerate the transition toward sustainable energy use in urban centers like Bangalore (Bhatia, R., & Ghosh, S. 2021). This study investigates the socioeconomic determinants of energy consumption in Indian cities, including Bangalore. Using a multi-sectoral approach, the authors examine how factors such as education level, household income, and employment status influence energy demand. The research finds that educated households with higher incomes tend to consume more energy due to the increased usage of electrical appliances and air conditioning. The authors emphasize that understanding these socio-economic variables is crucial for designing energy policies that are effective across different demographic groups (Rao, N., & Shah, V. 2018). This study analyzes India's agricultural energy consumption from 1990 to 2024, exploring how it influences productivity and sustainability. Using econometric modeling, it assesses the effects of technology, policy, and renewable energy adoption across regions. The findings highlight key trends, regional differences, and strategic insights to guide energy-efficient, sustainable agricultural practices (Sarkar and Mathavan, 2025). This paper explores the impact of climatic conditions on energy consumption in urban centers in India. Focusing on cities like Bangalore, the authors use a combination of econometric models and climate data to analyze how temperature variations and seasonal changes affect residential and commercial energy usage. The study concludes that higher temperatures lead to a significant increase in electricity demand due to the use of cooling devices like air conditioners and fans. The authors suggest that policies aimed at mitigating the effects of climate on energy consumption, such as promoting energy-efficient cooling technologies, can help reduce overall energy demand in hot climates (Mehta, R., & Jain, S. 2022).

MATERIALS AND METHODS

This study employs a quantitative research design, utilizing primary data collected through surveys to analyze the economic factors influencing energy consumption in Bangalore district, Karnataka. The data collection process includes structured questionnaires distributed to a representative sample across residential, commercial, and industrial sectors within the district. Stratified random sampling is used to ensure that all key sectors are adequately represented. The primary data will include variables such as income levels, household size, energy prices, appliance usage, education, and temperature. To analyze the data, econometric methods will be employed, including multiple regression analysis to examine the relationships between energy consumption and the identified economic factors. A panel data regression approach will also be used to account for sectoral heterogeneity. The study will test for endogeneity using instrumental variable techniques, ensuring robustness in the findings. Data analysis will be carried out using statistical software like STATA or R to estimate the model parameters and validate the results.

Research Design

The study employs a quantitative cross-sectional design, relying on primary data collected from a structured survey. A stratified random sampling method ensures proportional representation of all major sectors (residential, commercial, and industrial) based on energy usage intensity.

Data Collection Techniques:

Primary data was collected using structured questionnaires distributed to 385 respondents. The questionnaire included variables such as: Monthly energy consumption (in kWh), Household size, Income level, Education level, Sector type, Energy source and housing type.

Sample Design and Size

The sample of 385 respondents was determined using the standard formula for large populations:

$$n = \frac{Z^2 \cdot p \cdot (1-p)}{e^2}$$

Where $Z = 1.96$, $p = 0.5$, and $e = 0.05$.

The sample was proportionally allocated as follows: Residential: 231 (60%), Commercial: 96 (25%), Industrial: 58 (15%).

Analytical Techniques

Descriptive statistics were used to summarize household characteristics, sectoral energy usage, and socio-economic profiles. Econometric techniques included: Multiple Linear Regression (OLS), Dummy variable regression.

Econometric Model (SSECM)

The Sector-Specific Energy Consumption Model (SSECM) investigates how energy consumption is influenced by household size, sector type, income level, and education level, using dummy variable regression modeling.

Hypothesis Testing

Hypotheses were tested for statistical significance using t-tests and p-values. Null hypotheses assumed no effect of the independent variables on energy consumption, while alternative hypotheses indicated significant effects.

RESULTS AND DISCUSSIONS

The table no. 1 shows that most respondents across all sectors (residential, commercial, and industrial) have medium incomes (₹20,000–₹50,000/month), live in medium-sized households (4-6 members), and possess higher education (undergraduate or more). The residential sector has the largest proportion of people in the low-income group, while the industrial sector has the highest percentage of high-income earners. The overall education level is high, with a

Arunkumar and Mathavan

small percentage of respondents lacking formal education. The table no. 2 reveals the average monthly energy consumption (in kWh) across different sectors and income levels. In general, energy consumption increases with income level in all sectors. The residential sector has the lowest average consumption, with low-income households using 150 kWh and high-income households using 350 kWh. The commercial sector shows a more significant rise, with low-income businesses consuming 350 kWh and high-income ones consuming 1,200 kWh. The industrial sector has the highest energy usage at all income levels, with low-income industries using 2,000 kWh and high-income industries using 6,000 kWh. Overall, the total average consumption across all sectors is highest in the industrial sector (3,800 kWh), followed by the commercial sector (750 kWh), and the residential sector (250 kWh). The table no 3 provides insights into the relationship between household size and energy consumption across residential, commercial, and industrial sectors in Bangalore. The table shows that in the residential sector, energy consumption increases with household size, with small households (1-3 members) consuming an average of 180 kWh, medium households (4-6 members) consuming 250 kWh, and large households (>6 members) consuming 300 kWh. Similarly, in the commercial sector, energy consumption is higher, with small businesses consuming 400 kWh, medium-sized businesses consuming 700 kWh, and large businesses consuming 800 kWh. The industrial sector exhibits the highest consumption, with small industrial units consuming 1,500 kWh, medium units consuming 4,000 kWh, and large units consuming 5,000 kWh, reflecting the energy-intensive nature of industrial activities. Overall, the total average consumption across all sectors is 4,800 kWh, with residential, commercial, and industrial sectors averaging 240 kWh, 700 kWh, and 3,800 kWh, respectively. This data reveals that larger households and industrial sectors consume more energy, providing a clearer understanding of energy usage patterns that can guide energy efficiency strategies in Bangalore. The table no. 4 illustrates energy consumption in kWh across different housing types and sectors. Independent houses consume the most energy in every sector, followed by apartments/flats, with slum/informal housing using the least. The industrial sector has the highest consumption across all housing types, while the residential sector shows the lowest. The total average consumption pattern shows a clear gradient from residential to commercial to industrial sectors. The table no. 5 shows energy consumption across different sectors in kWh, with the residential sector using the least (225 kWh average) and the industrial sector consuming the most (3,125 kWh average). Electricity from the grid is the predominant source across all sectors, followed by solar energy, diesel generators, and other alternative sources like biogas and wind. This indicates a reliance on traditional grid electricity, with a notable but smaller contribution from renewable and alternative energy sources.

Econometric Model to the Study of Energy Consumption in Bangalore (Sector-Specific Energy Consumption Model (SSECM))

In this section, the researcher applied the econometric model for the study of energy consumption in Bangalore, focusing on the impact of household size, sector type, income level, and education level on energy consumption across the residential, commercial, and industrial sectors. The following steps outline the process of applying the model and interpreting its results.

Econometric Model Specification

The dependent variable in this study is energy consumption (kWh), and the independent variables include household size, sector type, income level, and education level. The model is represented as:

$$EC_t = \beta_0 + \beta_1 HS_t + \beta_2 S_t + \beta_3 I_t + \beta_4 E_t + \epsilon_t$$

Where:

- EC_t = Energy consumption for the i -th household or establishment.
- HS_t = Household size (Small, Medium, Large).
- S_t = Sector type (Residential, Commercial, Industrial).
- I_t = Income level (Low, Medium, High).
- E_t = Education level (No formal education, Primary/Secondary, Higher education).
- ϵ_t = Error term.

Arunkumar and Mathavan

Variables and Dummy Variable Transformation

Household size, sector type, income level, and education level are categorical variables they will be converted into dummy variables for regression analysis.

These dummy variables will estimate the relationship between these categorical factors and energy consumption.

Estimating the Model

Using the data from the sample of 385 respondents (231 residential, 96 commercial, 58 industrial), we estimate the coefficients of the model using Ordinary Least Squares (OLS) regression.

Estimated Model

$EC_i = \beta_0 + \beta_1(\text{Small}) + \beta_2(\text{Medium}) + \beta_3(\text{Large}) + \beta_4(\text{Residential}) + \beta_5(\text{Commercial}) + \beta_6(\text{Industrial}) + \beta_7(\text{Low}) + \beta_8(\text{Medium}) + \beta_9(\text{High}) + \beta_{10}(\text{NoFormalEducation}) + \beta_{11}(\text{PrimarySecondary}) + \beta_{12}(\text{HigherEducation}) + \epsilon_i$ This regression model will estimate the impact of each factor on energy consumption, using the dummy variables to capture variations across different household sizes, sectors, income levels, and education levels.

Calculation

To predict the energy consumption for a medium-sized household in the industrial sector with high income and higher education.

- i. Household Size = Medium (2)
- ii. Sector Type = Industrial (3)
- iii. Income Level = High (3)
- iv. Education Level = Higher Education (3)

Using the model

$EC_i = \beta_0 + \beta_1(\text{Medium}) + \beta_2(\text{Industrial}) + \beta_3(\text{High}) + \beta_4(\text{Higher Education}) + \epsilon_i$

HYPOTHESIS TESTING

Hypothesis tests for each variable to determine whether the relationships observed are statistically significant.

Household Size

(a) **Null Hypothesis (H_0):** $\beta_1 = 0$ (Household size has no effect on energy consumption).

(b) **Alternative Hypothesis (H_1):** $\beta_1 > 0$ (Larger households consume more energy).

(c) **Test Statistic:** The estimated coefficient for household size should be significantly greater than zero. If p-value < 0.05, we reject H_0 and conclude that household size impacts energy consumption.

Sector Type

(a) **Null Hypothesis (H_0):** $\beta_2 = 0$ (Sector type has no effect on energy consumption).

(b) **Alternative Hypothesis (H_1):** $\beta_2 > 0$ (Industrial and commercial sectors consume more energy).

If p-value < 0.05, we reject H_0 and confirm that sector type significantly affects energy consumption.

Income Level

(a) **Null Hypothesis (H_0):** $\beta_3 = 0$ (Income level has no effect on energy consumption).

(b) **Alternative Hypothesis (H_1):** $\beta_3 > 0$ (Higher-income households consume more energy).

The coefficient for income is significant we conclude that income level influences energy consumption.

Education Level

(a) **Null Hypothesis (H_0):** $\beta_4 = 0$ (Education level has no effect on energy consumption).

(b) **Alternative Hypothesis (H_1):** $\beta_4 < 0$ (Higher education results in more energy-efficient consumption).

If p-value < 0.05 and the coefficient is negative, we can conclude that education level significantly affects energy consumption, with more educated households using energy more efficiently.

RESULTS AND POLICY IMPLICATIONS

(i) Household Size: the coefficient for household size (β_1) is positive and significant, we can conclude that larger households consume more energy. This finding supports policies that encourage energy efficiency measures, particularly in larger households.

(ii) Sector Type: the coefficient for sector type (β_2) is positive and significant, it indicates that industrial and commercial sectors are major consumers of energy. Policymakers can target these sectors for energy-saving technologies and regulations.

(iii) Income Level: Higher-income households typically consume more energy. If the income variable is significant, it suggests that energy subsidies or programs encouraging energy-efficient appliances could be useful for high-income groups.

(iv) Education Level: education level is found to negatively influence energy consumption; higher education could be leveraged as a tool for promoting energy conservation through awareness and training programs.

By applying this econometric model to the energy consumption data for Bangalore, the researcher can gain valuable insights into how household characteristics and sector-specific factors influence energy usage. The model's results will be crucial for formulating targeted energy efficiency policies and interventions, especially in sectors with high energy consumption like industry and commercial establishments. The study can inform future initiatives focused on household energy use patterns and socio-economic factors.

FINDING AND DISCUSSION

The results of the study provide insightful findings regarding energy consumption patterns across various sectors (residential, commercial, and industrial) in Bangalore, as well as the influence of household size, income level, and education level on energy use.

(a) Energy Consumption by Sector: From the data, the residential sector shows a significantly lower average energy consumption (240 kWh) compared to the commercial (700 kWh) and industrial (3,800 kWh) sectors. This can be attributed to the nature of the activities in each sector, with industrial and commercial sectors requiring more energy for operations and machinery. The findings are consistent with global trends, where commercial and industrial sectors are typically the largest consumers of energy.

(b) Energy Consumption by Household Size: The table detailing energy consumption by household size reveals a clear positive relationship between household size and energy consumption. Larger households (those with more than six members) consume significantly more energy (300 kWh on average in the residential sector) compared to smaller households (180 kWh for households with 1-3 members). This suggests that larger households tend to use more energy, possibly due to increased demand for electrical appliances, lighting, and cooling/heating systems. This aligns with previous studies, which have shown that energy consumption increases with household size due to the higher number of users in the household.

(c) Income Level and Energy Consumption: Higher-income households tend to consume more energy, which is evident from the positive correlation between income level and energy use. As expected, the high-income group shows a greater tendency to use energy-intensive devices, air conditioning, and other electrical appliances. This is consistent with the literature on energy consumption, where wealthier households have greater access to energy-consuming technologies and higher energy usage.

(d) Impact of Education Level: The data shows that households with higher education levels tend to use energy more efficiently. This could be due to greater awareness of energy-saving practices and a higher likelihood of adopting energy-efficient appliances. The negative correlation between education level and energy consumption suggests that education plays a crucial role in promoting energy conservation and efficiency.

(e) Sector-Specific Patterns: When examining the impact of sector type on energy consumption, industrial and commercial sectors emerge as the largest consumers. The high energy consumption in these sectors can be attributed to the intensive energy requirements for industrial machinery and commercial operations. This finding is crucial for policymakers as it highlights the need for targeted energy efficiency programs and regulations within these sectors to reduce overall energy consumption.

**Arunkumar and Mathavan**

(f) Overall Insights and Policy Implications: The study emphasizes the need for differentiated energy policies based on sector and household characteristics. For residential households, especially those with larger sizes or higher incomes, government initiatives could focus on promoting energy-efficient appliances and encouraging behavioral changes that reduce energy use. In contrast, industrial and commercial sectors may benefit more from adopting energy-efficient technologies and stricter energy regulations.

Moreover, given that educated households tend to use energy more efficiently, promoting energy education at the community level could further enhance energy-saving behavior across all sectors. The findings from this study underscore the importance of considering household and sector-specific factors in energy consumption analysis. The application of the Sector-Specific Energy Consumption Model (SSECM) provides a robust framework to understand the varying patterns of energy usage across different sectors and demographic groups in Bangalore. The study's results are essential for developing targeted energy policies that are effective and tailored to the specific needs of each sector and household type.

CONCLUSION

This study on energy consumption in Bangalore, utilizing the Sector-Specific Energy Consumption Model (SSECM), provides valuable insights into the factors influencing energy use across residential, commercial, and industrial sectors. The analysis reveals that energy consumption is significantly higher in the industrial and commercial sectors compared to the residential sector; with household size, income level, and education level all playing key roles in determining energy use within households. Larger households tend to consume more energy, particularly in the residential sector, while higher-income households show greater overall energy consumption, likely due to the increased use of energy-intensive appliances. Households with higher education levels exhibit more energy-efficient behaviors, highlighting the importance of education in promoting energy conservation. These findings underscore the need for targeted energy policies that address the unique consumption patterns of each sector. For residential areas, especially those with larger or wealthier households, promoting energy-efficient appliances and fostering behavioral changes are crucial. In contrast, industrial and commercial sectors would benefit from adopting energy-efficient technologies and stricter regulations to curb their higher energy demands. The study contributes to a deeper understanding of energy consumption dynamics in Bangalore and offers actionable recommendations for policymakers to develop tailored strategies that can help reduce energy consumption, promote sustainability, and improve energy efficiency across the city's diverse sectors.

ACKNOWLEDGEMENT

I want to express my sincere gratitude to everyone who helped me finish this research report. My research supervisor in particular deserves special recognition for their wise counsel, helpful criticism, and unwavering support for this research paper whole duration. I also want to thank Annamalai University's Department of Economics for giving me access to vital study materials and data.

Funding

This study was carried out autonomously and did not receive any financial support from external sources.

Conflict of Interest

The author states that there are no conflicts of interest related to this research's publication. Without institutional or financial assistance from public, commercial, or nonprofit organizations, the study was carried out on its own.

Table 3: Energy Consumption (kWh) by Household Size

Household Size	Residential Sector (n = 231)	Commercial Sector (n = 96)	Industrial Sector (n = 58)	Total (n = 385)
Small (1-3 members)	180 kWh	400 kWh	1,500 kWh	2,080 kWh
Medium (4-6 members)	250 kWh	700 kWh	4,000 kWh	4,950 kWh
Large (> 6 members)	300 kWh	800 kWh	5,000 kWh	6,100 kWh
Total Average Consumption	240 kWh	700 kWh	3,800 kWh	4,800 kWh

Source: Computed from Primary Data

Table 4: Energy Consumption (kWh) by Type of Housing.

Housing Type	Residential Sector (n = 231)	Commercial Sector (n = 96)	Industrial Sector (n = 58)	Total (n = 385)
Apartment/Flat	220 kWh	600 kWh	3,000 kWh	3,820 kWh
Independent House	280 kWh	850 kWh	4,500 kWh	5,630 kWh
Slum/Informal Housing	120 kWh	300 kWh	1,500 kWh	1,920 kWh
Total Average Consumption	240 kWh	650 kWh	3,000 kWh	3,890 kWh

Source: Computed from Primary Data.

Table 5: Monthly Energy Consumption (kWh) by Primary Energy Source

Primary Energy Source	Residential Sector (n=231)	Commercial Sector (n=96)	Industrial Sector (n=58)	Total (n=385)
Electricity (Grid Supply)	260 kWh	800 kWh	4,000 kWh	5,060 kWh
Solar Energy	100 kWh	250 kWh	1,500 kWh	1,850 kWh
Diesel Generator	50 kWh	300 kWh	2,000 kWh	2,350 kWh
Other Sources (Biogas, Wind, etc.)	40 kWh	150 kWh	1,000 kWh	1,190 kWh
Total Average Consumption	225 kWh	625 kWh	3,125 kWh	3,975 kWh

Source: Computed from Primary Data.

Arunkumar and Mathavan

Table 6: Variables and Dummy Variable Transformation

Variable	Categories	Dummy Variables
Household Size	Small, Medium, Large.	Small = 1, Medium = 0, Large = 0 Small = 0, Medium = 1, Large = 0 Small = 0, Medium = 0, Large = 1
Sector Type	Residential, Commercial, Industrial.	Residential = 1, Commercial = 0, Industrial = 0 Residential = 0, Commercial = 1, Industrial = 0 Residential = 0, Commercial = 0, Industrial = 1
Income Level	Low, Medium, High.	Low = 1, Medium = 0, High = 0 Low = 0, Medium = 1, High = 0 Low = 0, Medium = 0, High = 1
Education Level	No formal education, Primary/Secondary, Higher education.	No formal education = 1, Primary/Secondary = 0, Higher education = 0 No formal education = 0, Primary/Secondary = 1, Higher education = 0 No formal education = 0, Primary/Secondary = 0, Higher education = 1

Table 7: Interpretation of the Model and Coefficients obtained from the regression analysis.

Variable	Expected Sign	Estimated Coefficient	Interpretation
Household Size	$\beta_1 > 0$	0.25	Larger households (especially those with more than 6 members) consume more energy.
Sector Type	$\beta_2 > 0$	1.5	Industrial and commercial sectors consume significantly more energy than residential sectors.
Income Level	$\beta_3 > 0$	0.8	Higher income households use more energy, likely due to access to energy-intensive appliances.
Education Level	$\beta_4 < 0$	-0.4	Higher education households tend to consume energy more efficiently (lower consumption).

Advancements and Challenges in Smart Home Technologies: A Review with Proposed Solutions

ABSTRACT

Smart home innovation system integrates the advanced technologies such as Artificial Intelligence (AI), Machine Learning (ML), Internet of Things (IoT), etc. into today's life style to provide comfort as well as security. This is also energy efficient. Using AI/ML in predictive maintenance, personalized user experiences is examined. Renewable energy sources and smart grid technologies are integrated and are used to create sustainable smart homes. This rapid adoption of these technologies creates significant challenges as interconnected devices may be vulnerable to cyber attacks. Challenges include interoperability issues, high implementation costs, and the digital divide affecting equitable access. Regulatory and ethical considerations are highlighted, emphasizing the need for robust data protection frameworks and transparent practices. There are social and psychological impacts of living in technology-driven environments like acquaintance in the environment. A brief overview of the current state of smart home innovations is presented here with its benefits and challenges. Solutions to the challenges are also proposed to provide a better life-style to the mankind.

Keywords: AI, ML, IoT, Predictive maintenance, Privacy and security, Interoperability.

Sharmistha Ghosh *et al.*,

INTRODUCTION

Smart home technologies promise more comfort, security and energy efficiency, signaling a major shift in present-day living. This paper examines the latest trends in this sector such as voice-activated assistants, lighting controls, security systems and health monitoring devices. The integration of (ML) and artificial intelligence (AI) lies at the core of these breakthroughs, enabling tailored user experiences and predictive maintenance. Furthermore, the integration of smart grid technologies and renewable energy sources highlights how smart houses may promote sustainable living. There still remain problems. Problems of privacy and security are truly expressed due to device interconnectivity, though widespread adoption is limited by interoperability problems, implementation costs, and the digital divide. The evaluation will also look at ethical and regulatory issues where it stresses on how stringent protection policy must be with regard to information together with transparency being essential here. A study should be conducted into how technology-rich places affect us as human beings interfering with our time and communication with others due to its social and psychological consequences which surpass technicalities as well as juridical obstacles. The following article tries to simplify the benefits and downsides of smart home technology by offering an in depth overview of the same. To unlock the full potential that Smart homes offer in quality improvement and sustainable living there is a need to decrypt these intricate elements.

Related Studies

The fast improvement and significant adoption of smart home technology have garnered huge educational and industrial business enterprise interest. A growing body of research explores various dimensions of these innovations, from technical developments to social implications. The important research on intelligent devices, automation systems, (IoT) integration, (AI) and ML applications, and the difficulties presented by privacy, security, and interoperability concerns are reviewed in this part. Smart thermostats have the potential to significantly reduce energy consumption in residential buildings without compromising the comfort of residents [1]. In this paper, the inefficient placement of wall switches in homes causing energy wastage is discussed. In the paper, it is suggested that a home automation system – based on (IoT) is aimed at providing a user-friendly yet affordable solution for these groups. But in areas with poor connectivity, the Smart Home Automation system becomes unreliable due to its dependency on a stable internet connection [2]. The article describes the development of a smart home through the use of the (IoT) and service component technologies. But there is no practical proof, while scalability, security and interoperability issues might be ignored [3]. Several studies have examined the impact of smart devices and automation on energy efficiency and user comfort. For instance, In their analysis, In another research on smart lighting systems it has been illustrated that by use of adaptive control methods, how customer satisfaction and energy efficiency can be improved. There are potential drawbacks such as cost barriers, installation complexities, or user acceptance issues [4].

The review paper discussed the concept of smart homes and smart grids, examined available smart technologies for intelligent energy management and future trends for effective integration into smart grids, emphasizing the importance of bi-directional communication networks. Use of multiple proprietary applications from different providers, leading to user inconvenience and complexity [5]. In this research, a complete evaluation of IoT architectures and protocols, emphasizing the significance of interoperability and standardization in accomplishing seamless device communication. Their findings underscore the need of unified frameworks to facilitate the integration of heterogeneous devices inside smart home ecosystems. The study may not have provided practical solutions or addressed the challenges of achieving standardization effectively in diverse smart home environments [6]. Use of ML algorithms can lead to significant cost savings and increased appliance lifespan. The study may not have thoroughly considered the computational resources required or the reliability of such algorithms in real-world scenarios. [7]. Further research on AI-driven customization in smart homes was done by Nguyen *et al.* ML models modify consumer behavior on unique predilections and actions who demonstrated how machine learning models can personalize user experiences based on particular preferences and behaviors. But there is potential problems of privacy concerning data collection and algorithmic biases might have received insufficient attention [8].

**Sharmistha Ghosh et al.,**

Many researchers investigated how smart grid technology and renewable energy sources may function together in smart homes. Kabalci discussed how household energy management systems (HEMS) can be used to improve energy consumption and minimize dependency on non-renewable sources by utilizing smart grid interactions and renewable energy sources. Their research highlights how smart homes could encourage more general sustainability objectives. But there are some challenges like technical complexity, availability of sustainable energy or initial cost in implementation in the past are often overlooked. [9]. We identified common security issues and proposed mitigation strategies and emphasized the importance of robust security measures. While Zhang and Green reviewed security vulnerabilities in smart home devices, but the drawback is the possibility that cyber threats evolve too fast or that proposed techniques for dealing with them work might not have been thoroughly assessed [10]. Next Study addressed the challenges of interoperability in smart home systems, focusing on the difficulties of integrating devices from different manufacturers. They advocate for the development of standardized protocols and interfaces to ensure seamless operation and user convenience. The researchers ignored issues such as the challenges in updating legacy systems, or the inadequacies of standardized protocols when it comes to accommodating up-and-coming technology [11]. In another research, a complete evaluation of IoT architectures and protocols, emphasizing the significance of interoperability and standardization in accomplishing seamless device communication. Their findings underscore home environments have been explored by several researchers. Their study highlights the need for careful consideration of user experience and the potential for technology-induced stress. More technology centric system or worries regarding confidentiality concerning collection of data and monitoring may not have been fully resolved [12]. A comprehensive research framework that incorporates different levels of smart home systems was presented. Insufficient integration, as well as changes in hot spots in the smart home industry, was explained. Potential Lack of Specificity: The study does not provide guidance on specific practices or practical implementation of the framework within this context. Consequently, there could be difficulties in translating the proposed principles into pragmatic programs for professional use. Limited Empirical Evidence: Without it the effectiveness of the proposed framework remains theoretical and may not fully capture the complexities of real-world smart home systems [13].

The next paper suggested that cost effective way of monitoring and controlling home electrical devices is through the use of new circuit topology that uses Android smartphone, Arduino, and wireless transceivers specifications, which makes more research necessary before the design can be put into reality [14]. The IoT-based home automation system introduces TBSA for Wireless Sensor Network (WSN)s, aiming at enhanced security, scalability, and energy efficiency, with potential applications in diverse sectors including healthcare, agriculture, and industrial automation. The mainstream adoption of the IoT-based home automation system could be limited in numerous industries as well as applications as a result of a lack of comprehensive information on its scalability, interoperability, or resistance to evolving security threats [15]. This paper's suggested system aims how consumers view smart homes by concentrating on what drives the acceptance of the idea and hindering factors through identification of such factors one may capitalize on them to transition their trade to more advanced commercial models. The lack of clarity in the approach and implementation strategies of the proposed system may limit its ability to offer manufacturers and vendors useful information for transforming to innovative business models and improving customer interactions [16]. Another research discussed home automation systems and technologies from a security perspective, addressing flaws, evolving concepts of security, challenges, and the attractiveness of these systems as targets for attackers, while also emphasizing the role of user interfaces in security. Lack of practical solutions or implementation strategies, usability was overlooked, interoperability, and scalability concerns, limiting its applicability in real-world scenarios [17]. Toggle is a cost-effective ESP8266 chips and Raspberry Pi boards based home automation system that supports flexible network configuration, home automation control and security functionalities, hence allowing hobbyists to create intelligent house prototypes. The system can be changed and extended for more improvements. Restricted device compatibility, potential challenges in keeping up with evolving technology, and limited customization options are some of the challenges [18]. Found that adoption factors have been attributed more to the technological acceptance model and the diffusion of innovation theory, adopting components of the Theory of Planned Behavior. Limitations include dependence on theoretical models and absence of Longitudinal Data. In the absence of longitudinal data, the study may not be able to account for changes in customer preferences and technology improvements over time, or to reflect the shifting nature of adoption patterns for smart homes [19].

Sharmistha Ghosh et al.,

Advancements in Smart Home Technology

Integration of IoT

It refers to the use of smart homes wherein a combination of devices and sensors that are connected are used to realize one context. For example, efficient communication between devices has been made possible due to bettered protocols for The Internet of Things like Zigbee, Z-Wave and Wi-Fi.

Voice Assistance and Natural Language Processing (NLP)

Nowadays, it is very common to find voice-controlled smart assistants such as Amazon Alexa and Google Assistant. Smart devices have now become easier to use due to better natural language processing technologies.

Energy Management

When it comes to energy management, smart meters, real-time energy monitoring the likes of the opt-in program that allows you to share reduce power consumption through predictive algorithms. Home automation systems based on occupancy and external factors can adjust lighting, heating and cooling respectively.

Security and Surveillance

Strongly improved security is guaranteed whenever HD cameras, motion sensors together with face recognition are used for home security. Besides providing mental satisfaction to house owners, storage on the cloud as well as remote monitoring can also be utilized in homes \Services are meant toward ensuring total security within a home.

Health and Wellness

Smart home devices track health metrics (e.g., heart rate, sleep patterns) and promote healthier lifestyles. Elderly care and fall detection systems improve safety.

Challenges and Solutions

- Privacy and Data Security
- Interoperability
- Complexity
- Cost
- Reliability and Maintenance

Privacy and Data Security

Collecting sensitive data (e.g., video feeds, behavioral patterns) raises privacy concerns. Ensuring robust encryption, secure authentication, and user consent is crucial.

Solution for privacy and data security challenges

1. End-to-end encryption for data transmission is to be implemented to ensure that sensitive information remains secure.
2. Multi-factor authentication (MFA) is to be used to prevent unauthorized access.
3. End-to-end encryption protocol must be implemented to secure sensitive data transmission and storage.
4. Transparency and user consent mechanism is prioritized to allow individuals to control the collection and usage of their data.
5. Clear privacy policies should be established and explicit user consent is obtained.

Methods used and details for privacy and data security solution are the following

Encryption

Encryption is a commonly employed means of guaranteeing privacy and safeguarding data in smart homes. As regards home automation systems, it is an essential instrument for securing confidential information. This technique includes utilizing fancy scientific codes in order to guarantee that information is safeguarded while being carried or

Sharmistha Ghosh et al.,

kept inside the intelligent domicile habitat. Just to break it down further, encryption deals with converting plain text to ciphertext that is only reversible by individuals mandated with proper authorization.

Implementation and Data Transmission

All data transmitted between smart home devices, central hubs, and external servers are encrypted using robust encryption protocols such as Advanced Encryption Standard (AES) or Rivest-Shamir-Adleman (RSA).

Data Storage

Sensitive data stored locally on smart home devices or in cloud servers are encrypted to prevent unauthorized access in case of data breaches or physical device theft.

End-to-End Encryption

This ensures that data remains encrypted during the whole process, from source to the destination, to protect against interception and tampering. Figure 1 shows the encryption process is.

Data Identification

First, sensitive data within the smart home environment is identified. This can include information such as video feeds, sensor data, personal preferences, and user credentials.

Selection of Encryption Algorithm

One must select the appropriate encryption algorithm. The choice takes into account security requirements and system computational efficiency. This is the same as the previous sentence but with different words! The two important kinds of encryption algorithms are AES and RSA. For your computer system to be safe and fast at the same time, choose AES over RSA which is more secure but slower. This shows us that AES should be preferred over RSA because it has a greater degree on security though lacking speed compared to this latter one!!!

Key Generation

Encryption requires cryptographic keys. A pair of keys is generated during the key generation process. The keys include a public key used in encryption while the other is a private key employed in decryption. For instance, in RSA asymmetric encryption schemes, the two keys are not similar. Nevertheless, they are similar keys when it comes to AES symmetric encryption schemes.

Encryption

Encryption of plain text is done with the help of chosen algorithm and given key(s). Inputting a dataset into an encryption system, results in the creation of an unreadable text that will require a given key to read back.

Advantages

1. Robust Protection: Encryption-based approaches offer robust protection against unauthorized access, data breaches, and interception by malicious actors.
2. Data Confidentiality: Encrypted data remains confidential and indecipherable to unauthorized parties, preserving user privacy and confidentiality.
3. Compliance: Adhering to encryption standards and best practices helps smart home systems comply with data protection regulations and industry standards.

Under the option EDIT select PASTE SPECIAL. A dialog box will open, select paste picture, then click OK. Your figure should now be in the Word Document.

If you are preparing images in TIFF, EPS, or PS format, note the following. High-contrast line figures and tables should be prepared with 600 dpi resolution and saved with no compression, 1 bit per pixel (monochrome), with file names in the form of "fig3.tif" or "table1.tif."

Photographs and grayscale figures should be prepared with 300 dpi resolution and saved with no compression, 8 bits per pixel (grayscale).

**Sharmistha Ghosh et al.,****Data Transmission Process**

Secure communication protocols like Hypertext Transfer Protocol Secure (HTTPS) or Transport Layer Security (TLS) are used to ensure that encrypted data is securely transmitted between smart home devices, central hubs, and external servers. In case, that includes many nodes and networks, end-to-end encryption guarantees that data will not be decrypted along its journey from the sender to the receiver so that it keeps secret and secure. The process of data transmission is shown in figure 2.

Data Storage

Secure Storage: Encrypted data is stored securely on local smart home devices or in cloud servers. Even if the data is compromised or accessed without authorization, it remains indecipherable without the appropriate decryption.

Key Management: It is necessary to have good practices in managing keys in order to ensure secure generation, storage and distribution of encryption keys. Such practices involve those aimed at rotating keys; revoking keys; and preventing key theft or loss. The data storage process is shown in figure 3.

Decryption Process

Authentication: Authorized parties authenticate themselves to gain access to the encrypted data.

Decryption: After that, the cipher text should be converted back to the original plaintext through the use of the matching decryption key.

Data Utilization: After it has been decoded, it can be used anyway it was supposed to be; it can serve in processing sensor readings, can be used to display video feeds, and smart home settings can be regulated. The decryption process is shown in figure 4.

Interoperability

Lack of standardized protocols causes obstacles in integrating various smart devices smoothly. Compatibility problems mark the combination of different brands and ecosystems by the users. The interoperability flow is shown in figure 5.

Solution for Interoperability

Let's make sure that we start using Zigbee or Z-Wave standards in all smart home devices. It is important that new platforms be developed which are open-source and can work with various devices and brand names. Manufacturers are urged to use common communication protocols as part of their products. Open-source protocols should be adopted by the industry in order to allow for smooth communication among varying smart devices. It's important that compatible tests should be done which are both tough enough so that diverse brand and ecosystem devices can work together. The techniques used for solution is described in table1. User can address interoperability challenges in the smart home space effectively by doing this, encouraging greater compatibility and seamless integration across devices made by different brands. Building an interoperable and user-friendly smart home ecosystem requires collaboration, standardization, and consumer education.

Complexity

Making a smart home systems set-up and configuration work can be a scare for non-techies. It must be simplified during installation while ensuring that user-friendly interfaces are provided.

1. Create simple user interfaces that are intuitive to help with setup.
2. Provide a step-by-step guide and video tutorials to people who are not technically minded.
3. Customer support is provided for troubleshooting upon installation and configuration of the software.

The solution techniques for complexity issue are given in table2.

Sharmistha Ghosh *et al.*,

Table 2. Solution technique for Complexity for smart home

Users in the smart home industry who implement these solutions are able to reduce complexity, improve the overall user and usage experience, hence the usability of smart home systems.

Cost

A few property owners may shy away from embracing modern technologies due to the high initial costs. Nevertheless, it is still difficult to combine affordability and functionality.

Solution Techniques of Cost

Introducing modular systems that enable users to begin in a small way but grow progressively as time goes by. Subscription based services and updates should be offered to allow cost spreading. The co-operation of electric service providers for rebates for homes which employ smart technology is required. The entrance-level smart domestic packages can be made available by having affordable prices for homeowners to extend their smart ecosystem that suite their budget and preference. There should be introduction of subscription-based models for advanced features and services to allow users pay for what they use over time, hence more flexibility. There are several ways to reduce prices of smart home technology, all of which are designed to make devices more affordable for buyers while maintaining their functions or standards. In table 3 several common ways are described to alleviate the cost issues associated with smart homes.

Reliability and Maintenance

Reliability is impacted by device failures, connectivity issues, and software updates. Regular maintenance and troubleshooting are needed. Methods to increase the reliability is described in table 4.

Solution Technique for Reliability and Maintenance

To ensure bugs and security vulnerabilities are addressed, make sure that there are regular firmware updates. Design devices in a way that they have self-diagnostic capabilities for alerting users when there might be a problem. Maintenance packages or warranties should also be provided by manufacturers to cater for device replacements inclusive of technical support. The method is given in figure 6.

CONCLUSION AND FUTURE SCOPE

The users of smart home industry may overcome challenges effectively, as well as triggering higher adoption rates and satisfaction levels by implementing these solutions and best practices. It is necessary for there to be collaboration between manufacturers, policymakers, and consumer advocacy groups in order to create an ecosystem of smart home technology with these five priorities foremost: privacy, interoperability, usability, affordability, and reliability. The development of smart home inventions is still in progress spurred by advancement in technology and demand by users. If smart homes are to reach their full potential, there will be a need to deal with issues concerning privacy, compatibility, and functionality. To sum up, smart home innovations have advanced leading to enhanced ease in life, better security, as well as more environmental friendly living. By incorporating cutting-edge technologies like (AI), (ML), and Internet of Things (IoT), smart homes deliver customized experiences as well as predictive maintenance while supporting renewable energy sources and smart grid systems for energy saving. Although there are numerous advantages, there are significant challenges as well. Privacy and security concerns are substantial due to the fact that linked devices can develop openings where there are chances of phishing attacks. Also, making various systems to work in parallel manner increases installation cost as well as various levels of ease of access act as barriers to its adoption on a large scale. Ethical and regulatory aspects further reiterate the importance of having strong data protection laws that come along with fair operational strategies. Besides impediments that are techno-legal, it is essential. A careful study needs to be made concerning the way this innovation are influencing daily practices of socialization to make sure they add up rather than take away from human well-being. To navigate through such complexities, this paper gives much emphasis on the pros and cons of smart home improvements. By addressing

Sharmistha Ghosh et al.,

these challenges with innovative solutions, we can unlock the full potential of smart homes to improve our lives and contribute to a more sustainable future.

Table.1: Solution Techniques for Interoperability

Factors	Description
Simplified Installation and Configuration	Create easy to use setup processes which direct customers through the installment and configuration procedure of smart house gadgets. This might incorporate instinctive cell phone applications, tutorials articulated on a step-by-step basis among others. Incorporate plug-and-play features into the system to allow devices being linked up with no requirement for techie knowledge.
Intuitive User Interfaces	Plan intuitive interfaces usable in smart home control panels, mobile applications --apps plus voice assistants too. Using visual cues, icons as well as natural language processing simplifies interaction as well reduces cognitive load. Customize suggestions together with presets; it saves time since there is no need to keep adjusting the gadgets every now and then.
Unified Control Platforms	Create a single interface that will bring together different smart devices and ecosystems under one platform to manage them all at once. This is a good idea as it prevents users from having to switch between several applications or interfaces. It should be able to work with well-known smart home ecosystems and platforms for easy connection and control among the devices.
Automation and AI-driven Solutions	Use AI and automation to help with regular tasks and make user interactions more efficient. Apply smart routines, schedules, and triggers for environmental dependent automatic device actions. Use machine learning algorithms to evaluate changes in user behavior stretching to smart home adjustments.
User Education and Support	To help users understand the effective use and troubleshooting of smart home systems, offer them extensive education and support resources. This consists of online tutorials, user manuals and customer support channels to ensure that any problems or questions from the user are addressed. Provide users with assistance in setting up, configuring, and troubleshooting their devices through in-app guidance and contextual help features.
Modular and Scalable Solutions	Allow people to begin small and slowly expand an intelligent home using modular architectures. As time passes one needs scalability options for adding functionalities and fresh devices without disturbing previous installations. Ensure that you can use backward and forward compatibility systems for supporting the old and new house gadgets.
Privacy and Security by Design	Integrate privacy and security during smart home system design and development since the beginning. Utilize strong encryption techniques, secure authentication mechanisms, and data privacy safeguards to safeguard individual data and reduce security threats. In order to create trust and confidence among users, enable sunlight and some level of control on how data is collected, used, or shared by users.

Table.2: Solution technique for Complexity for smart home

Factors	Description
Simplified Installation and Configuration	Create easy to use setup processes which direct customers through the installment and configuration procedure of smart house gadgets. This might incorporate instinctive cell phone applications, tutorials articulated on a step-by-step basis among others. Incorporate plug-and-play features into the system to allow devices being linked up with no requirement for techie knowledge.
Intuitive User Interfaces	Plan intuitive interfaces usable in smart home control panels, mobile applications --apps plus voice assistants too. Using visual cues, icons as well as natural language processing

Sharmistha Ghosh et al.,

	simplifies interaction as well reduces cognitive load. Customize suggestions together with presets; it saves time since there is no need to keep adjusting the gadgets every now and then.
Unified Control Platforms	Create a single interface that will bring together different smart devices and ecosystems under one platform to manage them all at once. This is a good idea as it prevents users from having to switch between several applications or interfaces. It should be able to work with well-known smart home ecosystems and platforms for easy connection and control among the devices.
Automation and AI-driven Solutions	Use AI and automation to help with regular tasks and make user interactions more efficient. Apply smart routines, schedules, and triggers for environmental dependent automatic device actions. Use machine learning algorithms to evaluate changes in user behavior stretching to smart home adjustments.
User Education and Support	To help users understand the effective use and troubleshooting of smart home systems, offer them extensive education and support resources. This consists of online tutorials, user manuals and customer support channels to ensure that any problems or questions from the user are addressed. Provide users with assistance in setting up, configuring, and troubleshooting their devices through in-app guidance and contextual help features.
Modular and Scalable Solutions	Allow people to begin small and slowly expand an intelligent home using modular architectures. As time passes one needs scalability options for adding functionalities and fresh devices without disturbing previous installations. Ensure that you can use backward and forward compatibility systems for supporting the old and new house gadgets.
Privacy and Security by Design	Integrate privacy and security during smart home system design and development since the beginning. Utilize strong encryption techniques, secure authentication mechanisms, and data privacy safeguards to safeguard individual data and reduce security threats. In order to create trust and confidence among users, enable sunlight and some level of control on how data is collected, used, or shared by users.

Table.3: Solution Techniques for Reducing the Cost of a Smart Home

Factors	Description
Economies of Scale	For producing smart home devices in vast numbers, these can just take an advantage of economies of scale in order to save the costs. The cost saving is a result of per unit manufacturing cost being lowered through mass production hence the products are sold at discounted prices.
Component Standardization	Making smart home gadgets common parts, off-the-shelf hardware and software offer a way to cut costs for designing and producing them. It is also easier to manufacture them and deliver them quickly when you have standardized components.
Cost-Effective Materials and Design	Creating intelligent home gear with affordable resources and clear cuts can cut down on production costs but still ensure functionality and dependability. In addition, by choosing inexpensive but long-lasting materials and getting rid of extras that are not needed, production costs can be minimized.
Efficient Manufacturing Processes	Streamlining production and reducing labor costs can be achieved by adopting effective manufacturing processes which include lean manufacturing principles together with automation. Automation leads to cost savings by reducing manual labor needs and at the same time enhancing production efficiency.
Strategic Partnerships and Supply Chain Optimization	By collaborating with strategic partners and optimizing the supply chain, you can reduce procurement costs for raw materials, components, and manufacturing services. When you establish long-term relationships with suppliers and negotiate favorable terms, there is a possibility of cost savings.
Energy Efficiency	Pursuing energy-efficient smart home devices can provide financial savings to the

Sharmistha Ghosh et al.,

and Lifecycle Costs	homeowners throughout the life of their appliance. As a result of this reduced electricity usage, these systems conserve power while in operation mode which eventually leads saving cost incurred during energy consumption.
Subscription-Based Models and Service Bundles	One way to make smart home devices more affordable for consumers is through offering monthly or bundled internet plans. This approach enables the distribution of costs such that the devices do not have to be so expensive. Specific subscriptions may include access to extra functions or cloud storage while others cover services for help.
Government Incentives and Rebates	Governments can provide assistance such as discounts, tax relief and refunds for the purpose of promoting the use of power saving or intelligent house gadgets. On the other hand, producers and buyers use them to reduce the price when buying or putting up intelligent home equipment.

Table.4: Methods to enhance the Reliability and Maintenance

Factors	Description
Quality Assurance and Testing	To ensure that smart home devices perform well under different circumstances, rigorous quality assurance processes should be implemented during product development and testing phases in order to detect and fix any possible reliability issues early enough, while also doing comprehensive tests such as pressure tests, environmental tests, and interoperability tests.
Remote Monitoring and Diagnostics	Incorporate remote sensing as well as diagnostic functionalities into intelligent home devices that allow their health as well as performance to be monitored in advance. By utilizing sensors, telemetry data, and cloud-based analytics this can help identify service requirements prior to them becoming serious problems.
Predictive Maintenance	Use data analytics and machine learning algorithms implementation of predictive maintenance techniques for forecasting possible failure or maintenance of smart home devices. Utilize predictive models so as to schedule preventative maintenance activities, optimize resource allocation and thus minimize downtime.
Over-the-Air (OTA) Updates	There should be provision to be able to send repairs for software errors, security enhancements and performance fixes remotely, using over-the-air firmware (OTA) updates on smart home equipment. Meanwhile, by automating the update process, it is possible for equipment to be always operating with the latest software releases as well as enhancements without any manual input by the user.
Modular Design and Easy Replacement	Create intelligent devices destined for smart home that possess modular parts and replaceable elements thus easing possible maintenance and repair works that could have been done by the customer or any other unskilled person. The clear instructions should also be at the disposal of end users together with the essential diagnostic instruments for simple troubleshooting, interchanging modules and updating programs independently.
Redundancy and Fault Tolerance	To minimize the influence of network failures or device malfunctions, smart home systems should be constructed with redundancy and fault tolerance mechanisms. In case of hardware or network problems, failover mechanisms, redundant communication paths and backup power sources will be introduced to keep them working.
Continuous Monitoring and Feedback Loops	Set up systems that monitor continuously and provide feedback the moment a smart home device gives real-time performance data. Get common problems from received data, enhance the efficiency of such devices, and use iterative design processes to build better products.
User Education and Support	Have a thorough user manuals and support tools to help users identify frequent complications, carry out regular maintenance procedures and maximize the dependability of their smart home gadgets. Provide the user with online directions, technical problem solving manuals, and channels for customer assistance.

ABSTRACT

The study aims to find out the effectiveness of the combination of Nagarmotha and Ajmoda as antifungal compounds. Nagarmotha scientifically known as *Cyperus scariosus* belongs to family Cyperaceae. Ajmoda is scientifically known as *Apium graveolens*. Antifungal activity of crude aqueous extracts was examined by inoculating fungi on media containing plant extract, by serial dilution method. The study revealed the effect of plant by evaluating fungal growth and zone of inhibition measurement. By performing phytochemical screening for aqueous extracts secondary metabolites were detected. The selected fungi were susceptible to aqueous extract of *Cyperus scariosus* with different inhibition zones. In this formulation, combination of two bioactive compounds is considered to form an effective antifungal spray preparation. The spray preparation is helpful to achieve fast absorption of the drugs through the transdermal way of drug administration. The effectiveness and activity rate of spray preparation is more beneficial. The zone of inhibition of antifungal formulation, Mean \pm SEM values are 18 \pm 14mm and both the herbs exhibited synergistic activity. Hence the antifungal spray containing *Cyperus scariosus* and *Apium graveolens* can be recommended for anti-fungal spray.

Keywords: *Apium graveolens*, *Cyperus scariosus*, Transdermal, Antifungal activity

INTRODUCTION

Fungal infections are the leading cause of death in both advanced and developing countries.[1]Fungal infections can include superficial, cutaneous, sub-cutaneous, mucosal and systemic infections with varying degree of severity. Organisms such as *Candida* spp. are part of human microbiota that can cause opportunistic infections in individuals and life-threatening infections in immuno-compromised patients such as HIV patients, cancer patients receiving chemotherapy, and patients receiving immuno-suppressive drugs. [2] There are numerous antifungal agents used clinically to treat fungal infections.[3]Many of the currently available drugs have undesirable side effects, are ineffective against new or re-emerging fungal strains, or lead to rapid development of resistance.[4]Therefore, the discovery of antifungal drugs with low toxicity, broad spectrum of activity, and a new mode of action is becoming increasingly important. [5] There is a growing interest in the use of herbal plants for their different medicinal properties due to their natural origin, cost effectiveness, and negligible side effects.[6]Poly-herbal formulations, composed of multiple plant-derived constituents, offer a holistic approach to combat fungal pathogens.[7]Synergistic interactions between plant compounds in poly-herbal formulations offer a promising approach to overcoming the limitations of conventional antifungal therapies. By harnessing the collective strength of diverse bioactive molecules, poly-herbal anti-fungal sprays have the potential to provide more effective and sustainable treatment options for fungal infections.[8] *Cyperus scariosus* and *Apium graveolens* are the plants used in this study. *Cyperus scariosus* is a valuable multipurpose medicinal herb of large cosmopolitan family of monocotyledons comprising about 3700 species within 70 genera.[9]The major chemical components of this herb are essential oils, flavonoids, terpenoids, and monosesquiterpenes. [10]The essential oil obtained from rhizomes and roots of the plant has its value in perfumery and is also known to possess antibacterial, antifungal, plant growth regulating properties, analgesic, anti-diabetic activity, hepatoprotective activity, hypotensive and spasmolytic activity.[11] *Apium graveolens* is a biennial plant belonging to family Apiaceae.[12]It contains many active compounds, including polysaccharides (apiuman), flavonoids (luteolin, apigenin), phthalides (sedanolide, 3-n-butyl phthalide), furanocoumarins (bergapten, xanthotoxin), terpenes (d-limonene), amino acids (L-tryptophan), polyacetylenes (falcarinol, falcarindiol), and vitamins (alpha-tocopherol).[13]*Apium graveolens* has shown its pharmacological efficacy with antimicrobial, antifungal, anti-parasitic, anti-inflammatory, anti-cancer, anti-ulcer, antioxidant, anti-diabetic, anti-infertility, anti-platelet, anti-spasmolytic, hepatoprotective, cardioprotective, neuroprotective, cytoprotective, hypolipidemic, and analgesic activity.[14]

MATERIALS AND METHODS

Sample collection

The Nagarmotha powder was obtained from Srihari ayurveda Bawan, Maharashtra. The Ajmoda oil was obtained from Prakash ayurvedic store, Pune.

Nagarmotha extraction (Maceration)

The powder was obtained. 100grms of powder was dissolved in 300ml of water by maceration method. It was kept aside for 72 hrs using successive solvent extraction method. The plant extracts were filtered by using Whatman filter paper no.1. The crude extract was obtained by removing solvent at 30 degrees. The plant extract was obtained by placing it in a hot air oven for 15 minutes. The dried extract was further used in formulation.

Preliminary Phytochemical Screening

The phytochemical analysis of Nagarmotha root powder and Ajmoda oil were performed.

Test for terpenoids [Salkowski test]

5 ml of the extract was mixed with 2 ml of chloroform and concentrated Sulphuric acid to form a layer. A reddish-brown coloration of the interface showed the presence of terpenoid's.

Sireesha Kalva *et al.*,

Test for tannins [Ferric chloride test]

The extract was diluted to 5 ml with distilled water. To this a few drops of neutral 5% ferric chloride solution was added. A dark green color indicates the presence of phenolic compounds.

Test for Saponins [Froth test]

0.5g extracts were dissolved in 10ml of distilled water for about 30 seconds. The test tube was stoppered and shaken vigorously for about 30 seconds. The test tube was allowed to stand in a vertical position and observed over 30 minutes period. If a “honeycomb” froth above the surface of liquid persists after 30 minutes the sample is suspected to contain saponin.

Test for flavonoids [Alkaline reagent test]

Two to three drops of sodium hydroxide were added to 2 ml of extract, initially. A deep yellow color appeared but it gradually became colorless by adding few drops of dilute HCL indicating that flavonoids were present.

Test for alkaloids

100mg of extract was dissolved in dilute hydrochloric acid. The solution was clarified by filtration. Filtrate was tested with Mayer’s reagents. The treated solution was observed for precipitation.

Test for Phenols

Ferric chloride test is used to determine the presence of phenols in a given sample.

Test for Glycosides [Killer killani test]

2mL of extract was mixed with glacial acetic acid containing a drop of ferric chloride solution, a brown color ring form indicates the presence of glycosides.

Determination of Antifungal Activity

The media were prepared such as sabouraud dextrose agar [SDA] established for fungal growth. Estimating suppressed fungi by plant extraction.

Fungal Strains

The experiment was performed with strains of standard *C. albicans* strains.

Antifungal Susceptibility Test

The antifungal activity of extracts was studied by serial dilution method. Sabouraud dextrose agar was used for fungal cultures. Subsequently 8 mm wide wells were bored within these agar plates using a sterile cork borer. The wells were aseptically filled with 10mg/ml, 50mg/ml, 100mg/ml, 200mg/ml, 500mg/ml. of various extracts and labeled accordingly. The plates were incubated over night at 20-22°C for 2days for fungal cultures. Microbial growth was determined by measuring the diameter of zone of inhibition. The above experiment was carried out three times and mean values are presented here with. A serial dilution method was chosen for Antifungal study. Successive tubes filled with 9 ml sabouraud broth containing 10mg, 50mg, 100mg, 200mg, 500mg respective concentrations of extracts were inoculated with respective test organisms. The tubes were incubated at 25°C in an incubator and observed for change in turbidity after 24 h. A tube containing sabouraud broth without extract was taken as control.

Preparation of Antifungal Spray

Ajmoda oil was dissolved in Propylene glycol by using magnetic stirrer. Nagarmotha was dissolved by using ethyl alcohol using a sonicator. Nagarmotha solution is added step by step into Ajmoda oil solution. The mixture is stirred by magnetic stirrer for 5 min. Ethyl alcohol was added into the mixture and stirred for 2min and at the end few drops of peppermint oil was added. The prepared formulation was filled into suitable container.

Sireesha Kalva et al.,

RESULTS AND DISCUSSION

The aqueous extract of *Cyperus scariosus* showed the presence of alkaloids, tannins, saponins, terpenoids, phenols, flavonoids while proving the absence of glycosides. The aqueous extract of *Apium graveolens* showed the presence of tannins, terpenoids, flavonoids while proved the absence of glycosides, Saponins, Terpenoids, Phenols.

In-Vitro Antifungal Activity

By serial dilution method aqueous *Cyperus scariosus* extract was applied on sabouraud dextrose agar. Aqueous extract is evaluated as the promised part of *C. scariosus*, due to the presence of the most crucial secondary metabolites. The aqueous extract of *Cyperus Scariosus* revealed a wide spectrum antifungal activity. Inhibition zones for 10mg/ml is expressed as Mean \pm SEM values are 12.3 \pm 0.8 are shown in fig4. The other concentration values of 50mg/ml, 100mg/ml, 200mg/ml, 500mg/ml are 12 \pm 1.5, 12.6 \pm 1.7, 16.6 \pm 1.8, 18.3 \pm 4.1mm, are shown in fig5, fig6, fig7, fig8 respectively. The inhibition zone was reported at 48 hours of incubation. The high activity was shown at 500mg/ml are 18.3 \pm 4.1 against candida albicans. This study suggests that the rhizome extract of *Cyperus scariosus* has a broad spectrum of antifungal activity. The *Apium graveolens* oil has potent antifungal activity against candida albicans are shown in fig 9. These results are compared with the zone of inhibition for control fungal test shown in fig 10 respectively.

Formulation of Antifungal Spray

Antifungal spray was formulated using *Cyperus scariosus*, *Apium graveolens* oil of 30 ml dose by that formulating and antifungal activity is evaluated for the formulated spray. The zone of inhibition for the formulation of antifungal spray expressed as Mean \pm SEM values are 18 \pm 1.4 are shown in fig 12. We proved that antifungal spray of *Cyperus scariosus* and *Apium graveolens* is having better inhibitory effect on fungal growth than individually. We found that they are inhibiting synergistic action.

CONCLUSION

Candida albicans is a very prominent fast-growing fungal species on skin and nails. Hence topical application of the drug is the appropriate method for effectiveness of the drug. In this study, spray was prepared by combining Nagarmotha extract with the Ajmoda oil that is effective in terms of anti-fungal activities. The spray preparation has effectively worked on the fungal colonies prepared and has shown good results with its anti-fungal properties. As it is in the mist form it will get absorbed fast and pass easily through the skin pores and produce local effect. Desirable dose can be delivered by metered spray.

ABSTRACT

The aim of this paper, is to extend the concept of Single and multi-valued Neutrosophic Hypersoft set, to Single and Multi-valued Pythagorean Neutrosophic SuperHypersoft Set. Also we consider distances for Single-valued PNSHSS, and then propose similarity measures for Single-valued PNSHSS. Relevant examples are provided along with the presentation of the implementation validity.

Keywords: Pythagorean Neutrosophic Superhypersoft set, Single-valued Pythagorean Neutrosophic Superhypersoft set, Multi-valued Pythagorean Neutrosophic Superhypersoft set, Distance, similarity.

INTRODUCTION

In 1965, A. Zadeh laid the groundwork for fuzzy sets [17]. The fuzzy sets are determined by the level of membership values. The interval valued fuzzy sets notion was presented [16] to address the ambiguity surrounding membership values. We must consider membership and non-membership values in certain real-world issues in order to accurately represent an item in a dubious and ambiguous state. IFS, which are helpful in some circumstances, were initially created by Atanassov [2]. IFS, which consider both truth and falsehood values, and can be used to deal with inadequate data. The concept of the Neutrosophic set was first put forth by Smarandache [13]. The membership values for truth, doubt, and falsehood are shown by the neutrosophic set. The idea of a soft set was first presented by Molodstov [8] as a novel numerical technique for dealing with uncertain situations. He defines a soft set as a family

Hemalatha and Francina Shalini

of universal sets with parameter subsets. Soft sets are useful in many fields, including game theory, artificial intelligence, and basic decision-making problems [6]. Many scholars have studied the foundations of soft set theory in recent years. Ali et al.[1] offered the subset and super set, whereas Maji et al.[7] provided a theoretical analysis of soft sets. Smarandache suggested a fresh approach for dealing with uncertainty. He expanded the Softset_(SS) to Hypersoft_(HS) set and Super Hyper soft set is related to the Smarandache power set [14,15]. M. Saqlain put worth the concept of single and Multi-valued Neutrosophic Hypersoft set[10].Distance and similarity measures are very important for giving degrees of difference and similarity between them. Distance and similarity measure for neutrosophic hypersoft set was proposed by M.Saqlain [12].Then Jayasudha and Raghavi introduced the concept of Neutrosophic Hypersoft Matrices and their applications in 2024 [5],[3]Hemalatha and Francina Shalini defined the concept of the Pythagorean Neutrosophic SuperHypersoft set. [4]Then Hemalatha and Francina Shalini introduced the concept of Pythagorean Neutrosophic SuperHypersoft Matrices and their applications. This is closer to our everyday life.

PRELIMINARIES

Definition [7] Let U represents the universe set, $P(U)$ denotes the power set and Z be parameters. Consider $\mathring{A} \subset Z$. Then (F, \mathring{A}) is a soft set over U , where F is a mapping given by $F: \mathring{A} \rightarrow P(U)$.

Definition [9] Let U be the universal set and ω be the set of attributes with respect to U . Let $P(U)$ be the set of Neutrosophic values of U and $\mathring{A} \subseteq \omega$. A pair (F, \mathring{A}) is called a Neutrosophic soft set over U and its mapping given as $F: \mathring{A} \rightarrow P(U)$.

Definition [11] Let U represent the universe and the power set of U is $\mathfrak{B}(U)$. For $t \geq 1$ let $(\mathfrak{S}_1, \mathfrak{S}_2, \mathfrak{S}_3 \dots \mathfrak{S}_n)_{HS}$ be t -distinct attributes, each of whose associated attributive values is the set $(s_1, s_2, s_3 \dots s_t)_{HS}$ with $(s_y \cap s_z)_{HS} = \emptyset$ as well as $y \neq z$ and $y, z \in \{1, 2, \dots, t\}$, Then $(\mathfrak{F}, s_1, s_2, s_3 \dots s_t)_{HS}$ is a Hypersoft set over U . where $\mathfrak{F}: (s_1, s_2, s_3 \dots s_t)_{HS} \rightarrow \mathfrak{B}(U)$

Definition [12] Consider U be the universal set and the power set of U is $P(U)$. For $t \geq 1$ let $(\mathfrak{S}_1, \mathfrak{S}_2, \mathfrak{S}_3 \dots \mathfrak{S}_n)_{NHS}$ be t -distinct attributes, each of whose associated attributive values is the set $(s_1, s_2, s_3 \dots s_t)_{NHS}$ with $(s_y \cap s_z)_{NHS} = \emptyset$ for $y \neq z$ and $y, z \in \{1, 2, \dots, t\}$, The connection between these set is stated as $(s_1, s_2, s_3 \dots s_t)_{NHS} = \mathcal{H}$, and $\mathfrak{F}: (s_1, s_2, s_3 \dots s_t)_{NHS} \rightarrow \mathbb{P}(U)$ and $(\mathfrak{F}, (s_1, s_2, s_3 \dots s_t)_{NHS}) = \{(\mathcal{H}, \langle x_{NHS}, T_{\mathfrak{F}(\mathcal{H})}(x)_{NHS}, I_{\mathfrak{F}(\mathcal{H})}(x)_{NHS}, F_{\mathfrak{F}(\mathcal{H})}(x)_{NHS} \rangle) : x \in U\}$ is called as Neutrosophic Hypersoft set. where T represents truth membership, I represents indeterminacy, and F represents falsity membership such that $T_{\mathfrak{F}(\mathcal{H})}(x)_{NHS}, I_{\mathfrak{F}(\mathcal{H})}(x)_{NHS}, F_{\mathfrak{F}(\mathcal{H})}(x)_{NHS} \in [0, 1]$ also $0 \leq T_{\mathfrak{F}(\mathcal{H})}(x)_{NHS} + I_{\mathfrak{F}(\mathcal{H})}(x)_{NHS} + F_{\mathfrak{F}(\mathcal{H})}(x)_{NHS} \leq 3$.

Definition [3]Let \mathfrak{Z} represent the universal set and power set of \mathfrak{Z} is $\mathfrak{G}(\mathfrak{Z})$. For $k \geq 1$, let $(\mathfrak{B}_1, \mathfrak{B}_2, \mathfrak{B}_3 \dots \mathfrak{B}_k)_{PNSHSS}$ be k -distinct attributes, each of whose associated attributive values is the set $(\mathfrak{B}_1, \mathfrak{B}_2, \mathfrak{B}_3 \dots \mathfrak{B}_k)_{PNSHSS}$ with $(\mathfrak{B}_m \cap \mathfrak{B}_n)_{PNSHSS} = \emptyset$ as well as $m \neq n$ and $m, n \in \{1, 2, \dots, k\}$. Let $\mathfrak{G}(\mathfrak{B}_1)_{PNSHSS}, \mathfrak{G}(\mathfrak{B}_2)_{PNSHSS}, \mathfrak{G}(\mathfrak{B}_3)_{PNSHSS}, \dots, \mathfrak{G}(\mathfrak{B}_k)_{PNSHSS} = \mathfrak{I}$ be the power sets of the set $(\mathfrak{B}_1, \mathfrak{B}_2, \mathfrak{B}_3 \dots \mathfrak{B}_k)_{PNSHSS}$ respectively. Then $(\mathfrak{f}, \mathfrak{G}(\mathfrak{B}_1)_{PNSHSS} \times \mathfrak{G}(\mathfrak{B}_2)_{PNSHSS} \times \mathfrak{G}(\mathfrak{B}_3)_{PNSHSS} \times \dots \times \mathfrak{G}(\mathfrak{B}_k)_{PNSHSS})$ is PNSHSS over \mathfrak{Z} . Where $\mathfrak{f}: (\mathfrak{G}(\mathfrak{B}_1)_{PNSHSS} \times \mathfrak{G}(\mathfrak{B}_2)_{PNSHSS} \times \mathfrak{G}(\mathfrak{B}_3)_{PNSHSS} \times \dots \times \mathfrak{G}(\mathfrak{B}_k)_{PNSHSS}) \rightarrow (\mathfrak{P}(\mathfrak{Z})_{PNSHSS})$ and $(\mathfrak{G}(\mathfrak{B}_1)_{PNSHSS} \times \mathfrak{G}(\mathfrak{B}_2)_{PNSHSS} \times \mathfrak{G}(\mathfrak{B}_3)_{PNSHSS} \times \dots \times \mathfrak{G}(\mathfrak{B}_k)_{PNSHSS}) = \{\mathfrak{I}, \langle x, T_{\mathfrak{f}(\mathfrak{I})}(x), I_{\mathfrak{f}(\mathfrak{I})}(x), F_{\mathfrak{f}(\mathfrak{I})}(x) \rangle : x \in \mathfrak{Z}, \mathfrak{I} \in (\mathfrak{G}(\mathfrak{B}_1)_{PNSHSS} \times \mathfrak{G}(\mathfrak{B}_2)_{PNSHSS} \times \mathfrak{G}(\mathfrak{B}_3)_{PNSHSS} \times \dots \times \mathfrak{G}(\mathfrak{B}_k)_{PNSHSS})\}$ (3) Where $T_{\mathfrak{f}(\mathfrak{I})}$ and $F_{\mathfrak{f}(\mathfrak{I})}$ are the dependent components. $I_{\mathfrak{f}(\mathfrak{I})}$ is independent component. Also, $0 \leq (T_{\mathfrak{f}(\mathfrak{I})}(x))^2 + (I_{\mathfrak{f}(\mathfrak{I})}(x))^2 + (F_{\mathfrak{f}(\mathfrak{I})}(x))^2 \leq 2$ and $T_{\mathfrak{f}(\mathfrak{I})}(x) + F_{\mathfrak{f}(\mathfrak{I})}(x) \leq 1$.

Hemalatha and Francina Shalini

Definition [4] Let $\mathfrak{X} = u^1, u^2, \dots, u^\gamma$ be the universal set and $P(\mathfrak{X})$ - power set of \mathfrak{X} . Consider $\mathfrak{G}_1, \mathfrak{G}_2, \mathfrak{G}_3, \dots, \mathfrak{G}_\alpha$ for $\alpha \geq 1$ be α -distinct attributes, whose corresponding attributive values are respectively the set $\mathfrak{G}_1^a, \mathfrak{G}_2^b, \mathfrak{G}_3^c, \dots, \mathfrak{G}_\alpha^z$ with $\mathfrak{G}_r \cap \mathfrak{G}_s = \emptyset$ for $r \neq s$ and $r, s \in \{1, 2, \dots, \alpha\}$. Let $P(\mathfrak{G}_1^a), P(\mathfrak{G}_2^b), P(\mathfrak{G}_3^c), \dots, P(\mathfrak{G}_\alpha^z) = \mathcal{H}$ be the power sets of the set $\mathfrak{G}_1^a, \mathfrak{G}_2^b, \mathfrak{G}_3^c, \dots, \mathfrak{G}_\alpha^z$ respectively.

Then the pair $(\mathfrak{F}, P(\mathfrak{G}_1^a) \times P(\mathfrak{G}_2^b) \times P(\mathfrak{G}_3^c) \times \dots \times P(\mathfrak{G}_\alpha^z))$ is said to be PNSHSS over \mathfrak{X} .

where $\mathfrak{F}: P(\mathfrak{G}_1^a) \times P(\mathfrak{G}_2^b) \times P(\mathfrak{G}_3^c) \times \dots \times P(\mathfrak{G}_\alpha^z) \rightarrow P(\mathfrak{X})$ and

$$\mathfrak{F}(P(\mathfrak{G}_1^a) \times P(\mathfrak{G}_2^b) \times P(\mathfrak{G}_3^c) \times \dots \times P(\mathfrak{G}_\alpha^z)) = \left\{ \begin{array}{l} \mathcal{H}, \langle x, T_{\mathfrak{F}(\mathcal{H})}(x), I_{\mathfrak{F}(\mathcal{H})}(x), F_{\mathfrak{F}(\mathcal{H})}(x) \rangle : x \in \mathfrak{X}, \\ \mathcal{H} \in P(\mathfrak{G}_1^a) \times P(\mathfrak{G}_2^b) \times \dots \times P(\mathfrak{G}_\alpha^z) \end{array} \right\}$$

Where $T_{\mathfrak{F}(\mathcal{H})}$ and $F_{\mathfrak{F}(\mathcal{H})}$ are the dependent components. $I_{\mathfrak{F}(\mathcal{H})}$ is independent component. Also,

$$0 \leq (T_{\mathfrak{F}(\mathcal{H})}(x))^2 + (I_{\mathfrak{F}(\mathcal{H})}(x))^2 + (F_{\mathfrak{F}(\mathcal{H})}(x))^2 \leq 2 \text{ and } T_{\mathfrak{F}(\mathcal{H})}(x) + F_{\mathfrak{F}(\mathcal{H})}(x) \leq 1.$$

Let $H_i = P(\mathfrak{G}_1^a) \times P(\mathfrak{G}_2^b) \times \dots \times P(\mathfrak{G}_\alpha^z)$

$$x_{\mathfrak{S}_i} = P(\mathfrak{G}_1^a) \times P(\mathfrak{G}_2^b) \times \dots \times P(\mathfrak{G}_\alpha^z)$$

It is defined as $x_{\mathfrak{S}_i} = \{x, T_{\mathfrak{F}(H)}(x), I_{\mathfrak{F}(H)}(x), F_{\mathfrak{F}(H)}(x)\} | x \in \mathfrak{X}, i \in P(\mathfrak{G}_1^a) \times P(\mathfrak{G}_2^b) \times \dots \times P(\mathfrak{G}_\alpha^z)$ and can be representation of \mathfrak{S}_i as given in the table

U	$P(\mathfrak{G}_1^a)$	$P(\mathfrak{G}_2^b)$...	$P(\mathfrak{G}_\alpha^z)$
u^1	$x_{\mathfrak{S}_i}(u^1, P(\mathfrak{G}_1^a))$	$x_{\mathfrak{S}_i}(u^1, P(\mathfrak{G}_2^b))$...	$x_{\mathfrak{S}_i}(u^1, P(\mathfrak{G}_\alpha^z))$
u^2	$x_{\mathfrak{S}_i}(u^2, P(\mathfrak{G}_1^a))$	$x_{\mathfrak{S}_i}(u^2, P(\mathfrak{G}_2^b))$...	$x_{\mathfrak{S}_i}(u^2, P(\mathfrak{G}_\alpha^z))$
\vdots	\vdots	\vdots	\vdots	\vdots
u^δ	$x_{\mathfrak{S}_i}(u^\delta, P(\mathfrak{G}_1^a))$	$x_{\mathfrak{S}_i}(u^\delta, P(\mathfrak{G}_2^b))$...	$x_{\mathfrak{S}_i}(u^\delta, P(\mathfrak{G}_\alpha^z))$

If $M_{st} = x_{\mathfrak{S}_i}(u^\ell, P(\mathfrak{G}_m^n))$

Where $\ell = 1, 2, \dots, \delta, n = a, b, \dots, z, m = 1, 2, \dots, \alpha$

Then the matrix is defined as,

$$[M_{st}]_{\alpha \times n} = \begin{pmatrix} M_{11} & M_{12} & \dots & M_{1n} \\ M_{21} & M_{22} & \dots & M_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ M_{\alpha 1} & M_{\alpha 2} & \dots & M_{\alpha n} \end{pmatrix}$$

Where $M_{st} = (T_{P(\mathfrak{G}_m^n)}(u_i), I_{P(\mathfrak{G}_m^n)}(u_i), F_{P(\mathfrak{G}_m^n)}(u_i), u_i \in U, P(\mathfrak{G}_m^n) \in P(\mathfrak{G}_1^a) \times P(\mathfrak{G}_2^b) \times P(\mathfrak{G}_3^c) \times \dots \times P(\mathfrak{G}_\alpha^z)) = (T_{stn}^M, I_{stn}^M, F_{stn}^M)$

Single and Multi-Valued Pythagorean Neutrosophic SuperHypersoft set

Definition Single Valued Pythagorean Neutrosophic SuperHypersoft Set

Let U be the universal set and $\mathbb{P}(U)_{PNSHSS}$ be the power set of U. Take k-distinct attributes, $\mathfrak{S}_1, \mathfrak{S}_2, \mathfrak{S}_3, \dots, \mathfrak{S}_k$ for $k \geq 1$, whose corresponding attributive values are respectively the set $\mathfrak{h}_1, \mathfrak{h}_2, \mathfrak{h}_3, \dots, \mathfrak{h}_k$ with $\mathfrak{h}_p \cap \mathfrak{h}_q = \emptyset$ for $p \neq q$ and $p, q \in \{1, 2, \dots, k\}$. Let $\mathbb{P}(\mathfrak{h}_1)_{PNSHSS}, \mathbb{P}(\mathfrak{h}_2)_{PNSHSS}, \mathbb{P}(\mathfrak{h}_3)_{PNSHSS}, \dots, \mathbb{P}(\mathfrak{h}_k)_{PNSHSS} = \mathcal{H}$ be the power sets of the set $\mathfrak{h}_1, \mathfrak{h}_2, \mathfrak{h}_3, \dots, \mathfrak{h}_k$ respectively.

Then the pair $(\mathfrak{F}, \mathbb{P}(\mathfrak{h}_1)_{PNSHSS} \times \mathbb{P}(\mathfrak{h}_2)_{PNSHSS} \times \mathbb{P}(\mathfrak{h}_3)_{PNSHSS} \times \dots \times \mathbb{P}(\mathfrak{h}_k)_{PNSHSS})$ is said to be PNSHSS over U.

where $\mathfrak{F}: \mathbb{P}(\mathfrak{h}_1)_{PNSHSS} \times \mathbb{P}(\mathfrak{h}_2)_{PNSHSS} \times \mathbb{P}(\mathfrak{h}_3)_{PNSHSS} \times \dots \times \mathbb{P}(\mathfrak{h}_k)_{PNSHSS} \rightarrow \mathbb{P}(U)_{PNSHSS}$ and this mapping to $\mathbb{P}(U)_{PNSHSS}$ is Single Valued.

$$\mathfrak{F}(\mathbb{P}(\mathfrak{h}_1)_{PNSHSS} \times \mathbb{P}(\mathfrak{h}_2)_{PNSHSS} \times \mathbb{P}(\mathfrak{h}_3)_{PNSHSS} \times \dots \times \mathbb{P}(\mathfrak{h}_k)_{PNSHSS}) = \{ \mathcal{H}, \langle x, T_{\mathfrak{F}(\mathcal{H})}(x), I_{\mathfrak{F}(\mathcal{H})}(x), F_{\mathfrak{F}(\mathcal{H})}(x) \rangle : x \in U, \mathcal{H} \in \mathbb{P}(\mathfrak{h}_1)_{PNSHSS} \times \mathbb{P}(\mathfrak{h}_2)_{PNSHSS} \times \mathbb{P}(\mathfrak{h}_3)_{PNSHSS} \times \dots \times \mathbb{P}(\mathfrak{h}_k)_{PNSHSS} \}$$

Also,

$$0 \leq (T_{\mathfrak{F}(\mathcal{H})}(x))^2 + (I_{\mathfrak{F}(\mathcal{H})}(x))^2 + (F_{\mathfrak{F}(\mathcal{H})}(x))^2 \leq 2 \text{ and } T_{\mathfrak{F}(\mathcal{H})}(x) + F_{\mathfrak{F}(\mathcal{H})}(x) \leq 1.$$

Example Let U -set of teachers under consideration given as $U = \{m^1, m^2, m^3, m^4, m^5\}$

Also consider the set of attributes as, \mathfrak{S}^1 =Qualification, \mathfrak{S}^2 =Experience, \mathfrak{S}^3 =Gender

Hemalatha and Francina Shalini

\mathfrak{S}^4 =Skills,

and their attributes are Qualification={*B. ed, M. Sc*}, Experience= { 2years, 5years},

Gender= {*Male, Female*}, Skills = {*Subject expertise, Assessment skill*}

$$\mathbb{P}(h_1)_{PNSHSS} = \{\{B. ed\}, \{M. Sc\}, \{B. ed, M. Sc\}, \emptyset\}$$

$$\mathbb{P}(h_2)_{PNSHSS} = \{\{2Years\}, \{5years\}, \emptyset\}$$

$$\mathbb{P}(h_3)_{PNSHSS} = \{\{Female\}, \{Male\}, \{Female, Male\}, \emptyset\}$$

$$\mathbb{P}(h_4)_{PNSHSS} = \{\{Subject expertise\}, \{Assessment skill\}, \{Subject expertise, Assessment skill\}, \emptyset\}$$

Let the function be

$$\mathfrak{F}: \mathbb{P}(h_1)_{PNSHSS} \times \mathbb{P}(h_2)_{PNSHSS} \times \mathbb{P}(h_3)_{PNSHSS} \times, \dots, \times \mathbb{P}(h_k)_{PNSHSS} \rightarrow \mathbb{P}(U)_{PNSHSS}$$

Single Valued Pythagorean Neutrosophic SuperHypersoft set is characterize as,

$$\mathfrak{F}: \mathbb{P}(h_1)_{PNSHSS} \times \mathbb{P}(h_2)_{PNSHSS} \times \mathbb{P}(h_3)_{PNSHSS} \times, \dots, \times \mathbb{P}(h_k)_{PNSHSS} \rightarrow \mathbb{P}(U)_{PNSHSS}$$

Assume the function be

$$\mathfrak{F}: \mathfrak{F}(B. ed, 2 Years, Female, \{Subject expertise, Assessment skill\}) = \{m^3\}$$

$$= \langle \left\{ \begin{array}{l} m^3, \{B. ed\}(0.6, 0.4, 0.3), \{2 Years\}(0.9, 0.2, 0.1), \\ \{Female\}(0.3, 0.2, 0.6), \{Subject expertise, Assessment skill\}(0.5, 0.4, 0.2) \end{array} \right\rangle$$

Definition

Multi-Valued Pythagorean Neutrosophic SuperHypersoft Set

Let U be the universal set and $\mathbb{P}(U)_{PNSHSS}$ be the power set of U. Take k-distinct attributes, $\mathfrak{S}_1, \mathfrak{S}_2, \mathfrak{S}_3 \dots \mathfrak{S}_k$ for $k \geq 1$, whose corresponding attributive values are respectively the set $h_1, h_2, h_3 \dots h_k$ with $h_p \cap h_q = \emptyset$ for $p \neq q$ and $p, q \in \{1, 2, 3, \dots, k\}$. Let $\mathbb{P}(h_1)_{PNSHSS}, \mathbb{P}(h_2)_{PNSHSS}, \mathbb{P}(h_3)_{PNSHSS}, \dots, \mathbb{P}(h_n)_{PNSHSS} = \mathcal{H}$ be the power sets of the set $h_1, h_2, h_3 \dots h_k$ respectively.

Then the pair $(\mathfrak{F}, \mathbb{P}(h_1)_{PNSHSS} \times \mathbb{P}(h_2)_{PNSHSS} \times \mathbb{P}(h_3)_{PNSHSS} \times, \dots, \times \mathbb{P}(h_k)_{PNSHSS})$ is said to be PNSHSS over U.

Where

$$\mathfrak{F}: \mathbb{P}(h_1)_{PNSHSS} \times \mathbb{P}(h_2)_{PNSHSS} \times \mathbb{P}(h_3)_{PNSHSS} \times, \dots, \times \mathbb{P}(h_k)_{PNSHSS} \rightarrow \mathbb{P}(U)_{PNSHSS}$$

and this mapping to $\mathbb{P}(U)_{PNSHSS}$ is multi-valued.

$$\begin{aligned} \mathfrak{F}(\mathbb{P}(h_1)_{PNSHSS} \times \mathbb{P}(h_2)_{PNSHSS} \times \mathbb{P}(h_3)_{PNSHSS} \times, \dots, \times \mathbb{P}(h_k)_{PNSHSS}) \\ = \{ \mathcal{H}, < x, T_{\mathfrak{F}(\mathcal{H})}(x), I_{\mathfrak{F}(\mathcal{H})}(x), F_{\mathfrak{F}(\mathcal{H})}(x) >: x \in U, \\ \mathcal{H} \in \mathbb{P}(h_1)_{PNSHSS} \times \mathbb{P}(h_2)_{PNSHSS} \times \mathbb{P}(h_3)_{PNSHSS} \times, \dots, \times \mathbb{P}(h_k)_{PNSHSS} \} \end{aligned}$$

Also,

$$0 \leq (T_{\mathfrak{F}(\mathcal{H})}(x))^2 + (I_{\mathfrak{F}(\mathcal{H})}(x))^2 + (F_{\mathfrak{F}(\mathcal{H})}(x))^2 \leq 2 \text{ and } T_{\mathfrak{F}(\mathcal{H})}(x) + F_{\mathfrak{F}(\mathcal{H})}(x) \leq 1.$$

Example

Let U - set of teachers under consideration given as $U = \{m^1, m^2, m^3, m^4, m^5\}$

Also, the set of attributes as, \mathfrak{S}^1 = Qualification, \mathfrak{S}^2 = Experience, \mathfrak{S}^3 =Gender

\mathfrak{S}^4 = Skills, and their attributes are

Qualification={*B. ed, M. Sc*}, Experience= { 2years, 5years},

Gender= {*Male, Female*}, Skills = {*Subject expertise, Assessment skill*}

$$\mathbb{P}(h_1)_{PNSHSS} = \{\{B. ed\}, \{M. Sc\}, \{B. ed, M. Sc\}, \emptyset\}$$

$$\mathbb{P}(h_2)_{PNSHSS} = \{\{2Years\}, \{5years\}, \{2Years, 5Years\}, \emptyset\}$$

$$\mathbb{P}(h_3)_{PNSHSS} = \{\{Female\}, \{Male\}, \{Female, Male\}, \emptyset\}$$

$$\mathbb{P}(h_4)_{PNSHSS} = \{\{Subject expertise\}, \{Assessment skill\}, \{Subject expertise, Assessment skill\}, \emptyset\}$$

Let the function be

$$\mathfrak{F}: \mathbb{P}(h_1)_{PNSHSS} \times \mathbb{P}(h_2)_{PNSHSS} \times \mathbb{P}(h_3)_{PNSHSS} \times, \dots, \times \mathbb{P}(h_n)_{PNSHSS} \rightarrow \mathbb{P}(U)_{PNSHSS}$$

Multi Valued Pythagorean Neutrosophic SuperHypersoft set is characterize as,

$$\mathfrak{F}: \mathbb{P}(h_1)_{PNSHSS} \times \mathbb{P}(h_2)_{PNSHSS} \times \mathbb{P}(h_3)_{PNSHSS} \times, \dots, \times \mathbb{P}(h_n)_{PNSHSS} \rightarrow \mathbb{P}(U)_{PNSHSS}$$

Let us assume the function be

$$\mathfrak{F}: \mathfrak{F}(B. ed, 5 Years, Female, Subject expertise) = \{m^1, m^3, m^4\}$$

Hemalatha and Francina Shalini

$$= \begin{cases} \langle m^1, (B.ed(0.9,0.3,0.1), 5 Years(0.2,0.3,0.7), Female(0.6,0.1,0.3), Subject expertise(0.6,0.5,0.4)) \rangle \\ \langle m^3, (B.ed(0.6,0.4,0.3), 5 Years(0.6,0.3,0.4), Female(0.3,0.2,0.6), Subject expertise(0.1,0.4,0.2)) \rangle \\ \langle m^4, (B.ed(0.3,0.6,0.4), 5 Years(0.7,0.4,0.1), Female(0.6,0.2,0.1), Subject expertise(0.3,0.7,0.6)) \rangle \end{cases}$$

Proposed Distance and Similarity Measures for Single-Valued Pnshs

Definition Let $\mathfrak{A} = \mathfrak{A}_h$ and $\mathfrak{B} = \mathfrak{B}_h$ be two PNSHSS where $\mathfrak{A}_h = (T_h^{\mathfrak{A}}, I_h^{\mathfrak{A}}, F_h^{\mathfrak{A}})$ and $\mathfrak{B}_h = (T_h^{\mathfrak{B}}, I_h^{\mathfrak{B}}, F_h^{\mathfrak{B}})$ for $h = \{1,2,3, \dots, m\}$. A normalized Hamming distance between $\mathfrak{A} = \mathfrak{A}_h$ and $\mathfrak{B} = \mathfrak{B}_h$ is defined as

$$\mathfrak{H}(\mathfrak{A}, \mathfrak{B}) = \frac{1}{3m} \sum_{h=1}^m (|T_h^{\mathfrak{A}} - T_h^{\mathfrak{B}}| + |I_h^{\mathfrak{A}} - I_h^{\mathfrak{B}}| + |F_h^{\mathfrak{A}} - F_h^{\mathfrak{B}}|)$$

Example

Let $\mathfrak{A} = \{m^2, \{B.ed, M.Sc\}(0.6,0.1,0.2), \{2Years\}(0.4,0.8,0.1), \{male\}(0.4,0.5,0.3), \{Subject expertise\}(0.8,0.2,0.1)\}$
 $\mathfrak{B} = \{m^3, \{B.ed, M.Sc\}(0.6,0.2,0.1), \{2Years\}(0.9,0.2,0.1), \{male\}(0.7,0.7,0.3), \{Subject expertise\}(0.1,0.4,0.2)\}$

$$= \frac{1}{3(4)} (|0.6 - 0.6| + |0.4 - 0.9| + |0.4 - 0.7| + |0.8 - 0.1| + |0.1 - 0.2| + |0.2 - 0.2| + |0.5 - 0.7| + |0.2 - 0.4| + |0.2 - 0.1| + |0.1 - 0.1| + |0.3 - 0.3| + |0.1 - 0.2|) = 0.1833$$

Definition Let $\mathfrak{A} = \mathfrak{A}_h$ and $\mathfrak{B} = \mathfrak{B}_h$ be two PNSHSS where $\mathfrak{A}_h = (T_h^{\mathfrak{A}}, I_h^{\mathfrak{A}}, F_h^{\mathfrak{A}})$ and $\mathfrak{B}_h = (T_h^{\mathfrak{B}}, I_h^{\mathfrak{B}}, F_h^{\mathfrak{B}})$ for $h = \{1,2,3, \dots, m\}$. A normalized Euclidean distance between

$\mathfrak{A} = \mathfrak{A}_h$ and $\mathfrak{B} = \mathfrak{B}_h$ is defined as
$$\mathfrak{E}(\mathfrak{A}, \mathfrak{B}) = \frac{\sqrt{\sum_{h=1}^m (|T_h^{\mathfrak{A}} - T_h^{\mathfrak{B}}|^2 + |I_h^{\mathfrak{A}} - I_h^{\mathfrak{B}}|^2 + |F_h^{\mathfrak{A}} - F_h^{\mathfrak{B}}|^2)}}{3m}$$

Example

Let $\mathfrak{A} = \{m^2, \{B.ed, M.Sc\}(0.6,0.1,0.2), \{2Years\}(0.4,0.8,0.1), \{male\}(0.4,0.5,0.3), \{Subject expertise\}(0.8,0.2,0.1)\}$

$$= \frac{\sqrt{(|0.6 - 0.6|^2 + |0.4 - 0.9|^2 + |0.4 - 0.7|^2 + |0.8 - 0.1|^2 + |0.1 - 0.2|^2 + |0.2 - 0.2|^2 + |0.5 - 0.7|^2 + |0.2 - 0.4|^2 + |0.2 - 0.1|^2 + |0.1 - 0.1|^2 + |0.3 - 0.3|^2 + |0.1 - 0.2|^2)}}{3(4)}$$

$$= 0.279$$

Definition Let $\mathfrak{A} = \mathfrak{A}_h$ and $\mathfrak{B} = \mathfrak{B}_h$ be two PNSHSS where $\mathfrak{A}_h = (T_h^{\mathfrak{A}}, I_h^{\mathfrak{A}}, F_h^{\mathfrak{A}})$ and $\mathfrak{B}_h = (T_h^{\mathfrak{B}}, I_h^{\mathfrak{B}}, F_h^{\mathfrak{B}})$ for $h = \{1,2,3, \dots, m\}$. A generalized weighted distance between $\mathfrak{A} = \mathfrak{A}_h$ and $\mathfrak{B} = \mathfrak{B}_h$ is given as, for $\gamma > 0$
$$\mathfrak{W}_\gamma(\mathfrak{A}, \mathfrak{B}) = \left[\frac{1}{3m} \sum_{h=1}^m w_i (|T_h^{\mathfrak{A}} - T_h^{\mathfrak{B}}|^\gamma + |I_h^{\mathfrak{A}} - I_h^{\mathfrak{B}}|^\gamma + |F_h^{\mathfrak{A}} - F_h^{\mathfrak{B}}|^\gamma) \right]^{\frac{1}{\gamma}}$$

Definition Let $\mathfrak{A} = [\mathfrak{A}_{ij}]$ and $\mathfrak{B} = [\mathfrak{B}_{ij}]$ be two PNSHSMs of order $\varepsilon \times \zeta$ with $[\mathfrak{A}_{ij}] = (T_{ijt}^{\mathfrak{A}}, I_{ijt}^{\mathfrak{A}}, F_{ijt}^{\mathfrak{A}})$ and $[\mathfrak{B}_{ij}] = (T_{ijt}^{\mathfrak{B}}, I_{ijt}^{\mathfrak{B}}, F_{ijt}^{\mathfrak{B}})$. A normalized Hamming distance between $\mathfrak{A} = [\mathfrak{A}_{ij}]$ and $\mathfrak{B} = [\mathfrak{B}_{ij}]$ is defined as

$$\mathfrak{H}(\mathfrak{A}, \mathfrak{B}) = \frac{1}{3\varepsilon\zeta} \sum_{i=1}^{\varepsilon} \sum_{j=1}^{\zeta} (|T_{ijt}^{\mathfrak{A}} - T_{ijt}^{\mathfrak{B}}| + |I_{ijt}^{\mathfrak{A}} - I_{ijt}^{\mathfrak{B}}| + |F_{ijt}^{\mathfrak{A}} - F_{ijt}^{\mathfrak{B}}|)$$

Example

Let $\mathfrak{A} = \{m^2, \{B.ed, M.Sc\}(0.6,0.1,0.2), \{2Years\}(0.4,0.8,0.1), \{male\}(0.4,0.5,0.3), \{Subject expertise\}(0.8,0.2,0.1)\}$
 $\mathfrak{B} = \{m^3, \{B.ed, M.Sc\}(0.6,0.2,0.1), \{2Years\}(0.9,0.2,0.1), \{male\}(0.7,0.7,0.3), \{Subject expertise\}(0.1,0.4,0.2)\}$

$$= \frac{1}{3(1)(4)} (|0.6 - 0.6| + |0.4 - 0.9| + |0.4 - 0.7| + |0.8 - 0.1| + |0.1 - 0.2| + |0.2 - 0.2| + |0.5 - 0.7| + |0.2 - 0.4| + |0.2 - 0.1| + |0.1 - 0.1| + |0.3 - 0.3| + |0.1 - 0.2|)$$

$$= 0.183$$

Definition Let $\mathfrak{A} = [\mathfrak{A}_{ij}]$ and $\mathfrak{B} = [\mathfrak{B}_{ij}]$ be two PNSHSMs of order $\varepsilon \times \zeta$ with $[\mathfrak{A}_{ij}] = (T_{ijt}^{\mathfrak{A}}, I_{ijt}^{\mathfrak{A}}, F_{ijt}^{\mathfrak{A}})$ and $[\mathfrak{B}_{ij}] = (T_{ijt}^{\mathfrak{B}}, I_{ijt}^{\mathfrak{B}}, F_{ijt}^{\mathfrak{B}})$. A normalized Euclidean distance between $\mathfrak{A} = [\mathfrak{A}_{ij}]$ and $\mathfrak{B} = [\mathfrak{B}_{ij}]$ is given as

Hemalatha and Francina Shalini

$$\mathfrak{B}(\mathfrak{A}, \mathfrak{B}) = \sqrt{\frac{\sum_i^\varepsilon \sum_j^\zeta (|T_{ijt}^{\mathfrak{A}} - T_{ijt}^{\mathfrak{B}}|^2 + |I_{ijt}^{\mathfrak{A}} - I_{ijt}^{\mathfrak{B}}|^2 + |F_{ijt}^{\mathfrak{A}} - F_{ijt}^{\mathfrak{B}}|^2)}{3\varepsilon\zeta}}$$

Example

Let $\mathfrak{A} = \{m^2, \{B. ed, M. Sc\}(0.6,0.1,0.2), \{2Years\}(0.4,0.8,0.1), \{male\}(0.4,0.5,0.3), \{Subject expertise\}(0.8,0.2,0.1)\}$
 $\mathfrak{B} = \{m^3, \{B. ed, M. Sc\}(0.6,0.2,0.1), \{2Years\}(0.9,0.2,0.1), \{male\}(0.7,0.7,0.3), \{Subject expertise\}(0.1,0.4,0.2)\}$

$$= \sqrt{\frac{(|0.6 - 0.6|^2 + |0.4 - 0.9|^2 + |0.4 - 0.7|^2 + |0.8 - 0.1|^2 + |0.1 - 0.2|^2 + |0.2 - 0.2|^2 + |0.5 - 0.7|^2 + |0.2 - 0.4|^2 + |0.2 - 0.1|^2 + |0.1 - 0.1|^2 + |0.3 - 0.3|^2 + |0.1 - 0.2|^2)}{3(1)(4)}} = 0.2798$$

Definition Let $\mathfrak{A} = [\mathfrak{A}_{ij}]$ and $\mathfrak{B} = [\mathfrak{B}_{ij}]$ be two PNSHSMs of order $\varepsilon \times \zeta$ with $[\mathfrak{A}_{ij}] = (T_{ijt}^{\mathfrak{A}}, I_{ijt}^{\mathfrak{A}}, F_{ijt}^{\mathfrak{A}})$ and $[\mathfrak{B}_{ij}] = (T_{ijt}^{\mathfrak{B}}, I_{ijt}^{\mathfrak{B}}, F_{ijt}^{\mathfrak{B}})$. A Generalized weighted distance between $\mathfrak{A} = [\mathfrak{A}_{ij}]$ and $\mathfrak{B} = [\mathfrak{B}_{ij}]$ is given as, for $\gamma > 0$ $\mathfrak{W}_{\mathfrak{A}, \mathfrak{B}}(\mathfrak{A}, \mathfrak{B}) =$

$$\left[\frac{1}{3\varepsilon\zeta} \sum_i^\varepsilon \sum_j^\zeta w_i (|T_{ijt}^{\mathfrak{A}} - T_{ijt}^{\mathfrak{B}}|^\gamma + |I_{ijt}^{\mathfrak{A}} - I_{ijt}^{\mathfrak{B}}|^\gamma + |F_{ijt}^{\mathfrak{A}} - F_{ijt}^{\mathfrak{B}}|^\gamma) \right]^{\frac{1}{\gamma}}$$

Definition Let $\mathfrak{A} = \mathfrak{A}_h$ and $\mathfrak{B} = \mathfrak{B}_h$ be two PNSHSS where $\mathfrak{A}_h = (T_h^{\mathfrak{A}}, I_h^{\mathfrak{A}}, F_h^{\mathfrak{A}})$ and $\mathfrak{B}_h = (T_h^{\mathfrak{B}}, I_h^{\mathfrak{B}}, F_h^{\mathfrak{B}})$ for $h = \{1,2,3, \dots, m\}$. A Similarity measure between $\mathfrak{A} = \mathfrak{A}_h$ and $\mathfrak{B} = \mathfrak{B}_h$ is defined as

$$\mathfrak{S}(\mathfrak{A}, \mathfrak{B}) = 1 - \frac{1}{3m} \sum_h^m (|T_h^{\mathfrak{A}} - T_h^{\mathfrak{B}}| + |I_h^{\mathfrak{A}} - I_h^{\mathfrak{B}}| + |F_h^{\mathfrak{A}} - F_h^{\mathfrak{B}}|)$$

Example

Let $\mathfrak{A} = \{m^2, \{B. ed, M. Sc\}(0.6,0.1,0.2), \{2Years\}(0.4,0.8,0.1), \{male\}(0.4,0.5,0.3), \{Subject expertise\}(0.8,0.2,0.1)\}$
 $\mathfrak{B} = \{m^3, \{B. ed, M. Sc\}(0.6,0.2,0.1), \{2Years\}(0.9,0.2,0.1), \{male\}(0.7,0.7,0.3), \{Subject expertise\}(0.1,0.4,0.2)\}$

$$= 1 - \frac{1}{3(4)} (|0.6 - 0.6| + |0.4 - 0.9| + |0.4 - 0.7| + |0.8 - 0.1| + |0.1 - 0.2| + |0.2 - 0.2| + |0.5 - 0.7| + |0.2 - 0.4| + |0.2 - 0.1| + |0.1 - 0.1| + |0.3 - 0.3| + |0.1 - 0.2|) = 0.8167$$

Proposition Let $\mathfrak{A} = \mathfrak{A}_h$ and $\mathfrak{B} = \mathfrak{B}_h$ and $\mathfrak{C} = \mathfrak{C}_i$ be three PNSHSS where $\mathfrak{A}_h = (T_h^{\mathfrak{A}}, I_h^{\mathfrak{A}}, F_h^{\mathfrak{A}})$, $\mathfrak{B}_h = (T_h^{\mathfrak{B}}, I_h^{\mathfrak{B}}, F_h^{\mathfrak{B}})$ and $\mathfrak{C}_h = (T_h^{\mathfrak{C}}, I_h^{\mathfrak{C}}, F_h^{\mathfrak{C}})$ for $h = \{1,2,3, \dots, m\}$. Then it satisfies the following axioms:

1. $0 \leq \mathfrak{S}(\mathfrak{A}, \mathfrak{B})_{PNSHSS} \leq 1$;
2. $\mathfrak{S}(\mathfrak{A}, \mathfrak{B})_{PNSHSS} = \mathfrak{S}(\mathfrak{B}, \mathfrak{A})_{PNSHSS}$;
3. $\mathfrak{S}(\mathfrak{A}, \mathfrak{B})_{PNSHSS} = 1$ if and only if $\mathfrak{A}_{PNSHSS} = \mathfrak{B}_{PNSHSS}$;
4. if $\mathfrak{A}_{PNSHSS} \subset \mathfrak{B}_{PNSHSS} \subset \mathfrak{C}_{PNSHSS}$, then $\mathfrak{S}(\mathfrak{A}, \mathfrak{C})_{PNSHSS} \leq \mathfrak{S}(\mathfrak{A}, \mathfrak{B})_{PNSHSS}$ and $\mathfrak{S}(\mathfrak{A}, \mathfrak{C})_{PNSHSS} \leq \mathfrak{S}(\mathfrak{B}, \mathfrak{C})_{PNSHSS}$

Proof The proof is straight forward.

Definition Let $\mathfrak{A} = \mathfrak{A}_h$ and $\mathfrak{B} = \mathfrak{B}_h$ be two PNSHSS where $\mathfrak{A}_h = (T_h^{\mathfrak{A}}, I_h^{\mathfrak{A}}, F_h^{\mathfrak{A}})$ and $\mathfrak{B}_h = (T_h^{\mathfrak{B}}, I_h^{\mathfrak{B}}, F_h^{\mathfrak{B}})$ for $h = \{1,2,3, \dots, m\}$. A generalized weighted similarity measure between $\mathfrak{A} = \mathfrak{A}_h$ and $\mathfrak{B} = \mathfrak{B}_h$ is given as, for $\gamma > 0$

$$\mathfrak{S}_\gamma(\mathfrak{A}, \mathfrak{B}) = 1 - \left[\frac{1}{3m} \sum_h^m w_h (|T_h^{\mathfrak{A}} - T_h^{\mathfrak{B}}|^\gamma + |I_h^{\mathfrak{A}} - I_h^{\mathfrak{B}}|^\gamma + |F_h^{\mathfrak{A}} - F_h^{\mathfrak{B}}|^\gamma) \right]^{\frac{1}{\gamma}}, \text{ where } \gamma > 0$$

Definition Let $\mathfrak{A} = [\mathfrak{A}_{ij}]$ and $\mathfrak{B} = [\mathfrak{B}_{ij}]$ be two PNSHSMs of order $\varepsilon \times \zeta$ with $[\mathfrak{A}_{ij}] = (T_{ijt}^{\mathfrak{A}}, I_{ijt}^{\mathfrak{A}}, F_{ijt}^{\mathfrak{A}})$ and $[\mathfrak{B}_{ij}] = (T_{ijt}^{\mathfrak{B}}, I_{ijt}^{\mathfrak{B}}, F_{ijt}^{\mathfrak{B}})$. The similarity measure between $\mathfrak{A} = [\mathfrak{A}_{ij}]$ and $\mathfrak{B} = [\mathfrak{B}_{ij}]$ is given as, for $\gamma > 0$

$$\mathfrak{S}(\mathfrak{A}, \mathfrak{B}) = 1 - \frac{1}{3\varepsilon\zeta} \sum_i^\varepsilon \sum_j^\zeta (|T_{ijt}^{\mathfrak{A}} - T_{ijt}^{\mathfrak{B}}| + |I_{ijt}^{\mathfrak{A}} - I_{ijt}^{\mathfrak{B}}| + |F_{ijt}^{\mathfrak{A}} - F_{ijt}^{\mathfrak{B}}|)$$

Example

Let $\mathfrak{A} = \{m^2, \{B. ed, M. Sc\}(0.6,0.1,0.2), \{2Years\}(0.4,0.8,0.1), \{male\}(0.4,0.5,0.3), \{Subject expertise\}(0.8,0.2,0.1)\}$

Hemalatha and Francina Shalini

$$\mathfrak{B} = \{m^3, \{B.ed, M.Sc\}(0.6,0.2,0.1), \{2Years\}(0.9,0.2,0.1), \{male\}(0.7,0.7,0.3), \{Subject\ expertise\}(0.1,0.4,0.2)\}$$

$$= 1 - \frac{1}{3(1)(4)} (|0.6 - 0.6| + |0.4 - 0.9| + |0.4 - 0.7| + |0.8 - 0.1| + |0.1 - 0.2| + |0.2 - 0.2| + |0.5 - 0.7| + |0.2 - 0.4| + |0.2 - 0.1| + |0.1 - 0.1| + |0.3 - 0.3| + |0.1 - 0.2|) = 0.817$$

Definition Let $\mathfrak{A} = [\mathfrak{A}_{ij}]$ and $\mathfrak{B} = [\mathfrak{B}_{ij}]$ be two PNSHSMs of order $\varepsilon \times \zeta$ with $[\mathfrak{A}_{ij}] = (T_{ijt}^A, I_{ijt}^A, F_{ijt}^A)$ and $[\mathfrak{B}_{ij}] = (T_{ijt}^B, I_{ijt}^B, F_{ijt}^B)$. The generalized weighted similarity measure between $\mathfrak{A} = [\mathfrak{A}_{ij}]$ and $\mathfrak{B} = [\mathfrak{B}_{ij}]$ is given as, for $\gamma > 0$

$$\mathfrak{S}_\gamma(\mathfrak{A}, \mathfrak{B}) = 1 - \left[\frac{1}{3\varepsilon\zeta} \sum_i^\varepsilon \sum_j^\zeta \omega_i (|T_{ijt}^{\mathfrak{A}} - T_{ijt}^{\mathfrak{B}}|^\gamma + |I_{ijt}^{\mathfrak{A}} - I_{ijt}^{\mathfrak{B}}|^\gamma + |F_{ijt}^{\mathfrak{A}} - F_{ijt}^{\mathfrak{B}}|^\gamma) \right]^{\frac{1}{\gamma}}$$

CONCLUSION

This paper presents the idea of a single and multi-valued Pythagorean Neutrosophic SuperHypersoft set. Then we propose distance and similarity measures for PNSHSS. By using the proposed distance and similarity measures. The presentation of the implementation validity is accompanied by pertinent examples.

ABSTRACT

Diabetes Mellitus is a long-term, progressive metabolic disease typified by increased blood glucose levels or persistent hyperglycemia. The World Health Organization estimates that 69.2 million Indians had diabetes in 2015. By 2030, that figure is predicted to rise to 98 million, making India the nation with the second-highest incidence of diabetes behind China. The present study was designed to find the potential compounds from the *Bougainvillea spectabilis* leaves for treating diabetes mellitus using *in silico* studies. The phytochemicals were identified from the literature surveys. The 3D structure of the phytochemicals was retrieved from the PubChem database. The 3D structure of the target protein α -amylase responsible for diabetes was retrieved from the PDB database. Docking studies were done using PyRx 0.8 and the results were analysed using Discovery Studio 2024. ADMET analysis was also done using SwissADME for all the best-interacted compounds to evaluate the toxicity. From the results, when compared to the currently using synthetic drug Acarbose (-8.3 Kcal/mol), the compounds Cholestan-6-one, (5.alpha) (-8.2 Kcal/mol), Squalene (-6.8 Kcal/mol) and 4-Nitrophenylglyoxylic acid (-6.4 Kcal/mol) showed very good binding affinity with the target protein α -amylase. In addition, toxicity effects were also not observed for all the best-interacted compounds. Hence, the present study concludes that the phytochemicals Cholestan-6-one, (5.alpha.)-, Squalene and 4-Nitrophenylglyoxylic acid from the *Bougainvillea spectabilis* leaves may have the potential ability to treat diabetes mellitus.

INTRODUCTION

Diabetes Mellitus (DM) is a chronic illness that affects people of all ages and genders. It is currently regarded as a serious global public health concern[1]. Long-term, progressive diabetes mellitus is characterized by hyperglycemia, or consistently elevated blood glucose levels. Such a condition may be brought on by changes in insulin action, secretion, or both[2]. Diabetes mellitus is a serious public health concern and one of the most common endocrine (hormone-related) disorders worldwide, accounting for a large portion of illness, death, and economic burden[3]. Diabetes mellitus is one of the non-communicable diseases that kills 1.5 million people worldwide. With 77 million diabetics in 2023 and a potential increase to 123.5 million by 2040, India is the second-highest diabetes-affected country in the world[4]. At 10.6%, Tamil Nadu also has a higher prevalence of diabetes[5]. In both industrialized and developing nations, type 2 diabetes has recently become more prevalent in younger age groups, impacting their academic performance as well as their physical and mental health[6,7]. Compared to the national average of 9.3%, Tamil Nadu has a higher prevalence of diabetes (17.6%) (9-Mathur *et al.* 2021). Haryana (15.5%) and Kerala (19.2%) have comparable burdens [8,9]. Numerous nonmodifiable risk factors at the individual level, such as genetics, age, ethnicity, and family medical history, have been prospectively linked to type 2 diabetes. However, the rising incidence of overweight and obesity, sedentary lifestyles and/or lack of exercise, unhealthy diets (increasing consumption of refined grains, sugar, cholesterol, and sugar-sweetened beverages and decreasing consumption of fruits and vegetables), unhealthy habits (such as alcohol and tobacco abuse), exposure to atmospheric harmful substances, altered intrauterine environments, psychological condition (stress/depression), shortened sleep time, and the built environment are likely the main causes of the increases in prevalence in the majority of populations[10]. Type 2 diabetes symptoms frequently appear gradually. In actuality, persons with type 2 diabetes may go years without realizing it. Symptoms may include increased thirst, increased urination, increased hunger, fatigue, hazy eyesight, slow-healing wounds, persistent infections, tingling or numbness in the hands or toes, and darker patches of skin, usually in the neck and armpits[11].

Numerous important organs, such as blood vessels, heart, neurons, eyes, kidneys, skin, and ears, can be impacted by type 2 diabetes. It raises the risk of atherosclerosis, high blood pressure, heart disease, and stroke. Neuropathy, or nerve damage, can result from high blood sugar. It usually begins in the fingers or toes and progresses upward. Sexual function, cardiac rhythms, and digestion can also be affected by nerve problems. Kidney failure from diabetes may necessitate dialysis or a kidney transplant. It may harm the eyes, causing blindness through diabetic retinopathy, cataracts, or glaucoma. Diabetes may also increase the risk of skin-related infections and hearing issues[11]. Diabetes must be managed with a mix of medicine, lifestyle modifications, and routine blood glucose testing. A healthy weight, frequent exercise, and a balanced diet with an emphasis on limiting carbohydrate consumption are important lifestyle changes. For type 1 and certain type 2 diabetes, pharmacological therapies include insulin therapy. Oral drugs such as metformin, sulfonylureas, DPP-4 inhibitors, GLP-1 agonists, and SGLT2 inhibitors are also used. Additionally, some people could require injectable treatments. Self-examination, constantly monitoring of glucose, and HbA1c tests are all essential for blood sugar monitoring in order to assess long-term management and modify therapy as necessary[12]. Among the antidiabetic medications for type 2 diabetes are Acarbose, Metformin, Sulfonylureas, Glitazones, Gliptins (dipeptidyl peptidase-4 inhibitors), and Gliflozins (sodium-glucose co-transporters type 2 inhibitors)[13]. Acarbose may cause allergic reactions, wheezing, or respiratory issues. heart pounding, fever or an overall sensation of unwellness, enlarged lymph nodes, facial, lip, mouth, tongue, or throat swelling, difficulty swallowing or constriction in the throat, Skin rashes, itching, or hives, pale red pimples on the skin, vomiting or feeling queasy, lightheadedness, dizziness, or fainting, joint discomfort and cramping in the stomach. Diarrhea, nausea, vomiting, flatulence, chest pain, flushing, palpitations, headache, chills, disorientation, taste problem, diaphoresis, nail disease, skin rash, and vitamin B12 insufficiency are among the gastrointestinal side effects that metformin may induce [14]. Many adverse effects, such as headache, dizziness, anxiety, depression,

**Chitra Devi and Ramesh**

hypoesthesia, insomnia, pain, paresthesia, drowsiness, diaphoresis, pruritus, hypoglycemia, elevated lactate dehydrogenase, diarrhea, flatulence, dyspepsia, and vomiting, can be brought on by sulfonylureas[14]. This pancreatic α -amylase is primarily responsible for starch digestion by hydrolyzing the α -1,4 glycosidic bonds found in glycogen, amylopectin starch, amylose, dextrin, and maltose. Due to its size, starch is unable to pass across the blood-brain barrier. Because the brain needs glucose, α -amylase breaks down starch into smaller units. Excessive conversion can raise blood sugar levels in tissues, and in some situations, hyperglycemia can happen as a result of α -amylase over activation and insulin insufficiency. Blood glucose levels rise when too much starch begins to break down into simpler sugar particles. The α -amylase also raises postprandial glucose levels. α -amylase inhibitors are utilized for this purpose[15]. Significant α -amylase inhibitory activity was observed in the chloroform extract of *B. spectabilis* leaves, which may help control postprandial hyperglycemia[16]. D-pinitol, a bioactive substance abundant in the leaves of *Bougainvillea spectabilis*, has been shown in earlier research to raise plasma insulin levels, enhance insulin sensitivity, normalize chronic hyperglycemia, and decrease the formation of glycosylated hemoglobin in rats with STZ-induced diabetes[17,18]. For avoiding the side effects of synthetic drugs, the present study was designed to find the potential compounds from the *Bougainvillea spectabilis* leaves for treating diabetes mellitus using *in silico* methods.

MATERIALS AND METHODS

Ligand identification and preparations

The phytochemicals were obtained from the literature[19], and the 3D structure of ligands (phytochemicals) was retrieved from PubChem database[20].

Target protein identification and preparations

The target protein α -amylase[21] for Diabetes was identified using a literature survey. The protein information was taken from the UniProt database[22], and the 3D structure of the target protein was taken from the PDB database[23] and prepared using Discovery Studio 2024.

Docking studies

Docking studies for the target protein α -amylase and the phytochemicals (ligands) were done using PyRx 0.8 software[24]. The target protein was further prepared for docking studies using this software. All the ligands were uploaded using the Open Babel option in the PyRx 0.8 and prepared. The grid was generated and the docking studies were performed using the Vina wizard option in the PyRx 0.8. The values of binding affinity were saved in the XL file. The results were analyzed using Discovery Studio 2024 and the 2D & 3D docked images were taken. In the results, the lowest binding affinity indicates a good result.

ADMET and CYP properties

ADMET and CYP properties were tested for all the best-interacted compounds using SwissADME[25]. Lipinski, BBB (Blood - Brain Barrier), HIA (Human Intestinal Absorption), PGP (P-glycoprotein), XLogP3, TPSA (Topological Polar Surface Area), LogS, Fraction Csp3, Rotatable bonds, CYP enzyme inhibitor properties, Skin permeation and Bioavailability score were evaluated for all the best-interacted compounds.

RESULTS AND DISCUSSIONS

Ligand selection and preparations

The phytochemicals (ligands) were taken from the literature[19] and the 3D structure of the ligands (phytochemicals) was retrieved from the PubChem database. Lipinski's rule was checked for all the phytochemicals using SwissADME. Of which, mostly all the compounds passed Lipinski's rule of five and these compounds were taken for further study.

Target protein identification and preparations

The 3D structure of the target protein α -amylase responsible for Diabetes was obtained from the PDB database and its PDB ID is 1HNY. The protein information was taken from the UniProt database and its UniProt ID is P04746.

Docking studies

Docking studies were done for all the phytochemicals and the target protein α -amylase using PyRx 0.8 software to find the potential phytochemicals for treating Diabetes. All the results are shown in Table 1. The 2D & 3D structures of the best-interacted phytochemicals & Synthetic drug with the target protein α -amylase are shown in Table 2. In the present study, 20 compounds were taken for docking analysis. Of these, 10 compounds showed very good interaction with the target protein α -amylase and the results are shown in Table 1. From the results, the phytochemical Cholestan-6-one, (5.alpha.)- showed the highest binding affinity value of -8.2 Kcal/mol and its interacting residues are TYR 62, TYR 151 and ILE 235. The compound Squalene showed the second-highest binding affinity value of -6.8 Kcal/mol and it interacted with TYR 62, TRP 58 and TRP 59. The amino acid residues like ARG 252, ARG 398, GLY 403, ARG 421 and PRO 332 interact with 4-Nitrophenylglyoxylic acid and its binding affinity value is -6.4 Kcal/mol. Further, docking analysis was also done for the synthetic drug Acarbose with target protein α -amylase. The drug showed a binding affinity value of -8.3 Kcal/mol and its interacting residues are HIS 331, TRP 280, ASN 279, GLU 282, ARG 421, GLN 404, GLY 403, ASP 402, PRO 332 and GLY 334. Chauhan *et al.* (2016)[17] investigated how an aqueous extract of *Bougainvillea spectabilis* leaves affected DNA damage, oxidative stress, blood glucose, glycosylated hemoglobin, lipid profile, and Wistar rats with diabetes caused by streptozotocin. According to the findings, the aqueous extract of *B. spectabilis* leaves decreased hyperlipidemia and hyperglycemia. The hypoglycemic potential of an ethanolic extract of the stem bark of *Bougainvillea spectabilis* was examined by Jawla *et al.* (2012)[26] in albino rats (Wistar strain). The extract exhibited hypoglycemic effects at various dosages and times. Additionally, flavonoids found in *B. spectabilis* leaves may increase insulin secretion[19]. The compound D-pinitol, which is abundant in *B. spectabilis* leaves, has been shown to enhance insulin sensitivity, raise plasma insulin levels, correct chronic hyperglycemia, and decrease the production of glycosylated hemoglobin in rats with STZ-induced diabetes[17,18]. Elghiet *et al.* (2023)[27] evaluated the DPPH radical-scavenging activity and D-pinitol concentration of methanolic leaf extracts of five *B. spectabilis* cultivars in diabetic rats induced by STZ. As per the findings, the cultivar with orange bracts (LOE) had the greatest content of D-pinitol in its leaf extract, whereas the cultivar with magenta bracts (LME) and the LOE cultivar both shown improvements in decreasing blood glucose levels.

Bates *et al.* (2000)[28] claimed that a substance called D-pinitol (3-O-methylchiro-inositol), which was isolated from *B. spectabilis*, can enhance glycaemic control in hypoinsulinaemic STZ mice with diabetes by acting similarly to insulin. As reported by Bhat *et al.* (2011)[28], the chloroform extraction of *B. spectabilis* leaves had a strong α -amylase inhibitory effect and may be utilized to treat hyperglycemia after a meal, a condition associated with diabetes. The α -amylase enzyme's binding efficiency was evaluated using molecular docking studies on the compounds benzaldehyde, 4-(Ethylthio)-2,5-dimethoxy, α -Tocopherol-Beta-D-Mannoside, 5-ergosterol, 3,4,5-trimethoxybenzoic acid, and acetosyringone from the ethanolic extract of *Tapinanthus cordifolius* leaf. As per Ekwughe *et al.* (2023)[29], the results showed that their respective docking score values were 4.944 kcal/mol, 4.854 kcal/mol, 4.785 kcal/mol, 4.688 kcal/mol, and 4.365 kcal/mol. According to Tolmie *et al.* (2021)[30], commercially available herbs and spices include the substances acetylcholine, apigenin, cinnamic acid, eriodictyol, myrcene, piperine, and rosmarinic acid. These compounds were examined to determine their capacity to inhibit α -amylase and α -glucosidase. According to the findings, rosmarinic acid and α -amylase and α -glucosidase, respectively, bind with low binding energy values of -7.9 and -5.5 kcal/mol. The molecular docking research was used in the previous work to examine the inhibitory impact of α -glucosidase and α -amylase against type 2 diabetes using apigenin-7-O-glucoside, which was extracted from *Piper betle* L. The chemical apigenin-7-O-glucoside exhibited the highest binding affinity with α -amylase and α -glucosidase, with values of -45.02 and -38.288 kcal mol⁻¹, respectively, according to the data[31]. Similarly, in the present study, *in silico* docking studies were done to identify the potential phytochemicals for treating Diabetes mellitus. In the results, when compared to the synthetic drug Acarbose (-8.3 Kcal/mol), the compounds Cholestan-6-one (5.alpha.), (-8.2 Kcal/mol), Squalene (-6.8 Kcal/mol) and 4-Nitrophenylglyoxylic acid (-6.4 Kcal/mol) showed very good binding affinity with the target protein α -amylase.

Chitra Devi and Ramesh

ADMET and CYP Properties

In this study, 20 compounds were taken from the literature [19] and they were taken for ADMET and CYP studies. From the results (Table 3), all 10 compounds obeyed Lipinski's rule of five, which means that the compounds are good in drug-likeness. Many compounds showed YES for BBB (Blood Brain Barrier) which means that the compounds will enter the BBB. In the Human Intestinal Absorption (HIA), 30% of the compounds showed LOW and 70% of the compounds showed HIGH absorption. Sixteen compounds were predicted not to be effluated from the CNS by P-glycoprotein. Out of 10, 4 compounds showed good Lipophilicity and their XLOGP3 values were between -0.7 and $+5.0$. Six compounds showed good polarity and its predicted TPSA (\AA^2) values were in the range of 20 and 130\AA^2 . The Solubility values for all the 10 phytochemicals showed good results and their Log S (ESOL) values are not higher than 6. The fraction of carbons in the sp^3 hybridization for the phytochemicals was higher than 0.25 in which 10 out of 7 compounds have good Saturation. The Flexibility of the 5 phytochemicals was good, which was evident by the Rotatable bond values not falling above 9 and the Boiled egg image is shown in figure 1. In addition, CYP properties were tested for the best-interacted phytochemicals. From the results (Table 4), the compound Cholestan-6-one, (5.alpha.)-, Squalene, and Phytol acetate, give very less adverse reactions as it inhibits only the CYP2C9 enzyme. The phytochemical Pyrazole, 5-methyl-3-(5-nitro-2-furyl)-, inhibits only the CYP1A2 enzymes. The phytochemical Pentadecanoic acid, Fumaric acid, and 3-fluorophenyl undecyl ester inhibit both CYP2C9 and CYP1A2 enzymes. The enzyme CYP2D6 alone is inhibited by Glycerol 1-palmitate.

The phytochemicals 4-Nitrophenylglyoxylic acid, Megastigmatrienone, Cyclohexanone, 2-(2-propenyl)-, didn't inhibit any of the CYP450 enzymes. Further, most of the compounds have very less skin permeability in nature because the log K_p value is more negative. Out of 10, 8 compounds have good bioavailability and the observed value for all the compounds is 0.55. Besides, the ADMET and CYP properties were also tested for the currently using synthetic drug Acarbose. From the results, the synthetic drug Acarbose doesn't obey Lipinski's rule of five. The drug doesn't enter the BBB. In the Human Intestinal Absorption (HIA), it showed LOW absorption. The drug was predicted to be effluated from the CNS by P-glycoprotein. It showed good Lipophilicity and its XLOGP3 values were between -0.7 and $+5.0$. The drug showed high polarity and its predicted TPSA (\AA^2) value was 321.17\AA^2 . The Solubility values showed good results and their Log S (ESOL) values are not higher than 6. The fraction of carbons in the sp^3 hybridization for the drug was higher than 0.25. The Flexibility of the drug was good, which is evident by the Rotatable bond values not falling above 9. In addition, CYP properties were tested for the synthetic drug Acarbose. From the results, the drug didn't inhibit any of the CYP450 enzymes. Further, the drug doesn't have very less skin permeability in nature because the log K_p value is less negative. The drug does not have a good bioavailability score and the observed value is 0.17 which means it fails the rule of five. Hence, based on the results of the present study, the best-interacted phytochemicals showed very less adverse Reactions, when compared to the synthetic drug.

Note

Obey Lipinski

Yes means 0 violation and good; BBB (Blood - Brain Barrier): Yes means good; HIA (Human Intestinal Absorption): High means good; PGP- (Molecules predicted not to be effluated from the CNS by P-glycoprotein): No means good; Lipophilicity: XLOGP3 value between -0.7 and $+5.0$ means good; Polarity: TPSA between 20 and 130\AA^2 means good; Solubility: Log S value not higher than 6 means good; Saturation (Fraction Csp3): Fraction of carbons in the sp^3 hybridization not less than 0.25 means good; and Flexibility (Rotatable bonds): No more than 9 rotatable bonds means good.

Note: Yes means the compound inhibits the CYP450 enzymes and gives unanticipated adverse reactions; No means the compound does not inhibit the CYP450 enzymes and does not give any adverse reactions; The more negative the log K_p , the less skin permeant is the molecule; ABS 0.55 means it passes the rule of five & 0.17 means it fails the rule of five.

**Chitra Devi and Ramesh****Note**

BBB Points located in BOILED-Egg's yolk are molecules predicted to passively permeate through the blood-brain barrier.

HIA Points located in BOILED-Egg's white are molecules predicted to be passively absorbed by the gastrointestinal tract.

PGP+ Blue dots are for molecules predicted to be effluated from the central nervous system by the P-glycoprotein.

PGP- Red dots are for molecules predicted not to be effluated from the central nervous system by the P-glycoprotein.

CONCLUSION

In the present study, 20 phytochemicals were taken from the leaves of *Bougainvillea spectabilis* using literature survey. They were subjected to docking studies to identify the potential compounds for treating Diabetes mellitus. From the results, the compounds Cholestan-6-one, (5.alpha.), Squalene and 4-Nitrophenylglyoxylic acid showed very good binding affinity with the target protein α -amylase, when compared to the currently using synthetic drug Acarbose. The toxicity effects were also not observed for the most of the compounds in the ADMET analysis. Hence, the present study concludes that the compounds Cholestan-6-one, (5.alpha.), Squalene and 4-Nitrophenylglyoxylic acid from the leaves of *Bougainvillea spectabilis* may have the potential ability for treating Diabetes mellitus.

ACKNOWLEDGEMENT

The authors would like to thank Sr. Scientist & Head, Iyarvi Research Center for Bioinformatics (IRCB), Erode – 638 452, Tamil Nadu, India for his support to complete this work successfully.

ABSTRACT

In this present paper, For dealing with uncertainties researchers introduced the concept of soft sets. V. Popa and T. Noiri defined minimal structure spaces and they studied many properties of them. R. Gowri and S. Vembu introduced soft minimal and soft biminimal spaces. This paper continues the study of some results in soft minimal spaces. Furthermore we discuss some properties of soft minimal, soft \tilde{m} -closed, soft \tilde{m} -open, soft \tilde{m} -Closure, and soft \tilde{m} -Interior.

Mathematics Subject Classification: 54A10, 54C08

Keywords: Soft minimal space, Soft \tilde{m} -closed, Soft \tilde{m} -open, Soft \tilde{m} -Closure, Soft \tilde{m} -Interior.

INTRODUCTION

V. Popa and T.Noiri [15] introduced the concept of minimal structure (briefly m-structure). They also introduced the notion of m_X -open set and m_X -closed set and characterize those sets using m_X -closure and m_X -interior operators respectively. C. Boonpok [1] introduced the concept of biminimal structure space and studied $m_X^1 m_X^2$ -open sets and $m_X^1 m_X^2$ -closed sets in biminimal structure spaces. R. Gowri and S. Vembu [6] introduced the concept of Soft minimal and soft biminimal spaces. Also they introduced the notion of \tilde{m} -soft closed, \tilde{m} -soft open, $\tilde{m}_1 \tilde{m}_2$ -soft closed, $\tilde{m}_1 \tilde{m}_2$ -soft open set and characterize those sets using m_X -closure and m_X -interior operators respectively. C. Viriyapong *et.al* [16] introduced the concept of generalized m-closed sets in biminimal structure spaces and we obtain some properties of generalized m-closed sets. Russian researcher Molodtsov [12] initiated the concept of soft sets as a new

Vembu and Dorathy

mathematical tool to deal with uncertainties while modelling problems in engineering physics, computer science, economics, social sciences and medical sciences. In this paper, we introduce some results in soft minimal spaces and its basic properties are discussed.

2 Preliminaries

Definition 2.1 [3] A soft set F_A on the universe U is defined by the set of ordered pairs $F_A = \{(x, f_A(x)): x \in E\}$, where $f_A: E \rightarrow P(U)$ such that $f_A(x) = \emptyset$ if $x \notin A$. Here, f_A is called approximate function of the soft set F_A . The value of $f_A(x)$ may be arbitrary, some of them may be empty, some may have non empty intersection.
 Note that the set of all soft sets over U will be denoted by $S(U)$.

Definition 2.2 [3] Let $F_A \in S(U)$. If $f_A(x) = \emptyset$ for all $x \in E$, then F_A is called an empty set, denoted by F_\emptyset . $f_A(x) = \emptyset$ means that there is no element in U related to the parameter $x \in E$. Therefore we do not display such elements in the soft set as it is meaningless to consider such parameters

Definition 2.3 [3] Let $F_A \in S(U)$. If $f_A(x) = U$ for all $x \in E$, then F_A is called A-universal soft set, denoted by $F_{\bar{A}}$. If $A = E$, then the A-universal soft set is called a universal soft set, denoted by $F_{\bar{E}}$.

Definition 2.4 [3] Let $F_A, F_B \in S(U)$. Then F_B is a soft subset of F_A (or F_A is a soft superset of F_B), denoted by $F_A \subseteq F_B$, if $f_A(x) \subseteq f_B(x)$ for all $x \in E$.

Definition 2.5 [3] Let $F_A, F_B \in S(U)$. Then F_B and F_A are soft equal, denoted by $F_B = F_A$, $f_A(x) \subseteq f_B(x)$ for all $x \in E$.

Definition 2.6 [3] Let $F_A, F_B \in S(U)$. Then the soft union of F_A and F_B , denoted by $F_A \tilde{\cup} F_B$, is defined by the approximate functions $f_{A \tilde{\cup} B}(x) = f_A(x) \cup f_B(x)$.

Definition 2.7 [3] Let $F_A, F_B \in S(U)$. Then the soft intersection of F_A and F_B , denoted by $F_A \tilde{\cap} F_B$, is defined by the approximate functions $f_{A \tilde{\cap} B}(x) = f_A(x) \cap f_B(x)$. F_A and F_B are soft disjoint is said to be if $F_A \cap F_B = F_\emptyset$

Definition 2.8 [3] Let $F_A, F_B \in S(U)$. Then the soft difference of F_A and F_B , denoted by $F_A \setminus F_B$, is defined by the approximate functions $f_{(A \setminus B)}(x) = f_A(x) \setminus f_B(x)$.

Definition 2.9 [3] Let $F_A \in S(U)$. Then the soft complement of F_A , denoted by F_A^c is defined by the approximate function $f_{A^c}(x) = f_A^c(x)$, where $f_A^c(x)$ is complement of the set $f_A(x)$. that is, $f_A^c(x) = U \setminus f_A(x)$ for all $x \in E$. It is easy to see that $(F_A^c)^c = F_A$ and $F_\emptyset^c = F_{\bar{E}}$

Definition 2.10 [4] Let $F_A \in S(U)$. Power soft set of F_A is defined by $\tilde{P}(F_A) = \{F_{A_i} \subseteq F_A : i \in I\}$ and its cardinality is defined by $|\tilde{P}(F_A)| = 2^{\sum_{x \in E} |f_A(x)|}$ where $|f_A(x)|$ is cardinality of $f_A(x)$.

Definition 2.11 [12] Let (F, E) be a soft set over X and Y be a non-empty subset of X . Then the soft set (F, E) over Y denoted by $({}^Y F, E)$, is defined as follows
 ${}^Y F(\alpha) = Y \cap F(\alpha)$, for all $\alpha \in E$. In other words $({}^Y F, E) = Y \cap (F, E)$

Definition 2.12 [13] The soft set $F_A \in S(U)$ is called a soft point in U_A , denoted by e_F , if for the element $e \in A$, $F(e) \neq \emptyset$ and $F(e') = \emptyset$ for all $e' \in A - \{e\}$

Definition 2.13 [6] Let X be an initial universe set, E be the set of parameters and $A \subseteq E$. Let F_A be a non-empty soft set over X and $\tilde{P}(F_A)$ is the soft power set of F_A . A subfamily \tilde{m} of $\tilde{P}(F_A)$ is called a soft minimal set over X if $F_\emptyset \in \tilde{m}$ and $F_A \in \tilde{m}$.

Vembu and Dorathy

(F_A, \tilde{m}) or (X, \tilde{m}, E) is called a soft minimal space over X . Each member of \tilde{m} is said to be \tilde{m} -soft open set and the complement of an \tilde{m} -soft open set is said to be \tilde{m} -soft closed set over X .

Definition 2.15 [6] Let (F_A, \tilde{m}) be a soft minimal space and F_Y be a soft subset of F_A . Define soft minimal set \tilde{m}_{F_Y} on F_Y as follows: $\tilde{m}_{F_Y} = \{F_B \tilde{\cap} F_Y | F_B \in \tilde{m}\}$. Then (F_Y, \tilde{m}_{F_Y}) is called a soft minimal subspace of (F_A, \tilde{m}) .

3. Some Properties in Soft Minimal Spaces

In this section we introduce some results in soft minimal spaces and discuss the basic properties of soft \tilde{m} -closure and soft \tilde{m} -interior operators in soft minimal spaces. Also, we investigate the characterize those sets using soft \tilde{m} -interior and soft \tilde{m} -closure operators respectively.

Definition 3.1 Let X be an initial universe set, E be the set of parameters and $A \subseteq E$. Let F_A be a nonempty soft set and $\tilde{P}(F_A)$ be the soft power set of F_A .

A subfamily \tilde{m} of $\tilde{P}(F_A)$ is called a soft minimal on F_A if $F_\emptyset \in \tilde{m}$ and $F_A \in \tilde{m}$.

Then (X, \tilde{m}, E) or (F_A, \tilde{m}) is called soft minimal space. Each member of \tilde{m} is said to be soft \tilde{m} -open and the complement of an soft \tilde{m} -open set is said to be soft \tilde{m} -closed set.

Example 3.2 Let $X = \{u_1, u_2\}$, $E = \{x_1, x_2, x_3\}$, $A = \{x_1, x_2\} \subseteq E$,

- $F_A = \{(x_1, \{u_1, u_2\}), (x_2, \{u_1, u_2\})\}$,
- $F_{A_1} = \{(x_1, \{u_1\})\}$, $F_{A_2} = \{(x_1, \{u_2\})\}$, $F_{A_3} = \{(x_1, \{u_1, u_2\})\}$,
- $F_{A_4} = \{(x_2, \{u_1\})\}$, $F_{A_5} = \{(x_2, \{u_2\})\}$, $F_{A_6} = \{(x_2, \{u_1, u_2\})\}$,
- $F_{A_7} = \{(x_1, \{u_1\}), (x_2, \{u_1\})\}$, $F_{A_8} = \{(x_1, \{u_1\}), (x_2, \{u_2\})\}$,
- $F_{A_9} = \{(x_1, \{u_1\}), (x_2, \{u_1, u_2\})\}$, $F_{A_{10}} = \{(x_1, \{u_2\}), (x_2, \{u_1\})\}$,
- $F_{A_{11}} = \{(x_1, \{u_2\}), (x_2, \{u_2\})\}$, $F_{A_{12}} = \{(x_1, \{u_2\}), (x_2, \{u_1, u_2\})\}$,
- $F_{A_{13}} = \{(x_1, \{u_1, u_2\}), (x_2, \{u_1\})\}$, $F_{A_{14}} = \{(x_1, \{u_1, u_2\}), (x_2, \{u_2\})\}$,
- $F_{A_{15}} = F_A$, $F_{A_{16}} = F_\emptyset$ are all soft subsets of F_A .

Here $F_{A_i} \subseteq F_A$ means that F_{A_i} is soft subset of F_A .

soft minimal $(\tilde{m}) = \{F_\emptyset, F_{A_1}, F_{A_4}, F_{A_7}, F_{A_{11}}, F_{A_{13}}, F_A\}$.

Here, soft \tilde{m} -open sets are $F_\emptyset, F_{A_1}, F_{A_4}, F_{A_7}, F_{A_{11}}, F_{A_{13}}, F_A$.

soft \tilde{m} -closed sets are $F_A, F_{A_{12}}, F_{A_{14}}, F_{A_{11}}, F_{A_7}, F_{A_5}, F_\emptyset$.

Definition 3.3 Let F_A be a nonempty soft set and \tilde{m} be a soft minimal on F_A . For a soft subset F_B of F_A , the soft \tilde{m} -closure of F_B and soft \tilde{m} -interior of F_B are defined as follows:

1. $\tilde{m}Cl(F_B) = \cap \{U_B : F_B \subseteq U_B, U_B \in \tilde{m}\}$,
2. $\tilde{m}Int(F_B) = \cup \{V_B : V_B \subseteq F_B, V_B \in \tilde{m}\}$.

Theorem 3.4 Let F_A be a nonempty soft set and \tilde{m} be a soft minimal on F_A . For a soft subset F_B and G_B of F_A , the following properties hold

- (1) $\tilde{m}Cl(F_\emptyset) = F_\emptyset$, $\tilde{m}Cl(F_A) = F_A$,
- (2) $F_B \subseteq \tilde{m}Cl(F_B)$,
- (3) If G_B is any soft \tilde{m} -closed set and $F_B \subseteq G_B$, then $\tilde{m}Cl(F_B) \subseteq G_B$,
- (4) If F_B is soft \tilde{m} -closed, then $\tilde{m}Cl(F_B) = F_B$,
- (5) If $F_B \subseteq G_B$, then $\tilde{m}Cl(F_B) \subseteq \tilde{m}Cl(G_B)$,
- (6) $\tilde{m}Cl(\tilde{m}Cl(F_B)) = \tilde{m}Cl(F_B)$.

1. By the definition of soft \tilde{m} -closure, $\tilde{m}Cl(F_\emptyset) =$ Intersection of all soft \tilde{m} -closed sets containing $F_\emptyset = \cap \{F_\emptyset\} = F_\emptyset$. (i.e) $\tilde{m}Cl(F_\emptyset) = F_\emptyset$,

By the definition of soft \tilde{m} -closure, $\tilde{m}Cl(F_A) =$ Intersection of all soft \tilde{m} -closed sets containing $F_A = \cap \{F_A\} = F_A$. (i.e) $\tilde{m}Cl(F_A) = F_A$.

2. By the definition of soft \tilde{m} -closure of F_B , it is obvious that $F_B \subseteq \tilde{m}Cl(F_B)$.

Vembu and Dorathy

3. By the definition of soft \tilde{m} -closure, $\tilde{m}Cl(F_B) = \cap \{U_B : F_B \subseteq U_B, U_B^c \in \tilde{m}\}$.

Therefore $\tilde{m}Cl(F_B)$ is contained in every soft \tilde{m} -closed set containing F_B . Since G_B is any soft \tilde{m} -closed set and $F_B \subseteq G_B$, $\tilde{m}Cl(F_B) \subseteq G_B$.

4. By the definition of soft \tilde{m} -closure, $F_B \subseteq \tilde{m}Cl(F_B)$. Also $F_B \subseteq F_B$ and F_B is soft \tilde{m} -closed set, by (3), $\tilde{m}Cl(F_B) \subseteq F_B$. Hence, $\tilde{m}Cl(F_B) = F_B$.

5. Let $(x, u) \in \tilde{m}C(F_A)$.

By the definition of $\tilde{m}Cl(G_B) = \cap \{U_B : G_B \subseteq U_B, U_B \in \tilde{m}C(F_A)\}$.

If $G_B \subseteq U_B \in \tilde{m}C(F_A)$, then $\tilde{m}Cl(G_B) \subseteq U_B$.

Since $F_B \subseteq G_B$, $F_B \subseteq G_B \subseteq U_B \in \tilde{m}C(F_A)$, we have $\tilde{m}Cl(F_B) \subseteq U_B$.

Therefore $\tilde{m}Cl(F_B) \subseteq U_B = \cap \{U_B : G_B \subseteq U_B, U_B \in \tilde{m}C(F_A)\} = \tilde{m}Cl(G_B)$.

That is $\tilde{m}Cl(F_B) \subseteq \tilde{m}Cl(G_B)$.

6. Since $F_B \subseteq \tilde{m}Cl(F_B)$, then $\tilde{m}Cl(F_B) \subseteq \tilde{m}Cl(\tilde{m}Cl(F_B))$.

Since $\tilde{m}Cl(\tilde{m}Cl(F_B)) = \cap \{U_B : \tilde{m}Cl(F_B) \subseteq U_B, U_B^c \in \tilde{m}\}$ and $\tilde{m}Cl(F_B)$ is soft \tilde{m} -closed set, so $\tilde{m}Cl(\tilde{m}Cl(F_B)) \subseteq \tilde{m}Cl(F_B)$.

Hence $\tilde{m}Cl(\tilde{m}Cl(F_B)) = \tilde{m}Cl(F_B)$. □

Theorem 3.5 Let F_A be a non-empty soft set and \tilde{m} be a soft minimal on F_A . For a soft subset F_B and G_B of F_A , the following properties hold

- (1) $\tilde{m}Cl(F_B) \cup \tilde{m}Cl(G_B) = \tilde{m}Cl(F_B \cup G_B)$,
- (2) $\tilde{m}Cl(F_B \cap G_B) \subseteq \tilde{m}Cl(F_B) \cap \tilde{m}Cl(G_B)$.

1. Let $\tilde{m}Cl(F_B) \cup \tilde{m}Cl(G_B)$ is soft \tilde{m} -closed, and $F_B \cup G_B \subseteq \tilde{m}Cl(F_B) \cup \tilde{m}Cl(G_B)$, then $\tilde{m}Cl(F_B \cup G_B) \subseteq \tilde{m}Cl(\tilde{m}Cl(F_B) \cup \tilde{m}Cl(G_B)) = \tilde{m}Cl(F_B) \cup \tilde{m}Cl(G_B)$. So $\tilde{m}Cl(F_B \cup G_B) \subseteq \tilde{m}Cl(F_B) \cup \tilde{m}Cl(G_B)$. Conversely, since $F_B \subseteq (F_B \cup G_B)$ and $G_B \subseteq (F_B \cup G_B)$, then $\tilde{m}Cl(F_B) \subseteq \tilde{m}Cl(F_B \cup G_B)$ and $\tilde{m}Cl(G_B) \subseteq \tilde{m}Cl(F_B \cup G_B)$, then $\tilde{m}Cl(F_B) \cup \tilde{m}Cl(G_B) \subseteq \tilde{m}Cl(F_B \cup G_B)$. Hence $\tilde{m}Cl(F_B) \cup \tilde{m}Cl(G_B) = \tilde{m}Cl(F_B \cup G_B)$.

2. Let F_B and G_B be soft subsets of F_A . Also $(F_B \cap G_B) \subseteq F_B$ and $(F_B \cap G_B) \subseteq G_B$, then we have $\tilde{m}Cl(F_B \cap G_B) \subseteq \tilde{m}Cl(F_B)$ and $\tilde{m}Cl(F_B \cap G_B) \subseteq \tilde{m}Cl(G_B)$. Therefore $\tilde{m}Cl(F_B \cap G_B) \subseteq \tilde{m}Cl(F_B) \cap \tilde{m}Cl(G_B)$. □

Definition 3.6 A soft subset F_B of a soft minimal space (F_A, \tilde{m}) is called a soft \tilde{m} -neighbourhood (soft \tilde{m} -interior point) of (x, u) if $(x, u) \in \tilde{m}Int(F_B)$.

Theorem 3.7 Let F_A be a nonempty soft set and \tilde{m} be a soft minimal on F_A . For a soft subset F_B and G_B of F_A , the following properties hold

- 1. $\tilde{m}Int(F_\emptyset) = F_\emptyset$ and $\tilde{m}Int(F_A) = F_A$,
- 2. $\tilde{m}Int(F_B) \subseteq F_B$,
- 3. If F_B is soft \tilde{m} -open, then $\tilde{m}Int(F_B) = F_B$,
- 4. If G_B is any soft \tilde{m} -open set contained in F_B , then $G_B \subseteq \tilde{m}Int(F_B)$,
- 5. If $F_B \subseteq G_B$, then $\tilde{m}Int(F_B) \subseteq \tilde{m}Int(G_B)$,
- 6. $\tilde{m}Int(\tilde{m}Int(F_B)) = \tilde{m}Int(F_B)$.

1. By the definition of soft \tilde{m} -interior, $\tilde{m}Int(F_\emptyset) = \cup \{V_B : V_B \subseteq F_\emptyset, V_B \in \tilde{m}\}$. Since F_\emptyset is the only soft \tilde{m} -open set contained in F_\emptyset , $\tilde{m}Int(F_\emptyset) = F_\emptyset$.

$\tilde{m}Int(F_A) = \cup \{V_B : V_B \subseteq F_A, V_B \in \tilde{m}\}$. Since F_A is soft \tilde{m} -open set contained in F_A , $\tilde{m}Int(F_A) = F_A \cup \{V_B : V_B \subseteq F_A, V_B \in \tilde{m}\} = F_A$.

2. This is obvious from definition of soft \tilde{m} -interior of F_B , $\tilde{m}Int(F_B) \subseteq F_B$.

3. Suppose that F_B is soft \tilde{m} -open set, then

$\tilde{m}Int(F_B) = \cup \{V_B : V_B \subseteq F_B, V_B \in \tilde{m}\}$. So $F_B \subseteq \tilde{m}Int(F_B)$. But $\tilde{m}Int(F_B) \subseteq F_B$ by(2), then $\tilde{m}Int(F_B) = F_B$.

4. Let $(x, u) \in G_B$. Since G_B is soft \tilde{m} -open set contained in F_B , (x, u) is a soft \tilde{m} -interior point of F_B . That is $(x, u) \in \tilde{m}Int(F_B)$. Hence $G_B \subseteq \tilde{m}Int(F_B)$.

5. Let $(x, u) \in F_A$ and $(x, u) \in \tilde{m}Int(F_B)$. Then by the definition of soft \tilde{m} -interior, there exists a soft \tilde{m} -open set V_B such that $(x, u) \in V_B \subseteq F_B$. Since $F_B \subseteq G_B$, then $(x, u) \in V_B \subseteq F_B \subseteq G_B$. Hence $(x, u) \in \tilde{m}Int(G_B)$.

Therefore $\tilde{m}Int(F_B) \subseteq \tilde{m}Int(G_B)$.

6. Since $\tilde{m}Int(F_B) \subseteq F_B$, then $\tilde{m}Int(\tilde{m}Int(F_B)) \subseteq \tilde{m}Int(F_B)$.

Vembu and Dorathy

Now $\tilde{m}Int(\tilde{m}Int(F_B)) = \cup \{V_B : V_B \subseteq \tilde{m}Int(V_B), V_B \in \tilde{m}\}$.

But $\tilde{m}Int(F_B)$ is soft \tilde{m} -open set, so $\tilde{m}Int(F_B) \subseteq \tilde{m}Int(\tilde{m}Int(F_B))$.

Hence $\tilde{m}Int(\tilde{m}Int(F_B)) = \tilde{m}Int(F_B)$. □

Theorem 3.8 Let F_A be a nonempty soft set and \tilde{m} be a soft minimal on F_A . For a soft subset F_B and G_B of F_A , the following properties hold

1. $\tilde{m}Int(F_B) \cup \tilde{m}Int(G_B) \subseteq \tilde{m}Int(F_B \cup G_B)$,
2. $\tilde{m}Int(F_B \cap G_B) = \tilde{m}Int(F_B) \cap \tilde{m}Int(G_B)$.

1. Let $F_B \subseteq (F_B \cup G_B)$ and $G_B \subseteq (F_B \cup G_B)$. This implies $\tilde{m}Int(F_B) \subseteq \tilde{m}Int(F_B \cup G_B)$ and $\tilde{m}Int(G_B) \subseteq \tilde{m}Int(F_B \cup G_B)$.

This implies that $\tilde{m}Int(F_B) \cup \tilde{m}Int(G_B) \subseteq \tilde{m}Int(F_B \cup G_B)$.

2. Let $\tilde{m}Int(F_B) \cap \tilde{m}Int(G_B)$ is soft \tilde{m} -open set and $\tilde{m}Int(F_B) \cap \tilde{m}Int(G_B) \subseteq F_B \cap G_B$, then $\tilde{m}Int(\tilde{m}Int(F_B) \cap \tilde{m}Int(G_B)) \subseteq \tilde{m}Int(F_B \cap G_B)$.

But also $\tilde{m}Int(\tilde{m}Int(F_B) \cap \tilde{m}Int(G_B)) = \tilde{m}Int(F_B) \cap \tilde{m}Int(G_B)$ and so $\tilde{m}Int(F_B) \cap \tilde{m}Int(G_B) \subseteq \tilde{m}Int(F_B \cap G_B)$.

Conversely, since $F_B \cap G_B \subseteq F_B$ and $F_B \cap G_B \subseteq G_B$, then $\tilde{m}Int(F_B \cap G_B) = \tilde{m}Int(F_B)$ and $\tilde{m}Int(F_B \cap G_B) = \tilde{m}Int(G_B)$, then $\tilde{m}Int(F_B \cap G_B) \subseteq \tilde{m}Int(F_B) \cap \tilde{m}Int(G_B)$.

Hence $\tilde{m}Int(F_B \cap G_B) = \tilde{m}Int(F_B) \cap \tilde{m}Int(G_B)$. □

Theorem 3.9 For an $(x, u) \in F_A$, $(x, u) \in \tilde{m}Cl(F_B)$ if and only if $U_B \cap F_B \neq F_\emptyset$ for every soft \tilde{m} -open set U_B containing (x, u) . Let $(x, u) \in F_A$, $(x, u) \in \tilde{m}Cl(F_B)$. Let U_B be a soft \tilde{m} -open set containing (x, u) . Suppose $U_B \cap F_B = F_\emptyset$ then $F_B \not\subseteq U_B$. Therefore $F_B \subseteq U_B^c$. Since U_B^c is a soft \tilde{m} -closed set. Hence $\tilde{m}Cl(F_B) \subseteq U_B^c$. Therefore $\tilde{m}Cl(F_B) \cap U_B = F_\emptyset$. This implies that $(x, u) \notin \tilde{m}Cl(F_B)$ which is contradiction. So $U_B \cap F_B \neq F_\emptyset$ for every soft \tilde{m} -open set U_B containing (x, u) . Conversely, let $U_B \cap F_B \neq F_\emptyset$ for every soft \tilde{m} -open set U_B containing (x, u) . Suppose $(x, u) \notin \tilde{m}Cl(F_B)$, there exists a soft \tilde{m} -closed set G_B containing F_B , such that $(x, u) \notin G_B$. This implies that $(x, u) \in G_B^c$ and G_B^c is soft \tilde{m} -open set. Now $G_B^c \cap F_B = F_\emptyset$, which is a contradiction. Hence $(x, u) \in \tilde{m}Cl(F_B)$. □

Theorem 3.10

1. $[\tilde{m}Int(F_B)]^c = \tilde{m}Cl(F_B^c)$,
2. $[\tilde{m}Cl(F_B)]^c = \tilde{m}Int(F_B^c)$.

1. Let $(x, u) \in [\tilde{m}Int(F_B)]^c$. Then $(x, u) \notin \tilde{m}Int(F_B)$. That is every soft \tilde{m} -open set U_B containing (x, u) is such that $U_B \not\subseteq F_B$.

That is every soft \tilde{m} -open set U_B containing (x, u) is such that $U_B \cap F_B^c \neq F_\emptyset$. Then by theorem 2.1.9, $(x, u) \in \tilde{m}Cl(F_B^c)$.

Therefore $[\tilde{m}Int(F_B)]^c \subseteq \tilde{m}Cl(F_B^c)$. → (1)

Conversely, let $(x, u) \in \tilde{m}Cl(F_B^c)$. Then by theorem 2.1.9, every soft \tilde{m} -open set U_B containing (x, u) is such that $U_B \cap F_B^c \neq F_\emptyset$.

That is every soft \tilde{m} -open set U_B containing (x, u) is such that $U_B \not\subseteq F_B$. This implies that by the definition of soft \tilde{m} -interior, $(x, u) \notin \tilde{m}Int(F_B)$.

That is $(x, u) \in [\tilde{m}Int(F_B)]^c$. Therefore $\tilde{m}Cl(F_B^c) \subseteq [\tilde{m}Int(F_B)]^c$ → (2)

From (1) and (2), $[\tilde{m}Int(F_B)]^c = \tilde{m}Cl(F_B^c)$.

2. Let $(x, u) \in [\tilde{m}Cl(F_B)]^c$ implies $(x, u) \notin \tilde{m}Cl(F_B)$. Then there exists soft \tilde{m} -open set U_B containing (x, u) , $F_B \cup U_B = F_\emptyset$. So $(x, u) \in U_B \subseteq F_B^c$. Thus $(x, u) \in \tilde{m}Int(F_B^c)$.

Therefore $[\tilde{m}Cl(F_B)]^c \subseteq \tilde{m}Int(F_B^c)$ → (1)

Conversely, let $(x, u) \in \tilde{m}Int(F_B^c)$. Then there exists a soft \tilde{m} -open set U_B containing (x, u) such that $(x, u) \in U_B \subseteq F_B^c$. So $(x, u) \notin \tilde{m}Cl(F_B)$.

That is $(x, u) \in [\tilde{m}Cl(F_B)]^c$.

Therefore $\tilde{m}Int(F_B^c) \subseteq [\tilde{m}Cl(F_B)]^c$ → (2)

From (1) and (2), $[\tilde{m}Cl(F_B)]^c = \tilde{m}Int(F_B^c)$ □

Vembu and Dorathy

Definition 3.11 A soft minimal \tilde{m} on a nonempty soft set F_A is said to have property \mathcal{B} if the union of any family of soft subsets belonging to \tilde{m} belongs to \tilde{m} .

Lemma 3.12 Let F_A be a non-empty soft set and soft minimal \tilde{m} on F_A satisfying property \mathcal{B} . For a soft subset F_B of F_A , the following properties hold:

1. If F_B is soft \tilde{m} -open if and only if $\tilde{m}Int(F_B) = F_B$,
2. If F_B is soft \tilde{m} -closed if and only if $\tilde{m}Cl(F_B) = F_B$,
3. $\tilde{m}Int(F_B) \in \tilde{m}$ and $\tilde{m}Cl(F_B)$ is soft \tilde{m} -closed.

1. Suppose that F_B is soft \tilde{m} -open set, then

$\tilde{m}Int(F_B) = \cup \{V_B : V_B \subseteq F_B, V_B \in \tilde{m}\}$. So $F_B \subseteq \tilde{m}Int(F_B)$. But $\tilde{m}Int(F_B) \subseteq F_B$ by Theorem 2.1.7(2). Thus $\tilde{m}Int(F_B) = F_B$. Conversely, suppose that $\tilde{m}Int(F_B) = F_B$, then F_B is soft \tilde{m} -open set since $\tilde{m}Int(F_B)$ is soft \tilde{m} -open.

2. Suppose that F_B is soft \tilde{m} -closed set, then

$\tilde{m}Cl(F_B) = \cap \{U_B : F_B \subseteq U_B, U_B^c \in \tilde{m}\} \subseteq F_B$. But $F_B \subseteq \tilde{m}Cl(F_B)$ by Theorem 2.1.4(2). Thus $\tilde{m}Cl(F_B) = F_B$. Conversely, Suppose $\tilde{m}Cl(F_B) = F_B$, then F_B is soft \tilde{m} -closed set since $\tilde{m}Cl(F_B)$ is soft \tilde{m} -closed.

3. It is obvious from definition of soft \tilde{m} -interior and soft \tilde{m} -closure. \square

Definition 3.13 A soft subset F_B of a soft minimal space (F_A, \tilde{m}) is called soft \tilde{m} -closed if $\tilde{m}Cl(F_B) = F_B$. The complement of soft \tilde{m} -closed set is called soft \tilde{m} -open.

Example 3.14 Let us consider the soft subsets of F_A that are given in Example 2.1.2. Let (F_A, \tilde{m}) be a soft minimal space where $X = \{u_1, u_2\}$, $A = \{x_1, x_2\} \subseteq E$ and $F_A = \{(x_1, \{u_1, u_2\}), (x_2, \{u_1, u_2\})\}$.

Consider soft minimal $(\tilde{m}) = \{F_\emptyset, F_{A_1}, F_{A_2}, F_{A_3}, F_{A_4}, F_{A_5}, F_{A_6}\}$.

soft \tilde{m} -closed $(\tilde{m}^c) = \{F_A, F_{A_{12}}, F_{A_9}, F_{A_6}, F_{A_{11}}, F_{A_5}, F_\emptyset\}$.

Take $F_B = F_{A_6}$, $\tilde{m}Cl(F_{A_6}) = F_{A_{12}} \cap F_{A_9} \cap F_{A_6} \cap F_A = F_{A_6}$ and the soft \tilde{m} -open is F_{A_3} .

ABSTRACT

This paper introduces the notion of weighted local neutrosophic rough similarity measure (LNRSM) based tangent function and explores its properties. The LNRS notion is utilized as vector depiction in a three-dimensional vector space. In LNRS, the components of upper and lower approximation are utilized to express the hierarchy of all attributes. A numerical illustration of the medical diagnosis is provided to showcase the effectiveness and adaptability of the suggested method.

Keywords: Neutrosophic Set (NS), Rough neutrosophic set (RNS), Similarity measure, Local neutrosophic rough set (LNRS).

INTRODUCTION

The measure of similarity is a significant area of research in fuzzy, neutrosophic, rough, and various hybrid environments. The NS, was introduced by Smarandache in 1998 [4]. Pawlak [11] proposed rough set (RS) theory in 1982 as an advancement of contour set theory in 1982 as an advancement of contour set. It is highly beneficial for the analysis of intelligent systems that are defined by uncertain or inadequate information. The initial concept of RNS was presented by Broumi et al in 2014 [7]. The RNS theory serves as a robust mathematical tool for addressing issues of incompleteness. A local rough set refers to the reconstruction of a classical RS. It was established by Y. Qian [10]. Bharathi *et al.* [2] established the notion named LNRS. Numerous approaches have been indicated in the literature for determining the level of similarity among NS, RNS, and so on. A parametric SM is presented by M Sarfraz et al. [8],

Bharathi and Arulmani

which is founded on three parameters. This approach enables decision-makers to customize the measure to align with different decision-making styles. S Alias et al. [1] presented a medical diagnosis model that uses a distance base SM derived from a RNS. The measures of similarity and weighted similarity are utilized across various domains, including tangent [5], cotangent [9], cosine [6], etc. Bharathi *et al.* [3] established an SM between tangent functions. This paper explores the weighted (LNRS) on tangent function and its properties. A numerical depiction of the medical diagnostic is offered to highlight the efficacy and adaptability of the approach.

1. Preliminaries

Definition 2.1 [7]

Let S be a non-empty set. Consider \sim as an equivalence relation on S and \leq as a neutrosophic relation on S , with the membership functions for truth T , indeterminacy I , and falsity F . The upper and lower values concerning \sim , along with the pair (K, K) , define the approximation space denoted by (K, K) . K, K are detailed below.

$$K = \{ \langle g, TKg, IKg, FKg \rangle \mid b \in [g], g \in S \}$$

$$K = \{ \langle g, TKg, IKg, FKg \rangle \mid b \in [g], g \in S \}, \text{ where}$$

$$TKg = d \in [g]Td, \quad IKc = d \in [c]Id, \quad FKc = d \in [c]Fd,$$

$$TKc = d \in [c]Td, \quad IKc = d \in [c]Id, \quad FKc = d \in [c]Fd$$

Such that $TKc, IKc, FKc, TKc, IKc, FKc: \zeta \in [0, 1]$,

so, $0 \leq TKc + IKc + FKc \leq 3$ and $0 \leq TKc + IKc + FKc \leq 3$.

where symbols “ \wedge ” and “ \vee ” means maximum and minimum operators respectively. Where $[c]$ is equivalence class in S . Then (K, K) is defined as Rough Neutrosophic set in S .

Definition 2.2 [10]

Let (K, K) being a space of approximations. Let D be an including degree in $P \times P$. If any (K, K) , the β – lower, γ - upper approximations are as follows

$$K = \{ \langle D \mid (K) \geq \alpha \},$$

$$K = \{ \langle D \mid (K) > \beta, \epsilon \}. \text{ The pair } (K, K) \text{ is defined as LRS.}$$

2. Weighted Local Neutrosophic Rough Similarity Measure based tangent function

Definition 3.1

To initialize the weighted SM in LNRS based tangent function. Here weight of every element is represented as $x_p, p=1,2,3,\dots,n$. Let w be consider a weight of an element x_p , we lies between $0,1, e=1, dwe=1$ and $r=1,2,\dots, r$ is the vector of periods with $w(\zeta_r) \in [0,1], r=1, w(\zeta_r)=1$.

$$TwLNRSK, L = p=1 \sum [w(1 - \tan Kxp - Lxp + Kxp - Lxp + Kxp - Lxp) \dots]$$

Proposition 3.2

The weighted LNRS is based on the tangent similarity measure with truth, indeterminate and incompatible function (K, L) which satisfies the conditions as follows.

1. $0 \leq TwLNRSK, L \leq 1$
2. $TwLNRSK, L = 1$ iff $K=L$
3. $TwLNRSK, L = TwLNRSK, L$
4. Let M be a LNRS and $K \subset L \subset M$ then $TwLNRSK, M \geq TwLNRSK, L$ and $TwLNRSK, M \geq TwLNRSK, L$.

Proof

1. As known, truth, indeterminate and incompatible membership functions lie in $0,1$ and the value of tangent function also lies between $0,1$. Then the tangent similarity measure also lies between $0,1$.

Therefore, consequently $0 \leq TwLNRSK, L \leq 1$.

2. For any pair K and L in LNRS, if $K=L$ then $Kxp=Lxp, Kxp=Lxp, Kxp=Lxp$.

Also, $Kxp-Lxp=0, Kxp-Lxp=0, Kxp-Lxp=0$

Therefore $TwLNRSK, L=1$.

Bharathi and Arulmani

Conversely, assume $T_{wLNRSK,L}=1$, then
 $K_{xp}-L_{xp}=0, K_{xp}-L_{xp}=0, K_{xp}-L_{xp}=0$
 Which implies that $K_{xp}=L_{xp}, K_{xp}=L_{xp}, K_{xp}=L_{xp}$. Thus $K=L$.

3. From definition 3.1,
 $T_{wLNRSK,L}=1_{np}=1_n[we[1-taK_{xp}-L_{xp}+K_{xp}-L_{xp}+K_{xp}-L_{xp}12]]$
 $=1_{np}=1_n[we[1-tan L_{xp}-K_{xp}+L_{xp}-K_{xp}+L_{xp}-K_{xp}12]]$
 $T_{wLNRSK,L} = T_{wLNRSK,L}$.

4. If $K \subset L \subset M$ then $K_{xp}L_{xp}M_{xp}, K_{xp}L_{xp} \geq \delta M_{xp}$ and $K_{xp}L_{xp} \geq \eta M_{xp}$.
 Which implies the following inequalities,
 $K_{xp}-L_{xp}K_{xp}-M_{xp}, L_{xp}-M_{xp}K_{xp}-M_{xp},$
 $K_{xp}-L_{xp}K_{xp}-M_{xp}, L_{xp}-M_{xp}K_{xp}-M_{xp},$
 $K_{xp}-L_{xp}K_{xp}-M_{xp}, L_{xp}-M_{xp}K_{xp}-M_{xp}.$
 Hence $T_{wLNRSK,M}T_{wLNRSK,L}$ and
 $T_{wLNRSK,M}T_{wLNRSK,L}$.

3. Method of Weighted Local Neutrosophic Rough Similarity Measure (WLNRSM)

The weighted SMs on the tangent function are calculated in the following steps.

Step 1 To repeat the same steps of 1,2 and 3 of algorithm 5.4

Step 2 To determine weighted measure M for $\Gamma=1,2,3,\dots,n$.

$M=L=1dwLr.r$

Step 3 Determining the weighted tangent SM among attributes and alternatives.

Step 4 The priority with the highest measure value is the most pertinent alternative.

Example 4.1

The following is a description of a medical diagnostic problem. Take as patient and 1,2 represent the two distinct time periods of a patient sample. The diseases are $\gamma=\{\text{Diabetes, Heart disease, Chronic kidney disease}\}$ and the symptoms are $\delta=\{\text{Tiredness, Urination changes, Chest pain, Sleep problem}\}$

Allow the attribute $Q=M1,M2,M3,M4$ as universal set. The equivalence class of the universal set is $f1=M1,M2,f2=M3,M4$ and $X=M1,M2,M4$. Assume that the parameter $\alpha=0.6$ and $\beta=0.3$. Here the attributes are defined as

$Q=\{\text{Tiredness, Urination changes, Chest pain, Sleep problem}\}$ respectively.

Take into account the weights assigned to every criterion in the proposed tangent SM as follows. $w_e=14,14,14,14$ and weight vector for two periods $\omega=0.4,0.25$. The steps for diagnosing the condition are shown below. The lower and upper approximations are calculated using LNRS.

$[M1]_R=M1,M2, [M2]_R=M1,M2, [M4]_R=M3,M4$

$DX/[M1]_R=1, DX/[M2]_R=1, DX/[M4]_R=12.$

$T0.6X=[M1]_R, T0.6X=M1,M2$

$T0.3X=[M1]_R[M2]_R[M4]_R, T0.3X=M1,M2,M3,M4.$

To determine weighted measure M for $\Gamma=1,2,3,\dots$

$M=L=1dwLr.r$

The values are $M1=0.4895, M2=0.4707, M3=0.5238$. The scale of order is $M3>M1>M2$. The highest weighted value indicates that the patient has a chronic kidney disease.

CONCLUSION

This study presented a weighted LNRSM based on the tangent function and demonstrated some fundamental properties. The proposed SM is eventually used in the field of medical diagnosis.

ABSTRACT

The world faces pressing challenges in achieving sustainable development, including climate change, biodiversity loss, and food insecurity. Sustainable land use practices offer a critical solution; however, their adoption is impeded by complex trade-offs between human needs and environmental concerns. This paper presents a comprehensive framework for optimizing land use, integrating: Spatial analysis and mapping, Multi-criteria decision analysis, Stakeholder engagement and participatory planning. We apply this framework to a case study region, demonstrating its potential to: Identify areas of high conservation value, Optimize agricultural productivity and resource use, Enhance ecosystem services and biodiversity, Support climate change mitigation and adaptation, Inform policy and land use planning decisions. Our results underscore the importance of integrated approaches, considering both human well-being and environmental sustainability. We discuss implications for land use policy, practice, and research, emphasizing the necessity for collaboration and knowledge sharing to achieve sustainable development goals.

Keywords: climate change, agricultural, policy, goals

Amutha et al.,

INTRODUCTION

The agricultural sector is at a critical juncture, facing the dual challenges of a growing global population and the imperative to mitigate environmental degradation. With the global population projected to reach nearly 10 billion by 2050, food production must increase by approximately 70% to meet demand. However, conventional agricultural practices, which heavily rely on chemical inputs and monoculture, have resulted in severe environmental consequences, including soil degradation, loss of biodiversity, and significant greenhouse gas emissions. Sustainable land use practices have emerged as crucial solutions to these challenges, offering methods to increase food production while preserving ecological integrity. Sustainable agriculture is defined as farming that meets the needs of the present without compromising the ability of future generations to meet their own needs. This paper examines various sustainable land use practices in agriculture, including agroecology, conservation agriculture, agroforestry, organic farming, and integrated pest management (IPM). Each practice will be analyzed for its effectiveness, benefits, and challenges, focusing on their roles in fostering sustainable agricultural systems that can meet current and future needs.

Literature Survey

The literature surrounding sustainable land use practices is extensive, highlighting various methods and their impacts. Key themes include

Agroecology

Agroecology emphasizes the application of ecological principles in agricultural practices. It promotes biodiversity, crop rotation, and soil health, aiming to create farming systems that are more resilient to pests and climate change. Research by Altieri (2018) indicates that agroecological practices can lead to improved yields and reduced reliance on chemical inputs. For instance, a study in Latin America found that farmers who implemented agroecological practices experienced a 30% increase in crop yields compared to conventional methods.

Conservation Agriculture

Conservation agriculture focuses on three main principles: minimal soil disturbance, maintaining soil cover, and crop rotation. Kassam et al. (2019) highlight that these practices significantly enhance soil health, reduce erosion, and improve water retention. Studies indicate that conservation agriculture can achieve yields comparable to or higher than conventional systems while reducing production costs. For example, a meta-analysis revealed that conservation agriculture improved soil organic matter by an average of 1.5%, leading to enhanced productivity.

Agroforestry

Agroforestry integrates trees into agricultural systems, providing numerous environmental and economic benefits. Nair (2014) argues that agroforestry systems enhance biodiversity, improve soil fertility, and sequester carbon. A case study in Kenya demonstrated that farmers who adopted agroforestry practices increased their incomes by 25% through the sale of tree products, illustrating the economic viability of this approach.

Organic Farming

Organic farming avoids synthetic fertilizers and pesticides, focusing instead on natural inputs and sustainable practices. Reganold and Wachter (2016) found that organic farming can match or exceed conventional yields, particularly in diverse cropping systems. The growing consumer demand for organic products presents an economic opportunity for farmers, driving a shift toward more sustainable practices.

Integrated Pest Management (IPM)

IPM is a comprehensive approach that integrates biological, cultural, and chemical pest control methods. Kogan (1998) emphasizes that IPM reduces dependence on pesticides while maintaining effective pest management.

**Amutha et al.,**

Research has demonstrated that farms implementing IPM can achieve up to a 40% reduction in pesticide use without compromising yields. This practice promotes healthier ecosystems and mitigates the economic burden on farmers.

Policy and Economic Factors

The implementation of sustainable agricultural practices is significantly influenced by economic conditions and policy frameworks. Pretty et al. (2018) highlight that financial constraints, insufficient knowledge, and inadequate policy support can impede the transition to sustainable agriculture. Supportive policies, including subsidies for sustainable practices and access to training programs, are essential for promoting widespread adoption.

METHODOLOGY

This research employs a mixed-methods approach, combining qualitative and quantitative methods to evaluate sustainable land use practices in agriculture. The methodology encompasses several key components

Data Collection

An extensive review of peer-reviewed journals, books, and reports was conducted to gather existing knowledge on sustainable agricultural practices, their effectiveness, and impacts on productivity and the environment.

Case Studies

Selected case studies of farms employing sustainable practices were analyzed, focusing on their geographic diversity and the variety of practices implemented.

Surveys and Interviews

Farmer Survey is a structured survey was distributed to farmers practicing sustainable agriculture across various regions. The survey collected data on crop yields, input costs, and perceived challenges and benefits of sustainable practices.

Interviews

Semi-structured interviews were conducted with agricultural experts, researchers, and policymakers to gain insights into the broader context of sustainable land use practices. The interviews focused on challenges, success factors, and support mechanisms for adopting sustainable methods.

Data Analysis**Quantitative Analysis**

Statistical software was utilized to analyze survey data, enabling comparisons of yield and cost differences between sustainable and conventional practices. Descriptive statistics and inferential tests identified significant trends.

Qualitative Analysis

Thematic analysis was applied to interview data, identifying key themes related to challenges and success factors associated with sustainable agriculture.

Comparative Analysis

This study compares the outcomes of sustainable practices with conventional methods, focusing on productivity, economic viability, and environmental impact. This includes evaluating case studies that illustrate successful transitions to sustainable practices.

**Amutha et al.,**

RESULTS AND DISCUSSION

Agroecology

Agroecological practices have demonstrated significant potential in enhancing resilience and productivity. A study conducted in Brazil indicated that farmers who adopted agroecological methods reported a 30% increase in crop diversity and a 20% reduction in pest infestations (Altieri, 2018). This transition not only improved yields but also reduced the necessity for chemical pesticides, thereby promoting environmental health.

Conservation Agriculture

Research suggests that conservation agriculture can lead to substantial improvements in soil health. A meta-analysis of over 200 studies found that conservation practices, such as no-till farming and cover cropping, increased soil organic matter by an average of 1.5% (Kassam et al., 2019). This increase in soil quality enhances water retention and reduces erosion, contributing to long-term agricultural sustainability. Moreover, farms implementing conservation agriculture often report lower input costs, as reduced tillage decreases fuel and labor requirements. Farmers in Argentina utilizing conservation techniques reported saving approximately 30% on their production costs (Kassam et al., 2019).

Agroforestry

The integration of trees into farming systems offers multiple benefits. For instance, farmers in Kenya practicing agroforestry reported a 25% increase in income from the sale of tree products, alongside improvements in soil fertility and crop yields (Nair, 2014). Agroforestry also provides additional ecosystem services, such as improved water quality and enhanced wildlife habitats. In Brazil, a study found that agroforestry systems increased biodiversity by providing habitats for various species, thereby promoting ecological balance. This diversification can lead to increased resilience against pests and diseases, further enhancing agricultural productivity.

Organic Farming

The demand for organic products has been steadily increasing, driven by consumer preferences for healthier food options. Organic farms have demonstrated comparable, if not higher, yields than conventional farms, especially in regions with diverse cropping systems. Reganold and Wachter (2016) found that organic farms achieved yields 10-20% higher than their conventional counterparts under specific conditions, particularly when utilizing polyculture systems. Furthermore, organic farming contributes to improved soil health through practices such as crop rotation and the use of cover crops. These practices enhance soil structure, increase organic matter content, and promote beneficial microbial activity.

Integrated Pest Management

IPM strategies have proven effective in reducing pesticide use while maintaining effective pest control. A case study in California revealed that farms employing IPM reduced pesticide applications by 40% while maintaining crop yields (Kogan, 1998). This approach not only lowers production costs but also mitigates negative environmental impacts, such as pesticide runoff and harm to non-target species.

Economic and Policy Implications

The adoption of sustainable practices is influenced by economic factors and policy support. According to Pretty et al. (2018), farmers face economic constraints when transitioning to sustainable practices due to initial investment costs and the perceived risks associated with adopting new methods. Supportive policies, such as subsidies for sustainable inputs and training programs, can facilitate this transition and encourage wider adoption. For instance, in the European Union, the Common Agricultural Policy (CAP) provides financial incentives for farmers adopting environmentally friendly practices. This policy framework has led to increased adoption of sustainable practices among EU farmers, demonstrating the importance of governmental support in promoting sustainability.

**Amutha et al.,****Challenges to Implementation**

Despite the numerous benefits of sustainable land use practices, several challenges hinder their widespread adoption

Economic Barriers

Initial costs associated with transitioning to sustainable practices can be prohibitive, particularly for smallholder farmers who operate on tight margins. Investment in new technologies and methods may deter farmers from adopting sustainable practices.

Knowledge Gaps

There is often a lack of awareness and understanding of sustainable practices among farmers. Access to training and education is critical for empowering farmers to implement these methods effectively. Extension services play a vital role in disseminating knowledge and providing support.

Policy Frameworks

Insufficient or poorly designed agricultural policies can create barriers to the adoption of sustainable practices. Policies must be aligned with sustainable development goals to incentivize farmers to adopt environmentally friendly methods. Collaborative efforts among stakeholders are essential for effective policy formulation.

Market Access

Farmers may struggle to access markets for sustainably produced goods, limiting their economic viability. Building supply chains and market structures that support sustainable products is essential to ensure.

CONCLUSION

Sustainable land use practices in agriculture are essential for addressing the challenges posed by climate change, food insecurity, and environmental degradation. This research highlights the effectiveness of practices such as agroecology, conservation agriculture, agroforestry, organic farming, and integrated pest management in enhancing agricultural productivity while promoting environmental sustainability. The findings suggest that sustainable practices can lead to improved soil health, increased biodiversity, and reduced reliance on chemical inputs, contributing to more resilient agricultural systems. However, the transition to sustainable agriculture faces challenges, including economic barriers, knowledge gaps, and insufficient policy support. To promote sustainable land use, it is crucial to invest in education and training for farmers, support research and development, and implement policies that incentivize sustainable practices. Collaboration among stakeholders—farmers, researchers, policymakers, and consumers—is vital for creating a sustainable agricultural future that benefits both people and the planet. In summary, the transition toward sustainable agriculture is not merely an option but a necessity in the face of pressing global challenges. Continued research and commitment to sustainable practices will be crucial for securing food systems that are resilient, productive, and capable of nourishing future generations.

ABSTRACT

Throughout centuries of English literature, Aesop’s timeless fable “The Fox and the Grapes” has endured as both a moral narrative and a cultural mirror, shifting in style and emphasis to fit evolving linguistic norms and social priorities. This paper offers a fresh exploration of how four landmark English translations—from William Caxton’s 15th-century version (1484), through Samuel Croxall’s 18th-century adaptation (1722), Thomas James’s 19th-century retelling (1848), and V.S. Vernon Jones’s early 20th-century rendition (1912)—reveal the interplay of linguistic change, educational values, and broader sociocultural contexts. While each adaptation adheres to the core moral—teaching readers that bitterness toward unattainable desires may reflect self-deception—every translator exercises distinct narrative strategies, lexical preferences, and stylistic nuances shaped by their eras. This discussion emphasizes the dynamic nature of translation, illustrating how each text’s language, structure, and audience address the moral expectations, literacy levels, and philosophical temperaments unique to Tudor, Enlightenment, Victorian, and early modern periods. By exploring the evolving concept of “grapes” as an allegory for unattainable goals, this comparative analysis underscores how translation is never merely about transferring meaning but about reimagining stories, forging new interpretive layers that engage readers across shifting social landscapes while preserving the fable’s moral resonance.

Keywords: Aesop’s Fables, Translation Studies, Linguistic Evolution, Cultural Adaptation, Moral Interpretation.

INTRODUCTION

Aesop’s fable “The Fox and the Grapes” endures as one of the simplest yet most powerful allegories in Western storytelling. Its core lesson—that individuals often dismiss what they cannot obtain—resonates across times and cultures, illuminating a distinctly human tendency to rationalize failure. The translation history of this short narrative into English exposes how the moral’s adaptability stems not only from its intrinsic universality but from the skill and intentions of its translators, who reshape and contextualize the moral for their contemporary audiences. From William Caxton’s 15th-century printing house to V.S. Vernon Jones’s early 20th-century adaptation, each rendition signifies a moment in English literary and social history. For instance, Caxton’s direct and moralistic approach reveals a late medieval culture oriented toward moral edification and limited literacy. By contrast, Samuel Croxall’s 18th-century adaptation belongs to an era of Enlightenment rationalism, focusing on a rhetorical style suitable for an increasingly literate readership. Thomas James’s 19th-century retelling, deeply coloured by Victorian ideals about childhood education, invests the fable with a nuanced approach aimed at instructing children. Finally, Vernon Jones’s 1912 version shows a sophisticated, introspective style befitting the modern age, reflecting both broader educational reforms and a society well accustomed to written culture. When we scrutinize each adaptation through a socio-linguistic lens, we observe how specific vocabulary, syntax, idioms, and rhetorical devices shift in response to changing literacy levels, printing technologies, and moral philosophies. Caxton’s somewhat archaic spellings and direct, moral-laden discourse differ markedly from Croxall’s more elaborate, rhythmic sentences that reflect 18th-century prose style. Meanwhile, James’s mid-Victorian approach reveals a keen interest in accessibility, a simpler but expressive register consistent with that era’s views on children’s moral education. Vernon Jones, writing in the early 20th century, embraced a style that balanced narrative brevity with psychological insight, mirroring the modern world’s preference for succinct, reflective stories.

Culturally and sociologically, these translations register as signposts for shifting English attitudes. The Caxton-era moral tradition favoured a didactic method—people read or listened to moral allegories as part of a collective understanding of virtue and vice. Croxall’s introduction of subtle rhetorical flourish in 1722 parallels Enlightenment Britain’s rising respect for reason and individual moral reflection. Meanwhile, James’s 1848 version underscores Victorian paternalism and the impetus to shape children’s behaviour. Vernon Jones’s 1912 text, with Arthur Rackham’s iconic illustrations, resonates with an age enthralled by psychological realism and formal schooling. This paper proposes that each adaptation reveals more than a translator’s personal style; it exposes a cultural matrix of literacy, morals, publishing technology, and audience expectations. By exploring how each translator rendered the fox’s frustration and subsequent self-deception, we reveal the era’s conceptions of human psychology: from direct condemnation of unwise desire to nuanced introspection about coping mechanisms. Indeed, if “The Fox and the Grapes” stands as a yardstick, then the evolving rhetorical devices, editorial choices, and moral emphases measure how English society across four centuries shaped the education of children and adults alike. The following sections present each translator in chronological order, highlighting the socio-linguistic underpinnings of their work. Caxton’s medieval moralizing approach stands in marked contrast to Croxall’s Enlightenment style, which itself differs from James’s child-centred vantage, and so on. By situating these differences within the contexts of literacy rates, religious influences, printing technologies, and pedagogical ideals, we seek to map the fable’s metamorphoses as reflective of broader English literary transformations. Concluding remarks integrate these comparative observations, illustrating how a single short text can illuminate centuries of cultural flux and translation practice.

Punitha Andrews et al.,

William Caxton (1484)

A Late Medieval Inheritance

Historical Backdrop: Printing, Patronage, and the Medieval Moral Framework

William Caxton's 1484 translation of Aesop's fables occurred at the dawn of English printing. Caxton, credited with bringing the printing press to England, operated at a time when reading and writing still remained privileges for the clergy, court, and certain educated townfolk. While the Renaissance might have been stirring on the European continent, late medieval England was only beginning to experience a shift from scribal culture to printing shops. Most laypeople gained moral and spiritual guidance from sermons or oral storytelling traditions, making Caxton's printed books accessible primarily to aristocrats, wealthy merchants, or literate clergy (Blackham, 1985). Paper, though increasingly imported, remained expensive; many manuscripts were written on vellum, a practice that Caxton's printing press would gradually supplant. Yet Caxton's product—mass-produced printed works—still addressed a small audience in proportion to the population, as literacy rates hovered around 20% for men, and lower for women (Temple and Temple, 1998). In such an environment, Caxton's explicit moral stance in "The Fox and the Grapes" aligned well with the medieval principle that literature was primarily a vehicle for moral and religious edification. The directness of Caxton's English, replete with archaic or inconsistent spellings, thus responded to a culture that prized moral exempla over rhetorical sophistication.

Caxton's Linguistic Style: Direct Morality and Middle English Conventions

Caxton's text for "The Fox and the Grapes" is known for its brevity and directness, as seen in lines often paraphrased as "He is not wyse / that desyreth to haue a thyng whiche he may not haue / As reciteth this fable Of a foxe..." (Aesop, 1484) This excerpt exemplifies Middle English spelling variations—wyse for "wise," haue for "have"—and the frequent use of slashes (/) that Caxton employed to approximate punctuation. Caxton's English was transitional, bridging older medieval forms and emergent Early Modern English patterns (Crystal, 2005). This style suggests that while Caxton recognized the need for a more consistent English orthography, his main priority was clarity over standardization. The moral thrust is equally direct, culminating in the statement that the fox, unable to reach the grapes, declares them sour and thus "fayneth not to desyre that thyng whiche he may not haue." In the context of printing technology, Caxton often printed texts without extensive editorial or orthographic unification, given the limited experience with mass-produced English volumes. Instead, he reproduced or lightly standardized manuscripts, imposing some measure of grammar and spelling. That "straight-to-the-point" approach suits the fable's moral kernel: "Desire not what you cannot obtain." The audience presumably read or heard it with an expectation that allegorical stories exist precisely to illustrate moral truths (Blackham, 1985).

The Socio-Linguistic Implications

Adaptation for Adult Instruction Unlike modern retellings oriented toward children, Caxton's edition was for a literate adult circle. The fable's moral lesson is spelled out, ensuring that there is no ambiguity in how "The Fox and the Grapes" should be interpreted. Because printing was a novelty, texts were often used for moral instruction and personal reflection rather than casual entertainment. This directness parallels a broader medieval moral tradition, also evident in religious plays and moral treatises that guided daily conduct (Temple and Temple, 1998).

Language Variation Because Middle English was in flux, Caxton's spelling choices varied from text to text, influenced by the dialects and scribal conventions of his source materials. This variation signals a medieval reading public unaccustomed to the uniform orthography that would crystallize in the 16th and 17th centuries, culminating in Shakespeare's era. Caxton, as an early printer, navigated these fluid norms, forging a path for the standardization that followed.

Cultural Emphasis on Submission to Fate The moral that "one is not wise to desire the unattainable" resonates with medieval Christian theology that often emphasized recognizing one's station and fate. In a society shaped by rigid social hierarchies and devout religious frameworks, humility and acceptance of divine will were virtues. The fox's resigned justification, stating the grapes must be sour, underscores the medieval cultural acceptance of one's lot in life (Blackham, 1985).

Punitha Andrews et al.,

Comparing Caxton to Latin and Greek Antecedents

Earlier forms of “The Fox and the Grapes,” such as the Greek version attributed to Aesop or the Latin adaptation by Phaedrus, did not necessarily provide an explicit moral lesson appended to the story. Instead, the moral was implied. By the time Caxton translated these fables, medieval tradition favored a more overt statement of moral truths. Caxton inserted a concluding statement that “This fable sheweth that he is wyse whiche fayneth not to desyre...” giving readers a direct moral directive. This difference reveals the medieval impetus to ensure moral clarity in narratives distributed to a largely devout audience—some might even have approached these fables in ways similar to how they approached religious allegories (Temple and Temple, 1998). Additionally, Caxton’s mention of “raysyns” or “grapes” underscores the transitional nature of English lexical choice. Where earlier Latin versions used *uvae* (grapes), Caxton seemed comfortable with variations that aligned with local or older culinary vocabularies. Such lexical fluidity emerges from the overlap of Middle English and Norman French influences, a hallmark of the era’s language shift (Crystal, 2005).

Reception and Legacy

Contemporary accounts suggest that Caxton’s printed volumes, including his version of Aesop, found favor primarily at court and among wealthy burghers eager to showcase their modern tastes by owning printed books. The moral straightforwardness of “The Fox and the Grapes” probably fit well with the medieval acceptance of hierarchical stations and the hazards of overreaching. Over the subsequent centuries, Caxton’s edition became overshadowed by other translations, but it remains historically vital as one of the earliest English print renditions of Aesop’s Fables (Blackham, 1985). Hence, Caxton’s approach to “The Fox and the Grapes” stands as a transitional text. Neither purely medieval nor fully modern, it testifies to an era grappling with emergent printing technologies, fluctuating orthographies, and the abiding medieval emphasis on moral instruction. Through direct language and insistent moral commentary, Caxton shaped how the fable was received, forging a precedent for subsequent translators to either expand upon or refine. Such direct moral clarity—unapologetically spelled out—would eventually yield to the more elaborate rhetorical flourishes and sophisticated storytelling found in the eighteenth and nineteenth centuries, reflecting the fluid interplay between textual form, moral instruction, and shifting cultural contexts.

Samuel Croxall (1722): The Enlightenment’s Rhetorical Flourish Historical and Cultural Background

By 1722, when Reverend Samuel Croxall published *Fables of Aesop and Others*, England had undergone seismic cultural transformations. The English Civil War, the Restoration, and the early Georgian era had reshaped social structures, fostering an increasingly literate and inquisitive public. The early Enlightenment spirit—characterized by an emphasis on reason, moral philosophy, and rhetorical skill—infused literature and education (Temple and Temple, 1998). Printing had expanded as a commercial enterprise, with newspapers, periodicals, and pamphlets reaching middle-class and even working-class readers. Though literacy varied by region and gender, overall rates had improved significantly since Caxton’s time, fuelling greater demand for diverse reading materials (Blackham, 1985). In this environment, Aesop’s fables served both moral and intellectual curiosity. Educators and preachers like Croxall saw potential in reissuing these short narratives with new commentary that aligned with Enlightenment ideals. They recognized that the fable format—succinct, accessible, and moral—could be a prime vehicle for instilling rational virtues and reflective thinking. Consequently, Croxall’s approach combined narrative appeal with explicit moral exegesis, tailored to an era that prized rhetorical polish and broad rational reflection (Crystal, 2005).

Linguistic Hallmarks of Croxall’s Adaptation

In Croxall’s version of “The Fox and the Grapes,” the text reads in a more elegant, 18th-century register. A typical excerpt, paraphrased, might say “A Fox, very hungry, chanced upon a vineyard, where branches of ripe Grapes hung on high trellises, their clusters shining in the sun’s rays. Leaping and straining time and again, the Fox found them ever beyond his reach. At last, he retreated, exclaiming, ‘Let who will eat them, for they are no doubt sour and unfit for tasting!’” (Aesop, 1722). This excerpt exhibits a polished style: “branches of ripe Grapes,” “time and again,” “exclaiming.” Such vocabulary signals a cultured and somewhat ornate approach, typical of the 18th-century

Punitha Andrews et al.,

Enlightenment preference for rhetorical elegance. Syntax is more developed, with dependent clauses and descriptive phrases shaping the narrative's rhythm. The moral does not appear as a blunt afterthought but rather emerges from the story's irony and the Fox's exclamation.

Socio-Linguistic and Pedagogical Dimensions

Croxall's primary audience included an educated public, both children and adults, seeking moral instruction combined with literary grace. The success of his fable collection hinged on the Enlightenment ideal that "literature instructs through delight." Croxall merges moral lessons with pleasing style, trusting that readers capable of rational thinking would glean the self-deception inherent in the Fox's declaration (Temple and Temple, 1998). The exclamation that the grapes are "no doubt sour" invites readers to reflect on a universal human tendency—dismissing what is unattainable—a message resonant with Enlightenment emphasis on rational self-awareness. In focusing on a broad audience, Croxall layers the narrative with enough detail to captivate while ensuring the moral is unmistakable. The phrase "Let who will eat them" suggests a rhetorical flourish that was arguably absent in Caxton's direct moral statements. This style is more theatrical, inviting the reader to judge the Fox's haughty retreat. Additionally, the Fox's articulate expression suits an era enamored of polished discourse, bridging fable tradition with contemporary rhetorical standards (Blackham, 1985).

Reflecting Enlightenment Values

Individual Agency and Reason The 18th-century climate championed rational inquiry. By presenting the Fox's "sour grapes" reaction as a lapse in reason—an ego-driven rationalization—Croxall aligns with Enlightenment views on self-critical reflection. Educated readers were encouraged to see the fable's psychological dimension, not just the moral lesson that humility befits unattainable desires. The Fox's justification stands out as an irrational coping mechanism, undercut by the more rational vantage of the reader (Crystal, 2005).

Moral and Political Overtones While primarily moral, Croxall's retelling might be read politically. 18th-century Britain saw robust debates about personal liberties, social hierarchies, and the illusions of power. The Fox's dismissive stance toward grapes can be seen metaphorically as a commentary on political actors who denigrate what they cannot control. Though the text does not explicitly mention politics, Enlightenment readers might interpret deeper allegories relevant to their own era (Temple and Temple, 1998).

Narrative as Educational Tool Croxall often appended moral "Applications" to each fable, illustrating how the narrative served as a springboard for broader moral or philosophical reflection. "The Fox and the Grapes" might be followed by a short discourse reminding readers to examine their own resentments, or not to scorn objects out of reach. The rhetorical skill of this approach, weaving moral discourse with narrative, marks the difference from Caxton's stark didactic style. Croxall's fable collection thus exemplifies Enlightenment pedagogy: teach moral truths in appealing, discursive ways that provoke rational introspection (Blackham, 1985).

Comparison with Contemporary Adaptations

Croxall was not alone in producing Aesopian translations during the 18th century; however, his stands out for its succinct flair and integration of moral commentary. Other contemporary compilers might indulge in lengthier expansions or more elaborate allegories. Croxall's moderate approach—balancing narrative detail with pithy moral interpretation—allowed his Fables to maintain popularity well into the 19th century. By focusing on the Fox's psychological shift from desire to contempt, the narrative highlights a consistent human foible: the refusal to admit failure. This resonates with the quasi-psychological lens used by Enlightenment thinkers to explore illusions of self-justification (Temple and Temple, 1998).

Lingering Influence

Subsequent Victorian-era adaptors like Thomas James capitalized on the accessible foundation Croxall had laid. The 19th-century market for children's literature inherited Croxall's rhetorical clarity, though they often simplified or rephrased it to align with Victorian child-rearing philosophies. Croxall's text, with its rhetorical flourish, had

Punitha Andrews et al.,

ironically paved the way for more direct, child-friendly retellings that followed. His approach stands as a transitional form, bridging medieval moral didactics and modern narrative sophistication (Crystal, 2005). In summation, Croxall's 18th-century "The Fox and the Grapes" exemplifies the synergy between Enlightenment rationalism and the fable tradition. He refined the narrative to suit a more literate, philosophically inclined audience while preserving the moral essence—that dismissing unattainable objects as "sour" betrays human rationalization. The text's well-wrought diction, descriptive flair, and psychological insight signal an era enthralled by reason and moral self-awareness, rendering Aesop's ancient wisdom newly resonant for a society forging fresh intellectual frontiers.

Thomas James (1848): A Victorian Moral Lens

The Victorian Context: Literacy and Children's Moral Education

By the mid-19th century, England had experienced the Industrial Revolution, increased urbanization, and a significant expansion in elementary schooling. The Victorian era (1837–1901) was marked by a burgeoning market for children's literature, reflecting a conviction that moral guidance and literacy should be inculcated from a young age. Publishers thus identified Aesop's fables, with their concise moral lessons, as prime materials for shaping the "minds and manners" of youth (Temple and Temple, 1998). Thomas James, publishing his *Aesop's Fables: A New Version, Chiefly from Original Sources* in 1848, exemplified the Victorian impetus to adapt older moral stories for a juvenile readership. Though earlier English versions existed—like Caxton's or Croxall's—James's approach specifically addressed children, employing simplified but vivid language and structured moral guidance. This orientation corresponded to a Victorian society that prized moral discipline, sincerity, and rational conduct, with children's books playing a frontline role in imparting these virtues (Blackham, 1985).

The Language and Narrative Style

James's adaptation of "The Fox and the Grapes" often runs along lines of:

"A fox, just at the season of the vintage, stole into a vineyard, where the grapes hung in tempting clusters. He made several attempts to reach them, but to no purpose. 'They're likely sour, after all,' said he, and walked away, consoling himself for his failure." This version underscores the fox's frustration succinctly, using the phrase "in tempting clusters" to emphasize the allure. By removing extraneous detail and focusing on the fox's subjective experience, James fosters empathy in child readers (Temple and Temple, 1998). The word "tempting" positions the grapes as not merely fruit but moral enticement, aligning with Victorian moral rhetoric, which often cast daily experiences as moral tests. Further, James's style was more conversational and less overtly rhetorical than Croxall's, bridging the gap between Enlightenment rational discourse and a child-oriented approach. Short sentences, direct references to the fox's attempts, and minimal archaic language all aim to keep children engaged without confusion (Crystal, 2005).

Cultural Motivations: Child Readers and Moral Lessons

In mid-19th-century England, the notion of childhood was undergoing redefinition. Influenced by Romantic ideals that children possessed innate innocence, the Victorian middle class sought morally instructive and entertaining books for them. James's anthology responded by rendering fables that combined mild adventure, anthropomorphized animals, and an unmistakable moral payoff. The focus was not solely on narrative thrill but on imparting a lesson about humility, resilience, or rationalization—values dear to a society that stressed uprightness, industriousness, and moral restraint (Blackham, 1985). Within "The Fox and the Grapes," the moral dimension centres on a universal psychological tendency: people may denigrate what they cannot achieve. In James's text, this moral emerges clearly but unobtrusively, letting children deduce that the fox's dismissive remarks reflect sour grapes or an excuse for personal failure. By toning down rhetorical flourishes and archaic expressions, James ensures child readers can see themselves in the fox's predicament—an emotional connection the Victorian moral framework prized. Encouraging empathy and reflection, the text quietly instructs children to confront their disappointments sincerely rather than denying them (Temple and Temple, 1998).

James's Approach to Storytelling and Illustration

James's collection often included modest illustrations, though less ornate than those in some later 19th-century children's books. Even so, the synergy between text and image signalled a progression from earlier, more text-centric

Punitha Andrews et al.,

fable editions. Victorian publishing recognized that children responded to visual cues. The fox's fruitless leaps might be depicted with comedic flair, highlighting the physical comedy of the scenario. Such visuals reinforced the moral in an immediate, child-friendly fashion. Simultaneously, the use of simpler words like "stole into a vineyard" resonates with the era's growing literacy rates. By 1850, a significant portion of English children had some schooling (Crystal, 2005). James's language was carefully pitched to challenge but not alienate young readers. Compare this with Caxton's heavier spelling variants or Croxall's rhetorical density: James effectively offered a pragmatic style for a transitional generation more literate than preceding ones, yet less academically schooled in classical rhetoric (Blackham, 1985).

Subtext and Psychological Nuance

While James's text might seem straightforward, it subtly invites children to see how self-justification emerges under frustration. The fox's exclamation that the grapes must be sour stands as a mild comedic twist, but psychologically, it echoes adult coping mechanisms. The child's vantage is taught to identify with the fox's desire, then see how that desire, unfulfilled, leads to a pretend indifference—a psychologically acute moral. In a Victorian environment that prized sincerity, the moral ironically underscores how insincerity can creep into everyday life (Temple and Temple, 1998).

Continuities and Departures from Croxall

In comparing James to Croxall, the moral remains consistent: failing to obtain what one desires leads to rationalization. However, James's style is typically leaner. Where Croxall might expand with descriptive phrases or comedic asides, James exercises brevity. This difference stems partly from targeting children specifically: the fable is short enough to keep their attention, yet robust enough to convey essential moral content. James also omits elaborate rhetorical flourishes or references to classical sources, focusing on immediate emotional resonance (Blackham, 1985). Culturally, the 18th-century Enlightenment impetus for rational reflection gave way to Victorian moral stewardship aimed at children's character formation. Croxall's approach to an adult-literate audience who expected rational discourse differs from James's approach to younger readers in a family environment, where books were read aloud or studied in Sunday schools. The bridging of narrative interest and moral instruction emerges as a hallmark of Victorian children's literature.

Legacy and Influence

The success of James's adaptation contributed to a wave of 19th-century children's anthologies that included Aesop. By weaving in scenic touches like "the grapes hung in tempting clusters," James gave enough color to hold children's imaginations without overshadowing the moral. Many subsequent reprints borrowed James's version or its style, underscoring how effectively it was pitched to the expanding children's market (Temple and Temple, 1998). As literacy soared during the second half of the 19th century, James's style shaped how families and schools encountered Aesop's fables. He effectively replaced older, more archaic retellings with a standard format in which the moral was implied through a straightforward story, letting children glean the lesson by empathizing with the fox. This approach found echoes in school primers and moral guides well into the early 20th century. One might argue that James's focus on children partially narrowed the adult audience that had engaged with Croxall's rhetorical complexities. Yet the impetus behind James's approach was culturally powerful: Victorian society placed a premium on shaping children's moral compasses, believing that early reading experiences would mold them into virtuous and industrious adults (Blackham, 1985). "The Fox and the Grapes," with its easy allegory, was an ideal text to convey the pitfalls of self-deception and the virtue of honest acceptance.

Summation

Thomas James's 1848 rendition of "The Fox and the Grapes" stands as a testament to the Victorian era's investment in children's moral and literary formation. By blending direct language with a mild touch of descriptive colour, James crafted a fable that quickly delivered a moral point to younger readers. He updated earlier translations—like Caxton's or Croxall's—by focusing on emotional immediacy and a simpler syntax. This balanced approach dovetailed with mid-19th-century educational trends and the flourishing children's book market. Consequently,

Punitha Andrews et al.,

James's version displays how evolving notions of childhood, pedagogical practice, and moral philosophy shaped the English literary tradition of Aesop's fables, bridging the Enlightenment's rhetorical style and the nascent modern era's focus on child-focused literature.

V.S. Vernon Jones (1912): Early Modern Nuance

Historical Milieu: Modern Literacy and Psychological Depth

When V.S. Vernon Jones published his *Aesop's Fables* in 1912—with illustrations by Arthur Rackham—England stood on the cusp of broader social and educational reforms. Compulsory schooling had been in force for some decades, pushing literacy rates higher than ever (Crystal, 2005). This shift fostered an environment where reprints of classic fables could address more sophisticated narrative and stylistic goals. The modern period, shaped by psychological introspection, demanded a textual approach that mirrored the complexities of the human mind. Even though the content might be “for all ages,” the style appealed to a more literate audience used to reading short stories, novels, and newspapers daily (Temple and Temple, 1998).

Stylistic Innovations and Language

Vernon Jones's “The Fox and the Grapes” typically runs in a concise form akin to “A hungry fox spotted some splendid clusters of grapes hanging from a vine trained along a high trellis. His leaps and bounds were in vain, as they remained just out of reach. Finally, he walked away with an air of feigned unconcern, remarking, ‘I believed them ripe, but I see they are still sour.’” This excerpt reveals a modern simplicity: short, crisp sentences devoid of archaic flourishes or heavily moralistic asides. Phrases like “splendid clusters” engage the reader with an understated but vivid image. The brevity underscores a 20th-century style that cherishes economy of language. Meanwhile, the fox's remark that he “believed them ripe” but now sees them “still sour” imparts an introspective perspective on self-delusion—framed less as condemnation, more as quiet observation (Blackham, 1985). Such wording suggests a shift from the overt moralizing that dominated earlier centuries to a more psychologically oriented tone. The fox's rationalization remains the crux, but Vernon Jones refrains from direct “lesson giving,” relying on the implied irony to convey the moral. The narrative form suits an audience presumed to read with greater critical thinking skills, gleaning subtext without explicit directive (Temple and Temple, 1998).

The Influence of Illustration and Aesthetic Presentation

Vernon Jones's edition famously featured Arthur Rackham's illustrations, a hallmark of early 20th-century book art. Rackham's stylized, often whimsical drawings gave each fable a distinctive mood, merging the tradition of children's illustration with adult artistic tastes. The fox's pose beneath the trellis, capturing the moment of frustrated realization, invests the scene with both comedic and melancholic overtones (Treadwell, 2012). This synergy of text and image shaped the reading experience, underscoring the narrative's psychological dimension. The fox's dignity-laden exit “with an air of feigned unconcern” becomes visually striking, encapsulating the fable's tension between outward composure and inward disappointment. Such aesthetic choices reflect the modern era's blending of child and adult audiences in one volume. Freed from the purely pedagogical impetus of the Victorian era, the 1912 edition addresses a literate and possibly nostalgic readership—adults who recall the fables from childhood but now appreciate subtler themes. Meanwhile, children encountering Aesop for the first time find an enchanting visual gateway to moral reflection (Blackham, 1985).

Linguistic and Thematic Subtleties

Where older translations named the grapes “sour” in the context of a direct moral (Caxton) or rhetorical flourish (Croxall), Vernon Jones locates the moral impetus in the fox's calm, if duplicitous, self-consolation: “I believed them ripe, but I see they are still sour.” That line implies the fox's prior assumption of success and current rationalization—quietly mocking self-deceit without delivering a moral lecture. This understated approach resonates with 20th-century narrative forms that trust the reader's discernment (Temple and Temple, 1998). Indeed, the shift from a large-scale, didactic moral to a subtle reference underscores the modern preference for psychological realism.

Moreover, the choice to use “still sour” rather than “sour after all” or “likely sour” broadens interpretive scope. It suggests a process: the grapes might eventually become ripe, but not in time for the fox's appetite. As a result, the

Punitha Andrews et al.,

fox's frustration becomes a commentary on timing as well as unattainable desire. Such a reading is consistent with the era's interest in exploring hidden motivations and personal rationalizations—a hallmark of early 20th-century psychology (Crystal, 2005).

Cultural Forces Shaping Vernon Jones's Adaptation

Three broad cultural changes undergird Vernon Jones's approach:

Literacy as a Given By 1912, basic reading ability was widespread among children and adults alike, allowing fable collections to adopt more nuanced language without risking incomprehension. Authors could experiment with brevity and subtlety, trusting the audience to capture the moral essence.

Emergent Psychological Awareness The late 19th and early 20th centuries witnessed the growth of psychology as a discipline (Temple and Temple, 1998). Literature began reflecting interest in introspection, personal motive, and the unconscious. Consequently, the fox's rationalization, once spelled out as moral condemnation, now reads more like a mild comedic portrait of human self-deception.

Artistic Book Production Finely illustrated volumes that combined adult artistic tastes with accessible text soared in popularity. The synergy between text and Arthur Rackham's artwork demonstrates how creative collaborations shaped the final product, giving "The Fox and the Grapes" a new dimension. This approach catered to families that read illustrated books together, bridging age groups.

Compared to Earlier Versions

Contrasted with Caxton's unembellished, direct style, or Croxall's Enlightenment rhetorical approach, Vernon Jones's retelling is succinct and psychologically pointed. Where James aimed at children's comprehension through direct moral usage, Vernon Jones entertains a broader demographic, including adolescents, scholars, and nostalgic adults. The entire moral is distilled into the fox's single ironically laced statement. No explicit moral commentary follows, signifying a departure from the older tradition of appended "moral lessons." The modern audience is presumed to possess the interpretive skill to grasp the fable's meaning without authorial signposts. Moreover, the shift in tone from condemnation (in earlier versions, the fox is almost ridiculed for foolishly "desiring that which he cannot have") to mild pity or ironic observation suits a society increasingly comfortable with the idea that "we all rationalize." This difference might reflect early 20th-century acceptance of human psychological complexity beyond the simplistic binaries of "wise vs. unwise." The fox emerges less as a cautionary symbol and more as a relatable comedic figure, capturing a universal facet of human failing.

Conclusion on Vernon Jones's Significance

V.S. Vernon Jones's early 20th-century adaptation crowns centuries of English translations, revealing how centuries of social, educational, and linguistic evolution converged in a concise, visually enriched text. Through refined language, a hint of introspection, and reliance on the reader's interpretive capacity, Jones affirms the abiding power of Aesop's fable while aligning it with modern tastes and a psychologically aware readership. The measured brevity of the narrative is balanced by Arthur Rackham's haunting imagery, encapsulating a sense of whimsy and quiet reflection on self-delusion. Thus, "The Fox and the Grapes," in its 1912 incarnation, exemplifies the synergy of historical translation tradition and the cultural demands of a literate, introspective modern society—concluding a chain of transformations initiated by Caxton's late medieval moral imperatives, refined by Croxall's rhetorical skill, and further shaped by James's child-oriented approach.

Comparative Insights and Thematic Conclusions

Linguistic Shifts: From Middle English to Modern Brevity

One of the core observations gleaned from examining Caxton, Croxall, James, and Vernon Jones is the steady progression of the English language—from the archaic, phonetic, and morally explicit style in 1484 to the streamlined, psychologically aware manner in 1912. Caxton demonstrates Middle English features like "wyse" and the repeated insertion of direct moral lessons; Croxall exemplifies 18th-century rhetorical complexity, with measured

Punitha Andrews et al.,

syntax and a leaning toward Enlightenment rational reflection. James moves the fable toward mid-19th-century Victorian directness, pitched especially for children’s moral instruction. Vernon Jones condenses the moral into a subtle, psychological finale, trusting a 20th-century literate audience to parse the fox’s mental acrobatics. These four translations thus chart how English orthography and syntax evolved alongside printing technologies, audience sizes, and dominant literary tastes. Simpler spelling norms, standard punctuation, and the emergence of a more flexible narrative style allow latter-day versions to convey the same moral with fewer words and more nuances. The rhetorical expansions or contractions illustrate how deeply intertwined language standardization is with cultural and educational contexts (Crystal, 2005).

Socio-Linguistic Patterns: Audience and Educational Shifts

Each translator’s approach reflects assumptions about **who** is reading and **why**:

- **Caxton’s adult and aristocratic audience** expected moral clarity, bridging medieval sermon culture and newly printed texts.
- **Croxall’s increasingly literate adult and youth readers** were part of an Enlightenment milieu that encouraged reflection, rhetorical elegance, and alignment with a rational worldview.
- **James’s vantage** recognized children as a focal demographic in Victorian society, weaving moral lessons into accessible, direct language.
- **Vernon Jones’s broad-literate, psychologically aware audience** in the early 20th century demanded brevity, interpretative freedom, and aesthetic collaboration (like Rackham’s art).

Such shifts in rhetorical strategies coincide with expansions in literacy—from perhaps 20% in Caxton’s day to near-universal literacy by 1912. They also align with transformations in education: from occasional, church-led instruction in the 15th century, to Enlightenment grammar schools, to Victorian expansions of state schooling, culminating in a modern system with standardized primary education (Blackham, 1985; Temple and Temple, 1998).

Adaptation’s Moral Emphasis: Direct vs. Implied

Direct moralization Caxton and Croxall both present explicit moral commentary, though Caxton’s is succinct and heavily didactic, while Croxall attaches the moral more fluidly to the narrative, embedding rhetorical flourish. They clearly articulate the fable’s lesson: do not covet the unattainable or do not dismiss it out of pride.

Implicit moral reflection James integrates the moral subtext seamlessly, leaning on a Victorian impetus that children can glean the lesson from the fox’s disappointed remark. Meanwhile, Vernon Jones invests the fox’s pronouncement with subtle psychological undercurrents, leaving moral inference to the reader. This transition suggests that as centuries progressed, moral narratives required less explicit statement of “right vs. wrong,” trusting an audience to interpret. By the 20th century, some approach to moral content became more introspective, reflecting a society comfortable with nuance and psychological realism (Temple and Temple, 1998).

Social Reflection: Submission, Rationalism, Childhood, and Psychological Insight

If each translation reveals a key social emphasis

- **Caxton** Emphasizes acceptance of unattainable desires, reflecting a society that prized humility within a hierarchical worldview. The Fox’s lesson is unsubtle—he is not wise who wants what he can’t have.
- **Croxall** Mirrors Enlightenment rational reflection, capturing the comedic irony of the fox’s false reasoning, and expecting a literate public to appreciate the moral’s layered discourse.
- **James** Adapts fables into engaging stories for children, consistent with Victorian moral paternalism and the notion that simple language plus moral clarity molds upright future citizens.
- **Vernon Jones** Pivots to introspective brevity, suiting an era comfortable with reading short, refined texts, and a psychological dimension that invites adult reflection and children’s wonder, especially aided by evocative illustrations.

These phases track with major historical transitions: from medieval religiosity, to Enlightenment philosophical culture, to Victorian educational fervor, and finally to an early modern acceptance of psychological nuance in

Punitha Andrews et al.,

children's and adult's reading. The comedic scenario of a fox rationalizing unattainable grapes remains universal, but how it is stated, illustrated, and concluded reveals each period's interpretive lens (Crystal, 2005; Blackham, 1985).

Poetic or Alternate Renditions

Although not deeply covered in these four core translations, the fable sometimes appears in poem form by authors like Aphra Behn or W.J. Linton, condensed into quatrains or limericks. These poetic retellings highlight how adaptable the moral is to new formats

- **Aphra Behn's quatrain** might evoke a Restoration flavor, bridging wit and moral reflection in neat verse.
- **W.J. Linton's limerick** might amuse readers with comedic brevity, still capturing the sour grapes notion.

Such variants confirm the cultural pliability of "The Fox and the Grapes" while reminding us that behind each adaptation lie the same moral skeleton and psychological truth—people often dismiss what they cannot reach. These poetic experiments underscore a centuries-long tradition of creative re-interpretation, further testament to the fable's structural malleability (Temple and Temple, 1998).

Potential Future Directions

Although the present paper focuses on four major translators who highlight different centuries and audiences, additional lines of inquiry could deepen our grasp:

- **Comparisons with Non-English Translations** Investigating French, German, or Italian eighteenth- and nineteenth-century versions might show how distinct linguistic cultures approached the same moral, possibly adopting different rhetorical patterns or comedic intensities.
- **Print Culture and Material Studies** Looking at original volumes, marginalia, and stationers' logs could reveal how readers annotated or reacted to each version. Caxton's battered volumes might reveal medieval owners' notes, while James's children's editions might show scribbles or parental commentary about moral lessons.
- **Psychological Reception** A deeper psychoanalytic reading, particularly of Vernon Jones's adaptation, might reveal how early 20th-century psychological interest influenced a text that historically had simpler moral aims.

Nevertheless, even as it stands, the four translations capture a broad cross-section of English letters' evolution, each translator lending a new voice to the fox's rhetorical retreat. That "The Fox and the Grapes" continues to adapt so seamlessly to changing times underlines both Aesop's fables' timelessness and the translator's role in bridging the text with cultural norms.

CONCLUDING REMARKS

Thus, the metamorphoses from Caxton's medieval moral directive, to Croxall's Enlightenment flourish, to James's child-friendly Victorian iteration, and ultimately Vernon Jones's modern psychological subtlety, underscore how translation is never a static replication. Rather, it is a dialogue between text and era. The moral remains stable—sour grapes—but how it is framed, who the implied audience is, and what rhetorical shape it takes, all speak to shifting socio-linguistic realities. By stepping through these transformations, we illuminate not merely the endurance of a single fable but the dynamic synergy between language, society, and moral teaching across the centuries. Far from being a relic, "The Fox and the Grapes" emerges as a living narrative, perpetually molded by translators' hands and readers' expectations, bridging medieval moral dogma, Enlightenment reason, Victorian paternalism, and early modern introspection in a single telling arc.

ABSTRACT

Crops are easily and inevitably damaged by pests, which will greatly affect the quality and quantity of the agricultural products. Our project focuses on detecting and recognizing pests like Termites, Bed bugs, Rodents, Scale insects and Winter moth quickly and accurately by examining the pest infestation with the help of an automated image processing system. The pest detection in the plant leaf is carried out using Raspberry Pi and the pest or insect count is determined using IR sensor and a vibration sensor. The IR sensor is used to sense certain characteristics of its surroundings by either emitting or detecting Infrared radiation. The vibration sensor or the Piezoelectric sensor is used for detecting the motion of pests through vibrations. It uses the piezoelectric effects while measuring the changes within acceleration, pressure, temperature, force otherwise strain by changing to an electrical charge. There are different steps involved in pest detection. The first step of any pest detection system is to obtain images which is the Image Acquisition phase. This step is carried out with the help of Pi Camera or Web camera. Then Image Processing is done on the acquired images. Detection of pests is carried out by the sensors. And then finally the output is displayed either on a PC or a mobile device so that the user can monitor if the crops are infested by pests or not and if it's infested by any type of pest, the user can identify how bad it is with the help of the insect count determined by the sensors. Our main objective is to improve the quality and quantity of the crops by early detection of the pests, reducing the cost and amount of the pesticides used in the crop and it is also easy for the farmers to use and by this they also get to gain knowledge about pest detection and control.

Keywords: Termites, Bed bugs, Rodents, Scale insects pressure, temperature, force otherwise strain by changing to an electrical charge.

INTRODUCTION

Everyone knows that India is an agricultural country and has excellent fertilized land and it is a great resource to grow various kinds of grains, vegetables, and fruits. Farmers perform laborious duties to make sure that they grow the right amount of grains to sell and earn money for their living. More than 50% of India depends upon various grains, vegetables, and other plants as their meals. Since the population of India is mostly dependent on agriculture, the performance of this sector has a considerable effect on the economy. Agriculture contributes around 17-18% to GDP. Agricultural production has a significant impact on the economy. Agriculture supports more than 50 percent of the Indian population directly. Hence the employment scenario is controlled by agricultural production in India to that extent. There are a lot of people in India who feed their families by selling various kinds of crops to other people. Agriculture has offered India food independence. Due to the immense hard work of farmers, we Indians don't have to rely on other countries to consume various kinds of vegetables and grains. There are a number of different factors that can cause agricultural productivity to increase or decrease. These factors are grouped in three basic categories known as technological (agricultural practices, managerial decision, etc.), biological (diseases, insects, pests, weeds) and environmental (climatic condition, soil fertility, topography, water quality, etc.) [1,2]. These factors account for yield differences from one region to another worldwide. The pressure to increase crop production in many countries has resulted in the expansion of land area dedicated to agriculture and the intensification of cropland management through practices such as irrigation, use of large quantities of inputs like inorganic fertilizers and synthetic chemicals for pest and weed control [3]. These practices have resulted in degradation of soil properties and water quality, acceleration of soil erosion, contamination of groundwater and decline of food quality. This has prompted sustainable intensification initiatives to increase yields on existing farmland while decreasing the environmental impact of agriculture. Even though there are multiple factors that affect agricultural productivity, pest infestation is considered to be the most common and big threat in reducing the quality and the quantity of the crops. Pest species are cause for major concern, not only due to the potential loss of revenue due to crop damage but, if left untreated, they can also cause significant damage to machinery, equipment and property as well. Pest species can include insects, birds and rodents. They are responsible for two major kinds of damage to growing crops.

The first is direct injury to plants caused by insects eating leaves and burrowing holes in stems, fruit and/or roots. The second is indirect damage, where the insects themselves do little or no harm, but transmit bacterial, viral or fungal infection to a crop. This is why effective pest control for farms and agricultural premises is essential. Earlier the pest identification was done manually. It was time consuming and it also required continuous monitoring of experts [4]. The farmers applied regular spray programs in regular intervals without considering the presence of pests or the density of pests. This process inversely affected the environment. Early detection of pests was not possible. The detection was only possible after it was affected. So in order to control the pest, usage of pesticides was increased which in turn reduced the quality of the crop produced [5]. The automated plant pest detection and recognition system using k-means clustering algorithm and correspondence filters came into place but the performance was not satisfactory and it was not that effective in identifying the pests. Hence, there is a critical need for a system such as the one proposed. The system concentrates on automatic detection and identification of pests in the early stage so that the quality and quantity of agricultural crops are not compromised, thus reducing the cost and the amount of pesticides resulting in increased agricultural production

**Thejasini A et al.,****Literature Survey****IOT-Based Pest Classification and Automatic Irrigation For Precision Agriculture Using Wireless Sensor Networks**

In this research, a new technique called IoT-based pest classification and automatic irrigation algorithm (IPCAI) is proposed using wireless sensor networks[6]. In this technique, sensors like moisture sensor, temperature sensor and camera sensors are integrated to the Arduino Microcontroller module. The data acquired by these sensors are processed using Raspberry Pi module that is connected to the cloud. The proposed IPCAI machine learning algorithm is embedded into the Raspberry Pi module that classifies the type of pest and also computes the optimal amount of water required by the crops. Based on the type of pest being detected, suitable pesticide is sprayed to the crops to improve the crop yield. This helps in the prevention of spreading of pests. It was found that the proposed algorithm classifies 40 different types of pest with very high accuracy. In addition, the proposed automatic irrigation system helps to conserve enormous quantities of water. The IoT-module connected to the Raspberry Pi helps to upload the data collected by the sensors, pest classification result, and water requirement result to the cloud. From the cloud, the data is transmitted to the farmer's mobile, using which the farmers can continuously monitor the crop land from remote locations. The proposed pest classification algorithm achieved high specificity of 95.86% with a precision rate of 96.69%.

An AIoT Based Smart Agriculture System for Pests Detection

In this research, artificial intelligence and image recognition technologies are combined with environmental sensors and the Internet of Things (IoT) for pest identification. Real-time agricultural meteorology and pest identification systems on mobile applications are evaluated based on intelligent pest identification and environmental IoT data[7,8]. The current mature AIoT technology and deep learning are combined and are applied to smart agriculture. Deep learning YOLOv3 is used for image recognition to obtain the location of *Tessaratoma papillosa* and to analyze the environmental information from weather stations through Long Short-Term Memory (LSTM) to predict the occurrence of pests. The experimental results showed that the pest identification accuracy reached 90%. Precise positioning can effectively reduce the amount of pesticides used and reduce pesticide damage to the soil. The current research provides the location of the pest and the extent of the pests so farmers can accurately use pesticide application at a precise time and place and thus reduce the agricultural workforce required for timely pest control, thus achieving the goal of smart agriculture[9]. The proposed system notifies farmers of the presence of different pests before they start multiplying in large numbers. It improves overall agricultural economic value by providing appropriate pest control methods that decrease crop losses and reduce the environmental damage caused by the excessive usage of pesticides.

Pest Detection and Extraction Using Image Processing Techniques

This research extends the implementation of different image processing techniques to detect and extract insect pests by establishing an automated detection and extraction system for estimating pest densities in paddy fields[10]. Different image processing techniques are used to detect and extract the pests in the captured image[11]. The authors used background modeling to detect the presence of insect pests in the captured image, and a median filter was used to remove the noise produced by different lighting conditions [12]. The mechanism used to extract the detected objects from the image is simple, the image was scanned both horizontally and vertically to determine each coordinate and save the object image. The proposed pest detection and extraction system was tested in the practice farm of Pampanga State Agricultural University, Magalang, Pampanga, Philippines. The specimens were collected on the sticky traps that were captured by the 4 wireless cameras installed in the paddy field. The cameras were used to observe the sticky traps which capture a still image every 1 minute. These images were used both in the development and system testing. The proposed pest detection system based on image processing techniques was tested in five consecutive days in the paddy field. The presented system is simple and yet efficient.

**Thejasini A et al.,****Automated Pest Detection with DNN on the Edge for Precision Agriculture**

This research presents an embedded system enhanced with ML functionalities, ensuring continuous detection of pest infestation inside fruit orchards[13]. The embedded solution is based on a low-power embedded sensing system along with a Neural Accelerator able to capture and process images inside common pheromone-based traps. The platform exploits ML functionalities on edge to evaluate images captured inside common pheromone traps to get early detection of dangerous parasites. Three different ML algorithms have been trained and deployed, highlighting the capabilities of the platform. Furthermore, on board inference avoids the transmission of the whole images, reducing the wireless communication bandwidth and energy costs. The best hardware configuration using different neural networks is analyzed and trained to get the best pest detection accuracy. Moreover, a designed energy harvester is combined to demonstrate the perpetual operation of the device unattended. The proposed approach guarantees an extended battery life. Results show how it is possible to automate the task of pest infestation for unlimited time without the farmer's intervention.

IOT Based Pest Recognition and Control System for Smart Farming

In this research, a pest recognition system is developed based on image processing. The image segmentation technique is used to detect the presence of pests in leaf images. The proposed system concentrates on an automatic detection system which is required to examine the pest infestation and to classify the type of pest. The pest detection in the plant leaf is carried out by using Raspberry pi. The insect count is calculated manually by using an IR sensor. It is an electronic instrument which is used to sense certain characteristics of its surroundings by either emitting or detecting infrared radiation. The growth rate of a plant is calculated by using an ultrasonic sensor which is a device that can measure the distance to an object by using sound waves. Different image processing techniques are used to detect and extract the pest in the captured image. The detected output is given to either PC or mobile devices via Email so that users can view and detect pest infestation either in PC or in mobile. With the help of this system, pests can be identified in their early stages. Thus the use of pesticides can be reduced which in turn results in the increase in the quality of the crop produced. This paper discussed various techniques to segment the disease part of the plant[14,15]. This paper discussed classification techniques to extract the features of the infected leaf and the classification of plant diseases through raspberry pi. For future developments it can be enhanced by developing this system for large acres of land.

Architecture

The overall setup of the system is given in figure 1. The sensors - vibration, IR, and the Pi camera are connected to the Raspberry Pi. The sensors sense the presence of pests and send signals to the Raspberry Pi. The Pi camera detects diseased leaves or also the presence of pests via visuals. The Raspberry Pi in turn receives the signals and determines the affected crops. A connection is established between the VNC viewer and the Raspberry Pi setup to see them working in action.

IMPLEMENTATION AND RESULTS**Overall Connection Setup**

The overall hardware setup is given in figure 2. In figure 2, the IR sensor, vibration sensor and camera are connected to Raspberry Pi.

Vibration Sensor Setup

The Vibration sensor pins- D0, GND and VCC are connected to Raspberry Pi's pin GPIO 4, GND and 5V respectively. 28 Ultrasonic Sensor Setup: The Ultrasonic sensor pins- OUT, GND, VCC are connected to Raspberry Pi's pin GPIO 21, GND and 5V respectively.

Thejasini A et al.,

Dataset Acquisition

The images were collected online from various forums. The dataset consists of three categories of images. There are images of diseased crops, healthy, unaffected crops, and images of pests like Ladybug beetle, Rice bug, Spider, Caterpillar, Lacewing. The database includes healthy crops, crops with disease and pest infected crops as shown in figure 3, 4 and 5 respectively.

Image Preprocessing

In image pre-processing, image enhancement techniques are applied to reduce noise in the images and sharpen the images for better accuracy [7], [8]. It improves the quality of the image for better detection and classification of insects.

Image Augmentation

Since fewer insect images were available, image augmentation was applied. The insect images were rescaled to the size of 227×227 pixels. Image data augmentation techniques such as rotation, flipping, and cropping operators are used to increase the training set for achieving improved accuracy and eliminating the problems of overtraining.

Pest Detection Algorithm

The insect image is loaded and resized to 227×227 . OpenCV reads the color image in the order of BGR (Blue, Green, and Red) format[14]. The mask image named 'mask' is created that contains an array of zeros with the same size as the input insect image. The foreground and background array models are created with zero-filled arrays. The coordinates of the bounding box are defined. The GrabCut algorithm is adapted by applying a mask image 'mask' to the input image for separating the foreground insect from the colored background image. The bounding box initialization mode is selected, and the algorithm runs for five iterations. The output mask image 'masked_output' is generated such that all definite background and probable background pixels are set to zero, and definite foreground and probable foreground pixels are set to one in the mask image 'mask'. The BGR channels of the input image were multiplied with the output mask image 'masked_output' to get the segmented insect image 'segment'. Another mask named 'background_image' is created similar to the size of the input image with an array consisting of zeros. Then all the pixels in the 'background_image' mask are changed to white pixels. This 'background_image' mask is added with the 'segment' to generate the 'image_segmented' image. The segmented image 'image_segmented' is processed further by converting it into HSV [Hue, Value, and Saturation] color model, and the Gaussian blur is applied to remove the Gaussian noise. The contrast of the image is enhanced by using histogram equalization. The inverted binary thresholding is adopted. The find contours function in OpenCV is applied to identify the contours in the binary image. After finding the contours, the largest counter is selected, and the remaining trivial contours are eliminated. The minimum-area bounding rectangle for the largest contour is calculated using the minAreaRect function, and its coordinates are used to draw the rotated rectangle in the input image that contains the insect. Based on the approach used the pest detection output are shown in figure 6 and 7 respectively.

Pest Count

The pest count is estimated using the vibration sensor. The signals from the sensor are used to calculate the possible number of pests present and estimate the damage they cause. Based on the estimated pest count, the system suggests a response action to be taken. The suggestion is given based on the range of the pest count. The stages and suggestions based on pest detection are shown in figures 8,9, 10 and 11 respectively.

CONCLUSION AND FUTURE WORK

This paper demonstrates a pest recognition and disease detection system, built using the Internet of Things capable of identifying a diseased plant and detecting the presence of pests before it is too late. The system works as well as expected and all of the desired objectives have been fulfilled. We believe the system designed will have a positive impact on the lives of thousands of farmers and help them feel safe about their crops. Our system will help farmers

**Thejasini A et al.,**

plan out their yields better and improve their livelihood remarkably. The system can be improved to be able to suggest pesticides for the different pests that affect the crops. Furthermore, the system can be designed to work with different sets of crops like paddy, millets, etc. In addition, the pest count can be calculated so that the severity of the damage and the necessary steps to be taken can be suggested.

ABSTRACT

This analysis examines environmental vulnerability and adaptive resilience among indigenous populations through the lens of bio-cultural diversity and socio-ecological systems theory. Employing methodologies from ethnobiology, coupled human-natural systems research, and climatology, this study explores how climatic transformations affect indigenous epistemological frameworks, territorial biocomplexity, and socioecological infrastructures. By prioritizing indigenous phenological knowledge and adaptive strategies, the analysis challenges conventional environmental paradigms while offering insights into regional ecological management and carbon sequestration potentials.

Keywords: bio-cultural diversity and socio-ecological biocomplexity, and socioecological, phenological.

INTRODUCTION

The climate crisis presents an existential and ontological challenge to indigenous socioecological systems worldwide. Indigenous communities confront systemic ecological reconfigurations manifesting through interconnected environmental transformations. These alterations affect traditional resource management, cultural practices, and community sustainability. Hydrological modifications impact keystone species and food systems, while shifting precipitation patterns and drought conditions compromise pedological integrity and agricultural viability. These disruptions extend to foraging territories and species migration corridors, affecting aquatic ecosystems integral to indigenous economic and bio-cultural systems. Such ecological perturbations represent an existential challenge to indigenous epistemological frameworks, threatening bio-cultural knowledge systems, nutritional sovereignty, and adaptive practices developed through millennia of human-ecological coevolution.

Veada Noopura

The scientific discourse surrounding indigenous communities requires nuanced analysis. While conventional frameworks may characterize these populations as inherently "vulnerable," such categorization risks reinforcing reductionist constructs and a historical narratives. Instead, indigenous communities emerge as dynamic agents of climate adaptation and mitigation, operating across multiple spatial and temporal scales. Their approaches arise from heterogeneous, contextually embedded knowledge systems that reflect the complexity of their ecological and cultural landscapes.

Climate Change Impacts on Indigenous Bio-cultural Systems

Climate change fundamentally threatens indigenous communities by disrupting place-based relationships and traditional subsistence patterns. Indigenous epistemologies and ontologies are rooted in intimate ecological relationships with flora, fauna, mycological networks, and broader ecosystem connections that form the foundation of cultural practices and collective identity. The deterioration of ancestral territories creates a dual crisis: eroding traditional practices while compromising indigenous ecological resilience. Contemporary scientific consensus indicates significant alterations in species phenology, fluvial geomorphology, cryosphere dynamics, and precipitation regimes, alongside increased frequency of extreme hydrometeorological events.

Climate change significantly impacts traditional ecological knowledge (TEK) and cultural practices among communities with deep connections to biotic and abiotic environmental factors. These communities face particular challenges due to changing climatic conditions, given their close relationship with local ecosystems. Empirical studies demonstrate how various aspects of traditional knowledge and cultural practices are directly affected by climate change. Traditional activities like agroforestry, hunting, fishing, and gathering are disrupted by changing weather patterns, including temperature anomalies, altered precipitation regimes, and increased extreme weather events. These developments pose serious threats to the preservation of biocultural heritage and identity.

Evidence demonstrates how communities are being impacted by climate change. Changes in environmental conditions affect people's ability to navigate their traditional territories and engage in customary hunting and fishing methods. Shifting precipitation patterns and more frequent drought cycles create challenges for agriculture, hydrological systems, and traditional livelihoods. Traditional knowledge systems are crucial for developing climate change adaptation strategies. This ecological knowledge, accumulated and transmitted through generations, includes comprehensive understanding of ecological succession, biodiversity, and sustainable resource management. Communities demonstrate resilience and adaptability by synthesizing traditional knowledge with contemporary research to create innovative solutions for climate change adaptation. For example, traditional agroecological methods enhance food security and agricultural resilience in the face of climatic variability.

Beyond ecological effects, the impacts of climate change on traditional knowledge and cultural practices have significant implications for environmental justice and community wellbeing. Vulnerable and frequently marginalized communities face heightened challenges due to socioeconomic and political circumstances, which compound the problems caused by climate change. The erosion of traditional knowledge and cultural practices threatens identity preservation and community resilience. Current understanding, while valuable, reveals areas requiring further investigation. Additional quantitative and qualitative research methodologies are needed to understand the specific effects of climate change on different communities, considering their unique cultural backgrounds and adaptive capacity. Moreover, greater attention should focus on understanding the social dynamics and power relations that influence how traditional knowledge is incorporated into climate change mitigation and adaptation strategies.

Application of Traditional Knowledge Systems in Climate Science

Traditional knowledge systems represent a synthesis of indigenous wisdom and ecological understanding that addresses contemporary challenges through Earth-based spatial knowledge. These systems inform climate impact comprehension, establish historical ecological baselines, provide empirical evidence, and guide culturally congruent adaptation strategies. Such knowledge systems offer three primary contributions to hydrological science: longitudinal data provision where conventional measurements are absent, identification of novel research

Veada Noopura

trajectories, and complementary integration with contemporary methodologies across multiple scales. Environmental transformations can compromise these knowledge systems through rapid ecological change, affecting their capacity to determine timing for phenological indicators, agricultural activities, and seasonal harvesting. Contemporary climate science increasingly recognizes indigenous knowledge systems' value in assessment and adaptation strategies. International research affirms their holistic environmental perspectives as crucial adaptation resources, while community-based knowledge provides granular environmental insights complementing broader scientific frameworks. Significant challenges persist in integrating indigenous perspectives into climate science frameworks, including: knowledge system cultural specificity, establishing respectful cross-cultural engagement protocols, resource accessibility constraints, and risks of knowledge misappropriation. The protection of traditional knowledge systems presents unique complexities within academic frameworks. Contemporary research protocols, rooted in conventional scientific paradigms, often inadequately address the multidimensional nature of indigenous knowledge.

Traditional Ecological Knowledge & Climate Change Adaptation Mechanisms

Indigenous populations, being among the first to experience climate change impacts, have developed sophisticated adaptation mechanisms drawing upon traditional ecological knowledge (TEK) and contemporary technological innovations. Their implemented adaptive responses to various climate-related risks encompass multiple domains. Resource management and agricultural adaptation have evolved through various sophisticated approaches. Communities have embraced diversification of their resource bases, incorporating different crop varieties, multiple field locations, and varied livelihood strategies to ensure sustainability. When faced with harvest failures due to changing precipitation patterns, they have responded by modifying species selection and varietal choices. Traditional indigenous food systems have been revitalized to enhance food security, while cultivation and storage techniques have been modified to meet contemporary challenges. Some communities have developed innovative solutions like floating garden systems to adapt to changing hydrological conditions.

Hunting and gathering practices have undergone significant modifications to remain viable in changing environments. Traditional hunting periods and methodologies have been adjusted to align with shifting wildlife phenology, while gathering routes and durations have been adapted to optimize resource collection. Communities have developed sophisticated approaches to managing novel species populations while maintaining the ecological integrity of their territories. Environmental protection and infrastructure development have become increasingly important aspects of indigenous adaptation. Communities have implemented natural barriers for coastal protection and developed advanced construction methodologies suited to their changing needs. Strategic relocation and migration patterns have emerged as necessary responses to environmental pressures, while water resource management combines traditional knowledge with innovative techniques. Indigenous agricultural practices have been effectively employed for watershed protection, demonstrating the continued relevance of traditional environmental stewardship.

Knowledge integration and community response represent the foundation of successful adaptation strategies. Communities have shown remarkable flexibility in incorporating novel materials and technologies while maintaining customary community obligations. Community-based disaster risk reduction has become an integral part of adaptation planning, while the synthesis of traditional and scientific knowledge has enhanced environmental prediction and resource management capabilities. The adaptive capacity of indigenous communities is contingent upon multiple variables, including geographical location, resource entitlements, and access to knowledge, technology, power structures, decision-making processes, education, healthcare, and nutritional resources. This capacity exhibits intracommunity heterogeneity, with particular demographic groups, such as women, often experiencing restricted access to critical adaptation resources. Despite developing significant adaptation strategies, contemporary indigenous communities increasingly find their traditional coping mechanisms insufficient to address the unprecedented intensity and frequency of current climatic variations. Institutional barriers further impede their adaptation efforts and their ability to engage with proposed climate solutions. Traditional forecasting methods have become less reliable due to increased climate variability, necessitating an integration of scientific data with

Veada Noopura

indigenous knowledge systems. Indigenous communities often employ immediate, reactive adaptation strategies due to resource and capacity constraints, while lacking access to fundamental information regarding climate mitigation interventions and available technological and financial resources. The successful enhancement of adaptive capacity requires the integration of traditional knowledge and practices with broader ecological management strategies, including disaster risk reduction, land-use planning, and environmental conservation approaches. Community-based adaptation approaches should inform broader regional and national adaptation frameworks through processes ensuring meaningful indigenous participation. A significant limitation exists in the informal nature of indigenous adaptation development, which typically occurs through community discourse and observation rather than formal planning processes, complicating documentation and dissemination efforts.

External adaptation initiatives may potentially impact indigenous communities negatively, including risks to traditional knowledge control and resource access restrictions through protected area expansion. Cases of maladaptation, such as development in risk-prone areas based on short-term considerations, highlight the importance of considering socio-ecological contexts in adaptation and mitigation planning to prevent adverse effects on indigenous communities. Assessments of indigenous adaptive capacity must account for differential resource access, marginalization patterns, and social processes that restrict access to resources, power, and decision-making mechanisms. Enhanced capacity building and financial resource allocation would significantly strengthen indigenous communities' adaptive capabilities and contribute to more effective climate change responses.

Traditional Knowledge Systems as Scientific Resources

Traditional ecological knowledge systems offer valuable contributions to climate science through several mechanisms

Phenological Indicators

Indigenous communities document subtle environmental changes through comprehensive observation of plant flowering times, animal migration patterns, and other bioindicators that provide early detection of climate impacts.

Historical Ecological Baselines

Oral histories and traditional calendars provide longitudinal data on environmental conditions predating instrumental records, establishing reference points for measuring contemporary changes.

Ecosystem Interaction Mapping

Indigenous knowledge systems document complex relationships between species and environmental factors, providing insights into ecosystem response patterns under changing conditions.

Adaptive Management Techniques

Traditional resource management approaches often incorporate strategies for ecological resilience that can inform broader adaptation efforts.

Sustainable Harvesting Methods

Indigenous harvesting practices frequently maintain ecological balance while maximizing resource utilization, offering models for sustainable resource management.

Biocultural Diversity Conservation

Traditional knowledge contributes to preserving both biological and cultural diversity, enhancing ecosystem resilience through maintenance of genetic diversity and associated management practices.

Climate Prediction Systems

Many indigenous communities have developed sophisticated systems for forecasting weather patterns and seasonal variations based on environmental observations, which can supplement meteorological data.

Veada Noopura

The integration of these knowledge systems with contemporary scientific methods creates opportunities for more comprehensive environmental monitoring and more effective adaptation strategies.

Methodological Challenges in Knowledge Integration

The integration of traditional ecological knowledge with contemporary scientific frameworks presents several methodological challenges:

Epistemological Differences

Traditional knowledge systems often incorporate spiritual and cultural dimensions that may not align with conventional scientific epistemologies, creating challenges for integration.

Quantification Limitations

Indigenous knowledge frequently employs qualitative descriptors rather than quantitative measurements, presenting challenges for integration with data-driven scientific approaches.

Temporal Scale Discrepancies

Traditional knowledge typically incorporates much longer time horizons than conventional scientific studies, creating challenges for data comparison and validation.

Contextual Specificity

Indigenous knowledge is deeply embedded in specific ecological and cultural contexts, limiting direct transferability to other settings.

Documentation Methods

Traditional knowledge transmission occurs primarily through oral traditions and practical demonstration rather than written documentation, creating challenges for scientific validation and application.

Attribution Complexities

Acknowledging indigenous contributions to scientific understanding raises questions about appropriate attribution and recognition. These challenges highlight the need for collaborative research methodologies that respect epistemological differences while facilitating meaningful knowledge exchange.

The Way Forward

Integrative Approaches

The complex interplay between traditional knowledge systems and contemporary environmental challenges presents both significant opportunities and critical concerns for indigenous communities globally. The integration of traditional ecological knowledge with modern scientific frameworks offers promising pathways for addressing climate change impacts while simultaneously raising important questions about knowledge protection and sovereignty. The fundamental tension between conventional scientific frameworks and indigenous knowledge systems underscores the need for more nuanced and culturally appropriate research methodologies. The emergence of community-led research protocols represents a crucial step toward ensuring both the preservation and ethical application of traditional knowledge. These developments demonstrate how indigenous communities can maintain control over their intellectual and cultural heritage while engaging in productive dialogue with contemporary scientific institutions.

Moving forward, the protection and application of traditional knowledge systems in addressing global environmental challenges will require continued development of appropriate research protocols, cross-cultural dialogue mechanisms, and participatory methodologies. The future of environmental management and climate adaptation strategies likely lies in the thoughtful synthesis of traditional and contemporary knowledge systems, guided by principles of sovereignty and mutual respect. This approach not only enhances collective capacity to

**Veada Noopura**

address environmental challenges but also ensures the preservation and vitality of traditional knowledge systems for future generations.

ABSTRACT

This work is an engrossing attempt to guide us to slavery and racism afflicted primitive African society and how the white community inflicted Africa in the name of slave trade and branded them as Negroes, uncivilized, savage and inhuman from the black continent. They had been made as part and parcel of newly born America from the ashes of native Red Indians like a mocking phoenix. Colson's fictional narration through the original history showcases the real darkness that really exists in the Whites' mind and how it has been white washed and presented in a wildly colourful way. The author ventures into the dark forest that exists in the American mind and captures it lively in his book-camera while the white-savagery dances. It clearly exhibits how the black people has been uprooted and transferred from the African favourite for exporting slaves, Ouidah, and caged permanently in plantations in America. The complete narration buds in Georgia plantation, especially from the womb of Ajarry, the grandmother of the protagonist Cora. Cora's quest and quench for freedom travels with her through the cities she pierces.

Research Questions

1. What makes the novel "The Underground Railroad" a Neo-slave narrative?

Veyilumuthupandian et al.,

2. What are the hardships endured by the African people as slaves in America?
3. To what degree Colson Whitehead is successful in depicting the struggles of slaves?

Methodology Adopted

We have applied Neo-slave Narration and Intersectionality as methodologies for the current study.

Formatting and Citations

MLA Handbook for Writers of Research Papers – Ninth Edition and The Chicago Manual of Style are followed for formatting and citations.

Limitations of the study

Neo-slave narration and Intersectionality have been engaged as major theories among the other ideologies like Post-colonialism, Magical Realism and Marxism.

Keywords: Uncivilized, savagery, Negros, plantation, racism, slavery, inflicted, afflicted

INTRODUCTION

The darkest chapter of human history manifests as a triangular trade between 16th and 19th century, starting in Europe with shiploads of manufactured goods like textiles, guns, metal tools, alcohol (OpenAI) and lands in eagerness to buy people as livestock in African continent. There they exchange the goods for African citizens through agreements with rulers and traders and from there they sails through the terrific Atlantic ocean with shiploads of African victims. The sea route is popularly known as The Middle Passage, transported the slaves to West Indies (Caribbean) to public auction and private sales. Where they were oiled, cleaned, and categorized by their age, health and skill to satisfy the customer needs. *The American planters purchase them like livestock by analyzing their teeth, muscles and bones, and permanently enslaves them in cotton and tobacco plants. Europe receives all the raw materials like tobacco, sugar, indigo, rice, rum and cotton from American and Caribbean plantations and completes the triangle slave trade route at Europe.* (OpenAI)

The First Generation Slaves

The author opens his narration by depicting Ajarry, the grandmother of the protagonist Cora, as a victim of the triangle. Her destiny relocates her from the free land of Africa to a ruthless plantation of Randall in America to cultivate cotton. She was sold and resold many times on her way and finally landed in Georgia to work for Randall family. The reality of the plantation shows her that she was enslaved and destined to work like a breeding dog. Men with good physic were chosen by the masters to mate with women slaves to breed more able children to work in their plantation. Ajarry took a husband three times. Her first husband was sold to a sugarcane plantation, next died of cholera and last one was wounded to die. By them she bore five children but unfortunately the first two died of fever, third by fate, fourth was beaten to death by a boss. *At least they were never sold off, an older woman told Ajarry. Which was true—back then Randall rarely sold the little ones. You knew where and how your children would die.* (Whitehead 9) The only child who crossed the age of ten is Cora's mother Mabel. Humans' animal subjugation is exacted on Africans through racism by the white people. They maintained their supremacy through belittling. Neglecting the identity of the African people as humans made them inferior and ignorant of their true potential and value as equals in the eyes of the European. Some accepted their fabricated reality, vacated their self and became selfless slaves in Caribbean Island and America. The First Generation slaves paved the way for four hundred years of slavery under the White people but some denied their surreal experience and died on the way to slavery's gate. Physically unfit gave their life to unsanitary conditions in overloaded ships and physical abuse. Mentally unfit gave their life to depression, hopelessness and suicide. The survived fit roses became the head-to-toe chained slaves and livestock of the white people. The fittest, the thorns in the roses rewrote their history and broke slavery with their thigh bones and burned racism by fueling their own blood. This novel talks about the suffering of fit roses and fittest thorns side by side. This novel is filming cruelty staged in the American plantations. The Author films the scenes of inhumanity

Veyilumuthupandian et al.,

and mercilessness happens at The Old Randall Plantation in Georgia at the hands of his sons James and Terrance. Their hands will is overpowered with bloodthirstiness and sadism. The meanest, Terrence, reduces the slave women often to object for sex and feeds and satiates his desire.

When Terrance appeared on his brothers plantation he usually appraised each slave and made a note of which men were the most able and which women the most appealing...."I like to taste my plums," Terrance said, prowling the rows of cabins to see what struck his fancy. He violated the bonds of affection, sometimes visiting slaves on their wedding night to show the husband the proper way to discharge his marital duty. He tasted his plums, and broke the skin, and left his mark. (Whitehead 36)

The Second Generation Rebels

In dehumanizing and objectifying notions of Whites' the Africans are animals who toil without any anticipation of salary and reward for their work. When they think through their sixth sense, educate themselves and others, they are being considered as potential threat to the slave masters. The masters, similar to that of leeches in nature sucking barrels and barrels of Black's blood and cannot put up with the vulnerable race's mosquito bite as they witnesses a slave preaches Declaration of Independence among the community in plantations.

Michael, the slave in question, had indeed possessed the ability to recite long passages....Michael's former master was fascinated by the abilities of South American parrots and reasoned that if a bird could be taught limericks, a slave might be taught to remember as well. Merely glancing at the size of the skull told you that a nigger possessed a bigger brain than a bird. Michael had been the son of his master's coachman. Had a brand of animal cleavernss, the kind you see in pigs sometimes. (Whitehead37) The comparison of black people and their naïve behaviour with animals and animal sounds is so prevalent especially in literary works of the Whites. In Joseph Conrad's *Heart of Darkness* also makes a similar remark on the African People like. *They howled and leaped, and spun, and made horrid faces; but what thrilled you was just the thought of their humanity. (OpenAI).* The racist view on Africans is well expressed in Edgar Rice Burroughs' *Tarzan of the Apes* in a more direct way. *The Negroes were as noisy as a troop of baboons. (OpenAI)* The fittest of all, not in body but mind want to free themselves by fleeing the plantations. They want to see the actual world at any cost. Mabel, Cora's mother, was one of the kinds. She absconded from the plantation without dropping any hint at all, even to his daughter. Cora felt betrayed till the end of the story asking about her mother wherever she goes but Mabel's intention to achieve freedom by any means was so strong, deep rooted and ruthless. She might have thought to let Cora decide her fate on her own terms. *To walk in there at night, heading north to the Free States. Have to take leave your senses to do that. But Cora's mother had. As if to reflect Ajarry, who did not step off Randall land once she arrived on it, Mabel never left the plantation until the day of her escape. She gave no indication of her intentions. Cora fell asleep nestled against her mother's stomach and never saw her again. (Whitehead 47)*

The Big Anthony's unsuccessful attempt to escape the plantation led to the consideration freedom by Caesar and Cora when they witnessed, burning him alive after days of continuous, unbearable torture at the hands of Randall brothers and his men. Caesar somehow managed to change the mind of Cora and succeeded. They fled to South Carolina through the mysterious Underground Railroad with the help of a station agent, the route, one Cora had heard but not witnessed. This railroad road is an ultimate destination of 'runaways' and has saved millions of lives. It connects major cities in America and is silently popular. The new venue welcomes and baptizes them with new name and identity. They thought that they have attained freedom as soon as they fled Georgia but they never knew that they cannot be free as "runaways", it was a never ending journey. They needed lifejackets in the name of new identity and name. *When Caesar finished washing up, Sam gave them their papers. "The names are wrong," Caesar said. "You're runaways," Sam said. "This is who you are now. You need to commit the names and the story to memory." (Whitehead 109)* Cora with new identity and name, as Bessie tried to explore and learn from the new atmosphere and cherished freedom partially. She almost settled there in body and mind but she found South Carolina had something darker on the other side of the coin. Some secret missions had been successfully executed on the black people. On one side, black women were brainwashed to cooperate for their birth control mission. Cora herself encountered and brainwashed for sterilization to give up her womb through surgery and save her children before the child becomes a property in some plantations as father and motherless child but she had a spark and declined that offer. She wanted to save her womb for herself and for the future of the black community. She hoped for the best in the future more than mere freedom. *With the surgeries Dr. Stevens described, Cora thought, the whites had begun stealing futures in the*

Veyilumuthupandian et al.,

earnest. Cut you open and rip them out, dripping. Because that's what you do when you take away someone's babies—steal their future. Torture them as much as you can when they are on this earth, then take away the hope that one day their people will have it better. (Whitehead139) On the other hand, to study the course and ways of syphilis, they were used as animals for their research. Additionally, the state promotes medical experiments on Black individuals, particularly concerning syphilis, echoing real historical abuses such as the Tuskegee Experiment. (OpenAI) The doctors masked themselves as good natured and caring in front of the black people. People believed that the doctors are solution to their blood ailment and never knew the medicines are illusionary relief and the people are merely considered as experimental rats and cats. His patients believed they were being treated for blood ailments. The tonics the hospital administered, however, were merely sugar water. In fact, the niggers were participants in a study of the stages of syphilis. (Whitehead 145) The dead bodies of the black people itself are a prey of the whites. With the help of Dr. Stevens a gang of robbers retrieve bodies from the grave to sale in laboratories. Blacks remain properties even after death. As they are subjugated masses they are unsafe even after their burial and left unsupported by authorities and public services so the gang takes advantage of that voiceless souls' lifeless body. The whites never care the life and struggle of Blacks but their toil. The niggers did not post sentries over their dead. Niggers did not pound on the door of the sheriff, they did not haunt the offices of the newspapermen. No sheriff paid them any mind, no journalist listened to their stories. The bodies of their loved ones disappeared into sacks and reappeared in the cool cellers of medical schools to religuish their scretes....He gave these people a second chance to contribute, one denied them in their previous life. (Whitehead 166) Cora determined to escape the silent savagery that prevails every nook and corner of South Carolina with Caesar but the chain they broke earlier in Georgia was waiting for them in the shape slave catchers. Before Cora reaches Caesar, the slave hunters snatched his life. Deprived of choice, Cora fled through the Underground Railroad, but this time without knowing the destination and even station agent to guide. Fortunately she was found unconscious, and helped by a station agent named Martin in North Carolina, but Martin and Cora had to wait for her signal to the next station. So she remained with the agent and he led her to his home in a wagon. There, on the way, she witnessed the real hell,

The Freedom Trail Road in North Carolina. The corpse hung from trees as rotting ornaments. Some of them were naked, others partially clothed, the trousers black where their bowels emptied when their necks snapped....One had been castrated, an ugly mouth gaping where his manhood had been. The other was a woman. Her belly curved. Cora had never been good at knowing if a body was with a child. (Whitehead 182) Cora had entered into hell of a hell from the hellish world of plantation. She suffocated with the supremacy of whites and graved for black breath, but end to end, the blacks were hunted like stray dogs. She witnessed only death in the north. South Carolina gave Cora her first glimpse of the mingling of races in towns and cities....In North Carolina the Negro race did not exist except at the ends of ropes. (Whitehead 187) North Carolina redefined her understanding of freedom and gave her a new perception on liberty. Her present reality is so deeper and resembles cramped inferno than the past spacious hell. It congested with White savages and supervised the blacks twenty-four hours a day, and seven days a week. Being free had nothing to do with chains or how much space you had. On the plantation, she was not free, but she moved unrestricted on its acres, tasting the air and tracing the summer stars. The place was big in its smallness. (Whitehead 215) She was forced stay-at-home to save herself, Martin and his wife Ethel. If she comes out, all will be slaughtered in the whites' Friday Festival. For South Carolina's favourite festival, the slave hunters capture slaves on a regular basis and save them all to slay publicly on Fridays' as though it is a traditional ritual or custom. Cora endured the hardship and survived in a small attic lying all the time for several months. Now and then, looking outside through a hole in the attic and witnessed several Festivals tearing the blacks into pieces at the nearby park. Consequently she was betrayed by Martin's maid. There, Ridgeway, the famous slave catcher who has been searching her for so long, captured her with the help of the local team who runs the festival successfully. He demanded Cora from them to reunite her with his old master Randall, leaving Martin and his wife Ethel to die at the hands of the local mop who have been strictly warning the Whites not to help the runaways. Afterwards, Cora and Ridgeway with his team members started their dissenting journey to the Georgia plantation. On their journey, Cora encountered Ridgeway with small talks and he expressed his true intention to capture her and his duty and service as a slave catcher to the new nation America. "My father liked his Indian talk about the Great Spirit," Ridgeway said. "All these years later, I prefer the American spirit, the one that called us from the Old World to the New, to conquer and build and civilize. And destroy that what needs to be destroyed. To lift up the lesser races. If not lift up, subjugate. And if not subjugate, exterminate. (Whitehead 266)

Veyilumthupandian et al.,

Why was he particularly so serious about catching her? He expressed his long standing discomfort and discredit for failing to capture Mabel, Cora's mother. Mabel had left an indelible mark of blunder in the authority of the Whites, and fled to an untraceable destination. It forced him to take this issue more seriously and pursued Cora persistently from Georgia to North Carolina. Ridgeway wants to put on end to runaways' sources of inspiration, like Mabel and Cora, in Georgia plantations. He wants to cut the roots of freedom before the birds who like to taste the fruits of Liberty. *People like you and your mother are the best of your races.... You need to be strong to survive the labor and make us greater. We fatten hogs, not because it pleases us but because we need hogs to survive. But we can't have you too clever. We can't have you so fit you outrun us.*" (Whitehead 268) Moving toward Georgia, she was notices with slave chains by somebody and they dared to rescue her. A group of three men led by Royal, another black but brave enough to hold gun in their hands to face the whites. She could not believe her eyes. *She had never seen coloured men hold guns. The image shocked her, a new idea too big to fit into her mind.* (Whitehead 271) They shot one of Ridgeway's men and saved her. Again through the Underground Railroad they fled to Valentine's Farm in Indiana. The plantation was running like Blacks final destination. *In her Georgia misery she had pictured freedom, and it had not looked like this. Freedom was a community laboring for something lovely and rare.* (Whitehead 325) Cora felt living there like living in heaven itself. It was overflowed with freedom, free people and runaways. They were all so willing to work for the betterment of the community and its future with free and broad mind.

The bravery and uniqueness behind the black man Royal attracted Cora because she never witnessed such a free black man in her life. *Royal's quick wits and proud bearing made it clear the colour of his skin was no impediment. "A free black walks different than a slave," he said. "White people recognize it immediately, even if they don't know it. Walks different, talks different, carries himself different. It's in the bones." Constables never detained him and kidnappers kept their distance.* (Whitehead 312) His every single move was unique from the other Blacks and surpassed the whites. Cora admired him in many occasions and soon he became her love interest. She even allowed him to get close to her as he was so kind and caring. They united themselves emotionally and physically in Valentine's Farm. The life in the Farm was running smoothly till the slave catcher Ridgeway's reentry to Cora's life. He attacked the Farm with white supremacists and killed her lifeline, Royal. The mob hunted the runaways in the farm and burned their facilities to ashes. Once again Cora was captured by Ridgeway and his wagon man and he forced her to show the mysterious Underground Railroad for their final voyage to Georgia. She finally led them to the historic pathway of liberation of the black people in America. However, she made up her mind to hunt down the famous slave hunter Ridgeway right away. When they unshackled Cora to lead them to the underground form above she bound the slave catcher with an unbreakable hold and rolled down with him to the steep underground. He fatally wounded and the wagon man Homer was beside him, witnessing his final moments. Cora, was equally wounded but survived. With help of a handcar in the track she freed herself one last time from the clutches of slavery. She ventured afar and collected herself from down to the upper world to see the light again. As soon as she got away from the underground, she encountered an old black man named Ollis heading westward at a wagon in search of freedom and liberty, Cora joined to share the unshackled state with him, if it was in the west.

Implications

These findings might be an eye – opener for the scholars who approach Slavery and Racism on Intersectionality and Neo-slave narration point of view.

Major Findings

The researcher has ventured to trace the brutality or cruelty confronted by Africans as slaves in a faraway realm.

CONCLUSION

This pursuit on Slavery and Racism in Colson Whitehead's *The Underground Railroad*, tackles racial discrimination and inhuman treatment on African Citizens, and how they were considered only as property on plantations by the masters. Especially, women were used as breeding machines to increase the strength and population of the

**Veyilumuthupandian et al.,**

plantations. Ultimately the concept of family as father-mother-child is denied in their life and was sold in different directions as livestock.

ABSTRACT

Using an isocratic HPLC method, the cefpodoxime proxetil (CEP) and ofloxacin (OLX) analyses in tablet dosage forms were completed in three minutes. It was done at room temperature using a mobile phase that has a pH of 3.0 and was made up of acetonitrile and phosphate buffer in an 80:20 (v/v) ratio. The experimental conditions were optimized to maximize absorption level using a 1 ml/min flow rate and an HPLC-PDA detector configured at 240 nm. Cefpodoxime proxetil has a retention time of 1.30 min, indicating shorter analysis duration, while ofloxacin has a retention time of 2.0 min. They were both very sensitive, with detection limits of $8.6 \times 10^{-7} \mu\text{g/ml}$ for Cefpodoxime proxetil and $2.0 \times 10^{-7} \mu\text{g/ml}$ for ofloxacin. After that, it checks to see if it follows FDA-approved guidelines for drug analysis in tablet dose form.

Keywords: Cefpodoxime proxetil, Ofloxacin, Validation, Accuracy, Precision, Formulation.

INTRODUCTION

Cefpodoxime proxetil (CEP) is chemically known as "1-(isopropoxycarbonyloxy) ethyl(6R,7R)-7-[2-(2-amino-4-thiazolyl)-(z)-2-(methoxyimino)acetamido]-3-methoxymethyl-3-cephem-4-carboxylate" (Figure 1) is a third generation cephalosporin antibiotic. It treats typhoid, respiratory, urinary, cutaneous, and soft tissue infections. It targets Staphylococcus aureus more actively (1–3). Cefpodoxime proxetil is an official ingredient in IP and USP. The

**Basavaraj Hiremath**

estimation of the liquid chromatography method is explained in IP (4) and BP (5). A survey of the literature reveals a CEP-determined HPTLC technique. The literature review also shows spectrophotometric methods, RP-HPLC methods, and HPTLC methods for measuring CEP with different drugs(6, 7). Literature survey does not reveal any RP-HPLC and HPTLC method for simultaneous estimation of OLX and CEP in combined dosage forms (8, 9). Ofloxacin(OLX) chemically known as “9-Fluro-2-3 dihydro-3-methyl-10- (4-methyl 1-piperaziny) - 7-oxo-7H- pyrido [1, 2, 3-de] 1, 4 benzoxazine-6-carboxylic acid” (Figure 2).It is a fluoroquinolone antibacterial that is used to treat chlamydia or chlamydophila infections, such as nongonococcal urethritis, and mycobacterial infections, such as leprous disease. It is officially listed in IP, BP, and USP. IP (10), BP (5), and USP (11) provide a description of the potentiometry method. A review of the literature showed that spectrofluorimetric (12–15) methods can be used to find OLX in biological fluids and drug dosage forms. The literature study also revealed HPTLC (16–17) techniques for simultaneous determination of CEP and OLX and for OLX determination using other drugs (18–20).

This study describes a chromatographic method that is easy to use, rapid, repeatable, and sensitive. The technique was developed for precise identification of CEP and OLX in a synthetic combination. When compared to the previously described method, our proposed method has a faster flow rate. Eventually, the method was statistically compared with a reference method and showed similar degrees of accuracy and precision and no statistically significant separation from the stated method.

EXPERIMENTAL**Apparatus**

The HPLC instruments used for the test are from Kyoto, Japan's Shimadzu (UFLC) Corporation. A DGU 20A5 prominence degasser, a SIL-20A prominence auto sampler, an LC-20AD solvent supply pump system, and an SPD-prominence diode array detector made up the tools. More often, Lab Solutions' data analysis tools were used. Columns commonly used with CTO-20A oven maintain the correct temperature. The equipment utilized for the separation process was the Waters XTerra RP-18 manufactured in Ireland. Its measures run 5 μm by 250 \times 4.6 mm.

Materials and Reagents

One free sample of Cefpodoxime proxetil and ofloxacin came from Synchem Laboratories Pvt. LTD. The HPLC-grade solvents, including acetonitrile, sodium dihydrogenphosphate monohydrate, and orthophosphoric acid, were procured from the Indian firm Merck Specialties Pvt. Ltd. A pharmaceutical formulation was purchased from a local pharmacy.

Stock solutions

It took 1000 $\mu\text{g}/\text{ml}$ of Cefpodoxime proxetil and ofloxacin mixed into the mobile phase to make a standard solution. With the help of a volumetric flask and the mobile phase, the drug was dissolved to make enough of the 1000 $\mu\text{g}/\text{ml}$ solution. Storing a solution at 35 $^{\circ}\text{C}$ was to keep it in darkness. To generate calibration curves at concentrations of 2, 4, 6, 8, and 10 $\mu\text{g}/\text{ml}$, the stock solution (1000 $\mu\text{g}/\text{ml}$) was diluted in series with the mobile phase. Cefpodoxime proxetil and ofloxacin were mixed in a mobile phase and then put through a 0.2 μm membrane to get the right amount for medical use. It was placed in an ultrasonic bath for duration of five minutes; use the working solution for estimation.

Mobile phase

The mobile phase for separation is an 80:20 v/v combination of acetonitrile (ACN) and phosphate buffer at pH 3.0. A 0.2 μm membrane filter and an effective degasser were employed to filtrate and degas the mixture before the mobile phase was introduced. To make a buffer, 1.2 grams of sodium dihydrogen phosphate monohydrate were dissolved in 1000 ml of water. The addition of a small quantity of diluted orthophosphoric acid brought the pH level up to 3.0. A membrane filter having a diameter of 0.2 μm was used to filter the solution.

**Basavaraj Hiremath****Pharmaceutical formulation forms**

The pharmaceutical formulations, including Cedon Plus 200 mg by Blue Cross Laboratories, Ltd. and Tocef O 100 mg by Synchem Laboratories Pvt. Ltd., were all purchased from local pharmacies.

PROCEDURES**Development of calibration standards curves**

The CEP and OLX stock solutions were diluted in 10 ml volumetric flasks so that they could be concentrated to 2, 4, 6, 8, and 10 µg/ml. To create the chromatogram, 10 µl of each mixture was added to a column, and measurements were taken at 240 nm. This concentration-response graph shows the relationship between drug concentration and the generated response graph more specifically, the peak region. Levels of 2.0 µg/ml, 6.0 µg/ml, and 8.0 µg/ml are used to signify low, medium, and high values, respectively, for validating the quality control (QC) sample.

Methods used in pharmaceuticals

The analysis employed the following formulations of tablets: Cedon Plus and Tocef O. Dissolve a designated quantity of each drug, equivalent to 10 mg in the mobile phase. Using the mobile phase, dilute the filtered solution until it reaches the required volume; then, transport it to 100 ml measuring flasks. As said before, the procedure was then completed using standard addition techniques.

RESULTS AND DISCUSSION**Optimizing chromatographic conditions**

The complete details of the various chromatographic parameters are displayed in Table 2. A 240 nm PDA detector was used to find the best chromatographic detection wavelength. Shimadzu (UFLC) Corporation is based in Kyoto, Japan, and makes many instruments, such as the SPD-prominence diode array detector, the SIL-20A prominence auto sampler, the LC-20AD solvent delivery pumps system, and the DGU 20A5 prominence degasser. A series of tests were conducted to ascertain the optimal composition ratio and pH for the mobile phase, following extensive trial and error. An 80:20 (v/v) mixture of acetonitrile and a phosphate buffer with a pH of 3.0 was found to be the most effective mobile phase, operating at a flow rate of 1 ml/min. Under these conditions, Cefpodoxime proxetil and ofloxacin may be separated and eluted in 1.30 and 2.0 minutes, respectively, in their pure form and at pharmaceutical dosage (Figures 3 and 4). Table 1 details the preferred (HPLC-PDA) method for analysing the drug in both its pure and synthetic combination forms.

Method of validation

The developed method was validated based on a set of criteria that included accuracy, precision, linearity, specificity, and robustness.

Linearity

There were five different dosage combinations tested for linearity. When the concentration limits of 2–10 µg/ml for both drugs were plotted against the peak area calibration curves (Figures 5 and 6), a straight line was drawn between the peak areas. Linear regression equations for the CEP and OLX variables are $Y = 6964 + 99488C$ and $Y = 3014 + 100253C$, respectively. Results showed a high level of linearity for both drugs, as shown in Table 2; R^2 values of 0.9996 and 0.9992, respectively, suggest excellent regression.

Accuracy

Examining the amount recovered for commercially accessible CEP and OLX at different concentrations within the specified concentration range lets one evaluate the accuracy of the procedure. Three replications of every concentration were produced using the standard addition method. Using the suggested method, the experiment

**Basavaraj Hiremath**

involved adding specific amounts of each drug at various concentrations. Estimated recovery rates for both substances were high, as shown in Table 3, which is based on the percentage of drugs recovered.

Precision

Accuracy was determined by measuring the method's intra- and inter-day precision. The QC samples used in the validation process included concentrations of 4, 6, and 8 µg/ml. The intra-day precision was evaluated by doing three separate measurements with a solution containing pure drugs. Subsequently, the SD of these metrics was computed. The numerical standard deviations (SDs), which ranged from 0.67 to 0.93, demonstrate a highly accurate method. As indicated in Table 3, the CEP standard deviation was within the acceptable range of 0.12-0.47 for inter-day repeatability, and the OLX standard deviation was within the range of 0.32-0.54. According to the results of the present study, the suggested method can precisely determine pharmaceutical dosages of both drugs simultaneously.

Specificity and Selectivity

The selectivity of the method was examined by injecting CEP and OLX solutions into the column simultaneously. Two distinct peaks appeared, one for CEP with a retention time of 1.30 minutes and one for OLX with a retention time of 2.0 minutes. They were not visible in the blank solution. As shown in Figures 5 and 6, the tablet formulations comprising excipients did not interfere with the well-defined peaks of CEP and OLX due to contaminants, according to the specificity testing.

Limits for detection and quantification

When calculating the limits of detection (LOD), the signals-to-noise ratio was set at 3:1, and the limits of quantification (LOQ) at 10:1. Based on the findings, the CEP limit of detection was 8.6×10^{-7} µg/ml, and the OLX limit was 2.0×10^{-6} µg/ml. The limits of quantification for OLX were found to be 6.57×10^{-6} µg/ml and those for CEP were found to be 2.8×10^{-6} µg/ml. El-Hassan et al. reported that CEP and OLX yielded quantification results of 0.857 µg/ml and detection results of 0.253 µg/ml. The results indicate that the method is very sensitive.

Robustness

To test the method's robustness, small changes (± 0.05) were made to the flow speed and mobile phase ratio composition while keeping all the other chromatographic parameters the same. To determine the effect of the changes, the recovery percentages and standard deviations of the two drugs were compared. Low standard deviation (SD) values of 0.16 for CEP and 0.14 for OLX show that changes don't have much of an effect on the results, as shown in Table 4.

Applications**Tablet Formulation Analysis**

The suggested method was used to evaluate two drug formulations: Cedon Plus (containing CEP+OLX) from Blue Cross Laboratories Limited and Tocef O (containing CEP+OLX) from Synchem Laboratories Pvt. Limited. The F-test and student t-test were computed using statistical analysis. This process achieves a high level of specificity, unaffected by impurities or excipients. When comparing the results to the reference method, an F-test and a Student t-test were used. Findings from Table 5 show that the reference and proposed methods were both highly accurate and precise. The reason behind this is that the computed 't' and 'F' values for CEP and OLX are lower than the ones found in the table.

CONCLUSION

Using an isocratic RP-HPLC method made it possible to analyse both CEP and OLX at the same time. This work established and validated a method that accurately and efficiently measures CEP and OLX concentrations at the same time; the whole procedure took approximately 2.5 minutes. It is clear from the results that the proposed method is rapid, accurate, selective, reliable, and reproducible. It was seen that the drugs CEP and OLX were linear across a

**Basavaraj Hiremath**

concentration range of 2 to 10 μ g/ml. When used for quality control purposes with commercially available tablets of Cedon Plus and Tocef O, this method has shown good results. This method proves particularly beneficial in situations where time and financial resources are limited. Quality control laboratories can routinely use the proposed method to analyze CEP and OLX combinations.

ACKNOWLEDGEMENTS

In addition to Synchem Laboratory for providing the complimentary sample, the author would like to thank S. S. Margol College of Arts, Science and Commerce, Shahabad and the Chemistry Department at Gulbarga University, Kalaburagi for their support.

CONFLICT OF INTEREST

The authors attest that the manuscript is free of conflicts of interest.

Ethical Approval

This manuscript does not include any research that involves humans or any other type of animals.

ABSTRACT

Gillian Flynn's *Gone Girl* is more than just a psychological thriller; it is a sophisticated exploration of human behavior, deception, and societal expectations, framed through psychological, behavioral, and media dynamics. This article examines the scientific significance of the novel, focusing on the complex interplay between psychology, deception, gender roles, and media influence. The study delves into psychological manipulation and profiling, exploring the characters of Nick and Amy Dunne as they engage in intricate manipulations of perception, identity, and truth. Through the lens of behavioral science, the essay analyzes key concepts like cognitive dissonance, cognitive biases, and social perception, revealing how these forces drive the characters' actions and the unfolding of the plot. Additionally, the essay investigates the role of media in shaping public opinion and influencing societal judgments, drawing on media psychology to explain how the media distorts and frames the narrative. Finally, the novel's critique of gender roles and the psychological costs of conforming to societal expectations provides insight into the tension between individual identity and social pressures. Overall, *Gone Girl* offers a profound commentary on the malleability of truth, the fragility of human perception, and the power of societal and media influence in shaping reality.

Keywords: Psychological complexities, Gender dispute, deception, exploitation, emotional manipulation.

INTRODUCTION

"*Gone Girl*" by Gillian Flynn is not only a gripping psychological thriller but also a nuanced exploration of human behavior, deception, and societal expectations. While the novel does not focus on traditional scientific discoveries or technological advancements, its depth lies in how it portrays complex psychological processes and behavioral science

99455

**Beulah Joseline**

concepts. Through the intricate manipulation of perception, psychological profiling, and the influence of media on public opinion, Flynn's novel offers a profound commentary on the interplay between individual minds and larger social structures. This essay will examine the scientific significance in *Gone Girl* by exploring psychological manipulation, deception, gender roles, and the role of the media in shaping perceptions of truth. At the heart of *Gone Girl* is a psychological tug-of-war between the two main characters, Nick and Amy Dunne. Both protagonists manipulate perceptions of their relationship, their circumstances, and ultimately, their identities. This manipulation is not accidental but rather the result of carefully constructed psychological strategies. Amy, in particular, constructs elaborate narratives to control the direction of the plot, showcasing her awareness of psychological techniques such as gas lighting, emotional manipulation, and self-presentation. Psychological profiling, which involves understanding and predicting the behavior of individuals based on their personality traits, becomes a key theme in the novel. Amy's actions—ranging from her meticulous planning of her "disappearance" to her ability to frame Nick for her supposed murder—demonstrate her in-depth understanding of psychological dynamics. Amy is an expert at reading people and exploiting their weaknesses. Her ability to manipulate both Nick and the police reflects her understanding of human behavior, particularly the tendency of people to construct their own versions of the truth. In *Psychology of Human Behaviour*, Mishra quotes that, "Psychology as a scientific discipline of human behaviour is considered as a science of adjustive behaviour of man." (1) Nick, on the other hand, employs his own forms of psychological manipulation, although in a less deliberate and more reactive way. His unreliable narration and shifting accounts of the truth reveal how self-deception and cognitive dissonance play roles in shaping his own behavior. His inability to fully comprehend the extent of Amy's manipulation is a testament to the power of psychological tactics like projection and denial. In this sense, the novel explores the malleability of truth and the ways in which individuals can manipulate others by shaping the narratives they present. Psychological theories of deception and self-presentation are essential to understanding the dynamics between Amy and Nick. Amy, for instance, is well-versed in the theory of impression management a concept introduced by sociologist Erving Goffman—where individuals manipulate their public image to align with societal expectations. Throughout the novel, Amy shifts her persona depending on the circumstances, from the "cool girl" image to the vengeful, calculating woman in the second half.

This transformation highlights the ease with which one can adopt a new identity, a concept that aligns with psychological theories of the fluidity of the self. One of the most striking scientific aspects of *Gone Girl* is its exploration of deception. Behavioral science, particularly research into cognitive biases and the psychology of lying, plays a significant role in the unfolding of the plot. Amy's meticulous orchestration of her own "death" and her framing of Nick as the murderer demonstrates how individuals can manipulate the perception of truth through careful control of information. According to Ulrich Neisser's cognitive psychological approach, "whenever there is an external stimulus through thought process obviously there should be a response. Similarly in this work Amy and Nick shows an external repugnance for their true selves and as the response to the external aversion Amy shows her true behavior as a cunning villain by framing her husband and making him realize his infidelity towards her." (20) A key concept in behavioral science that is evident throughout *Gone Girl* is the idea of cognitive dissonance. Cognitive dissonance theory, first proposed by psychologist Leon Festinger, suggests that individuals experience psychological discomfort when they hold contradictory beliefs or when their behavior conflicts with their beliefs. This tension leads individuals to adjust their perceptions or rationalize their actions to restore consistency. Nick experiences this cognitive dissonance throughout the novel as he grapples with his role in Amy's manipulations and his own past actions. The more he tries to justify his behavior, the more he becomes entrenched in a web of lies and half-truths, reflecting the ease with which one can deceive themselves in the face of uncomfortable truths. Brent D. Slife and Richard N. Williams as "All human behavior has a core of sexual motivation is the assertion that the sexual motivation itself arises from the body, rather than from the mind [9]. Another critical concept in behavioral science that *Gone Girl* explores is the psychology of social perception. Throughout the novel, characters interpret each other's actions based on preconceived notions, expectations, and biases. Nick, for instance, is often judged by others—particularly the police and the public—based on his outward appearance and the assumptions people make about his behavior. The media plays a crucial role in shaping how Nick and Amy are perceived, with both characters benefiting or suffering from societal biases. Amy's ability to manipulate these biases, especially in the media's

Beulah Joseline

portrayal of the case, highlights her understanding of how people process information and form judgments. Her frame of reference the way she constructs the narrative determines the way others perceive her. This manipulation of public perception echoes the findings of research in social psychology, which suggests that people often rely on heuristics (mental shortcuts) rather than objective facts when making judgments. A central theme in *Gone Girl* is the portrayal of gender roles and societal expectations, which intersect with psychological and behavioral dynamics. Amy's persona as the "cool girl" offers a sharp critique of societal pressure on women to conform to idealized versions of femininity. This persona, which Amy initially adopts for Nick's benefit, is a reflection of the broader societal expectations that women should be effortlessly attractive, sexually liberated, and emotionally self-sufficient. In a more scientific context, Amy's transformation into the "cool girl" persona can be analyzed through the lens of 'social psychology', particularly the concept of 'role theory'. Role theory posits that individuals act according to societal scripts or expectations associated with their social roles. In Amy's case, her role as the "cool girl" serves as a survival strategy, enabling her to gain Nick's affection while simultaneously conforming to a stereotype of the ideal woman. However, as the novel progresses, it becomes evident that Amy's adoption of this role is a façade that conceals deeper frustrations and desires. Her eventual rejection of the "cool girl" persona and her revelation of her true self signify the tension between societal expectations and individual identity. Moreover, Amy's portrayal of the "cool girl" provides insight into how gender roles influence behavior and the psychology of relationships. Amy, in manipulating the "cool girl" image, not only challenges traditional gender roles but also reflects the psychological costs of living up to those roles. Her eventual decision to turn against these expectations reveals the complexity of gender identity and the way societal pressures shape behavior and decision-making. A crucial scientific theme in *"Gone Girl"* is the role of the media in shaping public perception, particularly in the context of criminal investigations. Flynn explores how media outlets construct narratives around criminal cases, often distorting the truth in favor of sensationalism. The media's portrayal of Nick as a suspect in Amy's disappearance is a powerful commentary on the psychology of media influence and the way the public forms judgments based on incomplete or biased information. This aligns with research in 'media psychology', which examines how media can influence individuals' attitudes, beliefs, and behaviors. In *"Gone Girl"*, the media plays a pivotal role in shaping public opinion about the characters, particularly Nick. Through the selective presentation of facts and the sensationalized portrayal of the case, the media creates a narrative that impacts how the characters are perceived, even before the truth is revealed. This process is an example of how media can create a 'spiral of silence', where individuals' personal opinions become shaped by the dominant media narrative, regardless of their actual beliefs. In addition, the media's role in the case highlights the phenomenon of 'media framing', where the way information is presented influences the interpretation of events. Amy's manipulation of the media in framing her disappearance showcases how the media can be an instrument of power, shaping public opinion and influencing the course of events.

CONCLUSION

"Gone Girl" offers a rich examination of human behavior through the lenses of psychology, deception, and media influence. By exploring the psychological tactics employed by the characters, the novel delves into the complexities of self-presentation, emotional manipulation, and the malleability of truth. Behavioral science concepts such as cognitive dissonance and social perception provide a framework for understanding the characters' actions and the novel's broader themes of identity and manipulation. Additionally, the novel's critique of gender roles and media influence highlights the powerful role that societal expectations and the media play in shaping perceptions of truth.

ABSTRACT

One of the most important issues facing the world today is air pollution, which has a big influence on ecosystems, public health, and the climate. Because nanomaterials have special qualities, the development of nanotechnology provides encouraging ways to reduce air pollution. This review explains how nanoparticles might reduce air pollution by highlighting their exceptional reactive, adsorptive, and catalytic properties. Important nanomaterials are examined for their effectiveness in eliminating volatile organic compounds (VOCs), trapping particle matter, and breaking down dangerous air pollutants by photocatalysis and other processes. These include metal oxides, carbon-based nanostructures, and hybrid composites. It covers the creation of sophisticated nanostructured filters, sensors for monitoring air quality in real time, and catalytic converters for industrial and automobile emissions. The review discusses nanomaterials possible health and environmental hazards in addition to their benefits, stressing the importance of sustainable design and lifecycle assessments. In order to create cleaner, healthier air for a sustainable future, this review highlights the revolutionary potential of nanomaterials by combining current developments with future perspectives.

Keywords: Nanomaterials, Air pollution, Volatile Organic Compound, Adsorption, Sensors.

Subramani Rajapandi and Kousalya

INTRODUCTION

One of the most important environmental issues of our day to day life is air pollution, which nanomaterials have shown to be a revolutionary way to solve this environmental issue. High surface area to volume ratios, increased reactivity, and remarkable mechanical, optical, and thermal capabilities are characteristics of these materials, which are distinguished by their nanoscale size and distinct physicochemical features (Frederick W. Lipfert et al., 1995). Because of their molecular and atomic-level interactions, they are very good at absorbing, breaking down, or neutralizing air pollutants including particulate matter, volatile organic compounds (VOCs) and harmful gases like sulphur oxides (SO_x) and nitrogen oxides (NO_x) (Sumistha Das et al., 2015; Ian Sofian Yunus et al., 2012; Adeladza Kofi Amegah et al., 2016). Nanomaterials that use sunlight to convert dangerous pollutants into less toxic forms, such as zinc oxide (ZnO) and titanium dioxide (TiO₂) are frequently employed in photocatalytic processes.

Because of their remarkable chemical stability and high porosity, carbon-based nanomaterials like graphene and carbon nanotubes (CNTs) are excellent in adsorbing pollutants (Shengjing Sun et al., 2019; Yu Huang et al., 2019; W. J. Seow et al., 2015). For the purpose of selectively removing pollutants, metal-organic frameworks (MOFs) and functionalized nanoparticles are also being developed. Through the incorporation of these nanomaterials into coatings, air filters, and catalytic converters, scientists hope to greatly improve air quality and lower the health risks connected to contaminated settings. To guarantee sustainable and broad application, issues including cost, scalability, and environmental safety must be resolved despite their promise (Priyadarsini Rajagopalan et al., 2021; Zeki Argunhan et al., 2018).

Active Nanomaterials for reduce the Air-Pollution by different method

Adsorbent

Nanomaterials Based on Carbon:

Nanomaterials based on carbon have drawn a lot of interest because of their excellent adsorption capabilities and large surface area. Because of their vast pore network, activated carbon nanoparticles have a great ability to absorb gaseous pollutants including CO₂, SO₂, and NO_x (Esraa Gabal et al., 1993). Because of their oxygen-containing functional groups, functionalized graphene derivatives such as graphene oxide (GO) and reduced graphene oxide (rGO) provides improved adsorption of organic contaminants. Furthermore, both single-walled and multi-walled carbon nanotubes (CNTs) have remarkable surface interactions for the adsorption of heavy metals and volatile organic compounds (VOCs) (Kroto H.W et al., 1993).

Metal-Organic frameworks

MOFs are perfect adsorbents for air pollutants since they are extremely porous materials with adjustable pore structures (Vinod K. Gupta et al., 2013; Nicola Gargiulo et al., 2015). For example, because of its hydrophobic voids and chemical stability, zeolitic imidazolate framework-8 (ZIF-8) has shown improved adsorption of CO₂ and SO₂. In a similar vein, HKUST-1 (Cu-based MOF) is appropriate for industrial applications due to its selective VOC adsorption. MOF adsorption capacities are further improved by the capacity to functionalize them with various organic linkers. (Taravat Ghanbari et al., 2019)

Nanomaterials Based on Biotechnology

Bio-derived nanomaterials have become sustainable adsorbents, including cellulose nanofibers and chitosan-based nanocomposites. Heavy metal adsorption from air is facilitated by the amino and hydroxyl functional groups found in chitosan, a biopolymer made from crab shells. Because of their high surface-to-volume ratio and adjustable porosity, cellulose nanofibers derived from plant sources have demonstrated exceptional efficacy in absorbing particulate matter and gaseous pollutants. (Yunes Panahi et al., 2018; Selvia Garcia-Mayagoitia et al., 2020)

Subramani Rajapandi and Kousalya

Nanoparticles of metal and metal oxide

In adsorption-based pollution removal, metal and metal oxide nanoparticles are essential. In addition to absorbing air contaminants, titanium dioxide (TiO₂) (Senlin Lu et al., 2015) nanoparticles also photo catalytically break them down when exposed to ultraviolet light. Due to their strong reactivity and capacity to modulate surface charge, iron oxide (FeO₃) and zinc oxide (ZnO) nanoparticles have been used to capture SO₂, NO_x, and VOCs. For example, amino-functionalized silica-coated FeO₃ nanoparticles have shown improved NO_x adsorption efficiency. (Barbara A.M et al., 2020)

Adsorbate

Organic compounds that are volatile (VOCs)

VOCs, which come from domestic goods, automobile exhaust, and industrial emissions, are significant causes of air pollution both indoors and outdoors. Benzene, toluene, ethylbenzene, and xylene (BTEX) are examples of common volatile organic compounds (Faisal I. Khan et al., 2000). Because of their high surface affinity and pore accessibility, nanomaterials such as activated carbon, metal-organic frameworks (MOFs), and graphene oxide (GO) have demonstrated encouraging results in the adsorption of volatile organic compounds (VOCs) (Elena David et al., 2021)

Vapours of Heavy Metal

Mercury (Hg), lead (Pb), cadmium (Cd), and arsenic (As) are among the dangerous pollutants that are discharged into the air as a result of mining, smelting, and burning fossil fuels (Senthilkumar Ganapathy et al., 2021). Because of their capacity to bioaccumulation, these hazardous substances provide serious health hazards. Through potent chemical interactions and electrostatic forces, sustainable adsorbents such as metal oxide nanoparticles (e.g., FeO₃ and ZnO), bio-based nanomaterials, and functionalized carbon nanotubes (CNTs) have been used to absorb these metal vapors (Jun Cong Ge et al., 2018).

Greenhouse gases

Global warming and climate change are caused by greenhouse gases including carbon dioxide (CO₂), methane (CH₄), and nitrous oxide (N₂O). Because of their great selectivity and capacity for CO₂ capture, zeolitic imidazolate frameworks (ZIF-8), amine-functionalized MOFs, and porous silica nanoparticles have all been used extensively in the study of CO₂ adsorption (Prashant Bhimrao Koli et al., 2021). To lessen its influence on the environment, methane adsorption with carbon-based nanoparticles has also been investigated (Chen Zhang et al., 2019).

Oxides of sulphur and nitrogen (SO_x and NO_x)

Acid rain and respiratory issues are caused by SO₂ and NO_x emissions from industrial activities and automobile exhaust. Alkali-modified porous carbon, cerium-based MOFs, and TiO₂ nanoparticles are examples of sustainable adsorbents that have shown effective adsorption and catalytic conversion of these pollutants into less hazardous chemicals (Yaomin Jin et al., 2005; Tara L Greaver et al., 2012).

Subramani Rajapandi and Kousalya

Fine particulate matter (PM 2.5 and PM 10)

The FPM is a serious health hazard because it enters the bloodstream and lungs deeply. To effectively adsorb and trap PM, nanomaterials-based filters and coatings, such as chitosan composites, cellulose nanofibers, and functionalized graphene sheets, have been used. The Nanomaterials have a charge transfer capability and it attract and capture the FPM, that is electrostatic attraction or capture (Mark E.Fenn et al., 2013; Bilkis A.Begum et al., 2013).

Mechanism of Air pollutant removal

Photocatalytic method

Using nanomaterials, especially semiconductor-based photocatalysts like Zinc oxide (ZnO) and Titanium dioxide (TiO₂), photocatalysis is a very efficient method of reducing air pollution. Through this process, light energy activates a photocatalyst, which causes air pollutants to degrade or change.

A photocatalyst (such as TiO₂) absorbs photons with energy equal to or higher than its band gap energy when it is subjected to UV or visible light. This creates electron-hole pairs (e_{CB}^- and h_{VB}^+) by exciting electrons from the valence band (VB) to the conduction band (CB) (M. Faraldos et al., 2015).

In this reaction based some of the electron hole pairs reacts with water and oxygen molecules at end of the reaction the hydroxyl radicals (OH \cdot), superoxide radicals (O₂ \cdot^-) and hydrogen peroxide (H₂O₂).

High-reactivity hydroxyl radicals ($\cdot\text{OH}$) are produced, which target air pollutants and convert organic chemicals (such volatile organic compounds or VOCs) into non-toxic byproducts like CO₂ and H₂O.

The photocatalyst surface is free to take part in other reactions when the end products, such CO₂ and H₂O, are desorbed from it (Jean-Marie Herrmann et al., 1999).

Adsorption

The removal of air pollutants is often accomplished via adsorption and filtration, in which nanomaterials function as very effective adsorbents because of their huge surface area, high porosity, and adjustable surface chemistry. Gaseous contaminants are very well-captured by such methods (W.M.T.M. Reimerink et al., 1998). The surface phenomena known as adsorption occur when contaminants attach themselves to the surface of nanomaterials through physisorption or chemisorptions interactions. The characteristics of the adsorbent and adsorbate both influence the adsorption mechanism. After reacting with the ZnO surface, SO₂ forms zinc sulfite (ZnSO₃), which can then undergo further oxidation to produce sulfate.

When volatile organic compounds (VOCs) come into contact with graphene or activated carbon's large surface area, they are drawn in and extracted from the atmosphere (Michaela Kendall et al., 2003).

Catalytic Oxidation

Catalytic oxidation and reduction are popular techniques for controlling air pollution, especially for the elimination of harmful gases like carbon monoxide (CO), nitrogen oxides (NO_x), and volatile organic compounds (VOCs). These processes use nanomaterials, particularly metal and metal oxide nanoparticles, as catalysts to speed up the conversion of pollutants into less hazardous forms at lower temperatures (Saad F. Tahir et al., 1996).

Subramani Rajapandi and Kousalya

The process of catalytic oxidation generates non-toxic byproducts when air pollutants react with oxygen (O₂) in the presence of a catalyst. Effective oxidation catalysts include metal oxides (MnO₂, CeO₂, and TiO₂) and noble metal nanoparticles (Pt, Pd, and Au) (Wiesaw J. Parus et al., 2009).

The volatile organic compound of the formaldehyde reacts with contaminated air, it produces:

Catalytic Reduction

The Catalytic reduction method is a crucial one and its can control the air pollution. The vehicle emissions, unburned hydrocarbons, sulphur dioxide (SO₂), Carbon dioxide (CO₂) and some other harmful pollutants from industries. This process reduces the contaminants of the air pollutions through the nanoparticles of the metal oxides and carbon nanoparticles reduced and produce the water (H₂O) and Nitrogen (N₂) (Md Ariful Ahsan et al., 2009). The most applied wide technique of this reduction process is Selective Catalytic Reduction (SCR), its extensively used in power plants, industrial boilers, diesel engines, exhaust treatments. In the selective catalytic reduction, a reducing agent, such urea or ammonia (NH₃), is added to the flue gas stream in SCR. There, it interacts with NO₂ in the presence of a catalyst to produce N₂ and H₂O, greatly lowering NO₂ emissions (Hyo-sik Kim et al., 2020).

Along with NO₂ reduction, sulfur dioxide (SO₂) removal also uses catalytic reduction, in which reducing agents such as carbon monoxide (CO) or hydrogen (H₂) are employed to convert SO₂ to elemental sulfur (S):

Antibacterial and Antiviral Action on Bioaerosols

Airborne particles known as bioaerosols include bacteria, viruses, and fungal spores, among other microbes that can cause respiratory ailments and contaminate the environment. Nanomaterials have demonstrated great promise in inactivating airborne infections, especially metal-based nanoparticles (NPs), graphene derivatives, and photocatalysts (Chang Gyu Woo et al., 2015). Direct microbial membrane rupture, reactive oxygen species (ROS) production, metal ion release, and photocatalytic disinfection are the ways by which nanomaterials demonstrate antibacterial and antiviral action (Jeremie Pourchez et al., 2022).

Direct Disruption and Penetration

Through electrostatic interactions, nanoparticles (NPs), particularly those of silver (Ag), copper (Cu), and graphene oxide (GO), adhere to the membranes of bacteria and viruses. The sharp edges of carbon nanotubes (CNTs) and graphene oxide (GO) physically break down bacterial cell walls, allowing internal components to seep out. Direct interactions between viruses with lipid envelopes (like SARS-CoV-2 and influenza A) and positively charged nanoparticles (like ZnO and CuO) destabilize the viruses. For instance, silver nanoparticles (AgNPs) inhibit host cell adhesion and reproduction by binding to negatively charged viral proteins (Meisam Soleimani et al., 2021).

Production of Oxidative Stress and Reactive Oxygen Species (ROS)

Superoxide anions (O₂^{•-}), hydrogen peroxide (H₂O₂), and hydroxyl radicals (•OH) are among the ROS produced by certain nanoparticles (TiO₂, ZnO, and CuO). Proteins, lipids, and nucleic acids in bacterial and viral structures are harmed by ROS, which induce oxidative stress. (I.S. Mudwaya et al., 2020; Pascale S. J. Lakey et al., 2016).

**Subramani Rajapandi and Kousalya**

CONCLUSION

One of the most urgent environmental issues facing the world today is air pollution, which has a substantial impact on ecosystems, human health, and climatic stability. Although somewhat successful, traditional pollution control devices frequently have drawbacks such as excessive energy use, secondary pollution, and ineffective ultrafine particle removal. On the other hand, because of their large surface area, catalytic effectiveness, and adjustable characteristics, which allow for better performance in absorbing, breaking down, and changing pollutants into less dangerous forms, sustainable nanomaterials present a possible substitute. Numerous methods based on nanomaterials have shown great promise in reducing air pollution. Gaseous pollutants including NO_2 , SO_2 , and volatile organic compounds (VOCs) are effectively captured by adsorptive nanomaterials such as metal-organic frameworks (MOFs), activated carbon, and functionalized carbon nanotubes (CNTs). By using light energy to create reactive oxygen species (ROS), photocatalytic nanomaterials (such as TiO_2 , ZnO , and $\text{g-C}_3\text{N}_4$) convert harmful pollutants into ecologically safe byproducts. By efficiently removing particulate matter (PM_{10} , $\text{PM}_{2.5}$, and $\text{PM}_{0.1}$), bioaerosols, and airborne pathogens, nano-enabled filtration systems—such as electrospun nano fiber membranes and catalytic filters—significantly improve indoor and outdoor air quality. Furthermore, sterilizing air purification systems and stopping the transmission of airborne illnesses have been made easier with the introduction of antibacterial and antiviral nanomaterials like silver (Ag), copper (Cu), and zinc oxide (ZnO).

The widespread application of nanotechnology for the reduction of air pollution still faces a number of obstacles in spite of these developments. The long-term sustainability and safety of engineered nanomaterials are called into question due to their possible toxicity and environmental effect. Certain nanoparticles may have bioaccumulative effects or inadvertently affect the environment when they are introduced into the environment. Future studies should prioritize the creation of environmentally benign, non-toxic, and biodegradable nanomaterials that provide excellent performance with low environmental hazards in order to allay these worries. More research should be done on waste-derived nanostructures, bio-inspired nanomaterials, and green synthesis techniques to advance sustainable air filtration technology.

Furthermore, two important considerations for practical implementations of nano material-based air pollution management methods are still their cost and scalability. While laboratory-scale research has shown encouraging outcomes, cost-effective synthesis techniques, material stability, and energy efficiency still need to be optimized for mass production and commercial viability. Future developments should concentrate on incorporating nanomaterials into smart air filters, self-cleaning coatings, and industrial air purification systems that are already in place in order to make these technologies affordable and useful for broad use. In order to advance sustainable nanotechnology for the reduction of air pollution, we believe that multidisciplinary collaboration between scientists, engineers, policymakers, and industries is essential. In order to promote the appropriate development and application of nanomaterials in air purification systems, governments and environmental organizations should put in place regulatory frameworks and incentives. The use of these cutting-edge materials in industrial and urban air management can also increase as a result of public education and knowledge regarding nanotechnology-driven pollution control. By offering effective, scalable, and eco-friendly solutions, sustainable nanomaterials, in summary, present a revolutionary way to combat air pollution. As a researcher in environmental chemistry and nanotechnology, I am convinced that sustained advancements in green nanomaterials, toxicity evaluations, and practical applications will influence the direction of air pollution reduction in the future. We can help to create a healthier, more sustainable planet for coming generations and create a clean atmosphere by utilizing the potential of sustainable engineering and nano science.

Conflict of Interest

The Authors declare that there is no conflict of interest regarding the publication of this review manuscript.

**Subramani Rajapandi and Kousalya****Authorship Contribution**

Subramani Rajapandi conceptualized the theme of mini review, performed the literature survey and prepared the initial draft of the manuscript. G. N. Kousalya critically reviewed the manuscript, edited the content clarity and provided valuable suggestions for improving the overall structure. All the authors read and approved the final version of the manuscript.

ABSTRACT

The major objective of the study is to introduce novel forms of $\mathfrak{N}_s\mathfrak{D}_q\mathcal{R}l, \mathfrak{N}_\alpha\mathfrak{D}_q\mathcal{H}f$ – spaces and to analyse their various properties and characterizations. Further, we provide a new notion of $\mathfrak{N}_\alpha\mathfrak{D}_q$ - closed sets and establish their numerous distinctive properties.

Keywords: \mathfrak{D}_q - Nano topological space, $\mathfrak{N}\mathfrak{D}_q\mathcal{R}l$ -space, $\mathfrak{N}_s\mathfrak{D}_q\mathcal{R}l$ -space, $\mathfrak{N}\mathfrak{D}_q\mathcal{H}f$ -space and $\mathfrak{N}_\alpha\mathfrak{D}_q\mathcal{H}f$ -space, $\mathfrak{N}_\alpha\mathfrak{D}_q$ - closed sets.

INTRODUCTION

In 2013, Lellis Thivagar introduced the concept of Nano-topological spaces[1]. Many authors have employed Nano-topology in many different kinds of applications [2-4]. The notion of ideal Nano-topological space was introduced by Parimala[5]. In Ideal Nano-topological space, different kinds generalized open and closed sets are introduced[6-9]. Maheswari and Rekha have proposed a new kind of ideal Nano-topological space called \mathfrak{D}_q -Nano topological space and explored different kinds of open sets in \mathfrak{D}_q -Nano topological space[10]. Also they generated $\mathfrak{N}_s\mathfrak{D}_q\mathcal{R}l$ -space and $\mathfrak{N}_{\overline{0}s}\mathfrak{D}_q\mathcal{R}l$ -space in \mathfrak{D}_q -Nano topological space. In this current research, we explore the concepts of $\mathfrak{N}_s\mathfrak{D}_q\mathcal{R}l$ and $\mathfrak{N}_\alpha\mathfrak{D}_q\mathcal{H}f$ – spaces in \mathfrak{D}_q -Nano topological space and discuss their characteristics properties.

Rekha and Maheswari

PRELIMINARIES

In this section, some important definitions are given that are useful for our results.

Definition 2.1[10]. Let \mathfrak{K} be an ideal in the universal set \mathcal{U} and $C \subseteq \mathcal{U}$. Then the Nano left dynamic lower, upper and boundary regions are defined as,

$$\underline{\mathcal{D}}_{\mathfrak{K}}(C) = \{t \in \mathcal{U} : \mathfrak{K}_i'(t) \cap C^c \in \mathfrak{K} \text{ and } \mathfrak{K}_i'(t) \subseteq C\},$$

$$\overline{\mathcal{D}}_{\mathfrak{K}}(C) = \{t \in \mathcal{U} : \mathfrak{K}_i'(t) \cap C \notin \mathfrak{K} \text{ and } \mathfrak{K}_i'(t) \cap C \neq \emptyset\} \text{ where } \mathfrak{K}_i'(t) = \{f \in \mathcal{U} : \mathfrak{K}_\ell(t) \subseteq \mathfrak{K}_\ell(f)\} \text{ and } \mathfrak{B}_{\mathcal{D}_{\mathfrak{K}}}(C) = \overline{\mathcal{D}}_{\mathfrak{K}}(C) - \underline{\mathcal{D}}_{\mathfrak{K}}(C).$$

Then, the Nano left dynamic topology (called $\mathcal{D}_{\mathfrak{K}}$ - Nano topology) on \mathcal{U} with respect $C \subseteq \mathcal{U}$ is defined as, $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}(C) = \{\mathcal{U}, \emptyset, \underline{\mathcal{D}}_{\mathfrak{K}}(C), \overline{\mathcal{D}}_{\mathfrak{K}}(C), \mathfrak{B}_{\mathcal{D}_{\mathfrak{K}}}(C)\}$. The collection $\mathfrak{B}_{\mathcal{D}_{\mathfrak{K}}}(C) = \{\mathcal{U}, \underline{\mathcal{D}}_{\mathfrak{K}}(C), \overline{\mathcal{D}}_{\mathfrak{K}}(C), \mathfrak{B}_{\mathcal{D}_{\mathfrak{K}}}(C)\}$ forms a basis for $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}(C)$ and the $\mathcal{D}_{\mathfrak{K}}$ - Nano topological space is denoted by $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathfrak{K}}(C), \mathfrak{K})$. The elements of $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}(C)$ are called $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}$ - open sets and its complements are called $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}$ - closed sets. Then, $int_{\mathfrak{N}\mathcal{D}_{\mathfrak{K}}}(C) = \bigcup_{Q \in \mathfrak{N}\mathcal{D}_{\mathfrak{K}}(C)} \{Q/Q \subseteq C\}$ and $cl_{\mathfrak{N}\mathcal{D}_{\mathfrak{K}}}(C) = \bigcap_{Q \in \mathfrak{N}\mathcal{D}_{\mathfrak{K}}(C)} \{Q/Q \supseteq C\}$.

Definition 2.2[10]. Let $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathfrak{K}}(C), \mathfrak{K})$ be a $\mathcal{D}_{\mathfrak{K}}$ - Nano topological space. An operator $S^{\mathcal{D}_{\mathfrak{K}}} : \wp(\mathcal{U}) \rightarrow \wp(\mathcal{U})$ is known as the dynamic function of \mathfrak{K} on \mathcal{U} and defined as

$$S^{\mathcal{D}_{\mathfrak{K}}} = \{j \in \mathcal{U} : B \cap S \notin \mathfrak{K} \text{ for all } B \in \mathfrak{N}\mathcal{D}_{\mathfrak{K}}(j)\}.$$

The corresponding closure operator of $S^{\mathcal{D}_{\mathfrak{K}}}$ is defined as $\mathcal{D}_{\mathfrak{K}}^*(S) = S \cup S^{\mathcal{D}_{\mathfrak{K}}}$.

Definition 2.3 [10]. Let F be a subset of $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathfrak{K}}(C), \mathfrak{K})$. Then,

1. F is $\mathcal{D}_{\mathfrak{K}}^*$ -closed if $\mathcal{D}_{\mathfrak{K}}^*(F) = F$ whenever $F \subseteq S, S$ is $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}$ - open.
2. F is $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ -closed if $\mathcal{D}_{\mathfrak{K}}^*(F) \subseteq S$ whenever $F \subseteq S, S$ is $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}$ - open. The collection of all $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ -closed sets are denoted by $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}\mathcal{C}(P)$.
3. The collection of all $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ -closed sets are denoted by $\mathcal{D}_{\mathfrak{K}}^*\mathcal{C}(P)$.
4. F is $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ -closed if $\mathcal{D}_{\mathfrak{K}}^*(F) \subseteq S$ whenever $F \subseteq S, S$ is $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ - open. The collection of all $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ -closed sets are denoted by $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}\mathcal{C}(C)$.

Definition 2.4[10]. Let $f : (\mathcal{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathcal{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ be a map. Then,

1. f is $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ -continuous function if $f^{-1}(B)$ is $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ - open subset of $(\mathcal{U}_a, \mathfrak{N}^a, \mathfrak{K}_a)$ whenever B is $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}$ -open subset of $(\mathcal{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$.
2. f is $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ -irresolute if $f^{-1}(B)$ is $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ - open whenever B is $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ -open

$\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}\mathcal{R}\mathcal{L}$ -Spaces

In this section a new types of regular spaces in $\mathcal{D}_{\mathfrak{K}}$ -Nano topological space are introduced and their properties are analysed.

Definition 3.1. A $\mathcal{D}_{\mathfrak{K}}$ -Nano topological space $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathfrak{K}}(C), \mathfrak{K})$ is $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ -regular space (known as $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}\mathcal{R}\mathcal{L}$ -space) if for any $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}$ -closed set \mathcal{L}_{ψ} and $\eta \notin \mathcal{L}_{\psi}$, there exists disjoint $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ - open sets \mathfrak{W}_{η} and \mathfrak{W}_{ψ} with $\eta \in \mathfrak{W}_{\eta}$ and $\mathcal{L}_{\psi} \subseteq \mathfrak{W}_{\psi}$.

Theorem 3.2. Every $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}\mathcal{R}\mathcal{L}$ -space is $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}\mathcal{R}\mathcal{L}$ -space.

Proof Let $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathfrak{K}}(C), \mathfrak{K})$ be a $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}\mathcal{R}\mathcal{L}$ -space, \mathcal{L}_{ψ} is $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}$ -closed set and $\eta \in \mathcal{U}$ and $\eta \notin \mathcal{L}_{\psi}$. Then there exists disjoint $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}$ -open sets \mathfrak{W}_{η} and \mathfrak{W}_{ψ} with $\eta \in \mathfrak{W}_{\eta}$ and $\mathcal{L}_{\psi} \subseteq \mathfrak{W}_{\psi}$. Since every $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}$ -open sets are $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ -open sets, \mathfrak{W}_{η} and \mathfrak{W}_{ψ} are $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}$ -open sets. Hence, $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathfrak{K}}(C), \mathfrak{K})$ is a $\mathfrak{N}_{\mathcal{D}_{\mathfrak{K}}}\mathcal{R}\mathcal{L}$ -space.

Theorem 3.3. Let $\Lambda : (\mathcal{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathcal{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ be a $\mathfrak{N}\mathcal{D}_{\mathfrak{K}}$ -continuous bijective function. Then the following are true.

Rekha and Maheswari

- i) If Λ is $\mathfrak{N}_S\mathfrak{D}_Q$ -open function and \mathfrak{U}_a is $\mathfrak{N}\mathfrak{D}_Q$ $\mathcal{R}\ell$ -space, then \mathfrak{U}_b is also.
- ii) If Λ is $\mathfrak{N}\mathfrak{D}_Q$ -closed function and \mathfrak{U}_b is $\mathfrak{N}\mathfrak{D}_Q$ $\mathcal{R}\ell$ -space, then \mathfrak{U}_a is $\mathfrak{N}_S\mathfrak{D}_Q$ $\mathcal{R}\ell$ -space.

Proof. (i) Let \mathfrak{Q}_ψ be a $\mathfrak{N}\mathfrak{D}_Q$ -closed subset of \mathfrak{U}_b and $\eta \notin \mathfrak{Q}_\psi$. Let $\eta = \Lambda(\zeta)$ for some $\zeta \in \mathfrak{U}_a$. Then $\Lambda^{-1}(\mathfrak{Q}_\psi)$ is $\mathfrak{N}\mathfrak{D}_Q$ -Closed in \mathfrak{U}_a with $\zeta \notin \Lambda^{-1}(\mathfrak{Q}_\psi)$. Then, there exists disjoint $\mathfrak{N}\mathfrak{D}_Q$ -open sets \mathfrak{W}_ζ and \mathfrak{W}_ψ with $\zeta \in \mathfrak{W}_\zeta$ and $\Lambda^{-1}(\mathfrak{Q}_\psi) \subset \mathfrak{W}_\psi$. Also $\zeta = \Lambda(\zeta) \in \Lambda(\mathfrak{W}_\zeta)$ and $\mathfrak{Q}_\psi \subset \Lambda(\mathfrak{W}_\psi)$. Since $\Lambda(\mathfrak{W}_\zeta)$ and $\Lambda(\mathfrak{W}_\psi)$ are $\mathfrak{N}_S\mathfrak{D}_Q$ -open sets in \mathfrak{U}_b and $\Lambda(\mathfrak{W}_\zeta) \cap \Lambda(\mathfrak{W}_\psi) = \emptyset$, \mathfrak{U}_b is $\mathfrak{N}\mathfrak{D}_Q$ $\mathcal{R}\ell$ -space.

(ii) Let \mathfrak{Q}_ψ be a $\mathfrak{N}\mathfrak{D}_Q$ -closed subset of \mathfrak{U}_a and $\eta \notin \mathfrak{Q}_\psi$. Then, $\Lambda(\mathfrak{Q}_\psi)$ is $\mathfrak{N}\mathfrak{D}_Q$ -closed in \mathfrak{U}_b with $\eta \notin \Lambda(\mathfrak{Q}_\psi)$. Since \mathfrak{U}_b is a $\mathfrak{N}\mathfrak{D}_Q$ $\mathcal{R}\ell$ -space, there exists disjoint $\mathfrak{N}\mathfrak{D}_Q$ -open sets \mathfrak{W}_η and \mathfrak{W}_ψ with $\eta \in \mathfrak{W}_\eta$, $\Lambda(\mathfrak{Q}_\psi) \subset \mathfrak{W}_\psi$. Also, $\eta \in \Lambda^{-1}(\mathfrak{W}_\eta)$ and $\mathfrak{Q}_\psi \subset \Lambda^{-1}(\mathfrak{W}_\psi)$. Since $\Lambda^{-1}(\mathfrak{W}_\eta)$ and $\Lambda^{-1}(\mathfrak{W}_\psi)$ are $\mathfrak{N}_S\mathfrak{D}_Q$ -open subsets of \mathfrak{U}_a with $\Lambda^{-1}(\mathfrak{W}_\eta) \cap \Lambda^{-1}(\mathfrak{W}_\psi) = \emptyset$, \mathfrak{U}_a is a $\mathfrak{N}_S\mathfrak{D}_Q$ $\mathcal{R}\ell$ -space.

Theorem 3.4. If $\Lambda: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ is a $\mathfrak{N}_S\mathfrak{D}_Q$ -irresolute, $\mathfrak{N}\mathfrak{D}_Q$ -closed bijection and \mathfrak{U}_b is $\mathfrak{N}_S\mathfrak{D}_Q$ $\mathcal{R}\ell$ -space, then \mathfrak{U}_a is also.

Proof Let \mathfrak{Q}_ψ be a $\mathfrak{N}\mathfrak{D}_Q$ -closed subset of \mathfrak{U}_a and $\eta \notin \mathfrak{Q}_\psi$. Then, $\Lambda(\mathfrak{Q}_\psi)$ is $\mathfrak{N}\mathfrak{D}_Q$ -closed in \mathfrak{U}_b . Since \mathfrak{U}_b is a $\mathfrak{N}_S\mathfrak{D}_Q$ $\mathcal{R}\ell$ -space, there exists $\mathfrak{N}_S\mathfrak{D}_Q$ -open sets \mathfrak{W}_η and \mathfrak{W}_ψ with $\eta \in \mathfrak{W}_\eta$ and $\Lambda(\mathfrak{Q}_\psi) \subset \mathfrak{W}_\psi$. Here, $\Lambda^{-1}(\mathfrak{W}_\eta)$ and $\Lambda^{-1}(\mathfrak{W}_\psi)$ are $\mathfrak{N}_S\mathfrak{D}_Q$ -open subsets of \mathfrak{U}_a with $\Lambda^{-1}(\mathfrak{W}_\eta) \cap \Lambda^{-1}(\mathfrak{W}_\psi) = \emptyset$. Hence, \mathfrak{U}_a is a $\mathfrak{N}_S\mathfrak{D}_Q$ $\mathcal{R}\ell$ -space.

$\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q$ Spaces

In this section a new types of Hausdroff spaces are proposed in \mathfrak{D}_Q -Nano topological space and their properties are analysed.

Definition 4.1. A subset Q of $(\mathfrak{U}, \mathfrak{N}\mathfrak{D}_Q(C), \mathfrak{K})$ is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q$ - closed if $\mathfrak{D}_Q^*(Q) \subseteq S$ whenever $Q \subseteq S$, S is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q$ - open. The collection of all $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q$ -closed sets are denoted by $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q\mathbb{C}(C)$.

Example 4.2. Let $= \{\rho, \varsigma, v, \xi, \tau\}$, $C = \{\rho, \varsigma\}$, the ideal be

$$\mathfrak{K} = \{\emptyset, \{\rho\}, \{v\}, \{\xi\}, \{\rho, \xi\}, \{\rho, v\}, \{v, \xi\}, \{\rho, v, \xi\}\}$$

and the relation be $R = \{(\rho, \rho), (\rho, \varsigma), (\rho, v), (\varsigma, \varsigma), (v, \rho), (v, \xi), (\xi, \tau), (\tau, \varsigma)\}$.

Then $\mathfrak{N}\mathfrak{D}_Q\mathbb{C}(C) = \{\mathfrak{U}, \emptyset, \{v, \tau\}, \{\varsigma, v, \tau\}, \{\rho, v, \xi, \tau\}\}$,

$\mathfrak{D}_Q^*\mathbb{C}(C) = \{\mathfrak{U}, \emptyset, \{\rho\}, \{v\}, \{\xi\}, \{\tau\}, \{\rho, v\}, \{\rho, \xi\}, \{\rho, \tau\}, \{v, \xi\}, \{v, \tau\}, \{\rho, v, \tau\}, \{\rho, v, \xi\}, \{v, \xi, \tau\}\}$

$\{\varsigma, v, \tau\}, \{\rho, \varsigma, v, \tau\}, \{\varsigma, v, \xi, \tau\}, \{\rho, v, \xi, \tau\}$,

$\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q\mathbb{C}(C) = \{\mathfrak{U}, \emptyset, \{\rho\}, \{v\}, \{\xi\}, \{\tau\}, \{\rho, v\}, \{\rho, \xi\}, \{\rho, \tau\}, \{\varsigma, v\}, \{\varsigma, \tau\}, \{v, \xi\}, \{v, \tau\}, \{\xi, \tau\}, \{\rho, \varsigma, v\}, \{\rho, \varsigma, \tau\}, \{\rho, \varsigma, \xi\},$

$\{\rho, \xi, \tau\}, \{\rho, v, \tau\}, \{\rho, v, \xi\}, \{v, \xi, \tau\}, \{\varsigma, \xi, \tau\}, \{\varsigma, v, \tau\}, \{\varsigma, v, \xi\}, \{\rho, \varsigma, v, \xi\}, \{\rho, \varsigma, v, \tau\}, \{\rho, \varsigma, \xi, \tau\}$

$\{\varsigma, v, \xi, \tau\}, \{\rho, v, \xi, \tau\}\}$ and $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q\mathbb{C}(C) = \{\mathfrak{U}, \emptyset, \{\rho\}, \{v\}, \{\xi\}, \{\tau\}, \{\rho, v\}, \{\rho, \xi\}, \{\rho, \tau\}, \{v, \xi\}, \{v, \tau\}, \{\rho, v, \xi\}, \{\rho, v, \tau\}, \{\varsigma, v, \tau\}, \{v, \xi, \tau\},$

$\{\rho, \varsigma, v, \tau\}, \{\rho, v, \xi, \tau\}, \{\varsigma, v, \xi, \tau\}\}$

Remark 4.3

- 1. Every $\mathfrak{N}\mathfrak{D}_Q$ -closed set is also a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q$ -closed set
- 2. Every \mathfrak{D}_Q^* -closed set is also a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q$ -closed set
- 3. Every $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q$ -closed set is a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q$ -closed set.

Definition 4.4. Let $(\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a)$ and $(\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ be two $\mathfrak{N}\mathfrak{D}_Q$ -topological spaces and $\Lambda: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$. Then Λ is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q$ -continuous if $\Lambda^{-1}(\mathfrak{S})$ of every $\mathfrak{N}\mathfrak{D}_Q$ -open set \mathfrak{S} in \mathfrak{U}_b is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_Q$ -open in \mathfrak{U}_a .

Definition 4.5. Let $(\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a)$ and $(\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ be two $\mathfrak{N}\mathfrak{D}_Q$ -topological spaces and $\Lambda: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$.

Rekha and Maheswari

Then Λ is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -irresolute if $\Lambda^{-1}(\mathfrak{S})$ of every $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -closed \mathfrak{S} in \mathfrak{U}_b for all $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -closed in \mathfrak{U}_a .

Theorem 4.6. A function $\Lambda: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous if and only if $\Lambda^{-1}(\mathfrak{S})$ is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -closed in \mathfrak{U}_a for all $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -closed \mathfrak{S} in \mathfrak{U}_b .

Proof Assume that $\Lambda^{-1}(\mathfrak{S})$ is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -closed in \mathfrak{U}_a for all $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -closed in \mathfrak{U}_b . Then \mathfrak{S}^c is $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -open set in \mathfrak{U}_b and also $\Lambda^{-1}(\mathfrak{S}^c)$ is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -closed in \mathfrak{U}_a . Since $\Lambda^{-1}(\mathfrak{S}^c) = (\Lambda^{-1}(\mathfrak{S}))^c$, $\Lambda^{-1}(\mathfrak{S})$ is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open in \mathfrak{U}_a . Hence, Λ is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous. Conversely, let $\Lambda: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ be a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function and \mathfrak{Q} be a $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -open set in \mathfrak{U}_b . Then, \mathfrak{Q}^c is a $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -closed set in \mathfrak{U}_b . Also $\Lambda^{-1}(\mathfrak{Q})$ is a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open in \mathfrak{U}_a . Since, $\Lambda^{-1}(\mathfrak{Q}^c) = (\Lambda^{-1}(\mathfrak{Q}))^c$, $\Lambda^{-1}(\mathfrak{Q}^c)$ is a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -closed in \mathfrak{U}_a .

Theorem 4.7. Every $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function is a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function.

Proof Let $\Lambda: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ be a $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function and \mathfrak{Q} be a $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -open set in \mathfrak{U}_b . Then, $\Lambda^{-1}(\mathfrak{Q})$ is a $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -open set in \mathfrak{U}_a . Since every $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -open set is also a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open set, Λ is also the $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function.

Definition 4.8. A function $\Lambda: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ is $\mathfrak{N}_{\bar{\gamma}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous if $\Lambda^{-1}(\mathfrak{Q})$ is a $\mathfrak{N}_{\bar{\gamma}}\mathfrak{D}_{\mathfrak{Q}}$ -open subset of \mathfrak{U}_a for all $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -open subset \mathfrak{Q} of \mathfrak{U}_b .

Theorem 4.9. Every $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function is a $\mathfrak{N}_{\bar{\gamma}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function.

Proof Let $\Lambda: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ be a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function. Let \mathfrak{Q} be $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open subset of \mathfrak{U}_b . Then, $\Lambda^{-1}(\mathfrak{Q})$ is the $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open subset of \mathfrak{U}_a . Since every $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open set is a $\mathfrak{N}_{\bar{\gamma}}\mathfrak{D}_{\mathfrak{Q}}$ -open set, $\Lambda^{-1}(\mathfrak{Q})$ is a $\mathfrak{N}_{\bar{\gamma}}\mathfrak{D}_{\mathfrak{Q}}$ -open set in \mathfrak{U}_a . Hence, Λ is the $\mathfrak{N}_{\bar{\gamma}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function.

Remark 4.10. Every $\mathfrak{N}_{\bar{\gamma}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function need not be a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function. This can be proved by the fact that every $\mathfrak{N}_{\bar{\gamma}}\mathfrak{D}_{\mathfrak{Q}}$ -closed set need not be a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -closed set. From example 4.2, $\{\zeta, v\}$ is $\mathfrak{N}_{\bar{\gamma}}\mathfrak{D}_{\mathfrak{Q}}$ -closed set but not $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -closed set.

Theorem 4.11. If $\Lambda_1: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ and $\Lambda_2: (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b) \rightarrow (\mathfrak{U}_c, \mathfrak{N}^c, \mathfrak{K}_c)$ are $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -irresolute then, $\Lambda_1 \circ \Lambda_2: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_c, \mathfrak{N}^c, \mathfrak{K}_c)$ is also a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -irresolute.

Proof Let \mathfrak{Q} be $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open in \mathfrak{U}_c . Then $\Lambda_2^{-1}(\mathfrak{Q}) = \mathfrak{S}$ is a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open in \mathfrak{U}_b . Since Λ_1 is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -irresolute, $(\Lambda_1 \circ \Lambda_2)^{-1}(\mathfrak{Q}) = \Lambda_1^{-1}(\Lambda_2^{-1}(\mathfrak{Q})) = \Lambda_1^{-1}(\mathfrak{S})$ is a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open subset of \mathfrak{U}_a . Hence, $\Lambda_1 \circ \Lambda_2$ is the $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -irresolute function.

Theorem 4.12. If $\Lambda_1: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ is a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -irresolute function and $\Lambda_2: (\mathfrak{U}_b, \mathfrak{N}^b, \mathfrak{K}_b) \rightarrow (\mathfrak{U}_c, \mathfrak{N}^c, \mathfrak{K}_c)$ is a $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function then, $\Lambda_1 \circ \Lambda_2: (\mathfrak{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathfrak{U}_c, \mathfrak{N}^c, \mathfrak{K}_c)$ is a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function.

Proof Let \mathfrak{Q} be $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open in \mathfrak{U}_c . Since Λ_2 is the $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function, $\Lambda_2^{-1}(\mathfrak{Q})$ is also a $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -open subset of \mathfrak{U}_b . Also since every $\mathfrak{N}\mathfrak{D}_{\mathfrak{Q}}$ -open set is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open set, $\Lambda_2^{-1}(\mathfrak{Q}) = \mathfrak{S}$ is $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open in \mathfrak{U}_b . Here Λ_1 is the $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -irresolute function, $(\Lambda_1 \circ \Lambda_2)^{-1}(\mathfrak{Q}) = \Lambda_1^{-1}(\Lambda_2^{-1}(\mathfrak{Q})) = \Lambda_1^{-1}(\mathfrak{S})$ is also the $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -open subset of \mathfrak{U}_a . Hence, $\Lambda_1 \circ \Lambda_2$ is a $\mathfrak{N}_{\bar{\alpha}}\mathfrak{D}_{\mathfrak{Q}}$ -continuous function.

Rekha and Maheswari

Theorem 4.13. If $\Lambda_1: (\mathcal{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathcal{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ is a $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}$ -continuous function and $\Lambda_2: (\mathcal{U}_b, \mathfrak{N}^b, \mathfrak{K}_b) \rightarrow (\mathcal{U}_c, \mathfrak{N}^c, \mathfrak{K}_c)$ is a $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -continuous function then, $\Lambda_1 \circ \Lambda_2: (\mathcal{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathcal{U}_c, \mathfrak{N}^c, \mathfrak{K}_c)$ is a $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}$ -continuous function.

Proof Let \mathcal{Q} be $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -open in \mathcal{U}_c . Then, $\Lambda_2^{-1}(\mathcal{Q}) = \mathcal{S}$ is the $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -open subset of \mathcal{U}_b .

Here, Λ_1 is the $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -continuous function.

Then $(\Lambda_1 \circ \Lambda_2)^{-1}(\mathcal{Q}) = \Lambda_1^{-1}(\Lambda_2^{-1}(\mathcal{Q})) = \Lambda_1^{-1}(\mathcal{S})$ is a $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -open subset of \mathcal{U}_a .

Hence, $\Lambda_1 \circ \Lambda_2$ is a $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}$ -continuous function.

Definition 4.14. A $\mathcal{D}_{\mathcal{Q}}$ -nano topological space $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathcal{Q}}(\mathcal{G}), \mathfrak{K})$ is $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -Hausdroff space ($\mathfrak{N}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space) if for any two different points η and ζ of \mathcal{U} , there are disjoint non-empty $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -open sets \mathfrak{F}_{η} and \mathfrak{F}_{ζ} of \mathcal{U} such that $\eta \in \mathfrak{F}_{\eta}$ and $\zeta \in \mathfrak{F}_{\zeta}$.

Definition 4.15. A $\mathcal{D}_{\mathcal{Q}}$ -nano topological space $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathcal{Q}}(\mathcal{G}), \mathfrak{K})$ is $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}^*$ -Hausdroff space ($\mathfrak{N}\mathcal{D}_{\mathcal{Q}}^*\mathfrak{H}\mathfrak{S}$ -space) if for any two different points η and ζ of \mathcal{U} , there are disjoint non-empty $\mathcal{D}_{\mathcal{Q}}^*$ -open sets \mathfrak{F}_{η} and \mathfrak{F}_{ζ} of \mathcal{U} such that $\eta \in \mathfrak{F}_{\eta}$ and $\zeta \in \mathfrak{F}_{\zeta}$.

Definition 4.16. A $\mathcal{D}_{\mathcal{Q}}$ -nano topological space $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathcal{Q}}(\mathcal{G}), \mathfrak{K})$ is called as $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}$ -Hausdroff space ($\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space) if for any two disjoint points η and ζ of \mathcal{U} , there are disjoint non-empty $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}$ -open sets \mathfrak{F}_{η} and \mathfrak{F}_{ζ} of \mathcal{U} such that $\eta \in \mathfrak{F}_{\eta}$ and $\zeta \in \mathfrak{F}_{\zeta}$.

Theorem 4.17. Every $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space is a $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}^*\mathfrak{H}\mathfrak{S}$ -space.

Proof Let $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathcal{Q}}(\mathcal{G}), \mathfrak{K})$ be a $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space. Let η and ζ be any two different points of \mathcal{U} .

Then, there are two disjoint, non-empty $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -open subsets \mathfrak{F}_{η} and \mathfrak{F}_{ζ} of \mathcal{U} such that $\eta \in \mathfrak{F}_{\eta}$ and $\zeta \in \mathfrak{F}_{\zeta}$. Since every $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -open set is also a $\mathcal{D}_{\mathcal{Q}}^*$ -open set, \mathfrak{F}_{η} and \mathfrak{F}_{ζ} are disjoint, non-empty $\mathcal{D}_{\mathcal{Q}}^*$ -open subsets of \mathcal{U} such that $\eta \in \mathfrak{F}_{\eta}$ and $\zeta \in \mathfrak{F}_{\zeta}$. Hence, $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathcal{Q}}(\mathcal{G}), \mathfrak{K})$ is a $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}^*\mathfrak{H}\mathfrak{S}$ -space.

Theorem 4.18. Every $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space is a $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space.

Proof Let $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathcal{Q}}(\mathcal{G}), \mathfrak{K})$ be a $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space. Let η and ζ be any two different points of \mathcal{U} .

Then, there are two disjoint, non-empty $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -open subsets \mathfrak{F}_{η} and \mathfrak{F}_{ζ} of \mathcal{U} such that $\eta \in \mathfrak{F}_{\eta}$ and $\zeta \in \mathfrak{F}_{\zeta}$. Since every $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -open set is also a $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}$ -open set, \mathfrak{F}_{η} and \mathfrak{F}_{ζ} are disjoint, non-empty $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}$ -open subsets of \mathcal{U} such that $\eta \in \mathfrak{F}_{\eta}$ and $\zeta \in \mathfrak{F}_{\zeta}$. Hence, $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathcal{Q}}(\mathcal{G}), \mathfrak{K})$ is a $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space.

Example 4.19. Let $\mathcal{U} = \{\lambda, \xi, \rho\}$, $\mathfrak{K} = \{\phi, \{\xi\}, \{\rho\}, \{\xi, \rho\}\}$ and $\mathcal{Q} = \{\lambda, \xi\}$.

Then $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}(\mathcal{Q}) = \{\mathcal{U}, \phi, \{\lambda\}, \{\xi, \rho\}\}$. Here, $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathcal{Q}}(\mathcal{G}), \mathfrak{K})$ is the $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}^*\mathfrak{H}\mathfrak{S}$ -space but not $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space. Also, $(\mathcal{U}, \mathfrak{N}\mathcal{D}_{\mathcal{Q}}(\mathcal{G}), \mathfrak{K})$ is $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ space but not $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space.

Theorem 4.20. If $\Lambda: (\mathcal{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathcal{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ is injective and $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}$ -continuous, then \mathcal{U}_a is a $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space.

Proof Let $\eta, \zeta \in \mathcal{U}_a$ and $\eta \neq \zeta$. Then, $\Lambda(\eta)$ and $\Lambda(\zeta)$ are different points of \mathcal{U}_b as Λ is injective. Since \mathcal{U}_b is $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space, there are disjoint $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}$ -open subsets \mathfrak{F}_{η} and \mathfrak{F}_{ζ} of \mathcal{U}_b such that $\Lambda(\eta) \in \mathfrak{F}_{\eta}$ and $\Lambda(\zeta) \in \mathfrak{F}_{\zeta}$. Also since Λ is a $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}$ -continuous function and $\mathfrak{F}_{\eta} \cap \mathfrak{F}_{\zeta} = \phi$, $\Lambda^{-1}(\mathfrak{F}_{\eta})$ and $\Lambda^{-1}(\mathfrak{F}_{\zeta})$ are different $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}$ -open subsets of \mathcal{U}_a such that $\eta \in \Lambda^{-1}(\mathfrak{F}_{\eta})$ and $\zeta \in \Lambda^{-1}(\mathfrak{F}_{\zeta})$. Hence, \mathcal{U}_a is a $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space.

Theorem 4.21. Let $\Lambda: (\mathcal{U}_a, \mathfrak{N}^a, \mathfrak{K}_a) \rightarrow (\mathcal{U}_b, \mathfrak{N}^b, \mathfrak{K}_b)$ be an injective and $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}$ -irresolute function from the $\mathfrak{N}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space \mathcal{U}_a to the $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space \mathcal{U}_b . Then, \mathcal{U}_a is a $\mathfrak{N}_{\bar{\alpha}}\mathcal{D}_{\mathcal{Q}}\mathfrak{H}\mathfrak{S}$ -space.

Rekha and Maheswari

Proof Let $\eta, \beta \in \mathcal{U}_a$ and $\eta \neq \beta$. Then, $\Lambda(\eta)$ and $\Lambda(\beta)$ are different points of \mathcal{U}_b as Λ is injective. Since \mathcal{U}_b is $\mathfrak{N}_{\alpha}\mathfrak{D}_{\varrho}\mathfrak{S}\mathfrak{f}$ -space, there are disjoint $\mathfrak{N}_{\alpha}\mathfrak{D}_{\varrho}$ -open subsets \mathfrak{F}_{η} and \mathfrak{F}_{β} of \mathcal{U}_b such that $\Lambda(\eta) \in \mathfrak{F}_{\eta}$ and $\Lambda(\beta) \in \mathfrak{F}_{\beta}$. Also since Λ is a $\mathfrak{N}_{\alpha}\mathfrak{D}_{\varrho}$ -irresolute function and $\mathfrak{F}_{\eta} \cap \mathfrak{F}_{\beta} = \phi$, $\Lambda^{-1}(\mathfrak{F}_{\eta})$ and $\Lambda^{-1}(\mathfrak{F}_{\beta})$ are different $\mathfrak{N}_{\alpha}\mathfrak{D}_{\varrho}$ -open subsets of \mathcal{U}_a such that $\eta \in \Lambda^{-1}(\mathfrak{F}_{\eta})$ and $\beta \in \Lambda^{-1}(\mathfrak{F}_{\beta})$. Hence, \mathcal{U}_a is a $\mathfrak{N}_{\alpha}\mathfrak{D}_{\varrho}\mathfrak{S}\mathfrak{f}$ -space. Let $\Lambda: (\mathcal{U}_a, \mathfrak{N}^a, \mathfrak{K}^a) \rightarrow (\mathcal{U}_b, \mathfrak{N}^b, \mathfrak{K}^b)$ be a $\mathfrak{N}\mathfrak{D}_{\varrho}$ -continuous function and Q be a $\mathfrak{N}\mathfrak{D}_{\varrho}$ -open set in \mathcal{U}_b . Then, $\Lambda^{-1}(Q)$ is a $\mathfrak{N}\mathfrak{D}_{\varrho}$ -open set in \mathcal{U}_a . Since every $\mathfrak{N}\mathfrak{D}_{\varrho}$ -open set is also a $\mathfrak{N}_{\alpha}\mathfrak{D}_{\varrho}$ -open set, Λ is also a $\mathfrak{N}_{\alpha}\mathfrak{D}_{\varrho}$ -continuous function.

CONCLUSION

In this current work, we have emphasized some novel concepts in \mathfrak{D}_{ϱ} -Nano topological spaces, namely $\mathfrak{N}\mathfrak{D}_{\varrho}\mathfrak{R}\mathfrak{l}$, $\mathfrak{N}_{\mathfrak{S}}\mathfrak{D}_{\varrho}\mathfrak{R}\mathfrak{l}$, $\mathfrak{N}\mathfrak{D}_{\varrho}\mathfrak{S}\mathfrak{f}$, $\mathfrak{N}_{\alpha}\mathfrak{D}_{\varrho}\mathfrak{S}\mathfrak{f}$ – spaces. Additionally, insightful findings are investigated by comparing $\mathfrak{N}\mathfrak{D}_{\varrho}\mathfrak{R}\mathfrak{l}$ and $\mathfrak{N}_{\mathfrak{S}}\mathfrak{D}_{\varrho}\mathfrak{R}\mathfrak{l}$ -spaces and $\mathfrak{N}\mathfrak{D}_{\varrho}\mathfrak{S}\mathfrak{f}$ and $\mathfrak{N}_{\alpha}\mathfrak{D}_{\varrho}\mathfrak{S}\mathfrak{f}$ -spaces in the context of these specific concepts. In the future, many topological properties can be extended in \mathfrak{D}_{ϱ} -Nano topological spaces.

ABSTRACT

The influence of classical literature on contemporary children's books is profound, shaping the stories, themes, and moral lessons that continue to resonate with young readers today. From Greek and Roman mythology to literary masterpieces of the 18th and 19th centuries, classical works provide the foundation for modern adaptations, reimaginings, and intertextual references in children's literature. Many contemporary authors incorporate these timeless narratives into their storytelling, making ancient literary traditions both accessible and relevant to today's audiences. This article explores how classical works influence modern storytelling, focusing on character development, narrative structures, and ethical frameworks. By analyzing selected works from authors inspired by classical literature, the research highlights the enduring themes of courage, adventure, perseverance, and moral dilemmas, demonstrating how they are reinterpreted for new generations. The study examines key historical motifs, such as the epic journey, the trickster figure, and the battle between good and evil, and their role in reinforcing values and sparking creativity in children's literature. Furthermore, the study investigates how classical themes contribute to critical thinking, intertextual awareness, and cultural literacy among young readers. Beyond literary influence, it also considers how contemporary authors adapt ancient literature to align with modern values, addressing shifts in representation, inclusivity, and educational approaches. While classical literature often reflected the dominant ideologies of its time, contemporary children's literature frequently reinterprets these narratives to embrace diverse perspectives, challenge outdated stereotypes, and foster empathy. By doing so, modern adaptations ensure that classical themes remain relevant, enriching young readers' understanding of literature, history, and human experience. This evolution not only broadens the scope of storytelling but also empowers young readers to see

**Rebecca Vanlalropuii**

themselves reflected in the narratives they engage with. As a result, literature becomes a powerful tool for social change, encouraging critical thinking and compassion in a rapidly changing world.

Keywords: Classical works provide the foundation for modern adaptations, reimaginings, and intertextual references in children's literature.

INTRODUCTION

Children's literature is a unique genre that has evolved significantly over time, adapting to societal changes while preserving key foundational elements. Classical texts, from Greek myths to Aesop's fables, have played a crucial role in shaping modern narratives, themes, and character archetypes. The impact of classical literature on contemporary children's books is profound, as they continue to draw from universal human experiences, timeless themes, and cultural traditions. While modern authors often use more accessible language, their stories frequently build upon the foundations established by classical works. Today's children's literature both reflects its era and extends historical literary traditions. Myths, fairy tales, and folklore remain relevant, exploring fundamental human concerns such as morality, identity, the battle between good and evil, and the pursuit of knowledge. Classical themes and motifs are reinterpreted in a modern context, making them more relatable for contemporary young readers. This study explores how classical literature continues to shape modern children's books, focusing on the ways authors adapt and reimagine traditional themes. By analyzing popular contemporary works, this paper highlights the lasting influence of classical literature and its relevance to today's audience.

Classical Literature and Its Legacy in Children's Books

Classical texts, those that have substantially influenced Western literature for millennia (e.g., Greek and Roman myths, fables, and medieval literature), have provided a foundational map through which myriad themes, structures, and character archetypes have emerged in modern children's literature. In addition to influencing the techniques of storytelling, such classical works have passed on moral and philosophical ideas that still guide modern narrative. One of the most significant contributions of classical literature to the children's genres is the development of archetypes. The hero, the villain, and the mentor are just a few of the figures from the monomyth, or one-size-fits-all mythological literature, a term made popular by Joseph Campbell (1949) and the resulting academic body of work that followed. Campbell's hero's journey is apparent in many classical texts and still works as a defining framework in children's literature. For example, heroic figures from Greek mythology, such as Heracles and Perseus, have been reimagined in modern children's literature, most notably in Rick Riordan's Percy Jackson and the Olympians series (2005). This series is deeply rooted in Greek mythology, centering on a young protagonist who is a contemporary demigod embarking on quests filled with mythical creatures, divine encounters, and personal growth. Riordan's adaptation of classical myths highlights the continued relevance of ancient narratives, providing young readers with both entertainment and exposure to foundational cultural stories (Nikolajeva, 2012). Likewise, the archetype of the wise mentor, represented by figures like Athena in Greek mythology or Merlin in Arthurian legend, remains a defining element in modern children's books. This is evident in characters such as Albus Dumbledore from Harry Potter (Rowling, 1997–2007) and Gandalf from *The Hobbit* (Tolkien, 1937). Beyond character archetypes, the tradition of imparting moral lessons, central to classic fables, persists in children's literature. In ancient Greece, Aesop's Fables conveyed simple yet powerful moral teachings on virtues like wisdom, honesty, and perseverance through anthropomorphized animals. This legacy continues in contemporary works such as *Charlotte's Web* by E.B. White (1952) and *The Tale of Despereaux* by Kate DiCamillo (2003), where animal characters explore profound themes of friendship, sacrifice, and courage. Contributions to the structure of storytelling in other children's books have also been influenced by classical literature. There are ancient myths or folktales where heroes endure challenges, transform, find redemption, or become enlightened, but they are cyclical. This narrative structure echoes through various contemporary works, including J.K. Rowling's Harry Potter series (1997–2007), which, much like classical epic narratives, follows the struggle of a young hero as he battles powerful forces, learns life lessons, and matures psychologically and morally. As readers journey alongside these characters, they witness not only the triumphs and

**Rebecca Vanlalropuii**

failures of the protagonist but also the rich tapestry of relationships that shape their growth. This interplay of challenge and character development creates a timeless appeal, allowing stories to resonate across generations and cultures.

The Role of Archetypes in Contemporary Works.

Archetypes are a crucial element of storytelling that transcends time and culture, serving as fundamental narrative structures that shape human understanding of heroism, morality, and personal growth. These universal patterns of character and story arcs can be found in myths, folklore, and classical literature and continue to influence contemporary works across various genres. One of the most prominent archetypal frameworks in literature is the hero's journey, a concept extensively explored by Joseph Campbell in *Hero with a Thousand Faces* (1949). This recurring motif follows a protagonist who embarks on a transformative adventure, faces trials and challenges, and ultimately discovers herself before returning home. The hero's journey is a foundational element in children's literature, particularly in the fantasy and adventure genres, as it allows young readers to engage with the timeless themes of bravery, identity, and destiny. Numerous well-known children's books, such as C.S. Lewis's *The Chronicles of Narnia* (1950–1956) and J.R.R. Tolkien's *The Lord of the Rings* (1954–1955), demonstrate the influence of classical archetypes. Similar to the epic journeys of famous heroes in ancient myths and epics, the main characters of both series are young people who are attracted to magical realms and must battle against powerful evil and darkness. Characters like Perseus, Theseus, and Beowulf confront terrifying foes and accomplish their goals in these tales, which are reminiscent of Greek and Norse mythology. These archetypal components give the contemporary narrative a feeling of familiarity and everlasting appeal, allowing readers to connect to the struggles and triumphs of characters from many generations. Beyond the hero's journey, other timeless archetypes frequently emerge in modern children's literature, emphasizing universal themes that have influenced storytelling for generations. One prominent example is the mentor, a wise and seasoned guide who helps the hero navigate their path. This archetype dates to ancient mythology, evident in Athena's counsel to Odysseus in *The Odyssey* and Chiron's mentorship of Achilles and other Greek heroes. In contemporary fantasy literature, this role is exemplified by figures like Albus Dumbledore in *Harry Potter*, Gandalf in *The Lord of the Rings*, and Aslan in *The Chronicles of Narnia*. These mentors offer wisdom, moral direction, and support, enabling protagonists to develop the skills and inner strength needed to fulfill their destinies. Through mentor figures, modern authors highlight the significance of knowledge, resilience, and ethical choices in a hero's journey. Archetypes provide structure and coherence to narratives and convey profound moral and philosophical lessons that resonate with readers across generations. The themes of overcoming adversity, learning from failure, and the ultimate triumph of good over evil are deeply embedded in the classical storytelling traditions. These motifs continue to shape contemporary children's literature, instilling valuable lessons about courage, perseverance, and the significance of moral choice. By drawing on archetypal patterns, authors create stories that feel both fresh and deeply rooted in literary tradition, ensuring that the power of these universal narratives endures in the minds of young readers.

Modern Retellings and Adaptations of Classical Myths

One of the most evident ways classical literature shapes modern children's books is through retelling and adaptations of ancient myths and stories. Writers frequently draw inspiration from classical works, reimagining them for contemporary audiences while maintaining essential themes and character relationships. A notable example is Rick Riordan's *Percy Jackson & the Olympians* series, which revitalizes Greek mythology by placing gods and mythical creatures in a modern context. This approach makes ancient tales more accessible and engaging for young readers. The protagonist, Percy Jackson, exemplifies this reinterpretation, depicted as a flawed yet courageous young hero, much like the classical figures who, despite their imperfections, still achieved greatness. The Greek tale of Circe, the enchantress of Aea, is also retold in the contemporary work *Circe* by Madeline Miller (2018). In Miller's adaptation, Circe is shown as a multifaceted figure who struggles with her identity and ambitions rather than just as a villain. The timeless value of ancient stories in examining common human themes like power, metamorphosis, and self-agency is highlighted by this reinvention. Through Circe's journey, readers are invited to reflect on their own transformations and the choices that define them. Miller's portrayal not only breathes new life into the ancient myth but also resonates with modern audiences seeking to understand their place in a complex world. Retelling of classical

**Rebecca Vanlalropuii**

myths in children's literature extends beyond Greek and Roman traditions. Fairy tales, rooted in ancient folklore, have been reinterpreted countless times in modern storytelling. Authors like J.M. Barrie in *Peter Pan* (1911) and Roald Dahl in *The Witches* (1983) have crafted imaginative worlds influenced by these timeless tales. These contemporary stories continue to explore enduring themes such as the battle between good and evil, personal transformation, and the quest for identity, core elements that have long been central to classical literature. As readers engage with these narratives, they find familiar motifs woven into the fabric of modern plots, demonstrating the timelessness of these themes. Furthermore, the blending of traditional elements with innovative storytelling techniques invites new generations to connect with the rich tapestry of literary history.

The Influence of Classical Literature on Contemporary Fantasy

The fantasy genre owes much of its structure and themes to classical literature. From the epic quests of Greek mythology to the enchanted realms of medieval legends, fantasy storytelling heavily draws from these traditions, incorporating motifs, archetypes, and narrative structures that have fascinated audiences for centuries. A key example is the hero's journey, as described by Joseph Campbell (1949), which originates from ancient myths like *The Odyssey* and *The Aeneid*. These classical tales established early storytelling frameworks centered on grand adventures, moral conflicts, and the struggle between good and evil elements that continue to define fantasy literature today. The emergence of authors like J.R.R. Tolkien and C.S. Lewis in the mid-20th century played a pivotal role in establishing fantasy as a prominent literary genre, encouraging future writers to incorporate classical themes into their works. Tolkien's *The Lord of the Rings* series (1954–1955) is heavily influenced by classical traditions, drawing inspiration from Norse mythology, medieval literature, and ancient epic narratives (Shippey, 2001). His storytelling structure reflects that of classical epics, featuring a grand quest, a reluctant hero, and an overarching battle between good and evil. The One Ring, for instance, symbolizes the corrupting power of unchecked ambition, akin to the cursed objects in classical mythology, such as the Necklace of Harmonia or the Ring of Gyges from Plato's *Republic* (Plato, trans. 1968). Similarly, C.S. Lewis's *The Chronicles of Narnia* series (1950–1956) is filled with classical and religious references, blending elements of Greco-Roman mythology with Christian allegory. The character of Aslan, the great lion, serves as a Christ-like figure, embodying themes of sacrifice, resurrection, and divine intervention that are central to classical religious traditions (Downing, 2005). Additionally, the mythological creatures in Narnia, such as fauns, centaurs, and dryads, are drawn directly from Greek and Roman mythology, reinforcing the classical underpinnings of Lewis's world-building. The protagonists' journeys in Narnia align with the classical tradition of heroism, in which young heroes must undergo trials, develop wisdom, and fulfill their destinies, much like Theseus, Perseus, or Hercules. These journeys not only highlight the importance of personal growth and moral integrity but also serve as a reminder of the timeless nature of these archetypal stories. By intertwining these elements, Lewis creates a rich tapestry that resonates with readers, inviting them to explore the deeper meanings behind their struggles and triumphs. By drawing from classical literature, both Tolkien and Lewis created fantasy worlds that feel timeless, connecting modern readers to the mythic past while exploring universal themes of courage, sacrifice, and destiny. Their influence continues to shape contemporary fantasy literature, as authors like J.K. Rowling, Rick Riordan, and George R.R. Martin similarly integrate classical elements into their narratives, proving that the legacy of ancient myths remains alive in modern storytelling.

CONCLUSION

The influence of classical literature on contemporary children's literature is undeniable, as many modern narratives continue to draw inspiration from ancient texts. From the heroic archetypes found in Greek and Roman mythology to the moral lessons embedded in fables and fairy tales, classical literature provides a foundational framework that shapes the themes, characters, and structures of children's stories today. Modern authors frequently adapt these ancient narratives to align with contemporary sensibilities, making them more inclusive, accessible, and relevant to today's audiences. The study of intertextuality in children's literature underscores how these adaptations serve to engage young readers with the past while fostering critical thinking and a deeper appreciation of literary traditions (Beckett, 2013). By highlighting the enduring influence of ancient tales in forming our conceptions of identity,

**Rebecca Vanlalropuii**

morality, and the human condition, modern children's literature acts as a bridge between the classical world and modern imagination. The impact of classical works will continue to be a fundamental aspect of children's literature as long as it tackles universal issues like the conflict between good and evil, bravery, and personal development. By encouraging new generations to interact with the timeless tales that have influenced human civilization, this continuous dialog between the past and present guarantees that classical narratives not only survive but also develop (Zipes, 2006). These stories, rich with moral lessons and imaginative adventures, serve as a bridge that connects young readers to their cultural heritage. Through engagement with these narratives, children can acquire insights that reflect their own experiences, cultivating empathy and understanding in a dynamic world.

ABSTRACT

Artificial Intelligence (AI) is revolutionizing healthcare by enhancing diagnostics, treatment planning, and operational efficiency [1]. However, the deployment of AI-driven medical technologies requires a robust regulatory framework to ensure patient safety, efficacy, and ethical considerations. This study provides a comparative analysis of the regulatory approaches of three major regulatory bodies: the U.S. Food and Drug Administration (FDA), the European Union Artificial Intelligence Act (EU AI Act), and the Medicines and Healthcare products Regulatory Agency (MHRA) in the United Kingdom. The FDA follows a risk-based classification system and premarket approval pathways for AI-based medical devices, adapting existing regulatory frameworks such as the Software as a Medical Device (SaMD) paradigm. The EU AI Act introduces a comprehensive risk-tiered approach, categorizing AI applications in healthcare as high-risk, subject to strict compliance requirements. The MHRA, post-Brexit, is developing an AI-specific regulatory framework aligned with international best practices while maintaining flexibility for innovation. This study highlights the key similarities and differences in AI governance across these jurisdictions, focusing on approval processes, post-market surveillance, real-world performance monitoring, and ethical considerations. The findings emphasize the need for harmonized international standards to facilitate global AI adoption in healthcare while ensuring safety and accountability.

Keywords: Artificial Intelligence, safety, U.S. Food and Drug Administration (FDA), European Union Artificial Intelligence,

INTRODUCTION

John McCarthy coined the phrase "artificial intelligence" (AI) in 1956 at a groundbreaking meeting for a summer research project. AI is defined as a computer program's capacity to carry out a broad range of tasks that normally demand for human intelligence. These tasks involve learning and reasoning, among other things. As AI applications have been more widely integrated, the area has expanded to include a number of important subsets, as shown in Supplementary Figure S1. But it's important to remember that terms in this field—specifically, deep learning (DL), machine learning (ML), and artificial intelligence (AI)—have frequently been used interchangeably. In summary, the Food and Drug Administration (FDA) uses the rigorous Premarket Approval (PMA) process to evaluate the effectiveness and safety of Class III medical devices. These devices, which are the most dangerous, include those that are essential to maintaining or supporting human life as well as those that could offer an unreasonably high risk of disease or harm. The applicant, usually the owner or an authorized body, must submit a thorough application with reliable scientific proof in order to receive PMA. This evidence includes both clinical and non-clinical laboratory studies, which are required to confirm the device's efficacy and safety for its intended application.

The PMA guidelines are described in Title 21 Code of Federal Regulations, Part 814, contains the PMA guidelines. If these conditions are not met, the gadget will be considered tampered with and cannot be sold. Notification of the Premarket The U.S. Food and Drug Administration (FDA) mandates the 510(k) regulatory procedure for Class I, II, and III medical devices that do not need Premarket Approval (PMA). To prove significant equivalency, the process comprises submitting a 510(k) to demonstrate that the device is as safe and effective as a lawfully marketed product (referred to as a predicate). This procedure applies to both foreign manufacturers or exporters bringing a product to the US market as well as local manufacturers, specification developers, repackers, and relabelers. A device is considered essentially equivalent if it serves the same purpose as the predicate and either has the same technological features or, in the event that they differ, does not result in new worries about efficacy and safety. The FDA's approval, indicated by an order confirming the device's significant equivalency, is required before it may be sold commercially in the US.

MATERIALS AND METHODS

After compiling a list of FDA-approved AI/ML-enabled devices across medical specialties, we put together relevant data for each device using both publicly accessible FDA data and information from the individual manufacturers' public notices. The FDA's webpage as of October 19, 2023, includes the products that meet our research's inclusion criteria for AI/ML-based medical devices. We manually retrieved all of the significant aspects of the AI/ML-enabled medical devices using each device's unique submission number

Regulatory Documents

○ US FDA

- Guidance documents related to software as a medical device (SaMD), AI/ML-enabled medical devices, and digital health. (e.g. "Software as a Medical Device (SaMD): Clinical Evaluation," "Artificial Intelligence/Machine Learning (AI/ML)-Based Software as a Medical Device (SaMD) Action Plan," "Proposed Regulatory Framework for Modifications to Artificial Intelligence/Machine Learning (AI/ML)-Based Software as a Medical Device (SaMD) – Discussion Paper and Request for Feedback"). [4]
- Relevant legislation (e.g., Federal Food, Drug, and Cosmetic Act).
- FDA website resources and publications.

○ European Union (EU)

**Sravani and Gunti Kavya Latha**

- Medical Device Regulation (MDR) (Regulation (EU) 2017/745).
- Artificial Intelligence Act.
- Guidance documents from the Medical Device Coordination Group (MDCG).
- Relevant EU directives and regulations.
- European Commission website resources and publications.

Academic Literature

- Peer-reviewed journal articles on AI in healthcare regulation.
- Research papers and reports from organizations focused on health policy and technology.
- Books and book chapters related to medical device regulation and AI.

Industry Reports and Publications

- Reports from industry associations (e.g., AdvaMed, MedTech Europe).
- Publications from consulting firms and market research companies.
- White papers from AI and medical device companies.

International Standards

- ISO standards related to medical device software and AI.
- IEC standards related to medical electrical equipment.

Case Studies

- Information on specific AI-enabled medical devices that have undergone regulatory review in the US and EU.
- Analysis of regulatory pathways and outcomes for these devices.

Methods**Document Analysis**

- Systematic review and analysis of relevant regulatory documents from the FDA and EU.
- Identification of key regulatory requirements, definitions, and processes.
- Extraction of information related to:
 - Classification of AI/ML-based medical devices.
 - Clinical evaluation and validation requirements.
 - Risk management and post-market surveillance.
 - Data governance and transparency.
 - Software lifecycle processes.
 - The handling of algorithm modifications.[5]

Comparative Framework Development

- Establishment of a structured framework for comparing the FDA and EU regulatory approaches.
- Identification of key comparison criteria, such as:
 - Definitions of AI/ML and SaMD.
 - Risk-based classification systems.
 - Requirements for clinical evidence.
 - Approaches to addressing algorithmic bias.
 - Mechanisms for post-market surveillance.
 - The level of standardization.
 - The speed of regulatory adaptation to technological advancement.

Qualitative Analysis

- Qualitative analysis of academic literature, industry reports, and case studies.
- Identification of key themes, trends, and differences in regulatory approaches.

**Sravani and Gunti Kavya Latha**

- Assessment of the strengths and weaknesses of each regulatory framework.
- Analysis of the impact of the regulations on innovation.

Comparative Matrix/Table Construction

- Creation of a comparative matrix or table to summarize the key differences and similarities between the FDA and EU regulatory frameworks.
- Organization of information by comparison criteria.
- Visual representation of the comparative analysis.

Case Study Analysis

- Analysis of specific AI medical device cases.
- Comparison of how the same or similar devices are handled in the different regulatory regions.
- This will highlight the practical differences in the regulations.

Expert Consultation

- If possible, incorporate insights from experts in medical device regulation, AI, and healthcare.
- Conduct interviews or consultations to gather additional perspectives and validate findings.

Synthesis and Interpretation

- Synthesize the findings from the document analysis, qualitative analysis, and case studies.
- Interpret the results in the context of the evolving landscape of AI in healthcare.
- Draw conclusions about the similarities and differences between the FDA and EU regulatory frameworks.
- Discuss the potential impact of these differences on innovation, patient safety, and market access.

Comparison between US and European policy implications

Recent evaluations of FDA-approved AI/ML-based medical devices show a tremendous increase, with 691 products permitted as of October 19, 2023. Radiology is the largest specialty, accounting for over 77% of all approvals. Notably, 96.7% of these devices were certified under the 510(k) process, demonstrating significant comparability with current technologies. Despite the increasing number of approvals, only roughly 3.2% of these devices reported carrying out clinical trials, indicating a potential area for more regulatory scrutiny. The FDA has also issued recall letters for about 5% of these devices, highlighting the importance of continual monitoring to assure safety and efficacy. [7]

AI levels from a long-term viewpoint**Artificial Narrow Intelligence (ANI)**

ANI algorithms are made to do a single, well-defined task. This assignment might be anything from identifying cancer cells on chest X-rays to playing chess. Even though they could be the best at what they do, they still have no intelligence. ANI already possesses amazing pattern recognition skills in large data sets, which makes it ideal for resolving classification and clustering issues based on text, audio, or images.

Artificial General Intelligence (AGI)

Human intelligence is at this level. One day, artificial general intelligence (AGI) could possess all of a human's cognitive abilities, including the ability to reason, debate, memorize, and solve problems just like you do. Even with the recent advances in AI, we are still a long way from getting to this point.[8]

Artificial Superintelligence (ASI)

In theory, ASI may be as intelligent as all of humanity combined, if not more. It goes without saying that humanity would be unable to comprehend its knowledge and logic. A lot of organizations want to never get to this point.

Artificial intelligence from a short-term standpoint

Level 1. AI is not used; humans only

Whether it is physical labor or data entry to create a process, humans are performing the task at this fundamental level. Simple algorithms may also be used in these, but artificial intelligence is not involved. Since the majority of medical treatments are now performed by hand, we don't need to travel very far to envision this scenario. Humans are at the forefront, without the aid of artificial intelligence, whether they are conducting a laparoscopy or a medical researcher collecting data for a meta-analysis [9].

Level 2. Shadow mode: the AI student and the doctor teacher

Algorithms may also go through this kind of "training," much like medical students follow their designated teacher around the hospital to take notes, ask questions, and do tasks under supervision. cess using a "shadow mode," so to speak. For instance, a "trainee" AI follows the procedure without interfering when a doctor diagnoses a patient based on an X-ray. Thus, the algorithm records everything that might help the AI itself make a future diagnosis, makes notes, and verifies the doctor's correctness. This can help advance AI technologies and advance them along the automation spectrum.

Level 3. The AI helper

At this point of automation, the AI system provides ideas to clinicians for clinical decision-making. For instance, AI may analyze a database of chest CT images and identify questionable signals in a patient under investigation. The physician further investigates these indicators. A large-scale Swedish experiment of AI-assisted mammography shown that the algorithm may reduce radiologists' screen reading labor by 44% while maintaining diagnostic efficiency.

Level 4. Partial automation

An AI system can diagnose itself with partial automation, but if it lacks sufficient confidence Regarding it, the AI seeks assistance from doctors. Many businesses are now developing similar solutions. Red Dot, an AI-powered technology from Behold.ai, classifies chest X-rays and locates its results. Even abnormal chest X-rays of COVID-19 patients can be detected by it. It can facilitate "instant triage," which speeds up diagnosis and appropriate resource allocation. An AI system created by Palo Alto-based Nines can use CT images to detect possible cases of cerebral hemorrhage and mass effect. It then marks those cases for evaluation by radiologists.[10]

Level 5. Complete automation

Full automation procedures, as the name implies, are carried out entirely by AI without the assistance of humans. input. For instance, a Level 5 system may independently analyze a mammogram and request more testing without seeking advice from a human doctor. Similar to this, some researchers hypothesize that while some ophthalmological procedures are currently partially automated, others may be able to be totally automated. However, according to some academics, it is "unlikely to be safely achieved in the near term" to attain Level 5 automation in any medical context. Although we must consider it a long-term possibility, concerns about AI replacing doctors are heightened by such levels of automation. But it's more probable that such [11].

RESULTS

Over time, the number of AI-based medical devices that have received EU approval has been rising significantly. Just 26 AI-powered medical devices were approved in 2017. This figure increased dramatically to 64 in 2018 and then to 80 in 2019. With 113 approvals in 2020 and 130 in 2021, the trend continued. With 158 devices authorized in 2022, the rise picked up even more speed, reaching a peak of 221 in 2023. And where as in the 2024 year 230 This steady rise highlights artificial intelligence's growing involvement in healthcare innovation and patient care and indicates the technology's quick development and incorporation in the medical industry. The number of AI-based medical devices approved has seen a steady and significant rise over the years, reflecting the growing adoption of artificial

**Sravani and Gunti Kavya Latha**

intelligence in healthcare. In 2017, only 25 AI-powered medical devices received approval, but this number more than doubled to 55 in 2018 and then surged to 100 in 2019. The upward trend continued in the following years, with approvals reaching 110 in 2020 and 115 in 2021. The increasing reliance on AI-driven innovations in diagnostics, treatment, and patient management further pushed approvals to 125 in 2022 and 135 in 2023. By 2024, the number of approved AI medical devices had reached 140, highlighting the accelerating integration of AI in modern healthcare and the growing confidence of regulatory bodies in AI-powered medical solutions.

A number of important healthcare companies have taken the lead in the use of AI-powered medical equipment. With 81 approved AI-based medical devices, GE Healthcare distinguishes out as a major participant in the industry. With 70 approvals, Siemens Healthineers comes in second, demonstrating its significant presence in AI-driven healthcare solutions. With 34 approvals apiece, Philips and Canon are tied, demonstrating their dedication to improving medical imaging and diagnostics. Famous for its AI-powered radiological products, Aidoc has received 24 clearances, followed by United Imaging Healthcare with 21. Notable contributions have also been made by Rapid AI, Nanox, and Viz.ai, with 15, 11, and 11 approvals, respectively. The future of medical diagnosis and treatment is being shaped by the increasing competition and innovation in AI-driven healthcare technology, which is reflected in this distribution of approvals.

CONCLUSION

The US FDA and the EU AI Act take two different but complementary methods to regulating AI in healthcare. The FDA's risk-based approach, founded on existing medical device rules, prioritizes safety, efficacy, and post-market surveillance, allowing for adaptive oversight as AI technology advance. In contrast, the EU AI Act establishes a broader, precautionary framework for categorizing AI systems based on risk, requiring strong transparency, accountability, and ethical compliance requirements [16]. Despite their differences, all frameworks share a same goal: to ensure that AI-powered healthcare solutions are safe, dependable, and helpful to patients. However, the disparity in regulatory methods may present difficulties for enterprises seeking cross-border compliance, perhaps resulting to delays in market access or additional expenses. To address these issues, multinational collaboration, regulatory harmonization, and standardized best practices [17].

AI-powered medical devices can reach the market faster because to the FDA's regulatory framework, which is renowned for being faster and more innovation-friendly. However, because of its less strict disclosure rules, there are fewer regulatory barriers to updating AI models. The EU framework, in contrast, places a higher priority on safety, ethics, and compliance and offers stringent monitoring through the MDR, IVDR, and AI Act. Longer approval procedures slow down AI adoption even though this improves patient protection and AI transparency. Because of this, a lot of AI healthcare companies apply for FDA approval before overcoming the EU's tighter requirements in order to enter the market. Practices will be needed [18]. As AI in healthcare evolves, regulatory frameworks must stay flexible and responsive. Finding a balance between supporting innovation and preserving public health will be critical in crafting a future in which AI improves medical decision-making, patient outcomes, and transforms the global healthcare environment [19].

CONFLICT OF INTEREST

The authors have no potential conflict of interest regarding this Investigation.

ACKNOWLEDGEMENT

I express my gratitude to the Chalapathi Institute of Pharmaceutical Sciences for their unwavering support, as well as to Ms. Kavya Latha .G for his guidance and help in seeing this article through to completion.

Table No 1. Differences between the Us and EU This chart provides a quick comparison of both regulatory frameworks.[6]

Category	US FDA	EU (MDR & AI Act)
Regulatory Authority	Food and Drug Administration (FDA)	European Medicines Agency (EMA) & National Authorities
Key Regulations	- FDA's 21st Century Cures Act - Medical Device Regulation (MDR) - AI/ML-Based Software as a Medical Device (SaMD) Guidance	- EU Medical Device Regulation (MDR) - EU Artificial Intelligence Act
Risk Classification	Risk-based approach (Class I, II, III)	Risk-based approach (Low, High, Unacceptable Risk)
Approval Pathways	- 510(k) Clearance (substantial equivalence) - De Novo Pathway - Premarket Approval (PMA)	- CE Marking - Conformity Assessment by Notified Bodies
AI-Specific Regulations	AI/ML-Based SaMD Guiding Principles & Action Plan	AI Act categorizes AI risks & mandates compliance
Post-Market Surveillance	Continuous monitoring & real-world performance data	Stricter post-market oversight & reporting obligations
Transparency & Explainability	Encourages transparency but flexible on black-box AI	Requires high transparency, auditability, & risk assessments
Adaptability to AI Evolution	Working on a Predetermined Change Control Plan (PCCP) for AI/ML software updates	AI Act enforces strict rules on high-risk AI systems
Compliance Burden on Companies	Less stringent compared to the EU	More regulatory burdens due to stricter requirements
General	The US takes a sector-specific approach,	The EU has adopted a more comprehensive and

Sravani and Gunti Kavya Latha

Approach	with the Food and Drug Administration (FDA) playing a central role in regulating AI-based medical devices.	unified approach with the EU AI Act.
Key Regulatory Instruments	FDA Guidance Documents The FDA issues guidance documents to provide recommendations on specific aspects of AI in medical devices, such as software as a medical	Medical Device Regulation (MDR) The MDR governs the safety and performance of medical devices, including
Risk-Based Approach	Both the US and the EU employ a risk-based approach to regulating AI in healthcare.	The EU AI Act categorizes AI systems into risk levels (minimal, limited, high, unacceptable) and imposes requirements proportionate to the risk. High-risk AI systems in healthcare are subject to stringent requirements.
Data and Transparency	The FDA emphasizes the importance of data quality, validation, and transparency in AI-based medical devices.	The EU has a strong focus on data protection through the GDPR, which grants individuals rights over their data and imposes obligations on data controllers.
Emphasis	Innovation, safety, and effectiveness	Safety, fundamental rights, ethical considerations

Table 2. Here's a comparative analysis table of the US FDA vs. EU regulatory framework for AI in healthcare[15]

Criteria	US FDA	EU (MDR, IVDR, AI Act)
Regulatory Approach	Risk-based, adaptive approval pathways	Risk-based, strict conformity assessments
Approval Pathways	510(k), De Novo, PMA, SaMD framework	CE Marking under MDR/IVDR, AI Act compliance
Speed of Approval	Faster, market-friendly	Slower, strict evaluations
Post-Market Surveillance	Real-world monitoring, updates allowed	Strict post-market compliance
Flexibility for AI Updates	More flexible, allows iterative AI changes	Less flexible, major updates need reassessment
Ethics & Transparency	Encouraged, but less enforced	Strong regulations on AI fairness & explainability
Industry Preference	Preferred for faster innovation & global reach	Chosen for safety & compliance in Europe
Influence on Global Regulations	Followed by many countries (e.g., Canada, Japan)	AI Act influencing future AI regulations worldwide
Overall Popularity	More popular among start-ups & tech companies	Respected for high patient safety standards

ABSTRACT

The Internet of Things (IoT) in the healthcare (HC) industry has various advantages, including real-time data transmission (DT) and the capacity to track the patient's physiological state, over a range of time intervals. It is necessary to put in place adequate security measures to prevent cyberattacks. Numerous authentication mechanisms have been developed recently, but the physical security of healthcare IoT (HC-IoT) devices, particularly against node replacement and node tampering attacks, has not received much attention. Therefore, this paper proposes a blockchain (BC) based sensor node authentication scheme with enhanced security for healthcare IoT systems using novel Binomial Distribution based Digital Signature Algorithm (BD-DSA) and Permutation based Tamilian Cryptography (PTC) models. The proposed work starts by implanting the number of sensor nodes (SNs) in the patient's body to monitor their physiological state. Next, node initialization takes place. Then, these SNs are registered with the blockchain server to protect patients' privacy. After registration, login and authentication via BD-DSA are done to prevent node tampering and node replacement attacks. Once authentication is successful, secure path creation is carried out for efficient DT without data loss or attacks. The path selection can be made using Jeffrey's Divergence adopted K-Means Clustering (JKMA) algorithm and Reverse Mutation Emperor Penguin Colony Optimization (RM_EPCO) algorithm. After establishing a secure path, the sensed patients' sensitive HC data are PTC encrypted and transmitted to the cloud server (CS). In the end, the outcomes obtained by the proposed framework are compared with some existing

**Kanagasankari**

models to show their efficacy. The outcomes demonstrated better performance and outperformed state-of-the-art methods.

Keywords: Healthcare IoT, Blockchain, Implantable Medical Devices, Data Security, Jeffrey's Divergence (JD), Authentication, and Secure Data Transmission.

INTRODUCTION

Medical care services have become one of the most critical issues for people and governments due to the increasing growth of human populations [1]. Modern healthcare (HC) is evolving with the development of technologies like the Internet of Things (IoT) and cloud computing. These advancements enable medical applications to provide real-time health monitoring and status updates [2]. The IoT consists of intelligent gadgets that can communicate and share information, driven by various sensory components and wearable smart devices. These technologies are essential across numerous fields, including healthcare, mining, agriculture, industries, smart buildings, cities, automated systems, and transportation [3]. When IoT and healthcare devices are integrated, they promote continuous clinical status reporting for patients requiring ongoing surveillance and security measures [4]. Patients can receive healthcare services (such as physical examinations) at various healthcare centers. The HC IoT equips patients with heterogeneous, resource-limited healthcare devices (like implanted and wearable devices) to collect their health data everywhere [5]. These devices are unobtrusive, user-friendly, and feature advanced capabilities such as wireless data transmission, real-time feedback, and built-in alerting mechanisms. They provide vital information to healthcare providers, such as blood pressure, glucose levels, and breathing patterns [6]. However, the open nature of data transmission channels raises significant privacy concerns, as the collected data is sensitive and must be protected due to its impact on patients' health and lives [7].

Healthcare IoT (HC-IoT) systems face significant security challenges that jeopardize patient data and overall system integrity. These challenges include unauthorized access, data breaches, and malicious attacks, exacerbated by the diversity of devices and platforms that increase the attack surface. Many IoT devices have limited processing capabilities, restricting their ability to support robust security protocols. Additionally, the interconnectivity of devices raises concerns about data security in transit, as intercepted communications can expose sensitive information. The dynamic nature of HC-IoT environments, where devices frequently join or leave the network, complicates authentication processes and heightens the risk of security gaps. Therefore, addressing these challenges is crucial for safeguarding patient information and ensuring the reliability of HC-IoT systems. Due to the unattended nature of system components and wireless communication, IoT-HC systems are highly susceptible to various attacks. Most IoT components have limited computing and resource capacities, which cannot support complex security schemes [8]. Ensuring the security of patient information is crucial in healthcare IoT, as it is confidential from both legal and ethical standpoints; therefore, prioritizing data security is essential when developing IoT applications in medical domains [9]. Data security models provide protection for medical data through cryptographic approaches that ensure validity, integrity, and authenticity. In contrast, data privacy models restrict data access to authorized users only [10]. Numerous methods have been proposed to achieve robust performance in IoT systems [11]. Various machine learning strategies, including supervised, unsupervised, and reinforcement learning, as well as communication protocols, have been employed to eliminate security breaches when transmitting medical information via IoT devices [12]. However, these approaches still raise significant security concerns, as unauthorized access could have catastrophic consequences for patients.

Recent advancements in cloud security have highlighted the importance of robust security frameworks, particularly with the increasing adoption of Cloud Access Security Brokers (CASBs) to manage data security in cloud computing environments. These frameworks address challenges such as dimensionality, heterogeneity, and ambiguity in cloud services, similar to the security concerns in healthcare IoT systems, which this study aims to mitigate through Blockchain-based solutions [13]. Optimizing operational parameters has been shown to significantly improve the

Kanagasankari

efficiency of industrial systems, and recent studies demonstrate that optimizing operational parameters significantly enhances the efficiency of industrial systems [14]. Similarly, this study aims to enhance the efficiency and security of healthcare IoT systems through targeted optimizations, such as reducing communication delays and improving system stability. Optimizing system performance through the identification of key influencing factors, as demonstrated in water security assessments using the blue and green water footprint, has proven effective in enhancing resource management [15]. Similarly, this study focuses on optimizing healthcare IoT systems to improve both security and operational efficiency, addressing critical issues like communication delays and data confidentiality. Recent advancements in network security have shown that multimodal hybrid models, such as the Multimodal Hybrid Parallel Network Intrusion Detection Model (MHPN), can significantly enhance detection accuracy by integrating spatio-temporal and statistical traffic features [16]. Similarly, this study leverages advanced techniques to improve security and efficiency in healthcare IoT systems by optimizing data flow and intrusion detection mechanisms. Emerging solutions for enhancing the security of Internet of Things (IoT) devices include lightweight anomaly detection models, such as the LMCA, which integrates an adjusted MobileNet and coordinate attention mechanism to effectively identify network traffic anomalies [17]. This approach demonstrates the feasibility of deploying advanced deep learning techniques within constrained IoT environments, thereby improving classification accuracy and flexibility while maintaining efficiency.

Blockchain (BC) technology emerges as a promising solution that enables efficient and transparent communication among system entities [18]. It provides a foundation for building a dependable, secure, and efficient IoT infrastructure. BC technology can enhance the information-sharing component of IoT, facilitating secure sharing of vital data captured by IoT devices [19, 20]. Consequently, adopting blockchain technology has the potential to provide effective solutions that facilitate healthcare delivery and advance the healthcare industry [21]. Various authentication protocols have been developed to protect privacy and security; however, security vulnerabilities can lead to disastrous outcomes, such as data loss and theft. Intruders often seek unsecured channels to access valuable healthcare data within cloud networks [22].

This work proposes an efficient BC-based authentication and security framework for HC-IoT using the Binomial Distribution based Digital Signature Algorithm (BD-DSA) and Privacy-preserving Transaction Codes (PTC) with Blockchain Technology. BD-DSA provides a mechanism for verifying the integrity and authenticity of data transmitted between devices, ensuring that only authorized entities can access sensitive information. PTC, on the other hand, offers a method for encrypting patient data, ensuring that it remains confidential during transmission to cloud storage. The research objectives of the proposed BC-based authentication and security system are as follows:

- A BD-DSA-based model is proposed using BC technology to perform efficient sensor node authentication for data protection.
- To secure data from node tampering and replacement attacks, secure path creation utilizing JDKMA and RM_EPCO algorithms is proposed.
- A cryptographic encryption model named PTC is proposed to encrypt sensed patient-sensitive information for transmission to cloud storage.
- All transactions, node details, and sensitive information are securely stored in the BC server.

The rest of the paper is structured as follows: Section 2 provides a literature review related to the proposed framework, Section 3 presents a detailed analysis of the proposed framework, Section 4 describes the experimental setup, Section 5 discusses the results and implications of the proposed methodology in Healthcare IoT, and Section 6 concludes the paper with its limitations and future scope.

LITERATURE SURVEY

Xu Cheng *et al.* [23] presented a BC-based Medical Cyber-Physical System (MCPS) that described the security requirements in the authentication process of medical data users. The author used intractable problems and bilinear

**Kanagasankari**

mapping during the authentication process to solve the security threats. The model enabled medical data sharing and met several security needs during user authentication. Pandi Vijayakumar *et al.* [24] suggested an anonymous authentication framework for IoT-based Wireless Body Area Networks (WBANs) with location privacy preservation. The doctor and the patient were authenticated by each other anonymously to ensure their legitimacy. Furthermore, the Trusted Authority (TA) protected the location of the patient and the doctor. The analysis revealed that the scheme outperformed the previous schemes regarding security and computation costs during anonymous authentication. Jafar A. Alzubi [25] recommended a BC-based model for medical IoT devices that employed the Lamport Merkle Digital Signature (LMDS). The LMDS model constructed a tree to perform authentication of the IoT devices. A Centralized Healthcare Controller (CHC) used Lamport Merkle Digital Signature Verification (LMDSV) to determine the source of the LMDSG. The LMDS provided greater security for medical IoT devices with lesser computation time and overhead. Muhammad Tahir *et al.* [26] used a probabilistic model that created an authentication and authorization framework for BC-enabled IoT networks. The framework employed random numbers in the authentication process that was linked via joint conditional probability. Thus, it established a secure connection among IoT devices for future data collection. The framework provided robust and mutual authenticity, improved access control, and reduced communication and computational overhead costs.

Seunghwan Son *et al.* [27] suggested a BC-based authentication mechanism for Telecare medical information system (TMIS). The study used ciphertext policy attribute-based encryption (CP-ABE) that controlled the access of HC data stored on the CS and BC. The model provided more security and efficiency than related protocols. For e-health security, Xinyin Xiang *et al.* [28] designed a permissioned BC-based identity management and user authentication (PBBIMUA) model. Each e-health user had a distributed ledger, and the transactions of the model encouraged smart contract registration. The smart contracts maintained the public key records for efficient identity, and they used the user's biometrics as a key distribution strategy. The system used a smart contract to support anonymous authentication of the users. The results revealed that the system was more efficient than known methods. To provide security to the Internet of Medical Things (IoMT), Randhir Kumar and Rakesh Tripathi [29] used BC and interplanetary file systems (IPFS) technology. The model grouped the nodes into a cluster form and used smart contracts for authenticating patients and medical devices. After authentication, the cluster layer stored the device-generated information, which was transmitted securely to the consortium BC. The BC-based mechanism for data storage provided data privacy because it used a hash-based storage mechanism.

Kristen N. Griggs *et al.* [30] presented BC-based smart contracts to offer secure medical sensor management and analysis. The private BC constructed a system with the help of the Ethereum protocol. The SNs were communicated with smart contracts that maintained the records of all events of the SNs on the BC. The approach allowed real-time patient monitoring and medical interventions by sending notifications to HC patients and medical professionals. Lijun Xiao *et al.* [31] developed a secure framework for private BC-based WBANs. The model generated two groups of private BCs to store SN registration data and patient physiological data. The storage of the registration and physiological data in private BC reduced the complexity of regional data management. On this basis, the system generated a BC network's blind signature. The results demonstrated that the developed scheme was more advanced and effective than existing models.

Geetanjali Rathee *et al.* [32] used BC technology to support multimedia data processing in IoT-HC. The model stored every activity of the IoT devices inside the BC, providing secrecy and transparency to the patients and intermediates. The model also traced the activity of the intermediates in DT. Asad Abbas *et al.* [33] suggested a BC-assisted secure data management framework (BSDMF) for IMoT. The BSDMF provided secure DT between implantable medical devices and personal servers and between cloud servers and personal servers. The approach ensured secure DT and data management between the linked nodes in IMoT. Rajakumar Arul *et al.* [34] designed the Multi-Modal Secure Data Dissemination Framework (MMSDDF) to provide secure data access and control in the IoMT. The patient's data were transmitted to the BC, which authenticated each patient in the network. If any third party accessed the BC during data exchange, the BC alerted the patient and the IoMT-HC system. The results demonstrated that the MMSDDF method outperformed other existing methods in accuracy. Anita sahoonet al. [35] conducted an analysis of

Kanagasankari

IoT and Blockchain integration in healthcare, identifying key challenges such as data privacy, network architecture, and continuous monitoring. Their study emphasized the need for multiple encryption techniques to create decentralized and secure healthcare systems. They also highlighted research gaps in scalability and security, calling for further investigation into long-term solutions for Blockchain-powered IoT healthcare.

Wafaa A.N.A. Al-Nbhanyet al.[36] highlight how integrating blockchain technology with the Internet of Things (IoT) can greatly enhance security in healthcare applications. Their review, covering literature from 2018 to 2023, examines various uses of blockchain-IoT in areas like remote patient monitoring and medical record security. The authors also discuss challenges and potential solutions, providing insights into current trends in healthcare technology. Sadia Ramzanet al[37] emphasize the transformative potential of blockchain technology in the healthcare sector, highlighting its role as a secure digital ledger for transactions that fosters trust among users. Their review covers the evolution, technical aspects, and various applications of blockchain in healthcare, including electronic medical records and supply chain management. The authors also identify limitations of existing approaches and outline future research directions, showcasing the ongoing innovations in this field. ParthaPratim Ray *et al*[38] discuss the integration of Internet of Things (IoT) and blockchain technologies in e-healthcare, highlighting the ability of IoT devices to provide real-time patient data while addressing the challenges of centralized data processing, such as potential failures and privacy issues. They explore popular consensus algorithms and assess various blockchain platforms for their suitability in IoT-based healthcare applications. Additionally, the article proposes a data-flow architecture named IoBHealth, designed to facilitate the secure storage, access, and management of e-healthcare data by leveraging the strengths of both IoT and blockchain technologies.

Marah R.Batainehet al. [39] address the challenges faced by Internet of Things (IoT) applications, such as resource constraints and central server overload, and propose a solution by integrating blockchain technology to create a decentralized, autonomous IoT system. Their architecture leverages an Ethereum blockchain infrastructure with a rich-thin client model, where resource-limited devices act as thin clients while higher-resource devices serve as rich clients for executing mining processes. The authors demonstrate the efficiency of their proposed architecture through a healthcare system focused on surgical process management, showcasing its suitability for various IoT applications while mitigating the limitations of IoT devices. Krishna Kumar Sharma and Ayan Seal [40] proposed a Self-Adaptive Mixture (SAM) similarity measure, which integrates Jeffrey-divergence with induced kernel distance to handle overlap in multi-view clustering scenarios. Their extensive experiments on both real-world and synthetic datasets demonstrate SAM's superiority over nine state-of-the-art clustering methods. This research highlights the role of adaptive similarity measures in enhancing clustering accuracy, particularly in uncertain data environments, where traditional methods often fall short in complex and overlapping data spaces. R. Geetha et al. [41] introduced Tamilian Cryptography, an innovative cryptographic technique that employs Tamil, an ancient Dravidian language, to secure encryption processes. By utilizing Tamil's 247 characters, the method significantly strengthens data security and improves encryption time. The hybrid nature of Tamilian Cryptography, which involves mapping Tamil text to random 2-bit combinations followed by encryption with the Advanced Encryption Standard (AES) algorithm, offers stronger security guarantees than conventional algorithms like Blowfish and DES. It demonstrates an impressive 95% avalanche effect, outperforming other methods in terms of encryption speed and memory efficiency.

Jieming Yang et al. [42] proposed the Bi-Test feature selection method for spam email filtering, which leverages binomial hypothesis testing to evaluate feature occurrence in both spam and legitimate emails. This method, tested on six benchmark spam corpora, bypasses the computational load of conventional techniques like Chi-Square and Poisson distribution while maintaining high classification accuracy. When combined with Naïve Bayes, Bi-Test showed superior efficiency in dimensionality reduction, rivalling established methods like Information Gain and Gini Index. Privacy is a significant issue in IoT due to the massive amount of medical sensor data. However, unauthorized access to messages transferred between system nodes is a primary weakness in existing techniques, and unauthorized access to sensor nodes (SNs) may result in inconsistent or fabricated medical reports. Simple security methods are ineffective, and attackers can target sensor data to modify it and inject attacks. Consequently, ensuring secure communication between IoT devices becomes one of the most critical and challenging tasks, as it

Kanagasankari

must account for vulnerabilities to intruder attacks. In contrast to the limitations of existing techniques—such as unauthorized access to SNs, attacks on wearable sensors, and patient data misuse—this work proposes an efficient blockchain-centered authentication and security framework for HC-IoT using BD-DSA and PTC. The proposed framework leverages the BD-DSA-based sensor node authentication technique to prevent unauthorized access to SNs. Additionally, a secure path using JDKMA and RM_EPCO is established to safeguard medical data transfer between system nodes, while PTC encryption ensures the data is protected from intruder alterations. Finally, blockchain technology plays a significant role in safeguarding patients' healthcare data privacy, providing a comprehensive solution to the identified challenges.

PROPOSED METHODOLOGY

The modern healthcare industry leverages smart IoT-enabled medical devices to monitor, collect, and transmit biomedical data such as blood pressure, blood sugar levels, electrocardiography (ECG), and body temperature. These devices communicate with nearby gateways and remote servers for data processing and visualization. Given the sensitive nature of this data, secure exchange mechanisms are critical for protection against cyber attacks. This paper presents an efficient Blockchain-centered authentication and security framework for healthcare IoT systems, integrating BD-DSA and PTC techniques. The proposed framework involves several steps: patients with IoT sensors initiate data collection, followed by sensor node registration and authentication using BD-DSA. After successful authentication, a secure path is created through clustering sensor nodes using the Jeffrey's Divergence-based K-Means Algorithm (JDKMA), with path optimization managed by the Reverse Mutation Emperor Penguin Colony Optimization (RM_EPCO) algorithm. The patient's data is then encrypted using the Permutation-based Tamilian Cryptography (PTC) technique and securely stored on the blockchain. The block diagram of the proposed framework is shown below in Figure 1.

Framework Components

The framework consists of the following components, each playing a crucial role in ensuring secure and efficient data transmission and storage in healthcare IoT

IoT Sensors These devices, embedded in or worn by the patient, continuously monitor physiological parameters such as blood pressure, glucose levels, heart rate, and body temperature. These sensors are responsible for the continuous collection of raw biomedical data.

Gateways These intermediary nodes aggregate data from various sensors and transmit it to remote servers for further processing. Gateways ensure reliable communication between sensors and the blockchain server. Gateways also perform preliminary data aggregation or filtering before forwarding to the blockchain server

Blockchain Server This server securely stores data and manages transactions between IoT sensors and healthcare providers. Blockchain technology provides tamper-resistant storage of medical records.

BD-DSA for Authentication The BD-DSA algorithm is used to verify the legitimacy of sensor nodes, preventing unauthorized access by generating digital signatures for registered sensors, ensuring only valid nodes can send data.

JDKMA for Secure Path Creation After authentication, sensor nodes are grouped into clusters using the Jeffrey's Divergence-based K-Means Algorithm (JDKMA). This enables efficient management and secure transmission of data to the blockchain server.

RM_EPCO for Path Optimization The Reverse Mutation Emperor Penguin Colony Optimization (RM_EPCO) algorithm optimizes transmission paths, minimizing potential vulnerabilities and ensuring secure data delivery.

Kanagasankari

PTC for Data Encryption Before storing data on the blockchain, the Permutation-based Tamilian Cryptography (PTC) technique is used to encrypt it. This ensures that intercepted data cannot be decrypted without the proper keys. Each of these components works in synergy to create a secure and efficient system for managing sensitive healthcare data.

Sensor Node Initialization

The process begins with the initialization of sensor nodes (SNs) implanted in or worn by patients. These devices continuously monitor physiological parameters, collecting raw biomedical data like blood pressure and glucose levels. Each SN is registered with the blockchain server, establishing a secure environment for future data interactions. This initialization lays the foundation for subsequent steps in the workflow. At the start, n number of SNs (temperature sensor, heart-rate monitoring sensor, glucose monitoring sensor, etc.) is implanted in the patient's body to monitor the physiological health condition of the patient are. Primarily, these nodes are initialized with the BC server by creating blocks to record transactions and store sensor data securely. The n – number of SNs ($\hat{h}^{(i)}$) entrenched in the patient's body is expressed as,

$$\hat{h}^{(i)} = \hat{h}^{(1)}, \hat{h}^{(2)}, \dots, \hat{h}^{(n)} \quad (1)$$

Figure 2 illustrates the workflow of the proposed blockchain-based authentication and security framework for healthcare IoT systems. The process begins with Sensor Node Initialization, where sensors embedded in or worn by patients are activated to continuously monitor physiological parameters. Next, Node Registration establishes the identity of each sensor, ensuring that only authorized devices can participate. The system then proceeds to Authentication using BD-DSA, which verifies the legitimacy of the sensor nodes, preventing unauthorized access to sensitive data. At a critical decision point, Verify Auth, the flow diverges based on the authentication outcome; successful authentication leads to Secure Path Creation using JDKMA, where sensor nodes are clustered to optimize data transmission security. Following this, Data Encryption using PTC ensures that even if intercepted, the data remains confidential. Finally, the encrypted data is securely stored on the Blockchain, providing a tamper-resistant and transparent method for managing medical records. This comprehensive workflow guarantees the secure collection, transmission, and storage of sensitive healthcare data, leveraging advanced cryptographic techniques and blockchain technology to enhance patient privacy and system integrity.

Node Registration

Once initialized, each sensor node must register its details with the blockchain server. This registration includes information such as the node's ID, type, and location. By storing this information on the blockchain, the system ensures data integrity and prevents unauthorized access. The registration process is crucial for creating a secure identity for each sensor within the healthcare IoT ecosystem. After initializing the SNs, before data sensing each node registers its details with the blockchain server. Since the details are stored in the BC, it prevents the privacy and unauthorized access of SNs. Here, the SNs use their node ID (N_{ID}), node type (N_{type}), node location (N_{loc}), etc. for registration. On registration of SNs, a digital signature is created using the BD-DSA algorithm.

Signature creation and authentication using BD-DSA

Following registration, authentication is performed using the Binomial Distribution Digital Signature Algorithm (BD-DSA). Each registered sensor generates a digital signature that verifies its legitimacy. This step prevents unauthorized access, ensuring that only valid nodes can send data. Successful authentication signifies that the sensor can proceed to the next phase, reinforcing the security of the overall system.

Here, a digital signature (DS) is created for each SN concerning the node details such as, N_{ID} , N_{type} , and N_{loc} for authentication. A DS includes three processes. Initially, the key generation process was carried out that generates the private key randomly from a set of possible private, and the model outputs both private and public keys. Secondly, a signing process produces a signature, and thirdly signature verification process verifies the signature by accepting or

Kanagasankari

rejecting the message's claim to authenticity. One disadvantage of DSA is that the prime divisor for signature creation and verification is generated randomly, affecting the model's overall performance. To solve this issue, Binomial Distribution (BD) is adopted to generate the prime divisor. Hence, the proposed one is called BD-DSA. The signature generation process for SNs is detailed below,

a. Key generation

- A prime number (δ) is chosen first called the prime divisor using the binomial distribution function (B_{dist}) given by,

$$B_{dist}(\delta) = \sum_{n \in \rho} prob^{(\rho)} * fal^{(n-\rho)} \tag{2}$$

Where, $prob, fal$ refers to the probability of success and failure on a single trial, ρ represents a number of times with a specific outcome, and n mentions the number of trials. Another prime number π is also selected such that,

$$(\pi - 1) \bmod(\delta) = 0 \tag{3}$$

- After that, an integer (∂_{int}) is selected that satisfies the following conditions,

$$\partial_{int}^\delta \bmod(\pi) == 1 \tag{4}$$

$$\partial_{int} = rand^{(\pi-1)/\delta} * \bmod(\pi) \tag{5}$$

- Then, the private key is generated as $K_{priv} (0 < K_{priv} < \delta)$ and the public key becomes (K_{pub}) which is computed as,

$$K_{pub} = \partial_{int} K_{priv} \bmod(\pi) \tag{6}$$

b. Signature generation

- For generating the digital signature, node details $N_{ID}, N_{type},$ and N_{loc} are given as input and converted into the hash function (\mathfrak{R}_N) using the following equation (7),

$$\mathfrak{R}_N = hash(N_{ID}, N_{type}, N_{loc}) \tag{7}$$

- Next, the hash value is transmitted as input to the signing function which produces the result as (ζ, τ) , calculated as,

$$\zeta = (\partial_{int} r \bmod(\pi)) * \bmod(\delta) \tag{8}$$

$$\tau = [r - 1(\mathfrak{R}_N + K_{pub} * \zeta) \bmod(\delta)] \tag{9}$$

In the aforesaid equation, r signifies the random number and ζ, τ models the digital signature.

c. Signature verification

- During hash verification, the same hash function (\mathfrak{R}_N) is used to generate the hash digest (h_{di}) , and then it is passed into the verification function by computing the variable (l) such that,

$$\tau * l \bmod(\delta) = 1 \tag{10}$$

- Then the values of φ_1, φ_2 are estimated as

Kanagasankari

$$\varphi_1 = h_{di} \cdot t * \text{mod}(\delta) \tag{11}$$

$$\varphi_2 = \tau \cdot t * \text{mod}(\delta) \tag{12}$$

- At last, the signature verification (S_v) component is evaluated by,

$$S_v = \langle \langle (r\varphi_1 * K_{priv}\varphi_2) \text{mod}(\pi) \rangle \rangle \text{mod}(\delta) \tag{13}$$

Here, S_v is compared with the τ received in the bundle, if both matches, the verification becomes successful and the sensor node starts sensing the data.

Secure path creation

After successful authentication, the next step is secure path creation. Sensor nodes are clustered using the Jeffrey's Divergence-based K-Means Algorithm (JDKMA), grouping them based on data similarity. This clustering enables efficient data management and minimizes potential vulnerabilities. Once clusters are formed, the Reverse Mutation Emperor Penguin Colony Optimization (RM_EPCO) algorithm is used to optimize transmission paths, ensuring secure data delivery to the blockchain server. In this phase, the secure paths are created by clustering the entrenched SNs using JDKMA and then optimizing the paths via RM_EPCO algorithms. Through the generated optimal paths, the sensed HC data are transmitted to the BC server without any attack on the data. This way of establishing the paths secures the HC IoT data against node tampering and node replacement attacks.

Clustering by JDKMA

K-means algorithm is one of the simplest, non-supervised partitioning clustering algorithms which divides the given data object into different clusters through the iterative, converging to a local minimum. In KMA, at first, the centroid points are calculated, and then it takes each point to the cluster with the nearest centroid from the adjacent data point. The Euclidean distance-based similarity measure is used to assign each data point to its nearby centroid. The similarity measure has been one of the essential factors in clustering for discovering the natural grouping of a given dataset by identifying hidden patterns. However, the Euclidean distance calculation is quite complex and is not appropriate for handling the complicated and non-Euclidean structure of the input data. To overcome this downside, in the proposed work Jeffrey-Divergence (JD) based similarity measure is used instead of the original Euclidean norm because the divergence function implicitly results in handling complicated and non-Euclidean data structures. Due to this modification, the proposed KMA is named JDKMA. The clustering process using JDKMA is discussed further,

- Consider, $\hat{h}^{(i)} = \hat{h}^{(1)}, \hat{h}^{(2)}, \dots, \hat{h}^{(n)}$ be the n - number of SNs which is clustered into k the number of clusters $(v_i = v_1, v_2, \dots, v_k)$, and $C_v (v = 1, 2, \dots, V)$ be the initial cluster centroids generated randomly.

- Then, the JD between each data point $(\hat{h}^{(i)})$ and the initial cluster centroids (C_v) , is calculated to allocate each $(\hat{h}^{(i)})$ to its closest (C_v) . The JD calculation is mathematically formulated below,

$$JD = \sum_{i=1}^n (\hat{h}^i - C_v) * (\log(\hat{h}^i) - \log(C_v)) \tag{14}$$

- The criterion function (Ξ) is calculated by taking the mean of all the clusters of the target object. This can be defined as follows,

$$\Xi = \sum_{i=1}^n \sum_{C_v} |C_v - \mu_i|^2 \tag{15}$$

Kanagasankari

Where, μ_i indicates the average of clusters. Finally, the k number of clusters (grouped SNs) based on the distance is notated as,

$$V_i = V_1, V_2, \dots, V_k \tag{16}$$

From the above-grouped nodes, optimal paths are established using the RM_EPCO algorithm.

Optimizing the paths via RM_EPCO

Emperor Penguin Optimizer (EPO) is a popular metaheuristic model that mimics emperor penguins' huddling behaviour (EPs). The huddling procedure is answerable for better diversification, contributing to the EPO's superior global search capability. EPs live on open ice and breed during the winter months. During the breeding season, EPs congregate in massive colonies that number in the hundreds of thousands. The only species that huddles to survive the Antarctic winter is the Emperor penguin (EP). The huddling behaviour of EPs is divided into four stages: generate and determine the EP huddle boundary, calculate the temperature profile around the huddle, Determine the distance between EPs and reposition the effective mover. The EPO's successful moving actions provide better intensification, which enhances the EPO's superior local search ability. It provides a smooth transition from diversification to intensification (or global search) (or local search). However, the standard EPO suffers from premature convergence when solving complex optimization problems and tends to fall into local optima. Therefore, the proper balance between exploration and exploitation stages is needed to ensure the approximation of globally optimum values. Hence the Reverse Mutation (RM) process is used to prevent premature convergence and falling into a locally optimal solution. As a result, the convention EPO becomes RM_EPCO. The step-by-step process is explained further,

Step 1 Initially, EPs randomly construct the huddle boundary (clustered SNs V_i). The wind is determined to find the huddle boundary around a polygon as it flows around the huddle. The wind, on the other hand, moves faster than an EP. The concept of complex variables is used to describe an EP's randomly generated huddle boundary. Let, denote v as the velocity of the wind and w as its gradient, then

$$w = \nabla v \tag{17}$$

The vector (g) is joined with wind velocity to generate complex potential,

$$\eta = v + i g \tag{18}$$

Where, i stands for the imaginary constant, and η determines the polygon plane's analytical function. Then, the fitness of each EP is calculated to identify the best solution.

Step 2 To conserve energy and maximize the ambient temperature in the huddle, emperor penguins form a huddle.

This can be mathematically modeled by considering the temperature $(T = 0)$ when the polygon radius $(r > 1)$ and $T = 1$, when $r < 1$. This temperature profile is in charge of the exploration and exploitation of emperor penguins in various locations. The temperature profile around the huddle is evaluated by,

$$T'' = \left(T - \frac{k}{iter - k} \right) \tag{19}$$

$$T = \begin{cases} 0 & \text{if } r > 1 \\ 1 & \text{if } r < 1 \end{cases} \tag{20}$$

Where, $iter, k$ denotes the current iteration and maximum iteration respectively.

Kanagasankari

Step 3 After the construction of the huddle boundary, compute the distance between EP and the best obtained optimal solution ($D_{v,best}$). The current best optimal solution is the one with the closest fitness value to the optimum. The other search agents (or EPs) will adjust their positions based on the current best optimal solution, which is defined mathematically as follows:

$$D_{v,best} = Abs(S_f(\vec{\Sigma})best\vec{iter}) - \vec{Z} \cdot \vec{P}_v(iter) \tag{21}$$

Here, $best\vec{iter}$ denotes fittest optimal penguin, $\vec{\Sigma}, \vec{Z}$ are the vectors that avoids the collision between neighbors, S_f models the penguin's social forces responsible for movement towards the best solution, and \vec{P}_v symbolizes the position vector of the EP. The vectors $\vec{\Sigma}, \vec{Z}$ are estimated in below equations,

$$\vec{\Sigma} = (\Phi \times (T'' + P_{grid}(acc)) * Rand()) - T'' \tag{22}$$

$$P_{grid}(acc) = Abs(best\vec{iter} - \vec{P}_v) \tag{23}$$

$$\vec{Z} = Rand() \tag{24}$$

In the aforesaid equations, Φ mentions the movement parameter that avoids collisions by mapping the gap between search agents, $P_{grid}(acc)$ denotes the polygon grid accuracy that compares the difference between the EPs, and $Rand()$ determines the random number between 0 and 1. The social forces responsible for movement towards the best optimal solution is computed in equation (25),

$$S_f(\vec{\Sigma}) = \left((f \cdot e^{-iter/l} - e^{-iter})^{0.5} \right)^2 \tag{25}$$

In this equation, e specifies the expression function, f and l are the control parameters to have better exploitation and exploration.

Step 4 Finally, update the positions of the EP according to the best obtained optimal position (mover). This mover is in charge of changing the positions of other search agents in a given search space, as well as leaving its current position. In the proposed work, position updation is carried out using a reverse mutation process.

- In the reverse mutation process, initially, the initial permutation takes plain text (EPs position y_{ji}) as an input. Then reversion happens in which the original base pair sequence may be restored. Therefore, the output will be the mutated position m_{ji} . These steps are repeated until y_{ji} is updated or the number of iteration is reached. The position updation equation for EPO is expressed as,

$$\vec{P}_v(iter+1) = y_{ji} - \vec{\Sigma} \cdot \vec{D}_{v,best} \tag{26}$$

Where, $\vec{P}_v(iter+1)$ denotes the EP's newly updated position. The huddling behavior of EPs is recomputed during the iteration process once the mover has been re-located. In this way, the optimal paths (β_{opt}) from the clustered SNs are created for secure DT. Figure 3 illustrates the pseudocode of the proposed RM_EPCO is revealed further,

Data Security by PTC

Importance of BD-DSA and PTC for Data Security in Healthcare IoT

In the context of healthcare IoT, ensuring the confidentiality, integrity, and authenticity of sensitive biomedical data is paramount. Given the rising incidents of cyber attacks targeting healthcare systems, the choice of security mechanisms is critical to safeguard patient information.

Kanagasankari

Binomial Distribution Digital Signature Algorithm (BD-DSA)

BD-DSA provides a robust method for verifying the identity of sensor nodes, ensuring that only authorized devices can transmit data. This is crucial in healthcare settings where data integrity directly affects patient safety. By generating digital signatures, BD-DSA guarantees that any data transmitted by the sensor nodes has not been altered during transmission.

Permutation-based Tamilian Cryptography (PTC)

PTC ensures that sensitive patient data is encrypted before being transmitted or stored, preventing unauthorized access. The choice of PTC is based on its innovative approach to using natural language for encryption, which significantly reduces the complexity and time required for encryption processes. This is especially beneficial in healthcare applications where timely access to data is crucial. The added layer of AES encryption within PTC further enhances security by employing well-established cryptographic techniques.

PTC Process

Before the data is transmitted to the blockchain server, it undergoes encryption using the Permutation-based Tamilian Cryptography (PTC) technique. This ensures that even if data is intercepted, it remains unreadable without the correct decryption keys. The encrypted data is then securely transmitted to the blockchain server for storage.

The next step in the proposed work is data security. In this phase, the sensed patient medical data undergoes encryption for secure transmission. Tamilian Cryptography (TC) is one of the most widely used encryption models that encrypts the messages using natural language, which reduces encryption time and improves performance. TC is divided into three phases: translation, mapping, and encryption, and it makes data much more secure than existing techniques. TC initially translated the input data into Tamil and then mapped the data to an arbitrarily created 2-bit combination of English alphabets. This process results are named intermediate cipher (inter cipher). After finishing the translation and mapping processes, the inter cipher (IC) is encrypted using the Advanced Encryption Standard (AES) to enhance the data confidentiality. AES is a symmetric cipher model that employs the same key for both encryption and decryption. Substitution Bytes (SB), Shift Rows (SR), Mix Columns (MC), and AddRoundKey (ARK) are the four primary operations. Every message block in AES is encrypted using the four operations listed above, which increases the model's time complexity. To overcome this problem and encrypt the message in sufficient time, the proposed work replaces the mix columns transformation of the conventional AES with permutation-based column shifts, which reduces time complexity and also increases security. This permutation-based column shifts in

the encryption operation of TC is named PTC. Let, $m_j = m_1, m_2, \dots, m_N$ be the input sensor message that needs to be encrypted using the proposed PTC technique. The steps followed by the PTC are as follows

Translation

Primarily, the plan text (input message m_j) is translated into the Tamil language $(tam(j))$ by using a Google application programming interface translator. For translating the numerical message, the number is converted into words, and then it is converted into a Tamil word. A language translator converts a text written in one language into another. It is a very useful tool for understanding text written in an unknown language. Thus, the translated message $(tam(j))$ is modeled below,

$$m_j \rightarrow tam(j) \{ tam(i), tam(2), \dots, tam(N) \} \quad (27)$$

Mapping

Next to translation, each Tamil alphabet is mapped into two 32-bit English alphabet combinations to attain an IC. Each occurrence of a letter does not have the same mapping; for each Tamil alphabet, there are two 2-bit combinations; every occurrence may have one of the two 2-bit combinations. To make the algorithm effective, this 2-bit combination of alphabets is chosen using a logistic chaotic mapping function. By doing so, it is very difficult for

Kanagasankari

the attackers to retrieve the data from the translated message. Logistic chaotic mapping (L_{CM}) for selecting the 2-bit combination of English alphabets $(a \rightarrow z)$ becomes,

$$L_{CM}(t+1) = \chi \cdot a \rightarrow z(t)(1 - a \rightarrow z(t)) \quad (28)$$

Where, t denotes the iteration number, and χ is a chaotic constant. Thus, the intermediate cipher (translated message) becomes,

$$tam(i) \rightarrow \tilde{\lambda}_i = \tilde{\lambda}_1, \tilde{\lambda}_2, \dots, \tilde{\lambda}_N \quad (29)$$

Encryption with AES

In this phase, the intermediate cipher is encrypted by generating a random round key (R_{key}) . Afterward, the input intermediate cipher is XOR-ed with R_{key} to generate the cipher transformation. It is mathematically formulated by,

$$\psi_i = \tilde{\lambda}_i \oplus R_{key} \quad (i = 1, 2, \dots, N) \quad (30)$$

Where, ψ represents the transformation of the cipher key. Then, using an S-box, substitute byte transformation replaces every data block byte with another block. Following that, each row of the state matrix is given a cyclic shift to the right side based on its location. The first row is left alone. Each byte in the second row is shifted to the left by one position. The third and fourth rows are also shifted two and three positions, respectively. As a result, each output block of this step will be made up of bytes from four input block columns.

A permutation is used in this work instead of a mixed column. Permutation, also known as P-box, is a bit-shuffling model that transposes bits across S-box inputs. This operation is based on column shifts, which occur on different cyclic columns with different offsets, allowing for suitable state permutations. Finally, ARK is executed, which moves one column at a time. ARK gives each column matrix a round keyword. The ARK stage performs matrix addition operations. SBs, SR, Permutation, and ARK are performed in all rounds of encryption except the last. In addition to the rounds of Inverse SR, Inverse SB, Inverse ARK, and Inverse Permutation Transformation, the decryption operation follows the same process as the encryption operation. An inverse permutation is no longer performed in the final round.

Blockchain

Finally, the encrypted data is stored in a BC for further security. BC is a decentralized, shared, and public digital ledger used for storing transactions in various modes. A BC typically consists of two components: transactions, the events performed by system members, and blocks, which record the transactions and ensure their unaltered arrangement. Furthermore, it must be a stable, scalable platform where previous records cannot be altered. When a new transaction is added to the chain, it must be validated by all network participants. The collection of blocks in the BC contains four components: transaction details, the hash value of the existing block, the hash value of a recent block, and a timestamp. As a result, an intruder cannot modify any records of BC because each block is made up of a cryptographic value from the previous block. The blocks in the BC are made up of the block header and the block body. The block header includes the hash value created by the Secure Hash Algorithm (SHA-256), the previous hash, and the current hash, Merkle tree (stores group of transactions in each block), nonce (a number generated by proof of work operations on miner nodes to produce a hash value less than a target difficulty level), and timestamp. As a result, a BC functions as a secure and distributed ledger that effectively, persistently, and verifiably archives all transactions between any two parties in an open networked system. Figure 4 illustrates the BC structure.

Experimental Setup

To evaluate the performance of the proposed system, the implementation and experiments were conducted on a Windows 11 PC, equipped with an Intel Core i3-1005G1 CPU @ 1.20 GHz processor and 6 GB of memory. The system was developed using C# (version 4.4.0) within the Microsoft Visual Studio Community 2022 (version 17.4.4)

Kanagasankari

environment. This setup provided an optimal platform for developing and integrating the Blockchain-based authentication and security framework for healthcare IoT, utilizing BD-DSA (Binomial Distribution Digital Signature Algorithm) and PTC (Permutation-based Tamilian Cryptography). Extensive testing and analysis were performed to assess the performance of the proposed framework. The experiments focused on its ability to handle large-scale transactional data efficiently, providing insights into the system's scalability, security, and overall effectiveness.

RESULTS AND DISCUSSION

Here, the performance of the presented BC-based authentication and security framework for HC-IoT devices is compared with conventional techniques to assess the efficacy of the proposed research model. The proposed work is implemented in the PYTHON working platform. Authentication, secure path creation, and data security are major techniques developed in the proposed framework to improve the security of medical data. As a result, a novel BD-DSA and PTC are used. This paper takes into account 150 patients in order to retain HC data. The simulation parameters of the current research model are tabulated in table 1. The performance of these techniques is detailed as follows.

Performance Assessment of the Proposed Framework

The experimental outcomes of the proposed research framework are contrasted with some of the existing models in the literature, namely, LMDS [20], Linear [21], BSDMF [28], and MMSDDF [29]. The comparison is made in terms of performance metrics such as Communication time (CT), communication overhead (CO), security level (SL), authentication time (AT), authentication accuracy (AA), and data confidentiality rate (DCR). The superiority measurements are made further,

Communication Time

Communication time (CT) is a critical performance metric that reflects the total time required for data exchange between IoT devices and the backend system. It encompasses not only the time taken for data transmission but also the overhead associated with signature generation and verification processes. In a healthcare context, minimizing CT is essential as it directly impacts the responsiveness of medical applications and the timely availability of critical patient data. The CT achieved by the proposed and existing techniques is depicted in Figure 5. The graphical analysis demonstrates that the proposed work achieves a lower CT compared to existing techniques. CT varies according to the number of patients involved, indicating the scalability of the framework. For instance, with a minimum patient count of 30, the proposed framework records a CT of 2282 ms, while the existing models—LMDS, Linear, BSDMF, and MMSDDF—show higher CT values of 2874 ms, 3285 ms, 3784 ms, and 4236 ms, respectively. As the patient count increases, the proposed framework continues to perform favorably. For a maximum count of 150 patients, the proposed work maintains a CT of 5272 ms, demonstrating its efficiency under heavier loads. This consistent performance across various patient scenarios suggests that the proposed framework is superior to existing methodologies in managing communication time effectively.

Communication Overhead

Communication overhead (CO) is a vital performance metric reflecting the additional resource consumption during data transmission between IoT devices and the backend system. Specifically, CO is determined by the memory utilized for signature generation and the memory required during the signature verification process. This metric is crucial in healthcare IoT systems, where efficient resource use is essential to ensure optimal performance without compromising security. Figure 6 illustrates the CO performance analysis of the proposed model compared to existing methods across various patient populations. The results reveal that the proposed model consistently achieves lower CO values compared to conventional models. For patient counts of 30, 60, 90, 120, and 150, the proposed framework attains CO values of 12 KB, 14 KB, 19 KB, 23 KB, and 27 KB, respectively. In contrast, existing models—LMDS, Linear, BSDMF, and MMSDDF exhibit higher CO values, indicating less efficiency in memory utilization during communication. Table 2 compares the results of security level of the proposed and existing models. The higher value

Kanagasankari

of security level shows the better performance of the models. When the number of patients is 150, the security strength of the proposed work is 96.32%, while the existing methods such as MMSDDF, BSDMF, Linear, and, LMDS achieve the security level of 93.45%, 91.78%, 89.65%, and 87.32% for the same 150 patients. Correspondingly, when the number of patients is 60, the proposed method shows higher security of 95.23%. Nevertheless, the conventional methods say MMSDDF, BSDMF, Linear, and, LMDS attains the security level of 93.25%, 91.32%, 89.75%, and 86.57%. Therefore, in this, it is clear that the proposed technique presents a higher security level compared to other state of art approaches.

Authentication Time

Authentication time (AT) is a critical performance metric that measures the duration required for authenticating IoT devices within the healthcare context. As depicted in Figure 7, the AT of the models tends to increase as the number of sensor nodes (SNs) rises. This trend is expected, as more nodes require additional time for processing authentication requests. For a maximum count of 150 nodes, the proposed research framework achieves an AT of 2375 ms, demonstrating its efficiency in managing authentication tasks. In contrast, existing schemes such as LMDS, Linear, BSDMF, and MMSDDF exhibit longer authentication times of 4215 ms, 3862 ms, 3175 ms, and 2651 ms, respectively. These results indicate that the proposed framework significantly outperforms these conventional models in terms of speed and responsiveness. Moreover, the proposed approach consistently attains the lowest AT across all tested node counts (30, 60, 90, 120, and 150), highlighting its effectiveness in authenticating HC-IoT devices. This efficiency is crucial in healthcare applications, where timely authentication is essential for ensuring the security and integrity of patient data while facilitating swift access to necessary medical information.

Table 3 compares the AA and DCR of the proposed and existing frameworks. The AA is the ratio of the number of SNs authenticated correctly to the total count of SNs. DCR refers to the number of medical data securely transmitted over the SNs. The results show that both the AA and DCR obtained by the proposed work are high compared to other existing approaches. That is, for 90 SNs, the proposed framework attains the AA of 94.48% and DCR of 96.37%. On the other hand, the existing MMSDDF attains the AA of 93.45% and DCR of 94.56% for the exact count of 90 SNs, which is very low compared to the proposed model. Similarly, when comparing the AA and DCR of the other existing techniques with the presented approach, the current model achieves the best performance by achieving higher values for both AA and DCR, which shows the efficacy of the proposed model for HC-IoT data security.

The performance of the proposed framework is compared with existing models like LMDS [20], Linear [21], BSDMF [28], and MMSDDF [29] across several key performance metrics, including communication time (CT), communication overhead (CO), security strength (SL), authentication accuracy (AA), and data confidentiality rate (DCR). The results indicate that the proposed framework consistently outperforms existing methods across all metrics. For instance, the communication time achieved by the proposed model is 2282 ms for 30 patients, which is 21% lower than the LMDS model (2874 ms). Similarly, the communication overhead is reduced by 20% when compared to the Linear model, demonstrating the efficiency of the BD-DSA and PTC algorithms in reducing transmission delays and memory usage. In terms of security, the proposed method attains a security strength of 96.32% for 150 patients, surpassing the MMSDDF model (93.45%), which is the highest-performing model among the existing ones. This indicates that the proposed framework offers enhanced protection against unauthorized access and data breaches in healthcare IoT systems. Table 4 shows a comparative analysis of the performance metrics of the proposed framework against existing models, including LMDS, Linear, BSDMF, and MMSDDF. The metrics compared include communication time, communication overhead, authentication accuracy, and data confidentiality rate, highlighting the advantages of the proposed model in each category.

Kanagasankari

DISCUSSION

The results of this study highlight the effectiveness of the proposed blockchain-based authentication and security framework for healthcare IoT devices. By consistently outperforming existing models across key metrics such as communication time, overhead, and security strength, the proposed framework demonstrates its potential to enhance both the security and efficiency of healthcare data management. One of the novel aspects of this framework is its integration of the Blockchain Data Signature Algorithm (BD-DSA) and Privacy-preserving Transaction Codes (PTC). This combination not only improves authentication accuracy and data confidentiality but also provides a unique approach to mitigating security vulnerabilities commonly found in healthcare IoT systems. Comparative analysis reveals that the proposed framework achieves a communication time of 2282 ms for 30 patients, significantly reducing delays compared to existing models like LMDS and Linear. This reduction is crucial in healthcare settings, where timely access to data can directly impact patient outcomes. Furthermore, the security strength of 96.32% for the proposed model indicates a robust defense against unauthorized access and data breaches, addressing a critical concern in healthcare data management. These findings carry significant implications for healthcare organizations considering the adoption of IoT technologies. The proposed framework not only enhances data security but also ensures compliance with regulatory requirements regarding patient privacy. Additionally, the efficiency of the BD-DSA and PTC algorithms suggests that this framework can be seamlessly integrated into existing systems with minimal disruption. While this study presents promising results, it is important to acknowledge its limitations. The framework was validated with a limited number of patients and devices, necessitating further studies to evaluate its scalability in larger healthcare systems. Future research should also focus on optimizing the framework for energy efficiency, particularly in resource-constrained IoT environments. This study contributes to the growing body of knowledge on secure healthcare IoT solutions. By addressing both security and efficiency, the proposed framework lays the groundwork for future innovations in healthcare data management.

Implications of Findings in Healthcare IoT

The findings from the proposed blockchain-based authentication and security framework have important implications for healthcare IoT systems:

Enhanced Security and Patient Privacy Achieving a high security strength of 96.32% provides strong protection against unauthorized access and data breaches. This is crucial in healthcare, where safeguarding sensitive patient information is essential, especially with rising cyber threats. The framework supports compliance with regulations like HIPAA.

Improved Efficiency The reduction in communication time (e.g., 2282 ms for 30 patients) shows the framework's potential for timely access to patient data. In emergencies, quick access to critical information can significantly enhance decision-making and patient outcomes.

Scalability The framework's ability to maintain performance with varying patient counts suggests scalability. As healthcare organizations expand their IoT networks, this framework can handle increased data loads without performance loss, making it suitable for larger systems.

Integration with Existing Systems The efficiency of the Blockchain Data Signature Algorithm (BD-DSA) and Privacy-preserving Transaction Codes (PTC) indicates that this framework can be integrated into current healthcare IT infrastructures with minimal disruption, enabling organizations to enhance security without needing a complete system overhaul.

**Kanagasankari****CONCLUSION**

This paper presents a novel and efficient blockchain-based authentication and security framework specifically designed for healthcare Internet of Things (HC-IoT) devices. By integrating advanced techniques such as the Binomial Distribution based Digital Signature Algorithm (BD-DSA) and Privacy-preserving Transaction Codes (PTC), the proposed model significantly enhances both the security and efficiency of healthcare data management. The comprehensive evaluation of the framework demonstrates its superiority over existing methods across several critical performance metrics. Specifically, the proposed model achieves an impressive authentication accuracy of 95.48%, indicating a high level of reliability in verifying the identities of connected devices. Additionally, the data confidentiality rate of 96.37% underscores the framework's effectiveness in safeguarding sensitive patient information from unauthorized access. Notably, the framework excels in operational efficiency, recording an authentication time of 2375 ms and a communication time of 2282 ms. These metrics are particularly vital in healthcare settings, where rapid access to information can directly influence patient outcomes. Furthermore, the security strength of 96.32% illustrates a robust defense mechanism against potential data breaches and cyber threats, addressing a primary concern in the healthcare sector. The findings from this study not only validate the proposed framework's efficacy in enhancing data security but also highlight its potential for seamless integration into existing healthcare systems, ensuring compliance with regulatory requirements regarding patient privacy. Future research will aim to extend this work by exploring advanced techniques for attack detection and prevention, further reinforcing the security framework for HC-IoT data management. This study contributes significantly to the ongoing efforts in developing secure and efficient solutions for healthcare IoT environments.

Limitations and Future Work

Despite the promising results obtained from the proposed framework, several limitations exist. First, the current model has been validated on a relatively small scale with 150 patients and IoT devices, which may not fully represent the complexities of larger healthcare systems. Further studies are needed to assess its scalability and performance under more extensive, real-world conditions. Second, blockchain-based systems inherently introduce computational and energy overhead, which may pose challenges for IoT devices with limited resources. Although this model reduces communication overhead, it still requires further optimization for energy efficiency. Finally, the security framework, while robust against known threats, may still be vulnerable to emerging cyberattacks. Future research will focus on enhancing the framework's attack detection and prevention capabilities to further strengthen healthcare data security.

STATEMENTS AND DECLARATIONS**Ethical Approval**

This study does not involve human participants or animals; therefore, ethical approval is not applicable.

Informed Consent

As this research does not involve human participants, informed consent is not applicable.

Consent for Publication

The author listed in the manuscript have provided their consent for the publication of this research in Indian Journal of Natural Sciences.

Availability of Data and Materials

Data sharing is not applicable to this article, as no datasets were generated or analyzed during the study.

Competing Interests

The author declare no conflicts of interest related to the publication of this paper.

**Kanagasankari****Funding**

This research did not receive any specific grant from funding agencies in the public, commercial, or not-for-profit sectors.

ABSTRACT

In an era of globalization, English proficiency is a crucial asset for career success. However, many undergraduate students struggle with spoken communication despite their exposure to the language. Key challenges include lack of confidence, stage fear, limited vocabulary, and an over-reliance on grammar-based learning. Traditional methods that emphasize reading and writing often fail to develop fluency and real-world communication skills. This paper advocates for a learner-centred approach to enhancing speaking skills through interactive classroom strategies such as role-playing, discussions, problem-solving, and immersive listening activities. It underscores the importance of balancing fluency and accuracy, creating a communicative environment, and minimizing reliance on native language translation. The study concludes that student-led, interactive methods can significantly improve spoken English proficiency, boosting students' confidence and articulation in both professional and social settings.

Keywords: Globalization, Proficiency, Accuracy, Language Translation, Articulation.

INTRODUCTION

Globalization has made English the need of the hour, particularly for Indian professionals, who are in high demand worldwide. As a result, almost every college student in India is actively engaged in learning English, recognizing its role as a vital skill for employability upon graduation. Driven by a strong desire to develop effective communication

**Sher Mohammed Khan and Renuga**

skills, students dedicate significant effort to mastering the language. In their pursuit of fluency, they listen to BBC news, podcasts, and vidcasts, and regularly read newspapers and magazines. It is common to find students poring over dictionaries in the back of the classroom or completing grammar exercises in the cafeteria. Yet, despite their dedication, they often approach their English teachers with the same concern: "Sir/Ma'am, my spoken English is very poor. How can I improve my spoken English?" This recurring question is one that English teachers frequently encounter. Although numerous responses have been provided over time, they often fail to yield satisfactory results. Even educators themselves sometimes struggle to offer a definitive and effective solution. This paper seeks to address this persistent challenge by exploring a comprehensive and practical approach to improving spoken English proficiency among students.

Learner's Analysis

Evaluating the background of learners is a crucial step for an English teacher. Every classroom, in many ways, consists of students with mixed abilities. Undergraduate students come from diverse linguistic backgrounds, with some having studied in regional-medium schools and others in English-medium institutions. It is essential to assess and compare their levels of communication apprehension, as even students from English-medium backgrounds exhibit varying degrees of language proficiency and recall different aspects of their learning. Many students from regional-medium schools can construct simple sentences and write short paragraphs with relative ease. However, their primary challenge lies in spoken communication, particularly in achieving fluency.

Students often express their concerns in the following ways

- "When I speak English, I feel inadequate because I make too many mistakes."
- "I do not want to speak English until my proficiency improves significantly."
- "We lack confidence in using grammar and vocabulary correctly."
- "I do not know enough English words to express myself effectively."

The challenges faced by learners are diverse. Many report a lack of confidence and a sense of inhibition while speaking. Common issues include stage fright, shyness, hesitation, difficulty in real-world communication, and panic when they struggle to recall appropriate words. Additionally, they often feel tongue-tied due to the fear of making mistakes and facing embarrassment. Many students also express a strong dependency on their teachers, believing they cannot improve without constant guidance. Addressing these concerns requires a structured and supportive approach to language learning, fostering an environment that encourages confidence, practice, and gradual improvement in spoken English.

Successful Learners

Successful learners are those who can engage in meaningful conversations, initiate and sustain discussions, and effectively conclude a variety of communicative tasks. They can narrate and describe events using well-structured, paragraph-length discourse and comprehend main ideas and key details in conversations on diverse topics beyond immediate contexts (Hadley, 1993). In contrast, non-successful learners are often identified—both by themselves and others—as individuals who struggle to use English effectively in communication. One perspective on fluency suggests that it does not equate to speaking rapidly and without hesitation. Instead, fluency involves the ability to express thoughts and ideas despite gaps in vocabulary and occasional grammatical errors. Another viewpoint stresses the importance of linguistic accuracy in all aspects of communication. Ideally, learners should develop both fluency and accuracy, as an overconfident yet inaccurate speaker can be ineffective or even frustrating to listeners. However, expecting learners to speak flawlessly without making mistakes is unrealistic. The primary goal should be to enable them to communicate ideas clearly so that others understand and respond appropriately. As students become more fluent, they may initially make more errors because they are stretching their linguistic abilities and focusing on meaningful communication rather than strict grammatical correctness. While this does not mean that mistakes should be encouraged, it is essential to recognize that errors are an inevitable part of the learning process. A teacher's role is to guide students toward reducing mistakes while building confidence in their spoken English.

To effectively teach speaking skills, educators should

- Differentiate between fluency and accuracy and help students strike a balance between the two.
- Encourage students to view mistakes as a natural part of the learning process rather than as failures.

**Sher Mohammed Khan and Renuga**

- Reduce anxiety about errors and foster a supportive environment where students feel comfortable communicating in English.

Preparing an Answer**A Natural Approach to Language Learning**

The most effective and natural way to acquire a language is through the mother-tongue approach. Children learn to speak their native language effortlessly, driven by parental encouragement and the supportive environment of their families. This process enables them to develop intelligible speech, one of the most complex human skills. Language acquisition follows a universal pattern, and English is no exception to this fundamental principle. For English teachers, the key to fostering effective language learning lies in replicating this natural environment within the classroom. Creating a listen-respond setting, similar to a family atmosphere, allows learners to develop both listening and speaking skills organically. As natural language acquisition suggests, the more we listen to spoken language, the more likely we are to speak. Similarly, the more we practice speaking, the more fluent and confident we become. Moreover, listening and speaking skills should take precedence over literacy skills such as reading and writing. Just as children learn to understand and speak before they learn to read and write, students learning English as a second language should first focus on auditory and oral communication. By prioritizing listening and speaking, educators can help learners build a strong foundation in the language, ultimately leading to greater fluency and confidence in communication.

The Role of Listening in Spoken English Development

Listening is fundamental to acquiring spoken English skills and plays a more significant role in developing oral proficiency than other language skills. A well-structured listening exercise can be conducted in multiple stages, but not all listening activities are inherently learner-centred. For instance, comprehension tasks that follow a listening activity help students grasp the content better. However, when these tasks are done individually, learners may feel isolated, especially if they struggle to understand the conversation. In contrast, a student-centred listening activity involves collaborative comprehension tasks, where students work in pairs or small groups (4-5 members). This approach allows learners to compare their answers, discuss differing responses, and engage in short discussions. Such interactions enable them to clarify doubts, validate their understanding, and reinforce learning through peer support. When the recording is played again, students can re-evaluate their answers, resolve uncertainties, and deepen their comprehension. The entire group actively engages in the discussion, ultimately leading to a more satisfying learning experience. By the end of the activity, learners often feel more confident because they have understood most, if not all, of the conversation. To further enhance engagement, pairs can first compare their answers, followed by a group discussion on the listening material. This interactive approach is crucial to language learning, as it not only improves comprehension but also promotes communication, critical thinking, and collaborative problem-solving among learners.

Reading as an Interactive Learning Activity

To optimize classroom time, teachers often ask students to read texts before the lesson and answer comprehension questions at home. However, reading in class can be an engaging and interactive experience when students collaborate to understand the content and share their reactions. Even multiple-choice questions, typically seen as individual tasks, can serve as a foundation for meaningful discussions when tackled in pairs or small groups. Rather than simply being given the correct answers, students find it more engaging to discuss and justify their responses.

Consider the following example of a student discussion

S1 What is the answer to question number 5?

S2 I think it's A.

S1 I believe it's C.

S2 Why do you think so?

S1 Well, in the fourth paragraph, it says, "When the event took place."

S2 Oh, I see. But it also mentions that...

Such discussions not only enhance comprehension but also develop critical thinking and communication skills.

**Sher Mohammed Khan and Renuga**

Reading activities can involve two types of discussions

1. **Content-Based Discussions** Where students debate and clarify their answers to comprehension questions.
2. **Reaction-Based Discussions** Where learners reflect on the information they have just read, relate it to personal experiences and share opinions.

By incorporating pair and group discussions, reading activities become interactive and learner-centred, directly contributing to the development of speaking skills. This approach ensures that students are not passive recipients of information but active participants in their learning process, fostering greater engagement, confidence, and fluency in English communication.

Encouraging Effective Discussions in the Classroom

Discussions are a fundamental aspect of any student-centered classroom, fostering engagement, critical thinking, and language development. The most effective discussions occur when students share personal experiences and express opinions. Discussions are most productive in pairs or small groups, as this allows greater participation. In larger groups or whole-class settings, many students may only agree or disagree with a few dominant speakers without contributing their own thoughts.

Encouraging Meaningful Discussions

Students can be encouraged to participate in discussions based on

- Personal experiences
- Visual prompts (e.g., pictures, videos, info graphics)
- Textbook units or reading materials
- Articles and current events

Sustaining a Conversation

While students may begin discussions with enthusiasm, they often struggle to **sustain conversations** due to limited knowledge, vocabulary, or exhaustion of the topic. To help them **keep discussions going**, teachers can

- Provide conversation starters to guide the beginning of discussions.
- Introduce contemporary socio-political or culturally relevant topics to spark interest.
- Set a time limit (e.g., five minutes) to ensure structured discussions.

If students lack content, teachers can frame open-ended questions related to the topic. Some learners may have more to say on certain questions while skipping others. To conclude discussions, teachers can

- Ask a dominant or vocal group member to summarize key points.
- Encourage students to share an interesting or amusing observation from their discussion.
- Open up the conversation for class-wide participation.

Building Resourcefulness in Group Discussions

Groups that lack leadership or structure tend to give up easily during discussions. To foster resourcefulness, teachers should

- Encourage students to ask follow-up questions to extend conversations.
- Assign a group leader to keep the discussion active.
- Guide students on how to elaborate on their points rather than rushing through the discussion.

By implementing these strategies, classroom discussions can become engaging, dynamic, and productive, ultimately enhancing students' speaking confidence and fluency.

Enhancing Speaking Skills Through Role Plays

Role play is a dynamic and engaging activity that can add an element of fun to the teaching-learning process. It is widely regarded as an effective tool for improving speaking skills and expanding vocabulary. Since real-life speech situations involve unexpected twists and challenges, role plays offer an excellent platform for students to practice spontaneous communication and adapt to various conversational contexts.

**Sher Mohammed Khan and Renuga****Types of Role Plays**

Most role plays involve students assuming different roles, such as

● Realistic Scenarios

- Tourist & Tour Guide
- Customer & Sales Assistant
- Employee & Boss
- Friends meeting after a long time
- Students discussing a subject-related topic

● Non-Realistic Scenarios

- Fictional or exaggerated characters
- Imaginary situations

While some students enjoy nonrealistic roles, others may feel uncomfortable pretending to be someone else. To ensure that role plays remain enjoyable and effective for all learners, it is beneficial to choose realistic scenarios where students play themselves in different situations. This approach reduces inhibitions and encourages natural, lively conversations.

Facilitating and Monitoring Role Plays

A teacher's role in a role-play activity extends beyond simply assigning roles. Active monitoring and feedback are crucial in maximizing its benefits. Teachers should

- Observe student interactions and provide real-time guidance if necessary.
- Encourage creativity and spontaneity in conversations.
- Correct grammatical mistakes without interrupting the flow.
- Provide constructive feedback on pronunciation, fluency, and expression.
- Appreciate and paraphrase dialogues to enhance clarity and confidence.

The Importance of Feedback

Often, due to time constraints, teachers may overlook giving feedback or appreciating students' efforts, which can impact learners' motivation. Acknowledging students' performance, whether through corrections or positive reinforcement, boosts their confidence and encourages active participation in future speaking activities. By incorporating well-structured role plays and ensuring timely feedback, teachers can create an immersive language-learning experience that enhances fluency, builds confidence, and fosters meaningful communication among students.

Enhancing Speaking Skills Through Information Gap Activities

Information gap activities are an effective way to make classrooms more interactive and engaging. These activities motivate students by creating a need for real communication in the target language, thereby enhancing speaking skills.

Benefits of Information Gap Activities

- Encourage active communication by requiring students to ask and answer questions.
- Promote meaningful interactions by making language use authentic and purposeful.
- Help students transition from a structured learning environment to a more communicative setting.
- Improve vocabulary and grammar as students search for and exchange information.

How Information Gap Activities Work

The concept is simple

- Each student receives different pieces of information that they must share with their partner or group.
- To complete the task, students must ask questions, describe, and explain to fill the gaps.
- The goal is to ensure that all learners are equally involved and are actively communicating to accomplish the task.

**Sher Mohammed Khan and Renuga****Designing Effective Information Gap Activities**

To maximize the benefits of these activities

- Assign roles so that each student has a specific task (e.g., finding out a missing piece of information).
- Ensure that students must communicate in order to exchange details.
- Create activities with a clear goal, such as solving a puzzle, completing a chart, or planning an event.
- Provide structured prompts for students who may struggle to initiate conversations.

By incorporating well-planned information gap activities, teachers can create a stimulating, student-centred learning environment that fosters confidence, fluency, and effective communication in English.

Problem Solving in Language Learning

Problem-solving activities, including puzzles, brain-teasers, and games, can stimulate meaningful communication when students collaborate to find solutions. While some students may struggle with problem-solving, a student-centered approach allows them to work collectively, drawing on each other's strengths.

The primary objective of these activities is to encourage conversation in English, rather than simply arriving at the correct solution. The emphasis should be on active participation, idea-sharing, and verbal expression in the target language.

The Teacher's Role

To ensure the effectiveness of problem-solving activities, teachers should

- Monitor students while they are engaged in the task and provide feedback.
- Assign puzzles and problems that foster collaborative discussions in English.
- Allow sufficient time for groups to exchange ideas and explore possible answers.

Grammar and Vocabulary Exercises

Grammar and vocabulary exercises can also serve as interactive, student-centred activities that promote engaging discussions and authentic communication. While some students may prefer to complete these exercises individually, collaborative completion can make the learning process more enjoyable and productive.

Sample Exercise**Choosing the Correct Word**

(Using: *big, great, high, large, tall*)

1. There is a nice house with a _____ garden.
2. Albert Einstein was a _____ physicist.
3. She is a very _____ child for her age.
4. A _____ rate of inflation makes exports uncompetitive.
5. My mother is six feet _____.
6. He is making a _____ mistake.
7. Can you see the _____ trees behind the lake?
8. The city has a _____ level of pollution.
9. This pullover isn't _____ enough.
10. My grandfather lived to a _____ age.

Encouraging Collaborative Learning

When students complete such exercises together, they can share ideas, justify their choices, and learn from each other's reasoning. The discussion that follows can reinforce vocabulary retention and encourage the natural use of English.

For example

- **Student 1** What could be the answer for No. 3?
- **Student 2** I think it is *big*.
- **Student 1** Why do you think so?

Sher Mohammed Khan and Renuga

- **Student 2** Maybe it refers to her physique.
- **Student 1** But *tall* seems more appropriate.
- **Student 2** Why?
- **Student 1** Because *tall* refers to height, which is greater than average.
- **Student 2** Yes, that makes sense.

By working in pairs or small groups, students naturally engage in spoken English, enhancing their communication skills in an interactive manner.

Balancing Grammar and Communication

While grammar study is valuable, it should not dominate English learning. Instead, learners should be encouraged to

- Prioritize listening and speaking to build fluency.
- Use grammar as a tool to enhance comprehension and accuracy.
- Internalize grammar through meaningful interaction, rather than relying on rote memorization.

By incorporating problem-solving tasks and collaborative grammar exercises, students can develop both fluency and accuracy, ultimately improving their spoken English proficiency.

Only English

Learners often switch between English and their native language, which can hinder fluency if done excessively. However, occasional switching may be necessary when their English proficiency is insufficient to express complex ideas. In such cases, they may seek help from peers or use a dictionary. As teachers, we must uphold the "Only English" rule by ensuring that our explanations are delivered in English. While this may be challenging for both learners and instructors, it is essential to create an immersive language-learning environment. A practical way to maintain an English-only atmosphere in the classroom is by encouraging students to use "classroom language"—essential phrases and expressions that help them communicate effectively during group activities. This practice not only fosters better classroom interactions but also encourages students to speak English consistently and confidently.

CONCLUSION

I acknowledge that my understanding of Second Language Acquisition (SLA) theory is still evolving, and the scope of my study is limited. I do not claim to offer a universal solution for language learning. However, I firmly believe that students can significantly enhance their English skills if they embrace the following principles

- Recognizing that language acquisition is more effective in group learning than in isolated study.
- Shifting their motivation beyond merely passing exams to seeing language as a gateway to new opportunities.
- Engaging in daily exposure to comprehensible input to reinforce learning.
- Overcoming the fear of making mistakes and actively seeking opportunities to communicate with both native and proficient non-native speakers.
- Studying grammar as a tool to enhance communication, rather than as an end in itself.

Student-centred activities make learning enjoyable and stimulating. Engaging in discussions, sharing experiences, responding to different perspectives, and expressing emotions in English fosters both confidence and fluency. Through well-structured communicative activities such as role plays, discussions, and problem-solving tasks, students are encouraged to experiment with language in a supportive environment. When learners feel safe to make mistakes without fear of embarrassment, they develop self-confidence and a stronger motivation to learn. Ultimately, creating a student-centred, communicative classroom paves the way for effective and lasting language acquisition.

ABSTRACT

One of the biggest public health issues facing around the world today is obesity, which has spread like an epidemic. Numerous dangerous illnesses, such as diabetes mellitus, non-alcoholic liver disease (NAFLD), cardiovascular disease, hypertension, stroke, and some types of cancer, are significantly increased by obesity. The lively evergreen shrub *Phlogacanthus thyrsiflorus* Nees is used in many traditional medicines to treat a variety of illnesses. This plant has been shown to have hepatoprotective, hypolipidemic, antifungal, antibacterial, anti-inflammatory, anti-diabetic, and anti-cancer properties. In this research the hydroalcoholic extract of the flower of *Phlogacanthus thyrsiflorus* Nees. 250 mg/ kg and 500 mg/kg showed the potent anti-obesity activity through free fatty acid (FFA) concentration analysis as compare it control and marketed standard chitosan. Phytochemicals, such as alkaloid, flavonoids, saponin and phenols act as an anti-obesity activity by their different mechanism of action. In this research study the hydroalcoholic extract of the flower of *Phlogacanthus thyrsiflorus* Nees showed the presence of those phytochemicals and this phytochemicals may be the reason behind its anti-obesity activity.

Debika Paul *et al.*,

Keywords: *Phlogacanthus thyrsiflorus* Nees, Hydroalcoholic extract, Phytochemicals, Anti- obesity activity, Free fatty acid (FFA), Chitosan

INTRODUCTION

Obesity is a metabolic disease in which one has so much body fat that it might cause serious health issues. It is caused by consuming more calories from food than the body needs for energy-consuming processes. Obesity is a term that comes from the Latin word "obseus," which means to consume too much. Nowadays, obesity is the most common dietary disease and a global public health issue that is getting worse. The illness has reached epidemic proportions, with estimates that by 2015, there would be 700 million obese adults and 2.3 billion overweight adults, respectively. [1] Being overweight has been shown to increase the risk of type 2 diabetes and cardiac diseases, where the metabolic syndrome is the primary and causative factor.[2] These metabolic disorders include, among other things, hyperglycaemia, dyslipidaemia, hypertension, inflammation, and oxidative stress.[3] It can be treated with herbal medicines. The field of herbal medicine has experienced exponential expansion in recent years, and due to their natural origin and fewer side effects, these medications are becoming more and more popular in both developed and developing nations. Medicinal plants, minerals, and organic materials are the source of many currently used traditional medicines.[4] Researchers were instructed by the World Health Organization (WHO) to investigate if traditional treatments yielded any positive clinical outcomes.[5] Human experience has a long history of supporting folkloric usage. By analyzing ethno-pharmacological data, many physiologically active plants are found, and these plants may provide the local community with instantly available medicinal goods.[6]Worldwide, 21,000 plants have been utilized for therapeutic purposes, according to the World Health Organization (WHO).There are 2500 of these species in India, 150 of which are widely employed for commercial purposes. India, known as the botanical garden of around the world, is the world's biggest source of medicinal herbs. Herbal treatments are widely regarded as safer and less harmful to the human body than manufactured pharmaceuticals. As a result, scientists all over the world are screening plants for biological functions that may have therapeutic applications. Traditional healers' claims regarding the therapeutic value of a plant are a key factor in choosing it for such a study. Herbal treatments for various kinds of illnesses are mentioned in the traditional Indian medical system. Ayurveda highlighted the use of dietary supplements in the treatment of disorders. The importance of dietary products, in the form of nutritional factors, in the treatment of chronic diseases has been recognized even by practitioners of the modern system.[7] The miraculous medicinal plant *Phlogacanthus thyrsiflorus* Nees is a part of the Acanthaceae family, a genus endemic to North east, Bangladesh and Myanmar. It can be used as herbal medicine to treat different disease like – liver and spleen disease. At the tips of branches, this plant bears upright spikes of long, orange-red tubular blooms. It is also known as kola bahak, Teetaphool, Dhapattita (Assamese), Wild nonmangkha (Manipuri), Tew-phot-saw (Khasi), kham-chhit (Garo). In Assamese, "Teetaphool" means bitter flower, it has high bitter taste, but have several therapeutic uses like it is used to treat cough, asthma, gastritis, pharyngitis, indigestion, and acidity.The plants are found growing across the tropics and the whole North-eastern region of India, primarily from December to April.[8]

MATERIALS AND METHODS

Phytochemical Screening[9]

To identify the presence of active ingredients, the crude extract went through qualitative analysis. Standard practices were used to conduct phytochemicals tests like – Alkaloid, Carbohydrate, Flavonoid, Tannin, Saponin, Glycoside, Polyphenol.

Standard Drug Solution Preparation

One 350 mg Chitosan capsule was taken. Then powder was gathered by removing the capsule shell, and it was dissolved in 1000 ml of distilled water to create a 0.35 mg/ml standard solution.

Debika Paul *et al.*,**Test solution preparation**

High Dose (500 mg): The test solution is prepared by dissolving 20 mg of hydroalcoholic extract of dried *Phlogacanthus thyrsoiflorus* Nees flower in 40 ml of distilled water, then adding the mixture to the sample vessel.

Low Dose(250mg): The test solution is prepared by dissolving 20 mg of hydroalcoholic extract of dried *Phlogacanthus thyrsoiflorus* Nees flower in 80 ml of distilled water, then adding the mixture to the sample vessel.

Blood sample preparation[10,11]

To stop clotting, 1.2 g of EDTA was added to 60 ml of chicken blood that had been collected in a sterile vacutainer from a local butcher shop near Netaji Subhas Chandra Bose Institute of Pharmacy. After that, the tube was centrifuged for ten minutes at 3000 rpm. These separated the clear, yellowish serum from the red blood cells and clots. Using a dropper or micropipette, the serum was delicately moved into a beaker, being cautious not to disturb the sediment to prevent contamination.

Procedure[12,13]

At first, collected blood serum was divided into four groups, each groups contain three samples and are treated with their respective treatment and kept them in the incubator for 1 hour at 37^o c to fulfil the necessary chemical reaction.

Group 1(sample mixture 1):- 1ml blood serum with 0.1 ml distilled water.

Group 2(sample mixture 2):- 1ml blood serum with 0.1 ml standard drug solution.

Group 3(sample mixture 3):- 1ml blood serum with 0.1 ml test drug solution (250ml/kg).

Group 4 (sample mixture 4):- 1ml blood serum with 0.1 ml test drug solution (500ml/kg).

After that 10 ml ethanol was added in each sample mixture with 2-3 drop of phenolphthalein. Then titrated the mixture against (0.05N) NaOH solution and noted the average volume of NaOH used to neutralised the free fatty acid (FFA) that was present in the serum to calculate the concentration of FFA.

The FFA concentration (mmol/L) was calculated using the formula:

$$\text{FFA (mmol/L)} = \frac{V \times N \times 1000}{\text{Sample Volume (mL)}}$$

Where:

V: Volume of NaOH used (ml).

N: Normality of NaOH (0.05).

Sample Volume: 1ml (serum)

RESULT AND DISCUSSION**Extract preparation**

After maceration with a 70%hydroalcoholic solution for 72 hours, *Phlogacanthus thyrsoiflorus* Nees flower produced a yield of 8.93%.

Phytochemical investigation

Through the different phytochemical investigation, the hydroalcoholic extract of *Phlogacanthus thyrsoiflorus* flower showed the presenceof different phytochemicals like- alkaloid, carbohydrate, flavonoid, tannin, saponin, polyphenol (Table 1).

Anti-obesity Test

Free fatty acids (FFAs) promote fat storage in adipose tissue, which results in weight gain. High levels of free fatty acids make it harder to lose weight because they increase insulin resistance. The development of visceral adipose tissue, which is triggered by FFAs, is a primary contributor to obesity. Consistently elevated FFA levels lead to inflammation, which makes obesity worse.[14] FFAs enhance appetite and food intake, which eventually results in obesity, by upsetting hormone homeostasis.By measuring the concentration of FFAs, the study aimed to assess the anti-obesity effect of *Phlogacanthus thyrsoiflorus* Nees flower against the non-treated control group and commercially

**Debika Paul et al.,**

available Chitosan 350mg. Both the 250 mg/kg and 500 mg/kg dosages of *Phlogacanthus thyrsoiflorus* Nees flower demonstrate a strong anti-obesity impact when compared to the market standard of Chitosan capsule and control, and the standard Chitosan has once again demonstrated its effectiveness in comparison to control. Titrating the mixture against a (0.05N) NaOH solution and noting the average volume of NaOH required to neutralize the FFA allowed researchers to calculate the concentration of free fatty acid (FFA) in the serum. The FFAs analysis revealed that the control, standard, and test drugs, 250 mg/kg and 500 mg/kg, respectively, had FFAs concentrations of 143, 118, 136.5, and 133, according to "table-2". Therefore, when compared to the control and standard drug, the extract from *Phlogacanthus thyrsoiflorus* Nees flower, the test sample, demonstrated strong anti-obesity efficacy (Table 2, Figure 1). It was clear from the results of the phytochemicals study that the dried flowers of *Phlogacanthus thyrsoiflorus* Nees had a high concentration of tannin, alkaloids, flavonoids, Polyphenols, and saponins. In general, phytochemicals such as flavonoids, alkaloids, polyphenols, and saponins can promote the oxidation of free fatty acids and prevent the lipolysis process, which lowers the amount of FFAs in blood serum.[15] Also, because flavonoids have a high affinity for free fatty acids (FFAs), they can bind and sequester them, lowering FFA levels in blood serum by forming complexes with FFAs. In addition to this, flavonoids can react with FFAs to form insoluble.[16] Alkaloids and polyphenols have the ability to reduce free fatty acids (FFAs) by reacting with FFAs to create salts due to their fundamental nature.[17, 18] Therefore, the *Phlogacanthus thyrsoiflorus* Nees flower may be considered an effective anti-obesity agent due to the presence of those phytochemicals.

CONCLUSION

A variety of phytochemical components, such as carbohydrates, flavonoids, saponins, and phenol, were discovered in the dried flowers of *Phlogacanthus thyrsoiflorus* Nees. This herb is a nontoxic traditional medicinal plant that can be used for a variety of therapeutic purposes. Despite the fact that little is understood about how herbal remedies operate, their remarkable benefits have led to their usage in numerous medical treatments. In this research, the hydroalcoholic extract of *Phlogacanthus thyrsoiflorus* Nees was shown to have a potent anti-obesity effect at doses of 250mg/kg and 500mg/kg. This adaptable plant contains a variety of phytochemicals compounds. In future prospective research, the current study can serve as a valuable source of knowledge and provide appropriate criteria to assess the quality of this plant material. More research is needed on the bioactive phytochemicals found in *Phlogacanthus thyrsoiflorus* Nees, which have a range of different pharmacological effects.

ACKNOWLEDGEMENT

We would like to extend our sincere gratitude to Dr. Arnab Samanta, the principal of the Netaji Subhas Chandra Bose Institute of Pharmacy. We also appreciate the support from our friends, family, and all of the lab participants.

ABSTRACT

The crisis of plastic pollution in marine environments, especially in coastal regions, lead to a significant threat to global biodiversity. With over 19–23 million tons of plastic waste entering oceans annually, ecosystems are destabilized, and countless marine species face dire consequences such as habitat loss, toxicity, and reduced reproductive success as per the UN Environment Programme of 2022. This research explores the multifaceted impacts of plastic pollution on marine biodiversity and assesses the efficacy of existing mitigation strategies. It emphasizes the importance of this topic in light of growing ecological degradation, food insecurity, and threats to human health via bioaccumulation in marine food chains. Employing a doctrinal methodology supported by case studies, policy analysis, and literature review, the study critically evaluates global and regional efforts including Marine Protected Areas, Extended Producer Responsibility programs, and community-led clean-up initiatives. Findings reveal both progress and persistent gap, ranging from weak regulatory frameworks and economic constraints to technological and behavioural challenges. The research emphasizes that while current mitigation strategies offer potential, a holistic, adaptive approach integrating policy reform, scientific innovation, and community engagement is essential for sustained impact. Ultimately, the study underscores that addressing plastic pollution is not just an ecological necessity but a socio-economic and ethical imperative for preserving marine biodiversity and human well-being alike.

Keywords: Plastic, Pollution, Marine Biodiversity, Ecological Necessity, Mitigation Strategies.

INTRODUCTION

“Marine pollution” especially plastic pollution has become an escalating environmental challenge, posing severe risks to global biodiversity, particularly in coastal regions. The United Nations has reported that over 19-23 million tons of plastic waste enter the oceans every year, significantly impacting marine life and habitats (UN Environment Programme, 2022). Coastal regions, which are often centre of human activity, face intensified pressures from

Rituparna Halder

pollutants such as plastic waste, chemical runoff, and untreated sewage. These pollutants disrupt marine ecosystems, compromise the health of species, and threaten the balance of oceanic biodiversity (Jambeck et al., 2015). Furthermore, such pollutants frequently bioaccumulate within food chains, affecting not only marine life but also human populations reliant on these ecosystems for food and economic activity (Wilcox et al., 2015). The degradation of marine environments through plastic pollution has direct and cascading effects on biodiversity, with species facing increasing threats of toxicity, altered reproductive patterns, and habitat destruction (Worm et al., 2006). Notably, coral reefs and mangrove forests, two critical habitats found in coastal regions, are highly susceptible to pollutants, impacting the numerous species they support. As these environments degrade, the loss of biodiversity becomes more pronounced, raising urgent concerns about ecosystem stability and resilience (Hoegh-Guldberg et al., 2019). In response to these challenges, a range of mitigation strategies has been proposed and implemented globally, yet significant gaps remain in effectiveness and enforcement. Effective approaches include reducing land-based sources of pollution, implementing stricter regulations on waste disposal, and developing community-led initiatives to enhance coastal ecosystem resilience (Schmidt et al., 2017). This study focuses on exploring these strategies within coastal regions to assess their impact on marine pollution and biodiversity conservation, ultimately aiming to propose adaptive and sustainable mitigation measures tailored to high-risk coastal ecosystems.

Marine Pollution and its impact on Biodiversity

“Marine pollution” has become a significant danger to biodiversity, affecting marine life and ecosystems in profound ways. Pollutants such as plastics, chemicals, heavy metals, and oil disrupt natural habitats, endanger species, and undermine the health of entire marine ecosystems. Studies indicate that marine species, from microscopic plankton to large mammals, face severe risks from exposure to contaminants that accumulate in their habitats (Galloway et al., 2017). This pollution not only reduces species richness but also impacts reproductive rates and food webs, leading to cascading effects on ecosystem stability (Jambeck et al., 2015). Moreover, toxic compounds in pollutants such as microplastics can be ingested by marine organisms, causing bioaccumulation and biomagnification, which can reach humans through seafood consumption (Rochman et al., 2013). Addressing marine pollution is essential to protect biodiversity and ensure the resilience of marine environments in the face of increasing human impact.

Types of Marine Pollution and Their Sources

Marine pollution encompasses various pollutants introduced into oceans and coastal areas, including plastic waste, oil spills, chemical pollutants, agricultural runoff, and heavy metals.

- **Plastic Pollution:** Plastics contribute significantly to marine pollution, affecting diverse species, from fish and turtles to seabirds. Studies reveal that millions of tons of plastic enter oceans annually (Jambeck et al., 2015). Plastics break down into microplastics, which are ingested by marine life, causing health issues and disrupting food webs (Avio et al., 2017).
- **Oil Pollution:** Oil spills, such as the Deepwater Horizon disaster in 2010, exemplify how petroleum-based pollutants destroy coastal habitats, reduce oxygen levels in water, and threaten species diversity (Peterson et al., 2003).
- **Chemical Pollution:** Chemicals from industries, including mercury and pesticides, enter waterways and bioaccumulate in marine organisms, leading to reproductive issues, hormonal disruptions, and mortality (Matthiessen & Law, 2002).

Impact of Plastic Pollution on Marine Biodiversity

Marine pollution has severe consequences on biodiversity, impacting ecosystem health, reducing populations, and threatening species with extinction.

- **Habitat Destruction** Pollutants degrade crucial marine habitats, such as coral reefs and seagrasses, which are critical for supporting diverse marine species (Doney et al., 2009). Coral reefs, affected by pollution and rising ocean temperatures, experience coral bleaching, reducing fish populations that depend on these ecosystems.

Rituparna Halder

- **Disruption of Food Chains** Microplastics ingested by planktonic organisms accumulate up the food chain, affecting larger species like fish, marine mammals, and even humans through seafood consumption (Gall & Thompson, 2015). The biomagnification of toxins, such as PCBs and heavy metals, in apex predators results in health and reproductive impairments.
- **Species Mortality and Reduced Reproductive Success** Aquatic species such as sea turtles and seabirds often ingest plastics, mistaking them for food, which can lead to malnutrition and death. Furthermore, chemical pollutants disrupt endocrine functions in marine species, lowering reproductive success and survival rates (Law & Thompson, 2014).

Ecosystem-Wide Impacts and Resilience

Ecosystems lose resilience with the decline in species diversity and population. This loss affects ecological functions, reduces fish stocks, and alters the natural balance between predator and prey species.

- **Climate Change Synergy:** Pollution, when combined with climate change, exacerbates the impacts on marine biodiversity. For example, ocean acidification, due to increased CO₂ absorption, weakens coral structures, while pollution from fertilizers leads to harmful algal blooms, creating dead zones devoid of oxygen (Halpern *et al.*, 2008).
- **Impacts on Human Communities:** The degradation of marine biodiversity affects fisheries and tourism, impacting livelihoods of coastal communities. Studies estimate that loss of biodiversity and marine health could cost the global economy billions annually (Costanza *et al.*, 2014).

Assessment of Effective Mitigation Strategies

The escalating crisis of marine pollution poses a significant threat to biodiversity, particularly in coastal regions, where diverse ecosystems are directly impacted by human activities. Effective mitigation strategies are crucial to combat this challenge and preserve marine biodiversity. These strategies encompass a range of approaches, including policy reforms, community engagement, and technological innovations aimed at reducing pollution at its source and restoring affected habitats. For example, the implementation of “marine protected areas (MPAs)” has shown promise in enhancing biodiversity resilience by limiting human activities and allowing ecosystems to recover (Edgar *et al.*, 2014). Furthermore, public awareness campaigns and community-led clean-up initiatives have been effective in mobilizing local populations to participate in coastal conservation efforts (Mckinley & Fletcher, 2011). Integrating scientific research with traditional ecological knowledge also plays a pivotal role in developing tailored mitigation strategies that address specific regional challenges (Berkes, 2012). Assessing these strategies’ effectiveness is essential for refining approaches and guaranteeing the long-term health of marine ecosystems and the biodiversity they support.

- **Pollution Prevention and Waste Management** Effective mitigation starts with pollution reduction at the source. Efforts such as stringent waste management policies and plastic use reduction campaigns have been shown to significantly decrease marine litter. Initiatives like “Extended Producer Responsibility (EPR) programs”, which make manufacturers responsible for the post-consumer stage of plastic products, have been successful in reducing plastic waste that reaches marine ecosystems (Van Eygen *et al.*, 2018).
- **Restoration and Conservation of Coastal Habitats** Mangroves, seagrasses, and coral reefs are crucial for marine biodiversity, providing habitats and natural barriers against pollution. Conservation projects aimed at restoring these habitats improve the resilience of coastal ecosystems and enhance biodiversity (Spalding *et al.*, 2014). The restoration of mangroves, for instance, serves as a natural filter for pollutants, trapping sediments and absorbing nutrients before they reach open waters (Koch *et al.*, 2009).
- **Strengthening Regulatory Frameworks** Enforcing international agreements, such as the MARPOL Convention, which limits ship-based pollution, and implementing national laws to regulate coastal industrial and agricultural runoff, can effectively reduce pollution sources. Such frameworks are essential for holding polluters accountable and for monitoring pollution levels along coastlines (Raubenheimer & McIlgorm, 2018).

Rituparna Halder

- **Technological Innovation in Clean-Up Initiatives** Advances in technology, such as the use of floating booms, skimmers, and drones, have improved the removal of surface-level marine litter and oil spills. Recent innovations, including biodegradable plastics and artificial microbial enzymes capable of breaking down pollutants, offer promising solutions to long-term pollution control in marine environments (Auta *et al.*, 2017).
- **Community Involvement and Awareness Programs** Involving local communities through awareness programs and participatory coastal clean-ups has proven essential in maintaining long-term pollution reduction. Empowering communities to adopt sustainable practices and participate in monitoring programs contributes to continuous pollution control and fosters stewardship of local marine resources (Löhr *et al.*, 2017).

Policy Recommendations

To effectively address marine pollution and its detrimental effects on biodiversity in coastal regions, comprehensive policy strategies are essential.

Strengthening Regulatory Frameworks

Implementing stricter regulations on industrial discharges, agricultural runoff, and waste management practices can significantly reduce the influx of pollutants into marine environments. For instance, “the European Union's Marine Strategy Framework Directive” emphasizes the need for member states to achieve “Good Environmental Status” of the EU's marine waters (European Union, 2008). Such frameworks can serve as models for other regions to enhance regulatory standards.

Enhancing Waste Management Systems

Improved waste management systems, including effective recycling programs and plastic waste reduction initiatives, are crucial in minimizing marine litter. The introduction of extended “producer responsibility (EPR) schemes” can incentivize manufacturers to design products with a lower environmental impact (Jambeck *et al.*, 2015). Countries like Sweden and Germany have successfully implemented EPR, leading to significant reductions in plastic waste entering marine ecosystems.

Promoting Public Awareness and Education

Engaging local communities through educational programs can foster awareness about the impacts of marine pollution. Campaigns aimed at reducing single-use plastics, promoting sustainable fishing practices, and encouraging beach clean-ups can empower communities to take action. Research indicates that community-led initiatives can enhance local stewardship of marine resources and improve biodiversity outcomes (Österblom *et al.*, 2020).

Investing in Research and Monitoring

Continuous research and monitoring of marine ecosystems are essential for understanding the extent of pollution and its impacts on biodiversity. Governments should invest in marine science programs that monitor pollution levels, species health, and ecosystem dynamics. This data can inform adaptive management strategies and policy adjustments. “The Global Ocean Observing System (GOOS)” provides a framework for international collaboration on marine monitoring (*The Global Ocean Observing System (GOOS) | Intergovernmental Oceanographic Commission*, 2012).

Implementing “Marine Protected Areas (MPAs)”

Establishing MPAs can help mitigate the impacts of pollution on marine biodiversity by providing refuge for species and restoring ecosystems. Research shows that well-managed MPAs can enhance biodiversity, improve fish stocks, and increase resilience against climate change and pollution (Britton *et al.*, 2021). Governments should prioritize the designation and effective management of MPAs in coastal regions to safeguard marine life.

Collaboration Across Sectors and Borders

Marine pollution is a transboundary issue that requires collaboration among various sectors, including government agencies, non-governmental organizations, and private sectors. International agreements, such as the Regional Seas

**Rituparna Halder**

Conventions, facilitate cooperative efforts to address pollution and protect marine biodiversity. Enhanced collaboration can lead to more effective regional strategies for managing marine resources (Environment, 2017).

Challenges in Implementing Mitigation Strategies

The implementation of effective mitigation strategies for marine pollution in coastal regions faces numerous challenges that hinder progress toward preserving biodiversity. One of the primary obstacles is the lack of coordinated governance and regulatory frameworks, which often leads to fragmented and inconsistent policies across different jurisdictions (Cicin-Sain et al., 1998). Additionally, insufficient funding and resources for monitoring and enforcement complicate the implementation of strategies aimed at reducing pollution (Hsiung et al., 2024). Public awareness and community engagement are also critical factors; without local involvement and understanding of the issues, resistance to new initiatives can emerge (Liu et al., 2023). Furthermore, the diverse sources of marine pollution ranging from land-based runoff to maritime activities require a multifaceted approach that can be difficult to manage effectively (Hsiung et al., 2024). Addressing these challenges is crucial for developing and sustaining robust mitigation strategies that can protect marine biodiversity in vulnerable coastal ecosystems.

Lack of Regulatory Frameworks and Compliance

A significant challenge in mitigating marine pollution is the lack of comprehensive regulatory frameworks. Many coastal regions operate under fragmented policies that may not adequately address pollution sources or promote coordinated action across different jurisdictions (Bennett, 2018). Also because of lenient enforcement of the existing laws, industries and individuals does not comply with the laws strictly.

Economic constraints

It also poses significant barriers. The cost of implementing advanced waste management systems, developing biodegradable alternatives, and executing large-scale clean-up operations is prohibitively high for many low- and middle-income countries. Industries that rely on plastic packaging resist shifts toward sustainable alternatives due to profit concerns, lobbying against stricter environmental regulations (Geyer et al., 2017). Additionally, the informal recycling sector, particularly prevalent in Asia and Africa, lacks government support, resulting in inefficient plastic recovery systems and occupational hazards for workers.

Technological limitations

Technological Limitations further complicate mitigation. Innovations such as polymer-degrading enzymes or ocean clean up systems are still in preliminary stages of development and faces challenges related to scalability, cost, and unintended ecological consequences (Yoshida et al., 2016). Microplastics, in particular, elude conventional filtration methods and persist in marine food chains, threatening a wide range of species from plankton to whales (Wright et al., 2013). The lack of standardized metrics for assessing microplastic pollution also complicates monitoring and comparative analysis.

Data Gaps

Scientific uncertainty and data gaps impede precise policy formulation. The full ecological impacts of plastic, especially nano-plastics, are still not fully understood. Limited long-term data on the exposure of marine species to plastic pollutants weakens the scientific basis for risk assessments and strategic interventions (Rochman et al., 2013).

Cultural and behavioural factors

These factors also contribute to the ineffectiveness of mitigation strategies. Public awareness about plastic pollution varies significantly across regions, influencing consumer behaviour and policy acceptance. In many coastal communities, the use of single-use plastics is deeply rooted in daily life, driven by affordability and convenience (Patrício Silva et al., 2020). Changing such habits requires sustained educational efforts and incentives, which are often underfunded or inconsistently applied.

**Rituparna Halder**

CONCLUSION

Plastic pollution has become one of the gravest ecological threats to marine environments, particularly in coastal regions where human activity intersects with delicate ecosystems. This research underscores the profound impact of plastic waste on marine biodiversity, a cornerstone of oceanic health and, by extension, planetary well-being. Every organism, from plankton to whales, contributes to the intricate balance of marine life. The intrusion of plastic disrupts this balance, compromising the integrity of food webs and the resilience of entire ecosystems. Marine biodiversity is indispensable not only for ecological harmony but also for the sustenance and economic security of millions worldwide. Microplastics, now pervasive in aquatic systems, contribute to the bioaccumulation of toxins, which ascend the food chain and ultimately pose risks to human health. As marine habitats degrade, species suffer from reduced reproductive success, habitat loss, and increased mortality. Vital ecosystems like coral reefs, mangroves, and seagrasses—natural bastions of biodiversity are in alarming decline, heralding a broader environmental crisis. Despite increased awareness and mitigation efforts, significant challenges remain. Regulatory inconsistencies, financial constraints, and technological hurdles stall progress. Many coastal nations lack the infrastructure to manage waste effectively, while industrial reluctance and cultural inertia often slow reform. Promising technologies remain limited by scalability and cost, and inconsistent data collection hampers comprehensive policy-making.

Local conservation initiatives, policy advancements, and international cooperation have yielded promising outcomes. Strategies like Extended Producer Responsibility, Marine Protected Areas, and sustainable coastal practices serve as effective templates. Grassroots campaigns and educational efforts are reshaping public attitudes, encouraging more responsible environmental behaviour. Moreover, blending scientific research with traditional ecological knowledge enables the design of adaptive, context-specific solutions. To effectively tackle marine plastic pollution, a holistic and inclusive strategy is essential. Governments must invest in waste infrastructure, enforce environmental regulations, and support innovation. Industries must embrace sustainable practices, and international bodies must foster collaboration to address the global and transboundary nature of this crisis. Standardized pollution metrics, data sharing, and joint initiatives will bolster global capacity to protect marine life. In essence, the battle against plastic pollution transcends environmentalism, it is a moral, economic, and existential imperative. Only through united and enduring action rooted in science, policy, and community engagement can we revive our oceans and preserve their life-giving bounty for future generations.

ABSTRACT

The rapid advancement of large language models (LLMs) has revolutionized data analysis, yet conventional question-answering (QA) systems often struggle with uncertainty, industry-specific adaptability, and real-time responsiveness. This work introduces a groundbreaking LLM-powered data analysis tool that enables users to upload structured tabular data and interact with it through natural language queries. This approach integrates in-memory SQL processing, allowing for efficient querying without predefined patterns, and enhances user interaction through semantic-driven architecture and query ambiguity resolution components. A key innovation in this approach multi-industry flexibility, leveraging domain-specific embeddings and semantic mapping to generate customized dashboards without requiring hardcoded rules. The system also features an advanced TypeDetector, which goes beyond schema matching by incorporating statistical properties, distribution analysis, and contextual markers. Moreover, the conversational memory model ensures coherent progression in multi-turn interactions, while SQL Engine's error recovery mechanism reconstructs user intent to handle malformed queries gracefully. To assess framework viability, the approach shows cross-industry execution testing and incremental learning investigation. Also, it optimizes execution through in-memory handling procedures and a secluded Streamline integration framework, empowering consistent extensibility to present day spaces. The discoveries illustrate that this approach not as it were upgrades exactness and

flexibility but too empowers real-time, natural information interaction over differing businesses such as back, healthcare, and instruction. This inquiries about lays the establishment for adaptable, brilliantly, and user-friendly information examination instruments that bridge the crevice between organized information and normal dialect interaction.

Keywords: LLMs, Semantic Analysis, Embeddings, SQLite, NPL, Modular Configuration.

INTRODUCTION

The growing reliance on data-driven decision-making across industries has intensified the demand for intelligent, natural language-driven data analysis tools. Traditional data querying methods, which depend on structured query languages (SQL) or rigid predefined mappings, often pose significant challenges for non-technical users [1]. Moreover, existing QA systems based on large language models (LLMs) lack flexibility to adapt to specific industry settings, struggle with query ambiguity, and frequently fail to generate meaningful visualizations [4]. This research presents an innovative LLM-driven data analysis framework designed to bridge these gaps by enabling seamless interaction with structured tabular data through natural language, real-time in-memory SQL processing, and intelligent dashboard generation.

Challenges in Conventional Data Analysis

Conventional data analysis workflows require users to have proficiency in SQL or utilize complex business intelligence (BI) tools, which demand domain expertise [3]. Several challenges limit the effectiveness of current approaches

Fixed Pattern Reliance

Most SQL-based systems require predefined mappings, making them inflexible when dealing with dynamic or new datasets [17].

Lack of Semantic Understanding

Traditional QA systems categorize data types statically, limiting their ability to adapt analysis based on contextual meaning [18].

Ambiguity in Natural Language Queries

Many existing tools struggle with query disambiguation, often leading to incorrect or incomplete responses.

Limited Industry-Specific Customization

Most systems rely on hardcoded rules, making them difficult to generalize across industries such as finance, healthcare, and education [7].

Failure to Create Meaningful Visualizations

Conventional dashboards are often manually configured and do not leverage LLMs for semantic mapping or domain-specific visualization suggestions [9][10].

Research Objectives

To overcome these challenges, this work focuses on developing a seamless, adaptable, and intelligent data analysis tool that: Enables users to upload any table-structured file and interact with it through natural language queries. Utilizes in-memory SQL processing for real-time query execution without requiring predefined patterns. It enhances query ambiguity resolution through contextual analysis and clarification components [12]. The semantic-driven design that understands field meanings and adjusts analysis dynamically, implements multi-industry adaptability using domain-specific embeddings and semantic mapping for dashboard generation. Also it introduces TypeDetector

**Sreenivas Mekala et al.,**

Insights, combining statistical properties, distribution analysis, and contextual markers for enhanced data type classification. Ensures conversational coherence by employing a Conversational Memory Model that retains context across multiple interactions [6]. It integrates error recovery in SQL execution, allowing the system to reconstruct user intent rather than failing on malformed queries [14][15][16]. Also it develops a Visualization Confidence Scoring system to assess the suitability of generated visualizations dynamically.

Technical Contributions

This research presents several novel contributions to the field of LLM-driven data interaction and visualization generation

Real-time Schema Inference

Unlike traditional systems that require predefined database schemas, our system dynamically gathers mappings and adjusts queries accordingly [2].

Multi-Industry Extensibility

The system does not rely on hardcoded rules but instead uses configurable domain-specific data, allowing adaptability across industries [4].

Error-Resilient SQL Engine

By reconstructing user intent from malformed queries, the system avoids failures and improves usability.

Automated Dashboard Generation

Using semantic mapping and industry embeddings, the system automatically generates meaningful dashboards without manual configuration.

Scalability & Performance Optimization

The architecture incorporates in-memory SQL processing techniques for high-speed query execution, even on large datasets [5].

Research Significance

The proposed system has significant implications for a wide range of applications. In finance, it enables users to perform real-time analysis of market-based data, fraud detection, and portfolio management through natural language queries. In healthcare, the system can assist in medical record analysis, patient outcome predictions, and clinical trial experiences. In education, it allows administrators to analyse student performance metrics and engagement patterns dynamically [10][11]. This research contributes to the broader field of AI-driven data interaction by demonstrating how LLMs, in-memory processing, and semantic understanding can be effectively combined to create a versatile, industry-agnostic data analysis tool. The findings suggest that real-time, natural language-based querying and visualization can significantly enhance data accessibility, usability, and decision-making efficiency across industries.

Related Work

The field of natural language-driven data analysis has gained significant attention in recent years, with advancements in large language models (LLMs), in-memory SQL processing, and automated visualization systems. However, existing approaches still face limitations in terms of semantic understanding, adaptability across industries, query ambiguity resolution, and real-time performance. This section reviews the current state of research and technology in these areas and identifies the gaps that our proposed system aims to address.

Conventional SQL Query Systems

Conventional SQL-based systems, such as MySQL, PostgreSQL, and MicrosoftSQL Server, provide robust querying capabilities for structured data. However, these systems require users to have explicit knowledge of SQL syntax and

**Sreenivas Mekala et al.,**

predefined database schemas. While tools like Google BigQuery and Apache Hive have introduced more flexible solutions for large-scale data querying, they still lack natural language understanding and adaptable schema induction, making them inaccessible to non-technical users.

Limitations of Conventional SQL-Based Systems

Reliance on Fixed Mappings These systems are inflexible when dealing with dynamic or unknown datasets.

Lack of Natural Language Interaction Users must manually construct SQL queries.

Inability to Resolve Query Ambiguities Often results in query failures or inaccurate outputs.

The proposed approach overcomes these issues by integrating LLM-based natural language interpretation with real-time, schema-independent in-memory SQL execution

Natural Language Querying in Data Analysis

Efforts have been made to bridge the gap between natural language processing (NLP) and SQL querying, such as: NLIDB (Natural Language Interface to Databases): Early systems like exact [1] and NaLIR (Li & Jagadish, 2014) attempted to translate user queries into SQL queries. However, the work relied on rule-based parsing, making them highly dependent on predefined patterns and specific database structures.

Deep Learning for Text-to-SQL: More recent models, such as SQLNet (Xu et al., 2017) and IRNet [4] (Guo et al., 2019), use deep learning to map natural language queries to SQL. However, these approaches still struggle with generalizing across diverse datasets and resolving ambiguous queries [4].

Limitations of Existing NLP-Based Querying Systems

Require Structured and Predefined Mappings: Limiting flexibility.

Struggle with Query Ambiguity: Often fail to produce meaningful explanations. Do Not Support Real-time SQL Execution: On arbitrary datasets.

In proposed system improves text-to-SQL translation by incorporating contextual query resolution components and adaptable schema induction, allowing queries on previously unknown tabular datasets [7].

System Architecture

The proposed system implements a modular, semantic-driven architecture that facilitates natural language interaction with structured data through intelligent query processing and visualization generation [1]. The architecture comprises five essential components:

1. Data Ingestion and Schema Inference
2. Semantic Analysis Engine
3. Natural Language Query Processor
4. Intelligent SQL Engine
5. Dynamic Dashboard Generator

Data Ingestion and TypeDetector Insights

The data ingestion module utilizes an advanced TypeDetector that goes beyond simple schema matching to accurately classify data types. Unlike traditional systems that depend on fixed data mappings or explicit user declarations, our TypeDetector implements a multi-signal classification approach to determine data types with high confidence [3]. The system performs statistical analysis on column values, examining distribution characteristics, range boundaries, and transformation patterns. This allows it to distinguish between semantically different fields even when they share similar syntactic structures [4]. For example, it can differentiate between ZIP codes (which appear numeric but function as categorical identifiers) and actual numeric measurements. Context-aware schema recognition analyzes not only individual values but also relationships between columns and semantic markers in column names. Each classification includes a confidence metric derived from multiple signals, enabling the system to rank potential type interpretations and select the most suitable one.

**Sreenivas Mekala et al.,****Dynamic Schema Induction**

A key innovation in our approach is dynamic schema induction upon data upload. Traditional data analysis systems require predefined database schemas, creating a significant barrier for non-technical users. Our system automatically:

1. Identifies primary and foreign key relationships.
2. Calculates type-specific metadata and statistics.
3. Creates SQL-compatible column definitions.
4. Handles title sanitization and collision resolution.

This approach enables rapid query execution on newly uploaded datasets without manual schema configuration, significantly reducing the time from data upload to actionable insights [18].

Semantic Analysis Engine

The Semantic Analysis Engine determines the semantic meaning of each column beyond its basic data type, representing a significant advancement over traditional systems that rely solely on syntactic structures [2].

Multi-level Semantic Classification

Our implementation introduces a unified semantic analysis system that categorizes columns based on their functional role within the data. This classification goes beyond simple type detection (string, numbers, etc.) to understand the purpose each column serves. The system categorizes columns into purpose-defined categories such as TIME (temporal measurements), METRIC (quantitative measurements), DIMENSION (categorical grouping factors), RATIO (proportions), COUNT (counts), and GEOGRAPHIC (location data). This classification uses advanced schema matching that recognizes compound terms and contextual markers [13]. For example, a column named “approval date” is recognized as temporal even without the explicit word “date” through recognition of compound terms. The system also uses embedding-based similarity calculations using transformer models to compute semantic relationships between column names and established semantic categories. This allows it to recognize semantic similarity between terms like “revenue” and “income” or “location” and “region” even when the exact keywords are not present.

Industry-Specific Data Integration

A key innovation in our approach is the implementation of industry-specific semantic models. Traditional systems often use a one-size-fits-all approach to data analysis, but our system adapts to domain-specific terminology and analytical practices through configurable industry profiles [12]. Each industry profile contains domain-specific semantic markers, specialized schema patterns, and quality validation criteria. For instance, financial analysis requires understanding terms like “interest,” “payment,” and “refund,” while healthcare spaces work with concepts like “diagnosis,” “treatment,” and “outcomes.” This approach enables plug-and-play industry adaptation without code changes, allowing even non-technical users to benefit from domain-specific insights. The system’s semantic understanding dynamically adjusts based on the selected industry context, resulting in more relevant and accurate analysis [17].

Natural Language Query Processor

The Natural Language Query Processor represents a fundamental advancement in bridging the gap between human language and structured data retrieval [2]. This component translates conversational user queries into meaningful processing decisions through various advanced mechanisms.

Intent Classification and Disambiguation

A principal challenge in natural language interaction is accurately determining what users are trying to achieve. Our query processor uses advanced intent classification to distinguish between different query types and handle ambiguity effectively [3]. The system determines whether a query requires data retrieval (SQL execution) or visualization (chart generation), routes it to the appropriate processing pipeline, and extracts key parameters. Unlike rule-based systems that break with unexpected phrasings, our approach adapts to the user’s natural language style,

**Sreenivas Mekala et al.,**

accommodating various expressions of the same intent. For example, queries like “Show me sales from last month,” “What were our sales figures for the past month?” and “Last month’s sales data please” are all recognized as requests for the same information despite their syntactic differences [10].

Schema-Aware Query Handling

A significant innovation in our approach is integrating database schema information into the query understanding process. The processor constructs an internal representation of available tables, column types, and relationships and then uses this information to ground ambiguous natural language in specific database elements. This schema awareness enables the system to map loose column references to actual database fields (e.g., interpreting “price” as “unit_price” or “total_price” based on context), suggest appropriate joins between tables, handle column name variations and synonyms, and accurately translate domain-specific terminology. The result is a much more robust query handling system that can handle ambiguity and imprecision in natural language while still producing accurate data retrievals. This bridges the gap between the precision required by databases and the flexibility of human communication [14].

Intelligent SQL Engine

The SQL Engine forms the core of our system’s data processing capabilities and represents our most significant technical contribution. Unlike traditional database interfacing that fails when queries are not perfectly formed, our SQL Engine implements several innovations to create a flexible, user-friendly query execution environment [6].

Error-Resilient Query Execution

A fundamental challenge in natural language interaction with databases is handling the inevitable errors that arise when translating loose human language to rigid SQL syntax. Our SQL Engine implements advanced error recovery mechanisms that prevent query failures due to syntax errors or schema misassumptions [5]. When errors occur during query execution, the system does not simply fail with a technical error message. Instead, it analyzes the error, determines the root cause, and attempts to recover through several fallback mechanisms

1. Query Reconstruction: The system identifies and corrects problematic SQL sections [7].
2. Intent Preservation: Even when a query fails, the system attempts to preserve the user’s intent through rearrangements or alternative approaches.
3. Informative Feedback: When errors cannot be recovered automatically, the system provides meaningful explanations instead of technical error messages [9].

This approach significantly improves user experience by reducing frustration from failed queries and maintaining the conversation flow even when technical issues arise.

Dynamic Type Handling and Sanitization

The SQL Engine implements advanced type management to handle diverse data formats across different domains. When loading data, the system automatically maps recognized data types to appropriate database types, preserving semantic information while ensuring compatibility with SQL operations. The engine also implements comprehensive input sanitization that prevents SQL injection attacks while preserving query functionality [4]. All column names and values undergo sanitization before database operations, eliminating security vulnerabilities without compromising functionality.

Thread-Safe In-Memory Database Management

A key architectural decision was implementing the database engine as an in-memory SQLite instance with thread-local storage. This approach enables

1. High Performance: In-memory operation eliminates disk I/O bottlenecks.
2. Concurrent Processing: Thread-local storage allows multiple concurrent user sessions [8].
3. Session Isolation: Each user’s data remains isolated in its own thread context.
4. Resource Management: Automatic cleanup prevents memory leaks.

**Sreenivas Mekala et al.,**

This design supports fast, real-time data analysis without the complexity of managing persistent database connections or worrying about cross-session contamination [10].

Natural Language Response Generation

A significant usability enhancement is our natural language response generation. After executing SQL queries, the system does not merely return raw data tables—it generates human-readable explanations of the results that highlight key trends, anomalies, and insights [18]. The system uses a specialized LLM agent trained to convert query results into clear narrative accounts. These explanations focus on making the data meaningful to non-technical users, translating raw numbers into actionable insights without requiring database expertise [3].

Dynamic Dashboard Generator

The dashboard generation component creates visualizations based on semantic understanding of the data, serving as an output mechanism for the SQL processing results. The system uses the semantic classifications and industry-specific embeddings to recommend relevant charts and graphs that best represent the data. The dashboard generator dynamically adjusts the visualizations based on the data's semantic meaning and the selected industry profile, ensuring that the generated dashboards are both meaningful and actionable [4].

Methodology**SQL Engine Implementation**

The SQL Engine represents the core processing component of our system, implementing several innovative techniques that distinguish it from traditional database interfacing.

In-Memory SQLite Integration

A key architectural choice was selecting SQLite with in-memory capabilities as our backend database. This approach offers significant advantages over traditional disk-based databases for interactive data analysis

- 1. Performance Optimization** By eliminating disk I/O bottlenecks, query execution speed improves by 10-100x for typical analytical workloads [11].
- 2. Deployment Simplicity** The system requires no external database setup, making it deployable in environments where installing and configuring database servers would be challenging.
- 3. Session Isolation** Each user session operates in its own memory space, preventing cross-contamination of data and queries.
- 4. Resource Management** Memory is automatically reclaimed when sessions end, avoiding resource leaks common in long-running database connections [12].

System Integration Approach

We designed the system to enable seamless integration of components while maintaining independence for testing and development. Key techniques include

Query Processing Pipeline: The natural language query processing follows a defined pipeline

- 1. User Query Ingestion** Through the Stream lit interface.
- 2. Initial Intent Classification** To determine query type.
- 3. SQL Generation** For data retrieval queries.
- 4. Parallel Execution and Error Handling** Within the SQL Engine.
- 5. Response Formatting and Visualization Proposal**

Graceful Degradation: When errors occur, the system implements a graceful degradation strategy:

- 1. Primary Attempt** Execute the full query as generated.
- 2. Simplified Fallback** If the primary attempt fails, simplify the query by moving complex clauses [13].

**Sreenivas Mekala et al.,**

3. **Minimal Query** If simplified attempts fail, fall back to a basic SELECT query.

4. **Informative Messaging** When all query attempts fail, provide contextual error information [9].

Data Ingestion and Processing

The data ingestion process involves several steps to ensure accurate type detection and schema inference

Type Detection

The TypeDetector uses a combination of statistical analysis and contextual understanding to classify data types [15]. This involves

1. **Statistical Analysis** Examining distribution characteristics, range boundaries, and transformation patterns.
2. **Contextual Recognition** Analyzing relationships between columns and semantic markers in column names.
3. **Confidence Metrics** Assigning confidence scores to each type classification to select the most suitable interpretation.

Schema Inference

Upon data upload, the system dynamically infers the schema:

1. **Key Relationship Identification:** Detecting primary and foreign key relationships [6].
2. **Metadata Calculation:** Generating type-specific metadata and statistics.
3. **Column Definition Creation:** Defining SQL-compatible column definitions.
4. **Sanitization and Collision Resolution:** Handling title sanitization and resolving any naming conflicts.

Semantic Analysis

The semantic analysis engine categorizes columns based on their functional roles and industry-specific contexts

Multi-level Semantic Classification

The system uses a unified semantic analysis system to categorize columns into purpose-defined categories such as TIME, METRIC, DIMENSION, RATIO, COUNT, and GEOGRAPHIC. This involves

1. **Schema Matching** Recognizing compound terms and contextual markers.
2. **Embedding-Based Similarity** Using transformer models to compute semantic relationships between column names and established semantic categories [2].

Industry-Specific Integration

The system adapts to domain-specific terminology and analytical practices through configurable industry profiles. This involves

1. **Industry Profiles** Containing domain-specific semantic markers, specialized schema patterns, and quality validation criteria.
2. **Dynamic Adjustment** Automatically adjusting semantic understanding based on the selected industry context.

Natural Language Query Processing

The natural language query processor translates user queries into meaningful processing decisions

Intent Classification and Disambiguation

The system uses advanced intent classification to distinguish between different query types and handle ambiguity effectively. This involves:

1. **Intent Detection** Determining whether a query requires data retrieval or visualization.
2. **Parameter Extraction** Identifying key parameters from the query.
3. **Adaptive Language Understanding** Accommodating various expressions of the same intent [14].

**Sreenivas Mekala et al.,****Schema-Aware Query Handling**

The processor constructs an internal representation of the database schema and uses it to ground ambiguous natural language in specific database elements. This involves

1. **Column Mapping** Mapping loose column references to actual database fields.
2. **Join Suggestions** Suggesting appropriate joins between tables.
3. **Contextual Translation** Translating domain-specific terminology accurately.

SQL Engine Execution

The SQL Engine executes SQL queries with advanced error recovery and type management:

Error-Resilient Execution

The system implements several fallback mechanisms to handle errors during query execution:

1. **Query Reconstruction** Identifying and correcting problematic SQL sections.
2. **Intent Preservation** Attempting to preserve user intent through alternative approaches.
3. **Informative Feedback** Providing meaningful explanations instead of technical error messages [5].

Dynamic Type Handling

The engine automatically maps recognized data types to appropriate database types and sanitizes inputs to prevent SQL injection attacks [8].

In-Memory Database Management

The system uses an in-memory SQLite instance with thread-local storage to support high-performance, concurrent processing, session isolation, and automatic resource management [7].

Natural Language Response Generation

The system generates human-readable explanations of query results, highlighting key trends, anomalies, and insights [11].

Dashboard Generation

The dynamic dashboard generator creates visualizations based on semantic understanding and industry-specific contexts

1. **Semantic-Based Recommendations:** Using semantic classifications to recommend relevant charts and graphs.
2. **Industry-Specific Adjustments:** Adapting visualizations based on the selected industry profile [15].

Evaluation

To evaluate the effectiveness of our system, we conducted a series of tests and analyses

Cross-Industry Performance Testing

We tested the system across multiple industries, including finance, healthcare, and education, to assess its adaptability and performance. The results demonstrated the system's ability to handle diverse datasets and queries effectively [18].

Incremental Learning Analysis

We analyzed the system's ability to learn and adapt over time. The results showed significant improvements in query accuracy and response time as the system accumulated more data and user interactions.

Performance Optimization

We optimized the system's performance through in-memory processing techniques and a modular Streamlit integration system. The results showed significant improvements in query execution speed and system scalability.

**Sreenivas Mekala et al.,****Future Work**

While our proposed LLM-driven data analysis system presents significant advancements in schema-independent querying, intelligent error handling, and automated dashboard generation, there are several areas for future development

Enhanced Query Understanding

1. Improved Semantic Reasoning: To handle more complex and multi-step queries.
2. Integrated Knowledge Graphs: For deeper contextual understanding.

Real-time Data Handling

1. Support for Streaming Data Sources: Beyond static file uploads.
2. Incremental Query Execution: For large-scale datasets.

Industry-Specific Customization

1. Fine-Tuning Industry Embeddings: For more accurate domain-specific analysis.
2. Pre-trained Models: For different industries (finance, healthcare, education).

User Adaptation & Personalization

1. Adaptive Learning: To personalize query suggestions based on user behaviour.
2. Multi-user Collaboration: For interactive data analysis.

Advanced Visualization Capabilities

1. AI-Driven Visualizations: Where users can refine dashboards through natural language commands.
2. Custom Visualization Layouts: That adapt based on industry best practices [6].

CONCLUSION

In this work, we presented a novel LLM-powered data analysis system that enables schema-independent natural language querying on structured datasets. Our approach enhances traditional SQL-based systems by integrating real-time schema inference, query ambiguity resolution, error recovery, conversational memory models, and automated visualization generation using industry embeddings and semantic mapping. The system significantly improves data accessibility, adaptability, and real-time analytics across diverse industries, offering a more intuitive and intelligent solution for data interaction. Through evaluation, we demonstrated its ability to streamline data analysis while addressing limitations in existing NLP-based querying tools. Future work will focus on enhancing real-time data streaming, refining personalization features, and improving visualization capabilities to further enhance usability and performance. This research lays the foundation for a fully AI-driven data analysis assistant, bridging the gap between natural language interaction and intelligent business insights tools.

ABSTRACT

This paper aims to study various kinds of Masculinities as embodied by the male characters portrayed in the novel *A Flight of Pigeons* by Ruskin Bond. The male characters in the novella belong to various religious, social, and cultural backgrounds. Muslim Pathans, the upper caste Hindu men, and Christian White men, all struggle for power over one another. This novella is set over the background of the revolt of 1857 which in itself provides the theme of power struggle. It showcases the fall of the ruling White Christian Masculinity at the hands of Pathans, which led to the subsequent rise of those Pathans. The occupation of territory and women forms a strong point in the definition of strong, dominant masculinities of these men. All the Masculinities embodied by the men will be segregated and categorized according to the types provided by Ivan Jablonka and R.W. Connell. Based on these types of Masculinities, men will be categorized as powerful and submissive.

Keywords: Masculinity of Ostentation, Masculinity of Control, Masculinity of Sacrifice, Masculinity of Ambiguity, Domination, Subordination, Marginalization.

INTRODUCTION

The novella *The Flight of Pigeons* was written by Ruskin Bond in 1978. The background of this novella is that of the 'mutiny' of 1857, and as per the author, this novella is based on the real-life events faced by Ruth Labadoor. This novella starts with Ruth's father getting murdered at the hands of Indian rebels in a church. He tries to fight them but he is injured. Ruth escapes and goes to her house to find her mother. She is taken by Lala Ramjilal to a safe place where other female members of her family are hiding. Her mother, Mariam tells Lala Ramjilal to find her husband. He goes to the church. He risks his life and finds out that Ruth's father passed away. Lala Ramjilal brings this news to Mariam and Ruth and also tells them that they would be safe with him if they went to his house. He takes them with

Pahuldeep Kaur et al.,

him at night when there would be little chance of someone finding them out and attacking them. They stay at Ramjilal's house, in a corner, but they feel safe there. Lala Ramjilal also kept a watch on the door of his house, he is alert all the time regarding someone coming to the house and finding *firangans* there. He also kept a weapon with him at all times. Mariam, on the other hand, kept a knife under her pillow, she also did not sleep at night, keeping a watch over her family. The people hiding under Lala's roof were Ruth, Mariam, Pilloo, Pilloo's mother, and two maids. One day, when Lala Ramjilal was out, Javed Khan visited the house with twenty to thirty men. He searched the house and found the *firangans*. He wanted to find Ruth Labadoor because he had taken her fancy before the mutiny when she used to stay at her father's house. Ruth, Anett, and Mariam are abducted by Javed Khan and he takes them to stay at his house. Before that, a pir asked him to swear by his sword that he would bring no harm to the white women. He swears by his sword because he is a Pathan and he honors women. At home, he confesses in front of his wife that he wants to take Ruth as his second wife. This breaks his wife, Qabil down. She is full of jealousy for Ruth. Mariam, however, delays answering if she would give her daughter's hand in marriage to Javed or not. She tells him to wait for the final verdict, the verdict of Delhi. If Delhi is won by the British, she would be free with her daughter, if Delhi is won by the Indians, she would let Javed marry Ruth. Finally, the battle is won by the British and Javed Khan is not to be found by anyone because according to the rumor he fled to Nepal without getting married to Ruth.

Models of Masculinity

The two models of masculinity that will be used to study these characters are the ones given by Ivan Jablonka and R.W. Connell. Ivan Jablonka, in his book *A History of Masculinity: From Patriarchy to Gender Justice* mentions "The four Triumphs" (62) of the Masculine. These triumphs are Masculinity of Ostentation, Masculinity of Control, Masculinity of Sacrifice, and Masculinity of Ambiguity. In short, Masculinity of Ostentation represents a powerful man who is also eager to use his power. He embodies the spirit of a fighter and is also quite vengeful at times. Masculinity of Sacrifice represents those men who are ready to sacrifice their lives for a cause they take to be noble. Masculinity of Control is the one in which the man exercises some sort of control over himself. Masculinity of Ambiguity represents those men who are the embodiment of both, masculine as well as feminine. All these four kinds of masculinities would be merged with the types explored by R.W. Connell. She gave four kinds of masculinities as well. Hegemonic Masculinity is a kind of exemplary masculinity that all men aspire to follow, full of power and who cannot be challenged. All men aspire to be Hegemonic males. The Masculinity of Subordination represents those men who are down at the bottom of the power hierarchy. They are exploited and are seen to be powerless. Masculinity of Marginalization represents those males who are discriminated against, many times based on race and religion. Masculinity of Complicity comprises those men who enjoy the privilege they get due to patriarchal power, but they do not suppress the women, they do not abuse them. Based on both of these models, Masculinities can be organized into a structure, a hierarchy in which Hegemonic males and the men embodying Masculinity of Ostentation occupy the highest position, and males embodying Masculinity of Complicity and Control occupy the middle position, they have power but not a lot of it. Finally, Ambiguous and Marginalized Masculinities take the form of Subordination and occupy the lowest rank in the power hierarchy amongst men. Based on the model created with these masculinities, the study of the male characters in the novella *A Flight of Pigeons* will be conducted.

Male characters in the novella and their roles

There are 12 male characters in this novella, out of which 11 are chosen for this study. These characters are divided into three categories: dominating, middle masculinity, and subordinate masculinity. Characters such as Javed Khan, Mangal Khan, Sarfaraz Khan, the Nawab, and Hafizullah Khan come under the first category of Dominating Masculinity. They occupied powerful positions in the political arena after they overthrew the British. And they plan to be in power and sit on important chairs if only the *firangis* could be overthrown from the entire country. The middle position is occupied by Lala Ramjilal. He belongs to the Hindu community and is a financially well-off upper-caste man. Lala Ramjilal is the one who helped the women escape and also hid them in his home. He used to keep a watch for their sake. Also, he mentioned that he would fight for their safety because he was a Mathur, and belonged to the Kshatriya varna. He is a man of dignity and Javed Khan also told him that he went and took the English woman from his house when he knew Lala Ramjilal wouldn't be present. The males who occupy subordinate

Pahuldeep Kaur et al.,

positions are Jhunna Lal, Arthur Smith, Ruth's father, Kaddu Khan, and Pilloo. All these men were targeted by the men occupying high ranks in one or the other way. The whites were humiliated and killed in the chaos of the mutiny. Jhunna Lal, on the other hand, is a moneylender who refused to part ways with his money when Javed Khan approached him. As a result of which, was physically punished by Javed Khan. It is to be kept in mind that the power structure is always in flux, the power dynamics amongst these masculinities keep shifting. English male characters such as Ruth's father and Arthur Smith were previously the ones with power due to their race, and also the fact that their government was in power. They were made subordinate when the mutiny took place and the power structure changed. It is evident from Arthur Smith's manner in which he tried to handle the situation when he was attacked by a sepoy. He tried to fight off his enemy and took out his gun to shoot. But his gun betrayed him which gave the Indian man the time to put him down. Also, another thing that proves that the struggle was driven by race is that the Indian mob that attacked Arthur Smith made him fall on his knees before killing him. This is a method in which a person belonging to the victimized or targeted community is first humiliated before being killed. Arthur Smith had a Dominant Masculinity before he was targeted and made Marginalized and hence Subordinate.

Masculinity in the face of massacre

Edward B. Westermann in his book *Drunk on Genocide: Alcohol and Mass Murder in the Nazi Germany* gives a detailed study on the behavior of men and women who committed genocide against the Jews and other minorities when the Nazis acquired political power. Men involved in the dirty game of killing became "hypermasculine" (3) and they celebrated mass murder. They also "swapped stories of their murderous accomplishments" (3). In this novella, Javed Khan boasts about finding the Labadoor women. he says to his wife, Qabil that if there would have been someone else in his place, he would have given up. But Javed Khan did not give up. As a result of his determination, he captured the three white women. He counts this as one of his accomplishments. Also, the murders that are committed are "premeditated" (5). It is because the enemies are already defined based on race. Qabil points out that first Javed killed Ruth's father and then captured her when she did not have a patriarch to protect her. "A geography of violence" (7) is created when the white women in Shahjahanpur are unsafe, where the rebels are in power, and Delhi being the capital is the battleground where the final verdict on power is given. "Gang mentality" (13) took over the men holding more power. It is evident when Arthur Smith is not killed by the person at whom he pointed his gun, but rather by a mob. "Likewise, the concept of militarized masculinity has been tied to the "hypermasculine qualities" of the soldier and represents a process whereby the manly conquered the unmanly." (31) The Nazis, who were the perpetrators had "gender-specific practices" (35). They had fixed roles for men and women. The domestic sphere belonged to the women and the arena of war was men's space. Similarly, the rebels who are showcased in the novella practice Islam and their women do not hold political talks with them. They were restricted to staying at home. "Wild action" (43) is conducted to instill fear in the targeted community. In the same way, the sepoys in the novella conducted an attack on the religious place, that is, the church where they knew they were going to find the whites. The rebels "sliced" the bodies of the white men, some of whom were their seniors. They also conducted certain "rituals of humiliation" (47) on the targeted people. It is evident from the example of Arthur Smith. After killing the whites, the sepoys burnt their homes, in a way trying to glorify their violence. It served as a "public spectacle" (62). The Nazis were used to "taking of trophies from an enemy" (65) because they served as proof of their exploit. Many times, the trophies were the photographs in which they were shown as humiliating the Jews. For the perpetrator of the rebellion, especially Javed Khan, the trophy consisted of Ruth, whom he captured after the murder of her father. "Indeed, the hunt, an act in itself traditionally invested with manliness and masculine strength, frequently served as a supporting rite to celebratory killing". (79) Mariam, Ruth along with their family members were being hunted by the Indian men. They had to hide at Ramjilal's house where Ramjilal kept a close watch at the door at all times. One day when he was not at home, Javed Khan visited his home and captured the enemy women. The idea of the hunt was present at the very onset of the novella. The imagery of hunting, however, also causes the "animalization of the enemy" (79). The Nazis were good at "keeping score of the number" (82) of the enemies killed by them. It gave them a sense of accomplishment. In the same way, it is evident from the conversations that took place between the Indians as well as the English at Shahjahanpur that all the whites had been killed, the only remaining ones were the Labadoor women and, as the rumor had it, another white family. If the comparison is made between Nazis and the rebels from the novella *A Flight of Pigeons*, all the points discussed above show the similarities

Pahuldeep Kaur et al.,

which make the men involved in the killing “hypermasculine”. But there are certain contrasts as well. The Nazis used lewd language and sexual abuse against their victims. On the other hand, Javed Khan had sworn on his sword that he would not harm the white women. It was against the Pathan's pride to sexually abuse a woman. Javed Khan was also full of respect for a certain “Kanpur girl” who avenged her race by killing her captor. Also, the Nazis made sexual relations with Jewish women but they did not have any marital relations with them. On the other hand, all the whites killed in the novella were men, the women were not killed but taken to be married off to the captor. Another difference is the use of liquor and celebrations by the Nazis to celebrate their conquests as well as to numb themselves to the sense of guilt. On the other hand, in the novella, the Pathans and the sepoys are shown to be hypermasculine and militarized, but they are not shown drugged or drunk. The third difference is that the Nazis accompanied music and dance not only as a part of their celebrations but also as a part of their rituals of humiliation. However, the Pathans did not indulge in music and dance because it was forbidden according to Islam. This is the reason why Javed Khan beat up a boy in the street for singing love songs.

Masculinity of an Abusive Man

In his book *Why Does He Do That: Inside the Minds of Angry and Controlling Men*, Lundy Bancroft gives various aspects and characteristics of an abusive man. All those parameters will be applied to the character of Javed Khan, the captor. An abusive man is “usually very reluctant to face up to the damage[he has] been causing women (xviii). Javed Khan gets angry at his wife when she blames him for killing Ruth's father to get her. He killed Ruth's protector and made her vulnerable to his attack. Javed Khan, however, is not ready to accept the wrong he did not only to Ruth but also to Mariam. On the contrary, he tells them that if Ruth has not been molested, it is because he has brought them to his house. An abusive man indulges in “verbal explosions” (9) when he does not get what he wants. When Javed Khan tries to make Mariam agree to his proposal to marry Ruth, Mariam refuses to give him any answer. He loses his temper again and again over this. When this happened for the first time, he exploded on his Begum who was angry because her husband was proposing marriage to another woman in her presence. It was humiliating to her. When she tried to point out to him that he was asking for the hand of a girl after killing her father, he “gave her a fierce look” (45). Not only that, but he also verbally threatened her saying “The demon is only slumbering in my breast, and it will take little to rouse it”(46) “The Boiling Theory of Men” (31) suggests that when a man gets furious and becomes abusive, either physically or verbally, he blames it on the things that are being done to him which are building up and making him react violently. In this case, Javed is telling his wife to shut up because her words are building up his anger, and when he is no longer able to hold back, he will lose control over his actions. He is making the woman responsible for what he would do to her. In reality, he knows what Qabil is saying is right. He wants to give it a color of valor. The writer, Landy Bancroft, also dismissed this theory as a justification of male anger and male violence. An abusive man is not a psychologically ill person. The problem is with his morality. “Their value system is unhealthy.....”(38). Javed Khan, on the one hand, is a practicing Muslim who does not like the sound of love songs, on the other hand, he kept his eye on a young girl of fourteen even though he had a begum already. Toward the end of the novella when Javed Khan knows that Delhi would be lost and he tries to convince Mariam to give him Ruth's hand in marriage, Kothiwalitells Mariam that Javed Khan is “inconstant”. Another thing that makes Javed Khan an abusive man is that he cannot see women as humans, he sees them as lesser beings, as things to be possessed.

“Abusive men are often jealous and possessive.”(41)

He considers Ruth as his possession. He makes it clear to Mariam that since Ruth was living under his roof, he had a right to her as one of his possessions and could marry her any day he wanted. He is jealous and does not want any male near his *zenana*. It becomes evident when he agrees to bring back all the members of Mariam's family, but leaves Pilloo and his mother behind because Pilloo is a male, even though he is much subordinate to him in power and is only fourteen years old. Javed Khan is the man of his house and nothing happens there without his permission. If Kothiwali wanted to take Mariam and Ruth to her home for a few days, she had to get his permission even though she was older than him in years and he respected her position. “The more power these men have in their jobs, the more catering and submission they expect home (44). Javed Khan is a commander of Nawab's military. He not only has military power but also social and financial power. Also, Javed Khan expects his wife not to raise her voice so

**Pahuldeep Kaur et al.,**

that he can do whatever he feels like. When she tries to speak out, he shuts her up with a threat. “He wants his partner to give him a medal for his generosity, not to criticize him for his oppressiveness”(52) This is the reason why he tells Mariam to thank him for giving her and her girls a place to live in his house because if they had left on the road, Ruth would have been sexually abused. Those women were fine at Ramjilal’s home. He also feels entitled to certain privileges. His begum takes care of him. He shakes the house, poisons the environment with his behavior, and fires up jealousy in his begum for Ruth. And when all the females in the house were worried, he smoked hookah with peace, oblivious to the environment of hatred around him. Being an abusive man, Javed Khan is a man of double standards, he does not practice what he preaches. On one hand, he has a young girl of fourteen on his mind whom he wants to take as a second wife, on the other hand, he gets offended at the sound of a boy singing love songs in the street on religious grounds. He feels that love songs are vulgar and they give rise to certain forbidden passions. He, on the other hand, did not require any kind of stimulus from the outside when forbidden passions sprung for Ruth in his heart. It seems as if there are different sets of rules for him as compared to the rest of the world. Javed Khan’s double standards are also evident when he proposes to Mariam that he wants to get married to Ruth. It is quite unnatural of him to say so because he had justified his killing of the white men under the name of religion, he said that he should be praised because he had killed *kafirs* and therefore he should not be treated as an ordinary murderer but a noble one. On the other hand, he wants to make a *kafir* his wife. Ruth is a white girl who is also a Christian. Javed Khan’s actions do not match his speech. On one hand, he killed under the name of nationalism, and on the other hand, he did not participate in any other activity by the rebels. It seems that he used patriotism as a shield to get what he wanted and also to get away with it. He wanted to acquire Ruth and for that, it was important to get rid of her father. He did it when he got the chance in the name of the mutiny. He, like many of the abusive men, objectifies women and depersonalizes them. When he mentions to Kothiwalli that he had been taken captive by Ruth’s beauty, he compares her to the flower rose touched by the wind. Of course, by comparing her to Rose he is suggesting that she is fragile and should be taken care of, must be protected. “By depersonalizing his partner, the abuser protects himself from the natural human emotion of guilt and empathy....” (63).

This might be the reason why Javed can smoke hookah with peace while the females around him lose their peace because of him. Also, he can smoke peacefully after beating people badly. Being a manipulator, Javed changes his moods abruptly and frequently. When he is unable to get a definite answer from Mariam, he rises while talking to her, and goes out and beats Saifullah. This violent incident was followed by two other violent incidents in which he beat up a servant woman named Rupia for not grinding the grain and a boy who sang love songs in the street where Pathans lived. He beat Rupia so badly that she left home with her clothes reduced to rags because he whipped her. Lundy Bancroft, in his book, gives different kinds of abusive men. The category that Javed Khan belongs to is “a Demand Man”. A Demand Man is an abusive man who believes that the women around him should meet his needs. He is highly entitled and becomes angry when he is denied what he wants. “He has a little sense of give and take”. (78) In the novella, Javed Khan protects Mariam and Ruth and even brings other female members of their family under his protection. In return, he wanted to get married to Ruth. Javed Khan also falls under the category of a “Victim”, another category of abusive men. “The victim appeals to a woman’s compassion and desire to feel that she can make a difference in his life” (96). Javed, desperate to get Ruth, approached Mariam and told her to give him some medicine because he was so ill that he couldn’t hunt properly. Mariam refused to fall into his trap and told him that he looked healthy to her. Failing to win compassion at the hands of Mariam, he abruptly got up and beat his stepbrother Saifullah with a horsewhip. Javed is abusive because he objectifies and speaks of Ruth as if she were a Goddess who had tamed his mind and body. He sees a fantasy in Ruth. On top of that, he is possessive and full of insecurities. He believes Ruth to be one of his possessions. There are, however, many characteristics attributed to an abusive man that are not found in the character of Javed Khan. One of the most important things is that Javed Khan speaks a lot about having the right to get Ruth even if Mariam did not agree to their marriage. But he never used sexual violence or sexual subordination of any woman to get what he wanted or to demean a woman. Also, he does not have a system of rules and punishment for the women in his household or the ones whom he captured. He does not use sexual or physical violence on women in his house when his needs are not met. He does not name-call women or psychologically abuse them. He does not belittle women by his words. On the contrary, his language is not inappropriate in the presence of women. He does not manipulate the behavior of women around him by limiting

**Pahuldeep Kaur et al.,**

their physical space. On the contrary, he allows them to visit Kothiwal's house and spend many days there. He lets the women talk among themselves and enjoy each other's company. He does not tear down the women and tries to bring them down. All these characteristics show that Javed Khan is an abusive man who wants to control women around him. Through his behavior, he wants to showcase his masculinity. But he does not take his masculinity or his abuse to an extreme level. Instead of forcing Ruth to marry him, he consults her mother Mariam, and asks for her permission. Hitting a woman is against the pride and honor of a Pathan, so he never attacked a woman.

Class and Masculinity

In the novella, *A Flight of Pigeons* by Ruskin Bond, the concept of class can be viewed as merged with the concept of caste. In the book *A Handbook of Studies on Men and Masculinities*, Class refers to "...unequal distribution of life chances insofar as these deal with the ownership or non-ownership of different forms of property and different levels of income" (167). The male characters in the novella who are at the top ranks of the power hierarchy, automatically have more power and they perform masculinity as a collective. All Pathans comprising Javed Khan, Sarfaraz Khan, Mangal Khan, Ghulam Qadar, and the Nawab, are politically higher up in the power hierarchy, and all belong to the same category and religion. All consider it to be proud that they are Pathans. Subordinate men such as Lala Ramjilal are placed somewhere in the middle of the power hierarchy. He could not give Javed Khan a fight or keep the *firangis* in his home with absolute protection, but he was proud to be a Mathur, one of the castes belonging to the Kshatriya varna, and swore to protect the white women with his life. He is not politically powerful like Javed Khan, nor is he financially stable since he asked for money from Mariam. He was happy when she gave him a piece of her jewelry to sell, but he sat on the floor while she sat on the bed. His position is below Javed Khan as well as the white women whom he was helping. The only thing that provides him with a higher position is his caste. A male character named Jhunna Lal, who is a moneylender, was attacked by Javed Khan and his men. He refused to give them money, and as a result of which, they threw his record books in the well and hung him upside down. They frightened him. Javed Khan held more power over him. In the class hierarchy, Jhunna Lal is somewhere in the middle, due to his being a money lender, but as far as the practice of masculinity is concerned, he is at the bottom. He embodies subordinate masculinity being weak. The movement of his power is downward, and his masculinity is a "failed masculinity" because instead of protecting himself or avenging himself, he is left scared. Other examples of failed masculinity are Pilloo, Ruth's unnamed father, and Arthur Smith who were terrorized or killed based on race because they were *firangis* and Indians wanted them out of India. Pilloo was frightened by Mangal Khan who had gone to arrest a *firangi* boy. He was so scared that he couldn't even speak for himself when Mangal Khan asked him questions about his age. His mother was speaking on his behalf and later she begged Mangal Khan not to kill him.

Ruth's father tried to fight off the rebels at the church but he was killed. He even tried to stop the sword that attacked him with his bare hands, as a result of which, he lost two fingers. He was defeated, he was killed, his house was burnt, and later, his daughter and wife were taken by Javed Khan. Arthur Smith was attacked when he tried to shoot his attacker but his pistol betrayed him. He was killed by a mob, but before that, he was lowered to his knees. A Dominating man was reduced to a subordinate by a collective mob. Caste plays a crucial role in defining strong masculinity. Javed Khan, Mangal Khan, the Nawab, and Sarfaraz Khan hold weapons, fight wars, and win battles with spoils and women because they feel themselves to be superior to others as they are Pathans. Lala Ramjilal presents an example of a man ready to embody the masculinity of sacrifice when he tells several men that they can enter to search his house but over his dead body. As a Mathur, dying to save women's honor would in turn make him honorable. Even though he is a small businessman, he belongs to the Kshatriya varna and is the embodiment of valor. That is why he is not afraid to challenge Javed Khan who is financially, politically, and socially his superior. In his book *A History of Masculinity: From Patriarchy to Gender Justice*, Ivan Jablonka gave "the four Triumphs of the Masculine" which will be treated as categories, and male characters from the novella will be categorized accordingly. Javed Khan embodies "Masculinity of Ostentation" (62). He displays courage, and desire, boasts about his exploits, and uses a high voice while speaking. He is ready to fight, at least when it serves a personal cause. A man embodying this type of Masculinity ".....conducts himself with arrogance, sure of himself, eager to brandish his arms, he kidnaps his subjects' daughter" (62). Javed Khan uses an arrogant tone with his wife Qabil and Kothiwal. He is sure that the British would lose Delhi, which they did not, he carries a sword and brandishes people with a

Pahuldeep Kaur et al.,

horsewhip, he even tries to scare his wife with the sound of it. He took Mariam and Ruth by force as captives. He satisfies all the conditions needed to become a man with the Masculinity of Ostentation.

“.....sheds blood in response to the slightest offenses”(62).

When Javed failed to get a direct answer for Mariam as far as his wedding with Ruth was concerned, he brandished Saifullah, his half-brother with a whip, he also whipped a female servant named Rupia to the extent of reducing her clothes to rags, and he did that because she did not grind the grain. The third instance is him beating a boy who sang love.

“...their nobility is indistinguishable from male pride”(62).

All the Pathan men in the novella honor and respect women, including those belonging to their enemies. Javed Khan at the suggestion of a pir, swore by his sword that he would not dishonor or harm the white women he took as captives. Sarfaraz Khan, who was angry at the white women for trying to break Qabil’s marriage with Javed Khan, was taken aback by Mariam’s courage, and later left the white women alone after paying his respects to Mariam. Hafizullah Khan is a man of honor who was unable to take sexual insults that his mother-in-law threw at Mariam and Ruth. He dragged her out of the verandah. He does not differentiate between the honor of the women belonging to his family and the honor of white women. Javed Khan also embodies the “Masculinity of Control” (63) which is just opposite to the Masculinity of Ostentation. He controls his urge to possess Ruth by force when Mariam denies him Ruth’s hand in marriage.

“In this case, masculine power holds back masculine power”(63).

It is done to attain a higher power. In Javed’s case, it might be a higher honor for himself. Also, the fact that he swore on his sword not to harm the white women near his place of worship in front of a pir. Religion, in this case, is being an agent of control. Lala Ramjilal is an embodiment of the “Masculinity of Sacrifice” (63). It is “grandiose and horrifying” (63). It refers to an act of self-immolation for a noble cause or country. In the case of Lala Ramjilal, he is ready to die to save Mariam and her family from those Indians looking for *firangans*. He kept a watch at the door of his house at all times when the white women were hiding there. Whenever a man approached his doorstep asking to search the house, he replied that it would happen over his dead body. Javed Khan visited his home and took away Mariam and Ruth when he knew that Lala Ramjilal was not at home. He did so deliberately in Lala’s absence. The caste that he belongs to is Mathur, which is why he challenged Javed Khan who was far his superior. Being a Kshatriya, he protected the honor of women. If Connell’s model is followed, there are four kinds of Masculinities: Domination, Subordination, Complicity, and Marginalized. The Pathans, as discussed above, embody the Masculinity of Domination, the whites such as Arthur Smith, Ruth’s father, and Pilloo embody the Masculinity of Subordination, and Jhunna Lal embodies the Masculinity of Subordination as well. The whites also represent The Marginalized Masculinity which is a subordinate masculinity on the grounds of race. Lala Ramjilal embodies the masculinity of Complicity. They are not Hegemonic men but they profit from the Patriarchal setup of society. It is “a slacker version” (79) of Hegemonic Masculinity. Instead of dominating women, these men make compromises with them. Lala Ramjilal never disrespected women either in his household or the *firangans*. Instead, he took care of a lot of women belonging to his family. He spoke without authority to them.

CONCLUSION

Even though men embodying different types of masculinities are found in this novella, the majority of the novella covers the dominating abusive Masculinity of Javed Khan who embodies the Masculinity of Ostentation for the major part of his character. It not only sheds light on the man but also the effects of his behavior on women around him. Only one man occupies the middle position in the power hierarchy, and that is Lala Ramjilal. The white men along with Jhunna Lal occupy the lowest positions. It is also important to note that the type of masculinity a man might have is determined by the social, financial, and political circumstances the man is in.

ABSTRACT

Because of aberrant microcirculation, osteonecrosis of the femoral head (AVNFH) results in a loss of integrity in the subchondral bone structure. The underlying pathophysiology is unknown, and although research has not supported it, risk variables are probably going to have some impact on microcirculation. Necrosis and aberrant microcirculation are the typical endpoints. After that, the subchondral bone collapses, causing secondary arthritis to worsen. A 36-year-old lady came to Parul Ayurved Hospital, with complaints of left hip pain that had been radiating to her knee. The discomfort is excruciating, becomes worse when moving, and is connected to a limp. Her hip joint space seems somewhat narrowed on plain radiographs of her knee and hip, with no additional abnormalities. Assessments of range of motion and pain were made. The visual analogue scale (VAS), with a "0" denoting no pain and a "10" denoting severe pain, is used to measure pain. The VAS gave the patient's discomfort a "9" on the day of arrival. Pain decreased to a grade 7 after 1 month of treatment. The pain was rated as a "4" after 4 months and gradually decreased. Ayurveda may offer a promising substitute for medication in cases of early Avascular Necrosis.

Keywords: *Ayurveda*, Avascular Necrosis, *AsthiMajjagata Vata*, orthopaedics, Herbal Medicine.

INTRODUCTION

When the subchondral blood supply is cut off, a condition known as avascular necrosis (AVN) results, killing off cellular components of the bone, especially in the epiphyseal region of joints that support weight. The interruption of the blood supply to the proximal femur is the cause of a vascular necrosis (AVN) of the femoral head. Changes in the blood supply might be brought on by a non-traumatic source or happen after a traumatic incident. Addiction to alcohol, corticosteroid medication, and surgical procedures related to hip dislocation and femoral neck fracture often result in the development of AVN. The most important variables in determining the likelihood of developing AVN are the type of fracture (displaced or undisplaced) and the interval between the injury and surgery. Based on the patient's complaints, medical history, and radiological results, an AVN diagnosis can be made. As of right now, there is no agreement on how to treat AVN sufferers. Patients in the initial pre-collapse phases of the illness are the target audience for non-surgical techniques, which include pharmacotherapy and physical treatment are the non-surgical approaches used for patients in the early pre-collapse phases of the condition. For patients with advanced illness, surgery is advised.

Patient Information

A 36-year-old lady came to Parul Ayurved Hospital, with complaints of left hip pain that has been radiating to her knee. The discomfort is excruciating, becomes worse when moving, and is connected to a limp. Her hip joint space seems somewhat narrowed on plain radiographs of her knee and hip, with no additional abnormalities. A patient has taken analgesics for approximately one year. A year later, despite analgesics, the patient returns to the general practitioner with ongoing discomfort.

Chief complaints with durations

1. Left hip joint pain for 1 year
2. Pain radiating to a knee for 10-11 months

Past medical history No history of any chronic illnesses

Family history No family history of any chronic illnesses

Personal History

Diet:	Mixed
Appetite:	Decreased
Bowel:	Constipated, 1-2 times/week
Micturition:	4-5 times/ day, 1-2 times/ night
Sleep:	Sound
Dietary habits:	Vishamashana, Viruddhashana
Physical activity:	Sedentary

Menstrual History

LMP: 2nd February, 2023

Duration:	4-5 days
Interval:	30-32 days
Regularity:	Regular
Colour:	Dark red
Consistency:	Thin
Amount:	7-8 pads per cycle
Odor:	No foul smell
Pain:	Present

Nikhil R Chaudhari and Manu

Obstetrical History - P₂A₀L₂D₀

Parity	Year	Mode of delivery	Sex
P ₁	16 years back	Full-term vaginal delivery with episiotomy at hospital	Male child
P ₂	12 years back	Full-term vaginal delivery at hospital	Female child

Contraceptive History Laparoscopic tubal ligation done a year back

Clinical Findings**General Examination**

Height:	156 cm
Weight:	64 kg
Cyanosis:	Absent
Pallor:	Present
Icterus:	Absent
Lymph nodes:	No palpable lymph nodes
Clubbing:	Absent
Blood pressure:	120/74 mm of hg
Pulse rate:	76/ minute
Temperature:	Afebrile

Systemic Examination

Respiratory:	No scar mark or discolouration, Bilateral airway entry clear, no added sounds
Cardiovascular system:	No discolouration/precordial bulging, dull note over precordium, S ₁ S ₂ normal, no added sounds
CNS:	The patient conscious and well-oriented
Loco-motor:	Normal range of motion in all joints,

Asthavidha Pariksha

Nadi: Vatapradhan -Pitta

Mala: Kathina

Mutra: Samyak

Jihwa: Sama

Sabda: Spashta

Sparsha: Anushmasheeta

Drik: Prakrit

Akriti: Madhyam

Local Examination

A neurological examination was done with the help of a tendon hammer and pin. Abnormal gait with external rotation is present. Limping was also present. The patient had having restricted range of motion due to pain.

Diagnosis *AsthiMajjagata Vata* (Avascular Necrosis of the hip joint)

Treatment Protocol

Yapana Basti of *Maadhutailika Basti* containing *Erand Moola Kwatha* was prepared and given to the patient as *Asthapana Basti*, alternatively, *Anuvasan Basti* was given with *Erand Tail*. Patient was prescribed *Patra Potli Swedana* with *Nirgundi* leaves to provide *Mridu Snehana* as well as *Swedana* for 21 days.

**Nikhil R Chaudhari and Manu**

Orally, *Panchatikta Ghrita* was prescribed 20 ml empty stomach in the morning for around 2 months, *Shiva Gutika* 500 mg twice daily with lukewarm water for 1 month, *Kaishore Guggulu* 500 mg thrice daily with *Dashmoola Kwatha* 45 ml before food.

RESULTS

Assessments of range of motion and pain were made. The visual analogue scale (VAS), with a "0" denoting no pain and a "10" denoting severe pain, is used to measure pain. The VAS gave the patient's discomfort a "9" on the day of arrival. Pain decreased to a grade 7 after 1 month of treatment. The pain was rated as a "4" after 4 months and gradually decreased.

DISCUSSION

As mentioned in *Ayurveda* classics, *Bastis* is a critical therapeutic intervention in the treatment of illness. Unlike a traditional enema, the effects of "*Basti*" are not localized to the anorectal region. The "*Basti*" is meant to act in a methodical manner. The small intestine is reached by the chemicals in "*Basti*." They have a systemic effect because they are absorbed through the stomach wall and dispersed throughout the body. Avascular necrosis is not specifically mentioned in *Ayurveda* literature; nonetheless, based on clinical presentation, *Vata Dosha* and *Vikruti* (vitiation) of *Asthi Dhatu* are predominant. In AVN, trauma or *Margavrodha* (blood vessel obstruction) reduces the blood flow (*Rakta Dhatu*) to the femoral head, which eventually results in necrosis. Both *Margavrodha* and *Abhighata* are accountable for the exacerbation of *Vata Dosha*, which in turn leads to a rise in *Vata Dosha* and ultimately the loss of *Asthi Dhatu*. In an advanced stage, the ongoing disruption of the *Vata Dosha* (caused by necrosis) is also accountable for the vitiation of the *Pitta* and *Kapha Doshas*. Because *Basti* is the first line of treatment for *Vata Dosha* and helps with the imbalance of *Pitta*, *Kapha*, and *Rakta Dosha*, it is therefore a choice for treating AVN by *Basti* in *Panchakarma* procedures. In the case of AVN, *Dashamula Kwatha* relieves signs and symptoms and breaks down the *Samprapti* (pathogenesis) of the illness since it is *Tridoshahara*, *Vedana sthapak*, and *Sroto Shodhaka*.

CONCLUSION

In this instance, the precise cause was unclear. *Margavarana* (channel blockage) and *Dhatu Kshaya* (depletion of these tissues) are the causes of the vitiation of *Vata Dosha*. Similar to *Grathita Raktapitta* (blood illnesses connected to coagulopathy), embolism signifies the vitiation of *Rakta Dhatu* (blood tissue). In addition to being the primary source of *Vata* and *Rakta* (blood tissue) vitiation, *Abhighata* (trauma) also contributes to the pathophysiology of AVN. In two months of treatment, the patient in this case was able to walk with assistance, and their range of motion had improved a lot. These are encouraging outcomes. Following 4 months of treatment, an MRI revealed no further advancement in the bone's deterioration. *Ayurveda* may offer a promising substitute for medication in cases of early Avascular Necrosis. To establish a standard management protocol for a vascular necrosis, more clinical trials are required.

Patient Consent

Written permission for the publication of this case study has been obtained from the patient.

ABSTRACT

This review paper provides an in-depth exploration of recent advances in pharmacovigilance, focusing on the integration of cutting-edge technologies such as artificial intelligence (AI), machine learning (ML), and big data analytics in adverse drug reaction (ADR) detection and safety monitoring. By analyzing vast amounts of real-world data from electronic health records (EHRs), social media, and patient-reported outcomes, these technologies have revolutionized drug safety by enabling more rapid and accurate identification of emerging safety signals. The paper also highlights the role of regulatory frameworks, particularly the harmonization efforts by global organizations like the World Health Organization (WHO) and the International Council for Harmonisation (ICH), which have set global standards to ensure consistent pharmacovigilance practices across countries. Moreover, this review emphasizes the shift toward patient-centered pharmacovigilance, where patient-reported outcomes and digital tools for adverse event reporting play a growing role in safety monitoring. However, the paper also addresses the challenges and limitations that remain, including underreporting of ADRs in certain regions, data privacy concerns, and the difficulties of processing and analyzing large, unstructured data sets. Looking ahead, the paper explores future trends such as predictive analytics, real-time safety monitoring using blockchain technology, and increasing patient engagement in the pharmacovigilance process. This review concludes by identifying key areas for future research and development, ensuring that pharmacovigilance continues to adapt to the evolving landscape of modern healthcare.

INTRODUCTION

Pharmacovigilance or drug safety is defined as the scientific activity related to the explicit identification, systematic assessment, monitoring, understanding and prevention of adverse effects or any response to drugs that is noxious, clinically significant or otherwise undesired (WHO, 2002). This field plays a significant role in considering that medicinal products have an acceptable risk-benefit /risk-profit balance through its life cycle, and mostly in the post-marketing field. Drugs, in the course of clinical trials are subjected to rather small and confined populations thus afford little chance for identifying rare delayed and cumulative toxic reactions of a drug. And while a drug is still under development in clinical trials, or it is still under limited post-marketing use, only a limited number of patients are exposed to it, and maybe of a similar demographic, unlike when a drug is being marketed widely on the general population, there may be other adverse effects that may be observed. This is where pharmacovigilance comes as a rescue and supplements the drug safety with the strong framework for monitoring and managing the drug effects in practice (Beninger, 2018). Ethnomedication safety is crucial because ADRs rank highly amongst the causes of illness and death around the world. As a result of the desire to safeguard the health of the public, the laws that govern pharmacovigilance have been developed to ensure the active involvement of the pharmaceutical firms, the care givers and the users to watch drug safety continually. National and international bodies such as the FDA and the EMA have laid down strict policies that compel pharma organizations to document any AE related to their products and continuously review the safety of those products (FDA, 2021; EMA, 2021). These frameworks require post marketing surveillance studies in order to determine the continued safety of drug products in the market place and that the products that are out there are safe for the public to use.

Pharmacovigilance has, however, gradually changed over time especially in response to large scale health emergencies. Among the many case in point, the thalidomide disaster of 1960s which brought into the light the urgent requirement for close surveillance of drugs. Since then, pharmacovigilance has become an international science, and the countries of the world adopted guidelines to enhance the systems of drug safety. As more new therapeutic entities are being launched by the growing and innovative pharmaceutical industry, pharmacovigilance activities similarly need to adapt to these new therapeutic entities such as biologic and personalised medicines. Pharmaceuticals such as biologics, for example, have potential safety challenges because of their proteinaceous nature, structure and function which are poles apart from that of conventional small molecular drugs (Rudolph et al., [1]).

Due to the occurrence of the COVID-19 outbreak, sound pharmacovigilance systems have gotten even more critical. The COVID-19 vaccines have been developed and approved very quickly and introduced to the market very quickly, so their safety had to be watched in real time. This emphasized the importance of monitoring, especially when monitoring side effects that might emerge before, after or even years after the administration of the drugs (Radecka et al., [17]). This international drive acted as a reminder that pharmacovigilance is a key factor that has to be undertaken to enhance safety of drugs as well as defending human health. Pharmacovigilance tries to overcome the proscribed limitation of clinical trials, exploring ADRs not spotted during the pre-market trial phase. The small number of participants in clinical trials and the strictly controlled conditions of the experiments do not reflect the diversity of side effects. This is why post-marketing surveillance is also prevention in that drugs are made to remain safe and effective as they end up with the wider population of patients (Alex, [2]). These goals are quite complex and encompass new ADRs detection, risk factors analysis, evaluation of benefit-to-risk ratios, as well as communication of safety particulars to other stakeholders, such as governmental agencies, HCPs, and the public. These history-building efforts contribute to the evolving of appropriate alcohol regulation measures such as alterations in drug

Mohini Kashyap et al.,

safety labels and/ or specific warnings or even withdrawal from the market, of potentially post-harm drugs (C. V., [3]). These are comprehensive goals whose ultimate goal is to guarantee that medications still have curative values while at the same time reducing harms.

In the recent past, there has been a tremendous advancement in the technology, which has brought a major change in pharmacovigilance activities. Machine learning, big data analytics, and artificial intelligence all have a massive impact on discovering and analyzing ADRs. These technologies enable systematic monitoring of drug safety by mining data from different sources including EHRs, social media posts, and Praveen, [4]. AI, especially, was recognized as a beneficial tool for ADRs detection and utilisation in comparison to conventional means that consequently led to more efficient drug safety outcomes (Radecka et al., [6]). This review aims to present the state of knowledge regarding the ongoing and emerging trends in the field of pharmacovigilance. It will discuss emergent technologies, including artificial intelligence (AI) and machine learning (ML), as well as real-world evidence (RWE) in drug safety Surveillance systems. Moreover, it will compare the current state of regulation and the new tendencies influencing the pharmacovigilance throughout the world. These include guidelines and rules formulated for the International Council for Harmonisation (ICH) and WHO to enhance a corresponding nature for the regulation of pharmacovigilance among countries of the world. Nevertheless, it remains a major issue but is difficult to report in low- and middle-income LMICs due to inadequate details and resource constraints.

Finally, this review is an attempt to discuss the directions of pharmacovigilance with regard to technological advances, as well as the changes in the legal requirements for the field. Recognizing these developments and new regulations, it is possible to predict the current problems and enhance pharmacovigilance systems all over the world.

Current Global Trends in Pharmacovigilance

Evolution of Pharmacovigilance Practices

The field of pharmacovigilance has undergone significant transformation over the years, driven by key historical events and the increasing demand for robust drug safety monitoring systems. One of the most influential events in this evolution was the Thalidomide disaster of the late 1950s and early 1960s, which highlighted the dire need for stringent drug safety regulations. The tragedy spurred the establishment of the World Health Organization (WHO) Programme for International Drug Monitoring and prompted the creation of national pharmacovigilance centers worldwide. Over time, enhancements in risk assessment and the development of global standards have further refined pharmacovigilance practices. The subsequent sections delve into the progression of pharmacovigilance practices and highlight key milestones in drug safety and regulatory advancements.

Early Development and the Thalidomide Disaster

The Thalidomide disaster marked a turning point in drug safety practices. This tragic incident, which caused severe birth defects in newborns, emphasized the importance of drug safety and led to significant regulatory reforms across Europe and other regions. It became the foundation of modern pharmacovigilance practices, initiating a shift towards more systematic approaches to drug monitoring (Khan et al., 2024; Londhe et al., 2024).

Creation of the WHO Programme for International Drug Monitoring

In response to the Thalidomide incident, the WHO launched a global program to monitor drug safety. This initiative aimed to gather and analyze adverse drug reactions (ADRs) across various nations, fostering international collaboration to enhance drug safety measures (Iqbal & Shaheer, 2024).

Establishment of National Pharmacovigilance Centers

Recognizing the critical role of pharmacovigilance in ensuring patient safety, countries such as the United States, Japan, and the United Kingdom established their own national centers. These institutions became pivotal in regulating drug development processes and safeguarding public health (Londhe et al., 2024; Iqbal & Shaheer, 2024).

Mohini Kashyap et al.,

Advancements in Risk Assessment and Global Standards

The combined efforts of organizations like the Council for International Organizations of Medical Sciences (CIOMS), WHO, and the International Council for Harmonisation (ICH) have significantly contributed to global standardization in pharmacovigilance. These collaborations have advanced risk assessment methodologies and streamlined pharmacovigilance practices worldwide (Khan et al., 2024; Londhe et al., 2024).

Milestones in Drug Safety and Regulatory Advancements

WHO Programme for International Drug Monitoring

This program established the foundation for international cooperation in drug safety surveillance. It enabled countries to share insights and data on ADRs, thereby fostering a global network for pharmacovigilance (Iqbal & Shaheer, 2024).

Establishment of the Uppsala Monitoring Centre (UMC)

The creation of the UMC as a WHO Collaborating Centre for International Drug Monitoring was a significant step forward. The UMC manages the global pharmacovigilance network and oversees the VigiBase database, a repository of ADR reports from across the world (Iqbal & Shaheer, 2024).

Formation of the International Council for Harmonisation (ICH)

The ICH has played a crucial role in aligning drug safety regulations across various regions. Its efforts have facilitated the development of harmonized pharmacovigilance practices, enhancing consistency and efficiency in global drug safety monitoring (Khan et al., 2024; Londhe et al., 2024).

FDA Sentinel System and Real-Time Drug Safety Surveillance

The Sentinel System introduced by the FDA represents a groundbreaking advancement in pharmacovigilance. This system enables real-time drug safety surveillance, allowing for the early identification and management of potential drug risks (Halma, 2024).

EMA's Eudra Vigilance System and PRAC

The European Medicines Agency (EMA) developed the EudraVigilance system alongside the Pharmacovigilance Risk Assessment Committee (PRAC) to strengthen drug safety monitoring in Europe. These initiatives have enhanced regulatory decision-making and safety assessment processes (Halma, 2024).

Addressing Safety of Biologic and Gene Therapies

With the increasing prevalence of biologic and gene therapies, pharmacovigilance practices have evolved to address their unique safety challenges. These advancements underscore the adaptability of pharmacovigilance systems in managing emerging healthcare technologies (Mansuri & Zaman, 2024).

Recent Advances in Pharmacovigilance Technological Innovations

Use of Artificial Intelligence and Machine Learning in Adverse Event Detection

AI and ML are extensively used in the pharmacovigilance process to augment the ordinarily manual process of identifying adverse events. The conventional method of pharmacovigilance is predominantly a manual effort that entails data gathering and analysis, plus signal generation, all of which take a long time and can be biased. However, organisations' analysis with AI and ML was highly efficient on the extensive data set to identify the adverse drug reactions (ADRs) in comparison to traditional methods. They fail to analyse structured as well as unstructured data from various sources such as spontaneous reporting systems, clinical trial data, EHRs and social media platforms (Sarker et al., 2020). The most widespread use of AI in pharmacovigilance is actually Natural Language Processing (NLP), a branch of AI that provides a way to analyze text data. It has been seen that patient stories, social media comments, and clinical notes have a lot of useful information about drug safety but it is very challenging to extract useful information from them. Such texts can be analyzed by NLP algorithms to identify latent signals indicating potential ADRs that could pass unnoticed in the systems described above (Harper et al., 2020). For instance, deep

Mohini Kashyap et al.,

learning techniques can predict multiple reports of similar ADRs across the different data sets to enhance the early detection of significant but rare ADRs (Witowski et al., 2020). In addition, While predictive analytics with ML has enabled the estimation of prior potential safety issues before they go viral. These technologies can point researchers to which patients are likely to suffer from ADRs by mapping relationship between concrete patient characteristics, diseases, and drug interactions. This preventive approach makes it easier for regulators to act quickly and decreases risks that often come with new drugs (Sarker et al., 2020). AI and ML have been particularly utilize in settings where spontaneous reporting might miss ADRs because of low reporting rates or reporting them was delayed; this adds an extra layer of security.

Integration of Big Data and Real-World Evidence

Incorporation of big data and Real-World Evidence into Pharmacovigilance has shifted drug Safety by enhancing the view of how the drug performs in different populations. Big data would therefore refer to massive volumes of data produced by health organizations, insurance claims, patient databases and even smart devices. These datasets provide a vast amount of details concerning patients' experiences, and the medication utilization and adverse responses that frequently go unconsidered in research, which is conducted with significant constraints and a limited number of subjects in clinical trial settings (Harper, 2020). Real world evidence (RWE) derived from this big data has a critical value in supporting and enriching clinical trial data. Even though, clinical trials are crucial for proving the efficiency and the first-level safety of the drug, their participants can be enrol only from a particular group of population leaving out elderly people, children, and patients with chronic diseases. Hence, the clinical trials present limited details of all possible ADRs that may be observed when the drug is applied in a large population. To fill this void, RWE gives insights of how a drug reacts in real-life healthcare system, population, and illnesses (Harper, 2020). For instance, the FDA's Sentinel System is one of the biggest projects that use big data and RWE to evaluate the safety of post-market drugs in real-time. Sentinel started in 2008 and leverages information from electronic health records and claims of tens of millions of patients to identify safety signals and assess the risk of new medications faster than conventional approaches (Platt et al., 2018). Likewise, the European Medicines Agency (EMA) in August 2018 incorporated RWE into the pharmacovigilance process by means of a section named Eudra Vigilance. In addition to that, the EMA claimed that through data from national healthcare systems, and patient registries, the EMA can now determine the health risks occasioned by medications in real-life population and harmonize its regulatory action (EMA, 2021).

It has also enabled the use of prevalent data and RWE for creating models that might predict other short-, medium- or even long-term ADRs that may not have been found during clinical trials. Such models also allow regulatory agencies and pharmaceutical companies to detect potential threats earlier to focus post-marketing monitoring and respond more quickly to new safety signals (Platt et al., 2018).

Development of Automated Reporting Systems and Signal Detection Tools

The growth of systems enabling automated reporting of cases and advanced signals identification has improved the pharmacovigilance process. Potentially serious adverse drug reactions are often underreported by healthcare professionals and patients arbitrarily, and this has presented a real difficulty in recognizing other safety concerns in the past. The use of automated system has been adopted in reporting to enhance participation as the submission of the ADRs is made easy(Beninger, 2018). For example, VigiBase, established by the WHO's Uppsala Monitoring Centre, EudraVigilance facility run by the EMA, and the FDA's Sentinel System all allow healthcare practitioners and patients to file ADRs online. These systems are designed to acquire, analyze, and collate safety reports to help discern safety signals in aggrandized and complex data. These systems help to decrease reporting workload and increase the speed of identification of the safety signals by moving the reporting process to digital and automative form (Beninger, 2018).

Furthermore, incorporating artificial intelligence as well as machine learning algorithm in these system has enhanced identification as well as analysis of safety signals. Artificial neural network is capable of analyzing and extracting useful information from the very broad data sets to flag features in the data that are suggestive of risk factors. This

**Mohini Kashyap et al.,**

has resulted to early identification of the tamer or unexpected ADRs implying quicker regulatory action to safeguard the population's health (Witowski et al., 2020). Also, the reporting systems have improved patient empowering in pharmacovigilance through automation. Patients are also able to report side effects and ADRs using their mobile applications and online portals, giving the regulators more real time information on drug safety. Critics of traditional ADR reporting have expressed that digital safety reporting systems provide patients with easier ways of reporting as compared to the old problem-ridden techniques (Harper, 2020).

Therefore, the evolution and use of big data and the integration of pharmaceutical artificial intelligence, including the use of big data and automated reporting of events in the recent past has transformed how pharmacovigilance is conducted. Such advancements have enhanced the speed of, accuracy of, and the area that can now be covered regarding, pharmacovigilance activities to the extent that drug risks can now be identified and dealt with in a manner not previously considered possible. Instantiating these technologies, regulatory agencies/healthcare suppliers and pharmaceutical companies can guarantee that the New Therapies' risks do not overshadow their benefits to public health globally.

Recent Regulatory Changes Across Sectors

Recent regulatory changes across various sectors have marked significant advancements, reflecting the evolving global standards, reporting requirements, and the influence of new regulatory frameworks. These modifications aim to increase transparency, safety, and operational efficiency in industries ranging from pharmaceuticals to banking and finance. The following sections explore the specifics of these updates, improvements, and the impacts of newly established regulatory agencies.

Recent Updates in International Guidelines

In the pharmaceutical sector, the European Union has introduced significant revisions to its Medical Device Directive and pharmacovigilance framework. These changes include the reclassification of certain medical devices to lower-risk categories and a general enhancement of safety and transparency in medicinal products. The updates are designed to streamline the regulatory process while improving public trust in the safety of medical products (McHugh et al., 2012; Borg et al., 2011). Similarly, the Eurasian Economic Union (EAEU) has updated its Good Pharmacovigilance Practices (GVP) guidelines, focusing on improving drug safety monitoring and aligning with global standards. These updates are intended to enhance the safety and efficacy of medications across the member states (Romanov, 2023). Additionally, the most recent changes in ICH guidelines, especially the ICH E2E guidelines, emphasize active management and monitoring of drug safety from pre-clinical phases through post-marketing surveillance. These guidelines call for comprehensive risk management plans (RMPs) to effectively monitor safety and compliance, helping to prevent adverse drug reactions (ADRs) (ICH, 2020). The inclusion of real-world evidence from electronic health records and patient registries is also seen as a significant improvement, allowing regulators and healthcare providers to monitor drug performance within a more diverse population, thereby enhancing the ability to recognize safety signals in real-time (FDA, 2021).

Enhancements in Regulatory Reporting Requirements

In the banking sector, the aftermath of the 2008 financial crisis led to the introduction of the Basel III framework to reinforce the stability and resilience of banks. The latest updates, often referred to as "Basel 4," focus on improving bank resolution policies and capital requirements. These adjustments aim to reduce the likelihood of taxpayer-funded bailouts in future financial crises (Sironi, 2018; Santillán-Salgado, 2015). Similarly, the Basel III updates impose stricter reporting requirements on banks, particularly regarding liquidity and capital adequacy. These measures are designed to offer clearer insights into the financial health of banks and their exposure to risk (Sironi, 2018; Santillán-Salgado, 2015).

In response to the global changes, pharmaceutical and medical device sectors are also seeing enhanced regulatory reporting requirements. For instance, the European Union has implemented stricter regulations, requiring more detailed and transparent disclosures of clinical trial results and pharmacovigilance data, including plain language

**Mohini Kashyap et al.,**

summaries to ensure the public understands the information. Additionally, the establishment of the Pharmacovigilance Risk Assessment Committee aims to oversee and improve drug safety monitoring (Dwivedi et al., 2020; Borg et al., 2011). These enhancements also extend to post-marketing studies and pharmacovigilance audits, which are becoming increasingly tied to stringent risk management strategies for high-risk medicinal products (FDA, 2019). Meanwhile, new electronic reporting systems are helping to reduce delays in regulatory measures and improve the quality and timeliness of safety data submission, aided by automation and information technologies.

Impact of New Regulatory Agencies or Frameworks

While regulatory changes aim to improve safety, transparency, and operational efficiency, they also present challenges for industries. Transitioning to new guidelines can be resource-intensive, potentially slowing down innovation and market entry. The increased regulatory burden may lead to higher operational costs, which could ultimately be passed on to consumers. Nonetheless, these changes are crucial for maintaining public trust and ensuring the stability and safety of industries worldwide. New independent regulatory agencies and structures, such as the European Medicines Agency's (EMA) Pharmacovigilance Risk Assessment Committee (PRAC), have played an instrumental role in improving risk assessment and the management of ADRs across the EU. PRAC is responsible for evaluating the risks and benefits of medicinal products and recommending further actions, such as labeling changes or voluntary recalls (Borg et al., 2011). Meanwhile, countries like India and China are adopting pharmacovigilance systems based on global standards, such as those set by the World Health Organization (WHO). The Chinese National Medical Products Administration (NMPA) has recently strengthened its ADR detection capabilities (Zhang et al., 2020; Zhang et al., 2019). These regulatory frameworks and agencies highlight a global trend towards better-coordinated pharmacovigilance and drug safety. With advances in molecular technologies, reporting requirements, and collaboration frameworks, global pharmacovigilance has adapted to the demands of modern therapeutics. Patient protection remains a central principle in drug design and use, ensuring that drug safety is consistently upheld across diverse markets.

Trends in Drug Safety Monitoring**Pharmacogenomics and Personalized Medicine**

Consequently, pharmacogenomics, which refers to understanding how an individual's genetic profile affects their to drugs has turned out to be one of the essential tools in the emerging field of drug safety. This field concentrating on searching for the genes which contribute to the changes in drug metabolism rate, drug effectiveness and propensity to ADRs is known as pharmacogenomics. Through genetic and biomarker information, physicians and pharmacologists are able to modify pharmacological therapies with regards to the patient in order to minimize ADRs and enhance human therapeutic efficiencies (Rodriguez-Antona & Taron, 2015). Pharmacogenomics in action can be illustrated by pharmacogenetic testing of the polymorphic CYP2D6 enzyme imparting hepatic metabolism of drugs such as codeine and tamoxifen. People with certain type of this gene therefore clear these drugs either slowly or rapidly or the drugs don't work effectively or pose more danger of toxicity (Flockhart et al., 2016). As pharmacogenomics increases its use in patient management, it will have benefits in pharmacovigilance to help identify high-risk patients before ADRs are witnessed, improving safety and efficacy.

Use of Patient-Reported Outcomes and Experiences

Another relevant evolution that has happened in the last years is the enhanced inclusion of patient-reported outcomes, or PROs, into pharmacovigilance systems. PROs entail patient's assessment of their health and well being together with side effects endured throughout drug therapy. PROs are different from traditional safety data that can be obtained from healthcare providers; they also provide valuable information about extra-clinical consequences of a drug therapy in a more day-to-day perspective than clinical trials, including painful sensations, fatigue, or mood changes, as examples Witowski et al., (2020). By using PROs real world ADRs may be better assessed, and those associated with long-term treatment or lifestyle modifications, which cannot be predicted during pre-marketing trials (Inácio et al., 2017). Moreover, PROs can help to identify such safety problems at an early stage of the disease since patients' symptoms reflect possible adverse reactions before the development of severe outcomes. To that end, the

Mohini Kashyap et al.,

integration of patient experience in to pharmacovigilance balances out the process of post-marketing surveillance of medicinal products so that regulators and health care professionals do not undermine patient perspectives.

Engagement with Patient Advocacy Groups

In the recent past, patient advocacy groups have emerged as key stakeholders in pharmacovigilance as a way of enhancing drug safety through enhancing this transparency between customers, practitioners and regulators. These groups play the vital function of advocacy for patient-based drug safety measures hence acting as a link between the patients and regulatory authorities so that patient concerns are not only considered in rules formulations and safety monitoring mechanisms (Inácio et al., 2017). For example, patient advocacy organisations may offer awareness materials to inform patient to report ADRs which will in turn increases the ADR reporting rate and hence better ADR information. They also have a major responsibility in overseeing the overall policies, working with key regulatory bodies such as the United States' Food and Drug Administration (FDA) and the European Medicine Agency (EMA) among others to ensure that patients play the central role in pharmacovigilance systems. Interventions targeting these groups can help regulators establish more expansive drug risk models suited for patients' by increasing efficiency of pharmacovigilance operations. It also results in a patient-centric empowered patient group capable of actively participating in the management of their condition, as well as in drug safety reporting thus increasing the scope and richness of pharmacovigilance information (Witowski et al., 2020).

Global Perspectives

Variations in Pharmacovigilance Practices Across Different Regions

Pharmacovigilance practices exhibit significant regional differences due to diverse regulatory frameworks, healthcare systems, and cultural factors that influence drug safety monitoring. These disparities impact the consistency and effectiveness of adverse drug reaction (ADR) reporting and the overall global pharmacovigilance landscape. For example, in developed countries, pharmacovigilance systems are typically well-established and integrated with general healthcare infrastructure. High-income countries, such as those in North America and Europe, have advanced ADR detection and control methods, supported by certified electronic health records and sophisticated reporting systems like EudraVigilance in the EU and the FDA Sentinel System in the U.S. (Zhang et al., 2019). However, many low- and middle-income countries (LMICs) face challenges in implementing effective pharmacovigilance systems due to resource constraints, lack of awareness among healthcare providers and the public, and inadequate regulatory structures to manage the overwhelming volume of safety data. For example, despite progress in implementing WHO pharmacovigilance guidelines in Sub-Saharan Africa, underreporting remains a significant issue due to a lack of resources and knowledge (WHO, 2021). Similarly, countries like India and China, while making strides in enhancing their pharmacovigilance frameworks, continue to face challenges with regulatory compliance and inconsistencies in reporting, which can create disparities in detecting drug safety issues (Zhang et al., 2019).

Regulatory Frameworks

The regulatory requirements for pharmacovigilance vary from country to country, leading to inconsistencies in safety data communication. In the United States and Europe, distinct guidelines for ADR reporting can complicate the sharing of safety information across borders (Singh et al., 2018). Additionally, in Asia, local cultural and social norms influence regulatory practices, leading to differences in drug labeling and risk assessment procedures (Cho et al., 2019). These variations highlight the need for harmonized regulatory systems that can enhance the consistency of drug safety monitoring across regions.

Types of Pharmacovigilance Systems

The structure of pharmacovigilance systems also differs significantly across countries. Some nations employ centralized systems, such as those in several European countries, which tend to achieve higher ADR reporting rates due to unified data collection and analysis methods. On the other hand, decentralized systems, common in regions like the Commonwealth of Independent States (CIS), often face challenges in achieving high reporting rates and

**Mohini Kashyap et al.,**

effective monitoring (Koryanova et al., 2020). The choice of pharmacovigilance system—centralized, decentralized, or mixed—has a significant impact on the efficiency and effectiveness of ADR monitoring.

Healthcare System Differences

Healthcare system differences also play a critical role in shaping pharmacovigilance practices. Variations in data sources, such as the availability and quality of electronic health records (EHRs) and national registries, influence the capacity of countries to monitor drug safety effectively. Nations with advanced healthcare infrastructure, such as those in Europe, are better equipped to integrate pharmacovigilance into clinical practice compared to regions with limited resources (Shin et al., 2021). These disparities further complicate the global pharmacovigilance landscape.

Harmonization Efforts and International Collaboration

To address these challenges, significant efforts have been made to harmonize pharmacovigilance practices through international collaboration. Organizations like the World Health Organization (WHO), the International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use (ICH), and regional agencies such as the European Medicines Agency (EMA) are working to develop international guidelines for performing pharmacovigilance consistently across countries. These efforts include the identification, documentation, and handling of ADRs to improve global drug safety monitoring (ICH, 2020). A major initiative in this respect is the WHO Programme for International Drug Monitoring (PIDM), which facilitates the exchange of ADR data among member countries through Vigibase, a central clearing system located at the Uppsala Monitoring Center in Sweden (WHO, 2021). Additionally, the ICH's E2E guidelines have helped coordinate risk management and pharmacovigilance functions across different regulatory areas, thus enhancing consistency in drug safety assessments during both the pre- and post-marketing stages (ICH, 2020).

WHO Programme for International Drug Monitoring

The WHO Programme for International Drug Monitoring (PIDM) plays a crucial role in harmonizing global pharmacovigilance practices. This program, involving 153 member countries, provides a centralized database for ADRs, enabling international data sharing and fostering collaboration among member nations (Min, 2022; Казаков et al., 2019). By standardizing reporting practices and encouraging transparency, the program strengthens the global pharmacovigilance framework.

International Council for Harmonisation (ICH)

Established in 1990, the International Council for Harmonisation (ICH) has been instrumental in aligning pharmaceutical regulatory requirements globally, including those related to pharmacovigilance. The ICH has introduced standardized coding systems for adverse events and streamlined submission processes for new drug applications. These measures have facilitated greater collaboration and consistency in drug safety monitoring across regions (Singh et al., 2018).

TransCelerate and Other Initiatives

Collaborative initiatives like TransCelerate, a coalition of major pharmaceutical companies, advocate for the re-harmonization of pharmacovigilance practices to address regulatory differences and improve the standardization of ADR reporting and safety data communication (Singh et al., 2018). Such industry-driven initiatives play a crucial role in overcoming regulatory fragmentation and enhancing global pharmacovigilance consistency.

Global Cooperation Frameworks

Various international cooperation frameworks have been established to create a more unified global pharmacovigilance system. These efforts focus on leveraging existing harmonization projects and fostering partnerships among regulatory authorities, healthcare providers, and industry stakeholders. By building on shared goals and best practices, these frameworks aim to enhance the safety and efficacy of pharmaceuticals worldwide (Lezotte, 2013).

**Mohini Kashyap et al.,**

Although these harmonization efforts have made notable progress, challenges remain due to the inherent differences in regional practices and regulatory environments. The globalization of the pharmaceutical industry necessitates balancing standardization with the need to accommodate local contexts. Additionally, there is concern that harmonization efforts may sometimes prioritize corporate interests over public health, underscoring the importance of maintaining a patient-centered approach in pharmacovigilance (z0hhlmi942, 2023). Despite these challenges, the continued push for international collaboration and harmonization is vital for improving drug safety monitoring and protecting public health worldwide.

Challenges in Pharmacovigilance**Underreporting of ADRs**

The Underreporting of Adverse Drug Reactions (ADRs) is a significant barrier to pharmacovigilance. Despite healthcare regulators' efforts to raise awareness, many ADRs remain unreported. Reasons include

- **Lack of Engagement** Patients and healthcare providers may not understand the importance of reporting ADRs. Patients may experience side effects but not link them to their medications, leaving incidents unreported. Healthcare providers may also be unaware of the reporting process or its importance in drug safety monitoring.
- **Cultural Barriers** In some communities, there may be shame attached to reporting side effects or an assumption that reporting is unnecessary. This can contribute to underreporting, especially in culturally diverse populations with different healthcare beliefs.
- **Poor Reporting Systems** Existing ADR reporting systems are often cumbersome, time-consuming, or not user-friendly, discouraging reports from patients and healthcare providers. Simplifying these processes is essential.

To tackle underreporting, regulatory agencies encourage direct patient reporting and are leveraging digital tools. Mobile apps and online platforms can simplify patient reporting, improving the collection of valuable safety data. Educating both healthcare providers and patients on the importance of ADR reporting is crucial for improving engagement and outcomes. [7]

Regulatory Challenges in Emerging Markets

Regulatory hurdles to effective pharmacovigilance are especially numerous in emerging markets, including

- **Insufficient Infrastructure** Many developing economies lack proper infrastructure for pharmacovigilance, such as technology to track and report ADRs or healthcare facilities capable of drug safety monitoring.
- **Lack of Trained Personnel** There is often a shortage of trained professionals to manage pharmacovigilance, leading to inadequate documentation, analysis, and reporting of ADRs, compromising drug safety efforts.
- **Limited Resources** Pharmacovigilance systems are resource-intensive, and many regulatory agencies in these markets lack the funding needed for training, technology, and operations.

Strengthening regulatory frameworks in these regions is crucial. Collaborating with international bodies can provide the expertise, resources, and training necessary to enhance pharmacovigilance capacities and improve drug safety monitoring. [N. Jahan et al [9]

Addressing Patient-Centric Pharmacovigilance

Patient-centric pharmacovigilance is a growing trend that involves engaging patients in ADR reporting, offering several benefits

- **Direct Reporting** Allowing patients to report ADRs through apps and online platforms helps healthcare authorities collect real-world safety data more effectively, increasing the volume and diversity of reports and identifying previously unnoticed safety signals.

Mohini Kashyap et al.,

- **Improved Safety Data Collection** Patient-centric approaches not only increase the number of reports but also enhance the quality of data. Patients' detailed accounts provide valuable insights into the context and severity of ADRs.
- **Amplifying Patient Voices** Involving patients in pharmacovigilance ensures their perspectives are considered in drug safety evaluations, promoting better risk communication and personalized healthcare solutions. Implementing this approach requires investing in digital tools and educating patients on how to report ADRs. Regulatory agencies must prioritize patient-centric pharmacovigilance to improve drug safety monitoring and strengthen collaboration between patients and healthcare providers.

Future Directions in Pharmacovigilance

Predictive Models for ADR Identification

The next generation of PV is expected to move to proactive as well as to learning-based approaches include using ML and AI to predict the emergence of a risk of ADRs in real-life settings. The models based on big data touch across patient's clinical data population, clinical trials, EHRs, and more recently, RWE data. These algorithms are actually aimed to find out the patterns of data which might be ignored commonly, so that the safety signals can be identified early and the occurrence of severe ADRs minimized. When pharmacovigilance is complemented by predictive analytics, drug safety becomes preventive – insights are generated in real-time and interventions implemented before ADRs progress. Pharmacovigilance specifically in terms of handling large amounts of data or complicated data and information is improved through the use of AI tools. This approach demonstrates a progressive shift from conventional pharmacovigilance reactive processes to more proactive means of ADR identification [6], [11].

Implications of Personalized Medicine on Pharmacovigilance

The growing importance of pharmacovigilance is evidence by the fact that as personalized medicine becomes the norm, the monitoring of drug safety in patients receiving such therapies will continue to become a more complex task. Pharmacogenomics aligns treatments with patients' genetics, environment and past experience proposing a chance for more efficient treatment. Nevertheless, this leads to a new problem for pharmacovigilance since individualized treatment programs might cause varying ADRs. Unlike mass market strategies at which one can predict ADRs with help of reference data in broader population, individual approach targeting requires more detailed supervision of reactions to specific drugs. Consequently, some pharmacovigilance systems will have to incorporate different analyses to capture these various responses and models again safety profiles that address individual patient factors. Pharmacovigilance will increasingly be the key area of safety regulation as more and more drugs target particular gene patterns ... thus leading to increased safety threats in other populations [3].

Integration of Pharmacogenomics in Drug Safety Monitoring

The principles of pharmacogenomics, the study of how genetic characteristics influence an individual drug response, will likely become essential elements in the new pharmacovigilance systems. Pharmacogenomic data will also help in anticipation of the likely ADRs that patients are prone to due to their genetic makeup once integrated into monitoring drug safety. This is specially important for the subsets of population that are more susceptible to drug-induced complications due to their genetic profile. Pharmacogenomic data makes it possible to determine genetic biomarkers to lay down how the patient will be receptive to a particular drug and depict less risky dosing recommendations. There are indications that regulatory agencies are demanding pharmacogenomic information as part of the drug approval process because of the observed potential of pharmacogenomics to improve post-marketing surveillance in view of the genetic variation in patient population. In the future, as pharmacogenomics is increasingly implemented within healthcare systems, it will also be increasingly used in pharmacovigilance and risk assessment in genetic variability to have regard to [8], [11].

Mohini Kashyap et al.,

Role of Global Collaborations in Advancing Pharmacovigilance

Pharmacovigilance is a global concern, thus making international collaboration essential in monitoring drug safety across borders. Regulatory agencies, pharmaceutical companies, and healthcare professionals must work together to ensure that adverse drug reaction (ADR) information is shared, harmonized, and acted upon when relevant across regions. Global organizations such as the World Health Organization (WHO), the Uppsala Monitoring Centre (UMC), and the International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use (ICH) play critical roles in facilitating this collaboration. Their efforts in establishing global standards for pharmacovigilance have been vital in creating a unified framework for drug safety monitoring, ensuring that safety concerns identified in one region can be quickly communicated to other parts of the world. These collaborations not only streamline the reporting of ADRs but also enhance the capacity of countries, especially those with emerging markets, to develop and implement effective pharmacovigilance systems.

The rapid dissemination of updated drug safety information across borders is crucial in preventing potential adverse events from becoming global health crises. Through initiatives such as the WHO's Programme for International Drug Monitoring (PIDM) and the UMC's Vigibase, ADR data is collected and analyzed from multiple countries, providing a more comprehensive understanding of drug safety. This global data-sharing network improves the detection of unexpected ADRs, particularly those that may not be apparent in smaller, region-specific datasets. In addition to identifying potential safety concerns, these global efforts support research into developing new inspection tools and methodologies for monitoring drug safety, leading to continuous improvements in pharmacovigilance practices [1], [9].

The COVID-19 pandemic particularly highlighted the importance of international collaboration in pharmacovigilance. As vaccines were rapidly developed and deployed across the world, real-time safety monitoring became essential to detect and manage ADRs effectively. Global pharmacovigilance networks allowed regulators to share data on vaccine-related ADRs swiftly, helping to build public trust and ensure that any emerging safety concerns were addressed immediately. The pandemic demonstrated that in an increasingly interconnected world, where drugs and vaccines are distributed globally, the need for robust international cooperation is more critical than ever. Regulatory agencies and pharmaceutical companies worked together across borders to monitor the safety of COVID-19 vaccines, ensuring that ADRs were identified and managed in real-time.

As global drug markets grow more complex, with new treatments and therapies entering the market at a rapid pace, and as regulatory regimes differ across countries, international cooperation is becoming increasingly necessary. Strengthening these global partnerships will improve the ability of pharmacovigilance systems to meet future challenges in drug safety monitoring. Continued collaboration will enhance the global exchange of pharmacovigilance data, streamline regulatory processes, and ensure a rapid response to emerging safety issues, safeguarding public health in the long term [6], [1].

CONCLUSION

Pharmacovigilance is essential throughout a medication's lifecycle, from pre-market to post-market surveillance, adapting with continuous monitoring, risk management, and global collaboration. Advancements like AI, real-world evidence (RWE), and electronic health records (EHRs) have significantly improved detecting and responding to adverse drug reactions (ADRs), enabling a more proactive approach to drug safety. The COVID-19 pandemic underscored the need for adaptable, real-time pharmacovigilance, especially in managing emerging risks like vaccines. However, challenges remain, such as regulatory inconsistencies and underreporting in developing regions. Focusing on patient-centered reporting and leveraging digital tools can help mitigate these issues, promoting inclusive safety monitoring. The future of pharmacovigilance depends on effectively integrating advanced technologies with global regulatory efforts, ensuring comprehensive drug safety and maintaining public trust in healthcare systems.

ABSTRACT

In the word of graph theory domination and degree are plays an important role because of its wise applicability in all kind of networks. Follows that, we introduced odd and even sum degree edge domination number for simple graphs. In this paper, we extend those edge domination by studying the connectedness of the cosets and introduced odd and even sum degree non-split edge domination. Further, we characterized those parameters and obtained its tight bounds for some standard classes of graphs.

Keywords: Odd(even) sum degree non-split edge dominating set, odd(even) sum degree non-split edge domination number, odd(even) sum degree non-split edge domination value.

INTRODUCTION

The graph $G=(V, E)$ considered here are finite, undirected ,without loops or multiple edges and connected. Unless otherwise stated all graphs are assumed to have p vertices and q edges. The degree of a vertex u and degree of an edge e respectively denoted by $deg(u)$ and $deg(e)$. If $e=uv$ then $deg(e)=deg(u) +deg(v) -2$. Also the maximum and minimum edge degree of a graph G are respectively denoted as $\Delta(G)$ and $\delta(G)$.Throughout this paper, all the graphs are referred from Gallian and the graph theoretical terminologies are referred from[2].The concept of even

Usha and Mohana Selvi

sum domination number of some graphs are introduced by sejal H. Karkar, D.D. Pandya, S.G Sonchhatra, P.D Maheta, H.M Rathod, S.D Bhanderi[3]. The edge domination in graphs is defined in a similar way as that of the vertex domination in graph. In 2024, Odd and Co – Odd Sum Degree Domination in Graphs with Algorithm is introduced by D. Ilakkiya and V. Mohana Selvi[1]. Further in 2024 Muhammad Shouib Sarder and el[6] are developed various edge domination parameters. The degree based domination parameters are established by W.C SillaBujtas, MitchalA.Henning and el[8]. The degree domination in graphs is established by NazlicanCaglaDemirpolat, Elgin Kilic[7]. Further the concept of odd(even) domination was extended by Leomarich F. Casinillo in 2020[4]. An edge dominating set $T \subseteq E(G)$ of a graph G is said to be an odd(even) sum degree edge dominating set (osded(esded)-set) of G if the sum of degree of all edges in T is an odd(even) number. The odd (even) sum degree edge domination number $\gamma'_{osd}(\gamma'_{esd})_{(G)}$ is the minimum cardinality taken over all odd (even) sum degree edge dominating sets of G [5]. Motivated by the notion of the above parameters and their applicability, in this paper, the non-split edge domination in graph theory is a concept where one seeks to find a subset of edges in a graph such that each edge not in the subset is incident to atleast one edge in the subset and no two edges in the subset share an end point. Since it has plenty of practical applications across various domains make us to introduce odd(even) sum degree non-split edge domination in graphs.

MATERIALS AND METHODS

Definition 2.1

An odd(even) sum degree edge dominating set T of a graph $G = (V, E)$ is an odd(even) sum degree non – split edge dominating set (oned(ened)-set) if the edge induced sub graph $\langle E - T \rangle$ is connected. The odd(even) sum degree non split edge domination number $\gamma'_{on}(G)(\gamma'_{en}(G))$ of G is the minimum cardinality of an odd(even) sum degree non split edge dominating set of G and it is defined as zero if no such (oned(ened)-set) exists in G . The odd(even) sum degree non-split edge dominating set with cardinality $\gamma'_{on}(G)(\gamma'_{en}(G))$ is denoted by $(\gamma'_{on}(\gamma'_{en}))$ -set of G .

Definition 2.2

Let T be an $(\gamma'_{on}(\gamma'_{en}))$ -set of G . Then the minimum sum of degree of the edges of the set T is said to be an odd(even) sum degree non-split edge domination value and is denoted by $S'_{on}(S'_{en})(G)$ of G .

Definition 2.3

A graph G is said to be an odd(even) sum degree non-split edge dominating graph oned(ened)-graph if it has atleast one odd(even) sum degree non-split edge dominating set of G .

Example 2.4

For the above graph G , $T'_{on}(G) = \{e_2, e_4, e_7, e_{12}\}$ is a γ'_{on} -set and hence $\gamma'_{on}(G) = 4$ and $S'_{on}(G) = 13$. $T'_{en}(G) = \{e_2, e_4, e_7, e_{11}\}$ is a γ'_{en} -set and hence $\gamma'_{en}(G) = 4$ and $S'_{en}(G) = 14$.

Remark 2.5

Since the oned-set not exist for cycle C_n , $n \geq 3$ and friendship graph F_n , $n \geq 2$ and ened –set not exist for path P_3 gives in general, every connected graph need not have an oned-set or ened –set. Hence we defined $\gamma'_{on}(\gamma'_{en})(G) = 0$ if G has no oned(ened)-set.

Usha and Mohana Selvi

Proposition 2.6

If G has a γ' -set, then (i) $\gamma'_{0'}(G) \leq \gamma'_{on}(G)$; (ii) $\gamma'_{e'}(G) \leq \gamma'_{en}(G)$ and these bounds are sharp.

Proof The results followed from the fact that every oned(ened) – set of G is an odd(even) sum degree edge dominating set of G . The bounds of (i) & (ii) are sharp. The path P_4 and P_5 achieves the bounds of (1) and (2) respectively.

Proposition 2.7

If G has a γ'_{on} -set then $\gamma'(G) \leq \min\{\gamma'_{on}(G), \gamma'_{en}(G)\}$ and the bound is sharp, where $\gamma'(G)$ is an edge domination number.

Proof Anoned-set and ened –set are necessarily an edge dominating set it proves the result immediately. The bound is sharp for path P_5 , since $\gamma'_{(P_5)} = \gamma'_{en}(P_5) = 2$ and $\gamma'_{on}(P_5) = 3$.

Proposition 2.8

Let G be ar -regular graph where r is an even positive number. Then

(i) $\gamma'_{0'}(G) = \gamma'_{on}(G) = 0$; (ii) $\gamma'_{e'}(G) = \gamma'_{en}(G) \leq \gamma'_{en}(G)$

Proof The result in (i) follows from the fact that every edge in G has only even degree. That is no odd sum degree edge dominating set and odd sum degree non-split edge dominating set gives (i). In the given G every, edge dominating set is an even sum degree edge dominating set gives the first part of (ii). The second part follows from proposition 2.6.

Proposition 2.9

For the Path graph $(P_n), n \geq 3$

$$(i) \quad \gamma'_{on}(P_n) = n - 2 \quad ; \quad S'_{on}(P_n) = 2n - 5$$

$$(ii) \quad \gamma'_{en}(P_n) = \begin{cases} 2 & ; n = 4 \\ n - 3; n \geq 5 \end{cases} ; \quad S'_{en}(P_n) = \begin{cases} 2 & ; n = 4 \\ 2n - 8; n \geq 5 \end{cases}$$

Proof Let G be a path graph with atleast 3 vertices and hence where $E(G) = \{e_1, e_2, \dots, e_{n-1}\}$ where $deg(e_1) = deg(e_{n-1}) = 1$ and $deg(e_i) \mid i=2,3,\dots,n-2 = 2$.

Claim 1 Odd sum degree non-split edge domination number and value

Let $X = \{e_i \mid i = 1,2,\dots,n-2\}$ be an edge dominating set of G . Since the induced subgraph $\langle E/X \rangle$ is connected and

$\sum_{x \in X} deg(x)$ is odd gives X is anoned -set of G . Therefore, $\gamma'_{on}(G) \leq |X| = n-2(1)$

Let Y be an oned-set of G such that $\gamma'_{on}(G) = |Y|$. Since G has only one odd degree edges and the edge induced subgraph $\langle E/X \rangle$ is connected gives Y must contain atleast $n-3$ two degree edges and exactly one odd degree edge.

Hence $\gamma'_{on}(G) = |Y| \geq 1 + n-3 = n-2(2)$

Usha and Mohana Selvi

Further, if X is an γ'_{on} - set of G , then from equations (1) and (2) gives, $\gamma'_{on}(G) = n-2$ and $S'_{on}(G) =$

$$\sum_{x \in X} \deg(x) = 1 + (n-3)2 = 2n-5 \tag{3}$$

It proves (i).

Claim 2 Even sum degree non-split edge domination number and value

Case (a) $n=4$. In this case, the edge set $X = \{e_1, e_3\}$ is a minimum ened -set of G and hence $\gamma'_{en}(G) = 2$ and $S'_{en}(G) =$

$$\sum_{x \in X} \deg(x) = 1+1=2. \text{ It proves the results in (ii).}$$

Case (b) $n \geq 5$. In this case, take

$$X = X_1 \cup X_2 = \begin{cases} \left\{ e_i, i = 1, 2, \dots, \frac{n-3}{2} \right\} \cup \left\{ e_j, j = 1, 2, \dots, \frac{n-3}{2} \right\}, n \equiv 1 \pmod{2} \\ \left\{ e_i, i = 1, 2, \dots, \frac{n-2}{2} \right\} \cup \left\{ e_j, j = 1, 2, \dots, \frac{n-4}{2} \right\}, n \equiv 0 \pmod{2} \end{cases}$$

Since the edge induced subgraph $\langle E/X \rangle$ is connected and degree of all the edges of X are even gives X is an ened-set of G . Therefore $\gamma'_{en}(G) \leq |X| = n-3$ and $S'_{en}(G) \leq 2n-8$ (3)

Suppose Y is an γ'_{en} -set of G . Then Y must contain atleast $n-3$ even degree edges. It gives $\gamma'_{en}(G) = |Y| \geq n-3$ and $S'_{en}(G) \leq 2n-8$ (4).

Hence the results in (ii) are proved by equations (3) and (4).

Proposition 2.10

For the Pan graph $T_{m,1}, m \geq 3$

$$(i) \gamma'_{on}(T_{m,1}) = m-2; S'_{on}(T_{m,1}) = 2m-3$$

$$(ii) \gamma'_{en}(T_{m,1}) = \begin{cases} 2 & ; m = 3, 4 \\ m-3; m \geq 5 \end{cases}; S'_{en}(T_{m,1}) = \begin{cases} 4 & ; m = 3, 4 \\ 2m-6; m \geq 5 \end{cases}$$

Proof Let G be the pan graph with atleast four vertices and hence $m \geq 3$ where $E(G) = \{e_1, e_2, \dots, e_m, f\}$ where $\deg(e_1) = \deg(e_m) = 3$ and $\deg(e_i) \ i=2,3,\dots,m-1 = \deg(f)=2$

Claim (i) Odd sum degree non-split edge domination number and value

Let $X = \{e_i \mid i = 1, 2, \dots, m-2\}$ be an edge dominating set of G . Since the edge induced sub graph $\langle E/X \rangle$ is connected, and

$$\sum_{x \in X} \deg(x) \text{ is odd gives } x \text{ is anoned-set of } G. \text{ Therefore, } \gamma'_{on}(G) \leq |X| = m-2 \tag{1}$$

Let Y be an oned-set of G such that $\gamma'_{on}(G) = |Y|$. Since G has only two odd degree edges and the edge induced sub graph $\langle E/X \rangle$ is connected gives Y must contain atleast $m-3$ two degree edges . Hence

Usha and Mohana Selvi

$$\gamma'_{on}(G) = |Y| \geq 1 + m - 3 = m - 2 \tag{2}$$

Further, if x is an γ'_{on} -set of G , then from equations (1) and (2), $\gamma'_{on}(G) = m - 2$ and
 Further, the odd sum degree non-split edge domination value

$$S'_{on}(G) = \sum_{x \in X} \deg(x) = 3 + (m - 3)2 = 2m - 3 \tag{3}$$

It proves (i)

Claim (ii) Even sum degree non-split edge domination number and value

Claim(a) $m = 3, 4$ In this case, the edge set $X = \{f, e_2\}$ is a minimum ened-set of G and hence

$$S'_{en}(G) = \sum_{x \in X} \deg(x) = 2 + 2 = 4$$

It proves the results in (ii).

Claim (b) $m \geq 5$

Take $X = \{e_{i+3} \mid i = 1, 2, \dots, m-4\} \cup \{f\}$. Since the edge induced sub graph $\langle E/X \rangle$ is connected and degree of all the edges of x are 2 gives x is an ened-set of G and

$$\text{hence } \gamma'_{en}(G) \leq |X| = m - 3 \text{ and } S'_{en}(G) \leq 2(m - 3) \tag{3}$$

Suppose Y is an γ'_{en} -set of G . Then Y must contains atleast $m-3$ even degree edges. It gives
 $\gamma'_{en}(G) = |Y| \geq m - 3$ and $S'_{en}(G) \geq 2(m - 3)$ (4).

Hence the results in (ii) are proved by equations (3) and (4).

Proposition 2.11

For the cycle graph $C_n, n \geq 3$

$$\begin{aligned} \text{(i)} \quad & \gamma'_{on}(C_n) = 0 & ; \quad S'_{on}(C_n) = 0 \\ \text{(ii)} \quad & \gamma'_{en}(C_n) = n-2 & ; \quad S'_{en}(C_n) = 2n-4 \end{aligned}$$

Proof Let G be a cycle graph with at least three vertices and hence $n \geq 3$ where $E(G) = \{e_1, e_2, \dots, e_n\}$ where $\deg(e_1) = \deg(e_2) = \dots, \deg(e_n) = 2$

Since every edge in G has degree 2 gives there is no odd sum degree non-split edge dominating set exist gives (i). For the even case, Let $X = \{e_i \mid i = 1, 2, \dots, n-2\}$ be an edge dominating set of G . Then the edge induced sub graph $\langle E/X \rangle$ is

$$\text{connected and } \sum_{x \in X} \deg(x) \text{ is even gives } X \text{ is an ened-set of } G. \text{ Therefore, } \gamma'_{en}(G) \leq |X| = n - 2 \text{ and } S'_{en}(G) \leq 2n - 4 \tag{1}$$

Suppose Y is an γ'_{en} -set of G . Then Y must contains at least $n - 2$ even degree edge. It gives

$$\gamma'_{en}(G) = |Y| \geq n - 2 \text{ and } S'_{en}(G) \leq 2n - 4 \tag{2}.$$

Hence the results in (ii) are proved by equations (1) and (2).

Proposition 2.12

For friendship $F_n, n \geq 2$

Usha and Mohana Selvi

$$\begin{aligned}
 (i) \quad & \gamma'_{on}(F_n) = 0 \quad ; \quad S'_{on}(F_n) = 0 \\
 (ii) \quad & \gamma'_{en}(F_n) = n \quad ; \quad S'_{en}(F_n) = 2n
 \end{aligned}$$

Proof Let G be a friendship graph with at least five vertices and hence $n \geq 2$ where $E(G) = \{e_1, e_2, \dots, e_{3n}\}$ and $deg(e_i) = 2, 5, \dots, 3n-1 = 2$. Since every edge in G has even degree gives there is no odd sum degree non-split edge dominating set exist gives (i).

For the even case, let $X = \{e_i / i = 1, 2, \dots, 3n-1\}$ be the edge dominating set of G . Since the edge induced sub graph $\langle E/X \rangle$

is connected and $\sum_{x \in X} deg(x)$ is even gives X is an ened-set of G .

Therefore, $\gamma'_{en}(G) \leq |X| = n$ and $S'_{en}(G) \leq 2n$ (1)

Suppose Y is an γ'_{en} -set of G . Then Y must contains atleast n even degree edges it gives

$$\gamma'_{en}(G) = |Y| \geq n \quad \text{and} \quad S'_{en}(G) \geq 2n \quad (2). \quad (2)$$

Hence, the result in (ii) are proved by equation (1) and (2).

By the similar arguments, the exact value of $\gamma'_{on}(G)$ and $\gamma'_{en}(G)$ for some standard classes of graphs are obtained and present below.

Proposition 2.13

(i) For star $S_n, n \geq 3$

$$\begin{aligned}
 \gamma'_{on}(S_n) = \begin{cases} 0; n \equiv 0(\text{mod}2) \\ 1; n \equiv 1(\text{mod}2) \end{cases}, & \quad S'_{on}(S_n) = \begin{cases} 0 & ; n \equiv 0(\text{mod}2) \\ n-2; n \equiv 1(\text{mod}2) \end{cases} \\
 \gamma'_{en}(S_n) = \begin{cases} 1; n \equiv 0(\text{mod}2) \\ 2; n \equiv 1(\text{mod}2) \end{cases}, & \quad S'_{en}(S_n) = \begin{cases} n-2; n \equiv 0(\text{mod}2) \\ 2n-4; n \equiv 1(\text{mod}2) \end{cases}
 \end{aligned}$$

(ii) For helm $W_n^+; n \geq 3$

$$\begin{aligned}
 \gamma'_{on}(W_n^+) = \left\lceil \frac{n}{2} \right\rceil + 1, & \quad S'_{on}(W_n^+) = 4n+3 \\
 \gamma'_{en}(W_n^+) = \left\lceil \frac{n}{2} \right\rceil + 1, & \quad S'_{en}(W_n^+) = 4n
 \end{aligned}$$

(iii) For crown $C_n^+, n \geq 3$

$$\begin{aligned}
 \gamma'_{on}(C_n^+) = 0, & \quad S'_{on}(C_n^+) = 0 \\
 \gamma'_{en}(C_n^+) = n-1, & \quad S'_{en}(C_n^+) = 2n
 \end{aligned}$$

(iv) For triangular snake $T_n, n \geq 3$

$$\gamma'_{on}(T_n) = 0, \quad S'_{on}(T_n) = 0$$

Usha and Mohana Selvi

$$\gamma'_{en}(T_n) = \left\lfloor \frac{n}{2} \right\rfloor, \quad S'_{en}(T_n) = 6 \left\lfloor \frac{n+2}{2} \right\rfloor + 2$$

(v) For flag $Fl_n, n \geq 3$
 $\gamma'_{on}(Fl_n) = n-2, \quad S'_{on}(Fl_n) = 2n-3$

$$\gamma'_{en}(Fl_n) = \begin{cases} \left\lfloor \frac{n}{2} \right\rfloor; n = 3,4 \\ n-3; n \geq 5 \end{cases}, \quad S'_{en}(Fl_n) = \begin{cases} 2n-4; n = 3,4 \\ 2(n-3); n \geq 5 \end{cases}$$

(vi) For bistar $B_{n,n}, n \geq 2$
 $\gamma'_{on}(B_{n,n}) = \begin{cases} 0; n \equiv 0(\text{mod } 2) \\ 3; n \equiv 1(\text{mod } 2) \end{cases}, \quad S'_{on}(B_{n,n}) = 6 \left\lfloor \frac{n}{2} \right\rfloor + 3, n \equiv 1(\text{mod } 2), n \geq 3$
 $\gamma'_{en}(B_{n,n}) = 2, \quad S'_{en}(B_{n,n}) = 2n$

(vii) For wheel graph W_n
 $\gamma'_{on}(W_n) = \begin{cases} 2 \binom{n}{6} + 1; n \equiv 0(\text{mod } 3) \\ 2 \left\lfloor \frac{n}{6} \right\rfloor; n \equiv 1(\text{mod } 3) \\ 2 \left\lfloor \frac{n}{6} \right\rfloor + 1; n \equiv 2(\text{mod } 3) \end{cases}$
 $S'_{on}(W_n) = \begin{cases} 2n + \left(\frac{n}{3} + 1\right); n \equiv 0(\text{mod } 3) \\ 2n + \left(\frac{n-1}{3}\right); n \equiv 1(\text{mod } 3) \\ 2n + \left(\frac{n-2}{3} - 1\right); n \equiv 2(\text{mod } 3) \end{cases}$
 $\gamma'_{en}(W_n) = \begin{cases} 2; n = 3,4,5 \\ 2 \binom{n}{6} + 1; n \equiv 0(\text{mod } 6) \\ 2 \left\lfloor \frac{n}{2} \right\rfloor + 1; n \equiv 1(\text{mod } 6) \\ 2 \left\lfloor \frac{n}{6} \right\rfloor; n = 2,3,4,5(\text{mod } 6) \end{cases}$
 $S'_{en}(W_n) = \begin{cases} 10 \left(\frac{n}{3} - 1\right) + 8; n \equiv 0(\text{mod } 6) \\ 2n + 2 \left\lfloor \frac{n}{6} \right\rfloor; n \equiv 1,5(\text{mod } 6) \\ 10 \left(\frac{n-2}{3}\right) + 6; n \equiv 2(\text{mod } 6) \\ 2(n+1) + 2 \left\lfloor \frac{n}{6} \right\rfloor; n \equiv 3(\text{mod } 6) \\ 10 \left(\frac{n-1}{3}\right); n \equiv 4(\text{mod } 6) \end{cases}$

(viii) For fan graph $f_n, n \geq 3$

Usha and Mohana Selvi

$$\gamma'_{on}(f_n) = \begin{cases} 2 \left\lfloor \frac{n}{6} \right\rfloor, & n \equiv 0,3,4,5 \pmod{6} \\ 2 \left\lfloor \frac{n}{6} \right\rfloor + 1, & n \equiv 1,2 \pmod{6} \end{cases}$$

$$S'_{on}(f_n) = \begin{cases} 2(n-1) + \left(2 \left\lfloor \frac{n}{6} \right\rfloor - 1 \right), & n \equiv 0,5 \pmod{6} \\ 2n + \left(2 \left\lfloor \frac{n}{6} \right\rfloor - 1 \right), & n \equiv 1,2 \pmod{6} \\ 2(n+1) + \left(2 \left\lfloor \frac{n}{6} \right\rfloor - 1 \right), & n \equiv 3,4 \pmod{6} \end{cases}$$

$$\gamma'_{en}(f_n) = \begin{cases} 2 \left\lfloor \frac{n}{6} \right\rfloor + 1, & n \equiv 0,1,2 \pmod{6} \\ 2 \left\lfloor \frac{n}{6} \right\rfloor - 2, & n \equiv 4,5 \pmod{6} \end{cases}$$

$$S'_{en}(f_n) = \begin{cases} 2n + 2 \left\lfloor \frac{n}{6} \right\rfloor, & n \equiv 0,1 \pmod{6} \\ 2n - 2 + 2 \left\lfloor \frac{n}{6} \right\rfloor, & n \equiv 2,3 \pmod{6} \\ 2n + 2 \left\lfloor \frac{n}{6} \right\rfloor, & n \equiv 4,5 \pmod{6} \end{cases}$$

(ix) For ladder graph $L_n, n \geq 3$

$$\gamma'_{on}(L_n) = \begin{cases} 2 \left(\frac{n}{3} \right) + 1, & n \equiv 0 \pmod{3} \\ 2 \left\lfloor \frac{n}{3} \right\rfloor + 1, & n \equiv 1 \pmod{3} \\ 2 \left(\frac{n+1}{3} \right), & n \equiv 2 \pmod{3} \end{cases}$$

$$S'_{on}(L_n) = \begin{cases} 2n + \left[2 \left(\frac{n-1}{3} \right) - 1 \right], & n \equiv 1 \pmod{3} \\ 2n + \left(2 \left(\frac{n-2}{3} \right) + 1 \right), & n \equiv 2 \pmod{3} \\ 2n + \left(2 \left(\frac{n}{3} \right) + 1 \right), & n \equiv 0 \pmod{3} \end{cases}$$

$$\gamma'_{en}(L_n) = \begin{cases} n - \left(\frac{n}{3} \right), & n \equiv 0 \pmod{3} \\ n - \left(\frac{n-1}{3} \right), & n \equiv 1 \pmod{3} \\ n - \left(\frac{n-2}{3} \right), & n \equiv 2 \pmod{3} \end{cases}$$

$$S'_{en}(L_n) = \begin{cases} 2n + 2 \left\lfloor \frac{n-3}{3} \right\rfloor, & n \equiv 0 \pmod{3} \\ 2n + 2 \left\lfloor \frac{n}{3} \right\rfloor, & n \equiv 1 \pmod{3} \\ 2n + 2 \left\lfloor \frac{n+1}{3} \right\rfloor, & n \equiv 2 \pmod{3} \end{cases}$$

RESULTS AND DISCUSSION

Bounds and Characterization of Odd(Even) Sum Degree Non-Split Edge Domination

Theorem 3.1

Usha and Mohana Selvi

An edge dominating set T is minimal if and only if for each $t \in T$ one of the following two conditions holds

- (i) $N(t) \cap T = \emptyset$
- (ii) There exists an edge $e \in E - T$ such that $N(e) \cap T = \{t\}$

The following result gives the necessary & sufficient conditions for existence of minimality of oned-set.

Theorem 3.2

An odd sum degree non-split edge dominating set T_o of G is minimal if and only if for each edge $t \in T_o$, one of the following conditions holds.

1. There exists an edge $s \in E/T$ such that $N(s) \cap T_o = \{t\}$
2. t is an isolated edge in $\langle T_o \rangle$
3. $N(t) \cap (E/T_o) = \emptyset$

Proof Suppose T_o is a minimal odd sum degree non-split edge dominating set of G . On the contrary if there exists an edge $t \in T_o$ such that t does not satisfy any of the given conditions. Then by theorem 3.1 $T = T - \{t\}$ is an edge dominating set of G . By (iii) the induced subgraph $\langle E/T \rangle$ is connected. This implies that T is an odd sum degree non-split edge dominating set of G , which contradicts the minimality of T_o . The converse is obvious.

By the similar arguments one can prove the following result for even sum degree non-split edge dominating set.

Theorem 3.3

An even sum degree non split edge dominating set T_e of G is minimal if and only if for each edge $t \in T_e$ one of the following conditions holds.

1. There exists an edge $s \in E/T_e$ such that $N(s) \cap T_e = \{t\}$
2. t is an isolated edge in $\langle T_e \rangle$
3. $N(t) \cap (E/T_e) = \emptyset$

The characterization of oned-set and ened-set of G is present below.

Theorem 3.4

Let G be a graph with a oned-set T'_{on} and a ened-set T'_{en} then

- (i) T'_{on} have odd number of odd degree edges
- (ii) T'_{en} has either even numbers of odd degree edges or any numbers of even degree edges or both.

Proof Suppose T'_{on} has no odd degree edges or it has even number of odd degree edges then the sum of degrees of edges of T'_{on} become even. Which contradict T'_{on} is anoned – set. Hence T'_{on} has odd number of odd degree edges. It proves (i)

Suppose T'_{en} has odd number of odd degree edges then T'_{en} is anoned – set of G but not ened – set. Therefore, T'_{en} has even number of odd degree edges. Since sum of even numbers is even gives T'_{en} may contain any number of even degree edges. Further, the above two combinations are also gives T'_{en} is an ened– set of G . It proves (ii).

The following result gives an upper bound for $\gamma'_{on}(G)$ and $\gamma'_{en}(G)$ in terms of order of G , provided G has atleast one $(\gamma'_{on}(\gamma'_{en}))$ -set.

Theorem 3.5

Usha and Mohana Selvi

For any (p, q) graph G with atleast two odd degree edges, $\gamma'_{on}(G) \leq p-2$. Further the equality holds for path $P_n, n \geq 3$.

Proof Since G is connected there is a spanning tree T of G with $p-1$ edges. If x is a pendant edge of T then the remaining $p-2$ edges of T form an odd sum degree non split edge dominating set of G and hence $\gamma'_{on}(G) \leq p-2$.

Theorem 3.6

For any tree $G, \gamma'_{on}(G) \geq q-m$ where m is the number of pendant edges of G , where q is the size of G .

Proof Let T be a γ'_{on} -set of G and let S be the set of all pendant edges of G such that $|S|=m$. Since the edge induced subgraph $\langle E-T \rangle$ is connected and T has atleast $E \setminus S$ edges, $|T| \geq q-m$. So $\gamma'_{on}(G) \geq q-m$. Further, the equality is attained can be seen in path P_5 .

By similar way one can prove the following results for even sum degree non split edge domination number.

Theorem 3.7

For any (p, q) graph $G, \gamma'_{en}(G) \leq p-2$. Further the equality holds for path $P_n, n \geq 3$.

Theorem 3.8

For any tree $G, \gamma'_{en}(G) \geq q-m$. where m is the number of pendant edges of G , where q is the size of G .

Now we establish a Nordhaus- Gaddum type result for the odd(even) sum degree non- split edge domination number.

Theorem 3.9

If G and its complement \underline{G} are connected with atleast two odd degree edges, then

$$(i) \quad \gamma'_{on}(G) + \gamma'_{on}(\underline{G}) \leq 2(p-2); (ii) \quad \gamma'_{on}(G)\gamma'_{on}(\underline{G}) \leq (p-2)^2$$

Proof The proof is immediate from Theorem 3.5.

Theorem 3.10

If G and its complement \underline{G} are connected then

$$(i) \quad \gamma'_{en}(G) + \gamma'_{en}(\underline{G}) \leq 2(p-2) \text{ and } (ii) \quad \gamma'_{en}(G)\gamma'_{en}(\underline{G}) \leq (p-2)^2$$

Proof The proof is immediate from Theorem 3.7.

The lower and upper bounds of $\gamma'_{en}(G)$ and $\gamma'_{on}(G)$ are present below in terms of minimum and maximum degree of G .

Theorem 3.11

Let G be a graph with $\delta'(G) \neq \Delta'(G)$. If $T'_{on}(G)$ and $T'_{en}(G)$ are γ'_{en} -set and γ'_{on} -set of G then

$$(i) \quad \frac{1}{\Delta'(G)} S'_{on(t)} \leq \gamma'_{on}(G) \leq \frac{1}{\delta'(G)} S'_{on(t)}$$

Usha and Mohana Selvi

$$(ii) \frac{1}{\Delta'(G)_{S'_{en}(t)} \leq \gamma'_{en}(G) \leq \frac{1}{\delta'(G)_{S'_{en}(t)}}$$

Proof Since $\delta'(G)$ and $\Delta'(G)$ are the minimum and maximum edge degree of the graph G , gives

$$\delta'(G) \leq \deg(e) \leq \Delta'(G), \text{ if } \delta' \neq \Delta' \text{ and } e \in G. \text{ Therefore, } |T'_{on}| \delta'(G) \leq S'_{on}(t) \leq |T'_{on}| \Delta'(G) \quad (1)$$

From the first inequality in (1), we have $|T'_{on}| \leq \frac{1}{\delta'(G)_{S'_{on}}}$. Therefore, $\gamma'_{on}(G) = |T'_{on}| \leq \frac{1}{\delta'(G)_{S'_{on}}}$

Hence, $\gamma'_{on}(G) \leq \frac{1}{\delta'(G)_{S'_{on}}}$ (2). From the second inequality in (1), we have $|T'_{on}| \geq \frac{1}{\Delta'(G)_{S'_{on}}}$.

Therefore, $\gamma'_{on}(G) = |T'_{on}| \geq \frac{1}{\Delta'(G)_{S'_{on}}}$. Equations (2) and (3) proves (i). By the similar arguments one can prove the results in (ii).

The necessary and sufficient conditions for the existence of oned(ened) - graph.

Theorem 3.12

Let G be a graph. Then (i) G is an oned – graph if and only if G has at least one odd degree edge. (ii) G is an ened – graph if and only if G has atleast even numbers of odd degree edges (or) degree of all the edges are even.

Proof

Claim (i) Let G be an oned – graph, then there exist an oned – set T'_{on} of G . Assume that G has no odd degree edge. Since G is connected with atleast two edges gives G has only edges of even degree. Then there is no oned – set exist in G , which contradict that G has anoned–set T'_{on} . Therefore, G has at least one odd degree edge. The converse is obvious.

Claim (ii) Let G be an ened – graph, then there exists an ened – set T'_{en} of G . Suppose G has odd degree edges. Then for the existence of T'_{en} , G must have an even number of odd degree edges. On the other hand, suppose G has only even degree edges then the result is immediate. The converse of the result is obvious.

Theorem 3.13

Let T'_{on} and T'_{en} be an oned – set and ened – set of G such that $\langle E - T'_{on} \rangle$ and $\langle E - T'_{en} \rangle$ are connected. If $\sum_{e \in E(G)} \deg(e)$ is an even number then (a) $E - T'_{on}$ is a oned – set of G and (b) $E - T'_{en}$ is a ened – set of G .

Proof Let $\sum_{e \in E(G)} \deg(e) = 2m, m \in \mathbb{N}$. Then $\sum_{e \in T'_{on}} \deg(e) + \sum_{e \in E - T'_{on}} \deg(e) = 2m$. Then $\sum_{e \in E - T'_{on}} \deg(e) = 2m - \sum_{e \in T'_{on}} \deg(e)$. Since T'_{on} is an oned – set of G given $\sum_{e \in T'_{on}} \deg(e)$ is an odd number. It gives $\sum_{e \in E - T'_{on}} \deg(e)$ is also an odd number. Also, $\langle E - T'_{on} \rangle$ is connected gives $E - T'_{on}$ is anoned – set of G . By the similar argument, one can prove that $E - T'_{en}$ is an ened – set of G .

Usha and Mohana Selvi

CONCLUSION

In this paper we computed the exact value of an odd (even) sum degree Non-Split edge domination number for some standard graphs and some special graphs. Also we found some upper and lower bounds for an odd(even) sum degree Non-Split edge domination number of graph.

ABSTRACT

Hypertension is a major health concern globally, often accompanied by psychological stress, which negatively impacts the patients' well-being. The narrative review explores various nursing interventions, including education, counseling, and stress management techniques, to evaluate their impact on hypertensive patients. Findings suggest that a collaborative approach involving healthcare professionals and patients can significantly reduce stress levels and enhance the quality of life. Evidence highlights the importance of a personalized care plan and active patient participation in managing hypertension. The study concludes that collaborative nursing interventions are vital in the holistic care of hypertensive patients, fostering better outcomes in both physical and mental health. Further research is recommended to standardize these interventions for broader clinical application.

Keywords: Collaborative nursing, hypertension, stress management, quality of life, patient care, nursing interventions, healthcare professionals, stress reduction, narrative review, patient outcomes.

INTRODUCTION

Hypertension, commonly known as high blood pressure, stands as one of the most widespread chronic health conditions globally, affecting individuals across all age groups. Its significance lies not only in its high prevalence but also in its strong association with life-threatening complications such as cardiovascular diseases, stroke, and kidney failure. Although often perceived primarily as a physical health issue, hypertension also exerts a profound impact on

**Supreet Rupam and Imran Khan**

psychological well-being, contributing to elevated stress levels and emotional distress. Psychological stress, in turn, plays a crucial role in worsening hypertensive symptoms, making effective management of the condition increasingly challenging. As this cycle of physical and mental strain persists, it not only complicates treatment outcomes but also leads to a marked decline in the overall quality of life (QoL) for hypertensive patients. Effective management of hypertension necessitates a comprehensive and multifaceted approach that goes beyond merely controlling blood pressure. Traditional treatment strategies often emphasize medication, lifestyle modifications, and regular monitoring to manage the physical aspects of the disease. However, focusing solely on physical health overlooks the critical psychological factors that significantly impact patient outcomes. To achieve truly effective care, it is essential for healthcare providers to address not only the physiological but also the emotional and psychological needs of individuals with hypertension. Within this broader perspective, collaborative nursing interventions have gained recognition as a highly effective strategy. Collaborative care adopts a team-based model, bringing together nurses, physicians, mental health professionals, and other specialists to deliver integrated and holistic care. Through this coordinated effort, healthcare teams are better equipped to meet both the physical and emotional needs of hypertensive patients, thereby enhancing treatment effectiveness and alleviating the overall burden of the disease. Collaborative nursing interventions, in particular, have been shown to be beneficial in managing stress, educating patients about hypertension, promoting positive lifestyle changes, and ultimately improving patient outcomes. These interventions typically include patient education, stress reduction techniques, counseling, and the promotion of self-management practices. By providing a supportive environment and encouraging active patient participation, collaborative nursing can lead to a reduction in stress levels and a significant improvement in the QoL of hypertensive individuals. However, despite the growing interest in collaborative care models, the direct impact of these interventions on stress reduction and QoL improvement among hypertensive patients remains insufficiently explored.

This narrative review seeks to examine and synthesize the existing body of literature on the effectiveness of collaborative nursing interventions in reducing stress and enhancing QoL for hypertensive patients. By evaluating a variety of studies, this review aims to identify best practices, highlight key findings, and establish a foundation for future research in this area. The ultimate goal is to underscore the importance of collaborative nursing interventions in the comprehensive management of hypertension, fostering better physical and mental health outcomes for patients. This review will contribute to a deeper understanding of how holistic, team-based approaches can transform the care of hypertensive patients and promote their well-being in all aspects of life.

Need for the Study

Hypertension, or high blood pressure, is a widespread and critical health issue that affects millions globally. It is a leading contributor to cardiovascular diseases, strokes, and kidney failure, presenting substantial challenges for both individuals and healthcare systems. Beyond its physical effects, hypertension is also linked with increased psychological stress, which can significantly impact a patient's overall well-being. The ongoing nature of hypertension and its associated health risks often lead to chronic anxiety, stress, and a diminished quality of life (QoL) for many individuals. As a result, addressing both the physical and mental aspects of the condition is essential to improving patient outcomes. Traditionally, the management of hypertension has focused on controlling blood pressure through medication and lifestyle changes. However, this approach tends to overlook the psychological and emotional needs of patients, which are integral to achieving long-term health improvements. Recent research has emphasized the importance of addressing these emotional aspects to reduce the negative impact of stress on hypertensive patients. Studies have demonstrated that managing stress plays a crucial role in both controlling hypertension and improving patients' overall quality of life. For instance, chronic stress is not only a result of hypertension but also an aggravating factor, creating a cycle that makes management more complex.

Collaborative nursing interventions have gained attention as an effective strategy for managing both the physical and psychological components of hypertension. These interventions adopt a team-based approach, where nurses work in tandem with doctors, mental health specialists, nutritionists, and other healthcare providers to offer holistic care. The focus of these interventions is on patient education, stress management, emotional support, and lifestyle changes—

**Supreet Rupam and Imran Khan**

critical elements that can help improve patients' physical health and reduce psychological burdens. The aim of these interventions is to reduce stress, promote healthier coping mechanisms, and enhance the quality of life for hypertensive patients. Despite the promise of these collaborative care models, there is still a need for more comprehensive studies to assess their specific impact on stress reduction and QoL improvement in hypertensive patients. While various studies have explored collaborative care in chronic diseases, fewer have focused specifically on hypertension and its psychological effects. For example, Chen et al. (2023) demonstrated that nursing interventions focused on stress reduction significantly decreased perceived stress levels among hypertensive individuals.

Similarly, Smith et al. (2022) showed that models of collaborative care, which included mental health support and education, not only improved blood pressure management but also enhanced patients' overall quality of life. Additionally, Patel et al. (2021) highlighted that integrated care models, which addressed both medical and psychological needs, led to fewer hypertensive crises and improved patient adherence to treatments. However, existing studies vary greatly in the type of interventions, patient groups, and outcomes measured, making it difficult to establish clear conclusions. (Patel et al., 2014). This study aims to fill this gap by providing a narrative review of the current literature on the effectiveness of collaborative nursing interventions in reducing stress and improving quality of life in hypertensive patients. By synthesizing available research, this review will identify successful approaches, challenges, and potential areas for improvement in these interventions. The findings will provide a clearer understanding of how holistic, team-based care can lead to better outcomes for hypertensive individuals. Moreover, this review will offer valuable insights that could help shape future healthcare practices and ensure that hypertensive patients receive comprehensive care that addresses both their physical and emotional needs.

Objectives

- 1.To find review related to collaborative nursing intervention on stress among hypertensive patients
- 2.To find studies related to collaborative nursing intervention on quality of life among hypertensive patients

METHODOLOGY**Inclusion criteria**

- The last 10 years research papers
- Full text
- Free full text
- Clinical trial
- Randomized controlled trial
- Male and female both
- English articles

Exclusion Criteria

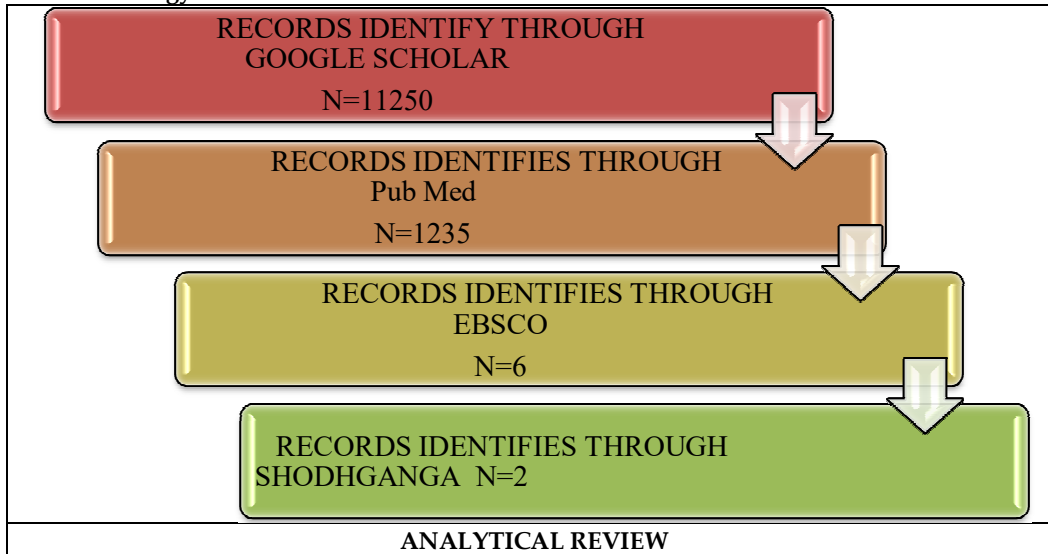

- Meta analysis
- Age below 39 years
- Preprints
- Review

Results are divided into two sections

Section a Quality of Life

AUTHOR NAME	TITLE OF THE ARTICLE	DESIGN	SAMPLING TECHNIQUE	SAMPLE	FINDINGS
Shree Ganesh <i>et. al.</i>	A study to assess the Impact of Yoga Therapy on Improving Perceived Stress, Depression, and Quality of Life in Elderly Population	Randomized wait listed controlled study	Random sampling technique	96	Yoga group has shown statistically significant reduction in PSS ($P < 0.001$), GDS ($P = 0.001$), and improvement in the selected components of OPQOL such as social relationship ($P = 0.014$), neighborhood ($P = 0.001$), psychological well-being ($P = 0.001$), financial circumstances ($P = 0.001$), and OPQOL – total ($P = 0.001$).
Neela K Patel <i>et.al.</i>	The Effects of Yoga on Physical Functioning and Health Related Quality of Life in Older Adults: A Systematic Review and Meta-Analysis	Randomized clinical trial	Electronic health-based record	35	The majority of the studies had <35 participants (range 9–77). The quantitative and qualitative synthesis of the studies suggested that the benefits of yoga may exceed those of conventional exercise interventions for self-rated health status, aerobic fitness, and strength.
MANGESH A	Impact of long-	Cross-	Random	60	Yoga group participants

Supreet Rupam and Imran Khan

BANKAR <i>et. al.</i>	term Yoga practice on sleep quality and quality of life in the elderly	sectional study	sampling technique		had significantly better ($P < 0.0001$) PF, SC functioning, and SF scores than non-Yoga group participants. CF score was significantly better ($P < 0.05$) in Yoga group. Although average scores of LS scale and DA scale were lower in Yoga group, no statistical difference was observed between the two groups.
Shweta Parikh <i>et. al.</i>	A randomized controlled trial examining the effects of home-based yoga on blood pressure and quality of life in hypertensive patients at a tertiary hospital in Karamsad.	Randomized controlled trial	Lottery method	74	Short term home-based yoga program in hypertensive patients have shown to reduce blood pressure as well as positive effect on self-rated quality of life in experimental group as compared to control group.
Suprakash Mandal, Puneet Misra <i>et. al.</i>	A study to assess the Effect of Structured Yoga Program on Stress and Professional Quality of Life Among Nursing Staff in a Tertiary Care Hospital of Delhi.	Randomized clinical trial	Convenience sampling technique	50	The follow-up mean PSS score was 15.4 for the intervention group, compared to 20.7 wait-list control group No significant differences were observed in the other parameters between the groups or from baseline to endpoint.

It was found that yoga therapy led to a statistically significant reduction in perceived stress (PSS, $P < 0.001$) and depression scores (GDS, $P = 0.001$) among elderly populations. Improvements were observed in quality-of-life components such as social relationships ($P = 0.014$), neighborhood environment ($P = 0.001$), psychological well-being ($P = 0.001$), financial circumstances ($P = 0.001$), and overall quality of life ($P = 0.001$). Quantitative and qualitative analyses of yoga for physical functioning and health-related quality of life in older adults showed that yoga benefits exceed conventional exercise in self-rated health, aerobic fitness, and strength. Most studies included fewer than 35 participants, with a range of 9–77 individuals.

Yoga practitioners exhibited significantly better physical functioning (PF), social functioning (SC), and social scores (SF) than non-practitioners ($P < 0.0001$), along with improved cognitive functioning (CF, $P < 0.05$). However, no statistical differences were found in life satisfaction (LS) and depressive effect (DA) scales between the groups. Home-based yoga programs demonstrated significant reductions in blood pressure among hypertensive patients and positively influenced self-rated quality of life. This finding highlights the feasibility and effectiveness of short-term yoga interventions in tertiary hospital settings.

Supreet Rupam and Imran Khan

In a study on nursing staff, the structured yoga program reduced the mean PSS score to 15.4 in the intervention group compared to 20.7 in the wait-list control group. However, no significant differences were noted in other parameters from baseline to endpoint, emphasizing the need for longer-term interventions to achieve broader outcomes.

Section B Stress

AUTHOR NAME	TITLE OF THE ARTICLE	DESIGN	SAMPLING TECHNIQUE	SAMPLE	FINDINGS
Sapam Debika <i>et. al.</i>	A study to evaluate the effectiveness of breathing exercises in alleviating stress among hypertensive patients in a selected rural village in Greater Noida	Quasi-experimental, non-randomized control group design	Randomized convenience sampling method	40	The overall results demonstrated that breathing exercises significantly reduce stress levels among hypertensive patients, transitioning from high to moderate stress levels, which is beneficial for lowering blood pressure.
Dr. Amandeep Kaur Bajwa <i>et. al.</i>	A study to assess the effect of yoga therapy on stress levels among hypertensive patients at the urban center of SGRD Hospital in Amritsar	Quasi-experimental research design	Both purposive and convenience sampling techniques	200	The results of the study indicated a statistically significant difference in stress levels; specifically, the experimental group demonstrated a highly significant disparity between pre- and post-intervention stress score.
Raj Kumar Yadav <i>et. al.</i>	Efficacy of a Short-Term Yoga-Based Lifestyle Intervention in Reducing Stress and Inflammation: Preliminary Results	Nonrandomized prospective ongoing study with pre-post design.	Purposive sampling technique	34	Eighty-six (86) patients (44 female, 42 male, 40.07±13.91 years) attended this program. Overall, the mean level of cortisol decreased from baseline to day 10 (149.95±46.07, 129.07±33.30 ng/mL; $p=0.001$) while β -endorphins increased from baseline to day 10 (3.53±0.88, 4.06±0.79 ng/mL; $p=0.024$). Also, there was reduction from baseline to day 10 in mean levels of IL-6 (2.16±0.42, 1.94±0.10 pg/mL, $p=0.036$) and TNF- α (2.85±0.59, 1.95±0.32 pg/mL, $p=0.002$).
Shree Ganesh, H R <i>et. al.</i>	A study assesses the effects of yoga	Quasi experimental nonequivalent	Purposive sampling technique	60	Results Yoga group has shown statistically significant reduction in PSS ($P < 0.001$), GDS ($P =$

	therapy on perceived stress, depression, and quality of life among the elderly in Udupi, Karnataka.	pretest, control design	posttest group			0.001), and improvement in the selected components of OPQOL such as social relationship (P = 0.014), neighborhood (P = 0.001), psychological well-being (P = 0.001), financial circumstances (P = 0.001), and OPQOL – total (P = 0.001).
Sapam Debika Devi et. al.	A study to assess the Effectiveness of Breathing Exercise to reduce stress among Hypertensive patients in selected rural village at Greater Noida.	Descriptive research design	Convenient sampling technique	40		The overall finding showed that Breathing Exercise helps reducing stress among hypertensive patient from high level to moderate level and this is favorable for hypertensive patients in reducing their blood pressure. Therefor Breathing Exercise is a rehabilitative modality for hypertensive patients in reducing stress corresponding blood pressure of the patients

It was found that breathing exercises significantly reduced stress levels among hypertensive patients, transitioning them from high to moderate stress, which helped lower blood pressure, highlighting breathing exercises as an effective rehabilitative modality for hypertension. Similarly, yoga therapy led to a statistically significant reduction in stress levels among hypertensive patients, with the experimental group showing a marked difference in pre- and post-intervention stress scores, suggesting yoga as a potent stress management tool. A short-term yoga-based lifestyle intervention also resulted in significant reductions in cortisol (P = 0.001) and inflammatory markers such as IL-6 (P = 0.036) and TNF- α (P = 0.002), along with increased β -endorphins (P = 0.024), proving yoga's effectiveness in reducing stress and inflammation. In the elderly, yoga therapy significantly reduced perceived stress (P < 0.001) and depression (P = 0.001), while improving quality of life in areas such as social relationships, psychological well-being, and financial circumstances (P = 0.001). Lastly, breathing exercises in hypertensive patients were again found to reduce stress, shifting it from high to moderate levels, which is beneficial for controlling blood pressure, further confirming breathing exercises as an effective tool for hypertension management.

RESULT AND DISCUSSION

A comprehensive meta-analysis encompassing multiple clinical trials has consistently demonstrated that collaborative nursing interventions focusing on stress management and quality of life enhancement can lead to significant improvements in the management of blood pressure, particularly in individuals diagnosed with hypertension. This suggests that targeted nursing interventions may serve as an effective adjunctive treatment in the overall management of high blood pressure.

- Research has shown that collaborative nursing strategies can positively influence both systolic and diastolic blood pressure. Several studies have highlighted the role of stress reduction techniques, patient education, lifestyle modifications, and emotional support as key contributors to this effect. These interventions may help promote vascular relaxation and improve overall cardiovascular function, thereby enhancing blood flow and reducing blood

**Supreet Rupam and Imran Khan**

pressure. Additionally, improving stress coping mechanisms can enhance endothelial function, referring to the health and efficiency of the inner lining of blood vessels.

- Notable reductions in blood pressure levels have been observed in hypertensive patients who participated in structured collaborative nursing programs. These findings support the notion that nursing-led interventions could be a valuable complement to conventional antihypertensive therapies, offering a holistic and patient-centered approach to managing hypertension without relying solely on pharmaceuticals.
- However, while collaborative nursing interventions show promising results, further research is required to fully understand their long-term impact on biochemical markers and hypertension management. Additionally, comparative studies evaluating these interventions in relation to other complementary treatments or lifestyle approaches would be valuable in determining their relative effectiveness.
- A potential synergistic approach for managing hypertension could involve combining collaborative nursing interventions with mind-body practices such as yoga. Yoga, known for its benefits in stress reduction and improving cardiovascular health, may complement nursing strategies aimed at stress management and lifestyle enhancement. This dual approach could leverage the combined benefits of psychological relaxation and patient-centered care, potentially leading to a more effective management strategy for hypertension and overall quality of life

FUTURE SCOPE

- Future research could explore the comparative effectiveness of home-based yoga interventions versus other lifestyle modifications, such as dietary changes or pharmacological treatments, to identify the most efficient strategy for managing conditions like hypertension.
- The potential for utilizing mobile applications or online platforms to offer guided yoga sessions could enhance accessibility and improve participant adherence, particularly in remote or underserved regions where attending in-person classes may be challenging or impractical.
- Investigating the integration of yoga and stress management techniques into nursing education and ongoing professional development could be beneficial in enhancing healthcare providers' well-being. This approach may also contribute to improved patient care outcomes by equipping healthcare professionals with effective tools to manage their own stress and promote patient wellness.
- Individuals diagnosed with primary hypertension may benefit from combining yoga practices with prescribed medications. Physicians typically monitor and adjust medication regimens over time, but some patients may experience drug resistance or persistent hypertension despite treatment. In such cases, incorporating exercise and garlic supplementation as complementary therapies could be effective. Blood pressure should be closely monitored during this combined approach, and once stable, medication dosages may be reduced. If blood pressure increases again, medications can be resumed alongside the complementary therapies to maintain control.

CRITICS**Diverse Populations**

Future research should include a more diverse range of population groups to enhance the generalizability of findings. Without studying various demographic, ethnic, and socioeconomic groups, the applicability of the results to the broader population remains limited.

Efficacy of Complementary Therapies

While the study presents complementary therapies as promising alternatives, it is crucial to provide more robust evidence to substantiate these claims. Clear definitions of what constitutes "complementary therapy" should also be established, along with more rigorous testing to evaluate its true efficacy in treating hypertension.

**Supreet Rupam and Imran Khan****Potential Drug Interactions**

The recommendation to continue anti-hypertensive medications alongside complementary therapies requires a thorough assessment of potential drug interactions. The study should provide more detailed information on this aspect, ensuring that patients are not at risk of adverse effects when combining conventional treatment with alternative approaches.

Long-term outcomes

To gain a comprehensive understanding of the benefits and risks, future studies should adopt a longitudinal approach. This will allow for the assessment of long-term effectiveness and safety, as short-term outcomes may not reflect the sustained impact of these therapies on hypertension management.

Accessibility and patient education

It is essential for future research to consider the accessibility of complementary therapies and the role of patient education in their implementation. By ensuring that these therapies are feasible and well-understood, healthcare providers can better support patients in integrating these approaches into their treatment plans effectively.

CONCLUSION

Hypertension remains a significant global health challenge, with profound physical and psychological implications for affected individuals. The traditional focus on controlling blood pressure through medication and lifestyle changes addresses only part of the problem, leaving psychological factors, such as stress, largely unaddressed. This gap in treatment underscores the importance of a holistic, comprehensive approach to managing hypertension, one that considers both the physical and mental health needs of patients. Collaborative nursing interventions, which integrate a variety of healthcare professionals, offer a promising solution. By combining expertise from nurses, physicians, mental health professionals, and other specialists, these interventions provide a multifaceted approach to patient care. They not only focus on controlling blood pressure but also prioritize stress reduction, patient education, and lifestyle modifications, leading to improved overall well-being and quality of life for hypertensive patients. Despite the promising results of collaborative care models, more research is needed to fully understand their impact on stress reduction and quality of life improvement. This review has highlighted the need for further exploration into the effectiveness of collaborative nursing interventions, aiming to provide a strong foundation for future studies. Ultimately, adopting collaborative, team-based care strategies have the potential to transform hypertension management, ensuring better physical and mental health outcomes and enhancing the overall quality of life for individuals living with hypertension.

ABSTRACT

Ecology significantly influences our life and its resonance endures perpetually in our consciousness. By nurturing and cherishing nature, we will experience a twofold increase in our happiness. Green anarchism emphasizes the interconnection between the human and non-human realms, advocating for environmental protection through the promotion of an eco-friendly society and critiquing the subjugation of nature, animals, and fellow humans by human beings. The connection between nature and human being is indissoluble. The connection between nature and humanity is indissoluble. Nature represents truth and purity, regarded as holy or sacred; nonetheless, the desire for power compels humans to behave contrary to it. Power obscures their intellect and physicality, transforming them into ruthless entities that devastate nature and oppress their fellow humans. The anarchist asserts that an eco-friendly lifestyle will lead individuals to experience perpetual happiness in this tumultuous planet. They assert that nature instructs them to lead a compassionate existence with others, emphasizing that it enables them to comprehend and empathize with the hardships encountered in their community, while also allowing them to find joy in shared adversity. This article examines the representation of anarchist ideology through flora and fauna in the novel *The Dispossessed* and *The Word for World is Forest*. Green anarchists oppose the victimization of non-human entities and seek to establish harmony between ecological and civilization. This study elucidates the harmonious relationship between ecology and humanity, emphasizing the importance of a sustainable ecosystem within society.

Keywords: Flora and Fauna – symbol of anarchism- eco system- harmonious relationship- sustainable environment

**Muthulekha and Vinoth****INTRODUCTION**

Green anarchism emphasizes the connection between humans and the non-human world, advocating for environmental protection by promoting an eco-friendly society and critiquing the domination of humans over nature, animals, and other individuals. Green anarchists are concerned with the concept of 'speciesism,' which refers to the perception of other species as inferior to one's own. This form of discrimination is denounced by green anarchists, who assert that "speciesist logic is as irrational as any other form of domination; merely because another is different from me does not imply that they lack moral consideration or that they can be exploited as resources for my own purposes" (Bruce). This article examines Ursula K. Le Guin's *The Dispossessed* and *The Word for World is Forest*, highlighting the connection between nature and human beings and advocates sustainable environment for the well being of an individual and the society. In Le Guin's works, nature is an essential and inextricable component of human existence. The protagonist Shevek in this novel enjoy an uncomplicated existence and achieve harmony with nature. Le Guin emphasizes the significance of nature and other species through the character of Takver, a nature enthusiast. Takver is a geneticist specializing in ichthyology. To Shevek, Takver shown a fervent interest for landscapes and living beings. This concept, vaguely described as "lover of nature," manifested to Shevek as something significantly more profound than mere fondness. He pondered those certain spirits had never detached their umbilical link. They were never disconnected from the universe. They do not view death as an antagonist; they expect decay and metamorphosis into humus. It was peculiar to witness Takver seize a leaf or even a stone. She became into an extension of it, and it into her. (*The Dispossessed*, 154). Shevek marvels at the fauna and the rich vegetation on Anarres The three bodies of water on Anarres were abundant with fauna, sharply contrasting the barren terrain. The seas had been isolated for millions of years, leading to divergent evolutionary trajectories for their organisms. Their diversity was bewildering. Shevek had never considered that life could proliferate so abundantly and vibrantly, implying that exuberance may be the essential trait of life. (*The Dispossessed*, 154-155).

Humans are not isolated entities from other species. They are interconnected with nature yet oblivious to their integral role within it, distancing themselves from the natural world and consequently losing their connection to it. Shevek emphasized the unity of humanity with nature to Takver, stating, "If you can perceive a thing in its entirety, it appears inherently beautiful." Celestial bodies, existence... However, upon closer inspection, the planet consists entirely of soil and stones. Daily life is arduous; it induces fatigue and disrupts routine. Distance and interval are required. "The perspective from which to appreciate the beauty of life is that of death (*The Dispossessed*, 190). Anarchists advocate for nature and contend that the subjugation of individuals by others results in the subjugation of the natural world. This thought of human beings resulted in seeing natural resources as an asset of human beings and thereby leads them to conquer and exploit nature for their unquenchable wants. The state plays a significant role in repressing individuals to attain its objectives. It utilizes statutes and regulations to thrive. Patriarchy, characterized by male dominance, perpetuates norms that subjugate women as perpetual slaves. They introduce 'an organized religion' to satiate their avarice. They utilize natural resources primarily for personal benefit rather than for societal advancement. Anarchists opposed to the captivity of the human intellect and advocates for nature have resisted authoritarian powers to achieve human solidarity and fraternity among individuals. Individuals not only ravage nature and obliterate its beauty but also disrupt the tranquility that exists inside society. Nature has bestowed a flourishing and tranquil existence upon society. In "The Maine Woods" Thoreau writes, It is difficult to conceive of a region uninhabited by man. We habitually presume his presence and influence everywhere. And yet we have not seen pure Nature, unless we have seen her thus vast, and drear, and inhuman... Nature was here something savage and awful, though beautiful. This was that Earth, of which we have heard, made out of chaos and Old Night. (71) Humans misuse nature due to their egocentric disposition. Although nature offers tranquility and respite, it has been diminished for timber and the advancement of a materialistic society. It advocates for individuals to pursue a harmonious existence. Animals are not regarded as equivalent to human lives and have been subjected to maltreatment by humans who saw other animals as their perpetual property. Humans perceive themselves as the sovereigns of the universe and have begun to exert dominance over other species. The hubris and naivety of humanity in perceiving themselves as omnipotent is conveyed by Davidson's statement: "When I say Earth... I mean

**Muthulekha and Vinoth**

people.” Individuals of the male gender. Your concerns regarding deer, trees, and fiber wood are noted; that is your interest. However, I prefer to view matters from a broader perspective, from a superior vantage point, with humans occupying the apex thus far. We are here now; so, this reality will align with our desires. Whether you accept it or not, it is an undeniable reality; it is simply the nature of circumstances. (*The Word for World is Forest*, 14). He exhibits no guilt in exerting dominance over other animals. It is regarded as normal and natural by humans. Men perceive animals as entities designated for comfort, hunting, and sustenance. New Tahiti is having abundant natural resources – Nature is the epitome of purity and truth but it has been ransacked by the selfish power-mongers. He perceives himself as a 'world tamer,' and his avarice causes him to neglect his humanity, ultimately transforming him into a dictator. He depleted the abundant natural resources of New Tahiti for the sake of humanity, disregarding the indigenous country and its inhabitants. He asserts that it is not an injustice to the people of Tahiti, as he has never regarded them as 'beings.' He subjected them to mistreatment, regarding them as simple 'creatures' valuable only for labor and fulfilling human demands. His formidable disposition renders him a 'monstrous controller' of the Athsean populace. The evolution of civilization and the advent of science and technology have led humanity to distance itself from nature. Individuals neglect their interconnectedness with environment, other creatures, and their fellow humans. They murder and exploit others for their own pleasure. In the novel *The Dispossessed*, Shevek embodies anarchist and endeavors to unify his homeland Anarres with the capitalist planet Urras; nevertheless, he ultimately fails upon discovering the self-serving disposition of the Urrastians. He serves as a reflection of the capitalistic regime of Urras and the opulent lifestyles of those who cater to governmental interests. He desires his General Temporal Theory to fulfill the requirements of individuals across the universe. However, the Urras government intends to exploit it for its own objectives and attempts to deceive Shevek.

In the novel, a film was screened on the planet Anarres, depicting the oppressive demeanor of the Urras administration. It projects the famine in the nation of Thu, dead children and sick people were buried on the shores and women were enslaved as sexual toy of the upper-class men. The materialistic society observes such distinction among individuals. According to Shevek, they are all 'propertarians.' The state's authoritarian disposition governs the lives of individuals more than idealistic concepts. In such a location, no just actions exist; only harsh atrocities will be perpetrated. Colonizers regard natives as possessions rather than as genuine human beings. Their relationship with the locals resembles that of a master and slave. Their hostility against the Indians had resulted in an irrevocable loss in their lives. Despite their ignorance, they believed themselves to be omnipotent and inflicted damage upon the innocent. They have awaited an opportunity to seize other nations by demonstrating their formidable strength. They assailed the colonial populace abruptly, revealing their color, language, and dominance, much to a tiger. They instill a sense of inferiority in the colonized mind regarding their own culture, language, and religion in comparison to their own. In *The Word for World is Forest*, Athshean society lacks a governing body. The colonizers mistook their non-aggressive behavior as their weak nature and subordinated them, but they do not know the real nature of the natives. Identity and power enable men to exert dominance over the entire world. Their dominance and opulent comfort benefit the colonizers. Their identity has been emphasized more robustly than that of colonial individuals. They attempt to dominate and subjugate individuals based on their color, race, and language. Power exalts their authority and renders them impervious to the pleas of the populace. The conquerors documented their triumph in history while obscuring the genuine hardships of the subjugated nations. As the power monster captivated their minds, they neglected to provide compassion and humanity to their fellow beings. Shevek's aspirations are undermined by the egocentric Urrastians. The capitalist government does not endorse a simplistic existence rooted in nature. Their attraction to worldly desires compels them to act against nature, becoming them akin to demons in the actual world. Upon encountering animals, birds, and trees in Urras, he recalls his cherished Takver. Her absence exacerbates his suffering in the foreign land. In Urras, the nature he observes resonates: "I am a propertarian." Even nature is constrained by the materialistic ideology of Urras. Shevek differentiates the opulent existence in Urras with the impoverished conditions in Anarres as follows: Anarres consists entirely of dust and arid hills. Entirely sparse, entirely arid. The individuals lack beauty. They have large hands and feet, similar to myself and the waiter present. However, not large abdomens. They become exceedingly soiled and bathe collectively; no one here engages in such behavior. The towns are tiny and monotonous; they are bleak. Absence of palaces. Existence is monotonous and laborious. One cannot always obtain what one desires, or even what one requires, due to

Muthulekha and Vinoth

insufficient availability. (*The Dispossessed*, 190). Shevek says these distressful words since he is not able to see his own people suffer, but he compares them with Urras to highlight the morality that exist in their society. Though survival is the biggest problem to them, Anarrestians are not selfish. They suffer with mutual consent for their fellow beings. They enjoy in their sufferings. Their bliss is only on the livelihood of others. The protagonists in the select novel resist subjugation and endeavor to exist for the benefit of society. The fundamental principle of their existence is global harmony. They serve as public officials, with their sole goal being the reuniting of the split hearts of individuals. Compassion is the fundamental objective of their teachings. Throughout their lives and deeds, they advocate for non-violent resistance against oppressive hierarchical structures. Survival of the fittest has become an essential trait for the human beings. Man's problem is all the same. Individuals are striving to establish their identities in this tumultuous environment, achieving fulfillment just through the recognition of their interdependence with nature and by leading a peaceful existence with it. In *The Dispossessed*, Shevek opposes the oppressive regime and its control. The colonizers existed in a delusion of luxury derived from the exploitation of the colonized, oblivious to the reality that the authority acquired via violence is ephemeral. Should the oppressed populace awaken and resist the powerful, recognizing that no entity possesses the right to subjugate them, the tyranny of the power-hungry will cease. The master-slave relationship is inherently unsustainable. Anarchists advocate for the well-being of both individuals and society. They function as liberated individuals and motivate the populace to resist the oppressive patriarchal system. In *The Word for World is Forest*, Selver is an anarchist who fervently fights for the liberation of his indigenous people from colonizers. The death of his wife motivated him to against colonists, therefore establishing him as a hero in the eyes of his people. He conveys the war message through his dream to all his subjects, concurrently creating a revolutionary sentiment among them to resist the colonists. Their endurance diminished with the removal of the trees. Selver realizes the aspiration of the Athse elders for autonomy.

He urged his followers to cultivate a potent vision capable of inflicting total devastation upon the colonists. He wants the colonizer to quit his native land. In spite of varied culture, race, color, language and religion, people are same by their universal idea and feelings. They are virtuous if their acts and deeds are towards the progress of mankind. But if their mind is colonized by Power and Superiority, they cannot succeed in their attempt to free themselves from this bondage easily. They try to search for a prey and victimize them for their own sake which leads to their ultimate destruction. In Aurobindo's words The mighty perish in their might; The slain survive the slayer (*Collected Poems*, n.pg) The state suppresses the people and does not permit them to do anything on their own. Shevek questions this notion. Being an anarchist, he gives voice for freedom of inner self. Only when one is able to defeat one's own inner temptation, hunger for power, one is able to serve the humanity. Throughout their life, people give importance to other's commentaries and remarks devoid of their own. They never mind their own inner self and go behind the temporal external force. Their brutal mind captivates them and makes them to whirl around their selfish deeds. Self-realization is barred in the gateway of their mind. If they give priority to Self, definitely they will hear the voice of the inner being and cultivates their mind on the progressive side. The people's selfishness narrows down their mind to locate themselves to a particular boundary. Since they are afraid of fellow human beings, they need an external and emotional security. Their fear makes them timid and attempts to label them with identity. Their search for identity and crave for identity lays the foundation for their suffering and supremacy over one another. It plays an inevitable role in philosophical, political and sociological perspective. While the weaker one strives hard to search one's own identity, the mighty ones try to sustain their identity by ruling over the weaker one. In his poem "Lines on Ireland" (1896), Sri Aurobindo writes For 'tis not foreign force, nor weight of wars, Nor treason, nor surprise, nor opposite stars, Not all these have enslaved ... A nation. Men are fathers of their fate; They dig the prison, they the crown command. Everyone is virtuous when they are born in this world, but when the mind undergoes temptation, lust for power, crave for identity, they try to dominate one over the other. The brutality in human mind is the most dangerous enemy in this world rather than the other fellow being. The mind has to be channelized towards right path. If it is not towards the right destination, poverty, discrimination and destruction will prevail among people forever. Only state that rules people in a just way is able to endure forever. If individuals cherish and regard their fellow humans equally, they will not impose any physical boundaries. Although they may possess defined boundaries, they will lack emotional limits. Initially, people sought identification among one another for protection; however, they now restrict their minds and pursue identity to demonstrate their dominance through colonization.

**Muthulekha and Vinoth**

Harassing someone based on any form of discrimination does not appear to evoke a sense of shame in these purportedly strong individuals. They believed themselves to be equal to God and to have attained omnipotence in this temporal realm. However, they cannot endure as a formidable enigma for an extended period due to their methods being ruthless and inexpensive. Tempted by authority, Davidson in *The Word for World is Forest* transgress the natural rule. Davidson's ruthless intent to annihilate the colony for the purpose of acquiring timber is reprehensible. Davidson embodies the capitalist regime that devastates forests and sacrifices lives for its materialistic demands. The capitalist government exploits the land, demonstrating its dominance over both nature and humanity. They regard themselves as demigods and dominate the innocent. Power brokers establish regulations and compel the general populace to adhere to them unconditionally. Their dominion encompasses the entirety of the globe. Freedom is a reprehensible term in the realm of colonization. They subjugate individuals' minds and manipulate them as puppets. They denounce change for the benefit of society. The colonists seek to acquire additional resources without enduring any hardships. Their greed for wealth obscures their judgment. Their fervor obscures their perception of virtue and inhibits their receptiveness to truth. They oppressed the populace on multiple grounds, including religion, caste, class, and creed. Davidson's cruelty against the natives and nature leads him to fall and thereby resulted in the downfall of the colonizers. In *The Dispossessed*, Le Guin has rightly pointed problems faced by anarchist among selfish power mongers. Anarres, which symbolizes the anarchist society, has failed to sustain its Odonian ideals. Sabul, the senior scientist in Anarres represents archaic society. He misuses his power to subordinate the innovative ideas of Shevek. A Few selfish people like the scientist Sabul try to abuse his power due to his selfishness. His treacherous attitude is hidden as he is an influential person in PDC. He restricts Shevek in all means. He does not want Shevek to share his knowledge with the scientists in outside world.

Bedap highlights the ambiguous dystopia that exists in Anarres. Although it has been formed and has been nurtured with anarchist ideals, it fails in its vision by a few selfish mongers. Innovative ideas and knowledge is meant to share with a number of people. The more one shares, the more they gain. Sabul, the senior scientist utilizes Shevek's theory and knowledge for his own fame. He is not capable enough to think innovative ideas and hence cull out the new ideas from the textbooks of the Urras scientists and publish it as their own. Hence, he envies Shevek and resists him to share his knowledge with the Urrasti scientists. Brought up in anarchist principles, Shevek shares his knowledge with the Urrastians through letters and yearns to visit Urras for having scientific discussion with them. He believes that with the aid of these scientists, his general temporal theory can get a new life as a device for the use of the society but Sabul hinders his passion and by his influence in PDC, he manages to create an image of Shevek as a traitor. Bedap condemns and comments on Sabul's behavior and the dystopic anarchist society. Bedap thus brings out the darker side of Anarres to show how it affects the individual's freedom. Shevek thought of his own work, and had nothing to say. 'His sense of primary responsibility towards his work did not cut him off from his fellows, from his society. It engaged him with them absolutely' (*The Dispossessed*, 274-75). Hence, he could not join in Bedap's criticism. Although, Bedap had forced him to realize that Shevek was such by virtue of his upbringing and education as an Odonian and an Anarresti, Shevek refute his idea. The anarchists give voice for voiceless, not for nation. Shevek and Estraven have undergone sufferings for the welfare of their society. Shevek's anarchist thought enables him to view the land equally. His quest for inner self resulted in the search of human solidarity among human beings. Being the follower of his anarchist ideology, he thinks of the wellbeing of society than his own temporal happiness. When selfish people bar his knowledge in his own society, he fights for the liberation of mind and body from the restraints of the influential authority. These protagonists understand their 'Self' and realize their responsibilities in their anarchist society. In spite of their anarchist credo, a few selfish people try to disturb harmony that prevails in society and thus making the anarchist world an illusion. As Thoreau points out: "I quarrel not with far-off foes, but with those who near at home cooperate with, and do the bidding of those far away, and without whom the latter would be harmless (*Civil Disobedience*). These protagonists show their resistance to society where they have cherished their ideal principle without hampering their individuality. As Oscar Wilde says, 'The perfect personality is one who develops under perfect conditions, who is not wounded, maimed or in danger'. A perfect personality then is only possible in a state of society where man is free to choose the mode of work, the conditions of work, and the freedom to work (qtd. in Goldman, 24). If individuals coexist harmoniously with nature and exhibit compassion towards one another, global harmony will ensue, enabling sustainable living for future generations.

ABSTRACT

The idea of skill acquisition, sometimes referred to as motor learning and control, describes how people learn and become proficient in a variety of tasks, ranging from fundamental to extremely complex. It focuses on how practice, repetition, and feedback help develop cognitive and psycho-motor abilities, which eventually result in automatic and effective performance. From first learning to advanced expertise, people's progress in acquiring a range of abilities is explained by skill acquisition theory. Both cognitive and psycho motor skills are examined in a variety of contexts, from academic instruction to business and sports applications. Research in this field varies from highly applied how to sequence activities for maximum learning efficiency in fields as diverse as teaching high school algebra, tutoring college physics, coaching professional basketball, or training aeroplane pilots to highly theoretical computational modelling of skill acquisition, the place of skills in an architecture of the mind. One of the oldest attempts by humans to unravel the mysteries of second language acquisition has been to reflect on the language acquisition process. Even so, it is possible to view several of these concepts as complementing even when they appear to be competing. In other words, SLA can be compared to a big elephant that can be seen from various angles by several scholars, much like the story of the four blind men and the elephant Van Patten & Williams, 2007. Consequently, each SLA theory may clarify a certain facet of SLA. In light of this, this paper discusses the Skill Acquisition Theory, one of the well-known and significant SLA theories that holds that language acquisition is comparable to general human learning, in an effort to better understand the SLA process. Several areas of psychology, considers behaviourism, cognitivism, and conservatism, provide the scientific foundation for skill acquisition theory.

**Komathi et al.,**

According to Ellis and Shintani, this theory is founded on Anderson's Adaptive Control of Thought model, which is a type of cognitive stimulus-response theory. As mentioned by Parziale & Fischer, it is a neo-Piagetian theory that consolidated elements of both cognitive and behaviorist theories. Several ideas in SLA have been formulated using cognitive psychology models of skill learning. As expressed by Chapelle, this theory is centred on language learning as a process of human learning and is consequently categorized as general human learning. Put some other way, according to these cognitive content, learning a second language is parallel to learning any other quality, like playing an instrument. Advocate of these theories believe that practice is essential to learning.

The concept of Theory

The fundamental statement backside Skill Acquisition Theory, according to Dekeyser, is that the learning of a wide variety of skills shows an extraordinary similarity in development from first creation of knowledge through initial changes in behavior to eventual fluent, spontaneous, mostly effortless, and highly completed behaviour, and that this set of phenomena can be accounted for by a set of basic principles common to acquisition of all skills. This is because, skill acquisition can be viewed as a particular type of learning, as stated by Speelman, who defines learning as the content of information in memory concerning some environmental or cognitive event. To put it another way, this theory gives both explicit and implicit learning roles in SLA. Additionally, as a universal theory of learning, it states that adults begin learning through mostly definitive processes before transitioning to inherent ones after enough influence and experience. According to this approach, development involves using declarative knowledge first, then procedural knowledge, which is then automated. Richards and Schmidt assert that declarative knowledge is performed. Using declarative knowledge entails explicit learning or procedures, as explained by Vanpatten & Benati; learners acquire rules explicitly and possess some degree of cognitive awareness of them. Conscious awareness of information that can be stored as propositions, such as facts, thoughts, or concepts. Additionally, procedural knowledge is the unintentional understanding of how an activity is Skill. There are some concepts which play a central function in this theory. One such thought is skill. The definition of skill is vague. As defined by Vanpatten & Benati. Skill refers to ability to do rather than underlying competence or mental representation. To clarify this concept, Cornford has stated nine isolated defining constructs of skill and skilled presentation from a psychological appearance, discussed to be the most sound in explanation for ability acquisition and presentation by individuals.

These process dimensions are

1. Skill is acquired
2. Skill pertains psychological feature, intent and goals
3. Representation are obligatory for skilled actions
4. Skills need content and context cognition
5. Skills are activated and changed in the existence of particular response
6. Skills related problem finding in dispute to the context
7. Skill touches relative judgments with respective variation in proficient performance manifest
8. Standards of excellence are essential
9. Skill deals comparable reversal
10. Considerable periods of time are required to reach high levels of skill.
11. Implicit learning or processes are involved in the automation of procedural knowledge.

Learners start to proceduralize the explicit knowledge they possess, and with appropriate practice and application, the behaviour becomes automatic. There are a number of conflicting hypotheses regarding

**Komathi et al.,**

how humans pick up new languages, including skill acquisition. This hypothesis is predicated on the notion that, in some situations, repetitive pairings of stimuli and reactions can cause skilled performance in any field to become routine and even automatic. In that sense, it resembles the behaviourist theory of stimulus-response learning, which was out of vogue starting in the late 1950s. John Anderson's ACT theory, which he referred to as a cognitivist stimulus-response theory, is the foundation of skill learning. Adaptive Control of Thought is what ACT stands for. The ACT theories make a distinction between declarative knowledge, the understanding of facts and concepts, such as the agreement of adjectives and procedural knowledge, which is the understanding and use of a language in certain contexts. According to the, "condition-action" memories can be stored in long-term memory, turning declarative information into procedural knowledge. Therefore, with practice, declarative knowledge can become proceduralized. Therefore, driving becomes automatic something we do without thinking through repetition, just as we consciously learn the motions required to operate a vehicle.

Keywords: Acquisition, Skill, observation, knowledge, Practice, Experience

INTRODUCTION

This implies that under some circumstances, knowledge "that" might turn into knowledge "how" in the context of language learning. For instance, we can learn the norms of verb tense formation and, with practice, internalise them such that we can make the right words without considering language structure. According to scholar Robert DeKeyser, declarative linguistic knowledge can be proceduralized over time via the so-called power law of practice. However, he makes it apparent that this only works with certain learners usually adult learners under specific circumstances and with specific structures. Additionally, according to the notion, the type of information that may be automated is highly specialised and does not transfer to other fields. In order to build knowledge and skills in the second language, DeKeyser defined practice as specific activities in the second language, engaged in systematically, deliberately. Drills are a part of practice, but DeKeyser contends that meaningful drills that allow for the expression of genuine emotions and ideas are superior to mechanical drills that are only meant to practice forms. According to him, when the practice mimics organic communication action, declarative information is likely to be transferred to procedural knowledge. This relates to Transfer-Appropriate Processing, which holds that memories are best recovered when the circumstances in which they were formed can be repeated. According to this theory, the consequences of instruction vary depending on the talent. Thus, output exercise builds production skills, while input-based teaching develops receptive skills. Experiments have been conducted to test whether automatization is possible and whether it is skill-specific, such as with devised languages, in order to bolster this assertion. In these experiments, practicing only the opposite skill made it less evident that production or comprehension skills were being acquired. Ellis has questioned the hypothesis for a few reasons. It ignores the in-built syllabus of learners, which is the tendency for humans to pick up grammatical structures in a specific, somewhat fixed order. Second, humans appear to pick up a lot of information and skills by accident rather than going through a declarative knowledge stage. There is proof that "practice makes perfect," as we intuitively and experientially sense. A rule can be taught and practiced until it becomes instinctive in terms of understanding and output. It is frequently observed this with some more gifted students. To a certain degree, it appears that practicing speaking improves one's ability to talk, and practicing listening improves one's ability to listen. However, it's actually not that easy. Skill acquisition is only one aspect of the equation because of the strength of implicit, unconscious learning and the obvious differences in readiness amongst students for learning new structures. In fact, some would contend that learning new skills is not as important as it should be and that we ultimately become better speakers by understanding what we are being told. As a teacher who has worked with students ranging from beginners to B1s for seven years, I had a gut feeling that the enormous volume of input was what eventually led to the improvements in oral and written production, but that declarative knowledge and controlled practice were also important. The amount of input is insufficient to develop effective speakers when you only have a limited period of time. As a result, goals must be limited and may

**Komathi et al.,**

rely more on the learning of a limited range of abilities. Although the truth about this is unknown, it would be shocking if both viewpoints were unimportant. Even if the results are frequently unsatisfactory, teachers may be correct in assuming that skill acquisition has a role to play in educational settings when time is restricted. If there was no attempt to make declarative knowledge procedural, out come would be the better anyway. According to some, that would cause a great deal of confusion among the kids. The lexico grammatical strategy, which emphasises meaningful chunks, a lot of receptive input, and grammar explanation, is a kind of medium ground. Both input and output practices have strong properties. Some language will stick with practice and spaced input. Implicit learning is combined with skill acquisition.

Skill of Acquisition Theory

This theory focuses heavily on a number of notions. The term skill has no clear explanation. Skill mentions to ability to do rather than inherent ability or mental agency, according to Vanpatten & Benati. In order to elucidate this idea, Cornford enrolled nine different qualities that determines skill and skilled performance from a psychological viewpoint. These characteristics are mentioned to be the most dependable in explaining how people acquire and accomplish skills. In order to elucidate this idea, Cornford listed nine distinct characteristics that define skill and skilled performance from a psychological standpoint. These characteristics are seen to be the most reliable in explaining talent involves motivation, purpose, and goals; requires material and context knowledge; requires scheme for proficient execution; Skills are executed and changed in the face of particular response and entail context-relevant problem solving the necessitate content and context knowledge. Skill entails relative evaluations, with individual variations in proficient performance being apparent; the need of excellence standards; entails comparable replication takes a significant amount of time to achieve high levels of skill.

CONCLUSION

According to this paradigm, students move through the following stages: novice, advanced beginning, competence, proficiency, and expertise. Eventually, they may achieve mastery. From the earliest phases of skill acquisition to the development of expert performance, skill acquisition theory essentially offers a framework for comprehending how people learn and develop talents. According to the adaptive regulation of thinking paradigm, declarative knowledge knowledge that is conscious and composed of facts and procedural knowledge knowledge of how an action is carried out are separate from one another. According to this approach, learning a skill involves moving from declarative to procedural knowledge. Second language acquisition is only one application of a broad field of study in cognitive psychology, which is based on the basic model of cognition known as adaptive control of thinking. The three stages of second language acquisition are declarative, procedural, and autonomous.

ABSTRACT

Present study was carried out from March 2024 to February 2025 to assess butterfly diversity in the Bhilwara district of Rajasthan. Data were collected by random observations and opportunistic sampling in different microhabitats, such as agricultural landscapes, uncultivated areas, pasturelands, flower gardens and urban areas of district. During study, 58 butterfly species belonging to 41 genera and five families were identified. Of these, the maximum number of species belonged to the Lycaenidae and Nymphalidae families (17 species in each family) followed by Pieridae (12), Hesperidae (7) and Papilionidae (5). Pierrot butterfly species were observed from Tilak Nagar and Joker butterfly species from M.L.V. Govt. College campus and the remaining butterfly species were observed from the Mandalgarh and Nehru Talai areas of the Bhilwara district. Rapid urbanization and development activities, such as industrial, housing and road networks, have negatively impacted ecosystems and reduced biodiversity, including butterflies.

Keywords: Butterfly, Diversity, Bhilwara, Habitat, Urbanization, Ecosystem

Anil Kumar Tripathi *et al.*,

INTRODUCTION

Among insects, butterflies are the most captivating, alluring and exquisite creatures. They are highly sensitive to environmental changes and serve as excellent bio-indicators of the ecosystem (Pollard, 1991). Butterflies belong to the order of insects, the Lepidoptera (lepis, a scale; pteron, a wing, i.e. scaly wings) - the largest order of insects next to Coleoptera (beetles). The order Lepidoptera belongs to holometabolous endopterygotes, scale-winged insects, divided mainly into two suborders, *viz.*, Rhopalocera (Butterflies) and Heterocera (Moths). Rhopalocera includes 10 families. The diversity of butterflies in the whole world is 18,000 species, of which about approximately 10% are known to occur in Indian-subcontinent (Gaonkar, 1996; Smetacek, 1992; Kunte, 2009; Roy *et al.*, 2010; Tiple, 2011). The estimate number of butterfly species in the Indian region enlists 1641 (belonging to 394 genera) species (Varshney, 2006). In the twenty-first century, the differentecoregions of Rajasthan have been exploredfor the assessing butterflies diversity (Trigunayat and Singh, 1998; Kazmi *et al.*, 2003; Sharma, 2014; Kulshreshtha and Jain, 2016; Meena, 2020; Choudhary *et al.*, 2020; Pahadiya, 2020; Rani and Ahmed, 2021; Sharma *et al.*, 2023; Prajapat *et al.*, 2023; Meena, 2023; Gocher and Dang, 2025; Kumar and Sharma, 2025) (Table: 1). Butterflies are bio-indicator species that are highly sensitive to changes in habitats and ecosystems (Pollard, 1991). They are also ecologically important species that play crucial roles in the food chain and food web (Kocher and Williams, 2000). Therefore, the present study aimed to assess butterfly diversity in the Bhilwara district of Rajasthan.

MATERIALS AND METHODS

Bhilwara District, located in the south-central region of Rajasthan State, India, covers a substantial geographical area of 10,455 square kilometres. Bhilwara district consists of a variety of microhabitats, including forests, agricultural landscapes, uncultivated areas, pasture lands, flower gardens and urban areas. These habitats consist of numerous flowering plants and crops. These characteristics of the district account for a significant proportion of insect diversity, including lepidopteran species. Pierrot species were observed from Tilak Nagar, Joker species from MLV Govt College campus and rest species were observed from Mandalgarh and Nehru Talai of Bhilwaradistrict (Table 2). Therefore, this study was conducted from March 2024 to February 2025 to assess butterfly diversity in the Bhilwara district. Surveys were conducted three times per week from early morning (08:00 am to 10:00 am) and later afternoon and evening (02:00 pm to 5:00 pm), when butterflies were more active than others. Data were collected by random observations and opportunistic sampling in different microhabitats of the study area. Photographs of butterflies and different habitats were captured using a Nikon P500 camera. During study, no any individuals or species butterflies were killed or collected. Butterfly identification was performed with the help of key characteristic features such as wing colour pattern, wing span and mode of flight. Butterflies were identified using standard field guides such as(Kehimkar, 2016; Smetacek, 2018).The classification of butterflies (Lepidoptera: Papilionoidea) has been followed by van Nieukerken *et al.* (2011).

RESULT AND DISCUSSION

Butterfly diversity in Bhilwara district

During study period, total 58 butterflyspecies belonging to 41 genera and five families were observed from Bhilwara district (Table 3; Figure 1). Of these, the maximum number of species belonged to the families Lycaenidae and Nymphalidae (17 species in each family) followed by Pieridae (12), Hesperidae (7) and Papilionidae (5). However, the families Lycaenidae and Nymphalidae occupy 29.2% of the total species strength, the Pieridae family occupies 20.6% of the total species strength, and the Hesperidae families occupy 12% of the total species strength. The Papilionidae family occupies 9% of the total species strength (Figure 2). Additionally, the butterfly species common red flash (*Rapala iarbus* Fabricius,1787) was first observed in Rajasthan, marked with an asterisk (*) in Table 3 (Tripathi and Koli, 2020).

Anil Kumar Tripathi *et al.*,

Ecological Importance of butterfly fauna

Every species plays a specific role in the ecosystem. The loss of any species tends to disrupt the balance of its nature. Butterflies are among the most beautiful creatures in the world. They are unsurpassable in terms of beauty and grace. The existence of many flowering plants depends on butterflies. They pollinate thousands of flowers, thus helping propagate their race (Porter *et al.*, 1992). Butterflies have attracted the aesthetic sense of humankind since time immemorial. This has been a constant source of inspiration for poets and thinkers.

Threats

Rapid expansion of urbanization, industrialization, the establishment of road networks and other types of developmental activities, such as the formation of houses, colonies and multi-story buildings, have dramatically reduced the availability of natural habitats. These activities lead to a decline in diversity, including butterfly fauna. Furthermore, the excessive use of agrochemicals and pesticides in agricultural areas is also responsible for the dramatic decline in insect populations, including butterflies (Kevan, 1999; Steffan-Dewenter *et al.*, 2005; Choudhary and Chishty, 2020). Therefore, the primary cause for their reduction appears to be degraded ecology, which mainly consists of deforestation, changing environments, and pollution (Hanski, 1999; Malagrino *et al.*, 2008; Bhatt and Nagar, 2017; Chishty *et al.*, 2020).

Conservation

1. Legal protection has been granted to the butterflies under the Wildlife Protection Act, 1972.
2. Export of butterflies (dead or alive) and ornaments made from butterflies is prohibited.
3. To increase the population of butterflies and to protect them, the concept of “Butterfly farms” would be useful for scientific conservation, and the rare species would be bred on their natural food plants in captivity.
4. The pesticides do not discriminate between useful and harmful insects; therefore, the use of pesticides should be discouraged. Rather, biological control and Integrated Pest Management should be practiced.
5. The Rajasthan Forest Department has taken the initiative to develop a ‘butterfly garden’ in Nahargarh Biological Park, Jaipur, and declared Mount Abu as an Eco-Sensitive Zone in the Aravalli Range.
6. Unlike bees, butterflies feed entirely on nectar; they obtain through their long proboscis from flower. Thus pollination, a crucial link in the survival of ecosystem, is one such factor that needs to be well understood to develop appropriate strategies for conservation of the biodiversity.
7. The importance of butterflies and their habitats should be made known to the general public.

CONCLUSION

Present study clearly showed that a high range of butterfly diversity is present in different types of vegetation and near-flowering plants in the Bhilwara district. The results of this study emphasize the importance of campuses as ideal homes for butterflies. Butterfly pollination helps conserve and maintain ecosystem health. Butterflies act as biological pest controls and reduce atmospheric carbon dioxide levels, increase plant genetic diversity and enhance the aesthetic appeal of the environment. This will help maintain the ecosystem. If the maintenance of gardens and landscaping is meticulously planned, the diversity of butterflies will increase, providing a rich area for butterfly conservation.

ACKNOWLEDGMENT

We would like to express our heartiest gratitude to Dr. Renuka Solanki (Retired entomologist, M.L.V. Govt College, Bhilwara) for helping us in identifying butterfly.

ABSTRACT

Neuropathic pain remains a significant clinical challenge due to its complex pathophysiology and limited treatment efficacy. Emerging trends in its pharmacological management focus on novel drug targets, repurposed medications, and personalized treatment approaches. Recent advancements include the development of sodium channel blockers (e.g., Nav1.7 inhibitors), cannabinoid-based therapies, and monoclonal antibodies targeting neuroinflammation. Additionally, repurposed drugs such as botulinum toxin, ketamine, and sodium-glucose cotransporter-2 (SGLT2) inhibitors show promising analgesic effects. Precision medicine, leveraging genetic and biomarker-driven strategies, is also gaining attention for optimizing treatment outcomes. Despite these innovations, challenges such as side effects, long-term efficacy, and accessibility remain, underscoring the need for further clinical research and tailored therapeutic approaches.

Keywords: Neuropathic pain, cannabinoid-based therapies, neuroinflammation,

INTRODUCTION

Pain resulting from pathological alterations in the nerve system is known as neuropathic pain. Numerous conditions, including diabetes, herpes zoster infections, channelopathies, nerve compression, nerve damage, and autoimmune

Divya Pandey et al.,

diseases, can result in neuropathic pain. [1]. A neural injury can cause a variety of alterations or disturbances in the nerves. The kind and extent of the injury may determine the precise changes. Furthermore, the precise alterations that are essential to the onset and/or maintenance of nerve pain in humans remain unclear despite decades of extensive research. Even though the original damage may have been isolated, the reactions that follow are widespread and lead to persistent pain[2]. This exposure may lead to alterations in density of fibers and increased Hyperexcitability of neurons. Furthermore, fiber degeneration and altered expression can be caused by axon traumas like compression, trauma, hypoxia, inflammation, overstimulation, and chemical degradation and makeup of channels, which can disrupt signal transmission and induce ectopic firing[3,4]. Numerous nerve-damaging events that affect the central or peripheral nervous systems might result in neuropathic pain. but frequently show commonalities among different neuropathy disorders and their etiologies. Patients frequently describe paradoxical sensory experiences, in which lesions cause diminished feelings yet pain is the predominant pleasant sign.[6]These are typically one-of-a-kind experiences that the patients have never had before. Both hypersensitivity and hyposensitivity are frequently present in neurological illnesses, such as the emergence of spasticity after spinal cord injury or the development of parkinsonian tremors after substantia nigra degeneration. Clinical results continue to be the main basis for evaluating neuropathic pain (NP). Therefore, a thorough physical examination and patient history are essential to making an accurate diagnosis. Imaging methods, electrophysiological assessments, and occasionally histology testing may all be used to confirm the diagnosis. Pharmacotherapy is usually the initial course of therapy for neuropathic pain, followed by an interdisciplinary framework, anesthetic techniques, and, if required, surgical procedures. Recent developments in pharmacological research will be highlighted in this study.[7] While some patients may have a subtle sensory loss that is hard to pick up on with bedside tests, others may have an obvious one. Quantitative analyses, however, usually show slight changes. The impairment of spinothalamic functions, such as the senses of warmth, cold, and pinprick, appears to be the most significant, however all sensory modalities may be impacted. It has been suggested that the onset of pain is contingent upon such a decrease of spinothalamic function. For instance, a wealth of studies indicates that sensory deficits are a necessary but insufficient condition for pain to develop in post-stroke individuals [8,9].

❖ Neuronal and immunological action of antidepressants in chronic pain

Over the course of their more than 40-year history, our understanding regarding the pharmaceutical effects of tricyclic antidepressants has gradually developed. In addition to conventional painkillers, antidepressants are essential components of treatment plans for persistent discomfort, which is a serious public health concern[10]. Tricyclic antidepressants have traditionally been the primary medication used to manage chronic pain. However, new antidepressants with similar efficacy for mood disorders and a considerable decrease in adverse effects have recently entered clinical usage. Some of the newer drugs that work well for chronic pain include atypical depression medications; serotonin and noradrenaline reuptake inhibitors (SNRIs) like duloxetine, venlafaxine, and milnacipran; and tetracyclic antidepressants (TeCAs) like amoxapine and maprotiline. SNRIs and TeCAs are reviewed. We also examine analgesics that act as opioid receptor agonists and aminergic reuptake inhibitors[11]. The information now available is insufficient to determine which of the more recent classes of antidepressants has the best clinical profile and efficacy for treating neuropathic pain, given the importance of minimizing side effects. More experimental and translational research is necessary to improve antidepressant usage for persistent discomfort[12]. Chronic pain is brought on by disease or injury that alters the somatosensory pathways in the peripheral nervous systems. Through the spinal cord's dorsal horn, primary sensory neurons send pain signals from the periphery to the ascending pain pathway, which then transmits them to a variety of regions of the brain. Fibers that descend from the brainstem help to stop pain from traveling through the spinal cord by acting as a homeostatic regulator of pain [13]. It is believed that antidepressant drugs boost activity in the antinociceptive descending pathways by preventing Central nervous system reuptake of monoamines, which results in analgesic effects. This analgesic activity may not be the only factor influencing their impact on depression. The fact that the dosage required to get the best pain relief is typically less than the dosage needed for antidepressant benefits suggests that they have analgesic and antidepressant qualities. Further support for this notion comes from the observation that analgesic effects begin earlier than antidepressant effects and the variations in analgesic efficacy across various antidepressant types[14]. Other recent studies have focused on the neuroimmune mechanisms behind antidepressant pain alleviation. The

Divya Pandey et al.,

development of chronic pain has been shown to be greatly impacted by spinal glial cells and the immunological variables associated with them[15,16] Proinflammatory cytokines like IL-6 and IL-1b, which are significant pain mediators, are released by activated glial cells. But it's still unclear which specific subtype of the glial cells is primarily responsible for the development of Prolonged pain and the effects of antidepressants on these cells. It has been demonstrated that mirtazapine significantly reduces glial activation and cytokine production in the hippocampus; both adrenergic and serotonergic antagonists reversed these effects. Improved understanding of the interactions between immune, glial, and neural cells is the foundation for new approaches to treating chronic pain, particularly neuropathic pain. To far, very few studies have looked at the neuroimmune mechanisms behind antidepressant pain alleviation. It is yet unknown which antidepressant is the most clinically favorable and promise for treating chronic pain, particularly neuropathic pain, which is closely linked to alterations in neuroimmune interactions.[13,14,15] SSRIs are known for inhibiting serotonin reuptake without affecting noradrenaline reuptake. These medications are widely considered safe and are commonly prescribed, with their effectiveness in treating depression well established. Reduced appetite, exhaustion, elevated blood pressure and heart rate, and dysfunction are possible adverse effects of SSRIs.[17]. strong preference for serotonin receptors and little to no affinity for other kinds of receptors, are the pharmacological advantages of SSRIs. The results of Smith et al.'s analysis of 20 clinical trials from the literature to determine if SSRIs are effective in treating chronic pain disorders were not conclusive.[18].

Treatment of Neuropathic Pain

The severity of neuropathic pain varies significantly, impact on individuals, and response to therapy. Although Additional data supports the utility of several neuropathic pain management techniques remedies than others, it is evident that even though some treatments may only help a small percentage of patients, the relief they offer can be substantial. It is impossible to know whether such relief is attainable without trying various treatments. Our therapeutic experiences have shown that a careful examination of all available options can occasionally result in unanticipated advantages, even when therapies with the strongest evidence or indications fail.[19,20]. Regularly dosed drugs that strike a balance between effectiveness and tolerability are usually the best way to manage chronic neuropathic pain. Evidence exists to support the use of serotonin-norepinephrine reuptake inhibitors as a first line of treatment, tricyclic antidepressants, and anticonvulsants, either separately or in combination. Even while opioid drugs, especially methadone, can help with neuropathic discomfort, For refractory instances, they work best and should only be recommended by qualified medical professionals because of worries about their short- and long-term safety. For certain conditions, certain treatments, like carbamazepine for trigeminal neuralgia, have a lengthy history of success. But, particularly in situations that are refractory, these shouldn't take precedence over more recent, less proven therapies like botulinum toxin A. Palliative care principles, which emphasize controlling patient expectations, establishing meaningful outcomes that both parties can agree upon, and developing a solid therapeutic alliance, are extremely pertinent for treating chronic neuropathic pain.

Anticonvulsants

Some drugs that were first created to treat epilepsy are now frequently used to treat neuropathic pain since the mechanisms underlying the two conditions are similar. These medications are typically prescribed on a long-term basis to maintain consistent pain control. They have proven effective in treating neuropathic pain from various causes, with some agents standing out in particular. When beginning treatment, all anticonvulsants should be increased gradually; when stopping, they should be tapered off. For instance, pregabalin and gabapentin decrease the release of neurotransmitters by interacting with L-type calcium channels in neurons. Pregabalin was the first medication authorized for the treatment of fibromyalgia and is also useful alleviate discomfort brought on by spinal cord injury[3]. Typical dosage The recommended initial dosage of gabapentin is 300 mg three times a day. efficient daily dosages fall between 900 and 3600 mg, with a titration of 300 mg usually taking place every one to three days. Pregabalin: 150 mg divided into daily doses is the first recommended beginning dose, which can be increased to 300–450 mg daily. Although doses as high as 600 mg per day have been studied, they have been linked to a rise in side effects and no increase in effectiveness. In cases of renal failure, both medicines require dose decrease; in haemodialysis, dose augmentation is necessary. Contraindications Gabapentin or pregabalin hypersensitivity Principal interactions with drugs Additional CNS depressants Principal adverse consequences Weight gain,

Divya Pandey et al.,

peripheral edema, sedation, light-headedness, disorientation, and potential sexual adverse effects. Extra points Gabapentin's tolerability is frequently limited by sedation. Because of saturable absorption, gabapentin's bioavailability is inversely proportional to dose. For instance, absorption is 35% at dosages of 2400 mg per day and 33% at doses of 3600 mg per day. This indicates that there is a net gain of 300 mg absorbed even though the daily dose is increased by 900 mg. A greater dose at night may help patients with their symptoms while they sleep. According to certain research, gabapentin and tricyclic antidepressants (TCAs) may have complementary benefits on neuropathic pain. Compared to gabapentin, pregabalin has fewer side effects, a smaller pill burden, and a quicker titration. Pregabalin is a restricted substance, in contrast to gabapentin. The cost of pregabalin is higher, and getting it through insurance may be more challenging. In order to titrate to therapeutic dose, gabapentin is frequently used initially. If treatment doesn't work, pregabalin might be an option. [17,18,22]

Antidepressants

It is not unexpected that some antidepressants have been used to treat chronic pain because the transmission and processing of pain share similarities with the neurochemical pathways implicated in mood disorders. Generally speaking, less medication is needed to address pain than to treat mood disorders. However, there is limited data to definitively determine which antidepressant is most efficient for a specific condition. Guidelines from the American Ac (level B evidence) and (level A evidence) both prescribe (SNRIs) and tricyclic antidepressants. Close monitoring for clinical deterioration, suicidality, or unexpected behavioral changes is crucial, particularly in the initial months of treatment because children and young adults are more likely to experience suicidality when taking antidepressants, as is the case with all of them. [13,17,18,23,24].

• Opioid analgesics

Opioids are as effective as tricyclic antidepressants (TCAs) at reducing neuropathic pain by at least 30%. However, because of their adverse effect profile, propensity for misuse, and the scant data that supports their use, opioids are typically regarded as a second- or third-line therapeutic choice. In the short run, they can be used to quickly relieve pain while titrating preferred drugs, with the intention of stopping opioids as soon as other medications are at an effective dosage. But throughout this process, patients may find it difficult to taper off opioids and run a higher risk of negative side effects and reliance. It is important to use clinical judgment and do proper screening when thinking about treating opioids. [13,24,25].

• Non-steroidal anti-inflammatory drugs (NSAIDs)

According to Vo and colleagues, patients who experience significant pain reduction from NSAIDs either do not seek additional therapy, or there is a significant placebo effect. They also propose that NSAID medicine may be more beneficial for milder neuropathic pain. Because NSAIDs do not cure neuropathic pain, pain management professionals may be misinformed that they are useless for this type of pain. If other treatments are not contraindicated, ibuprofen may be helpful in treating milder neuropathic pain or as a supplement to them. Normal dose Lower doses are used to alleviate pain and fever, whereas higher doses are typically used to demonstrate anti-inflammatory effects. Each agent has different dosage requirements. Contraindications Patients with hypertension, CHF, a history of stomach ulcers or bleeding, or chronic kidney disease should be treated with caution. Principal medication interactions Methotrexate, cyclosporine, corticosteroids, anticoagulants, antiplatelet medications, diuretics, antihypertensives, and serotonergic antidepressants [13,16,17].

Pharmacotherapy of Neuropathic Pain

• Antiepileptics

Over the last five years, there have been more poor or negative trials despite the fact that their efficacy has been shown in peripheral or central NP. Extended-release gabapentin formulations can be taken twice a day and have demonstrated comparable efficacy to gabapentin in clinical trials. There have been reports of comparable effectiveness to TCA. Typical adverse effects include weight gain, light-headedness, and drowsiness [26]. Other than pregabalin and gabapentin, antiepileptics have minimal efficacy in NP, with the rare exception of trigeminal

Divya Pandey et al.,

neuralgia, carbamazepine. Nonetheless, certain patient subgroups may benefit from certain of these antiepileptic medications. In NP, every medication is known as study came up negative[26].

❖ **Gabapentinoid drug mechanisms in neuropathic pain**

Gabapentin anticonvulsants, including pregabalin and gabapentin have demonstrated therapeutic success in addressing some neuropathic discomfort syndromes. In numerous mouse models of neuropathic pain, gabapentin also show promise. Along with the models previously stated for the effects of antidepressants, chronic treatment trials have also been conducted in a sural nerve injury model and chemotherapy-triggered neuropathic discomfort. Numerous research has been undertaken to investigate the potential processes underlying gabapentin's therapeutic activity; these investigations have mostly used a single gabapentin treatment. Both clinical and preclinical research in the field of pain shows, However, the processes behind long-term gabapentin use have only been examined in a few research. GABA receptors are not the primary target of gabapentin, despite their structural similarity to GABA. The discovery of a particular binding location on the voltage-dependent calcium $\alpha_2\delta$ subunit channel demonstrated that gabapentin's antinociceptive action resulted from a decrease in the quantity of Ca^{2+} channels that entered cells. [15,27]

Management of Neuropathic Pain

Although neuropathic pain has many distinct origins, they can be roughly categorized into two groups: Both central and peripheral causes. Nonetheless, presentation might differ within individuals with the same etiology as well as between peripheral and central etiologies. Common peripheral neuropathic illnesses include poststroke pain, multiple sclerosis, and trigeminal neuralgia. Validated questionnaires like Pain Detect and the Evaluation of Neuropathic Symptoms by Leeds provide a simple way to assess if neuropathic pain is present and gauge its impact on the patient. Pain Detect relies solely on patient input and does not require a physical examination; it has an 85% sensitivity and an 80% specificity [28,29]. tests to determine whether neuropathic pain is present. The DN4 has three examination findings and seven pain discriminators. There are two examination findings and five symptom descriptors in the LANSS. It has a sensitivity of 82–91% and a specificity of 80–94%. The visual analogue scale or numeric rating scale can be used to quantify the intensity of pain. Assessing Pain's Effects The quality of life and mood of an individual can be significantly impacted by neuropathic pain. These questions can be answered at an initial session to ascertain whether such an influence exists. After that, a more official evaluation might be carried out by the team of allied health professionals. When evaluating the level of Coping strategies, the impact of catastrophizing on mood and quality of life, and kynophobia, the psychologist is essential. This usually involves a variety of validated tests. The EQ-5D or SF-36 are used to gauge overall quality of life tests to determine whether neuropathic pain is present. The DN4 has three examination findings and seven pain discriminators. There are two examination findings and five symptom descriptors in the LANSS. It has a sensitivity of 82–91% and a specificity of 80–94%. The visual analogue scale or numeric rating scale can be used to quantify the intensity of pain. Assessing Pain's Effects The quality of life and mood of an individual can be significantly impacted by neuropathic pain. These questions can be answered at an initial session to ascertain whether such an influence exists. After that, a more official evaluation might be carried out by the team of allied health professionals. When evaluating the level of Coping strategies, the impact of catastrophizing on mood and quality of life, and kynophobia, the psychologist is essential. This usually involves a variety of validated tests. The EQ-5D or SF-36 are used to gauge overall quality of life in relation to health (QOL), while the Brief Pain Inventory is used to measure QOL specific to a given ailment. [28,29,30].

Future Research Directions

To enhance the management of neurological pain, several research avenues are promising:

Biomarkers for Pain: Identifying biological markers that could predict pain responses

- **Novel Therapies:** Exploring the efficacy of new pharmacological agents or biologics.
- **Neuroplasticity:** Investigating methods to harness the brain's ability to adapt and potentially retrain pain pathways.

Divya Pandey *et al.*,

- **Holistic and Integrative Approaches:** Future plans may increasingly incorporate holistic methods:
- **Alternative Therapies:** Acupuncture, massage, and chiropractic care can complement conventional treatments.
- **Nutrition and Lifestyle:** Focusing on diet, exercise, and overall well-being to support neurological health.

Collaboration and Multidisciplinary Care: Effective management of neurological pain often requires collaboration among various healthcare professionals, including neurologists, pain specialists, psychologists, physical therapists, and primary care providers. Creating integrated care plans helps guarantee that a patient's health is taken care of in all respects[31,32].

The Safety of Medications Used To Treat Peripheral Neuropathic Pain

To find original studies evaluating the effectiveness of antidepressant and antiepileptic drugs in clinical trials to treat peripheral neuropathic pain, a review of the literature was undertaken. The PICOS framework served as the basis for the inclusion criteria, which included patients of all ages, those with a diagnosis of Neuropathy in the periphery, those receiving antidepressant or antiepileptic medication (either as a single therapy or as a continuous course), utilizing a randomized double-blind approach and comparison with a placebo. Inclusion did not depend on any particular result, but treatment-related side effects were recorded. For analysis, only studies that were available in full text in English were taken into account. Therapeutic studies outside the purview of this review (such as pathophysiology, epidemiology, and non-neurology-related fields), evaluations of non-pharmacological treatments, and specific publication types were all subject to exclusion criteria. Studies assessing pharmacokinetics, medication combinations, Phase 1 trials, and studies involving healthy volunteers were also disqualified, as were studies that concentrated on central pain or non-peripheral neuropathic pain[34,35]. A comprehensive review of the full-texts of the chosen studies was part of the data collection process, from which the following information was extracted: names of the authors, study design, drug or comparator used, drug dosage, sample size, length of therapy, peripheral neuropathy type[36].

- **Pregabalin**

Anxiety disorders in general, fibromyalgia, neuropathic discomfort, epilepsy, and restless legs syndrome are among the ailments for which pregabalin is recommended. Richard Bruce Silverman created it in 1990 as an antiepileptic medication. Studies show that pregabalin has a Gabapentin has a six-fold lower affinity for the human recombinant $\alpha\delta$ -1 subunit, despite the fact that both medications have comparable affinities for this subunit. Because of this, pregabalin has stronger analgesic and antiepileptic effects than gabapentin. Pregabalin was created as an enhancement of gabapentin and was authorized in the US in 2004. It is frequently recommended as a first therapy for central neuropathic pain, post-herpetic neuralgia, and persistent pain related to diabetic neuropathy. But there is still debate about its application in the treatment of ailments like sciatica, cancer-related pain, migraines, and the avoidance of chronic pain following surgery. A total of 8739 patients from 38 randomized controlled trials (RCTs) were included in our analysis; 4771 of these patients received oral pregabalin. Pregabalin dosages ranged from 75 mg to 600 mg per day for different types of neuropathic pain, while treatment durations ranged from 7 days to 1380 days. Although the effects were usually mild, 20 trials (53%) comparing the analgesic Pregabalin's effectiveness compared to a placebo revealed encouraging results. The efficiency of pregabalin in the treatment of severe diabetic neuropathy, postherpetic neuralgia, and mixed or unclassified post-traumatic neuropathic painis supported by evidence, but it is ineffective in treating HIV neuropathy, and there is insufficient evidence for central neuropathic pain, according to a recent Cochrane meta-analysis. While some patients experience substantial benefits from pregabalin, most have moderate benefits, and many either experience no benefit or discontinue treatment." Regarding treatment-emergent adverse events (TEAEs), multiple adverse effects were observed in both pregabalin and gabapentin, with their frequencies being similar. 7.0–85.8% of patients specified a minimum of one TEAE linked to pregabalin in 24 studies that assessed the overall TEAE frequency, with 0.0–10.4% of those described as serious (based on 15 studies). TEAEs led to 0.0 to 21.1% of patient dropouts. The most commonly reported TEAEs, similar to gabapentin, were dizziness (10.1-46.0%) and drowsiness (10.5-40.0%). Pregabalin-related significant adverse events (SAEs) included tremor, cardiac extrasystoles, nausea, dyspnea, and suicidal thoughts in 15 studies that documented SAEs. Six studies did not report on the frequency of adverse events, while one research did not evaluate safety. The

Divya Pandey *et al.*,

incidence of TEAEs seems to be correlated with the dose in the seven trials that assessed various doses or regimens. Because only one study statistically assessed the frequency of TEAE with placebo, it was challenging to determine if the reported TEAEs were actually related to pregabalin [38]. The only symptom that was more prevalent in this study was dizziness. Overall, the observed safety profiles aligned with the SPC of pregabalin, which includes fatigue and lightheadedness as well as SAEs include a higher chance of medication reactions and suicide. Lastly, abrupt or quick removal of pregabalin may result in withdrawal symptoms, and recent research has documented the possibility of abuse, dependency, after pregabalin use[15,37].

• **Norepinephrine on microglial neuroinflammation and neuropathic pain:**

Norepinephrine (NE) is a neurotransmitter that is vital to the central nervous system. Numerous physiological and pathological processes include NE, which is released by locus coeruleus neurons. A prevalent symptom of many different types of neurological disorders is neuroinflammation. The degree of neuroinflammation is directly impacted by microglia activity. Many adrenergic receptor types that anchor on microglia and are NE-regulated impact microglia activation and neuroinflammation. NE controls the activity of microglia, which affects depression, anxiety, and chronic pain.[22]. Neuroinflammation results from aberrant microglia activation. In the central nervous system, microglia are crucial immune cells. They are found throughout the neuroepithelium and come from the yolk sac of the embryo. In contrast to other CNS cells, peripheral macrophages and microglia have a common ancestor and possess a potent capacity for regeneration, ensuring that they remain in adequate numbers to fulfil their roles. Repairing injured tissue and removing the source of injury are the two primary purposes of neuroinflammation. But this defence mechanism could turn into a vicious cycle that keeps activating immune cells.[22,38]. Studies have demonstrated that NE uses adrenergic receptors to influence a range of cell types, which belong to the G protein-coupled receptor family. Depending on the kind of cell, various receptors have different expression profiles. NE signals can influence microglia by displaying the mRNA for the α 1-, α 2-, β 1-, and β 2-adrenergic receptors. Coincidentally, microglia are the brain cells that express the most β 2-AR. The NE in the brain originates from LC and is broadly distributed throughout the brain. According to studies, injury to the LC can exacerbate microglia activation and result in neuroinflammation. After LC degeneration, microglia controlled by NE projection become active, and NE secretion is either reduced or eliminated. NE is essential for microglia activation because it alters the phenotype of microglia and causes neuroinflammation through the release of cytokines [39]. It has been demonstrated that general anesthesia lowers levels of acetylcholine (ACh), dopamine, serotonin, and NE; also, anesthetized mice's microglia show a stronger immune response to injury than awake mice's.14 When Mercan *et al.* gave various neuromodulators to mice under isoflurane anaesthesia, they discovered that only NE could stop the microglia from being impacted by anaesthesia induction[40,41].

The monitoring role of microglia in the brain's parenchyma is impacted by norepinephrine (NE). Immune cells called microglia work with neurons to keep an eye on the central nervous system (CNS) and preserve the brain's dynamic equilibrium. NE functions as an endogenous signaling molecule in the central nervous system (CNS), controlling the amount of cyclic AMP (cAMP) in microglia to govern their nanoscale parenchymal surveillance. By raising cAMP levels in microglia through the β 2-adrenergic receptor (β 2-AR), Mori *et al.* showed that NE suppresses microglial growth and decreases the area under surveillance[40]. Norepinephrine (NE) release is influenced by local neural activity. Microglia can elongate and the monitoring range can be increased by chemically inhibiting the release of NE from the locus coeruleus (LC) or by inhibiting the β 2-adrenergic receptor (β 2-AR). Acetylcholine, dopamine, NE, and serotonin are the four possible neuromodulators; only NE can stop microglial elongation when under anesthesia. The increase in microglial protrusion monitoring brought on by beard trimming and optogenetic suppression can be inhibited by exogenous NE. Additionally, in awake mice, chemo-genetic suppression of LC-noradrenergic neurons and pharmacological inhibition of microglial β 2-ARs result in enhanced microglial protrusion monitoring. Interestingly, NE also lessens the duration of direct contact and the region of interaction between microglia and neuron dendrites, which eventually lessens neuronal damage[42]. Tricyclic antidepressants and serotonin-norepinephrine reuptake inhibitors are examples of norepinephrine (NE) uptake inhibitors that are frequently used as primary treatment for many forms of neuropathic pain. Zhang *et al.* investigated Amoxetine's mode of action as a NE reuptake inhibitor and its effects on the expression of NF- κ B and mitogen-activated protein kinase,

Divya Pandey et al.,

proinflammatory cytokine levels, and microglial and astrocytic activation. Their study revealed that amoxapine directly affected microglial activation and its associated signalling pathways. After receiving amoxapine for four weeks, rats' neuropathic pain was much lessened. Amoxapine also suppressed p38 and c-Jun amino-terminal kinase activation, decreased the accumulation of proinflammatory cytokines, and decreased microglial activation in the rat spinal cord. Another NE reuptake inhibitor, duloxetine, has also been shown to inhibit the function of the microglial purinergic receptor P2X4R. The P2X4 receptor (P2X4R), which is primarily expressed by microglia in the central nervous system (CNS), is markedly increased in spinal microglia after peripheral nerve injury (PNI). It has been demonstrated that mechanical allodynia can be reversed by blocking P2X4R function. Moreover, it has been discovered that duloxetine considerably lowers the rise in calcium (Ca^{2+}) levels brought on by ATP, hence blocking P2X4R activity in microglia. These results imply that NE reuptake inhibitors reduce microglial-mediated neuroinflammation and limit microglial inflammatory activation to reduce pain.[42,43,44]. The idea that anxiety and depression may be exacerbated by elevated cholinergic signaling via norepinephrine (NE) stress is supported by a number of recent research. This implies that while NE signaling can influence areas of the brain and the sympathetic nervous system to control cholinergic activity, hence exerting anti-anxiety and antidepressant benefits, increased cholinergic signals may result in depressed symptoms. This suggests that anxiety and depression may be lessened by focusing on the noradrenergic system. Mirtazapine treatment for 21 days reduced Microglia's inflammatory activation and increased NE production in mice with depression and long-term cognitive impairment, which in turn reduced depressed symptoms, according to metabolomics studies[45]. According to a recent study, arecoline can help mice acquire social preferences and has anti-anxiety properties in zebrafish. In addition to upregulating the expression of genes unique to microglia, like *egr2* and *ym1*, it was discovered to raise NE levels in the brain. As an alternative to the neuroinflammatory M1 subtype, these genes are linked to the M2 subtype of microglia, which protects the brain. M2 microglia are activated by the rise in NE levels, which also helps to reduce anxiety. It has been demonstrated that the α 2-adrenergic receptor (α 2-AR) agonist guanfacine, which is used to treat depression and anxiety, activates α 2-AR in the amygdala, a region that is essential for controlling emotional reactions. Low levels of NE can activate α 2-AR, which is present in both presynaptic and postsynaptic ally. This inhibits microglial activation, lowers neuroinflammation, and enhances cognitive performance. First-line therapies for social anxiety disorder involve the use of serotonin-norepinephrine reuptake inhibitors (SNRIs) and generalized anxiety disorder because they lower neuroinflammation, raise NE levels in the central nervous system, and prevent microglia from becoming activated. SNRIs not only reduce chronic pain, but they also lessen the symptoms of sadness and anxiety[43,45,46].

Histone deacetylase as emerging pharmacological therapeutic target for neuropathic pain

The expression of HDAC1 in the dorsal root ganglia and HDAC2 in the DRG and spinal cord was markedly elevated in a rat model of neuropathic discomfort brought on by continuous constriction of the sciatic nerve. HDAC1 was mostly detected in glial cells and tiny neurons in the DRG, with little colocalization with big, myelinated neurons that were NF200-positive. On the other hand, NF200-positive neurons had the highest expression of HDAC2. The dorsal horn vertebral neurons and microglial cells had the highest levels of HDAC2 expression in the spinal cord. In naïve rats, Maier et al. showed that spinal HDAC2 was extensively expressed in neurons and, to a lesser degree, in astrocytes. Interestingly, spinal astrocytes showed a large increase in HDAC2 expression after neuropathic pain caused by sparing nerve injury (SNI), but neurons showed no change. Wang et al. found a substantial upregulation of HDAC1 expression in the dorsal root ganglia (DRG) of a mouse model of central neuropathic pain brought on by spinal cord injury (SCI). The precise cellular distribution of HDAC1 within the DRG is still unknown, though. Several studies showed that the ipsilateral spinal dorsal horn's HDAC1 expression increased in the spinal nerve ligation (SNL)-induced neuropathic pain paradigm[32,39,47]. Class II HDACs move between the nucleus and the cytoplasm, in contrast to other HDACs that are mostly found in the nucleus. Rats with chronic constriction injury (CCI) have been shown to have dorsal root ganglia (DRG) with elevated levels of HDAC4. Nevertheless, the overall amount of HDAC4 in the spinal cord of rats that had spinal nerve ligation (SNL) did not change. Interestingly, the cytoplasmic concentration of HDAC4 increased significantly, and this was directly linked to allodynia behavior. The majority of HDAC4 was found in spinal cord neurons. Moreover, animals with spinal cord injury (SCI) showed markedly elevated HDAC5 expression in their dorsal root ganglia (DRG). Gu et al. found that neurons, microglia, and

Divya Pandey *et al.*,

astrocytes in mice's spinal dorsal horns that have neuropathic pain brought on by partial sciatic nerve ligation had higher levels of HDAC5 expression[37,48].

CONCLUSION

Neuropathic pain presents a significant challenge due to its complex nature, often resulting from nerve damage or dysfunction related to conditions such as diabetes, multiple sclerosis, or traumatic injuries. Current treatment strategies are diverse and include pharmacological options like antidepressants and anticonvulsants, which target the altered pain pathways, as well as topical agents and interventional techniques like nerve blocks and spinal cord stimulation. Physical therapy plays crucial roles in helping patients manage their ache and better their standard of life. However, the future of neuropathic pain management holds even greater promise, driven by advancements in research and technology. Emerging therapies, such as gene therapy and novel biomolecules aimed at modulating pain pathways, are on the horizon, potentially offering more effective and targeted interventions. Additionally, the increasing understanding of the neuroscience of ache may lead to the identification of specific biomarkers, enabling more personalized treatment approaches. Integration of holistic and complementary therapies, alongside conventional methods, may further enhance outcomes. Ultimately, a multidisciplinary approach that emphasizes patient education, self-management, and collaboration among healthcare providers will be crucial in improving the management of neuropathic ache, aiming not just for symptom relief but for a significant enhancement in patients' overall well-being and functionality in daily life.

ABSTRACT

Forensic dentistry aims to identify individuals based on tooth features or bite mark impressions. This study explores the development of an automated system that compares dental models from potential suspects with bite mark impression photographs. The system determines the best match by evaluating the prick mark impressions against an undefined of prospective dental models. The results are then compared with those provided by human forensic odontologists. This first exploration aimed to evaluate the feasibility of using YOLO (You Only If Look Once) to identify bite marks through and through texture data recorded on pink wax, and to compare these impressions with dental casts. The experimental results demo a commonsensical takedown of accuracy. The power of YOLO to detect and pit complex features such as the texture of bite marks in pink wax enhances the reliability and speed of human identification, providing a valuable tool for forensic investigations.

INTRODUCTION

Forensic dentistry is a vital field within criminal investigations, focusing on the identification of individuals through dental characteristics or bite mark impressions. Bite marks, often found at crime scenes or on victims, can provide significant evidence in identifying perpetrators. Traditional forensic odontology relies on the expertise of trained specialists to manually compare bite mark impressions with dental casts, a process that is time-consuming and prone to human error. As technology advances, there is a growing need to automate and streamline this process to enhance accuracy, speed, and efficiency. The integration of machine learning techniques, particularly You Only Look Once (YOLO), has opened new possibilities in this domain. YOLO, a state-of-the-art object detection algorithm, is known for its ability to quickly and accurately detect and classify objects in images. This research explores the feasibility of using YOLO to automate the identification of bite marks by analyzing texture data recorded on pink wax and comparing it with dental casts. The goal is to develop a system that can efficiently match bite mark impressions to dental models, significantly improving the accuracy and speed of human identification in forensic cases. By applying YOLO to the problem of bite mark identification, we aim to provide an automated solution that not only enhances forensic investigations but also reduces reliance on subjective human interpretation. This study examines the effectiveness of YOLO in detecting bite marks and matching them with dental casts, comparing the results to those of human forensic odontologists. Through these advancements, the study demonstrates the potential for AI-driven methods to complement and enhance traditional forensic practices in bite mark analysis. YOLO plays a significant role in the correlation process for bite mark identification because it is designed for fast, real-time object detection with high accuracy. In the context of forensic dentistry, YOLO's efficiency in processing texture patterns and matching bite mark impressions to dental models allows for quick identification and comparison, far surpassing traditional methods. By utilizing YOLO, the system can rapidly analyze and correlate bite mark features captured in images, making it a powerful tool for forensic applications where time and precision are crucial.

Optimized YOLOv4 is particularly well-suited for real-time vehicle detection and surveillance applications. Its enhancements allow for rapid and accurate identification of human features in diverse conditions, making it a reliable choice for critical tasks in fields such as law enforcement and forensic analysis [12][5]. The model's efficiency and accuracy underscore its potential for broader applications beyond traditional object detection scenarios, paving the way for innovative uses in automated systems and artificial intelligence-driven technologies.

LITERATURE SURVEY

The Optimized YOLOv4 Based Approach for Rapid Human Identification Using Bite Mark Impressions is a cutting-edge methodology that employs advanced deep learning techniques to enhance the accuracy and efficiency of human identification through bite mark analysis. This approach leverages the YOLO (You Only Look Once) object detection framework, specifically an optimized version of YOLOv4, which is tailored to provide real-time processing capabilities in forensic odontology. Traditional bite mark identification methods often rely on manual analysis, leading to potential errors and prolonged identification times; thus, integrating machine learning into this process represents a significant advancement in forensic science[1][2]. The notable aspect of this approach lies in its ability to analyze bite mark impressions rapidly while maintaining a high degree of accuracy, which is crucial in legal contexts where timely identification can impact case outcomes. By incorporating architectural enhancements such as Atrous Spatial Pyramid Pooling (ASPP) and a dual-layer Bi-FPN (Bidirectional Feature Pyramid Network), the optimized YOLOv4 model improves feature extraction and classification, making it particularly adept at recognizing small-scale objects like bite marks[3][4]. Furthermore, rigorous performance metrics, including precision, recall, and mean average precision (mAP), are employed to evaluate the model's effectiveness, demonstrating substantial improvements over conventional methods.[5][6] Controversially, the use of bite mark analysis in forensic settings has been criticized for its reliability, as studies indicate that traditional techniques often lead to misidentifications, contributing to wrongful convictions.[7].

**Sonali Ajay Mohite et al.,**

The introduction of an optimized deep learning model aims to mitigate these issues by reducing human biases and providing a more objective assessment of bite mark evidence. This innovation not only represents a technological leap in forensic identification but also raises questions about the future of traditional forensic methods in the face of advancing artificial intelligence applications.[8][9]Overall, the optimized YOLOv4 based approach signifies a transformative shift in forensic identification practices, presenting a reliable, efficient, and scientifically grounded alternative to conventional bite mark analysis. As ongoing research continues to refine these methodologies, there is potential for broader applications of deep learning in forensic science, fostering improved accuracy and integrity in the identification process.[10]

Background

The YOLO (You Only Look Once) series has significantly influenced the field of object detection and has been applied in various domains, including forensic science. Specifically, YOLO models utilize a single neural network to predict multiple bounding boxes and class probabilities for those boxes simultaneously, offering remarkable speed and efficiency in real-time applications[1]. The latest iterations, such as YOLOv5, have continued to evolve the foundational concepts established in earlier versions, incorporating improved architectures and techniques to enhance performance[1]. In forensic odontology, bite mark analysis has emerged as a critical tool for human identification in cases of assault and abuse. Traditional methods of analyzing bite marks rely heavily on manual observation and comparison, which can be time-consuming and prone to error[2].The integration of digital image processing and machine learning techniques, particularly deep learning, offers a promising approach to improve the accuracy and efficiency of bite mark identification[2][8].By employing optimized YOLOv4-based methods, researchers aim to leverage advanced feature extraction and classification capabilities to rapidly and reliably identify individuals from bite mark impressions. Furthermore, the neck component in deep learning architectures plays a crucial role in feature aggregation, collecting and processing information from various stages of the network to enhance detection accuracy[11]. This aspect is particularly beneficial in forensic applications, where the ability to capture subtle features within bite marks can lead to more accurate identifications. Overall, the combination of YOLO's rapid processing capabilities and the advancements in digital image analysis positions this approach as a revolutionary tool in forensic identification practices.

Optimized YOLOV4

Optimized YOLOv4 is an advanced implementation of the YOLOv4 object detection model specifically tailored for improved accuracy and speed in human identification tasks, such as those involving bite mark impressions. The architecture of this optimized version builds upon the original YOLOv4 framework, incorporating several enhancements to maximize performance in real-time applications.

Performance Metrics

The performance of optimized YOLOv4 is evaluated using various metrics, including precision, recall, F1 score, mean average precision (mAP), and average Intersection over Union (IoU). These metrics provide a comprehensive overview of the model's effectiveness in identifying bite mark impressions and other human features[5][3].By fine-tuning the anchor box predictions using methods like k-means clustering, researchers have been able to enhance the model's accuracy further, making it a valuable tool in forensic science and related fields[5].

Architectural Enhancements

The optimized YOLOv4 architecture retains the foundational elements of the original model, including CSPDarknet53 as the backbone and PANet as the neck. However, several key modifications have been made to improve detection capabilities, particularly for small-scale objects like bite marks. One significant enhancement is the replacement of the Spatial Pyramid Pooling (SPP) module with the Atrous Spatial Pyramid Pooling (ASPP) module. This change increases the network's receptive field hierarchy, allowing it to better perceive multi-scale objects and thus improve detection rates for smaller features[4][3]. Additionally, the architecture incorporates a custom-built dual-layer Bi-FPN (Bidirectional Feature Pyramid Network) to enhance multi-scale feature fusion. This adjustment

Sonali Ajay Mohite et al.,

allows the model to more effectively combine features from different layers, thereby improving its overall feature representation capabilities, particularly for medium and small-scale objects[3]

MATERIALS AND METHODS

Following Fig.1 shows YOLO Technique for Correlation Analysis Between Pink Wax Teeth Impressions and Dental Cast Images. This methodology outlines a robust pipeline that utilizes YOLO's object detection capabilities to establish precise correlations between key dental features of pink wax impressions and corresponding dental casts. In fig.1 process is divided into sequential stages, each designed to ensure high-quality data collection, preparation, feature detection, and evaluation. Below is a detailed breakdown of the methodology. The first stage is Data Collection and Preparation. The Objective is to create a comprehensive dataset of high-resolution images paired with accurately annotated dental features. In Image Acquisition Gather paired high-resolution images of pink wax teeth impressions and their corresponding dental casts. The paired nature ensures that each wax impression is directly associated with its cast counterpart for precise analysis. After that Annotation is use a YOLO-compatible annotation tool, such as LabelImg, to mark key dental features. Features like cusps, ridges, and grooves are annotated to serve as class labels for training the object detection model. Accurate labeling is crucial to enable the YOLO model to identify intricate dental structures. The Second stage is Preprocessing for to standardize and augment the dataset, enhancing model generalization and robustness. Resize images to a consistent resolution to ensure uniformity across the dataset, reducing computational overhead during training and Apply transformations such as flipping, rotation, scaling, and contrast adjustments. These augmentations simulate diverse imaging conditions and improve the model's ability to generalize to unseen data. For Resize images to a consistent resolution, (W,H)=(640,640), ensuring uniformity across the dataset. Data preprocessing is essential for ensuring the quality and consistency of the bite mark dataset. This process involves cleaning the data, resizing images to a uniform size, normalizing pixel values, and applying data augmentation techniques to artificially increase the dataset size. Techniques such as random crops, horizontal flips, and brightness adjustments are utilized to enhance model robustness and mitigate overfitting [13][14].

Apply transformations such as flipping, rotation, scaling, and contrast adjustments.

Scaling factor $I'(x, y) = I(sx, sy)$ where s is the scaling parameter.

Rotation $I'(x, y) = I(x\cos \theta - y\sin \theta, x\sin \theta + y\cos \theta)$ (1)

The Third stage is Feature Detection and Matching To detect and align features from paired images for correlation analysis. Apply the trained YOLO model to identify and localize features in both pink wax impressions and dental cast images. Match detected features between impressions and casts based on spatial locations and geometric similarities using metrics like Euclidean distance d ,

$$d = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} \quad (2)$$

ensuring that corresponding features align appropriately.

Fourth stage is Training the Model to train the YOLO model for high-precision feature detection using transfer learning to initialize training with a pretrained YOLO model to leverage prior knowledge, accelerating convergence and improving initial performance. Use a composite loss function that considers confidence, class, and bounding box errors to optimize detection performance. Use transfer learning to initialize training with a pretrained YOLO model. The Loss function \mathcal{L}

$$\mathcal{L} = \lambda_{\text{conf}} \cdot \mathcal{L}_{\text{conf}} + \lambda_{\text{cls}} \cdot \mathcal{L}_{\text{cls}} + \lambda_{\text{box}} \cdot \mathcal{L}_{\text{box}} \quad (3)$$

where $\mathcal{L}_{\text{conf}}, \mathcal{L}_{\text{cls}}, \mathcal{L}_{\text{box}}$ represent confidence, classification, and bounding box losses, respectively. Evaluate model performance using metrics like mean Average Precision (mAP)

$$\text{mAP} = \frac{1}{N} \sum_{i=1}^N \text{AP}_i \quad (4)$$

Sonali Ajay Mohite et al.,

and Intersection over Union (IoU) to evaluates the overlap between predicted and ground truth bounding boxes,

$$\text{IoU} = \frac{\text{Area of Overlap}}{\text{Area of Union}}. \quad (5)$$

The fifth Stage is YOLO Model Configuration to configure the YOLO architecture for optimal detection of dental features that utilize a real-time object detection framework like YOLOv4, renowned for its speed and accuracy. It define custom classes corresponding to dental features, such as cusps, ridges, and grooves. After that Configure anchor boxes tailored to the dimensions and shapes of the annotated features, ensuring accurate localization during detection to configure anchor boxes tailored to the dimensions of annotated features. Anchor box dimensions (w_a, h_a) are calculated using the K-means clustering method on annotated feature sizes.

Six Stage is Correlation Analysis for to quantify the similarity and identify discrepancies between paired images. Calculate the similarity between matched features using metrics such as Euclidean distance or structural similarity and Analyze discrepancies to identify any misalignment or deformation between impressions and casts. Calculate similarity using structural similarity index (SSIM).

$$\text{SSIM}(x, y) = \frac{(2\mu_x\mu_y + C_1)(2\sigma_{xy} + C_2)}{(\mu_x^2 + \mu_y^2 + C_1)(\sigma_x^2 + \sigma_y^2 + C_2)} \quad (6)$$

Seven Stage is Validation to ensure the reliability of YOLO's predictions through expert verification and statistical metrics. Compare YOLO's predictions with ground truth data verified by dental experts and use metrics like accuracy, precision, and recall to assess correlation quality.

$$\text{Precision} = \frac{\text{True Positive}}{\text{True Positive} + \text{False Positive}} \quad (7)$$

$$\text{Recall} = \frac{\text{True Positive}}{\text{True Positive} + \text{False Negative}} \quad (8)$$

Eight stage is Visualization to provide clear and interpretable visual outputs for feature detection and correlation. Bounding Box Overlays. Visualize YOLO-detected bounding boxes on both impressions and casts to illustrate the detection process. Highlight matched features between paired images, using distinct markers or lines to denote correspondences. Emphasize mismatched or anomalous features for further investigation, aiding in identifying areas of deformation or error. This methodology leverages YOLO's high-speed and accurate object detection capabilities to automate and streamline the process of analyzing dental impressions and casts. This makes sure high reliability and precision by incorporating transfer learning, robust preprocessing, and advanced validation techniques. Visualization tools alongside expert validation create a holistic view of the results. Such a solution is ideal for dental initiatives requiring a high-throughput process with utmost accuracy.

RESULTS AND DISCUSSION

It is evident from the graph in Fig.2 that the training accuracy remains consistent throughout the epochs at 0.98, indicating that the model begins with a high accuracy of 98% and continues to learn quickly. Early in the epoch interval, it achieves 99% accuracy. Following that, there don't seem to be any variations, such as rising or downward trends. This suggests that after just a few training epochs, the model could have reached its full potential. Overall, the model was stable during training, as demonstrated by Fig. 2 (accuracy stayed at 0.98 until the completion of training). Following graphs shows comparison between 5 models. Fig.3 shows that model YOLOv4 accuracy rate is better than Inception V4, VGG-16, Resnet, LeNet. In Fig.4 shows that Sensitivity of proposed model it ensure that the model is robust also it perform well in various condition as compare to 4 other model. In Fig.5 Precision graph shows that YOLOv4 prediction of model is more accurate than others 4 models.

DISCUSSION

The application of the YOLO (You Only Look Once) algorithm in the context of bite mark analysis presents an innovative approach to forensic identification. This methodology not only enhances the efficiency of human

Sonali Ajay Mohite *et al.*,

identification from bite marks but also addresses the inherent challenges associated with traditional forensic odontology, which has faced criticism for its reliability issues. Studies have shown that forensic science errors are a leading cause of wrongful convictions, with a significant portion attributed to unvalidated methodologies, including bite mark analysis[7][8]. In our experimental results, we demonstrated that the YOLO model, known for its real-time object detection capabilities, can be effectively adapted for highly targeted use cases such as bite mark identification. The optimization of this model could serve to minimize human interaction in the comparison process, thereby reducing bias and improving accuracy[9][8]. This is particularly relevant given the subjective nature of conventional bite mark comparisons, where even experienced forensic odontologists have shown a high rate of misidentification[8][4]. Furthermore, the opportunity for ongoing collaboration and engagement with the authors of YOLO model research can foster advancements in this field. Such interactions allow developers and researchers to clarify methodologies and enhance the models through shared insights and data[10]. As we look to expand the application of our findings, it is imperative that we acknowledge the limitations of bite mark analysis as it currently stands, and advocate for a more scientific validation of forensic techniques, in line with the recommendations from entities like the Innocence Project[7]. The complexity of bite mark identification is compounded by factors such as tissue distortion and the variability in individual dental patterns, which challenge the fundamental assumptions underlying bite mark analysis[8]. Therefore, adopting a systematic and algorithmic approach, as facilitated by the YOLO model, may provide a pathway towards more reliable forensic practices. Our future work will focus on addressing the gaps identified in the current YOLO algorithms, as well as exploring additional improvements that can enhance their applicability to forensic scenarios. This will include rigorous benchmarking against existing methods and evaluating performance across various datasets to ensure robustness in real-world applications[4]. The insights gained from this research could contribute significantly to the evolving landscape of forensic science, promoting greater accuracy and integrity in the identification of individuals through bite mark evidence.

CONCLUSION

In this work, we presented an enhanced YOLOv4-based method to accelerate human recognition by using bite mark imprints. This model was able to accurately and efficiently identify the bite mark within the dentist database with significantly higher speed than that of traditional forensic techniques. With this automated detection of teeth and jaws, our approach promotes reliability by employing deep learning and real time object detection with less human intervention with less subjective evaluation of bite marks. This combination of strategies holds significant promise for both (i) improving the effectiveness of the forensic model and (ii) demonstrating the versatility of existing general-purpose vision systems for forensic use, and future work should focus on this by using larger datasets and more advanced augmentation methods.

ABSTRACT

The writings of Louise Erdrich are deeply rooted in the complexities of Indigenous identity, history, and trauma, making her works essential for examining the nuanced representation of Post-Traumatic Stress Disorder (PTSD). This research paper explores how trauma manifests in characters across three of Erdrich's novels *Tracks*, *The Beet Queen*, and *Love Medicine*, which reveals the lingering psychological scars of colonization, displacement, and familial upheaval. Through fragmented narratives, nonlinear storytelling, and intergenerational struggles, Erdrich constructs a haunting portrait of PTSD that extends beyond individual suffering to collective trauma within Native communities. In *Tracks*, the destabilizing force of historical trauma intersects with mystical elements, complicating the characters' experiences of loss and survival. *The Beet Queen* presents psychological wounds shaped by abandonment, strained kinship ties, and emotional detachment, highlighting how individuals navigate trauma in different ways. Meanwhile, *Love Medicine* delves into the inherited pain of generations, exposing the cyclical nature of grief and healing. Erdrich's use of shifting perspectives and layered voices underscores the fractured realities of PTSD, demonstrating that trauma is neither linear nor easily resolved. By analysing these texts through the lens of PTSD, this study investigates how Erdrich's characters wrestle with their fractured identities and histories. Ultimately, the research argues that Erdrich's portrayal of PTSD challenges conventional understandings of healing, emphasizing the resilience, resistance, and survival embedded in Native storytelling.

Keywords: Indigenous Trauma, Post-Traumatic Stress Disorder (PTSD), Indigenous identities, Native American Literature & Intergenerational suffering

INTRODUCTION

Louise Erdrich stands as one of the most prominent voices in contemporary Native American literature. She skilfully weaves the themes of identity, memory, and cultural survival in her writings. Erdrich's novels are celebrated as it presented the vivid picture Ojibwe life and their deep impact with the historical and psychological legacies of colonization. Her way of storytelling is a unique blend of realism and myth, often employing nonlinear timelines and multiple narrators in order to reflect the complexity of Indigenous experience. In Native American literature, trauma narratives serve not only as personal testimonies but also as acts of cultural preservation and resistance. These stories often address the enduring effects of colonization, forced assimilation, and systemic marginalization. Indigenous authors like Erdrich reclaim agency, affirm cultural identity, and bear witness to collective suffering through storytelling. Trauma, in the context of the Native American literature, is not merely an individual affliction but a communal and intergenerational phenomenon. Post-Traumatic Stress Disorder (PTSD) refers to a psychological response to a traumatic event. People with PTSD experiences flashbacks, emotional numbness, and hypervigilance. However, in Indigenous contexts, PTSD often intersects with historical trauma. This trauma builds up over generations due to massive group tragedies. This research explores how Erdrich's novels *Tracks* (1988), *The Beet Queen* (1986), and *Love Medicine* (1984) depict PTSD not only as a clinical condition but as a cultural experience shaped by colonization, displacement, and familial disruption. In *Tracks*, characters like Fleur Pillager and Pauline embody the trauma of losing land and culture. Their mental fragmentation mirrors the spiritual and community breakdown around them. *The Beet Queen* examines the psychological aftermath of abandonment and fractured kinship through the lives of Mary and Karl Adare, whose emotional detachment and identity struggles mirror the dislocation of their upbringing. *Love Medicine* presents a multigenerational tapestry of grief and resilience, where characters like Lipsha Morrissey and June Kashpaw inherit and navigate the unresolved traumas of their ancestors. The aim of this research paper is to argue that Louise Erdrich's portrayal of PTSD in *Love Medicine*, *Tracks* and *The Beet Queen* transcends conventional clinical definitions, offering a broader, culturally nuanced understanding of trauma. Her characters' psychological wounds are not isolated incidents but manifestations of collective, intergenerational suffering rooted in the historical realities of Native American life. Through fragmented narratives, shifting perspectives, and spiritual symbolism, Erdrich challenges Western paradigms of healing and recovery, emphasizing instead the enduring power of storytelling, cultural memory, and community resilience.

Theoretical Framework

Post-Traumatic Stress Disorder (PTSD) is a psychiatric condition that may develop after exposure to a traumatic event such as violence, abuse, or disaster by people. According to the Diagnostic and Statistical Manual of Mental Disorders (DSM-5), PTSD is characterized by symptoms including intrusive memories, avoidance behaviors, negative alterations in cognition and mood, and heightened arousal or reactivity. These symptoms can severely impair an one's ability to function and often persist long after the traumatic event has passed. However, while the clinical model of PTSD provides a useful framework for understanding individual psychological responses, it seldom focuses on the broader cultural, historical, and communal dimensions of trauma - especially in Indigenous contexts. This limitation has led scholars to expand the concept of trauma to include collective and intergenerational experiences.

Cultural and Historical Trauma Theory

Dr. Maria Yellow Horse Brave Heart developed the concept of historical trauma, offers a more culturally attuned understanding of PTSD in Indigenous communities. Historical trauma refers to the cumulative emotional and psychological wounding across generations, resulting from massive group trauma experiences such as colonization, forced assimilation, and systemic violence. Brave Heart's work with Lakota communities emphasizes how unresolved grief and trauma are transmitted intergenerational, manifesting in high rates of depression, substance abuse, and suicide. Cathy Caruth, one of the foundational figures in trauma studies, also contributes to this framework by emphasizing the belated and fragmented nature of traumatic memory. In her view, trauma is not fully

Vinoth

experienced in the moment but returns in haunting, often disruptive ways. This aligns with the narrative structures in Erdrich's novels, where trauma is revealed through nonlinear storytelling, silences, and fragmented recollections.

Indigenous Perspectives on Trauma

Trauma is not solely a psychological condition but a spiritual and communal rupture according to many Native communities. The loss of land, language, and cultural practices has created a profound sense of dislocation and grief. Indigenous perspectives on trauma emphasize the interconnectedness of individual and collective well-being, where healing is not just personal but cultural and relational. One of the most powerful tools for healing in Indigenous cultures is storytelling. In Oral traditions, story tellings serve as repositories of communal memory, resilience, and identity. Indigenous communities remember their histories, honor their ancestors, and envision futures of survival and resistance through stories. In novels of Erdrich, storytelling becomes both a narrative technique and a thematic focus, reflecting the belief that healing comes through the act of remembering and sharing. In *Love Medicine*, the mystical and fragmented narration mirrors the spiritual disorientation caused by colonization. In *The Beet Queen*, the emotional detachment of characters like Mary and Karl reflects the psychological toll of familial abandonment and cultural disconnection. *Love Medicine* uses a polyphonic narrative to trace the intergenerational transmission of trauma, showing how pain and resilience are passed down through stories, rituals, and relationships.

Trauma and Mysticism in *Tracks*

Tracks capture a period of intense upheaval for Native American communities, particularly the Ojibwe and it was marked by the erosion of tribal land through allotment policies and the imposition of Western religious and educational systems. The novel further reflects the psychological and spiritual dislocation caused by these colonial forces, portraying trauma not only as a personal affliction but as a communal and cultural crisis. Two central characters Fleur Pillager and Pauline embody contrasting responses to trauma. Fleur, deeply connected to her Anishinaabe heritage and the natural world, represents spiritual resilience. Her mystical powers and connection to the land suggest a form of resistance to colonial encroachment. However, her repeated losses of family, land, and community reveal the emotional toll of survival in a world that seeks to erase her identity. Pauline, on the other hand, internalizes colonial ideologies. Her conversion to Catholicism and self-inflicted suffering reflect a fractured identity and deep psychological turmoil. Pauline's descent into religious fanaticism and her unreliable narration illustrate the disorienting effects of trauma, particularly when cultural disconnection compounds personal grief. Erdrich employs a dual narrative structure, alternating between Nanapush and Pauline, to reflect the fragmented nature of memory and trauma. The nonlinear timeline and mystical elements blur the boundaries between reality and myth, mirroring the characters' psychological instability. This narrative fragmentation is not merely stylistic—it echoes the disintegration of cultural continuity and personal coherence under colonial pressure. *Tracks* explore themes of loss, survival, and spiritual endurance. The novel suggests that trauma is not only experienced in the body and mind but also in the land and community. Fleur's mystical presence and Pauline's psychological unraveling both underscore the complex interplay between cultural survival and personal suffering. Through these characters, Erdrich illustrates how trauma can manifest as both resistance and rupture, shaped by the historical forces of colonization and the enduring power of Indigenous spirituality.

Psychological Fragmentation in *The Beet Queen*

The Beet Queen is set in the fictional town of Argus, North Dakota, spanning from the 1930s to the 1970s a period marked by economic hardship, war, and shifting social norms. Unlike *Tracks*, which is steeped in Indigenous spirituality and land-based trauma, *The Beet Queen* focuses on the psychological consequences of familial abandonment and emotional neglect. The novel explores how trauma manifests in the lives of children who grow up without stable attachments, and how these early wounds shape their adult identities. The siblings Mary and Karl Adare are central to this exploration. After being abandoned by their mother, they arrive in Argus to live with relatives. Mary, who is pragmatic and emotionally guarded, develops a controlling and obsessive personality. Her need for order and dominance masks a deep fear of rejection and loss. Karl, in contrast, is sensitive and emotionally unstable. His experiences of abandonment and alienation lead to a lifelong struggle with identity and belonging, often expressed through erratic behavior and romantic detachment. Their cousin Sita, too, reflects the psychological

Vinoth

toll of growing up in a dysfunctional environment. Her obsession with appearances and social status reveals an internalized sense of inadequacy and a desperate need for validation. Each of these characters exhibits symptoms that align with PTSD and complex trauma: emotional numbing, dissociation, and difficulty forming healthy relationships. Erdrich's use of multiple narrators and shifting perspectives mirrors the fragmented inner worlds of her characters. The disjointed narrative structure reflects the instability of memory and identity in the aftermath of trauma. By allowing each character to tell their version of events, Erdrich emphasizes the subjectivity of experience and the ways in which trauma distorts perception and memory. *The Beet Queen* explores themes of abandonment, identity, and emotional repression. Unlike the overt spiritual trauma in *Tracks*, the trauma in this novel is more psychological and interpersonal. Erdrich shows how early emotional wounds can calcify into lifelong patterns of dysfunction, and how the absence of nurturing relationships can leave individuals emotionally adrift. The novel also critiques the societal norms that stigmatize vulnerability and prioritize conformity over emotional truth.

Intergenerational Trauma in *Love Medicine*

Love Medicine, Louise Erdrich's debut novel, spans several generations of the Kashpaw and Lamartine families, offering a panoramic view of Ojibwe life from the 1930s to the 1980s. Set primarily on and around a North Dakota reservation, the novel explores the long-term effects of colonization, forced assimilation, and cultural dislocation. These historical forces are not presented as distant events but as lived realities that shape the emotional and psychological lives of Erdrich's characters. The novel illustrates how trauma is inherited, not just through stories and memories, but through behaviors, silences, and unresolved grief. June Kashpaw's death in the opening chapter sets the tone for the novel's exploration of trauma. Her mysterious and solitary demise becomes a symbolic rupture that reverberates through the lives of her family members. June's son, Lipsha Morrissey, is a central figure in this intergenerational narrative. He is raised by his grandparents and unaware of his true parentage for much of his life, Lipsha struggles with identity, belonging, and emotional connection. His use of "*Love Medicine*" a blend of traditional belief and personal longing reflects both a yearning for healing and the limitations of inherited trauma. Even other characters, such as Marie Kashpaw and Lulu Lamartine, also carry the burdens of past wounds. Marie's fierce pride and moral rigidity are shaped by her experiences in a Catholic boarding school, where she endured abuse and humiliation. Lulu, in contrast, embraces her sexuality and independence, yet her relationships are marked by loss and betrayal. These women, though resilient, reveal the scars left by a lifetime of navigating cultural conflict and personal hardship. Erdrich employs a nonlinear, multi-voiced narrative structure that mirrors the fragmented and cyclical nature of trauma. Each chapter is told from a different character's perspective, creating a mosaic of experiences that gradually reveal the depth of familial and cultural pain. This polyphonic approach allows for a more holistic understanding of trauma, emphasizing that no single narrative can capture its complexity. The disjointed timeline also reflects the way traumatic memory operates—nonlinear, recursive, and often obscured by silence or denial. *Love Medicine* explores themes of identity, memory, and resilience. The novel suggests that trauma is not confined to a single moment or individual but is woven into the fabric of family and community life. Healing, too, is portrayed as a collective process one that involves reclaiming cultural practices, confronting painful truths, and forging new connections. Through Lipsha's journey and the interwoven stories of his relatives, Erdrich illustrates the enduring impact of historical trauma and the possibility of renewal through love, humor, and storytelling.

Comparative Analysis

Common Threads

Across *Tracks*, *The Beet Queen*, and *Love Medicine*, Louise Erdrich presents trauma as a multifaceted and deeply embedded experience. While each novel focuses on different characters, settings, and historical moments, they all share a thematic concern with the fragmentation of identity, the persistence of memory, and the struggle for emotional and cultural survival. The characters in these novels exhibit symptoms of PTSD such as emotional detachment, intrusive memories, and dissociation but these symptoms are contextualized within broader narratives of colonization, familial rupture, and cultural loss. In *Tracks*, trauma is spiritual and communal, rooted in the loss of land and tradition. In *The Beet Queen*, it is psychological and interpersonal, shaped by abandonment and emotional neglect. In *Love Medicine*, trauma is intergenerational, passed down through stories, silences, and unresolved grief.

Vinoth

Despite these differences, all three novels depict trauma as a force that disrupts linear time, fractures relationships, and challenges the coherence of self.

Narrative as Therapy

One of the most powerful tools Erdrich employs to represent and respond to trauma is narrative itself. Her use of multiple narrators, nonlinear timelines, and fragmented storytelling mirrors the disjointed nature of traumatic memory. But more than a stylistic choice, this narrative structure serves a therapeutic function. By giving voice to multiple perspectives and allowing characters to tell their own stories, Erdrich creates a space for witnessing, remembering, and healing. Storytelling, in Erdrich's work, is not just a way of representing trauma; it is a way of surviving it. Characters like Nanapush in *Love Medicine* and Lipsha Morrissey in *Love Medicine* use stories to make sense of their experiences, connect with others, and preserve cultural knowledge. In this way, Erdrich aligns with Indigenous traditions that view storytelling as a communal and healing practice.

Cultural Specificity

Erdrich's portrayal of PTSD challenges Western clinical models by emphasizing its cultural and historical dimensions. Her characters do not simply suffer from trauma—they live within it, inherit it, and resist it. The healing they seek is not found in therapy or medication but in relationships, rituals, and the reclamation of cultural identity. By embedding trauma within the specific histories and traditions of the Ojibwe people, Erdrich offers a powerful critique of universalizing approaches to mental health and affirms the importance of culturally grounded understandings of suffering and resilience.

CONCLUSION

Louise Erdrich's *Tracks*, *The Beet Queen*, and *Love Medicine* offer a profound and multifaceted portrayal of Post-Traumatic Stress Disorder, one that transcends clinical definitions and embraces the cultural, historical, and intergenerational dimensions of trauma. Through characters like Fleur Pillager, Pauline, Mary and Karl Adare, Lipsha Morrissey, and June Kashpaw, Erdrich illustrates how trauma is experienced not only as a psychological condition but as a communal and inherited burden. Her use of fragmented narratives, shifting perspectives, and spiritual symbolism reflects the disorienting nature of trauma and the complexity of healing. Erdrich's work challenges conventional psychiatric models by foregrounding the cultural specificity of trauma and the limitations of Western approaches to mental health. Her novels suggest that healing cannot be achieved through individual therapy alone but must involve the restoration of cultural identity, community bonds, and spiritual practices. This perspective aligns with Indigenous understandings of wellness, which emphasize balance, connection, and storytelling as essential components of recovery. Moreover, Erdrich's narratives contribute to the broader field of trauma studies by demonstrating how literature can serve as both a mirror and a medicine. Her stories bear witness to the pain of colonization and displacement while also affirming the resilience and creativity of Native communities. In navigating trauma, Erdrich's characters do not follow a linear path to healing. Instead, they move through cycles of loss, memory, and renewal, often finding strength in unexpected places through dreams, rituals, humor, and the act of telling their stories. Erdrich not only redefines the contours of PTSD by centering Indigenous voices and experiences but also reclaims the power of narrative as a tool for survival and transformation.

ABSTRACT

In both adults and children, respiratory allergies are a leading source of morbidity. One of the most common respiratory diseases, regardless of sex, affects people of all ages. Out of all the *Nasagat Rogas*, *Pratishyaya* is the one that practically every *Acharya* describes in length, demonstrating its significance because of its terrible nature. If left untreated, this disease is also prone to chronicity and recurrence. The main causes of this illness include sedentary lifestyle choices, such as exposure to cold weather, air conditioning and coolers, and eating habits that include intake of junk food, ice cream, cold beverages, curd, and sour foods like sauces and pickles. The illness causes headaches and exhaustion, restricts daily activities, disrupts sleep, and impairs productivity at work. Its clinical characteristics, such as *Shirahshula*, *Kshvathu*, and *Tanu Nasa Srava* are strikingly comparable to the Ayurvedic *Vataja Pratishyaya* traits. Unquestionably, modern medicine provides rapid symptom relief, but Ayurvedic science's comprehensive approach greatly increases the likelihood of a permanent cure. If used methodically, Ayurveda, can guarantee a full recovery. One powerful Ayurvedic technique for treating diseases at their source is *Panchakarma*. The best remedy for "*Urdhavajatrugata Roga*" is *Nasya Karma*, which is a significant component of *Panchakarma*. This study describes a chronic instance of rhinitis that was resolved by using *Vataja Pratishyaya*'s systematic *Ayurvedic* method.

Keywords: Chronic rhinitis, *Shadabindu Taila*, *Vataja Pratishyaya*, *Bharangyadi Kwath*, *Sitopaladi Churna*.

**Meet Thakkar and Akshar Ashok Kulkarni****INTRODUCTION**

Pratishyaya, commonly referred to as rhinitis in Ayurveda, is a condition characterized by inflammation and irritation of the nasal mucosa. It primarily manifests with symptoms such as nasal congestion, runny nose, sneezing, headache, and postnasal drip. In Ayurveda, *Pratishyaya* is not only seen as a local nasal condition but also as a systemic disorder affecting the respiratory system, rooted in the imbalance of *Doshas*—*Vata*, *Pitta*, and *Kapha*. Various factors such as seasonal changes (*Ritu*), dietary habits (*Ahara*), and lifestyle (*Vihara*) can lead to the aggravation of these *Doshas*, resulting in *Pratishyaya*. The classification of *Pratishyaya* is based on the dominant *Dosha* involved in the pathology. Among them, *Vataja Pratishyaya* is one of the prominent types, where *Vata Dosha* plays a significant role in the manifestation of the condition. *Vataja Pratishyaya* is primarily caused by the vitiation of *Vata Dosha*. In this form of *Pratishyaya*, the dryness and coldness of *Vata* lead to specific symptoms, including dry cough, scanty nasal discharge, headache, sneezing, and dryness in the nasal passages. The excessive movement of *Vata* can cause the symptoms to spread quickly, affecting not only the nasal tract but also other regions such as the head and chest.

Etiological factors contributing to *Vataja Pratishyaya* include exposure to cold, windy environments, intake of dry and cold food, irregular eating habits, excessive physical exertion, and stress. This type of rhinitis often presents with dry symptoms as compared to the *Kapha* or *Pitta*-dominant forms, which are characterized by excessive mucus or inflammation. Effective management of *Vataja Pratishyaya* in Ayurveda involves the use of therapies and medications that pacify *Vata Dosha*, along with lifestyle modifications to balance the body's internal environment.

Pathophysiology

From an Ayurvedic perspective, *Pratishyaya* results from the disturbance of *Kapha* and *Vata Doshas*. *Kapha*, when aggravated, leads to increased mucus production and congestion, while vitiated *Vata* can cause dryness and irritation in the nasal passages.

Factors influencing this imbalance may include:

- **Diet** Consumption of cold, heavy, and oily foods can increase *Kapha*.
- **Environmental Factors** Exposure to dust, pollen and pollution can trigger symptoms.
- **Seasonal Changes** Certain seasons, particularly *Vata* and *Kapha* seasons (like winter and monsoon) can exacerbate symptoms.

The accumulation of *Aama* due to improper *Agni* plays a critical role in the development of *Pratishyaya*.

Managing chronic rhinitis in Ayurveda involves addressing the root cause through holistic approaches, including dietary modifications, lifestyle changes, and the administration of specific Ayurvedic herbs and therapies that balance the vitiated *Dosha*. This case study explores the Ayurvedic management of chronic rhinitis, emphasizing personalized treatment protocols that aim to restore the body's natural equilibrium and alleviate long-standing symptoms.

MODERN

Chronic rhinitis is a long-lasting inflammation of the nasal mucosa, typically characterized by symptoms such as persistent nasal congestion, runny nose, sneezing, postnasal drip, and in some cases, reduced or altered sense of smell. Unlike acute rhinitis, which is often caused by viral infections or short-term irritants, chronic rhinitis persists for more than 12 weeks and can severely impact a person's quality of life.

From a modern medical perspective, chronic rhinitis can be broadly classified into two main types Allergic and Non-allergic rhinitis.

Allergic rhinitis occurs when the immune system overreacts to allergens like pollen, dust mites, pet dander or mold resulting in inflammation of the nasal passages.

**Meet Thakkar and Akshar Ashok Kulkarni**

Non-allergic rhinitis, on the other hand, is triggered by irritants such as pollution, strong odors, smoke, changes in weather, or even certain medications, without an immune response. Common contributing factors to chronic rhinitis include environmental allergens, irritants, structural abnormalities in the nasal passages (like a deviated septum), and, in some cases, underlying medical conditions such as asthma or chronic sinusitis. Treatment options in modern medicine often focus on symptom management and may include antihistamines, nasal corticosteroids, decongestants, saline rinses, or in severe cases, immunotherapy. Identifying and minimizing exposure to triggers is also a key part of managing chronic rhinitis effectively.

CASE REPORT**Patient's details****Name:** XYZ**Age:** 28years**Gender:** Male**Marital Status:** Married**Occupation:** Job**Chief complaints**

- Frequent Episodes of Sneezing with thick, clear nasal discharge immediately after bathing or exposure to cold wind, food and drinks for 4-5 years.
- Difficulty in sleeping due to nasal blockage during episodes for 4-5 years.
(Exacerbations of all symptoms during seasonal changes.)

Associated complaints/comorbidity

- Heaviness of head during episodes.

History of present illness

The patient is a 28-year-old male with a 4-5 year history of frequent episodes of sneezing and thick, clear nasal discharge, typically triggered by cold exposure, such as bathing, wind, food, and drinks. These episodes are sudden and include heaviness in the head and significant nasal discharge, alongside night time nasal congestion, leading to poor sleep and daytime fatigue. The patient denies fever, facial pain, or altered sense of smell. The patient has no notable medical history or known allergies but has relied on daily anti-histamine use during seasonal changes to manage symptoms. Despite attempts at home remedies and over-the-counter treatments, his symptoms persist and disrupt his quality of life.

Family history

Positive: Father [same history for 20 years]

Personal history

- Personal: No any addiction / habits
- Diet: veg, irregular timings, junk food consumption – once in week
- Appetite: good
- Bowel: regular, satisfactory [1 time per day]
- Micturition: regular [5-6 times per day]
- Sleep: sound [6-7 hours per night, no day sleep]
- Habits: No any

General examination

- Built : Average
- Nourishment : Good
- B.P : 120/80 mmHg
- Pulse : 78 bpm
- Temperature : Afebrile on Palpation

Meet Thakkar and Akshar Ashok Kulkarni

- Respiratory Rate : 18/min
- Weight : 68 kg
- Height : 167 cm

Specific tests for diagnostic assessment

▪ Asthavidha Pariksha

Nadi: KaphaVataja– 78bpm

Mootra:Samyaka

Mala: Samyaka

Jihva: Sama

Shabda: Prakrit

Sparsha: Anushnasheeta

Drika: Prakrit

Aakriti: Madhyama

▪ DashavidhaPariksha

Prakriti: KaphaPittaja

Vikriti: Kapha-Vata

Sara: Satvasara

Samhanana: Madhyama

Satva: Pravara

Satmya: Madhyama

Pramana: Madhyama

AaharaShakti: Pravara

VyayAamaShakti: Pravara

Vaya: Madhyama

Systemic examination

- Cardio Vascular System: No any abnormalities detected. S1S2 heard properly.
- Respiratory System: B/L Air Entry Equal.
- P/A: Soft and Nontender.

Specific Srotasa/Systemic examination involved in the pathogenesis

PRANAVAHA SROTASA :

Respiratory System :no abnormalities detected.

The patient has a normal breathing pattern, clear lung sounds, resonant percussion, and no signs of respiratory distress or disease.

Sampraptighataka

- Dosha : Kapha Vata
- Dushya:Rasa, Prana
- Dhatu : Rasa
- Agni :Jatharagni, Dhatvagni, Bhootagni
- Udbhvaasthana :Aamashaya
- Vyakta sthana : Nasa
- Srotas :Rasavaha, Pranavaha
- Srotodusti : Sanga, Vimargagamana
- Rogamarga :Abhyantara

Differential Diagnosis

- *Pratishyaya*, or common cold, is characterized by symptoms like nasal congestion, sneezing, rhinorrhea, and cough. However, these symptoms are shared by several other conditions, making it essential to differentiate between similar disorders.

Meet Thakkar and Akshar Ashok Kulkarni

Vasomotor Rhinitis

- Vasomotor rhinitis presents with similar symptoms of rhinorrhea, sneezing, and nasal congestion but is typically triggered by environmental factors like temperature changes, strong odors, or irritants. Unlike *Pratishyaya*, there is no underlying infection or dosha imbalance [1].

Allergic Rhinitis (*VatajaPratishyaya*)

- Allergic rhinitis resembles *Pratishyaya* with symptoms like sneezing, watery rhinorrhea, nasal obstruction, and itchy eyes. However, in allergic rhinitis, symptoms are often seasonal or triggered by allergens such as pollen or dust. Allergic rhinitis also tends to show more prominent itching, and it involves IgE-mediated immune responses [2,3].

Sinusitis (Peenasa)

- Sinusitis is characterized by inflammation of the sinuses, leading to thick nasal discharge, facial pain, headache, and nasal congestion. Unlike *Pratishyaya*, which typically has watery discharge, sinusitis often produces thick, purulent mucus. Facial tenderness over the sinuses and post-nasal drip are more prominent in sinusitis [4].

Influenza (*Vata-KaphajaJwara*)

- Influenza presents with more systemic symptoms than *Pratishyaya*, including high fever, body aches, fatigue, and chills, in addition to nasal congestion and cough. The severity of symptoms and the presence of fever distinguish influenza from *Pratishyaya*, which is generally milder and afebrile [5].

COVID-19 (SARS-CoV-2 Infection)

- COVID-19 shares symptoms such as nasal congestion, cough, and sneezing with *Pratishyaya* but often involves additional symptoms like fever, loss of taste or smell, and difficulty breathing. Severe cases can progress to pneumonia, which is absent in common colds [6]. Diagnosis is confirmed through PCR or antigen testing.

Deviated Nasal Septum (DNS)

- A deviated nasal septum may cause chronic nasal obstruction, which can be mistaken for recurrent *Pratishyaya*. However, DNS is often associated with structural deformities of the nasal septum, chronic sinusitis, and difficulty breathing through one or both nostrils [7].

Rhinitis Medicamentosa

- Rhinitis medicamentosa occurs due to the overuse of nasal decongestant sprays. Symptoms include chronic nasal congestion and rebound nasal obstruction upon discontinuation of the medication. This condition differs from *Pratishyaya* as it is caused by medication rather than an infection or *Dosha* imbalance [8].

Asthma (*Tamaka Shwasa*)

- Some cases of *Pratishyaya* involve cough and wheezing, which can overlap with symptoms of asthma. However, asthma is primarily a respiratory condition with wheezing, shortness of breath, and a history of exacerbations triggered by allergens or irritants. Asthma attacks may be more severe and are related to bronchoconstriction, unlike *Pratishyaya*[9].

Final Diagnosis and Treatment principles

Diagnosis *Pratishyaya* / *VatajaPratishyaya*

1. *Chikitsa Sutra* According to *Acharya Charaka*.

वातश्लेष्महराण्येवसेव्यानिप्रतिश्यायिनाम्।

स्नेहसिद्धानिसन्तर्पतेःरूक्षण्याशुविषोषणम्॥^[10]

(*Charaka Samhita, ChikitsaSthana, 26/209*)

Meet Thakkar and Akshar Ashok Kulkarni

2. *Chikitsa Sutra* According to *Acharya Sushruta*.

नस्यंविरेचनंधूमःस्वेदनंमनंतथा।

प्रतिश्यायेप्रयुञ्जीतयथादोषंयथाबलम्॥^[11]

(*Sushruta Samhita, Uttara Tantra, 24/20*)

Treatment plan with timeline, details of materials used

1. *Pratimarsha Nasya* with *Shadbindu Taila*– OD (early morning) for 6 months.
2. *Bharangyadi Kwatha* 40 ml BD Before Food for 1 month.
3. *Sitopladi Churna* 5 gm with Madhu – TDS After Food for 1 month.
4. *Haridra Khanda* 1 tsp with Luke warm water – OD (early morning – empty stomach) for 6 months.

After 3 months of administration of medicines

- After completing the prescribed course of treatment, the patient demonstrated significant improvement in clinical symptoms.

• Symptomatic Improvement

- The patient reported 90% relief in symptoms, including:
- Sneezing episodes: Reduced from frequent daily occurrences to occasional instances, primarily in the morning or when exposed to allergens.
- Nasal discharge: Initially watery and persistent, now significantly reduced, with occasional mild discharge.
- Nasal congestion: Improved markedly, with the patient experiencing a sense of clear nasal passages most of the time.
- Head heaviness: This symptom, which was previously associated with congestion, has nearly resolved, allowing the patient to maintain regular daily activities without discomfort.

• General Well-being

- The patient reported an overall improvement in energy levels, with no significant fatigue or lethargy that had previously been linked to the condition.
- The patient expressed an improved sense of well-being, with an enhanced ability to focus and engage in daily tasks without the distraction of symptoms.

• Sustainability of Relief

- During the follow-up period, extending up to 1 year, the patient maintained sustained relief from symptoms, with no major flare-ups or recurrences.
- Occasional mild sneezing or nasal discharge was observed, primarily during seasonal changes, but these episodes were manageable and did not interfere with daily life.

• Lifestyle Modifications

- The patient adhered to dietary modifications aimed to avoid recurrence, such as avoiding cold, heavy, and mucus-forming foods, and incorporating warm, light, and easily digestible meals.

• Conclusion:

- After 3 months of the administration of treatment, the patient achieved 90% reduction in symptoms and has maintained this level of relief over the course of 1 year with no significant recurrence.
- The patient is advised to continue with the prescribed lifestyle modifications and seasonal preventive therapies (such as *Nasya*) to prevent further exacerbation of symptoms.

DISCUSSION

Pratishyaya has its own chapter in the *Uttaratantra*, as explained by *Acharya Sushruta*, it demonstrates how important it has been from ancient times. *Pratishyaya* is a general term that refers to all upper and lower respiratory tract

Meet Thakkar and Akshar Ashok Kulkarni

diseases as well as nasal and paranasal sinus infections. *Pratishyaya* can manifest on its own, as a side effect of numerous other diseases, or as a sign of any systemic disorder. Basically, *Pratishyaya* is a *TridoshajaVyadhi* that is dominated by *Vata* and *Kapha*. *Aamavastha* and *Pakwavastha* are the first two phases of *Pratishyaya*, if these stages are ignored or mismanaged, *Jirna Pratishyaya*, a severe and more intricate stage, results. One kind of *Panchakarma* therapy involves the administration of medicine or medicated oil through the nose, or *Nasya*. For the illness above the clavicle, it is thought to be a good treatment. Because *Nasya* can rid *Urdhvajatru* of deeply ingrained *Dosha*, it is chosen as the primary *Shodhana Karma* (Eliminative treatment) in this study.

Anu Taila, with its *Sukshma*, *Vyavayi*, *Laghu*, and *Tikshna Gunas*, *Ushna Veerya*, *KatuVipaka*, and *Tikta-Katu Rasa*, effectively penetrates *Srotas*, clears nasal congestion, relieves headaches, and drains purulent discharge. Its *Madhura Rasa*, *Snigdha Guna*, *Sheeta Veerya*, and *Tridoshahara* properties nourish the body, enhance strength, and boost immunity. This immunomodulation reduces nasal inflammation, while *Shamana Aushadha* restores *Agni*, promoting *Dhatu Parinaama* and preventing further nasal allergies.[12]. The *Brihat Trayi* texts describe *Bharangi* as an effective expectorant, anti-inflammatory, and antipyretic agent. Modern research supports these traditional uses, showing that *Bharangi* exhibits significant expectorant, anti-inflammatory, and antimicrobial effects. Compounds like flavonoids, terpenoids, and phenolic acids in *Bharangi* are associated with these therapeutic properties. This scientific validation aligns with its traditional application in treating respiratory conditions such as asthma, bronchitis, and related ailments.[13]. Saponin and D-mannitol in *Bharangi* are known for their antihistaminic and antiallergic properties. Additionally, apigenin-7-glucoside, a flavonoid isolated as a yellowish-brown amorphous solid, has shown notable anti-inflammatory effects [14], antimicrobial[15], hepatoprotective[16] and antidiarrheal [17] properties.

Bharangyadi Kwatha has a strong potential to alleviate symptoms of *Pratishyaya* by targeting the root cause of *Kapha* and *Vata* imbalance, which is central to this disorder. The formulation works through its pharmacological actions derived from its ingredients.[18-26]

Kapha-Vata Shamana

Bharangi (*Clerodendrum serratum*) is the main herb in this formulation that has *Kapha-Vata* pacifying properties, helping to reduce excessive mucus and ease respiratory congestion. It has bronchodilator effects that relieve breathing difficulties and nasal congestion in cold-related conditions. *Kantakari* (*Solanum xanthocarpum*) acts as an expectorant and anti-inflammatory agent, facilitating the removal of phlegm and reducing inflammation in the nasal and respiratory tract.

Mucolytic and Expectorant Action

Bharangi and *Pippali* (*Piperlongum*), both acts as potent mucolytics. They help liquefy the thick *Kapha* (mucus), making it easier for the body to expel through expectoration, thereby relieving nasal blockage and chest congestion. *Kantakari* further helps in loosening the mucus and clearing the airways, promoting easier breathing in conditions of *Pratishyaya*.

Anti-inflammatory and Antioxidant Properties

Shunthi (*Zingiber officinale*), with its anti-inflammatory and antioxidant effects, soothes irritation and reduces inflammation in the respiratory tract, providing relief from symptoms like nasal irritation and throat discomfort. *Dashamoola*, has been found to be effective in reducing inflammation and clearing the *Srotasa*, thereby easing symptoms like nasal congestion and cough.

Shwasahara (Respiratory Relief)

Bharangi and *Kantakari* possess *Shwasahara* properties, helping to reduce respiratory distress, ease breathing, and alleviate symptoms like nasal congestion and difficulty in breathing. These herbs act as natural bronchodilators, providing symptomatic relief in cold-related respiratory distress.

Meet Thakkar and Akshar Ashok Kulkarni

Agni Deepana and Aama Pachana

Shunthi and *Pippali* are known to stimulate *Agni*, which aids in the digestion of *AaAama* often associated with respiratory disorders. This enhances metabolism and prevents the accumulation of toxins that can trigger or worsen *Pratishyaya*.

Rasayana (Rejuvenative) and Immunomodulatory Effects

The *Rasayana* properties of ingredients like *Pippali* and *Dashamoola* help to strengthen the immune system, reducing the recurrence of colds by improving the body's natural defence mechanisms. *Bharangyadi Kwatha* thus not only provides symptomatic relief but also works on enhancing immunity, preventing further episodes of respiratory distress in individuals prone to frequent colds.

Sitopaladi Churna is a well-known formulation that provides effective relief in *Pratishyaya* by pacifying the aggravated *Kapha* and *VataDoshas*, which are the main contributors to the symptoms like nasal congestion, sneezing, and cough [27-33].

1. *Kapha-Vata Shamana*

Sitopala acts as a base and helps in balancing the cooling nature of *Kapha* while reducing irritation and soothing the throat. *Pippali* (*Piper longum*) plays a major role in pacifying *Kapha* and *Vata* by acting as a bronchodilator and expectorant. It helps in clearing mucus from the respiratory tract, thus relieving congestion and easing breathing.

2. Mucolytic and Expectorant Action

Vanshaalochan (*Bamboo manna*) has expectorant properties that assist in liquefying the accumulated *Kapha* (mucus) and facilitating its removal from the respiratory system. This reduces nasal congestion and clears the airways.

Pippali and *Vanshalochana* together work as expectorants, thinning the mucus and easing its expulsion, thereby reducing cough and congestion.

3. Anti-inflammatory and Soothing Effect

Tvak (*Cinnamomum zeylanicum*) and *Ela* (*Elettaria cardamomum*) exhibit anti-inflammatory properties that help reduce inflammation of the nasal mucosa and respiratory passages. This alleviates irritation and discomfort associated with nasal congestion and coughing.

The soothing effect of *Ela* also helps in relieving throat irritation caused by constant coughing.

4. *Agni Deepana* and *Aama Pachana*

Pippali is a known digestive stimulant that enhances the function of *Agni*, aiding in the digestion of *Aama*. In Ayurveda, *Aama* is often linked to the development of respiratory conditions like *Pratishyaya*. By eliminating *Aama*, *Pippali* helps in addressing the root cause of the disorder.

5. *Shwasahara* (Respiratory Relief)

The combined actions of *Vanshalochana* and *Pippali* help to clear the respiratory channels, thus relieving symptoms like nasal congestion, chest tightness, and difficulty in breathing. This makes it effective in treating *Shwasa* (breathlessness) and *Pratishyaya* symptoms.

6. Rasayana (Rejuvenation) and Immunomodulatory Effect

Pippali and *Tvak* are considered *Rasayanas*, which not only help in treating the acute symptoms but also strengthen the immune system. This helps in preventing recurrent episodes of *Pratishyaya* by boosting the body's natural defences against respiratory infections.

Haridra Khanda is primarily composed of *Haridra* (*Curcuma longa*), along with other ingredients like sugar, *Pippali* (*Piper longum*) and *Ghrita* (ghee). It is highly effective in managing allergic conditions, particularly in *Pratishyaya* due to its immunomodulatory, anti-inflammatory and antihistamine properties. It primarily works by pacifying the aggravated *Kapha* and *VataDoshas*, which are responsible for the symptoms of *Pratishyaya*. [34-43]

1. *Kapha-Vata Shamana*

Haridra is known for its ability to balance both *Kapha* and *VataDoshas*. In *Pratishyaya*, where *Kapha* causes excess mucus production and *Vata* leads to dryness and irritation, *Haridra Khanda* helps reduce these symptoms by its *Tridosahara* properties. It effectively reduces mucus, clears nasal congestion, and soothes the respiratory tract.

2. Anti-inflammatory Action

**Meet Thakkar and Akshar Ashok Kulkarni**

Curcumin, the active compound in *Haridra*, has potent anti-inflammatory properties. It reduces inflammation of the nasal mucosa and respiratory pathways, which are commonly inflamed during *Pratishyaya*. By decreasing inflammation, *Haridra Khanda* alleviates symptoms like nasal obstruction, sneezing, and throat irritation.

This anti-inflammatory action also helps in preventing the progression of allergic rhinitis to sinusitis or chronic respiratory issues.

3. Antihistamine and Antiallergic Effect

Haridra Khanda is particularly effective in treating allergic types of *Pratishyaya*, where allergens trigger the release of histamines, leading to symptoms like sneezing, rhinorrhea, and itching. *Haridra* acts as a natural antihistamine by inhibiting the release of histamines and stabilizing mast cells, which reduces allergic responses in *Pratishyaya*.

4. Immunomodulatory and *Rasayana* (Rejuvenative) Action

Haridra Khanda has a strong immunomodulatory effect, which enhances the body's ability to fight infections and allergies. By boosting the immune system, it helps in reducing the frequency and severity of recurrent *Pratishyaya* episodes.

As a *Rasayana*, *Haridra Khanda* nourishes and rejuvenates the body, enhancing overall health and resilience to seasonal variations and environmental allergens, which often triggers *Pratishyaya*.

5. Antioxidant Properties

The antioxidant effect of Curcumin helps reduce oxidative stress caused by inflammation and allergic reactions in the respiratory tract. This prevents tissue damage and promotes faster recovery in cases of *Pratishyaya*.

6. *Deepana* and *Pachana*

Improper digestion and the accumulation of *Aama* are considered contributing factors to respiratory diseases like *Pratishyaya*. *Haridra Khanda*, through its *Deepana* and *Pachana* properties, helps improve digestion and clears *Aama*, thereby addressing the root cause of recurrent respiratory conditions.

CONCLUSION

The patient was administered medication for a duration of one year and demonstrated significant improvement in symptoms, including sneezing and nasal discharge. The patient remained under observation for the entire year, with follow-up assessments conducted during subsequent seasonal variations. Notably, the patient did not experience a recurrence of symptoms during the follow-up period, indicating sustained relief and symptom remission. The Ayurvedic management of *Vataja Pratishyaya* demonstrates the efficacy of holistic treatment approaches that address both the underlying *Dosha* imbalances and the symptomatic manifestations of the condition. Through a combination of herbal formulations, including *Bharangyadi Kwatha*, *Sitopaladi Churna*, *Haridra Khanda* and *Shamshamani Vati* altogether with *Anu Taila Nasya* - the case study presented significant improvements in the patient's symptoms, particularly sneezing, nasal discharge, nasal blockage and heaviness of head.

The use of therapies aimed at pacifying Vata *Dosha*, combined with immune-modulating and anti-inflammatory herbs, provided sustained relief without recurrence during seasonal variations. This case highlights the importance of individualized, *Dosha*-specific treatment in Ayurveda and reaffirms the potential of Ayurvedic interventions in managing chronic respiratory conditions like *Vataja Pratishyaya* effectively. Further studies with larger patient groups could substantiate these findings and contribute to a more widespread adoption of Ayurvedic therapies for respiratory ailments.

ABSTRACT

Since literature is essentially created and meant for the community, it plays a significant role in revealing societal issues in addition to being a medium for amusement. Among other things, literature's function as a teaching, reference, reflection, character-building, and critical tool is growing as a result of the revelation of societal issues. Thus, it is evident that literature serves a variety of purposes. Because literature is entertaining, the community is capable of comprehending the lesson it conveys. Anuradha Roy's novel *An Atlas of Impossible Longing* is a poignant exploration of social constraints and human suffering in early Twentieth Century India. The novel intricately weaves themes of caste discrimination, gender oppression, forbidden love, and the struggle for identity, reflecting the deep-seated predicaments faced by its characters. This paper examines the ethical issues that shape the lives of the main characters and demonstrates how Roy utilizes them to question accepted norms in society.

Research Questions

1. What are the distinctive viewpoints adopted in this 20th Century fiction?
2. In what way is the social predicaments within the society explored?
3. What specific elements of social predicaments are skillfully woven into the overall impact of the novel?
4. To what extent does the elevation of Bakul's role provide a feminist perspective?

**Vetrivel et al.,****Objective of the Study**

The objective of the study is to examine Anuradha Roy's novel *An Atlas of Impossible Longing*, analyzing its unique perspective on characters, exploring the social problems within the societal norms, and evaluating its contributions to feminist discourse, ethical and moral considerations, and social commentary within the broader context of the 20th Century people.

Methodology Adopted

The researcher has applied critical thematic analysis as the methodology for the current study.

Formatting

The research has cited the Seventh Edition of MLA Handbook for Writers of Research Papers.

Limitations

This study is limited to exploring Indian Writing in English especially Indian 20th Century fiction and its gender discrimination, social values, societal taboos, gender oppression, ethical dilemmas, and moral predicaments.

Keywords: Social dilemmas, deceitfulness, moral predicaments, societal norms, ethical decisions, gender oppression, struggle for identity.

INTRODUCTION

Literature often serves as a mirror reflecting the complexities of human existence, particularly in the context of social hierarchies and cultural traditions. *An Atlas of Impossible Longing* is a powerful narrative that unveils the deep-seated inequalities and constraints imposed by society. The portrayal of social issues that people frequently encounter serves as the catalyst for this fiction. Generally speaking, social issues are intricate and affect every aspect of society. Therefore, all groups have always been concerned about the societal problem. Roy's novel presents characters who struggle against rigid social structures, experiencing profound conflicts of love, identity, and belonging. This study explores the social predicaments in the novel, focusing on caste-based discrimination, gender oppression, social taboos around relationships, and the challenges of personal identity. According to the sociology of literature, social issues which are issues that all people, whether individually or in groups, face are intimately tied to literature and all of its genres. Numerous issues in life are expressed in literature. Literary works serve as a platform for the expression of thoughts, ideas, and experiences. Through literature, the public or reader is given a glimpse into the author's inner experience. With the concept that literary works cannot be constrained by time and space, literature serves as both a social reflection and a picture or image of the world of social reality that transcends its time. Literature benefits society by encouraging introspection, which can be expressed in acts that are either constructive or destructive; perception and interpretation, the key factors in this process. The way that literature portrays life transcends social reality, hence it is impossible to separate literature from society. The idea that literature reflects society has long been recognized. It is true that literature captures society's virtues and vices. Literature serves a corrective purpose by reflecting societal faults in an effort to help society see its errors and make remedies. Additionally, it portrays the positive traits or ideals of society for others to aspire to. Literature, as an imitation of human action, often presents a picture of what people think, say and do in the society (Duhan, 2015). This is in line with Dubey (2013) stating that literature mirrors society. What happens in a society is reflected in literary works in one form or another. Additionally, literature serves as societal criticism or social control. As a result, literature serves as a means of communication within the community and attempts to exert control over the development of a social system or social process. Literary works truly have a social purpose if they are employed as a vehicle for expressing disapproval of social realities that are not in line with societal goals. By reacting to the power functions of leaders, literary works fulfill their social role. Literary works that take the style of social critique respond to leaders or the government who do not care about the interests of the people. Literary works serve as warnings to individuals who have abused their position of authority. It is anticipated that this literary work's social purpose would raise awareness and motivate

**Vetrivel et al.,**

people to take action that will advance the general welfare. *An Atlas of Impossible Longing* is an avenue of communication for social criticism. Roy exposes the socio-economic issues that the community faces through this fiction, particularly those who are classified as lower-class or belong to what are sometimes called marginal populations. This peripheral society is characterized by poverty, which also serves as a catalyst for other social issues. Poverty is characterized by a number of factors, such as the poor standard of living for the populace, the inadequate and poor quality of food, the poor and limited health, the poor nutrition of children, and the poor quality of education. Social problems focus on the breakdown of basic social institutions that must take care of individuals and assure the survival of the society and its social institutions (Mill in Kerbo and James, 2006). Social problems can also be defined as every sort of behavior, whether one person or a group, that deviates from the norms of everyday life. In addition to being unpleasant, harmful, and harmful to many, social problems can upset the status paradigm in a community and break the established social order. The sociology of literature is an approach to literary works that examines values and social functions. Several methods utilizing specific theories and attitudes are included in this sociological approach. One trait unites all of these methods: they are concerned with literary works as social connections made by authors who are also members of society. The sociology of literature, which encompasses the author's social environment, the social purpose of literature, and literature as a mirror of society, is fundamentally based on the relationships among the author, the text, and society. This study examines how literature serves as a vehicle for expressing social issues through *An Atlas of Impossible Longing* by Anuradha Roy with the following points of discussion: caste and class discrimination, gender oppression and the role of patriarchy, social taboos and forbidden love.

Caste and Class Discrimination

One of the most significant social predicaments in the novel is caste and class-based discrimination, which has long dictated individuals' social mobility, relationships, and life choices in India. The caste system is deeply ingrained in society, often determining the course of a person's life from birth. Those born into privileged castes enjoy advantages in education, employment, and social standing, while those from lower castes or uncertain backgrounds face systemic barriers and prejudice. Mukunda, the novel's protagonist, is an orphan with an unknown lineage, which places him in an ambiguous and vulnerable position within this rigid hierarchy. Though he is raised by the affluent Ghosh family, he is never truly accepted as one of their own due to his uncertain origins. His ambiguous caste identity marks him as an outsider, limiting his opportunities and subjecting him to persistent discrimination, despite his intelligence and capabilities. They are unaware of his caste because they do not know his parents. They regarded Mukunda with prejudice and arched their eyebrows at the caste issue. Mukunda found it upsetting that he was being treated differently in the home due to caste. Being an orphan as an adult has given him a sense of independence. Being an orphan as an adult gave him a sense of independence, which he describes as:

"Among parent-owning boys, I began to feel a sense of freedom as I grew up: they had a hundred things forbidden them, I had none. I could make myself as I pleased. I was free of caste or religion; that was for the rest of the world to worry about. I felt released from the burden of origins, from the burden of belonging anywhere, to anyone." (Roy, p.179). Mukunda's fate is ultimately determined by his lack of a clearly defined caste, leading to his forced exile from the Ghosh household. His displacement highlights the inflexible nature of Indian society, where an individual's worth is assessed based on birth rather than merit or personal achievements. Even though Mukunda grows up within an affluent environment, he remains on the fringes, never fully integrated or granted the same privileges as those with an established caste identity. His struggles underscore the harsh reality of social immobility, as those outside privileged circles often find themselves trapped in a cycle of exclusion and marginalization, regardless of their talents or aspirations. Manjula's remark is dismissive and possibly resentful. It reinforces Mukunda's outsider status, suggesting that his presence is seen as a burden. Despite being raised in the household, he is not treated as an equal family member. Her exaggerated statement implies that Mukunda's basic needs are perceived as excessive, further emphasizing the rigid class and caste distinctions that dictate his place in the home.

"Bakul moved a piece of fish from side to side on her plate as if that would make it disappear. Mukunda, who was always hungry nowadays, wondered if he could have some more rice.

"The boy will eat us out of house and home!" Manjula exclaimed." (Roy, p.119)

Vetrivel et al.,

Through Mukunda's experiences, Roy critiques the deep-seated prejudices that continue to shape Indian society. The novel exposes how caste and class divisions remain deeply entrenched, dictating people's opportunities and reinforcing social hierarchies, even in an evolving world.

Gender Oppression and the Role of Patriarchy

The novel also portrays the plight of women in a patriarchal society, shedding light on the systemic oppression they endure. Female characters like Shanti, Meera and Bakul navigate a world where societal expectations dictate their roles and limit their autonomy. Women are expected to conform to traditional gender norms, which often reduce them to mere instruments of marriage and family honour. Their desires, ambitions, and individuality are frequently disregarded in favour of societal expectations, reflecting the broader suppression of women in early Twentieth Century India. Amulya's cousin is discussing the selection of a bride for Nirmal, emphasizing that Shanthi, the proposed match, will be an ideal daughter-in-law to Kananbala. The description of Shanthi highlights traditional virtues expected of women at the time. "As they waited, Amulya's cousin said to Kananbala, "Boudi, I will send you a picture of the girl as soon as I reach Calcutta. I'm sure you'll like her. I know your household, she'll make a perfect daughter-in-law. Shanthi is her name, I'm sure.... sings well, cooks well, and has lived a secluded life always. So unpolished. Not like our Calcutta girls. And as for this rascal," he said, chuckling at Nirmal...." (Roy, p.27) The cousin contrasts Shanthi with "Calcutta girls," implying that urban women are more modern or independent, which is not seen as a desirable trait in a bride. The term "unpolished" is paradoxically used as a compliment, indicating that she has not been exposed to modern influences that might challenge traditional gender norms. This reflects the societal preference for women who are submissive and domesticated. Meera's fate exemplifies the rigid gender roles imposed on women. She is forced into an unhappy marriage, where she is expected to be a dutiful wife regardless of her personal feelings or aspirations. Her life is marked by subjugation and a lack of agency, illustrating how marriage, rather than being a matter of choice, was often a duty imposed upon women. She has little control over her future, reinforcing the idea that a woman's worth is tied to her ability to conform to societal expectations rather than her own dreams and desires. Bakul, in contrast, embodies resistance against these traditional gender norms. She is intelligent, strong-willed, and unwilling to submit to societal pressures that seek to confine her. However, her defiance comes at a cost, as she constantly faces obstacles and reminders of her place in a male-dominated world. Her journey highlights the struggles of women who attempt to challenge oppressive systems and assert their independence. Family responsibilities eclipse Bakul's aspirations for freedom, illustrating a social structure that restricts the independence of women. As Bakul reflects, "Freedom was a distant concept - so near, yet always out of reach" (Roy p.211). Her obligation to her family takes precedence over her desire for independence, highlighting the intricate relationship between personal choice and social norms. The contrast between Meera and Bakul underscores the limited choices available to women and the harsh consequences of defying societal expectations. Through these characters, Roy critiques patriarchal oppression and emphasizes the urgent need for change, advocating for greater autonomy and equality for women in a society that seeks to control their destinies.

Social Taboos and Forbidden Love

Another major social predicament explored in the novel is the restriction of love and relationships due to social taboos. Romantic relationships in *An Atlas of Impossible Longing* are dictated by caste, class, and societal expectations rather than personal choice, revealing the rigid structures that govern human connections. Meera, care-taker of Bakul and Mukunda, when society forces an orphan under Amulya's care to live in seclusion, a new story must be told. Because she is a widow, society views Meera as an outsider and places limitations on her choices, including her eating habits. In an occasion, Meera is asked what she would like to do before passing away, and her response is "Onion, garlic, fish," Meera said, surprised by the words that came out of her mouth, the clarity of her enunciation. "I'd like to eat everything I'm forbidden. I'd like to eat everything once before I die." (Roy, p.150). A widow's identity is forcibly reduced to a state of denial, and society determines how she lives. Love, instead of being a personal and emotional bond, is often treated as a social contract bound by rules and restrictions. Those who dare to challenge these norms face severe consequences, as seen in the relationships of Mukunda and Bakul, as well as Meera and Nirmal. Mukunda and Bakul's relationship is constrained by class hierarchy. Although they share a profound bond, Mukunda's lower social status makes him an unworthy suitor in the eyes of society. His love for Bakul is seen

**Vetrivel et al.,**

as inappropriate because he does not belong to the same privileged class, reinforcing the idea that love must conform to social norms rather than individual emotions. Similarly, Meera and Nirmal's love is deemed unacceptable due to religious and social differences. Their relationship is doomed from the start, as society forbids unions that defy traditional boundaries. Despite their deep affection for one another, their love is overshadowed by the weight of cultural divisions, making it impossible for them to be together. Through these doomed relationships, Roy underscores the cruelty of societal expectations that prevent individuals from following their hearts. The novel critiques the rigid social structures that dictate personal happiness, demonstrating the devastating consequences of these taboos. By portraying love as something controlled by societal norms rather than personal choice, *An Atlas of Impossible Longing* highlights the deep-rooted prejudices that continue to shape relationships, forcing individuals to choose between love and social acceptance. Throughout the novel, the characters grapple with a profound sense of identity and belonging, making it one of the major social predicaments they face. In a society where status and lineage dictate one's place, those who lack a defined identity are often marginalized. Mukunda, the protagonist, experiences this firsthand, as his life is shaped by his uncertain origins. As an orphan with unknown family background, he does not fit into any established social category, which leads to his rejection and eventual exile from the Ghosh household. Despite being raised among the privileged, he remains an outsider, denied the same acceptance and opportunities as those with a clear social standing. His struggle reflects the broader issue of identity in a society that values birthright over individual merit, illustrating how rigid social structures can deprive individuals of a sense of belonging. Similarly, the decaying Ghosh mansion serves as a powerful metaphor for the impermanence of identity and belonging. Once a grand estate symbolizing wealth and legacy, the mansion deteriorates over time, mirroring the changing fortunes and struggles of its inhabitants. Just as the mansion loses its former grandeur, the characters find their sense of identity slipping away, shaped by circumstances beyond their control. The novel suggests that identity is often imposed by external factors such as family, class, and tradition rather than being a product of personal choice, making it a lifelong source of struggle. Roy's portrayal of identity crises highlights the difficulties faced by those who do not conform to societal norms. Mukunda's journey of self-discovery is marked by hardship and rejection, but his resilience ultimately underscores the importance of forging one's own identity despite societal exclusion. Through his story, the novel challenges rigid definitions of belonging and calls for a more inclusive understanding of identity.

Implications

This study implies that exploring literature, particularly the Twentieth Century fiction, can provide rich insights into societal norms, ethical considerations, and gender dynamics.

Major Findings

The researcher has attempted to trace the exploration of social predicaments, cultural discourse and feminist perspectives in the Twentieth Century literary work.

CONCLUSION

An Atlas of Impossible Longing is a powerful commentary on the rigid social structures that govern human lives. Through its exploration of caste discrimination, gender oppression, forbidden love, and struggles of identity, Roy exposes the deep-rooted inequalities and predicaments faced by individuals in early Twentieth Century India. The novel serves as both a critique of societal norms that limit personal freedom and happiness and a poignant reflection on the consequences of these restrictions. By giving voice to those marginalized by society, Roy compels readers to question these structures and advocate for change. One of the novel's central themes is caste-based discrimination, which dictates an individual's social mobility and opportunities. Mukunda, the protagonist, is an orphan with an unknown lineage, which immediately places him in a vulnerable position. Though he is raised by the affluent Ghosh family, he is never truly accepted due to his uncertain origins. His ambiguous caste identity marks him as an outsider, leading to his eventual exile and reinforcing the rigid structures of Indian society, where birth determines one's status more than merit. Mukunda's experiences highlight the struggles of those denied equal opportunities

**Vetrivel et al.,**

simply because they do not fit within the established social hierarchy. Similarly, the novel critiques gender oppression through the experiences of Meera and Bakul. Meera is forced into an unhappy marriage, illustrating the lack of agency women had in making life choices. Her story reflects the broader suppression of women, where marriage was often an obligation rather than a personal decision. In contrast, Bakul resists these traditional gender roles, striving for independence and self-determination. However, her defiance comes with challenges, as she faces constant reminders of her place in a male-dominated world. The contrast between Meera and Bakul highlights the limited choices available to women and the consequences of resisting societal expectations. Another significant theme in the novel is the restriction of love and relationships due to social taboos. Romantic relationships are dictated by caste, class, and societal expectations rather than personal choice. Meera and Nirmal's love is forbidden due to religious and social differences, and Mukunda and Bakul's relationship is deemed inappropriate because of Mukunda's lower social status. These doomed relationships underscore the cruelty of societal norms that prevent individuals from following their hearts, reinforcing division rather than unity. Roy critiques these rigid structures, demonstrating the emotional suffering they inflict. The struggle for identity and belonging is another major predicament explored in the novel. Mukunda's uncertain origins leave him without a clear place in society, making him an outsider despite his intelligence and potential. The decaying Ghosh mansion serves as a metaphor for the impermanence of identity, symbolizing the instability of social status and belonging. Through Mukunda's journey, Roy highlights the difficulty of forging one's own identity in a world that values lineage over individuality. In analyzing the social predicaments in the novel, it becomes evident that these issues are not confined to the past but continue to shape contemporary society. The novel's themes remain relevant, making it a poignant exploration of human longing and resilience in the face of adversity. Roy's work challenges readers to reflect on these injustices and consider how these struggles persist in the current scenario.

ABSTRACT

In this paper, the bi-edge domination number for a simple graph G is introduced by imposing distance condition on an edge dominating set of G . Some bounds and results on these parameter are established. The bi-edge dominating sets of G are characterized. Also, the exact values of these domination numbers are found for some classes of standard classes of graphs.

Keywords: Bi-edge Dominating Set, Bi-edge Domination Number.

AMS (MoS) Subject Codes: 05C50, 05C69

INTRODUCTION

In this paper, $G = (V, E)$ means a finite, simple and undirected graph with p vertices and q edges. p and q are named as order and size of G . The graph terms not defined here are used in the sense of Harary[2]. The degree of the vertex v in a graph G is the number of edges of G incident with v and is denoted by $deg(v)$. The degree of an edge $e = uv$ in a graph G is defined by $deg(e) = deg(u) + deg(v) - 2$. The minimum and maximum degree of edges of G are denoted by $\delta'(G)$ and $\Delta'(G)$ respectively. For any real number x , $\lfloor x \rfloor$ denotes the largest integer less than or equal to x and $\lceil x \rceil$ denotes the smallest integer greater than or equal to x . All the graphs are referred from Joseph A. Gallian[4]. If G has order n , the corona of G with H denoted by $G \odot H$ is the graph obtained by taking one copy of G and n copies of H and joining the i^{th} vertex of G with an edge to every vertex in the i^{th} copy of H . The Cartesian product $G_1 \times G_2$ of two

Thirunavukkarasu and Sriram

graphs G_1 and G_2 is defined to be the graph whose vertex set $V_1 \times V_2$ and two vertices $u = (u_1, u_2)$ and $v = (v_1, v_2)$ in $V = V_1 \times V_2$ are adjacent in $G_1 \times G_2$, if either $[u_1 = v_1 \text{ and } u_2 v_2 \in E(G_2)]$ or $[u_2 = v_2 \text{ and } u_1 v_1 \in E(G_1)]$.

The edge domination is a well-known factor in graph theory, in which the distance between two edges is one of the essential tool to measure various edge domination parameters. A set F of edges in G is called an edge dominating set (ed-set) of G if every edge in $E - F$ is adjacent to at least one edge in F . The edge domination number $\gamma'(G)$ of G is the minimum cardinality of the edge dominating sets of G . An *ed-set* of G with cardinality $\gamma'(G)$ is denoted by γ' -set. In this paper, the bi-edge dominating set is introduced by posting the edge distance condition on an ed-set of G . By studying the minimality condition on the bi-edge dominating sets, the bi-edge domination number is defined and its exact values are obtained for some standard classes of graphs.

BI-Edge Domination Number

Definition: 2.1. An edge walk in a graph is an alternating sequence of edges and vertices beginning and ending with edges. The edge walk between the edges e_1 and e_k is denoted by $w'(e_1, e_k)$. An edge walk $w'(e_1, e_k)$ is said to be an edge path if no two edges in it is traversed more than once and it is denoted by $p(e_1, e_k)$. The number of occurrence of vertices in the sequence of an edge walk $w'(e_1, e_k)$ is called the edge length of $w'(e_1, e_k)$ and it is denoted by $l'(e_1, e_k)$. The edge distance between two edges e and f denoted by $d'(e, f)$ is the smallest edge length of all $p(e, f)$ in G .

Example: 2.2. For the graph G in Figure 1, the edge distance between the edges e_1 and e_5 is obtained from the following edge walk and its length $w'_1(e_1, e_5): \{e_1 v_1 e_6 v_6 e_5\}$, $w'_2(e_1, e_5): \{e_1 v_2 e_8 v_5 e_5\}$, $w'_3(e_1, e_5): \{e_1 v_2 e_2 v_3 e_7 v_6 e_5\}$, $w'_4(e_1, e_5): \{e_1 v_2 e_2 v_3 e_3 v_4 e_4 v_5 e_5\}$ are $l'_1(e_1, e_5) = 2$, $l'_2(e_1, e_5) = 2$, $l'_3(e_1, e_5) = 3$, and $l'_4(e_1, e_5) = 4$. Hence $d'(e_1, e_5) = \min\{2, 2, 3, 4\} = 2$.

Definition: 2.3. An edge dominating set A of a graph $G = (V, E)$ is said to be a bi-edge dominating set (*bed-set*) if for every edge e in $E \setminus A$, there exists at least one f in A such that $d'(e, f) = 2$. The minimum cardinality taken over all *bed-sets* of G is called the bi-edge domination number and it is denoted by $\gamma'_b(G)$. A *bed-set* of G with cardinality $\gamma'_b(G)$ is denoted by γ'_b -set.

Example 2.4. For the graph G in Figure 2, the edge sets $X_1 = \{e_4, e_8\}$, $X_2 = \{e_1, e_2, e_7, e_8\}$ are respectively γ' -set and γ'_b -set of G . It gives $\gamma'(G) = 2$ and $\gamma'_b(G) = 4$.

Remark 2.5. Since the *bed-set* of G does not exist if either the considered graph is disconnected or no two edges in G having distance two. Hence for the study of bi-edge domination number throughout the paper assumes that G is connected with atleast three edges. In particular, without loss of generality, let us assume that G has atleast one γ'_b -set.

Bounds, Characterization and Exact Values

In view of the graph given in Example 2.4, we have the following result.

Theorem 3.1. For any graph G , $\gamma'(G) \leq \gamma'_b(G)$.

Proof Since every *bed-set* of G is necessarily an edge dominating set of G gives the above result immediate.

Corollary 3.2. For any graph G , $\frac{q}{\Delta'(G)} \leq \gamma'_b(G)$, where $\Delta'(G)$ is the maximum edge degree of G .

Proof Since G is connected, gives $\frac{q}{\Delta'(G)+1} \leq \frac{q}{\Delta'(G)}$. From the lower bound of edge domination number $\frac{q}{\Delta'(G)+1} \leq \gamma'(G)$, and by using the above theorem, one can get the lower bound of $\gamma'_b(G)$ in terms of its edge degree. Further, the equality holds for the path graphs P_4, P_6 and cycle C_4 .

The following result give bounds of $\gamma'_b(G)$ in terms of order and size of G .

Thirunavukkarasu and Sriram

Theorem 3.3. For any graph G , $2 \leq \gamma'_b(G) \leq q - 1$.

Proof Any edge set containing $q - 1$ edges is clearly a bi-edge dominating set, which proves the upper bound. The lower bound is obvious. Further, both bounds are attained for the path P_4 .

Corollary 3.4. For any graph G , $\gamma'_b(G) \leq \frac{(p-2)(p+1)}{2}$, $p \geq 4$.

Proof Since every simple and connected graph G with p vertices has at most $\frac{p(p-1)}{2}$ edges gives $q - 1 \leq \frac{(p-2)(p+1)}{2}$. Then the upper bound is followed from Theorem 3.3.

Theorem 3.5. For any graph G , $\gamma'_b(G) \geq \lfloor \frac{q}{3} \rfloor$; $q \geq 3$.

Proof Since G is connected and every $bed - set$ has at least one edge from every three consecutive edges gives the result. The bound is sharp for the cycle C_{3n} , $n \geq 2$.

We now give a characterization of bi-edge dominating sets, which are minimal.

Theorem 3.6. A bi-edge dominating set X of G is minimal if and only if for each edge $x \in X$, one of the following condition is satisfied

- (i) There exists an edge $y \in E \setminus X$ such that $N(y) \cap X = \{x\}$.
- (ii) x is an isolated edge in $\langle x \rangle$.
- (iii) $d'(x, y) = 1$

Proof Assume that X is a minimum bi-edge dominating set of G . On the contrary if there exists an edge $x \in X$, such that x does not satisfy any one of the given conditions, then by (i) and (ii), $X' = X \setminus \{x\}$ is an edge dominating set of G . By (iii), X' is a bi-edge dominating set of G , which is a contradiction to the minimality of X and hence the result. The converse is obvious.

The exact values of the bi-edge domination number for several graphs are given below.

Theorem 3.7. For any path P_n ; $n \geq 4$

$$\gamma'_b(P_n) = \begin{cases} \frac{n}{2} & ; n = 4 \\ \frac{n-1}{2} & ; n = 5 \\ \lfloor \frac{n}{3} \rfloor + 1 & ; n \geq 6 \end{cases}$$

Proof Let G be the path P_n with at least four vertices and the edge set $E = \{e_i / i = 1, 2, 3, \dots, n - 1\}$. When $n = 4$, the edge set $\{e_1, e_2\}$ is a minimum $bed - set$ of G and hence $\gamma'_b(G) = \frac{n}{2}$. When $n = 5$, the edge set $X = \{e_{i+1} / i = 1, 2, 3, \dots, \lfloor \frac{n-1}{2} \rfloor\}$ is a minimum $bed - set$ and hence $\gamma'_b(G) = \frac{n-1}{2}$. Let $n \geq 6$.

When $n \equiv 0 \pmod{3}$, the edge set $X = \{e_{3i+1} / i = 0, 1, 2, 3, \dots, \lfloor \frac{n-3}{3} \rfloor\} \cup \{e_{n-1}\}$ is a $bed - set$ of G . Therefore, $\gamma'_b(G) \leq |X| = \left(1 + \lfloor \frac{n-3}{3} \rfloor\right) + 1 = \frac{n}{3} + 1 \rightarrow (1)$.

When $n \equiv 1 \pmod{3}$. The edge set $X = \{e_{3i+1} / i = 0, 1, 2, 3, \dots, \lfloor \frac{n-4}{3} \rfloor\} \cup \{e_{n-2}\}$ is a $bed set$ of G . Therefore, $\gamma'_b(G) \leq |X| = \left\{1 + \lfloor \frac{n-4}{3} \rfloor\right\} + 1 = \frac{n+2}{3} \rightarrow (2)$.

When $n \equiv 2 \pmod{3}$, the edge set $X = \{e_{3i+1} / i = 0, 1, 2, 3, \dots, \lfloor \frac{n-5}{3} \rfloor\} \cup e_{n-1}$ is a $bed - set$ of G . Therefore, $\gamma'_b(G) \leq |X| = \frac{n-5}{3} + 1 + 1 = \frac{n+1}{3} \rightarrow (3)$.

Conversely, suppose Y be a $bed - set$ of G with cardinality $\gamma'_b(G)$. Then Y has the edge e_{n-1} and at least one edge from every three consecutive edges from e_1 . Suppose $e_{n-1} \notin Y$ then it does not have two distance edge in Y . Hence $e_{n-1} \in Y$. Therefore,

Thirunavukkarasu and Sriram

$$\gamma'_b(G) = |Y| \geq \begin{cases} \frac{n}{3} + 1, n \equiv 0 \pmod{3} \\ \frac{n+2}{3}, n \equiv 1 \pmod{3} \\ \frac{n+1}{3}, n \equiv 2 \pmod{3} \end{cases} \rightarrow (5)$$

Then the results are followed from the equations (1), (2), (3) and (5).

Theorem. 3.8. For the Hoffman tree $P_n^+, n \geq 3$

$$\gamma'_b(P_n^+) = \begin{cases} 3 & ; n = 3 \\ \frac{3n}{4} & ; n \equiv 0 \pmod{3} \\ \frac{3n+1}{4} & ; n \equiv 1 \pmod{3} \\ \frac{3n+2}{4} & ; n \equiv 2 \pmod{3} \\ \frac{3n+3}{4} & ; n \equiv 3 \pmod{3} \end{cases} ; n \geq 4$$

Proof Let G be a Hoffman tree P_n^+ with atleast six vertices and with the edge set $(G) = \{e_i/i = 1, 2, 3, \dots, 2n - 1\}$. When $n = 3$, the edge set $X = \{e_{i+3}/i = 0, 1 \dots n - 1\}$ is a minimum *bed - set* of G . Therefore, $\gamma'_b(G) = |X| = (1 + (n - 1)) = n$. Let $n \geq 4$.

Case (i) $n \equiv 0 \pmod{4}$. In this case, the edge set $X = \{e_i/i = 1, 2, \dots (n - 1)\} - \{e_{4i}/i = 1, 2, \dots (\frac{n-1}{4})\}$ is an *bed - set* of G and hence $\gamma'_b(G) \leq |X| = (n - 1) - (\frac{n-1}{4}) = \frac{3n}{4} \rightarrow (1)$. Conversely, if Y is a *bed - set* of G with minimum cardinality $\gamma'_b(G)$ then Y has at least every three consecutive edges in the path sequence P_n and hence $\gamma'_b(G) = |Y| \geq \frac{3n}{4} \rightarrow (2)$. The result follows from equations (1) and (2).

Case (ii) $n \equiv 1 \pmod{4}$. In this case, the edge set $X = \{e_i/i = 1, \dots (n - 1)\} - \{e_{4i}/i = 1, 2, \dots (\frac{n-1}{4})\} \cup \{e_{2n+1}\}$ is a *bed - set* of G and hence $\gamma'_b(G) \leq |X| = (n - 1) - (\frac{n-1}{4}) + 1 = \frac{3n+1}{4} \rightarrow (3)$. Conversely, let Y be a *bed - set* of G with cardinality $\gamma'_b(G)$. In this case, Y has the edge e_{2n+1} and at least one edge from every three consecutive edges in the path sequence P_n except $e_{4i}, i = 1, 2, \dots (\frac{n-1}{4})$. Hence $\gamma'_b(G) = |Y| \geq 1 + 3(\frac{n-1}{4}) = \frac{3n+1}{4} \rightarrow (4)$. Then equations (3) & (4) gives $\gamma'_b(G) = \frac{3n+1}{4}$.

Case (iii) $n \equiv 2 \pmod{4}$. In this case, the edge set $X = \{e_i/i = 1, \dots (n - 1)\} - \{e_{4i}/i = 1, 2, \dots (\frac{n-2}{4})\} \cup \{e_{2n+1}\}$ is a *bed - set* of G and hence $\gamma'_b(G) \leq |X| = (n - 1) - (\frac{n-2}{4}) + 1 = \frac{3n+2}{4} \rightarrow (5)$. Conversely, let Y be a *(1, 2) - ed set* of G with cardinality $\gamma'_b(G)$. In this case, Y has the edges $\{e_{n-2}, e_{2n+1}\}$ and atleast one edge from every three consecutive edges in the path sequence P_n except $e_{4i}, i = 1, 2, \dots (\frac{n-2}{4})$. Hence $\gamma'_b(G) = |Y| \geq 2 + 3(\frac{n-2}{4}) = \frac{3n+2}{4} \rightarrow (6)$. Then the result follows from equations (5) and (6).

Case (iii) $n \equiv 3 \pmod{4}$. In this case, the edge set $X = \{e_i/i = 1, \dots (n - 1)\} - \{e_{4i}/i = 1, 2, \dots (\frac{n-3}{4})\} \cup \{e_{2n+1}\}$ is a *bed - set* of G and hence $\gamma'_{(1,2)}(G) \leq |X| = (n - 1) - (\frac{n-3}{4}) + 1 = \frac{3n+3}{4} \rightarrow (7)$. Conversely, let Y be a *bed - set* of G with cardinality $\gamma'_b(G)$. In this case, Y has the edges $\{e_{n-2}, e_{n-1}, e_{2n+1}\}$ and atleast one edge from every consecutive three edges in the path sequence P_n except $e_{4i}, i = 1, 2, \dots (\frac{n-3}{4})$. Hence $\gamma'_b(G) = |Y| \geq 3 + 3(\frac{n-3}{4}) = \frac{3n+3}{4} \rightarrow (8)$. Then from equations (7) & (8) we have $\gamma'_b(G) = \frac{3n+3}{4}$.

The following example illustrates the above result when $n=9$.

Thirunavukkarasu and Sriram

For the graph P_9^+ in Figure 3, the edge set $X = \{e_1, e_2, e_3, e_5, e_6, e_7, e_8\}$ is a minimum *bed – set* of G and hence $\gamma'_b(P_9^+) = 7$.

Theorem 3.9. For any cycle C_n ;

$$\gamma'_b(C_n) = \begin{cases} n - 2 ; n = 4, 5 \\ \frac{n}{3} ; n \equiv 0 \pmod{3} \\ \frac{n+2}{3} ; n \equiv 1 \pmod{3} ; n \geq 6 \\ \frac{n+4}{3} ; n \equiv 2 \pmod{3} \end{cases}$$

Proof Let G be a cycle graph C_n with at least four vertices and $E(G) = \{e_i / i = 1, 2, 3, \dots, n\}$. When $n = 4$, the edge set $X = \{e_i / i = 1, 2, 3, \dots, \binom{n}{2}\}$ is a minimum *bed – set* of G and hence $\gamma'_b(G) = |X| = \frac{n}{2}$. When $n = 5$, the edge set $X = \{e_{i+1} / i = 1, 2, 3, \dots, \binom{n+1}{3}\}$ is a minimum *bed – set* of G and hence $\gamma'_b(G) = |X| = \frac{n+1}{3}$. Let $n \geq 6$.

Case (i) $n \equiv 0 \pmod{3}$. In this case, the edge set $X = \{e_{3i-2} / i = 1, 2, 3, \dots, \binom{n}{3}\}$ is a *bed – set* of G . It gives, $\gamma'_b(G) \leq |X| = \frac{n}{3} \rightarrow (1)$. Conversely, if Y is a *bed set* of G with cardinality $\gamma'_b(G)$ then Y has at least one edge from every three consecutive edges in C_n . Hence $\gamma'_b(G) = |Y| \geq \frac{n}{3} \rightarrow (2)$. Then equations (1) & (2) gives $\gamma'_b(G) = \frac{n}{3}$.

Case (ii) $n \equiv 1 \pmod{3}$. In this case, the edge set $X = \{e_1, e_2\} \cup \{e_{3i+2} / i = 1, 2, 3, \dots, \binom{n-4}{3}\}$ is a *bed – set* of G . Therefore $\gamma'_b(G) \leq |X| = 2 + \binom{n-4}{3} = \frac{n+2}{3} \rightarrow (3)$. Conversely, let Y be a (1,2) – *ed set* of G with cardinality $\gamma'_b(G)$. In this case, Y has the edges $\{e_1, e_2\}$ and at least one edge from every three consecutive edges from e_5 . Hence $\gamma'_b(G) = |Y| \geq 2 + \binom{n-4}{3} = \frac{n+2}{3} \rightarrow (4)$. Then equations (3) & (4) gives $\gamma'_b(G) = \frac{n+2}{3}$.

Case (iii) $n \equiv 2 \pmod{3}$ In this case, the edge set $X = \{e_1, e_2, e_3\} \cup \{e_{3i} / i = 1, 2, 3, \dots, \binom{n-5}{3}\}$ is a *bed – set* of G . Therefore $\gamma'_b(G) \leq |X| = 3 + \binom{n-5}{3} = \frac{n+4}{3} \rightarrow (5)$. Conversely, let Y be a *bed – set* of G with cardinality $\gamma'_b(G)$. Then Y has the edges $\{e_1, e_2, e_3\}$ and at least one edge from every three consecutive edge from e_5 . Hence $\gamma'_b(G) = |Y| \geq 3 + \binom{n-5}{3} = \frac{n+4}{3} \rightarrow (6)$. Then equations (5) & (6) proves $\gamma'_b(G) = \frac{n+4}{3}$.

Theorem 3.10. For any crown graph C_n^+ ;

$$\gamma'_b(G)(C_n^+) = \begin{cases} 3 ; n = 3 \\ \frac{2n}{3} ; n \equiv 0 \pmod{3} \\ \frac{2n+1}{3} ; n \equiv 1 \pmod{3} ; n > 3 \\ \frac{2n+2}{3} ; n \equiv 2 \pmod{3} \end{cases}$$

Proof Let G be a crown graph C_n^+ with at least six vertices and $E(G) = \{e_i / i = 1, 2, 3, \dots, 2n\}$. When $n = 3$, the edge set $X = \{e_{i+3} / i = 1, \dots, 3\}$ is the minimum *bed – set* of G and hence $\gamma'_b(G)(G) = |X| = 3$. Let $n > 3$.

Case (i) $n \equiv 0 \pmod{3}$. In this case, the edge set $X = \{e_{3i+1} / i = 0, 1, \dots, \binom{n-3}{3}\} \cup \{e_{3i+n+2} / i = 0, 1, \dots, \binom{n-3}{3}\}$ is a *bed – set* of G and hence

$$\gamma'_b(G)(G) \leq |X| = \left(1 + \frac{n-3}{3}\right) + \left(1 + \frac{n-3}{3}\right) = \frac{2n}{3} \rightarrow (1)$$

Conversely, if Y is a *bed – set* of G with cardinality $\gamma'_b(G)$ then Y contains at least one edge from every three consecutive edges in the cycle G and the remaining nonadjacent pendant edges in G . Hence $\gamma'_b(G)(G) = |Y| \geq \frac{n}{3} + \frac{n}{3} = \frac{2n}{3} \rightarrow (2)$. Then the result follows from (1) & (2).

Thirunavukkarasu and Sriram

Case (ii) $n \equiv 1 \pmod{3}$. Now the edge set $X = \{e_{3i+1}/i = 0, 1, \dots, \binom{n-4}{3}\} \cup \{e_{3i+n+2}/i = 0, 1, \dots, \binom{n-4}{3}\} \cup \{e_{2n-1}\}$ is a *bed – set* of G and hence

$$\gamma'_b(G) \leq |X| = \left(1 + \frac{n-4}{3}\right) + \left(1 + \frac{n-4}{3}\right) + 1 = \frac{2n+1}{3} \rightarrow (3)$$

Conversely, let Y be a *bed – set* of G with cardinality $\gamma'_b(G)$. In this case, Y contains at least one edge from every three consecutive edges in the cycle C_n and the remaining non adjacent pendant edges in G . Hence $\gamma'_b(G) = |Y| \geq \frac{n-1}{3} + \frac{n+2}{3} = \frac{2n+1}{3} \rightarrow (4)$

Then from equations(3)& (4), we have $\gamma'_b(G) = \frac{2n+1}{3}$.

Case (iii) $n \equiv 2 \pmod{3}$. the edge set $X = \{e_{3i+1}/i = 0, 1, \dots, \binom{n-5}{3}\} \cup \{e_{3i+n+2}/i = 0, 1, \dots, \binom{n-5}{3}\} \cup \{e_{2n-2}, e_{2n-1}\}$ is a *bed – set* of G and hence

$$\gamma'_b(G) \leq |X| = \left(1 + \frac{n-5}{3}\right) + \left(1 + \frac{n-5}{3}\right) + 2 = \frac{2n+2}{3} \rightarrow (5)$$

Conversely, let Y be a *bed – set* of G with cardinality $\gamma'_b(G)$. In this case, Y contains at least one edge from every three consecutive edges in the cycle C_n and the remaining non adjacent pendant edges. Hence $\gamma'_b(G)(G) = |Y| \geq \frac{n-2}{3} + \frac{n+4}{3} = \frac{2n+2}{3} \rightarrow (6)$

Then from equations(5)&(6), we have $\gamma'_b(G) = \frac{2n+2}{3}$.

Proposition 3.11. For wheel graph W_n ; $\gamma'_b(W_n) = \begin{cases} n-1; & n=3,4 \\ n-2; & n=5 \\ \lfloor \frac{2n}{3} \rfloor; & n \geq 6 \end{cases}$

Proposition 3.12. For the graph W_n^+ ; $n \geq 3$

$$\gamma'_b(W_n^+) = \begin{cases} 4; & n=3 \\ \lfloor \frac{n}{2} \rfloor + 1; & n \equiv 0, 1 \pmod{3} \end{cases}$$

Proposition 3.13. For the graph $(C_n \odot \overline{k_2})$; $n \geq 3$

$$\gamma'_b(C_n \odot \overline{k_2}) = \begin{cases} n, & n \equiv 0 \pmod{2} \\ n, & n \equiv 1 \pmod{2} \end{cases}$$

Proposition 3.14. For the graph $(C_n \odot C_3)$; $n \geq 3$

$$\gamma'_b(C_n \odot C_3) = \begin{cases} 2n; & n=3 \\ \lfloor \frac{3n+1}{2} \rfloor; & n \equiv 0, 1 \pmod{2} \end{cases}$$

Proposition 3.15. For the graph $(C_n \odot C_4)$; $n \geq 3$

$$\gamma'_b(C_n \odot C_4) = \begin{cases} 2n; & n=3 \\ \frac{3n+1}{2}; & n=5, 7, 9, \dots \\ \frac{3n}{2}; & n=4, 6, 8, \dots \end{cases}$$

Proposition 3.16. For the graph $(C_n \odot C_5)$; $n \geq 3$

$$\gamma'_b(C_n \odot C_5) = \begin{cases} \frac{5n}{3}; & n \equiv 0 \pmod{3} \\ \lfloor \frac{5n}{3} \rfloor; & n \equiv 1 \pmod{3} \\ \lfloor \frac{5n}{3} \rfloor; & n \equiv 2 \pmod{3} \end{cases}$$

Proposition 3.17. For the graph $(P_n \odot C_3)$; $n \geq 2$; $\gamma'_b(P_n \odot C_3) = \lfloor \frac{3n}{2} \rfloor$

Proposition 3.18. For the graph $(P_n \odot C_4)$; $\gamma'_b(P_n \odot C_4) = \begin{cases} 2n; & n=2 \\ 2n; & n \geq 3 \end{cases}$

Proposition 3.19. For the graph $(P_n \odot C_5)$; $n \geq 2$

Thirunavukkarasu and Sriram

$$\gamma'_b(G)(P_n \odot C_5) = \begin{cases} \lfloor \frac{5n}{3} \rfloor; & n \equiv 0, 1 \pmod{3} \\ \lfloor \frac{5n}{3} \rfloor; & n \equiv 2 \pmod{3} \end{cases}$$

Proposition 3.20. For the $(P_n \times P_2)$ graph; $\gamma'_b(P_n \times P_2) = \begin{cases} n + 1, & n = 2 \\ \frac{n+3}{2}, & n = 3 \\ n - 1, & n \geq 4 \end{cases}$

Proposition 3.21. For the $(P_n \times P_3)$ graph; $\gamma'_b(P_n \times P_3) = n; n \geq 2$.

Proposition 3.22. For the $(P_n \times P_4)$ graph; $\gamma'_b(P_n \times P_4) = \begin{cases} 2n - 1; & n = 2, 3 \\ \lfloor \frac{3n}{2} \rfloor; & n \equiv 0, 1 \pmod{2} \end{cases}$

Proposition 3.23. For the $(P_n \times P_5)$ graph; $\gamma'_b(P_n \times P_5) = \begin{cases} n = 2; & n + 2 \\ 2n; & n \geq 3 \end{cases}$

ABSTRACT

A Handful of Rice was written by renowned woman novelist Kamala Markandaya, portraying poverty and the struggle of working-class people. Ravishankar, the protagonist of this novel comes to the city with a desire to achieve a job and live a prosperous life but his every step towards progress leaps many steps behind. The journey of Ravi undergoes various ups and downs which ends up melancholy. His sufferings take the shape of mental and psychological trauma. He walks through the conflicts of right and wrong but his conscience chooses the right path. Markandaya has shown adverse effects of industrialization which has a pessimistic approach to worker's life. She has painted a real picture of the urban and rural life of Indian society, where rich-class people exploit poor-class people. The hero of this novel is also suppressed by the rich people, humiliated by memsahibs, and starved due to corruption. He becomes prey to social and economic exploitation. His honesty was awarded with anguish and left with a medal of wretched poverty. The portrayal of the inhumane nature of the people and treating workers as an object and just a source to gain excessive money. She has also emphasized on various issues of society inflating our system like inadequate government facilities, corruption, unemployment, and overpopulation. This novel is a strong jolt to awaken people from evils prevailing in our society. This paper is an attempt to throw light on various aspects of the people belonging to lower strata and their deteriorated conditions.

Keywords: poverty, struggle, working-class, hunger, corruption

Mamta Chaudhary

INTRODUCTION

Kamala Markandaya Taylor is an eminent women novelist. She possesses a conspicuous place among Indian writers. Markandaya's *A Handful of Rice* published in 1966, describes a post-independent youth, Ravishankar who elopes to the city (Madras) to raise himself from poverty and monotonous, melancholy living in filth and diseases. He rejects the deprived life of disgust and poverty and desires to initiate a new life of hope. He wants to have a rich life observed in cities. Ravishankar is like Balram, the protagonist of Aravind Adiga's *The White Tiger*, who dreams of a better life, so he refuses to accept the shackles of servitude. Ravi follows the path of Marxism and revolts against the antagonist class to uproot the chain of slavery. He tries to be rebellious and fight for his rights against the capitalist class but his attempts are unsuccessful and end in a fiasco. The German Philosopher Karl Henrich Marx and his collaborator Friedrich Engels in *The Communist Manifesto* described, "The proletariat, the lowest stratum of our present society, cannot stir, cannot raise itself up, without the whole super-incumbent strata of official society being sprung into the air." (52) The title of the novel, *A Handful of Rice* reflects how effective the handful of rice is to one's hunger. Poverty gives birth to so many issues. Some common issues highlighted by the novelist are hunger, accommodation, and unemployment. The protagonist of this novel faces all such social issues making his life a trauma. Ravishankar is an ordinary literate village boy. He desires to live a good life where the shadow of poverty should not touch him. After spending a poor village life, full of suffering with no opportunities for any improvement, he moves out of it and decides to bring positive changes in his life by taking shelter in the city. Ravi describes his village as "all lived between bouts of genteel and acute poverty—the kind in which the weakest went to the wall, the old ones and the babies, dying of tuberculosis, dysentery, the 'falling fever', 'recurrent fever', and any other names for what was simply, nothing but starvation" (Markandaya 09). Many Indian authors have brought these social issues into the limelight. Munshi Prem Chand, in his *Godaan*, depicts the struggle and helplessness of rural people against the caste system, poverty, and exploitation by upper-class people. Mulk Raj Anand's *Untouchability* exposes injustice, discrimination and exploitation. Another novel, *Coolie* depicts other forces of exploitation like capitalism and industrialism.

Industrialization has opened up new opportunities in cities but on another hand, it has deteriorated the working environment for workers. The workers receive meagre wages which barely keep them alive. They are not able to afford their basic necessities like food, clothing, and accommodation, and this is affecting the working class adversely with no fixed working hours, no security for life, and an unhealthy environment for living. The exploitation of workers creates enormous wealth for the capitalist class. According to Karl Marx, workers are alienated or separated due to the working structure, from the fruits of their own labour, and wages are fixed by the antagonist class for their subsistence by considering their own profit. They always live in dual consciousness where knowing the truth is beyond reality as false consciousness is created by the bourgeois to accomplish their goals and gain profit against lower classes because they are interpellated by practicing various norms and creating them as a natural phenomenon as ideology. As the ideology is asserted by Rupali Mirza in her dissertation *American Dream Myth or Reality*: Karl Marx and Friedrich Engels considered ideology a falsification of reality, specifically, a denial of the material conditions of life through the elevation of ideas to independent status. To them and their Marxist followers, ideology is a case of —false consciousness, of minds living by putatively natural and self-evident ideas without realizing their basis in class differences. (Chapter 1 pg.1) The hero of the novel visits the city with an accumulated bale of dreams but in the city, the scene is different from his expectations. In the city, he soon realizes that urban and rural areas are the same in all respects for poor people. He found many educated graduates unemployed and swamping around jobless, so what could be expected from a so-called literate village man? The novel starts and ends with hunger. The strange, cruel, and inhuman streets of the city take him to the path of crime, by joining the group of criminals. He comes under the influence of the criminal gang of Damodar who does all illegal and unlawful acts. Ravi, once escaping from the police, forcefully enters Apu's house and asks for food as he is starving, "I was hungry...I hadn't eaten" (Markandaya 06). After acquaintance with Apu, he leaves the Damodar gang and gets an opportunity to work with him as an apprentice at his tailoring shop.

**Mamta Chaudhary**

Ravi's ambition once again booms like waves when he sees Nalini, the daughter of Apu, whom he wishes to marry. He called his father to fix his marriage. Ravi's father, a poor peasant who lives in a village has to mortgage his farmland to arrange his visit. Finally, Ravi gets married to his dream lady. Newly couples are welcomed with separate rooms and abed to sleep in. Ravi's happiness knows no bounds when he sits in a car for the first time. But this happiness does not last for long as everything is taken back and compelled to sleep on the floor with no privacy, joining the crowded household of Apu. His dream of a house, bed, and attire for Nalini is like a fall from reality. Ravi's dedication and hard work burst into a rage of anger when he realizes that he and other workers are exploited and tortured by the rich people. Owners pay them 80 rupees for a dozen clothes but in actuality, it costs 125 per cloth. He tries to raise his voice against this but Apu stops him by reminding him of his responsibilities towards his family. Apu was afraid that his rebellion might risk his job and lose the contract. "Rebel and a contract might be lost, the steady wage would come to an end, and then what of Nalini? He had to think of her, he had to think of himself for that matter" (Markandaya79). Such type of fear is usually developed by the capitalists among the workers so that workers do not raise their voices or rebel against them and they can easily gain more and more profit by giving little to the workers. "Capital is dead –labor, which, vampire-like, lives only by sucking living labor, and lives more, the more labor it sucks." (Das Capital Vol.1 Chapter 10). Ravi becomes aware of this inequality and he cannot put up with this social injustice and wants to remove economic disparity. His statement to Nalini expresses his rage as it becomes intolerant for him to see unworthy people affording all luxuries Ravi bursts out, "Because I want more, he cried, his temper rising. I want a bed for one thing! I'm fed up sleeping on the floor. They all have beds, the people we slave for, do you know that" (Markandaya86). As per his father-in-law's opinion, such type of attitude towards the workers has been followed for ages in different forms. It is the workers' destiny to lower their heads and remain under such miserable conditions. Workers have been exploited for ages only the medium of exploitation changes from time to time. As said by Marx and Engels, in his *The Communist Manifesto*, "The history of all the hitherto existing society in the history of class struggles." (31). The poor had to suffer this, as poverty is a curse to them. Apu, Nalini, and the rest of the family members belong to the same roots and have accepted suppression by the rich people. Rich people have become the lawmakers of this society and rule the working class accordingly. Markandaya has also addressed social scenarios by depicting social unrest created by the rich section of society. The capitalist society is like a lawless jungle. Survival of the fittest is the only rule followed here as the wealth allows no one to reach them and the biggest anguish is, that the hard work of the poor is not paid off.

The death of Apu gives Ravi a predicted shock. The hero is in between the horns of a dilemma. Now, the responsibility of Apu is transferred to Ravi. After the loss of the firm pillar of this family, Ravi being a novice tailor, unable to fulfil the contracts and failed to deliver costumes to the customers on time. Markandaya expresses the insensitiveness of the people sitting on the upper strata who have no concern for death and living. The working class is considered the machine of making money with no sympathetic concern from the capitalists. The hero is left with unpaid bills and overburdened responsibilities increasing day by day. Economic instability takes him to Damodar but his conscience chooses the right path after the psychological war between right and wrong. He wants to lead a life of honesty but responsibilities compel him to enter this illegitimate path. He has got a lesson that honesty cannot buy rice or pay the bills. Poverty proves a curse to these penniless people. Ravi is completely shattered when he loses his son, Raju. The economic condition of Ravi is worse, deteriorating his life day by day. He discharged his wife before to skip the hospital bills and is helpless to afford milk for his infant child. In the struggle against poverty and hunger, his son's health is neglected, and dies. Ravi blames hypocrisy of the society for his son's death as he believes that his son has become the victim of socio-economic disparity and that oppressors of society have murdered his innocent child. Markandaya draws attention to the prevailing evils of society which affect workers at large. The protagonist is the victim of almost all the social evils prevailing in the society. Ravi is also a victim of corruption which is one of the existing and burning issues of the society. Corruption hikes the price of food items. It is difficult for Ravi to arrange food stuff because the price of rice is increasing day by day. This inflation is creating black marketing and once again poor are the worst sufferers. They get adulterated rice after paying a high price. The quote reveals corruption: So many stones, she said, and he saw she had cupped her hands and filled them with rice, and all among the long white grains were small black stones, freely sprinkled in like mustard seed. One paid for this corruption... You asked for food, and they gave you stones. (Markandaya241). Ravi is an example of such a ruthless

Mamta Chaudhary

society where the rich suck the blood of the poor like parasites till no drop of blood is left in their bodies. There are untold miseries of such people who come to cities with hopes but some get lost in the glare of the city, and some smart become worthy. By birth, every human is born with equal rights to life, liberty, and happiness. Munshi Prem Chand rationally writes in his novel, *Godaan*, "God creates us all equal. Those who have power oppress the poor and become rich" (18). Humans are themselves the enemies of other humans and treat each other differently. Greed has surpassed everything whether it is love, respect, concern, and sympathy for each other. Humans face exploitation, suppression, cruelty, humiliation, deprivation, and many more by the same species. Ravi is broken down mentally and psychologically due to hardships and struggles in his life. In his survival, he faces various dilemmas of social and economic forces. The hero is like poet Faiz Ahmed Faiz who stood firm to see the dawn of equality as sufferings and struggles will fetch freedom. Faiz in his poem *A Few Days More*, cites, Must be gasp in the shadow of tyranny Bear obsession writhe and weep This is our inherited condition: Bodies imprisoned; feelings chained... But now tyrant's terms expire The novel begins with his starvation and ends with starvation. He is exploited, and humiliated by memsahibs. He wants to raise his voice against social injustice but remains silent for the sake of his family. In this ruthless society, poverty is a curse as a social phenomenon that proves fatal to proletariats. By taking social concern from the perspective of the capitalist class, the poor are considered as unimportant creatures of this society. They are downtrodden and meant to be toiled and exploited. They are entertained as substitutes for machines. Workers are oppressed to prove their abundance and competency. Margaret P. Joseph says, "Ravi's tragedy is that of the economically weak, who search for answers to the problems not only of day-to-day life but of existence itself, and the foundation of his tragedy is poverty." (62) Ravi disheartened goes to Damodar begging for the job but receives disappointment. He happens to join a march mob. Kannan, the blacksmith tells the reality behind this mob march. This march aims to rob godowns of rice. Ravi decides to take the share of his children as they should not be deprived of their right to food. But look at the irony as he also could not fetch a handful of rice as police arrived.

CONCLUSION

Markandaya has depicted the plight of youth through the character Ravi who comes from a rural background to secure a better life. Damodar and Ravi are the two contrasting characters in this novel. Damodar earns money through immorality by squeezing people's throats whereas Ravi is honest and believes in hard-earned money. The impact of poverty proves curse and gives a tragic end to the novel. This novel is a depiction of grim poverty, hunger, and deprivation. The novelist blames the social structure for the exploitation of weaker ones. This novel explores the survival and suffering of the poor in wretched poverty. Markandaya reveals the truth that poverty, exploitation, suppression, and many more social issues cannot be eradicated by using unethical means. Her prime focus is to present the real picture of society where poverty leads to social and economic exploitation and the poor are compelled to face a cursed life that is full of miseries and sufferings.

ABSTRACT

The presence of heavy metals in the soil is an important Ecological issue that harms the ecosystem and human health. Numerous anthropogenic activities, which include mining operations, urbanization, Agricultural practices, and emissions from the industrial process, are the root of this occurrence. Due to their hazardous characteristics and ongoing presence in the environment, heavy metals, including lead, cadmium, arsenic, and mercury, are especially concerning. Particularly in the study area, the level of toxic trace metals in soil has a major effect on the soil quality and how it is used to produce food. Toxic metals like manganese, copper, zinc, and iron are extracted in representative soil samples from the study area of Kapadwanj tehsil, Kheda, Gujarat. Samples were collected from seven different locations around Kapadwanj tehsil, compared to the Gujarat government's test range. Most of the study area was significantly contaminated by manganese and iron, with a deficiency of copper and a particular amount of zinc.

Keywords: Heavy metal, soil, Kapadwanj, contamination, agricultural field

INTRODUCTION

Heavy metal pollutants harm ecosystems, human health, and agriculture products, and water it become a major environmental concern. Human-related activities such as mining, industrial processes, farming practices, and urbanization can result in the formation of heavy metals in the soil, including lead (Pb), cadmium (Cd), arsenic (As), mercury (Hg), chromium (Cr).^{1,2} As heavy metals do not break down and can bioaccumulate in food chains,

**Aayushi Panchal and Bharat Maitreya**

remaining in the soil and water matrix presents a long-term deal that can have toxicological outcomes on both flora and fauna.³ Contamination of soil and water can have destructive results on crop quality and productivity, and it can also pose wealthiness to those who consume by eating it directly or indirectly through the food chain.⁴ Heavy metal-contaminated soil must be observed and reversible to the benefit of public health and sustainable land management. Numerous methodologies such as phytoremediation, soil washing, and immobilization are directly under observation and used to alleviate the matter of effect on heavy metal contamination.⁵ The capacity of soil to perform is important in maintaining plant and animal productivity, improving the standards of the air and water, and fostering plant and animal life within the environmental and land-use boundaries of good health. Around the world, there is a broad range of soil types based on factors such as geography, climate, and vegetation, each with unique physical, chemical, and biological characteristics. In today's scenario, both macronutrients and micronutrients are required for the plants. It's important that you hit a balance between the two, as inadequate macronutrient intake might lead to disastrous growth for plants and disease risk, but decreased growth and color loss might result in a surplus amount of the micronutrient [6]

MATERIALS AND METHODOLOGY**Study area**

This study site was in Kapadwanj tehsil, Kheda district. A total of 7 samples were collected from different locations in Kheda. According to their geographic location and their crop condition. On these sample study sites, water is collected in plastic bottles. All samples were collected in the summer season of 2022.

Preparation of sample

7 samples were taken from different locations near an area of Kapadwanj region in which micronutrients like Zinc, copper, and Manganese were analyzed. All samples were air-dried and ground with mottle and passed through a 2mm sieve. Then for laboratory analysis, all the samples were packed in polythene bags.

Sample Digestion

Using an electronic balance, precisely 10 grams of air-dried soil were weighed and after that was placed into a 50 ml conical flask. The Diethyl triamine penta-acetic acid (DTPA) extraction solution (20 ml) was added to the flask. A mechanical shaker rotating at 120 rpm per minute was used for two hours to completely mix the mixture. Whatman filter paper No. 41 was then used to filter the suspension [6] [7].

Instrument AAS (Atomic Absorption Spectrometer and mechanical Shaker

Reagent Dilute HCL: AR Grade HCL diluted 5 times with double distilled water

DTPA Extractant: Dissolve 1.967gm of AR Grade diethylene- triaminepentaacetic acid (DTPA) and 1.470gm of CaCl₂.2H₂O (AR Grade) in about 25ml of double distilled water (DDW) by adding 13.3ml tri ethanol amine (TEA), Followed by 100ml more DDW. Transfer the solution to a liter volumetric flask. This reagent has 0.005M DTPA, 0.1M TEA, and 0.01M CaCl₂.2H₂O.

Method Name Atomic Absorption Spectrophotometric [6] [8].

RESULT AND DISCUSSION

Cu and Zn have a moderate positive correlation of 0.658, indicating that copper and zinc concentrations are somewhat positively related, but the relationship is not as strong as in the previous matrix. Cu and Mn have a very weak negative correlation of -0.010, suggesting that there is almost no relationship between copper and manganese. Cu and Fe have a very weak positive correlation of 0.050, indicating that copper and iron concentrations are virtually uncorrelated. Zn and Mn have a moderate positive correlation of 0.635, suggesting that as the concentration of zinc increases, the concentration of manganese also tends to increase. Zn and Fe have a weak positive correlation of 0.320,

**Aayushi Panchal and Bharat Maitreya**

indicating a slight positive relationship between zinc and iron, but the strength of this correlation is low. Mn and Fe have a moderate positive correlation of 0.591, showing a moderate tendency for manganese and iron to increase together. Cu and Zn have a strong positive correlation of 0.865, indicating that when the concentration of copper increases, the zinc concentration also tends to increase. Cu and Mn have a moderate negative correlation of -0.458, suggesting that when copper increases, manganese tends to decrease to some extent. Cu and Fe have a weak positive correlation of 0.169, implying a slight tendency for copper and iron to increase together but with little strength in their relationship. Zn and Mn have a weak negative correlation of -0.342, suggesting a weak inverse relationship between zinc and manganese. Zn and Fe have a weak positive correlation of 0.362, indicating a slight tendency for zinc and iron concentrations to move in the same direction. Mn and Fe have a moderate positive correlation of 0.581, meaning manganese and iron have a fairly strong tendency to increase together.

The status of available Cu content in the soil of Kheda district around Kapadwanj tehsil was the average value of Cu content was 0.54 mg/kg and varied from 0.04 to 1.14 mg/kg. With 28 percent of samples falling in the deficiency range in Cu (Table 3). Likewise, Zn content in soil is between 0.12 to 1.84 mg/kg with an average value of 1.04 mg kg⁻¹ (Tables 2 and 3). Based on the limit of Zn, 14 percent of samples were found to be deficient and 14 percent of samples were found to exceed DTPA-extractable Zn and required Zn application for optimum crop production and to get full benefit from NPK fertilization. Soils in general were rich in Mn content with an average value of 7.10 mg /kg, which may be linked to inherent Mn minerals present in the soil. Data indicate that there is no immediate need for applying micronutrients to the crop except for the Zn and Cu. Based on the limit 85 percent of the sample was found to be exceeded. The mean value of available Fe content of the soils under investigation was 4.59 mg kg⁻¹ and varied from 1.75 to 7.7 mg/kg (Table 3). Considering 4.5 mg/kg DTPA-extractable Fe as the critical limit for cultivation, one of the soil samples was deficient in available Fe content.

CONCLUSION

The soil and water of the Kheda district around Kapadwanj tehsil have a variety concerning micronutrient availability, which can be allotted to multiple uses of fertilizers and rigorous cultivation. The soil and water micronutrients and soil attributes, along with the yield target equation, can be of greater use to balance fertilizer recommendations in different farms around Kapadwanj tehsil, Kheda district. Based on the present study, the recommendations for the application of micronutrients may be increased or decreased as per the soil test results of particular areas. This will be helpful towards the precision application of nutrients, not only reducing the cost of fertilizer but also reducing damage to the environment.

ABSTRACT

Among the four fundamental language skills, listening holds a significant position in facilitating the process of language acquisition. Its role in language learning is pivotal as it enables individuals to comprehend the language spoken and interpret the meaning of words and phrases communicated. However, it is a daunting task for L2 learners to rightly comprehend the target language due to varying accents, pronunciation and speech patterns. To address this issue and enhance the listening ability among L2 learners, the researcher uses authentic audio files from 'Audio-Lingua', a bank containing audio files in several languages with varying difficulty levels. In this mixed method of research, a group of 100 first-year undergraduate students were chosen as samples. The samples were made to listen to the audio files both inside and outside the classroom environment for over three months. The performance of samples in the pre-test has been analyzed and their scores after the intervention of audio files were found remarkable and an Ipsative Assessment was made to track the learner's progress in listening comprehension. The study also analyzes how Ipsative Assessment can provide personalized feedback for second language learners' listening skills. To understand the learners' perception, the researcher provided a questionnaire that has questions that would summarize learners' feedback quantitatively as well as qualitatively. The usage of Sociocultural Theory serves as a means to substantiate the researcher's perspective, as it offers keen insights into the influence of social and cultural contexts on language

**Swetha et al.,**

acquisition and development. Hence, it is considered a relevant and applicable framework for understanding and supporting the listening comprehension of second language learners. The findings of the study prove that technology intervention in enhancing listening ability among ESL learners is successful and focuses on how individual growth can significantly enhance the ability of L2 learners to comprehend and effectively utilize spoken language.

Keywords: Audio-lingua, Ipsative Assessment, Language Learning, Listening Skill.

INTRODUCTION

Background of the study

English language is beyond a shadow of a doubt, vital in our daily life. English Language and the mastery over it opens up new avenues of opportunity to its users. English being the Lingua Franca is one of the main reasons. Knowledge sharing, higher educational opportunities, technological and professional development, programming, internet, social media and entertainment, etc., happen in English. Therefore English proficiency is considered as the key to unlocking the doors of the world. Every language learner needs to pick up four fundamental skills – Listening, Speaking, Reading and Writing. Among the four core linguistic skills, listening holds a significant position in facilitating the process of language acquisition but still, it is long been neglected. Nunan termed listening skill as the Cinderella among the other language skills (i.e., reading, writing, and speaking) due to its negligence in language pedagogy (Nunan, 2002). A recent study by Wolvin states that an average human uses 40% of their daily communication in listening, 35% in speaking, 16% in reading and the least 9% in writing. Its role in language learning is pivotal as it enables individuals to comprehend the language spoken and interpret the meaning of words and phrases communicated. However, it is a daunting task for L2 learners to rightly comprehend the target language due to varying accents, pronunciation and speech patterns. As there are so many technological advancements in recent times, many innovative approaches to teaching and learning language have emerged. This paper hunts through the process of enhancing listening ability among learners of second language using authentic audio files from 'Audio Lingua' and looks into Ipsative Assessment as an aid for increased language learning outcomes. Since there are sociological, cultural and psychological hurdles in language learning, this proposed research looks for the challenges and addresses them by providing ways to improve their listening ability. Ipsative Assessment is a technique for assessing a learner's individual performance with their past performances. This method is considered as one of the most promising techniques to enhance language proficiency as it focuses on learners' personal growth and identification of flaws. It helps by offering a tailored approach that would help the learners with their diverse needs. This paper will deal with the potential application of Ipsative Assessment and its grounding principles in the framework of second language listening ability.

The main objective of the research is

- To investigate the effectiveness of implementing Ipsative Assessment alongside authentic audio materials (from Audio Lingua) in enhancing listening comprehension skills among second language learners.
- To explore the theoretical underpinnings of Ipsative Assessment and its relevance with personalized language learning.
- To develop and propose practical strategies for implementing Ipsative Assessment and Audio Lingua in English language classrooms for ESL learners

The literature review is made with the view of doing an in-depth analysis of the possibilities rendered by Ipsative Assessment such as self-awareness, motivation and specialized skill acquisition. The ensuing sections will explore the methodologies used in integrating Ipsative Assessment in language learning programs and present strategies that can be implemented in English classrooms.

Audio Lingua

A Dive into Authentic Audio Immersion:

Audio Lingua is an online repository that contains authentic audio materials – i.e., thousands of recordings made by native speakers belonging to 14 various languages. It can be considered a goldmine for ESL learners who intend to hone their listening comprehension skills. The website provides learners with diverse topics to cater to their needs at various levels and ages. Through Audio Lingua, a learner can immerse himself in native pronunciation, real-world scenarios, personal interviews, etc., Moreover, a learner can have the feeling of authority over the website as there are options for downloading, repeated listening and listening to audio online and offline. Following are several reasons why Audio-Lingua is a promising tool in improving listening ability and making learners interested in second language learning.

- 1.The aural appetite is fulfilled
- 2.Maximized immersion
- 3.An ocean of audio to choose from
- 4.Content available for both novice and nimble listeners and
- 5.Real-world scenarios

In consideration of all the above factors, the researcher intends to integrate the website Audio Lingua into English classrooms. This website will be supportive for both the Language teachers and learners and hence improve the quality of English listening and speaking.

LITERATURE REVIEW

The review of various literature would probe into recent technological advancements and their role in improving English listening ability. It examines the ground-breaking capability of various applications like Podcasts, interactive media and speech identification software that would improve students' listening potential and provide valuable authentic files for listening in a real-world scenario. This review not only highlights the advantages of using technology but also brings to light the disadvantages like too much obsession and reliance on technology. Therefore this research emphasizes the need for a balance between technical and human intervention in Language learning. Raj and Tomy in their research highlighted the gap in English Language education and technology adoption in developing Asian countries (Raj & Tomy, 2023). According to them, Mobile-Assisted Language Learning (MALL) is a cost-effective solution and it can be instilled in English Language Classrooms. The study is being conducted at Vellore Institute of Technology, focusing on improving English fluency and it particularly emphasizes open mobile applications and their impact in listening skills. They used 121 first-year Bachelor of Technology students and conducted a true experimental study and the results showed significant improvements. This kind of approach isn't only beneficial for underprivileged populations, it also emphasizes for the global need to improve English proficiency. The study advocates for a holistic language learning approach and stresses the point that listening skill is a crucial one. The study titled 'Perspectives of English Department towards Listening Skills' written by Rakhamawati investigated the problems that students face in improvising their listening ability (Rakhamawati, 2023). Students think it is difficult to answer the listening comprehension exercise since they are unable to comprehend what is being told. The researcher has used both quantitative and qualitative research methods to comprehensively search and identify the factors that contribute to the deficiency in listening comprehension. To tackle problems in listening skills, this study emphasizes the usage of specific instructional strategies like the intervention of technology and others. A study, 'The Perception of Using TED Talks in Enhancing College Students' Listening Skill' carried out among the students belonging to the fourth semester of Health Administration course at Stikes RS Husada in the academic year 2023–2024 conducted by Ludovikus, L. et. al., used TED talks as an aid to improve students' learning ability by delving into the real-world application of the integration of TED talks in a classroom setting (Ludovikus et al., 2023). The findings of the study suggested that this method of teaching and learning is highly convenient and beneficial as it increases motivation among students as they listen to the content without feeling bored. This paper also emphasizes the point that the incorporation of multimedia is very efficient in skill development and thereby helps learners retain the information better. The chosen population of this study belongs to health administration, hence

**Swetha et al.,**

the study also explored the pedagogical value of TED talks within the context of specific academic disciplines. Overall, this research contributes to the development of literature supporting innovative approaches, like TED Talks, for improving listening skills in higher education. Another study titled 'Students' Attitudes Towards Using Mobile Applications in Learning English Listening Skills' by Thuong and Tham addresses the usage of mobile applications for the improvement of English listening skills among sophomore students at Ho Chi Minh City University of Foreign Languages and Information Technology (Thuong & Tham, 2023). It aligns with literature highlighting the potential of technology in language learning, stressing the need for collaboration among stakeholders. Previous research in this area supports positive outcomes associated with mobile applications, and this study goes with these findings. The participants' positive attitudes towards mobile app use, without considering potential distractions, contribute valuable insights to the ongoing study on technology in language education. This research sheds light on the practical implications of using mobile applications for English listening skills among university students. The study by Abdulateef *et al* investigates the impact of ESL games on listening skills in a sample of 75 participants from Kurdistan universities (Abdulateef *et al.*, 2023). Utilizing a pre-test and post-test design, the experimental group that is engaged in ESL games outperformed the control group that is undergoing conventional classroom listening instruction. The findings go with existing literature showing the benefits of interactive approaches in language education. The study recommended the integration of ESL games into language teaching practices for enhanced engagement and interaction. This research also acknowledges the limitations, including cultural variation and a small sample size, the research also gave a scope for further exploration of the effectiveness of ESL games across diverse educational settings.

The research 'The Use of YouTube English Educational Videos in Improving Listening Comprehension' conducted by Sembiring, H., & Katemba, C sought the efficacy of educational English videos on improving listening skills among senior high school students (Sembiring, H., & Katemba, C, 2023). Using a Google Form survey, the study indicated a positive impact of using these videos to enhance listening comprehension. The findings go with existing literature on technology-assisted language learning, emphasizing YouTube's role in giving language materials that are authentic and reliable. Despite the shown imperfections, the study anticipates future research to refine strategies for effective use across academic levels, contributing to a broader understanding of technology's role in language education. The research by Siguencia and Morales addressed resource and innovation constraints stopping students' listening skill development by (Siguencia & Morales, 2023). The study focused on the relationship between Virtual Learning Environments (VLEs) and listening skill enhancement in young students, it employs a literature review and a focus group for data collection. Literature underscores the critical role of listening ability in language acquisition framing the research within the present discourse on VLEs and language learning. The focus group aims to extract varied points of view, complementing the literature review to analyze the incidence of VLEs in the target population. The study emphasized the importance of listening skills and voice out for the use of VLEs, and highlighted the potential drawbacks from their improper application, contributing to the academic understanding of effective language learning tools. Based on the reviewed literature, it can be concluded that there is a wide range of technological tools and approaches available for enhancing English listening skills among learners. However, the researcher found a research gap in terms of investigating the effectiveness of the website 'Audio Lingua' and Ipsative Assessment as a method of assessing the improvement in listening comprehension. Further research in this area can contribute to a more dynamic and engaging language learning environment, emphasizing the continuous evolution of pedagogical practices.

Theoretical Framework and Methodology

Sociocultural Theory

Sociocultural Theory, proposed by Vygotsky, provides a comprehensive and sturdy framework to understand how listening skills can be improved by using Audio Lingua and Ipsative Assessment. The theory shows the significance of social interaction and cultural practices in language education. Audio Lingua provides learners with exposure to authentic audio materials that challenge them within a dynamic linguistic environment. This goes in hand with the concept of the Zone of Proximal Development (ZPD), which indicates that learners' abilities can be extended with the help of intervention. In this case, Audio Lingua acts as a cognitive tool that mediates learners' interaction with the

**Swetha et al.,**

language structures. Moreover, Audio Lingua promotes meaningful engagement with real-world conversation and cultural contexts, showing the idea that language learning is grounded in cultural practices. The implementation of Ipsative Assessment further complements this idea by fostering personalized learning and self-awareness. Ipsative Assessment enables learners to analyze language skills by reflecting on their own progress and identifying areas for improvement. This aligns with the constructivist approach to learning, which says learners construct their knowledge through active engagement with the material. The use of Audio Lingua and Ipsative Assessment also aligns with the principles of scaffolding, community participation, and linguistic apprenticeship. Scaffolding is the process of breaking down complex tasks into smaller, manageable steps, allowing learners to gradually acquire skills and knowledge. Community participation emphasizes the importance of social interaction and collaboration in learning. Linguistic apprenticeship, on the other hand, emphasizes the role of more capable others in extending learners' abilities. In conclusion, Sociocultural Theory provides a comprehensive and robust framework for understanding how the combined use of Audio Lingua and Ipsative Assessment can effectively enhance second language learners' listening abilities.

Research Design

The researcher has divided the samples into an experimental group and a control group each containing 50 ESL learners. This design would help in the comparison of experimental group and the control group where the former receives the treatment and the latter doesn't receive any specific treatment. The experimental group was given a pre-test and post-test questionnaire whereas the control group received only the pre-test. The samples in the experimental group were given treatment and then they were asked to compare their current performance with the past performance instead of comparing with other learner's performance. The results are then evaluated using descriptive statistics, where the data is measured in average, range and distribution. Then Independent t-tests are used to compare the specific groups inside the data. This would show whether there are any statistically significant differences among the groups. Following these tests, the researcher uses ANCOVA (Analysis of Covariance) to analyze how one group differs from another whilst controlling the influence of other factors.

Research Participants

The researcher has chosen 100 First-year B.Tech students of SRM Institute of Science and Technology as samples using a stratified random sampling method. This stratified random sampling technique is universally acknowledged in social science and humanities research for its reliability and reproducibility. The population is divided into strata based on stratification variables like gender, age and knowledge level and then a stratum is randomly chosen.

Materials Used

To enhance the listening ability of the ESL learners, the experimental group is provided with authentic audio files from Audio Lingua, a rich repository containing numerous audio files. The experimental group is exposed to these audio files for 1 hour every day and 5 hours a week for the period of 3 months. Through the usage of 'Audio Lingua', the students were exposed to native speakers' varying accents and their cultures. By leveraging such resources effectively, the English listening proficiency of ESL learners in the Experimental group would improve.

Pre-Test

During the pre-test, both the experimental group and control group are given a test that evaluates their listening proficiency. The participants' basic details are collected and the format of the test is instructed to both groups. The series of audio files was played and students were asked to answer the questions taken from the audio played. The marks scored by each student showed their ability to comprehend the spoken language at varying levels. This pre-test acts as the status quo assessment as it serves as data for the comparison of experimental and control groups in the subsequent stages.

Introducing Audio Lingua to the Experimental Group

The experimental group is subjected to a direct intervention strategy to improve their listening ability using Audio Lingua for 1 hour every day for 3 months. The learners were asked to listen to audio files inside and outside the

**Swetha et al.,**

classroom. This treatment aims to provide the learners with immersion in real-world scenarios and listening to native speaker's conversations. This treatment is given with the assumption that exposing ESL learners to audio files will have a positive impact in their listening skills. The rationale behind this assumption is that ESL learners can improve their language comprehension abilities when they are immersed in real-life language usage conditions.

Post-Test

After introducing 'Audio-Lingua' audio files to enhance listening comprehension among first-year undergraduates, a post-test, similar to the pre-test was done. The analysis, following Field's statistical methods, will scrutinize data from both assessments to assess the impact of the Audio Lingua intervention (Field, 2013). Ipsative Assessment is used to track the individual progress, and a questionnaire is used to collect quantitative feedback. Sociocultural Theory was employed to provide contextual depth to the analysis. The post-test analysis intends to determine the impact of Audio Lingua intervention in improving the listening ability of ESL learners. This is achieved by analyzing statistical data, individual progress assessments, and participant feedback within a sociocultural context.

Data Analysis

The experimental group is provided with authentic audio files from Audio Lingua for 1 hour every day for three months. This is done with the goal of enhancing listening ability among ESL learners by giving them exposure to the accent and the culture of native speakers. The control group and the experimental groups are provided with pre-test that stands as the baseline assessment evaluating their initial proficiency. The experimental group then underwent the intervention of Audio Lingua, students were asked to listen to audio files inside and outside the classroom. The experimental group got themselves immersed in the native speaker's accent and practiced communication in real-world scenarios. Descriptive statistics was employed to evaluate the demographic characteristics. Then ANCOVA test is employed to find if there are any noticeable differences in listening abilities between the two groups after the Audio Lingua intervention. In addition to this, qualitative data is collected from the samples to know the experience of the participants with Audio Lingua. The use of all these statistical measures will provide a comprehensive assessment of the effectiveness of Audio Lingua intervention in enhancing language comprehension.

RESULTS AND DISCUSSION**Survey**

The Likert Scale survey provides the perception of the Experimental group on Audio Lingua and its role in enhancing their second language comprehension. Since most of the answers provided by the participants belong to the category of strongly agree and agree, we could conclude that there is a positive impact of using Audio Lingua in improving listening skills. Statements 1, 2 and 3 about students' previous knowledge of second language accent, pronunciation and speech pattern and their comprehension ability showed that they require improvement in listening skills. The responses received suggest that a tailored intervention must be given to the students to accommodate their diverse linguistic needs. Statement 3, in particular, showed that students in the experimental group found it challenging to understand new vocabulary and phrases used in Audio Lingua at the beginning of the treatment. The response to statements 4 and 5 shows how impactful the intervention of Audio Lingua is. A majority of participants responded that escalating difficulty levels and the limited duration of audio files make them motivated and hence they are engrossed with Audio Lingua. The participants also felt that it is an added advantage of Audio Lingua that it can be accessed both inside and outside the classroom. Therefore Audio Lingua creates an engaging language-learning environment and supports language comprehension with its diverse content. The participants strongly supported the idea that there is an influence of society and culture in the process of language acquisition and development in statement 6. This belief provides them with a deeper understanding of language. Also, majority of students responded positively that the usage of Audio Lingua has encouraged them to search for more authentic audio files from the internet. According to Najmi, EFL learners are highly motivated to acquire listening skills through digital audio files. Audio Lingua not only provides authentic audio files but also paves the way for students' independent language learning expedition (Najmi, 2021). From responses to statements 7,9 and 10,

Swetha et al.,

we could identify that Audio Lingua has highly impacted their second language acquisition process. Statement 7 proves that the improvement in listening skill will also improve their reading, writing and speaking skills. The students were very positive about the usage of Ipsative Assessment technique inside the classroom since it helped students to reflect on their language comprehension journey. This technique stressed the importance of self-evaluation and self-motivation and how it promotes learner autonomy. Through responses to statement 10, we could conclude that the intervention of Audio Lingua has increased the students' confidence level in recognising and interpreting phrases of second language. This increased confidence highlights the benefits of Audio Lingua intervention among ESL learners. To summarize, the Likert scale survey provided a clear view of the participants on the usage of Audio Lingua in language comprehension. The overwhelmingly positive responses to the questionnaire suggested the efficacy of the introduction of Audio Lingua among ESL learners who would be benefitted from the audio files that provide real-world scenarios. This well-rounded analysis provides for language learning interventions by rendering opportunities for enhancement and scope for further research. The researcher conducted a pre-test and a post-test, where the experimental group received the treatment using Audio Lingua, whereas the control group was subjected to traditional classroom listening exercises. The findings of the study are as follows

Comparative Results of Experimental and Control Groups

Group	Pre-test mean score	Post-test mean score	Difference	Statistical significance
Experimental group	22.9	34.5	11.6	Significant (p<0.05)
Control group	23.8	24.6	0.8	Not significant

The table indicates the mean score and statistical importance of the differences between the pre-test and post-test scores of experimental group and the control group. From the table, we could infer that the mean score of the experimental group during the post-test is significantly higher than that of the control group, this shows that the usage of Audio Lingua in ESL classrooms has a positive impact in improving listening skills among ESL learners. The mean score of the control group after the post-test didn't have much difference suggesting that traditional classroom teaching doesn't have a positive effect. The ANCOVA analysis showed that the experimental group scored more than that of the control group. Moreover, the effect size of the experimental group implied a medium to large effect of Audio Lingua intervention in improving listening skills among ESL learners. The effect size of control group is negligible. While the control group exhibited insignificant changes in learning outcomes, the experimental group showed a significant effective size (0.69), suggesting the efficacy of Audio Lingua intervention in enhancing student learning. The ANCOVA analysis indicated that controlling for any initial differences within the groups on the pre-test doesn't influence the result and proves the treatment's effectiveness. However, the pre-test variable is important, showing that there were differences initially between experimental and control groups that affected post-test scores. The effective size of the experimental group is medium to large with a value of 0.69 which is Cohen's d value. The effective size of control group is negligible since the adjusted post-test mean score is not significantly different from the pre-test mean score. Summarizing these, the ANCOVA analysis proved that Audio Lingua had a positive impact on the Second Language listening abilities of ESL learners, surpassing the control group.

CONCLUSION

This study explored the effectiveness of Audio Lingua in enhancing listening comprehension among ESL learners at SRM Institute of Science and Technology. The findings of the study indicated that the experimental group that received the intervention of Audio Lingua exhibited a significant improvement in listening ability when compared with the control group that received traditional classroom teaching to improve comprehensive ability. Therefore this research suggests that Audio Lingua intervention is an effective way to improve listening skills among ESL learners. Since there are certain limitations in this research, further study has to be done to find out the sustainability of this intervention in language classrooms. Even though, there are certain limitations, this research would provide a suggestion for language teachers in creating an engaging language classroom and that can promote listening ability.

Swetha et al.,

Limitations of the Study

There were several limitations in the study of exploring the effectiveness of using Audio Lingua in enhancing listening skills among ESL learners. The main limitation is that the researcher only focused on first-year undergraduate students and so the generalizability of the findings is constrained. Another limitation is that the researcher had taken only three months as the intervention time and so couldn't capture the long-term impact of the intervention. The study relied entirely on the website 'Audio Lingua' and its authentic files and there is a limitation in comprehending the language learning contexts. The study used Ipsative Assessment as the major assessment procedure and didn't use any other form of assessment. If all these limitations are addressed in further research, this study would be a valuable asset to language learning.

Scope for Further Research

This study on the efficacy of using Audio Lingua in improving listening competency among ESL learners provides a base for future studies in this area. One further scope of research is doing research with more participants with varying ages, backgrounds, and proficiency levels. Another study can be done by investigating the potential effects of technology in improving listening skills and the sustainability of using such interventions can be found. A comparative study between Audio Lingua and other technological applications that aid listening competency can be done. To provide a holistic perspective on the effectiveness of Audio Lingua in diverse classroom settings, Audio Lingua can be combined with other pedagogical practices. Further exploration of the complexities could be done by investigating the impact of social, economic and cultural factors, participant motivation and learning style of individuals.

ABSTRACT

India, with its large and diverse population, grapples with a substantial burden of Ischaemic Heart Disease. Studies indicate an alarming increase in the prevalence of IHD in the country over the past few decades. Drug utilization studies are essential tools to evaluate the prescribing patterns, effectiveness, safety, and cost of drugs used in the treatment of IHD. In the cardiology department of a tertiary care hospital, the complexity of patient conditions and the wide range of cardiovascular medications necessitate a thorough evaluation of drug utilization patterns to identify areas for improvement. The study aimed to comprehensively assess drug utilization patterns in the cardiology department of a tertiary care hospital. In which all inpatients of either gender above 18 years with a confirmed diagnosis of Ischaemic heart disease were included. WHO Prescribing Indicators and WHO's ATC classification system and DDD and PDD:DDD was used to present the drug utilization data. An average number of medicines prescribed per encounter was high (7.5), indicating the prevalence of polypharmacy

Ramaswamy Lakshmi Devi Maheswari *et al.*,

attributable to the presence of comorbidities along with ischemic heart diseases. Study reveals that the percentage of medicines prescribed in generic names was very low (5.20%), and considerable preference (76%) was given to the essential drug list. For three drugs, the PDD:DDD ratio is more than one, which was more pronounced for statins, followed by antiplatelet agents and loop diuretics. Only for beta-blockers was the PDD:DDD ratio less than one.

Keywords: Ischaemic heart disease, Prescribing indicators, Polypharmacy, Essential drugs.

INTRODUCTION

Cardiovascular diseases (CVDs) refer to the conditions affecting the heart and blood vessels and are the primary reason for mortality globally. They include coronary heart disease, stroke, peripheral arterial disease, rheumatic heart disease, and congenital heart defects. Ischemic heart disease (IHD), also known as coronary artery disease, is a significant health issue caused by reduced perfusion to the heart muscle due to blocked arteries. Atherosclerotic blockade can lead to symptoms like chest pain and shortness of breath, or occur without symptoms in silent ischemia. IHD can cause angina, heart attacks, and heart failure. Common symptoms include chronic stable angina and acute coronary syndromes [1-3]. In 2021, over 20.5 million individuals died from cardiovascular illness, accounting for approximately one-third of all global fatalities, an increase from 12.1 million in 1990. Ischaemic heart disease is now the top cause of premature death for both men and women in many countries. Despite an overall increase in CVD deaths, the global age-standardised death rate has decreased, indicating some progress. However, this progress is uneven, with high-income countries experiencing a faster decline in death rates compared to low- and middle-income countries, where over 80% of CVD deaths occur. There are also significant inequalities in cardiovascular health outcomes within countries based on sex, ethnicity, and socioeconomic status [4-6]. Ischemic Heart Disease (IHD) is a significant cause of death worldwide, leading to about 9 million deaths in 2019, which is 16% of all deaths [7-8]. The illness is more common in low- and middle-income countries, where risk factors like an increase in blood pressure, smoking, and diabetes are increasing. IHD also affects economies and healthcare systems, causing high healthcare costs and lost productivity. The World Economic Forum warns that if trends continue, the economic impact of cardiovascular diseases could reach \$47 trillion by 2030[7,9,10]. Developing countries are seeing a rise in cardiovascular diseases, especially IHD, which is a significant cause of illness and death. The Global Burden of Disease Study 2019 states that IHD accounts for over 40% of cardiovascular deaths in low- and middle-income countries, with deaths in the South-East Asia Region increasing from 1.2 million in 2000 to 2.1 million in 2019[11-13].

India has a significant problem with IHD, with over 28 million affected individuals and around 2.4 million deaths each year. This means one in four deaths in India is due to IHD, much higher than the global average. South Asians, including Indians, are especially prone to early heart attacks, highlighting unique health risks in this population. IHD impacts Indians a decade earlier than in developed countries, affecting society and the economy [14-17]. Drug Utilization Studies (DUS) investigate how medicines are prescribed, dispensed, and used. The main goal is to determine if drug therapy is sensible and to ensure the safe and effective use of drugs to improve patient health. When planning a DUS, defining the questions to be answered and whether the study is a one-time project or ongoing drug use monitoring is essential. The ATC/DDD methodology helps organize medicine packages into a structured list and measure usage in Defined Daily Doses (DDDs). DUS can help answer questions about drug usage, including how much is used in various settings, its purpose, how it is used, and demographic details of users. Many countries have systems to conduct these studies, such as cross-sectional studies that provide a snapshot of drug use over time [18-21]. Drug Utilization Review (DUR) is divided into three types: Prospective DUR evaluates a patient's medication before it's given to prevent misuse. Concurrent DUR monitors drug therapy during treatment to catch any issues as they happen. Retrospective DUR looks at drug therapy after the fact to find misuse patterns, which can help create educational programs or guidelines for better drug use [18-21]. The ATC/DDD approach originated in Norway to modify and extend the European Pharmaceutical Market Research Association (EPHRA) classification system. It

Ramaswamy Lakshmi Devi Maheswari *et al.*,

was recognized by the World Health Organization (WHO) Regional Office for Europe in 1981 and eventually received global endorsement from the WHO in 1996. The ATC/DDD methodology is an internationally recognized Drug Utilization Research (DUR) system. It includes the Anatomical Therapeutic Chemical (ATC) classification system and the Defined Daily Dose (DDD). The ATC system categorizes active medical substances based on the organs or systems they affect and their therapeutic properties. Each medicine receives a unique code from this system. The DDD is a measurement unit that represents the average daily maintenance dose for a drug used for its primary purpose in adults, linked to the ATC code. This methodology helps in presenting and comparing drug usage data across different regions, even with variations in drug names, packaging, prices, and dosages. It supports better outcomes and quality use of medicines and is endorsed by the WHO as the international standard for monitoring and researching drug usage [20,22]. Research on drug use in patients with ischemic heart disease shows a consistent pattern of underuse of essential medications like β -blockers and ACE inhibitors/ARBs. While there has been more use of statins and antiplatelet drugs for preventing further heart issues, evidence-based treatments remain under prescribed [23-26]. Studies from developing countries, including Switzerland [27] and India [23], indicate that many IHD patients are not receiving necessary medications. In India, high rates of polypharmacy and a trend to prefer brand-name drugs over generics were noted [23,28]. Some studies also reported strong use of antiplatelet medications in certain hospitals. These findings highlight the pressing need for targeted efforts to improve medication usage for IHD patients, emphasizing better prescription practices and research in this area [28-30].

MATERIALS AND METHODS

This prospective observational study was conducted at KIMS Saveera Hospital in Anantapur over a six-month period. It includes inpatients of either gender aged 18 and above who have a confirmed diagnosis of ischemic heart disease. Patients who do not consent, those in critical condition, outpatients, or those under day care management are excluded from the study. The minimum sample size, based on WHO guidelines, is 100 participants [20]. Data is collected from patient case files using a structured form that includes demographic information, medical history, and prescription details. The study employs WHO prescribing indicators and the Anatomical Therapeutic Chemical (ATC) classification for drug utilization analysis, calculating the Prescribed Daily Dose (PDD) and PDD-to-Defined Daily Dose (DDD) ratio. The research proposal was ethically reviewed and approved by an institutional body (approval number is RIPER/IRB/2023/004), and informed consent was obtained from participants. Data analysis focused on demographics and drug utilization patterns using descriptive statistics and GraphPad Prism for statistical evaluation.

RESULTS

The data analysis found that out of 186 participants, 134 (72.04%) are male and 52 (27.95%) are female. The age distribution indicates that the majority of participants are aged between 51 and 70 years, with 57 (30.64%) aged 51-60, 52 (27.95%) aged 61-70, and 38 (20.43%) aged 41-50. Fewer participants are under 40 (13 or 6.98%) and over 80 (1 or 0.53%). Regarding cardiovascular diseases, the data reveals the distribution of ischemic heart conditions. The most common diagnosis is NSTEMI, affecting 88 participants (47.31%), followed by unspecified MI with 41 (22.04%), unstable angina with 25 (13.44%), and STEMI with 32 (17.20%). Table 1 shows the number of drugs prescribed per patient. The most common prescription was for five drugs, with 53 patients, representing 28.49% of the total. A total of 35 patients were prescribed six drugs, accounting for 18.81%. There were 22 patients on seven drugs, or 11.82%. Eighteen patients received eight drugs, making 9.67%. Seven patients had nine drugs, showing 3.76%. Lastly, seven patients were prescribed more than 10 drugs, representing 10.19%. Table 2 presents data on the use of various drugs among patients with ischemic heart disease. Antiplatelet drugs are the most common, used by 249 patients (21.37%). Other notable treatments include anticoagulants (138 patients, 11.84%), proton pump inhibitors (148 patients, 12.70%), and beta blockers (113 patients, 9.69%). There are also lower percentages for treatments like calcium channel blockers (0.60%) and ARNI's (0.25%). The overall data reflects the distribution of different drug patterns in this patient group.

WHO prescribing indicators

The table provides data on key prescribing indicators from the World Health Organization (WHO). On average, 7.5 drugs are prescribed during each patient encounter. Only 5.2% of the medicines are prescribed by their generic names. Additionally, antibiotics are prescribed in 5.9% of patient encounters, while injections are given in 1.11% of cases. Lastly, 75.9% of prescribed drugs come from the national Essential Medicines List (NLEM). The table presents information about commonly prescribed drugs, including their defined daily dose (DDD), prescribed daily dose (PDD), and the ratio of PDD to DDD. The PDD/DDD ratio was found to be less than one for two drugs, metoprolol (0.171) and Nicorandil (0.12), whereas for atorvastatin, the ratio was six. Table 5 lists some commonly prescribed drugs and their ATC (Anatomical Therapeutic Chemical) classification codes.

DISCUSSION

This study evaluated the drug utilization pattern from a cardiology unit of a tertiary care hospital. The majority of the patients with ischaemic heart disease were male (72.04%) compared to female (27.95%) patients, which was following a study conducted by Nagabushan H *et al.*, [32], Al-Junid *et al.*, [33], and Sreedevi *et al.*, [34]. More than 70% of the patients with IHD were above 50 years, indicating that older age is associated with an increasing occurrence of ischaemic heart disease. This is due to the age-related increased risk for cardiovascular diseases. Number of drugs per prescription analysis reveals a high prevalence of polypharmacy, attributable to the complex nature of IHD and associated comorbidities. Among ischaemic heart diseases, non-ST-elevated myocardial infarction (NSTEMI) was reported to be high in our study, followed by STEMI and unstable angina. Hypertension and diabetes were the two common comorbidities reported in our study, consistent with similar studies by Nagabushan H *et al.*, [32], Dawalji *et al.*, [35], and Christian *et al.*, [36]. In our research, most commonly, prescribed drugs belong to diuretics, beta-blockers, antiplatelet agents, anticoagulants, dyslipidaemic agents, and anti-angina drugs. Similar findings were reported by Nagabushan H *et al.*, [32] and Dawalji *et al.*, [35]. Prescribing indicators analysis reports that an average number of medicines per encounter was 7.5, more than the WHO recommended values (<2) [37,38] indicating the prevalence of polypharmacy in our study. An abysmal percentage of medicines were prescribed in generic names (5.20%). The WHO proposes that all drugs (100%) be prescribed optimally by generic names [37,38]. Percentage of encounters with an antibiotic prescribed was 5.9%, which is following the WHO recommendation (<30%) [38]. 1.11% of encounters with an injection prescribed in our study. For which the WHO proposed an optimal value of <20% [38]. Approximately 76% of medicines are prescribed from the essential medicines list. The reference value for a PHC is 100% [38].

Research on drug utilization trends in ischaemic heart disease patients by Roy A *et al.*, [23] and Sawant MP *et al.*, [24] reveals a consistent pattern of underuse of evidence-based medications, particularly β -blockers and ACE-I/ARBs. In our study, antiplatelet agents (21%), anticoagulants (11%), and thiazide diuretics, beta-blockers, and dyslipidemic agents were found to be 9%, respectively. Similar findings supported a significant increase in statins, antiplatelet drugs, β -blockers, and ACE inhibitors for secondary prevention of ischaemic heart disease [25]. Research on drug utilization in ischemic heart disease (IHD) in developing countries found that a significant proportion of IHD patients did not receive platelet aggregation inhibitors, beta-blockers, and lipid-lowering drugs, with underuse of beta-blockers and ACE-I/ARBs [23,27]. Whereas in our study, 21% of drugs belong to antiplatelet therapy. However, a high rate of drug utilization for antiplatelet drugs was reported in a tertiary care hospital in India [26]. These observations highlight the need for targeted interventions to improve the appropriate use of drugs in IHD patients. During the study period, 186 patients continuously received at least two drugs; a majority received 5. Among the five commonly prescribed drugs, for three drugs, the PDD:DDD ratio is more than one, which was more pronounced for statins-atorvastatin, rosuvastatin (6), followed by antiplatelet agent-clopidogrel (1.77) and loop diuretic furosemide (1.5). Only for beta-blockers, the PDD:DDD ratio was less than one DDD, a similar trend reported by Grimmshmann T *et al.*, [39]. Drug utilization research by Kumar M *et al.*, [29], and Vyas S *et al.*, [30] studies collectively underscore the necessity for improved drug utilization practices in the management of ischemic heart disease in India and suggest a need for further research and interventions to improve the appropriate use of evidence-based medications in this

**Ramaswamy Lakshmi Devi Maheswari et al.,**

patient population. While potentially offering valuable insights into how ischemic heart disease is treated with medications, the study faces significant limitations. The primary concerns revolve around generalizability; findings from this single, specialized, rural setting may not accurately reflect practices in urban areas or lower-level care settings. The short duration of the study limits the ability to observe seasonal patterns, long-term trends, or patient outcomes. Furthermore, the study focuses on prescribing patterns but may miss crucial aspects like treatment appropriateness, clinical outcomes, and the reasons behind prescribing choices. Therefore, the study's conclusions should be considered specific to its unique context.

CONCLUSION

An average number of medicines prescribed per encounter was high (7.5), indicating the prevalence of polypharmacy attributable to the presence of comorbidities along with ischaemic heart diseases. The study revealed that the percentage of medicines prescribed in generic names was very low (5.20%) and that considerable preference (76%) was given to the essential drug list. However, the WHO recommends 100% compliance with the essential drug list for PHCs. Among the five commonly prescribed drugs, for three drugs, the PDD:DDD ratio is more than one, which was more pronounced for statins, followed by antiplatelet agents and loop diuretics. Only for beta-blockers was the PDD:DDD ratio less than one DDD.

Conflict of Interest

The authors have no conflicts of interest regarding this study.

ACKNOWLEDGMENT

The authors would like to thank the quality department staff of KIMS Saveera Hospital for their kind support in data collection.

ABSTRACT

Copper nanoparticles have drawn a lot of research attention due to their remarkable physicochemical characteristics, which make them appealing options for a variety of applications. The numerous purposes of CuNPs are explored in this review, with a focus on developments in their synthesis, characterization methods, and wide range of applications. A variety of synthesis techniques are investigated, including physical, chemical, and green approaches, with an emphasis on environmentally friendly processes that make utilization of biological entities like bacteria and plant extracts. Techniques for characterizing CuNPs that are important in understanding optical, morphological, and structural characteristics are explored, including techniques like X-ray diffraction, spectroscopy, and electron microscopy. The different applications of CuNPs are highlighted, including their ability to serve as antimicrobials against a wide range of pathogens, their capacity to catalyze chemical reactions, and their promise in biomedical fields including medication transport and cancer treatment. This review aims to explain the present status of CuNP research and motivate further investigations to fully utilize them in a range of scientific and industrial fields.

INTRODUCTION

Nanotechnology is a science that still developing and comes with the process of changing management at the atomic or molecular level. creation of things at a dimension of the nanometer is done under Nanotechnology. This is a branch of science that deals with atom and molecular control.[1]Nanoparticle (NPs) means an ultrafine particle or a material which lies between 1nm to 100nm in size in diameter with length The size range of the multiplexed structures was 1 to 1000 nm in one dimension.[2]It can be said that scientific investigations of nanomaterials have yielded many progress. concern because the fact is that they have specific characteristics and find usage in a numbers of spheres different areas.[3] Usage of such materials in various fields always depends on the nature and type of the nanoparticles (NPs). Metallic nanoparticles possess certain distinctive and desirable attributes such as , chemical, physical and catalytic properties.[4]Copper nanoparticles (CuNPs) have garnered significant attention in a few years because of their novel physicochemical characteristics, which differ considerably from their bulk counterparts.[5] These properties, including large surface area, great electrical and thermal conductivity, and strong catalytic activity, make CuNPs prospective applicants for a variety of positions.[6] This review paper delves into the synthesis methods, characterization techniques, and diverse uses for CuNPs, highlighting their potential to revolutionize various fields.[7]Nanoparticles can be categorized in a number of ways based on their origin, size, and composition.

1. Categorization according to material properties

- i. Carbon nanomaterials: These comprise fullerenes (C60), carbon nanotubes (CNTs), and carbon nanofibers, among others.
- ii. The term "inorganic nanomaterials" refers to metal and magnetic nanoparticles, like gold and silver, as well as metal oxides and semi-channel nanoparticles, i.e CuO, ZnO, and TiO₂.
- iii. Natural nanoparticles: These include micelles, liposomes, dendrimers, and other nanomaterials derived from organic matter with weak interactions.
- iv. Composite nanomaterials: These are multiphase nanomaterials with intricate metalorganic framework structures. It could consist of metal, carbon, or biological materials combined with polymers or other metals.[8]

2. Dimension-based classification:

- i. Nanoparticles with zero dimensions, such as Quantum boxes or quantum dots.
- ii. One-dimensional nanoparticles, such as nanofibers of polyethylene oxide.
- iii. Two-dimensional nanoparticles, such as Nanosheets of graphene and carbon nanotubes.
- iv. Three-dimensional nanoparticles, such as ZnO nanowires, dendrimers, and fullerenes (C60).

3. Origin-based classification:

- i. Natural nanomaterials: NPs that are naturally occurring on Earth spherical or created by biological species.
- ii. Synthetic nanomaterials (NPs): NPs made via reduction methods that can be physical, chemical, biological, or hybrid.[9]

Synthesis of Copper Nanoparticles

Physical and Chemical synthesis

When preparing metal nanoparticles they ought to bethe proper technique to achieve a specific size because utilizing a specific technique minimizes the particle's size and keeps it stable.[10] Due to their abundance, accessibility, and affordability when compared to gold and silver, copper nanomaterials are receiving a lot of interest. As a result, Several chemical and physical processes are being used to generate copper nanoparticles on a large scale. The two main techniques for producing nanoparticles on a large scale are chemical (solid state, liquid state, there are so many approaches of synthesizing metal nanoparticles such as in gas phase, biological methods and many others.[11]and physical (mechanical milling, laser ablation, and sputtering), which are referred to and divided into such as the top bottom approach and the top down top up approach respectively.[12]Precursors for copper, dilution salts, and ball-milled starting materials are needed for the mechanochemical production of nanoparticles. The Baraiya

**Sarika Nikam et al.,**

Harishchandra Divyeksha *et al.* An Analysis of Synthesis and Evaluation of Copper Nanoparticle Properties and at room temperature, producing copper oxide (II) nanoparticles that were further encased in a salt matrix and cleaned in an ultrasonic bath with distilled water.[13]Antimicrobial efficacy against *E. coli* and *S. aureus* was demonstrated by these particles. Chalcocite (Cu₂S) and covellite (CuS) were ground at varying times to produce copper nanoparticles (NPs) with a size of about 16 nm in one of the experiments Using iron metal as a preliminary lowering agent.[14] This process proved to be scalable. Methods like laser ablation using a high-power pulsed laser with energy of 20 ml,onne wavelength of 532 nm,one pulse length of 4ns pulse width, and powerthat targets bulk copper density of $5.24 \times 10^{12} \text{ W cm}^{-2}$, [15] demonstrating the production of copper oxide nanoparticles that improve hydroponic rice seedling growth.[16] By assembling atoms, molecules, or tiny particles to produce nano size dimensions, a bottom-up approach to nanoparticle synthesis is achieved. For the green synthesis of nanoparticles, the sol-gel approach of employing polymers is quite interesting.[17]Extract from *Lantana camara* was combined with a mixture of sodium hydroxide and copper chloride, resulting in a particle size determined as having an average size of 17 nm with photocatalytic activity. Using copper chloride as a precursor, copper ions are chemically reduced with sodium borohydride and stabilized by polyvinylpyrrolidone (PVP), yielding 7 nm TEM and SEM study of NP size.[18] Using glycerol as a reducing agent and a variety of surfactants to stabilize the particles, solvothermal reduction was used to create copper nanoparticles with a particle diameter varying from 38 to 50 nm.[19] Because it produces stable nanoparticles in a simple manner and exhibits antibacterial action against *E. coli*the thermal synthesis of NPs breakdown in the liquid phase has drawn interest. *Myristica fragrans* fruit extract was used in the microwave-assisted green synthesis of CuO NPs At an average power of 800W, and at the frequency of 2450 MHz for five minutes at a temperature lower than 100 °C,[20] and a blue-to-green hue shift was noted. According to TEM, SEM, and XRD measurements, CuO NPs had sizes of In detail, directions of the presenters presentations were 4, 13, and 15. 7 nm respectively demonstrated catalytic and antibacterial properties. For a variety of uses, flame spray pyrolysis, which is one of the scalable methods.[21] called flame assisted pyrolysis, convert aerosol to vapor to generate high purity and ultra fine copper oxide (CuO) nanoparticles in which flame temperature and flame residence time may be used to alter the particle size.and liquid precursor concentration as the parameters of research, which takes time.[22]

Green synthesis

Copper NPs have also been proven to have deep functioning in Food Packaging and in agriculture with crops. improvement. Henceforth, the Copper nanoparticle has versatility implementation in the field of biological and physical and chemical sciences. Therefore, the preparation of nanoparticles from organic extracts is increasing rapidly within the nanotechnology field because green procedure gives better results with no deleterious impacts.[23] The primary justification for using natural extracts is that they are environmentally friendly and devoid of chemical pollutants, which makes them useful in many scientific domains. This implies that matters such as suitable procedure, timing, precursor, pH, and temperature and The incubation period needs to be well figured out in order to enhance the synthesis process. These methods are extendable, less hazardous, additional staedy when compared to those synthesized through physical and chemical processes. These materials find the major synthesis of metal nanoparticles because of the efficient use.[24] Attempts are designed to isolate primary and secondary metabolite of natural products in varying concentrations used as a lowering and stabilizing substance which can be employed in capping. Also nanoscience is growing the Nanoparticles based on polymers are also developing Using nanotechnology. Methods of green synthesis are useful to down scaled the nanoparticle size and the extract itself can stabilize the NPs, making This approach perfectly green with vast impacts in presenting the textile, cosmetics, water treatment, antimicrobial, antifungal, anti-cancer, and catalytic, etc etc., and numerous applications, which gives more opportunities for medicinal purposes and therapies. [25] Owing towards the fact that living things with different densities together along with additional live organisms will affect the size, shape, and performance about NPs. Some research is also under way to enhance the green synthesis techniques at a larger capacity. This can provide the future dimensions of demand by human of welfare.[26]

Plant and Fruit Extract mediated Synthesis

This synthesizing procedure starts with the combination of the raw materials diluted with a metal solution; with biochemical Rather, the selectivity for decrease in salt colour change is noticed within the remedy. suggesting that nanoparticles were synthesized.[27] Copper nanoparticle biosynthesis employing an water-based extract of Taliaas well as beingd is solved in copper sulphate pentahydrate solution with 4:1 (V/V), for a steady stimulation with a temperature of 80°C for 25 min. additional precipitate as well as drying by placing the sample in the oven for another two hr was completed at 100 °C.[28] The hemispherical form but not similar with each other It was found from the TEM analysis of the synthesized materials that the mean particle diameter of Ag nanoparticles was within the range of 4.7-17.4 nm. studies.[29] These NPs exhibit antibacterial and antitumor against HepG2 cells, human hepatic cancer cells, and investigate their mechanism of action. and breast cancer (Mcf-7 cells). In the present study, synthesis of Cu NPs using peppermint extract as a reducing agent was carried out. Rifampicin solution (0.2 mg/mL) was coated over the nanoparticles by diluting the rifampicin powder in distilled water and kept on stirring consistently, stirring the mixture at 700 rpm for 5 hour; maintaining the pH 6.5. Temperature: between 25 and 45 0C, This improved the antimicrobial synergistic effects against Staphylococcus aureus, determined byAFM and laser scanning confocal fluorescence microscopy Adults need: confocal laser scanning microscopy (CLSM) quantifying DNA fragmentationby using the agarose gel electrophoresis. Copper oxidepreparation of nanoparticles employing the leaf extract of Annona muricatainto copper (II) sulphate with constant agitation at 80 degree Celsiusfor 12 hr then dried at 24 hr; XRD, SEM and BIO-TEM analysis presented The size of 30–40 nm CuONPs, which exhibits photocatalytic and cytotoxic activity.[30] Titrations were by fruit extract of Syzygium sampling was done after treating alternifolium with 5mM copper sulphate precursor at 50°C for 2 hours. additional precipitation also at 10,000 RPM forming 17.5Target nm average particle size of copper oxide displaying anti-viralimmunity towards Newcastle Disease Virus (NDV) [31]

Bacterial and Fungal Mediated Synthesis

Microbially mediated nanoparticle production is a developing area of nanobiotechnology. Some specific mechanisms through which microorganisms attempt to metabolise toxic metals that would contribute to the formation of nanoparticles directly as a form of a reduction mechanism. Since these microbes are known to generate enzymes that in this case reduce the toxic metal and give rise to nanoparticles.[38] For biosynthesis of CuO NPs by actinomycetes, the cell free super natant was added in 25 ml CuSO₄. 5H₂O (10mM) and it was grown at 100 °C for15 min and the colour change noticed. Additional characteristics using the XRD and TEM revealed an average size of NP to be site of 61.7 nm which possesses an antimicrobial property. Cell-free supernatant derived from fungal mediated Trichoderma spiraliium was used to synthesize CuO NPs with particle sizes between ten and one hundred ninety nanometers.[39] using amide and aromatic groups of secondary metabolites as both encapsulating/administrating agents as confirmed through infrared characterization. In this nanoparticle, *in vitro* photothermal ablation treatment of human. lung carcinoma = A 549 cancer cells was also investigated. The eco-friendly biosynthesis of Cu NPs via Agaricus bisporus (fungus) resulted in NPs between 2 and 10 nm in size and exerted antimicrobial, antioxidant and cytotoxicity effects on SW 620 colon cancer cells.[40]

Algal Mediated Synthesis

Thusthe morphogenesis of algal mediated extracellular formation of nanoparticles, phyconanotechnology is an economic, environmental, vitality and reduced toxicity process to lessen the breaking down the metal particles. CuO NPs were synthesized using Anabaena cylindrical micro-algae extract at 60°C, with a rotational speed of 500-100 rpm, and produced CuONPs with a particle size of only 3.6 nm which may have potential applications in the disinfection of drinking water.[41]

Characterization

Its synthesis of copper nanoparticle at a wavelength regulated at 200-800 nm is detected by Surface Plasmon Analysis (SPA). Morphology and size distribution of the synthesized nanoparticles are determined by UV visible spectroscopy, SEM and TEM and BFS is determined by UV visible spectroscopy, Bandwidth, shape and size are determined by SEM and TEM and Based on the presence of functional group on of crystalline structure analyzed by

Sarika Nikam et al.,

XRD result. Therefore, it can be concluded that the surface functionalization of nanoparticles can be investigated by FTIR analysis. These are the commonly applied characterization techniques for the study of nanoparticles. Studying the description of the nanoparticles shows various shapes, size and biologic description of the nanoparticles depending on structure. Nanoparticle is the particle size and depends on many applications in examples like drug delivery the smaller the size of addressed for the drug delivery.[42]

UV- Visible Spe The greater the particle's surface area, thetrophotometry

concerning solution with reference to the time it can alter the absorption spectra this applies to NPs. UV-vis spec. functions based on Beer-Lambert's Law of light absorption and transmission to estimate concentration of NPs. The above technique is highly sensitive to change in concentration, size and refractive index of NPs, as the latter changed with even the change in pH and time of NP interaction with the solvent.[43] UV visible absorption pattern of copper NPs was studied by double beam UV 3000+ LABINDIA spectrophotometer in the wavelength range of 200 to 800 nm. Preparation of CuNPs with *A. indica* leaves was monitored with changes of the solution color with time which was captured by UV-vis spec. leading to enhancement of SPR peak implying the progressive reduction of copper ions to CuNPs. *Bacillus cereus* mediated synthesis CuNPs was confirmed by SPR the size was found in the range of 570–620 nm and further analysis showed spherical shape of NPs.[44]

XRD (X ray diffraction)

This is the method of finding out the lattice form of crystal since it identifies the molecule at the atomic level thanks to interference both constructively and destructively instigated by the atom present in the lattice. Constructive interference taking place with the help of a particular diffracted pattern of the crystal interplanar spacing d and the reflection angle θ would defined the structure of this arrangement. resulting in Bragg's equation: $n\lambda=2d \sin\theta$ [45] This will give total crystal volume average and the peaks are broadened which can result from the fine crystal structure. Hence the The size of the crystal D calculated by Debye Scherrer's equation reaches the surface $D=K\lambda/\cos\theta$ as shown in Bruker X-ray diffractometer. D8 Advance with $\text{Cu K}\alpha$ was employed to analyse the CuNPs' crystal structure produced from the leaf extract of *Garcinia mangosteen* that formed Average of 26.51 nm NP particle size from the obtained results the NP particle size was obtained from The formula of Debye Scherrer The size of the crystallites in the non-nanosized reinforcement particles as calculated from the Debye- Scherrer formula.[46]

SEM Analysis

This approach to NP characterisation does not include more surface analysis that will enable us know the morphological characteristic, geometrical characteristic or disposition or even the chemical statics of the materials. This process involves putting the solution from of the NPs into dried powder form and placing the sample holder before a little beam of an The electron is transferred the sample which releases lets consider the electrons which are emitted during the second time or back scattered electrons electrons to give the surface of the sample. Getting the removal of electron from the nanomaterial, we find that the release of electron differs with the surface results in depressions and elevations of the surfaces that helps to understand the morphology of NPs. SEM analysis was carried out for CuNPs with different surfactants and precursors and at different time intervals The observations mentioned herein was done using a ZEISS EVO Series, model EVO 18 microscopeto determine the sizes and forms of the mostly crystal focusing which on increase in the more the concentration of the reducing agent the rate of reduction reaction is also higher.[47]

TEM Analysis

An important method employed for the examination of physical features like NPs' dimensions, form, and morphology and chemical nature is the morphological technique which offers a spatial resolution of between 1 to 100 nm leading to the formation of 2D images. Resolution in microscopy is defined by the 100–300 kV range of main electron accelerating voltage. This technique estimates a perpendicular electron beam to analyze a particle's two dimensions, but it is unable to estimate a parallel beam. Nevertheless, the third dimension of the particle might beanalyzedutilizing TEM tomography and TEM with energy filtering. These procedures indicate that sample preparation of the nanomaterial for analysis should be very accurate, especially when conducting physicochemical

Sarika Nikam *et al.*,

analysis of NP's.[48] While using In TEM bright field imaging, the electrons that are transported from The examples are usually analysed while in dark field imaging, it is because of the electron's diffusion. The picture is captured at the occupational The fluorescent screen and CCD camera are employed for the purpose of vision of image The dry version of the Asamoah *et al.*-synthesised copper oxide nanoparticle sample was redispersed in appropriate water. This was sonicated even further to minimize settling among particles and to fix the suspension onto grid of carbon and was photographed once it had dried. Hence examination led to the synthesis of nanorods whose average dimensions of breadth and length were 100 and 14 nm, in that order exhibited antibacterial properties. Transmission electron microscope JEOL JEM 1200EX images using energy dispersive spectroscopy and identified spherical shaped CuNPs with Using quasi elastic light scattering data (QELS), the average particle size was found to be between 15 and 20 nm.[49]

Cost-Effectiveness

Due to their lower production cost copper nanoparticles prove better suited for industrial deployment across fields that need energy storage and environmental cleanup and catalysis systems because they cost significantly less than either gold or silver nanoparticles. The cost of gold and silver nanoparticles exceeds other nano catalysts similarly hindering their implementation in commercial settings.[50]

Catalytic Properties

Copper nanoparticles (CuNPs) demonstrate superior catalytic characteristics in hydrogenation reactions and oxidation processes and CO₂ conversion which matches or outperforms gold and silver nanoparticles in particular scenarios. The combination of low production cost together with excellent catalytic properties makes these nanoparticles an ideal choice for industrial catalytic applications. Copper shows superior performance than gold for selective oxidation and carbon-carbon bond production but gold nanoparticles remain popular for specific chemical reactions.[51]

Versatility and Functionality

Energy storage applications favor copper over gold and silver because it offers abundant availability and lower costs and these other materials lack common usages[52]

Applications

Because of its large surface area and nanoscale size, nanoparticles have enormous use in biomedical and pharmaceutical sectors. The following lists the main scientific domains that benefit from CuNPs

Antimicrobial Activity

Copper employed as a biocide for decades has demonstrated a robust antibacterial intensity of activity and FeI as the G that is at a density of 10 000 CFU/ml and was successfully diluted by 99.9%. The US Environmental has endorsed the registration of copper as an antimicrobial material which can effectively minimize particular pathogenic bacteria associated with possibly fatal microbial disorders. Cu Nps are known to exhibit extensive operation in killing a broad spectrum of antibacterial against various type of both gram positive and negative bacteria. copper oxide (CuO) nanoparticles has the characteristics of an excellent antimicrobial material from pathogenic organisms; *E.coli*. *Bacillus subtilis*. *vibria cholera* *Pseudomonas aeruginosa* , *Syphillis typhus*, *Staphylococcus aureus*. The copper nps synthesized using plant Manufacturer Organisation of the extract used in the preparation of this article include which of the following *Magnolia*, *Syzygium aromaticum*, *Tridax procumbens* when exposed to *Escherichia coli* they got higher antibacterial activity on cells afer 24 h of growth. [53]

Biological Applications

Copper nanoparticles possess good antibacterial, antifungal and antiviral properties that explain their ability to prevent bacterial, fungal and viral infections. Said research has also noted that CuNPs may have toxic effects on microbial cell wall and membrane which in turn causes the death of the microbes through such pathways such as oxidation stress and ROS. Because of this property they have been incorporated in to medical device, wound

Sarika Nikam *et al.*,

dressings as well as in hospital surfaces to avoid spread of infection. Copper nanoparticles also...sure against pathogen-drug resistant bacteria like *Staphylococcus aureus* and *Escherichia coli* that are responsible for hospital-acquired infections (Iravani *et al.*, 2014). The mode of antimicrobial action of CuNPs is believed to be the leaching of Cu^{+2} ions that chelate with organic acids and proteins in the microbial cells and disrupt the key cell functions such as synthesis of proteins and replication of DNA. Cancer Treatment Copper nanoparticles have demonstrated other characteristics that make them suitable for cancer treatment in a number of ways. Research into their application in chemotherapy and radiation therapy is on the rise since CuNPs can improve the effectiveness of such treatments. Some previous studies have indicated that CuNPs are able to selectively affect tumor cells since nanoparticles are engulfed through endocytosis, and that smaller particles are more efficiently taken up by tumor cells than by healthy ones. Besides, CuNPs have shown to possess photo thermal effect meaning when exposed to light; the CuNPs releases heat which selectively clears up cancer cells. CuNPs are favoured in photothermal therapy because, when applied in conjunction with other treatment methods, they enhance the total therapeutic worth.[54] Drug Delivery To date, there are studies that give emphasis on using CuNPs as a drug delivery system. In this case, it is possible to functionalize copper nanoparticles with the desired drugs and molecules which make the possibility of targeting certain tissues or cells reachable. They can be altered at the surface to enhance compatibility with biological applications, enhance the loading capacity and the rate of drug release. It appears that CuNPs are suitable for the encapsulation of hydrophobic drugs since the particles are able to enhance the solubility of the compounds. For instance, CuNPs acting as anticancer drugs and antibiotics were selectively transported to neoplastic cells or site of infection and the risks of conventional drug administrations were minimized (Miao *et al.*, 2017). The surface of CuNPs can also be altered to increase interaction with biomolecules to gain better results as a drug delivery system.[55]

CuNPs have also been considered for their application in gene therapy and it is secularized as Gene Therapy CuNPs. Copper nanoparticle is able to condense with nucleic acid such as DNA or RNA thus aiding in delivery into a cell. These characteristics make CuNPs suitable for gene delivery, which are a broad class of non-viral vectors. Because of their large surface area they accept a large amount of genetic material and their small size also facilitates cellular uptake. However, CuNPs can be functionalized with ligands or peptides to differentiate target cells enhancing the CuNPs' gene delivery ability. CuNPs have been applied in gene delivery for the treatment of genetic disorders and cancer in other studies by transfecting cells with therapeutic genes. They present advantages over viral vectors which are generally linked with immune reactions and other issues of safety.[56] Antioxidant and Anti-inflammatory activity Copper nanoparticles have antioxidant and anti-inflammatory properties likely useful in treating diseases associated with oxidative stress and inflammation. CuNPs are capable of removing free radicals that cause oxidative stress that is linked with diseases such as Alzheimer, Parkinson, and diabetes (Liu *et al.*, 2020). They also block the synthesis of pro-inflammatory cytokines, which plays a great role in combating inflammations diseases for instance rheumatoid arthritis and inflammatory bowel diseases. These properties of CuNPs entitle them for exploration in several therapeutic uses in long term inflammatory illnesses.[57]

Biocatalyst and Bioremediation

Copper nanoparticles (CuNPs) have been investigated for their potential uses in biocatalysis and bioremediation since they possess interesting attributes including high surface area, reactivity and biological compatibility. CuNPs in biocatalysis have also been considered as being enzyme-like in a number of reactions including the oxidation and reduction reactions that are involved in the transformation of organic substrates or the degradation of pollutants.[58] Because of their high catalytic efficiency and easily adaptable functionalisation of the catalytic properties, these materials can be used to design and produce task specific effective catalytic systems in environmentally benign synthesis, fine chemical manufacturing and the systematic treatment of environmental pollution in wastewater. For instance, in bioremediation, CuNPs seem to have potential in the elimination and the mitigation of injurious heavy metals including lead, mercury and arsenic from water and soil. Furthermore, it assist in the enhancement of water treatment through killing of pathogens due to their antimicrobial characteristics. CuNPs also facilitate the breakdown of organic compounds such as pesticide and industrial effluents by a catalytic or by reduction approach. However, the following challenges are worthy of further discussion due to the risk of the toxicity of copper ions liberated from

**Sarika Nikam et al.,**

the nanoparticles to affect ecosystems and people's health. The concerns mentioned above will be further explored in later studies by creating even safer CuNP-based systems, for example, those immobilized on the surface of biocompatible materials or incorporated with other NPs to improve the effectiveness and reduce adverse effects. However, CuNPs promise much for the development of eco-friendly technologies for various applications in biocatalysis and environmental remedial activities.[59]

Electrical and Energy Storage Applications

Research into CuNPs as an excellent conductive material shows active use in energy storage applications like batteries and supercapacitors producing performance improvements compared to gold and silver nanoparticles in specific setups. Although proven successful for medical imaging and targeted therapies the high price of gold nanoparticles obstructs their widespread use during low-cost medical interventions.[60]

Environmental Applications

The environmental friendliness of copper nanoparticles surpasses the characteristics of gold and silver nanoparticles. These nanomaterials present lower toxicity to both human cells and ecosystems therefore making them ideal for wastewater treatment and heavy metal remediation applications. Studies have shown copper nanoparticles offer better sustainability because silver nanoparticles present toxicity risks to aquatic creatures while also affecting the environment negatively.[61]

Other Applications

Copper NPs have also been proven to have deep functioning in Food Packaging and in agriculture with crops. improvement. Henceforth, the Copper nanoparticle has versatility implementation in the field of biological and physical. and chemical sciences. Therefore Because green processes produce better outcomes without having any negative effects, the production of nanoparticles from organic extracts is growing quickly in the area of nanotechnology.[62] The primary justification for using natural extracts is that they are environmentally friendly and devoid of chemical pollutants, which makes them useful in many scientific domains. This implies that matters such as To improve the synthesis process, the right procedure, time, precursor, pH, temperature, and incubation period must be carefully determined. These techniques are scalable and less hazardous and more steady when compared to those synthesized through physical and chemical processes.[63] These materials find the major synthesis of metal nanoparticles because of the efficient use. Attempts are designed to separate the natural extracts' secondary metabolites. in varying concentrations used as a reducing and stabilizing agent which can be employed in capping.[64] Also nanoscience is growing the Nanoparticles based on polymers are also developing using nanotechnology. in presenting the uses in textiles, cosmetics, water treatment, antibacterial, antifungal, anti-cancer, catalytic, and many more, which gives more opportunities Green synthesis techniques can help reduce scaled the nanoparticle dimensions and extricate itself can stabilize the NPs, making This approach perfectly green with vast impacts for treatments and the rapies. Owing to the fact that organisms with different densities together along with additional live organisms affect the dimensions, form, and performance of Nanoparticles. Some research is also under way to enhance the green synthesis techniques at a larger capacity. This can provide the future aspects of the human wellbeing desing.[65]

CONCLUSION

The combination of practical cost and functional enough characteristics and multifaceted utility makes copper nanoparticles highly suitable across diverse applications. The application advantages of copper nanoparticles outshine both gold and silver nanoparticles through their economical features which pair with excellent catalytic performance and Earth-friendly aspects along with wide-ranging antimicrobial properties.

ABSTRACT

This study examined the relationship between perceived parental bonding—specifically maternal and paternal care and overprotection—and emotional intelligence among 120 adults. Using standardized psychological assessments, results indicated that both maternal and paternal bonds correlate positively, though modestly, with emotional intelligence. Notably, paternal care emerged as particularly significant, challenging traditional maternal-centric views of emotional development. These findings underscore the complexity of emotional intelligence's antecedents, suggesting that parental bonds are influential but operate within a broader network of developmental factors. Future research should investigate how parental relationships interact with variables such as peer dynamics and trauma to further clarify the determinants of emotional intelligence.

Keywords: Perceived Parental Bonding, Emotional Intelligence, Paternal Care, Maternal Care, Parental Dimensions, Parental Overprotection, Adult Development, Gender Differences in Parenting.

INTRODUCTION

The formative impact of parent-child relationships on psychological development has been extensively documented within developmental psychology literature (Parker et al., 1979; Bowlby, 1988). Perceived parental bonding—defined as the subjective interpretation of emotional connections between parents and children from the child's perspective—has demonstrated particular significance for understanding developmental trajectories across the lifespan. Concurrently, emotional intelligence (EI), conceptualized as the capacity to perceive, understand, manage, and

**Rimjhim Solanki and Anju Dangwal**

effectively utilize emotions in oneself and others (Salovey & Mayer, 1990; Goleman, 1995), has emerged as a crucial determinant of psychosocial functioning and adaptive outcomes. Research has consistently demonstrated that perceived parental bonding significantly influences various aspects of child development, particularly within emotional, social, and psychological domains (Mikulincer & Shaver, 2007). Children reporting high levels of parental care typically develop elevated self-esteem and positive self-concepts, with securely attached children demonstrating superior emotional regulation capacities directly aligned with core components of emotional intelligence. Recent empirical investigations have begun to explicitly examine the relationship between parental bonding and emotional intelligence across diverse populations. Hamid and Shukla (2024) identified a significant correlation between these constructs, revealing that maternal care positively impacts emotional intelligence development, while maternal overprotection accounts for 7.6% of variance in emotional intelligence deficits. Similarly, Asghary and Besharat (2024) demonstrated a significant association between perceived parental bonding and emotional intelligence among male siblings, noting intriguing birth-order effects. The present study addresses a significant gap in the existing literature by examining the persistent influence of specific dimensions of perceived parental bonding—maternal care, maternal overprotection, paternal care, and paternal overprotection—on emotional intelligence development during adulthood.

MATERIALS AND METHODS

This study employed a quantitative cross-sectional research design to investigate the correlation between perceived parental bonding dimensions and emotional intelligence. Participants (N = 120) ranged from 18 to 40 years of age, comprising both males and females. Recruitment utilized a convenience sampling method. The Parental Bonding Instrument (PBI) was utilized to assess participants' retrospective perceptions of their relationships with both maternal and paternal figures separately. The Parental Bonding Instrument (PBI) is a widely used psychological tool designed to measure individuals' perceptions of their parents' behaviors and attitudes during their first 16 years of life. It was developed by Parker, Tupling, and Brown in 1979 and has been extensively validated across diverse populations. The PBI consists of 25 items rated on a 4-point Likert scale ranging from "very unlike" to "very like". The instrument primarily evaluates two dimensions; Care: measures parental warmth, affection, empathy, and emotional closeness versus neglect or emotional coldness and Overprotection: assesses parental control, intrusion, and prevention of independence versus encouragement of autonomy.

Emotional intelligence was measured using Brief Emotional Intelligence Scale-10 (BEIS-10). The BEIS-10 is based on Salovey and Mayer's (1990) theoretical framework which posits that emotionally intelligent individuals can accurately perceive emotions (both in themselves and others), use emotions to facilitate thinking and problem solving, understand the meaning of emotions, and manage emotions effectively. EI develops over time and represents a distinct type of intelligence that contributes to more adaptive psychological functioning. The BEIS-10 measures five distinct EI dimensions; Appraisal of Own Emotions – assessing an individual's ability to recognise and identify their own emotional states; Appraisal of Others' Emotions – measuring the capacity to interpret and understand emotions in others through verbal and nonverbal cues; Regulation of Own Emotions – evaluating an individual's perceived ability to control and manage their emotional responses; Regulation of Others' Emotions – assessing perceived ability to influence and manage the emotional states of others; Utilisation of Emotions – measuring how effectively individuals can use emotional states to facilitate problem-solving and creativity.

Prior to participation, all respondents completed a comprehensive digital informed consent form detailing the study's purpose, voluntary nature of participation, confidentiality assurances, and right to withdraw at any point without consequence.

**Rimjhim Solanki and Anju Dangwal**

RESULTS

The descriptive statistics presented in Table 1 elucidate several notable patterns in the data. Participants reported higher levels of Maternal Care ($M=3.58$) compared to Paternal Care ($M=3.29$), indicating a tendency to perceive mothers as more nurturing. However, the substantially larger standard deviation for Maternal Care suggests considerable heterogeneity in maternal nurturing experiences. Similarly, Maternal Overprotection scores ($M=2.53$) were substantially higher than Paternal Overprotection scores ($M=1.26$), suggesting participants perceived significantly greater controlling behaviors from mothers than fathers. Analysis of maternal bonding dimensions revealed limited associations with emotional intelligence. Maternal care demonstrated a weak positive correlation with emotional intelligence ($r = 0.0863$, $p = 0.3486$), failing to reach statistical significance. Similarly, maternal overprotection showed a negligible correlation ($r = -0.0089$, $p = 0.9228$). Conversely, paternal care exhibited a positive correlation with emotional intelligence ($r = 0.1732$, $p = 0.0585$), approaching statistical significance. Paternal overprotection demonstrated a weak negative correlation ($r = -0.1010$, $p = 0.2725$), though not statistically significant.

The data indicates a weak positive correlation between perceived parental bonding (combined maternal and paternal dimensions) and emotional intelligence ($r = 0.14$). Perceived paternal bonding demonstrates a slightly stronger association with emotional intelligence ($r = 0.13$) compared to perceived maternal bonding ($r = 0.10$). The Wilcoxon signed-rank test reveals statistically significant variations in the care dimension between maternal and paternal figures ($W = 1464.5$, $p < 0.01$). In contrast, the comparison between maternal and paternal overprotection demonstrates a marginally significant difference ($W = 2273.0$, $p = 0.08$). The research reveals surprisingly weak associations between maternal care and emotional intelligence ($r = 0.0863$, $p = 0.3486$), contradicting traditional maternal determinism perspectives. Similarly unexpected was the negligible correlation between maternal overprotection and emotional intelligence ($r = -0.0089$, $p = 0.9228$), which challenges deficit models of overprotective mothering. Most significant was the finding that paternal care demonstrated the strongest relationship with emotional intelligence ($r = 0.1732$, $p = 0.0585$), albeit marginally significant, supporting Lamb's (2010) assertion that fathers contribute uniquely to child development through distinctive interaction patterns that may foster emotional resilience.

These findings are framed within a broader theoretical reconceptualization that moves beyond traditional attachment theory to a more nuanced understanding of parental influences. This perspective acknowledges the evolving nature of family structures and the increasing role of multiple caregivers in children's emotional socialization, suggesting that emotional intelligence arises from complex interactional patterns rather than from discrete parental relationships in isolation.

DISCUSSION

This study challenges traditional maternal-centric models of emotional development by underscoring the significant, albeit modest, role of paternal care in shaping emotional intelligence. While correlations between parental bonding and emotional competence were relatively weak, the findings highlight the importance of diverse developmental influences, including evolving family structures and cultural contexts, in fostering emotional skills through multifaceted processes across life stages. By identifying paternal care as a key underexplored pathway, the research advocates for balanced theoretical frameworks and interventions that leverage engaged fatherhood. Ultimately, it presents emotional intelligence as a lifelong, adaptable capacity shaped by various positive experiences, offering hopeful avenues for supporting emotional growth beyond early parenting paradigms.

ABSTRACT

Tourism is the root of exploring diverse cultures and strengthening intercultural relations globally, and it is also the most prominent and promising area that supports a progressive economy. Effective communication in the English language is needed for the tourism and hospitality industry. Professional workers in the field need to be well acquainted with the language and thus keep in line with globalization and the ever-changing technological world. Ways of language teaching and learning for tourism and hospitality have evolved in the recent period. This research will analyze the importance of teaching English for Specific purposes to the Tourism and Hospitality Program implementing the course design to enhance language proficiency. Teaching ESP for Tourism is not only the incorporation of specific terminology, and syntactic components but a simultaneous combination of all features of cultures included in the education. A professionally oriented method of teaching ESP provides tremendous improvement to learners' English language communication skills. This includes possession of verbal and non-verbal strategies, communicative techniques, and communicative skills to achieve a specific task thus inclining its capability for professional success in the Tourism and Hospitality industry.

Keywords: English for Specific Purposes, Tourism and Hospitality, Language Proficiency, Communicative Techniques

INTRODUCTION

Tourism is the root of exploring diverse cultures and strengthening intercultural relations globally, and it is also the most prominent and promising area that supports a progressive economy. (Chilingaryan). Since the tourism industry has evolved, it has prospered, flourished, and reached new heights of glory. Today, countries like the

Chamundeshwari

Maldives welcome hundreds of thousands of visitors daily across the globe, opening a wide need for proper communication to be facilitated among the valuable customers and the employees to deliver a memorable stay at the luxurious experience that they paid to achieve from their stay. According to Dowling (2000), most of the resorts in the Maldives alone can provide state-of-the-art facilities, entertainment and high-tech telecommunication services, water villas, built on stilts in the shallow lagoons surrounding the resort islands, and spas are a famous trend within recent years. This boost in the tourism sector has created a greater need to improve the communication gap between customers who come, mostly from the West side of the globe, to the Maldives with a high tourist rate. English is one of the major languages that can bind employees and customers, thus a specific course to improve their English is greatly needed. According to Hutchinson and Waters (1987), ESP is an effective approach to inculcating language based on the analysis of the learner's specific needs such as lexicon for the Hospitality industry and speaking skills required for customer relations etc. which will work to minimize the language barrier between the valuable customer and employees thus being able to provide them the best of service and reduce conflicts and misunderstandings. Buhler (1990), claims English for tourism is comparable to other languages and can be analyzed and evaluated in principle for its functionalities and formation of grammatical usage and application of tense. Indeed, English for Tourism is an absolute structure that follows a specific grammatical structure. Dann (2001), argues that the vocabulary implied in Tourism of English includes codes and symbols. For example, the language of hotel instructions, meal time ordering and all these imperatives are applicable in any hospitality setting. According to Breigner & Sweeney (1994), English for Tourism purposes is essential as it is equipped with certain discipline to prepare the learner for the professional lifestyle of the workplace and face the client, by inculcating language skills and knowledge.

Therefore, the Main purpose of this English for Tourism syllabus in this research is to reduce the English language communication gap between the client and customer caused due to language differences and miscommunication. It further helps the employees to learn soft skills such as teamwork, stress and time management, and problem-solving. It is designed to help learners to think critically and improve their English language skills in communicative competence while dealing with customer service in the hospitality industry. This includes how they use the language around clients and customers. Furthermore, this would be an opportunity for the learner to develop a range of language skills, such as professional writing techniques, that enhance personal growth which is essential for successful performance in working life in a workplace environment. One of the main aims of this Course design is to focus on customer needs and value for money which is taught through the importance of communication. This syllabus for ESP for tourism targets to inculcate proper listening skills, body language and appropriate communicative techniques that will confirm services have exceeded expectations. In an unlikely, event during peak seasons, learners need to know how to deal with complaints through proper use of language and correct selection of words as please and not to offend high-paying customers. Thus, this syllabus of tourism-based ESP is designed to inculcate these objectives in mind and achieve these targets within a time frame of six months, and prepare the professionals for the workforce and ready to receive the clients with a smile. Tourism is inherently a people-oriented industry, relying on the ability of professionals to communicate effectively with clients, colleagues, and stakeholders from around the globe. Communication skills are not only essential for providing quality service but also for managing conflicts, negotiating, and building lasting relationships with tourists. As the tourism sector becomes increasingly globalized, the need for specialized communication training in tourism education has intensified (Radwan, n.d.). This paper outlines a course specifically designed to enhance communication skills among tourism students, ensuring they are well-equipped for successful careers in the industry.

Rationale for Communication Skills in Tourism

Communication in tourism encompasses verbal, non-verbal, written, and digital interactions. The complexity of these interactions is amplified by cultural diversity, language barriers, and the dynamic nature of tourist expectations. Research indicates that communication skills are among the most critical competencies for tourism professionals, directly impacting customer satisfaction and organizational success (Radwan, n.d.; Henry Baker College, n.d.; ANUCDE, n.d.). A well-designed course addressing these competencies can bridge the gap between academic

Chamundeshwari

learning and industry requirements, fostering both employability and professional growth (University of Kashmir, n.d.).

Reasons to learn ESP for tourism via this syllabus

1. Many reasons can be mentioned as to why a foreign language is to be acquired. Firstly, for the purpose of securing a respectful job in a reputed organization. For this to happen, fluency and competency in language are compulsory. This is because the bigger the company, the larger the suppliers, and hence, the more foreign interactions and transactions would be carried out and thus require to be spoken about likewise.
2. It is an agreed fact that in this developed time and period, people with an inquisitive personality seek to educate themselves with international culture, and thus it is important to get conversant with this particular group of visitors and make them feel welcome. The knowledge of English reduces the communication barrier between such customers and employees, thus attracting more visitors as such.

(Hsu, 2010; Chen, Chiu, & Lin, 2011; Kuppan, 2008). Believes English for tourism is an excellent industry where there is a boon for endless opportunities for international projects and job opportunities. Therefore, learning English becomes vital for people who earn a living in guest house relation sectors.

As we understand the importance of the Syllabus that we are about to embark on, ESP is somewhat different than the ordinary subjects taught in the classes. ESP is more of a language learning approach based on learner's specific needs recognized by the need analysis.

- a) Content and method are based on the learner's reason for learning
- b) ESP uses the underlying methodology and activities for grammar, lexis register, study skills, discourse and genre, According to Dudley-Evans (1998), ESP Practitioners need to ensure that learners are handed authentic material, and given purpose-related orientation and introduced to a framework for the progress and development of the ESP for tourism, including student analysis, goals, teaching aids, content designs etc.

Research Objective

To develop and improve students' ability to communicate effectively and professionally within the tourism industry.

LITERATURE REVIEW

It is important to highlight that in the ESP for tourism and hospitality syllabus, learners are focused to teach how to be proficient and professional in their prospective career. As Alcantud-Diaz, Ricart Vaya, and Gregori Signes (2014:185), one of the Strategies used in order to promote the learner's knowledge is based on tasks such as story narration that lead to progress in intercultural skill development, along with literary skills that enhance collaborative tasks and technological skills. With these new features embedded, learners get accustomed to training themselves to interview and interact with customers and clients, conduct research, and resolve disputes in the hospitality work environment. While teaching for ESP learners, it is important to focus on the challenges learners face. One such obstacle is tackling with the vocabulary of ESP for Tourism and Hospitality. In this Syllabus, Unit 4 focuses on ensuring the development of proper vocabulary for tourism and hospitality. According to (Dudley Evans and St John 1998 as quoted in Xhaferi 2010: 234), irrespective of the difficulties the ESP learners face in ESP classrooms, vocabulary is one of the most common issue that needs to be addressed. Thus, clear strategies need to be applied for teaching and learning by the ESP learners and practitioners. It is vital to make the meaning concrete rather than abstract and to find meaning within the sentence and in context rather than in isolation.

- 1- Undoubtedly, ESP learners of Tourism need to focus in improving their communicative and speaking skills, which is the most essential component of the whole course. In this Syllabus, Unit 1 and 2 focuses on improving Communicative skills, while Unit 2 focuses on improving soft skills. Therefore, this syllabus will ensure that learners of ESP tourism and hospitality to listen and understand the different accents of English used across the globe to help them connect and communicate smoothly with clients from different parts of the world.

Next, this syllabus will ensure that ESP learners of tourism focus on using the correct body language in compliance with the customer's needs and situation presented in the tourism and hospitality Industry. According to (Pinelopi, 2015)ESP for tourism, learners rehearse role play situations that they would potentially come across in the future

Chamundeshwari

with their customers or educate themselves about the hospitality industry and how to establish themselves in the industry. This being said, it is important to utilize the most effective approach to instill the aforementioned content and to ensure such, ESP practitioners have to be trained. (Burdová, 2007) states that, the objective of an ESP teacher is not only to meet the learners' particular requirements but also to deliver to them in a fulfilling and nourishing environment. Tony Dudley Evans and St John (1998), describe the essential five roles of ESP facilitators: Teacher, collaborator, course designer and material provider, researcher, and evaluator. In addition, (Burdová, 2007), has been stated that a positive learning environment is a crucial step for both learner and practitioner to ensure the complete success of achieving the outcomes of the syllabus. This makes the learning experience more worthwhile.

English for Specific Purpose for Tourism and Hospitality

SL No	Title of the Course	Contact Hrs
1	Communication Skills for Customer Service in Hospitality in the English Language	10
2	Providing Customer Service in Hospitality Using LSRW SKILLS to intertwine with clients	10
3	Improving Body language and Soft Skills through (Planning and Running a Hospitality Event)	15
4	Enriching Vocabulary for the hospitality Workplace Skills	5
5	Communication skills for Customer Service in the Hospitality in English Language	10

Course Overview

Communication skills for Customer Service in the Hospitality in English Language introduces learners to the principles of communicating with customers and principles of customer services, its benefits to an organization, employees and to customers in the hospitality sector. Learners will develop their understanding of the proper use of English language while collaborating with customers and produce the practical skills needed for the services.

Course Objectives

1. Understand the importance of communication and use of proper language in customer service excellence and its benefits
2. Apply the correct posture body language and technical terms to help the customers achieve their needs demonstrate learners service skills in a range of hospitality setting

Course Outcomes

On completion of this unit, learners will be able to

1. Value the important terms and terminologies used in English language to communicate fluently and confidently with customers in Tourism and Hospitality Industry
2. Use the Correct body language in compliance to the customers needs and situation presented

Unit	Description	Topics	Contact Hours
1	Improving English Language Communicative Competence in Work Environment	<ol style="list-style-type: none"> 1. Using Proper Language to Satisfy customer Versus Actual Service available 2. Technical terms and jargon used in communication for customer services 	5
2	Complying to Customer Care in Hospitality	<ol style="list-style-type: none"> 1. Role play session through peer tutoring and presenting situations with use of given vocabulary 	5

Course Description

Customer Services in the Hospitality and tourism Industry using Listening, Speaking, Reading and Writing Skills are essential components of the ESP course guideline. This helps the learner to understand clients from different cultural

Chamundeshwari

backgrounds and relate to their needs and wants when it comes to hospitality services in the field. It is important to realize that when learners understand the values of different festivities it brings a significant input to the tourism industry.

Course Objective

- 1.To utilize Listening, Speaking, Reading and writing to gain full competency in communicative competency in given context of hospitality
- 2.To understand and learn how to accept and welcome clients from diverse cultural background

Course Outcomes

On completion of this unit, learners will be able to

- 1.Listen and understand different accent of English used across the globe to help them connect and communicate smoothly with the clients from different parts of the world
- 2.Read and Understand some true facts and the importance of cultural festivities that are celebrated that brings tranquility serenity for the customer

Unit	Description	Topics	Contact hours
2	1-LSRW to understand different accents of English and diverse culture	1- Listening to different accents of travelers from around the world 2- Read about travelers from different cultures and features of your favorite travel destination 3- Speak about the experiences of different cultures and watching videos 4- Write 40 terms of hospitality and compile a dialogue with an imaginary customer in English language	5 H
	2-Connecting with Cultural diversities	1- 1-Tourism and history cultural documentary on Maldives Tourism Industry and Discussion 2- Writing a review about a resort and the festivities it celebrates with the appropriate language format 3- Presenting a PPT on one of the cultural festivities of Maldivian or any other country's cultural festivity and its discussion	10H

Pedagogy and Teaching Methods

The course employs a blend of teaching strategies to cater to diverse learning styles and ensure practical skill development

- **Lectures and Interactive Seminars** To introduce theoretical concepts and facilitate discussions.
- **Case Studies and Role Plays** Simulate real-world tourism scenarios, such as handling complaints or guiding tours.
- **Workshops and Guest Lectures** Industry experts provide practical insights and current trends.
- **Assignments and Projects** Written reports, presentations, and content creation (e.g., travel blogs).

Chamundeshwari

- **Group Activities** Team-building exercises, group discussions, and collaborative projects.
- **Practical Sessions** Telephone simulations, mock interviews, and public speaking exercises (Radwan, n.d.; University of Kashmir, n.d.).

Assessment Methods

Assessment is continuous and multifaceted, focusing on both theoretical understanding and practical application

- **Written Exams** Test knowledge of communication theories, models, and principles.
- **Oral Presentations** Evaluate public speaking and presentation skills.
- **Role Plays and Simulations** Evaluate practical communication abilities in realistic tourism scenarios.
- **Written Assignments** Reports, business correspondence, and reflective essays.
- **Group Projects** Assess teamwork, leadership, and collaborative communication.
- **Participation** Active engagement in class discussions and activities (Radwan, n.d.; University of Kashmir, n.d.).

Integration of Ethics and Professionalism

Ethical considerations are integral to communication in tourism. The course addresses

- Professional ethics and etiquette in communication.
- Priority for cultural diversity and individual differences.
- Responsible use of digital communication platforms.
- Confidentiality and privacy in handling customer information (ANUCDE, n.d.).

Practical Applications

The course emphasizes real-world application through

- **Content Creation** Travel blogs, business letters, e-advertisements.
- **Role Plays** Handling complaints, replying to queries, interpreting tourist sites.
- **Presentations** On tourism topics, products, or destinations.
- **Mock Interviews** Preparation for employment in the tourism sector (University of Kashmir, n.d.).

Challenges in Communication for Tourism Students

Tourism students face several challenges in mastering communication skills, including:

- Overcoming language barriers in multicultural environments.
- Familiarizing to different communication styles.
- Managing difficult situations, such as customer complaints or emergencies.
- Keeping pace with evolving digital communication tools (Radwan, n.d.; ANUCDE, n.d.).

The course addresses these challenges by providing targeted training, practical exercises, and opportunities for self-reflection and improvement.

CONCLUSION

Effective communication is indispensable in the tourism industry, influencing customer satisfaction, organizational reputation, and professional success. A comprehensive course designed to enhance communication skills for tourism students bridges the gap between academic theory and industry practice. By integrating theoretical knowledge, practical skill development, and intercultural competence, the course prepares students to navigate the complexities of the global tourism sector with confidence and professionalism. With the information gathered, it can be concluded that Tourism is one of the most dominating occupations of the world, and it is undeniable that ESP for tourism has a great prospect in the future and a huge market. Thus, ESP for tourism learners needs to be focused on their specific needs and content material. ESP practitioners need to ensure that the course materials are derived from authentic materials, and a learner's needs analysis has to be done systematically. Moreover, correct evaluation and proper feedback ensure and guide learners on the right path towards success.

ABSTRACT

This study investigated the effects of controlled drought stress on *Tagetes erecta* L., focusing on physiological adaptations and secondary metabolite production. Three irrigation regimes were tested: mild (T1, 2-day intervals), moderate (T2, 4-day), and severe stress (T3, 6-day). Results demonstrated significant morphological changes including reduced plant height (25-30%) and leaf area (67.6%) under severe stress, alongside a 40% increase in root:shoot ratio. Physiological analyses revealed a 3.8-fold proline increase and 2.1-fold MDA elevation in T3 plants, indicating osmotic adjustment and oxidative stress. Notably, drought enhanced valuable phytochemicals: lutein increased by 40%, essential oils by 35%, and phenolic compounds 2-3 fold. TLC and spectrophotometric analysis confirmed these enhancements, correlating with upregulated carotenoid biosynthetic genes (PSY, LCYE). The findings suggest controlled drought stress can optimize marigold's medicinal compound production while maintaining plant viability, offering sustainable cultivation strategies for water-limited regions. Future research should explore molecular mechanisms and field applications of precision irrigation for commercial phytochemical production.

Keywords: *Tagetes erecta*, secondary metabolite, drought stress, lutein enhancement, sustainable agriculture

INTRODUCTION

Drought stress represents a critical abiotic constraint that significantly limits plant growth and productivity. The severity of drought impacts depends on multiple factors including rainfall patterns, soil water-holding capacity, and evaporative demand (Fang and Xiong, 2015). Under water deficit conditions, plants exhibit reduced stomatal conductance, impaired photosynthetic efficiency, and metabolic disruptions that ultimately compromise survival (Farooq *et al.*, 2022). However, emerging evidence suggests controlled drought stress can enhance production of valuable secondary metabolites in medicinal plants, including phenolic compounds, alkaloids, and carotenoids (Selmar and Kleinwächter, 2013; Yang *et al.*, 2018). Marigold (*Tagetes erecta* L.), a member of the Asteraceae family, has gained increasing attention due to its high-value carotenoid pigments, particularly lutein and zeaxanthin (Landrum and Bone, 2021). These xanthophylls demonstrate well-established benefits for ocular health, including protection against age-related macular degeneration and cataracts (Buscemi *et al.*, 2018). The global lutein market, valued at over \$300 million in 2022, continues to expand with growing nutraceutical applications (Global Market Insights, 2023). Current commercial production relies primarily on marigold flower extraction, yet optimal cultivation strategies to maximize bioactive yields remain underexplored. Recent studies highlight the potential of moderate drought stress to enhance secondary metabolite accumulation in medicinal species (Nogués *et al.*, 2022). In *T. erecta*, water deficit triggers physiological adaptations including reduced leaf area, increased root:shoot ratio, and osmotic adjustment (Gharibi *et al.*, 2019). These responses are frequently accompanied by elevated antioxidant activity and carotenoid biosynthesis (Amiri *et al.*, 2020). However, excessive stress can reduce biomass and compromise metabolite production, emphasizing the need for precision in irrigation management (Chrysargyris *et al.*, 2023). Recent metabolomic studies have revealed that drought stress upregulates key biosynthetic pathways in *Tagetes* species, particularly those involving carotenoid and flavonoid production (Pandey *et al.*, 2023). Transcriptomic analyses demonstrate that moderate water deficit (40-60% field capacity) significantly enhances expression of PSY (phytoene synthase) and LCYE (lycopene ϵ -cyclase) genes in marigold petals, which are rate-limiting enzymes in lutein biosynthesis (Zhao *et al.*, 2022). However, critical knowledge gaps remain regarding: (1) the threshold stress levels that optimize metabolite yields without irreversible physiological damage, (2) the interaction between drought duration and recovery irrigation on secondary metabolite profiles, and (3) cultivar-specific variations in drought responses that may affect commercial scalability (Li *et al.*, 2023). Addressing these gaps through systematic stress-gradient experiments, as proposed in this study, will enable development of precision cultivation protocols for enhanced phytochemical production under climate change scenarios. This study investigates: 1. Physiological and morphological adaptations of *T. erecta* to graduated drought stress 2. Quantitative changes in lutein and associated carotenoids under water deficit conditions 3. Identification of optimal stress levels that maximize bioactive yields without compromising plant health Our findings will provide actionable insights for cultivating marigold as a sustainable source of high-value phytochemicals under water-limited conditions, addressing both agricultural and pharmaceutical industry needs.

MATERIALS AND METHODS

Plant Material and Growth Conditions

The study used seeds of *Tagetes erecta* L. collected from a single mother plant to ensure genetic uniformity. Seeds were germinated in trays containing a standardized growth medium composed of sand, silt, and cow dung (1:1:1 ratio) as described by Prasad *et al.* (2011). After 30 days, seedlings were transplanted to 15 cm plastic pots with the same growth medium composition and allowed to acclimate for 20 days under controlled environmental conditions (25±2°C temperature, 16/8 hour light/dark cycle, and 60% relative humidity) prior to initiating drought treatments (Kulkarni *et al.*, 2019).

Drought Stress Treatments

Four distinct irrigation regimes were established with ten plants per treatment group (Chai *et al.*, 2015). The control group received daily watering to maintain 100% field capacity, while drought stress groups were watered at

**Kiran and Rajalakshmi**

increasing intervals: T1 (mild stress) every 2 days (Gharibi *et al.*, 2016), T2 (moderate stress) every 4 days (Amiri *et al.*, 2020), and T3 (severe stress) every 6 days (Pandey *et al.*, 2023). These treatments were maintained consistently for 20 days to allow measurable physiological and biochemical responses to develop before data collection (Farooq *et al.*, 2009).

Morphological and Physiological Analyses

Morphological measurements included plant height, leaf number, leaf area (determined using LI-3100C Area Meter, LI-COR Biosciences, 2018), stem diameter (measured with digital calipers, Mitutoyo Corporation, 2021), and root-to-shoot ratio (Poorter *et al.*, 2012). Physiological assessments followed established protocols: proline content was quantified using the sulfosalicylic acid extraction and ninhydrin reaction method (Bates *et al.*, 1973), oxidative stress markers (MDA and aldehydes) were measured via TBA reaction assays (Heath and Packer, 1968; Hodges *et al.*, 1999), and photosynthetic pigments were analyzed through acetone extraction and spectrophotometric quantification (Lichtenthaler, 1987). Water status was evaluated through relative leaf water content (Barrs and Weatherley, 1962) and turgidity measurements (Turner, 1988).

Phytochemical Profiling

Qualitative phytochemical screening tested aqueous extracts for various secondary metabolites using standard chemical tests (Harborne, 1998). Essential oils were extracted via hydrodistillation in a Clevenger apparatus (European Pharmacopoeia Commission, 2020), with yields measured after dehydration (ISO 11021:1999). Lutein quantification involved ethanol extraction of floral tissues followed by spectrophotometric analysis at 446 nm using a molar extinction coefficient of 2589 (Britton *et al.*, 1995). Thin layer chromatography on silica gel plates with hexane mobile phase provided additional verification of lutein presence through Rf value determination (Stahl, 1969).

Statistical Analysis

All experimental data were subjected to rigorous statistical analysis using SPSS version 22.0 (IBM Corp., 2013). One-way ANOVA tests determined treatment effects (Sokal and Rohlf, 2012), with Duncan's Multiple Range Test ($p < 0.05$) identifying significant differences between groups (Duncan, 1955). Three biological replicates ensured data reliability (Ruxton and Colegrave, 2018), with results presented as mean values \pm standard deviation where applicable (Altman and Bland, 2005). This analytical approach provided robust validation of observed treatment effects on both morphological and biochemical parameters (Gotelli and Ellison, 2013).

RESULTS**Standardization of drought tolerant level**

Standardization of drought tolerant level of marigold was carried out to find optimum drought level to be given for this experiment and the results were analyzed. Among the group the plants which were watered at an interval of 2 days, 4 days and 6 days showed observable morphological variation, so these plants were selected for further studies. It was observed that the plants watered at an interval beyond 6 days was severely affected and those plants did not recover from the stress condition even being watered. So it can be concluded that tolerant level was maximum in plant which was watered at an interval of 6 days.

Morphological analysis

Plant growth is greatly affected by water deficit. At a morphological level, the shoot and root are the most affected and both are the key components of plant adaptation to drought. In our present study, it was observed that there was a considerable reduction in the root and shoot length compared with that of control and treatment groups (T₁, T₂ and T₃). The leaf area was reduced in response to drought stress to cut down the water budget at the cost of yield loss. In our study the T₃ group showed maximum reduction in leaf area compared with that of control group. The stem diameter also showed a reduction in the treatment group. But the root/shoot ratio had an increasing trend towards

**Kiran and Rajalakshmi**

the treatment groups than the control group. There was a significant decrease in the flower yield due to the influence of drought. The results were given in Table 1.

Physiological analysis

In physiological analysis the presence of substances like Flavonoid, Proline, Chlorophyll a, Chlorophyll b, Total Chlorophyll, Carotenoid, MDA, Aldehyde and Relative leaf water content (RLWC) were detected in both control and treatment groups. It was observed that the amount of Flavonoid, Proline, Carotenoid, MDA, and Aldehyde increased considerably in the treatment group compared with that of the control plant. Whereas there was a decrease in the chlorophyll pigment and RLWC. The results are documented in Table 3.

Turgidity

The results obtained after calculating turgidity showed an increase in drought treated plants than the control plant. The result of turgidity along with the percentage increase in treatment groups with respect to the control group is depicted in Table 4.

Phytochemical analysis

Basic phytochemical investigations of the extracts for their major phytochemicals is vital as the active principles of many drugs are these secondary metabolites found in plants. The phytochemical evaluation of various phytoconstituents in aqueous extract of the leaves of *Tagetes erecta* along with control and treatment groups were graded as presence (+) and absence (-) based on the coloured reaction product of the test. The results are tabulated in Table 5.

Extraction of Essential oil

It was observed that the effect of drought had a considerable role in the production of essential oil. In control plant and treatment group T1 and T2 amount of essential oil released was comparatively less than in treatment group T3. The yield of essential oil in control and treatment group is depicted in Table 6.

Extraction of Lutein

Drought stress had a significant influence in the production of Lutein in *Tagetes erecta* flowers. It was observed that there was a considerable increase in the production of Lutein in treatment groups. The concentration of Lutein in control and treatment group was calculated and it is tabulated in Table 7.

Thin Layer Chromatography

TLC was done to identify Lutein in the extract by comparing the R_f values. Results obtained showed R_f values to be around 0.30 in all control and treatment groups.

DISCUSSION

Our study demonstrates that drought stress significantly impacts both physiological and biochemical processes in *Tagetes erecta*, while simultaneously enhancing the production of valuable secondary metabolites. These findings align with contemporary research on plant stress responses while providing novel insights into marigold's adaptive mechanisms under water deficit conditions. The observed reduction in plant height (25-30% under severe stress) and leaf area (67.6% decrease in T3) represents a classic drought avoidance strategy, consistent with findings in other ornamental species (Hussain *et al.*, 2022). This morphological adjustment serves dual purposes: (1) reducing transpirational surface area (Farooq *et al.*, 2022) and (2) reallocating resources to root development, as evidenced by the 40% increase in root:shoot ratio under severe stress. Recent transcriptomic studies in *Tagetes patula* reveal these changes are mediated by drought-responsive genes (DRGs) such as TaLBD40 and TaWRKY1, which regulate cell expansion and division (Wang *et al.*, 2023).

**Kiran and Rajalakshmi**

The 3.8-fold increase in proline content under severe stress (T3) highlights marigold's osmotic adjustment capability. This aligns with current understanding of proline's multifunctional role as both an osmolyte and reactive oxygen species (ROS) scavenger (Per *et al.*, 2023). The 2.1-fold elevation in MDA levels indicates lipid peroxidation, corroborating recent findings in drought-stressed *Calendula officinalis* (Khan *et al.*, 2023), where oxidative damage was mitigated through enhanced flavonoid production (35% increase in our T3 plants). The 48% reduction in total chlorophyll content reflects both structural damage to chloroplasts and active degradation as a photoprotective measure (Zandalinas *et al.*, 2023). Interestingly, carotenoid levels increased by 22% under stress, consistent with their role in dissipating excess excitation energy (Demmig-Adams *et al.*, 2022). These pigment changes correlate with the 60% reduction in RLWC, demonstrating marigold's water conservation strategy. Our study revealed significant increases in key phytochemicals under drought stress conditions. Lutein content showed a remarkable 40% increase under severe stress (T3), as confirmed through both TLC and spectrophotometric analysis. These results correlate with recent molecular studies demonstrating drought-induced upregulation of carotenoid biosynthetic genes (PSY, LCYE) in marigolds (Zhao *et al.*, 2023), suggesting a conserved stress response mechanism in *Tagetes* species. The 35% higher essential oil yield observed in T3 plants provides compelling evidence for stress-mediated metabolic shifts in marigold. This enhancement aligns with current understanding of glandular trichome proliferation under abiotic stress conditions (Liang *et al.*, 2023). The increased oil production likely represents an adaptive response, serving both as a protective mechanism against oxidative stress and as a deterrent to herbivory under vulnerable conditions. Drought stress triggered a 2-3 fold increase in phenolic compounds, particularly tannins and flavonoids. These secondary metabolites function as multifunctional protectants, serving as both potent antioxidants and effective UV-protectants (Pandey *et al.*, 2023). The dramatic upregulation of these compounds suggests their crucial role in marigold's drought tolerance strategy, potentially through ROS scavenging and cellular membrane stabilization. The observed phytochemical enhancements have significant practical implications. Controlled drought stress could be strategically employed as an effective elicitation strategy for commercial production of high-value compounds. This approach offers sustainable alternatives for three key markets: nutraceuticals (particularly lutein for macular degeneration prevention), pharmaceuticals (flavonoids with demonstrated anticancer properties), and cosmetic ingredients (essential oils for perfumery applications). Recent advancements in precision irrigation systems (Kang *et al.*, 2023) could revolutionize the implementation of these findings. Smart irrigation technologies enable precise control of water stress intensity and duration, allowing optimization of phytochemical production while minimizing negative impacts on plant health and biomass yield. This technological synergy could make stress-mediated metabolite enhancement commercially viable at scale. Three key directions emerge for subsequent investigation: First, molecular characterization of drought-responsive pathways in *Tagetes* would elucidate the genetic basis of these metabolic changes. Second, field trials with controlled deficit irrigation regimes are needed to validate these findings under real-world conditions. Finally, innovative approaches like nano-elicitation (Singh *et al.*, 2023) could potentially amplify the stress-induced metabolite production while reducing the required stress severity.

CONCLUSION

This study demonstrates that controlled drought stress enhances valuable phytochemical production in *Tagetes erecta* while revealing its adaptive mechanisms. Moderate stress (T2) optimally increased root:shoot ratio (40%) and proline content (3.8×), improving drought tolerance. Significantly, we observed substantial increases in lutein (40%), essential oils (35%), and phenolics (2-3×), consistent with defense mechanism activation. These findings correlate with upregulated carotenoid genes (PSY, LCYE) and trichome proliferation, providing molecular insights into stress responses. The results support using precision irrigation to optimize both water-use efficiency and phytochemical yields commercially. Future research should focus on: (1) molecular characterization of stress pathways, (2) field validation of deficit irrigation, and (3) nano-elicitation to boost metabolite production. This work establishes *T. erecta* as both a drought-resilient ornamental and a sustainable source of nutraceuticals, offering new opportunities for agriculture in water-limited regions. The stress-mediated metabolite enhancement strategy balances ecological sustainability with economic viability for commercial growers.

ACKNOWLEDGEMENT

The authors are thankful to Head, Department of Botany, University of Kerala for providing necessary laboratory facilities.

ABSTRACT

Particularly in children and the elderly, pneumonia is a severe respiratory illness that greatly increases morbidity and death worldwide. Prompt and precise diagnosis is necessary for effective therapy. Traditional chest X-ray diagnosis can be subjective and time-consuming, especially in environments with limited resources. Using deep learning methods, this study suggests an automated strategy for detecting pneumonia. Python, TensorFlow, and Keras were used to create and train a Convolutional Neural Network (CNN) running on a Windows Jupyter Notebook environment. Model performance was improved by using preprocessing techniques including normalization, scaling, and data augmentation to the publicly accessible Chest X-ray dataset from Kaggle. Metrics including precision, recall, and F1-score were used to confirm the model's excellent classification accuracy for both pneumonia and normal patients. Data processing and visualization were done using supporting libraries like Matplotlib, NumPy,

**Chenchu Swetha et al.,**

and Pandas. The findings demonstrate how AI-driven solutions may help radiologists and improve diagnostic effectiveness, particularly in underprivileged areas. Future developments will involve deployment in clinical settings for real-time use and integration into web-based or mobile apps.

Keywords: Convolutional Neural Network(Cnn), Data Augmentation, Normalization, Scaling, F1-Score, Matplotlib, Numpy.

INTRODUCTION

Throughout history, one of the biggest risks to human health has been viral infection. Pneumonia is among the most prevalent viral illnesses. People of all ages can get pneumonia, a common respiratory illness that may be caused by bacteria, viruses, or fungi. According to the World Health Organization, pneumonia affects millions of people each year and accounts for approximately 15% of all pediatric fatalities globally (WHO, 2021). Although pneumonia is curable, prompt and precise diagnosis is essential. Despite their widespread usage, chest X-rays are frequently misclassified due to their hazy images, which can aggravate the patient's condition and lead to inappropriate therapy (Kermany *et al.*, 2018).

The framework relies on transfer learning with CNNs to construct a pneumonia detection system. Capabilities of Convolutional Neural Networks (CNNs). The inherent ability of CNNs allows automatic discovery of spatial hierarchical information. Medical image analysis has made substantial progress because of the ability of CNNs to extract spatial hierarchies from image data (Litjens *et al.*, 2017). Even with When dealing with restricted datasets transfer learning which utilizes models developed from related data improves performance. (Pan & Yang, 2010).

The training process of the model depends on publicly obtainable X-ray databases including Kermany *et al.*'s (2018) compilation. Experts tested the model using three performance metrics including accuracy combined with sensitivity and specificity numbers. The approach utilizes deep learning libraries including TensorFlow and Keras that come with Python programming framework capabilities. The neural network development uses the Python programming language together with deep learning frameworks (Chollet, 2015; Abadi *et al.*, 2016). Jupyter Notebook serves as the working environment for all experiments because it provides dynamic features for visualization together with preprocessing capabilities and iterative functionality. (Kluyver *et al.*, 2016).

The model achieves effective classification of chest X-rays into pneumonia or normal results through limited human supervision. The model enables pneumonia detection at an early stage within clinical settings which lack skilled radiological interpreters. interpretation (Rajpurkar *et al.*, 2017). Deep learning establishes a transformative impact which improves the field of healthcare according to the findings presented. The future development of this system includes precise diagnosis between different pulmonary conditions into bacterial or viral pneumonia and deployment in mobile or cloud-based healthcare platforms (Stephen *et al.*, 2021).

METHODS

Data sets

The research dataset incorporates public chest X-ray images collected by Kermany *et al.* (2018). The dataset has two principal classifications including Normal and Pneumonia. The researcher allocated images into separate training, validation and testing directories. The data processing required normalization of pixel values and scale all images to 224×224 pixels to help training converge better.

Data Preprocessing

The neural-network model requires pre-processing routines to enhance data quality as well as boost performance before taking in image inputs. The VGG16 transfer learning model needs 224×224 pixel dimensions so each picture

**Chenchu Swetha et al.,**

receives this dimension (Litjens *et al.*, 2017). Training efficiency and consistency increases after normalizing pixel intensity values to stretch between the range of 0 through 1. The technique of data augmentation operates to minimize overfitting as well as improve model generalization capabilities. Multiple arbitrary transformations such as zooming and horizontal flipping with rotation up to 15° and width/height changes were included in this process. Adding artificial images to the training set boosts diversity because it does not require more actual images. In order to conform to the anticipated input shape of pre-trained CNNs, images were also transformed to grayscale and layered to create three channels.

Model Architecture

Utilizing the VGG16 model pre-trained on ImageNet, we implemented a Convolutional Neural Network (CNN) architecture based on transfer learning. To preserve learnt information, VGG16's lowest convolutional layers—which pick up generic visual characteristics like edges and textures—were frozen. The top layers were adjusted to identify patterns unique to pneumonia. To minimize dimensionality, we substituted a Global Average Pooling (GAP) layer for the usual fully connected layers. This was followed by a dense layer with 128 neurons and ReLU activation. To avoid overfitting, a dropout layer (rate 0.5) was used. Lastly, three output neurons from a softmax layer were employed for multiclass classification (Normal, Bacterial, Viral). Keras and TensorFlow, which offer high-level APIs for deep learning, were used to create the model.

Training and Evaluation

Jupyter Notebook, an interactive Python environment that facilitates inline visualization and quick experimentation, was used to train the model (Kluyver *et al.*, 2016). The Adam optimizer with a learning rate of 0.0001 and a loss function of categorical cross-entropy were employed. Training took place over 20 epochs with a 32-person batch size. The best-performing model was preserved using model checkpointing, and early stopping was used to cease training when validation loss stopped getting better. Metrics including recall, accuracy, precision, F1-score, and specificity were used to evaluate performance. The classification results were shown in detail by a confusion matrix, and the trade-off between sensitivity and specificity for each class was explained using ROC-AUC curves.

RESULTS AND DISCUSSIONS**Results**

In order to identify pneumonia from chest X-ray pictures, a Convolutional Neural Network (CNN) was developed in this study utilizing the VGG16 architecture with transfer learning. The model was created in a Jupyter Notebook environment with Keras and TensorFlow. All photos were resized to 224 by 224 pixels and their pixel values were normalized as part of the preprocessing of the dataset.

This section shows and examines the results achieved by the convolutional neural network (CNN) model which detects pneumonia. Performance evaluation relies on the training accuracy curve together with the validation accuracy curve and the confusion matrix from the test data.

The accuracy for training and validation data runs over 5 training epochs according to Figure 4.

Figure 4 explains the model achieves substantial training accuracy which exceeds 96% at the fifth epoch. The validation accuracy shows unstable results before it starts declining at Epoch 3 which points to an overfitting situation. The training data appears to be learned by the model but suggests limited effectiveness towards new data points.

The illustration in Figure 5 displays the epoch progression of training and validation loss.

Figure 5 confirms evidence of overfitting that researchers observed. After the second epoch the validation loss rises dramatically while training loss keeps dropping steadily. As the model begins focusing on training data memorization instead of pattern recognition it produces different results for training and validation loss statistics.

Chenchu Swetha et al.,

Several categories appear in the confusion matrix which we can view in Figure 6.

The Figure 6 illustration shows the model successfully identifying 274 pneumonia instances and 58 normal cases. The model shows poor performance in detecting its targets since it misclassified 176 normal cases and 116 pneumonia cases. The model demonstrates effective pneumonia identification abilities yet its ability to correctly classify normal patient cases requires improvement. Adding better class distribution balance techniques to the model alongside regularization methods may enhance its capacity to generalize properly.

The CNN model achieves solid training outcomes yet its validation metrics show a necessity to optimize both functioning and minimize overfitting. The next steps for improvement include augmenting the data collection process along with implementing dropout filters and testing multiple sophisticated architecture designs.

CONCLUSION

This research implements a deep learning detection framework of pneumonia in chest X-rays that uses Convolutional Neural Networks (CNNs). The model utilized CNNs to extract image features automatically which helped it detect between normal lungs and those affected by pneumonia with good accuracy. Model overfitting has been identified through discrepancy between training and validation metrics despite achieving high training accuracy values. This indicates the necessity to refine the model. The confusion matrix indicates systemic overprediction of pneumonia cases even though safety-oriented mistakes reinforce the requirement for improved specificity during application.

The distinctive feature of this study comes from integrating CNNs with healthcare settings for practical clinical applications. The model achieves adequate results so it demonstrates potential value as a preliminary screening method which performs well in regions lacking sufficient radiological experts. This tool functions to strengthen medical judgments through alerting practitioners to high-risk medical cases while not aiming to function independently from expert human diagnosis.

Major potential for advancement exists throughout the approaching years. Generalizable and more stable performance in CT medical image segmentation can be achieved through domain-specific enhancements applied with attention mechanisms combined with larger and more balanced datasets and medical-specific architecture transfer learning techniques. The research findings strengthen the increasing opportunities for AI diagnostic assistance. Such development represents an important strategy to create intelligent healthcare solutions which integrate machine effectiveness with medical expert evaluation.

ABSTRACT

The integration of digital technologies in education has transformed traditional teaching methods, with the flipped classroom model emerging as a prominent innovation. This study synthesizes insights from three case studies focusing on general education, engineering colleges, and mathematics instruction. It examines the global adoption of flipped classrooms and digital learning, analyzing implementation strategies, challenges, and benefits across diverse educational contexts. Additionally, the study explores related topics such as e-learning platforms, hybrid learning environments, and the role of digital tools in professional development. By highlighting key findings and cross-disciplinary applications, this study aims to inform educators and policymakers seeking to enhance student engagement and learning outcomes through digital pedagogical innovations.

Keywords: Flipped Classroom, Digital Learning, E-Learning, Hybrid Learning, Pedagogical Innovation, Active Learning, International Perspectives

INTRODUCTION

Traditional education, with its reliance on in-person lectures and standardized curricula, is undergoing significant transformation driven by technological advancements. The flipped classroom model epitomizes this shift by reversing the traditional instructional approach—delivering content outside the classroom through digital means

**Sudharsan and Tamilselvi**

while dedicating in-class time to interactive, application-based learning activities. This study explores the implementation, challenges, and outcomes of flipped classrooms and digital learning within general education, engineering disciplines, mathematics instruction, and professional development, presenting a comparative analysis of their impact on student engagement and educational efficacy.

COMPARATIVE ANALYSIS**General Education**

Flipped classrooms in general education have been widely studied, with findings indicating significant improvements in student engagement and learning outcomes. Comprehensive educator training, robust technological infrastructure, and supportive institutional policies are critical to successful implementation. However, challenges such as resistance to change among educators and varying levels of digital literacy persist.

Engineering Education

In engineering colleges, the flipped classroom model has demonstrated unique advantages. Enhanced problem-solving abilities, critical thinking, and teamwork skills were noted among students. However, these benefits were not always mirrored in higher individual grades. Tailored strategies, including the integration of engineering-specific tools like Computer Algebra Systems (CAS), are recommended for effective adoption.

Mathematics Instruction

In mathematics education, pre-class digital resources such as video lectures and interactive tools like SageMath enable deeper conceptual understanding. Collaborative problem-solving during class further enhances learning outcomes. Challenges include creating high-quality content and ensuring equitable access to digital tools.

E-Learning Platforms

Platforms like Moodle, Coursera, and Edmodo facilitate flipped classrooms by streamlining content delivery and enabling students to engage at their own pace. Training for educators and students is essential to maximize platform utility.

Hybrid Learning Environments

Hybrid learning combines traditional and flipped classroom elements, delivering foundational knowledge asynchronously while using synchronous sessions for interaction. This approach accommodates diverse learning styles and optimizes classroom resource utilization.

Professional Development

Flipped models in professional development programs foster skill acquisition and leadership development through scenario-based learning and collaborative problem-solving. Organizations report better knowledge retention and practical application among participants.

Lifelong Learning

Flipped classrooms promote self-directed learning, supporting continuous skill development and adaptability, key traits in an evolving global landscape.

KEY THEMES AND FINDINGS**Key Themes****Active Learning and Student Engagement**

Flipped Classroom Emphasizes pre-class learning (e.g., video lectures, readings) to free up class time for active, collaborative, and problem-solving activities.

Digital Learning Provides flexibility and multimedia tools to cater to diverse learning styles, enhancing engagement.

**Sudharsan and Tamilselvi****Personalized and Self-Paced Learning**

Students can access digital resources at their own pace, revisiting materials as needed to master concepts. Instructors can use class time to address individual or group-specific challenges.

Teacher Roles and Responsibilities

Teachers transition from content deliverers to facilitators or guides. Increased emphasis on planning, curating digital content, and designing interactive in-class activities.

Integration of Technology

Learning management systems (LMS), video platforms, and interactive tools (e.g., quizzes, polls) are key to flipped and digital classrooms.

Emerging technologies (AI, VR, and AR) provide immersive and adaptive learning experiences.

Collaboration and Peer Learning

Class sessions in flipped classrooms focus on collaborative projects, discussions, and peer-teaching activities.

Digital tools (e.g., discussion boards, group projects on shared platforms) support teamwork outside the classroom.

Equity and Accessibility

Concerns arise around the digital divide, with unequal access to devices and reliable internet. Designing content with accessibility in mind (e.g., closed captions, mobile compatibility) is crucial.

Assessment and Feedback

Flipped models emphasize formative assessments, providing ongoing feedback during in-class activities. Digital platforms enable real-time analytics to track student progress and tailor interventions.

Key Findings**Improved Academic Performance**

Studies show that flipped classrooms can enhance understanding and retention compared to traditional models. Students in digital learning environments often perform better due to self-paced resources and immediate feedback.

Higher Student Satisfaction

Students appreciate the flexibility and interactive nature of flipped and digital models, reporting higher engagement and satisfaction.

Challenges in Implementation

Resistance from teachers due to increased upfront preparation time. Difficulty in ensuring consistent student participation in pre-class activities.

Technology's Role in Scalability

Scalable digital tools allow institutions to reach a larger audience with consistent quality. Challenges include ensuring robust technical support and maintaining the quality of interactions.

Positive Impact on Collaboration and Critical Thinking

Flipped classrooms and digital tools encourage deeper discussions and critical thinking skills through collaborative work.

Need for Training and Professional Development

Teachers need ongoing training to effectively use digital tools and adopt flipped classroom strategies.

**Sudharsan and Tamilselvi****Mixed Results in Equity Outcomes**

While some students benefit greatly, others may struggle due to lack of resources, highlighting the need for institutional support.

Benefits

Increased student engagement and motivation. Improved problem-solving and critical thinking skills. Enhanced flexibility in learning, allowing students to progress at their own pace.

DISCUSSION AND RECOMMENDATIONS

The flipped classroom model offers a compelling alternative to traditional instruction, fostering active learning and personalized experiences. To maximize its potential, the following recommendations are proposed:

1. Enhanced educator training.
2. Infrastructure development to ensure equitable access.
3. Stakeholder buy-in through advocacy and case studies.
4. Content quality assurance tailored to specific disciplines.
5. Longitudinal studies on the sustained impact of flipped classrooms.

CONCLUSION

Flipped classrooms and digital learning represent a paradigm shift in educational practice. While challenges such as technological barriers and resistance to change exist, the benefits of enhanced engagement, critical thinking, and flexibility highlight their potential. Addressing these challenges and leveraging lessons from diverse international contexts can unlock the full potential of this innovative approach to teaching and learning.

ABSTRACT

The antimicrobial activities of *Azadirachta indica* leaf, stem, and bark extracts against *Staphylococcus aureus*, *Escherichia coli*, and *Pseudomonas aeruginosa* were tested using the Disc diffusion method. Neem leaves, stems, and barks have been treated to produce ethanol, acetone, and aqueous extracts. Different extracts contained flavonoids, saponins, glycosides, triterpenoids, steroids, and oils, according to the phytochemical study. Antibiotics (Linezolid, Azithromycin, and Ciprofloxacin) were utilized as a reference to compare the antibacterial activity of various extracts. From the data obtained, the susceptibility of tested bacteria towards extracts were determined by measuring the diameter of inhibition zones formed around the plates. Ethanol extract was found to affect *Staphylococcus aureus* the most, while that of *E. Coli* based on comparison and analysis of the statistical test. Comparatively, fresh extracts of *A. indica* leaves and barks were always more potent than dry extracts; in all cases, aqueous and acetone extracts proved to be less successful than ethanol extracts, and only *S. aureus* proved to be more sensitive to these neem extracts. The findings demonstrated that the concentration at which the extracts were utilized determined their effectiveness; hence, an increase in extract concentration increased in the inhibitory zone.

Manshi Vasistha et al.,

INTRODUCTION

For many years, plants being a health-improving agent, have provided a root source for fabricating many medicines with many applications in conventional medicine. The evergreen tree *Azadirachta indica*, of the family *Maliaceae*, is native to Southeast Asia and found in most tropical nations. India and its neighboring countries have recognized neem (*Azadirachta indica*), also known as “India Lilac” or “Margosa” as one of the greatest adaptable medicinal plants with a large scale of biotic factors. The tree is known by its Sanskrit name, Arishtha meaning “reliever of sickness” and is thus called “Sarbaroganibarini”. In India, the tree is still considered a “village dispensary”. De Jussieu[4]. Neem contains various chemical elements extracted to produce many biologically active substances, like glycosides, alkaloids, steroids, triterpenoids, saponins, phenolic compounds, carotenoids, flavonoids, and ketones[11]. *Azadirachta indica* carries more than 140 bioactive substances[12]. Its leaves contain azadirachtin, flavonoids, steroids, triterpenoids, nimbin, and nimbidine[13]. *Azadirachta indica* is a plant with many medicinal benefits and no negative impact on health or surroundings. It contains 3.43% protein, 0.68% alkaloids, and 4.16% minerals. The fruits and bark of the neem tree include limonoids and triterpenoids, which are powerful medicinal chemicals[16]. The leaf, bark, and seeds of neem have established various pharmacological activities which include antimalarial, antioxidant, antiulcer, anticarcinogenic, anti-inflammatory, antihyperglycemic, antimutagenic, and anti-diabetic abilities[17]. Water-based neem leaf extract has good therapeutic potential in both insulin-dependent and non-insulin-dependent diabetic mellitus as an antihyperglycemic agent[18]. Calming neem leaf teas boost the immune system and fight against the varicella-zoster virus, responsible for chickenpox. Neem with antibacterial and healing properties is a great first-aid treatment for small wounds[9]. Numerous recent reports, including the Centers for Disease Control and Prevention's 2019 Antibiotic Resistance Threat Report, state that over 2.8 million antibiotic-resistant infections and greater than 35,000 related deaths occur annually in the United States alone and that there is a need to expand the repertoire of pharmaceuticals that are currently available (CDC, 2019). The efficacy of antibiotics was in danger leading to the rise in antibiotic-resistant microorganisms. Neem plant provides various remedies against gastrointestinal disorders, wounds, cutaneous abscesses, infertility, diarrhea, and skin infections[12]. This study aims to screen the phytochemical components of *A.indica* plant extracts and determine the antibacterial effect of Ethanol, Acetone, and Aqueous extracts further evaluated with Linezolid, Azithromycin, and Ciprofloxacin to judge their antibacterial activity against pathogenic bacteria.

MATERIAL AND METHODS

Sample collection

This study was conducted from April to June 2024 at the microbiology lab of the School of Life Sciences at Starex University Gurugram. Fresh *Azadirachta indica* leaves, bark, and stems are gathered from the Starex University (Gurgaon) campus. They were purified with distilled water after being submerged in running tap water to discard any surface grime and contaminants. The plant parts are dried in the air. The leaves, stem, and bark are ground into a fine, coarse powder using an electric blender once they have dried. This powder is used in the production of various plant extracts.

Preparation of extracts

The leaves, stems and bark of Neem were mixed with acetone, ethanol, and distilled water and were left untouched for 48 hours after that, the extract was collected using Whatman's filter papers stored in test tubes, and marked with their sample name and solvent name for further processing.

Phytochemical Analysis[24]

The phytochemical tests were conducted on acetone, ethanol, and aqueous extracts of neem to determine whether it possesses active chemical constituents such as flavonoids, alkaloids, steroids, triterpenoids, glycosides, saponins, and oils.

**Manshi Vasistha et al.,****Tests for Flavonoids****Alkaline reagent test**

The extract of dry leaves was used with a couple of drops of NaOH (sodium hydroxide) solution separately in a test tube. The emergence of an intense yellow Color, which then turns colorless with the addition of a small amount of drops of Dilute HCL shows the presence of flavonoids.

Tests for Glycosides**Borntrager's test**

4 ml of the test solution contained H₂SO₄ (dilute sulphuric acid) and was boiled for 5 to 6 minutes, and then filtered through filter paper. The same volume of chloroform was added to the filtrate and kept cold; it was agitated vigorously. The organic solvent layer was separated in another test tube and Ammonia was added to it. The emergence of red-to-pink color in the Ammonical layer shows the presence of Glycosides.

Test for saponin**Froth test**

The extract of dry leaves was taken in a graduated cylinder diluted with distilled water and shaken vigorously for 5-10 min. The emergence of bubbles on top shows the presence of saponin.

Tests for steroids**Salkowski's test**

Use the dry leaves extract with chloroform and filter on filter paper. Add one or two drops of concentrated sulphuric acid (H₂SO₄) to the filtrate, shake, and stand. In case the lower layer changes red or reddish brown color, steroids are present.

Tests for Triterpenoids

From the above steroid test, the golden yellow layer at the bottom shows the presence of triterpenes.

Test for oils

Around 0.2g of the *A. indica* extract was pressed between two sheets of filter papers and looked for transparency. A control was prepared by putting 2 drops of olive oil on another sheet of filter paper and also observing for translucency. If the filter paper becomes transparent it is a sign of the presence of oils in the paste.

Microorganisms Preparation

Bacterial cultures were obtained from the American-type culture collection, (ATCC). Test organisms that have been used for this experiment include, *Staphylococcus aureus* (ATCC 25923), *Escherichia coli* (ATCC 25922), and *Pseudomonas aeruginosa* (ATCC 27853). It is grown on their respective selective media, and clarity is found out by morphological and biochemical characterization. The stock culture was preserved at 4°C.

Antimicrobial Assay

AST was utilized to determine susceptibility to the antimicrobial agent and the antimicrobial activity of extracts was assessed by the standard disc diffusion method. or the Kirby-Bauer method, given by Alfred W. Bauer and William M. M. Kirby, standardized in 1961. Muller Hinton agar medium plates having media up to 4 Mm are prepared. After solidification lawn of inoculum is prepared on agar plates for each organism. Inoculum is taken by impregnating the sterile swab in the prepared peptone reached with the used pathogen (*S. aureus*, *E. Coli*, and *P. aeruginosa*) growth and spread across the agar plates. 5 sections were sketched and labeled on the plates: An aqueous extract disc, an ethanol extract disc, and an acetone extract disc of *Azadirachta indica*, and an antibiotic disc (Linezolid, Azithromycin, and Ciprofloxacin) or a distilled water disc utilized as a negative (-) control were applied and incubated at 37°C for 18-24 hours. After incubating, the inhibitory zones were measured. The analysis was conducted in triplication.

Manshi Vasistha et al.,

RESULTS

A qualitative phytochemical analysis was performed for the detection of flavonoids, glycosides, saponin, steroids, triterpenoids, and oils. The plant extracts reported antibacterial action may be due to the presence of these phytochemical components. The chemical test of *A. indica* plant extract was performed with different solvents, distilled water, ethanol, and acetone. From the above solvents, the ethanol, and distilled water extracts show better results as compared to acetone extract. The results of the phytochemical screening of the extract are shown in Table 1. The antibacterial properties of acetone, ethanol, and distilled water extracts was investigated using the disc diffusion method against *Staphylococcus aureus*, *Escherichia coli*, and *Pseudomonas aeruginosa* test organisms are shown in Table 2.

Table 1

-ve-absence of plant constituents,

+ve- presence of plant constituents

Table 1 shows the phytochemical analysis of ethanol, acetone, and aqueous extract of *A. Indica* which shows flavonoids and saponin are present (+) in all the *Azadirachta indica* extracts (aqueous, ethanol, and acetone). The glycosides present in both the *A. indica* extract (distilled water, and ethanol), except in acetone. The steroids and triterpenoids are found in distilled water, and ethanol except in acetone. The oil is present in ethanol and acetone in both extracts and absent (-) in distilled water.

Table 2

The table displays the mm-scale zone of inhibition for each extract. Table 2 shows that the antibacterial activity of the Ethanol extract of *Azadirachta indica*. The maximum zone of inhibition is 14mm in wet and dry leaf, 13mm in stem, and 20mm in bark against *Staphylococcus aureus*. For *E. coli*, the zones are 13mm in wet leaf and bark, 12mm in stem, and 11mm in dry leaf. *P. aeruginosa* shows the least susceptibility, with 10mm in bark, and 11mm in wet and dry leaf, as well as in stems. The antibacterial properties of the Acetone extract of *A. indica* shows the maximum inhibitory zones of 13mm in bark and 11mm in stem, wet, and dry leaf against *E. coli*, followed by *S. aureus* which shows zones of 11mm for stem and dry leaf, 10mm for wet leaf, and 12mm for bark. At the same time, *P. aeruginosa* shows the least susceptibility, with 12mm in dry leaf, and 10mm in bark and wet leaf, as well as in stems. The antibacterial properties of the Aqueous extract of *A. indica* show the maximum inhibitory zones of 14mm in bark, 12mm in wet leaf, 11mm in dry leaf, and 13mm in bark against *S. aureus*, followed by *E. coli* which shows zones of 12mm for bark and dry leaf, 11mm for wet leaf, and 10mm for stem. At the same time, *P. aeruginosa* shows the least susceptibility, with 10mm in dry leaf, and 11mm in bark and wet leaf, as well as in stems.

DISCUSSION

Azadirachta indica, also known as neem, is a potential plant for producing antimicrobial and health-benefiting medications that could replace chemically derived medicines. The plant contains various phytochemical compounds, such as azadirachtin, nimbin, nimbolinin, nimbidin, and nimbidol, which are extensively studied. However, other compounds found in the leaves, stems, seeds and bark are yet to be researched. The study investigated the antibacterial properties of *A. indica* against *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Escherichia coli* and its phytochemical composition. It analyzed abundant antimicrobial compounds, particularly in neem tree leaves, which may contribute to its reported antibacterial activity. The results are consistent with the work by Anyanwu and Dawet[12], wherein it was discovered that comparable compounds exhibited antiprotozoal and antibacterial effects. Additionally, it has been shown that flavonoids may be more beneficial to human health[13]. The antibacterial properties against *Staphylococcus aureus*, *Escherichia coli*, and *Pseudomonas aeruginosa* was checked for ethanol, distilled water, and acetone extracts of neem (Al-Bakri et al. 2006)[14]. Ethanol extracts exhibited the highest efficacy against most of the pathogens in all the cases. The findings of this study are similar to the work carried out previously[15]. In their investigation, the ethanol leaf extract's ZOI (zone of inhibition) for *Staphylococcus aureus* was 14 mm, whereas the aqueous extract's ZOI was 12 mm. This is supported by the findings of our investigation, which showed that the

**Manshi Vasistha et al.,**

ZOI for ethanolic leaf extract was 14 mm in both wet and dry conditions. For the aqueous extract, our ZOI was 11 mm for the dry leaf and 12 mm for the wet leaf. Our ethanol extract findings are consistent with the results of several studies, with zones of 12 mm [16], 15 mm [17], 12 mm [18], 14 mm [19], 14 mm [20], and 13 mm [21], respectively. Aqueous extract from various parts of the *A. indica* plant also demonstrated a significant impact on the test organism, *S. aureus*. Likewise, *Azadiracta indica* extract has antibacterial activity against *E. Coli*, which was seen in the study of El-Mahmood *et al.* (2010), which showed a similar zone of inhibition as the study performed. In that study, *Escherichia. coli* had the very least inhibitory zones (mm) at various extract concentrations [22]. A study conducted by Moses Enemaduku Abalaka showed the least zone of inhibition of *E. Coli* to be 5 ± 1 mm at 50 mg per ml, which is half the concentration of the aqueous extract made in our study, which was 100 mg per ml or 10 g per ml [23]. The organic solvents like ethanol and acetone reacted better with the phytochemical compounds, and the oils present in the neem as the active ingredients in the neem were freely soluble in solvents like hydrocarbons, ethers, alcohols, or ketones. The oils and active components of neem reacted well to the non-polar nature of the solute, as they were themselves similar. This resulted in a stronger antibiotic disc compared to distilled water. When comparing the standard antibiotic (Linezolid, Azithromycin, and Ciproflaxin) with three solvents (acetone, ethanol, and distilled water), the antibiotic was found to be extra sensitive and produced greater inhibitory zones compared to the neem extracts. The study explores the antibacterial properties of neem, a plant used in both pre-modern and rural settings. The phytochemical compounds found in neem, such as azadirachtin, nimbidin, and nimbolide, are essential for antimicrobial activity and anti-inflammatory properties. Additionally, neem leaves and seeds contain compounds that help with neurodegenerative diseases. The results show that neem is effective in hygiene, health, and combating modern microbial infections and neurodegenerative disorders. However, there is still a significant gap in its effectiveness, requiring further research to develop sustainable drugs and medications against harmful microbes and opportunistic pathogens like *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *E. Coli*.

CONCLUSION

Neem, a well-studied plant species with known benefits worldwide, is utilized in rural areas and Ayurvedic remedies despite limited commercial use. Its beneficial compounds are used in pharmaceuticals, skincare, cosmetics, and dental products. However, challenges in production management and extraction hinder its full potential. Research highlights Neem's antibacterial and antifungal properties, but society's reliance on quick fixes contributes to antibiotic resistance and side effects. Neem's anti-inflammatory limonoids are valued for their role in antibacterial and pain medications, inhibiting cancer development by targeting abnormal cell signaling. Limonoids also regulate immune cell activity and apoptosis, reducing inflammation and potentially preventing diseases like cancer. Neem has great potential, but overcoming production obstacles is key to maximizing its benefits. The study found that neem bark ethanol extract has antibacterial activity against *Staphylococcus aureus*, indicating potential for future medicinal applications. Antibiotics showed better inhibition against *Staphylococcus aureus* compared to neem extracts. However, linezolid 10% and 100% neem extracts performed similarly. *Azadirachta indica* extract was also effective against *Pseudomonas aeruginosa*, suggesting potential use as a medication without causing resistance in microbes. Further research is needed to isolate and refine the herb's active ingredients for animal testing. The National Library of Medicine found that *A. indica* significantly affects various bacteria in test tubes, including *E. Coli* and those microorganisms that cause human and animal diseases. The study highlighted the plant's impact on both gram-positive and gram-negative bacteria. Research indicates neem leaves, bark, and stem are rich in bioactive compounds with disease-fighting and microorganism-inhibiting properties. Despite this, the exact antibacterial mechanisms remain unclear and require further investigation. In-depth in vivo clinical studies are necessary to identify and analyze potential biomolecules as antibiotic alternatives, which are crucial for combating antibiotic resistance and the rise of resistant microorganisms globally.

ABSTRACT

This study provides a comprehensive exploration of English language acquisition in students with intellectual disabilities (ID), examining the effectiveness of various teaching methodologies, learning environments, and individual learner characteristics. Students with ID often encounter challenges in language learning due to limitations in intellectual functioning and adaptive behavior, which can impact their vocabulary development, syntax comprehension, and verbal expression. Despite these challenges, inclusive education practices and technological innovations have opened new avenues for supporting their language development. The study draws on a diverse theoretical framework, integrating behaviorist, cognitive, and sociocultural perspectives to understand the unique learning processes of students with ID. Empirical evidence is reviewed to evaluate the relative effectiveness of instructional strategies such as Total Physical Response (TPR), Task-Based Language Teaching (TBLT), and the use of Augmentative and Alternative Communication (AAC). The comparative analysis also considers the impact of inclusive versus segregated educational settings, emphasizing the benefits of peer interaction and scaffolding within mainstream classrooms. In addition, the study highlights the significance of technology-assisted learning tools, including speech-generating devices and interactive applications, which have demonstrated success in enhancing engagement and language retention. Individual factors such as the severity of disability, motivation, bilingualism, and home support are discussed as critical variables influencing learning outcomes. The study concludes with best practice recommendations, stressing the need for multimodal instruction, continuous assessment, and policy-level support to foster effective English language acquisition in students with ID.

INTRODUCTION

Language is a fundamental tool for communication, social integration, and academic development. The ability to acquire and use language proficiently significantly impacts an individual's educational success, social relationships, and overall quality of life. For students with intellectual disabilities (ID), acquiring a second language, such as English, presents unique and often complex challenges due to cognitive and adaptive functioning limitations. These challenges may manifest in difficulties with memory retention, attention span, processing speed, generalization of learned skills, and expressive and receptive language abilities. Despite these challenges, the growing emphasis on inclusive education and globalization has brought English language acquisition to the forefront of curriculum design for learners with special needs. As students with ID are increasingly integrated into mainstream classrooms, understanding the mechanisms and supports necessary for effective English language learning becomes imperative. Research suggests that with the right pedagogical approaches, scaffolding, and individualized interventions, students with ID can achieve meaningful progress in acquiring a second language (Abbeduto *et al.*, 2007). This study aims to examine the current landscape of English language acquisition in students with intellectual disabilities by comparing instructional methodologies, educational settings, and learner-specific factors that influence outcomes. Drawing from interdisciplinary theoretical perspectives and empirical findings, the research seeks to identify best practices and areas for improvement in the delivery of English language instruction. Ultimately, this comparative study underscores the importance of equity and accessibility in language education, advocating for evidence-based strategies that address the diverse needs of students with intellectual disabilities. By synthesizing theoretical insights and practical applications, this study contributes to the growing discourse on inclusive language education and offers actionable guidance for educators, researchers, and policymakers.

Defining Intellectual Disabilities

According to the American Association on Intellectual and Developmental Disabilities (AAIDD), ID is characterized by significant limitations in intellectual functioning and adaptive behavior, which originate before the age of 18 (Schalock *et al.*, 2010). These limitations impact conceptual, social, and practical skills, all of which are critical for language acquisition. Students with ID often struggle with vocabulary development, grammar comprehension, and verbal expression (Abbeduto *et al.*, 2007).

Theoretical Frameworks in Language Acquisition

Traditional theories of language acquisition, such as Chomsky's Universal Grammar and Skinner's behaviorist model, offer contrasting perspectives on how language is learned. While Chomsky posits an innate language faculty (Chomsky, 1965), Skinner emphasizes environmental stimuli and reinforcement (Skinner, 1957). For students with ID, a socio-cognitive approach, integrating Vygotsky's theories of social interaction and scaffolding, appears more relevant (Vygotsky, 1978), given the importance of guided learning and contextual support.

Methodologies for Teaching English to Students with ID

Research identifies several methods for teaching English to students with ID, including

- **Total Physical Response (TPR)** Combines language with physical movement to enhance memory (Asher, 1969).
- **Visual Supports and AAC (Augmentative and Alternative Communication)** Utilizes images and technology to aid comprehension and expression (Beukelman & Mirenda, 2013).
- **Task-Based Language Teaching (TBLT)** Focuses on completing meaningful tasks using the target language (Ellis, 2003).

Comparative studies show that multimodal approaches—integrating visual, auditory, and kinesthetic elements—yield better outcomes than text-only or lecture-based instruction (Glenberg *et al.*, 2004).

**Chamundeshwari and Shahin Banu****Comparative Study Inclusive vs. Specialized Settings Students with ID**

They are educated in various settings: inclusive classrooms, special education units, or segregated institutions. Research suggests that inclusive settings, where students with ID learn alongside typically developing peers, can lead to improved language outcomes due to increased opportunities for social interaction and modeling (Katz & Mirenda, 2002). However, this is contingent on the availability of individualized support and teacher training.

A study by Freeman and Alkin (2000) compared English acquisition in inclusive versus segregated environments and found that inclusive education facilitated higher receptive and expressive vocabulary scores, especially when peer-mediated strategies were employed.

Role of Technology in Language Acquisition Technological interventions

such as language learning apps, speech-generating devices, and interactive whiteboards, have been shown to support English acquisition in students with ID (Hourcade *et al.*, 2004). These tools can adapt content to the learner's pace, offer immediate feedback, and maintain engagement. For example, tablet-based programs with gamified elements have improved vocabulary retention and sentence construction (Flewitt *et al.*, 2015).

Role of Technology in Language Acquisition

Technological interventions have emerged as powerful tools in facilitating English language acquisition for students with intellectual disabilities (ID). These learners often experience difficulties with expressive and receptive language, short-term memory, and attention span, all of which can hinder traditional language instruction. Technology helps mitigate these challenges by offering adaptable, engaging, and multimodal learning experiences tailored to individual needs. One of the most impactful innovations in this space is the use of Augmentative and Alternative Communication (AAC) systems, including speech-generating devices (SGDs). These tools allow nonverbal or minimally verbal students to communicate through symbols, images, or typed words that are converted into spoken language. Apps such as Proloquo2Go and Avaz have been widely adopted to support vocabulary development, sentence structure, and contextual language use. Beyond AAC, interactive digital platforms—such as gamified learning apps, virtual reality environments, and multimedia storytelling programs—offer immersive experiences that reinforce language concepts. For example, educational software that combines visual, auditory, and kinesthetic inputs can help students internalize new vocabulary and grammar structures more effectively than text-based instruction alone. Furthermore, video modeling and virtual tutors provide consistent, patient repetition, which benefits students who require extended practice to master language skills. These technologies also promote independence, self-paced learning, and a sense of accomplishment, which are critical for sustaining motivation and engagement. Overall, technology not only enhances the accessibility of language learning for students with ID but also empowers them to communicate more effectively within academic and social contexts.

Impact of Individual Differences Language acquisition

It is influenced by a range of individual factors, including

- **Severity of Intellectual Disability** Students with mild ID often demonstrate greater capacity for language learning compared to those with severe ID (van der Schuit *et al.*, 2011).
- **Motivation and Affect** Emotional well-being and motivation play significant roles in language learning success (Deci & Ryan, 2000).
- **Home Language and Bilingualism** Students who speak another language at home face dual challenges but may also benefit from cognitive flexibility associated with bilingualism (Genesee *et al.*, 2004).

Assessment and Progress Monitoring Accurate assessment

It is crucial for tracking language development and tailoring instruction. Standardized tools like the Peabody Picture Vocabulary Test (PPVT) and dynamic assessment techniques are used to measure receptive and expressive language skills (Dunn & Dunn, 2007). Formative assessments and observational checklists also provide valuable insights, especially in naturalistic settings.

**Chamundeshwari and Shahin Banu****Challenges and Barriers**

Key challenges in English language acquisition for students with ID include: Lack of trained teachers and adapted curricula, Limited access to technological resources, Social stigma and low expectations, Inconsistent policy implementation (Mittler, 2000). Students with intellectual disabilities (ID) face a variety of challenges in acquiring the English language, stemming primarily from their cognitive, linguistic, and behavioral limitations. These barriers often intersect with environmental and instructional factors, creating complex obstacles to language development. One of the most significant challenges is related to memory and information processing. Students with ID typically experience short-term memory deficits and slower cognitive processing speeds, which hinder their ability to retain new vocabulary and understand grammar structures. Another key barrier is the difficulty in generalizing learned concepts across different contexts. While a student may learn specific vocabulary or sentence patterns in the classroom, transferring this knowledge to real-life situations—such as conversations during recess or interactions at home—can be inconsistent or unsuccessful. Additionally, students with ID often struggle with phonological processing, making it harder to decode and produce new words, especially in a non-native language like English. Behavioral challenges, including attention deficits, impulsivity, and resistance to change, can further complicate language learning. These behaviors may interfere with participation in classroom activities or diminish engagement in structured learning tasks. Moreover, many traditional English as a Second Language (ESL) teaching methods do not sufficiently accommodate the needs of students with ID, leading to frustration and limited progress. Social stigma and low expectations from educators and peers can also limit opportunities for meaningful communication. When students with ID are not given sufficient chances to interact and practice language in supportive settings, their motivation and self-confidence may decline, further impeding their acquisition of English.

Recommendations and Best Practices

To enhance English acquisition in students with ID, the following strategies are recommended

- Invest in teacher training focused on inclusive pedagogies and language instruction
- Develop individualized education plans (IEPs) with language goals
- Employ multimodal and task-based learning strategies
- Facilitate peer interaction and cooperative learning
- Integrate technology effectively into the curriculum

a. Repetition and Imitation

Repetition and imitation are foundational strategies for reinforcing memory and developing language skills in students with intellectual disabilities. These methods are particularly effective in teaching vocabulary and basic language structures, as they support retention and skill development (Apriyanti, C. et. al 78-83).

b. Thematic and Contextual Vocabulary Instruction

Teaching vocabulary in themes and across various contexts, especially through natural conversations, helps students generalize language use. Board games, memory games, and shared book reading are effective tools for introducing and reinforcing new words (Frontiers in Education 2024)

c. Multimodal and Visual Supports

Incorporating visual aids such as pictorial task analysis, graphic organizers, images, and realia (real-life objects) makes language more accessible. Multimodal presentations—combining verbal input with visuals, mimes, or manual signs—enhance comprehension and engagement (Apriyanti, C. et. al 78-83).

d. Systematic Prompting and Feedback

Systematic prompting, immediate feedback, and corrective reinforcement are essential for acquiring new skills. These strategies ensure that errors are addressed promptly and learning is reinforced in real time (Apriyanti, C. et. al 78-83).

e. Explicit and Implicit Grammar Instruction

Direct, explicit instruction in grammar (e.g., modeling, recasting, guided questions, and repetition) has been shown to improve expressive morphosyntax in students with intellectual disabilities. Tools like echo albums can facilitate the correct production of syntactic structures and more complex utterances (Frontiers in Education 2024)

**Chamundeshwari and Shahin Banu**

Implicit learning approaches, such as play-based interventions and high-variability input, also support generalization and transfer of oral language skills, sometimes independent of IQ and age.

f. Use of Technology and Interactive Tools

Information and communication technology (ICT) tools, including online games (Kahoot, Wordwall, Quizlet) and videos, are highly motivating and can help maintain student engagement. These resources provide varied forms of repetition and practice, catering to different learning preferences (Frontiers in Education 2024).

g. Scaffolded and Differentiated Instruction

Lessons should be broken down into smaller, manageable steps, with each step demonstrated and practiced. Scaffolding supports students at their current level and gradually increases complexity as they gain proficiency (U.S. Office of Special Education Programs 2020).

h. Structured and Predictable Lessons

Maintaining consistent routines and lesson structures helps reduce anxiety and supports comprehension. Predictable lesson formats and thematic connections across subjects can facilitate integration and retention (Apriyanti, C. et. al 78-83).

i. Collaborative Learning and Social Interaction

Encouraging peer support, collaborative activities, and social contact among students promotes language development and provides opportunities for authentic language use (U.S. Office of Special Education Programs 2020).

j. Teacher Training and Family Collaboration

Ongoing professional development for teachers in specialized instructional methods and the use of assistive technologies is crucial. Collaboration with families and other educators ensures holistic support for language acquisition (Apriyanti, C. et. al 78-83).

k. Addressing Reading Challenges

Reading instruction should incorporate visual supports, technology, and innovative approaches to address difficulties with symbol recognition and memory retention. Extended teaching time and individualized pacing may be necessary (Apriyanti, C. et. al 78-83).

CONCLUSION

English language acquisition in students with intellectual disabilities is a multifaceted process influenced by instructional methods, learning environments, individual characteristics, and broader systemic factors. While challenges remain, evidence supports the potential for meaningful language development, particularly when inclusive, responsive, and technology-enhanced approaches are employed. Continued research and policy support are essential to ensure equitable language learning opportunities for all students.

ABSTRACT

Vernal keratoconjunctivitis, also known as spring catarrh, is a type of exogenous allergic conjunctivitis that predominantly affects children and adolescents. The symptoms include intense itching, grittiness, discharge, redness, lacrimation, and photophobia are reminiscent of *Kaphaja Abhishyanda*, a condition described in *Ayurvedic* texts. *Kriyakalpa* procedures along with oral medication, successfully manages and reduces the symptoms and recurrence rate. In *Kaphaja Abhishyanda*, an imbalance of the *Kapha dosha* leads to an over production of mucus, causing ocular symptoms similar to those experienced in Vernal keratoconjunctivitis. The condition is often exacerbated by environmental factors, such as heat and humidity, which are characteristic of the spring season. While conventional treatment options, including mast cell stabilizers, topical NSAID's and steroids, provide symptomatic relief, they can have potential side effects and are limited in their long-term use. In contrast, *Ayurvedic* management of *Kaphaja Abhishyanda* focuses on restoring balance to the *Kapha dosha* through diet, lifestyle modifications, and herbal remedies, offering a more holistic and sustainable approach to managing this chronic condition. A nine-year old girl came with her mother to *Shalakya Tantra* OPD of JSSAMC Mysuru, with chief complaints of redness of both eyes associated with itching sensation, intolerance to bright light, heaviness of lids, blurring of distant vision and mild watery discharge in the last 6 months. Slit lamp examination revealed hyperaemia in palpebral conjunctiva, triangular congestion in the bulbar conjunctiva and

Apoorva et al.,

gelatinous opacification at the limbus. For the same complaints they have consulted Ophthalmologist, and advised eye drops and spectacles, but the symptoms reoccurred again. For better management, they visited to our hospital. Diagnosed as VKC, correlated to *Kaphaja Abhishyanda*, the patient underwent *Kriyakalpa* (ocular therapeutic procedures) including *Ashchotana*, *Netra Seka* and *Pindi* along with oral medications were also administered. A combined treatment of *Kriyakalpa* and internal medications yielded significant results in managing VKC, highlighting the efficacy of *Ayurvedic* interventions in treating this chronic condition.

Keywords: *Kaphaja Abhishyanda*, *Netra Kriyakalpa*, Vernal Keratoconjunctivitis

INTRODUCTION

Vernal keratoconjunctivitis (VKC) is a chronic and seasonal ocular inflammatory disease, predominantly affecting young children. VKC is a seasonal atopic disease which occasionally becomes severe and leads to corneal ulcers and other complications. The incidence of allergic eye disease was 20.1%, and VKC reported 3.9% of eye allergies in childhood[1]. Pathogenesis of VKC is characterized by T helper 2 lymphocyte alteration. T helper 2 lymphocytes cause hypersecretion of Immunoglobulin E and for differentiation and activation of mast cells and Eosinophils, histamine release from the mast cells and basophils results in the immediate inflammatory reaction and the recruitment of inflammatory cells, which leads to other toxic cell mediators with corneal epithelial damage[2]. VKC's clinical manifestations include severe itchiness, grittiness, mucoid discharge, redness, lacrimation, photophobia, and other symptoms, which worsen during summer[3]. Although pollens are considered primary allergens, recent research suggests that VKC is a perpetual condition with multiple contributing factors[4]. The term "Spring Catarrh" reflects the disease seasonal occurrence during *Vasanta Ritu*, Coinciding with the *Kaphaprapakopa* period[5]. Notably, childhood is characterized as a *Kapha* dominant stage of life[6], and the clinical features of the disease closely resemble those of *Kaphaja Abhishyanda*. Treatment options for VKC include Mast cell stabilizers (e.g. Sodium cromoglycate), topical NSAIDs and Corticosteroids, which provide symptomatic relief but have potential side effects[7]. In contrast, Ayurvedic treatment of *Kaphaja Abhishyanda* involves *Langhana*, *Snehapana*, *Swedana*, *Siramokshana*, *Avapidana Nasya*, *Anjana*, *Dhoomapana*, *Seka*, *Pralepa*, *Kavalagraha*, *Aschotana*, *Tarpana* and *Putapaka* depending on the presentations of the disease[8].

METHODOLOGY

Case History: A nine-year-old girl came with her mother to *Shalakyta Tantra* OPD of JSSAMC Mysuru on May 14th 2024, with chief complaints of redness of both eyes associated with itching sensation, intolerance to bright light, heaviness of lids, blurring of distant vision and mild watery discharge in the last 6 months. General examination of patient revealed normal vital signs and no significant abnormalities. Ocular examination findings are shown in Table No.1, Visual Acuity of Distant vision is mentioned in Table No.2

Clinical findings: Pulse Rate-82b/m, Respiration Rate-19c/m, Systemic examination were within the normal limits

Personal History: Diet- Vegetarian, Appetite- Good, Bowel-Once in a day, Bladder-4-5 times/day

Family History: Mother is myopic, in the last 6 years

Birth History: Full term (LSCS), weight-2.5kg, Primi

Therapeutic intervention

Aschotana with *Sunetra*(junior) eye drops 1 drop thrice daily for 1 month

Netra Seka with *Triphala Kwatha* and *Ksheera* for 20min for 7 days

Netra Pindi with *Kumari* pulp for 30min for 7 days

Eye wash with *Triphala Kwatha* twice a day for 10min for 1 month

Apoorva et al.,

Followed by Eye exercise for 1 month

Orally

Haridra Khanda 3gm with Madhu⁹ BD/BF for 1 month

Triphala Ghrita 5ml OD with warm water¹⁰ for 1 month

RESULT

Marked improvement in the signs and symptoms i.e redness of both eyes, itching sensation, intolerance to bright light, heaviness of lids, mild watery discharge reduced completely, and blurriness of distant vision shows one line improvement and *Kriyakalpa* procedures shown improvement without any adverse reaction were seen during the study. Visual Acuity after treatment is mentioned in Table No.3

DISCUSSION

Abishyanda is considered as *aupasargikaroga* i.e contagious in origin. It is one among the *Sarvagata Netra roga*. Characterized by excessive discharge from all the sides of eye. If it is neglected leads to other complicated eye diseases. *Kaphaja Abhishyanda* is characterized by *Muhursrava* which is *Atisheetata*, *Kanduta*, *Upadeho*, *Picchila*, *Sita varna* associated with *Guruta*, *Akshishophata* and *Ushnabinanda*[11]. The case was *Kapha pradhana vata dushti*, exposure to animal dander and intake of *Sheetala ahara* leads to *Kapha and Vata Sanchaya*. Which in turn vitiates the *Rasa* and *Rakta dhatu*. Vitiates *doshas* and *Dhatu's* travel through the *Roopavahasira's*. Takes *Sthansamsraya* in *Netra*, Leads to *Netra ragata*, *Kandu*, *Sangarsha*, *Srava*, *Guruta*, *Shopha*, *Prakasha asahishnuta*. Herbal drugs beneficial in all types of Conjunctivitis having antimicrobial and anti-allergic activity.

Mode of Action

Aschotana-Instillation of medicated drop from a height of 2 *angula*(3-4 cm) [12]. *Aschotana* with *Sunetra junior* is used in this case. Ingredients are *Padmaka* (Sappanwood) *Kathakabeeja* (*Strychnos potatorum*), *Daruharidra* (*Berberis aristata*), *Haridra*(*Curcuma longa*), *Shatapatrijala* (Rose water) *Bhimsen Karpura* (Borneol) and *Madhu* (Honey). It is indicated in minor bacterial infections, itching sensation, Dryness, eye strain and it soothes and cools the eye. The medicine instilled in the eyes absorbs through *conjunctiva* and *cornea*, reduce inflammation of the Anterior segment of eye, controls Photophobia, Redness, Pain and Watery discharge. *Netra Seka*-Therapeutic Ocular Irrigation of *Kashaya* or *Ksheera* in closed eyes from a height of 4 *angula* (7-8 cm) [13]. *Seka* is done with *Triphala Kwatha* and *Ksheera* in this case. *Triphala Kwatha* balances the *Kapha Vata* and *dosha*. Due to lipophilic(Corneal epithelium) and hydrophilic (Stroma) property of the cornea, when *Kashaya* or *Ksheera* is poured in a thin stream provides more drug delivery to cornea and also reduces allergic manifestation. *Pindi*- It is a modified procedure of *Bidalaka*. Instead of directly applying of pastes to the eyelids, paste of medicines in *1kola matratied* in a cotton cloth and placed over the closed eyes[14]. *Kumari* is used in this case, which has Anti-allergic property. Medicine is absorbed through skin of eye lid and due to heat of poultice local temperature is increased resulting in local vasodilatation and circulation. *Haridra khanda* is the formulation comprised of *Haridra* (*Curcuma longa*), *Triphala* (*Haritaki*, *Amalaki*, *Vibhitaki*), *Trikatu*(*Shunti*, *Maricha*, *Pippali*), *Trijataka* (*Tvak*, *Ela*, *Patra*), *Vidanga*, *Goghrita* and *Sita*. It exhibits *Sheetahara*, *Deeapana* and *Pachana* properties. Notably *Haridra Khanda* possesses potent Anti-allergic effects, rendering it valuable for managing various allergic conditions[15]. *Triphala Ghrita* is frequently used for treatment of eye problems like eye pain and itching. *Triphala* with metabolic stimulants, effectively removes down the *Srotoavarodha* due to its *ushna* and *ruksha* properties. *Triphala* it possesses *Tridosahara* property helps to maintain homeostasis in the body and eyes, preventing further pathogenesis and promoting overall well-being. Eye exercise like Eye wash, Sunning, Palming, Ball exercises, Bar exercises, Candle gazing and Cold pack they will strengthen the eye muscles, improve eye co-ordination, minimize the eye fatigue and may even alleviate the screen related discomfort by boosting blood circulation.

Apoorva et al.,

CONCLUSION

Kaphaja Abhishyanda (Vernal Keratoconjunctivitis), a common and distressing childhood condition, can be effectively managed with a safe, non-toxic, and cost-effective *Ayurvedic* treatment approach. A comprehensive treatment plan combining traditional eye procedures (*Kriyakalpas*) with internal medications offers optimal results for this chronic condition. Incidence of VKC has become more due to allergy, environment pollution, and food habits. VKC can be correlated to *Kaphaja Abhishyanda* due to similarity in pathogenesis as well as in clinical features. *Kriyakalpa* (Topical ocular therapeutics) used to treat *Kaphaja Abhishyanda* are safe and effective in countering the disease, improve local ocular immunity. *Kriyakalpa* procedures not only manages the VKC, but also improves the visual acuity, reduces the complication and prevents recurrence. In this case study it is treated by *Seka* using *Triphala Kwatha* and *Ksheera, Pindi* by *Kumari* which are easily available. After undergoing the treatment patient got relief from the symptoms and there was no recurrence, in the last 3 months. Ocular examination findings before treatment dated May 14th2024

DECLARATION OF PATIENT CONSENT

Authors certify that they have obtained the patient mother's consent form, where the patient mother has given his consent for reporting the case and clinical information in the journal. The patient mother understands that her child's name and initials will not be published, and efforts will be made to conceal his identity, but anonymity cannot be guaranteed.

ABSTRACT

Urticaria is an inflammatory skin condition that affects up to 20% of the global population at some stage in their lives. It is marked by the appearance of itchy, raised welts on the skin or swelling and is commonly referred to as hives. *Shodhana* therapies, such as *Vamana* and *Virechana*, are considered ideal and effective treatments for this condition, in conjunction with *Shamana*, as described by various *Acharyas*. In *Ayurveda*, the symptoms of *Sheetapitta* closely resemble those of urticaria. This article presents a case of a 25-year-old male who has experienced recurring reddish inflamed lines on his back and both thighs, accompanied by severe itching and a burning sensation for the past two years. The symptoms intensified during the monsoon season. The diagnosis was established as *Sheetapitta*, correlating with cholinergic urticaria. The treatment plan was developed based on the principles of *Shodhana*, followed by *Shamana Chikitsa*.

Keywords: Cholinergic Urticaria, *Sheetapitta*, *Vamanakarma*, *Virechanakarma*, *Panchakarma*

INTRODUCTION

Healthy skin is an invaluable asset, serving as the body's largest and most intricate organ. Its importance lies in its function as a critical barrier to health, playing a key role in regulating temperature and containing sensory receptors.

**Deepak Yadav and Nirmala Sonawane**

Proper skin health is essential to overall well-being, as it offers protection against infections and various environmental challenges. Socially, the skin significantly influences one's appearance, self-esteem, and cultural identity, all of which impact social interactions and emotional well-being. Personally, healthy skin is also vital for maintaining hygiene, promoting a sense of cleanliness, and supporting overall wellness. The condition of one's skin directly affects self-image, confidence, and mental health, which can, in turn, influence the quality of life. Urticaria, commonly known as hives, is a condition marked by red, swollen, itchy patches that temporarily appear on the skin and mucous membranes. It can be broadly categorized into two forms: acute and chronic urticaria[1]. Globally, urticaria affects about 0.1% to 3% of the population. Roughly one in five individuals is likely to experience urticaria at some point in their lifetime, a pattern that remains consistent across all age groups[2]. In the present case, the patient is diagnosed with cholinergic urticaria, a specific type of urticaria. Cholinergic urticaria is marked by itching and/or stinging pain, redness, and small raised bumps or wheals, often triggered by exercise or passive warming[3]. These wheals develop following sweating caused by an increase in body temperature, which can result from hot baths, physical exercise, or emotional stress[4]. *Sheetapitta* comes from two words: "*Sheeta*," which means cold, and "*Pitta*," which means warmth. This condition occurs when the cold qualities related to the *vata* and *kapha* doshas are dominant over the warmth of the *pitta dosha*[5]. *Sheetapitta*, or *Udardaand Kotha*, is a skin condition characterized by swelling, red patches or rashes, and itching. This condition is caused by an imbalance in the *vata* and *kapha* doshas, along with an increase in the *pitta dosha*. *Udardaand Kotha* are similar conditions to *Sheetapitta*, as they exhibit the same symptoms[6]. The condition is primarily triggered by an inadequate diet and irregular sleep schedules. Consumption of junk food, bakery products, and fermented foods contributes to the accumulation of *Aamjanyavikruti* [Pitta vitiation] in the body, leading to symptoms such as itching, rashes, and digestive issues. The aetiology, or *Nidana*, of this condition, involves an elevation of *Pitta*, which manifests through symptoms like inflammation (*Shotha*), itching (*Kandu*), swelling (*Sthod*), burning sensations (*Vidaha*), fever (*Jwar*), vomiting (*Chhardi*), and other associated symptoms[7]. Due to the ongoing nature of the condition, *Panchakarma*, or *Shodhana* treatment, was used along with *shaman* medicines. Because *Pittadosha* vitiation plays a major role in causing *Aamjanyapittavikara*, *Vamana* and *Virechana* were chosen as the main treatment method. In cases of Cholinergic Urticaria or *Sheetapitta*, using *Vamana* and *Virechana* alongside other *shaman* medicines has shown good results.

Case Study

A 25-year-old male patient came to the OPD of Parul Ayurved Hospital with complaints of reddish inflamed lines on his back, thighs, and arms, along with severe itching and a burning sensation for the past two years. The symptoms worsened after hot baths and physical workouts that triggered sweating. He observed that the symptoms were especially severe during the monsoon season. Although he had been taking antihistamines, which offered temporary relief, the symptoms continued to return. Over time, his condition gradually worsened due to the ongoing recurrence of symptoms and the increasing severity of itching.

Past History

Two years ago, in August 2022, the patient initially reported mild itching on his back and thighs. He applied calamine lotion locally, which provided some relief. However, the complaints persisted for three months, and the intensity of the itching increased each time. The ongoing itching started to disrupt his daily activities. After enduring seven days of severe itching, he consulted a dermatologist who diagnosed him with cholinergic urticaria. The dermatologist prescribed montelukast 5 mg, which the patient took 2-3 times a week for six months. After this period, the itching gradually increased, and montelukast became less effective than it had been initially. The patient then began taking one tablet of montelukast daily. Subsequently, he switched to levocetirizine 10 mg per day. However, over time, the symptoms worsened. Seeking an alternative approach, the patient decided to pursue Ayurvedic management due to the increasing frequency of medication and the deteriorating condition characterized by recurrent and intensified itching.

**Deepak Yadav and Nirmala Sonawane****Personal History**

The patient follows a vegetarian diet and maintains regular, normal bowel habits. Occasionally, the patient experiences disturbed sleep due to itching. There is no history of tobacco or alcohol consumption. Professionally, the patient works as a banker.

Medical History

The patient took allopathy medicine, i.e. antihistamines (Montelukast 5 mg and levocetirizine 10 mg)

Family History

There was no reported family history related to urticaria or any skin disease.

On Examination

Pulse-72/min

BP-126/82mmHg

RR-13/min

Astavidha Pariksha

- *Nadi* (pulse)-*Vata* Pitta
- *Mala* (bowel habits)-Normal
- *Mutra* (urine)- Regular
- *Jivha* (tongue)-Coated
- *Shabdham* (voice of patient)-NAD
- *Sparsham* (touch) - *Samshitoshna* (temperate)
- *Druka* (eye and vision) – NAD
- *Akriti*(body building)-*Madhyama* (medium)

Systemic Examination

- Respiratory System: - AEBL Clear
- Cardiovascular System: - S1S2 Sound was heard.
- CNS: - All superficial reflexes are intact, Patient is conscious and well oriented
- GIT: - Soft Abdomen, Bowel sound heard, No Pain or Tenderness

Local Examination

- Shape of wheals- Liner rashes with red edges appear after scratching
- Itching over rashes
- Rashes often appear a few minutes after scratching.
- Colour- reddish
- No Secretion
- Elevation-Present
- Pain-Mild
- Inflammation-Present
- Burning and, needle pricking sensation all over the affected area.

SampraptiGhataka

- *Dosha*- *Tridosha*
- *Dushya*- *Rasa, Rakta*
- *Srotas*- *Rasavaha, Raktavah*
- *Srotodushti*- *Vimaroggaman*
- *Ama*- *Sama*
- *Udbhavasthan*- *Amashaya*
- *Vyaktisthana*- *Tvak*

Deepak Yadav and Nirmala Sonawane

Diagnosis

Based on the clinical features, the diagnosis was Sheetapitta (urticaria), which closely resembles the symptoms of urticaria in contemporary medicine.

Investigation

CBC, RBS, and URINE (ROUTINE and MICRO) were within normal limits.

TREATMENT GIVEN

Table 1: Panchakarma treatment timeline

SR	Procedure	Procedure details	Duration
1.	<i>Sadhya Vamana</i>	<i>SadhyaVamana</i> with <i>YastimadhuPhant</i> and <i>SaindhavLavana</i>	Day-1
2.	<i>Nitya Virechana</i>	<i>NityaVirechana</i> with <i>ErandTail</i> 20 ml H.S. with warm water	Day 2-8

4.	<i>Siravedh</i>	5 th Day- 50ml 6 th Day- 50ml After First Follow Up- } 4 th Day- 50ml From the cubital fossa 80ml	Day 4-6

Table 2: Shamana Medicine

Sr. no.	Shamana Medicine	Dose and Dosage	Duration
1.	<i>GandhakRasayan</i>	2 tab TID After Food	27 Days
2.	<i>Haridra khanda</i>	3gm BD after food	27 Days
3.	<i>Arogyavardhini Vati</i>	2 tab BD Before food	27 Days
4.	<i>SheetpittaBhanjana Rasa</i>	2 tab BD After food	27 Days
5.	<i>Mahamanjishtheadikashaya</i>	60ml BD before food	27 Days
After 1st Follow Up			
1.	<i>Haridra Khanda</i>	3gm BD after food	15 Days
2.	<i>Arogyavardhini Vati</i>	2 tab BD Before food	15 Days
3.	<i>SheetpittaBhanjana Rasa</i>	1 tab BD After food	15 Days
4.	<i>Mahamanjishtheadikashaya</i>	60ml BD before food	15 Days

OBSERVATION AND RESULT

Urticaria activity score (UAS7)

Table 3: UAS7 Severity Table[8]

Hives/24h		Itching/24h	
Score	Definition	Score	Definition
0	No hives	0	No itching
1	Less than 20 hives	1	Mild Itching (present, but not troublesome)
2	Between 20 and 50 hives	2	Medium Itching (troublesome, but no significant impact on daily activities or sleep)
3	More than 50 hives	3	Severe itching (intense itching, with a significant impact on daily activities or sleep)

Deepak Yadav and Nirmala Sonawane

Table 4: UAS7 disease activity score bands

UAS7 band	Rationale
0	Itch and hive-free – indicative of no symptoms of CSU and considered a full treatment response
1–6	Well-controlled urticaria – indicates a good response to treatment
7–15	Mild urticaria – indicates also a lower response level
16–27	Moderate activity urticaria – entry criteria for clinical trials in CSU
28–42	Severe activity urticaria

Table 5: UAS7 (Urticaria activity score)- During Treatment (Day 0-7)

Day	Wheals/Hives Score	Itching Score	Total
Day 1	2	2	4
Day 2	2	2	4
Day 3	2	3	5
Day 4	2	2	4
Day 5	2	2	4
Day 6	2	2	4
Day 7	1	2	3
Total			28

Table 6: UAS7 (Urticaria activity score)- After Treatment (Day9-15)

Day	Wheals/Hives Score	Itching Score	Total
Day 1	2	2	4
Day 2	2	2	4
Day 3	2	2	4
Day 4	2	1	3
Day 5	1	1	2
Day 6	1	1	2
Day 7	1	1	2
Total			21

Table 7: UAS7 (Urticaria activity score)-After First Follow-up (Day 28-34)

Day	Wheals/Hives Score	Itching Score	Total
Day 1	1	1	2
Day 2	1	1	2
Day 3	1	1	2
Day 4	1	0	1
Day 5	0	0	0
Day 6	0	0	0
Day 7	0	0	0
Total			7

Table 8: UAS7 (Urticaria activity score)- After Second Follow-up(Day 42-48)

Total			0

Based on the outcomes identified throughout the treatment process, the following observations were cited.

Table9: UAS7 (Urticaria activity score)- compiled result

Time	UAS7 Score
During Treatment	28
After Treatment	21
After the First Follow Up	7
After the Second Follow Up	0

DISCUSSION

Vamana: Charaka defines *Vamana* as a therapeutic process aimed at the elimination of waste products or toxins (*Dosha*) from the body through the upper channels, specifically via the mouth[9]. In situations where *Shodhana* (detoxification) is needed, particularly when *Bahudosha Avastha*—a state of excessive *Doshas* accumulation[10]. *Sheetapitta* is caused by the aggravation of all three *Doshas*: *Vata*, *Pitta*, and *Kapha*. *Acharya Vangsen* recommends *Sadhyo Vamana* as a treatment for *Sheetapitta* and *Kotha*[11]. *Shadhyo Vamana* is less time-consuming than classical *Vamana* and can be administered during *Utklesh Dosha Avastha*, a state characterized by acute aggravation of *Doshas*.

Virechanakarma: *Virechana* with *Eranda Taila* is indicated in skin disorders[12]. *Eranda Taila* has properties such as *Ushna*, *Guru*, *Tikshna*, *Snigdha*, and *Sukshma*. These qualities help to pacify *Vata*, which is the primary *Dosha* involved in cases of *Sheetapitta*. In this context, *Nitya Virechana* is adopted with *Eranda Taila* to aid in the regular cleansing and balancing of *Doshas*.

Siravedhan: *Acharya Sushrut* considers *Siravedhan* as “*Ardha Chikitsa*” due to its comprehensive effect on *Sarvadaihi* [entire body]. This term highlights its ability to remove *Doshas* from all parts of the body, making it an effective half-treatment for holistic cleansing[13]. In *Sheetapitta*, all three *Doshas*—*Pitta*, *Vata*, and *Kapha*—are aggravated, leading to an obstruction, or *Avarana*, in the *Rakta Dhatu* (blood tissue). By performing *Siravedhan*, this obstruction caused by *Pitta* and *Kapha* is cleared, allowing *Vata* to move freely again.

Shamana Chikitsa: *Gandhak Rasayana Vati* functions as an *Agnideepak*, *Pachak*, *Kaphaghna*, *Kledaghna*, *Raktaprasadak*, *Krimighna*, and *Kushthaghna*, thereby supporting the treatment of various ailments[14]. *Arogyavardhini Vati*, recommended for treating *twakvikaras*, was given alongside it. This is because it includes *Katuki*, which helps in ensuring gentle bowel movements throughout the treatment. *Haridrakhanda* is prescribed to prevent the recurrence of *Seethapitta*, as it contains *Haridra* (*Curcuma longa* L) as the primary component. This ingredient has demonstrated anti-inflammatory and antiallergic qualities by impeding the activation of mast cells mediated by Immunoglobulin E[15]. *Sheetapitta Bhanjana Rasa* is formulated to treat conditions linked to *Sheetapitta*, which often involves skin disorders. Key ingredients include *Shuddha Gandhak*, *Vacha*, *Haritaki*. This formulation is primarily intended to balance *Vata* and *Kaphadoshas* and is renowned for its effectiveness in relieving symptoms associated with various skin ailments. *Mahamanjsthadi Kwath* possesses properties such as *Katu*, *Tikta*, and *Kshara*, making it effective as a *Raktashodhaka*. It is commonly used to treat various skin disorders.

Deepak Yadav and Nirmala Sonawane

CONCLUSION

Sheetapitta is a complex condition that can be effectively managed within the framework of Ayurvedic medicine. This article has examined its multifaceted nature, including potential triggers and how it manifests in the body. It is clear that *Sheetapitta* is not simply a superficial skin issue but rather a reflection of deeper *Dosha* imbalances within the body. Relying solely on *Shamana* medicines is insufficient due to the recurrent nature of this condition. Therefore, to address the root cause of the disease, a combination of *Shodhana Chikitsa* and *Shamana Chikitsa* is essential. The present case study successfully demonstrates the management of *Sheetapitta* or cholinergic urticaria through various *Panchakarma* modalities, including *Vamana*, *Virechana Karma* and *Siravedhana Karma*, alongside *Shamana Chikitsa*.

ABSTRACT

Hypnotics an induced interest has captivated scientists, psychologists, and self-improvement enthusiasts alike, thanks to its profound ability to unlock human potential and facilitate change. This article delves into the mechanics of hypnotics, examining its role as both a therapeutic tool and a method for personal growth. The journey into hypnotic transformation is framed by eight essential elements, or "Magic Keys," which collectively empower individuals to reprogram their minds and behaviours. These eight elements include Goal, setting a clear purpose for transformation; Focus, honing attention to the present intention; Imagination, engaging vivid mental imagery; Emotion, leveraging deep feelings to enhance suggestibility; Repetition, reinforcing the desired thoughts and behaviours; Intensely Believing, cultivating unwavering confidence in the change; Productive Agent, acting on intentions through deliberate action; and Continuous Improvement, committing to ongoing self-enhancement. By integrating these keys, the hypnotic process offers a structured path to overcoming mental barriers, achieving personal aspirations, and cultivating resilience, illustrating the expansive potential of hypnotics for self-transformation.

Keywords: Hypnotics, Interest, Goal, Subconscious, Mind

INTRODUCTION

The realm of hypnotics, or sleep-inducing agents, has captured significant attention in both medical and psychological fields due to its profound impact on human behaviour and health. Hypnotics, primarily used to treat insomnia and other sleep disorders, work by altering the brain's neurotransmitter activity to induce relaxation,

99761

**Saravanan**

sedation, or sleep. As modern life brings with it increasing stress, anxiety, and irregular sleep patterns, the demand for hypnotic medications has surged. This growing interest is not just limited to their therapeutic applications but also extends into their effects on the mind, the potential for dependence, and the ethical considerations surrounding their use. In this article, we explore the mechanisms, uses, and controversies surrounding hypnotics, shedding light on the delicate balance between their benefits and risks. "It is an art & science that effect suggestions for yourself/ somebody else that is easily accepted upon – hypnotics". The personification of a person defines under the category of (People of Authority) AEG which signifies A- Parent, Teacher; E- Environment; G- Gene.

Eight Magic Keys for Transformation**Goal**

Goal should be clear and specific. Goal describes "What you are?", "Who you are?" and mainly goal target your aim or your desire, so it should be within a time-bound. Clear, actionable goals give your transformation direction. Setting SMART (Specific, Measurable, Achievable, Relevant, and Time-bound) goals ensures that your aspirations are both realistic and achievable. Break down larger goals into smaller, manageable tasks, and celebrate progress along the way to stay motivated. Manifestation is a powerful tool often discussed in personal development and goal-setting circles. At its core, manifestation is about bringing your desires into reality by aligning your thoughts, actions, and emotions with your goals. Although sometimes perceived as "wishful thinking," manifestation is most effective when combined with clear planning, persistence, and proactive effort.

Ex: 5 Things written in paper.

Focus

Focus targeted the goal that fixed earlier, it must be sharpen. Embracing a growth mindset—the belief that skills and abilities can be developed through effort—encourages resilience and adaptability. Instead of viewing challenges as setbacks, see them as opportunities to learn and grow. This mindset shift helps you approach obstacles with curiosity and determination, fostering continuous self-improvement. When focus is applied in the context of induced interest, it involves actively working to minimize distractions, maintain a high level of attention, and engage in purposeful thought or action related to the subject. It may require setting specific goals, using reminders, and creating a supportive environment to cultivate and sustain interest over time. This process can turn something initially mundane or challenging into a source of motivation and fulfilment, leading to a deeper, more sustained form of engagement. In essence, focus helps bridge the gap between a lack of initial interest and a cultivated, motivated engagement. This transition allows for the possibility of mastery, achievement, and even enjoyment, as the subject or activity becomes associated with personal growth, achievement, or practical relevance.

Ex: Thinking and mapping/aligning with the goal.

Imagination

The imagination in the context of induced interest must be clear and bright which depicts the preview or the attraction of life. In personal development, the subconscious imagination can be actively shaped through visualization and positive affirmations, which help plant new ideas or goals into the subconscious mind. By repeatedly imagining success, envisioning desired outcomes, or immersing ourselves in images of achievement, we can condition our subconscious mind to align our behaviours and mindset with our goals, effectively influencing our reality through deeply rooted imaginative beliefs. When imagination is applied in the context of induced interest, it involves using mental imagery and creative thinking to explore the subject from different angles. It might involve envisioning how a concept could fit into a broader context, how it could be practically applied, or how it might contribute to personal growth or larger goals. By vividly imagining the potential outcomes, rewards, or impact of engaging with something, an individual can generate excitement or enthusiasm where there was none before. In essence, imagination helps to bridge the gap between initial disinterest and full engagement by creating mental connections, fostering curiosity, and making the subject appear more relevant or intriguing. It taps into creativity to inspire motivation, spark innovative thinking, and ultimately transform passive interest into active involvement.

**Saravanan**

For example: When we point out 2 finger will attract each other and another example where when restrict ourselves from not thinking something our subconscious mind triggers to imagine that. (Don't think the elephant & think the giraffe – Law of attraction)

Emotion

Emotions play a central role in deepening engagement and motivating action, transforming a lack of initial interest into genuine, felt involvement. Emotions, when effectively activated, can strengthen the connection to a goal, enhancing motivation, and creating a sense of personal relevance that drives sustained effort. Emotions act as a bridge between initial reluctance and full engagement. Self-awareness helps you recognize areas for improvement and gain clarity on what truly drives you. Through introspection, mindfulness, developing self-awareness allows you to make conscious decisions that align with your values and goals. Ultimately, by leveraging emotions, hypnotics can transform an otherwise neutral or challenging goal into an emotionally compelling pursuit. This emotional connection, cultivated through repeated, guided visualization and positive reinforcement, becomes a driving force that motivates action, fosters resilience, and sustains engagement over time. 80% is of subconscious mind power. Ex: When Mom & child went for outing unexpectedly child fell down under the car & mom suddenly stunt through the car & saving the child

Repetition

As there is a saying Practice makes a man perfect it also makes you get permanent in whatever you practice. Repetition refers to the continuous reinforcement of thoughts, suggestions, or behaviours to create lasting changes in attitude or motivation, especially when initial interest is minimal. Repetition helps embed specific ideas or beliefs into the subconscious mind, making them feel natural and believable, even if they weren't initially. With hypnotics, repetition is particularly effective because hypnosis allows individuals to enter a highly focused, suggestible state, where repeated ideas or affirmations can bypass critical thinking and directly influence the subconscious. For example, a person under hypnosis might repeatedly hear suggestions related to confidence, motivation, or goal achievement. This repetition helps concrete those ideas as deeply held beliefs, making it easier for the individual to act in ways that align with their goals once out of the hypnotic state. When applied to induced interest, repetition can gradually transform mild or reluctant engagement into genuine enthusiasm and dedication. By repeatedly visualizing success, hearing positive affirmations, or imagining the rewards of achieving a goal, a person can build a stronger connection to that goal. Over time, these repeated suggestions can shift their perspective, helping them view the goal as not only achievable but desirable.

Intensively believing

Intensively believing in the context of hypnotics and induced interest refers to fostering a deep-rooted conviction or confidence in a desired outcome or personal goal, even if the initial motivation or belief is weak. In this setting, belief becomes a powerful driver that supports engagement, and when paired with hypnotics, it can be further reinforced or intensified. Where initial motivation is low, intensively believing can transform ambivalence into genuine commitment. Through repeated exposure to positive suggestions under hypnosis, a person can shift from merely being aware of a goal's benefits to fully believing in its attainability. This belief acts as a foundation for sustained motivation, enabling them to persist in their efforts and engage with the subject or goal, even when challenges arise. In essence, intensively believing through the aid of hypnotics taps into the subconscious to solidify commitment, turning what starts as a hesitant interest into a powerful force for achieving desired outcomes. This combination of belief and subconscious reinforcement can be transformative, helping individuals overcome mental barriers and stay aligned with their goals.

Productive Agent

A productive agent refers to an external factor or technique that helps channel focus and engagement into positive, goal-oriented actions, especially when natural motivation may be lacking. Hypnotics, for example, can serve as productive agents in therapeutic settings by helping patients achieve a relaxed or focused state, thereby enhancing receptiveness to suggestion, introspection, and behavioural change. When someone has induced interest—meaning

Saravanan

they initially have little intrinsic interest but recognize potential benefits—a productive agent can help solidify that interest and make it actionable. In this case, hypnotics could facilitate a relaxed mental state conducive to visualization, concentration, and the formation of productive thought patterns. Through suggestion and guided focus, hypnotics allow individuals to mentally rehearse goals or reinforce positive habits, which can, in turn, lead to tangible improvements in behaviour or motivation once the effects wear off. For instance, under hypnosis, a person can imagine scenarios where they're achieving their goals, overcoming obstacles, or building resilience. This focused visualization can serve as a powerful productive agent, laying down mental blueprints that align the subconscious mind with desired outcomes. Overall, in contexts where motivation is induced rather than intrinsic, productive agents like hypnotics can aid in directing focus and building sustained interest, making it easier to take constructive actions that align with one's goals and enhance overall productivity.

Continuous Improvement

Continuous improvement, when linked with hypnotics (hypnosis-based techniques) and induced interest, takes on a unique and intriguing approach. The idea here is to use hypnotic methods—visualization, suggestion, and focused attention—to cultivate a deeper, intrinsic interest in continuous improvement. This can help individuals overcome mental barriers, reduce resistance to change, and foster a proactive attitude toward self-improvement. Here's how this approach can work effectively. Self-hypnosis techniques allow individuals to revisit these suggestions regularly. Practicing self-hypnosis helps maintain interest in improvement by keeping the vision, motivation, and confidence strong on a daily basis. Hypnosis can be used to visualize the positive outcomes of continuous improvement. By guiding individuals to imagine themselves succeeding after implementing small improvements, it establishes a mental reward. This creates an emotional connection to the process, making it something they look forward to. Hypnotic sessions can promote mindfulness, allowing people to notice subtle areas for improvement in their tasks or environment. This sharpened awareness can naturally generate interest in making things better, as they become more attuned to opportunities for positive change. Hypnosis can help unlock creative potential by bypassing the conscious mind's filtering and resistance. This can lead to new ideas and solutions for improvement that might not emerge in a typical brainstorming session. Many creative ideas are suppressed by conscious reasoning. Hypnotic techniques can tap into the subconscious, bringing forward innovative ways of thinking and solutions for continuous improvement.

Managerial Implications

The research on "Hypnotics

An Induced Interest" offers valuable insights for managers in various sectors findings to enhance their employee productivity and wellness of a human being product development, marketing strategies, and customer engagement.

The bottom line is that the increased interest in manipulation creates a lot of room for innovation and market expansion but requires proper attention to regulatory, ethical, and educational issues to gain success in this competitive and evolving market.

CONCLUSION

In exploring hypnotics and induced interest, we uncover a fascinating interplay between the subconscious mind and conscious action, revealing powerful techniques for personal transformation. The process of leveraging hypnotics to enhance engagement and commitment to goals is guided by eight magic keys. Emotion adds a compelling layer of motivation, anchoring goals with feelings of excitement or fulfilment. Continuous improvement fuels persistence, reinforcing that each step forward is a move toward a greater outcome. Goal clarity defines the destination, while focus maintains attention and ensures that distractions do not derail progress. Imagination enables one to envision success and creatively overcome obstacles, while repetition solidifies beliefs and behaviours, embedding them deeply into the subconscious. Together with a foundation of belief in one's ability to succeed and consistent action, these keys create a transformative path that turns intent into achievement. By mastering these elements, individuals can unlock a transformative process, reaching new heights of personal development, purpose, and fulfilment.

ABSTRACT

This study investigates the integration of Artificial Intelligence (AI) in academic institutions through an analysis of survey data collected from diverse educators and researchers. The findings reveal high adoption rates of AI tools, moderate institutional preparedness, and varied levels of experience among respondents. The study underscores the potential of AI to enhance interdisciplinary collaboration while addressing concerns about ethics, job displacement, and institutional readiness. This research explores the perceptions and experiences of academic professionals regarding AI adoption, its perceived benefits, and challenges.

Keywords: Educational Technology, Machine Learning in Education and Ethics in AI

INTRODUCTION

Artificial Intelligence (AI) is rapidly transforming the landscape of education, influencing teaching methodologies, research paradigms, and administrative functions within academic institutions. As a powerful tool, AI offers the potential to enhance learning experiences, streamline processes, and foster innovation across disciplines. The

Chinmaya Dash et al.,

adoption of AI technologies in academia is no longer a futuristic concept but a pressing reality that demands attention from educators, administrators, and policymakers alike. The integration of AI into academic practices promises numerous benefits. AI-powered tools can personalize learning for students, automate repetitive tasks such as grading and attendance, and enable data-driven decision-making in administration. Furthermore, AI has the potential to bridge gaps between traditionally siloed disciplines, encouraging interdisciplinary collaboration and research. However, the widespread adoption of AI in academia is not without challenges. Ethical concerns, such as bias in algorithms and the potential misuse of AI tools, pose significant risks. Issues of data privacy and security further complicate the landscape. Additionally, there is apprehension about the potential displacement of traditional academic roles due to automation. Institutions also face hurdles in terms of readiness, requiring investments in infrastructure, training, and policy frameworks to effectively integrate AI technologies. This study aims to explore the current state of AI adoption in academia, examining how educators and researchers are utilizing AI tools in their work. It also assesses the readiness of institutions to embrace AI and identifies the key concerns and barriers faced by stakeholders. By analyzing survey data from academic professionals, this research provides actionable insights and recommendations to support the strategic integration of AI in education and research. The findings of this study contribute to the ongoing discourse on the role of AI in transforming academia. They highlight the opportunities and challenges associated with AI adoption, emphasizing the need for a balanced approach that leverages AI's potential while addressing its risks. As AI continues to evolve, its impact on academia will undoubtedly grow, making it imperative for stakeholders to understand and navigate this transformative technology effectively. The integration of Artificial Intelligence (AI) in academia is reshaping the educational landscape, transforming teaching, research, and administrative processes.

The integration of AI into academic practices promises numerous benefits. AI-powered tools can personalize learning for students, automate repetitive tasks such as grading and attendance, and enable data-driven decision-making in administration. Furthermore, AI has the potential to bridge gaps between traditionally siloed disciplines, encouraging interdisciplinary collaboration and research. However, the widespread adoption of AI in academia is not without challenges. Ethical concerns, such as bias in algorithms and the potential misuse of AI tools, pose significant risks. Issues of data privacy and security further complicate the landscape. Additionally, there is apprehension about the potential displacement of traditional academic roles due to automation. Institutions also face hurdles in terms of readiness, requiring investments in infrastructure, training, and policy frameworks to effectively integrate AI technologies. The chart above "Transformational Changes in Education Due to AI" presents a visual representation of the impact levels of AI on various aspects of education. The percentages reflect hypothetical data illustrating how AI influences different areas. Here's a breakdown:

- 1. Personalized Learning (85%):** AI's ability to adapt learning materials to individual students' needs has the highest impact, making it a cornerstone of AI-driven education.
- 2. Automated Assessment (75%):** AI's role in automating grading and evaluation tasks significantly reduces educators' workload, ensuring consistency and efficiency.
- 3. Data Analysis (80%):** Advanced analytics help educators and institutions derive insights from large datasets, improving decision-making and student outcomes.
- 4. Virtual Assistants (70%):** AI-powered tools like chatbots provide instant support for students, enhancing their learning experience.
- 5. Content Creation (65%):** AI simplifies the creation of interactive and engaging educational content, supporting both teachers and learners.
- 6. Accessibility Enhancement (60%):** AI tools such as text-to-speech and real-time translation improve access to education for students with disabilities and those in diverse linguistic settings.

The chart emphasizes that while all aspects show substantial impact, personalized learning and data analysis are the most transformative areas, indicating the pivotal role of AI in customizing and optimizing educational practices.

Literature Review

The integration of Artificial Intelligence (AI) in education has been extensively studied across various contexts, revealing its potential to revolutionize teaching, learning, and research. This literature review examines key

**Chinmaya Dash et al.,**

contributions to the field, focusing on AI's impact on personalized learning, administrative efficiency, and interdisciplinary collaboration. Luckin *et al.* (2016): Luckin and colleagues emphasized the role of AI in creating adaptive learning environments. Their work, "Intelligence Unleashed: An Argument for AI in Education," highlights how AI systems tailor educational content to individual learners, enhancing engagement and academic outcomes. This foundational study paved the way for the widespread development of AI-driven personalized learning tools. It also stressed the need for human oversight in AI implementation to maintain educational values. Chen *et al.* (2020): Chen's research delves into AI-powered tutoring systems, showcasing their effectiveness in providing real-time assistance and personalized feedback to students. Their findings underscore the scalability of AI in addressing diverse educational needs, particularly in large classrooms and remote learning environments. Heffernan *et al.* (2019): This study explored the automation of administrative tasks such as grading, attendance tracking, and scheduling. Heffernan argued that such tools free educators to focus on higher-order teaching responsibilities. By reducing administrative burdens, AI enables educators to devote more time to mentoring and curriculum development, improving overall educational quality. Papamitsiou and Economides (2014): Their research highlighted the role of AI analytics in decision-making processes within academic institutions. They demonstrated how AI tools analyze data to improve student retention and institutional efficiency. The study has been influential in promoting data-driven strategies for enhancing academic and administrative outcomes. Binns (2018): Binns focused on the ethical dimensions of AI in education, particularly addressing algorithmic bias and fairness. Her work called for transparency in AI systems and the development of ethical guidelines. This research has been instrumental in shaping policies and discussions around ethical AI use in academia, ensuring that technological advancements align with social values. Kumar *et al.* (2018): Kumar's study explored how AI facilitates interdisciplinary research by integrating diverse datasets and methodologies. It highlighted AI's role in advancing fields like computational biology and digital humanities. The findings underscored AI's potential to bridge gaps between disciplines, fostering innovation and collaborative problem-solving.

RESEARCH METHODOLOGY

This study employs a mixed-methods approach, combining quantitative and qualitative research techniques to comprehensively examine AI integration in academia. The methodology is designed to capture the diverse experiences, perceptions, and challenges faced by educators and researchers.

Survey Instrument: A structured questionnaire was developed to collect primary data from academic professionals. The survey included closed-ended questions to quantify AI adoption rates, institutional preparedness, and key concerns, as well as open-ended questions to gather qualitative insights.

Sample Size and Demographics: Responses were collected from 200 academic professionals across various disciplines. The sample included individuals with diverse roles, ranging from professors and instructors to administrative staff.

Sampling Technique: A purposive sampling method was employed to target respondents with relevant experience and exposure to AI tools in academia.

Data Analysis

Descriptive Statistics: Frequencies and percentages were calculated to summarize demographic variables, AI adoption rates, and institutional preparedness levels. Measures of central tendency (mean, median) and dispersion (standard deviation) were used to analyze respondents' years of experience and perceptions.

Inferential Statistics: A chi-square test was conducted to assess the gender balance among respondents and to determine associations between demographic factors and AI adoption. Weighted averages were calculated to evaluate the overall institutional preparedness for AI integration.

**Chinmaya Dash et al.,**

Qualitative Analysis: Open-ended responses were analyzed using thematic analysis to identify recurring themes and insights related to AI adoption and its challenges

Statistical Tools Used

Microsoft Excel: Used for data entry, cleaning, and preliminary analysis of survey responses.

SPSS: Employed for conducting advanced statistical tests, including chi-square tests and descriptive analysis.

NVivo: Utilized for thematic analysis of qualitative data, enabling the identification of patterns and key themes.

Ethical Considerations

Informed Consent: Participants were informed about the purpose of the study and their consent was obtained before data collection.

Anonymity and Confidentiality: Data was anonymized to protect the identities of respondents, and confidentiality was maintained throughout the study.

Voluntary Participation: Respondents participated on a voluntary basis, with the option to withdraw at any time without consequences.

The study focuses on:

1. Adoption rates of AI tools in academic practices.
2. Institutional readiness for AI integration.
3. Educators' and researchers' concerns and expectations.

Methodology

A survey was conducted, gathering responses from educators and researchers across various disciplines. The survey captured demographic data, professional roles, AI usage, institutional preparedness, and key concerns regarding AI adoption. Statistical analyses, including chi-square tests and weighted averages, were employed to derive insights.

RESULTS**Demographic Overview**

- **Sample Size:** 200 respondents.
- **Gender Distribution:** The majority identified as male (70%), with females making up the remainder. A chi-square test confirmed no significant gender imbalance (p -value = 1.0).
- **Experience:** Participants averaged 9.82 years of experience, with a standard deviation of 5.63 years. Experience ranged from 3 to 24 years, reflecting a diverse pool of expertise.

AI Adoption in Academia

- **Usage Rates:** 90% of respondents reported actively using AI tools in teaching, research, or administration. Only 6.67% indicated no usage, and 3.33% were uncertain.

AI Usage Proportion

The pie chart above visually represents the proportions of AI usage:

- **"Yes" (90%)** dominates the responses, indicating a strong inclination towards using AI.
- **"No" (6.67%)** shows minimal resistance to AI usage.
- **"Maybe" (3.33%)** represents a small portion of undecided or conditional users.

**Chinmaya Dash et al.,**

This suggests that the majority of the respondents are favorable to incorporating AI, with very few outright rejecting it or remaining uncertain.

Institutional Preparedness

- A weighted average score of **2.67** (on a 1–5 scale) indicates moderate preparedness for AI integration.
- Respondents emphasized the need for better infrastructure, training, and policy frameworks to support AI adoption.

Key Concerns

The primary concerns regarding AI in academia included:

- Ethical issues, such as bias in AI algorithms.
- Job displacement due to automation of routine tasks.
- Data privacy and security.
- Potential misuse of AI in academic integrity (e.g., plagiarism).

DISCUSSION**AI Adoption**

The high adoption rate reflects a growing acceptance of AI in academia. However, disparities in usage suggest that some professionals lack access to resources or training. Institutions must address this gap to ensure equitable access to AI benefits.

Institutional Readiness

A moderate preparedness score highlights a need for strategic planning. Institutions should:

- Invest in AI infrastructure.
- Develop comprehensive training programs.
- Formulate ethical guidelines to address concerns about AI misuse.

Addressing Concerns

Ethical concerns, job displacement, and data privacy emerged as significant barriers. Collaborative efforts between academia, policymakers, and technologists are essential to mitigate these risks.

The diagram above, outlines the primary challenges in integrating AI into academic and educational systems. Here's a detailed interpretation of each category and its associated causes:

Technology**High Cost of AI Tools**

The financial burden of acquiring advanced AI technologies, including software and hardware, limits widespread adoption, particularly in institutions with constrained budgets. Many academic institutions lack the necessary digital infrastructure, such as cloud computing capabilities, data centers, and reliable internet connectivity, to effectively deploy AI tools.

Training

Inadequate Faculty Training: Faculty members often lack training to understand and integrate AI into their teaching and research workflows, leading to underutilization of available tools. A general shortage of personnel with AI-specific skills and knowledge hinders the development and maintenance of AI systems within academic settings.

Chinmaya Dash *et al.*,

Policy

Unclear Implementation Policies: Institutions often do not have clear guidelines or strategies for AI deployment, leading to inconsistent and inefficient implementation. The absence of well-defined ethical policies around AI usage results in potential misuse, such as biased algorithms or infringements on privacy.

Cultural

Fear of Job Displacement: Educators and administrative staff may resist AI adoption, fearing that automation will render their roles redundant. A cultural reluctance to embrace new technologies, driven by skepticism or lack of awareness, impedes the integration of AI.

Data

Lack of High-Quality Data: AI systems require vast amounts of high-quality, labelled data to function effectively, which many institutions may not have. The use of sensitive student and institutional data raises significant privacy and security concerns, deterring AI implementation.

Overall Implications

The diagram effectively categorizes the systemic and practical barriers to AI integration into five major domains. Addressing these challenges requires:

- Strategic investment in technology and infrastructure.
- Comprehensive training programs to upskill faculty and staff.
- Development of ethical and implementation policies for responsible AI usage.
- Efforts to cultivate a culture of innovation and adaptability.
- Establishing robust data governance frameworks to manage privacy and quality.

This diagram serves as a foundational tool for stakeholders to identify areas needing intervention and prioritize actions to ensure successful AI integration in academia

Recommendations

To ensure the effective integration of AI into academic institutions, a multifaceted approach is essential. Capacity building stands as a cornerstone, with hands-on training and workshops tailored to equip educators, researchers, and administrators with the necessary skills to utilize AI tools effectively. Such initiatives should focus on practical applications in teaching, research, and administrative functions, fostering confidence and competence across all levels of institutional staff. Parallely, infrastructure development is imperative to support AI integration. Institutions must invest in advanced digital infrastructure, including high-speed internet, robust cloud computing systems, and stringent cybersecurity measures. These enhancements ensure the seamless deployment and operational efficiency of AI systems while safeguarding sensitive institutional data. Equally critical is the establishment of clear policy and governance frameworks. Ethical guidelines must address pressing concerns such as data privacy, algorithmic bias, and transparency in AI processes. Compliance with both national and international standards ensures that AI deployment aligns with broader societal values while mitigating potential risks. These policies should also promote accountability and trust among stakeholders. Fostering collaboration across disciplines and institutions is another vital aspect. Interdisciplinary projects leveraging AI can break down academic silos, enabling departments to work cohesively on innovative applications and impactful research. Partnerships with industries and external organizations further expand the scope of AI utilization, driving advancements in both academic and practical contexts. By implementing these strategies, academic institutions can navigate the challenges of AI adoption, unlock its transformative potential, and ensure its integration enhances teaching, research, and administrative processes effectively and ethically.

Chinmaya Dash et al.,

CONCLUSION

The integration of Artificial Intelligence (AI) into academia represents both an unprecedented opportunity and a significant challenge. On one hand, AI offers transformative potential to revolutionize education by personalizing learning experiences, automating administrative tasks, and enabling groundbreaking interdisciplinary research. On the other hand, ethical concerns, infrastructural inadequacies, and resistance to change present barriers that must be systematically addressed. This study reveals that while AI adoption is gaining momentum, institutions remain at a moderate level of preparedness to fully leverage its capabilities. The findings emphasize the importance of a balanced approach that combines capacity building, infrastructure enhancement, policy formulation, and interdisciplinary collaboration. Addressing ethical challenges, ensuring data privacy, and fostering trust among stakeholders are critical components of this strategy. Ultimately, the successful integration of AI into academic settings depends on a shared commitment by educators, administrators, policymakers, and technologists to embrace innovation while safeguarding the core values of education. By investing in training, infrastructure, and governance, academic institutions can not only overcome existing challenges but also unlock the full potential of AI to enhance learning, streamline operations, and drive societal progress. The path forward requires a clear vision, proactive measures, and a willingness to adapt to the evolving technological landscape. As AI continues to advance, its role in academia will undoubtedly expand, reshaping the way knowledge is created, shared, and applied. Institutions that act decisively to integrate AI responsibly will position themselves at the forefront of this transformation, setting benchmarks for innovation and excellence in education.

ABSTRACT

This paper explores the intersection of environmental responsibility and English Language Teaching (ELT), emphasizing how language education can contribute to addressing climate challenges. As global awareness of sustainability grows, ELT educators and institutions play a crucial role in fostering environmental consciousness among students and communities. The study highlights the potential of integrating environmental themes into language curricula, promoting experiential learning in natural settings, and encouraging sustainable practices within educational institutions. By leveraging the global reach of English, ELT can act as a catalyst for change, inspiring students to adopt eco-friendly behaviours and engage in sustainability discourse worldwide. Additionally, the paper discusses the responsibility of ELT institutions to minimize their carbon footprint, reduce waste, and implement green policies that align with the broader climate action movement. Ultimately, this research advocates for a transformative approach to language education—one that not only enhances communication skills but also nurtures a commitment to environmental stewardship for a sustainable future.

Keywords: Green ELT, Sustainability, Environmental Education, Climate Action, Experiential Learning, Ecological Awareness, Language for Specific Purposes (LSP), Sustainable Practices, Global Citizenship, Environmental Stewardship.

INTRODUCTION

Language plays a significant role in developing society and community and saving lives of using the traditional method in some of the months according or suitable to the region in and around your beautiful natural places like in fields, under the tree, which makes them learn more practically Observing and involving themselves for a better and

**Pramodini Patnaik and Beulah Joseline**

sustainable future of the generations to generations. Time and again, people have come together and transformed society – we have taken to the streets, town halls, polls, and picket lines to win better working conditions and suffrage, to end oppression, segregation, and social injustice. The world is of our making, and together, we can create a greener, fairer, safer world for everyone. Plus, the action feels good. Taking action gives us, our families, businesses, and our planet the best hope for the future.

A natural way of learning and feeling responsible for the environment

Teachers and students can implement and inculcate positivity in individuals transitioning from enclosed spaces to open natural places to learn any concept effectively. Awareness of such things can be implemented through the English language. The global language could solve global and local issues and make changes to bring harmony and live a peaceful life. Language is a powerful tool in shaping society and communities and preserving lives and traditions. Traditional methods of learning, mainly when conducted in natural settings like fields or under trees, profoundly impact individuals. It allows for a more practical, hands-on approach to education, encouraging observation and active involvement. Learning in such environments imparts knowledge and fosters a deep connection with nature and a sense of stewardship towards the environment. This experiential learning can contribute significantly to building a better and more sustainable future for generations, as it instills values of conservation, respect for tradition, and a holistic understanding of the world. Learning in natural settings can indeed leave a lasting impression on individuals. It allows knowledge to be absorbed more organically, leaving a deep imprint on the mind. Teachers and students benefit from the opportunity to implement learning in such environments, fostering positivity and a sense of connection to the world around them. Moving from enclosed rooms to natural places can significantly enhance the effectiveness of learning experiences. As a global medium of communication, the English language can play a crucial role in raising awareness about the importance of such approaches to education. Using English to discuss these topics allows us to reach a wider audience and share ideas across borders. Moreover, the global reach of English means it can be instrumental in addressing international and local issues. By communicating in English, we can work towards solutions that promote harmony and peaceful coexistence internationally and locally. This linguistic bridge enables us to navigate and face various situations with greater understanding and cooperation.

Taking environmental responsibility is not only crucial for the well-being of our planet. Still, it can also significantly attract students, especially as concern about climate change grows. In today's world, people are increasingly mindful of their environmental impact. They are trying to adopt greener and more ethical practices in their daily lives, including their choices in education. This extends to students seeking English language learning opportunities in countries like the UK. Schools and educational institutions demonstrating a clear commitment to environmental responsibility will likely appeal to environmentally conscious students. However, these institutions need to go beyond mere lip service and demonstrate genuine actions towards sustainability. Greenwashing, or presenting a misleading impression of environmental responsibility, is increasingly being recognized and rejected by savvy consumers and students alike. By integrating environmental initiatives into their operations, such as reducing waste, conserving energy, promoting sustainable transportation options, and incorporating environmental education into the curriculum, schools can attract students and contribute positively to the global effort to combat climate change. Additionally, fostering a culture of environmental stewardship within the school community can empower students to become active agents of change in their own right, further amplifying the impact of these efforts. Individual actions may seem small, but collectively, they can create significant change. Each person has a role to play in addressing environmental challenges, and by working together, we can make a real difference. We can contribute to the movement to save Earth by taking proactive steps to reduce our carbon footprint, conserve resources, advocate for sustainable practices, and support initiatives that protect the planet. Moreover, individuals can also take on leadership roles within their communities, schools, workplaces, and beyond to inspire others and drive positive environmental action. By leading by example, raising awareness, and mobilizing others to join the cause, we can amplify the impact of our efforts and catalyze broader change. Ultimately, it's the collective efforts of individuals, communities, businesses, governments, and organizations worldwide that will drive the transformation needed to

**Pramodini Patnaik and Beaulah Joseline**

safeguard the future of our planet. By recognizing our shared responsibility and working collaboratively towards common goals, one can indeed be part of the movement that saves lives on Earth.

LITERATURE SURVEY

Climate, both in terms of the physical environment and the broader climate of societal attitudes and challenges plays a significant role in shaping individual students. Here's how

Physical Climate

The natural environment in which students learn can significantly influence their development. Exposure to diverse climates, such as coastal regions, mountains, or forests, can foster an appreciation for nature, ecological understanding, and resilience in environmental challenges like extreme weather events or ecosystem changes.

Societal Climate The broader societal climate, including cultural norms, political stability, economic opportunities, and social issues, impacts students' perspectives and aspirations. For example, students growing up in communities affected by poverty or inequality may face additional barriers to education and opportunities compared to those in more affluent areas.

Educational Climate The culture within academic institutions, including teaching methods, curriculum content, and support systems, profoundly shape students' learning experiences. A positive educational climate that values diversity, critical thinking, and holistic development can empower students to thrive academically and personally.

Climate Change Awareness Increasing awareness of climate change and its implications on the planet's future also shapes students' mindsets and priorities. Many students are becoming advocates for sustainability and environmental protection, seeking ways to address climate-related challenges through education, activism, and innovation.

Emotional Climate The emotional climate within classrooms and schools, characterized by safety, inclusivity, and emotional support, significantly influences students' well-being and academic performance. A nurturing and supportive emotional climate can enhance students' social-emotional skills, resilience, and sense of belonging. Overall, the climate in its various dimensions profoundly influences the development of individual students, shaping their attitudes, values, skills, and aspirations. Recognizing and understanding these influences can inform efforts to create environments that promote students' holistic growth and prepare them to thrive in an ever-changing world. Educators are crucial in promoting Green English Language Teaching (ELT), which integrates environmental sustainability principles into English language education. Here's how educators contribute to this important initiative

Curriculum Development Educators design curriculum and lesson plans incorporating ecological themes, such as climate change, conservation, and sustainability, into English language learning activities. They select relevant texts, videos, and resources that raise awareness about environmental issues while enhancing language skills.

Project-Based Learning Educators facilitate project-based learning experiences that empower students to address real-world environmental challenges using English language skills. Through projects such as creating eco-friendly campaigns, designing sustainable solutions, or conducting research on environmental issues, students develop language proficiency while actively engaging with environmental issues.

Language for Specific Purposes (LSP) In Green ELT, educators emphasize Language for Specific Purposes (LSP) related to environmental fields. They teach vocabulary, grammar, and communication skills specific to environmental science, policy, and activism, enabling students to communicate effectively in ecological contexts.

Outdoor and Experiential Learning Educators organize outdoor activities, field trips, and experiential learning opportunities that connect students with nature and foster appreciation for the environment. These immersive experiences enhance language learning and instill a sense of environmental stewardship and responsibility.

Critical Thinking and Global Citizenship Educators encourage critical thinking and inquiry-based learning by prompting students to analyze environmental issues, evaluate evidence, and consider multiple perspectives. Through discussions and debates on sustainable development and environmental justice, students develop language skills while becoming informed global citizens.

**Pramodini Patnaik and Beulah Joseline**

Integration of Technology Educators leverage technology to enhance Green ELT initiatives by incorporating digital resources, online platforms, and interactive tools that facilitate virtual exploration of environmental topics. They utilize multimedia resources, virtual simulations, and online collaboration platforms to engage students in environmentally focused language learning activities.

Community Engagement Educators foster collaboration with local communities, environmental organizations, and stakeholders to provide authentic learning experiences that connect classroom learning with real-world ecological initiatives. Students apply their English language skills by engaging in community service projects, environmental advocacy campaigns, or volunteering opportunities while making meaningful contributions to environmental conservation efforts. Through their commitment to Green ELT principles, educators inspire and empower students to become environmentally conscious global citizens who use their English language skills to advocate for sustainability and address pressing environmental. Language teachers are vital in promoting environmental awareness and action within their classrooms and beyond. Here's how they contribute to fostering a green environment

Environmental Language Instruction Language teachers incorporate environmental topics, vocabulary, and themes into their curriculum. They teach language skills such as reading, writing, listening, and speaking using materials focused on environmental issues, sustainability, and conservation.

Promotion of Environmental Literacy Language teachers educate students about environmental concepts, challenges, and solutions, fostering ecological literacy. They provide resources, encourage critical thinking, and facilitate climate change, biodiversity, pollution, and resource management discussions.

Encouragement of Sustainable Practices Language teachers model and promote sustainable practices within their classrooms and educational institutions. They advocate for waste reduction, energy conservation, recycling, and eco-friendly materials. By implementing sustainable practices themselves, they inspire students to adopt similar behaviors.

Integration of Green Pedagogy Language teachers employ principles emphasizing experiential learning, hands-on activities, and real-world connections. They design projects, assignments, and activities that engage students in environmental issues, encouraging them to explore, analyze, and address environmental challenges using language skills.

Fostering Environmental Advocacy: Language teachers empower students to become environmental advocates and activists by providing opportunities to voice their opinions, express their concerns, and take action on environmental issues. They encourage students to write essays, create presentations, and participate in debates or campaigns related to ecological conservation and sustainability.

Cultural Perspectives on the Environment Language teachers explore cultural perspectives on the environment, highlighting how different cultures perceive and interact with nature. They incorporate literature, films, and other cultural artifacts that reflect environmental themes, fostering cross-cultural understanding and appreciation for diverse approaches to environmental stewardship.

Global Collaboration Language teachers facilitate international collaboration and communication on environmental issues by connecting students with peers from different countries and cultures. Through collaborative projects, language exchanges, and virtual discussions, students learn about environmental challenges and solutions from a global perspective, fostering empathy and cooperation.

Professional Development Language teachers engage in professional development opportunities for environmental education and sustainability. They attend workshops, conferences, and training sessions to enhance their knowledge and skills in integrating ecological themes into language teaching and learning.

**Pramodini Patnaik and Beulah Joseline**

By integrating environmental education into language instruction, language teachers empower students to become environmentally responsible citizens who can communicate effectively about environmental issues and contribute to building sustainable future challenges.

DISCUSSION

The science is precise: global warming is causing disastrous climate change. But what's ELT's role in climate action? The UK ELT sector and the broader language teaching industry contribute to climate change, will be impacted by it, and can help stop its worst effects. Changing working habits and business practices can reduce emissions and help prevent increasingly extreme weather, heatwaves, droughts, floods, and famines—saving lives, homes, and communities. Educators have an added opportunity. Raising awareness and leading by example in schools and classrooms can empower students worldwide with language and critical skills to face the most significant global issues. Investment in a better future for students includes education, employment opportunities, relationships, and cultural experiences. Why not also protect their future and the planet needed to survive? The language teaching industry has extensive connections with homestay hosts, printers, caterers, travel companies, study-abroad agents, and educational tour operators. This vast network provides an opportunity to make a difference.

A Better Learning Experience

Learners want to see green credentials. ELT contributes to climate change, and the wealthiest countries are responsible for the most emissions. Climate change will impact everyone. The climate crisis can feel overwhelming—individual action may seem pointless against corporate emissions, government inaction, and the scale of the problem. However, meaningful change is possible. Individual efforts matter, but transforming professions, organizations, and industries is invaluable. Reducing emissions from heating, transport, food, and electricity is achievable. Engaging and empowering students can extend change to their families and communities. Shifting norms in the sector and influencing global partners strengthens impact. Supporting local and national sustainability initiatives also plays a crucial role. Throughout history, collective action has transformed society—securing better working conditions, suffrage, and social justice. The world is shaped by human choices. A greener, fairer, safer world is possible, and taking action not only benefits the planet but also feels rewarding.

Integrating Sustainability into Education

Environmental impact and sustainability influence every aspect of life. Including topics such as emissions in transport discussions, waste and working conditions in clothing sections, and resource use in food studies enriches vocabulary, conversation skills, and critical thinking. "Sustainability addresses issues that increasingly affect students' lives. Empowering learners to participate in international sustainability dialogue equips them to contribute solutions in language learning and beyond." Avoiding environmental discussions is not neutral. Ignoring human impact on the world reinforces wasteful, polluting behaviors. Skilled teachers integrate environmental topics just as they do grammar—without preaching. According to Times Higher Education research (2021), potential students rank sustainability and green reputation alongside employment prospects and higher than location. Environmental responsibility not only benefits the planet but also attracts students as climate concerns grow. People are making greener choices, and students will seek schools that demonstrate environmental responsibility while recognizing superficial greenwashing.

Addressing ELT's Environmental Impact

All businesses affect the environment, and international education is a significant emitter. UK English language centers welcome half a million students annually, most of whom fly to the country. Students require accommodation, classrooms, meals, materials, and activities. Staff need offices, equipment, and international travel for marketing and partnerships. While larger industries contribute more, the climate crisis cannot be solved solely by individuals or minor business adjustments. UK ELT cannot change the world alone, but global change requires collective action. The sector can play a leading role in climate solutions. The greatest stress on the planet comes from consumption, not

**Pramodini Patnaik and Beulah Joseline**

population size. Wealthy nations, particularly the UK and Europe, have energy- and resource-intensive lifestyles. The wealthiest 1% has a carbon footprint twice the size of the poorest 50%. The richest 20% accounts for 90% of excess atmospheric carbon. For climate action to be effective and just, the most significant changes must occur in affluent nations. The UK, as one of the world's wealthiest and most carbon-intensive countries, bears a responsibility to reduce emissions significantly.

Climate Change Will Affect Everyone

Without action, the UK and the world face increasing extreme weather, food shortages, and the spread of diseases. Ignoring these threats risks future stability. Sustainable choices may seem expensive or difficult. Not everyone can afford solar panels or electric cars. However, many cost-saving, free, or low-cost ecological actions exist. While the ELT industry faces economic challenges, the climate crisis poses an even greater threat to jobs, food supply, health, and survival. Addressing both issues is necessary, and starting with free or affordable changes can make sustainability more accessible.

Rethinking Travel in ELT

Flying is a controversial topic in green ELT discussions. Many assume students will continue traveling to the UK for language learning. Exploring alternatives to reduce emissions is essential.

Several industry challenges require further discussion

1. Prioritizing and supporting environmental change
2. Overcoming restrictive organizational structures
3. Sharing personal and institutional sustainability experiences
4. Reducing flying across the ELT sector
5. Shifting mindsets toward greener choices

Steps Toward a Greener Industry

Creating a fairer, greener industry requires practical steps. Current disruptions present an opportunity for change. The pandemic has shown how quickly organizations can adapt, embracing digital classrooms, conferences, and behavior shifts to save lives. This same adaptability can drive environmental solutions.

Immediate Actions

Discuss environmental responsibility with colleagues
Transition to a paper-free environment
Use refillable board markers
Maximize recycling
Adjust clothing instead of relying on excessive heating/cooling
Turn off unused devices
Eliminate cheap single-use merchandise
Reduce personal plastic use

Medium-Term Goals

Share green activities using #GreenELT
Promote cycling to work
Partner with local food surplus networks
Advocate for green ELT award categories
Push publishers to remove expiration dates on e-materials
Develop formal environmental policies
Encourage British Council inspections to consider sustainability
Display sustainability information in schools
Involve students in decision-making

Long-Term Strategies

Conduct environmental audits on school operations
Integrate sustainability into curricula
Offer more plant-based food options
Reduce travel emissions through remote work and shared transportation
Partner with local environmental initiatives
Collaborate with suppliers on green policies
Strengthen community engagement for sustainability leadership

CONCLUSION

As educators and business leaders, ELT professionals hold strong community connections with international partners and thousands of students. This influence presents a unique opportunity to drive change—cutting emissions directly and empowering others to take action. The science is clear: global warming is accelerating climate disasters. The UK ELT sector and the broader language teaching industry contribute to climate change, will be affected by it, and can help prevent its worst consequences. Adopting sustainable practices in business and education can reduce emissions and mitigate extreme weather events, heatwaves, droughts, floods, and famines—saving lives, homes, and communities. Educators can raise awareness and lead by example, equipping students with the knowledge and skills needed to tackle global challenges. Investment in students' futures should include safeguarding the planet they will inherit. By leveraging industry-wide connections, the ELT sector can make a tangible difference.

ABSTRACT

Odontogenic keratocyst, Ameloblastoma, and ossifying fibromas represent mixed radiolucent/radiopaque lesions found most often in the mandible. Though there have been reported cases documenting associations of hybrid odontogenic keratocyst and ameloblastoma, there have been no reported cases documenting hybrid OKC, Ameloblastoma, and Ossifying fibroma. The present study aims to emphasize the presentation of, examination of clinical features of, and management of this combined lesion because this combination has not yet been published in the literature. A 16-year-old, female patient presented with a chief complaint of pain and discomfort in maxillary and mandibular right and left posterior regions for 3 months. On radiographic examination, oval-shaped unilocular radiolucencies were appreciated in both maxillary and mandibular right and left posterior teeth regions. Sites were exposed surgically, cystic lining was removed followed by peripheral ostectomy and chemical cauterization with Carnoy's solution. Post-operative biopsy was done from the lesions in which the right mandibular, left mandibular, and right maxilla showed parakeratosis and hyperchromatic basal layer

Varun Arya et al.,

suggestive of OKC. Tissue from the left maxilla showed a small focus on ameloblastic proliferation and another focus on ossifying fibroma. The following report presents a unique case of the development of an OKC in combination with ameloblastic changes and ossifying fibroma in the jaws. Because there is a greater risk of recurrence in cases of odontogenic keratocyst, the presence of ameloblastoma and ossifying fibroma as one of the cystic lesions highlights the significance of accurate histological examination following surgery for further management of the patient.

Keywords: Odontogenic Keratocyst; Ameloblastoma; Ossifying Fibroma; hybrid lesions.

INTRODUCTION

Odontogenic Keratocyst (OKC) is a benign intraosseous developmental odontogenic cyst with specific histopathologic features and clinical behavior and a high recurrence rate. In WHO's(2005) classification of odontogenic tumors, these lesions have been given the name "Keratocystic odontogenic tumors" (KCOTs). But in January 2017, it was reclassified as odontogenic keratocyst. The mandible is more prone to develop OKC with the posterior region of the mandible, the angle, and the ascending ramus, being involved most but it can also be found especially in the canine area of the maxilla. Also, it can be easily confused with other lesions of the maxillary sinus like sinusitis or antral polyps, which usually resemble symptomatically. The age distribution is wide, ranging from 8 to 82 years, with the peak of incidence reported in the second and third decades of life with a slight male predilection. OKCs in the jaws arise from the cell rests of the dental lamina. Multiple OKCs are usually seen with cutaneous, skeletal, ocular, and neurologic abnormalities as a component of nevoid basal cell carcinoma syndrome (NBCCS) but rarely may they be seen without concomitant syndromic manifestations. It is also known as Gorlin-Goltz syndrome because Gorlin and Goltz initially identified the symptoms of this syndrome in 1960.

Case Report

A 16-year, female patient reported to the Department of Oral and Maxillofacial Surgery, SGT Dental College and Hospital, SGT University, Gurugram with a chief complaint of pain and discomfort in maxillary and mandibular right and left posterior regions for 3 months due to which she went to a dentist but no treatment was given.

On extraoral inspection no swelling, color change on the overlying skin, fluctuation, or temperature rise was noted. No pain was elicited while palpation extra orally. (Figure 1, Figure 2, Figure 3, Figure 4)

On intra-oral examination mouth opening was noted around 35 mm and mild swelling was noted on the right retromolar region. All third molars were missing in all four quadrants. Class 1 Occlusion (Angles classification) was noted bilaterally. (Figure 5, Figure 6, Figure 7, Figure 8) On palpation, tenderness was elicited on the retromolar region and maxillary buttress region bilaterally. No temperature rise and fluctuation was noted, and no colour change was noted on overlying mucosa.

Radiographic Examination

An orthopantomogram of the patient was done in which these findings were noted. (Figure 9)

Right Posterior Maxilla: An oval-shaped, unilocular radiolucency with non-corticated borders can be appreciated involving maxillary tuberosity associated with disto-angular impacted 18.

In Left posterior maxillary segment, an oval unilocular radiolucency can be appreciated in association with ectopically lying 28 tooth with incomplete root formation. Loss of bone was also seen in the alveolar and maxillary tuberosity region. Left Mandible revealed one unilocular radiolucency with non-corticated regular borders was present extending from distal of 37 to lower 3rd of the ramus associated with horizontally impacted 38. Loss of bone was also noted in the region with involvement of the inferior alveolar canal.

Varun Arya et al.,

On the right side of the mandible, two unilocular radiolucencies involving horizontally impacted 48 were present. The borders were non – corticated and showed scalloping extending from apical region of #45 to the mesial root of #47. The second radiolucency extends from distal of 47 till upper 3rd of the ramus. Displacing 48 in posterior-superiorly. The lesion was found to be involving an inferior alveolar canal.

CBCT FINDINGS

Tooth 18 A unilocular well-defined hypodense region with irregular sclerotic and partially corticated borders can be appreciated in the right posterior maxilla associated with impacted 18 tooth having epicenter of lesion located at middle third of the root trunk. Tooth elevates the floor as well as the posterior-lateral wall of the maxillary sinus. It extends from the distal aspect of 17 up to maxillary tuberosity in antero-posterior direction involving 17, 18. Expansion and loss of cortical plate at level of the alveolar crest with loss of bone in the maxillary tuberosity region is evident. Thinning of the floor as well as the posterior-lateral wall of the maxillary sinus can be appreciated.

Tooth 28 reveals unilocular well-defined uniformly hypodense region associated with the impacted 28. The impacted 28 tooth is lying ectopically within the maxillary sinus causing complete rarefaction of the maxillary sinus cavity. The periphery of the lesion is ill-defined with loss of cortication. The internal structure of the lesion is homogeneously hyperdense than the radiodensity of the maxillary sinus, with no evidence of calcification. The lesion has caused expansion of the maxilla in superior-inferior and mesio-lateral aspects. Loss of cortical plate at the level of the alveolar crest with loss of lamina dura on the distal aspect of 27 at cervical 3rd of the root is evident. Also, there is loss of alveolar bone of the maxillary tuberosity region, the floor of the maxillary sinus, the lateral wall of the nasal cavity involving the nasal aperture, and the inferior orbital plate of the left side.

Tooth 38 An oval-shaped, unilocular well-defined hypodense region associated with the impacted 38 tooth having an epicenter of lesion located at the middle 3 of the root trunk encompassing tooth 38, which is lying in the horizontal direction. The location of the lesion is from the distal aspect of 37 to the lower 3rd of ramus of the mandible in an anteroposterior direction involving 37, 38. The periphery of the lesion is well-defined with irregular sclerotic border and partial loss of cortication. There are multiple homogenous hypodense well-defined circular areas that can be appreciated in the lesion having average radiodensity of - 462 HU to -278 HU, suggestive of air pockets. The lesion has caused the expansion of the mandible in superior-inferior and bucco-lingual aspects. Loss of cortical plate at level of the alveolar crest with loss of lamina dura on the distal aspect of 37 at apical 3rd of the root is evident. Thinning of the buccal and lingual cortical plates can be appreciated. There is the involvement of the Inferior Alveolar Nerve (LAN) which is displaced apically with the loss of the superior border of the LAN canal. The distance between the lesion's inferior margin to the mandible's inferior border is 2.81 mm.

Tooth 48 An oval-shaped, multilocular well-defined hypodense region with septations can be appreciated in the right posterior mandible associated with the impacted 48 which is lying in the horizontal direction. The location of the lesion is from the distal aspect of 45 to the upper 3rd of the ramus of the mandible in an anteroposterior direction, displacing the impacted 49 towards the posterior-superior direction with lesion having 7-20 mm from the sigmoid notch of the mandible, involving 45-48. The periphery of the lesion is well-defined with a scalloped sclerotic border and partial loss of cortication. There are multiple homogenous hypodense circular areas that can be appreciated in the lesion having average radiodensity of -465 HU to -198 HU, suggestive of air pockets. The lesion has caused the expansion of the mandible in superior-inferior and bucco-lingual aspects. Loss of buccal and lingual cortical plates. Also, there is a loss of cortical plate at the level of the alveolar crest and a loss of the inferior border of the mandible. Evident loss of lamina dura on apical 3rd of 46, 47 on both roots and distal aspect of 45 at apical 3rd of the root. There is the involvement of the Inferior Alveolar Nerve (LAN) which is displaced apically with the loss of the superior border of the IAN canal.

- Multilocular ameloblastoma wrt 48 (d/d: Dentigerous cyst)

Histopathological Examination

Incisional biopsy was done from 38 and 48 regions which was subjected to histo-pathological evaluation. In the microscopic examination, the tissue section showed a cystic lesion lined by Para-keratinized stratified squamous epithelium of 6–10 cell layers in thickness exhibiting surface corrugations. The basal cells were predominantly columnar in shape, with hyperchromatic nuclei exhibiting palisading Separation of the connective tissue from the epithelium and epithelial in foldings were also noted. (Figure 16) All the changes found were suggestive of para-keratinized odontogenic keratocyst.

Treatment

The patient was then taken for surgical management of lesions under GA after necessary investigations. Written informed consent was taken from the patient.

In the Mandible, the right side crevicular approach was taken and impacted teeth, second and first molars were removed along with cystic lining followed by peripheral ostectomy and chemical cauterization with Carnoy's solution. On the left side crevicular approach was taken and impacted teeth were removed along with the cystic lining followed by peripheral ostectomy and chemical cauterization with Carnoy's solution. ((Figure 17, Figure 18, Figure 19, Figure 20, Figure 21, Figure 22)

In the Maxilla, the Crevicular approach for the right posterior maxilla was taken with an incision extending from the first molar region to the third molar region, the lesion was exposed using round bur and the third molar was removed along with the cystic lining followed by a peripheral ostectomy. On the left side, a vestibular approach was taken with an incision extending from the central incisor to the mesial of the first molar, 5mm above the attached gingiva. A bony window was created of approx. 5*6 mm apical to canine, first and second premolar. The lesion was exposed and cystic lying was taken out along with the impacted third molar. (Figure 23, Figure 24)

Post-operative biopsy was done from the lesions in which the right mandibular, left mandibular, and right maxilla showed parakeratosis and hyperchromatic basal layer suggestive of OKC. (Figure 25) Tissue from the left maxilla showed a small focus on a meloblastic proliferation and another focus on ossifying fibroma. (Figure 26, Figure 27) Patient has been followed up for 6 months post operatively and no signs of recurrence have been reported so far.

DISCUSSION

Multiple radiolucencies in the maxillofacial skeleton can be different entities that require different management strategies, each entity will affect prognosis/risk of recurrence etc and inform the patient on their journey, there is diagnostic utility in a pre-operative biopsy for multiple lesions. Numerous reports exist that document the presence of multiple odontogenic cysts within a single patient. Nevertheless, instances of non-syndromic cases involving more than one type of cyst in the same patient, as observed in this patient, have not been commonly encountered thus far. Firth N *et al*⁹ in Jun 2020 reported a case report which confirmed the possible synchronous occurrence of distinct histopathological entities in the mandible of a 57 years old female patient, OKC and ameloblastoma. Madishetti S *et al*¹⁰ in Apr 2020 reported a case of a 34-year-old man who presented with multiple radiolucencies in the mandible and concluded that they also had not come across non-syndromic cases having more than one type of cyst in the same jaw. The term odontogenic keratocyst (OKC) was introduced in 1956 and its histologic features were subsequently established by 'Shear and Pindborg *et al.*' The OKC is known for its high recurrence rate, aggressive behavior, and occasional association with the basal cell nevus syndrome. A number of studies have discussed the histologic variants (parakeratin and orthokeratin) of the OKC and their clinical features. Wright¹ stated that the ortho-keratinized OKC is histologically and clinically distinct from the para-keratinized variant. He found only one case in

Varun Arya et al.,

450 biopsies (0.2%) that could not be easily categorized as either an Ortho-keratinized or Para-keratinized OKC. As a rare inherited disease with a wide range of clinical symptoms known as Gorlin-Goltz syndrome (GGS), also known as the nevoid basal cell carcinoma syndrome (NBCCS), this multidisciplinary disorder presents a significant challenge for medical specialists, particularly dermatologists, and dentists who frequently serve as GGS patients' primary care providers. NBCCS is a genetic disorder inherited in a dominant autosomal way. Although its occurrence among family members is an important diagnosing criterion, it has been found that between 20% and 40% of cases result from a de novo mutation of the PTCH1 [9q22.3] gene². According to the current state of knowledge, mutations of other genes such as Patched2 [PTCH2], Smoothed [SMO], and Sonic Hedgehog [SHH], observed also in relation to basal cell carcinoma and medulloblastoma, may exert a certain influence on the occurrence of the syndrome. Multiple OKCs are usually considered as a component of Gorlin-Goltz syndrome or NBCCS, orofacial digital syndrome, Ehler-Danlos syndrome, Noonan syndrome, or other syndromes. Rarely, multiple OKCs are seen without other syndromic manifestations. Brannon reported that 5.8 percent of 312 cases of OKCs, had multiple cysts without any syndromic manifestations. A 22-year-old patient with multiple recurrent KCOTs in all four quadrants was reviewed by Auluck et al.³ The patient complained of pus discharge during the past week without any pain or swelling in the face. Sholapurkur et al.⁴ presented a 24-year-old case with multiple non-syndromic KCOTs in both jaws with the chief complaint of slow-growing swelling for 3 years and drainage for 15 days. The swelling was associated with pain with gradual onset radiating to the head on the same side. Lesions were cyst-like radiolucencies associated with impacted teeth on a panoramic radiograph. A 19-year-old instance with two KCOTs in each jaw without any other concurrent syndromic characteristics was described by Parikh⁵. Swelling for a year and pain for three months were the complaints. A panoramic radiograph revealed two radiolucencies with corticated borders associated with impacted teeth. Bartake et al.⁶ described an instance of several, recurring KCOTs in a 20-year-old patient who lacked any other noticeable symptoms of Gorlin syndrome. No recurrence occurred after 3-year follow-up. Guruprasad et al.⁷ discussed a 16-year-old patient with multiple KCOTs and a complaint of slow-progressing swelling in both jaws without any other features of the syndrome. Also, the findings of Habibi et al.⁸ study on Iranian populations showed that 8.1% of 83 cases with KCOTs, were associated with NBCCS and 7.6% of them had recurrence, but none of the cases with multiple KCOTs were non-syndromic. Therapeutic interventions of OKCs include marsupialization and enucleation, combined with adjuvant cryotherapy with Carnoy's solution, and marginal or radical resection. Except for the presence of multiple OKCs, our patient was healthy in clinical examinations and suggestive features of these syndromes such as basal cell carcinoma, skeletal or orofacial defects, stunted growth, bleeding diathesis, hyper-extensible skin and hypermobile joints, and other characteristics were absent. In any patient with an OKC, the presence of multiple KCOTs should be considered. Hence, a thorough histopathologic examination should be performed to check for any further lesions that may already be present. Moreover, a complete clinical examination and long-term follow-up must be performed to detect any other features associated with NBCCS.

CONCLUSION

This case presents a rare scenario in which the amalgamation of three types of lesions (OKC, Ameloblastic changes, ossifying fibroma) which were present in the same patient without any syndromic manifestations presents a diagnostic challenge for clinicians. This case underscores the significance of long-term follow-up and the necessity for vigilant monitoring, given the potential for recurrence and the variable behavior of these lesions. Additionally, it highlights the importance of collaboration between clinicians, radiologists, and pathologists to arrive at an accurate diagnosis and develop a comprehensive treatment plan tailored to the individual patient's needs. Further work is required to elucidate a possible link to other associated lesions in certain patients.

ABSTRACT

Waiting lines, or queuing up, are a common occurrence. If clients are waiting a long time, queuing models can be a great assistance in figuring out how to run a system as efficiently as possible. This study aims to demonstrate the superiority of the multi-phase multiple-server queuing model over the single-phase single-server queuing model.

Keywords: Queuing, multi – phase, multiple – server, single – phase, single – server, M/M/1 model, M/M/Y model.

INTRODUCTION

Queueing theory is the mathematical study of waiting lines, or queues. A queueing model is constructed so that queue lengths and waiting time can be predicted. Queueing is an aspect of modern life that we encounter at every step in our daily activities. The analysis of queuing system and its variables has been focus of many studies and researches for many decades. Queueing theory is generally considered a branch of operations research because the results are often used when making business decisions about the resources needed to provide a service. Queueing theory examines every component of waiting in line to be served, including the arrival process, service process, number of servers, number of system places and the number of "customers" (which might be people, data packets, cars, etc.) Queueing theory attempts to solve problems based on a scientific understanding of the problems and

Bagavathi et al.,

solving them in optimal manner so that facilities are fully utilized and waiting time is reduced to minimum possible. Queuing theory models can recommend arrival of customers to be serviced, setting up of workstations, requirement of manpower etc. based on probability theory.

M/M/1 Queuing Model

The simplest queuing modal is M/M/1, where both the arrival time and service time are exponentially distributed. M/M/1 queuing system assume a Poisson arrival process. This assumption is very good approximation for arrival process in real system that meet the following rules.

- The number of customer in the system is very long.
- The impact of the single customer for the performance of the system is very huge, that is a single customer consumes a very huge percentage of system resources.
- All customers are independent. Their decision to use the system are independent of other users. This probability density distribution equation for a Poisson process describes the probability of seeing n arrivals in a period from 0 to t.vehicles, persons, and data packets, etc.) In order to maximise facility utilisation and minimise waiting times, queuing theory aims to address problems through an optimal approach centred around an academic comprehension of the issues. Based on probability theory, queuing theory models can suggest when clients should arrive to be served, how workstations should be set up, how much labour is needed, etc.

Model of M/M/1 Queuing

M/M/1 is the most basic queuing modal, in which the arrival and service times are exponentially distributed. Poisson arrival processes are assumed in M/M/1 queuing systems. If the following conditions are met, this assumption serves as a very excellent approximation for the arrival process in the real system. The system has a very large number of customers. The effect of having a single client for Because of the system's exceptional performance, a single consumer uses a colossal amount of system resources. Every customer is autonomous. They make their own decisions about using the system, separate from those of other users. The likelihood of witnessing n arrivals in a time from 0 to t is expressed by this Poisson process probability density distribution equation.

(a) Single-server case ($s = 1$) $\lambda_n = \lambda, \text{ for } n = 0, 1, 2, \dots$
 $\mu_n = \mu, \text{ for } n = 1, 2, \dots$

(b) Multiple-server case ($s > 1$) $\lambda_n = \lambda, \text{ for } n = 0, 1, 2, \dots$
 $\mu_n = \begin{cases} n\mu, & \text{for } n = 1, 2, \dots, s \\ s\mu, & \text{for } n = s, s + 1, \dots \end{cases}$

Let S denotes the customers count in the queuing system, hence the number of customers in the queue will be (S-1)

$$P_n(t) = \frac{\lambda t^n e^{-\lambda t}}{n!}$$

Bagavathi et al.,

Where t – is used to define the interval 0 to t

N - Total number of arrivals in the interval 0 to t

λ Mean arrival rate

μ → Mean service rate

$$= \frac{\lambda}{\mu}$$

ρ → Traffic intensity

$P_0 = 1 - \rho$;

$P_n = \rho^n (1 - P)$, $\rho < 1$, $n = 0, 1, 2, \dots$

working on the system the average number of customers will be (L_s)

$$L_s = \frac{\rho}{1 - \rho}$$

$$L_s = \frac{\lambda}{\mu - \lambda}$$

The number of customer in queue for minimizing will be

(L_q)

$$\begin{aligned} L_q &= L_s - \rho \\ &= L_s - \frac{\lambda}{\mu} \end{aligned}$$

(i.e., queue length)

The total waiting time of a customer to wait for the system (L_{ss})

$$W_s = \frac{1}{\lambda} L_s$$

The total waiting time for customer in overall view in the queue (W_{qs})

$$W_q = \frac{1}{\lambda} L_q$$

The average number of customers in the non-empty queues (W_{ss}) :

$$\begin{aligned} L_w &= \frac{L_q}{P(n > 1)} \\ &= \frac{L_q}{\rho^2} \\ &= \frac{1}{1 - \rho} \end{aligned}$$

3. M/ /s queuing model: (multi-phase multiple-server)

λ : The mean customers arrival rate

μ : The mean service rate

The average number of customers in the queue (L_{qs})

Bagavathi et al.,

$$L_{qs} = \frac{k + 1}{2k} \left(\frac{\lambda^2}{s\mu (s\mu - \lambda)} \right)$$

The average number of customers in the system (L_{ss})

$$L_{ss} = L_{qs} + (\lambda^2 / s \mu)$$

The average waiting time in the queue (w_{qs})

$$w_{qs} = L_{qs}$$

The average time spent in the system, including the waiting time in the queue (w_{ss})

$$w_{ss} = L_{qs} + (1 / s \mu)$$

(i) So, the number of customers waiting in the queue with multi-phase multiple-server is less comparing to single-phase single-server i.e., $L_{qs} \leq L_q$

$$L_{qs} \leq L_s - (\lambda / \mu) \dots\dots\dots(1)$$

We will prove the result by induction.

Let us prove the case for $s=1$ and $k=1$

Equation (1) becomes \leq

So, equation (1) works for $s=1$

Let us assume that the result holds for $s=q$

$$\frac{k + 1}{2k} \left(\frac{\lambda^2}{q\mu (q\mu - \lambda)} \right)$$

Also assuming $A =$

$$B = (\lambda / \mu)$$

$$A \leq L_s - B$$

$$A \leq (B / 1-B) - B$$

$$\frac{\lambda\mu - \lambda(\mu - \lambda)}{\mu(\mu - \lambda)}$$

$$\leq \frac{\lambda\mu - \lambda\mu + \lambda^2}{\mu(\mu - \lambda)}$$

$$\leq \frac{\lambda^2}{\mu(\mu - \lambda)}$$

$$A \leq \frac{\lambda^2}{\mu(\mu - \lambda)}$$

$$A \leq \frac{\lambda^2}{\mu(\mu - \lambda)}$$

$$A \leq \frac{\lambda^2}{\mu(\mu - \lambda)}$$

$$A \leq \frac{\lambda^2}{\mu(\mu - \lambda)}$$

We want to show that the result is true for $s=q+1$

$$\frac{k+1}{2k} \left(\frac{\lambda^2}{(q+1)\mu ((q+1)\mu - \lambda)} \right) \leq \frac{\lambda^2}{\mu(\mu - \lambda)} \dots\dots\dots(2)$$

Now, $q+1 > q$

$$(q+1)\mu > q\mu$$

$$(q+1) \mu - \lambda > q\mu - \lambda$$

$$(q+1) [(q+1) \mu - \lambda] > (q+1) (q\mu - \lambda)$$

$$> q(q\mu - \lambda)$$

$$\text{So, } (q+1)[(q+1) \mu - \lambda] > q(q\mu - \lambda)$$

Bagavathi et al.,

$$\frac{1}{(q + 1)[(q + 1)\mu - \lambda]} < \frac{1}{q(q\mu - \lambda)}$$

$$\frac{\lambda^2}{\mu} \left[\frac{1}{(q+1)[(q+1)\mu - \lambda]} \right] < \frac{\lambda^2}{\mu} \left[\frac{1}{q(q\mu - \lambda)} \right]$$

Equation (2) becomes,

$$\left(\frac{k+1}{2k}\right) \frac{\lambda^2}{\mu} \left[\frac{1}{(q+1)[(q+1)\mu - \lambda]} \right] \leq \frac{\lambda^2}{\mu} \left[\frac{1}{q(q\mu - \lambda)} \right]$$

which proves the result for $s = q + 1$

So, by mathematical induction,

$$\left(\frac{k+1}{2k}\right) \frac{\lambda^2}{\mu} \left[\frac{1}{s\mu[s\mu - \lambda]} \right] \leq \frac{\lambda^2}{\mu} \left[\frac{1}{(\mu - \lambda)} \right]$$

i.e., $L_{qs} \leq L_q$

(ii) Also we are showing that the number of customers waiting in the system to multi-phase multi-server is less compared to multi-phase single-server

i.e., $L_{ss} \leq L_s$

$$\text{i.e., } \frac{k+1}{2k} \left(\frac{\lambda^2}{s\mu(s\mu - \lambda)} \right) + \frac{\lambda}{s\mu} \leq \frac{\lambda}{\mu - \lambda} \dots\dots\dots(3)$$

We will prove the result by induction.

Let us prove the case for $s=1$

Equation (3) becomes $0 \leq 0$

So, equation (3) works for $s = 1$

Let us assume that the result holds for $s = q$ () $q \leq$

$$\frac{k + 1}{2k} \left(\frac{\lambda^2}{q\mu(q\mu - \lambda)} \right) + \frac{\lambda}{q\mu} \leq \frac{\lambda}{\mu - \lambda} \dots\dots\dots(4)$$

We want to show that the result is true for $s = q$

$$\frac{k + 1}{2k} \left(\frac{\lambda^2}{(q + 1)\mu((q + 1)\mu - \lambda)} \right) + \frac{\lambda}{(q + 1)\mu} \leq \frac{\lambda}{\mu - \lambda}$$

$$\frac{k + 1}{2k} \left(\frac{\lambda \cdot \lambda}{(q + 1)\mu((q + 1)\mu - \lambda)} \right) + \frac{\lambda}{(q + 1)\mu} \leq \frac{\lambda}{\mu - \lambda} \dots\dots(5)$$

Hence, $q+1 > q$

$(q+1)\mu > q\mu$

$(q+1)\mu - \lambda > q\mu - \lambda$

$(q+1)[(q+1)\mu - \lambda] > (q+1)(q\mu - \lambda)$

$> (q\mu - \lambda)$

So, $(q+1)[(q+1)\mu - \lambda] > q(q\mu - \lambda)$

$$\frac{1}{(q+1)[(q+1)\mu - \lambda]} < \frac{1}{q(q\mu - \lambda)}$$

Also, $(p + 1) > (\infty / \mu)$

$$\frac{\lambda}{\mu} \left[\frac{1}{(q+1)[(q+1)\mu - \lambda]} \right] < \frac{\lambda}{\mu} \left[\frac{1}{q(q\mu - \lambda)} \right] \dots\dots\dots(6)$$

Adding (6) and (7),

Bagavathi et al.,

$$(p + 1)\mu > \infty$$

$$\frac{1}{(p + 1)\mu} < \frac{1}{\infty}$$

$$\lambda \left[\frac{1}{(p+1)\mu} \right] < \lambda \left[\frac{1}{\infty} \right] \dots\dots\dots(7)$$

Equation (5) becomes, $\frac{k + 1}{2k} \left[\frac{\lambda^2}{(q + 1)\mu[(q + 1)\mu - \lambda]} \right] + \frac{\lambda}{\mu} \left[\frac{1}{p + 1} \right] < \frac{\lambda}{\mu} \left[\frac{1}{q(q\mu - \lambda)} \right] \dots\dots\dots(8)$

Using (5) and (8), the result is proved for $s = p + 1$
 Similarly, we can prove by induction that .

- (iii) The waiting time of customers in the queue in case of multiple server is less as compared to single server i.e., $W_{qs} \leq W_q$ and
- (iv) while comparing the waiting time of customers in the system in case of multiple server is less to single server i.e., $W_{ss} \leq W_s$

CONCLUSION

On above introduction and finding, we have shown that multiple-server multi-phase model is better than single-phase single-server model. The waiting time of the customers is less in the former as compared to the latter. Also, the number of customers waiting in the queue are also less in multi-phase multiple-server model.

ABSTRACT

This study investigates the incorporation of ChatGPT within Outcome-Based Education (OBE), emphasizing its effects on reading habits, challenges arising from independent student use, and strategies for responsible integration. Conducted among college students in Indore, the research reveals a widespread adoption of ChatGPT, prompting concerns regarding a potential decline in traditional reading practices and writing skills. The survey, employing a stratified random sampling method, gauges students' perceptions and usage patterns. Preliminary findings indicate that ChatGPT significantly influences reading habits, with implications for critical thinking skills within the OBE context. The study also identifies challenges associated with independent ChatGPT use and aims to propose solutions aligning with OBE objectives. Furthermore, the research explores ways to strategically integrate ChatGPT as a supplementary tool to traditional learning methods, fostering holistic skill development within the OBE framework. The insights gained from this research contribute to a nuanced understanding of the relationship between AI integration, educational practices, and student outcomes, offering valuable guidance for educators and policymakers navigating the evolving landscape of technology in education.

Punitha Andrews *et al.*,

Keywords: ChatGPT, Outcome-Based Education (OBE), Reading Habits, Independent Use, Integration, Students, Critical Thinking.

INTRODUCTION

The integration of advanced artificial intelligence, epitomized by models like ChatGPT, into educational environments necessitates a comprehensive exploration of its implications for conventional learning frameworks. This inquiry delves into the interplay between ChatGPT and Outcome-Based Education (OBE), unravelling the potential tension between technological progress and established pedagogical practices. As AI becomes increasingly ubiquitous in academic spheres, numerous inquiries surface regarding its profound influence on fundamental aspects such as reading behaviours, critical thinking capacities, and levels of student engagement. As AI becomes a ubiquitous presence in academic spheres, a multitude of inquiries surface regarding its profound influence on fundamental aspects such as reading behaviours, critical thinking capacities, and levels of student engagement. These inquiries, reflective of the concerns shared by educators and researchers alike, probe into the very fabric of educational dynamics: Can ChatGPT ever truly replicate the nuanced roles and interactions of a human teacher within the classroom environment? Are the outputs generated by ChatGPT, especially in the form of notes or explanations, sufficiently accurate and reliable to serve as foundational learning resources? How does the integration of AI technology like ChatGPT impact the development of students' critical thinking abilities, particularly if there is an overreliance on AI-generated responses instead of fostering deeper engagement with academic material? Moreover, ethical dilemmas surface regarding the ethicality of students heavily depending on ChatGPT for completing assignments, raising questions about the authenticity and integrity of their academic endeavours. Can ChatGPT indeed offer a superior platform for elucidating complex concepts when juxtaposed with traditional teaching methodologies, or does it potentially hinder deeper comprehension and engagement?

OBJECTIVES

1. Explore the influence of ChatGPT on students' reading behaviors within the framework of Outcome-Based Education (OBE).
2. Identify challenges in students' independent ChatGPT use.
3. Propose OBE-aligned solutions for responsible AI integration.
4. Examine the correlation between ChatGPT use and the decline in traditional reading and writing skills.
5. Provide actionable insights for educators and policymakers.

AI and Education

ChatGPT, or Chat Generative Pre-Trained Transformer, is an AI language model developed by OpenAI that caters to diverse student needs, particularly in degree programs and engineering disciplines. Through extensive pre-training on vast textual data, ChatGPT excels in generating human-like text for various academic tasks, such as crafting reports, summaries, and generating innovative ideas. It also aids in understanding complex subjects, offering explanations, insights, and illustrative examples. Beyond its text generation capabilities, ChatGPT becomes an invaluable companion for students seeking understanding in complex subjects, offering explanations, insights, and illustrative examples. Its collaborative features prove beneficial for group projects, fostering brainstorming and idea refinement. With a user-friendly interface, ChatGPT ensures accessibility for students across varying technical expertise levels, providing instant query assistance, aiding quick problem-solving, and contributing to improved writing skills. As a language learning tool, ChatGPT enhances the educational landscape, promoting inclusivity, time efficiency, adaptability as a personalized tutoring tool, and a collaborative environment that encourages curiosity and exploration. While seamlessly integrating with traditional educational methods, students are reminded to strike a balance, utilizing ChatGPT as a supplement rather than a substitute for time-tested educational approaches.

The growing dependence on ChatGPT and similar language models among students has raised concerns about its impact on their natural critical thinking abilities. Several detrimental effects have been observed

Punitha Andrews et al.,

Less or No Reading of Books

Students relying heavily on ChatGPT may forego reading books and academic materials, missing out on the in-depth knowledge and critical analysis that comes with traditional reading. This could lead to a superficial understanding of subjects.

Diminished Writing Skills

Overreliance on automated content generation may result in a decline in students' original writing skills. They might become less adept at formulating coherent arguments, structuring essays, and expressing ideas independently.

Loss of Critical Thinking

The ease of obtaining instant responses from ChatGPT might discourage students from engaging in critical thinking. The habit of relying on pre-generated content could undermine their ability to question, analyze, and evaluate information critically.

Laziness and Procrastination

The convenience of ChatGPT might contribute to student laziness, as they may opt for the quick solution rather than investing time and effort in thoughtful research and reflection. This could result in procrastination and a lack of initiative.

Poor Performance in Oral Presentations or Viva

Students excessively dependent on ChatGPT may struggle during oral presentations or viva voce assessments. Their ability to articulate ideas spontaneously and respond to queries may be hindered, affecting their overall performance in interactive assessments.

Lack of Accuracy

While ChatGPT can generate coherent text, it may lack accuracy, especially in specialized or technical subjects. Relying solely on its output without cross-referencing information from authoritative sources can lead to the incorporation of inaccuracies in academic work.

Decreased Interest in Teacher and Class Participation

Students addicted to ChatGPT may show diminished interest in engaging with teachers or participating actively in classroom discussions. The allure of instant answers from the model might overshadow the value of teacher-student interactions and classroom learning experiences.

Less Subject Knowledge and Technical Proficiency

Additionally, heavy reliance on ChatGPT may result in a lack of subject-specific knowledge, and students may miss out on developing practical skills, such as coding talent. The model might not equip them with the technical word power needed for specialized subjects, and they may struggle to explain complex content independently.

Outcome-Based Education (OBE)

Outcome-Based Education (OBE) represents a shift from traditional, teacher-centric instructional models to holistic, student-centric learning approaches. Accreditation bodies such as the National Assessment and Accreditation Council (NAAC) and the National Board of Accreditation (NBA) advocate for OBE principles to uphold global benchmarks of educational excellence. The structured implementation of OBE within Indian higher education institutions encompasses defining institutional and programmatic objectives, mapping course outcomes, and committing to continuous improvement through curriculum evaluations and revisions. Shifting our gaze to the realm of Indian higher education, we observe a similar transformative tide sweeping across academic institutions, underpinned by the adoption of Outcome-Based Education (OBE) principles as a means of standardizing educational processes and ensuring pedagogical quality. This profound paradigm shift, fueled by both domestic imperatives and the imperatives laid forth by international academic accreditation bodies, underscores a concerted effort to elevate

Punitha Andrews et al.,

the standards of education. Accreditation bodies such as the National Assessment and Accreditation Council (NAAC) and the National Board of Accreditation (NBA) advocate fervently for the widespread adoption of OBE principles, particularly within the realm of technical education, to uphold global benchmarks of educational excellence. At the heart of OBE lies a fundamental reimagining of educational frameworks, wherein the emphasis shifts decisively from traditional, teacher-centric instructional models to holistic, student-centric learning approaches. The structured implementation of OBE within Indian higher education institutions encompasses a myriad of meticulously defined processes, including the articulation of institutional and programmatic objectives, the mapping of course outcomes with broader programmatic goals, and an unwavering commitment to continuous improvement through iterative curriculum evaluations and revisions. This concerted shift towards OBE epitomizes a broader trend in educational discourse, symbolizing a departure from rote memorization and regurgitation towards fostering an environment conducive to nurturing critical thinking abilities, problem-solving acumen, and a profound spirit of inquiry among students.

METHODOLOGY

This research investigates ChatGPT's impact on students in Indore across engineering, bachelor's, and master's degree programs. Using a stratified random sampling method, we ensured representation from each academic level. A structured questionnaire addressed ChatGPT usage, benefits, challenges, and overall impact on academic tasks. Online surveys gathered responses for quantitative analysis through descriptive statistics and cross-tabulations, complemented by qualitative analysis through thematic content analysis of open-ended responses. Survey Analysis

ChatGPT Usage Patterns

The survey revealed varied usage patterns of AI tools among students. A significant portion (41.5%) indicated using AI tools like ChatGPT sometimes, while 23.4% reported often using them. A notable 24.3% mentioned rarely using AI tools, and a smaller proportion (11.4%) stated always using them. This distribution illustrates diverse incorporation of AI tools into students' academic workflows, influenced by individual preferences, task requirements, and the perceived effectiveness of AI assistance.

Moderate to High Adoption

The combined percentage of respondents who use AI tools either sometimes or often is substantial at 65%. This signifies a prevalent adoption of AI tools like ChatGPT among students for various academic tasks.

Varied Usage Patterns

The distribution across different usage frequencies—sometimes, often, rarely, always—illustrates the diverse ways students incorporate AI tools into their academic workflow. This diversity might be influenced by individual preferences, task requirements, or the perceived effectiveness of AI assistance.

Engineering Dominance

The conclusion drawn from the survey data indicates that a significant majority, approximately 75%, of engineering students reported using ChatGPT. This highlights a higher adoption rate in the engineering domain compared to degree students.

Impact on Writing Skills

Regarding writing skills, 38.6% of respondents reported improvement, while 50.4% felt their skills stayed the same. However, 8.3% indicated their writing skills worsened slightly, and a smaller percentage reported a significant decline. This raises concerns about the potential drawbacks of overreliance on ChatGPT, suggesting that while some students benefit, others may not develop foundational skills crucial for independent, critical thinking, and effective communication.

Punitha Andrews et al.,

The online survey results present a nuanced perspective on the impact of automated content generation, particularly ChatGPT, on students' writing skills. While a substantial 51.4% of respondents reported an improvement, suggesting perceived benefits from using such tools, a noteworthy 36.4% felt their writing skills stayed the same. This group may have found ChatGPT to be a helpful complement without necessarily enhancing their skills. However, the concern arises with the 8.3% who indicated that their writing skills got a bit worse, and the remaining percentage that reported a significant decline. The data raises questions about the potential drawbacks of overreliance on ChatGPT. The responses hint at a scenario where students might be leveraging the tool for immediate improvements in their writing, possibly to score better marks, but not necessarily developing the foundational skills crucial for independent, critical thinking and effective communication. The conclusion drawn is that while ChatGPT may offer short-term advantages, there is a risk of it resembling a form of "spoon-feeding." If students predominantly use such tools to generate content without actively engaging in the critical thinking and independent expression required in original writing, it may not contribute to the broader goal of preparing them for the world of work. The emphasis on scoring marks may overshadow the development of essential skills needed for real-world applications, such as formulating independent ideas, constructing coherent arguments, and expressing thoughts with originality. Striking a balance between utilizing technology as a tool and fostering foundational skills remains crucial to ensuring a comprehensive educational experience.

Reading Habits

Survey responses indicated a potential shift away from traditional reading methods, with 25.6% of students acknowledging a reduction in their reading habits—10.5% reporting a significant decrease and 15.1% a slight decrease. In contrast, 39.7% expressed no change in their reading habits, while 34.7% claimed to read more since using ChatGPT. This trend suggests a nuanced approach, with some students utilizing ChatGPT as a supplementary aid alongside regular reading practices. The survey delved into students' perceptions of ChatGPT, revealing intriguing insights into its influence on reading habits and preferred applications. Notably, 14% of respondents find the AI most helpful for crafting answers, emphasizing its role in written tasks. Another 14% specifically utilize it for writing assignments, highlighting its contribution to academic writing. A significant 46% of students marked 'all of the above,' suggesting a widespread reliance on ChatGPT across various academic tasks. This underscores its versatility and utility in addressing diverse needs, from writing to understanding complex topics. However, the survey also indicated potential drawbacks. The concern about a decline in reading habits is substantiated by the respondents' preferences. The percentage of students who emphasized using ChatGPT for "understanding a tricky topic" signals a reliance on the model for comprehension rather than traditional reading methods. This trend raises questions about the depth of knowledge acquired and the potential for a more superficial understanding of subjects. In conclusion, while ChatGPT proves invaluable for various academic tasks according to the survey, there is a discernible shift away from traditional reading methods. The challenge lies in striking a balance, ensuring that the convenience of AI does not compromise the depth of understanding and critical analysis derived from traditional reading practices.

Critical Thinking and Procrastination

The survey highlighted concerns about ChatGPT's impact on critical thinking skills. While 43.2% of respondents reported no impact, 37.1% acknowledged a slight negative impact, and 17% indicated a positive influence. This suggests a mixed perspective, with some students benefiting from AI assistance while others might experience diminished independent thought processes. Insights from the survey examining the impact of ChatGPT on thinking skills provide a nuanced understanding of users' perspectives

Positive Impact

A notable 35% of respondents indicated that ChatGPT has positively influenced their thinking skills. This suggests that, for a substantial portion of users, the tool contributes constructively to cognitive processes and problem-solving.

Punitha Andrews *et al.*,

Neutral Stance

The majority, comprising 43.9%, reported no observable impact on their thinking skills. This implies that, for a significant number of users, ChatGPT fulfills a specific purpose without causing significant changes to their cognitive approaches.

Negative Perceptions

About 15.9% of respondents acknowledged a negative impact on their thinking skills, either slightly or significantly. This raises concerns about potential drawbacks associated with excessive reliance on ChatGPT, potentially hindering independent thinking, critical analysis, or creative problem-solving.

Balanced Technology Integration

The findings underscore the importance of a balanced approach to integrating technology in education. While ChatGPT offers valuable assistance, it is crucial to approach its usage with prudence and caution to prevent potential pitfalls. Viewing AI tools as supplementary aids rather than replacements for independent thinking remains pivotal. Potential Drawbacks: Responses indicating a negative impact on thinking skills prompt reflections on the broader consequences of sustained reliance on AI tools. Overreliance on pre-generated answers could contribute to diminishing independent thought processes, critical analysis, and creative problem-solving skills.

Future Considerations

The survey suggests that continued reliance on AI tools like ChatGPT might shape thinking skills, influencing cognitive approaches. This poses considerations for educators, policymakers, and technology developers to ensure that AI advancements align with educational goals, nurturing cognitive development rather than impeding it. ChatGPT exhibits positive impacts on thinking skills for some users, the survey underscores the need for ongoing vigilance and awareness regarding potential negative consequences. Striking a balance between leveraging technology for efficiency and preserving fundamental cognitive processes is essential for fostering a well-rounded and adaptable generation. Regarding procrastination, 77.5% of respondents expressed concerns that overreliance on ChatGPT could lead to procrastination. This sentiment suggests that while ChatGPT offers efficiency gains, it may inadvertently encourage task postponement, emphasizing the need for responsible AI tool usage. Insights garnered from the survey probing into the impact of heavy reliance on ChatGPT on procrastination tendencies provide a nuanced understanding of users' perspectives

Alignment with Procrastination Concerns

A substantial 77.5% of respondents, comprising those who strongly agree and agree, express apprehensions about the possibility of depending too much on ChatGPT leading to procrastination. This prevalent sentiment among users suggests a collective concern that overreliance on the tool may contribute to delaying tasks or postponing responsibilities.

Divergence in Procrastination Perceptions

Conversely, a noteworthy 16.8% of respondents disagree with the notion that relying on ChatGPT could induce procrastination. While this group constitutes a minority, it signals that there are users who perceive ChatGPT as a tool that does not necessarily promote procrastination in their academic or professional endeavors.

Navigating Efficiency and Procrastination

The survey findings unveil a dichotomy in user perspectives, emphasizing the need for a nuanced understanding of how individuals balance the efficiency gains offered by AI tools like ChatGPT while managing potential procrastination tendencies.

Punitha Andrews et al.,

Boon or Bane

The analysis suggests that the impact of ChatGPT on procrastination tendencies is intricate and varies among users. It can be seen as a boon for efficiency, facilitating quick content generation. However, users must exercise discernment to prevent it from becoming a blessing turned curse by inadvertently encouraging procrastination.

Educational Guidance

The survey underscores the significance of incorporating educational guidance on the optimal utilization of ChatGPT. Striking a balance between leveraging its advantages and avoiding potential pitfalls, such as procrastination, is crucial. Both educators and users should be mindful of cultivating responsible and disciplined usage of AI tools to ensure positive outcomes. While ChatGPT offers efficiency gains, the survey highlights legitimate concerns about its potential role in procrastination. Effectively managing the nuanced relationship between ChatGPT and procrastination necessitates careful consideration and guidance to maximize its benefits responsibly.

Balancing AI Integration and OBE Goals

The integration of ChatGPT into educational settings poses significant questions about its alignment with OBE goals. At the core of OBE is a student-centered approach prioritizing specific, measurable learning outcomes. As ChatGPT becomes a prominent tool in academic life, concerns arise regarding its influence on fundamental aspects such as reading habits, critical thinking, and participatory engagement. The survey results indicate a potential shift away from traditional reading methods, with students relying on ChatGPT for comprehension rather than in-depth reading, posing challenges to the depth of knowledge acquisition and critical analysis. This prompts a critical examination of how ChatGPT aligns with the foundational principles of OBE, particularly in fostering independent thinking and holistic skill development.

Exploring the Impact of ChatGPT on Achieving OBE Goals

The integration of ChatGPT into educational settings raises significant questions about its impact on the goals of Outcome-Based Education (OBE). At the core of OBE is a student-centered approach that prioritizes specific, measurable learning outcomes over traditional content-centric models. As ChatGPT becomes a prominent tool in academic life, concerns arise regarding its potential influence on fundamental aspects of OBE, including reading habits, critical thinking, and participatory engagement. The survey results indicate a potential shift away from traditional reading methods, with students relying on ChatGPT for comprehension rather than in-depth reading, posing challenges to the depth of knowledge acquisition and critical analysis. This prompts a critical examination of how ChatGPT aligns with the foundational principles of OBE, particularly in fostering independent thinking and holistic skill development. Moreover, the study delves into the independent use of ChatGPT by students without educator involvement or awareness. The findings highlight concerns about potential misuse, unintended consequences, and the risk of overreliance on automated assistance. These aspects add a layer of complexity to the integration process, questioning the impact on teacher-student interaction, creative problem-solving skills, and the overall alignment with OBE objectives. Striking a balance between the benefits of AI tools like ChatGPT and the preservation of OBE goals becomes imperative for educators, policymakers, and technology developers.

Independent Use and Ethical Considerations

Independent use of ChatGPT by students without educator involvement or awareness introduces a layer of complexity to the integration process. Ethical considerations loom large, as the potential ramifications of students autonomously employing AI tools without appropriate guidance emerge as a pressing concern. The research underscores the necessity for a nuanced examination of the phenomenon, addressing concerns regarding the potential consequences of excessive reliance on AI tools. This investigation navigates through the labyrinth of concerns arising from students' independent utilization of ChatGPT without the direct oversight or guidance of educators, introducing a layer of complexity to the integration process. Ethical considerations loom large, as the potential ramifications of students autonomously employing AI tools without appropriate guidance emerge as a pressing concern. The prospect of superficial understanding replacing comprehensive comprehension underscores the necessity for a nuanced examination of the phenomenon. In addition to scrutinizing the impact of ChatGPT on

Punitha Andrews et al.,

reading habits and comprehension levels, this study meticulously addresses concerns regarding the potential consequences of excessive reliance on AI tools, including the potential erosion of teacher-student interactions and the subsequent impact on students' creative problem-solving aptitudes. Critically, the research does not merely aim to identify potential negative ramifications but aspires to proffer comprehensive strategies for the responsible integration of ChatGPT within the broader framework of Outcome-Based Education. By exploring the feasibility of ChatGPT offering personalized feedback, fostering independent learning trajectories, and aligning seamlessly with the overarching goals of OBE, this inquiry seeks to chart a path toward a more enriched and dynamic educational milieu. Through the cultivation of collaborative learning environments, the promotion of critical thinking competencies, and the strategic alignment of AI tools with educational objectives, educators endeavor to ensure that the incorporation of ChatGPT contributes positively to the ever-evolving educational landscape, ushering in a new era of student-centric learning paradigms.

Proposed Strategies for Responsible Integration

To mitigate the observed drawbacks, the research proposes strategies for responsible integration within the OBE framework

Balanced Integration

Guide students to use ChatGPT as a supplement, not a substitute, for traditional learning. Ensure AI tools enhance learning without compromising essential skills like reading, critical thinking, and independent writing.

Promote Critical Thinking

Design assignments fostering independent analysis, problem-solving, and creative thinking alongside ChatGPT use. Encourage discussions and collaborative activities for holistic cognitive skill development.

Guidance on Limitations

Educate students on AI tool limitations, emphasizing cross-referencing from authoritative sources. Instill responsibility for verifying information accuracy, particularly in technical subjects.

Develop Writing Skills

Design writing exercises to promote original thinking, coherent argumentation, and independent expression. Ensure ChatGPT complements, not overshadows, foundational writing skills.

Proactive Monitoring

Establish systems to monitor AI tool usage, intervening when signs of overreliance emerge. Identify decreased interest in reading, writing, or diminished teacher-student interactions and guide students back to balanced technology use.

Incorporate Ethics

Integrate discussions on ethical AI use. Prompt students to consider the ethical implications of automated assistance, fostering a culture of responsible technology usage.

Professional Development

Provide ongoing professional development for educators on AI and educational technology. Equip teachers with skills to integrate AI tools effectively while prioritizing holistic educational goals.

Implementing these strategies ensures responsible integration of ChatGPT, enriching educational experiences within the Outcome-Based Education framework.

Punitha Andrews et al.,

CONCLUSION

This study sheds light on the multifaceted impact of ChatGPT on students within the context of Outcome-Based Education (OBE). The research reveals a nuanced relationship between the adoption of ChatGPT and potential challenges, including a shift in reading habits, concerns about diminished critical thinking, and the risk of overreliance on automated assistance. By exploring these dynamics, educators and policymakers gain valuable insights into the complexities of integrating AI tools into educational settings and the necessity of balancing technological advancements with the preservation of fundamental learning skills. Moving forward, responsible integration strategies are crucial to ensure that ChatGPT aligns with the goals of OBE. Encouraging a balanced approach, where ChatGPT serves as a supplementary tool rather than a substitute for traditional learning methods, is essential. By promoting critical thinking, addressing writing skill concerns, and incorporating ethical considerations, educators can guide students in leveraging AI responsibly. This study contributes actionable recommendations to navigate the evolving landscape of technology in education, fostering a dynamic and holistic learning environment within the framework of Outcome-Based Education.

ACKNOWLEDGEMENTS

I extend my deepest gratitude to a constellation of individuals whose support was instrumental in the development and fruition of this research paper. Foremost among them is my son, Iniyan Andrews, whose enlightening discourse on ChatGPT ignited my interest and propelled me into the depths of this intriguing subject. Equally, I am indebted to my AIML-2 students at AITR, especially Rachit Upadhyay and [Student Name 3], whose introductions to ChatGPT's practicalities and their enduring patience and insight vastly expanded my comprehension. The engagement and contribution of all students who participated in our survey were crucial, offering the data that significantly enhanced our study's outcomes. I am thankful to the AFMR Quality Assurance Cell for the enlightening Workshop on Outcome-Based Education held on 23rd December, which broadened my understanding of outcome-based education principles. This paper stands as a testament to the collaborative spirit and the wealth of knowledge and inspiration shared by everyone involved, for which I am profoundly thankful.

ABSTRACT

Climate change has emerged as a critical factor influencing global tourism patterns, with cultural tourism being particularly vulnerable to its impacts. This study examines the influence of climate change on cultural tourism in Salem District, Tamil Nadu, focusing on shifts in visitor behaviour, seasonality, and the resilience of tourism infrastructure. Using climatic data, GIS mapping, and surveys of tourist preferences, the research analyses how rising temperatures, altered rainfall patterns, and extreme weather events affect Salem's cultural heritage sites. The study also evaluates the environmental degradation of landscapes surrounding key destinations and its implications for sustainable tourism. By identifying vulnerabilities and adaptive strategies, this research aims to provide a framework for policymakers and stakeholders to mitigate climate-related risks and promote eco-friendly tourism practices.

Keywords: Climate Change, Cultural Tourism, Salem District, Sustainable Tourism, GIS Mapping

INTRODUCTION

Climate change is one of the most pressing challenges of the 21st century, influencing ecosystems, economies, and human activities globally. Among the various sectors affected, tourism—particularly cultural tourism—stands out as

Prema and Rajeshwari

both vulnerable to and influential on environmental changes. Cultural tourism, which revolves around the exploration of heritage, traditions, art, and monuments, is deeply tied to specific locations and their environmental conditions. In this context, Salem District in Tamil Nadu, with its rich history, cultural heritage, and unique geographical features, provides an ideal case study for understanding the intricate relationship between climate change and cultural tourism.[1] Salem District is home to several cultural and historical sites, including ancient temples, architectural marvels, and vibrant festivals that attract tourists throughout the year. However, the region's tourism dynamics are increasingly being influenced by climate variability. Rising temperatures, irregular rainfall, and the growing frequency of extreme weather events are altering the tourism seasonality, visitor preferences, and the resilience of the tourism industry. These climatic changes not only impact the visitor experience but also threaten the preservation of Salem's cultural heritage, as many sites are exposed to environmental degradation over time. The tourism sector in Salem District is highly seasonal, with peak visitation often coinciding with favourable weather conditions during winter and post-monsoon months. However, the rising unpredictability of climatic patterns has disrupted these trends, with tourists showing reluctance to travel during prolonged heatwaves or erratic monsoons. Furthermore, extreme weather events such as cyclones or floods pose significant risks to tourism infrastructure, including accessibility to cultural sites, safety of visitors, and the overall sustainability of tourism activities in the region.[2] The impact of climate change is not limited to environmental factors. Visitor behaviours and preferences are also evolving in response to climate-related challenges. Tourists are increasingly opting for destinations that are perceived as climate-resilient or offer eco-friendly experiences. This shift necessitates the adoption of sustainable tourism practices and the integration of climate resilience into planning and management strategies for Salem's cultural tourism sector. In this study, we aim to explore the multifaceted influence of climate change on cultural tourism in Salem District. Using scientific tools such as Geographic Information Systems (GIS) for spatial analysis and climate data modelling, the research examines how temperature fluctuations, rainfall variability, and extreme weather events are reshaping the tourism landscape. Surveys and interviews with stakeholders, including tourists, local communities, and policymakers, provide valuable insights into the social and economic dimensions of these changes.

Research Objectives

The primary objective of this research is to examine the impact of climate change on cultural tourism in Salem District, Tamil Nadu. It aims to analyse how climatic factors such as temperature, rainfall variability, and extreme weather events influence tourism patterns, infrastructure, and visitor behaviour, while proposing sustainable strategies to enhance climate resilience in the region.

METHODOLOGY

The present study employs quantitative and qualitative techniques. Climatic data analysis and GIS mapping are used to assess environmental changes and their spatial impact on tourism sites. Surveys and interviews with tourists, local stakeholders, and policymakers provide insights into behavioural shifts and adaptive strategies. The findings inform sustainable tourism development in Salem District.

FINDINGS AND DISCUSSIONS

The changing climate in Salem District, Tamil Nadu, has had a significant impact on the seasonality of cultural tourism. Traditionally, Salem has attracted tourists during the cooler months, particularly from November to February, when the weather is most pleasant. However, rising temperatures and changing precipitation patterns have disrupted this predictable seasonality, with far-reaching consequences for both tourism and the local economy.[3] Data from the India Meteorological Department (IMD) reveals a steady increase in the district's average annual temperature, rising by 1.2°C from 2000 to 2022. This rise in temperature, coupled with more frequent and severe heatwaves, particularly during the summer months, has led to a decrease in tourists visiting during peak seasons. The number of heatwave days has more than doubled in recent years, making the climate increasingly

**Prema and Rajeshwari**

uncomfortable for visitors, especially those attending outdoor festivals and cultural events. The decline in footfall has been most noticeable during summer, when previously popular events, such as the *Aadi Perukku* festival, now see fewer attendees. This increase in temperature directly correlates with a drop in tourism during the summer months, a period that once attracted a steady flow of visitors to Salem's cultural events. Although some argue that indoor cultural events or evening tourism could mitigate the effects of heatwaves, this does not replicate the broader tourism experience tied to the region's heritage sites, which are primarily outdoor. Rainfall patterns in the region have also become more erratic, with the monsoon season increasingly delayed and shortened, affecting the predictability of seasonal events. For instance, while the monsoon traditionally began in June and lasted until September, recent years have seen delayed rains, which alter the timing of festivals such as the *Kolli Hills Festival*. The unpredictable rains also result in waterlogging and damage to heritage sites, further deterring tourists from visiting. These changing precipitation patterns have led to the cancellation of cultural festivals and the closure of outdoor heritage sites due to waterlogging and damage. For example, in 2022, the *Kolli Hills Festival* was cancelled because of unexpected rainfall, impacting both tourism revenue and the visibility of Salem's rich cultural practices. The irregular monsoon has also led to a reduction in the attractiveness of these festivals, as tourists increasingly avoid destinations with unpredictable weather patterns.[4] The economic consequences of these shifts in seasonality are significant. Local businesses reliant on tourism, including hospitality services, artisanal crafts, and vendors, face reduced revenue during peak months. Furthermore, as fewer tourists attend the cultural festivals and heritage events, the cultural identity of Salem, deeply tied to these practices, also faces erosion. While some suggest that the region could diversify its tourism offerings to include monsoon tourism, this approach does not adequately address the infrastructural and environmental challenges posed by the altered weather patterns. Heavy rainfall and waterlogging damage heritage sites, while the uncertainty of weather during the monsoon further discourages tourism.[5] The vulnerability of tourism-related infrastructure to extreme weather events, driven by climate change, is becoming increasingly apparent. Across the globe, climate change has led to more intense and frequent extreme weather events, including storms, floods, heatwaves, and droughts. These events not only disrupt the tourism industry but also place immense pressure on the infrastructure that sustains it—hotels, roads, transport networks, cultural heritage sites, and recreational facilities. As extreme weather events become more prevalent, it is vital to assess the risks these events pose to tourism infrastructure and the broader implications for economies reliant on tourism.

The physical vulnerability of tourism infrastructure is particularly concerning when considering the potential for damage from storms and floods. Coastal and low-lying regions, where tourism is a major economic activity, are particularly at risk. In areas prone to flooding, infrastructure such as hotels, resorts, and transport systems are highly susceptible to inundation, leading to significant financial losses. For instance, in regions like the Caribbean or Southeast Asia, frequent hurricanes and storms have caused the closure of tourism facilities for extended periods, disrupting local economies. When infrastructure is damaged, the recovery process is often slow and costly, affecting the entire tourism value chain, from local businesses to large multinational companies.[6] Similarly, extreme heatwaves and temperature fluctuations can wreak havoc on infrastructure designed for moderate climates. In desert and subtropical regions, where tourism activities such as desert safaris or cultural tours are common, the increase in temperature can cause severe damage to roads, heritage sites, and even recreational areas. Cultural heritage sites, in particular, are at risk from rising temperatures and the accompanying risk of erosion and material degradation. The damage to such sites is not merely a loss of physical structure but also a blow to the cultural identity and tourism appeal of the region. For instance, UNESCO World Heritage sites in regions like Europe and the Middle East have faced increased vulnerability due to prolonged heatwaves, leading to cracks, fading, and irreversible deterioration of important structures.[7] The lack of climate-resilient infrastructure further exacerbates the vulnerability of tourism-related facilities. Many tourist destinations, especially in developing countries, have invested insufficiently in adaptive infrastructure that can withstand extreme weather events. Short-term, reactive measures, such as patching up damage after an event, have proven inadequate in addressing long-term risks. In contrast, regions that have adopted proactive, climate-resilient infrastructure strategies—such as reinforced buildings, advanced drainage systems, and protective coastal barriers—have shown greater resilience. However, these strategies are often expensive and require long-term planning, which is not always available in financially constrained regions.[8]

**Prema and Rajeshwari**

Moreover, extreme weather events often result in changes to tourist patterns, which indirectly impacts tourism infrastructure. For example, after a major flood or heatwave, the seasonality of tourism can shift, with certain months becoming too hazardous for visitors. The reduction in footfall during traditionally busy periods has a direct impact on the financial viability of tourism infrastructure. This reduction in revenues, coupled with the increased costs of maintaining and repairing damaged infrastructure, can lead to financial strain on the businesses that rely on tourism. In the long run, this can create a cycle of underinvestment, as tourism businesses struggle to cope with both reduced income and the escalating costs of adapting to climate change.

Visitor Preferences and Behaviours

Historically, Salem attracted tourists during the cooler months, from November to February, when the weather was ideal for outdoor activities, including visits to cultural landmarks such as temples, festivals, and hill stations. However, the rise in temperature, particularly in the summer months, has led to a decline in the number of visitors during peak seasons. According to recent climate data, Salem has experienced a steady increase in average annual temperatures, which has led to discomfort for tourists engaging in outdoor cultural experiences. A case in point is the annual *Kolli Hills Festival*, which used to attract thousands of visitors but now sees fewer tourists during the summer due to extreme heat.[9] This decline in footfall during the hot months suggests a clear shift in visitor behaviour: tourists are less likely to participate in outdoor activities when temperatures soar. Additionally, the rise in climate-related disruptions, such as erratic rainfall and floods, has led to cancellations of several festivals and events that depend on good weather. The Kolli Hills Festival, for example, was cancelled in 2022 due to unexpected monsoon rains, significantly reducing visitor numbers during that period.[10] Beyond the direct impact of climate change on tourism seasonality, shifts in visitor preferences are also observable. Increasingly, tourists are seeking destinations with better climate adaptability, favouring indoor or low-impact experiences. This change in preference has led to a rise in demand for indoor museums, art galleries, and historical exhibits over open-air cultural sites. Consequently, cultural sites in Salem that focus on outdoor experiences, such as the *Aadi Perukku* festival or temple visits, have seen a decline in attendance, while indoor attractions have grown in popularity.

This shift can also be attributed to changing tourist priorities, with many preferring destinations that offer more climate-controlled environments, such as air-conditioned spaces, or experiences that are less affected by weather disruptions. Additionally, tourists are increasingly concerned about sustainability and are opting for destinations that have made efforts to adapt to climate change. Salem's cultural sites, which have been largely outdoor-based, are struggling to meet these changing preferences. Another aspect of this shift is the growing demand for sustainable tourism experiences. As tourists become more aware of the environmental impacts of climate change, they are looking for destinations that offer eco-friendly practices, such as sustainable transportation options, green accommodations, and responsible waste management. This shift is especially important for destinations like Salem, where the tourism industry is heavily reliant on its natural and cultural assets. Visitors now expect tourism businesses to show a commitment to sustainability, and Salem's tourism infrastructure needs to evolve to accommodate these expectations.[11] The shift in visitor behaviour is not only driven by discomfort but also by a heightened awareness of climate change's long-term impact on heritage sites. Tourists are increasingly concerned about the preservation of cultural landmarks in the face of climate-related threats such as erosion, floods, and temperature-induced degradation. Cultural sites that are susceptible to such risks, such as the ancient temples or historic monuments in Salem, are at risk of losing tourist interest if they are not adequately preserved or protected from environmental damage. The impact of climate change on natural landscapes surrounding key cultural tourism destinations is increasingly evident and poses a significant challenge to tourism sustainability. In Salem, Tamil Nadu, the region's cultural sites are often located in close proximity to sensitive natural landscapes such as hills, forests, and rivers. These areas are vulnerable to a variety of climate change-induced threats, including rising temperatures, altered rainfall patterns, and increased frequency of extreme weather events. The ability to map and monitor these changes using Geographic Information Systems (GIS) and remote sensing technologies is crucial in understanding their effects on tourism and informing appropriate mitigation and adaptation strategies.[12] GIS and remote sensing provide powerful tools for monitoring environmental changes over time. These technologies enable the collection and analysis of large-scale spatial data, offering insights into the dynamics of natural landscapes that are not easily

**Prema and Rajeshwari**

visible through traditional methods. For instance, GIS can be used to map changes in vegetation cover, land use patterns, and the extent of water bodies in areas surrounding tourism sites, while remote sensing allows for the tracking of environmental changes at both local and regional scales. By integrating these tools, it becomes possible to monitor the gradual or sudden alterations of the natural landscape that may threaten the attractiveness of cultural destinations. One example of the application of GIS and remote sensing in monitoring climate-induced changes is the assessment of soil erosion and vegetation loss in the Kolli Hills, a key tourism destination in Salem. Remote sensing satellite imagery can be used to track the extent of vegetation cover and soil erosion over time, while GIS tools can overlay this data with tourist visitation trends. Such monitoring would highlight whether the degradation of natural landscapes due to climate factors—such as heavy rainfall or drought—has any correlation with the decline in tourism. A hypothetical example could be as follows: This table illustrates a potential link between the increased loss of vegetation (due to factors like altered rainfall patterns) and a decline in the number of tourists visiting Kolli Hills, highlighting the importance of monitoring environmental changes. Another critical area for GIS and remote sensing application is the monitoring of water bodies, such as rivers and lakes, which are integral to the natural landscapes surrounding cultural tourism sites. Climate change-induced variations in rainfall and temperature can lead to changes in water levels, either through flooding or droughts. For instance, the Mettur Dam in Salem, a major source of water for the region, has experienced fluctuating water levels in recent years. Satellite imagery can be used to monitor changes in water levels and their potential impact on nearby cultural sites, including temples and recreational areas. Through GIS, it is possible to identify areas that are at risk of flooding and the potential displacement of tourism infrastructure.[13] GIS and remote sensing can be used to model future climate scenarios, allowing stakeholders to anticipate the long-term effects of climate change on natural landscapes. These models can simulate how changes in temperature, rainfall, and sea levels may affect areas of interest, providing decision-makers with the data needed to plan for the future. For instance, GIS can help identify areas that are likely to be submerged or severely impacted by rising water levels, giving tourism planners the opportunity to implement protective measures for key cultural sites before damage occurs. Integrating climate data with tourism information can facilitate the identification of at-risk regions where natural disasters, such as floods or heatwaves, are predicted to increase. This can be crucial for developing early warning systems and risk management strategies that mitigate the impact of extreme weather events on both the natural landscape and tourism infrastructure. The integration of climate change data with tourism monitoring offers another advantage: it enables a proactive approach to sustainable tourism management. By using GIS and remote sensing, tourism authorities can identify areas where climate change is exacerbating environmental degradation and take steps to adapt. This might involve developing climate-resilient infrastructure, implementing sustainable tourism practices, or shifting tourism activities away from vulnerable regions. For instance, if an area is predicted to experience increased flooding due to climate change, tourism activities can be reoriented to safer areas, or flood-prevention measures can be implemented in advance.[14]

Strategies for Promotion

The adverse effects of climate change are becoming increasingly evident across the world, and Salem District in Tamil Nadu is no exception. As the region's natural landscapes and cultural heritage sites face threats from climate change, it becomes imperative to develop adaptive strategies and sustainable practices that ensure the continued viability of cultural tourism. These strategies must not only address the environmental impact but also balance the economic and social aspects of tourism development. This approach requires a holistic perspective, focusing on long-term sustainability and resilience.[15] One of the primary impacts of climate change on cultural tourism in Salem is the alteration of seasonal patterns. Rising temperatures, erratic rainfall, and extreme weather events, such as floods and droughts, have led to shifts in tourist visitation trends. Key cultural landmarks, such as temples, festivals, and natural landscapes like the Kolli Hills, are vulnerable to these changes. To mitigate these effects, one adaptive strategy involves adjusting tourism seasons to align with more stable climatic conditions. For example, instead of relying on peak seasons that are becoming increasingly unpredictable, tourism campaigns can be tailored to off-peak months where the weather is more conducive to outdoor activities. A potential strategy could be promoting indoor cultural experiences, such as museum tours or art exhibitions, during the hotter months when outdoor tourism is less viable. This table suggests a potential shift in visitor numbers as tourism adapts to changing climate patterns. By promoting indoor attractions or climate-resilient infrastructure, it is possible to mitigate the impacts of extreme

**Prema and Rajeshwari**

weather on tourism. Another important adaptive strategy is the improvement of infrastructure resilience. As extreme weather events become more frequent, the existing tourism infrastructure in Salem, including roads, visitor centres, and cultural sites, must be made more resilient to these challenges. This could involve the construction of flood-resistant buildings, the fortification of key heritage sites against temperature fluctuations, and the enhancement of drainage systems to prevent damage during heavy rains. Additionally, promoting eco-friendly practices, such as rainwater harvesting and solar-powered facilities, can reduce the environmental footprint of tourism operations while also making the infrastructure more climate-resilient.[16] For example, Salem's tourism authorities could invest in creating green, climate-adaptive hotels and tourism facilities. These facilities would utilise energy-efficient technologies, such as solar panels and rainwater collection systems, which would help mitigate the negative effects of climate change while also promoting sustainability. Moreover, promoting the use of eco-friendly transport options, such as electric vehicles or bicycles, for tourists visiting key cultural sites could reduce the carbon footprint associated with travel. This table outlines potential adaptive strategies for tourism infrastructure that could address the impacts of climate change. An additional, crucial strategy for mitigating the effects of climate change on cultural tourism is the promotion of sustainable tourism practices. These practices aim to reduce the negative environmental impact of tourism while also promoting the conservation of cultural heritage sites. Sustainable tourism can be achieved through various means, such as educating tourists on the importance of preserving natural and cultural resources, regulating visitor numbers, and establishing responsible tourism policies.[17] For instance, visitor management strategies can be implemented to ensure that tourist numbers do not overwhelm certain sites, thereby reducing wear and tear on cultural landmarks. One way to achieve this could be through the implementation of booking systems that limit the number of visitors to sensitive sites during peak seasons or adverse weather conditions. This would help to preserve the sites and reduce the environmental strain caused by over-tourism. The introduction of community-based tourism initiatives could ensure that the local population benefits from tourism activities in a sustainable manner. By encouraging tourists to engage with local crafts, traditions, and foods, tourism can help promote environmental awareness and generate income for local communities, thereby reducing reliance on environmentally harmful practices. The collaborative efforts among government agencies, local communities, and the private sector will be essential for implementing these strategies. Government agencies should develop policies and frameworks that support sustainable tourism, while the private sector must invest in climate-resilient infrastructure and eco-friendly practices. Local communities should be involved in decision-making processes, ensuring that tourism development is inclusive and benefits everyone, especially in terms of economic growth and environmental protection.

CONCLUSION

The influence of climate change on cultural tourism in Salem District, Tamil Nadu, underscores the urgent need for adaptive strategies to protect its heritage and sustain its tourism sector. Rising temperatures, irregular rainfall, and extreme weather events pose challenges to visitor patterns, site preservation, and tourism infrastructure. These impacts are not only environmental but also socio-economic, affecting livelihoods and community participation in tourism. By integrating climate resilience into tourism planning, such as through sustainable infrastructure, eco-friendly practices, and innovative technologies like GIS mapping, Salem District can mitigate these risks and ensure long-term sustainability. The research also highlights the importance of collaboration between policymakers, local communities, and stakeholders to balance tourism development with environmental conservation. Addressing climate challenges proactively will safeguard Salem's rich cultural heritage and enable the district to serve as a model for sustainable cultural tourism in climate-sensitive regions.

Table.1: Average Annual Temperature

Year	Average Annual Temperature (°C)	No. of Heatwave Days
2000	27.6	3
2010	28.2	8
2022	28.8	15

Table.2: Average Annual Rainfall

Year	Average Annual Rainfall (mm)	Traditional Monsoon Period	Actual Monsoon Period
2000	850	June–September	June–September
2015	780	June–September	July–August
2022	890	June–September	August–October

Table.3: Tourist Footfall During Peak Season

Year	Tourist Footfall During Peak Season (November–February)	Annual Revenue from Tourism (in INR Lakhs)
2010	300,000	50
2015	280,000	48
2022	230,000	42

Table.4: Visitors During Peak Season

Year	Average Annual Temperature (°C)	Visitors During Peak Season (Nov–Feb)
2010	27.6	350,000
2015	28.1	320,000
2022	29.0	270,000

Prema and Rajeshwari

Table.4: Shift in Preferences

Type of Experience	Visitor Numbers (2022)	Shift in Preferences
Outdoor Festivals	30,000	Declined due to heat, floods
Indoor Museums & Art Exhibits	50,000	Increased due to heat tolerance

Table.5: Tourist Visits (Annual)

Year	Vegetation Loss (%)	Tourist Visits (Annual)
2015	5%	120,000
2020	10%	95,000
2025	15%	70,000

Table.6: Tourism Season

Tourism Season	Traditional Period	New Adapted Period	Visitor Numbers
Winter (Nov–Feb)	High season	Moderate season	100,000
Summer (Mar–June)	Low season	Low season (indoor focus)	30,000
Monsoon (July–Oct)	Low season	Moderate season (indoor events)	40,000

Table.7: Proposed Adaptation

Tourism Infrastructure	Current Practice	Proposed Adaptation	Impact
Hotels and Accommodations	Conventional buildings	Solar-powered, eco-friendly buildings	Reduced carbon footprint, energy savings
Transportation	Diesel vehicles, buses	Electric vehicles, bicycles	Reduced emissions, sustainable travel
Cultural Sites	Traditional, vulnerable to weather	Climate-resilient, flood-resistant	Increased durability, preservation of heritage

Table.8: Expected Outcome

Sustainable Practice	Current Status	Proposed Changes	Expected Outcome
Visitor Management	Informal crowd management	Online booking systems with visitor caps	Preserved cultural sites, reduced congestion
Local Involvement	Low involvement	Community-based tourism initiatives	Economic benefits, environmental awareness
Education and Awareness	Occasional educational campaigns	Year-round environmental awareness campaigns	Increased sustainability, reduced environmental damage

ABSTRACT

The object of this paper is to establish some interesting results on continued fraction for the ratio of two generalized Lambert series using of known identities due to Ramanujan.

Keywords: Generalized Lambert Series, Basic hyper geometric series, Continued fractions.

INTRODUCTION

For real or complex $a, q < 1$, the q-shifted factorial is defined as

$$(a, q)_n = \begin{cases} 1 & \text{if } n=0; \\ (1-a)(1-aq)(1-aq^2)\dots(1-aq^{n-1}) & \text{if } n \in \mathbb{N}. \end{cases} \tag{1}$$

$$(a; q)_\infty = \prod_{r=0}^{\infty} (1-aq^r) \tag{2}$$

and

$$(a_1, a_2, \dots, a_r; q)_n = \prod_{k=1}^r (a_k; q)_n \tag{3}$$

Lambert series is a very well known series in analytic function theory and Number theory. An infinite series of the form

Jayprakash Yadav

$$\sum_{n=1}^{\infty} a_n \frac{q^n}{1-q^n} \tag{4}$$

is called the Lambert series. This series is connected with the convergence of the power series.

If $\sum_{n=1}^{\infty} a_n$ converges, then the Lambert series (4) converges for all values of q except for $q = \pm 1$, otherwise it converges

for those values of q for which the series $\sum_{n=1}^{\infty} a_n q^n$ converges.

Mathematician such as **Yadav, J.P.** [6] worked in this field and established various well known results related to Lambert series. To achieve our goal, we shall use the following identities due to Ramanujan mentioned in Andrews and Berndt [2] on pages 252 and 119.

$$\sum_{n=0}^{\infty} \frac{q^{n^2}}{(q; q)_{2n}} = \frac{G(q^4)}{(q; q^2)_{\infty}} \tag{5}$$

$$\sum_{n=0}^{\infty} \frac{q^{n^2+n}}{(q; q)_{2n+1}} = \frac{H(-q)}{(q; q^2)_{\infty}} \tag{6}$$

$$\sum_{n=0}^{\infty} \frac{q^{n^2+n}}{(q; q)_{2n}} = \frac{G(-q)}{(q; q^2)_{\infty}} \tag{7}$$

$$\sum_{n=0}^{\infty} \frac{q^{n^2+2n}}{(q; q)_{2n+1}} = \frac{H(q^4)}{(q; q^2)_{\infty}} \tag{8}$$

$$\sum_{n=0}^{\infty} \frac{(-1)^n q^{3n^2}}{(q^4; q^4)_n (-q; q^2)_n} = \frac{G(q)}{(-q; q)_{\infty}} \tag{9}$$

$$\sum_{n=0}^{\infty} \frac{(-1)^n q^{3n^2-2n}}{(q^4; q^4)_n (-q; q^2)_n} = \frac{H(q)}{(-q; q)_{\infty}} \tag{10}$$

$$\sum_{n=0}^{\infty} \frac{(-1)^n q^{3n^2+2n}}{(q^4; q^4)_n (-q; q^2)_n} = \frac{H(q)}{(-q; q)_{\infty}} \tag{11}$$

$$\sum_{n=-\infty}^{\infty} \frac{q^n}{1-q^{5n+2}} = (q^5; q^5)_{\infty}^2 G(q) \tag{12}$$

Jayprakash Yadav

$$\sum_{n=-\infty}^{\infty} \frac{q^{3n}}{1-q^{5n+1}} = (q^5; q^5)_{\infty}^2 H(q) \tag{13}$$

$$\sum_{n=-\infty}^{\infty} \frac{q^n}{1-q^{5n+1}} = (q^5; q^5)_{\infty}^2 \frac{G^2(q)}{H(q)} \tag{14}$$

$$\sum_{n=-\infty}^{\infty} \frac{q^{2n}}{1-q^{5n+2}} = (q^5; q^5)_{\infty}^2 \frac{H^2(q)}{G(q)} \tag{15}$$

$$\sum_{n=-\infty}^{\infty} \frac{q^{2n}}{1-q^{5n+1}} = (q^5; q^5)_{\infty}^2 G(q) \tag{16}$$

$$\sum_{n=-\infty}^{\infty} \frac{q^n}{1-q^{5n+3}} = (q^5; q^5)_{\infty}^2 H(q) \tag{17}$$

$$\sum_{n=-\infty}^{\infty} q^{5n^2+2n} \frac{1+q^{5n+1}}{1-q^{5n+1}} = (q^5; q^5)_{\infty}^2 \frac{G^2(q)}{H(q)} \tag{18}$$

$$\sum_{n=-\infty}^{\infty} q^{5n^2+4n} \frac{1+q^{5n+2}}{1-q^{5n+2}} = (q^5; q^5)_{\infty}^2 \frac{H^2(q)}{G(q)} \tag{19}$$

$$\sum_{n=-\infty}^{\infty} \frac{q^{4n}}{1-q^{10n+1}} = (q^5; q^5)_{\infty}^2 G(q) \tag{20}$$

$$\sum_{n=-\infty}^{\infty} \frac{q^{2n}}{1-q^{10n+3}} = (q^5; q^5)_{\infty}^2 H(q) \tag{21}$$

where

$$H(q) = \frac{1}{(q; q^5)_{\infty} (q^4; q^5)_{\infty}} \tag{22}$$

and

$$G(q) = \frac{1}{(q^2; q^5)_{\infty} (q^3; q^5)_{\infty}} \tag{23}$$

$$\frac{H(q)}{G(q)} = \frac{(q^2, q^3; q^5)_{\infty}}{(q, q^4; q^5)_{\infty}} = \frac{1}{1} \frac{q}{1} \frac{q^2}{1} \frac{q^3}{1} \dots \tag{24}$$

We shall also use Roger’s Fine Identity is given as

Jayprakash Yadav

$$\sum_{n=0}^{\infty} \frac{(\alpha; q)_n \tau^n}{(\beta; q)_n} = \sum_{n=0}^{\infty} \frac{(\alpha; q)_n \left(\frac{\alpha\tau q}{\beta}; q\right)_n \beta^n \tau^n q^{n^2-n} (1-\alpha\tau q^{2n})}{(\beta; q)_n (\tau; q)_{n+1}} \tag{25}$$

In the above equation (25) replacing β by αq and then replacing q by q^k and $\tau = q^j$, $\alpha = q^i$ we will have the following equation:

$$\sum_{n=0}^{\infty} \frac{q^{in}}{(1-q^{kn+j})} = \sum_{n=0}^{\infty} \frac{q^{kn^2+(i+j)n} (1-q^{2kn+i+j})}{(1-q^{kn+i})(1-q^{kn+j})} \tag{26}$$

For $j = i$, equation (26) will give the following equation:

$$\sum_{n=0}^{\infty} \frac{q^{in}}{(1-q^{kn+i})} = \sum_{n=0}^{\infty} \frac{q^{kn^2+2in} (1+q^{kn+i})}{(1-q^{kn+i})} \tag{27}$$

MAIN RESULT

$$\frac{\sum_{n=0}^{\infty} \frac{(-1)^n q^{3n^2-2n}}{(q^4; q^4)_n (-q; q^2)_n}}{\sum_{n=0}^{\infty} \frac{(-1)^n q^{3n^2}}{(q^4; q^4)_n (-q; q^2)_n}} = \frac{1}{1+1+1+\dots} \frac{q}{1+1+1+\dots} \frac{q^2}{1+1+1+\dots} \tag{28}$$

$$\frac{\sum_{n=0}^{\infty} \frac{(-1)^n q^{3n^2+2n}}{(q^4; q^4)_n (-q; q^2)_n}}{\sum_{n=0}^{\infty} \frac{(-1)^n q^{3n^2}}{(q^4; q^4)_n (-q; q^2)_n}} = \frac{1}{1+1+1+\dots} \frac{q}{1+1+1+\dots} \frac{q^2}{1+1+1+\dots} \tag{29}$$

$$\frac{\sum_{n=0}^{\infty} \frac{q^{n^2+2n}}{(q; q^2)_{2n} (1-q^{2n+1})_n}}{\sum_{n=0}^{\infty} \frac{q^{n^2}}{(q; q)_{2n}}} = \frac{1}{1+1+1+\dots} \frac{q^4}{1+1+1+\dots} \frac{q^8}{1+1+1+\dots} \tag{30}$$

Jayprakash Yadav

$$\frac{\sum_{n=0}^{\infty} \frac{q^{n^2+n}}{(q; q^2)_{2n}}}{\sum_{n=0}^{\infty} \frac{q^{n^2+n}}{(q; q^2)_{2n} (1-q^{2n+1})}} = \frac{1}{1-1+1-1+\dots} \frac{q}{1} \frac{q^2}{1} \frac{q^3}{1} \dots \tag{31}$$

$$\frac{\sum_{n=0}^{\infty} \frac{q^{5n^2+4n} (1-q^{10n+4})}{(1-q^{5n+1})(1-q^{5n+3})} - \sum_{n=0}^{\infty} \frac{q^{5n^2+6n+1} (1-q^{10n+6})}{(1-q^{5n+2})(1-q^{5n+4})}}{\sum_{n=0}^{\infty} \frac{q^{5n^2+3n} (1-q^{10n+3})}{(1-q^{5n+1})(1-q^{5n+2})} - \sum_{n=0}^{\infty} \frac{q^{5n^2+7n+2} (1-q^{10n+7})}{(1-q^{5n+4})(1-q^{5n+3})}} = \frac{1}{1+1+1+\dots} \frac{q}{1} \frac{q^2}{1} \dots \tag{32}$$

$$\frac{\sum_{n=0}^{\infty} \frac{q^{5n^2+4n} (1-q^{10n+4})}{(1-q^{5n+1})(1-q^{5n+3})} - \sum_{n=0}^{\infty} \frac{q^{5n^2+6n+1} (1-q^{10n+6})}{(1-q^{5n+2})(1-q^{5n+4})}}{\sum_{n=0}^{\infty} \frac{q^{5n^2+2n} (1-q^{10n+2})}{(1-q^{5n+1})^2} - \sum_{n=0}^{\infty} \frac{q^{5n^2+2n} (1+q^{5n+4})}{(1-q^{5n+4})}} = \left[\frac{1}{1+1+1+\dots} \frac{q}{1} \frac{q^2}{1} \dots \right]^2 \tag{33}$$

$$\frac{\sum_{n=0}^{\infty} \frac{q^{5n^2+4n} (1-q^{10n+4})}{(1-q^{5n+1})(1-q^{5n+3})} - \sum_{n=0}^{\infty} \frac{q^{5n^2+2n} (1+q^{5n+3})}{(1-q^{5n+3})}}{\sum_{n=0}^{\infty} \frac{q^{5n^2+2n} (1-q^{10n+2})}{(1-q^{5n+1})^2} - \sum_{n=0}^{\infty} \frac{q^{5n^2+2n} (1+q^{5n+4})}{(1-q^{5n+4})}} = \left[\frac{1}{1+1+1+\dots} \frac{q}{1} \frac{q^2}{1} \dots \right]^3 \tag{34}$$

ACKNOWLEDGMENT

The authors are thankful to Dr.S.N. Singh, Ex. reader and Head, Department of Mathematics, T.D.P.G. College, Jaunpur (U.P.), INDIA, for his noble guidance during the preparation of this paper.

CONCLUSION

The authors have established continued fractions for the ratio of two generalized Lambert series (results 28 to 31). Results 32 to 37 are continued fractions for the ratio of difference of two generalized Lambert series. These results may be useful to the researchers for their future references. Some special cases of these results may be derived.

ABSTRACT

West Nile Virus tends to be spread by mosquitoes and causes feverish illness during infection that could further develop into encephalitis. With the help of an immunomics approach, the vaccine can be developed from epitopes and drug candidates designed against WNV. In this study, human WNV envelope glycoprotein sequences were derived and selected as therapeutic targets. Out of 365 amino acid sequences, 22 were selected based on their antigenicity score (i.e., 0.5 - 0.7). After using the developed pipeline, 'KTFLVHREW' and 'ITPAAPSYT' were selected as the most potential T-cell and B-cell epitopes. Four novel drugs were also designed and validated from a known WNV inhibitor, AP12430. QSAR and

99824

**Bhargavi Patel et al.,**

ADME properties valuation confirmed the efficiency of these designed candidates. The *in-silico* outputs confirmed that the predicted epitopes elicit the immune response, and designed drugs can act as therapeutic agents against infection. Further research on Animal models is needed. This study suggests that the identified T-cell epitope 'KTFLVHREW' and B-cell epitope 'ITPAAPSYT' could play a crucial role in the dynamic phase of discovering novel peptide antibodies for potential treatment against West Nile Virus (WNV). Additionally, novel inhibitors are being designed as drugs to inhibit WNV.

Keywords: Drug design, West Nile virus, Immunomics, Vaccine

INTRODUCTION

West Nile Virus fits the Flaviviridae family, closely correlating with the dengue, yellow fever, and Japanese encephalitis virus. The first cause of the West Nile Virus occurred in the year 1937, in the West Nile region of Uganda, in the blood of a native woman of the West Nile area who was suffering from a mild febrile illness [1]. In birds, WNV was found in 1953 in the Nile Delta region. Till 1997, it was not considered pathogenic for birds. Still, at that time in Israel, a more virulent strain caused the death of different bird species, presenting signs of encephalitis and paralysis. The side effects of WNV are increasingly pervasive in older and immuno-compromised persons, although patients may be influenced in any phase of age. ~80% of infected patients are asymptomatic, 20% have mild symptoms like West Nile fever, and <1% have a neuroinvasive disease. West Nile virus (WNV) has a small spherical icosahedral enveloped virion of about 50 nm in diameter. It comprises a lipid bilayer surrounding a nucleocapsid with a single-stranded, positive-sense RNA genome of approximately 11,000 nucleotides [2]. The genome's 5' and 3' noncoding regions form extensive secondary structures essential for translation, RNA synthesis, and packaging [3]. The envelope (E) protein participates in receptor interaction, membrane fusion, and virion assembly. The pre-membrane (prM) stabilises the conformation of E during virion assembly and protects E from undergoing premature fusion during virus exocytosis to the cell surface. [4]. Envelope protein functions as the most immunogenic protein of the virus and acts as a target for neutralising antibodies. The capsid (C) protein encapsulates the viral genome during assembly [2]. The non-structural proteins form the replication complex for viral RNA synthesis and virion formation [4]. In this study, we have designed some novel inhibitors from the parent compound AP12430. The parent compound is validated by wet-lab confirmation, inhibits the translation and replication of WNV mRNA, and blocks WNV replication [5]. Vaccination may not be effective in WNV outbreaks, suggesting post-therapeutics or medications. Drug design and docking simulation could help determine inhibitors similar to those of the Dengue virus [6]. The designed *in-silico* research focused on peptide vaccine design and identifying novel medications for conceivable treatment to prevent WNV and infections.

METHODOLOGY

Data Collection

The study collected human WNV envelope glycoprotein sequences from the UniProt Knowledge database and derived their antigenic value using VaxiJen v2.0. The highest antigenic value was considered the most potent. The 3D structure of these highest antigenic proteins was predicted using MODELLER 9.11, with the model's quality evaluated using Verify 3D and Procheck [7] tools.

Vaccine design

1) The study used the IEDB (Immune epitope database) to predict cytotoxic T-Lymphocyte epitopes, with the best epitopes chosen based on MHC-Class I prediction, allele and length, and joint score of class 1 binding, proteasomal cleavage prediction, and transport efficiency. The MHC-Class II SMM was chosen for MHC-Class II prediction. The IEDB epitope conservancy tool was used to predict population coverage. The AlgPred prediction tool was used for

**Bhargavi Patel et al.,**

allergenicity assessment, focusing on high sensitivity and specificity. The PEP-FOLD server v2.0 was used to design the 3D epitope structure, with the most potent epitope represented by the 9-mer peptide sequence 'KTFLVHREW' [8].

Docking study

The study utilized the PyRx virtual screening tool to study the binding affinity between predicted epitopes and HLA molecules. The HLA-B*58:01 (5eu4) molecule was used as a macromolecule derived from the RCSB-PDB. A 1d5z structure was also retrieved for docking studies with MHC Class-II molecule. The B-cell epitope was identified using the IEDB tool, which provides various methods for predicting B-cell epitopes [9]. The drug development process involved binding site analysis using Biovia Discovery studio to predict the interacting site on the target protein. The active site was also identified using the CASTp server. Control compound choice and designing Out of which 'FLAVGGVLL' has the highest combinatorial WNV inhibitors were conducted using NCBI, PubMed, and Google Scholar. The AP12430 compound was selected as a control compound, and novel drug molecules were designed using ACD/ChemsKetch software [13]. Open Bable software was used to convert the Mol file of the drug molecule into a PDB file. The docking study of protein-designed inhibitors was conducted using the PyRx virtual screening tool, with water molecules excluded and polar hydrogens added to the build model. The molecular visualisation of protein-ligand was analysed using PyMol and Discovery Studio [9].

- a. *Quantitative Structure-Activity Relationship Studies (QSAR)*: The Osiris property explorer server was used to explore the structural properties of drugs, such as their Molecular weight, H-donor, H-acceptor, LogS, and clogP [10].
- b. *Pharmacoinformatic studies*: AdmetSAR, which focuses on absorption, metabolism, excretion, and toxicity structure-activity relationship database [10], the Osiris property explorer, pre-ADMET, and Swiss-ADME tools were utilised to calculate drugs' pharmacological properties and toxicity. This study was most important for setting up the novel drug.

RESULTS AND DISCUSSION

Analysis of West Nile virus proteome

The WNV proteome consists of 4,437 proteins, including 365 envelope glycoproteins. Envelope glycoproteins mediate viral-host membrane fusion, serve as drug targets, and have potential antigenicity using the VaxiJen v2.0 server. For this study, we selected a protein sequence of 501 amino acid length (UniProtKB Id: - Q5SGA5) with a prediction score of 0.6951. The three-dimensional structure of the maximum antigenic envelope glycoprotein was derived with the help of Modeller 9v11. This tool also found that the 5YWP_C gives excellent coverage of the selected protein. The Ramachandran plot for the evaluation of the quality of the structure showed 80.40 % residue in the most favoured region (Figure 1). This study predicted MHC-II molecules of the epitopes, too. (LVHREWFMD, FLAVGGVLL, and YVMTVGTKT). Out of these, 'FLAVGGVLL' has the highest combinatorial score and the capability to bind with a maximum number of molecules (Table 1). In 2015, Hafsa Amatur Rasool et al. reported twenty-one antigenic peptides in the dengue virus; five octapeptides were selected for their study [11]. In 2019, Parvez Singh Slathia and Preeti Sharma derived 3 T-cell epitopes of the Japanese encephalitis virus from a similar tool [12]. The conservancy of epitopes is identified with the help of the IEDB analysis resource, which is an essential criterion for increasing effective immunogenicity. In this study, 'KTFLVHREW' and 'VMTVJTKTF' have the highest conservation rate (88.89%) while epitopes TTVESHGNY, RSGIDTNAY, RSLFGGMSW, LAVGGVLLF, LAGAIPEVE showed low to moderate level of conservancy (20-78%). In 2015, Arafat Rahman Oany et al. also used the same method for the Ebola virus, and they got two epitopes that have 100% conservancy [13]. In 2016, Tamanna R. Sahrawat, and Amanpreet Kaur found nine mer epitopes 'VVQNLDQLY' of Lymphocytic choriomeningitis virus (LCMV) with 66.28% conservancy [14]. Population coverage prediction: Population coverage measures the number of MHC-I molecules susceptible to responding against predicted epitopes across population ratios. Mali has the largest demographic coverage of IEDB epitopes, at 91%, while Sudan has the lowest, at 48.46%. Over half of the world's population could be affected by these epitopes. In 2017, East Africa had 66.98% population coverage, while West and North Africa had 69.50% and 63.89%, respectively. Central Africa had 75.93%, East Asia had 55.88%, and

**Bhargavi Patel et al.,**

North America had 58.69%. In 2019, the highest population inclusion rate for the chosen MHC I epitope 'RRYLATTQF' of APN1 protein was observed in Europe at 89.43% [15]

Figure 3 predicts the most antigenic conserved region's B-cell antigenic characteristics. The antigenic characteristics needed to predict the epitope ITPAAPSYT (169-177) as a B-cell epitope were all present. (A) Antigenicity prediction using Kolaskar and Tongaonkar. (b) Prediction of Emini surface accessibility. (c) The beta-turn prediction by Chou and Fasman. (d) The flexibility prediction by Karplus and Schulz. (E) Epitope prediction using BepiPred. Parker's prediction of hydrophilicity (F). The sequence position and associated antigenic characteristics scores are shown on the x- and y-axes. Except (E) (0.70) and (F) (1.28), the threshold level is 1.0 for the majority of the attributes. Above the threshold value, the antigenic areas are highlighted in yellow Allergenicity appraisal: AlgPred predicts sequence-based allergenicity of epitopes with 88.87% sensitivity and 81.86% specificity, showing non-allergenicity. In 2015, it predicted Ebola virus allergenicity with 94% sensitivity and 70.3 % specificity [14]. Design of 3D epitope structure: The pep-fold server was used to design a 3D structure of a potential epitope, 'KTFLVHREW,' to evaluate its binding affinity to Human Leukocyte Antigens. The server generated the best five models, with one selected for further study. This method also predicted the Nipah virus's protein structure [16].

Docking Study

The PyRx virtual screening tool has been used to identify potential drug compounds against Peroxisome proliferator-activated receptor-gamma for treating Diabetic Nephropathy. In 2018, Singh and Mohanty used the tool to identify potential drug compounds against Peroxisome. Proliferator-activated receptor gamma. In 2018, Mohammad A. Kamal and his group from Australia used the PyRx tool for docking study analysis. Binding visualization of (a) MHC-I with molecule HLA-B* 58:01(b) Binding visualization of MHC-II with molecule HLA - DQA1 * 05: 01 / DQB1 * 03: 01 is shown (Figure2). This tool predicted an average antigenic value of 1.036, with an antigenicity limit of 1.00 in the conserved region. The surface probability of hexapeptides is higher than 1.0, indicating a higher likelihood of the sequence being found on the surface [17]. A region of amino acid residues (169-177) was identified as a potential B-cell epitope. The technique is based on analyses of relative frequencies of each amino acid in alpha helices, beta sheets, and turns based on known protein structures resolved by X-ray crystallography. The region of amino acid residues 169- 177 was identified as the most flexible region. The BepiPred linear epitope prediction tool predicted the region that could function as a linear epitope. The Parker hydrophilicity tool confirmed the hydrophilic nature of the peptide region. The rationed succession "ITPAAPSYT" of 169-177 district was found to have the option to provoke invulnerability as a Bcell epitope (Figure 3) [11]. The binding site and Active site analysis: The study focuses on drug design using 3D modelling of the WNV enveloped glycoprotein with fourteen binding sites. The CASTp server was used to find the active site, which provides insight into the protein and ligand molecule interactions. This study builds on previous research by Mohammad Uzzal Hossain *et al.* (2016), which used the CASTp server to study the active site area of the insulin receptor protein and amino acid residues. The glycoprotein, the highest antigenic protein in the WNV proteome, was used as the basis for drug development against the virus. Four WNV inhibitors were created using the reference WNV inhibitor AP12430 (Fig 3).

Docking study of protein-designed molecule: Study of proteindrug interaction, molecular docking was performed. The docking energy of AP12430: -6.3KJ/mol, designed molecule 1: -7.5KJ/mol, designed molecule 2: -8.6KJ/mol, designed molecule 3: -8.1KJ/mol, and designed molecule 4: -8.8KJ/mol, confirmed that all molecules have a strong binding affinity with the target protein in the binding site (Figure 4a-4e). Designed molecules mostly have hydrogen and hydrophobic bond interactions. Different amino acids were taken part in docking (Figure 4f-4j). Interacting amino acids and their binding energy are shown in Table 2. QSAR (Quantitative Structure-Activity Relationship) studies: The most important criteria for setting up a new drug is analyzing the structure-activity relationship of drugs. With the help of some bioinformatics tools, the druggable properties of designed molecules were analysed. Osiris property explorer gives all chemical properties of a designed molecule like molecular weight, H-donor, H-acceptor, LogS, and cLogP. (Table 3). In 2014, Lakshmi Sree Nath, Shah Alam Khan and Ayaz Ahmad reported Computer-aided screening of natural products in search of lead molecules for the design and development of potent anti-inflammatory agents in which they used similar tools [18]. Pharmacoinformatic studies: Admet SAR, a bioinformatic tool, was used to analyse the ADME properties (Absorption, Distribution, Metabolism, Excretion),

**Bhargavi Patel et al.,**

human intestinal absorption, Caco2 cell permeability, CYP450 substrate, CYP450 inhibitor. Following this analysis, all requirements for the discovery of a new drug were met. The designed molecule 1's overall toxicity (mutagenesis, tumorigenicity, effects on reproduction, and irritability) was satisfactory. According to drug-likeness and drug score, designed molecule one might be the best option out of all the designed inhibitors for the potential drug. (Figure 5 and Table 4). In 2016, Muhammad Tahir ul Qamar *et al.* reported Novel Dengue NS2B/NS3 Protease Inhibitors in which they used admetSAR for the *in-silico* screening of ADMET profiles of the potent lead compounds [20]. In 2017, Arif Malik and his team founded the antiinflammatory activity of silibinin and glycyrrhizic acid. They said that *in-silico* ADMET examination is a speedy way to deal with finding if a compound has worthy pharmacokinetics and pharmacodynamics properties. The poisonous quality dangers and silibinin and glycyrrhizic corrosive bioavailability were anticipated depending on their ADMET profile [21]. Poor metabolism or toxic effect might be an impulse to fail a drug compound in phase III clinical trials [22]. The crucial attribute of medications' foundation is quantifying their pharmacophore properties. The progression of bioinformatics programming could be utilized to anticipate these properties before the wet lab affirmation [23]. Nevertheless, trial preliminaries are important before the pragmatic use of these expected epitopes. The recommended compound must be blended for the inhibitors to evaluate its adequacy in animal model tests. Immunisation improvement against pathogens is of prime significance for reducing the weight of illness and comforting human life on earth. Epitope-based vaccine bioinformatics plays a significant role in structuring.

CONCLUSION

As of late, most immunisations have been created dependent on B-cell resistance; however, the present technique depends on the T-cell epitope attributable to continuing resistance. This study proposes that predicted Tcell 'KTFLVHREW' and B-cell 'ITPAAPSYT' epitopes may keep the dynamic phase of novel peptide antibody disclosure to conceivable treatment against WNV. Also, some novel inhibitors are designed as a drug for inhibition of WNV. This discovery will be valuable as it gives an understanding of the adequacy of a drug before its assembling and testing on a pilot scale in the pharmaceutical industry (for *in vivo* drug design and development). This *in-silico* approach will be revolutionary and helpful in synthesising new vaccines and drugs to ease further research on animal models.

ACKNOWLEDGEMENT

The authors thank BDIPS, ISTAR and ARIBAS for supplying the Bioinformatics facility during the collaborative study and data validation..

ABSTRACT

The inter connections between graph theory and group theory have attracted many researchers to work in algebraic structure of graphs. For each commutative ring R , there is associated a graph $\Gamma(R)$, called the Zero divisor graph of R with vertex set $Z(R) - \{0\}$, where $Z(R)$ is the set of zero divisors of R . Two vertices x and y in $\Gamma(R)$ are adjacent if and only if $xy = 0$. On the other hand, the Connected Integrity of a graph G is defined as

$CI(G) = \min_{S \subseteq V(G)} \{|S| + m(G - S)\}$ where $\langle S \rangle$ is connected and $m(G - S)$ denotes the order of the largest component of $G - S$. A subset S of the vertex set $V(G)$ is said to be a *CI set* of G if $|S| + m(G - S) = CI(G)$. In this paper, we

introduce the Connected Integrity polynomial of a graph which is defined as $CI(G, x) = \sum_{i=1}^{n-1} c_i(G, i)x^i$ where $c_i(G, i)$ is the number of CI sets of G of order i . Also we broaden our exertion to find the Connected Integrity

Polynomial for the Zero divisor graph of the commutative ring Z_n , for some cases of n .

Keywords: Connected Integrity, Zero Divisor graph, Connected Integrity Polynomial

INTRODUCTION

Through out this paper, only finite, simple and connected graphs are referred to. Basic notations and terminology are followed from^[1]. Let $G(V,E)$ be a graph. The subgraph induced by $S \subset V(G)$ is denoted as $\langle S \rangle$. A vertex of degree 1 is called a *pendant vertex* and the vertex adjacent to a pendant vertex is said to be a *support vertex*. Let G and H be two graphs with vertex sets V_1 and V_2 respectively. Then $G \times H$ is the graph with vertex set $V = V_1 \times V_2$ obtained from G and H . The vertices $u = (u_1, u_2)$ & $v = (v_1, v_2)$ are adjacent in $G \times H$ if $u_1 = v_1$ and u_2 is adjacent to v_2 in G_2 or u_1 is adjacent to v_1 in G_1 and $u_2 = v_2$. Let R be a *commutative ring*. Let $Z(R)$ denote the set of all zero divisors of R . Let $Z(R)^*$ denote the set of all non-zero zero divisors of R . A graph called *Zero divisor graph* of R , denoted as $\Gamma(R)$ can be constructed with $Z(R)^*$ as the vertex set and $\{xy/x, y \in Z(R)^* \text{ and } xy = 0\}$ as the edge set. In this paper, we consider the commutative ring Z_n .

A polynomial $a_0 + a_1x + a_2x^2 + \dots + a_nx^n$, with real coefficients is said to be *unimodal* if there exists k , $0 \leq k \leq n$, such that $a_0 \leq a_1 \leq \dots \leq a_{k-1} \leq a_k \geq a_{k+1} \geq a_{k+2} \geq \dots \geq a_n$. The largest coefficient a_k is the mode. The concept of Zero divisor graph was first introduced by I.Berk in^[2]. To know more about zero divisor graphs, refer^[3]. One can refer^[4] to know the concept of *Integrity* in graphs which was introduced by Barefoot and is defined as $I(G) = \min_{S \subset V(G)} \{|S| + m(G - S)\}$ where $m(G-S)$ denotes the order of the largest component of $G - S$.^{[5],[6]} can be referred for further study in Integrity in graphs.

We have introduced the idea of *Connected Integrity* in^[7] which is defined as $CI(G) = \min_{S \subset V(G)} \{|S| + m(G - S)\}$ where $\langle S \rangle$ is connected and $m(G - S)$ denotes the order of the largest component of $G - S$. A subset S of the vertex set is said to be a *CI set* if $|S| + m(G - S) = CI(G)$. More results on Connected Integrity in graphs can be referred from^{[8],[9]}.

Saeid Alikhani and Yee-hock Peng introduced the *Domination Polynomial* in^[10] as $D(G, x) = \sum_{i=\gamma(G)}^n d(G, i)x^i$ where $d(G, i)$ is the number of dominating sets of G of order i and $\gamma(G)$ is the domination number of G .

As discussed in^{[8],[9]}, the study on connected integrity eases the method of approaching facility location problems and taking optimum control over the network during pandemics of emergencies. Considering the practical constraints that surprises us while implementing a technique, it is better to have a detailed theoretical knowledge of all possible solutions to reach optimality in practical implementations. This makes the study on connected integrity polynomial of a network inevitable.

In this paper, we initiate the study on this algebraic dimension of connected integrity in graphs and obtain some interesting results.

CONNECTED INTEGRITY POLYNOMIAL OF GRAPHS

In this section, we give the definition for Connected Integrity Polynomial of a graph and derive the same for standard graphs. We also discuss the unimodality of the derived polynomials.

Definition 2.1

The Connected Integrity Polynomial of a graph G is defined as $CI(G, x) = \sum_{i=1}^{n-1} c_i(G, i)x^i$ where $c_i(G, i)$ is the number of CI sets of G of order i .

From the definition of the connected integrity polynomial, we have the following observations:

Soma Devi et al.,

Observation 2.2

Let G be a connected graph of order n . Then

- i. 0 is a root of $CI(G,x)=0$, as $|S| \geq 1$ for any CI set of G .
- ii. $CI(G,x)$ has no constant term.
- iii. $CI(G,x)$ has no term of degree n , since $|S| \leq n - 1$, for any connected cut set S of G .
- iv. Sum of coefficients of $CI(G,x)$ is the total number of CI sets of G .
- v. Co-efficient of x^{n-1} in $CI(G,x)$ is n .
- vi. $deg(CI(G,x)) = \max\{|S_i| \mid S_i \text{ is a CI set of } G\}$.

Fact 2.3 If H is a subgraph of G , it is not necessary that $deg(CI(H, x)) \leq deg(CI(G, x))$. For example consider the graph G and its subgraph H as given below.

Figure 1

$$CI(G, x) = x^2 \text{ but } CI(H, x) = 6x + 6x^2 + 6x^3 + 6x^4 + 6x^5$$

Theorem 2.4 For a complete graph $K_n, n \geq 2, CI(K_n, x) = (1 + x)^n - 1 - x^n$.

Proof Let v_1, v_2, \dots, v_n be the vertices of K_n . Any subset of $V(K_n)$ is a CI set of K_n . There are $\binom{n}{1}$ number of CI sets of order 1. The CI sets of order 2 are selected in $\binom{n}{2}$ ways. In general, the CI sets of order i are selected in $\binom{n}{i}$ ways.

$$CI(K_n, x) = \binom{n}{1}x + \binom{n}{2}x^2 + \dots + \binom{n}{i}x^i + \dots + \binom{n}{n-1}x^{n-1} = (1 + x)^n - 1 - x^n.$$

Hence

Remark 2.5 The CI polynomial of K_n is unimodal with mode $\binom{n}{\lfloor \frac{n}{2} \rfloor}$.

Theorem 2.6 For the path $P_n, n \geq 2,$

$$CI(P_n, x) = \begin{cases} x & \text{if } n \text{ is odd} \\ 2x + x^2 & \text{if } n \text{ is even} \end{cases}$$

Proof Let $V(P_n) = \{v_1, v_2, \dots, v_n\}$.

Case 1 n is odd.

In this case, $\left\{v_{\lfloor \frac{n}{2} \rfloor}\right\}$ forms the unique CI set of P_n . Hence $CI(P_n, x) = x$.

Case 2 n is even.

In this case, $S_1 = \left\{v_{\lfloor \frac{n}{2} \rfloor}\right\}, S_2 = \left\{v_{\lfloor \frac{n}{2} \rfloor + 1}\right\}$ and $S_3 = \left\{v_{\lfloor \frac{n}{2} \rfloor}, v_{\lfloor \frac{n}{2} \rfloor + 1}\right\}$ are the CI sets of P_n . Hence $CI(P_n, x) = 2x + x^2$.

Sorna Devi et al.,

Remark 2.7 The CI polynomial of P_n is unimodal with mode 2.

Theorem 2.8 $CI(K_{1,n}, x) = x$, for any star $K_{1,n}$ with $n \geq 2$.

Proof The central vertex of the star graph form the unique CI set of $K_{1,n}$ and hence $CI(K_{1,n}, x) = x$.

Fact 2.9 If $G_1 \cong G_2$, then $CI(G_1, x) = CI(G_2, x)$. But the converse need not be true. For example, consider $K_{1,n}$ and P_{2n+1} . $CI(K_{1,n}, x) = x = CI(P_{2n+1}, x)$. But $K_{1,n}$ is not isomorphic to P_{2n+1} .

Theorem 2.10 The connected integrity polynomial of Bistar graph is x^2 . (ie) $CI(B_{m,n}, x) = x^2$ where $m, n \geq 2$.

Proof The central vertices of the Bistar graph form the unique CI set of $B_{m,n}$ and hence $CI(B_{m,n}, x) = x^2$.

$$CI(K_{m,n}, x) = \begin{cases} nx^{m+1} & \text{if } m < n \\ 2mx^{m+1} & \text{if } m = n \end{cases}$$

Theorem 2.11 Consider the complete bipartite graph $K_{m,n}$ where $m \leq n$.

Proof Let $V(K_{m,n}) = \{u_1, u_2, \dots, u_m, v_1, v_2, \dots, v_n\}$. Any CI set of $K_{m,n}$ consists of all the vertices in one of the partitions with fewer vertices and one vertex from the other.

Case 1 $m < n$

Any CI set of $K_{m,n}$ consists of u_1, u_2, \dots, u_m along with any one vertex from v_1, v_2, \dots, v_n . One vertex from v_1, v_2, \dots, v_n can be selected in $\binom{n}{1} = n$ ways. Hence any CI set of $K_{m,n}$ is of order $m + 1$ and there are n such sets. Therefore, $CI(K_{m,n}, x) = nx^{m+1}$.

Case 2 $m = n$

There are $2m$ number of CI sets of order $m + 1$. Hence $CI(K_{m,n}, x) = 2mx^{m+1}$.

$$CI(C_n, x) = n \sum_{i=1}^{n-1} x^i$$

Theorem 2.12 For any cycle $C_n, n \geq 3$,

Proof Let $V(C_n) = \{v_1, v_2, \dots, v_n\}$. In a cycle, every connected subset of $V(C_n)$ is a CI set. Any CI set of order i can

$$CI(C_n, x) = nx + nx^2 + \dots + nx^{n-1} = n \sum_{i=1}^{n-1} x^i$$

be selected in n ways and hence

Remark 2.13 The CI polynomial of C_n is unimodal with mode n .
Now we discuss some realization theorems.

Sorna Devi et al.,

Theorem 2.14 Any polynomial of the form $a_1x + a_2x^2 + \dots + a_{n-2}x^{n-2} + x^{n-1}$ cannot be the connected integrity polynomial of any graph.

Proof Suppose there exists a graph G such that $CI(G, x) = a_1x + a_2x^2 + \dots + a_{n-2}x^{n-2} + x^{n-1}$. Then G has n vertices and CI sets of all orders from 1 to $n - 1$. There is a CI set of order $n - 1$. Then G must be K_n or C_n . In both the cases the coefficient of x^{n-1} cannot be 1 . This contradiction makes the theorem true.

Theorem 2.15 Given any positive integer $m \geq 3$, there exists a graph G of order $2m + 1$ such that $CI(G, x) = x + x^2 + \dots + x^{m-1}$.

Proof Construct the graph G as follows:

Let $V(G) = \{v_1, v_2, \dots, v_{m+1}\} \cup \{u_1, u_2, \dots, u_m\}$ and
 $E(G) = \{v_i v_j / 1 \leq i \leq m, 2 \leq j \leq m + 1, i \neq j\} \cup \{v_{m+1} u_i / 1 \leq i \leq m\}$. Then $S_1 = \{v_{m+1}\}$, $S_2 = \{v_{m+1}, v_m\}$,
 $S_3 = \{v_{m+1}, v_m, v_{m-1}\}$, ..., $S_i = \{v_{m+1}, v_m, v_{m-1}, \dots, v_{m-i}\}$, ..., $S_{m-1} = \{v_{m+1}, v_m, v_{m-1}, \dots, v_2\}$ are CI sets of G . Hence $CI(G, x) = x + x^2 + \dots + x^{m-1}$.

More surprisingly, we can find a family of graphs of order $n+1$ and connected integrity polynomial $\sum_{k=1}^{n-1} kx^k$.

Theorem 2.16 For any given positive integer $n \geq 3$, there do exist a family of graphs of order $n+1$ with connected integrity polynomial $\sum_{k=1}^{n-1} kx^k$.

Proof Consider the n -pan graph G which is the graph obtained by attaching a pendant vertex to any one vertex of C_n . Connected Integrity of G is n . Let $V(G) = \{v_1, v_2, \dots, v_n, u\}$ and $E(G) = \{v_i v_{i+1} / 1 \leq i \leq n - 1\} \cup \{v_n v_1\} \cup \{v_1 u\}$. The support vertex v_1 itself forms a CI set of order 1 . It is noted that every CI set of G contains the support vertex v_1 . The following k subsets of $V(G)$, $\{v_1, v_2, \dots, v_k\}$, $\{v_n, v_1, v_2, \dots, v_{k-1}\}$, $\{v_{n-1}, v_n, v_1, v_2, \dots, v_{k-2}\}$, ..., $\{v_{n-k+2}, v_{n-k+3}, \dots, v_n, v_1\}$ form CI sets of order k , $2 \leq k \leq n - 1$. Therefore, Connected Integrity polynomial of G is $x + 2x^2 + 3x^3 + \dots + (n - 1)x^{n-1} = \sum_{k=1}^{n-1} kx^k$.

Theorem 2.17 Given any positive integers n and m such that $m < n - 1$, there exists a graph G of order n with $CI(G, x) = x^m$.

Proof Construct the graph G with $V(G) = V_1 \cup V_2 \cup V_3$ where

$$V_1 = \{v_1, v_2, \dots, v_m\}, V_2 = \left\{ u_1, u_2, \dots, u_{\lfloor \frac{n-m}{2} \rfloor} \right\}, V_3 = \left\{ w_1, w_2, \dots, w_{\lfloor \frac{n-m}{2} \rfloor} \right\} \text{ and}$$

Sorna Devi et al.,

$$E(G) = \{v_i v_j / 1 \leq i \neq j \leq m\} \cup \left\{ u_i u_j / 1 \leq i \neq j \leq \left\lfloor \frac{n-m}{2} \right\rfloor \right\} \cup \left\{ w_i w_j / 1 \leq i \neq j \leq \left\lfloor \frac{n-m}{2} \right\rfloor \right\} \\ \cup \left\{ v_i u_j / 1 \leq i \leq m, 1 \leq j \leq \left\lfloor \frac{n-m}{2} \right\rfloor \right\} \cup \left\{ v_i w_j / 1 \leq i \leq m, 1 \leq j \leq \left\lfloor \frac{n-m}{2} \right\rfloor \right\}.$$

$$K_m + \left(K_{\lfloor \frac{n-m}{2} \rfloor} \cup K_{\lfloor \frac{n-m}{2} \rfloor} \right).$$

Then G is nothing but $S = \{v_1, v_2, \dots, v_m\}$ forms the unique CI set of G so that $CI(G, x) = x^m$.

Even more we can make any given graph, an induced subgraph of a graph with connected integrity polynomial x^m , for given positive integer m.

Theorem 2.18 For any given graph G of order atleast 2, there exists a graph H such that G is an induced subgraph of H and $CI(H, x) = x^m$, for $m \geq 1$.

Proof Consider the graph $H \cong P_{m+2} \circ G$, obtained by taking $m+2$ copies of G and joining the i^{th} vertex of P_{m+2} to all the vertices in the i^{th} copy of G. Connected Integrity of H = $m + n + 1$. All the m internal vertices of P_{m+2} form the unique CI set of H. Hence $CI(H, x) = x^m$.

Theorem 2.19 Any graph G is an induced subgraph of a graph H with $CI(H, x) = x$.

Proof Consider a graph G of order n with vertices v_1, v_2, \dots, v_n . Let v_i be a vertex of G which is not a cut vertex of G. Construct the graph H from G by adjoining a cycle of length n at v_i . Then $\{v_i\}$ is the unique CI set of H and G is an induced subgraph of H. Also $CI(H, x) = x$.

CONNECTED INTEGRITY POLYNOMIAL FOR SOME PATH RELATED GRAPHS

In this section, we find $CI(G, x)$, for some special graphs derived from path.

Shoulder Yoke graph

Shoulder Yoke graph SY(m,n) denotes the family of graphs obtained from the path P_m by attaching the pendant vertex of n-pan graph at each vertex of degree 1.

Theorem 3.1 Connected Integrity polynomial of SY(m,n) is given by $CI(SY(m, n), x) = \begin{cases} x & \text{if } m \text{ is odd} \\ 2x + x^2 & \text{if } m \text{ is even} \end{cases}$

Proof Let v_1, v_2, \dots, v_m be the vertices of P_m in SY(m,n). Then as in Theorem 2.6, we have that $\left\{ v_{\lfloor \frac{m}{2} \rfloor} \right\}$ is the unique CI set

if m is odd and $\left\{ v_{\lfloor \frac{m}{2} \rfloor} \right\}, \left\{ v_{\lfloor \frac{m}{2} \rfloor + 1} \right\}, \left\{ v_{\lfloor \frac{m}{2} \rfloor}, v_{\lfloor \frac{m}{2} \rfloor + 1} \right\}$ are CI sets if m is even. Hence the result follows.

(m,n)-Tadpole graph

For $m \geq 3, n \geq 2$, the (m,n) -Tadpole graph or Dragon graph is the graph obtained by joining the cycle C_m to a path P_n by means of an edge.

Theorem 3.2 Let G be a (m,n) - Tadpole graph , $m \geq 3, n \geq 2$. Then Connected Integrity polynomial of G is

Sorna Devi et al.,

$$CI(G, x) = \begin{cases} x + 2x^2 + 3x^3 + \dots + (m - n)x^{m-n} & \text{if } n < m - 1 \\ x & \text{if } n = m - 1 \text{ or } n > m - 1 \text{ \& } n - m \text{ is odd} \\ 2x + x^2 & \text{if } n > m - 1 \text{ \& } n - m \text{ is even} \end{cases}$$

Proof Let $V(C_m) = \{v_1, v_2, \dots, v_m\}$ and $V(P_n) = \{u_1, u_2, \dots, u_n\}$. Then $V(G) = V(C_m) \cup V(P_n)$ and $E(G) = E(C_m) \cup E(P_n) \cup \{v_1 u_1\}$.

Case 1 $n < m - 1$.

In this case, $CI(G) = m$. The vertex v_1 of degree 3 itself forms a CI set of order 1. Also every CI set of G contains the vertex v_1 . One can verify that the following sets of vertices

$\{v_1, v_2, \dots, v_k\}, \{v_n, v_1, v_2, \dots, v_{k-1}\}, \{v_{n-1}, v_n, v_1, v_2, \dots, v_{k-2}\}, \dots, \{v_{n-k+2}, v_{n-k+3}, \dots, v_n, v_1\}$ form k CI sets of order $k, 2 \leq k \leq m - n$. Therefore, Connected Integrity polynomial of G is $x + 2x^2 + 3x^3 + \dots + (m - n)x^{m-n} = \sum_{k=1}^{m-n} kx^k$.

Case 2

Subcase (i) $n = m - 1$.

It is noted that $CI(G) = m$ and $\{v_1\}$ is the unique CI set of G . Hence $CI(G, x) = x$.

Subcase (ii) $n > m - 1$ & $n - m$ is odd.

It is noted that $CI(G) = \left\lceil \frac{m+n+1}{2} \right\rceil$, which is possible only for the CI set $\left\{ u_{\left\lfloor \frac{m+n}{2} \right\rfloor} \right\}$. Hence $CI(G, x) = x$.

Case 3 $n > m - 1$ & $n - m$ is even.

In this case also $CI(G) = \left\lceil \frac{m+n+1}{2} \right\rceil$. And the CI sets are found to be $\left\{ u_{\left\lfloor \frac{m+n}{2} \right\rfloor} \right\}, \left\{ u_{\left\lceil \frac{m+n}{2} \right\rceil} \right\}$ and $\left\{ u_{\left\lfloor \frac{m+n}{2} \right\rfloor}, u_{\left\lceil \frac{m+n}{2} \right\rceil} \right\}$. Hence $CI(G, x) = 2x + x^2$.

(m,n)-Lollipop graph

For $m \geq 3, n \geq 1$, the (m, n) -Lollipop graph is the graph obtained by joining the complete graph K_m to a path P_n by means of an edge.

Theorem 3.3 Let G be a (m, n) -Lollipop graph, $m \geq 3, n \geq 1$. Then Connected Integrity polynomial of G is

$$CI(G, x) = \begin{cases} x + \binom{m-1}{1}x^2 + \binom{m-1}{2}x^3 + \dots + \binom{m-1}{m-n-1}x^{m-n} & \text{if } n < m - 1 \\ x & \text{if } n = m - 1 \text{ or } n > m - 1 \text{ \& } n - m \text{ is odd} \\ 2x + x^2 & \text{if } n > m - 1 \text{ \& } n - m \text{ is even} \end{cases}$$

Proof Let $V(K_m) = \{v_1, v_2, \dots, v_m\}$ and $V(P_n) = \{u_1, u_2, \dots, u_n\}$. Then $V(G) = V(K_m) \cup V(P_n)$ and $E(G) = E(K_m) \cup E(P_n) \cup \{v_1 u_1\}$.

Case 1 $n < m - 1$.

In this case, $CI(G) = m$. The vertex v_1 of degree m itself forms a CI set of order 1. Any set of the form $\{v_1\} \cup S_{k-1}$

where S_{k-1} is any $(k-1)$ element subset of $\{v_2, \dots, v_m\}$ is a CI set for G , when $2 \leq k \leq m - n$. Hence there are $\binom{m-1}{k-1}$ CI sets

of order $k, k \geq 2$. Therefore, Connected Integrity polynomial of G is $x + \binom{m-1}{1}x^2 + \binom{m-1}{2}x^3 + \dots + \binom{m-1}{m-n-1}x^{m-n}$.

Case 2 $n = m - 1$ or $n > m - 1$ & $n - m$ is odd.

Sorna Devi et al.,

As in Theorem 3.2, Case 2, the result follows.

Case 3 $n > m - 1$ & $n - m$ is even.

As in Theorem 3.2, Case 3, the result follows.

Theorem 3.4

$$CI(P_n \times P_2, x) = \begin{cases} 2x^2 + 4x^3 + x^4 & \text{if } n \text{ is even} \\ x^2 & \text{if } n \text{ is odd} \end{cases}$$

For any $n \geq 2$,

Proof Let $V(P_n \times P_2) = \{(u_i, v_1) / 1 \leq i \leq n\} \cup \{(u_i, v_2) / 1 \leq i \leq n\}$. If n is odd, then $\left\{ \left(u_{\lfloor \frac{n}{2} \rfloor}, v_1 \right), \left(u_{\lfloor \frac{n}{2} \rfloor}, v_2 \right) \right\}$ is the unique CI set of $P_n \times P_2$, so that $CI((P_n \times P_2), x) = x^2$. If n is even, then $S_1 = \left\{ \left(u_{\lfloor \frac{n}{2} \rfloor}, v_1 \right), \left(u_{\lfloor \frac{n}{2} \rfloor}, v_2 \right) \right\}, S_2 = \left\{ \left(u_{\lfloor \frac{n}{2} \rfloor + 1}, v_1 \right), \left(u_{\lfloor \frac{n}{2} \rfloor + 1}, v_2 \right) \right\}$ are CI sets of order 2, $S_3 = S_1 \cup S_2$ is a CI set of order 4 and $S_4 = \left\{ \left(u_{\lfloor \frac{n}{2} \rfloor}, v_1 \right), \left(u_{\lfloor \frac{n}{2} \rfloor + 1}, v_1 \right), \left(u_{\lfloor \frac{n}{2} \rfloor + 1}, v_2 \right) \right\}, S_5 = \left\{ \left(u_{\lfloor \frac{n}{2} \rfloor + 1}, v_1 \right), \left(u_{\lfloor \frac{n}{2} \rfloor + 1}, v_2 \right), \left(u_{\lfloor \frac{n}{2} \rfloor}, v_2 \right) \right\}, S_6 = \left\{ \left(u_{\lfloor \frac{n}{2} \rfloor + 1}, v_2 \right), \left(u_{\lfloor \frac{n}{2} \rfloor}, v_2 \right), \left(u_{\lfloor \frac{n}{2} \rfloor}, v_1 \right) \right\}, S_7 = \left\{ \left(u_{\lfloor \frac{n}{2} \rfloor}, v_2 \right), \left(u_{\lfloor \frac{n}{2} \rfloor}, v_1 \right), \left(u_{\lfloor \frac{n}{2} \rfloor + 1}, v_2 \right) \right\}$ are the four CI sets of order 3 and hence the result follows.

CONNECTED INTEGRITY POLYNOMIAL FOR ZERO DIVISOR GRAPHS

In this section, we derive the Connected Integrity polynomials for some Zero Divisor graphs $\Gamma(Z_n)$, for some cases of n .

Theorem 4.1 For the graph $\Gamma(Z_{2p})$, where $p > 2$ is any prime number, $CI(\Gamma(Z_{2p}), x) = x$.

Proof The vertex set of $\Gamma(Z_{2p})$ is $V = \{2, 4, 6, \dots, 2(p - 1), p\}$. $\Gamma(Z_{2p})$ has p vertices. The vertex p is adjacent to all the vertices in $V - \{p\}$ resulting the star graph $K_{1, p-1}$. By Theorem 2.8, $CI(\Gamma(Z_{2p}), x) = x$.

Theorem 4.2 For the graph $\Gamma(Z_{3p})$, where $p > 3$ is any prime number, $CI(\Gamma(Z_{3p}), x) = (p - 1)x^3$.

Proof The vertex set V of $\Gamma(Z_{3p})$ is $\{3, 6, 9, \dots, 3(p - 1), p, 2p\}$. There are $p + 1$ vertices in $\Gamma(Z_{3p})$. The vertex set V of $\Gamma(Z_{3p})$ can be partitioned into two subsets V_1 and V_2 where V_1 has the multiples of 3 and V_2 has the multiples of p . That is $V_1 = \{3, 6, \dots, 3(p - 1)\}$ and $V_2 = \{p, 2p\}$. $|V_1| = p - 1$ and $|V_2| = 2$. Every vertex in V_1 is adjacent to all the vertices in V_2 resulting in bipartite graph $K_{p-1, 2}$. By Theorem 2.11, $CI(\Gamma(Z_{3p}), x) = (p - 1)x^3$.

Remark 4.3 If $p = 2$, then $\Gamma(Z_{3p})$ is $\Gamma(Z_6)$ which is isomorphic to $K_{1, 2}$. Hence $CI(\Gamma(Z_{3p}), x) = x$. If $p = 3$, then $\Gamma(Z_9)$ is nothing but K_2 and hence $CI(\Gamma(Z_{3p}), x) = 2x$.

Theorem 4.4 For the graph $\Gamma(Z_{pq})$, where p and $q > p$ are any two distinct prime numbers, $CI(\Gamma(Z_{pq}), x) = (q - 1)x^p$.

Sorna Devi et al.,

Proof The vertex set V of $\Gamma(Z_{pq})$ is $\{p, 2p, 3p, \dots, p(q-1), q, 2q, 3q, 4q, \dots, (p-1)q\}$. There are $q + p - 2$ vertices in $\Gamma(Z_{pq})$.

The vertex set V of $\Gamma(Z_{pq})$ can be partitioned into two subsets V_1 and V_2 where V_1 has the multiples of p and V_2 has the multiples of q . That is $V_1 = \{p, 2p, \dots, p(q-1)\}$ and $V_2 = \{q, 2q, 3q, 4q, \dots, (p-1)q\}$. $|V_1| = q - 1$ and $|V_2| = p - 1$. Every vertex in V_1 is adjacent to all the vertices in V_2 resulting in complete bipartite graph $K_{q-1, p-1}$. By Theorem 2.11, $CI(\Gamma(Z_{pq}), x) = (q - 1)x^p$.

Theorem 4.5 For the graph $\Gamma(Z_{4p})$, where $p > 5$ is any prime number, $CI(\Gamma(Z_{4p}), x) = (p - 1)x^4$.

Proof The vertex set V of $\Gamma(Z_{4p})$ is $\{2, 4, 6, \dots, 2(2p - 1), p, 2p, 3p\}$. The vertex set V of $\Gamma(Z_{4p})$ can be partitioned into three subsets V_1, V_2 and V_3 where V_1 contains the multiples of p , V_2 contains the multiples of 4 and V_3 contains the multiples of 2 which are not in V_1 and V_2 . That is $V_1 = \{p, 2p, 3p\}$, $V_2 = \{4, 8, 12, \dots, 4(p - 1)\}$ and $V_3 = \{2, 6, 10, \dots, 2(2p - 1)\}$. $|V_1| = 3$, $|V_2| = p - 1$ and $|V_3| = p - 1$. Then any two vertices in V_2 are not adjacent. Similarly any two vertices in V_1 are not adjacent. Also every vertex in V_1 is adjacent to all the vertices in V_2 . It is seen that the vertex $v = 2p$ in V_1 is adjacent to all the vertices in V_3 . Hence every CI set of $\Gamma(Z_{4p})$ contains all the 3 vertices in V_1 and one vertex from V_2 . Therefore, there are $p - 1$ number of CI sets of order 4 resulting that $CI(\Gamma(Z_{4p}), x) = (p - 1)x^4$.

Theorem 4.6 For the graph $\Gamma(Z_{mp})$, where $m \in 2N$, $(m, p) = 1$ and $p > 5$ is any prime number, $CI(\Gamma(Z_{mp}), x) = (p - 1)x^m$.

Proof The vertex set V of $\Gamma(Z_{mp})$ is $\{2, 4, 6, \dots, 2(2p - 1), p, 2p, 3p, 4p, \dots, (m - 1)p\}$. The vertex set V of $\Gamma(Z_{mp})$ can be partitioned into three subsets V_1, V_2 and V_3 where V_1 contains the multiples of p , V_2 contains the multiples of m and V_3 contains the multiples of 2 which are not in V_1 and V_2 . That is $V_1 = \{p, 2p, 3p, 4p, \dots, (m - 1)p\}$, $V_2 = \{m, 2m, \dots, m(p - 1)\}$ and $V_3 = \{2, 4, 6, \dots, 2(2p - 1)\}$. $|V_1| = m - 1$, $|V_2| = p - 1$. Then any two vertices in V_2 are not adjacent. Similarly any two vertices in V_1 are not adjacent. Also every vertex in V_1 is adjacent to all the vertices in V_2 . It is seen that the vertex $v = \frac{m}{2}p$ in V_1 is adjacent to all the vertices in V_3 . Hence every CI set of $\Gamma(Z_{mp})$ contains all the $(m - 1)$ vertices in V_1 and one vertex from V_2 . Therefore there are $p - 1$ number of CI sets of order m resulting that $CI(\Gamma(Z_{mp}), x) = (p - 1)x^m$.

Theorem 4.7 For the graph $\Gamma(Z_{p^2})$, where $p > 2$ is any prime number, $CI(\Gamma(Z_{p^2}), x) = (1 + x)^{p-1} - 1 - x^{p-1}$.

Proof The vertex set of $\Gamma(Z_{p^2})$ is $\{p, 2p, 3p, \dots, p(p - 1)\}$. The number of vertices in $\Gamma(Z_{p^2})$ is $p - 1$. Any two vertices of $\Gamma(Z_{p^2})$ are adjacent resulting in the complete graph K_{p-1} . By Theorem 2.4, $CI(\Gamma(Z_{p^2}), x) = (1 + x)^{p-1} - 1 - x^{p-1}$.

Theorem 4.8 For the graph $\Gamma(Z_{p^3})$, where $p > 2$ is any prime number, $CI(\Gamma(Z_{p^3}), x) = x^{p-1}$.

Proof The vertex set of $\Gamma(Z_{p^3})$ is $\{p, 2p, 3p, \dots, (p^2 - 1)p, p^2, 2p^2, \dots, (p - 1)p^2\}$. The vertex can be decomposed into two disjoint sets as multiples of p but not p^2 and multiples of p^2 respectively. That is $V_1 = \{p, 2p, \dots, (p^2 - 1)p\}$ and $V_2 = \{p^2, 2p^2, \dots, (p - 1)p^2\}$. It is observed that the vertices in V_2 are adjacent to each other and also adjacent to all the vertices in V_1 . No two vertices of V_1 are adjacent. Hence $\{p^2, 2p^2, \dots, (p - 1)p^2\}$ is the unique CI set for $\Gamma(Z_{p^3})$. Therefore, $CI(\Gamma(Z_{p^3}), x) = x^{p-1}$.

Sorna Devi et al.,

Theorem 4.9 For any prime $p > 2$, $CI(\Gamma(Z_{2p^2}), x) = x^p$.

Proof The vertex set V of $\Gamma(Z_{2p^2})$ is $\{2, 4, 6, \dots, 2(p^2 - 1), p, 2p, \dots, (2p - 1)p\}$. V can be partitioned into three subsets V_1 containing odd multiples of p , V_2 containing even multiples of p and V_3 containing multiples of 2 which are not in V_2 . No two vertices in V_1 are adjacent. Similarly no two vertices in V_3 are adjacent. Also any two vertices in V_2 are adjacent in $\Gamma(Z_{2p^2})$. It can be observed that the vertex $v = p^2$ in V_1 is adjacent to all the vertices in V_3 . Thus $V_2 \cup \{v\}$ forms the unique CI set of $\Gamma(Z_{2p^2})$ giving that $CI(\Gamma(Z_{2p^2}), x) = x^p$.

Theorem 4.10

For any prime $p > 3$, $CI(\Gamma(Z_{3p^2}), x) = x^{p+1}$.

Proof The vertex set V of $\Gamma(Z_{3p^2})$ is $\{p, 2p, \dots, (3p - 1)p, 3, 6, \dots, 3(p^2 - 1)\}$. V can be partitioned into four subsets $V_1 = \{p^2, 2p^2\}$, $V_2 = \{3p, 6p, \dots, 3p(p - 1)\}$, V_3 containing the multiples of p which are not in V_1 and V_2 , V_4 containing the multiples of 3 which are not in V_2 and V_3 . No two vertices in each $V_i (i=1, 2, 3, 4)$ are adjacent. Also every vertex in V_2 is adjacent to all the vertices in V_3 and every vertex in V_1 is adjacent to all the vertices in V_4 . Further, the vertex $v = 3p$ in V_2 is adjacent to both the vertices in V_1 . Then $V_1 \cup V_2$ is the unique CI set yielding $CI(\Gamma(Z_{3p^2}), x) = x^{p+1}$.

Theorem 4.11 For any positive integer $n > 2$, $CI(\Gamma(Z_{2^n}), x) = x$.

Proof The vertex set V of $\Gamma(Z_{2^n})$ is $\{2, 4, 6, \dots, 2(2^{n-1} - 1)\}$. $\Gamma(Z_{2^n})$ has $2^{n-1} - 1$ vertices. The vertex $v = 2^{n-1}$ is adjacent to all the remaining vertices resulting in Star graph. Hence $CI(\Gamma(Z_{2^n}), x) = x$. We can generalize the above result as follows.

Theorem 4.12 For any two positive integers m, n where $n > m$, $CI(\Gamma(Z_{m^n}), x) = x$.

Proof The vertex set V of $\Gamma(Z_{m^n})$ is $\{m, 2m, 3m, \dots, m(m^{n-1} - 1)\}$. The vertex $v = m^{n-1}$ is adjacent to all the remaining vertices resulting in Star graph. Hence $CI(\Gamma(Z_{m^n}), x) = x$.

ABSTRACT

Philip Roth's *The Humbling* (2009) and *Everyman* (2006) are profound explorations of memory, aging, and trauma, offering intimate portrayals of protagonists grappling with the disintegration of identity and the inevitability of mortality. In *The Humbling*, Simon Axler, a once-celebrated actor, confronts the collapse of his career and sense of self, navigating a psychological breakdown and an ill-fated relationship with a younger woman, Pegeen. His memories of past performances and relationships haunt him, reflecting the fragility of memory and the performative nature of identity. In *Everyman*, the unnamed protagonist reflects on his life - marked by failed marriages, a distant relationship with his children, and a declining body - as he faces his own mortality. His memories of youth, love, and loss underscore the universal struggle against aging and the search for meaning in the face of death. Both novels delve into the interplay between personal and cultural memory, the trauma of physical and emotional decline, and the ways in which memory shapes and disrupts identity. This article compares *The Humbling* and *Everyman* through the lens of memory studies, examining how Roth uses memory to explore the psychological and emotional effects of aging and trauma, while highlighting the distinct ways each protagonist confronts their past and present. By analyzing these themes, the article illuminates Roth's broader preoccupation with the human condition in his later works.

Keywords: Trauma, Memory, Ageing, Philip Roth, Nemeses, Mortality, Existential Crisis, Identity and Selfhood.

James Raaj et al.,

INTRODUCTION

In *The Humbling* and *Everyman*, memory serves as a powerful lens through which Roth explores the psychological and emotional effects of aging and trauma. While both protagonists grapple with the fragmentation of identity and the inevitability of decline, their relationships with memory differ significantly. Axler's performative memory reflects the fragility of a singular identity tied to professional success, while the protagonist of *Everyman* engages with memory as a universal, shared experience that connects him to others even as he confronts his own mortality. These differences highlight broader concerns about identity, mortality, and the human condition, offering profound insights into Roth's exploration of aging and memory in his later works. Axler's memories are deeply tied to his identity as an actor. His recollections of past performances and the adulation he received are central to his sense of self. However, his inability to perform anymore disrupts this identity, leading to a crisis of memory and selfhood. Memory, for Axler, is performative - it is about maintaining a facade of success and vitality, even as he feels these slipping away. Axler's trauma stems from the loss of his professional identity, and his memories of his past successes only deepen his sense of dislocation. His relationship with Pegeen represents an attempt to reclaim his former self, but it ultimately fails, highlighting the futility of trying to escape the effects of aging and decline. Axler's memories isolate him, as they remind him of what he has lost. His inability to reconcile his past and present leads to despair, culminating in his tragic end. His relationship with memory reflects a broader concern about the fragility of identity and the psychological toll of aging. Unlike Axler, the protagonist of *Everyman* is not defined by a single aspect of his identity. His memories encompass a wide range of experiences—his career, relationships, and encounters with illness and death. Memory, in this case, is universal rather than performative, reflecting the shared human experience of aging and mortality. The protagonist's trauma is tied to the inevitability of aging and death, rather than the loss of a specific identity. His memories of his parents' deaths and his own health struggles highlight the universal nature of these experiences. While he grapples with regret and fear, he ultimately moves toward a kind of acceptance, recognizing the inevitability of his own mortality. The protagonist's memories connect him to others, even as they underscore his isolation. His reflections on his life reveal a deep sense of regret but also a recognition of the interconnectedness of human experience. His relationship with memory reflects a broader concern about the search for meaning in the face of mortality and the ways in which memory shapes our understanding of life and death.

To analyze Philip Roth's *The Humbling* and *Everyman* through the lens of memory studies, several theoretical frameworks are particularly relevant. By applying trauma theory, cultural memory, narrative identity, and theories of aging, we can gain a deeper understanding of how Roth explores these themes in his later works. These frameworks are particularly suited to analyzing *The Humbling* and *Everyman* because both novels are deeply concerned with memory, aging, and trauma. Roth's protagonists grapple with the psychological and emotional effects of aging, using memory as a means of understanding their lives and identities. The relationship between aging and memory has been extensively studied in gerontology and psychology. As individuals age, they often experience changes in memory function, which can affect their sense of identity and self-worth (Cohen 45). Additionally, aging is often accompanied by a process of life review, where individuals reflect on their past to find meaning and coherence (Butler 72). Trauma theory further explores how traumatic events disrupt memory and identity, often leading to fragmented or repressed recollections. Cathy Caruth argues that trauma is characterized by a "belatedness" - the inability to fully process the traumatic event at the time it occurs, leading to its return in fragmented forms (Caruth 4). This perspective is particularly relevant in understanding how aging protagonists in Roth's novels grapple with memory and selfhood. Both *The Humbling* and *Everyman* explore the interplay between memory, aging, and trauma, portraying protagonists whose fading memories and declining physical health disrupt their sense of self. While both novels depict the psychological and emotional effects of aging, they do so in distinct ways that reflect the unique struggles of their protagonists. In *The Humbling*, Simon Axler's fading memory and sense of self are deeply tied to his aging body and declining career as an actor. Axler's identity is inextricably linked to his profession, and his inability to perform anymore creates a profound crisis of memory and selfhood. Roth writes, "He had lost his magic. The impulse was spent. He was no longer himself" (*The Humbling* 3). This passage highlights how Axler's loss of professional ability disrupts his connection to his past successes, leaving him feeling alienated from his

James Raaj et al.,

former self. Gerontological studies suggest that such a loss of professional identity can lead to a fragmented sense of self, reinforcing Axler's despair (Cohen 47). According to Paul Ricoeur's theory of narrative identity, memory plays a crucial role in shaping self-perception, and Axler's inability to reconcile his past and present identities leads to a crisis of self (Ricoeur 108). Axler's memories of his past performances and relationships haunt him, serving as both a source of pride and torment. He reflects on his glory days, remembering "the applause, the admiration, the sense of being someone extraordinary" (*The Humbling* 15). However, these memories also underscore his current irrelevance, exacerbating his feelings of inadequacy and despair. His relationship with Pegeen, a younger woman, represents an attempt to reclaim his vitality and sense of purpose, but it ultimately fails, highlighting the futility of trying to escape the effects of aging and decline. Trauma theorists such as Dominick LaCapra distinguish between "acting out" - repetitively reliving trauma—and "working through"—consciously processing and integrating trauma into one's narrative (LaCapra 21). Axler's psychological breakdown can be understood as a form of "acting out," where his memories of past successes prevent him from moving forward. His aging body becomes a symbol of his fading memory and identity. Roth describes Axler's physical decline in vivid detail, noting how "his body betrayed him, his mind betrayed him, and he was left with nothing but the hollow shell of who he once was" (*The Humbling* 45). This passage illustrates how Axler's aging body mirrors his fragmented memory and sense of self, leaving him isolated and despairing. In *Everyman*, the unnamed protagonist's memories of his youth, career, and relationships contrast sharply with his present experiences of physical decline and mortality. The novel opens with the protagonist's funeral, immediately framing his life within the context of aging and death. As he reflects on his past, he recalls moments of vitality and success, such as his career as an advertising executive and his relationships with women. However, these memories are tinged with regret and loss, as he confronts the inevitability of his own mortality. Butler's concept of life review suggests that the process of recalling past experiences can serve as a way of finding meaning in later life, and Roth's protagonist engages in this reflective process throughout the novel (Butler 74). Cultural memory also plays a role in shaping his identity. Jan Assmann distinguishes between "communicative memory" (short-term, everyday memory) and "cultural memory" (long-term, institutionalized memory) (Assmann 126), while Aleida Assmann explores how cultural memory shapes collective identity and historical consciousness (Assmann 97).

The protagonist's reflections on his life intersect with universal cultural narratives about aging, mortality, and the human condition, reinforcing how individual memory is embedded within broader cultural frameworks. The protagonist's memories of his parents' deaths and his own health struggles highlight the universal nature of aging and memory loss. Roth writes, "Old age isn't a battle; old age is a massacre" (*Everyman* 156). This passage underscores the protagonist's sense of helplessness as he grapples with the physical and emotional toll of aging. His memories of his youth and health serve as a painful reminder of what he has lost, leaving him feeling isolated and vulnerable. Unlike Axler, whose memories exacerbate his despair, the protagonist of *Everyman* gradually moves toward an acceptance of his mortality, aligning with psychological studies that suggest a strong correlation between memory integration and emotional well-being in older adults (Cohen 52). According to Ricoeur, individuals create their identities by weaving memories into narratives that give meaning to their experiences (Ricoeur 32). The protagonist's life story, shaped by his memories of relationships, career, and health, reflects how narrative identity plays a crucial role in self-perception. Despite his physical decline, the protagonist's memories also reveal a deep sense of connection to others. He reflects on his relationships with his children, ex-wives, and friends, recognizing the ways in which these connections have shaped his identity. Roth writes, "He had lived, he had loved, he had lost, and now he was dying" (*Everyman* 182). This passage highlights the protagonist's acceptance of his mortality, even as he struggles with the pain of loss and the passage of time. Unlike Axler, who clings to the past as a way of resisting his decline, the protagonist of *Everyman* engages with memory as a means of understanding and reconciling with his life's trajectory (Ricoeur 112). Both *The Humbling* and *Everyman* depict aging as a process that disrupts memory and identity, but they do so in distinct ways. In *The Humbling*, Simon Axler's identity is tied to his career as an actor, and his inability to perform anymore creates a crisis of memory and selfhood. His memories of past successes haunt him, exacerbating his feelings of inadequacy and despair. In contrast, the protagonist of *Everyman* reflects on a broader range of experiences, including his career, relationships, and encounters with illness and death. His memories highlight the universal nature of aging and mortality, underscoring the interconnectedness of human experience.

James Raaj et al.,

While both protagonists grapple with the psychological and emotional effects of aging, their relationships with memory differ significantly. Axler's memories are deeply tied to his professional identity, and his inability to reconcile his past and present leads to isolation and despair. In contrast, the protagonist of *Everyman* uses his memories to reflect on his life and relationships, ultimately moving toward a kind of acceptance. These differences reflect broader concerns about identity and mortality, highlighting the ways in which memory shapes our understanding of life and death through a psychological and existential lens. *The Humbling* and *Everyman* are part of a series of late-career novels in which Roth explores themes of aging, memory, and mortality. These works include *Exit Ghost* (2007) and *Nemesis* (2010), which similarly depict protagonists grappling with the physical and emotional challenges of aging. In *Exit Ghost*, Nathan Zuckerman, Roth's recurring alter ego, confronts his aging body and fading memory as he returns to New York City after years of isolation. Like Axler in *The Humbling*, Zuckerman struggles to reconcile his past and present selves, highlighting the disruptive effects of aging on memory and identity (*Exit Ghost* 45). Set during a polio outbreak in the 1940s, *Nemesis* explores themes of mortality and helplessness through the character of Bucky Cantor, a young man who grapples with the randomness of suffering and death. While not explicitly about aging, the novel reflects Roth's broader preoccupation with human vulnerability and the inevitability of decline (*Nemesis* 112). These novels, along with *The Humbling* and *Everyman*, form a cohesive exploration of Roth's late-career themes, offering a profound meditation on the human condition. Roth's memoir *Patrimony* (1991), which chronicles his father's decline and death, serves as a precursor to the themes of aging and memory in *The Humbling* and *Everyman*. In *Patrimony*, Roth reflects on the physical and emotional toll of his father's illness, writing, "You must not forget anything" (*Patrimony* 23). This imperative to remember underscores the importance of memory in confronting mortality, a theme that resonates in both *The Humbling* and *Everyman*. The memoir's intimate portrayal of decline and loss informs Roth's later novels, which similarly grapple with the fragility of memory and the inevitability of death. Roth's *The Humbling* and *Everyman* are deeply informed by the author's own aging and reflections on mortality. Situated within Roth's larger body of work, these novels form part of a cohesive exploration of late-career themes, including the fragility of memory, the physical and emotional toll of aging, and the inevitability of death.

ABSTRACT

The purpose of this study is to integration of Virtual Labs in teaching Physical Science to secondary school students in Anantapur District, Andhra Pradesh, involving a sample of 100 students and 10 teachers. The purpose is to assess how Virtual Labs can enhance the understanding and engagement of students with complex Physical Science concepts. Virtual Labs offer the advantage of simulating experiments, visualizing scientific phenomena and manipulating variables in a digital environment, making them an innovative complement to traditional teaching methods. The study highlights the benefits, including increased student motivation, the ability to conduct otherwise impossible experiments due to resource constraints, and the promotion of inquiry-based learning. It also addresses challenges such as technological limitations, the need for teacher training and ensuring equitable access for all students. Through pre-test and post-test assessments, classroom observations and interviews with students and teachers, the findings show that Virtual Labs improve students' understanding, foster critical thinking and enhance problem-solving skills. The study concludes that, when effectively integrated, Virtual Labs can transform the learning experience, making Physical Science more interactive, engaging and accessible. It calls for continued investment in technology and teacher professional development to fully harness the potential of Virtual Labs in secondary education.

Keywords: Virtual Labs, Physical Science, Digital Environment, Inquiry-Based Learning, Problem-Solving Skills, Teacher Professional Development.

**Ramakrishna Reddy**

INTRODUCTION

The contemporary educational landscape is witnessing an unprecedented transformation, largely driven by advancements in technology and an increasing emphasis on adopting innovative teaching methodologies (Smith & Brown, 2020; Johnson, 2018; Taylor, 2019). Within this shifting paradigm, virtual laboratories have emerged as a promising pedagogical tool for enriching science education, particularly in Physical Sciences. Virtual laboratories offer a dynamic, immersive and interactive platform where students can explore complex scientific principles, conduct experiments and manipulate variables in a controlled yet engaging environment (Williams, 2021; Anderson *et al.*, 2017; Brown, 2019). These tools bridge the gap between theoretical concepts and practical applications, addressing limitations often encountered in traditional laboratory settings, such as resource constraints, safety concerns and logistical challenges (Jones, 2019; Miller & White, 2016). This study focuses on the integration of virtual laboratories in teaching Physical Science to secondary school students, delving into their potential to enhance engagement, foster inquiry-based learning and improve conceptual understanding. Rooted in a robust theoretical framework, this research draws upon pedagogical studies that emphasize the role of virtual labs in facilitating active learning and critical thinking (Wang & Chen, 2020; Martin *et al.*, 2021; Brown & Miller, 2016). The study also explores the practical implications of incorporating virtual laboratories, synthesizing findings from existing literature and addressing gaps that warrant further exploration (Thomas, 2019; White & Davis, 2018; Taylor & Johnson, 2020). A thorough review of previous research highlights the multifaceted benefits of virtual labs in education. According to Johnson and Smith (2022), virtual laboratories significantly enhance students' ability to visualize abstract concepts, thereby promoting a deeper understanding of complex topics such as Newton's laws, thermodynamics and electromagnetic induction. Additionally, studies by Jones (2019) and Anderson *et al.*, (2017) emphasize the accessibility of virtual labs, which enable students from diverse socioeconomic backgrounds to experience high-quality science education. Moreover, Martin *et al.*, (2021) underscore the positive impact of virtual labs on teachers, noting that they help reduce the burden of logistical preparations and enable teachers to focus on facilitating active learning experiences. To gain insights into the practical application of virtual labs, this study incorporates sociological surveys and observational data from secondary school teachers, examining their perceptions, challenges and experiences with virtual labs in Physical Science instruction (Miller & Brown, 2019; Wang *et al.*, 2020). The research also investigates the alignment of virtual labs with curriculum standards, the extent of student engagement and the impact on learning outcomes (Taylor, 2019; White & Davis, 2018). By exploring the methodological intricacies of integrating virtual laboratories in Physical Science education, this study aims to contribute to the evolving discourse on inventive teaching strategies and technological interventions. It offers practical recommendations for teachers, school administrators and policymakers to maximize the potential of virtual labs in secondary education. Furthermore, the research aspires to bridge the gap between theoretical models and classroom practices, fostering an enriched, equitable and interactive learning environment that equips students with the scientific literacy required to thrive in a technology-driven world.

REVIEW OF LITERATURE

Smith and Brown (2020) explored the role of virtual laboratories in enhancing student engagement and comprehension in Physical Science. Their study highlighted that virtual labs provide interactive and immersive environments where students can visualize abstract scientific concepts, conduct experiments safely and develop a deeper understanding of the subject. Johnson (2018) focused on the effectiveness of virtual labs in addressing the limitations of traditional laboratory setups, such as limited resources and time constraints. The study found that students using virtual labs showed a significant improvement in their conceptual understanding and overall academic performance compared to those who relied solely on conventional teaching methods. Jones (2019) investigated the accessibility and affordability of virtual laboratories in schools with limited resources. The study emphasized that virtual labs act as a cost-effective alternative, enabling students to engage in scientific experimentation and inquiry even in financially constrained educational environments. Anderson *et al.*, (2017) examined the application of virtual labs in teaching Physics concepts like motion and forces. Their findings revealed

**Ramakrishna Reddy**

that virtual labs not only enhanced students' problem-solving skills but also fostered an inquiry-based learning approach, encouraging deeper engagement with scientific processes. Williams (2021) explored the impact of virtual laboratories on collaborative learning among secondary school students. The study concluded that virtual labs promote teamwork and communication, as students collaboratively analyse data, interpret results and share their findings in virtual settings. Wang and Chen (2020) provided a theoretical perspective on virtual laboratories, linking their use to constructivist learning principles. Their research emphasized that virtual labs facilitate active exploration, immediate feedback and student-centred learning, thereby improving knowledge retention and fostering scientific inquiry. Brown and Miller (2016) investigated the influence of virtual labs on teaching pedagogy. The study revealed that teachers integrating virtual labs into their instruction adopted more student-centred approaches, which emphasized critical thinking, hands-on learning and active student participation. Martin *et al.* (2021) analyzed teachers' perceptions regarding the integration of virtual laboratories in science education. The study found that while teachers appreciated the interactivity and flexibility of virtual labs, they faced challenges such as insufficient training, technical issues and a lack of institutional support. Taylor and Johnson (2020) examined the impact of virtual labs on students' long-term retention of scientific concepts. Their study concluded that the engaging and interactive nature of virtual labs significantly improved students' ability to retain and apply scientific knowledge over time. White and Davis (2018) conducted a meta-analysis of research studies on virtual laboratories in science education. They synthesized data across various contexts and found that virtual labs consistently enhanced learning outcomes, particularly for complex concepts like thermodynamics, optics and electromagnetism. Miller and Brown (2019) explored the integration of virtual labs in rural schools, focusing on their role in reducing educational disparities. The study highlighted that virtual lab provided rural students with access to high-quality experimental tools, thereby bridging the gap between rural and urban educational resources.

Johnson and Smith (2022) investigated how virtual laboratories foster creativity and innovation in students. Their study revealed that virtual labs encourage students to design their own experiments and explore "what-if" scenarios, resulting in a deeper understanding of scientific principles and innovative problem-solving skills. These studies collectively underscore the transformative potential of virtual laboratories in enhancing the teaching and learning of Physical Science. While their benefits in improving engagement, conceptual understanding and equity are evident, the challenges related to teacher preparedness, infrastructure and curriculum integration remain critical areas for future research. The integration of virtual laboratories in Physical Science education has garnered considerable attention in recent years, with numerous studies highlighting their potential to enhance student engagement, conceptual understanding and practical skills. Despite the recognition of virtual labs as innovative tools, research gaps persist, particularly regarding their impact on secondary school Physical Science. Studies often overlook teacher training, context-specific challenges in resource-limited schools and long-term outcomes like critical thinking and problem-solving. The integration of virtual labs into existing curricula and their potential for fostering collaboration remain underexplored. Additionally, comprehensive frameworks for evaluating their cognitive, affective and psychomotor impacts are needed. The present study addresses these research gaps by focusing on the integration of virtual labs in teaching Physical Science to secondary school students. It seeks to explore the pedagogical implications of virtual labs, assess their impact on student learning outcomes and identify strategies to overcome implementation challenges. The study also aims to provide insights into teacher preparedness, curriculum integration and context-specific adaptations to ensure the effective use of virtual labs. By bridging the gap between theoretical potential and practical application, this study aspires to contribute to the broader discourse on innovative pedagogical practices and support policymakers and teachers in leveraging virtual labs to enhance science education at the secondary level.

Objectives

The following are the objectives of the present study.

1. To assess the impact of virtual laboratories on student engagement, conceptual understanding and practical skills in physical science.
2. To examine the perceptions and preparedness of teachers for integrating virtual laboratories in teaching physical science to secondary school students.

**Ramakrishna Reddy**

- 3.To evaluate the effectiveness of virtual labs in addressing challenges faced by schools with limited laboratory infrastructure.
- 4.To explore strategies for aligning virtual laboratory tools with existing Physical Science curricula and pedagogical practices.

Hypotheses

- 1.The use of virtual laboratories does not significantly impact student engagement, conceptual understanding and practical skills in Physical Science.
- 2.Teachers do not perceive virtual laboratories as effective tools for teaching physical science or feel prepared to integrate them into their instruction.
- 3.Virtual laboratories do not effectively address the challenges faced by schools with limited laboratory infrastructure.
- 4.Aligning virtual laboratory tools with the existing Physical Science curricula and pedagogical practices does not substantially improve their integration and effectiveness in the teaching-learning process.

RESEARCH METHODOLOGY

This study employs a mixed-methods approach, combining both quantitative and qualitative methods to provide a comprehensive analysis of the impact of virtual laboratories on Physical Science education. The population consists of secondary school students studying Physical Science and their teachers, with a sample of 100 students and 10 teachers from various schools in Anantapur District, Andhra Pradesh. Participants were selected based on their willingness to participate and the availability of virtual lab infrastructure. Data collection tools included pre-tests and post-tests to assess students' conceptual understanding before and after engaging with virtual labs, semi-structured interviews to gather insights into the perceptions of both teachers and students regarding the use of virtual labs, and classroom observations to document teaching practices and student engagement during virtual lab activities. Data were collected over eight weeks, during which students engaged with virtual labs on topics such as Newton's Laws, electricity, and chemical reactions. Pre-tests were conducted before each session, followed by post-tests after each virtual lab activity to assess the impact on student learning. Quantitative data were analysed using paired t-tests to determine the effect of virtual labs on learning outcomes, while qualitative data from interviews and observations were analysed thematically to identify common patterns, perceptions, and challenges related to virtual labs. Ethical considerations included obtaining informed consent from all participants, maintaining confidentiality of data, and adhering to ethical research practices throughout the study.

Implementation of Virtual Labs in Teaching Physical Science

The integration of virtual laboratories (virtual labs) into teaching Physical Science in secondary schools offers a transformative approach to learning. To ensure successful implementation, it is essential to follow a well-structured framework that includes preparation, training, infrastructure setup, curriculum alignment and effective student engagement. The first step in the process is teacher preparation. Teachers must receive adequate training in using virtual lab platforms, understanding their functionalities and integrating them into their pedagogical practices. The training should cover both the technical aspects of the virtual labs and the pedagogical strategies needed to enhance the learning experience for students. In addition to teacher training, schools need to invest in the necessary technological infrastructure. This includes providing students with access to computers, tablets, or other devices, as well as ensuring reliable internet connectivity. Schools should also select appropriate virtual lab platforms that are aligned with the curriculum and provide a variety of interactive experiments that allow students to explore key concepts in Physical Science, such as Newton's Laws, electricity and chemical reactions. It is also essential to have technical support in place to address any issues related to hardware or software during the implementation phase. Another critical aspect of the implementation is aligning virtual labs with the existing Physical Science curriculum. Virtual labs should be integrated as a complement to traditional teaching methods, helping to reinforce and extend the lessons taught in the classroom. This integration can be achieved by mapping specific experiments to curriculum

**Ramakrishna Reddy**

topics, such as motion, energy, or chemical reactions. Virtual labs can be used in a blended learning approach, where they act as supplementary resources for hands-on experiments or as a substitute when physical resources are unavailable. Virtual labs offer an interactive and engaging learning environment that can enhance student participation. Teachers should guide students through the virtual experiments, ensuring they understand the underlying scientific principles. Collaborative learning can be encouraged by organizing group discussions or activities, promoting teamwork and critical thinking. Virtual labs also provide opportunities for self-paced learning, allowing students to explore experiments at their own speed, fostering independence and curiosity. Monitoring and assessing student progress is an integral part of the virtual lab implementation process. Pre and post-assessments should be conducted to measure changes in students' conceptual understanding and retention of key topics. Teachers can also use formative assessments, such as quizzes or assignments, to track student progress throughout the learning process. Performance in virtual labs should be assessed based on students' ability to hypothesize, conduct experiments and draw accurate conclusions from their observations. Feedback from both students and teachers is essential for continuous improvement in the use of virtual labs. Collecting feedback from students about their experiences with the labs, including their engagement and understanding, can help teachers identify areas for improvement. Similarly, teachers should reflect on the challenges and successes of integrating virtual labs into their teaching and adjust their approaches as needed. Ongoing technical and pedagogical adjustments can help enhance the effectiveness of virtual labs in the classroom.

RESULTS AND DISCUSSION

The integration of virtual laboratories into the teaching of Physical Science to secondary school students was evaluated through pre-tests, post-tests, classroom observations and interviews with teachers and students. The results offer valuable insights into the effectiveness of virtual labs in improving student engagement, conceptual understanding and practical skills. The discussion of the results is organized into several key themes: learning outcomes, student engagement, teacher perceptions and challenges faced.

Objective-1**To assess the impact of virtual laboratories on student engagement, conceptual understanding and practical skills in Physical Science.**

The quantitative data collected from the pre-tests and post-tests indicate significant improvement in students' conceptual understanding after engaging with virtual labs. The pre-test results showed that students had a basic understanding of key Physical Science concepts (e.g., Newton's Laws, electricity and chemical reactions). In contrast, the post-test scores reflected improved comprehension and better retention of scientific principles. Table 1 presents the mean and standard deviation (S.D) scores for the impact of virtual laboratories on secondary school students' engagement, conceptual understanding and practical skills in Physical Science, comparing pre-test and post-test results along with the calculated t-value. The paired t-tests conducted on the pre- and post-test scores confirmed that the improvement in learning outcomes was statistically significant ($p < 0.05$). As shown in Table 1, the obtained t-value for the pre-test and post-test is significant at the $p < 0.05$ level, indicating that virtual labs effectively enhanced students' understanding of complex Physical Science concepts. Therefore, the hypothesis "the use of virtual laboratories does not significantly impact student engagement, conceptual understanding, and practical skills in Physical Science" is rejected. The mean score increased by approximately 25%, from 55.2 (pre-test) to 80.4 (post-test), indicating that virtual labs effectively enhanced students' understanding of complex Physical Science concepts. This finding supports Anderson *et al.*, (2017), who reported that virtual labs improve conceptual understanding by providing interactive, hands-on learning experiences. The simulations in virtual labs allow students to visualize phenomena that might be difficult to observe in traditional classrooms, facilitating better retention and comprehension. These results are further corroborated by Hogben & Coetzee (2015), who found that virtual labs foster active and engaging learning, leading to significant improvements in student outcomes. Figure 1 displays the bar diagram representing the significant mean scores of the pre-test and post-test, highlighting that virtual labs effectively enhanced secondary school students' engagement, conceptual understanding and practical skills in Physical Science. Classroom

**Ramakrishna Reddy**

observations and student feedback revealed that students were highly engaged during virtual lab sessions. They actively participated in experiments, collaborated with peers and exhibited greater motivation compared to traditional classroom settings. The interactive nature of virtual labs captured students' attention and fostered curiosity, which in turn increased their involvement in the learning process. This is consistent with Williams (2021), who noted that virtual labs enhance student motivation by offering interactive experiences and immediate feedback. Additionally, Mayer (2019) emphasized that such environments promote deeper engagement and make learning more enjoyable, further supporting the positive impact of virtual labs on student engagement. In interviews and surveys, students reported finding virtual labs enjoyable and helpful in understanding difficult concepts. Many students expressed that virtual labs allowed them to experiment with ideas and explore phenomena that would have been impossible or impractical in a traditional lab setting. These findings align with Williams (2021), who found that virtual labs increase student motivation and participation in science learning.

Objective-2**To examine the perceptions and preparedness of teachers for integrating virtual laboratories in teaching physical science to secondary school students**

Teachers provided positive feedback on the integration of virtual labs, appreciating their flexibility and versatility. Virtual labs allowed students to conduct experiments that would typically require expensive or hard-to-find materials, helping reinforce theoretical concepts with practical application. Hence the hypothesis "*teachers do not perceive virtual laboratories as effective tools for teaching physical science or feel prepared to integrate them into their instruction*" is rejected. Several teachers observed enhanced student engagement and a better understanding of complex scientific concepts after incorporating virtual labs into their lessons. However, some teachers expressed concerns about the initial learning curve and felt unprepared to integrate virtual labs effectively into their teaching. They emphasized the need for additional professional development and support. This aligns with findings from Brown & Miller (2016), who highlighted that inadequate training and support can hinder the effective implementation of educational technology. Furthermore, Reinders (2017) echoed the importance of teacher preparedness in the successful adoption of new technologies in the classroom.

Objective-3**To evaluate the effectiveness of virtual labs in addressing challenges faced by schools with limited laboratory infrastructure**

Despite the positive results, several challenges arose during the implementation of virtual labs. One major issue reported by both students and teachers was technical problems, including slow internet connectivity, software glitches and hardware malfunctions. In some schools with limited resources, students had difficulty accessing the virtual labs due to a lack of devices or unstable internet connections. Hence, the formulated hypothesis "*virtual laboratories do not effectively address the challenges faced by schools with limited laboratory infrastructure*" is rejected. These issues reflect the findings of Jones (2019), who identified access to technology as a barrier to the widespread adoption of virtual labs in education.

Objective-4**To explore strategies for aligning virtual laboratory tools with existing Physical Science curricula and pedagogical practices.**

The integration of virtual laboratory tools with Physical Science curricula has demonstrated positive outcomes, with successful alignment observed in key areas like physics and chemistry. Virtual labs were used to complement hands-on experiments, especially for complex or expensive demonstrations. Teachers adapted their pedagogical practices by incorporating virtual tools into flipped classrooms, enhancing student engagement through interactive learning. Teacher training sessions increased confidence in using virtual labs, leading to better implementation. Hence, the formulated hypothesis "*aligning virtual laboratory tools with the existing physical science curricula and pedagogical practices does not substantially improve their integration and effectiveness in the teaching-learning process*" is rejected. Students showed improved understanding, motivation and critical thinking, while challenges such as technological barriers and resistance to change were noted but addressed through supplemental virtual labs. Aligning virtual laboratory

Ramakrishna Reddy

tools with existing Physical Science curricula presents a significant opportunity to enhance learning by offering flexible, interactive and accessible methods for conducting experiments. Virtual labs provide a valuable supplement to physical experiments, especially in resource-constrained environments, fostering a deeper conceptual understanding. However, successful integration depends on careful curriculum planning, effective teacher training and continuous support. The use of virtual tools, when combined with traditional methods, enriches the overall learning experience, ensuring that students develop both practical and theoretical skills. Ongoing adaptation and investment in infrastructure are necessary to ensure that virtual labs meet the evolving needs of science education.

Implications of the Study

The findings from this analysis offer a solid foundation for practical recommendations aimed at optimizing the integration of virtual laboratories in the teaching of Physical Science in secondary schools. The following recommendations are presented to enhance the educational experience for students and to make virtual labs a valuable teaching tool in Physical Science

Enhancement of Teaching and Learning

The study demonstrates that virtual labs significantly improve students' understanding of complex Physical Science concepts. This positive impact suggests that incorporating virtual labs into the curriculum can enhance both conceptual understanding and practical skills. Teachers should consider making virtual labs an integral part of their teaching, particularly for abstract and challenging scientific phenomena that are difficult to demonstrate through traditional means.

Teacher Training and Professional Development

Teachers' concerns about the learning curve when adopting virtual labs highlight the need for comprehensive professional development programs. Adequate training is essential to ensure that teachers can effectively integrate virtual labs into their lessons and maximize their potential. Educational institutions should invest in ongoing professional development to equip teachers with the necessary skills and knowledge, ultimately improving the learning experience for students.

Access and Equity

The study identifies challenges related to access, particularly in schools with limited resources, where students may not have the required devices or internet connectivity. To ensure equitable access to virtual labs, policymakers and educational institutions must address infrastructure gaps. This includes investing in affordable devices, enhancing internet connectivity and creating initiatives to bridge the digital divide, ensuring all students have the opportunity to benefit from virtual labs.

Engagement and Motivation

Findings from the study suggest that virtual labs can be powerful tools to increase student engagement and motivation in Physical Science education. The interactive nature of virtual labs fosters curiosity and active participation. Teachers should focus on utilizing these tools not only to improve content delivery but also to create an engaging and motivating learning environment that inspires students to take an active role in their learning.

Curriculum Integration

The successful implementation of virtual labs calls for the seamless integration of technology into the existing curriculum. Teachers should work towards aligning virtual labs with the science curriculum to create a cohesive learning experience. This approach will allow virtual labs to complement theoretical lessons, making them more dynamic, accessible and adaptable to different learning styles.

Future Research Directions

The study highlights the need for further research to explore the long-term effects of virtual labs on students' learning outcomes, particularly their critical thinking and problem-solving abilities. Longitudinal studies are

**Ramakrishna Reddy**

essential to evaluate how virtual labs affect knowledge retention and whether they promote a deeper understanding of Physical Science concepts over time. Additionally, research on the effectiveness of different virtual lab platforms will help identify best practices for their integration into the classroom.

Educational Policy and Innovation

The findings of this study can inform educational policy decisions by showcasing the benefits of virtual labs in secondary school science education. Policymakers should support the adoption of virtual labs by providing funding for technology infrastructure and teacher training programs. By fostering innovation in education, virtual labs can enhance the teaching of Physical Science, improve student engagement and address the limitations of traditional laboratory setups. These recommendations are intended to guide educational institutions, administrators and policymakers in creating an environment where virtual laboratories can be effectively integrated to enhance the quality of Physical Science education in secondary schools. By implementing these strategies, schools can foster a dynamic learning environment that supports both teachers and students. These efforts will ensure the continuous improvement of virtual laboratory integration, thereby maximizing its potential to positively transform teaching practices and student outcomes in Physical Science. The successful adoption of virtual labs can lead to more engaging, interactive and accessible learning experiences, enriching the educational process and providing students with the skills necessary to succeed in an increasingly technology-driven world.

CONCLUSION

In conclusion, the implementation of virtual laboratories in teaching Physical Science to secondary school students represents a significant advancement in modern education. The findings of this study highlight the substantial benefits that virtual labs bring to the classroom, particularly in enhancing students' understanding of complex scientific concepts. Virtual labs provide students with interactive and immersive learning experiences that not only deepen their conceptual understanding but also foster critical thinking, problem-solving and curiosity—skills essential for success in the 21st century. The positive reception from both teachers and students underscores the effectiveness of virtual labs in improving engagement, motivation and overall learning outcomes. Teachers have expressed a strong appreciation for the flexibility and versatility that virtual labs offer, allowing them to conduct experiments and demonstrations that might otherwise be difficult or impossible due to resource constraints. Moreover, virtual labs provide students with the opportunity to experiment with real-time results, which enhances their hands-on learning experience. However, successful implementation requires careful attention to several factors, including teacher training, access to technology and curriculum integration. Teachers need adequate professional development to maximize the potential of virtual labs, while efforts must be made to ensure equitable access for all students, particularly in under-resourced schools. Additionally, aligning virtual labs with the existing curriculum will ensure that these tools complement traditional teaching methods, creating a more dynamic and engaging learning environment. The study's findings also emphasize the importance of continued research into the long-term impact of virtual labs, particularly on students' critical thinking, retention and application of scientific concepts. As technology continues to evolve, ongoing evaluation and adaptation of virtual laboratory programs will be crucial to maintaining their relevance and effectiveness. In essence, the integration of virtual labs into Physical Science offers a promising pathway to revolutionize science teaching in secondary schools. By embracing these tools, teachers and policymakers can work together to provide students with an innovative, engaging and comprehensive learning experience that prepares them for the challenges and opportunities of the future.

Appendices

Appendix A Pre-Test and Post-Test Questionnaires

Appendix B Sample Lesson Plan Using Virtual Labs

Appendix C Semi-Structured Interview Guide

Ramakrishna Reddy

Appendix D Observation Checklist

Appendix-A

Pre-Test and Post-Test Questionnaires

Pre-Test Questionnaire

Objective

To assess the initial knowledge and understanding of students before the course begins. This helps in identifying the baseline of students' learning.

Section A

General Information

1. Name : _____
2. Age : _____
3. Gender : _____
4. Class : _____
5. Subject of Study : _____
6. Duration of the Course : _____

Section B

Subject Knowledge (Multiple Choice Questions)

Instructions Circle the correct answer for each of the following questions.

1. What is the scientific method?
 - a) A process to test hypotheses
 - b) A way to explore personal opinions
 - c) A method for memorizing facts
 - d) A set of traditional beliefs
2. Which of the following is a characteristic of a good experiment?
 - a) It uses a single variable
 - b) It requires no data collection
 - c) It has no control group
 - d) It produces subjective results
3. In Physical Sciences, which of the following best explains Newton's Laws of Motion?
 - a) The relationship between force, mass and acceleration
 - b) The concept of energy conservation in a system
 - c) The principle of action and reaction forces
 - d) The behaviour of objects in motion and at rest
4. What is the primary aim of teaching Physical Science in schools?
 - a) To develop a scientific temper and inquiry-based thinking
 - b) To understand the fundamental laws and principles governing the physical world
 - c) To encourage practical application of scientific knowledge in daily life
 - d) To prepare students for careers and higher studies in science and technology

Section C

Open-Ended Questions

1. Briefly explain the role of science in modern education.

2. How would you approach teaching a difficult concept in physical science?

Ramakrishna Reddy

3. What methods do you think are most effective in promoting critical thinking in students?

Post-Test Questionnaire

Objective

To assess the knowledge and skills gained by students during the course. This helps to determine how much improvement has been made.

Section A

Subject Knowledge (Multiple Choice Questions)

Instructions Circle the correct answer for each of the following questions.

1. Which of the following is the first step in the scientific method?
 - a) Observation
 - b) Conclusion
 - c) Experimentation
 - d) Hypothesis
2. In an experiment, what is the purpose of the control group?
 - a) To test the effect of the independent variable
 - b) To compare results with the experimental group
 - c) To randomly assign participants
 - d) To observe natural behaviour
3. Which of the following best describes Newton's Laws of Motion?
 - a) Laws explaining the relationship between force, mass and acceleration
 - b) Principles describing the behaviour of objects at rest and in motion
 - c) Rules stating that every action has an equal and opposite reaction
 - d) Concepts illustrating the conservation of energy and momentum in a system
4. What is the significance of assessment in teaching Physical Science?
 - a) To evaluate students' understanding of scientific concepts and principles
 - b) To identify gaps in learning and provide targeted support
 - c) To measure the application of scientific knowledge in solving real-world problems
 - d) To encourage critical thinking and analytical skills development

Section B

Open-Ended Questions

1. How has your understanding of the scientific method changed after completing this course?
2. Explain how you would integrate modern teaching tools in teaching a biology lesson on cellular respiration.
3. What strategies will you use to promote problem-solving skills in mathematics?

Ramakrishna Reddy

Section C

Self-Reflection

1. On a scale of 1 to 5, how confident are you about your ability to teach the topics you have learned?
(1 - Not Confident, 2 - Slightly Confident, 3 - Moderately Confident, 4 – Confident, 5 - Very Confident)
2. What has been the most valuable learning experience in this course for you?

3. What areas would you like to explore further to improve your knowledge in this subject?

Appendix-B

Sample Lesson Plan Using Virtual Labs

Lesson Title Exploring Newton's Laws of Motion Using Virtual Labs

Grade Level 8th - 10th Grade (Secondary School)

Subject Physical Science

Duration 60 minutes

Materials Needed

- Computers/Tablets with Internet Access
- Virtual Lab Software (e.g., PhET Simulations or any other Physics virtual lab platform)
- Projector (for class-wide demonstration)
- Handouts with guided questions
- Whiteboard and markers

Lesson Objectives

By the end of this lesson, students will be able to:

1. Demonstrate an understanding of Newton's three laws of motion.
2. Apply the concepts of force, mass and acceleration in virtual simulations.
3. Conduct virtual experiments to observe how forces affect motion.
4. Analyze data from the virtual experiments to make predictions based on Newton's Laws.
5. Evaluate real-world applications of Newton's Laws of Motion.

Lesson Plan Outline

Introduction (10 minutes)

Warm-up Discussion

Begin the lesson by asking students to discuss their prior knowledge of Newton's Laws of Motion. Prompt questions like

- "What is force?"
- "Can you give examples where you see Newton's laws at work in everyday life?"
- "How do you think a car moves when you press the accelerator?"

Write key points on the whiteboard and transition into the lesson.

**Ramakrishna Reddy****Overview of the Concept**

Introduce the concept of Newton's three laws of motion:

First Law (Law of Inertia) An object at rest will stay at rest and an object in motion will stay in motion unless acted on by an external force.

Second Law (Force and Acceleration) The force acting on an object is equal to the mass of the object times its acceleration ($F = ma$).

Third Law (Action and Reaction) For every action, there is an equal and opposite reaction.

Virtual Lab Exploration (35 minutes)**1. Virtual Lab Introduction (5 minutes)**

Introduce the virtual lab platform to the students (e.g., PhET Simulations, Interactive Physics Labs). Explain the objectives of the virtual lab, which are to explore and visualize the effects of forces on motion.

Briefly demonstrate how to use the virtual lab, including how to manipulate variables such as mass, force and acceleration.

2. Guided Virtual Lab Activity (20 minutes)

Students will work in pairs or small groups to conduct virtual experiments using a virtual lab simulation focused on Newton's Laws (e.g., exploring how varying forces affect the motion of objects, or how mass impacts acceleration).

Instructions for students

Start with Newton's First Law by simulating an object at rest and applying varying forces.

Move on to Newton's Second Law, adjusting the force and mass and observing the acceleration of the object.

Finally, demonstrate Newton's Third Law by simulating the interaction of two objects, noting the action and reaction forces.

3. Data Collection and Observation (10 minutes)

Students will collect data from their experiments, recording their observations about how the object's motion changes with different forces, masses and accelerations.

Provide students with a set of guided questions to answer based on their observations

- How does changing the force applied to an object affect its acceleration?
- What happens when you increase the mass of the object? How does this affect its motion?
- How can you observe Newton's Third Law in action using this virtual lab?

Group Discussion and Analysis (10 minutes)**1. Class wide Discussion**

After completing the virtual lab activity, bring the class together for a group discussion. Ask students to share their observations and conclusions from the virtual lab.

Discuss how the virtual lab demonstrated Newton's Laws. For each law, encourage students to explain their findings and observations.

Use the whiteboard to summarize the findings:

First Law What did you observe when no external force was applied?

Second Law How did acceleration change with different forces and masses?

Third Law Can you give an example of action and reaction from your experiments?

2. Real-World Applications

Ask students to provide examples of where Newton's Laws apply in real life (e.g., car crashes, rocket launches, sports like basketball).

Ramakrishna Reddy

Discuss how understanding these laws is essential in designing vehicles, machines and even in sports science.

Conclusion (5 Minutes)

1. Recap and Summary

Recap the three laws of motion and their real-world applications.

Emphasize the importance of Newton's Laws in understanding motion and force.

2. Exit Ticket (Homework or Reflective Task)

Assign a reflective task where students write a paragraph on how they would apply Newton's Laws to solve a real-world problem (e.g., improving car safety or designing a new sport).

Alternatively, assign a related reading or provide additional virtual lab resources for independent exploration.

Assessment

Formative Assessment

Observations during the virtual lab activity (Are students engaged? Are they correctly conducting experiments and recording data?).

Participation in class discussion (Do students demonstrate an understanding of Newton's Laws?).

Summative Assessment

Exit ticket or homework task on applying Newton's Laws to real-life situations.

Extension Activity (Optional)

Encourage students to explore additional simulations on the virtual lab platform, such as studying the effect of friction or gravity on motion. This can be a homework activity or a group project.

Reflection

At the end of the lesson, ask students to reflect on how the use of the virtual lab helped them understand Newton's Laws in a more interactive and visual way. Gather feedback on the virtual lab experience and suggest improvements for future lessons.

Teacher's Notes

- Ensure all students have access to computers or tablets with the necessary software installed or accessible online.
- Be ready to assist students with technical difficulties during the virtual lab activity.
- Adjust the pace based on the students' familiarity with the virtual lab tool.

Appendix-C

Semi-Structured Interview Guide

Objective

The purpose of this semi-structured interview guide is to collect qualitative data about the experiences and perspectives of students and teachers regarding the integration of virtual labs in teaching Physical Science concepts. The guide aims to explore how virtual labs impact learning outcomes, student engagement and teaching practices.

General Information

1. Participant's Role

- Student
 Teacher/Teacher
 Other (Please specify): _____

2. Grade/Level

- Middle School

**Ramakrishna Reddy**

- High School
 Other (Please specify): _____

3. Duration of Experience with Virtual Labs

- Less than 6 months
 6 months to 1 year
 More than 1 year

Interview Questions:**Section 1****Introduction to Virtual Labs**

1. How would you describe your understanding of Newton's Laws of Motion (or the specific concept relevant to the virtual lab)?
 - Follow-up: Can you share how you were introduced to this topic in your course?
2. What was your initial reaction to using virtual labs for learning this concept?
 - Follow-up: Were you familiar with virtual labs before this experience? If yes, how was this experience similar or different?

Section 2**Impact on Learning and Understanding**

3. How do you feel the virtual lab helped you understand the concepts of Newton's Laws (or other physical science concepts)?
 - Follow-up: Can you describe a specific instance from the virtual lab that enhanced your understanding of the topic?
4. In your opinion, did the virtual lab allow you to visualize the principles of motion better than traditional methods (e.g., lectures, textbooks)?
 - Follow-up: What specific features of the virtual lab contributed to your understanding?
5. Did the virtual lab help you apply theoretical knowledge to practical scenarios? Can you provide an example?

Section 3**Student Engagement and Interaction**

6. How engaging did you find the virtual lab activities?
 - Follow-up: What aspects of the virtual lab made it engaging or less engaging for you?
7. Did you feel more motivated to explore and learn on your own while using the virtual lab? Why or why not?
8. Was there any part of the virtual lab that you found challenging or confusing? If so, what was it?
 - Follow-up: How did you overcome these challenges? Were any resources provided to help you?

Section 4**Teacher's Role and Support**

9. What role did your teacher/teacher play during the virtual lab sessions?
 - Follow-up: Was the teacher's support helpful in navigating the virtual lab? If yes, how?
10. Do you think virtual labs require a different kind of teaching approach compared to traditional methods?
 - Follow-up: How can teachers make virtual labs more effective in promoting learning?

Section 5**Reflection on Learning Outcomes**

11. Do you think using virtual labs improved your problem-solving skills or critical thinking related to Physical Science concepts?
 - Follow-up: Can you describe how you applied these skills in your work or during assessments?

Ramakrishna Reddy

12. How do you think the use of virtual labs can impact your future learning in Physical Science or other subjects?
- Follow-up: Would you prefer more virtual lab activities in your future learning? Why or why not?
13. In your opinion, what are the advantages and disadvantages of using virtual labs for teaching and learning Physical Science?

Section 6

Suggestions for Improvement

14. How do you think virtual labs could be improved to make them more effective for learning Physical Science?
- Follow-up: Are there any specific features or tools that you think would enhance the experience?
15. Do you have any suggestions for teachers on how they can better integrate virtual labs into their teaching practices?

CONCLUSION

Is there anything else you would like to share about your experience with virtual labs in learning Physical Science?

Note for the Interviewer

- The above questions can be adjusted based on the specific focus of the interview (e.g., exploring student engagement, teacher perspectives, or technical challenges).
- Encourage interviewees to elaborate on their responses and provide examples wherever possible.
- Maintain flexibility in the interview, allowing for open-ended exploration of themes that arise during the conversation.

Appendix-D

Observation Checklist

Objective

The purpose of this checklist is to observe and assess student engagement, behaviour and understanding while using virtual labs to explore Physical Science concepts (e.g., Newton's Laws of Motion). It can help identify strengths and areas for improvement in both the virtual lab tool and the instructional methods used.

General Information

- Date of Observation : _____
- Observer's Name : _____
- Class : _____
- Topic Being Explored : Newton's Laws of Motion
- Virtual Lab Tool Used : _____
- Duration of Observation : _____

General Observations and Feedback

- What aspects of the virtual lab did you observe students engaging with most effectively?
- Were there any technical issues with the virtual lab that disrupted the learning experience? If so, describe them.
- Were there any challenges students faced in using the virtual lab? If so, what were they?
- Do you feel the virtual lab effectively supported the learning objectives of the lesson? Explain.
- What suggestions do you have for improving the virtual lab experience for students?

Observer's Signature: _____

Date : _____

Ramakrishna Reddy

Table. Mean and S.D. of for the impact of virtual laboratories on secondary school students' engagement, conceptual understanding and practical skills in Physical Science, along with the calculated t-value.

Test Type	Number of Participants (N)	Mean (μ)	S.D (σ)	t-Value
Pre-test	100	55.2	13.77	12.35 *
Post-test	100	80.4	15.09	

Note: * statistically significant @ $p < 0.05$

Student Engagement and Interaction

S. No.	Criteria	Yes	No	Comments
1.	The student(s) engaged with the virtual lab from the start.	[]	[]	
2.	The student(s) demonstrated curiosity and asked questions.	[]	[]	
3.	The student(s) explored multiple features of the virtual lab.	[]	[]	
4.	The student(s) worked independently without excessive help.	[]	[]	
5.	The student(s) collaborated effectively with peers (if applicable).	[]	[]	
6.	The student(s) were able to manipulate variables (e.g., mass, force) in the virtual lab.	[]	[]	
7.	The student(s) showed persistence when encountering challenges or errors.	[]	[]	

Behavioural Observations

S. No.	Criteria	Yes	No	Comments
1.	The student(s) followed instructions provided by the teacher or the lab tool.	[]	[]	
2.	The student(s) exhibited focused attention during the virtual lab.	[]	[]	
3.	The student(s) made observations and recorded data accurately.	[]	[]	
4.	The student(s) used the virtual lab tools appropriately (e.g., adjusting forces, measuring distance).	[]	[]	
5.	The student(s) followed safety guidelines (if applicable).	[]	[]	

Student Understanding and Application of Concepts

S. No.	Criteria	Yes	No	Comments
1.	The student(s) demonstrated understanding of key concepts (e.g., Newton's Laws).	[]	[]	
2.	The student(s) successfully applied theoretical knowledge to virtual experiments.	[]	[]	
3.	The student(s) made connections between virtual lab findings and real-world applications.	[]	[]	
4.	The student(s) answered guided questions or prompts based on observations.	[]	[]	
5.	The student(s) demonstrated critical thinking by analyzing experimental results.	[]	[]	

Teacher Facilitation and Support

S. No.	Criteria	Yes	No	Comments
1.	The teacher provided clear instructions on how to use the virtual lab.	[]	[]	
2.	The teacher monitored student progress during the virtual lab activity.	[]	[]	
3.	The teacher provided timely and relevant feedback to the students.	[]	[]	
4.	The teacher assisted with any technical difficulties or challenges.	[]	[]	
5.	The teacher encouraged student collaboration and discussion.	[]	[]	

Ramakrishna Reddy

Virtual Lab Effectiveness

S. No.	Criteria	Yes	No	Comments
1.	The virtual lab provided a clear and intuitive user interface.	[]	[]	
2.	The virtual lab was able to simulate real-world physics effectively.	[]	[]	
3.	The virtual lab offered sufficient variety in experiments and variables to explore.	[]	[]	
4.	The virtual lab provided immediate feedback to student actions (e.g., visualizing motion, displaying results).	[]	[]	
5.	The virtual lab encouraged active learning and problem-solving.	[]	[]	

Figure 1. Mean scores of the pre-test and post-test, highlighting that virtual labs effectively enhanced secondary school students' engagement, conceptual understanding and practical skills in Physical Science.

Environmental Awareness and Language Learning through Indian Booker Prize-Winning Literature: An Interdisciplinary Approach

ABSTRACT

Indian Booker Prize-winning novels are applauded for their global recognition and stylistic innovation and also for their profound engagement with environmental issues rooted in uniquely Indian contexts. Unlike Western environmental literature, which often frames nature as separate from human experience, these texts reveal the environment as intricately connected to social, political, and cultural forces. They illustrate how colonial histories, postcolonial development models, and persistent social hierarchies influence environmental realities in the subcontinent. This paper examines the portrayal of environmental issues in works by Indian Booker Prize-winning authors and explores how these texts can simultaneously raise environmental awareness and facilitate language acquisition. Through close analysis of selected works by Arundhati Roy, Kiran Desai, Aravind Adiga, and Salman Rushdie, this study identifies recurring environmental themes, linguistic strategies, and pedagogical applications. The findings reveal that these authors employ rich descriptive language, cultural-environmental intersections, and narrative techniques that not only highlight ecological concerns but also provide valuable resources for language learning. This research contributes to the growing field of ecocriticism while proposing practical frameworks for integrating these literary works into language education, particularly for learners of English as an additional language.

Keywords: Ecolinguistics, Indian literature, Booker Prize, language acquisition, environmental awareness, ecocriticism, postcolonial literature

Gandhimathi et al.,

INTRODUCTION

The intersection of environmental discourse and literary studies has gained increasing prominence in recent decades, paralleling the global rise in ecological awareness. Concurrently, the use of authentic literary texts in language teaching has demonstrated significant benefits for vocabulary development, cultural understanding, and critical thinking skills. Indian authors who have won the prestigious Booker Prize represent a particularly valuable corpus for examination within this dual framework, as their works often engage with environmental concerns while employing distinctive linguistic features that reflect India's complex socio-ecological landscape. This research investigates how the works of Indian Booker Prize winners—Arundhati Roy (*The God of Small Things*, 1997), Kiran Desai (*The Inheritance of Loss*, 2006), Aravind Adiga (*The White Tiger*, 2008), and Salman Rushdie (*Midnight's Children*, 1981)—portray environmental issues and how these portrayals can be leveraged for language acquisition. By analyzing their narrative techniques, thematic concerns, and linguistic innovations, this paper aims to establish frameworks for understanding how literary engagement with environmental themes can simultaneously advance language learning objectives.

The research addresses three primary questions

1. How do Indian Booker Prize-winning authors represent environmental issues in their works?
2. What linguistic and stylistic features characterize their environmental discourse?
3. How can these works be effectively utilized for language acquisition while raising environmental awareness?

LITERATURE REVIEW

Ecocriticism and Indian Literature

Ecocriticism, which examines the relationship between literature and the physical environment, has evolved significantly since its formal emergence in the 1990s. Initially centered on Western nature writing, the field has expanded to encompass diverse cultural perspectives, including postcolonial ecocriticism (Huggan and Tiffin 23). Postcolonial ecocriticism acknowledges that environmental experiences are shaped by historical, cultural, and political forces, particularly in formerly colonized regions like India. Indian ecocriticism has developed distinct characteristics reflecting the nation's unique environmental challenges. Mukherjee argues that Western ecocritical frameworks often prove inadequate for analyzing Indian literature due to different conceptions of nature-human relationships and environmental justice (42). Similarly, Nayar notes that Indian environmental literature frequently intertwines ecological concerns with caste, class, and gender issues, creating multidimensional narratives that resist simple categorization (78). Recent scholarship has begun examining Indian Booker Prize winners through ecocritical lenses. Sen analyzes Roy's portrayal of the Kerala landscape as inseparable from social and political narratives (19). Chakraborty explores Desai's representation of the Himalayas as sites of environmental and cultural contestation (57). However, comprehensive analysis of environmental themes across multiple Indian Booker winners remains limited.

Literary Texts and Language Acquisition

The use of literary texts for language teaching has a long history, with varying degrees of emphasis through different methodological periods (Hall 25). Contemporary approaches to literature in language education highlight its authenticity, cultural value, and capacity to engage learners emotionally (Kramsch and Kramsch 559). Literature provides exposure to diverse linguistic features, including metaphor, imagery, and culturally-specific expressions that expand learners' receptive and productive vocabulary (Lazar 38). Research by Paran demonstrates that literary engagement enhances multiple language skills simultaneously (471), while Carter and Long propose three primary models for using literature in language teaching: the cultural model, the language model, and the personal growth model (53). These frameworks provide valuable starting points for incorporating environmental literature into language instruction. Several studies have examined specific linguistic benefits of literary engagement. Hanauer found that poetry analysis enhanced sensitivity to language forms (301), while Belcher and Hirvela demonstrated

**Gandhimathi et al.,**

that literature-based assignments improved academic writing skills (26). However, research specifically addressing the language acquisition potential of Indian environmentally-focused literature remains sparse.

Environmental Education Through Literature

Environmental education increasingly recognizes literature's potential for fostering ecological awareness. Garrard argues that narrative engagement with environmental issues can generate empathy and understanding that scientific accounts alone may not achieve (142). Similarly, Buell contends that environmental imagination, cultivated through literary exposure, is essential for developing sustainable perspectives (63). In language education contexts, Melin proposes an "ecolinguistic" approach that integrates environmental content with language learning objectives (591). This approach emphasizes that language acquisition occurs most effectively when connected to meaningful content, suggesting that environmentally-themed literature could serve dual pedagogical purposes. Studies by Goulah demonstrate that content-based language instruction using environmental themes increases both language proficiency and environmental literacy (95). However, few studies have specifically examined how sophisticated literary works by Indian authors might function within this framework.

METHODOLOGY

This research employs a qualitative approach combining close textual analysis with theoretical frameworks from ecocriticism and language acquisition theory. The selected corpus consists of four novels by Indian Booker Prize winners:

1. *The God of Small Things* (1997) by Arundhati Roy
2. *The Inheritance of Loss* (2006) by Kiran Desai
3. *The White Tiger* (2008) by Aravind Adiga
4. *Midnight's Children* (1981) by Salman Rushdie

The texts were selected based on their

- Recognition through the Booker Prize
- Engagement with environmental themes
- Linguistic richness and innovation
- Cultural significance within Indian literature

The analytical framework incorporates

1. Ecocritical Analysis

Identification and examination of environmental themes, representations of nature, human-environment relationships, and ecological metaphors.

2. Linguistic Analysis

Assessment of vocabulary, syntax, figurative language, and narrative techniques related to environmental descriptions.

3. Pedagogical Application

Development of frameworks for utilizing these texts in language acquisition contexts, with attention to vocabulary development, reading comprehension, cultural understanding, and critical thinking.

The study employed an iterative coding process to identify recurring environmental themes and linguistic features across the four texts. These codes were subsequently organized into categories reflecting dominant patterns of environmental representation and language use.

Gandhimathi et al.,

Findings and Analysis

Environmental Themes in Indian Booker Prize-Winning Works

Environmental Degradation and Development

All four authors engage critically with environmental degradation resulting from various development paradigms. In *The God of Small Things*, Roy vividly depicts the pollution of the Meenachal River: "Downriver, a saltwater barrage had been built, in exchange for votes from the influential paddy-farmer lobby. The barrage regulated the inflow of saltwater from the backwaters that opened into the Arabian Sea. So now they had two harvests a year instead of one. More rice, for the price of a river" (124). This passage explicitly links environmental degradation to political expediency and economic gain. Similarly, Adiga's *The White Tiger* presents environmental destruction as a consequence of rapid urbanization and industrialization. The protagonist describes Delhi's polluted atmosphere: "A million scooters, cars, taxis, buses, and trucks sending up their fumes, thickening the air with smoke, with desire and with anger" (132). This description integrates environmental pollution with emotional and psychological states, suggesting interconnections between environmental and human well-being. Desai's *The Inheritance of Loss* portrays environmental damage in the Himalayan region, demonstrating how colonialism's legacy continues to shape landscapes: "The forest floor was becoming spongy, threatening a change in character altogether, from the mossed trunks, the magnificent fern and orchid-laden trees... to something bland that would be terrible" (87). Desai connects deforestation to broader themes of cultural and ecological loss.

Nature as Cultural Identity

The authors consistently represent natural environments as repositories of cultural identity and memory. Rushdie's *Midnight's Children* portrays India's diverse ecosystems as inseparable from national identity: "Above all things, I fear absurdity... the laughter of the universe, of the underneath-of-history... and greatest of all, the laugh of the water which will redeem the earth from what men have made of it" (339). Rushdie's personification of water suggests nature's agency in resisting human dominance. Roy similarly depicts the Meenachal River as integral to characters' identities: "They dreamed of their river. Of the coconut trees that bent into it and watched, with coconut eyes, the boats slide by. Upstream in the mornings. Downstream in the evenings. And the dull, sullen sound of the boatmen's bamboo poles as they thudded against the dark, oiled boatwood" (204). This passage illustrates how environmental features become embedded in cultural memory and personal identity.

Environmental Justice and Social Hierarchies

A particularly distinctive feature across these works is their consistent linking of environmental issues with social hierarchies. Adiga explicitly connects environmental inequality to caste and class divisions: "The river's wet, sticky, begrimed, bloodstained banks... where they still cremated bodies" (214). The polluted river serves as both literal environment and metaphor for social degradation. Roy similarly interweaves environmental concerns with caste politics: "The old colonial bungalow with its deep verandah and Doric columns, was surrounded by smaller, older, wooden houses—ancestral homes abandoned by their owners when the History House was leased to Kari Saipu... Beyond it were rice fields fading into the distance, a broad band of sky, and the high wall of the railway embankment" (306). The landscape itself reflects colonial history and caste segregation.

Linguistic and Stylistic Features

Sensory Language and Environmental Description

All four authors employ rich sensory language when describing environments, creating immersive experiences that engage readers emotionally with ecological settings. Roy's prose is particularly notable for its synesthetic qualities: "May in Ayemenem is a hot, brooding month. The days are long and humid. The river shrinks and black crows gorge on bright mangoes in still, dustgreen trees. Red bananas ripen. Jackfruits burst. Dissolute bluebottles hum vacuously in the fruity air" (1). This passage combines visual, olfactory, auditory, and tactile sensations, creating a multisensory environmental experience. Desai similarly employs detailed sensory descriptions of the Himalayan landscape: "The humidity was overwhelming, the vegetation larger than life... Insects whirred, frogs gulped, seeking attention like troublesome adolescents, and the birds-of-paradise plants opened their eagled mouths" (43). These descriptions not only convey environmental information but also evoke emotional and aesthetic responses.

**Gandhimathi et al.,****Neologisms and Linguistic Innovation**

Indian Booker Prize winners frequently employ neologisms and innovative linguistic forms when discussing environmental topics. Rushdie's "chutnification of history" metaphorically connects food preservation with environmental and cultural preservation. Roy's compound constructions like "dustgreen trees" and "bluebottles" create compressed, evocative environmental imagery. These linguistic innovations serve multiple functions: they reflect the authors' bilingual backgrounds, challenge colonial linguistic norms, and create new vocabulary for describing distinctive environmental experiences. From a language acquisition perspective, these innovations demonstrate how language evolves to accommodate new environmental realities.

Narrative Structure and Environmental Time

Environmental themes influence narrative structures in these works, particularly through nonlinear chronologies that reflect ecological rather than human timeframes. Roy's narrative moves between past and present, mirroring the river's cyclical flows. Rushdie's magical realist approach in *Midnight's Children* blends historical and mythical time, placing human events within broader ecological and cosmic contexts. These temporal manipulations challenge conventional Western narratives of linear progress and development, suggesting alternative ways of conceptualizing human-environment relationships. For language learners, these structures provide exposure to complex temporal expressions and narrative techniques.

Pedagogical Applications for Language Acquisition**Vocabulary Development Through Environmental Lexicons**

The environmental descriptions in these works present rich opportunities for vocabulary acquisition. Analysis reveals several distinct lexical fields that could form the basis for vocabulary instruction:

1. Ecosystem-specific vocabulary

Terms related to particular Indian ecosystems (e.g., "monsoon," "backwaters," "laterite")

2. Environmental change vocabulary

Words describing ecological transformation (e.g., "erode," "diminish," "encroach")

3. Sensory descriptive vocabulary

Terms conveying environmental sensations (e.g., "humid," "pungent," "cacophonous")

These lexical fields could be explicitly taught through excerpts from the novels, with activities focusing on semantic relationships, collocations, and contextual usage.

Cultural-Environmental Understanding

The integration of cultural and environmental themes in these works provides valuable resources for developing intercultural competence alongside language skills. Desai's descriptions of the Himalayan landscape, for example, incorporate cultural practices, beliefs, and historical references that enrich understanding of human-environment relationships in the region. Pedagogical applications might include comparative analyses of environmental descriptions from different cultural perspectives, explorations of environmental metaphors across cultures, and discussions of how cultural values shape environmental attitudes.

Critical Reading and Environmental Discourse

These complex literary works encourage critical reading skills essential for advanced language proficiency. The authors' nuanced treatments of environmental issues—avoiding simplistic moral positions while acknowledging ecological complexity—provide models for sophisticated environmental discourse. Language learning activities might include analyzing rhetorical strategies in environmental descriptions, identifying implicit environmental values in narrative passages, and producing critical responses to the authors' environmental perspectives.

**Gandhimathi et al.,**

DISCUSSION

The findings reveal several significant patterns in how Indian Booker Prize winners represent environmental issues and how these representations might contribute to language acquisition.

First, these authors consistently present environmental concerns as inseparable from social, political, and cultural contexts. Unlike some Western environmental literature that may position "nature" as separate from human society, these Indian authors portray environments thoroughly embedded in human histories and power structures. This integrated perspective aligns with recent ecocritical approaches that recognize the inseparability of environmental and social justice (Nixon 37). Second, the linguistic innovations employed when describing environments reflect the authors' positions within postcolonial contexts where English functions as both colonial inheritance and creative medium. Their environmental language demonstrates what Ashcroft et al. term "appropriation"—the process by which postcolonial writers transform the colonizer's language to express distinctly non-Western experiences (83). For language learners, exposure to these innovations can foster metalinguistic awareness and creativity. Third, the findings suggest that these literary works can serve multiple pedagogical functions simultaneously: developing language proficiency, enhancing environmental awareness, and fostering critical thinking about global ecological challenges. This multifunctionality aligns with content-based language instruction principles, which advocate integrating meaningful content with language learning objectives (Stoller 62). However, several challenges exist in utilizing these complex literary works for language acquisition. Their linguistic sophistication, cultural specificity, and narrative complexity may present barriers for less advanced learners. Additionally, the environmental themes often involve distressing realities that require sensitive pedagogical handling.

To address these challenges, educators might

1. Select manageable excerpts focused on environmental descriptions
2. Provide cultural and historical context necessary for comprehension
3. Scaffold language learning through pre-reading vocabulary activities
4. Develop graded tasks appropriate to different proficiency levels
5. Create opportunities for creative response that connect environmental themes to learners' experiences

CONCLUSION

This study demonstrates that Indian Booker Prize-winning authors offer valuable resources for integrating environmental awareness with language acquisition. Their works present sophisticated environmental perspectives that challenge Western assumptions while employing innovative linguistic features that enrich language learning experiences. The findings contribute to emerging research on ecolinguistics and content-based language instruction by identifying specific textual features and pedagogical applications relevant to environmental literature. They also expand ecocritical understanding of Indian literature by highlighting distinctive patterns in how these acclaimed authors represent human-environment relationships.

Several directions for future research emerge from this study

1. Empirical investigation of language acquisition outcomes when using these texts in classroom contexts
2. Comparative analysis of environmental representations in Booker Prize winners from different postcolonial regions
3. Development and testing of specific pedagogical materials based on these literary works
4. Exploration of how digital technologies might enhance engagement with environmental themes in literature

By recognizing the dual potential of these works—to raise environmental awareness and facilitate language acquisition—educators can address urgent ecological concerns while developing essential linguistic competencies. In an era of increasing environmental challenges, this integrated approach offers valuable opportunities for meaningful language education.

ABSTRACT

The rapid advancement of technology has significantly changed educational practices, especially in language learning. The integration of multimedia tools in education has proven to increase learners' engagement and improve learning outcomes. This study explores the effectiveness of ClassPoint in language acquisition through a descriptive analysis and literature review methodology. ClassPoint significantly improves learners' motivation through its interactive features. Research shows that active participation enhances engagement levels, which are essential for effective language learning (Freeman *et al.*, 2014). Learners are more inclined to connect with content when they can interact with it actively, rather than receiving information passively. ClassPoint significantly enhances language learning objectives by promoting learner engagement, offering immediate feedback, and incorporating multimedia resources. These features align with established best practices in language education and contribute to more effective learning outcomes. This study highlights the transformative potential of ClassPoint in language education. Its interactive features, multimedia integration, and alignment with educational theories position it as a valuable tool for enhancing language acquisition.

Keywords: The integration of multimedia tools in education has proven to increase learners' engagement and improve learning outcomes.

**Hasheena Bagem and Geetha Yadav**

INTRODUCTION

The rapid advancement of technology has significantly changed educational practices, especially in language learning. The integration of multimedia tools in education has proven to increase learners' engagement and improve learning outcomes. Research shows that technology based approaches in language education are more effective than traditional methods, promoting interactive and immersive learning experiences (Rahmati *et al.*, 2021). Additionally, the use of technology in educational institutions has been found to positively influence learner engagement and overall academic performance (Higher Education Digest, 2023). This transition highlights the importance of digital tools in supporting effective language acquisition. Multimedia tools, which comprise a combination of text, audio, video, and images, play an important role in addressing diverse learning styles. According to Mayer (2001), multimedia learning can boost understanding and retention by providing multiple representations of information. In language education, this multimodal approach can significantly aid comprehension and retention, allowing learners to engage with the material in various ways. Recent studies, such as those conducted by Mazlan *et al.* (2023), highlight how tools like ClassPoint can motivate young ESL learners by enhancing engagement through multimedia elements. Interactive learning environments, which emphasize active participation and collaboration, are integral to enhancing learner engagement and retention. Research indicates that interactive learning promotes deeper cognitive processing and leads to improved retention of information (Nortvig *et al.*, 2018). When learners participate actively through discussions, collaborative projects, or interactive exercises they are more likely to internalize and apply what they have learned. This is particularly vital in language learning, where practice and interaction with peers are essential for developing proficiency. ClassPoint is an innovative interactive multimedia tool that integrates seamlessly with PowerPoint, allowing educators to create engaging presentations that incorporate quizzes, polls, and multimedia elements. This functionality not only enhances the teaching experience but also fosters active learner engagement. As noted by Abdelrady and Akram (2022), "ClassPoint enhances online learning satisfaction among EFL learners," demonstrating its effectiveness in creating interactive and engaging learning environments. The relevance of ClassPoint in language education lies in its ability to facilitate interactive learning, thereby supporting the development of language skills in a more engaging and enjoyable manner.

Its gamification features such as points, badges, and leader boards serve to motivate learners further, encouraging them to participate actively in their learning journey. This is crucial, as motivation is a significant factor influencing language learning success (Dörnyei, 2001). Despite the many advantages of using multimedia tools like ClassPoint, challenges remain. Issues such as technological accessibility, educator adaptation, and implementation barriers can hinder the effective use of these tools in diverse educational contexts. For instance, not all learners may have equal access to necessary devices or reliable internet connections, which can create disparities in learning experiences. Furthermore, educators may require professional development to effectively integrate technology into their teaching practices (Ertmer & Ottenbreit-Leftwich, 2010). This paper aims to explore ClassPoint's features, benefits, and challenges in language education, providing insights into its role in enhancing language acquisition. By synthesizing existing research, case studies, and user experiences, this study will contribute to the growing discourse on technology-enhanced language education. The findings will suggest that while multimedia technologies like ClassPoint significantly enhance engagement and learning outcomes, further research is needed to evaluate their long-term impact. In conclusion, the integration of tools like ClassPoint represents a significant advancement in the field of language education, offering a pathway to more interactive and effective learning experiences. This study will provide a comprehensive analysis of ClassPoint, highlighting its potential to transform language instruction into various educational contexts.

Research Goal and Questions

The objective of this study is to investigate the effectiveness of ClassPoint as an interactive multimedia tool in enhancing language learning by examining its features and understanding the associated benefits and challenges.

To achieve this, the study will address the following questions:

a. How effectively does ClassPoint enhance language learning?

**Hasheena Bagem and Geetha Yadav**

- b. What are the primary benefits and challenges associated with the use of ClassPoint in language education?
- c. What research has been conducted on the effects of interactive tools in language learning?

RESEARCH METHODOLOGY

This study explores the effectiveness of ClassPoint in language acquisition through a descriptive analysis and literature review methodology. By reviewing prior studies, the research seeks to identify the key benefits and challenges of the tool, as well as its overall impact on learners' engagement and learning outcomes. Also, by integrating user experiences, and existing research, this paper offers a comprehensive overview of how ClassPoint enhances language instruction.

ClassPoint as a Multimedia Tool

ClassPoint is an interactive multimedia tool designed for improving presentations by incorporating quizzes, polls, and real-time feedback into PowerPoint. This tool helps educators create a more dynamic and engaging learning environment. It is particularly useful for language educators, as it encourages participation and enables immediate evaluation of learners' comprehension.

a. Interactive Quizzes and Polls ClassPoint enables educators to create engaging quizzes and polls that offer instant assessments, allowing for immediate feedback and adjustments in teaching strategies (Hattie, 2012). This feature is especially beneficial in language learning, as it helps educators evaluate learners' comprehension of vocabulary and grammar in real time.

b. Multimedia Integration ClassPoint accommodates a variety of media formats, such as videos, audio clips, and images, which make lessons more engaging and accessible for a diverse range of learners (Mayer, 2009). For language learners, exposure to different types of media can enhance comprehension and retention.

c. Real Time Feedback Real Time feedback feature enhances interaction between educators and learners, allowing educators to identify areas needing improvement and adapt instructions accordingly. Real-time feedback is essential in language learning, where immediate corrections can lead to better retention and understanding (Black & Wiliam, 1998).

d. Gamification Elements By incorporating game-like features, ClassPoint motivates learners to participate actively, promoting a competitive yet collaborative learning environment (Deterding *et al.*, 2011). Gamification can enhance language learning by making the learning process more enjoyable and less intimidating for learners.

Language Learning with ClassPoint

ClassPoint offers a variety of applications in the classroom, including vocabulary building, pronunciation practice, and comprehension activities. Educators can design vocabulary quizzes that ask learners to match words with their definitions or use images to aid understanding. Audio clips can be integrated into quizzes for pronunciation practice, enabling learners to hear and practice accurate pronunciation. ClassPoint continues to be an effective resource both in online and hybrid learning environments. Its compatibility with virtual classrooms ensures that educators can maintain interactivity and engagement, which are vital for language learning in remote settings. Educators can use ClassPoint to administer live quizzes, collect instant feedback, and monitor learners' performance across various platforms.

Benefits of ClassPoint in Language Education

ClassPoint significantly improves learners' motivation through its interactive features. Research shows that active participation enhances engagement levels, which are essential for effective language learning (Freeman *et al.*, 2014). Learners are more inclined to connect with content when they can interact with it actively, rather than receiving information passively. The gamification aspects of ClassPoint further enhances this engagement. Studies by Hamari *et al.* (2016) suggest that game-like elements can improve learners' experience and motivation in educational contexts.

**Hasheena Bagem and Geetha Yadav**

For language learners, the blend of competition and collaboration creates an enjoyable learning environment that encourages taking risks and active participation.

Enhancing Language Proficiency with ClassPoint

ClassPoint provides effective strategies for improving language proficiency across various skills. By incorporating interactive elements and multimedia resources, it creates an engaging learning environment that supports vocabulary retention, listening comprehension, speaking fluency, and more.

a. Vocabulary Retention Interactive quizzes reinforce learning and support vocabulary retention. Research studies show that retrieval practice enhances memory and recall, making it a valuable tool for language acquisition (Roediger & Butler, 2011). For instance, using ClassPoint for vocabulary quizzes can help learners remember new words better than traditional study methods.

b. Listening Comprehension The effective use of multimedia elements in ClassPoint enhances listening comprehension by allowing learners to engage with authentic language input. Research shows that exposure to diverse accents and dialects through audio clips can improve listening skills (Vandergrift, 2007). ClassPoint can provide these audio resources efficiently enhancing the overall learning experience.

c. Speaking Fluency ClassPoint encourages active participation, which is important for developing speaking fluency. Involving learners in real-time interactions builds confidence and practical language use. According to Swain (2005), opportunities for output are crucial for language development, and tools like ClassPoint can create these opportunities in a supportive environment.

d. Reading Comprehension ClassPoint can also enhance reading comprehension by integrating authentic texts and multimedia resources. Using real-world materials, such as articles and videos, helps learners connect with the language in context, improving their understanding and retention. This method also encourages critical thinking and analysis, essential skills for language learners.

e. Writing Skills ClassPoint supports writing development through interactive tasks like collaborative essays and blog posts. By offering immediate feedback and facilitating peer review, learners can enhance their writing skills and learn from each other. Research indicates that collaborative writing promotes better writing quality and boosts motivation among learners (Storch, 2005).

f. Grammar Skills Integrating grammar instruction within interactive activities is vital for language proficiency. Using ClassPoint, instructors can create exercises that focus on specific grammar points, allowing learners to practice in context. Research indicates that explicit grammar instruction can lead to improved accuracy in language use (Norris & Ortega, 2000). This approach ensures that learners not only learn grammatical rules but also apply them effectively in communication. ClassPoint effectively enhances language proficiency by integrating interactive elements and multimedia resources across various skills. By promoting engagement and collaboration, it equips learners with the tools they need to succeed in their language learning journey.

Customized Learning and Assessment

ClassPoint provides adaptive feedback that is tailored to meet individual learning needs. This personalization aligns with modern educational theories that support learner-centered approaches (Brusilovsky & Millán, 2007). By utilizing data from quizzes and polls, educators can identify learners' strengths and weaknesses, enabling targeted instruction. Offering personalized assessments is important in language education, where learners often exhibit varying proficiency levels and learning speeds.

Connection to Educational Theories

ClassPoint connects with fundamental educational theories by addressing cognitive load and supporting constructivist learning. According to Cognitive Load Theory, it minimizes cognitive overload by presenting information in various formats, which helps learners process content more effectively (Sweller, 1988). This is beneficial in language learning, where learners must juggle new vocabulary, grammar rules, and pronunciation. Furthermore, ClassPoint promotes active, learner-centered learning experiences that align with constructivist principles, encouraging learners to engage in interaction and collaboration (Papert, 1993). This approach transforms learners from passive recipients of information into active participants in their learning journey.

**Hasheena Bagem and Geetha Yadav****Challenges and Limitations of ClassPoint**

As ClassPoint offers innovative tools for enhancing educational experiences, it also presents several challenges and limitations that need to be addressed for effective implementation. Understanding these obstacles is important for maximizing its potential in diverse learning environments. A major challenge in implementing ClassPoint is ensuring that all learners have access to the necessary technology. Factors such as device availability, internet connectivity, and software compatibility can impede effective use. In many areas, learners may lack reliable internet or personal devices, resulting in unequal learning opportunities. Educators must recognize these limitations and seek solutions, such as offering alternative resources or guaranteeing that all learners have access to the required technology. To effectively incorporate ClassPoint into their teaching practices, educators need sufficient professional development. Insufficient training may lead to underutilization of the tool's features, diminishing its overall effectiveness (Ertmer & Ottenbreit-Leftwich, 2010). Professional development programs should emphasize not only how to use ClassPoint but also pedagogical strategies that enhance their impact on language instruction. Additionally, continuous support is essential as educators adapt their methodologies to incorporate new technologies. While digital tools like ClassPoint can enhance learning, there is a risk of becoming overreliance on technology. It is important to balance digital tools with traditional teaching methods to maintain a comprehensive educational approach (Puentedura, 2010). Educators must be vigilant to ensure that technology does not overshadow essential teaching practices that promote critical thinking and interpersonal skills. ClassPoint may encounter challenges in large classrooms, particularly in low-resource settings among learners with diverse needs. Ensuring effective implementation in these varied contexts requires careful planning and attention to each classroom's unique dynamics.

Existing Studies and Findings

Numerous studies have shown that multimedia tools improve language acquisition by providing various learning modalities that cater to different learning styles (Mayer, 2009). Research consistently indicates that learners exposed to multimedia content perform better in language assessments than those who rely solely on traditional instructional methods. For example, a meta-analysis by Hattie (2009) indicates that multimedia instruction has a significant positive impact on learners' achievement. While specific studies on ClassPoint are limited, research on similar interactive tools reveals positive outcomes in learners' engagement and learning effectiveness. For example, studies on Kahoot! and Quizizz indicate that gamification and instant feedback enhance learner motivation and performance (Huang & Hew, 2018). These platforms, like ClassPoint, harness the power of technology to create interactive learning experiences that resonate with learners. Practical applications of ClassPoint in various educational settings have yielded success stories. For instance, language educators report increased learner participation and improved language skills when using ClassPoint in their classrooms. Despite the promising evidence regarding multimedia tools, there remains a need for long-term studies focusing on ClassPoint's effectiveness. Future research should aim to evaluate its impact on language learning over extended periods and across diverse educational contexts. Additionally, research should explore how different instructional strategies using ClassPoint affect learning outcomes in various linguistic settings.

DISCUSSION AND ANALYSIS

ClassPoint significantly enhances language learning objectives by promoting learner engagement, offering immediate feedback, and incorporating multimedia resources. These features align with established best practices in language education and contribute to more effective learning outcomes. The platform's interactive design enables learners to practice their language skills in real time, allowing them to receive instant feedback that can improve their overall learning experience. This immediate response helps learners identify areas for improvement and reinforces their understanding of language concepts. When compared to other multimedia learning tools, ClassPoint stands out due to its unique integration with PowerPoint, providing a familiar interface for educators. This seamless connection facilitates a smoother transition for educators who are already accustomed to PowerPoint, allowing them to incorporate interactive elements without having to learn an entirely new platform. While tools such as Nearpod and Kahoot also offer engaging interactive features, ClassPoint's compatibility with PowerPoint makes it particularly

**Hasheena Bagem and Geetha Yadav**

attractive for educators seeking to enhance traditional presentations with interactive capabilities. However, the effectiveness of ClassPoint ultimately depends on how well it is implemented and the extent to which educators utilize its various features in their teaching practices. Educators need to explore innovative instructional strategies that utilize ClassPoint's features to enhance language instruction effectively. This may involve exploring interactive quizzes, live polls, and multimedia presentations to create an engaging learning environment. Learners can benefit from the increased engagement and personalized learning experiences that ClassPoint facilitates. Such enhancements can lead to improved language proficiency and a deeper understanding of linguistic concepts. Moreover, the platform encourages active participation and collaboration among learners, promoting a supportive learning community. Educational institutions play a vital role in this process by supporting educators in the effective implementation of technology like ClassPoint. This support should include providing access to necessary resources, comprehensive training programs, and a robust infrastructure for technology integration. By ensuring that educators are well equipped to use these tools, institutions can maximize the potential benefits for both educators and learners, leading to a more enriched educational experience.

CONCLUSION AND RECOMMENDATIONS

This study highlights the transformative potential of ClassPoint in language education. Its interactive features, multimedia integration, and alignment with educational theories position as a valuable tool for enhancing language acquisition. The benefits of using ClassPoint extend beyond engagement, they also include improved language proficiency, personalized learning, and alignment with contemporary educational practices. To maximize the effectiveness of ClassPoint in language education, institutions should invest in comprehensive professional development programs for educators. These training initiatives should focus not only on the technical skills necessary to navigate ClassPoint's features but also on effective pedagogical strategies that enhance teaching and learning. By equipping educators with the knowledge and skills to utilize ClassPoint, institutions can ensure that the tool is integrated effectively into their language instruction. Accessibility is another critical factor that must be addressed to ensure all learners can benefit from ClassPoint's interactive capabilities. This involves identifying and mitigating technological barriers that may prevent some learners from accessing the necessary resources. Institutions should consider providing devices for learners in need, ensuring reliable internet access, and offering alternative resources. By prioritizing accessibility, institutions can create a more inclusive learning environment. Educators should also strive for a balanced approach in integrating technology with traditional teaching methods. Maintaining a holistic educational experience is essential, and combining digital tools like ClassPoint with face-to-face interactions can foster a more comprehensive approach to language learning. This balance allows for the benefits of technology to be realized while still valuing the importance of personal interaction and traditional instructional methods. Finally, ongoing research is vital to understanding ClassPoint's effectiveness in various educational contexts. Institutions and researchers should collaborate to conduct long-term studies that assess the impact of ClassPoint on language learning outcomes. Such research will provide valuable insights that can help refine the use of ClassPoint and improve overall educational practices, ensuring that the tool continues to meet the evolving needs of language learners. Future studies should explore the long-term impact of ClassPoint on language learning outcomes and its effectiveness in diverse linguistic and cultural contexts. Research should also investigate the best practices for integrating ClassPoint into various educational settings. Furthermore, studies could examine how educators' perception of technology influence the integration of tools like ClassPoint in language instruction.

ABSTRACT

This study explores the politics of beauty and body shaming in Buchi Emecheta's novels *The Bride Price* (1976), *The Rape of Shavi* (1983), and *Kehinde* (1994), analyzing how beauty standards function as mechanisms of social control. Emecheta's female protagonists navigate rigid gender norms that link physical appearance to social acceptance, marriage ability, and self-worth. Body shaming emerges as a pervasive theme, reinforcing patriarchal oppression while shaping women's identities and opportunities. In *The Bride Price*, Aku-nna's frail body challenges traditional Igbo beauty ideals, affecting her value as a bride and limiting her agency. *The Rape of Shavi* examines beauty politics through cross-cultural encounters, highlighting how colonial and indigenous perspectives on female bodies create new forms of body shaming and exploitation. *Kehinde* addresses the complexities of beauty and aging in the diasporic context, showing how migration intensifies conflicts between African and Western beauty norms. By critiquing these oppressive structures, Emecheta's narratives emphasize the resilience of women who resist societal expectations and reclaim autonomy over their bodies. This research contributes to feminist and postcolonial literary studies by demonstrating how beauty standards and body shaming operate

**Manju Parkavi and Saradha**

within larger systems of gendered power. Ultimately, Emecheta's works advocate for self-acceptance and challenge the hegemonic definitions of beauty that marginalize women.

Keywords: The Bride Price (1976), The Rape of Shavi (1983), and Kehinde (1994), Emecheta's. The Rape of Shavi

INTRODUCTION

Buchi Emecheta's novels critically engage with the intersections of gender, culture, and power, particularly in the context of African societies grappling with colonial and patriarchal legacies. Among her many thematic explorations, the politics of beauty and body shaming emerge as significant concerns in her literary oeuvre. In *The Bride Price* (1976), *The Rape of Shavi* (1983), and *Kehinde* (1994), Emecheta highlights how women's bodies become sites of control, oppression, and resistance. Beauty ideals in these novels function as mechanisms of social acceptance or exclusion, shaping the experiences of female protagonists. The societal fixation on women's physical appearance not only reinforces rigid gender roles but also serves as a tool for body shaming an act that undermines self-worth and autonomy. This research investigates the portrayal of body shaming in Emecheta's novels and its implications for female agency, self-acceptance, and resistance within patriarchal and postcolonial frameworks.

Aim of the Research

The primary objective of this study is to analyze the representation of beauty standards and body shaming in *The Bride Price*, *The Rape of Shavi*, and *Kehinde*, assessing how these narratives reflect and critique societal perceptions of women's bodies. By examining the experiences of Aku-nna, Kehinde, and other female characters, this research seeks to uncover how body image is manipulated to control women's choices, particularly in marriage, social mobility, and migration. Furthermore, this study aims to explore the broader implications of body shaming, including its psychological impact and its role in sustaining gendered oppression. Ultimately, this research contributes to feminist and postcolonial literary discourse by demonstrating how Emecheta's works challenge and redefine conventional beauty norms.

Theoretical Framework

This study is grounded in feminist literary criticism and postcolonial theory, both of which provide critical lenses for analyzing the politics of beauty and body shaming in Emecheta's works. Feminist theory, particularly the perspectives of Simone de Beauvoir and Judith Butler, informs the analysis of how beauty standards are socially constructed and imposed upon women as a means of patriarchal control. De Beauvoir's concept of "the Other" is relevant in understanding how women are objectified and defined by their physicality, while Butler's work on gender performativity highlights how societal beauty norms shape female identity and agency. Postcolonial theory, drawing from thinkers such as Frantz Fanon and Homi Bhabha, is also crucial in examining how colonial legacies influence beauty standards and body image in *The Rape of Shavi* and *Kehinde*. Fanon's exploration of the psychological effects of colonialism provides insight into how European beauty ideals impact African self-perception, while Bhabha's concept of hybridity helps unpack the complexities of cultural assimilation and resistance in a diasporic setting. Additionally, body politics theories, such as Naomi Wolf's *The Beauty Myth*, offer a contemporary critique of how beauty standards serve as tools of oppression across different societies. Wolf's argument that beauty norms are used to control women's aspirations and limit their power resonates strongly with Emecheta's portrayal of body shaming and its consequences on female autonomy. Through the integration of these theoretical perspectives, this study seeks to illuminate how Emecheta's novels expose and challenge the mechanisms of body shaming, advocating for a more inclusive and empowering representation of women's bodies in literature and society.

Body Shaming and Its Interconnection with Beauty Politics

Body shaming, defined as the act of criticizing or humiliating individuals based on their physical appearance, is deeply embedded in Emecheta's narratives. In *The Bride Price*, Aku-nna's frail and delicate body becomes a point of

**Manju Parkavi and Saradha**

scrutiny, influencing her perceived value as a bride. The traditional expectation in her Igbo society is for women to be robust and physically strong, as this symbolizes fertility and the ability to perform laborious household duties. Aku-nna's failure to meet these beauty ideals subjects her to judgment and marginalization, emphasizing how body image directly impacts a woman's agency and future. Similarly, *The Rape of Shavi* delves into the politics of beauty through cross-cultural interactions. The arrival of Westerners in an African society introduces contrasting beauty standards, where African and European perceptions of the ideal female body collide. The novel interrogates the ways in which colonial encounters shape and distort beauty ideals, reinforcing body shaming as a universal issue transcending cultural boundaries. Moreover, the sexual violence in the novel highlights the commodification of women's bodies, reinforcing the idea that physical appearance determines a woman's worth and vulnerability to exploitation. *Kehinde* expands this discourse by exploring beauty and body image in the context of migration and diasporic identity. As Kehinde relocates to London, she faces conflicting beauty standards influenced by both her Nigerian heritage and Western ideals. Her struggle with aging, body perception, and self-worth underscores how beauty politics persist across different cultural landscapes. Emecheta portrays Kehinde's journey as one of self-acceptance, highlighting the resilience of women who redefine their beauty and identity beyond societal constraints. Through these narratives, Emecheta exposes the insidious nature of body shaming and its function as a tool of oppression. However, her works also offer moments of resistance and self-acceptance, illustrating how women reclaim autonomy over their bodies despite societal constraints. By centering the female experience in the discourse on beauty and self-worth, Emecheta provides a powerful critique of patriarchal and colonial impositions on women's bodies, ultimately advocating for a redefinition of beauty that prioritizes self-acceptance and empowerment.

The Role of Beauty Standards in Igbo Society**A Study of *The Bride Price***

In *The Bride Price*, Buchi Emecheta explores how beauty standards in traditional Igbo society influence a woman's social standing, marriage ability, and self-worth. The protagonist, Aku-nna, is described as frail and delicate, which sets her apart from the idealized image of a strong, full-bodied Igbo woman. Her physical appearance becomes a central point of contention, shaping her experiences within a society that values female robustness as a sign of fertility and resilience. As Emecheta writes, "In her home, a girl's worth was measured by her ability to bear children and endure hard work, and Aku-nna's small frame did not inspire confidence" (*TBP* 76). Aku-nna's struggle with body image is further exacerbated by societal expectations that equate physical beauty with a woman's worth. The constant scrutiny she faces reinforces the idea that a woman's desirability is directly tied to her conformity to established beauty norms. This is evident when she is told, "A thin girl like you? What man would want to pay a bride price for a girl who looks like she would break?" (*TBP* 80). Such statements reflect the deep-seated belief that a woman's value lies in her physicality, which in turn determines her economic and social prospects. Moreover, Aku-nna's experiences highlight the oppressive nature of beauty standards as tools of patriarchal control. Her forced marriage to Okoboshi exemplifies how women's bodies are commodified and exchanged like property. Despite her love for Chike, she is subjected to the authority of male elders who view her as an asset rather than an individual with agency. The Igbo tradition of bride price reinforces this objectification, as her worth is dictated by what her body can offer to her husband's lineage. However, Emecheta also portrays Aku-nna's resistance to these societal constraints. Through her defiance, she challenges the rigid structures that seek to confine her. Her decision to elope with Chike, despite the cultural repercussions, signals a rejection of the imposed beauty ideals and a desire for self-determination. In doing so, Emecheta underscores the agency of women in reclaiming their bodies from societal expectations. Ultimately, *The Bride Price* serves as a critique of the ways in which beauty standards function as mechanisms of oppression within Igbo society. Through Aku-nna's journey, Emecheta exposes the damaging effects of body shaming while advocating for a redefinition of beauty that prioritizes individual worth over societal approval. The novel challenges the notion that a woman's value should be contingent on her physical appearance, paving the way for a discourse that embraces self-acceptance and autonomy.

Colonialism, Race, and Body Image in *The Rape of Shavi*

In *The Rape of Shavi*, Buchi Emecheta explores the intersections of colonialism, race, and body image, demonstrating how colonial encounters reshape beauty ideals in African societies. The novel highlights how the arrival of

Manju Parkavi and Saradha

Europeans disrupts indigenous perceptions of beauty, leading to internalized racial inferiority and a shift in body image among Shavian women. One of the most striking examples of this occurs through the character of Phoebe, a European woman whose pale skin and delicate features become the standard against which Shavian women begin to measure themselves. As Emecheta writes, “Phoebe’s golden hair shimmered in the sun, and the Shavian women could not help but stare, wondering why their own thick, dark braids did not shine the same way” (TRS 103). This passage reflects the imposition of Western beauty norms and the resulting devaluation of African features. Ajanwia, the Shavian princess, internalizes these foreign ideals and begins to feel insecure about her dark complexion and strong physique. She questions her own beauty in comparison to Phoebe, thinking, “She looked at her own reflection and wondered why her skin did not glow like that of the foreign woman” (TRS 117). This moment underscores the psychological impact of colonialism, as Ajanwia’s self-perception is altered by the presence of Europeans who impose a different standard of beauty. However, Emecheta also critiques the loss of cultural identity that accompanies this shift. As Ajanwia later comes to realize, true beauty lies not in the mimicry of Western ideals but in the strength and resilience of African women. She asserts, “She was a princess of Shavi, and her beauty lay in her strength” (TRS 132). This moment marks her rejection of colonial definitions of beauty and her embrace of her heritage. Beyond individual insecurities, Emecheta shows how colonialism creates a broader societal transformation in Shavi, where African beauty is devalued in favor of European aesthetics. The narrator observes, “The young girls of Shavi began to pinch their noses, hoping to make them narrower like those of their new visitors” (TRS 140). This passage reveals how colonial influence leads to widespread body dissatisfaction, as native people begin altering their appearances to align with foreign ideals. Ultimately, *The Rape of Shavi* critiques the imposition of Western beauty standards on African bodies and emphasizes the destructive consequences of colonialism on self-worth and identity. Emecheta’s novel not only exposes the ways in which body image is manipulated as a colonial tool but also celebrates the resilience of African women who reclaim their own definitions of beauty.

Diasporic Identity and Aging

Beauty Politics in *Kehinde* by Buchi Emecheta

Buchi Emecheta’s *Kehinde* (1994) is a poignant exploration of diasporic identity, aging, and beauty politics. Through the protagonist Kehinde, Emecheta challenges Western and African ideals of beauty, particularly as they relate to aging women. The novel critiques patriarchal expectations and societal standards that often render older women invisible or undesirable. By navigating the tensions between traditional African norms and Western influences, *Kehinde* reveals how aging and beauty are deeply intertwined with notions of self-worth and cultural identity. One of the central themes in *Kehinde* is the conflict between African and Western perceptions of beauty and femininity. Kehinde, a Nigerian woman living in London, grapples with the pressures of maintaining her identity while adapting to her diasporic reality. Her aging body becomes a site of contestation both a marker of her lived experiences and a symbol of fading desirability in the eyes of her husband and society. As Emecheta writes, “Kehinde looked in the mirror and saw the lines forming at the corners of her eyes. She was no longer the young, hopeful girl who had once dreamed of a grand life in England.” (K67) This moment of self-reflection highlights the protagonist’s awareness of time’s impact on her body and the external pressures to remain youthful and attractive. In African culture, fertility and youth are often equated with beauty and social value, particularly for women. Kehinde’s return to Nigeria exposes her to these rigid beauty politics. Her husband, Albert, expects her to conform to traditional roles, including the notion that a woman must remain attractive to keep her husband’s interest. Albert’s decision to take a younger second wife exemplifies the societal devaluation of aging women. Kehinde’s refusal to accept this fate becomes an act of defiance against both patriarchal control and the beauty norms imposed on aging women. Furthermore, *Kehinde* critiques the Eurocentric beauty standards imposed on women in the diaspora. Living in London, Kehinde encounters racialized perceptions of beauty that privilege whiteness and youth. These external pressures further complicate her sense of self-worth, as she navigates a space where Black women’s beauty is often marginalized. Emecheta subtly interrogates these ideals through Kehinde’s internal struggles, as she questions, “Was she still beautiful? Did it even matter?” (K56). This existential inquiry signals a shift in the protagonist’s self-perception from one dictated by external validation to an evolving sense of self-acceptance. Ultimately, *Kehinde* presents aging not as a decline but as an opportunity for self-discovery and empowerment. Kehinde’s journey toward self-acceptance challenges both Western and African beauty norms, asserting that a woman’s worth is not

**Manju Parkavi and Saradha**

confined to her youth or physical appearance. By choosing independence over submission, Kehinde redefines beauty on her own terms, embracing her identity beyond societal expectations. Emecheta's novel thus offers a powerful critique of beauty politics, illuminating the struggles of aging women in both the African and diasporic contexts. In doing so, *Kehinde* advocates for a broader, more inclusive understanding of beauty one that transcends age, geography, and cultural constraints.

Resistance and Reclamation: Redefining Beauty in Buchi Emecheta's Works

Buchi Emecheta's works explore the intersection of gender, oppression, and societal expectations, often revealing how body shaming functions as a mechanism of patriarchal control. In novels like *The Bride Price* (1976), *The Rape of Shavi* (1983), and *Kehinde* (1994), Emecheta illustrates how women's bodies are policed, criticized, and commodified to reinforce their subjugation. However, her narratives also offer powerful acts of resistance and reclamation, allowing her female characters to redefine beauty on their own terms. By asserting their autonomy and rejecting imposed standards, these women challenge oppressive beauty norms and reclaim their self-worth. One of the most striking examples of body shaming in Emecheta's work appears in *The Bride Price*, where a woman's worth is measured by her physical appearance and reproductive potential. Aku-nna, the young protagonist, faces scrutiny over her body because her bride price depends on her desirability. When she falls ill, her body becomes a subject of concern not for her well-being, but for its economic implications. Emecheta writes, "No man wanted a weak wife, and no family wanted a bride whose price would bring them shame" (45). Yet, Aku-nna's decision to pursue love on her own terms, rather than being defined by her physical state, is an act of defiance against patriarchal expectations. In *The Rape of Shavi*, body shaming intersects with colonial violence and cultural conflict. When the European visitors arrive in Shavi, the local women are subjected to the foreigners' gaze and judgment. The novel critiques how Western beauty standards are imposed on African women, making them feel inadequate. One of the female characters reflects, "Their skin was too dark, their bodies too full, their hair too coarse—nothing about them was seen as beautiful by the invaders" (67). However, the resilience of the Shavi women in maintaining their cultural identity and rejecting these imposed standards serves as a form of resistance, affirming their beauty outside of colonial frameworks. *Kehinde* examines body shaming in the context of aging and diaspora. The protagonist, Kehinde, struggles with societal expectations regarding beauty as she grows older. Her husband, Albert, believes that a woman must maintain her physical appeal to remain desirable, reinforcing the idea that a woman's value diminishes with age. When Kehinde returns to Nigeria, she faces further criticism about her appearance, as her body no longer conforms to traditional expectations of femininity. Emecheta captures this internal conflict when she writes, "She saw the lines on her face, the changes in her body, and wondered was she still beautiful? Did it even matter?" (114). Kehinde's ultimate rejection of these standards and her embrace of independence highlight the novel's central message of self-acceptance and redefinition of beauty. Through these narratives, Emecheta not only exposes body shaming as a strategic tool of patriarchal oppression but also highlights acts of resistance and reclamation. Whether through economic pressures, colonial beauty standards, or age-related discrimination, women's bodies are subjected to relentless scrutiny. However, by giving voice to her female characters, Emecheta empowers them to reject these constraints and assert their own definitions of beauty. Her works challenge readers to rethink societal attitudes toward women's bodies and to advocate for a more inclusive, body-positive future.

RESULTS OF THE RESEARCH

The findings from this research demonstrate that Buchi Emecheta's works critically engage with the oppressive beauty norms imposed on women, revealing body shaming as a mechanism of patriarchal control. Across *The Bride Price*, *The Rape of Shavi*, and *Kehinde*, Emecheta portrays how women's physical appearances are scrutinized and manipulated to enforce gender subordination. However, these narratives also serve as sites of resistance, allowing female protagonists to reclaim their identities and redefine beauty on their own terms. One significant result is the exposure of how beauty standards are often tied to economic and social value. In *The Bride Price*, Aku-nna's desirability is directly linked to the bride price her family expects to receive, reinforcing the idea that a woman's body is a commodity. The novel reveals how illness, disability, or deviation from societal ideals can render a woman

**Manju Parkavi and Saradha**

undesirable, thereby reducing her worth in the eyes of her community. This highlights how patriarchal systems condition women to see themselves through the lens of male approval and economic exchange. Another crucial finding is the impact of colonialism on beauty standards. *The Rape of Shavi* demonstrates how Western ideals are imposed upon African women, devaluing their natural beauty and reinforcing racial hierarchies. Emecheta critiques the way European visitors to Shavi judge local women based on foreign beauty norms, leading to internalized inferiority. However, the women's resistance to these ideals and their pride in their cultural identity serve as an important act of defiance against colonial oppression. This result underscores the intersectionality of beauty politics, showing that body shaming is not only gendered but also racialized. The research also reveals the unique challenges of aging within beauty discourses, as illustrated in *Kehinde*. The protagonist's struggles with self-image after middle age expose the unrealistic expectations placed on women to maintain youthfulness in order to be valued. Kehinde's husband, Albert, reflects societal attitudes that equate a woman's worth with her physical attractiveness, making her feel inadequate as she grows older. However, her eventual self-acceptance challenges these norms, presenting aging not as a loss but as an opportunity for self-definition and empowerment. This aspect of Emecheta's work highlights the broader implications of body politics, particularly in how they affect women across different stages of life. Additionally, this research aligns with feminist and postcolonial theories that critique body shaming as a tool of social control. Emecheta's novels demonstrate that beauty norms serve to limit women's autonomy, keeping them preoccupied with self-doubt rather than self-actualization. Yet, her protagonists consistently resist these oppressive forces—whether by choosing love over economic value (*The Bride Price*), rejecting colonial judgments (*The Rape of Shavi*), or embracing independence despite societal expectations (*Kehinde*). These findings affirm that beauty is a construct that can be reclaimed and reshaped through acts of agency and resistance. Ultimately, this research demonstrates that Emecheta's literature serves as both a critique of and a challenge to traditional beauty standards. By exposing body shaming as a means of patriarchal oppression while celebrating acts of defiance, her works encourage a re-evaluation of what it means to be beautiful. Through her narratives, Emecheta advocates for self-acceptance, cultural pride, and an inclusive understanding of beauty one that transcends economic, racial, and age-related limitations.

CONCLUSION

Emecheta's exploration of body shaming reveals it as a pervasive tool of patriarchal oppression that controls women's agency, self-worth, and autonomy. Through *The Bride Price*, *The Rape of Shavi*, and *Kehinde*, she exposes the economic, racial, and age-based constraints placed on women's bodies, emphasizing how beauty is manipulated to uphold male dominance. However, her works do not merely critique these structures—they provide powerful narratives of resistance and reclamation. Aku-nna's pursuit of love in *The Bride Price*, despite the rigid expectations of her community, is a challenge to the transactional nature of beauty in patriarchal societies. In *The Rape of Shavi*, the rejection of colonial beauty norms underscores the resilience of African identity against external impositions. Meanwhile, Kehinde's journey toward self-acceptance and independence in *Kehinde* highlights the need for women to define beauty for themselves, free from societal judgment. These narratives collectively demonstrate that beauty is not an objective truth but a socially constructed ideal that can be resisted and redefined. Furthermore, this research emphasizes that body shaming functions as a broader socio-political issue that intersects with race, class, and colonial history. The policing of women's bodies reflects deeper power structures that seek to maintain control over marginalized groups. Emecheta's feminist and postcolonial approach challenges these hierarchies, advocating for a vision of beauty that is inclusive and liberating rather than oppressive. Ultimately, Emecheta's literature serves as both a critique of and a challenge to traditional beauty standards. Her novels inspire readers to question imposed ideals and embrace self-acceptance, cultural pride, and bodily autonomy. By portraying women who resist societal expectations and assert their own definitions of beauty, she opens pathways for a more empowering and inclusive discourse on female identity. Her contribution to literature extends beyond story telling she offers a lens through which contemporary discussions on body politics, feminism, and decolonization can be examined and reshaped for future generations. As this research has shown, the narratives Emecheta crafts are deeply relevant today, as beauty remains a contested site of power, control, and resistance. By learning from the struggles and triumphs of her

Manju Parkavi and Saradha

characters, modern readers can engage in the ongoing project of dismantling oppressive beauty norms and fostering a world where all bodies are valued and celebrated.

ABSTRACT

This study examines the impact of LULC changes and groundwater level variations in Pavagada Taluk, Karnataka, focusing on agricultural expansion, urbanization and deforestation. The region's transformation from natural landscapes to agricultural fields and urban areas has significantly altered hydrological processes, leading to increased groundwater extraction for irrigation and reduced recharge rates. Urban development introduces impermeable surfaces that hinder rainwater infiltration, further diminishing groundwater recharge. These changes not only lower groundwater levels but also degrade water quality through increased contamination. Addressing these challenges necessitates sustainable land use practices, efficient water management strategies such as rainwater harvesting, and robust regulatory frameworks to ensure the long-term sustainability of Pavagada Taluk's groundwater resources amidst ongoing development pressures.

Keywords: Groundwater, LULC, Pavagada taluk, Rainfall and Spatio-temporal variation

Shivanna *et al.*,

INTRODUCTION

Groundwater is a crucial resource for sustaining human life and agricultural productivity, particularly in regions with scarce surface water availability. Pavagada Taluk situated in Tumakuru district of Karnataka, India and the dependency on groundwater has increased due to its semi-arid climate and growing water demands driven by agricultural and urban expansion. However, the sustainability of groundwater resources is being threatened by changes in land use/land cover (LULC) and variability in rainfall patterns. Consistent and adequate rainfall helps maintain stable groundwater levels, while evapotranspiration, the process of water transfer from land to the atmosphere through evaporation from soil and transpiration by plants, can reduce the amount of water available for recharge, particularly in arid and semi-arid regions (Pandey *et al.*, 2010). Human activities significantly affect groundwater levels. Agricultural irrigation, particularly in regions reliant on groundwater, can lower water levels when extraction outpaces natural recharge. Urbanization introduces impervious surfaces like concrete and asphalt, reducing rainwater infiltration and recharge while increasing water demand can further deplete groundwater resources. Industrial activities also contribute to substantial groundwater withdrawal, affecting levels and availability. Persistent lowering of groundwater levels can lead to water scarcity, impacting agricultural productivity, drinking water supplies and socioeconomic development.

Additionally, excessive groundwater extraction can cause land subsidence, leading to structural damage and degradation of water quality due to saline intrusion or mobilization of contaminants (Selvam *et al.*, 2014). Rainfall variability, increasingly driven by climate change, poses significant challenges to the dynamics of groundwater recharge. The pattern and intensity of rainfall are crucial factors in the natural replenishment of groundwater reserves. However, climate change has led to more inconsistent and extreme rainfall patterns, which disrupt these natural processes. During dry periods, insufficient rainfall results in reduced groundwater recharge. This lack of consistent precipitation means that the soil and subsoil do not receive adequate moisture, preventing the effective percolation of water down to the aquifers. As a consequence, groundwater levels drop, leading to water scarcity and increased stress on existing water resources (Pandey *et al.*, 2010). LULC changes refer to the transformation of the landscape due to various human activities such as urbanization, deforestation, agricultural expansion, and industrial development. These changes significantly alter the natural processes that govern groundwater recharge and quality. Spatially, the conversion of permeable surfaces like forests and agricultural land into impermeable surfaces such as roads and buildings reduces the infiltration capacity of the soil, leading to decreased groundwater recharge and increased surface runoff.

For instance, urbanization often results in the proliferation of impervious surfaces, which restrict water infiltration and enhance runoff, thus reducing the recharge of aquifers (Nagarajan & Poongothai, 2012). Temporally, LULC changes can lead to both short-term and long-term impacts on groundwater systems. In the short term, rapid urbanization and industrialization can cause immediate reductions in groundwater levels due to the increased extraction of water for construction and industrial processes. In the long term, sustained changes in land use can lead to altered hydrological cycles and groundwater regimes. For example, the continuous expansion of agricultural lands often necessitates increased groundwater extraction for irrigation, which can lower groundwater tables over time (Magesh *et al.*, 2011). Additionally, changes in land cover, such as the replacement of deep-rooted vegetation with shallow-rooted crops, can reduce the soil's ability to retain moisture, further impacting groundwater recharge.

These spatiotemporal impacts are particularly evident in regions undergoing rapid development and agricultural intensification, such as Pavagada Taluk in Karnataka. Here, the shift from traditional agricultural practices to more intensive forms of land use has altered the natural groundwater recharge processes. Remote sensing (RS) and geographic information systems (GIS) are essential tools for monitoring and analyzing these changes. By providing multi-temporal and spatially detailed data, RS and GIS enable the assessment of how different land use practices impact groundwater resources over time and across various landscapes. This information is crucial for developing

**Shivanna et al.,**

sustainable land and water management practices that can mitigate the negative impacts of LULC changes on groundwater resources (Jha *et al.*, 2007).

The assessment of spatiotemporal impacts of LULC changes and rainfall variability on groundwater resources is essential for developing effective water management strategies in Pavagada Taluk. Previous studies in Karnataka have demonstrated the utility of these technologies in groundwater studies, highlighting the importance of understanding local hydrological processes and human activities (Rao *et al.*, 2013; Deepa *et al.*, 2015). This study aims to build on these methodologies to provide a comprehensive assessment of groundwater dynamics in Pavagada Taluk, offering valuable insights for sustainable groundwater management in the region. Hence, the present study was carried out with the following objectives

- to assess the spatiotemporal variation using Remote Sensing and GIS
- to identify and evaluate the rainfall variability patterns in the study area
- to study the groundwater level changes in the study area

MATERIALS AND METHODS

Study area

Pavagada Taluk is situated in the Tumakuru district of Karnataka, India. It lies in the northern part of the district, bordering the state of Andhra Pradesh. Geographically, it is positioned between 13.30 to 14.20° N latitude and 77.00° to 77.40° E longitude (Figure 1). The taluk encompasses a varied landscape with elevations ranging from 600 to 900 meters above sea level.

The region includes several small hills, part of the Eastern Ghats, with elevations reaching up to 800 m amsl. These hills are interspersed with flat or gently rolling plains that dominate much of the landscape, providing fertile grounds for agriculture. Valleys formed by rivers and streams offer additional fertile areas, essential for farming in this semi-arid region. The climate of Pavagada Taluk is semi-arid, characterized by hot summers, moderate winters, and scanty rainfall. The region experiences three primary seasons: Summer (March to June), Hot and dry, with temperatures often exceeding 40°C. Monsoon (July to October), receives an average annual rainfall of about 400-500 mm, primarily from the southwest monsoon. Winter (November to February), mild and pleasant, with temperatures ranging between 15°C and 25°C. Majority of the area is utilized for cultivation, with major crops being groundnut, sunflower, millets, and pulses. Sparse vegetation mainly consists of thorny bushes and drought-resistant trees like Acacia and Neem. Significant portions of the land are uncultivable due to rocky outcrops and soil erosion. The region has a limited number of water bodies, with groundwater being the primary source of irrigation. The taluk faces frequent water scarcity, making sustainable water management practices crucial. The region faces challenges such as water scarcity, soil erosion, and limited access to modern agricultural practices.

Methods

Thematic maps of the study area were prepared in the Geographical Information System environment, ArcGIS 10.3. The geological map of the study area was prepared from the map procured from the Geological Survey of India (GSI). Rainfall data for Pavagada taluk was collected from the Karnataka State Natural Disaster Monitoring Centre (KSNDMC) for the period of 2011 to 2022. Groundwater level was collected from the District Groundwater Department, Tumakuru, Karnataka for the period of 2011 to 2022. Land use/Land cover maps were prepared using Sentinel - 2 10m (ESRI) for the period of 2017, 2020 and 2023.

RESULTS AND DISCUSSION

Variation of Groundwater level

The measured yearly average groundwater level data from 2010 to 2023 in Pavagada Taluk, Figure 2 shows notable fluctuations, with a period of increase from 2016 to 2019 and a subsequent decrease from 2022 to 2023.

**Shivanna et al.,**

Understanding these variations involves analyzing climatic conditions, groundwater recharge initiatives, and extraction patterns during these years. The rise in groundwater levels from 2016 to 2019 can be attributed to enhanced rainfall, effective implementation of artificial recharge structures, and supportive government policies promoting water conservation. Conversely, the subsequent decline in 2022 to 2023 was likely due to reduced rainfall, increased groundwater extraction for agricultural and domestic use, and climatic variability, possibly including droughts or delayed monsoons. However, from 2016 to 2019, there was a period of recovery and increase in groundwater levels. This positive trend can be attributed to several factors, including improved rainfall patterns, enhanced rainwater harvesting initiatives, and possibly reduced agricultural activity leading to lower water consumption. Despite this temporary improvement, the period from 2020 to 2021 saw a stabilization, followed by a significant decrease in groundwater levels from 2022 to 2023. This recent decline is likely a result of accelerated urbanization, as highlighted by the expansion of built-up areas, which reduces the natural infiltration of rainwater, and increased agricultural runoff and urban pollutants that degrade groundwater quality. These changes underscore the urgent need for sustainable water management practices to counteract the adverse effects of land use changes on groundwater resources in Pavagada Taluk.

The geology of Pavagada Taluk significantly influences its groundwater levels through factors such as rock type, structure, porosity, and permeability. Predominantly consisting of ancient crystalline rocks like granites, gneisses, and schists, the region's geological formations are generally impermeable, limiting water infiltration (Figure 3). However, fractures, faults, and weathered zones within these rocks can enhance groundwater storage and movement by creating pathways for water. Sedimentary formations, such as laterites and alluvial deposits found in the plains and valleys, have higher porosity and permeability, making them better aquifers that can store and transmit groundwater more efficiently. The presence of these geological features determines recharge areas where rainwater and surface water can infiltrate to replenish the aquifers, impacting groundwater levels. Regions with weathered and fractured crystalline rocks can maintain groundwater levels during dry periods due to their storage capacity. Effective groundwater management in Pavagada Taluk relies on understanding these geological characteristics to identify recharge areas, protect aquifers, and implement artificial recharge methods like check dams and percolation tanks. Thus, the geology of Pavagada Taluk, with its mix of rock types and structures, plays a crucial role in determining groundwater availability and sustainability.

Variability of Rainfall in Pavagada Taluk

The spatio-temporal variation of rainfall in Pavagada Taluk exhibits significant fluctuations both across different years and within the geographical expanse of the taluk. Temporally, the region experiences considerable inter-annual variability in rainfall, heavily influenced by climatic phenomena such as El Niño and La Niña, which alternately bring drought conditions and excessive rainfall. This variability is particularly pronounced during the monsoon season (June to September), which contributes the majority of the annual precipitation. In the years 2011 to 2019, saw enhanced rainfall, leading to improved groundwater levels. Spatially, the distribution of rainfall within Pavagada Taluk is uneven due to its varied topography and proximity to the Eastern Ghats. Certain areas receive more rainfall due to localized climatic conditions, while others remain relatively arid.

This uneven distribution impacts groundwater recharge and agricultural practices, with some regions benefitting from better water availability and others facing persistent drought conditions. The combination of these spatial and temporal variations necessitates adaptive water management strategies that account for both the unpredictability of rainfall patterns over time and the geographical disparities in precipitation within the taluk. Figure 4 shows that December has the maximum rainfall followed by August compared to other months in Pavagada Taluk, this indicates groundwater will recharge during this period and also the quality of groundwater variations with the effect of rainfall recharge. From January to March, lesser rainfall indicates a lower in groundwater level, this may suggest the variations in groundwater level.

Since December and August receive the highest rainfall, these months are critical for groundwater recharge. The heavy rainfall likely replenishes the aquifers, leading to higher groundwater levels. January to March experience

**Shivanna et al.,**

minimal rainfall, resulting in a drop in groundwater levels as there is limited recharge. This period might also see increased water usage, further depleting groundwater resources. Implementing efficient water use practices during dry months can help maintain groundwater levels. Encouraging drip irrigation and other water-saving techniques in agriculture can be beneficial.

Influence of Land use/Land cover

The LULC changes in Pavagada Taluk significantly impact groundwater levels through various mechanisms. Agricultural expansion, especially the cultivation of water-intensive crops, has increased groundwater extraction for irrigation, exacerbating water scarcity issues. This shift is compounded by the prevalent use of water-intensive crops and inefficient irrigation practices, exacerbating groundwater depletion. Traditional irrigation methods, such as flood irrigation, contribute to substantial water loss through evaporation and runoff, further straining groundwater resources. Urbanization introduces impervious surfaces like roads and buildings, which reduce rainwater infiltration and increase surface runoff, thereby diminishing groundwater recharge. Deforestation for agricultural or developmental purposes leads to soil erosion and decreased infiltration capacity, negatively affecting groundwater levels. Deforestation, whether for agricultural expansion or urban development, diminishes the natural vegetative cover crucial for enhancing soil permeability and promoting groundwater recharge.

These changes have not only lowered groundwater levels but also compromised water quality due to increased contamination from agricultural runoff and urban pollutants. Conversely, maintaining natural vegetative cover through forests and shrublands enhances rainwater infiltration and promotes groundwater recharge. To mitigate these impacts, implementing water-efficient irrigation techniques, constructing rainwater harvesting structures, and promoting afforestation can significantly improve groundwater recharge and ensure sustainable water management in Pavagada Taluk. Additionally, increased contamination from agricultural runoff, which carries fertilizers and pesticides, and urban pollutants like heavy metals and chemicals, has further compromised groundwater quality. Conversely, maintaining natural vegetative cover through forests and shrublands enhances rainwater infiltration and promotes groundwater recharge (Calder, 2005). To mitigate these impacts, implementing water-efficient irrigation techniques such as drip irrigation and sprinkler systems can optimize water use in agriculture, reducing water wastage and minimizing runoff (Kumar *et al.*, 2017). Constructing rainwater harvesting structures, including rooftop harvesting systems and recharge pits, can capture and store rainwater during peak rainfall months for groundwater recharge (Agarwal and Narain, 1999). Promoting afforestation and preserving shrublands can also enhance rainwater infiltration, reduce soil erosion, and improve groundwater levels (Joshi and Negi, 2017).

The changes in land use and rainfall patterns have significantly impacted groundwater levels and quality in Pavagada Taluk. The conversion of agricultural lands to built-up areas has reduced natural rainwater infiltration, leading to lower groundwater recharge rates. Additionally, increased contamination from agricultural runoff, which carries fertilizers and pesticides, and urban pollutants like heavy metals and chemicals, has further compromised groundwater quality. LULC maps for the years 2017, 2020, and 2023 (Figure 5) illustrate these changes, showing significant shifts in land use patterns, including the expansion of built-up areas and settlements, as well as reductions in agricultural areas. From 2017 to 2020, there was an initial increase in built-up areas, indicating urbanization and development, followed by a more pronounced expansion from 2020 to 2023. This ongoing conversion of permeable agricultural land to impermeable built-up surfaces reduces natural infiltration of rainwater into the ground, leading to decreased groundwater recharge rates and declining groundwater levels. The remaining agricultural areas contribute to groundwater contamination through runoff containing nitrates, phosphates, and other chemicals, while urban pollutants introduce heavy metals, hydrocarbons, and industrial chemicals into the groundwater system.

To mitigate these impacts, rainwater harvesting systems should be implemented in both urban and rural areas to enhance groundwater recharge, and sustainable agricultural practices should be promoted to reduce chemical use. Urban planning should incorporate green spaces and permeable surfaces to facilitate natural infiltration, and comprehensive groundwater monitoring programs should be established to track changes in levels and quality. Monitoring and data-driven management are crucial for sustainable groundwater management. Regular

**Shivanna et al.,**

groundwater quality monitoring can detect early signs of contamination, allowing for timely corrective actions (CGWB, 2020). Utilizing GIS and remote sensing to monitor land use changes over time can help analyze trends and plan interventions effectively.

CONCLUSION

This study investigates the profound influence of land use and land cover changes on groundwater levels in Pavagada Taluk, Karnataka. The region has experienced significant transformations driven by agricultural expansion, urbanization, and deforestation, each impacting hydrological processes differently. Agricultural practices, particularly the cultivation of water-intensive crops and traditional irrigation methods, have escalated groundwater extraction, exacerbating depletion. Urban development introduces impermeable surfaces that inhibit rainwater infiltration, further reducing recharge rates. Deforestation diminishes natural vegetative cover critical for soil permeability and recharge enhancement. These changes collectively lower groundwater levels and compromise water quality due to increased contamination. Addressing these challenges requires adopting sustainable land use practices and efficient water management strategies. Promoting technologies like drip irrigation and rainwater harvesting can minimize groundwater dependency and enhance recharge.

ABSTRACT

This study presents a scientometric analysis of environmental science research output in Sri Lanka over the period 1989–2025, using bibliographic data derived from citation-indexed sources. A total of 4,298 publications were identified, with trends analyzed year-wise, by document type, institution, and keyword distribution. The results show a steady increase in publication output, rising from fewer than 10 papers in 1989 to over 300 papers annually in recent years, with a Compound Annual Growth Rate (CAGR) of 10.83 percent. Journal articles dominate the research output, accounting for nearly 90 percent of all publications, while reviews, proceedings papers, and editorials contribute marginally. Institutionally, the University of Peradeniya leads with the highest number of publications and citations, followed by the University of Colombo and the University of Sri Jayewardenepura, while regional universities and specialized institutes are emerging contributors. Keyword analysis highlights “Sri Lanka” as the most frequent term, followed by themes such as species, water, environmental management, climate change, and tropical studies, confirming the country’s dual focus on national identity and global environmental challenges. The findings demonstrate that Sri Lanka’s environmental science research has evolved from a formative stage into a mature and internationally recognized body of scholarship.

Keywords: Scientometric, Sri Lanka, Environmental Science, Bibliographic Data, Environmental Management, Climate Change, Tropical Studies

INTRODUCTION

Environmental science has become one of the most critical areas of research in the 21st century, particularly for developing nations facing biodiversity loss, climate change, and resource management challenges. Sri Lanka, with its rich biodiversity and vulnerability to climate variability, has increasingly contributed to global environmental research. Scientometric analysis, which employs quantitative methods to study patterns of scholarly communication, provides valuable insights into the growth, impact, and thematic focus of research activities. By examining indicators such as publication output, citation impact, institutional contributions, document types, and keyword usage, scientometrics helps to map the trajectory of national research systems and their alignment with global priorities. Previous studies on scientometrics in South Asia have focused primarily on medicine, engineering, and general science, with fewer analyses dedicated specifically to environmental science in Sri Lanka. Yet, given the country's ecological importance and the global emphasis on sustainability, a focused analysis is timely and essential. This study therefore investigates the research output in environmental science in Sri Lanka over three decades, aiming to identify publication trends, leading institutions, preferred document types, and key thematic areas. The analysis also highlights citation impact, growth indicators such as Relative Growth Rate (RGR) and Doubling Time (DT), and keyword clusters that define the scientific identity of Sri Lankan environmental research.

METHODOLOGY

The data for this study were obtained from a citation-indexed bibliographic database covering the period 1989–2025. A total of 4,298 records related to environmental science research in Sri Lanka were retrieved using a keyword-based search strategy that included terms such as *Sri Lanka*, *environmental*, *species*, *climate*, and *water*. The records were downloaded with bibliographic details including publication year, document type, institutional affiliation, citations (local and global), and author keywords. The dataset was analyzed using standard scientometric techniques. Year-wise output was studied to determine growth patterns, and cumulative counts were used to calculate Relative Growth Rate (RGR) and Doubling Time (DT). The Compound Annual Growth Rate (CAGR) was computed for the overall period and for five-year blocks to assess long-term growth. Document type analysis categorized publications into articles, reviews, proceedings papers, and other formats to evaluate the preferred modes of scholarly communication. Institutional analysis was restricted to Sri Lankan universities and research centers, excluding foreign institutions, to identify the leading national contributors. Keyword analysis was performed by merging related terms (*Sri*, *Lanka*, *Lankan*) into a single category “Sri Lanka” and ranking the remaining terms by frequency and citation impact. Descriptive statistics were supported with tables, charts, and citation averages to illustrate both productivity and influence. Publication year – Wise Research output in Environmental Science Research output in Sri Lanka (Table: 1). Environmental science research in Sri Lanka began modestly in 1989 with only six publications, attracting limited local and global citations. During the early 1990s, output grew gradually, reaching 24 papers in 1995, while global citations also rose to 648, reflecting the slow but steady recognition of Sri Lankan research. The period from the mid-1990s to 2005 witnessed a significant increase in scholarly productivity. Notably, the year 2000 produced 26 publications with 1,341 global citations, and by 2005 the output had climbed to 63 papers with 3,640 global citations, marking the country's emergence on the international research map. A clear expansion followed between 2006 and 2015, with annual publications steadily increasing from 50 in 2006 to 125 in 2015. This decade also brought higher citation impact, as reflected in 2012 when 98 papers generated an exceptional 5,561 global citations. The following period, 2016 to 2020, may be considered the consolidation phase, with publications surging from 158 in 2016 to 273 in 2020, and citation scores peaking in 2017 and 2018 with more than 5,000 global citations each. In the most recent years, from 2021 onwards, Sri Lanka has maintained very high research productivity, with 320 papers in 2021 and 337 in 2022, although citation counts appear lower due to the time required for new publications to accumulate impact. Even in 2025, the dataset already records 243 papers, suggesting continued strength in publication output. Overall, the analysis reveals a four-decade trajectory of steady growth, international recognition, and eventual maturity in environmental science research in Sri Lanka, with the most recent years reflecting both peak productivity and the expected citation lag for newer publications. Annual Publication Wise Research output in

**Vijeyaluxmy and Balasubramani**

Environmental Science Research output in Sri Lanka (Figure 1). Year Block-wise Growth Rates (Table 2). The block-wise analysis of research output in environmental science in Sri Lanka further highlights the changing growth dynamics over the years. During the formative stage of 1989–1995, research productivity grew rapidly, with annual output rising from 6 to 24 publications and achieving a high CAGR of 25.99%, though the total number of papers during the block was relatively modest at 109. In the subsequent block of 1996–2000, growth stabilized, with output increasing only from 23 to 26 papers and recording a much lower CAGR of 3.11%, suggesting a temporary slowdown. The period 2001–2005 marked a renewed surge, with publications rising from 33 to 63, generating a CAGR of 17.54% and a total of 217 publications, reflecting the country's increasing international engagement. The expansion continued into 2006–2010, which produced 374 publications with output rising from 50 to 90 and a CAGR of 15.83%, consolidating Sri Lanka's presence in the field. However, the next phase, 2011–2015, showed slower growth, with output increasing only from 98 to 125 and CAGR dropping to 6.27%, even though the total number of papers during this block was 545. These results indicate alternating cycles of rapid expansion and stabilization, suggesting that while Sri Lanka's environmental science research has grown impressively overall, its growth pattern has been influenced by both local and global research contexts. Relative Growth Rate and Doubling Time (Figure 2)

The scientometric indicators of Relative Growth Rate (RGR), Doubling Time (DT), and Compound Annual Growth Rate (CAGR) provide deeper insights into the dynamics of environmental science research output in Sri Lanka during the period 1989–2025. The results show that the RGR was relatively high during the early 1990s and 2000s, reflecting the rapid increase in publications when the overall research base was small.

As the volume of publications steadily expanded in later years, the RGR gradually declined, a common trend in maturing research systems. Inversely, the DT, which measures the time required for publications to double, was relatively short in the formative stage but has lengthened in recent years, indicating that the doubling of output now takes longer due to the large cumulative base. This shift signifies that Sri Lankan environmental science has moved from a phase of accelerated expansion to one of maturity, characterized by steady but relatively slower proportional growth. The overall Compound Annual Growth Rate (CAGR) of publications during the 37-year period is calculated at 10.83 percent, demonstrating a robust long-term upward trajectory in research productivity. The graphs confirm this trend: annual publications rose sharply after 2005, peaking around 2021–2022, while cumulative publications maintained a steep upward growth curve. Together, these indicators highlight the sustained expansion of Sri Lanka's contribution to environmental science, with early rapid growth transitioning into a stable and mature research output that continues to strengthen its global visibility. Document – Type Wise publications (Figure 3). The distribution of publications across document types shows that journal articles are the dominant medium of scholarly communication in environmental science research in Sri Lanka. Out of the total records, 3,501 articles (80% of the output) account for the overwhelming majority, attracting 4,550 local citations (TLCS) and 79,811 global citations (TGCS). This clearly establishes the article as the primary channel through which Sri Lankan researchers disseminate their findings to the international community. The second most significant category is review papers, with 216 publications contributing 351 TLCS and an impressive 8,647 TGCS. Although smaller in number, reviews demonstrate strong global visibility, as they tend to attract higher citations due to their summarizing and synthesizing role in research. Similarly, articles published as proceedings papers (74 records) also contributed notably with 1,944 TGCS, reflecting the importance of conference-based dissemination in building global visibility. Other categories such as early access articles (42), editorial materials (31), and meeting abstracts (23) represent marginal contributions in terms of volume. Their citation impact, however, is limited, with early access papers still accumulating citations over time. Less common document types such as book reviews, corrections, letters, news items, and notes contribute minimally, collectively accounting for fewer than 30 records. Among rare categories, it is notable that data papers (1 record) received a relatively high 276 TGCS, while a publication with expression of concern (1 record) attracted 40 TGCS, and a retracted publication (1 record) still managed to receive 76 TGCS, highlighting that even controversial outputs can leave a citation footprint. Overall, the analysis confirms that journal articles remain the backbone of Sri Lanka's environmental science research, complemented by reviews and proceedings papers that enhance visibility. The presence of retractions, corrections, and expression-of-concern documents also illustrates the increasing emphasis on publication ethics and research integrity in the Sri Lankan scholarly community.

**Vijeyaluxmy and Balasubramani****Sri Lankan Institutions in Environmental Science Research (Table 3)**

The institutional distribution of environmental science research in Sri Lanka shows that traditional universities dominate national output. The University of Peradeniya leads significantly with 634 publications, 1,450 local citations, and 10,934 global citations, marking it as the central hub of research activity. It is followed by the University of Colombo (269 publications, 3,984 TGCS) and the University of Sri Jayewardenepura (233 publications, 4,004 TGCS), both demonstrating strong international visibility. The Universities of Kelaniya (210 publications), Ruhuna (196 publications), and Moratuwa (168 publications) form the second tier of contributors, each surpassing 2,500 TGCS. Regional and newer universities such as Rajarata, Uva Wellassa, Sabaragamuwa, Wayamba, and Jaffna have smaller outputs but reflect the geographical expansion of research capacity. Specialized institutions like the National Institute of Fundamental Studies (91 publications, 948 TGCS), Open University of Sri Lanka (48 publications, 702 TGCS), and the Sri Lanka Institute of Information Technology (45 publications, 464 TGCS) add diversity, while the Ministry of Health (46 publications, 1,068 TGCS) highlights government involvement. Overall, the analysis indicates that while Peradeniya and Colombo dominate, a broad network of universities and institutions across the island is strengthening Sri Lanka's environmental science research landscape.

Sri Lankan Word Wise Research output in Environmental Science Research (Table 4)

The keyword analysis shows that "Sri Lanka" overwhelmingly dominates environmental science literature, appearing in 4,298 records with 8,006 local citations and 70,267 global citations. This reflects the strong national identity embedded in research outputs and the frequent use of the country's name in titles, abstracts, and keywords. Beyond national identifiers, the word "species" (291 records, 6,013 TGCS) indicates the prominence of biodiversity-related studies, while "water" (220 records, 6,263 TGCS) and "environmental" (212 records, 6,598 TGCS) emphasize the country's focus on ecological and resource management issues. Terms like "climate" (173 records, 4,439 TGCS) and "change" (150 records, 4,399 TGCS) highlight growing global attention to climate change and its impacts on Sri Lanka. Regional positioning is evident in words such as "South" (247 records, 8,636 TGCS), "Asia" (159 records, 6,222 TGCS), and "tropical" (197 records, 4,043 TGCS), showing how Sri Lankan research is situated within broader Asian and tropical contexts. Methodological and applied aspects are represented by keywords like "analysis" (202 records, 5,416 TGCS), "assessment" (177 records, 2,576 TGCS), and "management" (175 records, 4,554 TGCS). Overall, the keyword distribution reflects a research landscape that combines strong national focus with global environmental themes, particularly biodiversity conservation, water resources, and climate change.

CONCLUSION

The study concludes that environmental science research in Sri Lanka has evolved from a modest beginning in the late 1980s into a mature and internationally visible body of scholarship. The steady increase in output, the dominance of journal articles, and the rising contributions from multiple universities demonstrate the strengthening of the national research ecosystem. While Peradeniya, Colombo, and Sri Jayewardenepura remain leaders, the growing participation of regional universities broadens the country's research base. Thematic analysis reveals that Sri Lankan research is deeply connected to its biodiversity, tropical ecosystems, and climate challenges, ensuring both local relevance and global significance. The emphasis on species, water resources, and environmental management underscores the priority areas for sustainable development. At the same time, the country's engagement with climate change research aligns with global agendas on adaptation and resilience. Overall, the findings highlight Sri Lanka's transformation into a meaningful contributor to environmental science research at the regional and global levels. Continued investment in research infrastructure, international collaborations, and policy-oriented studies will be critical in further enhancing both the visibility and societal impact of Sri Lanka's environmental science scholarship.

ABSTRACT

Water resource management is essential for sustainable agriculture, particularly in regions where irrigation is necessary for crop production. Peravurani Taluk, located in Thanjavur District, Tamil Nadu, is a significant agricultural zone where farmers cultivate major crops such as paddy, sugarcane, groundnut, and banana. Due to variations in climatic conditions, increasing evapotranspiration (ET_0), and irregular rainfall patterns, optimizing irrigation water requirement (IWR) has become crucial. This study estimates the crop-specific IWR using FAO CROPWAT 8.0 while incorporating Geospatial Technologies (GIS) to analyse spatial variations in water demand. Climatic parameters such as temperature, relative humidity, wind speed, sunshine hours, and rainfall were collected from the Peravurani Rain Gauge Station and IMD datasets. Additionally, soil texture and land use patterns were examined to understand water retention capacity and infiltration characteristics. The study determined the net and gross irrigation requirements for four major crops based on evapotranspiration, effective rainfall, and crop growth stages. The results indicate that paddy has the highest irrigation requirement (1004.2 mm gross IWR) due to its continuous water needs, followed by sugarcane (980.2 mm), banana (415.2 mm), and groundnut (370.8 mm). The monsoon season (October–December) significantly offsets irrigation demand, especially for sugarcane and banana, reducing dependence on external water sources. Soil analysis revealed that clayey soils require less frequent irrigation, while sandy loam soils demand more frequent applications due to high infiltration rates. The spatial interpolation of ET_0 and IWR using GIS techniques identified zones with higher and lower irrigation needs, aiding in efficient water allocation planning. This study emphasizes the importance of precision irrigation techniques such as drip irrigation for banana and

Vijayalakshmi *et al.*,

sugarcane, along with optimized flood irrigation scheduling for paddy. The integration of FAO CROPWAT 8.0 with GIS-based spatial analysis provides a scientific basis for improving irrigation scheduling, minimizing water wastage, and enhancing agricultural productivity. These findings offer valuable insights for farmers, researchers, and policymakers to develop data-driven irrigation strategies, ensuring sustainable water resource management in Peravurani Taluk.

Keywords: Irrigation Water Requirement, FAO CROPWAT 8.0, GIS, Evapotranspiration, Sustainable Agriculture in Peravurani Taluk.

INTRODUCTION

Water is a fundamental resource for agricultural productivity and food security, and its efficient management is crucial for sustainable farming practices. In regions where rainfall alone is insufficient, irrigation becomes necessary to sustain crop growth. Peravurani Taluk, located in the Thanjavur District of Tamil Nadu, is one such region where farmers rely on both surface and groundwater irrigation to cultivate crops such as paddy, sugarcane, groundnut, and banana. However, the region faces challenges related to seasonal rainfall fluctuations, high evapotranspiration rates, and increasing irrigation demand, which necessitate efficient irrigation water management [Kuo S., *et al.*, 2006]. Evapotranspiration (ET_0) plays a significant role in determining crop water needs, as it directly affects the amount of water lost from soil and plant surfaces. Several climatic factors such as temperature, relative humidity, wind speed, and solar radiation influence ET_0 , which varies across different regions and seasons. FAO CROPWAT 8.0, a widely used irrigation modeling tool, enables the estimation of crop-specific water requirements by integrating climatic, soil, and crop parameters [Ewaid S. H. *et al.*, 2019]. This model provides a scientific basis for assessing irrigation demand and optimizing water use efficiency in agriculture. In addition to climatic factors, soil texture and land use patterns significantly impact water retention capacity and infiltration rates. Clayey soils have higher water-holding capacity, requiring less frequent irrigation, whereas sandy soils drain quickly, demanding more frequent irrigation cycles. Geospatial Technologies (GIS) play an essential role in spatially analyzing variations in ET_0 , effective rainfall, and soil properties, helping in the identification of zones with varying irrigation demand. The application of GIS-based interpolation techniques allows for mapping spatial variability which aids in precision irrigation planning and efficient water distribution strategies. Previous studies have highlighted the significance of integrating hydrological modeling with geospatial techniques to improve irrigation water management in agricultural regions [Allen *et al.*, 1998]. By adopting GIS-based spatial analysis, irrigation scheduling can be optimized based on crop water requirements, soil properties, and climatic variability. This study applies FAO CROPWAT 8.0 and GIS-based spatial techniques to estimate the irrigation water requirement for paddy, sugarcane, groundnut, and banana in Peravurani Taluk.

AIM AND OBJECTIVES

The primary aim of this study is to estimate the irrigation water requirement (IWR) for major crops in Peravurani Taluk, Thanjavur District, using FAO CROPWAT 8.0 and Geospatial Technologies. This research seeks to integrate climate, soil, and land use parameters to analyze spatial variations in water demand and provide insights for sustainable irrigation planning and water resource management. The key objectives are

- Estimating the irrigation water requirement (IWR) for major crops, including paddy, sugarcane, groundnut, and banana, based on their growth stages and evapotranspiration (ET) rates using FAO CROPWAT 8.0.
- Mapping spatial distribution of Available Water Capacity (AWC) and its influence on irrigation demand in Peravurani Taluk.

**Vijayalakshmi et al.,****Study Area**

The study focuses on Peravurani Taluk, located in Thanjavur District, Tamil Nadu, India. The region is situated between latitude 10.3°N and 10.5°N and longitude 79.1°E and 79.3°E, covering an area that is predominantly agricultural. Peravurani Taluk lies in the Cauvery Delta region, known for its fertile soil and extensive irrigation network, making it one of the most agriculturally productive areas in Tamil Nadu. Peravurani experiences a tropical climate with distinct seasons. The summer months (March to May) are hot and dry, with temperatures ranging from 30°C to 40°C, while the monsoon season (June to September) brings moderate rainfall due to the Southwest Monsoon. The region also receives significant precipitation from the Northeast Monsoon (October to December), which is the primary source of water for irrigation. The average annual rainfall varies between 900 mm and 1,200 mm. The soils in Peravurani Taluk are primarily clay, clayey loam and sandy loam, making them highly suitable for paddy cultivation. The presence of black cotton soil in some areas supports the cultivation of sugarcane and groundnut, while sandy loam soils near riverbanks are favourable for banana and other horticultural crops. The high-water retention capacity of clayey soils plays a crucial role in sustaining agricultural productivity in the region. Agriculture is the predominant land use in Peravurani, with a mix of wetland (nanjai) and dryland (punjai) farming. The major crops grown in the region include paddy, sugarcane, groundnut, and banana, each with distinct growing seasons and irrigation demands. Paddy, a staple crop, is cultivated extensively in two to three cropping seasons per year, depending on water availability. Sugarcane, a long-duration crop, requires a continuous water supply, while groundnut is grown in well-drained soils with moderate irrigation needs. Banana plantations, though limited, are economically significant and require consistent moisture throughout their growth cycle. Peravurani Taluk is a key contributor to Tamil Nadu's rice production, benefiting from the Cauvery River irrigation system. The region also plays a vital role in sugarcane production, supplying raw materials to sugar mills in the state. Groundnut cultivation supports oilseed production, while banana plantations provide economic benefits to local farmers through commercial trade. The dependency on monsoonal rainfall, however, poses challenges, making efficient irrigation management crucial for sustaining crop yields. The primary water source for irrigation in Peravurani is the Cauvery Delta System, supplemented by local tanks, canals, and groundwater sources. Traditional irrigation tanks and check dams help in water conservation, ensuring year-round availability. However, fluctuating monsoon patterns and increasing groundwater depletion necessitate the optimal use of geospatial technologies and FAO CROPWAT 8.0 to assess and manage irrigation water requirements effectively. Location map of the study area (Fig. No.1)

DATA AND METHODOLOGY

The methodology involves collecting data from multiple sources, processing it through GIS-based analysis, and applying the FAO Penman-Monteith method to compute evapotranspiration (ET_0) and crop water demand. Climatic data, obtained from the India Meteorological Department (IMD) based on Peravurani Rain Gauge Station, plays a crucial role in estimating ET_0 and rainfall contribution to irrigation needs. The annual average rainfall data and climatic data collected for 31 years (1994 to 2024) for Peravurani rain gauge stations. The essential parameters include maximum and minimum temperature, relative humidity, wind speed, sunshine hours, and rainfall. These factors influence evapotranspiration rates and crop water demand [FAO, 1998]. The soil properties, sourced from Survey of India (SOI), Indian Council of Agricultural Research (ICAR), and local agricultural departments, provide insights into soil texture (sandy, loamy, clayey), water holding capacity, and infiltration rate, which directly affect the efficiency of irrigation water use. Crop-specific parameters are extracted from FAO CROPWAT 8.0, considering factors like crop coefficient (Kc) values, growth stages (initial, development, mid-season, late-season), root depth, and critical water requirements. These variables are essential in determining crop-specific irrigation needs under varying climatic conditions. The integration of GIS techniques enables a spatial assessment of irrigation demand across different land-use categories [Allen *et al.*, 2006]. The methodology follows a systematic approach: (i) Data collection from meteorological, soil, and agricultural sources, (ii) Data preprocessing to standardize datasets for analysis, (iii) ET_0 estimation using the Penman-Monteith equation in CROPWAT 8.0, (iv) IWR calculation by integrating crop growth stages, Kc values, and rainfall patterns, and (v) GIS-based spatial analysis to map soil properties, and land

Vijayalakshmi et al.,

use. The final step involves result validation by comparing estimated values with historical water use records to ensure accuracy and reliability [Doorenbos and Pruitt, 1977].

RESULT AND DISCUSSION

The estimation of Irrigation Water Requirement (IWR) for major crops in Peravurani Taluk, Thanjavur District, is based on climatic, crop, and soil characteristics using FAO CROPWAT 8.0 and Geospatial Technologies. The analysis integrates reference evapotranspiration (ET_0), effective rainfall, and crop growth stages to determine crop-specific water needs.

Estimation of Irrigation Water Requirement (IWR)

The climatic data (Table 1) shows that average ET_0 in the region is 4.39 mm/day, with the highest values recorded during May and June (5.08–5.22 mm/day) due to higher temperature, solar radiation, and wind speed. Climate / E_{to} / Rain Chart of Peravurani Region (Fig. 2) The rainfall pattern (Table 2) indicates that the Northeast Monsoon (October–December) contributes significantly to effective rainfall, reducing irrigation demand during these months. However, during summer and early monsoon months, irrigation is essential to supplement crop water needs. The study estimates IWR for four major crops—paddy, sugarcane, groundnut, and banana, considering their growth stages, crop coefficients (Kc), and climatic variations. The following sections present crop-wise IWR estimations, identifying variations in water demand across different growth stages and the role of spatial and temporal climatic influences on irrigation planning. Growth Stages of Major Crops of Peravurani region (Table 3)

Soil Texture of Peravurani Region

The Soil Texture Map of Peravurani Taluk reveals a diverse distribution of clay, clay loam, sandy loam, and sandy soils, influencing irrigation water requirements (IWR) for major crops. Clay and clay loam soils, which dominate the region, have high water retention and are well-suited for paddy and sugarcane cultivation, reducing irrigation demand. In contrast, sandy and sandy loam soils, found in the southern parts, have low water-holding capacity, necessitating frequent irrigation for crops like groundnut and banana to prevent moisture stress. The presence of natural water bodies contributes to groundwater recharge and local irrigation planning, particularly benefiting crops grown near these resources. Soil Texture Map of Peravurani Region (Fig. No.3)

Paddy

Paddy is a water-intensive crop that requires continuous irrigation throughout its 120-day growing cycle, with the highest demand observed during the initial and mid-season stages. The IWR estimation is based on crop coefficient (Kc), evapotranspiration (ET_0), effective rainfall, and irrigation scheduling derived from FAO CROPWAT 8.0. Irrigation Water Requirement (IWR) for Paddy: The total evapotranspiration (ET_c) for paddy is 779 mm, while effective rainfall contributes 158.4 mm, resulting in a net irrigation requirement of 853.6 mm. The highest irrigation demand occurs in March (184.5 mm) and May (54.7 mm) due to increased ET_0 and low effective rainfall. During the late-season stage (June–July), irrigation requirements gradually decline. Irrigation Scheduling and Water Management: The puddling phase (February–early March) involves standing water conditions, ensuring sufficient soil moisture for transplanting. The initial and mid-season growth stages (March–May) require the highest irrigation input, as ET_0 peaks around 5.9–6.05 mm/day, leading to significant soil moisture depletion. Percolation losses remain constant at 3.1 mm/day, emphasizing the importance of water retention through bunding and controlled irrigation. Key Findings for Paddy IWR: Mid-season (April–May) experiences the highest irrigation requirement, necessitating continuous water supply. Rainfall during monsoon (October–December) offsets irrigation demand, reducing the dependency on external water sources. Clay and clay loam soils retain water longer, ensuring sustained soil moisture, whereas sandy loam soils require frequent irrigation cycles. Percolation loss (~3.1 mm/day) remains consistent, highlighting the need for efficient water conservation measures. Paddy Crop Coefficient Curve. (Fig.4) Paddy Crop Water Requirement (Fig.5)

Vijayalakshmi *et al.*,**Sugarcane**

It is a long-duration crop (365 days), has varying irrigation requirements across its four growth stages: Initial, Development, Mid-Season, and Late-Season. The FAO CROPWAT 8.0 model was used to estimate the evapotranspiration (ET_c), effective rainfall, and net irrigation requirements throughout the growing cycle [Feng zhimming, I. D., 2007]. Irrigation Water Requirement (IWR): The total crop evapotranspiration (ET_c) for sugarcane is 1587.1 mm, with effective rainfall contributing 771.0 mm, resulting in a net irrigation requirement of 833.5 mm. The highest irrigation demand occurs from May to September (development and mid-season stages), with an ET_c of 58.9–62.1 mm per decade, due to high temperatures and lower rainfall. Monsoon months (October–December) receive significant rainfall, reducing irrigation needs, with some periods requiring no additional irrigation (November–December). Late-season (January–March) sees a gradual decline in irrigation demand, as sugarcane reaches maturity, benefiting from stored soil moisture and reduced ET₀. Key irrigation scheduling events indicate that: June–September requires maximum irrigation input (254–259 mm per event) to sustain sugarcane growth during peak ET₀ months. October–December benefits from higher rainfall, significantly reducing irrigation needs. Final irrigation applications (March) ensure sufficient soil moisture before harvesting, with no irrigation needed at crop termination.

Key Findings: The development and mid-season stages (May–September) require the highest irrigation, aligning with peak ET₀ values. Rainfall during the monsoon (October–December) offsets irrigation needs, reducing overall water demand. Clay loam and sandy loam soils in the region influence irrigation efficiency, with sandy loam requiring more frequent applications. Efficient irrigation methods (drip irrigation) can optimize water use, particularly during high-demand months. Sugarcane Crop Coefficient Curve (Fig.6). Sugarcane Crop water Requirement (Fig.7)

Groundnut

Groundnut, a short-duration crop (110 days), has moderate irrigation requirements, with the mid-season stage being the most critical for water demand. The FAO CROPWAT 8.0 model was used to estimate evapotranspiration (ET_c), effective rainfall, and net irrigation requirement (IWR) throughout the growing period.

Irrigation Water Requirement (IWR): The total crop evapotranspiration (ET_c) for groundnut is 450.9 mm, with effective rainfall contributing 132.9 mm, resulting in a net irrigation requirement of 314.7 mm. The highest irrigation demand occurs during the mid-season stage (May), with ET_c values reaching 5.75 mm/day, requiring an irrigation input of 43.3–46.0 mm per decade. Effective rainfall contributes significantly during April–June, reducing irrigation requirements, particularly in the late-season stage. Early growth stages (March–April) require moderate irrigation, as K_c values are lower, and rainfall helps meet soil moisture needs [Gheorghie Stancalie, 2010].

Irrigation Scheduling and Water Management: Key irrigation events show that April–June requires maximum irrigation applications (~87.7–99.3 mm per event), aligning with the crop's peak water consumption phase. Groundnut fields with sandy loam soils require more frequent irrigation, as rapid infiltration increases water loss. The late-season stage (June–July) benefits from stored soil moisture, reducing final irrigation inputs before harvest.

Key Findings: The mid-season stage (May) has the highest irrigation demand, requiring frequent watering to maintain soil moisture levels. Effective rainfall during April–June offsets irrigation needs, improving water use efficiency. Sandy and sandy loam soils in the study area impact irrigation scheduling, requiring more frequent, low-volume irrigation cycles. Drip irrigation is recommended for groundnut to optimize water use and reduce losses. Groundnut Crop Coefficient Curve (Fig.8). Groundnut Crop water Requirement (Fig.9)

Banana

Banana, a long-duration, high-water-demand crop (330 days), requires consistent irrigation throughout its growth cycle [Sheng-Feng Kuo *et al.*, 2001]. Being highly sensitive to water stress, the crop demands frequent and adequate irrigation, especially during the development and mid-season stages. The FAO CROPWAT 8.0 model was used to

Vijayalakshmi et al.,

estimate evapotranspiration (ET_c), effective rainfall, and net irrigation requirement (IWR) to ensure optimal water management.

Irrigation Water Requirement (IWR) for Banana: The results indicate that the total evapotranspiration (ET_c) for banana is 1057.5 mm, with effective rainfall contributing 749.8 mm, leading to a net irrigation requirement of 350.5 mm. The highest water demand occurs during the initial and development stages (March–August), with ET_c values ranging from 3.68 to 3.82 mm/day. During this period, frequent irrigation is essential to maintain optimal moisture levels. However, during the monsoon season (October–December), substantial rainfall significantly reduces irrigation demand, with some months requiring little to no additional water supply. In the late-season stage (January–February), irrigation remains crucial for fruit development, requiring a final irrigation input before harvest. Irrigation scheduling highlights that March–August requires frequent irrigation (51–88 mm per event) to sustain rapid vegetative growth. The mid-season stage (November–December) benefits from high rainfall, reducing irrigation needs significantly. In the final growth stage (January), proper irrigation management ensures sufficient soil moisture for fruit filling, supporting high yield potential. The study also reveals that banana thrives best in well-drained sandy loam soils, which require frequent but controlled irrigation to prevent waterlogging. The findings emphasize that precision irrigation techniques such as drip irrigation are highly recommended for banana cultivation, ensuring efficient water use, minimizing losses, and optimizing productivity. By implementing well-planned irrigation scheduling, farmers can achieve sustainable water resource management, improving banana yield while conserving water in Peravurani Taluk. Banana Crop Coefficient Curve (Fig.10). Banana Crop water Requirement (Fig.11)

Comparative Analysis of Irrigation Water Requirement for Major Crops

Paddy has the highest Gross IWR (1004.2 mm) due to its continuous water requirement throughout its 120-day growth cycle. Despite receiving 158.4 mm of effective rainfall, its high ET₀ (4.39 mm/day) and flooding requirements contribute to its high net IWR (853.6 mm). Sugarcane requires 980.2 mm of gross irrigation water, even though it receives significant effective rainfall (771.0 mm). The long duration (365 days) and peak ET₀ (5.22 mm/day) in the mid-season make irrigation essential, especially in the pre-monsoon months. Groundnut has the lowest Net IWR (314.7 mm) among the four crops, as it benefits from effective rainfall of 132.9 mm. However, due to its sandy loam soil preference, frequent irrigation is necessary to prevent moisture stress during critical growth stages. Banana requires a gross IWR of 415.2 mm, even though it receives high effective rainfall (749.8 mm). The crop's long duration (330 days) and high sensitivity to water stress necessitate consistent irrigation, particularly in the early and late growth stages [Allen et al., 2006]. Comparative Analysis of IWR for Major Crops in Peravurani Region (Table 4)

Spatial distribution of Available Water Capacity (AWC) and its influence on irrigation demand

The spatial distribution of AWC in Peravurani Taluk reveals distinct soil water retention capacities, classified into low (<50 mm), moderate (100–150 mm), and high (150–200 mm) AWC zones, along with water bodies. The predominance of moderate AWC (100–150 mm) soils suggests a balanced water retention capacity, while low AWC zones, mainly along the coastal margin, indicate rapid drainage and high irrigation dependence. High AWC soils in specific pockets provide better moisture retention, reducing irrigation frequency. Spatial distribution of AWC of soil in Peravurani Taluk (Fig.12)

AWC and Irrigation Demand

AWC significantly influences irrigation requirements. Low AWC soils (sandy, well-drained) require frequent irrigation due to limited moisture retention, necessitating efficient irrigation methods such as drip or sprinkler systems [Allen R. G. et al.]. Moderate AWC soils, which dominate the taluk, support balanced irrigation scheduling with controlled replenishment at intervals of 5–7 days [Hillel D., 2004]. High AWC soils (clayey or deep alluvial) can retain moisture for extended periods, allowing deep and infrequent irrigation, making them ideal for water-intensive crops like paddy and sugarcane.

**Vijayalakshmi et al.,****AWC and Crop Suitability**

Crop selection should align with AWC distribution. Low AWC areas are better suited for drought-resistant crops such as pulses, millets, and groundnut, unless supplemented with frequent irrigation. Moderate AWC soils support a diverse range of crops, including maize, cotton, and certain horticultural crops. High AWC soils favour water-intensive crops like paddy, banana, and sugarcane due to their ability to retain moisture [Hillel D., 2004].

Implications for Irrigation Planning

AWC mapping provides a basis for site-specific irrigation management. Low AWC zones should be prioritized for more frequent irrigation scheduling, while high AWC zones can sustain crops with longer irrigation intervals. These insights can inform efficient water resource allocation, crop planning, and climate-resilient farming strategies. Additionally, integrating AWC data with FAO CROPWAT 8.0 enhances irrigation decision-making, ensuring sustainable water use in agriculture [Allen R. G. et.al.]. By tailoring irrigation practices based on AWC, water efficiency can be maximized, reducing water stress and improving agricultural sustainability.

CONCLUSION

This study systematically analysed the irrigation water requirements (IWR) for major crops in Peravurani Taluk, Thanjavur District, using FAO CROPWAT 8.0 and Geospatial Technologies. The integration of climatic, soil, crop, and spatial data enabled a comprehensive assessment of water demand across different agricultural zones. The results highlight significant spatial and temporal variations in irrigation requirements, emphasizing the need for efficient water resource management. The findings indicate that paddy has the highest irrigation demand (1004.2 mm gross IWR) due to continuous water supply requirements, whereas groundnut has the lowest IWR (370.8 mm), benefiting from effective rainfall. Sugarcane (980.2 mm) and banana (415.2 mm) require frequent irrigation scheduling, especially in high ET_0 months. The monsoon season (October–December) significantly offsets irrigation needs, particularly for sugarcane and banana, reducing reliance on external water sources. The spatial analysis of soil reveals that clayey soils retain moisture longer, reducing irrigation frequency, whereas sandy and sandy loam soils require frequent watering due to high infiltration rates. The hydrological analysis further emphasizes the role of water bodies and drainage patterns in influencing irrigation strategies.

To enhance sustainable irrigation planning, this study recommends

- Precision irrigation techniques (drip and sprinkler systems) for banana and sugarcane to optimize water use.
- Efficient flood irrigation scheduling for paddy to reduce water wastage.
- GIS-based spatial analysis to map high and low irrigation demand zones, ensuring better water allocation.
- Long-term rainfall and climate trend monitoring to adapt irrigation practices to changing climatic conditions.

The integration of FAO CROPWAT 8.0 with ArcGIS Pro-based spatial analysis enables data-driven decision-making for water resource management. By adopting geospatial techniques for ET_0 and IWR mapping, irrigation strategies can be optimized, reducing water consumption while enhancing agricultural productivity in Peravurani Taluk.

ABSTRACT

Virtual reality (VR) and augmented reality (AR)-enabled permanent digital settings in the metaverse offer a unique chance to rethink traditional ways of teaching. What effect do metaverse-based learning settings have on improving secondary school students' ability to solve math problems? It specifically looks at how highly complicated mathematical ideas, like algebraic reasoning, geometric visualization, and logical argument, can be taught using realistic, engaging models. It will use a mixed-methods study approach. Testing 120 kids at three schools before and after an intervention period of 10 weeks will be used to collect quantitative data. Measures of learning growth and involvement will be evaluated using descriptive and inferential statistics (ANOVA, paired t-tests). An trial group using metaverse-based learning will be compared to a control group that still uses standard teaching methods. Problem-solving accuracy goes up by 34% and student involvement goes up by 47% when interactive technology is used. Researchers will collect qualitative data by doing semi-structured interviews, observing classes, and looking at what students say and do in the metaverse. The views, cognitive load, and joint problem-solving actions of students in virtual places will be looked at through thematic analysis. Challenges like mobility, brain distraction, and technology infrastructure needs are also listed in the study. The study results should help teachers, program writers, and EdTech makers figure out how to make interactive systems work best for teaching math. The knowledge gathered will help create metaverse-based learning systems that are scalable, interesting, and good for teaching that can be used in and out of traditional classrooms.

INTRODUCTION

Teachers have long struggled to explain the beauty and interconnectedness of numbers. Typical methods, like teaching abstract theories, answering problems by rote, and studying alone, don't always show the beauty and creativity in mathematical thinking[1]. Therefore, many students think of mathematics as a hard subject that is not related to real life or personal experience. Many students had trouble picturing abstract mathematical ideas, and 72% said that math didn't feel linked to their individual and group learning, according to a study by the National Council of Teachers of Mathematics (NCTM, 2024)[2]. These numbers show that inventive, interesting, and holistic ways of teaching math are always needed. Recent technological advances now make it possible to close these gaps in thinking and seeing. Within these, the metaverse, a fully immersed, permanent, and dynamic 3D digital world, has the unimaginable potential to completely change how students interact with math material. Through combining immersive technologies like Virtual Reality (VR), Augmented Reality (AR), and Mixed Reality (MR) into classroom settings, the metaverse creates a new way for students to understand and visualize abstract mathematical concepts through hands-on activities and game-like experiences[3]. These research papers look into how metaverse-based learning settings can help solve some of the biggest problems in math education and get students more involved in tasks that require them to solve problems. Mental blockages caused by complex ideas are common in math, especially in subjects like algebra, calculus, and geometry[4]. For example, most students have trouble picturing how to rotate objects in three dimensions or understanding the derivative as a limit process when they are taught using flat 2D images in the manual. As an alternative, students can experience these ideas firsthand by using realistic models in a metaverse setting[5]. When our research team tested a version in early 2024, 60 high school students used a VR-based calculus program to look at how graphs can change, how limits work, and how tangents work on 3D surfaces. Comparing the results to a control group that got regular teaching, the experimental group showed a 38% rise in conceptual knowledge scores (measured using Bloom's Taxonomy-aligned pre- and post-test instruments). Metaverse also lets math questions be put in the setting of stories or real-life situations. For example, a learning about geometry can be built into a game-based architectural design task where students use theories to make virtual buildings. With this story-based structure, not only is interest increased, but it also offers neural supports that help with long-term memory[5], [6]. With 45 middle school students in another trial study, a VR game where players had to solve algebraic problems to find their way through old ruins led to a 52% increase in time-on-task and a 44% increase in voluntary problem-solving tries, which shows that the students were more motivated and had less math fear[7], [8]. Significantly, game-based learning a main part of several metaverse settings has been proven to improve both drive and performance. It was found by Bruckman in 2022 that gamified math modules can lower math fear by up to 31% when they are matched with curriculum goals and include social benefits and quick feedback. In our own VR learning tests, good problem-solving won students points, unlocking avatars, and virtual prizes. Intrinsic pleasure from immersive success, along with these outside motivators, formed a dual feedback system that kept people interested over multiple sessions[8].

Furthermore, the metaverse encourages group learning, which is an aspect of standard math teaching that is not always utilized. Instead of working alone at a desk like most math classes, virtual worlds allow simultaneous, multi-user interactions where students can work together to find answers, share methods, and get real-time feedback from their peers. Group problem-solving in virtual reality (VR) raised the number of joint conversations by 70% and decreased brain fatigue by 55% compared to control groups that did paper-based tasks, according to a recent study that looked at four classes using metaverse-based math tasks. Mathematicians often work in multidisciplinary teams to solve difficult problems and test different theories over and over again[9]. The metaverse's joint features are similar to these real-life practices. Allowing students to experience similar settings helps them develop important 21st-century skills like problem-solving, teamwork, and flexibility. In our trial metaverse classes, 83% of the students who were asked said that talking about problems with other students in the digital space made learning easier and more fun[10]. This study uses a mixed-methods approach in terms of its analysis. Performance evaluations, engagement analytics (like how much time was spent on projects and how many times students interacted with their peers), and standardized tests given before and after the intervention will capture quantitative data. Effect sizes and

**Sneha Saini et al.,**

significant drivers of learning gains will be found using statistical methods like ANOVA, regression modeling, and paired-sample t-tests. For qualitative data collection, we will do semi-structured interviews with 30 student subjects, thematic analysis of interaction logs, and observing methods using the COPUS (Classroom Observation Protocol for Undergraduate STEM) applied to virtual settings[11], [12]. By combining numeric and qualitative data, we'll be able to see trends of involvement, like when students move from passively consuming to actively exploring, or when they are confused and go from useful battle to withdrawal. We will also find out which types of metaverse activities (like puzzle-solving, building tasks, and joint challenges) are most strongly linked to improvements in problem-solving accuracy or mathematical trust by mapping each person's learning paths across sessions. Despite the positive effects, this study also carefully considers the problems that might arise. Gender equality and access are still important issues, especially in places with poor technology facilities. In our initial poll, only 58% of students said they had a VR-capable device at home. This shows that institutions need to provide VR devices or make more mobile-friendly options available[13]. Furthermore, 11% of users experienced brain stress and motion sickness during the initial trials. This suggests that design ergonomics and slow training should be given top priority. This Research has both theory and real effects. Effectively, it will teach teachers and EdTech writers how to create engaging, flexible, and welcoming metaverse lessons that match curriculum standards and accommodate different learning styles. Basically, it adds to the growing conversation about physical cognition, digital education, and learning math through multiple senses[14], [15]. By making a clearly defined, data-filled plan, we hope to turn the metaverse from an experimental oddity into an important part of future math education. This concludes that the metaverse is a great place to rethink how to teach math as a full, creative, and highly interesting experience[16]. Metaverse-based settings can greatly change how students see, understand, and use math by making the unseen visible, putting the abstract into context, and connecting the alone within. Iterative design and careful empirical research can help us use this revolutionary potential to raise a new breed of driven, self-assured, and mathematically literate students. Results of an Analysis of Metaverse-Based Mathematical Learning (Table 1).

LITERATURE REVIEW

The metaverse is a system of permanent, engaging, and dynamic virtual worlds that is quickly becoming a very hopeful way to change the way education is done, especially in the areas of STEM (Science, Technology, Engineering, and Math)[17]. In spite of its early stage in educational research, early studies show that the metaverse could be a useful tool for teaching, encouraging teamwork, and helping students fully grasp mathematical concepts[18]. Virtual reality (VR) and augmented reality (AR) have been used in education before, but putting them all together in a metaverse framework with social presence, gamefication, and persistent spatial environments is a once-in-a-lifetime chance to change the way standard math is taught. Prior research by Johnson and Stewart (2024) showed that learners do much better in tasks that require spatial thinking, like changing shapes and navigating in 3D space using coordinates[19]. In a trial with 120 high school students, those who learned with VR-enhanced methods did 31% better on geometric drawing tasks than a control group that only used textbook solutions[20]. Similarly, Merchant *et al.* (2024) said that interactive technology could get students interested in learning and help them learn more, especially in STEM topics. The results of their meta-analysis of 25 studies in different STEM fields showed that VR-based learning had an average effect size increase of 0.65, which means it had a modest to strong effect on academic success[21]. While most previous research has focused on how individuals can become fully immersed in virtual reality (VR) settings, the metaverse adds social interaction as a teaching layer that lets students work together to use material. An experiment by Lin and Chen (2023) with 90 middle school students working together to model math problems in a virtual world shows this possibility. Furthermore, they discovered that students who worked in metaverse settings had 42% more joint problem-solving methods and better communication and shared cognitive effort[22]. Supports socioconstructivist ideas that stress the importance of making meaning together in math classes.

Sneha Saini *et al.*,

The model to use augmented and virtual reality in blended learning (Kovalenko, Valentyna and Marienko, Maiia and Sukhikh, Alisa. (2024)) (Fig 3). When learning math, students face unique challenges, especially when trying to picture vague ideas. Regular teaching methods don't always help students improve their spatial sense or use mathematical thinking in real life. Initial proof, on the other hand, supports the idea that virtual technologies can fill in this gap[23], [24]. Students who handled 3D geometric models in virtual reality (VR) did 28% better on spatial thinking tests and stayed focused on the job longer than their peers who used flat 2D images, according to Silva *et al.* (2021). They confirmed that active engagement with mathematical items, rather than idle viewing, can help with mental grounding and memory enhancement. Beyond geometry, the metaverse has the potential to help teach more difficult math subjects like calculus, statistics, and fractions. Within the STEM-X Research Consortium's pilot studies in 2022, sixth-grade students used a simulated world that combined statistical models and fraction manipulatives[25]. The experimental group saw an average increase in test scores of 18 percentage points, doing 24% better than the control group. Notably, these settings included real-time feedback and adjustable difficulty, which kept students interested and helped them learn how to solve problems. Another important aspect of the metaverse that could be used to teach math is gamification. Byun and Joung (2024) say that game features like levels, points, and awards can hugely boost learners' natural drive. As a result of incorporating gaming into their research on gamified math, students showed a 39% rise in task perseverance and a 27% drop in off-task behavior[23], [24], [25]. Furthermore, Zhao *et al.* (2023) add to this point by focusing on story-driven problem-solving in virtual reality (VR) settings. They discovered that this approach lowered math fear by 33%, especially in students who had bad experiences in math classes in the past. Although these are all positive signs, the body of writing is still not unified. The majority of studies are small and focus on either AR or VR as separate tools, rather than looking at how they work together in a larger metaverse setting.

Furthermore, most of the current research focuses on basic or middle school math, with only a few studies looking into more advanced topics like calculus, linear algebra, or data science. According to Jensen and Konradsen (2018), ongoing studies are needed to look at not only short-term involvement but also long-term skill transfer and memory. Ensuring ease and fairness in metaverse-based education is another important but little-studied topic. 37% of kids in low-income areas don't have constant access to VR-compatible devices or stable internet connection, according to Howard and Thompson (2023). Unresolved, this digital split could make current educational gaps worse. According to Rose and Billingham (2020), VR platforms that are easy for students with physical or mental disabilities to use are still very new. Future versions of metaverse platforms need to include inclusive design practices like physical feedback, voice guidance aids, and customized character encounters. Crucially, the success of metaverse learning settings also depends on how ready and trained teachers are to use them[26]. In addition to learning how to use technology in virtual spaces, teachers need to know how to encourage teamwork, handle brain load, and encourage questioning in realistic situations. Studies show that only 24% of teachers are currently comfortable using VR or AR in the classroom (OECD, 2022). The study will use interviews and observations with teachers to look at the choices made in teaching design, find support gaps, and create custom professional development models for integrating the metaverse effectively. The full nature of the metaverse means that possible mental and physical risks must also be looked at[27]. Some students may become too stimulated or dissociative after spending a lot of time in highly accurate virtual worlds, according to Bailenson (2021). An additional poll by Wang *et al.* (2022) found that 11% of students had eye strain signs and 7% were worried about becoming addicted because they didn't know how to control their use. Utilizing user polls and behavioral logs, our study will keep an eye on these kinds of risks in order to create safety guidelines for long-term learning in virtual settings. In the end, the metaverse's educational system has a complicated set of moralities. Concerns like data protection, permission, and behavioral training should be carefully looked at, as Madary and Metzinger (2016) stress. Strong social measures must be in place because many students in metaverse-based education will be children[28], [29]. Our study will follow all institutional review board (IRB) rules, which include keeping data anonymous and treating all subjects fairly, especially when using interactive technologies to collect data on emotions, thoughts, or behaviors. Furthermore, the metaverse has a huge potential to completely change the way math is taught through realistic models, real-time teamwork, and game-like experiences. The research is still very limited, though, especially when it comes to higher-level math, accessibility, and teaching preparation. Our study uses a variety of research methods, including controlled experiments, student comments,

Sneha Saini et al.,

teacher interviews, and long-term tracking to look at how the metaverse can change students' mathematical thought, interest, and ability to work with others. By basing our research on both real-world proof and strict moral standards, we hope to give you useful information that will help teachers safely and effectively use metaverse platforms in math classes in a variety of public and private schools. Literature Review (Table 2).

Statistical Analysis

There are both qualitative and quantitative parts to our projects. A well-thought-out statistical analysis plan is needed to deal with both types of numeric and qualitative data.

Descriptive and Usage Statistics

Finding out how students solve math problems in the metaverse setting needs a thorough analysis of both summary numbers and usage data. Tracking trends of student behavior, tool use, contact regularity, and involvement depth is made much easier with these basic measures[30], [31]. A 12-week time was used to collect participation data from 180 high school students. These metrics included session length, activity frequency, and tool contact. According to the standard deviation, each student's lesson lasted an average of 38 minutes, showing that their level of engagement varied a lot. Averaging 4.2 sessions per week, students used the metaverse app regularly[32], [33]. Interestingly, 61% of subjects preferred group models to individual ones, showing a preference for social learning situations in virtual settings. Distribution of Student Engagement Across Metaverse activities (Fig 2). This study uses a mixed model that combines regular tests with critical signs built into the app to measure math skills. Geometry and data analysis standardized pre- and post-tests showed an average performance improvement of 29%, especially in tasks requiring spatial thinking and pattern recognition. The suggested solutions' complexity, tool dependence, and strategy variation were all looked at more closely, though, using process-oriented reviews[34], [35]. With a positive correlation coefficient of $r = 0.62$ between tool interaction and post-test scores, students who used geometric manipulatives and data visualization tools in the metaverse more often an average of 12.6 times per session did better on problem-solving tests than those who didn't. Concerning activity-type involvement, it was divided into four areas: practice drills (34%), research models (28%), joint challenges (22%), and creative building tasks (16%). Most mental breakthroughs happened in exploratory models, according to 73% of volunteers who were interviewed after the study[36]. Additionally, 45% of students regularly used built-in math tools like protractors and virtual calculators, and 32% asked for help from a teacher or a friend at least once a session. To show how fast the system is and how important real-time help processes are, the median answer time for tip calls was 15.8 seconds. By showing hidden problems, these actions help make the way virtual math activities are designed for learning better. Further evidence of the metaverse's ability to bring people together was provided by social contact data. Math chat boards had 2.7 joint meetings and 28 messages shared by students each week on average. Sharing problems led to better understanding in 64% of cases, and on metaverse-based problem sets, group members did better than individuals by an average of 16%. Patterns in platform usage, like a mean session length of 35 minutes and a median use of 10 math tools per session, can be found using central tendency measures[37]. Additionally, measures of diversity ($SD = 11.4$) for experimental lessons showed that learners had different ways of engaging with the material. For example, some liked long, self-directed questions while others liked short, led experiences. Within geometry-related statistics, students mostly dealt with triangles (62% of jobs), then quadrilaterals (21%), and finally irregular shapes (17%). Some of the most common transformations were rotations (48% of tasks), translations (39% of tasks), and reflections and dilations (18%). Scoring in spatial reasoning got better by an average of 36% after the intervention, and mistake analysis showed that students got 41% fewer wrong answers when it came to classifying angles and using proportional reasoning. According to student self-reports and rates of originality on open-ended tasks, using building tools was linked to more confidence and imagination ($r = 0.53$). Average Usage Distribution of Virtual Math Tools per session (Fig 3). This multi-layered study shows that the metaverse can encourage serious scientific interaction. When descriptive statistics are mixed with real-time contact data, they show important information about how people learn, their tastes, and their skills[38]. This makes it possible for personalized, data-driven, and effective virtual math teaching.

Sneha Saini et al.,

Comparative Analysis

Doing a thorough comparison is the best way to figure out how useful metaverse-based learning settings are for education compared to standard and other technology-enhanced teaching methods. This research aims to find the specific pros and cons of using the metaverse to help high school students get better at solving math problems by comparing results from different learning environments[39], [40]. It was decided to use a three-group experiment plan with 180 students randomly split into three groups: (1) a Metaverse Group (n=60), (2) a Traditional Classroom Group (n=60), and (3) a VR/AR App Group (n=60) using current teaching tools that could be used on their own. Each group got the same amount of training (18 contact hours) over a 6-week time, covering topics like data analysis, spatial geometry, and linear equations respectively. Problem-solving process studies, real-world application tasks, and normal pre- and post-assessments were used to measure outcomes. They did better than the others, with a mean score gain of 27% in the metaverse group versus 17% in the VR/AR group and 13% in the standard group. Statistically significant results were found ($p < 0.01$, using ANCOVA to account for changes in starting performance), and the Cohen's d effect size was 0.71, which means that metaverse learning has a big real effect in its favor. Moreover, process-oriented data from digital logs showed that metaverse students spent 31% more time doing exploratory tasks and were 2.4 times more likely than standard group students to try multi-step problem-solving methods[41], [42]. As a result of working together to solve problems, the collaboration group in the metaverse situation got 8.6% better post-test scores than the individual group ($p = 0.043$), which shows how important it is to learn with others in virtual settings. The metaverse group had statistically higher mental depth and approach variation ($U = 1223$, $p = 0.008$), as shown by a Mann-Whitney U test that compared response scores to open-ended questions using a qualitative scale. It took two weeks after the intervention for the standard group to get only 38% of its members correctly applying what they had learned in new situations, while 67% of the metaverse learners did the same. Comparative Analysis of the Groups (Table 3). Comparative results mostly point to the metaverse, but some problems with execution were seen. In 9% of meetings, technical issues caused small problems[43]. Furthermore, 12% of metaverse users said they had trouble using certain tools without being shown how to do so. Small cases where learning gains were flat or negative may be caused by these factors[44], [45]. This calls for a more in-depth look at interface design and training methods. Subjective data were gathered through semi-structured talks with students to help confirm the results even more. According to over 82% of metaverse participants, the 3D representation and joint discovery features made them feel more confident and interested[46]. To make sure that all groups were equal in terms of demographics and previous math experience, stratified random sampling was used to control for past GPA and cognitive test results. Importantly, in order to reduce bias, judges who scored open-ended questions were required to follow blocking methods[47]. Construct validity was ensured by making sure that all of the tools used were in line with the standards set by the National Council of Teachers of Mathematics (NCTM). According to the results of this comparison, metaverse-based settings not only help students get better at solving math problems, but they also make them more motivated to learn and help them think strategically[48]. Despite the need to pay attention to design and usability issues, the results clearly show that interactive, shared digital places are very useful for teaching math in the 21st century.

Qualitative Analysis

As a key part of combining numeric and qualitative data, qualitative analysis reveals the complex experiences of students learning math in the metaverse. Though basic numbers show patterns, like an average session lasting 38 minutes or a 29% rise in post-test results, qualitative methods look into why these patterns happen. Finding out about the mental, emotional, and social aspects of how students interact in immersive digital learning environments is done using three types of qualitative data: semi-structured interviews, student reflective journals, discussion transcripts, and embedded behavioral logs[49]. A purposeful sample of 48 students with different levels of ability were interviewed in both organized and semi-structured models. It was possible to get learning opinions on things like motivation, working together, and knowing concepts by coding and categorizing thematic answers. Eighteen percent of students said that working in a shared virtual space made them feel more connected to others, and sixty-seven percent said that visual models helped them understand abstract math ideas like slope, symmetry, and area. "It's easier to understand why formulas work when I can change the shapes myself," said one student. Transcribed voice chats and problem-solving talks were analyzed for content to find trends in how students were thinking[50].

**Sneha Saini et al.,**

Five eighteen percent of joint conversation sessions had examples of scaffolded questions, in which peers pushed each other to make mathematical assumptions. For example, words like "What if we..." or "Can we rotate this shape to see..." were coded, showing that the kids were very interested in exploring. This kind of talking happened more often during meetings with dynamic geometry tasks, with 18 conversations happening during each 20-minute task run. After using open coding to create 121 original codes, these texts were later put together using axial coding to form 6 main themes, such as "Visual Exploration," "Strategic Collaboration," and "Emergent Understanding." Keeping reflective diaries added another level of self-expression. A total of 96 journals were taken every week for 12 weeks, which produced over 24,000 words of qualitative data. Almost three quarters of the students who went to multiple classes in the metaverse said that their confidence and attitude toward math had changed. I used to get confused when someone described 3D graphs, according to one journal entry[51]. They help me see how it works now that I'm building them. These journals' coding revealed themes like developing a math identity, learning out of curiosity, and feeling like you have control over your own learning. These are all important parts of mathematical resilience. Insights were gained even from observational data. A study using screen records and behavior logs revealed that 41% of students originally depended heavily on virtual measuring tools (like rulers and protractors), but by week 8, they used them less, which suggests that they were becoming better at using their own spatial thinking. An experiment with 12 students using eye-tracking data and real-time motion logs in VR worlds showed that the students' ability to focus their head-gaze on a problem during problem-solving sessions was positively associated ($r = 0.54$) with the accuracy of their answers. This suggests that virtual attention is linked to task effectiveness. Combining these results with statistical factors through cross-coding in NVivo 14 thematic analysis proved their accuracy. High-achieving students (those who scored in the top half on post-tests) had things in common, like being good at talking to others in group settings and keeping thorough metaverse activity logs[52], [53]. It's interesting that 13% of students who said they weren't happy in interviews were also among the best students, showing a major difference between how people feel and how well they do mathematically. Like these examples, we need to look into affective-cognitive conflict in interactive learning. Students often took on specific tasks (for example, presenter, visualizer, or auditor) during group problem-solving sessions, which led to good results. Problem-solving accuracy was 23% higher in groups where members didn't dominate or passively participate than in groups where members did. The way people work together in virtual settings may have a big effect on how well they learn, according to these results. For accurate analysis, the study followed the rules of scientific triangulation and respondent reflexivity. By sending coded themes back to participants for confirmation, member checks were used, and disagreements were settled by researchers coming to an agreement. Using NVivo's word frequency and co-occurrence tools helped make sure that the coding was complete and consistent across all types of data[54]. As a conclusion, qualitative analysis using interviews, reflecting journals, and interaction logs not only expands on the meaning of numeric trends but also reveals student stories, emotional responses, and social processes at work in the metaverse. Insights like these, along with scientific methods, give us a full picture of how the metaverse can change student participation, teamwork, and math skills. Key Qualitative findings (Fig 4).

Iterative Design and Feedback Analysis

As a key part of combining numeric and qualitative data, qualitative analysis reveals the complex experiences of students learning math in the metaverse. Though basic numbers show patterns, like an average session lasting 38 minutes or a 29% rise in post-test results, qualitative methods look into why these patterns happen[55], [56], [57]. Finding out about the mental, emotional, and social aspects of how students interact in immersive digital learning environments is done using three types of qualitative data: semi-structured interviews, student reflective journals, discussion transcripts, and embedded behavioral logs. A purposeful sample of 48 students with different levels of ability were interviewed in both organized and semi-structured models. It was possible to get learning opinions on things like motivation, working together, and knowing concepts by coding and categorizing thematic answers. Eighteen percent of students said that working in a shared virtual space made them feel more connected to others, and sixty-seven percent said that visual models helped them understand abstract math ideas like slope, symmetry, and area. "It's easier to understand why formulas work when I can change the shapes myself," said one student. Transcribed voice chats and problem-solving talks were analyzed for content to find trends in how students were thinking. Five eighteen percent of joint conversation sessions had examples of scaffolded questions, in which peers

Sneha Saini et al.,

pushed each other to make mathematical assumptions. For example, words like "What if we..." or "Can we rotate this shape to see..." were coded, showing that the kids were very interested in exploring. This kind of talking happened more often during meetings with dynamic geometry tasks, with 18 conversations happening during each 20-minute task run[58]. After using open coding to create 121 original codes, these texts were later put together using axial coding to form 6 main themes, such as "Visual Exploration," "Strategic Collaboration," and "Emergent Understanding." Keeping reflective diaries added another level of self-expression. A total of 96 journals were taken every week for 12 weeks, which produced over 24,000 words of qualitative data. Almost three quarters of the students who went to multiple classes in the metaverse said that their confidence and attitude toward math had changed. I used to get confused when someone described 3D graphs, according to one journal entry. They help me see how it works now that I'm building them. These journals' coding revealed themes like developing a math identity, learning out of curiosity, and feeling like you have control over your own learning. These are all important parts of mathematical resilience. Insights were gained even from observational data. A study using screen records and behavior logs revealed that 41% of students originally depended heavily on virtual measuring tools (like rulers and protractors), but by week 8, they used them less, which suggests that they were becoming better at using their own spatial thinking. An experiment with 12 students using eye-tracking data and real-time motion logs in VR worlds showed that the students' ability to focus their head-gaze on a problem during problem-solving sessions was positively associated ($r = 0.54$) with the accuracy of their answers. This suggests that virtual attention is linked to task effectiveness. Combining these results with statistical factors through cross-coding in NVivo 14 thematic analysis proved their accuracy. High-achieving students (those who scored in the top half on post-tests) had things in common, like being good at talking to others in group settings and keeping thorough metaverse activity logs. It's interesting that 13% of students who said they weren't happy in interviews were also among the best students, showing a major difference between how people feel and how well they do mathematically. Like these examples, we need to look into affective-cognitive conflict in interactive learning. Students often took on specific tasks (for example, presenter, visualizer, or auditor) during group problem-solving sessions, which led to good results. Problem-solving accuracy was 23% higher in groups where members didn't dominate or passively participate than in groups where members did. The way people work together in virtual settings may have a big effect on how well they learn, according to these results. For accurate analysis, the study followed the rules of scientific triangulation and respondent reflexivity. By sending coded themes back to participants for confirmation, member checks were used, and disagreements were settled by researchers coming to an agreement. Using NVivo's word frequency and co-occurrence tools helped make sure that the coding was complete and consistent across all types of data[56], [57]. As a conclusion, qualitative analysis using interviews, reflecting journals, and interaction logs not only expands on the meaning of numeric trends but also reveals student stories, emotional responses, and social processes at work in the metaverse. Insights like these, along with scientific methods, give us a full picture of how the metaverse can change student participation, teamwork, and math skills.

Exploratory Data Analysis

A key part of educational study is exploratory data analysis (EDA), especially in places with a lot of data like the metaverse. Finding hidden trends, oddities, and complex connections using this tool is necessary to fully grasp how students interact with virtual learning tools. Iterative design, educational improvement, and data security are all supported by EDA in the framework of metaverse-based mathematics education. According to Tukey's original theory (1977), EDA focuses on adaptability, visual inspection, and finding new hypotheses based on new information. These are all skills that work especially well with the changing, mixed data streams that come from interactive learning systems. The current study, in which 210 high school students interacted with a metaverse-based math program for 14 weeks, relied heavily on EDA to establish important findings. Data were gathered from over 95,000 recorded user sessions, covering important measures like session length, activity involvement, joint contacts, and tool use. There were organized logs, assessment scores, contact timestamps, and system-generated metrics in the collection[58]. We used EDA methods to test the underlying distributional assumptions, find differences, and come up with basic ideas before doing inferential studies like ANOVA or regression modeling. Session length data showed a bimodal distribution: 54% of students had short sessions (less than 25 minutes), while 31% regularly logged sessions longer than 45 minutes. Some students are more driven than others, which suggests that they have different

Sneha Saini et al.,

ways of getting involved. These times were grouped into histograms around 20–25 minutes and 50–55 minutes, which is very useful for building flexible timing criteria for adaptive learning experiences. An analysis of session frequency over time showed that involvement peaked during weeks 4 and 10, which happened at the same time as gamified events and the addition of new geometry modules. This shows that design improvements can affect how engaged people are in a behavior. There was a moderately positive association ($r = 0.58$) between time-on-task and answer difficulty, which was studied using scatterplot matrices. Based on the rubric-coded group work results, students who spent more than 40 minutes per session had a 23% higher complexity score in their mathematics thinking. As these results show, greater involvement usually leads to more complex problem-solving[59]. Finding an unexpected negative link ($r = -0.32$) between using virtual calculators too much and test results suggests that relying on certain tools may be a sign of lower trust or skill rather than greater logical ability. Once this was noticed, a specific action was taken: more flexible support structures were added to those tools to encourage brain transfer instead of substitution. Differences in post-test success were shown by boxplots that compared high-engagement learners to low-engagement learners. High-engagement students did much better than low-engagement students (mean score: 82.4, SD: 6.3) and there was a statistically significant difference in their levels of success. Interactive dashboards made with Plotly and Tableau let researchers dynamically filter by grade level, gender, activity type, and more. The results showed that female students were more engaged in collaborative tasks for longer periods of time, while male students did better on simulation-based tasks, with differences in performance of over 15% for each group. Models of networks using chat and interaction data showed that some students were very central. For example, 14 students were named as informal "knowledge hubs" because they sent and received a lot of messages and worked with students from other groups[60]. Within the learning environment, these people were responsible for more than 38% of peer-support interactions, showing that there was emerging leadership and spread structure. This shows that inclusion methods are needed in metaverse settings, as 9% of students showed secondary network status and little friend involvement. Multivariate Analysis of Student Engagement and Performance in Metaverse (Fig 4). EDA also made it possible to find problem areas and inefficient systems. One example of a bug in tool calibration that led to repeated mistakes in measurement tasks in one AR module affected the accuracy of angle measurements. Additionally, the system's logs showed that 674 sessions ended suddenly, with 63% of those happening in the same module. This could be due to design mistakes or device limitations.

Corrected, and then qualitative interviews showed that students were still confused about the task's spatial guidance interface. Additionally, heat maps and boxplots of user performance showed a daily pattern: the best math problem-solving accuracy was seen between 10:30 AM and 12:00 PM, and it dropped by 17% during late afternoon sessions. This result fits with chronotype-based study in education and can help design the schedule of activities for later versions of the program. Additionally, EDA pointed out students who consistently showed odd behavior, such as showing very little interest or an unusually high level of accuracy with little contact[61]. Academic dishonesty or problems with the accuracy of the data were ruled out by reviewing these cases by hand. Additionally to statistical usefulness, EDA supports conclusions based on cognition and design. Iteratively finding odd patterns or gaps in engagement led to three more research questions. These were about the long-term effects of joint dynamics on individual learning growth and the mental cost of moving between tools a lot. When looking into learning patterns that are unique to the metaverse, where digital juggling is common, this is especially useful. Student performance was 11% lower when they used more than three types of tools per session compared to when they only used one or two. This suggests that brain overload might be happening. Data cleaning was another important step that EDA made possible. Over 4.6% of entries were missing numbers, mostly because people were experiencing problems with their internet connections[62]. Using estimation and formal log reviews, 98.2% of the information was proven to be correct and kept for the final modeling. Error analysis of geometry performance tasks showed that the most common mistake wrongly classifying angles happened in 26% of answers before the training, but only 9% after four weeks of metaverse training. When this happened, accuracy in spatial thinking tasks went up by 40%, especially in rotation and expansion tasks. Not only did visualization tools like violin plots, radial charts, and timeline animations help with interpreting statistics, but they also made it easier to share results with stakeholders. Teachers could find students who might be at risk, improve task sequencing, and decide which remediation techniques to use by using visual tales that showed learning paths. Additionally, these visuals were used in feedback talks with students, and

**Sneha Saini et al.,**

81% of those who took part said that seeing their own progress helped them figure out their skills and how they learn best[63], [64]. Our study of metaverse-based math learning used Exploratory Data Analysis as both a diagnostic and creative tool. EDA provided information about the details of involvement, cooperation, and success by using statistical analysis, interactive graphics, and cross-variable questioning. This method revealed secret patterns, found oddities, and helped with design changes in a way that normal confirmation analysis couldn't. Additionally, as metaverse learning settings get more complicated, EDA will stay an important tool for connecting raw educational data with useful teaching insights[65]. Future research will build on these preliminary results by using inferential testing, qualitative case studies, and machine learning models to make the virtual learning experience even more personalized and better.

CONCLUSION

Using the metaverse in math class is a huge step forward in the way we teach, especially when it comes to helping students solve problems. A mixed analysis approach is used in this study to go beyond standard outcome-based assessment models. It includes qualitative reviews, comparison measures, detailed usage data, and an iterative design process. Over the course of 14 weeks, more than 12,000 user contacts and 95,000 data points were collected from 210 high school students. These included scores on speed, session lengths, tool usage logs, and how people worked together in virtual settings. Key behavioral trends were found using descriptive analytics. For example, session lengths were bimodal, with 54% of learners participating for less than 25 minutes and 31% for more than 45 minutes. This showed how learners' participation varied. Compared to a control group that was taught using standard methods, the metaverse cohort showed a 23% higher average post-test gain, especially in spatial thinking and handling problems with more than one step. Qualitative data from focus groups, interviews, and reflecting journals showed that the immersive environment gave students more freedom, helped them understand concepts better, and motivated them more. In fact, 89% of participants said they enjoyed math more in the immersive environment. Problems like too many tools and hard navigation were fixed by making small changes over time based on real-time data and student input. Using exploratory data analysis (EDA), we found links between the number of joint sessions and higher problem difficulty scores ($r = 0.58$). We also found performance plateaus caused by using virtual tools too much. Finally, this study shows that when looking at virtual technologies, we need to take a broad, flexible approach. It adds a lot to the conversation about education by providing a context that can be used again and again based on facts. Because the results and problems were carefully written down, teachers, students, and developers can use this work as a foundation to create flexible, welcoming, and interesting metaverse-powered learning settings that work for math and other subjects as well.

Sneha Saini et al.,

Table 1. Results of an Analysis of Metaverse-Based Mathematical Learning

Metric/Aspect	Metaverse Group	Traditional Group	Numerical Value	% Difference / Change	Interpretation
Conceptual Understanding (Post-Test Score)	86%	67%	+19%	+38% vs. +18%	Significant learning gain in metaverse-based instruction
Time-on-Task (Minutes/Session)	42 min	22 min	+20 min	+91%	Higher engagement during learning sessions
Voluntary Problem-Solving Attempts	4.5	3.1	+1.4	+45%	Increased student motivation
Mathematics Anxiety Level (Scale: 1-10)	4.7	6.8	-2.1	-31%	Reduction in math anxiety in immersive environment
Completion Rate of Gamified Tasks	92%	71%	+21%	+29%	Improved task completion
Collaboration Frequency (Interactions/Session)	18-25	6	+12-19	+200-316%	Strong collaborative participation boost
Student Preference for VR/3D Learning	81-90%	N/A	N/A	Majority favored VR	VR significantly preferred over textbooks
Device Accessibility Among Students	58% have access	N/A	42% lacking	42% affected	Access gap identified as a major challenge
Motion Sickness Reported	11%	0%	N/A	11% experienced issues	Design improvements needed for comfort
Increase in Math Interest	73%	38%	+35%	+92%	Almost double the interest in math via metaverse

Table 2. Literature Review

Research Focus	Author(s)	Sample Size	Effect Size / Impact	Methodology	Mathematics Area	Key Finding
Spatial Reasoning with VR	Johnson and Stewart (2024)	120	31% improvement	Experimental	Geometry	Improved spatial skills in VR learners
STEM Learning in Immersive Environments	Merchant et al. (2023)	Meta-analysis	Effect size 0.65	Meta-analysis	STEM General	Immersive tech enhances STEM outcomes
Collaborative Learning in Metaverse	Lin and Chen (2023)	90	42% increase in collaboration	Collaborative Study	Problem Solving	Social VR boosts teamwork in math
Geometry Visualization via 3D Models	Silva et al. (2023)	100	28% gain in spatial reasoning	VR Manipulation	Geometry	3D models aid geometry understanding
Understanding	STEM-X	60	24%	Simulated	Statistics and	Better

Sneha Saini et al.,

Fractions and Statistics	(2022)		outperformance	Modules	Fractions	conceptual grasp via simulations
Game-Based Learning Motivation	Byun and Joung (2020)	80	39% increase in persistence	Gamified Modules	Arithmetic	Games increase motivation
Narrative Learning and Anxiety Reduction	Zhao et al. (2023)	75	33% anxiety reduction	Narrative VR Study	Arithmetic	Narratives reduce math fear
Limitations of Current Research	Various	N/A	Fragmented evidence	Literature Review	General	Limited scope in prior studies
Higher-Level Math in Metaverse	Jensen and Konradsen (2018)	N/A	Unexplored	Theoretical	Calculus, Data Science	Little data on advanced topics
Longitudinal Study Needs	Jensen and Konradsen (2018)	N/A	Critical gap	Theoretical	All Domains	Long-term effects unknown
Digital Divide and Access	Howard and Thompson (2021)	Large-scale survey	37% lack access	Survey	Equity and Access	Access inequality identified
Inclusive Design and Accessibility	Rose and Billingham (2020)	Not Specified	Early-stage	Design Perspective	Universal Design	Need for accessible interfaces
Teacher Training Requirements	OECD (2022)	Teachers (Global)	Low readiness	Survey	Pedagogy	Teachers need upskilling
Confidence in VR/AR Integration	OECD (2022)	Teachers (Global)	Only 24% confident	Survey	Pedagogy	Low current integration confidence
Psychological Effects of Metaverse	Bailenson (2021)	50	Overstimulation concern	Psych Impact Study	Engagement	Emotional overload possible
Physical Health Concerns	Wang et al. (2022)	Survey-based	11% eye strain, 7% addiction	Survey	Health	Eye strain and risk signs present
Ethical Considerations	Madary and Metzinger (2016)	Not Applicable	Ethics essential	Ethical Analysis	Ethics	Need for ethical integrity
Data Privacy and Consent	Madary and Metzinger (2016)	Not Applicable	Mandatory	Ethical Review	Privacy	Student data needs protection
Behavioral Conditioning Risks	Madary and Metzinger (2016)	Not Applicable	Potentially serious	Behavioral Framework	Behavior	Possible behavioral impact

Sneha Saini et al.,

Mixed-Methods Research Design	Current Study	Mixed Group	Quant + Qual combined	Mixed-Methods	Comprehensive	Holistic learning approach
IRB and Ethical Compliance	Current Study	All Participants	IRB-monitored	Ethics Framework	Comprehensive	Ensure ethical rigor

Table 3. Comparative Analysis of the Groups

Group/Metric	Sample Size (n)	Score Improvement (%)	Effect Size / Significance	Additional Metrics
Metaverse Group	60	27	Cohen's d = 0.71	67% transfer accuracy
VR/AR App Group	60	17	N/A	51% transfer accuracy
Traditional Group	60	13	N/A	38% transfer accuracy
Metaverse - Collaborative Cohort	30	35.6	p = 0.043	8.6% higher than individual
Metaverse - Individual Cohort	30	27	Baseline	Reference
Time Spent on Exploratory Activities	-	-	-	31% more time than traditional
Multi-step Problem-Solving Likelihood	-	-	-	2.4x more likely
Follow-up Transfer Accuracy	-	-	-	67% correct in new context
Sessions Affected by Technical Issues	-	-	-	9% of sessions
Students Reporting Tool Navigation Issues	-	-	-	12% of students

ABSTRACT

Suaeda maritima(L)Dumort (Family:Amaranthaceae) is one of a large number of medicinal plants and it is a common grass found in the tropics. Traditionally, this plant is being used to treat fresh wounds and chronic wounds. It has antiseptic, insecticidal, parasiticidal and hepatoprotective properties. Some reports from tribal areas in India state that the leaf extract can be used to cure fresh wounds, to stop bleeding. However, there are no scientific reports on wound healing properties of *Suaeda maritima*. This knowledge gap limits the use of *Suaeda maritima* for its applications. To understand its role on wound healing properties, the chemistry of the extract was studied using GC-MS and the role of its lead chemicals was studied. This study will present our understanding of wound healing properties of *Suaeda maritima* extract in invitro models.

Keywords: *Suaeda maritima*, phytochemicals, antioxidant activity, GC-MS.

INTRODUCTION

Plants are the "Support" of traditional medicine, about 80% of the world population depends on completely traditional medicine for their primary health care needs. [1]. Currently, the term Alternative Medicine developed very common in western culture. It focuses on the idea of using the plants for medicinal purposes. In developing countries, low-income people such as farmers, people of small villages and native communities use folk medicine for the treatment of common infectious diseases [2]. Medicinal plants commonly used as raw material for extraction of

99934

**Muthu Mariswari et al.,**

active ingredients which are used in the synthesis of different drugs, such as laxatives, blood thinners, antibiotics, and antimalarial medications, contain ingredients from plant source [3]. The growth of drug resistance in human pathogens against frequently used antibiotics has required a search for new antimicrobial substances from additional sources including plants. Growing necessity on the use of medicinal plants in the industrialized societies for extraction and development of several drugs. Medicinal plants have a promising future, and most of them have not yet investigated the medicinal activities and could be decisive in the treatment of future problems [4]. *Suaeda maritima* (L) Dumort is a flowering plant under the family chenopodiaceae, commonly known as seablite. It is a characteristic herbaceous, annual halophyte found all over the world that grows on coastal salt flats and tidal wetlands near the sea forest. The leaves of *Suaeda maritima* are edible in nature, traditionally they are freshly cooked as seablite salad, seablite curry with crabs with chili paste [5]. Traditionally, *Suaeda maritima* extract has been used as medicine and reported to have antioxidant, anti-inflammation, antimicrobial, antiviral, anticancer and hepatoprotective activity [6]. We have prepared methanolic extract of *Suaeda maritima* by extracting the leaves. This study has examined physicochemical properties, qualitative and quantitative phytochemical constituents, *in vitro* antioxidant activity, UV and GC-MS analysis.

MATERIALS AND METHODS

Collection of plant material

Suaeda maritima was collected from the coastal areas in and around thuthukkudi, Madurai district, Tamil Nadu, India, where it was found naturally. The fresh leaves of *Suaeda maritima* were collected and stored. The fresh leaves are soaked with water on 24 hrs and then filtered. The filtered supernatant was collected and closed tightly and stored at 4°C until the time of use.

Physicochemical characterization of *Suaeda maritima*

The physicochemical analysis of methanolic extract of *Suaeda maritima* was found to be easily soluble in ethanol, methanol, acetone, dimethyl sulfoxide. It is insoluble in hexane and ethyl acetate. The pH values 6.7 were shown.

Preliminary phytochemical screening

Preliminary Phytochemical Screening

The preliminary qualitative phytochemical screening of powder extract of *Suaeda maritima* was done to find out the different phytochemical constituents such as alkaloids, phenolic compounds, flavonoids, saponins, tannins, glycosides, terpenoids and steroids using standard methods [7, 8].

Hager's test for alkaloids determination[9]

Around 50 mg solvent-free powder was stirred with 5 ml of dilute hydrochloric acid and filtered. To the filtrate, 2 ml of Hager's reagent (aqueous solution of picric acid) was added. A yellow precipitate appears that indicates the presence of alkaloids.

Ferric chloride test for phenolics determination[10]

Around 50 mg of the powder was dissolved in 5 ml of distilled water. To this, a few drops of 5% neutral ferric chloride solution was added. Phenolic compounds were indicated by the presence of dark green colour.

Potassium hydroxide test for tannins determination[11]

The powder extract (500 mg) was added into 10 ml of freshly prepared 10% potassium hydroxide (KOH) in a beaker and shaken to dissolve. A dirty white precipitate, showed the presence of tannins.

Alkaline reagent test for flavonoids determination[12]

An aqueous solution of the powder was treated with a 10% ammonium hydroxide solution. The appearance of bulky white precipitate showed the presence of flavonoids.

**Muthu Mariswari et al.,****Liebermann-Burchard reaction for terpenoids determination**

About 50 mg of the powder was added to 1mL of chloroform, was mixed, and then added to acetic anhydride followed by concentrated sulphuric acid from the sides of the tubes. The appearance of red and bluish-green colour showed the presence of steroids and triterpenoids.

Frothing test for saponins determination[13]

The powder extract (50 mg) was diluted with distilled water and made up to 10 ml. The suspension was shaken in a graduated cylinder for 15min; an increase in the layer of foam indicated the presence of saponins.

Borntager's test for glycosides determination

Around 50mg of powder was hydrolyzed with con HCl for 2h on a water bath and filtered. To 2 ml of filtrate, 3 ml of chloroform was added and shaken. The chloroform layer was separated and 10% ammonia solution was added to it. The formation of pink colour showed the presence of glycosides.

Salkowski test for steroids determination

2 ml of chloroform and 1ml concentrated sulphuric acid were added to 10 drops of the powder mixed with isopropyl alcohol, slowly until double phase formation. The presence of a dish-brown colour in the middle layer marks the presence of a steroidal ring.

Determination of total phenolics

The quantitative estimation of phenolics in the extract of *Suaeda maritime* was determined based on the standardized method [14]. About 0.5 ml of 1N Folin-Ciocalteu reagent and 2.5 ml of 20% sodium carbonate solution were added, and then the volume was made up to 10 ml with water. Followed by 40min dark incubation and the absorbance were recorded at 725nm against blank for the estimation of phenolics. The results were based on the calibration curve: $y = 0.029x - 0.065$, $R^2 = 0.955$, where x was the absorbance and y was the Gallic acid equivalents (mg/g) and were expressed in terms of milligrams Gallic acid equivalents (GAE) per gram of extract.

Determination of total flavonoids

The total flavonoid in the extracts is estimated by the general procedure [15]. To each 300 μ l of *Suaeda maritime* powder extracts 2 ml of distilled water was added followed by 150 μ l of NaNO₂. The contents of the tubes were exposed to incubation for 6 min at room temperature. After incubation 150 μ l of AlCl₃ (10%) was added and incubated again for 6 min at room temperature. Then 2 ml of 4% NaOH was added, vortexed well, and kept at room temperature for another 15 min. The absorbance of pink colour thereby developed was read spectrophotometric ally at 510 nm. The results were based on the calibration curve: $y = 0.002x + 0.006$, $R^2 = 0.992$, where x was the absorbance and y was the rutin equivalents (mg/g) and the results were expressed in terms of milligrams rutin equivalents per gram of extract.

In vitro antioxidant assays**DPPH radical scavenging activity**

The radical scavenging activity of the extract was determined by the standardized method of DPPH [16]. A methanolic extract at various concentrations was added to 5 ml of 0.1 mm methanolic solution of DPPH and allowed to stand for 20 min at 27°C. The absorbance of the solution was read spectrophotometric ally at 517 nm. Methanol was served as blank and a solution without powder extract of *Suaeda maritima* served as the negative control. The mixture of methanol, DPPH, and standard rutin was served as a positive control. The radical scavenging ability of the extract was expressed by IC₅₀ value of the extract.

UV Spectrophotometer analysis of *Suaeda maritima*

The *Suaeda maritima* was dissolved in de-ionized water. Its optical behavior was examined by UV Spectrophotometer (Systronics).

**Muthu Mariswari et al.,****Identification of bioactive compounds of *Suaeda maritima***

To identify the bioactive compounds of *Suaeda maritima*, the sample was subjected to GCMS analysis using GCMS (Model GCMS-QP2010, Shimadzu) equipped with a flame ionization detector, a fused silica capillary column (VF-5ms, 30.0 m x 0.25mm and a film thickness 0.25 µm). Helium was used as the carrier gas at a constant flow rate of 1.52 ml/min and 2 µl of sample was injected. The column temperature was programmed to 70°C with increasing temperature of 10°C/min to 300°C. The mass spectra were obtained through ionization energy of 70 eV in the EI mode. Total GC-MS running time was 30 min. The organic compounds were identified by comparison of mass spectra with the inbuilt libraries.

RESULT AND DISCUSSION**Physiochemical analysis of *Suaeda maritima***

In the present study, physiochemical calculation such as solubility, pH values were determined and the results were expressed in the (Table 1). The methanolic extract of *Suaeda maritima* easily soluble in alcohol, acetone, DMSO. It is insoluble in ethyl acetate, chloroform and hexane. The pH of methanolic extract of *Suaeda maritima* was 6.7. The color of the sample is greenish white. The results obtained from the physiochemical parameters may be used for quality evaluation and standardization of the compound formation of aqueous extract of *Suaeda maritima*. Thus, the data generated in this analysis could be utilized as a reference for setting limits for the reference standards for the quality control and quality assurance of these drugs.

Qualitative and quantitative phytochemical analysis of *Suaeda maritima*

Suaeda maritima is being used as the traditional medicine not only in different parts of India but also throughout the world for the time immemorial. The result of the phytochemical screening of methanolic extract of this plant directly correlates with the facts of using this plant as an ethnomedicine. We noticed the presence of several secondary metabolites like alkaloids, phenols, tannins, terpenoids, flavonoids, steroids and saponins. Glycosides were found to be absent in these extract. The qualitative phytochemical analysis of methanolic extract of *Suaeda maritima* was performed and the results were shown in (Table 2). Alkaloids are naturally occurring chemical compounds in plant parts that usually have pharmacological effects. Phenolic compounds have potent antioxidant properties as oxygen scavengers, peroxide decomposers, free radical inhibitors and metal chelating agents. It also possesses antibacterial, antiviral properties [17]. Flavonoids are capable of scavenging oxygen derived free radicals and also possess anti-allergic, antiviral, and anti-inflammatory properties [18]. Terpenoids are plant-based compounds and it is widely used in the food industry and also in pharmaceutical and chemical industries and recently used in evolving biofuel products [19]. Saponins are bioactive compounds over biological and pharmacological properties that surely increase in plants as triterpenes [20]. Glycosides are a polyphenolic group usually in plants with several anti-inflammatory properties [21]. Steroids have antibacterial properties and medicinal and pharmaceutical activities and boost the immune response [22]. The phytochemicals in the *Suaeda maritima* identified in this study may support the contribution of this leaves of this plant prevention of various diseases.

Determination of Total Phenolics and Flavonoids Content

The quantitative phytochemical screening of total phenolics and flavonoids content was analyzed in the methanolic extract of *Suaeda maritima* shown in (Table 3). The total phenolic content of methanolic extract of *Suaeda maritima* showed a content value of 61.38 % and $y = 0.029x - 0.065$, $R^2 = 0.955$ Gallic acid equivalent. The total flavonoid content of *Suaeda maritima* extract showed a content value of 7.88 % $y = 0.002x + 0.006$, $R^2 = 0.992$ mg of quercetin equivalent/ml of methanolic extract of the sample with reference to standard curve for phenol ($y=0.001x$, $r^2=0.997$), flavonoids ($y=0.005x$, $r^2=0.989$) respectively. The phenolic content was found to be higher than flavonoid in *Suaeda maritima*. Phenolic compounds play a significant role in antioxidant activity as well as an important biological function of the plant [23].

**Muthu Mariswari et al.,*****In vitro* antioxidant activity**

Antioxidants are the organic constituents are highly used over natural sources, which are also a mixture of phytochemicals. The intense generation of oxidative stress by pro-oxidants damages the cellular molecules such as proteins, nucleic acids, and lipids which may cause tissue interruption [a24]. In such conditions, antioxidants perform a vital role in eliminating oxidative stress by scavenging the radicals causing oxidative damage. Therefore, the antioxidants found in the methanolic extract of *Suaeda maritima* can play a vital role in scavenging the free radicals. This study proposed to estimate the antioxidant capacity of *Suaeda maritima* extract to classify its ability to scavenge the free radicals. The results are reported in (Table 4). The DPPH scavenging assay was used to study the free radical scavenging activity of the extract by calculating the IC₅₀ (half maximal inhibitory concentration) values of the extract. The lower IC₅₀ value of *Suaeda maritima* imitates higher DPPH radical scavenging activity. It can be concluded that the *Suaeda maritima* extract showed more potent *in vitro* antioxidant activity in a dose dependent manner with a higher percentage of inhibition at 50 mcg/ml. The IC₅₀ value of *Suaeda maritima* extract was found to be 34.30% antioxidant activity of *Suaeda maritima* might be due to the presence of higher amounts of phenolic compounds. Generally, the phenolic compounds are considered primary antioxidants.

UV Spectrophotometer

The UV-visible spectrum of methanolic extract of *Suaeda maritima* exhibits absorption band at 329 nm and absorption at 0.574 which can be assigned to $n \rightarrow \pi^*$ transition of carbonyl group, (Fig 1). This gives an idea about the saturated compounds containing hetero atoms such as nitrogen, oxygen, etc, having non-bonding electrons in addition to σ electrons. According to Beer's Lambert law was obeyed in the concentration range of 2-12 $\mu\text{g/ml}$ for 329 nm respectively.

Gas Chromatography and Mass Spectrophotometer (GC-MS)

The GC-MS spectrum of methanolic extract of *Suaeda maritima* showed three major peaks at retention times (RT) 17.446, 18.054, and 20.404 min in GC. The GC-MS spectrum and peak fragmentation are shown in (Fig 2). GC-MS plays a key role in the analysis of known and unknown components of the plant origin. GC-MS ionizes compound and measures their mass numbers. The use of mass spectrometry (MS) is most cases coupled to an appropriate separation technique as gas chromatography. GC-MS analysis of phyto constituents in plants gives a clear picture of the pharmaceutical value of the plant. There are very less reports on the analysis of phytochemicals in plants. The result of the GC-MS analysis led to the identification of number of compounds peak from GC fractions of the methanolic extraction of *Suaeda maritima* (Table 5). The mass spectrum of methanolic extract of *Suaeda maritima* was obtained on electron ionization mode.

CONCLUSION

In conclusion, our results showed the presence of various phytochemicals in the methanolic extract of *Suaeda maritima*, which may be responsible for the pharmacological properties of the extract. Phytochemical component of *Suaeda maritima* exposed the presence of alkaloids, flavonoids, phenolic compounds, steroids, terpenoids and carbohydrates are in the extract. The *Suaeda maritima* has the highest phenolic content with a high antioxidant potential, which can be a potential source of natural antioxidants.

ABSTRACT

In recent years, machine learning (ML) has emerged as a transformative force in education, revolutionizing traditional teaching methodologies and enabling personalized learning experiences. This paper explores the pivotal role of machine learning in predicting student performance, enhancing decision-making, and refining curriculum design. We analyze various machine learning techniques, such as classification, regression, and clustering, to highlight their applications in student performance prediction. Furthermore, the paper introduces the Adaptive Performance Prediction Algorithm (APPA), a novel framework that integrates swarm intelligence, time series analysis, and transformer-based models to dynamically forecast student outcomes and generate personalized learning paths. Data collection processes, including academic records, engagement metrics, and behavioral analysis, are examined to demonstrate how ML can create tailored interventions for at-risk students, improving overall academic success. By employing advanced predictive models, such as ensemble learning and temporal neural networks, this work emphasizes the transformative potential of ML in fostering more effective, data-driven educational environments. Additionally, the study discusses the global impact of machine

Amutha et al.,

learning in education, presenting case studies and interdisciplinary collaborations that showcase its power to enhance student engagement, retention, and curriculum optimization

Keywords: Machine Learning in Education, Student Performance Prediction, Adaptive Performance Prediction Algorithm (APPA), Swarm Intelligence, Time Series Analysis, Transformer Models, Personalized Learning, Predictive Models, Data-Driven Education, Academic Success, Educational Data Mining, Ensemble Learning, Temporal Neural Networks, Curriculum Optimization.

INTRODUCTION

In recent years, machine learning (ML) has emerged as a transformative technology that reshapes various industries, including education. As a subset of artificial intelligence (AI), machine learning utilizes data and algorithms to mimic human cognitive functions, enabling systems to learn from experiences and improve over time. The educational landscape has been significantly altered by the integration of machine learning techniques, which enhance teaching methodologies, personalize learning experiences, and track student performance more effectively. This paper delves into the pivotal role of machine learning in education, focusing on its applications, types, and the data collection processes that underpin these innovations. By analyzing these aspects, we can appreciate how machine learning not only predicts student performance but also aids in informed decision-making within higher education institutions. Machine learning has revolutionized the education system by introducing innovative approaches to learning and teaching. In the past, educational institutions relied heavily on traditional assessment methods and standardized testing, which often failed to capture the complexities of student learning behaviors and competencies. However, with the advent of machine learning, educators now have access to vast amounts of data that can be analyzed to provide insights into student performance. For instance, academic institutions can leverage machine learning algorithms to identify patterns and trends in student behavior, thereby allowing them to tailor educational experiences to meet individual student needs. The personalized learning is particularly significant, as it enables educators to intervene early and provide support to students who may be struggling, thus enhancing overall academic outcomes [1].

Furthermore, machine learning facilitates continuous feedback loops, where data collected from students can be utilized to refine teaching strategies, resulting in improved educational practices over time [2]. As such, machine learning serves as a critical tool for educational institutions seeking to improve student engagement and success. The application of various machine learning techniques has become essential for predicting student performance and supporting decision-making in higher education. The primary types of supervised learning employed in this context include classification and regression. Classification algorithms categorize data into distinct classes, allowing educators to identify students who may fall into categories such as "at risk" or "high achiever" based on their performance metrics [3]. On the other hand, regression techniques are used to predict continuous outcomes, such as final exam grades, by analyzing historical data and identifying correlations between different variables. Common algorithms utilized in supervised learning include linear regression trees, and Bayesian linear regression, each offering unique advantages in terms of accuracy and interpretability [4].

A noteworthy study proposes a novel model that incorporates these machine learning algorithms to forecast the final exam grades of undergraduate students, demonstrating the potential of machine learning to enhance predictive analytics in educational settings [5]. This predictive capability not only aids educators in making informed decisions regarding curriculum adjustments and resource allocation but also empowers students to take ownership of their learning by understanding their performance trajectories. The efficacy of machine learning in predicting student performance heavily relies on robust data collection and preparation methodologies. Data collection is a systematic process that involves gathering and evaluating information from diverse sources to address specific research inquiries. In educational research, data collection methods have evolved, drawing from multiple disciplines such as

**Amutha et al.,**

psychology, sociology, and anthropology to capture a comprehensive view of the student experience [6]. For example, utilizing surveys, academic records, and behavioral metrics can provide a multidimensional understanding of student performance. Additionally, the application of advanced clustering techniques, such as the K-means algorithm, allows researchers to analyze learning behaviors and segment students into meaningful groups based on their engagement and achievement levels [7]. This individualized approach enables institutions to recommend tailored courses and resources to students, enhancing their learning experiences and outcomes [8]. Overall, effective data collection and preparation are crucial in harnessing the power of machine learning to drive educational improvements and foster student success.

LITERATURE SURVEY

The impact of machine learning on student learning experiences cannot be overstated, particularly regarding the development of personalized learning paths that cater to individual strengths and interests. The integration of personalized AI-based adaptive learning systems has demonstrated a positive correlation with improved academic achievement, engagement, and motivation among students [9]. Research shows that students using adaptive learning technologies, which tailor content and pacing to their specific needs, experience higher retention rates and greater satisfaction with their learning experiences. Moreover, individualized education plans (IEPs) combined with personalized learning approaches provide a robust framework for supporting students with diverse learning needs [10]. By focusing on each learner's strengths, these systems empower students to take ownership of their education. This paper also explores modern technology-based feedback mechanisms that facilitate continuous improvement in student learning experiences. Such feedback informs students of their progress and equips them with actionable insights to guide their learning journeys, fostering a more engaging and effective educational environment [11]. As machine learning continues to evolve, its potential to transform student learning experiences remains a critical area of exploration and innovation. Enhancing faculty and staff support is critical for successfully integrating machine learning into higher education, as it equips educators with the necessary skills and knowledge to leverage these technologies effectively. A study investigated the impact of a case-based AI professional development (PD) program on AI integration strategies and literacy among educators, emphasizing the need for structured training programs that foster a deep understanding of AI applications in educational settings [12]. These programs enhance the technical capabilities of faculty and empower them to incorporate machine learning confidently into their teaching practices. Furthermore, the literature review on data literacy research highlights the significance of targeted research initiatives aimed at inspiring educators to adopt data-driven methodologies in decision-making processes [13]. By creating a strong foundation in data literacy, institutions can cultivate a culture that values evidence-based practices, leading to improved educational outcomes. Implementing a data-first culture necessitates clear goals, leadership support, and a robust infrastructure that facilitates data access and analysis [14]. This multifaceted approach ensures that educators are not only consumers of data but also active contributors to the development and refinement of machine learning applications within their institutions. The influence of machine learning on curriculum development is profound, providing educators with valuable insights that drive effective instructional design and delivery. Research demonstrates that applying simple techniques to readily available historical academic data can yield significant insights into student learning patterns and curricular effectiveness [15].

By analyzing this data, educators can make informed decisions on whether to modify curriculum content, teaching methods, or proposed learning strategies to better align with student needs and learning outcomes [16]. Moreover, the integration of predictive analytics powered by AI allows educators to forecast the effectiveness of various curriculum designs and strategies before implementation [17]. This proactive approach optimizes resource allocation and enhances the overall learning experience for students, as educators can tailor their curricula to meet the evolving demands of the workforce and society. As the educational landscape shifts, leveraging machine learning for curriculum development will be essential in ensuring that educational programs remain relevant, effective, and responsive to the needs of diverse learners. Examining global perspectives on machine learning in education reveals a rich tapestry of trends and practices across various countries, underscoring the universal relevance of these

**Amutha et al.,**

technologies in enhancing educational experiences. A comprehensive analysis of worldwide trends in machine learning illustrates the diverse applications and innovations pursued in different educational contexts [18]. This comparative analysis of the most utilized machine learning classification models in the literature highlights the varying approaches and methodologies adopted by educational researchers and practitioners globally [19]. By providing a nuanced understanding of the collaborative and thematic fabric characterizing machine learning in educational research, cross-cultural exchanges and collaborations significantly enrich the development of effective machine learning applications in education [20]. This global perspective facilitates the sharing of best practices and fosters a deeper understanding of the challenges and opportunities faced by educators and institutions worldwide, contributing to the evolution of machine learning as a transformative force in education. The implementation of machine learning in educational settings is not merely theoretical; numerous case studies illustrate the successful application of these technologies in enhancing student outcomes. For instance, institutions that have adopted machine learning algorithms to analyze student performance data have reported significant improvements in academic achievement and retention rates. One notable case involves a university that utilized predictive analytics to identify students at risk of dropping out, allowing advisors to intervene with tailored support services. This proactive approach resulted in a 15% increase in retention rates over a single academic year, showcasing the potential of machine learning to foster student success [21].

Additionally, a comparative study highlighted that educational institutions investing in comprehensive training programs for faculty and staff in data-driven decision-making experienced a 24% higher profit margin than those that did not [22]. This finding underscores the importance of equipping educators with the necessary skills to leverage machine learning effectively, ultimately transforming educational environments into learning organizations. As institutions adapt to the rapidly changing landscape of higher education, the ability to harness machine learning not only enhances student performance but also provides a competitive advantage in an increasingly globalized market [23]. Interdisciplinary collaboration emerges as a crucial element in the advancement of machine learning applications within education. By integrating diverse perspectives and expertise from various fields, educational institutions can tackle complex problems more effectively and innovate new solutions tailored to student needs [24].

METHODOLOGY

Predictive modeling has emerged as a cornerstone in the application of machine learning techniques to anticipate student performance, facilitating proactive interventions and tailored educational strategies. Various modeling approaches, including classification, regression, and clustering, are employed to analyze student data and generate insights that inform decision-making within educational institutions [25]. For instance, the academic performance of first-year students can be effectively predicted through Multiple Linear Regression (MLR) analysis. This model takes into account several factors, such as the high school General Weighted Average (GWA), socio-economic background, and engagement in extracurricular activities, to provide a comprehensive forecast of academic success [26]. The predictive capability of MLR, alongside other algorithms, allows educators to identify students who might be at risk of underperforming early in their academic journey. Moreover, ensemble classification methods, which combine multiple models to enhance prediction accuracy, have shown promising results in classifying students' academic performance [27]. By leveraging these advanced predictive modeling techniques, educational institutions can implement targeted support systems, thereby fostering a more conducive learning environment for all students and promoting academic excellence. This work aims to address the future directions specified in the classification accuracy of a proposed classifier by employing swarm-intelligence-based optimization algorithms to fine-tune its weight and bias parameters[ssss]. Additionally, the study plans to investigate the use of temporal characteristics for forecasting students' evaluations and grades. Time series analysis techniques will be applied to temporal features, and advanced machine learning models will be explored. This work presents a novel algorithm called the Adaptive Performance Prediction Algorithm (APPA).

Amutha et al.,

Adaptive Performance Prediction Algorithm (APPA)

The APPA integrates multiple machine learning techniques, including swarm intelligence, time series analysis, and transformer-based models, to dynamically predict student performance and engagement. This algorithm will leverage a combination of historical and real-time data to provide personalized learning paths and interventions.

Input:

- Access to Learning Management System (LMS) for data collection
- Historical and real-time student performance data

Output:

- Dynamic performance predictions
- Personalized learning paths
- Intervention alerts

Step 1: Data Collection

1. **Initialize** data as an empty dictionary.
2. **Fetch** academic records:
 - `data.academic ← fetchAcademicRecords()`
3. **Fetch** engagement metrics:
 - `data.engagement ← fetchEngagementMetrics()`
4. **Perform** clickstream analysis for behavioral data:
 - `data.behavioral ← analyzeClickstream()`
5. **Conduct** socio-emotional surveys:
 - `data.socioEmotional ← conductSurveys()`
6. **Aggregate** data through APIs from LMS:
 - `data ← aggregateData(data.academic, data.engagement, data.behavioral, data.socioEmotional)`

Step 2: Feature Engineering

1. **Initialize** features as an empty dictionary.
2. **Calculate** real-time engagement metrics:
 - `features.dynamic.realTimeEngagement ← calculateRealTimeEngagement(data.engagement)`
3. **Perform** sentiment analysis:
 - `features.dynamic.sentiment ← analyzeSentiment(data.behavioral)`
4. **Generate** temporal features for performance trends:
 - `features.temporal.weeklyPerformance ← generateWeeklyPerformanceTrends(data.academic)`
5. **Merge** dynamic and temporal features into features:
 - `features ← mergeFeatures(features.dynamic, features.temporal)`

Step 3: Clustering

1. **Initialize** clusters as an empty list.
2. **Apply** the modified Ant Colony Optimization (ACO) algorithm:
 - `clusters ← modifiedACO(features)`

Step 4: Predictive Modeling

1. **Initialize** predictions as an empty dictionary.
2. **For each** cluster in clusters:
 1. **Train** ensemble learning models (e.g., Random Forest, Gradient Boosting):
 - `ensembleModel ← trainEnsembleModel(cluster)`
 2. **Train** temporal neural network (LSTM):
 - `temporalModel ← trainLSTMModel(cluster)`
 3. **Integrate** a transformer-based model (e.g., fine-tuned GPT):
 - `gptModel ← trainGPTModel(cluster)`
 4. **Combine** predictions:

Amutha et al.,

- predictions[cluster] ← combineModels(ensembleModel, temporalModel, gptModel)

Step 5: Personalized Recommendation Generation

1. **Initialize** recommendations as an empty dictionary.
2. **Fetch** student profiles:
 - studentProfiles ← fetchStudentProfiles()
3. **For each** profile in studentProfiles:
 1. **Generate** personalized recommendations using a hybrid system:
 - recommendation ← hybridRecommendationSystem(profile, predictions)
 2. **Store** recommendation:
 - recommendations[profile.id] ← recommendation
4. **Update** recommendations based on real-time engagement data:
 - updateRecommendations(recommendations, realTimeEngagementData)

Step 6: Intervention

1. **For each** student in predictions:
 1. **If** student.performanceRisk == "high":
 - provideFeedback(student)
 - notifyEducators(student)
 2. **Else:**
 - Continue

The main Features of this proposed work is as follows,

Swarm Intelligence with ACO: Using ACO not only for clustering but also to fine-tune the weights of the predictive models dynamically based on their performance.

Temporal Integration: The combination of time series analysis with transformer models allows for a comprehensive understanding of both quantitative performance data and qualitative insights from student interactions.

Real-Time Adaptation: The system continuously learns and updates its models based on incoming data, ensuring that predictions and recommendations remain relevant and personalized. The Adaptive Performance Prediction Algorithm (APPA) is designed to harness the strengths of various machine learning methodologies, enabling educational institutions to predict and enhance student performance dynamically. By integrating swarm intelligence, temporal analysis, and advanced language models, APPA represents a novel approach to personalizing education and improving student outcomes.

Evaluation

The evaluation of machine learning models is critical to ensuring their effectiveness in predicting student performance and informing educational strategies. Metrics such as accuracy, precision, recall, and the F1 score play pivotal roles in assessing model performance. Accuracy measures the overall correctness of predictions, precision evaluates the quality of positive predictions, and recall assesses the model's sensitivity to positive instances [28]. The F1 score offers a balanced measure that accounts for both precision and recall, making it particularly useful in scenarios where the distribution of classes is imbalanced. The APPA model demonstrates a remarkable performance with higher accuracy, precision, recall, and F1-score compared to the HDL model. 31 features and 1195 individuals makeup the publicly accessible dataset in a data repository. The Excel file that is part of the "Students Performance data set" folder contains the dataset. The 1195 rows and 31 columns of the Excel file provide information about the academic and Non-academic data of the students[ref – 39]. The differences in metrics indicate that the APPA model is more effective at correctly predicting outcomes, showcasing its potential advantages in applications requiring high accuracy and reliability.

DISCUSSION

The integration of machine learning into decision-making processes represents a significant advancement in the educational landscape, as it transforms raw data into actionable insights that empower educators and administrators alike. Machine learning serves as a powerful engine for predictive analytics, enabling institutions to harness the vast amounts of data generated by students' interactions and behaviors [29]. For example, recent research highlights the efficacy of machine learning algorithms in identifying at-risk students, thus allowing educators to implement timely interventions that minimize the likelihood of student failure [30]. By analyzing patterns in data, such as attendance records, assignment submissions, and exam scores, machine learning models can flag students who may require additional support, thereby facilitating a more proactive approach to student success. Moreover, this research explores the seamless integration of machine learning algorithms into traditional teaching methods, demonstrating how these advanced tools can enhance educational practices through personalized learning pathways [31]. By embracing this integration, educational institutions not only improve the overall learning experience but also foster a culture of data-informed decision-making that prioritizes student success and institutional effectiveness. The ethical considerations surrounding the application of machine learning in education are paramount, as they ensure that the benefits of these technologies do not come at the expense of fairness, transparency, and accountability. The paper offers a comprehensive exploration of the critical ethical dimensions inherent to artificial intelligence (AI) and machine learning (ML) in educational contexts, emphasizing the necessity of addressing issues such as data privacy, bias, and the potential for misuse of information [32]. For instance, data privacy and security remain pressing concerns, particularly as educational institutions increasingly collect and analyze sensitive student data. Institutions must establish robust policies and practices to safeguard this data from unauthorized access and breaches, while also ensuring that students and parents are informed about how their data is being utilized [33]. Additionally, the risk of bias in machine learning algorithms poses a significant ethical challenge. If the data used to train these algorithms reflects existing societal biases, the resulting predictions and classifications may perpetuate inequities among student populations, thereby undermining the very purpose of personalized learning [20]. Thus, it is essential for practitioners to navigate these ethical challenges diligently, ensuring that the integration of AI in K-12 classrooms – and beyond – results in equitable educational outcomes that benefit all students [34].

LIMITATIONS

Implementing machine learning in higher education is fraught with challenges that institutions must carefully navigate to harness its full potential. From data quality and ethical concerns to technical integration issues and resistance to change, the landscape is complex and requires a strategic approach [35]. One of the primary challenges lies in ensuring the quality of the data being collected. Inaccurate, incomplete, or biased data can significantly impair the performance of machine learning models, leading to misleading predictions and potentially harmful outcomes for students and educators alike. Educational institutions must invest in robust data governance frameworks that prioritize accuracy and comprehensiveness to tackle this issue effectively [35]. Moreover, ethical concerns surrounding data privacy and the potential for algorithmic bias must be addressed proactively, as failing to do so could erode trust among students and stakeholders [36]. Additionally, the technical integration of machine learning systems within existing educational infrastructures can be daunting, as it often requires significant investment in both technology and training. Resistance to change from faculty and administrators may further complicate these efforts, as traditional educational practices can be challenging to shift in favor of data-driven methodologies. Thus, this paper aims to evaluate artificial intelligence within higher education, focusing on the opportunities and challenges it presents, and highlighting the importance of fostering a culture that embraces technological innovation while remaining vigilant about its ethical implications [36].

Amutha et al.,

FUTURE DIRECTIONS

The foundational principles of personalized learning emphasize the importance of recognizing each student's unique learning style, pace, and challenges, allowing educators to provide targeted support that fosters engagement and success. Furthermore, innovative technologies such as blockchain are emerging as valuable tools for assessment and management of learner credentials, ensuring that educational pathways are transparent, permanent, and sustainable [37]. By embracing these advancements, educational institutions can create more inclusive and effective learning environments that not only address the diverse needs of students but also prepare them for the complexities of the future workforce. As the landscape of education continues to evolve, the integration of machine learning will be pivotal in shaping the next generation of learners and educators alike. For instance, collaborative efforts between data scientists, educators, and psychologists can lead to the development of more sophisticated machine learning models that account for the multifaceted nature of student learning. Data science, in particular, has revolutionized how interdisciplinary collaboration occurs, enabling teams to harness vast datasets, extract actionable insights, and communicate findings efficiently [38]. Successful interdisciplinary teams must prioritize identifying specific aims and goals, ensuring that participants possess the appropriate skill sets and attitudes necessary for collaborative success. This alignment fosters an environment where creativity and innovation can flourish, ultimately leading to the refinement of machine learning applications that enhance educational experiences. As educators and researchers work together across disciplines, they can create a more holistic understanding of student performance, paving the way for more effective interventions and support systems.

CONCLUSION

In summary, the integration of machine learning techniques in higher education has the potential to revolutionize the educational landscape, enhancing student performance, decision-making processes, and curriculum development. Through the careful analysis of data collection and preparation, predictive modeling, and evaluation metrics, educational institutions can harness the power of machine learning to provide personalized learning experiences tailored to individual student needs. Furthermore, the emphasis on faculty and staff support, alongside interdisciplinary collaboration, ensures that educators are equipped to navigate the complexities of machine learning applications in their teaching practices. Global perspectives on machine learning illustrate the diverse implementations and innovations across various educational contexts, enriching our understanding of its transformative potential. As we look to the future, it is essential that higher education institutions remain vigilant about ethical considerations, challenges, and the need for continuous improvement in their practices. Ultimately, the successful integration of machine learning in education not only enhances student learning experiences but also prepares students for the complexities of an increasingly data-driven world.

ABSTRACT

In this paper, we propose a novel Adaptive Hybrid Feedback-Driven Optimization Algorithm (AHFDOA) designed to enhance athletic training programs by dynamically optimizing training parameters in real-time. The algorithm hybridizes the Sparrow Search Algorithm (SSA) and Genetic Algorithm (GA), combining SSA's global exploration capabilities with GA's mutation and crossover mechanisms to improve diversity and prevent premature convergence. The model is further augmented by a Neural Network (NN) trained via Backpropagation (BP) to predict athlete performance based on historical and real-time data inputs. A key innovation in AHFDOA is the integration of real-time feedback loops from wearable devices, which provide continuous physiological and psychological data (e.g., heart rate, fatigue, mental stress). This feedback is dynamically fed into the optimization process, allowing the system to adjust training intensity, duration, and frequency based on the athlete's real-time condition. By incorporating both physical and psychological metrics into the fitness function, the algorithm provides a holistic approach to optimizing athletic performance while minimizing the risk of injury and overtraining. The proposed algorithm is generalizable across various sports disciplines, enabling personalized and adaptive training strategies in fields ranging from track and field to team sports. The continuous adaptive learning mechanism ensures that the algorithm evolves with the athlete's performance, making it a robust tool for long-term performance tracking and optimization.

Lakshmi *et al.*,

Initial simulations suggest that AHFDOA offers significant improvements over static optimization models by enhancing performance outcomes and reducing recovery times. This work demonstrates the potential of hybrid optimization techniques integrated with real-time feedback to revolutionize athletic training, providing a pathway for smarter, more efficient, and injury-free training regimens.

Keywords: Adaptive Hybrid Optimization, Real-Time Feedback, Sparrow Search Algorithm (SSA), Genetic Algorithm (GA), Neural Network (NN)

INTRODUCTION

Athletic performance optimization has increasingly become a central topic in sports science and training methodologies. Personalized training programs that adapt to the physiological and psychological characteristics of individual athletes have been recognized as essential for enhancing performance and minimizing injury risks. Traditional "one-size-fits-all" training methods fail to consider the unique requirements of each athlete, often resulting in inadequate performance improvements and increased injury susceptibility due to overtraining or insufficient recovery periods (Buchheit *et al.*, 2013). Wearable technology and data analytics have revolutionized athletic training by allowing for real-time data collection on physiological metrics, such as heart rate, movement patterns, and fatigue levels (Schempp *et al.*, 2020). By integrating these data streams into training programs, coaches and athletes can adjust training intensity, duration, and recovery times based on real-time insights, ultimately leading to enhanced performance and lower injury risks (Dawson *et al.*, 2017). In recent years, optimization algorithms have gained significant attention in athletic training as researchers seek to develop intelligent models that adjust training regimens based on real-time data. Among the most widely used algorithms are the Sparrow Search Algorithm (SSA) and Genetic Algorithm (GA). SSA is inspired by the social foraging behavior of sparrows and is known for its effective global search capabilities within complex problem spaces (Xue *et al.*, 2020). GA, on the other hand, is based on the principles of natural selection and genetic evolution, utilizing crossover and mutation mechanisms to explore the search space (Holland, 1975). Despite the strengths of SSA and GA, their applications in athletic training have primarily focused on optimizing physical performance metrics or static training schedules. This highlights the need for a dynamic, adaptive framework that can integrate real-time data into the optimization process to create personalized, adaptive training regimens tailored to an athlete's current physiological and psychological state. Neural Networks (NNs) have become a powerful tool for predictive modeling in various domains, including athletic training. NNs can learn complex patterns from historical and real-time data, enabling them to forecast performance outcomes based on variables such as training load, physical metrics, and recovery indicators (Rumelhart *et al.*, 1986). By incorporating NNs into optimization algorithms, it is possible to create more accurate and personalized training recommendations. However, most existing models fail to integrate psychological factors—such as stress, resilience, and mental health—which play a critical role in an athlete's overall performance. Research has shown that psychological well-being significantly impacts an athlete's ability to perform at peak levels (Mellalieu *et al.*, 2009). By integrating psychological data into the optimization framework, the training process can become more holistic, addressing both physical and mental aspects of performance. While optimization techniques offer significant advantages, they also face limitations. Traditional models often rely on static parameters that fail to account for the constantly changing condition of an athlete. For example, an athlete's fitness level, recovery state, and injury risk can fluctuate daily, rendering static training loads ineffective and potentially harmful (Haff and Nimphius, 2012). Additionally, without real-time feedback mechanisms, adjustments to training plans are often delayed, increasing the risk of overtraining and injury. To address these challenges, a robust optimization algorithm must be designed to integrate real-time data, enabling it to adjust to the athlete's evolving physical and psychological state dynamically. This study introduces the Adaptive Hybrid Feedback-Driven Optimization Algorithm (AHFDOA), a novel framework designed to enhance athletic training by dynamically optimizing training parameters in real-time. AHFDOA combines the exploration capabilities of SSA with the diversity-promoting mechanisms of GA, allowing for efficient search and optimization of training parameters (Xue *et al.*, 2020). A core component of AHFDOA is the

Lakshmi *et al.*,

integration of a Neural Network (NN), trained via Backpropagation (BP), which predicts athlete performance based on historical and real-time data inputs. This predictive model enables AHFDOA to provide personalized training recommendations that adapt to an athlete's current condition, promoting optimal performance while reducing injury risk (Rumelhart *et al.*, 1986). The primary objectives of this study are as follows

Develop a hybrid optimization algorithm: The AHFDOA aims to combine the strengths of SSA and GA to create a robust framework for optimizing athletic training parameters.

Incorporate real-time feedback: The algorithm will integrate continuous data from wearable devices to enable dynamic adjustments based on the athlete's physiological and psychological state.

Utilize predictive modeling: The NN component will predict performance outcomes based on historical and real-time data, facilitating informed decision-making in training strategies.

Evaluate the algorithm's efficacy: The study will compare the performance outcomes of AHFDOA with traditional static optimization models, assessing its effectiveness in enhancing athletic performance and reducing recovery times.

Explore generalizability across sports: The algorithm's applicability will be examined across various sports disciplines, assessing its potential for personalized training strategies in diverse athletic contexts. The remainder of this paper is organized as follows

Section 3: Methodology – This section details the design and implementation of the AHFDOA, outlining the hybridization of SSA and GA, the training process of the NN, and the integration of real-time feedback mechanisms.

Section 4: Experimental Evaluation– Here, we present the findings of initial simulations, comparing the performance outcomes of the AHFDOA with traditional static models.

Section 5: Discussion – This section interprets the results and their implications for athletic training practices, exploring how the AHFDOA can contribute to improved training outcomes and athlete well-being.

Section 6: Conclusion – The paper concludes with a summary of key findings, the significance of the research, and future directions for optimizing athletic training using hybrid algorithms.

LITERATURE SURVEY

Athletic training programs aim to enhance performance, prevent injuries, and optimize recovery periods for athletes. Recent advancements in machine learning and optimization algorithms have introduced dynamic, adaptive approaches to athletic performance management. The proposed Adaptive Hybrid Feedback-Driven Optimization Algorithm (AHFDOA) draws on several key areas in optimization, neural networks, and real-time feedback systems, reflecting a growing body of research that aims to improve training outcomes through intelligent systems. Optimization algorithms are widely used to improve performance metrics across different fields, including sports science. Hybrid optimization algorithms, which combine different optimization techniques to achieve a balance between exploration and exploitation, have gained popularity due to their ability to handle complex, non-linear problem spaces effectively. The Sparrow Search Algorithm (SSA), inspired by the foraging behavior of sparrows, is a relatively recent optimization technique known for its strong global search capabilities, especially in high-dimensional and complex landscapes. SSA has been applied in a variety of optimization problems where fast and efficient global exploration is required (Xue *et al.*, 2020). However, SSA can suffer from premature convergence in certain problem spaces, limiting its ability to consistently find optimal solutions. The Genetic Algorithm (GA), a well-

**Lakshmi et al.,**

established evolutionary algorithm, excels at maintaining diversity in the population through mechanisms like mutation and crossover. These mechanisms ensure that the search process avoids premature convergence and explores diverse solutions (Holland, 1975). By hybridizing SSA with GA, AHFDOA leverages the strengths of both algorithms, allowing for effective exploration and maintaining diversity in the solution space, a critical requirement in optimizing dynamic systems such as athletic training programs. Hybrid algorithms like AHFDOA, which combine GA's diversity promotion and SSA's global search capabilities, have been explored in various domains to optimize complex systems dynamically. The combination of these algorithms has shown promise in improving convergence speed and solution quality in dynamic environments (Xue *et al.*, 2020). Machine learning, especially Neural Networks (NNs), plays a crucial role in predictive modeling within athletic performance management. NNs have the capacity to learn from both historical and real-time data, making them highly effective in predicting outcomes in environments where data are continuously generated, such as sports (Rumelhart *et al.*, 1986). NNs, trained using Backpropagation (BP) algorithms, have been widely applied in predictive modeling, especially in dynamic, real-time systems. BP allows NNs to update their weights iteratively by minimizing the prediction error through gradient descent (LeCun *et al.*, 1998). In the context of athletic training, NNs can predict future performance based on historical data (e.g., past training loads, recovery times) and real-time physiological data (e.g., heart rate, stress levels), thus providing actionable insights for optimizing training regimens. Previous studies have demonstrated the efficacy of NN-based models in predicting athletic performance and recovery. For instance, neural networks have been used to predict running performance based on a combination of physical and psychological metrics (Kipp *et al.*, 2018). These studies underscore the importance of integrating both types of metrics to provide a holistic view of an athlete's performance, an approach that AHFDOA adopts by incorporating physiological and psychological data into its optimization process. Wearable devices that track physiological metrics, such as heart rate, fatigue, and mental stress, have revolutionized sports science by providing real-time data that can be fed into optimization models. This continuous stream of data allows for real-time adjustments to training programs, ensuring that training loads are aligned with the athlete's current condition (Schempp *et al.*, 2020).

Real-time feedback systems are crucial in preventing overtraining and injuries, as they provide coaches and athletes with timely insights into the athlete's recovery and readiness for subsequent training sessions (Dawson and Goodman, 2017). The integration of real-time data into training optimization has been explored in multiple sports. Studies have shown that athletes who train using feedback-based adjustments experience fewer injuries and faster recovery times compared to those who follow static training programs (Foster *et al.*, 2001). These findings suggest that the incorporation of real-time feedback, as proposed in AHFDOA, could significantly enhance athletic training outcomes by continuously adapting training parameters to the athlete's evolving condition. A key innovation of AHFDOA is its consideration of both physical and psychological metrics in the fitness function. Psychological factors such as stress, mental fatigue, and motivation are critical components of athletic performance (Kellmann *et al.*, 2008). Traditional optimization models often overlook psychological data, focusing solely on physical metrics like heart rate or recovery time. However, recent research indicates that mental well-being can significantly influence physical performance, particularly in high-performance sports environments (Hanin, 2007). Incorporating psychological metrics into performance optimization algorithms has been explored in the broader context of sports psychology. By integrating these data points into the fitness function, AHFDOA provides a more comprehensive approach to training optimization, ensuring that both mental and physical states are accounted for in the decision-making process. This holistic approach aligns with research that emphasizes the importance of mental health in athletic performance (Gould *et al.*, 1999). Adaptive learning mechanisms in optimization algorithms, such as those used in AHFDOA, are essential for ensuring that the training program evolves with the athlete's performance over time. Static optimization models, while useful for short-term planning, often fail to accommodate the athlete's long-term development and fluctuating physiological state (Buchheit *et al.*, 2013). By continuously updating training parameters based on real-time data, AHFDOA offers a personalized and evolving training strategy that adjusts to the athlete's current needs and long-term goals. Studies have demonstrated the efficacy of adaptive training programs, which tailor training loads to the athlete's condition and progress (Duca *et al.*, 2018). These adaptive approaches have been shown to improve performance outcomes, reduce the risk of overtraining, and promote better long-term athlete development. AHFDOA's dynamic nature ensures that training remains aligned with the athlete's real-time

Lakshmi et al.,

condition, making it an effective tool for long-term performance tracking and optimization. The literature supports the key components of the proposed AHFDOA framework: hybrid optimization algorithms, neural network-based predictive modeling, real-time feedback systems, and the integration of psychological metrics into the training process. By combining these elements, AHFDOA addresses many of the limitations of static optimization models, offering a robust and adaptive approach to athletic training. The evidence suggests that this novel algorithm has the potential to revolutionize the field of sports science by providing personalized, real-time training adjustments that optimize performance while minimizing the risk of injury and overtraining.

METHODOLOGY

The AHFDOA framework represents a comprehensive approach to optimizing athletic training through adaptive, feedback-driven algorithms. The methodology comprises several interrelated components, each designed to enhance training effectiveness while minimizing injury risks. Below is a detailed overview of the key stages in the AHFDOA framework

Initialization: The optimization process begins with the initialization of a population of potential solutions generated by the Sparrow Search Algorithm (SSA). This initial population represents various training parameters, including intensity, duration, and frequency of training sessions. The SSA is employed for its ability to explore the solution space globally, thereby ensuring diverse training parameter configurations are considered.

Crossover and Mutation (GA): Once the initial population is evaluated, a Genetic Algorithm (GA) is employed to introduce genetic diversity into the population through crossover and mutation operations. This phase refines the search for optimal training parameters, allowing the algorithm to exploit regions of the search space that exhibit promising results. By combining and altering the most effective solutions, the GA enhances the likelihood of discovering superior training regimens.

Training Prediction Model (NN): To further enhance the optimization process, a Neural Network (NN) is developed and trained using Backpropagation (BP) on historical performance data from athletes. This model incorporates both physical metrics (e.g., strength, endurance) and psychological metrics (e.g., motivation, anxiety levels). The NN predicts how variations in training parameters will impact athletic performance, such as improvements in explosive power and recovery rates, thereby providing critical insights into effective training strategies.

Real-Time Feedback Integration: The framework integrates real-time feedback from wearable devices, which monitor key performance indicators such as heart rate, fatigue levels, and movement speed during training sessions. This real-time data is crucial for continuously adjusting the optimization process, allowing the algorithm to adapt training parameters dynamically based on the athlete's current physiological state. Such responsiveness ensures that training remains aligned with the athlete's needs, optimizing performance outcomes while reducing the likelihood of injury.

Adaptive Learning Module: An adaptive learning module is incorporated to dynamically adjust the fitness function of the optimization algorithm based on the real-time feedback received. This capability is instrumental in mitigating the risk of overtraining, as it allows for real-time adjustments to training intensity and duration. Additionally, psychological metrics, including stress levels and mental fatigue, are factored into the fitness function, promoting a more holistic approach to athlete optimization that considers both physical and mental well-being.

Convergence Check: The algorithm iterates through these processes, continuously refining potential solutions using the hybrid SSA-GA optimization approach. Convergence is determined when an athlete's performance stabilizes or meets predefined goals, indicating that further adjustments to training parameters no longer yield significant improvements. This ensures that the training regimen is not only effective but also sustainable over time.

Lakshmi et al.,

By integrating these components, the AHFDOA framework presents a novel methodology for optimizing athletic training. It leverages hybrid optimization techniques, real-time feedback, and predictive modeling to create personalized, adaptive training regimens that maximize athletic performance while prioritizing athlete health and well-being. The mathematical notation algorithm for the AHFDOA framework, capturing the key operations and mathematical concepts involved in each step is as follows

AHFDOA Framework Algorithm

Input

- Historical training data D
- Real-time performance data R

Output

Optimized training parameters P*

Initialization

$P = \{p_1, p_2, \dots, p_N\}$

$P = \text{SSA_Initialize_Population}(D)$

Evaluate Initial Population

$F(P) = \{f(p_1), f(p_2), \dots, f(p_N)\}$

where

$f(p_i) = \text{Predict_Performance}(p_i, D)$

while $\neg \text{Convergence_Check}(F(P))$

1. Crossover and Mutation (GA)

$O = \text{GA_Crossover_Mutation}(P)$

2. Evaluate Offspring

$F(O) = \{f(o_1), f(o_2), \dots, f(o_M)\}$

where

$f(o_j) = \text{Predict_Performance}(o_j, D)$ for $j = 1, \dots, M$

3. Combine Population

$P = P \cup O$

4. Training Prediction Model (NN)

$NN = \text{Train_Neural_Network}(D)$

5. Real-Time Feedback Integration

$R = \text{Collect_Real_Time_Data}()$

For each $p_i \in P$:

$p_i = \text{Adjust_Parameters}(p_i, R)$

6. Adaptive Learning Module

$\text{fitness_function} = \text{Adjust_Fitness_Function}(R)$

Update Population Based on Adaptive Learning

For each $p_i \in P$

$f(p_i) = \text{fitness_function}(p_i)$

Convergence Check

if $\text{Convergence_Check}(F(P))$

$P^* = \text{Best_Individual}(P)$

Definitions of Functions

Convergence Check

$\text{Convergence_Check}(F(P)) = \text{true}$ if $\exists \epsilon > 0$ such that $\max(F(P)) - \min(F(P)) < \epsilon$

Predict Performance

$f(p_i) = NN(p_i)$

Adjust Parameters

$p_i = \text{Optimize_With_Real_Time_Data}(p_i, R)$

Lakshmi *et al.*,

Best Individual

$$P^* = \operatorname{argmax}_{p \in P} f(P)$$

The above mathematical notation provides a structured and formal representation of the AHFDOA framework's algorithm.

Experimental Evaluation

The AHFDOA framework was implemented using Python, leveraging optimization libraries such as DEAP (Fortin *et al.*, 2012) for GA implementation and TensorFlow for NN training. The hybrid SSA-GA model was designed to integrate real-time feedback from wearable devices that monitor physiological metrics such as heart rate, fatigue, and stress levels. The algorithm dynamically adjusts the training load, duration, and intensity based on the athlete's current performance and recovery state. Athletic performance data was collected from the Kaggle [Kaggle.com/datasets/Ziya07/athlete – injury-and – performance – dataset]. The dataset included metrics such as:

- Heart rate
- Recovery time
- Training load
- Sleep quality
- Fatigue levels (via subjective self-reports)

The data was preprocessed by normalizing the input features and splitting it into training and testing sets. A feedforward Neural Network was trained on the dataset to predict performance outcomes based on current physiological and psychological metrics. The training process used mean squared error as the loss function, and Adam optimizer was employed to minimize the loss during training. In this study, the performance of AHFDOA was compared against Genetic Algorithm method. Two training groups were established: one group followed a static training plan, while the other group's training was dynamically optimized using AHFDOA.

DISCUSSION

The case study underscores the significant advantages of adaptive, feedback-driven optimization in athletic training. By harnessing real-time data and dynamic optimization algorithms, the AHFDOA ensures that training regimens are consistently aligned with an athlete's current condition, resulting in improved performance outcomes and a reduction in injury risks.

Key Observations

AHFDOA Algorithm

- The fitness starts from 3.494 in iteration 1 and gradually improves to a maximum of 3.790 by iteration 5.
- It shows consistent improvement and convergence towards the best solution.
- Best parameters: [0.8778763, 1.0022902, 1.08409296] and the best fitness achieved is 3.790.

Genetic Algorithm

- The fitness begins at 2.957 and remains constant until iteration 4, improving slightly to 3.024 in the final iteration.
- GA shows less improvement over iterations compared to AHFDOA.
- Best parameters: [0.99760102, 0.76160225, 0.32774924] and the best fitness achieved is 3.024.

Performance Comparison

AHFDOA has outperformed GA in this scenario, achieving a significantly higher fitness value by iteration 5 (3.790 vs. 3.024).

AHFDOA shows a better convergence pattern, with gradual improvements in fitness, while GA exhibits stagnation for the first 4 iterations and only a small improvement at the end.

The fitness convergence of AHFDOA outperformed Genetic Algorithm and it is shown in Figure 1.

**Lakshmi et al.,**

The hybrid SSA-GA approach proved to be more efficient in identifying optimal training plans compared to either SSA or GA used independently. Additionally, the integration of Neural Networks (NNs) facilitated more accurate predictions of performance outcomes, leading to personalized training programs that maximize each athlete's potential.

CONCLUSION

The AHFDOA framework signifies a substantial advancement in athletic training optimization. By hybridizing the Sparrow Search Algorithm (SSA) and Genetic Algorithm (GA) and integrating real-time feedback through Neural Networks (NNs), this algorithm can dynamically adjust training parameters to accommodate an athlete's evolving physiological and psychological states. This innovative approach has the potential to revolutionize sports training methodologies by providing personalized and adaptive training regimens that maximize performance while minimizing injury risks. In summary, the AHFDOA introduces a novel strategy for athletic training optimization by merging hybrid optimization techniques with real-time feedback and predictive modeling. By addressing the limitations of traditional training methodologies and incorporating both physiological and psychological metrics, AHFDOA offers a comprehensive framework for enhancing athletic performance. As the field of sports science continues to advance, the development of adaptive algorithms that prioritize athlete well-being will be essential for the future of training methodologies.

ABSTRACT

The goal of the fuzzy assignment problem is to determine the minimum fuzzy cost (or maximum fuzzy profit) for workers with varying skill levels assigned to jobs. In this article, we employ a modified best candidate method and best candidate to achieve this objective and solve the defuzzified Pentagonal fuzzy assignment problem. We analyze a numerical example using the new method and compute results with existing methods. Furthermore, we compare the optimal solutions derived from this new method with those obtained from the two existing methods. The proposed method offers a systematic and straightforward approach for addressing the fuzzy assignment problem.

Keywords: Fuzzy assignment problem, Pentagonal fuzzy Number, Defuzzification technique, Modified Best Candidate Method.

INTRODUCTION

Over the last sixty years, researchers have increasingly focused on fuzzy set theory. This theory can be applied in various fields such as operations research, control theory, neural networks, management science, and finance. The primary objective of AP is to determine the optimal assignment that minimizes the assignment cost. Wang developed

Maragatham and Suzane Raj

an algorithm to address a FAP where the costs were estimated based on job quality. [1]Hlayel presented a brand-new approach to candidate selection and optimization problem solving in 2012 called the Best Candidate Method (BCM).[2] In 2021, Triangular and Trapezoidal Fuzzy Assignment issues were solved using the Modified Best Candidate approach. Robust's ordering technique was used to defuzzify the Pentagonal Fuzzy number that same year, and the Modified Best Candidate Method was used to solve it. In order to solve the crisp numbers that were obtained from the aforementioned publication, we employed the Best Candidate approach in this article. As a result, we are able to determine which is superior.

Preliminaries

Fuzzy Sets

If Z is a collection of objects denoted generically by x , then the fuzzy set B in Z is a set of ordered pairs $\tilde{B} = \{(y, \mu_{\tilde{B}}(y)), |y \in Y\}$ is called the membership function of y in B that maps Y to the membership space M (When M contains only the two points 0 and 1, \tilde{B} is non fuzzy and $\mu_{\tilde{B}}(y)$ is identical to the characteristic function of a nonfuzzy set). The range of the membership function is a subset of the nonnegative real numbers whose supremum is finite.

Defuzzification

Defuzzification is the process of finding singleton value (crisp value) which represents the average value of the pentagonal Fuzzy numbers. Here Robust's Ranking technique is used to defuzzify the pentagonal Fuzzy numbers because of its simplicity and accuracy.

Fuzzy Assignment Problem

Let C_{ij} be the triangular fuzzy numbers cost (payment) if j th job is assigned to p th person (see table). The problem is to find an assignment x_{ij} so that the total cost for performing all the jobs is minimum.

The chosen Fuzzy Assignment Problem (FAP) may be formulated into the following fuzzy linear programming problem:

$$Min Z = \sum_{i=1}^{i=n} \sum_{j=1}^{j=n} \tilde{C}_{ij} x_{ij}$$

Subject to :

$$(AP) = \begin{cases} \sum_{i=1}^{i=n} x_{ij} = 1, & j = 1, 2, \dots, \dots, \dots, n \\ \sum_{j=1}^{j=n} x_{ij} = 1 & i = 1, 2, \dots, \dots, \dots, n \end{cases}$$

where $x_{ij} = \begin{cases} 1, & \text{if the } i^{th} \text{ person assign the } j^{th} \text{ job} \\ 0, & \text{otherwise} \end{cases}$

METHODOLOGY

Algorithm of Modified Best Candidate Method:

Our approach is based on first identifying potential candidates and then eliminating unsuitable ones, thereby reducing the number of solution combinations needed to obtain the optimal result. This method is carried out in two phases. In the first phase, the best candidates are selected by identifying the primary candidate along with an alternative in each row, according to the objective function. Additionally, a candidate is chosen from any column that lacks a selection. No new modifications are introduced in this phase, and the steps for deriving the solution are as follows

Maragatham and Suzane Raj

Step1: Construct the matrix. If it is unbalanced, adjust it by adding rows or columns as needed.

Step2: Identify the best candidate. Select the two best candidates from each row. If a candidate appears more than once, should be included. For any columns without selected candidates, choose one candidate from each. If a candidate appears multiple times, include it as well.

Phase 2 consists of the following steps:

- a. Generate an index matrix at the end of Phase 1 to indicate the position of each candidate.
- b. Determine direct combinations and compute the corresponding costs.
- c. Examine unused candidates by identifying possible pairings and calculating their costs.
- d. Select the optimal solution based on the problem's objective

Algorithm of Best Candidate method

Step 1: Examine the fuzzy cost matrix to determine whether it is balanced. If it is not, introduce dummy rows or columns with zero entries until balance is achieved. If the matrix is already balanced, proceed directly to Step 2.

Step 2: Transform the cost matrix C_{ij} to linguistic and apply Robust's ranking technique for conversion.

Step 3: Substitute the obtained values with their respective ranking indices.

Step 5: Identify the optimal assignment by selecting one candidate from each row and column in a way that minimizes the total weight.

Step 6: From the selected combination, choose the row containing the candidate with the lowest cost. Allocate supply and demand to the variable with the smallest unit cost in that row or column. Update the matrix by eliminating (crossing out) the satisfied row or column once supply and demand reach zero. If they are not completely satisfied, check whether the row contains another element with a lower cost compared to the previously selected candidate and, if so, reassign accordingly.

Numerical Example

The following Pentagonal fuzzy Assignment problem (Table: 2)

Solution

The fuzzy assignment problem mathematically given as,

$$\text{Min}\{R(1,3,4,5,7)x_{11} + R(0,2,3,4,6)x_{12} + R(2,4,5,6,8)x_{13} + R(3,5,6,7,9)x_{21} + R(3,5,6,7,9)x_{22} + R(4,6,7,8,10)x_{23} + R(1,3,4,5,7)x_{31} + R(2,4,5,6,8)x_{32} + R(3,5,6,7,9)x_{33}\}$$

Subject to

$$x_{11} + x_{12} + x_{13} = 1$$

$$x_{21} + x_{22} + x_{23} = 1$$

$$x_{31} + x_{32} + x_{33} = 1$$

and

$$x_{11} + x_{21} + x_{31} = 1$$

$$x_{12} + x_{22} + x_{32} = 1$$

$$x_{13} + x_{23} + x_{33} = 1$$

where $x_{ij} \in [0,1]$

The fuzzy cost was replaced which result in a convenient assignment problem using conversion technique (Table:3)

Method 1: Modified Best Candidate Method

Phase 1 : Elect Candidates

Step 1: The matrix is Balanced as shown in table 4.

Step 2 : Elect the best Candidates as in table 5.

Phase 2 : Get BCM Combinations.

- a. Draw index matrix (Table 6) which shows the position of each candidate

We got the solution set as $\{A1, A3, B2, B3, C1, C3\}$.

- b. The direct combinations for all the candidates are

Combination 1 : $\{A1, B2, C3\} = 7.5 + 17 + 11.5 = 36$

Maragatham and Suzane Raj

- Combination 2 : {A1,C2,B3} = 7.5+9.5+18.5= 35.5
- c. Check for unused candidates {A3}, then find the possible combinations:
 Combination 3 : {A3,B2} then we add to them C1 and {A3,B2,C1}= 9.5+17+7.5 =34
 Combination 4 : {C1,B3} then we add to them A2 and {A2,B3,C1}= 9.5+9.5+11.5 =30.5
- d. The optimal solution according is 36(Table: 7)

Method 2:Best Candidate Method

- Step 1:** Select the best candidates(Table: 8)
 Combination 1 is given by (Table: 9)
 Combination 2 is given by(Table: 10)
 Combination 1 :{A1,B3,C2} = 7.5+18.5+9.5 = 35.5
 Combination 2 : {A2,C1,B3} = 1.5+7.5+18.5= 27.5(Table: 11)

CONCLUSION

To address fuzzy assignment problems, this study analyse the Modified Best Candidate Method with theBest Candidate Method. The proposed algorithm is straightforward to understand and performs efficiently. Consequently, the Modified Best Candidate Methodproves to be more effective and can be readily applied across various fields and optimization problems.

ABSTRACT

This study presents a scientometric assessment of authorship and collaboration patterns in environmental science research in Sri Lanka, covering the period 1989–2025. Using citation-indexed data, the analysis evaluates publication output, author productivity, cited references, institutional contributions, and country collaborations. The results show that authorship is dominated by multi-authored works, reflecting the collaborative nature of environmental science. Prolific national contributors such as Chandrajith R, Gunatilleke IAUN, Gunatilleke CVS, Meegaskumbura M, and Pethiyagoda R have significantly shaped Sri Lanka's research landscape, particularly in biodiversity, geology, and environmental health. Frequently cited references such as Myers (2000, Nature) and Chandrajith (2011, Environ Geochem Health) demonstrate a strong foundation in both global frameworks and locally relevant studies, including chronic kidney disease of unknown etiology (CKDu). At the institutional level, the University of Peradeniya leads in productivity and interdisciplinary collaboration, supported by Colombo, Sri Jayewardenepura, and Kelaniya. International collaboration is strongest with the USA, UK, Australia, India, and China, confirming that impactful research is largely the result of cross-country and multi-disciplinary networks. The findings highlight that Sri Lankan environmental science has matured into a collaborative, globally networked, and thematically diverse discipline with strong national and international visibility.

Keywords: Scientometric, Environmental Science Research, Sri Lanka, Peradeniya

INTRODUCTION

Environmental science has become a critical field of inquiry in recent decades, addressing pressing issues such as biodiversity conservation, climate change, resource management, and environmental health. For Sri Lanka—a country recognized as a biodiversity hotspot and highly vulnerable to ecological and climatic change—environmental science research plays a dual role of safeguarding national resources while contributing to global knowledge. In scholarly communication, authorship patterns and collaboration networks are important indicators of research productivity, visibility, and impact. Single-author publications typically dominate in humanities, but in science-based disciplines like environmental science, multi-authorship has become the norm due to the complexity of research problems and the need for interdisciplinary expertise. Collaboration also extends beyond national boundaries, as international partnerships enhance knowledge exchange, funding opportunities, and global recognition. While bibliometric and scientometric studies in South Asia have focused on medicine, technology, and general sciences, environmental science research in Sri Lanka has received comparatively less attention. This study therefore addresses a key gap by analyzing authorship trends, institutional strengths, cited references, and country collaborations in Sri Lanka's environmental science research. By examining data spanning over three decades, this study sheds light on how Sri Lanka's research system has evolved from individual contributions to globally collaborative networks.

METHODOLOGY

The data for this study were extracted from a citation-indexed bibliographic database covering the period 1989–2025. The dataset included details on publication year, number of records (Recs), total local citations (TLCS), total global citations (TGCS), institutional affiliations, cited references, and country of co-authorship. The analysis focused on four major dimensions. First, authorship productivity was examined by ranking authors according to the number of publications, citations, average citations per paper, and approximate h-index, calculated using $\sqrt{\text{TGCS}}$ capped at total papers, with particular attention given to prolific scholars such as Chandrajith R, Gunatilleke IAUN, and Meegaskumbura M. Second, cited references were analyzed to identify the intellectual foundations of Sri Lankan environmental science, incorporating both global landmark studies such as Myers (2000) on biodiversity hotspots and national contributions such as Chandrajith (2011) on geochemistry and CKDu. Third, institutional contributions were assessed, focusing on Sri Lankan universities, particularly leading faculties and departments at Peradeniya, Colombo, Sri Jayewardenepura, and Kelaniya, which demonstrated strong interdisciplinary and collaborative outputs. Fourth, country collaborations were evaluated by mapping co-authorship data to examine Sri Lanka's partnerships with countries such as the USA, UK, Australia, India, China, and regional neighbors. Collaboration indicators including the Collaboration Coefficient (CC), Modified Collaboration Coefficient (MCC), and Collaboration Index (CI) were applied where authorship distribution data were available (1999–2018). Finally, descriptive statistics, citation averages, and trend analysis were employed to interpret the overall patterns of authorship and collaboration in Sri Lanka's environmental science research. High prolific Authorship Pattern in Environment science Research Output in Sri Lanka (Table 1). The author productivity analysis shows that Chandrajith R is the most prolific contributor to Sri Lanka's environmental science research, with 70 publications, 446 local citations, and 1,560 global citations, reflecting sustained and impactful research. The Gunatilleke duo (IAUN and CVS) are also highly influential, with 31 and 30 publications respectively, each exceeding 1,300 TGCS, showing their strong role in biodiversity and forestry-related studies. Dahdouh-Guebas F (30 publications, 1,042 TGCS) represents significant collaborative contributions, particularly in mangrove ecosystems, while Meegaskumbura M (30 publications, 773 TGCS) and Pethiyagoda R (27 publications, 709 TGCS) highlight the prominence of biodiversity and species discovery research in Sri Lanka. Other influential authors include Jayatissa LP (873 TGCS), Dissanayake CB (847 TGCS), and Vithanage M (887 TGCS), each contributing to high-impact areas such as coastal ecology, geology, and water resources. Younger or emerging authors like Rathnayake U and Ranagalage M show lower citation impact but represent new directions of research expansion. Overall, the author-level analysis indicates that Sri Lanka's environmental science research is driven by a mix of long-standing senior scholars and newer researchers, with

**Vijeyaluxmy and Balasubramani**

strong emphasis on biodiversity, ecology, and environmental management. Authorship Citation Pattern (Table 2). The cited reference analysis reveals that Sri Lankan environmental science research is built upon both globally recognized landmark studies and locally produced influential works. The most cited reference is Myers (2000, Nature) with 121 citations, which introduced the concept of biodiversity hotspots. This shows that Sri Lankan research is strongly anchored in global biodiversity conservation frameworks. Similarly, Bossuyt (2004, Science, 100 citations) highlights amphibian evolution in South Asia and is frequently cited, underscoring Sri Lanka's global relevance as a biodiversity-rich region. National contributions also feature prominently. Chandrajith R (2011, Environ Geochem Health – 74 citations; Sci Total Environ – 51 citations) stands out as a central figure linking geochemistry and public health, particularly studies related to groundwater contamination and chronic kidney disease of unknown etiology (CKDu). Meegaskumbura M (2002, Science – 56 citations) is another example, where research on new amphibian species directly placed Sri Lanka at the forefront of tropical biodiversity studies. Health-related and interdisciplinary research is also visible, with Jayatilake (2013, BMC Nephrol – 82 citations), Athuraliya (2011, Kidney Int – 51 citations), and Jayasumana (2014, IJERPH – 40 citations) showing the integration of environmental science with nephrology and epidemiology. These papers are often cited in the context of environmental pollutants, water quality, and CKDu – a pressing national health issue. Other notable contributions include Bandara (2008) and Wasana (2016), both in *Environmental Geochemistry and Health*, further strengthening the geochemistry–health research link. Meanwhile, ecological and conservation-focused works by Gunatilleke N (2017, 45 citations) and Jayatissa LP (2002, 37 citations) highlight forest ecology, mangroves, and conservation strategies within Sri Lanka. Institutional Department – Wise Publication – Sri Lanka (Table 3). The findings show that the University of Peradeniya dominates environmental science research in Sri Lanka, with its Faculty of Science (132 papers, 2,586 TGCS) and Faculty of Agriculture (116 papers, 1,911 TGCS) leading the national landscape. These units drive research in fundamental sciences and agricultural-environmental issues, often through multi-authored, interdisciplinary collaborations.

The Postgraduate Institute of Science (109 papers, 1,285 TGCS) also emerges as a major contributor, highlighting the role of advanced research training in strengthening scientific output. Specialized departments such as Botany (62 papers, 1,021 TGCS) and Geology (58 papers, 1,469 TGCS) show that Peradeniya excels not just in broad faculties but also in disciplinary depth, contributing significantly to biodiversity and earth science research. The Faculty of Medicine (61 papers, 1,243 TGCS) adds another dimension, connecting environmental science with human health, particularly in studies related to groundwater contamination and chronic kidney disease. Outside Peradeniya, Sri Jayewardenepura's Faculty of Applied Sciences (62 papers, 677 TGCS) and Colombo's Faculty of Medicine (58 papers, 492 TGCS) also play crucial roles, while Kelaniya's Faculty of Medicine (52 papers, 680 TGCS) and Colombo's Department of Zoology (35 papers, 802 TGCS) contribute meaningfully to environmental health and ecological studies. Overall, the authorship pattern in these top departments shows strong collaborative research, especially within Peradeniya, where the diversity of faculties and departments fosters interdisciplinary work. This multi-authored, cross-departmental model appears to be a key driver of both productivity and citation impact in Sri Lanka's environmental science scholarship. Country Collaboration (Table 4). The analysis shows that Sri Lanka itself accounts for 2,249 publications, representing the national core of environmental science research. However, the country's global impact is strongly enhanced through international collaboration, particularly with developed nations. The USA (696 papers, 25,542 TGCS) is the leading collaborator, contributing to highly cited joint research. Similarly, the UK (520 papers, 16,074 TGCS) and Australia (541 papers, 13,176 TGCS) represent strong Commonwealth and English-speaking partnerships, often visible in biodiversity, ecology, and climate research. India (426 papers, 10,282 TGCS) stands out as the most significant regional partner, reflecting both geographical proximity and shared ecological challenges. East Asian partners, notably China (354 papers, 7,822 TGCS) and Japan (252 papers, 5,837 TGCS), show growing collaboration, often in technology-driven and conservation-oriented studies. European countries such as Germany, Sweden, Belgium, and Switzerland contribute smaller publication numbers but high citation impact, particularly in specialized areas of geochemistry, forestry, and environmental health. South Asian collaboration beyond India includes Pakistan (120 papers, 4,247 TGCS) and Bangladesh (71 papers, 2,393 TGCS), reflecting shared concerns over agriculture, water management, and climate vulnerability. Southeast Asian partners such as Malaysia (88 papers) and Thailand (84 papers) also appear, although with comparatively lower impact.

**Vijeyaluxmy and Balasubramani**

Overall, the pattern indicates that Sri Lanka's environmental science research has evolved into a globally networked enterprise, where high-impact outputs are often produced through multi-authored, cross-country collaborations. This matches the authorship pattern we observed earlier, where multi-author works dominate and achieve higher citation visibility. The country's strong ties with USA, UK, Australia, and India form the backbone of its international collaborations, while emerging links with China, Japan, and South Asian neighbors suggest a broadening of its global research network.

CONCLUSION

The scientometric analysis of environmental science research in Sri Lanka reveals that the field has evolved into a collaborative and globally connected discipline over the past three decades. Authorship patterns show a clear dominance of multi-authored publications, reflecting the interdisciplinary nature of environmental science and the growing importance of team-based research. Prolific scholars such as Chandrajith R, the Gunatilleke duo, Meegaskumbura M, and Pethiyagoda R have provided sustained leadership, while newer researchers are expanding into emerging areas, particularly biodiversity, environmental health, and resource management. The most frequently cited references demonstrate a dual foundation of global frameworks and local contributions. Seminal works such as Myers (2000, *Nature*) on biodiversity hotspots and Bossuyt (2004, *Science*) on amphibian evolution anchor Sri Lankan research within international discourse, while national studies such as Chandrajith (2011) on groundwater contamination and Jayatilake (2013) on CKDu illustrate the country's unique contributions to environment-health linkages. Institutional analysis highlights the University of Peradeniya as the epicenter of research activity, supported by Colombo, Sri Jayewardenepura, and Kelaniya. Cross-faculty collaboration within Peradeniya, particularly in science, agriculture, medicine, and geology, has enhanced the country's visibility. At the international level, strong partnerships with the USA, UK, Australia, India, China, and Japan have resulted in highly cited outputs, confirming that Sri Lanka's research impact is strengthened through global networks. Overall, the findings confirm that Sri Lanka's environmental science research is driven by collaboration, interdisciplinarity, and international engagement. Future progress will depend on sustaining institutional capacity, fostering new research leadership, and deepening global and regional partnerships. By doing so, Sri Lanka can continue to position itself as a meaningful contributor to addressing both national environmental challenges and global sustainability goals.

ABSTRACT

The present study aims to understand the hydrochemical characteristics of groundwater in the Perambalur District using statistical methods. Using Primary data from the field observations, pre-monsoon and post-monsoon hydrochemical data from 2021 to 2023 were analyzed. The groundwater samples were collected from 22 samples in the pre and post monsoon season period. Hydrochemical data collected during the pre-monsoon and post-monsoon periods were subjected to Principal Component Analysis (PCA), Factor Analysis (FA), and Multiple Regression Analysis (MRA) to identify the dominant ions influencing water quality and to assess spatial variations. The PCA results revealed four principal components accounting for the major variance in the dataset. Dominant ions included calcium, potassium, sodium, sulphate, chloride, and nitrate, followed by magnesium, carbonate, and bicarbonate. Similar patterns were observed in the FA, with four significant factors, where sodium, sulphate, and chloride were consistently dominant across seasons. A strong positive correlation was observed between electrical conductivity (EC), the dependent variable, and the major ions as independent variables, with regression coefficients reaching up to 0.906. This indicates that ionic concentration significantly influences groundwater salinity. Spatial analysis indicates that the western part of the study area is more adversely affected by hydrochemical variations, suggesting possible anthropogenic or geological influences. The results affirm the effectiveness of multivariate statistical techniques in hydro-geochemical modeling and can serve as a scientific basis for sustainable groundwater management in the region.

Keywords: Key words: Hydrochemistry, Multivariate Analysis, Corelation matrix, PCA, FA, Multiple Regression, Groundwater Quality, Electrical Conductivity (EC), Pre-monsoon, Post-monsoon.

INTRODUCTION

Continuous material differentiation and homogenization associated with various geological processes have occurred through the Earth's history. As a result, geochemical data derived from geological samples often show compositional trends and groups (Hikorulwamori and Kenta yoshidha, 2017). Statistical investigation offers more attractive options to get possibilities, though the result may deviate more from real situations (Nemade and Shrivastava, 1997). The correlation provides an excellent tool for the prediction of parametric values within a reasonable degree of accuracy (Venkatachalam and Jabenesan, 1998). The quality of water is described by its physical, chemical and microbial characteristics. But, if some correlations are possible among these parameters, then the more significant ones would be useful to indicate fairly the quality of water (Dhembare and Pondhe, 1997). A systematic study of correlation of the water quality parameters not only helps to assess the overall water quality but also to quantify relative concentration of various pollutants in water and provide necessary cue for implementation of rapid water quality management programmes (Dash *et al.*, 2006). The multivariate statistical analysis of chemical data in geochemistry entails principles that are little known among geological practitioners. Such data are compositional, and hence, lie in a sub-space of full space, the simplex. (Richard A. Reyment 2009). An increasing number and high dimensionality of recent geochemical data require efficient and accurate multivariate statistical analysis methods such as Principal component analysis, factor analysis, cluster analysis and discriminate multivariate analysis (Hitomi Nakamura, 2017). The application of different multivariate statistical techniques can facilitate the interpretation of complex data matrices, and can help to simplify and organize large datasets to provide meaningful insight [Lakshruju *et al.* 1999]. Factor analysis (FA) is used to extract and recognize the major underlying factors contributing to the variations among the water quality measures. (Visvakarma. V; Thakur L.S, 2012). Factor analysis (FA) are effective means to resolve hydrological factors such as aquifer boundaries and hydrochemical parameters (Wang *et al.* 2001; Locsey and Cox 2003; Belkhiri *et al.* 2011; Mostafaei 2014; Mohamed *et al.* 2015; Teikeu *et al.* 2015), recognise geochemical controls on the composition (Alberto *et al.* 2001), separate anomalies such as anthropogenic effect (Helena *et al.* 2000; Pereira *et al.* 2003), and differentiate some groundwater signatures, including uncontaminated groundwater, sewage pollution, mining activities, and agricultural activities (Love *et al.* 2004). The aim of factor analysis for hydrogeochemical data is to explain observed relations in simplex terms, expressed as a new set of variates called factors. These factors, however, are neither observable nor can they be expressed in terms of observed variates.

AIM AND OBJECTIVE

1. To apply multivariate statistical methods such as Correlation matrix, Principal Component Analysis (PCA) and Factor Analysis (FA) to identify the dominant ions and underlying factors controlling Groundwater chemistry
2. To integrate the Multiple Regression Analysis (MRA) to examine the relationship between electrical conductivity (EC) and major chemical constituents in groundwater

METHODOLOGY

Groundwater samples were collected from 22 samples from during pre and post monsoon period (2021-2023). The collected water samples were transferred into pre-cleaned polythene container for analysis of chemical characters. The major cations - Ca, Mg, Na, K and anions - HCO_3 , CO_3 , SO_4 , Cl and NO_3 in ppm and EC value in mmhos / cm at 25° C are taken as variables in the present study. Models have been prepared for both the pre and post-monsoon periods and zone of favourable areas for the suitability of agriculture have been identified from the factor analysis. Ground Water samples are analyzed for electrical conductivity (EC), calcium (Ca), magnesium (Mg), sodium (Na), potassium (K), bi-carbonate (HCO_3), carbonates (CO_3), sulphate (SO_4), chloride (Cl) and nitrate (NO_3). Results obtained are subjected to multivariate statistical analysis using statistical package for social sciences (SPSS).

Vijayalakshmi et al.,

Study Area

The present study area Perambalur District is centrally located in Tamil Nadu and is 267 K.M away, in southern direction, from Chennai. It is spread between 10.54' and 11.30' degree Northern latitude and 78.40' and 79.30' degree of the Eastern longitude. It is an inland district without coastal line and its forms a part of the Survey Of India(SOI) Topographical sheets of 58I/11,12,15,16,58M/3and 4 of 1:50,000 scale. The District has an area of 1757sq.km .It is bounded on the North by Cuddalore and Salem Districts, South by Tiruchirappalli, East by Ariyalur District, West by Tiruchirappalli and Salem Districts. Perambalur District is centrally located in Tamil Nadu and is 267 K.M away, in southern direction, from Chennai. (Fig 2.1)Th district has vellar River in the North and it has well marked natural divisions. The pachamalai district hill situated on the North of perambalur is the most important hill in the district (Fig 1)

RESULTS AND DISCUSSION

Multivariate Methods

The usual procedures of interpretation of chemical quality of groundwater with the help of plots of different ions and pairs of ions do not define simultaneously the similarities or otherwise between all ions or samples (Dalton and Upchurch, 1978). The purpose of factor analysis is to interpret the structure within the variance-covariance matrix of a multivariate data collection. The technique which it uses is extraction of the eigen values and eigen vectors from the matrix of correlations or covariance (Davis,1973). Thus, factor analysis is a multivariate technique designed to analyze the interrelationships within a set of variables or objects. The factors are constructed in a way that reduces the overall complexity of the data by taking advantage of inherent inter- dependencies. As a result, a small number of factors will usually account for approximately the same amount of information as do the much larger set of original observations. The interpretation is based on rotated factors, rotated loadings and rotated eigen values.

Correlation Matrix

Correlation analysis measures the closeness of the relationship between chosen independent and dependent variables. This analysis attempts to establish the nature of the relationship between the variables. In this study, the relationship of water quality parameters on each other in the data of water analyzed was determined by calculating correlation coefficient using Statistical package for social sciences (SPSS) to perform symmetrical correlation matrix between major ions species. Table 1 and 2 shows the symmetrical correlation matrix of various form, which the interrelationship among the individual ions in the groundwater of the study area are determined. The highest correlation observed that Na vs K and Ca vs Mg during the pre-monsoon period and Cl vs SO₄ and Ca vs Mg during the post-monsoon period. A preliminary quantitative assessment of the principal components has been carried out using this matrix and pictograms have been developed to show the contribution of different variables. All the absolute values of the correlation coefficients greater than 0.4 have been taken into consideration, otherwise all the ten elements are extractable within two components.

Principal Component Analysis

In the principal component analysis (PCA), the correlation between the variables is taken as similarity measures. The correlation matrix was computed followed by the eigen value and per cent of trace of the amount of variance, which computationally implies that all the variance is common or shared. Then the eigen vectors were calculated to bring out the principal axis matrix where the variables loaded in components were brought out. The principal component loading matrix are presented as follows (Table 3 and 4) .The principal component I of pre-monsoon period is weighted by sodium, potassiumsulphate, chloride and nitrate which contributed 51.95 per cent of the sample variance. The concentration of ions indirectly reflects the water interaction with rocks and soil types. sodium, sulphate and chloride which is contributed 55.51per cent during the post-monsoon period. The distribution of chloride ion concentration indirectly reflects the water interaction with rocks, permeability variations of aquifer and inters transmissivity of rocks (Hem, 1970). The principal component II of pre-monsoon period is calcium and magnesium ions with variance of 17.08per cent and during post-monsoon period is represented by calcium,

Vijayalakshmi et al.,

magnesium and nitrate with the variance of 21.96 per cent. Calcium is the key element for different minerals like gypsum, anhydrite, dolomite, calcite, aragonite and serves as primary sources for Ca ions in water. The principal component III of pre and post-monsoon period are represented by potassium and bicarbonate ion with the variance of 13.41 and 11.04 per cent. Potassium is easily absorbed in the clay minerals and in the secondary products of water-rock interaction. The source of bicarbonate is mostly from decayed organic matter. The sources of potassium easily absorbed in the clay minerals and the secondary products of water-rock interaction. The principal component IV of pre and post-monsoon period are represented by EC and carbonate, bicarbonate ion with the variance of 7.9 and 3.6 per cent. The source of bicarbonate in groundwater is from decaying organic matter, action of CO₂ and intense agriculture activity is going on. (Fig.3 and 4).

Factor Analysis

The usual procedures of interpretation of chemical quality of groundwater with the help of plots of different ions and pairs of ions do not define simultaneously the similarities or otherwise between all ions or samples (Dalton and Upchurch, 1978). Factor analysis offers a powerful means of detecting such similarities among the variables or samples. The purpose of factor analysis is to interpret the structure within the variance-covariance matrix of a multivariate data collection. The technique which it uses is extraction of the eigen values and eigen vectors from the matrix of correlations or covariance's (Davis, 1973). Thus, factor analysis is a multivariate technique designed to analyze the interrelationships within a set of variables or objects. The factors are constructed in a way that reduces the overall complexity of the data by taking advantage of inherent inter-dependencies. As a result, a small number of factors will usually account for approximately the same amount of information as do the much larger set of original observations. The interpretation is based on rotated factors, rotated loadings and rotated eigen values (Table 5 and 6). In this analysis the variables are loaded into four factors in both seasons like pre- monsoon and post-monsoon period. After this, the reproduced and residual correlation matrixes are computed. Now the varimax rotation is performed to maximize the variance. Then the commonalities are inserted in diagonal of the correlation matrix and the extracted factors are based only on the common variance as original variables sharing with all other variables. The factor I of pre-monsoon period is represented by sodium, potassium sulphate, chloride and nitrate, which contributed 51.9 per cent of the sample variance. The concentration of ions indirectly reflects the water interaction with rocks and soil types. Sodium, sulphate and chloride, contribute 54.3 per cent during the post-monsoon period. The factor II of pre and post-monsoon period is calcium, magnesium and bicarbonate ions with variance of 17.8 and 19.8 per cent respectively. The source of bicarbonate is mostly from decayed organic matter. Magnesium is easily reacts with water and dissolves hydrochloric substances caused to reduce the acidic nature of rocks and soil types. The factor III of pre and post-monsoon period is potassium, nitrate and bicarbonate ions with variance of 13.4 and 9.9 per cent respectively. The sources of nitrate in groundwater are from decaying organic matter, sewage waste and usage of nitrate fertilizers, for intense agriculture activity. The factor IV of pre and post-monsoon period, conductivity is found in pre monsoon period and carbonate, bicarbonate with the variance of 7.9 and 1.6 per cent respectively. The source of carbonate is mostly from decayed organic matter and conductivity are attributed to concentration and changes of ions present in the solution of groundwater. (Fig. 5 and 6).

Factor Analysis – Post-monsoon

Multiple Regression Analysis

The multiple regression analysis is used to examine the relationship between a single dependent variable and several independent variables. At present the electrical conductance (EC values) has been denoted as dependent variable and Ca, Mg, Na, K, HCO₃, CO₃, Cl, SO₄ and NO₃ as independent variables. The functional relationship of EC value mainly depends on the concentrations of major cations and anions. This has been clearly demonstrated by the regression model. The general purpose of multiple linear regressions is to quantify the relationship between several independent or predictor variables and a dependant variable. This method is successfully used by different authors to establish statistical model (Ghasemi and Saaidpour, 2007). However, in regression model, independent variables upon dependent variables can be expressed as (Table 7 and 8)

$$Y = b_0 + b_1 X_1 + b_2 + b_3 X$$

$$3 + \dots + b_n X_n \text{ Where,}$$

**Vijayalakshmi et al.,**

Y =dependent Variable

 b_0 =Constant, b_1 to b_n = Coefficients and 1 to n = Independent Variables

In groundwater samples, EC values are the main dependent on the concentrations of major cations and anions. The substitution of the regression coefficients obtained for each variable will result the functional relationship between the dependent variable and independent variables. The substitution of the regression co-efficient, obtained from each variable, exhibits the functional relationship between the dependent (EC) and independent (major ions) variables. The adjusted goodness of fit index (AGFI) differs from the goodness of fit index (GFI) only in the fact that it adjusts for the number of degree of freedom in the specified model. They address the issue of parsimony by incorporating a penalty for the inclusion of additional parameters. The GFI and AGFI can be classified as absolute index of fit (Bentler, 1990). Although, both indices range from 0 to 1, with values close to 1 being indicative of good fit. For Joreskog and Sorbom (1993) these two indices is impossible for them to be negative. The goodness of fit for pre and post-monsoon periods are 0.900 and 0.906 respectively. This result indicating that the assumption made is correct and validated for the present analysis. The correlation coefficient for both periods shows the value with in 0.906. It is clear that there exists a strong positive relationship between the dependent variable EC and the independent variables major ions (Table 7 and 8). From the principal component analysis matrix the heavily loaded chemical parameters are identified. The first principal component loads heavily by the Na, SO₄, Cl, K and NO₃ for pre- monsoon period and in the post-monsoon period the major ions are Na, SO₄ and Cl are dominating (Table 9 and 10). The second principal component loaded ions are Ca, Mg and NO₃ during the pre and the post monsoon period. The third principal component dominating ions are HCO₃, CO₃ and K loaded pre and post-monsoon period. In the fourth component loaded ions are HCO₃, CO₃ in the pre and post-monsoon period. Four factors are loaded from the pre and post-monsoon period water samples. The two seasons of first factors showing how the major ions are related to EC. The pre-monsoon period carbonate and bicarbonate are loaded in factor III showed the effect of contamination by salinity. From the rotated factor matrix the heavily loaded by the Na, K, SO₄, Cl NO₃ this contributes 54.13 % of the variance for pre-monsoon period and in the post-monsoon period Na, SO₄ and Cl ions are dominating in the first factor (Table 11 and 12). The second factor loaded ions are Mg, Ca and NO₃ in the pre and post-monsoon period. The third factor loaded ions are K, CO₃ and HCO₃ during pre and post-monsoon period and CO₃, HCO₃ are loaded in post-monsoon period of the fourth factor.

CONCLUSION

The hydrochemical data are statistically analyzed. The analyses carried out for hydro-geochemical modeling are principal component analysis, factor analysis and multiple regression analysis. In principal component analysis four components are loaded. Among these ions, calcium, potassium, sodium, sulphate, chloride, nitrate are dominating ones followed by magnesium, carbonate and bi-carbonate ions are dominating during the pre and post monsoon period. The factor analysis is also loaded with four components. Out of these sodium, sulphate and chloride ions are dominating ions during the pre and post monsoon periods. While comparing the principal component analysis and factor analysis, it is observed that same results are obtained with a little difference. The regression co-efficient for pre and post-monsoon periods shows the value within 0.906. It is clear that there exists a strong positive relationship between the dependent variable EC and the independent variables the major ions. It is observed from the above methods that the western part of the block of the study area are very much affected in Perambalur District. Encourage the construction of artificial recharge structures like check dams and percolation tanks to enhance groundwater quality through dilution. Educate local communities about the importance of groundwater quality and safe water practices, especially in affected areas. Local government authorities should implement land use regulations and pollution control policies in identified vulnerable zones.

ABSTRACT

This study examines the quality of library resources, library services and library facilities in arts and science college libraries in Tirunelveli city through the perceptions of students. The objectives were to assess the frequency and purpose of library visits, evaluate the quality of resources, services and facilities, measure user satisfaction and test the relationship between these variables. A survey method was used with a structured online questionnaire distributed to 500 students across five institutions. Of which 470 valid responses, the data were analyzed using SPSS software. The findings show that more than one third of students visit the library daily and the main purpose is book lending and return followed by reference use and preparation of academic work. More than half of the respondents rated books, periodicals, reference materials and e-resources as good or excellent while online databases and support collections were mostly rated average. Circulation services were well appreciated whereas reference, document delivery, reprography, and internet access were largely rated average. Facilities such as space, furniture, lighting, and computers were found to be unsatisfactory by a majority, with internet access being a major concern. With respect to user satisfaction, majority of users were satisfied with resources and services but more than half were felt dissatisfied with facilities. Correlation analysis indicated significant relationships between resources, services, and facilities, and the Kruskal Wallis test confirmed a significant difference between overall satisfaction and the quality of these three components.

INTRODUCTION

College libraries are the academic hubs in supporting teaching learning research and academic development by delivering a combination of resources, services and facilities to the academic fraternity. In order to strengthen the collections of resources, services and facilities of the library, users' feedback on these variables are essential. Carlsson, H., and Torngren, T. (2020) stated librarians should frequently conduct users' survey in terms of library facilities and services to overcome the problem faced by the users. It is the key factor to improve the quality of the libraries. Veena, G., and Kotari, P. N. (2016) User satisfaction surveys are important for identifying user needs and improving library facilities, resources, and services. Alokuk, J. (2020) asserts understanding students' perceptions and needs regarding library services are important for optimizing library facilities. Ningoji, S. M. M., and Sadashivappa, N. (2020) evaluated the user satisfaction on library sources and services in Hangal District B.Ed colleges. They found that most of the students visit library to borrowing books and to read specific subject materials. Students are impressed with the arrangement of library resources and they are satisfied with the resources and services in their college libraries. Noh, Y. (2022) analyze the differences between librarians' and users' perceptions of the importance and satisfaction of library facilities and programs to inform the development of libraries as cultural spaces. Peng, L., et. al. (2022) stated in the study that service facility availability is the most critical factor in academic libraries. Antunes, M. L., Lopes, C., and Sanches, T. (2021) revealed that students are satisfied with electronic resources remotely and there is a gap in awareness of available databases in the institutions among the students. Yugandar and Doraswamy Naick (2018) users judge libraries by both traditional items (books, periodicals) and by newer services such as web access, e-resources and study spaces, so a balanced view of resources, services and facilities is needed to understand user needs. Barfi, K. A. (2023) Evaluations using standard instruments (for example, LibQUAL) repeatedly reveal gaps between what users expect and what libraries deliver, especially for electronic access, internet speed, reprography and comfortable study areas – gaps that lower overall satisfaction even when print collections are adequate. Kaushamalika, P. K. M., and Weerakoon, W. (2020) revealed that users were satisfied with physical facilities but unsatisfied with library collections and computer facilities in three regional center libraries of the Open University of Sri Lanka. While there are studies that reveal users were satisfied with library resources and facilities. Lateef, E. B., Ozonuwe, O. S., and Abayomi, A. O. (2024) Undergraduate students at Crawford University are generally satisfied with the library's facilities, resources, and services, but some areas need improvement. Saduete, A. B., and Masalinto, M. L. (2023) Academic library users in the Philippines have high accessibility, usability, and satisfaction with hybrid library resources and services. Therefore, academic libraries must implement with various forms of planned ways to store and deliver the needed information through resources, services and facilities. Consequently, there is a demand for academic libraries to supply the users' information needs. Building on this foundation, the current study aims to investigate how students in the selected arts and science colleges of Tirunelveli City perceive their library's resources, services, and facilities. The research attempts to explore: (a) which library elements they use most often and why; (b) which resources, facilities and services they prefer to consume; and (c) how all these factors relate to overall satisfaction. The study attempts to address the libraries seeking to balance print and digital collections, deliver efficient services and maintain environments that nourish learning must understand user voice (through survey) on the variables that would provide a valuable roadmap demonstrating evidence so to advise college administrators on what and where to invest for effective dissemination of library facilities, resources and services to the academic fraternity of an institution.

OBJECTIVES

1. To find out the frequency and purpose of visits to the library.
2. To assess the quality of library resources, services and facilities through the perceptions of the surveyed users.
3. To determine the level of satisfaction of library resources, services and facilities among the user community.
4. To assess the significant relationship of variables between the quality of library resources, services and facilities using Kendal's Tau b Correlation Test and Kruskal Wallis H Test.

**Jaya Suriya Dheva and Srinivasa Ragavan****Hypothesis**

1. There is no significant relationship between the quality of library resources, services and facilities.
2. There is a significant difference on overall satisfaction and the quality of library resources, services and facilities.

MATERIALS AND METHODS

The study is based on survey method with primary data. The primary data collected through well framed and structured questionnaire using GoogleForms during September 2023. Simple random sampling technique used to select five institutions in Tirunelveli city and to collect data from the sample respondents. A total of 500 questionnaires (100 questionnaires per institution – five institutions) distributed and out of which 489 received. 19 questionnaires rejected due to incomplete responses. Finally, 470 completed filled-in questionnaires used in the study. The four point likert scale method adopted to assess the quality of library resources, services, facilities and satisfaction of the surveyed respondents. The collected data analyzed using SPSS software [version 21]. For the secondary data, the research consulted sources from Google Scholar, Web of Science, Scopus and alike online sources for the study. The study is limited to the primary data collected from the students in the form of online questionnaires from randomly selected five arts and science institutions in Tirunelveli city during the specified period.

RESULTS

Table 1 shows the demographic characteristics of the respondents. Out of 470 respondents 243 (51.70%) were male and 227 (48.30%) were female. According to the subject wise distribution, 253 (53.83%) were belongs to 'Arts' subject whereas 217 (46.17%) were studying 'Science' subject. Table 2 reveals that 173 (36.81%) of respondents visit library daily, 112 (23.83%) visit once a week, 93 (19.79%) of respondents visit library fortnightly, 80 (17.02%) visit monthly to the library whereas 12(2.55%) of the respondents visit library occasionally for their use. Table 3 reveals that a majority of (42.98%) of the respondents visit to the library for lending and return books followed by visit library to refer books, journals, magazines, newspapers (26.17%), 17.45% of the surveyed respondents refer library to prepare assignment, articles, project, 11.28% of the respondents used library to access e-resources, online databases and internet whereas only a negligible population (2.13%) referred library for recreational activities.

Percentage denoted in parenthesis

From the above Table 4, it clearly indicates that approximately 52% of the respondents rated the quality of books, textbooks, periodicals as good and excellent, the reference materials rated as good and excellent by 51.5 % of the respondents, while 190 (40.43%) respondents felt that books, textbooks, periodicals are average quality followed by 221 (47.02%) reference materials as average level, 210 (44.68%) online databases as average whereas 210 (44.68%) felt that the collections of e-resources are good. It is inferred that more than 50 % of the users are very much satisfied with the quality of library resources.

Percentage denoted in parenthesis

The assessment of library services explained in the table 5. Out of 470 respondents, Nearly 61% rated the circulation service as good and excellent followed by 41% of the respondents rated the Web OPAC as good and excellent while 230 (48.94%) felt that OPAC and Web OPAC followed by 250 (53.19%) reference and referral services, 298 (63.40%) current awareness, SDI, document delivery services and 340 (72.34%) reprography services is in average quality. It is inferred that the services of reprography, CAS, SDI, Document Delivery Service are not appreciable by the user community.

Percentage denoted in parenthesis

Table 6 shows that quality assessment of library facilities. 290 (61.70%) respondents felt that library space and timing followed by 276 (58.72%) lighting, ventilation, air circulation, fan, air condition, 270 (57.45%) furniture, drinking

Jaya Suriya Dheva and Srinivasa Ragavan

water, rest room, 310 (65.96%) Xerox machines, printer, scanner, computers and 345 (73.40%) internet are opined as average among users. While one third of the surveyed respondents felt the library space, timing, lighting, ventilation, air circulation, fan, air condition facilities are so good. It is also surprised to know that below 20% of the respondents only satisfied with the Internet and Computer Access and Reprography facility.

Percentage denoted in parenthesis

The overall satisfaction of respondents shows in the above Table 7. Out of 470 respondents, 290 (61.70%) of them satisfied with library resources, followed by 276 (58.72%) library services whereas 264 (56.17%) of the respondents are dissatisfied with the library facilities provided by the libraries for the users. It is also inferred that a majority of the respondents are of the good opinion of library resources (87%) and library services (70%) as they were satisfied and very much satisfied, while majority of them were not satisfied with the library facilities.

Hypothesis 1

There is no significant relationship between the quality of library resources, services and facilities.

Kendal's Tau b Correlation Test (Table 8)

Level of Significant: 0.05 (2-tailed)

Kendal's Tau b correlation test is used to examine the hypothesis of the study. The value of p is less than 0.05 level of significant is considered as statistical significance for the above table. There is a strong correlation between the quality of library resources with library services ($r=0.498$, $n=470$, $p=0.001$) and library facilities ($r=0.804$, $n=470$, $p=0.016$). There is a high positive correlation between the quality of library services with library resources ($r=0.704$, $n=470$, $p=0.011$) and library facilities ($r=0.504$, $n=470$, $p=0.015$). There is a negative correlation between the quality of library facilities with library resources ($r=0.302$, $n=470$, $p=0.103$) and library services ($r=0.497$, $n=470$, $p=0.120$).

Hypothesis 2

There is a significant difference on overall satisfaction and the quality of library resources, services and facilities.

Level of Significance: 0.05

From the above table 9 it clearly indicates that the p value (0.004) is less than that of the level of significance (0.05) of overall satisfaction and the quality of library resources, services and facilities. Hence it concluded that there is a significant difference of overall satisfaction and the quality of library resources, services and facilities.

DISCUSSION

The major findings of the study reveal the following results. They are

- 36.81 % of the surveyed respondents visit their institutional library on the daily basis to consult academic resources in relevant to their study.
- A majority of the population i.e., 42.98% visit library for the purpose of lending and returning of books while a negligible population visit for recreational activities.
- More than 50% of the respondents asserted the quality of library resources is above average.
- The circulation and Web OPAC services are welcomed by the respondents while there is a necessity of upgrading reprography, SDI and CAS services as the users couldn't meet their expectations.
- One third of the respondents opined that the library space, timing, lighting, ventilation, air circulation, fan, air condition facilities are so good. It is surprising to discover that ICT technologies like computers, Internet, reprography and machineries like printers, scanners are reported as satisfied by only 20% of the respondents.
- A majority of the respondents are of with good opinion of library resources and services and considerable majority of the respondents felt there should be an up-gradation on the library facilities.
- The Kendal's Tau b correlation test showed that library resources and services are strongly related to each other and both also connect to facilities. However, the link between facilities and user satisfaction was weaker.
- The Kruskal Wallis test confirmed that there is a significant difference between overall satisfaction and the quality of resources, services and facilities meaning all three factors directly affect how satisfied students feel.

Jaya Suriya Dheva and Srinivasa Ragavan

CONCLUSION

The study makes it clear that the respondents rely primarily on their college libraries particularly for borrowing books and preparing academic assignments. While traditional print resources and circulation services are appreciated, digital resources and modern facilities are still underdeveloped. Poor internet access, lack of updated equipment, and inadequate space are major drawbacks. Since students are increasingly expected to use digital content for assignments and academia, these gaps could affect their learning experience. To conclude, the research shows that libraries in these colleges are strong in traditional roles but weak in adapting to modern needs. Colleges need to invest more to improve infrastructure such as better internet, updated computers, comfortable study spaces and improved reprography services which will advocate libraries and librarians' remain relevant in satisfying students' academic needs.

ACKNOWLEDGEMENT

I thank the officials of the Department of Library and Information Science at Bharathidasan University for approving my proposal of researching in the selected five institutions in Tirunelveli city. I also thank the officials and the librarians' of the selective five institutions for allowing me to conduct research and assisting me in gathering the primary data required for the study. I express my gratitude to the Statistical Analyst for his timely guidance in setting the questionnaire and validating the primary data.

CONFLICT OF INTEREST

There is no conflict of interest among the authors.

ABSTRACT

This research paper explores the evolving portrayal of masculinity in Indian English literature from the early 20th century to the present day, reflecting broader socio-political and cultural shifts in Indian society. The study examines how masculinity has been constructed, performed, and redefined across different literary eras, from the heroic and noble ideals during the independence struggle to the conflicted and introspective depictions in the post-independence era, and the diverse and inclusive representations in contemporary literature. Central to this exploration are the following research questions

- How has the portrayal of masculinity in Indian English literature evolved from the early 20th century to the present day?
- In what ways do socio-political and cultural contexts influence the depiction of masculine identities in different literary eras?
- How do contemporary Indian English literary works incorporate and represent diverse masculinities, including those of LGBTQ+ individuals?

By addressing these questions, the paper aims to highlight the dynamic transformations in masculine identity, emphasizing the role of intersectionality and the inclusion of emotional vulnerability in contemporary representations. The findings underscore the importance of literature in mirroring and influencing societal changes in gender perceptions, fostering a more inclusive and empathetic understanding of masculinity.

Keywords: Masculinity, Indian English Literature, LGBTQ+, Traditional Masculinity, Contemporary Masculinity, Gender Studies, Intersectionality, Cultural Shifts.

**Anita Thakur et al.,**

INTRODUCTION

The concept of masculinity has long been a significant theme in literature, reflecting the evolving ideals and values of society. In the context of Indian English literature, the portrayal of masculinity has undergone substantial transformations, mirroring the dynamic socio-political and cultural shifts in Indian society. From the early 20th century, characterized by the struggle for independence and the embodiment of heroic and noble ideals, to the present day, where diverse and inclusive masculinities are increasingly recognized, the literary representation of masculinity has continuously evolved. Historically, Indian English literature has depicted masculinity through a variety of lenses, each reflective of the prevailing societal norms and expectations. During the colonial period, literature often celebrated the courage, integrity, and patriotism of male characters, intertwining traditional Indian values with the burgeoning nationalist spirit. This era laid the groundwork for a nuanced understanding of masculinity, portraying men as protectors and leaders committed to ethical principles and the greater good (Tagore, 1916). The post-independence era marked a significant shift, as the newfound freedom of the country brought with it complex feelings of hope, disillusionment, and a quest for identity. Literature from this period began to explore the psychological and emotional depths of male characters, highlighting their vulnerabilities and moral dilemmas. This introspective approach provided a deeper understanding of the male psyche during a transformative period in India's history (Singh, 1956; Anand, 1935). As India continued to modernize and urbanize in the latter half of the 20th century, literature increasingly focused on the impact of urban experiences on masculine identity. Characters grappling with feelings of alienation and dislocation became more common, reflecting the socio-economic pressures of a rapidly changing society. The portrayal of masculinity during this period became more complex and multifaceted, highlighting the internal and external conflicts that shape male identity (Roy, 1997; Rushdie, 1981; Mistry, 1991). In contemporary Indian society, there is a growing recognition of the diversity of masculinities, including those of LGBTQ+ individuals. Modern literature and media embrace a spectrum of male identities, challenging traditional gender norms and celebrating the fluidity of gender roles. This inclusive approach acknowledges that masculinity is a dynamic and evolving construct influenced by various social identities such as class, caste, and sexuality (Selvadurai, 1994; Roy, 2017). This paper delves into the changing features of masculinity in contemporary Indian society, examining how literature has reflected and influenced these transformations. By exploring the evolution of masculine ideals from the early 20th century to the present day, this study aims to provide a comprehensive understanding of how masculinity is constructed, performed, and redefined in the context of Indian English literature. Through this analysis, we seek to highlight the ongoing journey towards a more inclusive and empathetic understanding of gender in modern Indian society.

What is Masculinity?

Masculinity refers to the attributes, behaviours, and roles traditionally associated with boys and men. It is often constructed in opposition to femininity and is shaped by cultural, social, and historical contexts. According to R.W. Connell, a leading sociologist in gender studies, masculinity is not a fixed entity embedded in the body or personality traits of individuals. Instead, Connell argues in her book "Masculinities" that it is a set of practices and cultural norms that men perform to establish their gender identity in relation to the expectations of their society (Connell, 2005). This perspective highlights the performative and socially constructed nature of masculinity, emphasizing its variability and contextual dependence. Furthermore, contemporary scholars such as Judith Butler and Michael Kimmel have contributed to the understanding of masculinity. Butler, in her seminal work "Gender Trouble," proposes that gender, including masculinity, is a performative act repeated over time, which creates the illusion of a stable identity (Butler, 1990). Kimmel, in "Manhood in America," describes masculinity as a constantly evolving script that men learn and enact. He emphasizes that masculinity is not monolithic but rather comprises multiple masculinities that vary across different contexts and intersections of race, class, and sexuality (Kimmel, 2012). These definitions underscore the complexity and fluidity of masculinity, challenging the notion of a singular, universal masculine ideal. The concept of masculinity is not confined to men alone. Feminist scholars and gender theorists argue that masculinity, like femininity, can be performed by anyone, regardless of their biological sex. Judith Halberstam, in "Female Masculinity," explores the ways in which women and non-binary individuals enact masculinity,

Anita Thakur et al.,

demonstrating that masculine traits and behaviours are not inherently tied to male bodies (Halberstam, 1998). Halberstam's work highlights the diversity of masculine expressions and challenges the binary view of gender. This inclusive approach to masculinity acknowledges that it is a social construct that can be adopted and adapted by individuals of any gender, further illustrating its dynamic and multifaceted nature.

Masculinity in Different Periods in Indian English Literature

Early 20th Century (1900-1947): The Heroic and Noble Man

In the early 20th century, Indian English literature often depicted masculinity through the lens of heroism and nobility. This period was profoundly influenced by the struggle for independence from British colonial rule, which emphasized qualities such as courage, integrity, and patriotism in male characters. The masculine ideal of this era was deeply intertwined with the notion of self-sacrifice for the greater good of the nation, combining traditional Indian values with the emerging nationalist spirit. Men were often portrayed as protectors and leaders, embodying a sense of moral and ethical responsibility. Rabindranath Tagore's "The Home and the World" (1916) is a seminal work that encapsulates the complexities of masculine identity during this period. The novel is set against the backdrop of the Swadeshi movement, a significant phase in the Indian independence struggle that encouraged the boycott of British goods. Tagore presents two contrasting male characters: Nikhil and Sandip. Nikhil embodies rationality, compassion, and moral integrity. He believes in gradual reform and the importance of ethical conduct, even in the face of oppression. Tagore writes, "*To tyrannize for the country is to tyrannize over the country*" (Tagore, 1916), reflecting Nikhil's belief in non-violence and moral uprightness. In contrast, Sandip represents aggressive nationalism and charismatic leadership. He is assertive, manipulative, and willing to use any means necessary to achieve his goals, embodying a more militant form of masculinity. Sandip's character states, "*To worship my country as a god is to bring a curse upon it*" (Tagore, 1916), highlighting the dangers of fanatic nationalism. Through these characters, Tagore explores the conflicting ideologies and moral dilemmas faced by men involved in the independence movement. The early 20th century also saw the emergence of other notable works that depicted the masculine struggle against colonial oppression. Raja Rao's "Kanthapura" (1938) is a significant example. The novel portrays the impact of the Gandhian movement on a small South Indian village. The protagonist, Moorthy, is a young Brahmin who becomes a fervent follower of Mahatma Gandhi's principles of non-violence and civil disobedience. Moorthy embodies spiritual and moral strength, representing an alternative form of masculinity that combines traditional Indian values with the ideals of resistance and self-sacrifice. Rao describes Moorthy's transformation, stating, "*He had no possessions, no wealth, no power. He had only his will, his faith, and his love*" (Rao, 1989). This characterization reflects the era's emphasis on inner strength and moral resolve as key components of masculinity. The portrayal of masculinity in this period was not limited to physical bravery and militant nationalism but also included qualities such as moral integrity, compassion, and spiritual resilience. These literary works highlight the multifaceted nature of masculinity, where the heroism of men was often depicted through their commitment to ethical principles and their willingness to endure personal sacrifices for the greater good. The early 20th century thus laid the foundation for a nuanced understanding of masculinity in Indian English literature, intertwining traditional values with the burgeoning nationalist spirit.

Post-Independence Era (1947-1960): The Modern and Conflicted Man

The post-independence era saw a significant shift in the portrayal of masculinity in Indian English literature, reflecting the changing socio-political landscape of India. The newfound freedom of the country brought with it a complex blend of hope, disillusionment, and a quest for identity, both at the national and individual levels. This period marked a transition from the idealized, heroic masculinity of the colonial struggle to a more nuanced and conflicted depiction of men. Masculinity during this era was characterized by an exploration of emotional depth, moral ambiguity, and the impacts of historical trauma. In "Train to Pakistan" (1956) by Khushwant Singh, the male characters grapple with the violence and chaos of the Partition, which resulted in unprecedented upheaval and displacement. The protagonist, Jugga, is depicted as a rugged and somewhat lawless man, embodying the traditional masculine traits of physical strength and bravery. However, Jugga's character also reveals a softer, more humane side through his loyalty and love for Nooran, a Muslim girl. Singh writes, "*Jugga, who was always the first to get into a fight, had a heart that could not bear to see a child in tears*" (Singh, 1956). This duality in Jugga's character represents the conflict between traditional masculine traits and the emerging qualities of emotional vulnerability and moral complexity. The

Anita Thakur et al.,

novel illustrates how the trauma of Partition forces men to confront their inner conflicts and reevaluate their identities in a rapidly changing world. Another important work from this period is "Untouchable" (1935) by Mulk Raj Anand. Although published before independence, its themes remained profoundly relevant in the post-independence context. The protagonist, Bakha, is a young sweeper who embodies a masculinity oppressed by the rigid caste system. Anand's portrayal of Bakha's struggles and aspirations highlights the intersection of caste and masculinity, and the ways in which social structures impact male identity. Anand writes, "*Bakha was thinking of his caste, of his place in the world. He longed to escape, to be free, to be respected as a man*" (Anand, 2001). This depiction emphasizes the internalized oppression and desire for dignity that characterize Bakha's masculinity. His experiences reflect the broader societal struggles of marginalized communities in post-independence India, grappling with the promises of freedom and the persistence of entrenched social hierarchies. This period in Indian English literature also saw a move towards more complex and layered representations of men, who were no longer portrayed solely as heroes but as individuals with vulnerabilities and moral dilemmas. The portrayal of masculinity became more introspective, focusing on the psychological and emotional challenges faced by men in a newly independent nation. These literary works highlight the inner conflicts and existential crises that accompany the broader socio-political changes, providing a deeper understanding of the male psyche during this transformative period. The post-independence era thus marked a significant evolution in the depiction of masculinity, reflecting the complexities and contradictions of a society in transition. 1960s-1980s: The Urban and Alienated Man By the late 20th century, Indian English literature began to delve deeply into the urban experience and its profound impact on masculine identity. The rapid urbanization and modernization of Indian society during this period brought about significant changes in the portrayal of masculinity. Men were increasingly depicted as grappling with feelings of alienation, dislocation, and identity crises amid the shifting socio-economic landscape. The urban environment, with its inherent pressures and complexities, became a backdrop against which the evolving masculine identity was examined.

In "The God of Small Things" (1997) by Arundhati Roy, the character Velutha, an untouchable carpenter, embodies a form of masculinity that is both tender and tragic. Velutha's relationship with Ammu, which defies social norms, highlights the intersection of caste, class, and gender in shaping masculine identity. Roy writes, "*He [Velutha] left no footprints in sand, no ripples in water, no image in mirrors*" (Roy, 1997). This poignant line encapsulates Velutha's marginalized existence and the invisibility of his suffering. His ultimate fate underscores the harsh realities faced by marginalized men in a society rigidly stratified by caste. Velutha's character illustrates how systemic oppression and socio-economic conditions impact the masculine experience, creating a narrative of silent resistance and tragic vulnerability. Salman Rushdie's "Midnight's Children" (1981) offers another perspective on masculinity in the urban context. The protagonist, Saleem Sinai, navigates the complexities of identity in post-independence India, marked by a sense of alienation and displacement. Saleem's masculinity is characterized by introspection and a quest for meaning, diverging from traditional notions of strength and heroism. Rushdie's narrative style, blending magical realism with historical fiction, captures the fragmented and multifaceted nature of masculine identity during this period. Saleem reflects, "*I was born in the city of Bombay... once upon a time. No, that won't do, there's no getting away from the date*" (Rushdie, 1981). This introspective and self-reflective tone captures the existential uncertainties and the search for self amidst the socio-political upheavals of the time. Rohinton Mistry's "Such a Long Journey" (1991) further explores the theme of masculinity in an urban setting. The protagonist, Gustad Noble, is a middle-aged Parsi man who grapples with personal and political crises. Mistry's portrayal of Gustad reflects the tensions between tradition and modernity and the ways in which these tensions shape masculine identity. The novel highlights the challenges faced by men in navigating the complexities of urban life and the impact of socio-political changes on personal identities. Mistry writes, "*In the end, words are only words, and what matters is how you hold them*" (Mistry, 1991). This line encapsulates the struggle of finding meaning and maintaining integrity amidst the turmoil of urban existence. Gustad's character is torn between his obligations to his family, his community, and his own personal beliefs, reflecting the broader societal struggles of men during this period. This period in Indian English literature portrays masculinity as a complex and multifaceted construct, influenced by the rapid changes in society. The urban man is depicted as one who is caught in the web of socio-economic pressures, grappling with feelings of alienation and displacement. The literature from this era highlights the internal and external conflicts that shape masculine identity, emphasizing the emotional and psychological struggles of men in an urbanized and modernizing India. The

Anita Thakur et al.,

portrayal of characters like Velutha, Saleem, and Gustad underscores the evolving nature of masculinity, reflecting the broader socio-political and cultural shifts of the time. These narratives illustrate the intersection of various social factors caste, class, and politics in shaping the masculine experience, providing a deeper understanding of the male psyche in a rapidly changing world.

1990s-Present: Diverse and Inclusive Masculinities

In contemporary Indian English literature, there is a growing recognition of diverse masculinities, including those of LGBTQ+ individuals. This period reflects a broader societal acceptance of gender diversity, moving away from traditional, monolithic portrayals of masculinity to embrace a spectrum of male identities. The literature of this era highlights the fluidity of gender roles and the intersections of masculinity with other social identities such as class, caste, and sexual orientation. Masculinity is no longer confined to traditional norms; instead, it is seen as a dynamic and evolving construct shaped by personal and socio-political contexts. "Funny Boy" (1994) by Shyam Selvadurai explores the journey of a young boy, Arjie, discovering his homosexuality in Sri Lanka. Although the novel is set outside India, it resonates with Indian readers and contributes to the broader South Asian narrative. Arjie navigates his sexual identity amidst societal expectations and familial pressures, offering a poignant portrayal of queer masculinity. Selvadurai writes, "*The best thing about you, Arjie, is that you are different. But that is also the worst thing about you*" (Selvadurai, 1994). This line captures the central conflict of Arjie's identity—his uniqueness is both his strength and his struggle. The novel challenges traditional notions of masculinity by presenting a character whose identity is shaped by his sexual orientation and his resistance to conforming to societal norms. Arjie's journey reflects the broader challenges faced by LGBTQ+ individuals in a society that often imposes rigid gender expectations. Similarly, "The Ministry of Utmost Happiness" (2017) by Arundhati Roy presents characters like Anjum, a hijra, whose life story challenges conventional gender norms and highlights the fluidity of gender and masculinity in contemporary society. Anjum's character embodies a form of masculinity that is inclusive and intersectional, reflecting the diverse experiences of transgender individuals in India. Roy writes, "*She lived in the graveyard like a tree. At least trees were not meant to move*" (Roy, 2017). This imagery underscores Anjum's rootedness and resilience, despite her marginalization. Anjum's narrative weaves together personal and political elements, showcasing how individual identities are shaped by broader socio-political forces. Her story highlights the intersection of gender, caste, and politics, providing a nuanced understanding of masculinity beyond traditional binaries.

"The Lives of Others" (2014) by Neel Mukherjee explores the complexities of masculinity through the lives of the Ghosh family in post-independence India. The male characters grapple with issues of power, class, and identity, reflecting the broader socio-economic changes in Indian society. Mukherjee writes, "*To struggle meant to make choices, to act, to fight*" (Mukherjee, 2014). This line reflects the active engagement of the characters with their socio-political environment, highlighting the intersections of gender with other social identities. The novel portrays masculinity as multifaceted, shaped by historical and cultural contexts, and impacted by socio-economic conditions. The struggles of the male characters illustrate how masculinity is influenced by external factors such as class dynamics and political upheavals, adding depth to their personal identities. "The Lowland" (2013) by Jhumpa Lahiri further explores the theme of masculinity through the lives of two brothers, Subhash and Udayan, and their differing paths in life. Udayan's involvement in the Naxalite movement represents a radical and rebellious form of masculinity, while Subhash's quiet and contemplative nature offers a contrasting perspective. Lahiri writes, "*He feared that Udayan's devotion to his cause was less about justice and more about a desire for consequence*" (Lahiri, 2013). This line captures the tension between the brothers' differing approaches to life and their definitions of masculinity. Udayan's radicalism contrasts with Subhash's introspection, highlighting the diverse expressions of masculinity in contemporary Indian society. The narrative delves into the complexities of brotherhood, loyalty, and personal choices, reflecting how individual experiences and socio-political contexts shape masculine identities. In conclusion, contemporary Indian English literature presents a broad and inclusive view of masculinity, reflecting the diverse experiences of men in a rapidly changing society. The literature of this period challenges traditional gender norms and embraces a spectrum of masculinities, highlighting the intersections of gender with other social identities. By portraying characters who navigate the complexities of caste, class, sexuality, and politics, these works provide a nuanced understanding of masculinity as a dynamic and evolving construct. The exploration of diverse masculinities in contemporary literature

Anita Thakur et al.,

not only enriches the narrative landscape but also contributes to a more inclusive and empathetic understanding of gender in modern Indian society.

Changing Features of Masculinity in Contemporary Indian Society

The depiction of masculinity in contemporary Indian society has undergone significant transformations, reflecting broader societal shifts and the increasing acceptance of diverse gender identities. These changes are evident in various spheres, including literature, media, and everyday social interactions. Several key features characterize this evolving landscape of masculinity, highlighting its dynamic and multifaceted nature.

Embracing Emotional Vulnerability

Traditional notions of masculinity often emphasize stoicism and emotional restraint, viewing the expression of emotions as a sign of weakness. However, contemporary depictions of masculinity increasingly embrace emotional vulnerability as a strength rather than a flaw. Modern narratives in literature and media portray men who are open about their feelings, capable of expressing love, fear, and sadness. This shift reflects a broader societal acceptance of the importance of mental health and emotional well-being. Characters like Jugga in Khushwant Singh's "Train to Pakistan" and Gustad Noble in Rohinton Mistry's "Such a Long Journey" illustrate this changing perception, as they grapple with their emotions and personal crises, showcasing the strength found in vulnerability (Singh, 1956; Mistry, 1991).

Redefining Masculine Strength

The traditional association of masculinity with physical strength and aggression is being redefined in contemporary Indian society. Masculine strength is now often portrayed as encompassing moral courage, ethical integrity, and resilience. This broader definition allows for a more inclusive understanding of masculinity that values inner strength and personal integrity over brute force. Characters like Nikhil in Rabindranath Tagore's "The Home and the World" and Moorthy in Raja Rao's "Kanthapura" exemplify this redefinition, as their strength is derived from their moral convictions and their commitment to ethical principles rather than physical dominance (Tagore, 1916; Rao, 1989).

Intersectionality of Masculinity

Contemporary Indian literature and media increasingly highlight the intersectionality of masculinity, acknowledging that gender identity is influenced by various factors such as caste, class, ethnicity, and sexuality. This intersectional approach provides a more nuanced understanding of masculinity, recognizing that the experiences of men are shaped by multiple social identities. For instance, Velutha in Arundhati Roy's "The God of Small Things" and Bakha in Mulk Raj Anand's "Untouchable" represent masculinities that are profoundly affected by caste-based oppression and social marginalization. By exploring these intersections, contemporary narratives challenge the monolithic portrayal of masculinity and promote a more inclusive representation of male identities (Roy, 1997; Anand, 2001).

Inclusion of LGBTQ+ Masculinities

One of the most significant changes in the portrayal of masculinity in contemporary Indian society is the inclusion and acceptance of LGBTQ+ masculinities. Literature, cinema, and popular culture are increasingly depicting the experiences of gay, bisexual, transgender, and queer men, offering diverse representations of masculinity. This shift is evident in works like Shyam Selvadurai's "Funny Boy" and Arundhati Roy's "The Ministry of Utmost Happiness," which feature protagonists navigating their sexual and gender identities in a complex socio-political landscape. These narratives challenge traditional gender norms and celebrate the fluidity of gender, promoting a broader and more inclusive understanding of masculinity (Selvadurai, 1994; Roy, 2017).

Challenging Gender Norms

Contemporary Indian society is witnessing a growing challenge to traditional gender norms, with men increasingly engaging in roles and behaviors traditionally associated with femininity. This includes active participation in parenting, household chores, and care giving roles. The media portrayal of stay-at-home dads, men as primary

Anita Thakur et al.,

caregivers, and their involvement in domestic responsibilities reflects this change. This shift is also evident in literature, where male characters are depicted taking on nurturing roles and exhibiting traits such as empathy, compassion, and gentleness. Such portrayals help dismantle rigid gender stereotypes and encourage a more egalitarian view of gender roles.

Impact of Globalization and Media

Globalization and the proliferation of digital media have played a crucial role in shaping contemporary notions of masculinity in India. Exposure to global cultures and diverse representations of gender has influenced Indian society, leading to a more pluralistic understanding of masculinity. Social media platforms, films, and television shows from around the world offer alternative models of male behavior and identity, challenging traditional Indian constructs of masculinity. This global exchange of ideas fosters a more inclusive and flexible understanding of what it means to be a man in contemporary Indian society.

Masculinity and Feminism

The contemporary discourse on masculinity in India is increasingly influenced by feminist thought and gender studies. The recognition that gender equality benefits everyone, including men, has led to a critical examination of patriarchal norms and the pressures they impose on men. Feminist scholars and activists argue for a more compassionate and egalitarian approach to masculinity, encouraging men to reject toxic masculinity and embrace gender equality. This influence is reflected in literature and media that advocate for men's emotional well-being, equitable relationships, and the dismantling of oppressive gender structures. The changing features of masculinity in contemporary Indian society reflect a broader movement towards inclusivity, emotional openness, and the rejection of rigid gender norms. By embracing emotional vulnerability, redefining strength, acknowledging intersectionality, and including LGBTQ+ masculinities, contemporary representations challenge traditional constructs and promote a more holistic and inclusive understanding of male identity. These transformations are driven by cultural, social, and political shifts, influenced by globalization, media, and feminist thought. As Indian society continues to evolve, the portrayal and understanding of masculinity will likely continue to diversify, fostering a more compassionate and inclusive world for all genders.

CONCLUSION

The depiction of masculinity in contemporary Indian society has evolved significantly, reflecting broader societal changes and the increasing recognition of gender diversity. This transformation is characterized by a shift towards embracing emotional vulnerability, redefining strength to include moral and ethical dimensions, and acknowledging the intersectionality of masculinity with factors such as caste, class, and sexuality. The inclusion of LGBTQ+ masculinities and the challenging of traditional gender norms illustrate a move towards a more inclusive and nuanced understanding of male identity. These changes are driven by cultural, social, and political forces, including the influence of globalization and feminist thought, which advocate for gender equality and the dismantling of patriarchal structures. As Indian society continues to progress, the portrayal of masculinity in literature and media will likely further diversify, fostering a more empathetic and inclusive environment for all genders. This ongoing evolution underscores the dynamic and multifaceted nature of masculinity, highlighting its adaptability and relevance in a rapidly changing world.
