ABSTRACT

Consider the graph $G=(V,E)$ with n vertices and e edges. In this work, Odd Fibonacci Stolarsky3- mean labeling and Difference of cube and Square labeling is used. By giving the vertices and edges typically positive numbers under certain circumstances, it simplifies applications in combinatorial optimization, coding theory, and communication networks. These two labeling strategies are primitively used particular graph like the Four Intersection Mirror Lagoon Step graph $FIM L_n S_m$ and the Four Intersection Opposite Lagoon Step graph $FIO L_n S_m$. Based on the combination of Fibonacci sequence and Stolarsky mean to construct a lucid Odd Fibonacci Stolarsky 3- mean labeling, although the edges are labeled by the Difference of cube and square labeling predicated on mathematical differences between cube and square terms. The results demonstrate that labeling both ensures that the graph labeling requirements are met and provides new structural knowledge about how these specialized graphs behave. Furthermore, the provided Python coding for an Absolute Differences of Cubic and Square Difference Labeling and Odd Fibonacci Stolarsky-3 Mean Labeling of $FIM L_n S_m$ and $FIO L_n S_m$.

Keywords: Four Intersection Mirror Lagoon Step Graph, Four Intersection Opposite Lagoon Step Graph, Difference of cube and Square labeling, Odd Fibonacci Stolarsky 3- Mean labeling.

INTRODUCTION

We refer Gallian [1] and Frank Harary [2] for complete surveys of graph labeling. Rosa[3] first proposed the idea of graph labeling in 1967. References were obtained from the Square Difference of Squared Labeling of Graphs [4] and an absolute difference of cubic and square sum labeling of a certain classes of a Tree [5]. P.Shalini and D. Paul

Vasanthi and Ramya

Dhayabavan [6] proposed the difference of cube and square labeling. Numerous disciplines, including mathematics, finance, science, biology, the arts, and coding theory, use the Fibonacci sequence.. The idea of “Stolarsky -3 mean labeling” of graphs was first presented by “S.S. Sandhya, S. Somasundaram, and S. Kavitha” [7].The notion of Odd Fibonacci “Stolarsky 3-Mean Labeling” was first presented by Sree Vidya.M and S.S. Sandhya [8]. Regarding the use of the Fibonacci number, we refer Koshy [9]. We refer “Sree Vidya.M”. and “Sandhya S.S”. [10] for the “Decomposition Stolarsky -3 mean labeling” of graph.

MATERIALS AND METHODS

Definition1. A Lagoon L_n ($n \geq 3$ & must be an odd) obtained from n -vertices with $n-1$ edges which is shown below

Definition 2. A Step graph S_m (where $m = \frac{n-1}{2}$ & number of steps) is a graph obtained from L_n ($n \geq 3$ & must be an odd) which is shown below

Definition 3. A Lagoon Step graph $L_n S_m$ is obtained from Lagoon L_n (L Shape) graph with vertices n ($n \geq 3$, must be an odd) joining with step graph S_m ($m \geq 1, m$ is number of steps with $m = \frac{n-1}{2}$), the graph consists of $n+2m-1$ vertices and $n+2m-1$ edges shown below.

Definition 4. Intersection Mirror Lagoon Step graph $IM L_n S_m$ obtained by attaching Lagoon step graph with Mirror image Lagoon step graph consists of $3n+m-4$ vertices and $3n+m-3$ edges (with $n \geq 3$ must be an odd and $m = \frac{n-1}{2}$, $m \geq 1$) shown below.

Definition 5. Intersection Opposite Lagoon Step graph $IO L_n S_m$ obtained by attaching Lagoon step graph with Opposite direction of Lagoon step graph consists of vertices $2n+4m-4$ vertices and edges $2n+4m-3$ (with $n \geq 3$ must be an odd and $m = \frac{n-1}{2}$, $m \geq 1$) shown below

Definition 6. Four Intersection of Mirror Lagoon step graph obtained by attaching two Intersection of Mirror Lagoon Step graph which has total number of vertices $3n+6(m-1)$ and total number of edges $3(n-1)+6m$ (with $n \geq 3$ must be an odd and $m = \frac{n-1}{2}$, $m \geq 1$, $m =$ number of steps) shown below.

Definition 7. Four Intersection of Opposite Lagoon step graph is obtained from attaching two graph of intersection of opposite Lagoon step graph which has total number of vertices $7(4m-n)+2$ and total number of edges $7(4m-n)+5$ (with $n \geq 3$ must be an odd and $m = \frac{n-1}{2}$, $m \geq 1$, $m =$ number of steps) shown below.

Definition 8: Consider 'G' be a graph, and take $G = (V(G), E(G))$. If there is a bijection $f: V(G) \rightarrow \{1, 2 \dots |V|\}$ such that the resulting function $f^*: E(G) \rightarrow$ multiple of 2 is specified by $f^*(u, v) = ||f(u)^3 - f(v)^3| - |f(u)^2 - f(v)^2||$ then a graph 'G' is said to have an absolute difference of the differences of the cubes of the vertices and difference of squares of the vertices.

Definition 9. A graph in which every edge associates a distinct value with multiples of 2 is called the differences of the cubes of the vertices and the differences of the squares of the vertices.

Definition 10. Absolute difference of cubic and square difference graphs are graphs that allow for an absolute difference of cubic and square difference labels.

Definition 11. The linear recurrence $F_n = F_{n-1} + F_{n-2}$, $n \geq 2$ may be used for defining the Fibonacci numbers. This creates an endless string of integers starting with 1,1,2,3,5,8,13,21,34,55,89,144, 233....., where $F_1=1, F_2=1, F_3=2, F_4=3, F_5=5,$

Vasanthi and Ramya

$F_6=8, F_7=13, F_8=21, F_9=34$ and so on. Odd Fibonacci numbers are $F_2=1, F_4=3, F_5=5, F_7=13, F_8=21, F_{10}=55, F_{11}=89$ and so on. An infinite series of odd Fibonacci numbers represented by F_k where $K \neq$ multiples of 3.

Definition 12. Let G be a graph with p vertices and q edges and an injective function $f: V \rightarrow \{1, 3, 5, 13, 21, 55, 89, \dots\}$ where each F_i is an odd Fibonacci number and the induced edge labeling $f^*: E \rightarrow \mathbb{N}$ are defined by

$$f^*(e=uv) = \left\lfloor \sqrt{\frac{f(u)^2 + f(u)f(v) + f(v)^2}{3}} \right\rfloor \text{ or } \left\lfloor \sqrt{\frac{f(u)^2 + f(u)f(v) + f(v)^2}{3}} \right\rfloor$$

for all $uv \in E$ and all these edge labeling are distinct is called Odd Fibonacci Stolarsky-3 Mean Labeling. A graph which admits an Odd Fibonacci Stolarsky -3 Mean Labeling is called an Odd Fibonacci Stolarsky - 3 Mean Graph.

RESULTS AND DISCUSSION

Theorem 1

FIM $L_n S_m$ is an absolute difference of cubic and square difference graph for $n \geq 3$ (n must be an odd, $m = \frac{n-1}{2}, m \geq 1$).

Proof. Let the graph G be the FIM $L_n S_m$ with $3n+6(m-1)$ vertices and $3(n-1)+6m$ edges when $n = 3, 5, 7, \dots$ then $m = 1, 2, 3, \dots$ respectively. The mapping $f: V \rightarrow \{1, 2, 3, \dots, 3n+6(m-1)\}$ is defined in two cases.

Case 1. when $n = 5, 7, 9, \dots$ then $m = 2, 3, \dots$ respectively

Let v_i be the outer most vertices, $f(v_i) = i, 1 \leq i \leq 3n+2m-3$ when $n = 5, 7, 9, \dots$, then $m = 2, 3, 4, \dots$ respectively. Let w_i be the left most inner vertices, x_i be the top most inner vertices, y_i be the right most inner vertices, and z_i be the bottom most inner vertices corresponding vertex labeling

$$f(w_i) = 3n + 2m + 4i - 6$$

$$f(x_i) = 3n + 2m + 4i - 5$$

$$f(y_i) = 3n + 2m + 4i - 4$$

$$f(z_i) = 3n + 2m + 4i - 3$$

this can be expressed as,

i	n	m
1	5	2
1, 2	7	3
1, 2, 3	9	4
.	.	.
.	.	.

respectively

Let c be the central vertex, $f(c) = 4n+4m-7$ when $n = 5, 7, 9, \dots$, then $m = 2, 3, 4, \dots$ respectively. For vertex labeling f , the resulting function $f^*: E(G) \rightarrow$ multiple of 2 is specified by $|f(u)^3 - f(v)^3| - |f(u)^2 - f(v)^2|$ defined as follows.

Let e_i be the outer most edges except last outer edges and r_i be the last outer edge,

$$f^*(e_i) = 3i^2 + i, 1 \leq i \leq 2n+4m-3 \text{ and } f^*(r_i) = i^3 - i^2, i = 2n+4m-2 \text{ when } n = 5, 7, 9, \dots, \text{ then } m = 2, 3, 4, \dots \text{ respectively.}$$

Let a_i be the left inner most edges, $f^*(a_i) = w_i^2 (w_i - 1) + v_k^2 (1 - v_k), k = 2n+2m+i-1, i = 1$ when $n = 5, 7, 9, \dots$, then $m = 2, 3, 4, \dots$ respectively.

$f^*(a_i) = w_i^2 (w_i - 1) + w_{i-1}^2 (1 - w_{i-1})$ this can be expressed as

respectively

From all above, edges received distinct labels which are multiple of 2.

Special case FIM $L_3 S_1$: Let v_i be the outer vertices, $f(v_i) = i, 1 \leq i \leq 8$. Let c be the central value, $f(c) = 9$. Let e_i, r_i, a_i, b_i, c_i and d_i be the outer edges except last edge, last edge of outer edges, left, top, right and bottom most edges of FIM $L_3 S_1$ respectively.

$f^*(e_i) = 3i^2 + i, i=1,2,3,4,5,6,7$

$f^*(r_i) = (i-1)i^2, i = 8$

$f^*(a_i) = c^2 (c-1) + i^2 (1-i), i = 8, c = 9$

$f^*(b_i) = c^2 (c-1) + i^2 (1-i), i = 2, c = 9$

$f^*(c_i) = c^2 (c-1) + i^2 (1-i), i = 4, c = 9$

$f^*(d_i) = c^2 (c-1) + i^2 (1-i), i = 6, c = 9$

From all above, edges received distinct labels which are multiple of 2.

Here all the edges have distinct labels which are multiple of 2. Hence FIM $L_n S_m$ is a difference of cubic and squared graph.

Theorem 2

FIO $L_n S_m$ is an absolute difference of cubic and squared difference graph for $n \geq 3$ (n must be an odd, $m = (n-1)/2$).

Proof. Let the graph G be the FIO $L_n S_m$ with $7(4m-n)+2$ vertices and $7(4m-n)+5$ edges when $n = 3, 5, 7, 9, \dots$ then $m = 1, 2, 3, \dots$ respectively. The mapping $f: V(G) \rightarrow \{1, 2, 3, \dots, 7(4m-n)+2\}$ defined by two cases.

Case 1. when $n = 5, 7, 9, \dots$ then $m = 2, 3, \dots$ respectively.

Let v_i be the outer vertices and let x_i be the inner vertices. $f(v_i) = i, 1 \leq i \leq 4n+4m-8$

when $n = 5, 7, 9, \dots$ then $m = 2, 3, 4, \dots$ respectively.

$f(x_i) = 4n+4m+i-8$ this can be expressed as

n	m	i

For vertex labeling f , the induced edge labeling $f^*: E(G) \rightarrow \text{Multiple of } 2$, is given by $|f(u)^3 - f(v)^3| - |f(u)^2 - f(v)^2|$ defined as follows.

Let e_i be the outer most edges except last outer edge and r_i be the last outer edge, $f^*(e_i) = 3i^2 + i$, $1 \leq i \leq 3n+6m-8$ and $f^*(r_i) = i^3 - i^2$, $i = 3n+6m-7$, when $n = 5, 7, 9 \dots$ then $m = 3, 4, 5 \dots$ respectively.

Let a_i be the inner horizontal edges, $f^*(a_i) = x_i^2(x_i - 1) + v_j^2(1 - v_j)$, $i = 1 \dots j = 4n+3m-7$, when $n = 5, 7, 9 \dots$ then $m = 2, 3, 4 \dots$ respectively.

$f^*(a_i) = x_i^2(x_i - 1) + x_{i-1}^2(1 - x_{i-1})$ which can be expressed as

i	n	m
2, 3	5	2
2, 3, 4, 5	7	3
2, 3, 4, 6, 7	9	4
⋮	⋮	⋮
⋮	⋮	⋮

respectively

$f^*(a_i) = x_{i-1}^2(x_{i-1} - 1) + v_j^2(1 - v_j)$, $j = n+3m-2$, $i = (n+3m-1)/2$, when $n = 5, 7, 9 \dots$, then $m = 2, 3, 4 \dots$ respectively.

Let b_i be the inner vertical edges, $f^*(b_i) = x_{i+k}^2(x_{i+k} - 1) + v_j^2(1 - v_j)$ when $j = (n+3m-1)/2$, $i = 1$ and $f^*(b_i) = x_{i+k-1}^2(x_{i+k-1} - 1) + v_j^2(1 - v_j)$ when $j = 2n+4m-4$, $i = 2$, which can be expressed as

n	m	k
5	2	1
7	3	2
9	4	3
⋮	⋮	⋮
⋮	⋮	⋮

respectively.

From all above, each edge have distinct values which are multiples of 2.

Special case FIO $L_3 S_1$: Let v_i be the outer vertices, $f(v_i) = i$, $1 \leq i \leq 8$. Let c be the central value, $f(c) = 9$. Let e_i, r_1, a_1, b_1, c_1 and d_1 be the outer edges except last edge, last edge of outer edges, left, top, right and bottom most edges of FIO $L_3 S_1$ respectively.

$f^*(e_i) = 3i^2 + i$, $i=1,2,3,4,5,6,7$

$f^*(r_1) = (i-1)i^2$, $i = 8$

$f^*(a_1) = c^2(c-1) + i^2(1-i)$, $i = 8, c = 9$

$f^*(b_1) = c^2(c-1) + i^2(1-i)$, $i = 2, c = 9$

$f^*(c_1) = c^2(c-1) + i^2(1-i)$, $i = 4, c = 9$

$f^*(d_1) = c^2(c-1) + i^2(1-i)$, $i = 6, c = 9$

From all above, edges received distinct labels which are multiple of 2.

Here all the edges have distinct labels which are multiple of 2. Hence FIO $L_n S_m$ is a difference of cubic and squared graph.

Vasanthi and Ramya

Theorem 3

FIM $L_n S_m$ allows Odd Fibonacci Stolarsky – 3 Mean Labeling.

Proof. Consider G to be the FIM $L_n S_m$ graph with $3n+6(m-1)$ vertices and $3(n-1)+6m$ edges when $n = 3, 5, 7, 9, \dots$ then $m = 1, 2, 3, 4, \dots$ respectively. The mapping $f: V(G) \rightarrow \{F_2, F_4, F_5, F_7, F_8, \dots\}$ where each F_i is an odd Fibonacci number defined by two cases

Case 1. when $n = 5, 7, 9, \dots$ then $m = 2, 3, 4, \dots$ respectively.

Let v_i be the outer vertices, $f(v_i) = F_k$, $k \neq$ multiples of 3 when $i = 1, 2, 3, 4, 5, \dots, 3n+2m-3$, then $k = 2, 4, 5, 7, 8, 10, \dots, 4n+4m-3$ respectively. Let w_i be the left most inner vertices, x_i be the top most inner vertices, y_i be the left most inner vertices and z_i be the bottom most inner vertices. Vertex labeling is

$$f(w_i) = F_r, r = 4n+4m+6i-8,$$

$$f(x_i) = F_d, d = 4n+4m+6i-6,$$

$$f(y_i) = F_h, h = 4n+4m+6i-5,$$

$$f(z_i) = F_u, u = 4n+4m+6i-3$$

this can be expressed as

n	m	i
5	2	1
7	3	1, 2
9	4	1, 2, 3
11	5	1, 2, 3, 4
.	.	.
.	.	.

respectively

Let c be the central vertex defined by $f(c) = F_s$, $s = 6n+6m-10$, when $n = 5, 7, 9, \dots$ then $m = 2, 3, 4, \dots$ respectively. The resulting function $f^*: E(G) \rightarrow N$ is defined by

$$f^*(e=uv) = f^*(e=uv) = \left\lfloor \sqrt{\frac{f(u)^2+f(u)f(v)+f(v)^2}{3}} \right\rfloor \text{ or } \left\lfloor \sqrt{\frac{f(u)^2+f(u)f(v)+f(v)^2}{3}} \right\rfloor$$

. Using above definition, all the edges have distinct labels.

Special case FIM $L_3 S_1$: Vertex labeling is given by $f(v_i) = F_k$, $k \neq$ multiples of 3, when $i = 1, 2, 3, 4, 5, 6, 7, 8$ then $k = 2, 4, 5, 7, 8, 10, 11, 13$ respectively. Here c is the central vertex, $f(c) = F_s$, $s = 14$.

Here all the edges have distinct labels. By two cases, FIM $L_n S_m$ allows Odd Fibonacci Stolarsky –3 mean labeling.

Theorem 4

FIO $L_n S_m$ allows odd Fibonacci Stolarsky – 3 Mean labeling.

Proof. Consider, ‘ G ’ be the Four Intersection opposite Lagoon step graph FIO $L_n S_m$ with $7(4m-n) + 2$ vertices and $7(4m-n) + 5$ edges when $n = 3, 5, 7, 9, \dots$ then $m = 1, 2, 3, \dots$ respectively. The mapping $f: V(G) \rightarrow \{F_2, F_4, F_5, F_7, \dots\}$ where each F_i is an odd Fibonacci number defined by two cases.

Case 1. when $n = 5, 7, 9, \dots$ then $m = 2, 3, \dots$ respectively.

Let v_i be the outer vertices, $f(v_i) = F_k$, $k \neq$ multiples of 3, when $i = 1, 2, 3, \dots, 4n+4m-8$, then $k = 2, 4, 5, 7, 8, 10, 11, \dots, 6n+6m-1$ respectively. Let x_i be the inner vertices, $f(x_i) = F_r$, where $r = 6m + 6m + j - 11$ which can be express

i	n	m	j
1, 2, 3	5	2	1, 3, 4

Vasanthi and Ramya

1, 2, 3, 4, 5	7	3 1, 3, 4, 6, 7
1, 2, 3, 4, 5, 6, 7	9	4 1, 3, 4, 6, 7, 9, 10
1, 2, 3, 4, 5, 6, 7, 8, 9	11	5 1, 3, 4, 6, 7, 9, 10, 12, 13
⋮	⋮	⋮
⋮	⋮	⋮

respectively.

The resulting function $f^*: E(G) \rightarrow N$ is defined by

$$f^*(e=uv) = f^*(e=u v) = \left\lfloor \sqrt{\frac{f(u)^2 + f(u)f(v) + f(v)^2}{3}} \right\rfloor \text{ or } \left\lceil \sqrt{\frac{f(u)^2 + f(u)f(v) + f(v)^2}{3}} \right\rceil \text{ for each } uv \in E(G). \text{ Here all the edges have distinct labels.}$$

Special case FIO $L_3 S_1$: Vertex labeling is given by $f(v_i) = F_k$, $k \neq$ multiples of 3, when $i = 1, 2, 3, 4, 5, 6, 7, 8$ then $k = 2, 4, 5, 7, 8, 10, 11, 13$ respectively. Here c is the central vertex, $f(c) = F_s$, $s = 14$.

Here all the edges have distinct labels. By two cases, FIO $L_n S_m$ allows Odd Fibonacci Stolarsky -3 mean labeling.

Exploring in Absolute Difference of Cubic And Square Difference Labeling Using Python Code

Verification of Absolute Difference of Cubic and Square Difference labeling of FIO $L_5 S_2$ using python coding

Exploring in Odd Fibonacci Stolarsky – 3 Mean Labeling Using Python Code

Verification of Odd Fibonacci Stolarsky-3 mean labeling of FIM $L_3 S_1$ using python coding

CONCLUSION

There are numerous real-world applications for graph theory. Examining an absolute difference of cubic and square difference graph labeling and odd Fibonacci Stolarsky – 3 Mean Labeling are quite intriguing. Enough illustrations are used to illustrate the generated conclusions in order to improve comprehension. All functions in Lagoon step graphs and an absolute difference of cubic and square difference graph labeling and odd Fibonacci Stolarsky – 3 Mean Labeling have Python code created for them. The FIM $L_n S_m$ and the FIO $L_n S_m$ are two graphs labeling that can be investigated under several graph labeling.

ABSTRACT

Building Information Modelling (BIM) represents a groundbreaking advancement in the design, construction, and management of buildings and infrastructure. As a digital representation of physical and functional characteristics, BIM has revolutionized traditional construction practices by enhancing efficiency, collaboration, and cost-effectiveness across all project phases. This paper examines the multifaceted applications of BIM within the construction sector, focusing on its role in mitigating quality management issues inherent in traditional methods. The research highlights BIM's transformative impact on project planning, resource allocation, regulatory compliance, and sustainability, while also identifying key challenges in its adoption. Through this exploration, the study underscores the need for widespread integration of BIM to foster smarter, more sustainable, and resilient built environments.

Keywords: Building Information Modelling, Construction Industry, Collaboration, Efficiency, Cost-effectiveness, Project Management.

INTRODUCTION

The construction industry is frequently confronted with challenges such as intricate project designs, stringent budgets, and the necessity for smooth collaboration among diverse stakeholders. Building Information Modelling (BIM) emerges as a groundbreaking solution, offering a dynamic digital representation of the entire construction lifecycle. By streamlining processes, reducing errors, and fostering collaboration at every stage, BIM heralds a transformative shift in construction practices. Its integration into the industry signifies a move towards smarter, more sustainable, and economically efficient built environments, making BIM an indispensable component of modern construction methodologies.

Paresh Mistry *et al.*,

Quality Management Problems In Old Construction

Traditional construction projects often encounter a range of quality management challenges that can significantly affect their success. Below are some common issues faced in conventional construction practices

Communication Gaps Ineffective communication among stakeholders, such as architects, contractors, and subcontractors, often leads to misunderstandings, errors, and unclear project requirements. These lapses can result in deviations from design specifications and quality standards.

Frequent Design Changes Modifications to design specifications during the construction process can create confusion and adversely impact quality. Poor communication of these changes often leads to inconsistencies between the original plans and the final execution.

Inadequate Planning Insufficient planning and coordination can result in poor resource allocation, causing delays, errors, and quality issues. A lack of foresight often leads to shortages of skilled labor, materials, or necessary equipment.

Substandard Workmanship Variability in workmanship, often due to unskilled labor or inadequate training, can compromise construction quality. This issue is compounded by insufficient supervision and inadequate quality control measures.

Material Quality Concerns The use of substandard or non-compliant materials can jeopardize the structural integrity and durability of the project. Material inconsistencies may lead to safety issues and long-term performance problems.

Weak Quality Control Mechanisms A lack of effective quality control procedures, inspections, and testing often allows defects to go unnoticed until later stages. Inadequate emphasis on quality assurance can result in the acceptance of subpar work.

Documentation Deficiencies Incomplete or inaccurate records of construction activities, inspections, and test results hinder accountability and traceability. Proper documentation is vital for demonstrating compliance with specifications and regulations.

Non-Compliance with Regulations Failure to meet evolving building codes, regulations, and industry standards can lead to legal complications and compromise both quality and safety. Adhering to these regulations remains a significant challenge for traditional projects.

Cost and Time Pressures Tight deadlines and budget constraints often push teams to prioritize speed over quality. This focus on cost and time management can lead to the adoption of shortcuts that adversely affect construction standards.

Limited Adoption of Technology Resistance to modern construction technologies and software tools hinders accuracy and efficiency. A lack of real-time data and collaboration tools exacerbates delays, communication gaps, and overall project inefficiencies.

Need of Bim in Construction Industry

Building Information Modelling (BIM) has become an indispensable technology in the construction industry, offering a multitude of benefits across the entire lifecycle of construction projects. Below are the key reasons why BIM is essential

**Paresh Mistry et al.,**

Enhanced Collaboration BIM fosters seamless collaboration among stakeholders—including architects, engineers, contractors, and owners—by providing a centralized platform for data sharing and communication. This real-time collaboration reduces errors, misunderstandings, and project delays.

Visualization and Simulation Through 3D modelling and advanced visualization, BIM allows stakeholders to better comprehend project designs and construction processes. Simulation tools enable testing and analysis of various scenarios, helping to pre-emptively identify and address potential issues.

Improved Data Accuracy and Consistency By centralizing project information, BIM ensures that all team members have access to the most up-to-date and accurate data. This consistency prevents conflicts, improves decision-making, and streamlines processes.

Cost and Time Efficiency BIM significantly enhances project planning, scheduling, and resource management. It enables early detection of design conflicts, thereby reducing costly rework during the construction phase and ensuring timely project delivery.

Facility Management Support The benefits of BIM extend beyond construction, providing a comprehensive digital model of the facility for effective maintenance and management throughout its lifecycle. Facility managers can rely on BIM for informed decision-making and asset tracking.

Clash Detection and Risk Mitigation BIM's ability to identify clashes between building components early in the design stage minimizes construction errors and reduces rework, saving both time and resources.

Regulatory Compliance BIM simplifies compliance with building codes and regulations by offering detailed digital models. It ensures projects meet statutory requirements, thus reducing the risk of legal complications.

Sustainability and Energy Optimization By enabling energy performance analyses and environmental impact assessments during the design phase, BIM promotes the adoption of sustainable and energy-efficient construction practices.

Asset Information Modelling Beyond design and construction, BIM offers detailed information on individual building components, simplifying asset management and maintenance in the operational phase.

Streamlined Communication and Documentation Serving as a centralized repository for project documentation, BIM ensures easy accessibility and sharing of relevant information. This reduces misunderstandings, enhances communication, and resolves disputes efficiently.

MATERIALS FOR BIM

To effectively implement Building Information Modelling (BIM), several materials and resources are needed to support its processes. Here's a breakdown

Software and Tools

- **BIM Software** Popular platforms like Autodesk Revit, ArchiCAD, Bentley Systems, and Vector works.
- **Collaboration Tools** Cloud-based platforms for real-time data sharing, such as Autodesk BIM 360 or Trimble Connect.
- **Clash Detection Tools** Navisworks or Solibri for identifying design conflicts.

Paresh Mistry *et al.*,

Hardware

- **High-Performance Computers** Systems equipped with powerful CPUs, GPUs, and ample RAM to handle complex 3D models.
- **Peripherals** Large monitors, 3D mice, and VR/AR devices for improved visualization and navigation.

Data Inputs

- **Building Component Libraries** Predefined digital objects (e.g., doors, windows, HVAC systems) for design models.
- **GIS and Survey Data** Geographic and topographic information for accurate site modeling.
- **Material Specifications** Properties like strength, durability, and sustainability for accurate simulations.

Standards and Guidelines

- **International BIM Standards** e.g., ISO 19650 for managing information in construction projects.
- **Project Execution Plans (BIM PxP)** Detailed documents outlining the BIM processes and roles.

Training and Knowledge Resources

- **Training Programs** Courses or certifications for architects, engineers, and contractors in BIM software and workflows.
- **Documentation and Manuals** BIM protocol guidelines and user manuals for consistent practices.

Storage Solutions

- **Cloud Storage** Secure and scalable platforms for storing BIM data, like Google Cloud, Microsoft Azure, or AWS.
- **Backup Systems** Redundant storage for safeguarding valuable project data.

Legal and Contractual Frameworks

- **BIM Contracts** Clear legal agreements specifying data ownership, responsibilities, and workflows in BIM projects.
- **Compliance Resources** Documentation to ensure alignment with regulatory requirements.

METHODOLOGY FOR BIM IMPLEMENTATION

Define Objectives and Scope

- Clearly outline project goals, objectives, and the scope of BIM implementation.
- Identify specific deliverables, such as 3D models, clash detection reports, and cost estimations.

Develop a BIM Execution Plan (BIM PxP)

- Prepare a detailed plan specifying roles, responsibilities, data-sharing protocols, workflows, and collaboration guidelines.
- Include timelines, key milestones, and standards to be followed, such as ISO 19650 or local BIM guidelines.

Select Tools and Technology

- Choose suitable BIM software (e.g., Autodesk Revit, ArchiCAD) and supporting tools for clash detection, scheduling, and collaboration.
- Establish cloud-based platforms for data storage and real-time updates.

Data Collection and Preparation

- Collect accurate site data, such as GIS and survey information, to set the foundation for the BIM model.
- Utilize building component libraries to integrate relevant materials and structural elements into the design.

Paresh Mistry et al.,

Model Development

- Create 3D models of the project that digitally represent physical and functional characteristics.
- Iterate designs based on stakeholder feedback, incorporating architectural, structural, and MEP (Mechanical, Electrical, Plumbing) disciplines.

Clash Detection and Resolution

- Use BIM tools like Navis works to identify and resolve design clashes between various building components during the pre-construction phase.
- Optimize the model to minimize errors and avoid costly on-site rework.

Collaboration and Communication

- Foster seamless collaboration among stakeholders using a centralized BIM platform.
- Schedule regular review meetings and updates to address challenges and ensure alignment.

Construction Simulation and Planning

- Leverage 4D BIM for construction sequencing and scheduling to visualize project timelines.
- Integrate cost analysis (5D BIM) to monitor budget compliance and allocate resources efficiently.

Implementation and Monitoring

- Utilize BIM to guide construction activities, including progress tracking, quality control, and adherence to design specifications.
- Employ real-time data updates and monitoring tools to maintain consistency.

Post-Construction and Facility Management

- Transition the BIM model into a digital asset for facility management and maintenance.
- Integrate the model with tools for energy performance monitoring and long-term asset management.

Review and Feedback

- Conduct a comprehensive review of the BIM implementation process, identifying successes and areas for improvement.
- Document lessons learned for future projects.

CONCLUSION

BIM acts as a digital backbone for sustainable building practices. By enhancing visualization, collaboration, and data-driven decision-making, it contributes significantly to the planning and realization of environmentally responsible and resource-efficient buildings. The combination of literature reveals that BIM significantly contributes to improved project efficiency, and cost-effectiveness in the construction industry. While challenges such as initial investment and skill gaps exist, the overall benefits underscore the importance of BIM adoption. As technology continues to advance, further research is encouraged to explore emerging trends and refine best practices for seamless BIM integration.

ABSTRACT

Evidence on binding conformation, pattern, and affinity can be obtained through *in-silico* molecular docking studies of chemical drug molecules or bioactive peptides that function by binding to particular receptors. The rabies virus glycoprotein (RVG) is most important for pathogenesis, having role in binding to the potential receptors, entry into the neurons, and fusion with the endosomal membrane. In this study, we performed molecular docking analysis of constituents of *Solanum nigrum* with the glycoprotein of rabies virus. It was observed that constituents of herb *solanum nigrum* like Solasonine, Solamargine, Rutin, showed high binding affinity towards RVG. Exploring our traditional medicine system to treat various deadly viral and bacterial diseases is very much essential. This analysis may help to create a new ethno-drug formulation for preventing or curing the Rabies.

Keywords: Molecular Docking, *Solanum nigrum*, Rabies, Dog bite, Siddha medicine, Computational study.

Divya Jayachandran et al.,

INTRODUCTION

Rabies is a zoonotic viral disease that mainly affects the central nervous system. Even though 99 percent of rabies infections occur through dogs, other wild animals can also cause it. It mainly affects the age group between 5 and 14 years via infected saliva. In India it leads to approximately 18000-20000 deaths every year [1]. Rabies can be of two types; one is furious type with aggravated behaviour and hallucinations and the other is paralytic which leads to coma and death. Siddha system of medicine is an ancient medical system which has many distinguished regimen methods. In this system of medicine there are also many remedies for poisonous bites and toxicity. In this system a separate department named Nanju Maruthuvam deals with toxic bites. Many literatures are available in this system that describes medications indicated for rabies. The use of *Solanum nigrum* leaf juice for rabies is mentioned in literature Pulippani Vaidyam 500 with an indication against rabid dog and fox bite [2]. *Solanum nigrum* is a herbaceous plant belonging to the family Solanaceae which is widely used in traditional medical practice and even in treatment of cancerous conditions [3]. The molecular docking approach can be used to model the interaction between a small molecule and a protein at the atomic level. This method helps to characterize the behavior of small molecules in the binding site of target proteins as well as to elucidate fundamental biochemical processes [4]. To cut down research timeline and cost of wet-lab experiment one can use this computer software model [5]. It also helps to understand drug interaction with the receptors in a highly specific and complementary manner. Vaccine is considered as the common management of rabies but the side-effects can range from mild to severe. Nerve tissue vaccines and vaccines derived from cell cultures are the two primary categories of vaccines currently in use. The use of brain tissue from goats or sheep infected with the rabies virus as a nerve tissue vaccine has resulted in serious undesirable effects and are presently being phased out in developing nations. Vaccines produced from cell cultures include the purified duck embryo vaccine, PCECV, PVRV, and the human diploid cell vaccine (HDCV). Because PCECV and PVRV are less expensive and just as safe and effective as HDCV, they are more widely available in developing nations. [6-7] In pediatric cases with history of allergic reaction these vaccines may cause breathlessness, abdominal cramps, lips and eyes swelling and later transient hypotension. [7] Also vaccine can have risk of failure as the individuals may not develop enough immunity and an updated quality validation in available vaccinations resulting in rabies deaths. [8] The need of exploration in alternative medicine is essential since it is a fatal condition leading to death. Even though many medicines are mentioned in Siddha literature for rabies not much study is done to find its effectiveness. This is a primary study to know the efficacy of Siddha herb *Solanum nigrum* for the management of rabid bites.

MATERIALS AND METHODS

To perform virtual screening using AutoDock Vina, the Rabies virus glycoprotein [6] pre-fusion trimer (PDB ID: 7U9C) was selected as the receptor protein which was obtained from RCSB Protein Data Base. The ligands of interest, that is the phytochemicals from the plant *Solanum nigrum* was obtained from literature review of various scientific research papers [7]. The receptor structure was prepared by removing any water molecules, ligands, and co-factors not relevant to the docking study. The ligands of interest, including Solasonine, Solamargine, Rutin, Yesaninoside G, Hibiscetin 3-glucoside, Viscidulin III tetraacetate, Cannabiscitrin, Tectoroside, 2beta,3beta,5beta,14,20,22R,25-Heptahydroxycholest-7-en-6-one, Cimicifugic acid A, Darendoside A, Ellagic Acid, Quercetin, Kaempferol, Beta-Sitosterol, gamma-Sitosterol monohydrate, beta-Tocopherol, Vitamin E, Phthalic acid, 3-Phenylpropionic acid, gamma-Tocopherol; 5,10-Diethoxy-2,3,7,8-tetrahydro-1H,6H-dipyrrolo[1,2-a:1',2'-d]pyrazine, 4-Hydroxycinnamic acid, Caffeic Acid, 3,4-Dihydroxybenzoic acid, 4,8,12,16-Tetramethylheptadecan-4-olide, 1,4-Benzodioxin, Catechol, Inositol, 3,5-Diethoxyphenol, Rengyoxide, Pimelic acid, Dioctyl ether, Pyrrolidine, 1-[2-(1,3-cyclopentadien-1-yl)ethyl]-, 2-(1-Cyclohexenyl)ethylamine, cis,cis,cis-7,10,13-Hexadecatrienal, Suberic acid, Squalene, 3,7,11,15-Tetramethyl-2-hexadecene, 3-Cyclopentylpropionic acid, 2-dimethylaminoethyl ester, Neophytadiene, xi-3,5-Dimethyl-2(5H)-furanone, 3,7,11,15-Tetramethylhexadec-2-EN-1-YL acetate, Palmitic Acid, Methyl (Z)-5,11,14,17-eicosatetraenoate, 2-Hexadecen-1-ol, cis-9-Octadecenal, Stearic Acid, (9Z,12Z)-Ethyl octadeca-9,12-dienoate, 1-Decene, 3,3,4-trimethyl-, Octanoic acid, 2-dimethylaminoethyl ester, Octyl acrylate, Oxetane, 3-(1-methylethyl)-, and

Divya Jayachandran et al.,

1-Tetracosanol, were obtained and prepared in the required format. For the virtual screening, a grid box was created with the following dimensions: size_x = 106, size_y = 101, and size_z = 126. The center of the grid box was set at coordinates (140.807, 140.809, 123.761), ensuring proper coverage of the binding site. An exhaustiveness value of 24 was chosen to allow for an extensive search and generate multiple binding modes during the docking process. To explore potential binding sites, blind docking was performed by covering the entire grid box. The AutoDock Vina software was used to carry out the virtual screening. The docking results were then analyzed, focusing on the binding energies of the docked ligands and analysed for molecular interactions [9,10].

RESULTS

The results of the virtual screening using AutoDock Vina revealed the docking scores of various ligands against the Rabies virus glycoprotein pre-fusion trimer (PDB ID: 7U9C). The docking scores are indicative of the binding affinity between the ligands and the receptor protein, with lower scores indicating stronger binding. Among the tested ligands, Solasonine exhibited the highest docking score of -11.3, closely followed by Solamargine with a score of -11.2. These compounds demonstrated the strongest predicted binding to the target protein. Rutin, another ligand of interest, exhibited a docking score of -10.1, indicating favorable binding affinity. Other ligands that demonstrated notable docking scores include Yesanchinoside G (-9.8), Hibiscetin 3-glucoside (-9.3), and Viscidulin III tetraacetate (-8.9). These compounds exhibited reasonably strong predicted binding to the receptor protein. Several other ligands displayed moderate to weak binding affinities based on their docking scores. These include Cannabiscitrin, Tectoruside, 2beta, 3beta, 5beta, 14, 20, 22R, 25-Heptahydroxycholest-7-en-6-one, Cimicifugic acid A, Darendoside A, and Ellagic Acid, among others.

DISCUSSION

Solanum nigrum is a species of flowering plant in the Solanaceae family, commonly referred to as black nightshade or just nightshade. Prior research in vitro demonstrated its antiviral efficacy against Hepatitis C virus[11], while in vivo investigations demonstrated its capacity to promote wound healing.¹² The purpose of this study on *Solanum nigrum* using computational molecular modelling is to determine its potential utility in the quest for rabies treatments. Solasonine, a natural compound, exhibits a variety of interactions with other molecules based on the provided data. It forms conventional hydrogen bonds with several residues, such as ASP285, GLU288, HIS303, and ASN259, through its hydrogen atoms(Fig 1). Solasonine also engages in carbon hydrogen bonding with residues SER289, ARG300, and HIS303, forming stable interactions. Additionally, it participates in electrostatic interactions with ASP285, contributing to a pi-anion interaction. Furthermore, Solasonine displays hydrophobic interactions, primarily as pi-alkyl interactions, with amino acid residues such as HIS303, ALA286, and LEU257. Solamargine exhibits various interactions within its molecular environment(Fig 2). It forms conventional hydrogen bonds with several residues, including ASP262, HIS21, GLU288, GLN383, and ASP285, as well as with other Solamargine molecules. Additionally, it engages in carbon hydrogen bonds with ASP285, GLU288, and HIS303. Solamargine also participates in hydrophobic interactions with PRO253, LEU257, MET236, and LEU260. Furthermore, it forms a pi-alkyl interaction with PHE263 and pi-sigma interactions with its own atoms. Rutin, a flavonoid compound, exhibits several interactions with other molecules based on the provided data(Fig 3). It forms conventional hydrogen bonds with B:THR292:HG1, B:ARG299:HH12, :Rutin900:H20, and :Rutin900:H30. These interactions involve hydrogen donors from Rutin and hydrogen acceptors from the respective molecules. Rutin also participates in carbon hydrogen bonds with A:SER289:HB1, B:SER289:HA, and B:THR292:HB, where Rutin acts as the hydrogen donor and the mentioned molecules serve as hydrogen acceptors. Furthermore, Rutin engages in a carbon hydrogen bond with :Rutin900:C10 and forms hydrophobic interactions with B:PHE263, :Rutin900:C12, and :Rutin900:C12. Hibiscetin_3_glucoside exhibits various interactions with different residues in the protein structure(Fig 4). It forms conventional hydrogen bonds with residues ASP285, GLU288, and GLN383, acting as the hydrogen bond donors, and their respective oxygen atoms (OD1, OE1, and O) act as the acceptors. Additionally, it forms carbon hydrogen bonds with residues ASP285, HIS303, and ARG300, where the hydrogen atoms of these residues serve as donors and specific oxygen

Divya Jayachandran et al.,

atoms of Hibiscetin_3_glucoside act as acceptors. The interaction between A:ASP285:OD2 and Hibiscetin_3_glucoside involves electrostatic attraction, with the negative charge on ASP285:OD2 interacting with the pi-orbitals of Hibiscetin_3_glucoside. Moreover, Hibiscetin_3_glucoside engages in hydrophobic interactions with residue ALA286, where their respective alkyl groups interact through pi-alkyl interactions. Yesanchinoside_G forms various interactions with its binding partners (Fig 5). It engages in conventional hydrogen bonds with residues such as H67 and H76, forming hydrogen bonds with O21 and O4, respectively. It also participates in conventional hydrogen bonding with H70, which interacts with the O atom of ASN259. Furthermore, Yesanchinoside_G forms a conventional hydrogen bond with H80, involving the O atom of GLY221. Carbon hydrogen bonds are also observed, with H70 acting as a donor and GLN383:O and ASP285:OD2 acting as acceptors. Additionally, hydrophobic interactions are present between Yesanchinoside_G and other molecules, such as the alkyl interactions between C13 and LEU257, C40 and VAL258:O, and C41 and ILE17.

CONCLUSION

In conclusion, based on the docking scores obtained from AutoDock Vina, Solasonine, Solamargine, Rutin, Hibiscetin_3_glucoside and Yesanchinoside_G demonstrated the strongest predicted binding to the Rabies virus glycoprotein pre-fusion trimer. These findings provide valuable insights for further investigation of these ligands as potential inhibitors or modulators of the target protein in the context of Rabies virus infection.

ABSTRACT

Hydrogels have gained recognition as promising platforms for controlled drug release in ophthalmology due to their unique properties, including high water content, biocompatibility and structural similarity to the natural extracellular matrix. These hydrophilic, three-dimensional polymer networks can encapsulate drugs, offering sustained and controlled release and can be tailored for specific therapeutic needs across different ocular regions, such as the cornea, retina and vitreous body. Their responsiveness to physiological stimuli, such as pH or temperature, further enhances their potential for on-demand drug release. Unlike conventional eye drops or ointments, which suffer from poor retention and rapid clearance, hydrogels can adhere to the ocular surface or be injected, providing prolonged drug release and reducing the frequency of administration. This makes them particularly advantageous for chronic eye conditions like glaucoma or age-related macular degeneration, where they can deliver drugs over extended periods, potentially transforming the treatment of ocular diseases by improving efficacy, patient compliance and therapeutic outcomes. This review examines critical aspects of hydrogels, including their permeability, biocompatibility, bioadhesive properties and roles as controlled release systems. These characteristics enable hydrogels to encapsulate medications, adhere to ocular tissues and provide controlled release leading to targeted and prolonged drug administration to the eye. In

Tejaswini Vasant Daund *et al.*,

ophthalmology, hydrogels serve multiple functions such as improving vision correction, developing advanced intraocular lenses, treating various eye conditions and acting as adhesives for wound healing. Their significance in ocular therapeutics is highlighted by their benefits compared to traditional drug release systems including enhanced absorption, minimized adverse effects and improved patient compliance. However, challenges such as regulatory issues, stability, shelf life and clinical translation must be considered in advance of hydrogel formulations can be commonly used for ocular drug delivery. Emerging technologies, including combination therapies, smart polymers, and nanoparticle integration, are advancing hydrogel design and show promise in overcoming these challenges. With continued research and development, hydrogels have the capacity to transform drug delivery to the eyes, greatly advancing patient care and treatment outcomes for ocular diseases.

Keywords: Permeability, Biocompatibility, Bioadhesive properties, Swelling behavior, Controlled drug release, Targeted drug administration.

INTRODUCTION

Ophthalmic Drug Delivery

One of the most important organs in the body is the eye which is segmented anatomically. The anterior part of the eye includes the anterior and posterior chambers and comprises several structures: the crystalline lens, conjunctiva, iris, ciliary body and aqueous humor. In contrast, the posterior segment of the eye encompasses the choroid, retinal pigment epithelium, and sclera. Conditions affecting the anterior segment include acute uveitis, cataracts, allergic conjunctivitis and glaucoma. Conversely, disorders of the posterior segment encompasses diabetic retinopathy and macular degeneration(1). The anatomy of the human eye is shown in Fig.1(2). Topical application is predominantly utilized for the management of conditions affecting the front part of the eye. Around 90% of ocular medicines are administered via traditional techniques, for example eye drops, which offer ease of application(3,4). Topical eye drops, while commonly used, have limited ocular bioavailability due to several biological and physiological barriers, including tear turnover, nasolacrimal drainage, and reflex blinking. These factors restrict deeper ocular penetration, resulting in only approximately 5% of medication reaching to the ocular tissues. Consequently, topical medications are often inadequate for effectively targeting conditions within the posterior segment of the eye. To bypass these limitations, alternative drug delivery techniques have been developed, such as systemic administration, periocular injections, and intravitreal injections. Among these methods, intravitreal injections are the most often utilized for treating posterior segment diseases. However, repeated intravitreal injections carry risks of complications, including intraocular infection, hematoma, detached retina, and reduced patient acceptance(5–7). Scleral drug administration to ophthalmic tissues is less invasive compared to methods targeting the posterior ocular segment. However, ocular hindrances to transscleral drug distribution consist of both stationary and dynamic obstacles. Static barriers consist of the choroid, retinal pigment epithelium (RPE), and sclera; while dynamic obstacles involve lymphatic drainage and blood flow within the conjunctiva and episcleral tissues (8,9).

Importance of efficient drug administration to the eye(10).

- Effective drug administration is essential to enhance drug contact time, ocular bioavailability, and penetration.
- Conventional eye preparations can help reduce side effects.
- Improving efficacy by increasing drug solubility is crucial.
- Sustained release in ocular tissues is necessary for prolonged therapeutic effects.
- Enhancing the chemical stability of the drug through ocular drug delivery is important.
- Traditional methods help minimize eye irritation and improve the efficacy of active pharmaceutical ingredients (APIs).
- Demonstrating superior compatibility with other concomitant drugs is vital.

Tejaswini Vasant Daund et al.,

- Providing localized controlled release is essential for targeted therapeutic outcomes.

Role of hydrogel in ophthalmic drug delivery

Incorporating nanocarriers into dynamic, stimuli-sensitive drug delivery platforms, such as hydrogels, can significantly prolong the therapeutic duration by reducing dosing frequency (11). Hydrogels are also utilized in various ophthalmic drug delivery applications, including silicone hydrogel lenses, flexible intraocular lenses, in situ gel systems and ocular adhesives for lesion healing. Current research is investigating their potential as vitreous substitutes and intravitreal drug administration systems to enhance bioavailability (12). Additionally, hydrogels are crucial for ensuring safety, as they exhibit less cell toxicity toward Cell line originated from fibroblast (L-929) and Human Corneal Endothelial Cell (HCEC) also have minimal impact on cell migration after 24 hours of incubation. Furthermore, hydrogels have demonstrated non-irritating properties in ocular tissue as evidenced by the draize eye test, fluorescein dye test and histopathological examination in rabbit eyes (13).

Properties of hydrogel for ophthalmic drug delivery

Definition and features of hydrogel.

Definition Hydrogels are three dimensional framework formed by artificial or biopolymers that exhibit a substantial capacity for water absorption and retention. The hydrogel network is established through lipophobic groups or areas within the polymeric networks, which interact with water during moisture uptake in an aqueous medium (14).

Characteristics (15)

- **Permeability and Water Holding Capacity** Key properties of a hydrogel include its permeability, which refers to the ability to allow substances to pass through it and its water holding capacity, which denotes its ability to retain water.
- **Primary Bound Water** This type of water forms when polar hydrophilic groups in the hydrogel first come into contact with water, leading to hydration and expansion of the network.
- **Secondary-Bound Water** Secondary-bound water is created when lipophilic groups react with aqueous molecules after the initial network expansion. It is also referred to as water that is hydrophobically bound.
- **Total Bound Water** This term represents the fusion of primary and secondary hydrated water within the hydrogel.
- **Swelling Behavior** The hydrogel's chains are driven towards infinite dilution by osmotic pressures, which enhances the network's water absorption capacity. An elastic network rebound force, resulting from covalent and non-covalent linkage, counteracts this swelling.
- **Equilibrium Swelling** Equilibrium swelling occurs when the forces of elastic retraction and osmotic pressure reach a balance, stabilizing the hydrogel's swelling state.
- **Free Water/Bulk Water** This refers to the additional water absorbed by the hydrogel that fills gaps, larger pores and spaces between network chains.
- **Degradation and Dissolution** Degradation occurs when the cross-links and network chains of the hydrogel break down if the material is degradable. The rate and manner of degradation depend on the hydrogel's composition and type.
- **Applications of Biodegradable Hydrogels** Due to their labile linkages, biodegradable hydrogels are advantageous for applications like as wound healing, tissue scaffold engineering and drug administration. These linkages are exhibit in the hydrogel's cross-links or polymer backbone.
- **Mechanism of Degradation** Under physiological conditions, labile bonds within the hydrogel can be broken chemically or enzymatically, most commonly through hydrolysis.

Biocompatibility and Bioadhesive properties

Xiong, Yingshuo *et al.* stated (16) that Biocompatibility is a crucial characteristic of hydrogels, reflecting their interaction with the immune system and the nature of their breakdown products. The term "biocompatibility" denotes how well the hydrogel integrates with biological systems without causing adverse reactions and whether its metabolised products are safe and can be effectively removed or converted into harmless substances by renal filtration. Hydrogels are generally regarded as compatible because of their hydrophilic nature, which exhibit lower

**Tejaswini Vasant Daund et al.,**

interfacial energy, reducing the tendency for protein and cell adhesion in contact with body fluids. Additionally, their soft, rubbery texture helps minimize tissue irritation(17). The structural properties, including elasticity and adhesiveness, are attributed to the linkage between polymer network chains, contributing to their viscoelasticity and occasionally purely flexible behavior. Hydrogels' contents high water amount imparts a degree of flexibility that resembles natural cell or tissue. Furthermore, the hydrogel's chemical properties can be tailored by altering its polarity, exterior characteristics, physical properties, and swelling response(18).

Tomic SL et al. proposed that drug absorption can be enhanced in a site-specific manner through localized delivery systems utilizing bioadhesive-controlled mechanisms. Understanding the adhesion between gel carriers and mucosal surfaces is crucial in both bioadhesion and mucoadhesion(19). Effective adhesion is significantly influenced by adhesion-promoting molecules, such as polymer-tethered structures, where (polyethylene glycol) PEG chains grafted to crosslinked networks or free-diffusing linear chains play an important role at the gel-gel interface. The uses of these techniques has been explored in advanced vaginal, buccal, and transmucosal drug delivery systems. Notably, Peppas NA et al. developed hydrophobically modified poly (acrylic acid) (PAA) hydrogels with markedly improved bioadhesion, thereby advancing the understanding of mucoadhesion(20).

Swelling behaviour and control drug release capabilities**Swelling behaviour**

Boya Liu et al. declared that hydrogels inherently exhibit swelling behaviour as solvents infiltrate the spaces between polymeric chains, resulting in volume growth. Factors including temperature, ionic strength and pH levels in the environment can significantly influence this behaviour. Nanogels, due to their interfacial area and high fluid exchange potential, swell more rapidly compared to conventional hydrogels (micro- and macro-sized). Additionally, a marked increase in nanogel volume in acidic environments is often attributed to the pH-dependent release of encapsulated drug cargo. This effect, known as the "proton sponge" effect, facilitates accelerated endosome disruption and enhances the accumulation of drug molecules in the cytosol(21).

Controlled drug release by various methods**a) Control release due to network breakdown**

Approach to managing drug moiety initially confined within a hydrogel is to control the breakdown of the polymer network. As the polymer network degrades and the mesh size expands, medication can be released from the hydrogel. Degradation typically occurs through hydrolysis or enzymatic activity and can affect either the interlinks or the polymer framework(22–27). Bulk erosion is a prevalent mechanism for hydrogels composed of polysaccharides that have been oxidized, such as sodium periodate-oxidized chitosan and alginate. The rate of decaying can be enhanced by the degree of oxidation. Hydrophilic PEG is commonly copolymerized with hydrophobic polyesters like poly(lactide) and poly(caprolactone), which undergo hydrolysis and contribute to bulk erosion in hydrogels. To achieve controlled degradation for prolonged drug release, these copolymers are typically employed at high polymer concentrations (20–30%). For example, extended release has been successfully demonstrated using a triblock copolymer of poly(caprolactone)-PEG-poly(caprolactone) (28–30). Control release through network degradation is shown in Fig.2(31).

b) Control release through swelling

Controlled swelling of hydrogels is another method for drug release, where the hydrogel expands and increases in mesh size. The extent of swelling is governed by osmotic pressure, which drives water absorption and by forces that resist network deformation. Various external factors, including temperature, glucose concentrations, pH, ionic strength, light exposure and electric fields, can impact on swelling behaviour as shown in Fig.3. These parameters have been extensively applied in drug delivery systems (32–39). A limitation of swelling-controlled method is the relatively slower response time of large-scale hydrogels because of the gradual water diffusion. For hydrogels with size on the scale of one millimeter, adjustments to drug release and swelling can take several minutes. To accelerate this response, two approaches can be considered: Minimizing the hydrogel dimensions or introducing macropores within the hydrogel to shorten the diffusion path. Alternatively, researchers have investigated the use of surface

Tejaswini Vasant Daund et al.,

layers that rapidly expand to regulate drug release, providing a solution to modifying the bulk structure of the hydrogel(40).Control release through swelling is shown in Fig.3(41).

Control release through mechanical deformation

A final method for releasing drug molecules trapped in hydrogels involves mechanically deforming the network. This deformation induces convective flow within the hydrogel and increases the mesh aperture by altering the network framework. This method enables precise regulation of the magnitude of instantaneous release rates, allowing the development of pulsatile release patterns. Such pulsatile release can mimic natural physiological processes, such as insulin release following by a meal. Mechanisms for network deformation include mechanical stress, as well as the application of magnetic and ultrasonic fields as shown in Fig.4. Studies have shown that direct mechanical deformation can enhance the release of growth factors, thereby promoting tissue vascularization. However, a potential drawback of these methods is cumulative damage to the hydrogel, which can lead to mechanical failure. Self-healing hydrogels present a promising solution to this issue. For instance, reversibly cross-linked alginate hydrogels can repair themselves under physiological conditions when disrupted by ultrasound, due to the presence of divalent cations. This self-healing capability enables repeated, controlled release of proteins, small molecules, and condensed oligonucleotides (42–44).Control release through mechanical deformation is shown in Fig.4(45).

Tunability of hydrogel properties for drug delivery

Tunability through the incorporation of Glycosaminoglycans (GAGs) in collagen hydrogels

Sodhi H et al. (2020) reported that hydrogels are fundamental in drug delivery because of their unique and effective attributes. Blends of glycosaminoglycan (GAG) and collagen, including collagen hyaluronic acid (HA) and collagen chondroitin sulfate (CS) hydrogels, offer significant versatility in drug delivery system design. These hydrogels provide an optimal balance between bioactivity and tunability, which is crucial for achieving targeted drug release. Crosslinking techniques, such as those involving carbodiimide, are utilized to improve stability and regulate drug release under physiological conditions. Hydrogels, particularly those incorporating collagen and alginate, exhibit notable biocompatibility and tunability, making them suitable for drug delivery applications. Alginate's mild gelation conditions enhance its suitability, although its potential dissolution under physiological conditions requires careful consideration. Future research is expected to focus on integrating bioactive factors and targeting peptides to further enhance the functionality of hydrogels in medication delivery systems (46).

Functional hydrogels with adjustable structures and properties for tissue engineering

Xiaomeng Li et al. (2018) expressed that hydrogels are crucial for advancements in tissue engineering by influencing cell functions through their structural and physicochemical properties. The diverse structural configurations of hydrogels enable the creation of customized microenvironments, such as micro-channel structures for flow stimuli and spatially layered constructs for co-culture settings. Despite significant advancements, there remains a need for hydrogels with improved biochemical and biophysical properties to more accurately replicate in vivo cellular environments. Future developments are anticipated to focus on dynamically responsive stimuli, spatiotemporally controlled architectures and biomimetic structures to achieve enhanced functionality in tissue engineering applications. In drug delivery, the ability to finely tune hydrogel properties is critical for precise customization to address specific therapeutic requirements (47).

Customizable Biomimetic Hydrogel Utilizing Silk Fibroin and Nanocellulose

Dorishetty et al. (2020) explores the development of a functional biomimetic hydrogel using silk fibroin and nanocellulose involves combining the unique properties of both materials to achieve targeted mechanical and biofunctional attributes. Silk fibroin imparts biocompatibility, while nanocellulose provides enhanced mechanical strength. By adjusting the ratio of these components and optimizing processing parameters, the properties of the hydrogel can be precisely adjusted to suit various biomedical applications, such as drug delivery and tissue engineering(48).

Tejaswini Vasant Daund *et al.*,

Type of hydrogels use in ophthalmic drug administration(49,50).

Classification Hydrogels are classified based on several factors, such as the type of polymers use, their source, crosslinking methods, response to stimuli and ionic charge. The polymers used in hydrogels can be synthetic, natural, or a mixture of both as shown in Table 1.

Drug loading and release mechanism in hydrogel

Method of Drug incorporation into Hydrogel

Lidocaine HCl, DiclofenacNa and ibuprofen were incorporated into hydrogel by using two distinct methods provided by M.N.; Qureshi, Ranjha *et al.*(2014) (51).

Post processing

Six samples of unmedicated dry hydrogel films were submerged in drug solutions at various saturations (25%, 50%, 75%, and 100%) for 24 hours at 32°C. The solvents for preparing Lidocaine HCL and Diclofenac Na solutions were deionized water, whereas the ibuprofen solution was an ethanol-water mixture of equivalent concentration. Preliminary studies indicated that optimal drug loading occurred at 32°C over 24 hours. Under these conditions, the maximum drug concentrations used were 9.12% w/v for Lidocaine hydrochloride, 1.97% w/v for Diclofenac sodium, and 8.00% w/v for ibuprofen (in a 100% ethanol solution). After 24 hours, the weight of the hydrogels was recorded, dried in a vacuum chamber oven, and then reweighed. Drug loading was determined using the equation below

$$\text{MD-M0 Drug loading \%} = \frac{\text{MD} - \text{M0}}{\text{M0}} \times 100$$

M0

Where, MD represents the final weight of the hydrogel loaded with drugs, and M0 is the initial weight of hydrogels(52,53).

In Situ Loading

Lidocaine and diclofenac used as model drugs, were first weighed and dissolved in distilled water according to their respective calculated amounts. Following by vigorous stirring, poly(ethylene oxide) (PEO) powder was incorporated into the solution. Each model drug was added in precise quantities to facilitate a comparison of the two loading methods. This comparison was based on drug loading efficiency, assessed through submersion in drug solutions at 25%, 50%, 75%, and 100% saturation. Due to the hydrophobic nature of ibuprofen, significant phase separation occurred in the resulting drug-loaded hydrogel films, rendering this method unsuitable for loading ibuprofen (54).

Factor influencing drug release from Hydrogel

In situ gelling hydrogels are pivotal for ocular drug administration, as they convert from a liquid to gel upon contact with ocular tissues. This phase transition extends drug retention and supports sustained release, thereby enhancing ocular bioavailability. These hydrogels can be activated by physiological stimulation such as pH, ion concentration and temperature. The following outlines are the different types of in situ gelling hydrogels used in ocular drug administration(49).

Temperature response

The study by Wang *et al.* (2021) explores the use of a thermo-sensitive hydrogel with mussel-inspired adhesion properties to enhance the non-fibrotic repair effect of Epidermal Growth Factor on the colonic mucosa barrier in rats with induced ulcerative colitis. Temperature-responsive hydrogels, such as those based on chitosan and HM-HPMC/CD, exhibit substantial promise for eye-related drug delivery. These hydrogels transition from sol to gel state in response to temperature changes, which improves drug retention and therapeutic efficacy. This property is particularly advantageous for treating conditions like uveitis, as the controlled release mechanisms of these biocompatible materials offer enhanced treatment outcomes(55).

Tejaswini Vasant Daund *et al.*,

Ion response

Ion-responsive in situ hydrogels, utilizing polymers such as gellan gum, have shown remarkable progress in intraocular drug delivery. These hydrogels facilitate prolonged drug release and enhance therapeutic effects for conditions including eye glaucoma and age-related macular degeneration. Notably, the integration of drug-loaded nanoparticles with in situ hydrogels has been identified as a promising strategy for improving drug loading and trans-corneal transport, further advancing ocular drug delivery methods (55).

pH response

Gupta *et al.* (2007), focuses on developing an ocular drug delivery system using a novel in situ gel that is triggered by temperature and pH changes. pH-responsive hydrogels used in ocular medication delivery incorporate polymers with either basic (ammonium salt) or acidic (carboxylic or sulfonic) groups. Commonly employed biopolymers include carbopol, polycarbophil, polyacrylic acid, and chitosan. These hydrogels remain in solution below pH 7.2 but transition to a gel at pH 7.2, which is consistent with the pH of tear fluid. Notably, polyacrylic acid exhibits sol-gel transition at molecular weights exceeding 16.5 kDa. It is essential to maintain the pH between 4 and 10 to avoid irritation of ocular tissues. Thiolated hydrogels, which form disulfide linkages with mucin glycoproteins, enhance corneal retention. Additionally, the mixture of pH-responsive and thermosensitive polymers leads to the development of pH-thermosensitive hydrogels. Polymers containing catechol groups have shown potential for extending ocular residence time due to their adhesive properties(56,57).

Sustain and control release profile

Lei L *et al.* (2022) mentioned drug-release tests were performed following gel synthesis to evaluate the diffusion of entrapped drugs from the hydrogel matrix. Despite its hydrophobic characteristics, lidocaine demonstrated limited solubility in water at approximately pH 6.5 during the experiment, enabling its diffusion from the nanomaterial into the aqueous phase through the gel network. Equilibrium in the dispersion process was achieved when the concentrations within the gel, particles and surrounding medium stabilized. During the drug distribution trials, test samples were immersed in aqueous media, with aliquots of the aqueous phase being periodically withdrawn. Drug concentrations in these aliquots were quantified using spectroscopy, measuring absorbance at 270 nm. For reference, blank hydrogels were taken that is identical to the drug-loaded samples but without medication, were prepared. The absorbance values from these blank samples were attributed to the diffusion of nanoparticle constituents, such as oil and surfactant, as well as any unreacted monomers. The drug concentration in the aqueous solution was determined by subtracting the absorbance of the blank samples from that of the drug-loaded samples (58).

Application of hydrogel in ophthalmology

Treatment of Ocular disease(59)

- **Corrective Vision Enhancement** Hydrogels are employed in the manufacturing of flexible contact lenses to correct visual impairments.
- **Intraocular Lens Innovation** Hydrogels facilitate the development of foldable intraocular lenses for use in cataract surgery.
- **Ophthalmic Drug Delivery** Hydrogels act as carriers for prolonged and sustained release of ocular medications.
- **Diverse Drug Categories** They are utilized for the administration of various pharmaceuticals, including antibiotic agents, anti-edema drugs, β -blockers, biological proteins, and gene therapies.
- **Minimally Invasive Administration** Hydrogels with properties such as temperature responsiveness and in situ chemical cross-linking support minimally invasive drug delivery techniques.
- **Posterior Eye Segment Targeting** Drug release systems are designed specifically to focus the interior segment of the eye.
- **Adhesive for Wound Repair** Hydrogels are evaluated for their potential as adhesive agents in ocular wound patches, promoting healing and tissue adhesion.
- **Vitreous Substitute Exploration** Research is ongoing into the use of hydrogels as potential substitutes for the vitreous humor in various ocular procedures.

Tejaswini Vasant Daund *et al.*,

- **Physicochemical Advantages** Hydrogels provide several benefits, including transparency, high water content, and mechanical flexibility, which contribute to enhanced therapeutic outcomes.
- **Challenges and Advances** Current research focuses on addressing challenges in hydrogel formulation to improve treatment efficacy and options.

Prolonged drug retention and enhanced therapeutic outcomes

- In the quest for improved treatments for chronic inflammatory bowel disease, a study by Zhang *et al.* (2015) presents an innovative approach involving an inflammation-targeting hydrogel for localized drug delivery. This hydrogel, composed of microfibers derived from the FDA-approved amphiphile ascorbyl palmitate, serves as a promising carrier for the anti-inflammatory corticosteroid dexamethasone. The use of a hydrogel as a delivery system proves advantageous by providing controlled drug release through enzymatic digestion and demonstrating selective adhesion to inflamed epithelial surfaces(60).
- Bhattarai *et al.* review chitosan-derived hydrogels for pharmaceutical delivery, highlighting their biocompatibility. Paulson *et al.* investigate a novel chitosan-glycerophosphate (CGP) hydrogel system for treating inner ear disease. In vitro studies demonstrate that the CGP-hydrogel releases 92% of dexamethasone over 4 days. In vivo, the system maintains sustained drug levels in the perilymph for 5 days, showing promise with temporary hearing loss resolving by the 10th day. This suggests the system's safety and efficacy. Multiple authors contribute to the exploration of these innovative drug delivery systems(61).
- Yoshida *et al.* (1993) explored pulsatile release mechanisms using hydrogels, focusing on temporal control to enhance pharmacotherapies. They discussed smart drug delivery technologies that respond to external triggers, achieving pulsatile drug release. This approach offers benefits such as bypassing drug tolerance and aligning with natural biological release patterns(62).
- Zielińska *et al.* (2022) reviewed the increasing interest in hydrogels within the pharmaceutical field as modified-release drug delivery systems. They discussed recent developments and perspectives on various delivery methods, including topical, nasal, parenteral, oral, and ocular. The authors highlighted the key features of polymers in creating optimal hydrogels for specific routes, based on a comprehensive review of studies published between January 2010 and December 2020. The review concludes that hydrogels offer several advantages, such as reducing doses and side effects, enhancing patient compliance, and improving drug bioavailability, ultimately enhancing treatment safety and efficacy(63).
- Sonker *et al.* (2021) conducted a comprehensive review of recent developments in selective drug delivery using hydrogels for cancer therapy. The authors highlighted the advantages of hydrogels, such as controlled drug release, structural adaptability, and protection from denaturation, which address the limitations of traditional delivery methods(64).

Advantages over traditional drug release system

Hydrogels offer significant advantages over conventional drug delivery systems in ophthalmic applications. Their intrinsic properties and adaptable plasticity enable prolonged retention of medication within the eye, thereby enhancing drug permeation, improving efficacy and reducing systemic adverse effects. Additionally, hydrogels increase patient acceptability compared to traditional delivery systems, which may lack these benefits. Consequently, hydrogels are considered a superior option for ophthalmic drug delivery (65).

Challenges and future prospective

Stability and shelf-life hydrogelbased formulations

Hydrogel-based formulations encounter several challenges related to stability and shelf life, including potential degradation, microbial contamination and alterations in physical properties. Addressing these issues involves optimizing formulation parameters, employing effective preservation strategies and conducting thorough testing. Future advancements hold promise with ongoing research aimed at enhancing stability through innovative materials, advanced encapsulation techniques and sustainable preservation methods. These efforts are focused on ensuring extended shelf life and maintaining the integrity of hydrogel-based products across various applications (66).

Tejaswini Vasant Daund *et al.*,

The stability and shelf life of hydrogel-based formulations are impacted by factors such as polymer degradation, water dynamics and microbial contamination. To mitigate these challenges, future research is directed towards the development of advanced polymer designs, smart hydrogels responsive to environmental stimuli and nano-technological support for improved stability. Strategies for overcoming these issues include improved preservative methods, accelerated stability studies and the use of biocompatible cross-linkers, all of which are essential for maintaining the efficacy of hydrogel-based drug administration systems(67).

A detailed review of hydrogel-based formulations, encompassing both natural and synthetic variants, highlights the stability challenges and strategies for extending shelf life. Natural polymers are noted for their biocompatibility, while synthetic polymers offer enhanced mechanical stability. The review explores the difficulties in maintaining stability and prolonging shelf life of hydrogel formulations and presents a forward-looking perspective on overcoming these challenges. It emphasizes the critical role of hydrogel technology in achieving durable and reliable biomedical applications, with a focus on potential future advancements in the field (68).

Clinical translation and regulatory consideration

Translating fundamental scientific concepts into advanced technologies capable of treating diseases in preclinical models and subsequently commercializing them for clinical use presents considerable challenges. This process involves conducting rigorous clinical research, understanding market demands, adhering to regulatory requirements, performing comprehensive intellectual property assessments and scaling up manufacturing. Effective translation may occur at various stages and contexts, including transitioning from academic research to commercial enterprises, changing companies, or adapting technologies from veterinary to human applications. Contract research organizations may be engaged to facilitate this intricate process. A well-defined development plan with specific goals and milestones is necessary to confirm that progress remains aligned to the path to successful commercialization.

- Preclinical models to clinical trials translation -The initial concept for a product often emerges from applying fundamental scientific knowledge to address a specific medical problem or need. To ensure both safety and efficacy, this concept must be developed into prototypes and subjected to rigorous preclinical testing before human trials can commence. While the FDA emphasizes patient safety, sponsors may also seek to evaluate efficacy prior to initiating clinical trials. Consequently, from the FDA's perspective, the primary aim of preclinical studies is to ensure product safety(69).
- Transitioning from the bench to the industry -As discussed, bench-scale laboratory research represents the preliminary phase in the advancement of innovations, such as new drug administration systems. This research is typically conducted in academic settings but may also occur within established companies. Academic research may subsequently lead to the formation of a new enterprise or acquisition by an existing company. Continued research and development are crucial for advancing a technology toward commercialization for specific applications (70).
- Translation between the animal health and human health markets- Translating products, such as drugs or medical devices, from veterinary to human medicine may seem logical, given that all human medical products undergo in vivo preclinical testing. Furthermore, the integrated health approach envisions collaboration between medical and veterinary professionals for mutual benefit. Many ocular diseases affecting humans also impact animals and some animal ocular structures closely resemble those of humans (69).

Emerging technologies and advancement in hydrogel design for ocular drug delivery

- 1.Nanoparticle Integration: Incorporating nanoparticles into hydrogels enhances the precision of drug delivery. Nanoparticles facilitate controlled drug release, ensuring a sustained therapeutic effect. This approach improves drug bioavailability due to the enhanced stability conferred by the hydrogel matrix (71).
- 2.Smart Polymers: The integration of stimuli-responsive polymers enables tailored drug release. Environmental stimuli including pH changes, temperature variations, or biomarkers, can trigger controlled delivery. Also optimizes therapeutic efficacy while minimizing side effects(72).
- 3.Extended Residence Time: Hydrogels address the issue of short ocular surface residence time by enhancing mucoadhesive properties. This improvement prolongs drug contact with the eye, thereby increasing drug absorption and reducing the frequency of administration. Consequently, patient compliance is enhanced (72).

**Tejaswini Vasant Daund et al.,**

4. **Penetration Enhancement:** Overcoming barriers to drug penetration within ocular tissues is a key research focus. Nanotechnology plays a vital role in achieving deeper dose of drug penetration, which is essential for reaching target cells. Enhanced permeation improves the therapeutic efficacy for conditions such as glaucoma and macular degeneration (71).
5. **Biocompatibility and Safety:** Advanced hydrogel formulations prioritize biocompatibility with ocular tissues to minimize irritation and adverse reactions. Rigorous testing and optimization of hydrogel compositions are essential for developing effective and safe ocular drug administration systems(73).
6. **Combination Therapies:** Hydrogel platforms enable the combination of multiple drugs, facilitating synergistic effects for complex ocular conditions. By optimizing drug combinations within hydrogel matrices, therapeutic outcomes can be significantly enhanced(74).

Potential for personalised medicine and target drug delivery(75–77).

Patient Assessment Perform genetic profiling and analyze individual health data to establish a comprehensive understanding of the patient's genomic and medical history.

Personalized Prescription Select specific medications tailored to the patient's genomic and medical history, ensuring a personalized therapeutic approach.

Formulation Design Develop a drug formulation that is specifically tailored for compatibility with hydrogel-based delivery systems.

Hydrogel Synthesis Synthesize a hydrogel matrix designed for effective ophthalmic drug delivery, ensuring appropriate physicochemical properties for ocular application.

Drug Loading Incorporate the personalized medication into the hydrogel matrix, ensuring uniform distribution and stability of the drug within the matrix.

Targeted Delivery Design Integrate targeted drug delivery mechanisms within the hydrogel to attain precise and prolong release of the medication.

Ophthalmic Application Administer the hydrogel-based medication to the ocular surface, ensuring proper placement and contact with the eye.

Real-time Monitoring Implement monitoring systems to track the drug release profile and patient response in real-time, providing data on the effectiveness and safety of the treatment.

Feedback Loop Collect and analyze data on patient response to adjust the treatment regimen as necessary, ensuring optimal therapeutic outcomes.

Optimized Treatment Refine and adjust both the medication and delivery system based on continuous monitoring and feedback to enhance treatment efficacy and patient compliance.

CONCLUSION

The morphological and biological barriers of the eye, particularly the anterior and posterior segments, cause significant issues for the effective administration of ophthalmic drugs. The limited ocular bioavailability associated with topical administration, primarily via eye drops, reduces its efficacy in treating anterior segment diseases, despite its widespread use. For enhancing medication delivery to the posterior segment, including intravitreal and periocular injections are frequently employed, although these methods are commonly related to considerable adverse

Tejaswini Vasant Daund et al.,

effects. Hydrogels have emerged as a promising alternative, offering several advantages including prolonged action, improved bioavailability, enhanced safety, and reduced ocular irritation. Their suitability for controlled and extended drug release is attributed to their permeability, swelling behavior and biocompatibility. The incorporation of glycosaminoglycans, functional structures and biomimetic materials into hydrogels enables the tailoring of their properties to meet specific therapeutic needs. Medications can be incorporated into hydrogels either post-installation or through site-specific loading; the latter method is particularly effective for hydrophobic drugs. Drug diffusion through hydrogels can be modulated by temperature, ionic strength and pH responsiveness, allowing for the formulation of in situ gelling formulations suitable for ocular applications. By addressing the drawbacks of conventional drug delivery systems, hydrogels offer substantial potential for the management of diseases affecting both the anterior and posterior segments of the eye. Despite challenges related to stability and shelf life, advances in ocular drug delivery using hydrogel matrices present promising alternatives. Emerging technologies, such as smart polymers and nanoparticle integration, hold significant promise for enhancing patient outcomes and therapeutic efficacy in ophthalmic treatments.

ABSTRACT

Road conditions significantly impact vehicle safety, driving comfort, and commute efficiency. Detecting and addressing road anomalies such as potholes, humps, and surface irregularities in a timely manner is crucial for improving transportation infrastructure and reducing road accidents. This paper introduces POTHOLTER, a collaborative software-hardware ecosystem for real-time pothole detection road condition monitoring, and navigation assistance.

Keywords: Pothole, IMU sensor, Road condition,

INTRODUCTION

Potholes, bumps, and cracks posed on roads are highly detrimental to the safety, comfort, and e vehicles using infrastructure. POTHOLTER is developed as an IoT based pothole measuring device that comes fitted with IMU components such GPS and GNSS for accurate location measurement and pothole depth analysis. Moreover, the device is paired with a microcontroller that works to merge the output of the IMU sensors with the fitted Kalman filter [3] to ensure that the data collected is accurate and reliable.

Abhinaba Roy et al.,

For optimal safety in transportation, there needs to be a solid road infrastructure to ensure high vehicle usage comfort, and safety. Unfortunately, poorly kept increments such as potholes and cracks make road infrastructure broken and if not monitored can lead to significant vehicle damage. Because of this, there is an increased need for automated technology that can highlight these road issues. Traditional approaches to road monitoring are slow and do not permit real time data collection. This is where POTHOLTER comes into play, as with the advanced technology it offers, potholes and repairs can be tracked and marked easily.

The device uses GNSS data to geotag an anomaly as it is detected. The location is uploaded to Firebase [1] for centralized monitoring. The system, also known as ANT1, works on a live mode so it can provide real-time updates for anomalies. The operator can also store the data on an SD card for future offline analysis. The device operates in a collaborative approach so data from multiple vehicles can be aggregated which makes road condition monitoring more accurate and dynamic. In order to enhance driver safety, pull a user friendly mobile app that enhances and allows the driver to see surrounding road defects with alerts for upcoming potholes and road anomalies while navigating bringing real time updates. Potholes are integrated into a stream for easy processing, which is why the device will geotag the accompanying images and upload them to the cloud [1] for real time processing and put the rest for offline processing. POTHOLTER aims to promote user road safety, reduce infrastructure damage and manage to improve it effectively by providing collaborative real-time data for road maintenance and navigation from his application.

Problem Statement

Road surface anomalies like potholes, cracks, and bumps pose significant risks to vehicle safety, cause infrastructure degradation, and increase maintenance costs. There is a need for an affordable, scalable, and automated system that can accurately detect and classify road anomalies using sensor-based data collected from moving vehicles, and provide actionable insights for timely maintenance. The core of the system is a specialized hardware device comprising an Inertial Measurement Unit (IMU), an ESP32 microcontroller, and a Global Navigation Satellite System (GNSS) receiver module. The device, mounted on vehicles, continuously monitors vibrations and accelerations caused by road anomalies. Using sensor fusion techniques, data is classified based on multiple parameters to identify anomalies such as potholes and humps. Identified defects are geotagged and uploaded to a cloud [1] database (Firebase) for centralized processing.

A key innovation of POTHOLTER is its collaborative approach. Data collected from multiple vehicles traveling through the same location is aggregated and processed using an adaptive algorithm, ensuring dynamic updates and improved accuracy of road condition assessments. This collective intelligence enables the system to refine anomaly detection, classify severity levels, and provide reliable information to users. The Android application developed as part of the ecosystem provides users with a real-time map of nearby road defects based on their current location. In commute mode, the application highlights upcoming anomalies along the selected route, allowing drivers to make informed navigation decisions and improve road safety. This research demonstrates the effectiveness of the POTHOLTER ecosystem in creating a scalable, collaborative solution for road anomaly detection and monitoring. By leveraging data from multiple sources, the system aims to foster safer roads, improve commuter experience, and assist in the timely maintenance of transportation infrastructure.

Collaborative Approach [4] for Confidence-Based Pothole Detection Potholter employs a Collaborative Approach [4], a threshold-based confidence scoring mechanism designed to enhance the accuracy of pothole detection by leveraging multi-sensor fusion and cross-validation from multiple vehicles. The system processes real-time IMU sensor data, particularly vertical acceleration (A_z), roll angular velocity (ω_x), and pitch angular velocity (ω_y), to identify road anomalies. Prior to threshold analysis, the raw IMU signals are passed through a Kalman filter [3], which fuses accelerometer and gyroscope data to reduce noise and provide a more accurate estimation of vehicle motion. This filtering improves the stability and reliability of the features used for scoring, especially in dynamic driving environments. Each detection event is assigned a confidence score based on predefined thresholds, with higher scores indicating greater certainty of a pothole. To improve detection reliability, the approach incorporates

**Abhinaba Roy et al.,**

vehicle speed filtering, which discards low-speed events (e.g., under 10 km/h) that are more likely caused by speed bumps or minor road irregularities. This ensures that only impacts occurring at typical driving speeds are considered valid, increasing the accuracy of the detection.

Additionally, multi-vehicle agreement is used to further strengthen validation by confirming anomalies that are detected at the same GPS coordinates by multiple vehicles. This collaborative element significantly reduces false positives and improves confidence in detections. The system is powered by a lightweight computational model, meaning it relies on simple rule-based logic and arithmetic operations instead of heavy machine learning algorithms—making it ideal for real-time, on-device execution even on low-power hardware. Altogether, the Collaborative Approach [4] establishes a practical and scalable solution for smart infrastructure and road maintenance systems.

System Architecture of DAD 2.0

The DAD 2.0 (Data Acquisition Device V2.0) system architecture is designed to detect and classify road anomalies using a combination of embedded hardware, cloud [1]-based processing, and a mobile client interface. The system follows a collaborative approach, where multiple vehicles equipped with DAD 2.0 devices contribute real-time road condition data to a centralized cloud [1] server.

Hardware Layer (On-Vehicle Device)

Each vehicle is equipped with a DAD 2.0 device, which consists of:

- ESP32 Microcontroller [1] – The central processing unit that manages sensor data, decision-making, and cloud communication.
- MPU6050 IMU (Inertial Measurement Unit) – Captures accelerometer and gyroscope data to measure vibrations and detect road surface irregularities.
- Neo M8N GNSS Module – Fetches the precise geolocation of detected anomalies.
- SD Card Module – Locally stores collected sensor data when the internet is unavailable.
- OLED Display – Provides real-time visualization of sensor data and device status.
- Push Buttons – Allow user interaction for switching between modes (e.g., data logging, visualization, live detection).

Data Processing and Cloud Communication

The DAD 2.0 device continuously collects raw accelerometer and gyroscope data. This data is

1. Processed using Sensor Fusion (Kalman Filter) – Reduces noise and enhances accuracy.
2. Pattern Recognition & Classification – The system identifies anomalies such as potholes, humps, and rough roads based on peaks, valleys, and inconsistencies in sensor data.
3. Geotagging & Data Caching – If an anomaly is detected, the GPS module logs its coordinates. If the internet is unavailable, data is cached on the SD card for later upload.
4. Cloud Upload (Firebase) – When connectivity is available, the device transmits processed data to a cloud [1] server.

Cloud Processing and Collaborative Data Aggregation

Once data reaches the cloud [1], a data processing engine refines the information through

- Data Aggregation – Multiple reports from different vehicles are combined to improve reliability.
- Weight Voting Algorithm – Confirms anomaly consistency based on past and present detections.
- Decision Making – Updates road condition status dynamically based on vehicle reports.

Mobile Client & User Interface

The mobile application [3] provides real-time road condition updates by

- Fetching geotagged pothole and road defect data from the cloud [1].
- Displaying upcoming road anomalies on the navigation interface.
- Updating road conditions dynamically based on collaborative inputs.

Abhinaba Roy et al.,

Observation

The DAD 2.0 system was tested under real-world conditions across different road profiles to evaluate its effectiveness in detecting anomalies based on motion sensor data. The filtered vertical acceleration data collected from the MPU6050 IMU module was visualized and analyzed to identify distinctive signal patterns corresponding to various types of road conditions. The results are summarized below

Ideal Road

When the vehicle traveled on a smooth, well-maintained road surface, the vertical acceleration data remained relatively constant with only minor fluctuations. This consistent and low-amplitude waveform represents the baseline condition for normal or ideal roads. The system correctly identified this state as non-anomalous, indicating stable terrain.

Speed Breaker

During traversal over speed breakers or humps, the system observed a distinct pattern characterized by a sharp positive peak followed by a steep negative dip. This corresponds to the vehicle first ascending the hump and then descending, producing a symmetrical waveform. The algorithm classified this event as a speed breaker based on its "peak-then-pit" temporal profile.

Pothole

The presence of potholes produced a reverse pattern—a sudden negative spike followed by a rebound positive peak. This waveform is caused by the vehicle's abrupt descent into the pothole and subsequent upward movement upon exiting it. The system accurately recognized this as a pothole, distinguishing it from humps through the sequence and polarity of signal changes.

Broken Road

On broken or uneven roads, the system detected irregular, continuous high-frequency oscillations with moderate amplitudes. This signal behavior is indicative of a jerky ride caused by small, frequent surface-level imperfections. These conditions were successfully classified as broken roads or damaged surfaces due to the prolonged presence of non-uniform signal variations.

CONCLUSION

In this paper we present the POTHOLTER which helps to detect the road condition as well as map it onto the mobile app for other users to get informed about the pothole in their route. This work is developed by integrating the device with different sensors to detect the potholes. The road has been categorized based on the sensor data, as normal, speed breaker, pothole or a rough road. This system will enable the device to inform the driver previously about road conditions, hence will act like a necessary equipment to install in the vehicle.

ABSTRACT

To address environmental concerns through innovative nanoproducts, "green nanotechnology" seeks to develop nanomaterials and goods that are harmless to humans and the environment. Green chemistry needs improvement in nanoparticle synthesis due to the instability of non-synthetically generated chemical residues. Research in this area has focused on developing and testing CaCO₃NPs from eggshell ethanol extracts for antibacterial activity against *Staphylococcus aureus* and other coagulase-positive Gram-positive cocci. The biosynthesized nanoparticles were examined for their optical characteristics, crystallinity, diameters, and shapes using scanning electron microscopy, ultraviolet-visible spectroscopy, and Fourier transform infrared spectroscopy. Even at the laboratory scale, a more sustainable procedure could be observed when an environmental study assessed the production and characterization of nanoparticles. The results of this research suggest that eggshell extracts could be used to create CaCO₃nanoparticles. By facilitating the creation of manufacturing in their original habitats, this technique promotes pollution control and provides ecologically beneficial alternatives to risky operations. The produced calcium carbonate nanoparticles have recently shown promise as an antioxidant and antimicrobial against a wide variety of pathogenic bacteria.

Keywords: Chicken eggshells, CaCO₃NPs, Antibacterial activity, DMSO.

Sheela et al.,

INTRODUCTION

Chicken eggs are an essential part of many people's meals due to their affordability and nutritional value. The principal components of an egg's outer layer include proteins, minerals, calcium carbonate (CaCO_3), and organic membranes [1]. According to the FAO, the world's egg production jumped from 61.7 million metric tons in 2008 to 76.7 million metric tons in 2018. Consistent with previous years, Iraq's egg production peaked in 2020 at 55,920 metric tons. The remainder of the ES waste is simply discarded in landfills without any treatment, as its sole use is in scientific research approach process[2]. Aiming to improve material properties at the atomic, molecular, and even supramolecular levels, nanotechnology is an interdisciplinary discipline. States that nanomaterials are utilized in microelectronics, glucose testing, DNA and RNA analysis, heavy metal detection, disease diagnosis, and disease management. The production of calcite nanoparticles can be accomplished in several ways [3].

The "biological method" involves using microorganisms, including plants, yeasts, algae, & bacteria, to make nanoparticles. The production of nanoparticles with a narrow size distribution is a benefit of physical and chemical processes. But these processes are expensive, time-consuming, and hazardous since they employ certain chemicals. When compared to conventional methods, biological technologies provide numerous advantages, including reduced costs, increased yields, decreased reliance on downstream processing, and reduced environmental effect. One name for the biological processes is "green synthesis." Therefore, making nanoparticles out of plant extracts offers a simple, one-step reduction process that can be mass-produced easily [4]. Plant extracts with high biological activity can be used to create nanoparticles, as shown in numerous research studies.

There is a serious issue with handling the enormous volumes of electronic trash generated worldwide each year since the majority of people dispose of their outdated gadgets in landfills, which emit foul odors and encourage the spread of microorganisms. Old electronics that are disposed of in landfills emit toxic gases like hydrogen sulfide (H_2S) and ammonia (NH_3), as well as offensive odors that attract insects and rodents [5]. Since calcium carbonate is an unprocessed natural mineral, it has been used extensively in various industries, including manufacturing, nanotechnology, and medicine. Eggshell-derived calcium carbonate (CaCO_3) is frequently used as a diluent in solid dosage forms in pharmaceutical excipients. Besides being a calcium supplement and food ingredient, calcium carbonate (CaCO_3) is also used in dentistry and pharmacology as a filler, buffer, and to aid in the breakdown of effervescent pills [6]. The goal of the current study was to determine whether leftover eggshells may be used to create compounds with antibacterial, antioxidant, and therapeutic qualities.

Section on Experiment

Making Powder from Chicken Eggshells

Nanomaterials were mechanically produced from CES powder by heating it in a hot air oven at 50°C for 12 hours. All of this happened over the course of three hours in an experimental ball mill from IndiaMART. Prior to usage, the powder was kept in a sterile vial at 50°C . An oven was used to calcine the eggshell powder for one hour at 850°C in order to produce calcium carbonate nanoparticles [7].

Calcium Carbonate Nanoparticle Synthesis

Distilled water devoid of ions was used to dissolve CaCO_3 NPs powder using a propane sonicator. Additional tests, including those for antioxidant and antibacterial properties, as well as character analysis of the CaCO_3 NPs, were conducted using the suspension [8]. Nanoparticles of calcite are expected to form, as shown in figure 1.

Characterization of Calcite Nanoparticles

UV-Vis Spectrophotometer

The measurements of prepared nanoparticles without frequencies spanning from 300 nm to 700 nm were carried out with the assistance of a UV-visible spectrophotometer that utilized a similar beam structure. With a resolution of one nanometer, the current examination was carried out with the assistance of a Perkin Elmer Spectrophotometer.

Sheela et al.,

Fourier Transform Infrared Spectroscopy

The functional components of samples synthesized from eggshells were determined using the Fourier transform infrared spectroscopy (FT-IR) technique (SHIMADZU instrument). The materials were ground using KBr particles, and an analysis was performed on the FT-IR spectra ranging from 4000 to 400 cm^{-1} .

Scanning Electron Microscopy

The CaCO_3 NPs sample's morphologies were determined using SEM. The imaging program was also used to quantitatively analyze and estimate the grain size of each sample.

Antibacterial activity by Agar Well Diffusion Method

Investigators tested calcium carbonate nanoparticles made from egg shell methanol extracts against Salmonella, Pseudomonas, and Escherichia coli, three harmful bacteria. Mueller-Hinton Agar and Broth were used to develop the bacterial cultures (Himedia). To test for antimicrobial activity, we used diffusion disc plate on agar and dispersed about 0.1 mL of each culture of bacteria throughout the plates. Following a 24-hour incubation using Himedia apparatus at 37°C, all bacterial strains were prepared for the antibacterial assay by plating them proper instrument and conducting agar diffusion experiments^[9]. Agar was used as an absorbent using 100 μL of egg shell methanol extracts. Six millimeters in diameter paper discs were placed on the agar. After fixation need 2 days beginning at 37°C, the inhibition diameters were measured. The susceptibility of a culture of bacteria was evaluated in this study using DMSO and Gentamycin (100 $\mu\text{g}/\text{ml}$) as the positive control. To test for antibacterial activity, various quantities of methanol extracts from chosen samples are used. The extracts are made in the same way.

Antioxidant activity by DPPH assay

Effecting the protocol laid out by Molyneux (2004), the ability of nanoparticles produced from egg shell extract to scavenge free radicals was evaluated. Using 95% methanol, a DPPH solution was generated, with a weight percentage of 0.006%. A range of quantities of nanoparticle methanol extract were dissolved in ethanol, including different concentration of given sample ($\mu\text{g}/\text{ml}$). A small amount of DPPH was mixed with three millilitres of produced nanoparticles of varying concentrations while the experiment was conducted in darkness. A variety of quantities of ascorbic acid, a powerful antioxidant, are produced in alcohol and used as a standard. Two millilitres of DPPH solution and three millilitres from standard have been combined in a dark setting^[10]. A UV spectrophotometer was used to detect absorbance at 517 nm after 30 minutes of incubation with the plant extract samples and ascorbic acid solution. In this experiment, methanol served as a control, and the proportion of free radicals that the sample was able to block was measured applying the formula.

RESULTS AND DISCUSSION

In order to increase the level of activity in the field of nanobiotechnology, a large amount of research has been conducted on this topic in recent years. There was a cascade of studies performed on the CaCO_3 NPs synthesized from egg shell extract. Scanning electron microscopy, ultraviolet spectroscopy, as well as FT-IR were all part of these examinations. These nanoparticles were the basis of the reduction and cap agent^[11]. Finding out the size and structure of the synthesized nanoparticles is made easier using the data gathered through the SEM. In order to determine how efficient the CaCO_3 NPs were, we looked for their properties. Given the available evidence, one could conclude that the procedure and its outcomes were considerably more successful than anyone had hoped for^[12].

UV-Visible spectroscopy analysis

CaCO_3 nanoparticles synthesised in chicken eggshells were analysed using UV-Vis spectroscopy, with the results illustrated in Figure 2. The absorbance peak at 205 nm confirmed the presence of CaCO_3 nanoparticles. This peak suggested that the nanoparticles were dispersed in the solution of water without any indication of aggregation^[13].

Sheela et al.,

Fourier Transform Infrared (FT-IR) Spectroscopic Analysis

The FTIR spectra of the synthesised calcite (CaCO_3) nanoparticles obtained from chicken eggshells. The different absorption bands seen at different points in the FTIR spectra are depicted in Figure 3 and are caused by the different translational modes of different chemical groups, which are present on the particle surface [14]. They were displayed six distinct bands at various peaks.

The FT-IR analysis revealed several absorption peaks at the following wavenumbers : 3405 cm^{-1} , 2926 cm^{-1} , 2875 cm^{-1} , 2514 cm^{-1} , 1798 cm^{-1} , 1417 cm^{-1} , 1083 cm^{-1} , 874 cm^{-1} , 848 cm^{-1} , and 708 cm^{-1} , which are indicative of the calcite phase. The highest points at 3405 cm^{-1} signify the O-H stretching in alcohol. The band observed at 2926 cm^{-1} indicates the stretching of the H-C=O bond in the aldehyde. The peak at 2875 cm^{-1} indicates the C=C stretching of the conjugated alkene. Additionally, the presence of alkaline compound C-H bending is evidenced by peaks at 2514 cm^{-1} and 1798 cm^{-1} . In the same bending, another peak was found at 1083 cm^{-1} , in addition to 1417 cm^{-1} . The presence of aromatic amine C-N stretching is evidenced by the band observed at 1798 cm^{-1} . The C-O stretching of aliphatic ether is indicated by the peak at 874 cm^{-1} . Sharp bands are observed at 848 and 708 cm^{-1} , which are identified as potent nitro compounds in the asymmetric stretch. This aspect is essential nanoparticles, as detailed in Table 1. The subsequent results demonstrate a resemblance to the findings of Joy Sarkar et al., 2013.

SEM Analysis

SEM analysis of nanoparticles of calcite (CaCO_3) produced by hens' eggshells. Nanoparticles of calcite CaCO_3 made from eggshells are shown in Figure 4 of the SEM image [16]. Clumps of aggregated CaCO_3 NPs with an arhombohedral cubic structure are revealed. The sizes of the particles vary between 31 to 34 nm.

Antibacterial activity

Medicinal plants have been used by humans since the dawn of civilisation. Given the issues with synthetic antibiotics, it was evident that nanoparticles derived from egg shells will eventually be used for medical purposes. Table 2 displays the results of the antibacterial activity of the calcite across many bacterial strains, including *Pseudomonas sp.*, *Escherichia coli*, and *Salmonella sp.* At various concentrations of $400\text{ }\mu\text{g/ml}$, $500\text{ }\mu\text{g/ml}$, and $600\text{ }\mu\text{g/ml}$, the zones for Gram Negative bacteria *Escherichia coli* and Gram Positive bacteria *Pseudomonas sp.* and *Salmonella sp.* were noted. The potential of the test chemical as an alternate or additional antibacterial agent is demonstrated by the comparison with Gentamicin. Even while Gentamicin inhibited all organisms to a consistent degree, the experimental substance worked better against *E. coli* and showed similar results against *Salmonella spp.* at higher concentrations. According to reference 17, the inhibition zone was 20 mm at $400\text{ }\mu\text{g/ml}$ and 23 mm for $500\text{ }\mu\text{g/ml}$.

Nonetheless, at $600\text{ }\mu\text{g/ml}$, a little decrease to 21 mm was noted, which could indicate a saturation or inhibitory impact at higher dosages. At $500\text{ }\mu\text{g/ml}$, the molecule showed the most antibacterial activity, with a zone of inhibition measuring 30 mm, the highest of all the concentrations studied [18]. Yet, the zone shrank to 20 mm at $600\text{ }\mu\text{g/ml}$, suggesting potential cytotoxic consequences or diminished effectiveness at higher dosages. A 15 mm inhibition zone was seen at $400\text{ }\mu\text{g/ml}$ and a 20 mm inhibition zone at $500\text{ }\mu\text{g/ml}$, indicating that the activity was varied. Figure 5 shows that there was a concentration-dependent effect, as the inhibition rose dramatically to 25 mm at $600\text{ }\mu\text{g/ml}$. Comparing methanol extracts to the well diffusion method revealed the largest inhibitory zones against *Pseudomonas sp.*, *Escherichia coli*, and *Salmonella sp.*, which were 21 mm, 20 mm, and 25 mm, respectively [19]. Nanoparticles of calcium carbonate derived from eggshells, dissolved in dimethyl sulfoxide (300 mg/mL), shown antibacterial activity against the microorganisms examined (Figure 6).

Antioxidant activity

In a recent discovery, it was discovered that nanoparticles that were generated possessed free radical scavenging capacity, which serves as a defence mechanism. Through our efforts, we were able to successfully extract and characterise calcium carbonate nanoparticles that displayed enhanced scavenging function. Because of its user-friendliness and transparency, the DPPH reaction is frequently utilised in the process of assessing scavenging activity [20]. The DPPH radical absorption activity test appears to have demonstrated that the nanoparticles formed from egg

**Sheela et al.,**

shells provide a higher level of activity compared to the ascorbic acid that served as the positive control. The data shown in Figure 7 demonstrates that the antioxidant property of CaCO₃ nanoparticles (NPs) becomes more visible at different concentrations, ranging from ± 52.5 to ±70%. This enables the CaCO₃ NPs to eliminate the free radicals [21-23]. In addition, the findings demonstrate that the efficiency of the solution is enhanced when it is combined with a standard as well as nanoparticles. There is a significant difference of 9.8 percentage points ($p < 0.05$) as shown in the visual depiction shown by figure 8. The DPPH test is a methodical, well-planned, and regenerative method due to the fact that the coefficient of difference is lower in each and every harvest [24].

CONCLUSION

A large intimate of nanomaterials with many possible applications in industry and medicine, synthetic calcite has just recently come to light. The eggshell extract used to synthesize calcium carbonate is an excellent option because it is effective, inexpensive, environmentally benign, and compatible with large-scale production. A distinct absorption peak at 205 nm is visible in the UV-Vis spectra of calcium carbonate nanoparticles. According to the results of the FTIR study, the primary functional categories in the nanoparticles' natural shell extract were identified by the absorption bands. Utilizing Calcium Carbonate Nanoparticles generated from eggshells significantly improves reaction time compared to earlier nanoparticle synthesis methods; this advantage is crucial to the biosynthetic process. Scanning electron microscopy confirms that the produced nanoparticles are round with a diameter of 31–34 nm. Plus, it works against both Gram-positive and Gram-negative bacteria, even those that have become resistant to other treatments in the lab. The MICs of traditional antibiotics were lowered as a result of its synergistic effect. The selected experiment showed it may capture free radicals, with ascorbic acid having an IC₅₀ value of 20 µg and the aqueous extract having an IC₅₀ value of 42.5 µg recently, calcium carbonate nanoparticles made from chicken eggshells have been proposed as a potential environmental and therapeutic agent.

ABSTRACT

Poor physical health and sedentary behavior has become a serious global concern. 81% of adolescents worldwide do not get enough physical activity. Physical health is an essential component of health linked with musculoskeletal system and biological function, which has negative impact on their long-term health. Recent studies have shown the importance of assessing the QoL of young adults. As this is an important phase of life. "Posture" means position of body in space. Imbalance between agonist and antagonist muscles of trunk due to poor posture, can lead to altered spinal curvature. Hyperkyphosis is increased in forward curvature of the thoracic spine, while hypokyphosis is decreased forward curvature of thoracic spine. There are three major types of abnormal kyphosis found in human beings, they are postural kyphosis, scheuermann disease, and congenital deformity. Postural kyphosis is common in adolescent age group. There are many numbers of literature on Scoliosis and kyphoscoliosis and its association with PA, there are limited literature on kyphosis and its relationship with PA in young adults/student. Therefore, this study aims to establish the relationship between physical activity levels and spinal curvature of the thoracic spine among college students. This study involved 125 subjects, who met the criteria for the study. The study involved two stages. Stage one involved filling of the IPAQ to asses PA. Stage two involved measuring of the spinal curvature using flexicurve ruler. Statistical analysis was done using software SPSS 23.0. Of these, the participants were mostly categorized in ages of 18-21 years (68.8%) and more females (55.2%). Descriptive statistics revealed average weight of 60.2 kg and

98628

**Maria Paul and Saniksha Sudhir Revandikar**

height of 164.8 cm, making a mean BMI of 22.2 and a Kyphosis index of 8.5. Analyzing MET-min/week, it can be found that it was largely distributed, with its median being 1,782 and an IQR of 693-4,627. No significant correlation of MET-min /week and Kyphosis index $r = 0.007$. This study assessed the relationship of PA with thoracic spinal curvature, in young adults. Although there was a positive relationship between the PA, which was expressed in MET-min/week, and the kyphosis index, the correlation coefficient was very low, not significant with $r = 0.007$ ($p = 0.938$). The findings suggested that the factors other than PA that is, posture and ergonomics are more important factors that affects the spinal curvature. This study also pointed out that the respondents differ in their levels of PA. In general, targeted interventions might be necessary in addressing kyphosis. Thus, universities should promote PA in conjunction with specialized programming for spinal health. The higher use of mobile and social media use causes sedentary activities that can result in a reduced level of PA. Mobile screen time has to be addressed for healthier behavior.

INTRODUCTION

Inactivity, unhealthy, and sedentary behavior are becoming serious global health Burden. Recent findings show that 1 in 4 persons worldwide and 81% of adolescents do not get enough physical activity. Because of motorized environment, rising rates of technology usage for work and play, social habits, and an increase in sedentary behavior, physical inactivity levels are on the rise and can reach 70% (1, 2). Physical health is one of the essential components of health linked with musculoskeletal system and biological function of human body. Exercise improves strength and endurance of the muscles, also increases cardiorespiratory endurance, provides oxygen and nutrition to organs and tissues faster. Minimal or no physical activity and sedentary behavior have been affecting human health system, habitat, financial growth, society and individual well-being and standard of living (3,4). Recent research has demonstrated the significance of evaluating young people quality of life (QOL) as this stage of life might be a critical period for monitoring and changing lifestyle choices that significantly influence future life practices (5). Poor posture due to sedentary behavior has a negative impact on spinal curvature. The term "posture" means the position of the body in space. When the line of gravity (LOG) passes through the external auditory meatus, the cervical spine's body, the acromion, and anterior to the thoracic spine, it is said to be in posture (6). Imbalance between agonist and antagonist muscles of the trunk due to poor posture, can lead to altered Spinal curvature, which may contribute to health issues in later stage of life. Poor posture during the college period can cause chronic health issues in students, such as back pain, decreased respiratory function due to reduced lung capacity, decreased core strength and stability, stress, poor self-esteem and subsequently lower QoL, poor sleep Quality (7). Hyperkyphosis, is an increase in the forward curvature of the thoracic spine, while hypokyphosis is a decrease in that forward curvature. Physical inactivity and sedentary behavior are two key risk factors for hyperkyphosis or hypokyphosis in young adults (8). Postural kyphosis typically starts in adolescent age group, which is higher in females comparatively. Increase in the forward curvature (hyperkyphosis) is usually caused by slouched posture, which leads to stretch in the 3 extensor muscles of the back and the posterior spine ligaments, which further leads to weakness (6,8) As per the literature search there were limited studies conducted to assess the relationship between the physical activity and spinal curvatures. John H et.al, conducted a study "to study the association between physical activity and Scoliosis" showed association between both the variables but there is a need to explore the relationship between Physical activity and kyphosis among student population to provide education on postural habits (9).Epidemiology of hyperkyphosis, it usually increases as age advances, particularly in individuals above 40 years, prevalence in adults aged 60 and above is 20% to 40%. Even though both the genders are affected, females have higher rate, usually in the menopausal period and 0.4 to 8% in children aged 13 to 16 more likely in males compared to females. (8, 10). There are many numbers of literature on Scoliosis and kyphoscoliosis and its association with PA, and there are also many numbers of researches

**Maria Paul and Saniksha Sudhir Revandikar**

done in elderly population, menopausal women and children, but there are limited literature on kyphosis and its relationship with PA in adolescents/students (11, 12, 13). And the increase in technology has reduced physical activity in students which will have an effect on spinal curvature (14). Therefore, this study aims to establish the relationship between physical activity spinal curvature of the thoracic spine in college students.

METHODOLOGY

Type of study A cross-sectional study

Study site RL Jalappa Hospital and research center, Tamaka, Kolar, Karnataka 563101

Study duration 6 months

Sample size 125

An estimation of the appropriate sample size for the study was calculated using General statistical principles With 90% confidence and 6% absolute precision, the study would need a sample size of 125 people, assuming that 21% of the population's subjects have the factor of interest.

Ethical clearance Institutional ethical clearance (Ref: SDUAHER/klr/R&D/CEC/S/18/2024-25) and informed consent were obtained prior to the commencement of the study.

Inclusion criteria

- Age 18 to 25 years
- Male and female

Exclusion criteria

- Spinal pathologies, systemic musculoskeletal disorders or pain (e.g. scoliosis, fracture, ligament tear, dislocation, sprain, strain etc.)
- History of spinal or extremity surgery.
- Participants with assistive devices or orthoses

Mode of selection of subject's: Convenient sampling.

Procedure

The research protocol consists of two stages.

- The 1st stage involves filling the questionnaire.
- The 2nd stage involves measuring of spinal curvature using flexi curve ruler.

Outcome measures**The International Physical Activity Questionnaire**

"The International Physical Activity Questionnaire short form (2002) was used to evaluate physical activity in the selected population. The questionnaire was highly reliable and valid, with $r = 0.74$ and $r = 0.72$, respectively (15). And the responses from the subjects were converted to metabolic equivalent task minutes per week (MET-min/week). The questions will ask about the time you spent being physically active in the last 7 days" (16, 17). In order to calculate the total physical activity in MET-min/week, this measure evaluates the forms of physical activity and sitting time that people engage in, on daily basis.

"MET values and Formula for computation of Met-minutes (17).

Walking MET-min/week = $3.3 * \text{walking minutes} * \text{walking days}$. Moderate MET-min/week = $4.0 * \text{moderate-intensity activity minutes} * \text{moderate days}$. Vigorous MET-min/week = $8.0 * \text{vigorous-intensity activity minutes} * \text{vigorous intensity days}$. Normative values for MET-min/week" (18) (table 1).

**Maria Paul and Saniksha Sudhir Revandikar****Evaluation of spinal curvature**

Flexi curve ruler was used to measure the thoracic kyphosis. It is reliable and valid method of measuring spinal curvature without side effects. In a relaxed standing position, posture measures were taken in the sagittal plane. The measurements were completed in a single day, without engaging in any exercises prior (19). Flexi curve ruler is a non-invasive device, a flexible metal covered with plastic which can mold spinal curvature. The device is placed over C7 spinous process and L5–S1 interspace (fig; 2.1 and 2.2). The molded curvature is traced over a sheet (fig; 2.3), a vertical line is drawn from C7 to L5–S1 interspace, thoracic length was measured from C7 to the intersecting point, and thoracic width was measured at the highest point curve (fig; 2.4). The kyphosis index is determined by the Thoracic width (TW) divided by the Thoracic length (TL) multiplied by 100. (KI): $(TW/TL) \times 100$ (20). The mean IK for the sample was 11.1 ± 3.3 (21). This procedure consisted of three trials.

RESULT

Statistical analysis was performed using SPSS 23.0. Frequency and percentage were used to present the categorical variable. Descriptive statistics was expressed using mean and standard deviation. Correlation was performed using Spearman's rank correlation. The distribution of age among the participant's shows that majority of participants were 18-21 years (68.8%). The remaining 31.2%, or 39 individuals, are aged between 22-25 years. The entire sample consists of 125 individuals. The average age is 20.9 ± 1.84 years with minimum of 18 years and maximum of 25 years (table 2). The table shows

Distribution based on gender

The table shows the gender distribution of a sample of 125 individuals. Out of the total sample, 69 are female, representing 55.2% of the population, while 56 are male, accounting for 44.8%. This distribution indicates that there are more females than males in the sample (table 3). The BMI data for 125 individuals' shows an average of 22.2 ± 3.959 , with a range from 14.5 to 35.1 (Table 4). The Kyphosis index shows an average of 8.474 ± 2.356 units, with a range from 3.61 to 16.56 (Table 5). The MET-min/week values range from 8.90 to 16,231.00. The median value is 1,782, indicating that half of the participants have MET-min/week values below this. The interquartile range (IQR) spans from 693 to 4,627 (Table 6). The analysis of the relationship between MET-min/week and Kyphosis index in 125 individuals resulted in a Spearman's correlation coefficient of 0.007. This indicates a positive correlation between MET-min/week and Kyphosis index. The associated p-value is 0.938, suggesting that the correlation is not statistically significant at the conventional 0.05 level (Table 7).

DISCUSSION

The present cross-sectional study aimed to investigate the relationship between physical activity and spinal curvature, using kyphosis index as a measure among young adults. Our findings revealed a positive correlation between physical activity levels and the kyphosis index; however, this association was not statistically significant. The findings of our study are closely aligned with the previous results of systematic review and meta-analysis. This study, showed weak correlation between physical activity and postural alignment (22). The possible reason could be the presence of multiple factors associated with change in spinal curvature like screen time, backpack usage, ergonomic habits and underlying musculoskeletal imbalances. Besides the proposed results, there is positive effect of physical activity it has been found to have strong correlation between posture parameters and physical activity. Prolonged sitting duration has greater risk of developing kyphosis disorder and decreases lumbar lordosis (23). Some form of physical activities such as ballet and gymnastics may induce postural deformities due to muscular imbalance and over recruiting of certain muscles (22). Other factors which can influence the spinal curvature change possibly could be age, gender and healthy body composition. A study conducted by Grabara, M., & Witkowska, A. found that thoracic kyphosis and lumbar lordosis found a correlation with body mass index, body adiposity index, waist circumference and fat percentage. It is also reported that with increasing age risk of idiopathic scoliosis increases and boys reported higher level of physical activity compared to females (24,22).

**Maria Paul and Saniksha Sudhir Revandikar**

Strength The study focuses on a relevant population, the use of validated tools (IPAQ and flexi curve ruler), and a comprehensive approach combining physical activity and spinal curvature measurements.

Limitations It is a cross-sectional design, reliance on convenience sampling and self-reported data, and a narrow age range (18-25 years), which may limit generalizability. The study also lacks exploration of confounding factors beyond spinal issues, reducing the ability to establish causality or broader musculoskeletal insights. The factors which have direct influence on change in spinal curvatures like BMI, gender, screen time, backpack usage and ergonomic habits were not studied.

Future studies Future studies should consider including others factors such as BMI, gender, screen time, backpack usage and ergonomic habits and include larger sample size.

CONCLUSION

The study concluded that even though PA is associated with several health benefits, such activities may have little or no effect on spinal curvature if they are not backed by focused interventions regarding posture and spinal alignment. There should thus be strategies adopted by universities that not only encourage PA but raise the same degree of awareness toward spinal health through specially designed exercise programs.

ABSTRACT

Waste heat can potentially be used to generate cooling through absorption cooling. A single stage vapour absorption refrigeration system using lithium bromide - water ($\text{LiBr}-\text{H}_2\text{O}$) and an ammonia-water and ($\text{NH}_3-\text{H}_2\text{O}$) system are both subjected to the first law of thermodynamics. MATLAB 7.0.1 is utilized to compute the performance analysis of every component using a mathematical model in MATLAB. Use empirical relations to assess the thermodynamic characteristics and energy transfer rate of each part of the both vapour absorption refrigeration systems. The system's coefficient of performance is being determined for several temperature ranges. As the heat source temperature is raised, the system's cooling coefficient of performance (COP) increases somewhat, according to the results. For $\text{LiBr}-\text{H}_2\text{O}$ system, if the temperature is below 58°C , the system COP will be close to zero, the system does not work at all, and from 58°C to 83°C , the COP will increase in a slower pace, after 83°C of generator temperature the COP increase rapidly. It is found that the COP of the ammonia water vapour absorption system is lower than the lithium bromide vapour absorption system, although both the pair having different refrigeration applications.

Keywords: Energy, $\text{LiBr}-\text{H}_2\text{O}$, $\text{NH}_3-\text{H}_2\text{O}$, COP.

Satish Raghuvanshi et al.,

INTRODUCTION

Finding other energy sources is our collective responsibility as the need for power grows daily. Air conditioning and refrigeration are two of the top energy consumers; a vapour absorption refrigeration system is one of the better options. Low grade thermal energy can power absorption devices, giving rise to a way to transform waste heat into something valuable and mitigating peak summer electricity demand. In addition, continuous investigations have shown that the vapor compression system's regular working liquids are depleting the ozone layer and having an adverse effect on greenhouse gases. In any case, geothermal energy, solar-based biomass, and harmless, inexpensive waste heat from ARS are energy sources whose supply costs are typically negligible. Besides, the working liquids of this system are environment friendly [1-3]. The general execution of the retention cycle as far as refrigerating impact per unit of energy input commonly poor, in any case, squander warmth, for example, that rejected from a power can be utilized to accomplish better by and large energy use. Alkali/water ($\text{NH}_3/\text{H}_2\text{O}$) frameworks are generally utilized where bring down temperature is required. In any case, water/lithium bromide ($\text{H}_2\text{O}/\text{LiBr}$) system are likewise broadly utilized where moderate temperatures are required (for example cooling), and the last system is more proficient than the previous [4-6]. The target of this paper is to think about the First Law Thermodynamic Analysis of single stage Vapor Absorption Refrigeration System with the assistance of numerical model. This model is produced on MATLAB Software (Simulink Tool). Many authors choose various computer programming, but here selected MATLAB where we can easily and directly take part for simulation through the block diagram and formulation. This paper is differs from the above literature studies in that availability analysis is carried out for each component of the both the system. Li-Br- H_2O and NH_3 - H_2O vapour Absorption Refrigeration System and their Comparison. In Li-Br- H_2O System lithium bromide as working liquid and water is utilized as a refrigerant. Heat exchange rate of every segment in the cycle, some execution parameters and Coefficient of Performance are determined from First Law Analysis. The consequence of this examination can be utilized either to measure another refrigeration cycle or rating a current framework.

Experimental Details and Methodology

Figure 1 shows the schematic block diagram of a simple absorption refrigeration system it consist of an absorber, a pump, a generator and a pressure reducing valve to replace the compressor in vapour compression refrigeration system. The other component of the system is same (condenser, evaporator and expansion valve). In this system the NH_3 is used as a refrigerant and the water is used as an absorbent. In this system the low pressure ammonia vapour refrigerant leaving the evaporator enters the absorber, where it's absorbed by the cold water in the absorber. The water has an ability to absorb a very large quantity of ammonia vapour, and the solution thus formed is known as aqua ammonia solution. The absorption of ammonia vapour in water lowers the pressure in the absorber which turn draw the more ammonia vapour from the evaporator and thus raise the temperature of the solution. Some form of cooling arrangement (usually water cooling) is employed in the absorber to remove the heat of solution evolved here, this is necessary in order to increase the absorption capacity of water, because of higher temperature water absorb less ammonia vapour, the strong solution thus formed in absorber is pumped to the generator by the liquid pump. The strong solution of ammonia in the generator is heated by some external source such as gas, steam, solar energy. During the heating process ammonia vapour is driven off from the solution at higher pressure and leaving behind the hot weak solution in the generator. The weak ammonia solution flows back to the absorber at low pressure after passing through the pressure reducing valve. The high pressure ammonia vapour from the generator is condensed in the condenser to high pressure liquid ammonia thus liquid ammonia is passed to the expansion valve through the receiver and then to the evaporator. This is the complete working of simple vapour absorption refrigeration cycle. Similarly working of LiBr-water vapour absorption refrigeration system in which water is used as a refrigerant and then it circulate through condenser, expansion valve and evaporator.

Satish Raghuvanshi et al.,

Assumption

1. No pressure changes except through the flow pump.
2. Refrigerant is pure water in ammonia water vapour absorption system.
3. At point1, 4 and 8, there is only Saturated Liquid.
4. At point10, there is only Saturated Vapour.
5. Pumping is isentropic.
6. Assume weak solution contain more percentage of refrigerant and less percentage of absorbent and strong solution contain more percentage of absorbent and less percentage of refrigerant.
7. Percentage of weak solution at state 1, 2 and 3 and Percentage of strong solution at state 4, 5 and 6 will remain same.
8. The Temperatures at Thermodynamic state 11,12,13,14,15,16,17 and 18 are the external circuit for water which is use to input heat for the components of system. As Shown in fig 1
9. We have divided our system into two pressure limits, one is high pressure limit and other is low pressure limit, in the following system we are taking high pressure from the table corresponds to generator temperature (T₇) and low pressure corresponds to evaporator temperature (T₁₀)

P₁ = P₆ = P₉ = P₁₀ = Low pressure

P₂ = P₃ = P₄ = P₅ = P₇ = P₈ = High pressure

Thermodynamic Analysis

GENERATOR

On balancing the energy across the generator, one can say;

$$Q_8 + Q_3 = Q_4 + Q_7 \tag{1}$$

Since:

$$Q_3 = m_3 \cdot h_3 \tag{2}$$

$$Q_4 = m_4 \cdot h_4 \tag{3}$$

$$Q_7 = m_7 \cdot h_7 \tag{4}$$

Balancing the concentration across the Generator, one can say,

$$m_3 \cdot X_3 = m_4 \cdot X_4 \tag{5}$$

Putting the value of m₃, X₃ and X₄ in Equation 5 we will get,

$$m_1 = \frac{m_4 \cdot X_s}{X_w} \tag{6}$$

Combining Equations 5 and 6, one can say

$$m_6 = \frac{-m_{10}}{1 - \frac{X_6}{X_1}}$$

Using Equation 8, [5] one can estimate the enthalpy (h₃) and (h₄) at thermodynamic state 3 and 4,

$$h(T, X) = 100 \sum_{i=1}^{16} a_i \left[\frac{T}{273.16} - 1 \right]^{m_i} (X)^{n_i}$$

Satish Raghuvanshi et al.,

help of table at $T_c=T_7$

Using equation 2, 3 and 4, one can calculate Q_3 , Q_4 and Q_7 putting the value of Q_3 , Q_4 and Q_7 one can calculate Q_c

$$Q_g = (m_7 \times h_7) + (m_4 \times h_4) - (m_3 \times h_3) \quad (9)$$

We also know that heat supplied to the generator is,

$$Q_g = m_{11} \times 4.2 \times (T_{11} - T_{12}) \quad (10)$$

On comparing equation (9) with (10), one can get m_{11}

Similarly by using energy balance, one can calculate m_{11}

$$m_{11} = \frac{(m_7 \times h_7) + (m_4 \times h_4) - (m_3 \times h_3)}{4.2 \times (T_{11} - T_{12})} \quad (11)$$

Condenser

On balancing the energy across the condenser, one can say;

$$Q_c + Q_8 = Q_7 \quad (12)$$

Since,

$$Q_8 = m_8 \cdot h_8 \quad (13)$$

$$Q_7 = m_7 \cdot h_7 \quad (14)$$

Enthalpy at thermodynamic state 8, calculated with the help of table at $T_c = T_8$

With the help of equation 13, 14, one can calculate Q_7 and Q_8

On putting the value of Q_7 and Q_8 in equation 12, one can get

$$Q_c = (m_7 \times h_7) - (m_8 \times h_8) \quad (15)$$

We also know that heat supplied to the condenser is,

$$Q_c = m_{15} \times 4.2 \times (T_{16} - T_{15}) \quad (16)$$

On comparing equation (15) with (16), one can get m_{15}

Similarly by using energy balance, one can calculate m_{15}

$$m_{15} = \frac{(m_7 \times h_7) - (m_8 \times h_8)}{4.2 \times (T_{16} - T_{15})}$$

Evaporator

On balancing the energy across the Evaporator, one can say;

$$Q_e + Q_9 = Q_{10} \quad (18)$$

Since,

$$Q_9 = m_9 \cdot h_9 \quad (19)$$

$$Q_{10} = m_{10} \cdot h_{10} \quad (20)$$

Enthalpy at thermodynamic state 9, calculated with the help of table at T_9

Enthalpy at thermodynamic state 10, calculated with the help of table at T_{10}

With the help of equation 19, 20, one can calculate Q_9 and Q_{10}

On putting the value of Q_9 and Q_{10} in equation 18, one can get,

$$Q_e = (m_{10} \times h_{10}) - (m_9 \times h_9) \quad (21)$$

We also know that heat Extracted from the evaporator is,

$$Q_e = m_{17} \times 4.2 \times (T_{18} - T_{17}) \quad (22)$$

On comparing equation (21) with (22), one can get m_{17}

Similarly by using energy balance, one can calculate m_{17}

Satish Raghuvanshi et al.,

$$m_{17} = \frac{(m_{10} \times h_{10}) - (m_9 \times h_9)}{4.2 \times (T_{18} - T_{17})} \tag{23}$$

Absorber

On balancing the energy across the Absorber, one can say,

$$Q_a + Q_1 = Q_6 + Q_{10} \tag{24}$$

Since,

$$Q_1 = m_1 \cdot h_1 \tag{25}$$

$$Q_6 = m_6 \cdot h_6 \tag{26}$$

$$Q_{10} = m_{10} \cdot h_{10} \tag{27}$$

Using Equation 8, one can estimate the enthalpy (h_1) and (h_6) at thermodynamic state 1 and 6

Enthalpy at thermodynamic state 10, calculated with the help of table at T_{10}

We have already found out m_1 and m_6 by using equation 5 and 6 for calculating T_5 , one can use the relation of effectiveness of Heat Exchanger

$$T_5 = -\varepsilon - \frac{T_4}{T_4 - T_2} \times (T_4 - T_2). \tag{28}$$

With the help of equation 25, 26 and 27, one can calculate $Q_1, Q_6,$ and Q_{10}

On putting the value of $Q_1, Q_6,$ and Q_{10} in equation 24, one can get,

$$Q_a = (m_6 \times h_6) + (m_{10} \times h_{10}) - (m_1 \times h_1) \tag{29}$$

We also know that heat Transfer from the absorber is,

$$Q_a = m_{13} \times 4.2 \times (T_{14} - T_{13}) \tag{30}$$

On comparing equation (29) with (30), one can get m_{13}

Similarly by using energy balance, one can calculate m_{13}

$$m_{13} = \frac{(m_6 \times h_6) + (m_{10} \times h_{10}) - (m_1 \times h_1)}{4.2 \times (T_{14} - T_{13})} \tag{31}$$

RESULTS AND DISCUSSION

Thermodynamic properties at the various states, energy flow rate at the various components of the system, Coefficient of performance of the system by using input parameters being calculated through the mathematical model on MATLAB. Summary of the same has been given in tables.

Variations in COP of the System with Temperature of inlet water to Generator

Figure 2 shows the influence of inlet water temperature to generator (T_{11}) on the system performance. It can be observed that when the T_{11} increases, the required circulation ratio decreases, and the system COP value increases. If the T_{11} is below 58°C , the COP of the system will be close to zero, the system does not work at all, and from 58°C to 83°C , the COP will increase in a slower pace, after 83°C of T_{11} , the COP increase rapidly, but as the heat source temperature increases, the heat transfer in all heat exchangers of the system also increases. The increased heat also results in increased heat transfer irreversibility and smaller increase of COP. This can be explained by the fact that, although while a system with a high T_{11} can produce more hot water vapor, it also has to supply more input energy and, as average temperatures rise, causes more energy losses in the generator, condenser, and absorber.

Satish Raghuvanshi et al.,

Variations in COP of the System with of Generator Temperature

Figure 3 shows the comparison of both the system ammonia water and lithium bromide water vapor absorption system. The COP of both the pair generally decreases by increasing the generator temperature. However it should be state that by definition, COP is equal to zero at minimum temperature. In other words, the COP first increases with T_g and then decrease. This pressure differential can be affected by fluid flow rates, the number of heat exchanger passes, pipe surface friction, bulk density and viscosity. If any deposits are present in the exchanger, the available surface area will reduce and the pressure differential will increase, thus resulting in an inadequate flow. If you notice a pressure difference, it's critical to quickly identify the cause.

Variations in COP of the System with Effectiveness of Heat Exchanger

Figure 4 shows the influence of Effectiveness of Heat Exchanger on the system performance. It can be observed that when the effectiveness of Heat Exchanger increases, than the value of COP of the system is also increases. The surface area available for heat exchange directly influences efficiency. Increase the surface area to provide more space for heat transfer between the fluids. This is why plate heat exchangers, with their extensive surface area, are often more efficient than other types. The operating temperature of the heat exchanger will affect how heat is exchanged. The stream temperatures can vary because of changes in the operating procedures. If there is any change in the stream temperature, it will create variations in the approaches, such as log mean difference and heat duty. A low approach difference will result in a corresponding log mean temperature difference and high load, and vice versa. If the operating temperatures exceed defined parameters, then the material will condense and form deposits that coat the interior of the heat exchanger. This will produce a wall temperature that will be lower than the bulk limit temperature. You must monitor the inlet and outlet temperature to maintain the correct operating temperature.

Variations in COP of the System with Condenser Temperature

Figure 5 shows the influence of condenser temperature on the system performance. The system COP decreases with the condenser temperature increase, at the same time, circulation ratio will increase. The influence of absorber temperature is almost the same as the influence of condenser temperature. The rationale is that a greater evaporator temperature will result in a higher absorbing pressure, which will significantly raise the strong solution's absorption efficiency. In contrast to COP, the system's Coefficient of Performance drops as the evaporator temperature rises. The second rule of thermodynamics' definition also explains why a lower evaporator temperature has a greater capacity to produce a cooling effect.

CONCLUSIONS

A feasibility Comparison study is usually conducted in order to determine the appropriateness and suitability of the selected fluid pairs. This is done before the expensive hardware development. In this Paper the first Law of Thermodynamics are applied to a single stage LiBr-Water absorption system and Ammonia water absorption system, the performance analysis of each component are calculated through mathematical model on MATLAB 7.0.1 and compare the results. In this study, related to ARS's are complied, and apart from the other studies, the effects of all performance parameters are investigated. From the above study, the following results can be drawn

- Empirical expressions to evaluate the thermodynamic properties at all the thermodynamic states and performance of a single stage LiBr-Water and Ammonia water vapour absorption system were presented, and the necessary heat and mass transfer equations for carrying out the components heat loads were specified.
- The energy analysis of all the thermodynamic components of both the Vapour Absorption System was determined by using empirical expressions. Moreover, the two pressures (Higher and Lower) were also derived. Finally, the value of Coefficient of performance was determined.
- The variations show that greater the difference between the absorber LiBr inlet and exit percentage ratios, more will be the coefficient of performance of the system. Moreover, coefficient of performance of the system goes on increasing with the rise in generator temperature.

Satish Raghuvanshi et al.,

- The thermal loads of the absorber and generator decrease, as generator and evaporator temperatures increases. The decrease of the generator thermal load increases the COP value.
- The VAR system using water lithium bromide solution with water as the refrigerant is predominantly for air conditioning applications. The VAR system using ammonia water with ammonia as a refrigerant has been used in large tonnage industrial application requiring low temperature for process work.

Results shows that,

- 1.The Coefficient of Performance of the both the pair system increases with increasing inlet water temperature to generator and evaporator temperatures.
- 2.As the generator temperature is increases than COP of the both the system decreases.
- 3.As we increase condenser and absorber temperatures than Coefficient of Performance of the both the system decreases.
- 4.As the effectiveness of Heat exchanger increases than COP of both the system is also increases.

Ultimately, the energy analysis findings reported in this paper can be utilized as a helpful instrument for assessing and enhancing the absorption system. It offers a quick and easy way to determine how losses at various devices are related to one another and where a particular design needs to be adjusted for optimal performance. Using MATLAB 7.0.1, I created a mathematical model of the LiBr-Water vapour absorption refrigeration system for this paper. All results were acquired through simulation. As a result, this approach gains versatility. All results will change if a parameter in the input box is altered. By changing the input parameters, we were able to assess this system and determine its ideal system coefficient of performance. In this Paper I have done energy analysis of Vapour Absorption Refrigeration system by generating empirical relations through curve fitting tool of MathCAD, and inserted these empirical relations in to the MATLAB. To the best of my knowledge, no one has created an empirical relationship and developed a MATLAB mathematical model for the Vapour Absorption System in order to perform an energy analysis of the system. These kinds of mathematical models can be used as an inspection tool and to improve system performance by adjusting only the parameters in the refrigeration and air conditioning sectors

ACKNOWLEDGEMENT

Every Endeavor that one undertakes requires an indomitable urge, perseverance, internal motivation and the proper guidance, especially when it is needed most. I feel immense pleasure in expressing my thankfulness towards my advisor, Dr. Naveen Kumar Agrawal, Professor and Head, Mechanical engineering Department, Sir Padampat Singhania University, Udaipur. I would like to use this opportunity to express my heartiest thanks to respected Dr. Abhinesh Kumar Prajapati, Professor of Chemical Engineering Department, IPS Academy, Institute of Engineering & Science, Indore, for his incessant and perpetual, support and encouragement during paper writing.

ABSTRACT

Nanotechnology has emerged as a transformative solution for air pollution control and prevention, offering novel approaches to tackle pressing environmental challenges. This review examines the latest advancements in the application of nanomaterials to combat air pollution, focusing on their unique properties, mechanisms, and roles in promoting environmental sustainability. Notable nanomaterials such as carbon nanotubes (CNTs), quantum dots, catalytic ceramic membranes, porous nanopolymers, and gold-silica nanocomposites demonstrate exceptional capabilities in pollutant detection, adsorption, and degradation. Nanomaterials facilitate the precise monitoring of toxic gases, heavy metals, and particulate matter through cutting-edge nanosensors. Methods utilizing CNTs and quantum dots enable high-sensitivity, real-time detection—essential for efficient air quality management. Adsorption techniques with functionalized CNTs effectively target volatile organic compounds (VOCs) and industrial pollutants, while catalytic membranes and nanocatalysts play a crucial role in breaking down harmful gases and organic contaminants, reducing their environmental impact. Furthermore, nanomaterials like nano-silica membranes and CNT-based composites are integral to carbon capture technologies, aiding in the mitigation of greenhouse gas emissions. In addition, nanocomposites such as TiO₂ and ZnO are increasingly utilized in water and wastewater treatment for enhanced pollutant removal and filtration. Porous nanopolymers excel in addressing challenges related to organic pollutant extraction, while gold-silica structures leverage surface plasmon resonance for sensitive heavy metal detection. Catalytic converters incorporating perovskites and metal oxides present cost-effective solutions for the reduction of NO_x and CO emissions. Despite these advancements, challenges such as high costs, scalability issues, and environmental risks associated with nanomaterial use remain. Overcoming these obstacles demands further research, regulatory development, and sustainable practices. This review

**Partha Protim Borthakur**

highlights the pivotal role of nanotechnology in fostering cleaner, more sustainable environments, contributing to global efforts in ecosystem preservation and public health improvement.

Keywords: Nanomaterials, Air pollution control, Environmental sustainability, Carbon nanotubes (CNTs), Nanosensors, Adsorption technologies, Catalytic membranes

INTRODUCTION

Air pollution is one of the most pressing environmental challenges of the 21st century, adversely impacting human health, ecosystems, and climate systems. Nanomaterials have emerged as a revolutionary class of materials with immense potential for air pollution management. Defined by their nanoscale dimensions and unique physicochemical properties, nanomaterials exhibit high surface area, enhanced reactivity, making them ideal for pollutant removal. Their ability to adsorb, degrade, and neutralize harmful pollutants through advanced mechanisms such as photocatalysis and catalytic oxidation has positioned them at the forefront of clean air technologies. Adsorption is one of the primary mechanisms by which nanomaterials operate; nano adsorbents, with their high surface area-to-volume ratio, efficiently trap and remove pollutants from the air (Chen *et al.*, 2011; Shan *et al.*, 2009). Catalysis is another critical function; for example, nanocatalysts like titanium dioxide (TiO₂) photocatalytically degrade harmful pollutants, such as NO_x and SO_x, converting them into less harmful substances (Shan *et al.*, 2009; Prasad & Gupta, 2024). Filtration systems incorporating nanostructured membranes physically remove particulate matter and contaminants due to their ultra-fine pore sizes (Mammadova *et al.*, 2022; Meda *et al.*, 2022). Additionally, nanosensors enable real-time monitoring of air quality, detecting harmful gases and pollutants at low concentrations (Shan *et al.*, 2009; Gogoi *et al.*, 2023). Notably, materials like titanium dioxide and its composites demonstrate remarkable capabilities in air pollution abatement. Their high surface area and reactivity make them exceptional as adsorbents, catalysts, and sensors (Gogoi *et al.*, 2023; Kumar *et al.*, 2022). This review explores recent progress in the development and application of nanomaterials for air pollution control, highlighting their diverse capabilities in removing gaseous pollutants and particulate matter. It also delves into the challenges associated with their scalability, environmental impact, and cost-effectiveness. Finally, the paper outlines future research directions and opportunities for integrating nanomaterials into sustainable pollution management strategies, aligning with global efforts to combat air pollution and achieve cleaner, healthier living conditions. By examining the current state of knowledge, this review aims to provide a comprehensive understanding of the role of nanomaterials in advancing air pollution mitigation technologies.

Applications of Nanomaterials in Air Pollution Control

Air pollution, caused by the release of particles, biological molecules, or harmful compounds into the atmosphere, poses a significant threat to ecosystems and human health. Sources of pollution range from natural processes, such as volcanic eruptions, to human activities like fossil fuel combustion, which generate primary pollutants such as carbon monoxide (CO) and nitrogen oxides (NO_x) (Saleem *et al.*, 2021). In addition, secondary pollutants, such as peroxyacetyl nitrate, form through chemical reactions involving primary pollutants and further exacerbate environmental damage (Sha & Bhattacharyya, 2020). Addressing air pollution effectively requires continuous monitoring to assess and mitigate its impacts. Nanosensors have emerged as a powerful tool in air quality monitoring due to their high sensitivity and precision in detecting a wide range of pollutants. These advanced devices leverage nanomaterials' unique properties, such as high surface area and tunable functionality, to detect toxic gases, particulates, and other contaminants at extremely low concentrations (Brahmkhatri *et al.*, 2021, Borthakur & Borthakur., 2025). Recent developments in nanosensor technology, such as the integration of smart dust, have further enhanced the potential for air pollution management. Smart dust consists of lightweight, miniaturized nanocomputers capable of airborne pollutant detection and wireless data transmission, providing real-time insights with remarkable precision (Mengali & Quarta, 2016; Niccolai *et al.*, 2019). The deployment of such systems has demonstrated practical applications in monitoring complex environments. For example, smart spraying systems equipped with nanosensors have been used in underground coal mines to control airborne PM10 and PM2.5 dust,

**Partha Protim Borthakur**

effectively reducing worker exposure to harmful particles (Bałaga *et al.*, 2021). These advancements underline the potential of nanosensors to revolutionize pollution monitoring by enabling data-driven strategies to mitigate environmental and health risks.

Types of air pollutant**Gaseous Pollutants**

Nanomaterials are widely used to remove gaseous pollutants such as nitrogen oxides (NO_x), sulfur oxides (SO_x), carbon monoxide (CO), and volatile organic compounds (VOCs), which are major contributors to air pollution. Nano adsorbents, like activated carbon nanotubes (CNTs) and metal-organic frameworks (MOFs), efficiently capture and adsorb these gases due to their large surface area and pore structures. Nanocatalysts, particularly titanium dioxide (TiO₂), play a crucial role in degrading harmful gases through photocatalytic oxidation. For example, TiO₂ nanoparticles are capable of converting NO_x and SO_x into less harmful substances like nitrates and sulfates under ultraviolet (UV) light. Other nanocatalysts, such as palladium and platinum nanoparticles, are integrated into catalytic converters to oxidize CO into CO₂ and facilitate VOC decomposition.

Particulate Matter (PM)

Particulate matter, particularly PM_{2.5} and PM₁₀, poses severe risks to human health and the environment. Nanomaterials are employed to capture and reduce PM levels through advanced filtration mechanisms. Nanostructured membranes, featuring ultra-fine pore sizes, serve as physical barriers to trap airborne particles. Carbon-based nanomaterials, such as graphene oxide and CNTs, enhance these filters by providing high mechanical strength and adsorption capacity, ensuring efficient PM capture. Electrospun polymer nanofibers, embedded with nanoparticles, are also used in air filters to trap particulates while maintaining high permeability and low-pressure drops. These filters are effective in industrial and residential applications, offering superior performance compared to conventional filters. For example, air filtration systems using graphene-based membranes have demonstrated a significant reduction in PM_{2.5} concentrations in polluted urban areas. Additionally, hybrid nanomaterials, such as CNT-metal oxide composites, provide enhanced filtration and catalytic decomposition of particles, ensuring sustainable PM management.

Indoor Air Quality Improvement

Indoor air pollution poses significant health risks, particularly in poorly ventilated spaces. Nanomaterials have been incorporated into air purifiers and ventilation systems to improve indoor air quality. Air purifiers equipped with nanofilters effectively remove PM, VOCs, and other contaminants. For example, nano-silver particles are incorporated for their antimicrobial properties, reducing bacterial and fungal growth in enclosed spaces. Nanocatalysts, such as TiO₂, are used to decompose VOCs and other organic pollutants indoors, ensuring cleaner air. Antimicrobial nanomaterials, including silver nanoparticles and zinc oxide, are also integrated into building materials, air conditioning systems, and surface coatings to combat microbial contaminants. These materials inhibit the growth of pathogens, enhancing air hygiene in hospitals, offices, and homes. Moreover, nanosensors installed in smart indoor systems enable real-time air quality monitoring, allowing for proactive measures to maintain safe air conditions.

Types of Nanomaterials Used in Air pollution control

Nanomaterials have revolutionized air pollution management by offering advanced solutions for mitigating both gaseous and particulate pollutants. Their nanoscale dimensions, coupled with high surface area and unique chemical reactivity, make them indispensable in developing efficient pollution control technologies. This section provides an overview of the key classes of nanomaterials utilized in air pollution management, highlighting their unique characteristics and applications. Metal and metal oxide nanoparticles are among the most widely studied nanomaterials for air pollution control. Metal nanoparticles, such as silver, gold, and platinum, exhibit exceptional catalytic properties, making them effective in breaking down toxic gases like nitrogen oxides (NO_x) and carbon monoxide (CO). Metal oxides, including titanium dioxide (TiO₂), zinc oxide (ZnO), and iron oxide (Fe₂O₃), are extensively used in photocatalytic and adsorption processes. For instance, titanium dioxide is a highly effective

Partha Protim Borthakur

photocatalyst capable of degrading harmful pollutants under ultraviolet (UV) light, converting them into less harmful substances. These nanoparticles also find applications in catalytic converters and air purification systems due to their ability to promote oxidation-reduction reactions. Carbon-based nanomaterials, such as carbon nanotubes (CNTs), graphene, and fullerenes, have garnered significant attention due to their outstanding mechanical, thermal, and electrical properties. Carbon nanotubes, with their hollow tubular structures, provide large surface areas for adsorption, enabling efficient capture of gaseous pollutants and particulate matter. Graphene, a two-dimensional nanomaterial, exhibits remarkable adsorption capacity and conductivity, making it a promising candidate for pollutant removal and air quality sensors. Functionalized graphene derivatives further enhance pollutant interaction, allowing for more targeted and efficient air purification. Polymer-based nanomaterials are increasingly being explored for air pollution applications due to their versatility, lightweight nature, and ease of synthesis. These materials often incorporate functional groups that interact with pollutants, improving their capture efficiency. For example, polymer-based membranes and filters embedded with nanoparticles have demonstrated superior performance in removing particulate matter and toxic gases. Additionally, conductive polymers, such as polyaniline and polypyrrole, have been used in air quality sensors to detect pollutants at low concentrations with high accuracy. Their tunable properties and compatibility with other nanomaterials make them highly adaptable for integrated air pollution management solutions. Hybrid and composite nanomaterials combine the advantages of different nanomaterial classes, creating multifunctional systems with enhanced performance. By integrating metal oxides with carbon-based materials or polymers, these composites achieve synergistic effects that improve adsorption, catalysis, and filtration efficiency. For instance, titanium dioxide-graphene composites exhibit superior photocatalytic activity compared to individual components, making them ideal for degrading a wide range of pollutants. Similarly, polymer-metal oxide composites enhance mechanical stability and chemical reactivity, enabling their use in advanced air filtration and catalytic applications. Based on their applications, nanomaterials used in air pollution mitigation can be categorized into nano-adsorbents, nanocatalysts, nanofilters, and nanosensors as shown in figure 1, each designed for specific roles in controlling air pollution.

Nano Adsorbents These nanomaterials, including carbon-based materials like carbon nanotubes and graphene, are highly effective in adsorbing contaminants from the air. Their large surface area and high reactivity enable them to capture pollutants such as volatile organic compounds (VOCs), heavy metals, and particulate matter, significantly improving air quality (Mammadova *et al.*, 2022), (Saleem *et al.*, 2022a), (Saleem *et al.*, 2022b).

Nanocatalysts These materials are employed for catalytic degradation of pollutants. Titanium dioxide (TiO₂) and its composites, for instance, are widely used for photocatalysis, facilitating the breakdown of harmful substances such as nitrogen oxides (NO_x) and sulfur oxides (SO_x) into less harmful byproducts (Mammadova *et al.*, 2022), (Dhir, 2023).

Nanofilters Nanostructured membranes with small pore sizes are effective in trapping particulate matter and other air pollutants. By physically blocking contaminants, these filters play a crucial role in improving the quality of breathable air (Mammadova *et al.*, 2022), (Sheoran *et al.*, 2024).

Nanosensors Nanosensors are highly sensitive devices used for the detection of harmful gases and pollutants. They enable real-time air quality monitoring by identifying gases such as hydrogen sulfide, sulfur dioxide, and nitrogen dioxide at extremely low concentrations (Arya, 2017), (Singh *et al.*, 2023).

Mechanisms of Nanomaterials in Air Pollution Management

Nanomaterials are at the forefront of innovative solutions for air pollution management, leveraging their unique physical and chemical properties to address complex environmental challenges. Their key mechanisms include adsorption, catalysis, filtration, sensing, and photocatalytic applications, each offering specific benefits in mitigating pollutants.

**Partha Protim Borthakur****Adsorption**

One of the most effective mechanisms, adsorption, involves the use of nanoadsorbents, such as carbon-based materials like carbon nanotubes and graphene, as well as metal-based nanomaterials. These materials are characterized by their exceptionally large surface areas and high reactivity, enabling them to efficiently capture pollutants from the air (Ahmad *et al.*, 2023), (Neto *et al.*, 2019). Nanoadsorbents can target contaminants such as volatile organic compounds (VOCs), heavy metals, and particulate matter, significantly reducing their concentration in the atmosphere (Mammadova *et al.*, 2022), Sheoran *et al.*, 2024, Saleem *et al.*, 2022) The elimination of toxic gases through nanotechnology has significantly advanced with the development of carbon nanotubes (CNTs) modified with gold or platinum nanoparticles. CNTs, characterized by their hexagonal grapheme layer structure and one-dimensional configuration, exhibit exceptional thermal stability and chemical reactivity. These properties make them superior adsorbents for both organic and inorganic contaminants in aquatic and atmospheric environments (Cui *et al.*, 2018; Adavan *et al.*, 2021). Benzene derivatives, including dioxins, toluene, and ethylbenzene, are effectively adsorbed by CNTs due to their porous structure and functionalized surfaces. Chemical and thermal treatments can further enhance the adsorption capacity of CNTs, tailoring them for specific applications. For example, functionalization through oxidation processes improves the affinity of CNTs for benzene derivatives. The high resistance of CNTs to oxidation enables their efficient regeneration at elevated temperatures, making them a sustainable option for toxic gas adsorption in industrial environments (Su *et al.*, 2010; Mubeen *et al.*, 2021).

Adsorption of Nitrogen Oxides (NO_x)

Nitrogen oxides (NO_x) are harmful pollutants produced from the incomplete combustion of fossil fuels, contributing to smog formation and acid rain. Carbon nanotubes (CNTs) have demonstrated the ability to adsorb NO_x by facilitating substrate interactions that synthesize and adsorb NO₂ on their surfaces. This process is supported by the high thermal stability, chemical reactivity, and unique surface structure of CNTs, which enhance their adsorption capacity (Dai *et al.*, 2009; Shukla *et al.*, 2021). Compared to traditional adsorbents like zeolites and activated carbon, CNTs provide superior adsorption efficiency and regeneration potential, making them an effective alternative for NO_x mitigation in industrial and vehicular emissions control (Sun *et al.*, 2021; Bian *et al.*, 2021).

Adsorption of Carbon Dioxide (CO₂)

Carbon dioxide (CO₂) is a major greenhouse gas contributing to global warming. The increasing focus on carbon capture and storage (CCS) has driven the development of advanced materials such as CNTs, nano-silica, and zeolites for large-scale CO₂ adsorption. CNT-based membranes exhibit exceptional efficiency in capturing CO₂, offering lower energy requirements compared to traditional amine-based processes. These properties make CNTs a sustainable and energy-efficient solution for carbon management, particularly in fossil fuel power plants (Baghery *et al.*, 2019). Their high surface area and functionalized surfaces enhance the adsorption process, contributing significantly to the efforts in reducing atmospheric CO₂ levels.

Adsorption of Dioxins

Dioxins, classified as persistent organic pollutants, are highly toxic compounds with prolonged environmental lifetimes. These pollutants are typically released during the combustion of organic materials in incinerators, posing significant environmental and health risks. Conventional methods, such as activated carbon adsorption, have long been employed to mitigate dioxin emissions. However, recent advancements demonstrate that carbon nanotubes (CNTs) provide a more effective solution, offering up to three times greater efficiency compared to traditional adsorbents. The enhanced performance of CNTs is attributed to their unique curved surfaces, which generate stronger interaction forces with dioxin molecules, leading to more efficient adsorption (Chang *et al.*, 2011; Fagan *et al.*, 2007). Compared to conventional materials such as clay, alumina, and zeolites, CNT-based adsorption systems represent a significant breakthrough in industrial dioxin mitigation. These systems not only outperform traditional materials but also enable the development of compact and scalable technologies for emission control. For instance, CNTs' ability to adsorb dioxins effectively under various conditions makes them ideal for deployment in diverse industrial processes. Their robustness and reusability further enhance their appeal as a sustainable option for pollution control (Lei *et al.*, 2021). Studies have also highlighted the potential of CNTs in conjunction with catalytic

**Partha Protim Borthakur**

systems for even greater efficiency. By integrating CNTs with palladium-based catalysts, for example, hydrodechlorination processes can be significantly improved, resulting in enhanced decomposition of dioxins into less harmful byproducts. These innovations mark a critical step forward in addressing the global challenge of dioxin emissions, particularly in industrial contexts such as waste incineration and chemical manufacturing (Cobo et al., 2009).

Catalysis

Catalysis, particularly photocatalysis, is another critical mechanism enabled by nanomaterials like titanium dioxide (TiO_2) and its composites. These nanocatalysts generate reactive oxygen species under light exposure, which break down harmful pollutants such as nitrogen oxides (NO_x), sulfur oxides (SO_x), and carbon oxides (CO_2) into less harmful substances (Saleem et al., 2022), (Meda et al., 2022). This process not only removes airborne pollutants but also supports sustainable air quality management in urban and industrial settings (Kumar et al., 2022). Nanoparticle catalysis offers a promising avenue for air pollution control due to the unique properties of nanomaterials, including high surface area, reactivity, and multifunctionality as adsorbents, catalysts, and sensors (Ghosh et al., 2024; Qi et al., 2023; Wu et al., 2022). Various mechanisms underpin the effectiveness of nanoparticle catalysis. Photocatalysis, for instance, leverages materials like titanium dioxide (TiO_2) and its composites, which are effective in mitigating pollutants such as NO_x , SO_x , and CO_2 , with potential applications in urban environments through coatings and construction materials (Nanoaerosol, 2014; Sun et al., 2024). Enhancing photocatalytic efficiency can be achieved by grafting metals like copper or iron onto TiO_2 , which improves ozone decomposition (Patzsch & Bloh, 2018). Catalytic oxidation represents another key mechanism, utilizing core-shell nanomaterials such as manganese and cerium-based variants for the effective removal of pollutants like ammonia (NH_3) and volatile organic compounds (VOCs) due to their thermal stability and shape-selective properties (Saleem et al., 2022). Plasma catalysis, integrating dielectric barrier discharge (DBD) reactors with nanocatalysts like $\text{Au}/\gamma\text{-Al}_2\text{O}_3$, further enhances VOC oxidation while minimizing harmful by-products (Kumar et al., 2022). Reductive catalysis, using metal nanoparticles such as palladium (Pd), facilitates the selective reduction of pollutants including nitrates and halogenated hydrocarbons (Gana et al., 2024). Applications of nanoparticle catalysis span various domains. In vehicle emissions control, catalytic converters with nanoparticle coatings effectively reduce NO_x and CO emissions (Pui et al., 2008). Industrial exhausts benefit from nanostructured membranes and filters that capture and degrade pollutants, thereby improving air quality (Ghosh et al., 2024). Indoor air quality can be enhanced by recirculating filtration systems employing nanocatalysts to reduce nanoparticle concentrations, thereby mitigating health risks (Strathmann et al., 2014). However, challenges remain. The potential environmental and health risks posed by the release of nanoparticles into the environment necessitate rigorous monitoring and management to ensure safe application (Xiang et al., 2005). Scaling up nanoparticle catalysis for widespread industrial use also presents technical and economic challenges (Ghosh et al., 2024; Wu et al., 2022). Future research directions emphasize the development of more efficient, stable nanocatalysts with improved selectivity and durability, alongside integrating sustainable practices for responsible implementation (Saleem et al., 2022; Meda et al., 2022).

Filtration

Air pollution control through nanoparticle filtration is a highly effective and innovative approach leveraging the unique properties of nanomaterials. Fibrous and membrane filters play a significant role in capturing nanoparticles via mechanisms such as interception, diffusion, and electrostatic attraction. Fibrous filters, particularly those incorporating nanofiber layers, offer high efficiency due to their large surface area and small pore sizes (Bian et al., 2024; Nam et al., 2019; Pui et al., 2008). Nanostructured membranes, including electrospun nanofibers and microporous polymeric variants, provide additional benefits by efficiently removing both particulate and molecular contaminants while maintaining low air-flow resistance (Moridi et al., 2018; Sachinidou et al., 2017). Filtration mechanisms employ nanostructured membranes and nanofilters with minuscule pore sizes to physically remove pollutants from the air. These filters are capable of trapping particulate matter, heavy metals, and organic pollutants, thereby preventing them from entering breathable air (Mammadova et al., 2022), (Neto et al., 2019). Among the types of nanomaterials used, electrospun nanofibers are notable for their effectiveness in capturing fine particulate matter (PM_{2.5}) and nanoparticles. Enhancements with additives further improve their filtration efficiency and durability

Partha Protim Borthakur

(Pui et al., 2008; Komaladewi et al., 2019). Metal-organic frameworks (MOFs), when integrated into nanofibers, enhance filtration performance by adding adsorption sites and maintaining low pressure drops (Sachinidou et al., 2017). Graphene oxide (GO)-based composites are another advanced option, excelling in removing pollutants like formaldehyde and sulfur dioxide, making them suitable for both indoor and industrial applications (Mohraz et al., 2019). Nanoparticle filtration technologies find applications in various areas. In automobiles and indoor environments, recirculating air filtration systems effectively reduce nanoparticle concentrations, offering a cost-effective solution to minimize exposure to harmful particles (Wang & Tronville, 2014). Personal protective equipment (PPE), such as nanoparticle-coated masks, demonstrates enhanced filtration efficiency for particulate matter and viruses, ensuring effective personal protection (Mohamed et al., 2023). Industrial filtration systems, including nanofiber filters and hybrid systems like ESP Bag Filters, are recognized for their high filtration efficiency and economic feasibility (Nag, 2022). Despite its potential, nanoparticle filtration faces challenges. Standardization and testing methods need to be refined, with international standards currently focusing on measuring minimum efficiency at the most penetrating particle size (Bian et al., 2024; Bortolassi et al., 2014). Additionally, scalability and cost remain significant hurdles, prompting ongoing research to improve production methods and develop environmentally friendly materials (Komaladewi et al., 2019; Liu et al., 2024).

Sensing and Monitoring

The emission and monitoring of toxic gases in industrial environments remain significant environmental challenges. Carbon nanotube (CNT) sensors, which feature single-layer nanotubes approximately 1 nm in thickness, have proven highly effective in detecting and absorbing toxic gas molecules. These sensors can identify minute quantities of hazardous gases, including nitrogen dioxide (NO₂) and ammonia (NH₃), as well as biochemical agents used in warfare (MesriGundoshmian et al., 2021; Meng, 2018). Nanosensors have revolutionized pollutant detection by providing fast, accurate, and molecular-level measurements. These devices, functioning as energy converters, detect physical, chemical, or biological changes and produce corresponding electrical or optical signals [Mammadova et al., 2022]. Their ability to enhance process control, ecosystem monitoring, and decision-making underpins their growing popularity in environmental applications. By enabling real-time pollutant detection at the nanoscale, these sensors play a critical role in supporting sustainable health and environmental initiatives. Nanosensors represent a breakthrough in real-time air quality monitoring. These sensors, which incorporate nanomaterials, offer unparalleled sensitivity and precision in detecting harmful gases such as hydrogen sulfide, sulfur dioxide, and nitrogen dioxide at extremely low concentrations (Pandey & Mishra, 2014), (Arya, 2017). The ability of nanosensors to provide continuous monitoring and early warnings enhances pollution management and allows timely interventions (Samriti et al., 2023). Advanced materials such as ultra-thin SnO₂ films have also demonstrated remarkable sensitivity, particularly in detecting sulfur dioxide (SO₂) and hydrogen sulfide (H₂S), underlining their importance in toxic gas monitoring (Griessler et al., 2011). Moreover, multi-walled carbon nanotubes (MWCNTs) functionalized with nanoparticles of platinum, silver, or copper enable selective detection of specific gases, enhancing the accuracy and efficiency of monitoring systems (Sharafeldin et al., 2021). Heavy metal pollution, associated with severe health risks like cardiovascular diseases and cancer, poses a persistent challenge due to the non-biodegradable nature of these pollutants. They persist in air, water, and soil, necessitating robust detection and remediation strategies. Quantum dot nanomaterials have emerged as advanced tools for detecting heavy metal ions due to their high specificity, reactivity, and unique optical properties (Numan et al., 2021; Kharwar & Singh, 2021). For example, graphene quantum dots have been used in optical sensors for their stability, ease of fabrication, and capability to detect metals such as ferric iron (Fe³⁺) in complex environments (Zhang et al., 2018). Additionally, eco-friendly quantum dots derived from green algae waste provide a sustainable alternative, combining biocompatibility with advanced sensing capabilities for heavy metal detection (Liu et al., 2020). These advancements in toxic gas and heavy metal ion detection represent significant progress in environmental monitoring and remediation technologies, paving the way for safer industrial practices and improved public health outcomes.

Photocatalytic Coatings

Nanomaterials such as TiO₂ are also applied as photocatalytic coatings on buildings and other surfaces. These coatings harness sunlight to activate the nanomaterials' photocatalytic properties, enabling the breakdown of

**Partha Protim Borthakur**

pollutants directly on the coated surfaces. This mechanism is particularly effective in urban areas, where pollution levels are high, and offers a passive yet impactful approach to improving air quality (Meda et al., 2022), (Kumar et al., 2022). Volatile organic compounds (VOCs), such as acetaldehyde, toluene, and hexane, are harmful to both air quality and human health. Nanomaterials, particularly manganese oxide-based catalysts coated with gold nanoparticles, have proven effective in decomposing VOCs at room temperature. These materials outperform conventional photocatalysts and adsorbents by offering higher efficiency and stability. Innovations in this field address the limitations of traditional systems, such as high energy consumption and restricted pollutant range, providing a viable solution for both indoor and outdoor air quality improvement (Parvizi et al., 2021; Hosseini et al., 2016). Additionally, plasma catalytic systems using nanocatalysts like Au/ γ -Al₂O₃ have demonstrated enhanced energy efficiency and reduced nanoparticle emissions, further advancing VOC oxidation technologies (Wu et al., 2022).

Advantages

Nanomaterials offer several advantages over traditional pollution control methods, including efficiency, versatility, and real-time monitoring capabilities.

High Efficiency Due to their high surface-to-volume ratio, nanomaterials exhibit enhanced reactivity, making them exceptionally efficient at capturing and degrading pollutants (Taran et al., 2021), (Kumar et al., 2022).

Versatility Nanomaterials can be tailored to target a wide variety of pollutants, including gases, particulate matter, and VOCs. Their adaptability in the form of adsorbents, catalysts, filters, and sensors enhances their utility in diverse applications (Mammadova et al., 2022), (Saleem et al., 2022a).

Real-Time Monitoring Nanosensors provide immediate feedback on air quality, enabling timely interventions. Their sensitivity allows for the detection of pollutants at very low concentrations, which is crucial for urban and industrial environments (Arya, 2017), (Singh et al., 2023).

Environmental Benefits Nanomaterials, including nanoadsorbents, nanocatalysts, nanofilters, and nanosensors, play a pivotal role in addressing air pollution challenges, offering numerous environmental advantages. These advanced materials possess the capability to adsorb various air contaminants effectively, making them highly suitable for photocatalytic remediation applications (Kumar et al., 2023). Nanostructured membranes equipped with minuscule pores enable the efficient separation of pollutants from exhaust emissions, thus contributing significantly to the control of air contamination (Darwesh et al., 2022). Moreover, nanomaterial-enabled sensors are instrumental in detecting harmful gases, which enhances air quality monitoring and management capabilities (Gogoi et al., 2023). The unique properties of nanomaterials, such as their high surface area and reactivity, render them valuable components in pollution remediation systems, highlighting their potential in improving environmental conditions (Darwesh et al., 2022).

Challenges and Concerns

Despite their potential, the widespread application of nanomaterials in air pollution management faces challenges. Concerns about their toxicity and environmental impact persist, particularly regarding the long-term accumulation of nanoparticles and their effects on human health and ecosystems (Ahmad et al., 2023), (Mammadova et al., 2022). Additionally, efforts are being made to develop modified nanomaterials (MNMs) with enhanced stability, reduced aggregation, and improved efficiency to address these concerns and optimize their performance (Sheoran et al., 2024, Boro et al., 2025, Sonowal et al., 2025).

Toxicity There is growing concern over the potential toxicity of nanomaterials to humans and the environment. Their accumulation in ecosystems and possible health impacts necessitate further research (Mammadova et al., 2022), (Arya, 2017).

**Partha Protim Borthakur**

Regulation The lack of comprehensive regulatory frameworks for nanomaterials in environmental applications poses a barrier to their widespread use. Clear guidelines on their production, usage, and disposal are critical (Singh et al., 2024, Pathak et al., 2023).

Scalability The high cost and complexity of producing nanomaterials at scale remain significant challenges. Addressing these barriers is crucial for broader adoption (Ruíz-Santoyo et al., 2024).

Potential Health Risks Despite their environmental benefits, concerns persist regarding the potential health and ecological risks posed by nanomaterials. The uncertainties in their size, shape, and chemical compositions raise the possibility of adverse effects on both the environment and human health (Kumar et al., 2023). Nanoparticles, due to their diminutive size, have the potential to remain suspended in the air for extended periods, allowing them to accumulate in the environment. This accumulation can lead to detrimental impacts on various bodily organs, posing significant health risks to humans (Abdeltif et al., 2020), (Saleem et al., 2022).

The large-scale implementation of nanomaterials in air pollution management faces significant challenges. Irregularities in their size, shape, and chemical composition, coupled with concerns over their toxicity, hinder their practical application (Kumar et al., 2023). Additionally, regulatory frameworks and practical obstacles must be addressed to facilitate the widespread adoption of these materials (Taran et al., 2021). Emerging concerns about the inhalation of nanoparticles and ultrafine particulates highlight the necessity for comprehensive toxicity assessments and rigorous risk evaluations to ensure safe applications (Bakand et al., 2012, Borthakur, 2025).

CONCLUSION AND FUTURE DIRECTIONS

Conclusion

Nanomaterials have demonstrated transformative potential in addressing air pollution challenges through their unique properties and diverse applications. As highlighted in this review, their ability to adsorb, degrade, and neutralize harmful pollutants positions them at the forefront of clean air technologies. Carbon nanotubes (CNTs), graphene, quantum dots, and nanocatalysts such as titanium dioxide have shown exceptional capabilities in capturing gaseous pollutants, particulate matter, and volatile organic compounds (VOCs). These materials also enhance the performance of catalytic converters, air filtration systems, and real-time air quality monitoring devices. The integration of nanotechnology into air pollution management offers numerous advantages, including high efficiency, adaptability, and the capacity for real-time monitoring. For instance, nanosensors enable the detection of toxic gases and particulates at molecular levels, providing timely data for environmental interventions. Moreover, the use of nanostructured membranes in air purification systems significantly improves their capacity to remove fine particles and gaseous contaminants. These advancements are crucial for urban and industrial applications where pollution levels are critically high. However, challenges remain in scaling up nanomaterial technologies for widespread adoption. Concerns about environmental toxicity, high production costs, and the lack of comprehensive regulatory frameworks must be addressed to ensure safe and sustainable use. Innovations such as green synthesis methods and modifications to enhance the stability of nanomaterials present promising pathways for overcoming these barriers.

Future Directions

The future of nanomaterials in air pollution management is rooted in the pursuit of sustainable and integrated approaches, aimed at addressing current limitations while maximizing their effectiveness. Advancements in synthesis methods, material stability, and integration with cutting-edge technologies are key to achieving these goals. One of the foremost priorities is the development of eco-friendly production methods for nanomaterials. Traditional synthesis processes often involve toxic chemicals and energy-intensive procedures, raising concerns about environmental and health impacts. Green synthesis, utilizing biological, plant-based, or waste-derived precursors, offers a sustainable alternative. By minimizing toxic byproducts and reducing energy consumption, green synthesis can make nanomaterials more sustainable and accessible for large-scale applications. For instance, biologically

**Partha Protim Borthakur**

synthesized nanoparticles have demonstrated effective pollutant removal capabilities, making them promising candidates for air purification systems (Ahmad et al., 2023). Moreover, adopting these methods aligns with global efforts to reduce the ecological footprint of industrial processes. Nanomaterials often face challenges related to instability and aggregation, which can limit their efficiency in air pollution control. Modifications to enhance stability, such as surface functionalization or the use of stabilizing agents, can significantly improve their performance. Enhanced stability ensures prolonged functionality and consistency in diverse environmental conditions, from high-temperature industrial settings to fluctuating urban climates. Stable nanomaterials not only deliver better pollutant adsorption and catalytic efficiency but also reduce material loss, contributing to cost-effectiveness and sustainability (Ahmad et al., 2023). These modifications are particularly vital for applications like carbon capture, where material durability is critical to long-term success. The integration of nanomaterials with advanced technologies offers immense potential for creating robust and efficient air pollution management systems. For example, combining nanomaterials with Internet of Things (IoT)-enabled devices can enable real-time air quality monitoring and adaptive responses to changing pollution levels. Similarly, hybrid systems that incorporate nanomaterials into catalytic membranes, filtration systems, or photocatalytic coatings can address multiple pollution sources simultaneously. In urban environments, these integrated systems could revolutionize pollution management by targeting vehicular emissions, industrial discharges, and indoor air quality in a unified manner (Sheoran et al., 2024). Furthermore, the synergy between nanotechnology and renewable energy sources, such as solar-powered air purification, could pave the way for sustainable and energy-efficient solutions (Borthakur et al., 2025).

Table.1. Mechanisms of Nanomaterials in Air Pollution Management

Mechanism	Nanomaterials Used	Key Pollutants Targeted	Benefits	Limitations
Adsorption	Carbon nanotubes (CNTs), graphene, metal-based nanomaterials	VOCs, heavy metals, particulate matter	High efficiency, large surface area, reusability	Potential toxicity, challenges in regeneration
Catalysis	Titanium dioxide (TiO ₂), TiO ₂ composites	NO _x , SO _x , CO ₂	Efficient degradation of pollutants, supports sustainable air management	High cost, scalability issues
Filtration	Nanostructured membranes, nanofilters	Particulate matter, heavy metals, organic pollutants	Enhanced air purification, adaptable for industrial and residential use	Complex manufacturing processes, limited durability
Sensing and Monitoring	Carbon nanotube sensors, quantum dots, ultra-thin SnO ₂ films	Harmful gases (H ₂ S, SO ₂ , NO ₂), heavy metals	Real-time monitoring, high sensitivity and precision	Lack of established regulations, potential for data inaccuracies
Photocatalytic Coatings	Titanium dioxide (TiO ₂), manganese oxide-based catalysts	Urban air pollutants, VOCs	Passive air quality improvement, effective in urban areas	Scalability concerns, long-term durability issues

ABSTRACT

Cyber threats like phishing, malware, ransomware, and injection attacks pose significant risks to individuals and organizations, leading to data breaches, financial losses, and compromised security loopholes. Prevention of such threats at various levels needs special attention as current measures like Content Security Policy (CSP), Same-Origin Policy (SOP), and HTTPS fail to fully prevent injection attacks. CSP helps mitigate Cross-Site Scripting (XSS) attacks but can be exploited through trusted sources. SOP restricts cross-origin access but cannot prevent attacks exploiting XSS, CORS (Cross-origin resource sharing) misconfigurations, or JSONP (JSON with Padding) vulnerabilities. HTTPS encrypts data during transmission but does not protect it inside the application. Weak input validation and misconfigured Web Application Firewalls (WAFs) also allow attackers to bypass security measures. A more robust security framework is needed, incorporating stronger input validation, real-time threat detection, and machine learning-based anomaly detection to defend against server-side injection attacks. To address these limitations, this study proposes an RNN Autoencoder-based framework for server-side injection attack detection. Trained on 30,919 SQL queries, the model achieved 97.95% accuracy, 98.56% precision, 95.85% recall, and 97.19% F1-score, proving its effectiveness in distinguishing benign and malicious queries. This framework seamlessly integrates with existing WAFs, offering real-time protection while maintaining optimal user experience. The study highlights the critical need for stronger

Seema B. Joshi et al.,

input validation, real-time threat detection, and deep learning-based anomaly detection to counter evolving server-side injection attacks and web-borne threats. The proposed solution contributes to developing adaptive and resilient web security mechanisms to safeguard sensitive information against sophisticated cyber threats.

Keywords: Server-side injection attacks, Recursive Neural Network, Browsers Security, Web Application, Input validation, Parameterized Queries, Machine learning and deep learning

INTRODUCTION

In today's digital era, web applications have become indispensable for dissemination of information, sharing of resources, conducting online business, and staying connected over the network. Web browsers serve as the interface and tool between clients and servers, playing a critical role in facilitating these interactions. However, this dependability on the web technologies also introduces significant security challenges for the data and network. According to the OWASP (Open Worldwide Application Security Project), top ten injection attacks are among the most prevalent threats, targeting database servers and compromising critical aspects such as confidentiality, authentication, authorization, and integrity, taking sensitive personal information like names, addresses, or health details to demand ransom or make money. Studies show that 94% of web applications have been tested for some form of injection vulnerability [1-4]. SQLi is ranked as the 3rd most dangerous software weakness according to MITRE's 2023 CWE Top 25 list, with attacks occurring every 39 seconds [5].

SQL injection (SQLi) attacks manipulate SQL queries to gain unauthorized access, as seen in the 2009 Heartland Payment breach. Similarly, NoSQL injection (NoSQLi) attacks, like the 2021 Rocket. Chat breach, exploit vulnerabilities in NoSQL databases to execute remote commands [6]. The study categorizes SQLi and NoSQLi attacks into several types and emphasizes their potential to cause data theft, malware infections, and damage to the reputations. It also noted that attackers are increasingly using unconventional methods like HTTP headers and DNS, to carry out these attacks [5]. Injection attacks exploit weaknesses in web applications to manipulate server behavior and access sensitive information [7], leading to serious consequences such as data breaches, financial losses, and reputational damage. These sophisticated attacks threaten both client-side and server defenses and preventions. While browsers implement security mechanisms like Content Security Policies (CSP), these measures often struggle to prevent complex attacks such as Cross-Site Scripting (XSS), SQL injection and command injection etc, due to unpredictable user behavior and incomplete input sanitization. Similarly, server-side defenses, including input validation and parameterized queries, can be bypassed by advanced techniques such as WAFs, CSP etc.

As cyber threats continue to evolve, enhancing browser security has become essential to mitigating vulnerabilities like server-side injection attacks. This research investigates how browser security mechanisms, including CSP, Same-Origin Policy, input validation, parameterized queries, HTTPS, and sandboxing, and HTTP Strict Transport Security (HSTS) help protect user data and enhance web application security. It also explores emerging technologies, such as machine learning (ML) and deep learning [8-9] etc. Machine learning, deep learning, and hybrid deep learning models offer a powerful approach for detecting injection attacks with high accuracy. These models analyze web traffic and application behavior to identify vulnerabilities, providing real-time threat detection and mitigation. Unlike traditional rule-based systems, machine learning and deep learning models are adaptable to evolving threats. Convolutional neural networks (CNNs), Long Short-Term Memory (LSTM) networks and recurrent neural networks (RNNs) are particularly effective at detecting complex attack patterns. Meanwhile, machine learning models leverage historical data on attack patterns to identify new variations. Deep learning techniques enhance detection by identifying intricate attack signatures and behavioral anomalies, while hybrid models combine these strengths to improve detection accuracy and minimize false positives, thus fortifying cybersecurity defences [10-14]

Seema B. Joshi et al.,

Objectives

The objective of this research is to enhance browser security against web-borne threats, with a particular focus on mitigating server-side injection attacks. The study addresses the limitations of current security mechanisms, such as Content Security Policy (CSP), Same-Origin Policy (SOP), and HTTPS, by identifying vulnerabilities that attackers exploit, including misconfigurations, bypass techniques, and outdated security protocols (ie. earlier versions of SSL/TSL). This research proposes an advanced security framework that integrates deep learning-based anomaly detections, robust input validations, and real-time threat mitigations to strengthen protection against these injection attacks. Additionally, the study emphasizes the importance of collaboration among developers, web designers, and cybersecurity experts to create unified defense strategies and improve threat detection systems.

Evaluate Existing Security Measures

This section assesses the effectiveness of current browser security mechanisms, such as Content Security Policy (CSP) and Same-Origin Policy (SOP), in preventing server-side injection attacks. The limitations of these existing measures are identified, and improvements are proposed to enhance protection against evolving threats.

Develop an Advanced Security Framework

A comprehensive security framework is designed, integrating robust input validations, real-time threat detections, and machine learning-based anomaly detections. This framework aims to strengthen defenses against various injection threats, including SQL Injection (SQLi/NoSQLi) and Cross-Site Scripting (XSS), Command Injections by leveraging advanced techniques for early identification and mitigation.

Leverage Machine Learning (ML) for Threat Detection

The study explores the application of Machine Learning and deep learning models, particularly hybrid approaches, to improve the accuracy of attack detection. These models are aimed at reducing false positives and enhancing real-time identification of threats, allowing for more effective and adaptive responses to emerging attack patterns.

Enhance Collaboration among Security Stakeholders

This research emphasizes the importance of promoting coordinated efforts between browser developers, web application designers, and cybersecurity professionals. By fostering collaboration, unified strategies can be developed to strengthen browser security and improve defenses against web-borne threats.

Educate Developers on Secure Coding Practices

The paper underscores the critical need for educating developers on secure coding practices, particularly focusing on input validation and adherence to the Open Worldwide Application Security Project (OWASP) top 10 security guidelines. By reducing vulnerabilities associated with improper coding practices, this approach seeks to minimize the risks of injection attacks.

Address Limitations of Traditional Security Approaches

This section identifies the weaknesses inherent in traditional Intrusion Prevention Systems (IPS) and signature-based detection methods, particularly when faced with zero-day exploits and server-side attacks. To address these limitations, the paper proposes advanced detection algorithms that can improve threat prevention and mitigation strategies, offering more robust protection against evolving threats.

Browser Security Issues

Browsers are essential tools for online communications and transactions. Web browsers play a crucial role in education and businesses by enabling easy access to websites and online content. However, they also present significant security risks. Research shows that 95% of undetectable malware spreads through web browsing, leading to substantial financial losses. On average, organizations lose \$3.2 million due to browser-based malware attacks[15]. There are different types of browsers, such as desktop, mobile, and server-side applications, each with its own security challenges. Desktop browsers, commonly used by individuals, need strong protection against Injections,

Seema B. Joshi *et al.*,

malware, phishing, and other online threats. Mobile browsers must address security concerns across a wide range of devices and platforms, ensuring smooth and consistent protection. Server-side browsers, which run untrusted code on servers, present unique risks and require careful attention for maintenance and regular updates to fix vulnerabilities. Web browsers connect users to web applications, but they also create security risks for servers. Cybercriminals take advantage of browser weaknesses to break into systems, steal important data, or damage server operations. Some common browser-based attacks that threaten server security include Injections, Cross-Site Scripting (XSS), Cross-Site Request Forgery (CSRF), Phishing, Drive-By Downloads, Man-in-the-Middle (MitM) attacks, Clickjacking, Browser Hijacking, Session Hijacking, Tabnabbing, Formjacking etc.

Browsers are vulnerable to security issues, especially server-side injection attacks. These attacks exploit weaknesses in user input handling, allowing attackers to manipulate server responses and steal sensitive data. Improving browser security is crucial to reduce risks, but challenges include session hijacking, cross-site scripting, command injection, and HTTP cookie management. Balancing security with performance and cross-browser compatibility is also challenging. For instance, older browsers may lack support for modern security protocols, making it challenging to implement uniform security measures while maintaining a consistent user experience. Strict security measures, such as TLS encryption, end-to-end encryption (E2EE), and encrypted cookies, enhance protection but can slow down web applications, especially on resource-limited devices. Similarly, extensive input validation, such as enforcing strict SQL injection prevention, increases server load and response time. Furthermore, outdated browsers may not support security features like Content Security Policy (CSP) or HTTP Strict Transport Security (HSTS), leading to inconsistent protection and heightened security risks.

Injection Attacks and Impact

According to the OWASP (Open Worldwide Application Security Project) Top Ten, injection attacks are among the most frequent and widespread threats, targeting database servers and compromising key server services like confidentiality, authentication, authorization, and integrity. Additionally, 94% of web applications have been tested for some form of injection vulnerability. Injection attacks, including SQL Injection, Cross-Site Scripting, OS Command Injection, LDAP Injection, Server-Side Includes, SQL Template Injection, and Remote Code Execution, pose significant threats to web security. These attacks exploit vulnerabilities in web applications, allowing attackers to manipulate server responses, access sensitive data, and execute unauthorized commands. Mitigation strategies include secure coding practices, input validation, and server-side configuration.

LITERATURE REVIEW

Is a critical area of research, particularly as web applications become increasingly complex. Future directions in this field can be categorized into several key aspects, including the integration of advanced detection systems, the application of innovative defense mechanisms, and the exploration of user behavior. This paper discusses web application security, particularly the A03 Injection vulnerability, and the importance of educating developers on secure coding practices. The authors created a prototype web application to teach secure coding practices, including lessons and an editor module. The analysis showed that the Output Escaping technique showed the greatest improvement at 80%, followed by Stored Procedure at 73% and Defensive Coding Practice at 67% [1,2]. Web browsers have several weaknesses that make them vulnerable to server-side injection attacks. These weaknesses are often caused by outdated software, poor input validation, and design flaws in security. Attackers can exploit these vulnerabilities to run harmful commands on the server, which can lead to serious security problems. The paper examines security vulnerabilities in text input fields on Google Chrome, Firefox, and Safari, revealing sensitive information like passwords and Social Security Numbers is exposed in plaintext on over 1,100 websites. It suggests solutions like JavaScript libraries and browser modifications, emphasizing the need for comprehensive analysis techniques [20]. The research, using the DiffCSP framework, identified 37 browser bugs (including 29 security bugs) and highlighted CSP inconsistencies, leading to 12 security patches in major browsers like Chrome and Safari [21].

Seema B. Joshi et al.,

This paper discusses SQL injection, which exploits weaknesses in web applications due to improper user input validation. It discusses various techniques for preventing SQL injection, including PHP and neural network-based methods. It identifies three types of SQL injection: In-band, Blind, and Out-of-band. Prevention techniques include input validation, prepared statements, advanced detection systems, and web application firewalls. Future research should focus on improving detection algorithms and exploring machine learning with neural networks [16]. Server-Side Browsers (SSBs) pose unique security risks due to their ability to execute untrusted code on servers. Over 60% of SSBs analyzed were vulnerable to exploits, including JavaScript-based attacks and DoS attacks. Many websites still use outdated SSBs, allowing attackers to bypass firewalls or exploit internal IP addresses. Future research should explore countermeasures and propose new strategies to mitigate risks associated with outdated SSBs. Timely updates and improved methodologies are crucial for enhancing server-side request security [22].

Server-Side Template Injection (SSTI) occurs when user input is incorrectly added to a template engine, allowing attackers to inject harmful code, potentially gaining server control or accessing sensitive data, unlike Cross-Site Scripting [19]. Server-Side Include (SSI) injection occurs when an application processes user input without validation, allowing attackers to inject harmful commands or content, similar to Cross-Site Scripting (XSS) [18]. The study discusses the limitations of traditional intrusion prevention systems and signature-based detection methods, emphasizing the potential of machine learning to improve detection by identifying anomalies in network traffic, particularly in URI paths and HTTP header strings. It emphasizes the importance of training machine learning models to detect these attacks using diverse data sources and suggests using Convolutional Neural Networks (CNNs) for detecting code injection, including SQL injection [23].

The paper discusses web application security issues, focusing on SQL injection, cross-site scripting, and Buffer Overflow attacks. It proposes a multilayered defense mechanism, including input filtering, detection modules, and validation techniques [24]. The study compares machine learning and deep learning models for detecting SQL injection, NoSQL injection, and malicious URLs. Introduce SMOTE or Synthetic Minority Oversampling Technique to balance the dataset and BERT outperforms them with 99.6% and 99.01% accuracy, respectively. BiLSTM is most effective for malicious URLs with 95.2% accuracy. The research emphasizes feature engineering, balanced datasets, and addressing dataset imbalance to improve model performance [6,25]. This text discusses SQL injection vulnerabilities and their mitigation strategies, focusing on web application firewalls and secure coding practices. It uses tools like OWASP Zap and SQL Map to identify 14 vulnerabilities, with future work focusing on machine learning techniques [23] SQL injection attacks.

The paper introduces a Convolutional Channel-BiLSTM Attention (CCBA) model for detecting web command injection attacks in web applications. The model combines dual CNN convolutional channels, a BiLSTM network, and an attention mechanism for feature recognition. The model outperforms traditional methods, achieving 97.23% accuracy and 98.2% recall on real-world datasets. Future research aims to expand detection capabilities to other threats[7].A deep learning-based multi-classification method using a GRU neural network has been developed to detect web injection attacks, outperforming traditional methods with over 99.3% accuracy. The method handles long sequences and improves server and browser security by detecting SQL injection, XSS, and command injection. Future research aims to extend detection capabilities to CSRF, file inclusion, and API abuse [26].

This paper discusses the use of machine learning and deep learning techniques to detect SQL injection attacks, focusing on HTTP/HTTPS protocols bypassing web application firewalls, with some models achieving detection accuracies exceeding 98% [11] A systematic literature review of 63 studies on Deep Learning approaches for detecting web application vulnerabilities from 2010 to 2021 reveals a gap between research and industry. It highlights the need for advanced models like Generative Adversarial Networks and Encoders-Decoders, as well as exploring various datasets for effective web attack detection [27]. SDN-based WAFs outperform ModSecurity WAFs in TCP ACK latency and CPU usage overhead, offering faster speed and better processing capacity management. They use deep packet inspection techniques for efficient, cost-effective blocking of malicious traffic [28]. The authors propose a Hybrid CNN-LSTM model for IoT security, detecting server-side injection attacks like SQL and command injection,

Seema B. Joshi *et al.*,

the methodology integrates Principal Component Analysis (PCA), data preprocessing, and advanced optimization techniques to enhance efficiency and data analysis, effectively reducing complex datasets to essential features while maximizing variance explanation in resource-constrained environments [8,29]. The model achieves high accuracy and efficiency, making it suitable for real-time IoT environments. Future work should focus on live testing and collaboration with industry partners [13]. Integrating Web Application Firewalls (WAFs) into an organization's security system presents challenges such as complex configurations, performance overhead, and evolving threats, requiring careful planning, updates, and resource allocation to avoid performance disruption. WAFs, crucial for defending against web attacks, analyze normal HTTP traffic and attack traffic using standard, identifying key features like IP protocol, time-to-live, and header length that distinguish DDoS attack traffic. Recent research proposes a deep learning-based WAF using LSTM networks to detect DDoS, SQL injection, and XSS attacks, achieving high accuracy rates—97.57% for DDoS detection and 89.34% for SQL injection and XSS—by utilizing datasets such as DDoS IDS ISCX 2012 and CIC-DDoS 2019. The study highlights the limitations of traditional firewalls and IDS, proposing a layered WAF to enhance detection accuracy and adapt to evolving threats. Future research should focus on expanding detection methods through a multi-faceted approach combining anomaly detection and behavior-based analysis to improve accuracy, reduce false positives, and address advanced threats like APTs and DDoS attacks, while exploring solutions for cloud security [10].

The study focuses on detecting SQL injection attacks using a Recurrent Neural Network (RNN) autoencoder model, which learns normal SQL query patterns and classifies queries as benign or malicious. The RNN autoencoder achieved 94% accuracy and a 92% F1-score, outperforming other machine learning models like CNN, ANN, and random forest in accuracy, precision, and recall, while models like naive Bayes and SVM showed lower performance. The model uses an LSTM layer for learning data sequences and a dense layer for classification, and was trained on a Kaggle dataset of 30,919 SQL queries, including 11,378 malicious and 19,529 benign queries, primarily focusing on 'SELECT FROM' command variations. The study highlights the model's effectiveness compared to other machine learning approaches but emphasizes the need for larger datasets, real-world testing, and further tuning to improve reliability. Future research could explore stacked RNNs, models using with RNNs or transformers, and use of diverse datasets like CICIDS and KDD Cup 1999 for enhanced generalization and performance [12].

Limitations

Existing security mechanisms such as Content Security Policy (CSP), Same-Origin Policy (SOP), HTTPS, Web Application Firewalls (WAFs), and input validation exhibit significant limitations in preventing server-side injection attacks. CSP helps mitigate Cross-Site Scripting (XSS) but can be bypassed through trusted sources and misconfigurations. SOP restricts cross-origin access but fails against XSS, CORS (cross-origin resource sharing) misconfigurations, and JSONP-based attacks. HTTPS ensures data encryption in transit but does not protect against injection attacks occurring within the server. WAFs rely on rule-based detection, making them ineffective against zero-day threats and obfuscated payloads. Additionally, weak input validation, reliance on blacklisting instead of whitelisting, and improper sanitization allow attackers to inject malicious commands into applications.

This research points out that web browsers have several vulnerabilities that make them prone to server-side injection attacks. These weaknesses are often caused by outdated software, poor input validation, and security design flaws. The study also highlights the lack of a clear security boundary between browser extensions and web pages, which allows malicious extensions to exploit vulnerabilities. Moreover, traditional intrusion prevention systems (IPS) and signature-based detection methods are limited, especially against zero-day exploits and other server-side attacks. The paper stresses the need for better detection algorithms and the use of machine learning to strengthen security, as well as the challenges of real-time threat detection.

Seema B. Joshi et al.,

METHODOLOGY

Many web applications lack proper validation checks, often due to programming errors, allowing attackers to bypass authentication and access sensitive database information. This study focuses on detecting SQL injection attacks, where malicious SQL code is inserted into input fields to manipulate databases. In this research, used datasets such as the SQL Injection Dataset [30], a dataset containing SQL queries labeled as either normal (0) or SQL Injection attacks (1). The dataset consists of 30,919 entries after cleaning there is a total 30,907 entries and includes two main columns "Query" and "Label", there are no missing values.

To detect SQL injection (SQLi) attacks, we used a Kaggle dataset that initially had an imbalanced distribution, with benign queries outnumbering malicious ones. To address this, Synthetic Minority Over-sampling Technique (SMOTE) [6] was applied to balance the dataset before training machine learning models [8,11] like Random Forest, SVM, Naïve Bayes, Decision Tree and Logistic Regression which struggle with class imbalance. Deep learning models, particularly Autoencoders, learn patterns rather than relying solely on class distribution. Instead of SMOTE, deep learning models handle imbalance using class weighting, dropout, or anomaly detection techniques. The models were evaluated based on their ability to distinguish SQLi attacks from benign queries, with the top-performing models selected for further analysis.

The following analysis with Machine Learning Models

Random Forest (RF) [5,8,11] Random Forest is an ensemble learning method that constructs multiple decision trees and merges their predictions to improve classification accuracy. It is highly effective in handling noisy and imbalanced data, making it a reliable approach for detecting various types of SQL injection attacks. In this study, we configured the model with 100 trees ($n_{\text{estimators}}=100$), limited tree depth ($\text{max_depth}=10$) to prevent excessive complexity, and set a minimum sample split of 5 ($\text{min_samples_split}=5$) to control overfitting.

Support Vector Machine (SVM)[5,8] Support Vector Machines (SVMs) are powerful classifiers known for their effectiveness in handling high-dimensional data and accurately distinguishing between normal and malicious SQL queries. By utilizing a linear kernel and a regularization parameter ($C=0.1$) to prevent overfitting, SVMs efficiently separate SQL injection attempts from benign queries using a hyperplane, ensuring reliable classification.

Naïve Bayes (NB) [5,8]. Naïve Bayes, a probabilistic classifier based on Bayes' Theorem, is highly effective for text-based classification tasks. Using Multinomial Naïve Bayes, commonly applied in NLP, it efficiently classifies SQL queries, especially in large datasets, despite its simplistic assumptions.

Decision Tree (DT) [8,11] A decision tree is a transparent, tree-based classification model that recursively splits features to classify queries. To enhance generalization, we set a depth limit ($\text{max_depth}=5$) and a minimum sample split ($\text{min_samples_split}=10$), making it effective in identifying attack-indicating features.

Logistic Regression (LR) [11,16] : Logistic regression is a statistical model for binary classification that estimates the probability of a SQL injection attack based on query features. We set $C=0.1$ for regularization and increased iterations to 500 for better convergence.

Each model was evaluated using Accuracy (overall performance), Precision (correctly identified SQLi attacks), Recall (ability to detect SQLi queries), F1-Score (balance between precision and recall), and Mean Cross-Validation (CV) Accuracy, which represents the average accuracy across multiple training-validation splits in 5-fold cross-validation to ensure generalization and provide a reliable performance estimate. Support Vector Machine (SVM) achieved the highest Mean CV Accuracy (95.30%), demonstrating strong generalization performance. It also maintained a high test accuracy (95.28%), with precision (99.17%) and recall (91.32%), making it highly effective for detecting SQL injection attacks. Similarly, Naïve Bayes (NB) recorded the highest test accuracy (97.79%), indicating strong performance on unseen data. However, its Mean CV Accuracy (91.48%) was lower, suggesting sensitivity to variations in training

Seema B. Joshi et al.,

data. Despite this, it achieved a high recall (97.00%), effectively detecting most SQLi attacks. Random Forest (RF) performed well overall, attaining a Mean CV Accuracy of 90.45% and a Test Accuracy of 91.45%. It had the highest precision (99.27%), making it effective at minimizing false positives. However, its recall (83.51%) was the lowest among the models, indicating that it missed some SQLi attacks. Decision Tree (DT) and Logistic Regression (LR) achieved Mean CV Accuracy above 93%, striking a balance between precision and recall, but were slightly outperformed by SVM and Naïve Bayes in overall detection effectiveness. In terms of precision and recall trade-offs, Random Forest and Logistic Regression achieved high precision (>98%), making them ideal when minimizing false positives is crucial. On the other hand, SVM and Naïve Bayes exhibited higher recall (>91%), ensuring better detection of all SQLi attacks. Overall, SVM and Naïve Bayes emerged as the most effective models due to their superior accuracy and recall. Random Forest proved beneficial in scenarios where reducing false positives is a priority, while Decision Tree and Logistic Regression provided a balanced approach but remained slightly less effective compared to the top-performing models.

Now we will explore deep learning models like CNN, BiLSTM, and RNN Autoencoders to improve SQL injection detection by capturing complex attack patterns more effectively [5,7,12]. SQL Injection (SQLi) is a major security threat in web applications, and traditional rule-based systems struggle against evolving attacks. This study explores deep learning, particularly CNN, for SQLi detection. The dataset includes labeled SQL queries, which were tokenized, converted into sequences, and padded for consistency. To handle class imbalance, SMOTE was applied to generate synthetic samples, ensuring equal representation of benign and malicious queries. The dataset was then split into 80% training and 20% testing while maintaining balanced class distribution.

To enhance SQL injection detection, both Convolutional Neural Networks (CNN) and Bidirectional Long Short-Term Memory (Bi-LSTM) models were implemented to extract deep features from SQL queries. The CNN model leveraged a 1D Convolutional Layer with 64 filters (kernel size = 3) to capture local patterns in SQL queries, followed by a Global Max-Pooling Layer to reduce dimensionality while preserving key features. A Dense Layer (64 neurons, ReLU activation, L2 regularization) further processed the extracted representations, followed by a Dropout Layer (0.5 probability) to prevent overfitting. The model was compiled using the Adam optimizer (learning rate = 0.0005) and trained for 50 epochs with a batch size of 128, achieving 99.26% accuracy, 99.28% precision, 99.23% recall, and 99.26% F1-score on the test set.

To capture long-term dependencies within SQL queries, a Bi-LSTM model was implemented. The architecture consisted of a pretrained embedding layer (300-dimensional word embeddings) followed by two Bidirectional LSTM layers (128 and 64 units, respectively) to analyze sequential patterns in both forward and backward directions. Dropout (0.3 probability), recurrent dropout (0.3 probability), and batch normalization were applied to improve generalization. A fully connected Dense Layer (64 neurons, ReLU activation) processed the extracted features before a sigmoid activation classified queries as SQL injection or benign. The Bi-LSTM model was trained for 10 epochs (batch size = 128) using the Adam optimizer (learning rate = 0.0005), achieving 99.08% accuracy, 99.46% precision, 98.69% recall, and 99.08% F1-score. Both models demonstrated high detection accuracy, with CNN excelling in extracting spatial features and Bi-LSTM capturing sequential dependencies in SQL queries. The combination of these deep learning techniques provides a robust framework for detecting SQL injection attacks, significantly improving web application security.

An RNN Autoencoder, leveraging unsupervised feature learning and reconstruction error analysis. This novel approach uses autoencoders for detecting server-side backdoor attacks [31] where the model learns to transform clean data in a way that highlights hidden triggers. Autoencoders are designed to learn efficient representations of data without requiring labeled outputs. They achieve this by compressing the input data into a lower-dimensional space (encoding) and then reconstructing the original data from this representation (decoding). To mitigate this threat, we propose a two-step approach: an RNN Autoencoder for data compression and an LSTM-based classifier for binary classification, distinguishing between normal and SQL injection queries [12]. The dataset preprocessing phase involves loading and preparing the dataset, followed by splitting it into 80% training and 20% testing to ensure

Seema B. Joshi et al.,

effective model evaluation. Next, an Autoencoder model is built, consisting of an input layer, an encoder for feature extraction, and a decoder for reconstructing the original input. The autoencoder is then trained on the preprocessed data to learn compressed representations of SQL queries. Once the autoencoder training is complete, the encoded feature representations are extracted for use in the RNN model. The RNN model is then constructed, incorporating a BiLSTM layer to capture sequential dependencies with a dense output layer and dropout for classification. The RNN model is trained using the extracted encoded data to enhance SQL injection detection. Finally, the trained model is evaluated using key performance metrics, including accuracy, F1-score, Recall, precision and ROC-AUC, to assess its effectiveness in detecting SQL injection attacks.

The following analysis with Proposed Methodology.

Data Collection and Preprocessing

In this research, as above mention we used kaggle dataset[30] for data collection and preprocessing with Feature Extraction Using TF-IDF, To convert textual SQL queries into numerical data, we applied Term Frequency-Inverse Document Frequency (TF-IDF) [5]. TF-IDF extracts features from SQL queries by assigning weights to words, highlighting uncommon but significant terms (e.g., malicious queries often contain keywords like "SELECT", "UNION", "DROP", "OR 1=1", which get higher weights in attack samples); the RNN Autoencoder then learns normal query patterns and detects anomalies based on unusual TF-IDF weights, effectively identifying SQL injection attacks. TF-IDF assigns importance scores to words, emphasizing critical terms related to SQL injection while minimizing common words' impact. By selecting the top 5000 most relevant words, we reduced dimensionality while preserving key attack patterns, enhancing the model's ability to differentiate between normal and malicious queries.

Data Normalization

To normalize TF-IDF values, we applied Standardization using StandardScaler, ensuring a mean of 0 and a standard deviation of 1. This prevents high-magnitude terms from dominating the model and improves the stability of the RNN Autoencoder, allowing it to learn meaningful query patterns effectively.

Splitting the Dataset and Reshaping Data for RNN Autoencoder

The dataset was divided into 80% training and 20% testing to ensure effective model evaluation. To meet the 3D input requirements of LSTM, the data was reshaped into (samples, timesteps, features), enabling proper sequence learning of SQL queries after TF-IDF transformation. Additionally, the Synthetic Minority Over-sampling Technique (SMOTE)[6] was applied to address class imbalance by generating synthetic samples for the minority class. This preprocessing step ensured a balanced dataset, improving the model's ability to learn and accurately detect SQL injection attacks.

RNN Autoencoder Model

LSTM layers are widely used in RNN Autoencoders for capturing sequential patterns and long-term dependencies. In SQL injection detection, the encoder extracts key query features, while the decoder reconstructs inputs, enabling effective anomaly detection. The autoencoder was designed to learn a compressed representation of SQL queries.

- **Encoder** Reduces query features to a lower-dimensional space.
- **Decoder** Reconstructs input queries to identify anomalies.

LSTM layers in RNN Autoencoders effectively process sequential data and capture long-term dependencies, making them ideal for detecting SQL injection attacks. The encoder extracts key query features, while the decoder reconstructs inputs, enabling anomaly detection.

Latent Space and Dimensionality Reduction

The latent space in an autoencoder represents compressed input data, with the encoding dimension being a critical hyperparameter. A smaller dimension may lose important features, while a larger one risks overfitting. In this study, an encoding dimension of 128 was chosen to balance representation accuracy and computational efficiency.

Seema B. Joshi et al.,

Activation Functions Used

- ReLU (Rectified Linear Unit) is used in the encoder to introduce non-linearity and improve learning efficiency
- Sigmoid Activation is applied in the final decoder layer to constrain output values between 0 and 1, ensuring stable reconstruction of the input data.

Model Evaluation

The performance of the proposed RNN Autoencoder model was evaluated using several key classification metrics, including accuracy, precision, recall, F1-score, and the AUC-ROC (Area Under the Curve - Receiver Operating Characteristic) curve. These metrics help assess the effectiveness of the model in distinguishing between normal and malicious SQL queries.

Appendix A. Accuracy measures the percentage of correctly classified samples.

TP (True Positives) represents correctly detected SQL injection queries.

TN (True Negatives) represents correctly classified benign queries.

FP (False Positives) are benign queries misclassified as SQL injection.

FN (False Negatives) are SQL injection queries misclassified as benign.

$$\text{Accuracy} = \frac{\text{correct classification}}{\text{total classification}} = \frac{(TP+TN)}{(TP+TN+FP+FN)} \quad (1)$$

Appendix B. Precision evaluates how many of the predicted malicious queries were actually malicious.

$$\text{Precision} = \frac{\text{correctly class if iedactual positives}}{\text{everything class if iedas positive}} = \frac{TP}{TP+FP} \quad (2)$$

Appendix C. Recall or true positive rate determines the proportion of actual SQL injection attacks correctly identified by the model.

$$\text{Recall} = \frac{\text{correctly classified actual positives}}{\text{all actual positives}} = \frac{TP}{TP+FN} \quad (3)$$

Appendix D. F1-score provides a balance between precision and recall, ensuring a reliable performance measure, F1-score, defined as the harmonic mean of precision and recall, provides a more reliable performance metric than accuracy. It is maximized only when both precision and recall are high, making it a suitable measure for imbalanced classification tasks.

$$\text{F1 - score} = 2 * \frac{\text{Precision*Recall}}{\text{Precision+Recall}} \quad (4)$$

Appendix E. The AUC-ROC curve in Fig. 6 visualizes the relationship between the True Positive Rate (TPR) and False Positive Rate (FPR) across different classification thresholds, providing insight into the model's ability to distinguish between normal and attack queries. The AUC value (0.9901) indicates the overall performance, with higher values signifying better classification effectiveness.

RESULT AND DISCUSSION

This study evaluates various ML and DL models for SQL injection (SQLi) attack detection. We compare traditional ML models (Random Forest, SVM, Naïve Bayes, Decision Tree, Logistic Regression) with DL models (CNN, Bi-LSTM, RNN Autoencoder). Performance is analyzed using accuracy, precision, recall, F1-score, and ROC-AUC. The machine learning models demonstrated competitive performance with trade-offs between precision and recall in Table 4. SVM achieved the highest Mean CV accuracy (95.30%) and test accuracy (95.28%), balancing precision (99.17%) and recall (91.32%), making it highly effective but prone to missing some SQLi attacks. Naïve Bayes excelled

Seema B. Joshi et al.,

in recall (97.00%) but had a lower Mean CV accuracy (91.48%), indicating sensitivity to data variations. Random Forest had the highest precision (99.27%) but a lower recall (83.51%), making it less effective in detecting all attacks. Decision Tree and Logistic Regression showed balanced performance with Mean CV accuracies of 93.67% and 93.69%, respectively. Overall, SVM and Naïve Bayes emerged as the best-performing models for SQLi detection. The deep learning models—CNN, Bi-LSTM, and RNN Autoencoder—outperformed traditional ML models in detecting SQLi attacks. CNN achieved the highest accuracy (99.26%) by capturing spatial features within SQL queries, making it highly effective in detecting subtle attack patterns. Similarly, Bi-LSTM, with an accuracy of 99.08%, leveraged bidirectional sequence learning to analyze SQL queries in both forward and backward directions, enhancing its ability to capture complex dependencies and improve detection performance.

This paper introduces the RNN Autoencoder for anomaly and SQL injection detection, leveraging its strengths in data compression and sequential learning. While CNN and Bi-LSTM models excel in accuracy, the RNN Autoencoder is particularly effective in identifying anomalies within SQL queries. The autoencoder captures compressed representations, aiding in detecting evolving attack patterns, while the Bi-LSTM classifier enhances long-term dependency learning. This hybrid approach enables comprehensive SQLi detection by combining feature compression and sequential analysis, making it a robust alternative to traditional models. These results in Table IV. indicate that the model can accurately differentiate between benign and malicious SQL queries, significantly enhancing the security of web applications. The integration of advanced preprocessing techniques, such as TF-IDF for feature extraction and SMOTE for addressing class imbalance, contributed to the model's high performance. The findings highlight the critical need for improved detection systems in web application security, particularly in light of the increasing sophistication of cyber threats.

Although the CNN model achieved the highest accuracy, it mainly captures spatial patterns in SQL queries, which may not fully detect sequential dependencies and contextual relationships in SQL injection attacks. In contrast, the RNN Autoencoder combines feature compression with sequence learning, allowing it to detect anomalies and identify previously unseen attack patterns. The Bi-LSTM classifier further enhances detection by capturing long-term dependencies in query structures. While CNNs may struggle with novel or modified attacks, the RNN Autoencoder generalizes better to evolving threats, making it a more adaptable and comprehensive solution for SQL injection detection.

Future Recommendations

Future research should focus on developing advanced detection systems that integrate machine learning and deep learning techniques to enhance security against evolving threats. Investigating hybrid models that combine multiple machine learning approaches could improve detection accuracy and robustness. Additionally, creating larger and more diverse datasets, particularly for NoSQL injection attacks, is essential for increasing model reliability. Strengthening collaboration between developers and cybersecurity experts will also foster secure coding practices and resilient web applications. This study highlights the effectiveness of deep learning-based anomaly detection, particularly RNN Autoencoders, in improving SQL injection detection by learning sequential attack patterns and reducing false positives. Future work will explore real-time deployment of the model in web security frameworks, integrating ensemble deep learning models for enhanced detection, and expanding the approach to detect other web threats such as Cross-Site Scripting (XSS) and Remote File Inclusion (RFI). The proposed solution represents a significant advancement in browser security, mitigating web-borne threats and server-side injection attacks.

CONCLUSION

This study highlights the critical need for advanced security measures to combat Injection attacks effectively. Traditional mechanisms like Content Security Policy (CSP), Web Application Firewalls (WAFs), and Same-Origin Policy (SOP) offer a baseline defense but struggle against sophisticated SQLi, XSS etc. techniques. Our proposed RNN Autoencoder model enhances security by dynamically learning attack patterns, integrating feature compression

Seema B. Joshi et al.,

and sequence learning to improve anomaly detection. While CNN and Bi-LSTM models demonstrated high accuracy, the RNN Autoencoder provides a more adaptable approach, capturing long-term dependencies in SQL queries and effectively detecting evolving attack patterns while reducing false positives. Deep learning techniques significantly outperform traditional machine learning models by identifying complex relationships within queries, yet challenges such as computational complexity, data imbalance, and generalization to new attack types persist. Future research should focus on hybrid models, larger datasets, and real-time deployment to further strengthen SQLi detection and enhance web application security. Overall, this research advances browser security by mitigating web-borne threats and reinforcing defenses against server-side injection attacks. By integrating deep learning-based anomaly detection with existing security frameworks, this study lays the groundwork for more robust, adaptive, and proactive cybersecurity solutions.

Table 1. Injection Attack and Impact.

Injection Type	Description	Impact on Server and Application
SQL Injection (SQLi) ^{5,16}	Attackers insert malicious SQL code to manipulate or access database records. e.g.: <code>SELECT * FROM users WHERE username = 'admin' --</code> ; (Bypasses authentication)	- Unauthorized data access (usernames, passwords) - Data manipulation (deletion/modification) - Potential database takeover
Command Injection ⁷	Exploits weak input validation to execute system commands on the server. e.g.: <code>ping 8.8.8.8; rm -rf /</code> (Deletes server files)	- Data theft or system compromise - Installation of malware or backdoors
Cross-Site Scripting (XSS) ^{14,17}	Malicious scripts into web pages to steal user data or manipulate content. e.g.: <code><script>alert('hacked');</script></code> (Steals session cookies)	- Theft of cookies, session tokens - Redirecting users to malicious sites Website content manipulation
LDAP Injection	Modifies LDAP queries to bypass authentication or alter directory entries.	-Unauthorized access to Sensitive directory information. - Potential modification or deletion of directory entries.

Seema B. Joshi et al.,

NoSQL Injection ⁶	Injects malicious NoSQL queries to manipulate unstructured databases.	- Unauthorized access to NoSQL data - Data manipulation or deletion
Server-Side Includes (SSI) Injection ¹⁸	Injects SSI directives to execute commands on the server. e.g. <code><!--#exec cmd="cat /etc/passwd" --></code> (Reads sensitive files)	- Execution of arbitrary server-side commands - Exposure of sensitive information
SQL Template Injection ¹²	Alters SQL templates by injecting malicious input into dynamic queries.	- Unauthorized access, data loss, or corruption

Table 2. Summary of study papers.

Paper	Dataset or Technique		Contribution
2	Prototype Web App	Developed lessons and editor module for secure coding	Highlights effectiveness of security techniques
6	BERT model, mURLi tool, techniques like SMOTE	BERT achieved accuracy for SQLi and NoSQLi detection at 99.6% and 99.01%, using Deep learning model and study on SQL, NoSQL, Malicious URLs	Emphasizing feature engineering and balanced datasets.
7	Convolutional Channel-BiLSTM Attention (CCBA) model, Web Command Injection Dataset, HTTP CSIC 2010 dataset, and HTTPParamDataset	Working on detecting web command injection attacks in web applications and achieving 99.3% accuracy and 98.2% recall on real-world datasets	Highlight traditional methods, detects command injection attacks using keyword-symbol fusion and an attention-based neural network
10	ISCX, CISC, and CICDDoS datasets	Deep learning-based WAF, LSTM-based detection of SQL injection, XSS and DDoS	Strengthens the case for DL-based WAF implementation
12	SQL injection dataset	RNN Autoencoder for detection SQLi, Achieved 94% accuracy & 92% F1-score	Highlighting the RNN autoencoder's balanced performance.
13	N-BaIoT, IoT-23, and CICIDS2017, PCA techniques to improve data analysis	novel Hybrid CNN-LSTM for IoT security, Detects server-side injection attacks in IoT environments,	Supports real-time attack detection in modern web applications
21	PHP-based SQL injection protection methods	Explores PHP and neural network methods from SQL injection prevention	Focusing on PHP and neural network-based detection using ISP user log data to train an MLP model
22	SSBs Security Analysis	Identifies 60% vulnerability rate in Server-Side Browser Vulnerabilities	Highlights risks in outdated security mechanisms
25	penetration testing using various tools	Identified 14 SQLi vulnerabilities on a web server, analyzed using the OWASP framework, recommending firewall installation and data protection.	Highlighting the importance of using the same testing methods and customizing security measures based on specific risks.

Seema B. Joshi et al.,

26	HTTP Dataset CSIC2010	High accuracy in detecting SQL, XSS, command injection with GRU and C-LSTM Model based multi-class detection	Deep learning approach offers a more effective solution for detecting complex web injection attacks
28	SDN-based WAF using ModSecurity	Performance comparison with ModSecurity WAFs, Shows improved efficiency and lower latency in SDN WAFs	Highlights future direction for efficient web security frameworks

Table 3. Dataset Distribution with Types.

Injection Type	Count
No SQL Injection	28,736
Time-based Injection	1,436
Union-based Injection	581
Error-based Injection	150
Out-of-Band Injection	4

Table 4. Result of Machine learning models

Model	Mean CV Accuracy	Accuracy	Precision	Recall	F1-Score
RF	90.45%	91.45%	99.27%	83.51%	91.00%
SVM	95.30%	95.28%	99.17%	91.32%	95.00%
NB	91.48%	97.79%	98.54%	97.00%	98.00%
DT	93.67%	93.37%	98.40%	88.17%	93.00%
LR	93.69%	93.56%	98.16%	88.79%	94.00%

Table 5. Value of Hyperparameter of Model

Hyperparameter	Value	Description
LSTM Units (BiLSTM layer)	128 units	The number of units (neurons) in the BiLSTM layer. Higher units allow the model to capture more complex patterns.
Dense Layer Units	64 units	Number of neurons in the Dense layer following the BiLSTM for further processing.
Dropout Rate	0.3	Dropout is used to prevent overfitting by randomly setting 30% of the neurons to zero during training.
Activation Function (Hidden Layer)	ReLU (Rectified Linear Unit)	Used in hidden layers (BiLSTM and Dense) for introducing non-linearity.
Activation Function (Output Layer)	Sigmoid	Used in the output layer to produce a probability score for binary classification (normal or SQL injection).
Optimizer	Adam (learning rate: 0.001)	Optimizer used for training the model, known for efficient weight updates.
Loss Function	Binary Cross-Entropy	Used for binary classification tasks, to differentiate between normal and malicious SQL queries.
Epochs	50	Number of times the model iterates over the entire dataset during training.
Batch Size	128	Number of samples processed before the model's internal parameters are updated.
Input Data Shape	(samples, 1, features)	The reshaped input data for LSTM, with 1 timestep and the number of features from the TF-IDF vectorization.

Table 6. Result of RNN Autoencoder models

Performance Metrics	Result
Accuracy	97.95%
Precision	98.56%
Recall	95.85%
F1-score	97.19%

ABSTRACT

The increasing health risks linked to synthetic pigments have the natural substitutes, especially microbial pigments with safety, biodegradability, and bioactive compounds. Synthetic pigments commonly used in food, cosmetics, and pharmaceuticals tend to be health hazards due to their toxicity, mutagenicity, and carcinogenicity. Natural pigments from plants and microorganisms that are non-toxic, biodegradable, and eco-friendly. Microbial pigments, especially bacterial pigments, have many benefits in that they are easy to have quick growth in inexpensive mediums and are resistant to diverse environmental situations. The most widely used natural pigments are carotenoids, among Staphyloxanthin, a yellow-orange pigmented carotenoid from *Staphylococcus aureus* has potential usage in food pigmentation and therapy. In this present research, the isolation of pigment-producing *Staphylococcus aureus* from tomato rhizosphere soil samples was done from various locations in Tirupattur District, Tamil Nadu, India. The isolates were characterized based on morphology and biochemical test results. Pigment extraction was carried out using a methanol-water solvent system followed by confirmation of Staphyloxanthin through

Lokeshwari et al.,

a colorimetric assay with concentrated hydrochloric acid that caused a yellow-to-orange colour change. Staphyloxanthin pigment acts as a food coloring agent in food industries. The antibacterial activity of the extracted Staphyloxanthin was tested against both Grampositive and Gramnegative isolates using the agar well diffusion assay. At 1500 mg concentration, the pigment had antimicrobial activity, with a maximum zone of inhibition. The results have shown the dual role of Staphyloxanthin as a natural pigmentation as well as a bioactive compound having a vast spectrum of antibacterial activity. The antimicrobial activity of the pigment can destabilize microbial cell membranes and inhibit oxidative metabolism. Staphyloxanthin pigment also has other therapeutic properties of bacterial pigments for medical and industrial purposes.

Keywords: *Staphylococcus aureus*, Natural Food Colorant, Staphyloxanthin, Bacteria and Antibacterial activity.

INTRODUCTION

Synthetic Pigments are widely used in manufacturing processes of foodstuff, dyestuff, cosmetics, and pharmaceuticals that have a wide variety of hazardous effects. Plants and microorganisms are the two natural sources from which natural pigments can be extracted. Natural pigments have many limitations including instability to light, heat, or pH, poor water solubility, and, often annual unavailability[1]. The pigments produced by the microorganisms have advantages that include the ability to grow easily and rapidly in a cheap culture medium and from several weather conditions and colours of different properties. Natural pigments are derived from vegetables, animals, and microorganisms. In many industries, artificial food color pigments have been used extensively. Carotenoids were found to be the most commonly used pigment among the identified types. Natural colorants or pigments obtained from flora and fauna are safe because of non-toxic, non-carcinogenic, and biodegradable [2]. Microorganisms synthesize pigments of different colours to protect their cells from the harmful effects of light rays in the visible and near ultraviolet range. These pigments are secondary metabolites that are generated by different kinds of bacteria and are not present in all species. They serve as colour enhancers, antioxidants, additives, and more. The synthesis and subsequent processing of microbial colorants make them significant food colouring agents [3]. These bacterially generated pigments have antibacterial properties that help fight off infections. Pigments are one of the many different bioproducts that bacteria can synthesis. Most microbial pigments are still being developed through research and development. Organic food to substitute synthetic pigments, and colouring agents are pigments that are taken from natural sources and are highly sought after [4]. The need for these substances from the natural sources is rapidly increasing as a result of their health advantages. Certain pigments are soluble in water they leave the cells and permeate the water-based culture medium by changing its colour. Bacterial pigment possesses vast potential for a variety of applications. These pigments are classified as natural colours as they are not only useful for colours in cosmetic and food products but also have biological properties like antimicrobial and antioxidant properties [5]. Microorganisms are responsible for producing different types of pigments and are responsible for the yellow, orange, and red colours found in many plants, animals, and microorganisms[6]. Synthetic colours may be harmful to human health because of their toxic effects such as mutagenicity and carcinogenicity in the development of pigments from natural sources. *Staphylococcus aureus* strains produce the light yellow-coloured carotenoid pigment called Staphyloxanthin[7]. Besides being colorants some of these pigments are good for health. Microorganisms also produce large quantities of physiologically and pharmacologically active molecules with antioxidant, antimicrobial, anticancer, immuno-regulatory, and anti-inflammatory properties.

MATERIALS AND METHODS

Collection of different Soil samples

Soil samples were collected from the Rhizosphere of Tomato plants from various parts of Tirupattur District, Tamil Nadu, India.

Isolation and Identification of *Staphylococcus aureus* from Tomato Rhizosphere Soil

Staphylococcus aureus isolates were isolated and identified from Tomato rhizosphere soils in Tirupattur region and identified using Bacteriological methods, including Staining techniques, Plating on the Selective media, and Biochemical tests.

Extraction of Pigments from *Staphylococcus aureus*

The extraction of pigments from *Staphylococcus aureus* involves culturing the bacterial isolates on selective media, to promote pigment production. After incubation, the pigmented colonies were used for the extraction of pigment solvents extraction method was used. The pigment-producing bacteria were harvested by centrifugation at 4500 rpm for 20 minutes and resuspended in methanol and water (80:20 v/v). The pigments were then extracted by incubating the mixture at room temperature for 30 minutes [8]. These solvent mixtures were then centrifuged and filtered through a 0.22 µm membrane filter to be separated from the bacterial cells. The extract was then sun-dried for 15 mins and resuspended in 5% Methanol. The resultant liquid was transferred to the petri dish and dried in a hot air oven at 60 °C overnight.

Presumptive test for Staphyloxanthin pigment extracted from *Staphylococcus aureus*

The presence of Staphyloxanthin pigment was confirmed by the yellow to orange colour change that was observed when Concentrated Hydrochloric acid (HCl) was used. To confirm the presence of Staphyloxanthin pigment, three drops of HCl were introduced to the centrifuged supernatant *Staphylococcus aureus* [9]. The stable colour change resulted from the pigment absorbing hydrogen ions from the acid.

Determination of Antibacterial activity of Staphyloxanthin Pigment

The antibacterial activity of the obtained Staphyloxanthin pigments against bacterial isolates, both Grampositive and Gramnegative bacteria was determined by using the Agar Well Diffusion Technique. Muller Hinton agar medium was used to plate the bacterial isolates that were then incubated at 37°C for 24 hours. The pigment sample was incubated for 24 hours after being loaded into the wells at varying concentrations. After incubation, the zone of inhibition was measured around the wells [10].

RESULTS AND DISCUSSION

Isolation and Identification of Pigment-producing Bacteria

The soil samples obtained from various sites in Tirupattur were utilized for the isolation of pigment-producing bacteria *Staphylococcus aureus*. These bacteria were characterized and identified with the help of Staining techniques, Plating on the Selective media, and Biochemical tests.

Screening of Pigment-producing Bacteria

The selective media plates were inoculated with *Staphylococcus aureus* to screen bacteria for pigment synthesis. After incubating at 37°C for 24 - 48 hours, the bacteria produce Staphyloxanthin, a yellow-orange pigment. Visual examination of the yellow pigment verified the presence of Staphyloxanthin.

Lokeshwari et al.,

Extraction and Confirmation of Staphyloxanthin pigment

Staphylococcus aureus isolates on the selective media were the source of the pigments for pigment production. The presence of Staphyloxanthin pigment was verified through the use of Concentrated Hydrochloric acid (HCl), which led to a yellow to orange colour change. This indicated the presence of Staphyloxanthin pigment.

Antibacterial activity of the extracted Staphyloxanthin pigment

The antibacterial activity of Staphyloxanthin pigment from *Staphylococcus aureus* was determined by the agar well diffusion method. At a concentration of 1500 mg, the Staphyloxanthin pigment showed significant zones of inhibition against selected pathogenic microorganisms, indicating broad-spectrum antibacterial activity. The highest inhibition zone was observed against *Pseudomonas aeruginosa* (22mm in dm), followed by *Salmonella typhi* (18mm in dm), *Escherichia coli* (17mm in dm), and *Streptococcus pyogenes* (14mm in dm). Microbial carotenoid pigments exhibit strong antimicrobial properties, likely due to their ability to disrupt cell membranes and oxidative metabolism. The findings of this study further support the potential of Staphyloxanthin not only as a food-grade pigment but also as a bioactive compound with therapeutic applications.

CONCLUSION

In this present research, *Staphylococcus aureus* was shown to be a viable source of the natural carotenoid pigment Staphyloxanthin that possesses both antibacterial and food colouring properties. *Staphylococcus aureus* was isolated from Tomato rhizosphere soil isolates for biochemical identification and acid-based colorimetric assay. Staphyloxanthin was shown to be efficient antibacterial against both Grampositive and Gramnegative isolated, with *Pseudomonas aeruginosa* being the most inhibited (22 mm in dm). These findings demonstrated Staphyloxanthin's dual potential as a non-toxic colourant food additive as well as an antibacterial agent. It is biodegradable, non-toxic, and has medicinal uses. Staphyloxanthin can be utilised as a yellow colourant pigment in foods, medicines, and cosmetics. These results indicated that Staphyloxanthin serves as an alternative to synthetic food colourants for industrial applications due to its bioactive properties and numerous health benefits.

ACKNOWLEDGEMENTS

The authors would like to thank the Secretary, Principal, Research Dean and Sacred Heart College Management for providing the financial support through Sacred Heart Fellowship (SHF) to carry out the present research.

ABSTRACT

The purpose of this paper, we introduce and study the micro binary continuous functions in micro binary topological spaces. Also we introduce some micro binary continuous functions and the relationships between these functions are also studied.

Keywords: M_B -continuous, $M_B \alpha$ -continuous, M_B semi continuous, M_B pre continuous, $M_B \beta$ - continuous.

INTRODUCTION

Rough set [9] was invented by pawlak in 1982. M. Lellis Thivagar [3] introduced the concept of nano topological space with respect to a subset X of a universe U . S. Nithyanantha Jothi and P. Thangavelu [6] introduced the concept of binary topological spaces. By combining these two concepts G. Hari Siva Annam and J. Jasmine Elizabeth [2] introduced nano binary (N_B) topological spaces. [10] Micro Binary topology (M_B) was invented by C. Sangeetha and G. Sindhu. Njastad [8], Levine [4] and Mashhour et al [5] respectively introduced the notions of α -open, semi-open and pre-open sets. In this paper we have introduced a new class of functions on Micro Binary Topological Spaces (M_B TS) called micro binary continuous functions. Also the relationships between some micro binary continuous functions are studied.

1. PRELIMINARIES

Definition 2.1. [7] Let X and Y be any two non-empty sets. A binary topology from X to Y is a binary structure $M \subseteq Q(X) \times Q(Y)$ that satisfies the axioms namely

- i. $(X, Y) \& (\phi, \phi) \in M$.
- ii. $(A_1 \cap A_2, B_1 \cap B_2) \in M$ whenever $(A_1, B_1) \in M$ & $(A_2, B_2) \in M$ and
- iii. If $(A_\alpha, B_\alpha): \alpha \in \Delta$ is a family of M , then $(\bigcup_{\alpha \in \Delta} A_\alpha, \bigcup_{\alpha \in \Delta} B_\alpha) \in M$. If M is a binary topology from X to Y then the triplet (X, Y, M) is called a binary topological space and the member of M are called binary open subsets of the binary topological space (X, Y, M) . The element of $X \times Y$ are called binary points of the binary topological space (X, Y, M) . If $Y = X$ the M is called a binary topology on X in which case we write (X, M) as a binary topological space.

Definition 2.2. [3] Let U be a non-empty finite set of objects called the universe and R be an equivalence relation on U named as the indiscernibility relation. Then U is divided into disjoint equivalence classes. Elements belonging to the same equivalence class are said to be indiscernibility with one another. The pair (U, R) is said to be the approximation space. Let $X \subseteq U$.

1. The lower approximation of X with respect to R is the set of all objects, which can be for certain classified as X with respect to R and it is denoted by $L_R(X)$. That is, $L_R(X) = \bigcup_{x \in U} \{R(x) : R(x) \subseteq X\}$ where $R(x)$ denotes the equivalence class determined by $x \in U$.
2. The upper approximation of X with respect to R is the set of all objects, which can be possibly classified as X with respect to R and it is denoted by $U_R(X)$. That is, $U_R(X) = \bigcup_{x \in U} \{R(x) : R(x) \cap X \neq \phi\}$.
3. The boundary region of X with respect to R is the set of all objects, which can be classified neither as X nor as not- X with respect to R and it is denoted by $B_R(X)$. That is, $B_R(X) = U_R(X) - L_R(X)$.

Definition 2.3. [3] Let U be an universe, R be an equivalence relation on U and

$tr(X) = \{U, \phi, L_R(X), U_R(X), B_R(X)\}$ where $X \subseteq U$ satisfies the following axioms:

1. $U, \phi \in tr(X)$.
2. The union of the elements of any sub-collection of $tr(X)$ is in $tr(X)$.
3. The intersection of the elements of any finite sub collection of $tr(X)$ is in $tr(X)$.

Then $tr(X)$ is called the nano topology on U with respect to X . The space $(U, tr(X))$ is the nano topological space. The elements of $tr(X)$ are called nano open sets.

Definition 2.4.[11] $(U, tr(X))$ is a nano topological space here $\mu_R(X) = \{N \cup N' \cap \mu : N, N' \in tr(X)\}$ and called it micro topology of $tr(X)$ by μ where $\mu \notin tr(X)$. The micro topology $\mu_R(X)$ satisfies the following axioms:

1. $U, \phi \in \mu_R(X)$.
2. The union of the elements of any sub-collection of $\mu_R(X)$ is in $\mu_R(X)$.
3. The intersection of the elements of any finite sub collection of $\mu_R(X)$ is in $\mu_R(X)$.

Then $\mu_R(X)$ is called the micro topology on U with respect to X . The triplet

$(U, tr(X), \mu_R(X))$ is the micro topological space. The elements of $\mu_R(X)$ are called micro open sets.

Definition 2.5. [2] Let (U_1, U_2) be a non-empty finite set of objects called the universe and R be an equivalence relation on (U_1, U_2) named as the indiscernibility relation. Elements belonging to the same equivalence class are said to be indiscernibility with one another. The pair (U_1, U_2, R) is said to be the approximation space. Let $(X_1, X_2) \subseteq (U_1, U_2)$.

1. The lower approximation of (X_1, X_2) with respect to R is the set of all objects, which can be for certain classified as X with respect to R and it is denoted by $L_R(X)$.

That is, $L_R(X_1, X_2) = \bigcup_{(x_1, x_2) \in (U_1, U_2)} \{R(x_1, x_2) : R(x_1, x_2) \subseteq (X_1, X_2)\}$ where $R(x_1, x_2)$ denotes the equivalence class determined by (X_1, X_2) .

Sangeetha and Sindhu

2. The upper approximation of (X_1, X_2) with respect to R is the set of all objects, which can be possibly classified as (X_1, X_2) with respect to R and it is denoted by $U_R(X)$.

That is, $U_R(X_1, X_2) = U_{\{x_1, x_2\} \in (U_1, U_2)} \{R(X_1, X_2) : R(X_1, X_2) \cap (X_1, X_2) = \phi\}$ where $R(x_1, x_2)$ denotes the equivalence class determined by (X_1, X_2) .

3. The boundary region of (X_1, X_2) with respect to R is the set of all objects, which can be classified neither as (X_1, X_2) nor as $\text{not-}(X_1, X_2)$ with respect to R and it is denoted by $B_R(X_1, X_2)$.

That is, $B_R(X_1, X_2) = U_R(X_1, X_2) - L_R(X_1, X_2)$.

Definition 2.6. [3] Let (U_1, U_2) be an universe, R be an equivalence relation on (U_1, U_2) and $\text{tr}(X) = \{(U_1, U_2), \phi, L_R(X_1, X_2), U_R(X_1, X_2), B_R(X_1, X_2)\}$ where

$(X_1, X_2) \subseteq (U_1, U_2)$ satisfies the following axioms:

1. $(U_1, U_2), (\phi, \phi) \in \text{tr}(X_1, X_2)$.
2. The union of the elements of any sub-collection of $\text{tr}(X_1, X_2)$ is in $\text{tr}(X_1, X_2)$.
3. The intersection of the elements of any finite sub collection of $\text{tr}(X_1, X_2)$ is in $\text{tr}(X_1, X_2)$.

Then $\text{tr}(X_1, X_2)$ is called the N_B topology on (U_1, U_2) with respect to (X_1, X_2) . The space $((U_1, U_2), (\phi, \phi), \text{tr}(X_1, X_2))$ is the N_B topological space (N_B TS). The elements of $\text{tr}(X_1, X_2)$ are called N_B open sets.

Definition 2.7. [10] $((U_1, U_2), (\phi, \phi), \text{tr}(X_1, X_2))$ is the N_B TS here

$\mu_R(X_1, X_2) = \{L \cup L' \cap \mu\} : L, L' \in \text{tr}(X_1, X_2)$ and it is called M_B topology. The M_B topology $\mu_R(X_1, X_2)$ satisfies the following axioms:

1. $(U_1, U_2), (\phi, \phi) \in \mu_R(X_1, X_2)$.
2. The union of the elements of any sub-collection of $\mu_R(X_1, X_2)$ is in $\mu_R(X_1, X_2)$.
3. The intersection of the elements of any finite sub collection of $\mu_R(X_1, X_2)$ is in $\mu_R(X_1, X_2)$.

Then $((U_1, U_2), (\phi, \phi), \text{tr}(X_1, X_2), \mu_R(X_1, X_2))$ are called M_B topological space (M_B TS), and the elements of $\mu_R(X_1, X_2)$ are called M_B open sets and the complement of a M_B open set is called a M_B closed sets.

Definition 2.8. [7] Let (X, Y, M) be a binary topological space and let (Z, τ) be a topological space. Let $f : Z \rightarrow X \times Y$ be a mapping. Then f is called binary continuous if $f^{-1}(A, B)$ is open in Z for every binary open set (A, B) in $X \times Y$.

2. Various form of Micro Binary Continuous mappings

Let $(U_1, \phi, \text{tr}(X_1), \mu_R(X_1))$ and $((V_1, V_2), (\phi, \phi), \text{tr}(Y_1, Y_2), \mu_R(Y_1, Y_2))$ be micro and M_B TS. A map $f : (U_1, \phi, \text{tr}(X_1), \mu_R(X_1)) \rightarrow ((V_1, V_2), (\phi, \phi), \text{tr}(Y_1, Y_2), \mu_R(Y_1, Y_2))$ is said to be

1. M_B O mapping (shortly M_B OM) iff the image of each MO sets in $(U_1, \phi, \text{tr}(X_1), \mu_R(X_1))$ is M_B O in $((V_1, V_2), (\phi, \phi), \text{tr}(Y_1, Y_2), \mu_R(Y_1, Y_2))$.
2. M_B continuous mapping (M_B CM), if $f^{-1}(u, v)$ of every M_B OS (u, v) in $((V_1, V_2), (\phi, \phi), \text{tr}(Y_1, Y_2), \mu_R(Y_1, Y_2))$ is MO set in $(U_1, \phi, \text{tr}(X_1), \mu_R(X_1))$.
3. M_B Semi continuous mapping (shortly, M_B SCM), if $f^{-1}(u, v)$ of every M_B SO (u, v) in $((V_1, V_2), (\phi, \phi), \text{tr}(Y_1, Y_2), \mu_R(Y_1, Y_2))$ is MSC in $(U_1, \phi, \text{tr}(X_1), \mu_R(X_1))$.
4. $M_B \alpha$ continuous mapping (shortly, $M_B \alpha$ CM), if $f^{-1}(u, v)$ of every $M_B \alpha$ O (u, v) in $((V_1, V_2), (\phi, \phi), \text{tr}(Y_1, Y_2), \mu_R(Y_1, Y_2))$ is $M \alpha$ O in $(U_1, \phi, \text{tr}(X_1), \mu_R(X_1))$.
5. M_B pre continuous mapping (shortly, M_B PrCM), if $f^{-1}(u, v)$ of every M_B PrO (u, v) in $((V_1, V_2), (\phi, \phi), \text{tr}(Y_1, Y_2), \mu_R(Y_1, Y_2))$ is MPPrO in $(U_1, \phi, \text{tr}(X_1), \mu_R(X_1))$.
6. $M_B \beta$ continuous mapping (shortly, $M_B \beta$ CM), if $f^{-1}(u, v)$ of every $M_B \beta$ O (u, v) in $((V_1, V_2), (\phi, \phi), \text{tr}(Y_1, Y_2), \mu_R(Y_1, Y_2))$ is $M \beta$ O in $(U_1, \phi, \text{tr}(X_1), \mu_R(X_1))$.

Definition 3.1. Let $f : (U_1, \phi, \text{tr}(X_1), \mu_R(X_1)) \rightarrow ((V_1, V_2), (\phi, \phi), \text{tr}(Y_1, Y_2), \mu_R(Y_1, Y_2))$ is both one-to-one and onto mapping where $(U_1, \phi, \text{tr}(X_1), \mu_R(X_1))$ and $((V_1, V_2), (\phi, \phi), \text{tr}(Y_1, Y_2), \mu_R(Y_1, Y_2))$ are two M_B TS.

Then f is said to be M_B -Homeomorphism if f and f^{-1} are M_B CM.

Sangeetha and Sindhu

Definition 3.2. A subset (X_1, X_2) of a micro binary topological spaces $((U_1, U_2), (\phi, \phi), \text{tr}(X_1, X_2), \mu_R(X_1, X_2))$ is said to be

1. $M_B \alpha$ open if $(X_1, X_2) \subseteq M_{B^0}(M_B(M_{B^0}(X_1, X_2)))$.
2. M_B semi open if $(X_1, X_2) \subseteq M_B(M_{B^0}(X_1, X_2))$.
3. M_B pre open if $(X_1, X_2) \subseteq M_{B^0}(M_B(X_1, X_2))$.

The complement of the above mentioned sets are called their respective M_B closed sets.

Example 3.3.

Let $Z = \{a, b, c, d, e\}$ with $Z/R = \{\{a, b\}, \{c\}, \{d, e\}\}$ and $X = \{\{c\}, \{e\}\}$. Then the nano topology $\mu_R(X) = \{\phi, Z, \{c\}, \{c, d, e\}, \{d, e\}\}$. Then $\mu = \{a, b\}$. Then the micro open set $\mu_R(X) = \{\phi, Z, \{c\}, \{a, b\}, \{a, b, c\}, \{c, d, e\}, \{d, e\}, \{a, b, d, e\}\}$.

Let $A = \{L, M, N, O, R\}$ and $B = \{S, T, U, V, W\}$ with

$(A, B)/R = \{\{L, S\}, \{M, N\}, \{U, T\}, \{O, W\}, \{R, V\}\}$ and

$(X_1, Y_1) = \{L, R\}, \{S, V\}$. Then the N_B topology $\text{tr}(X_1, Y_1) = \{(\phi, \phi), (A, B), \{O, W\}, \{M, N, O\}, \{U, T, W\}, \{M, N, U, T\}\}$. Then $\mu_R = \{L, R\}, \{S, V\}$. Then $\mu_R(X_1, Y_1) = \{(\phi, \phi), (A, B), \{L, R\}, \{S, V\}, \{O, W\}, \{L, R, O\}, \{S, V, W\}, \{M, N, O, U, T, W\}, \{M, N, U, T\}, \{M, N, L, R\}, \{U, T, S, V\}\}$.

Define $f : Z \rightarrow A \times B$ by $f(a) = \{L, S\}, f(b) = \{R, V\}, f(c) = \{O, W\},$

$f(d) = \{M, U\}, f(e) = \{N, T\}$.

The mapping $f : Z \rightarrow A \times B$ is clearly a M_B continuous mapping.

Theorem 3.4.

A function $f : Z \rightarrow A \times B$ is Micro Binary continuous mappings if and only if the inverse image of every Micro Binary closed set in (A, B) is Micro closed in Z .

Proof.

Let f be Micro Binary continuous mapping and (u, v) be Micro Binary closed in

(A, B) . i.e., $(A, B) - (u, v)$ is Micro Binary open in (A, B) . Since f is Micro Binary continuous, $f^{-1}((A, B) - (u, v))$ is Micro open in Z . i.e., $Z - f^{-1}(u, v)$ is Micro open in Z . Therefore, $f^{-1}(u, v)$ is Micro Binary closed in Z . Thus, the inverse image of every Micro Binary closed set in (A, B) is Micro Binary closed in Z , if f is Micro continuous on Z . Conversely, let the inverse image of every Micro Binary closed set be Micro closed. Let $\{g, h\}$ be Micro Binary open in (A, B) . Then $(A, B) - (g, h)$ is Micro Binary closed in (A, B) . Then, $f^{-1}((A, B) - (g, h))$ is Micro closed in Z . That is, $Z - f^{-1}(g, h)$ is Micro closed in Z . Therefore, $f^{-1}(g, h)$ is Micro open in Z . Thus, the inverse image of every Micro Binary open set in (A, B) is Micro open in Z . That is, f is Micro Binary continuous on Z .

Definition 3.5.

Let $(Z, \text{tr}(y), \mu_R(y))$ be a micro topological space and $((X, Y), (\phi, \phi), \text{tr}(x_1, x_2), \mu_R(x_1, x_2))$ be a Micro Binary topological space. Then the map $f : Z \rightarrow X \times Y$ is called Micro Binary semi continuous if $f^{-1}(A, B)$ is semi open in Z for every Micro Binary open set (A, B) in $((X, Y), (\phi, \phi), \text{tr}(x_1, x_2), \mu_R(x_1, x_2))$.

Proposition 3.6.

Every Micro Binary continuous function is Micro Binary semi continuous function.

Proof.

Let (A, B) be a Micro Binary open set in (X, Y, M) . Since f is Micro Binary continuous, we have $f^{-1}(A, B)$ is open in Z . We know that every open set is semi open. Hence $f^{-1}(A, B)$ is semi open in Z . Thus f is Micro binary semi continuous. The converse of Proposition 3.6 need not be true which is shown in the following example.

Example 3.7.

Consider $Z = \{p, q, r, s\}$. Let $Z/R = \{\{p, q\}, \{r\}, \{s\}\}$. $z = \{r\}, \{q\}$. $\text{tr}(z) = \{\phi, Z, \{r\}, \{p, q, r\}, \{p, q\}\}$. $\mu = \{s\}$. Then the micro open set $\mu_R(z) = \{\phi, Z, \{r\}, \{r, s\}, \{p, q, r\}, \{s\}, \{p, q\}, \{p, q, s\}\}$. The semi open sets in Z are $\phi, Z, \{p\}, \{q\}, \{r\}, \{s\}, \{p, q\}, \{p, r\}, \{p, s\}, \{q, r\}, \{q, s\}, \{r, s\}, \{p, q, r\}, \{p, q, s\}$ and $\{q, r, s\}$. $X = \{a, b, c\}$ and

$Y = \{d, e, f\}$ the the equivalence relation $(X, Y)/R = \{\{a, f\}, \{c, d\}, \{b, e\}\}$. $(x_1, y_1) = \{a, c\}, \{d, e\}$

Sangeetha and Sindhu

$tr_{(X_1, Y_1)} = \{(\phi, \phi), (X, Y), (\{c\}, \{d\}), (\{a\}, \{f\}), (\{a, c\}, \{f, d\})\}$.
 $\mu = (\{b\}, \{e\}) \subseteq (X, Y)$. $\mu_{R(X_1, Y_1)} = \{(\phi, \phi), (X, Y), (\{c\}, \{d\}), (\{b\}, \{e\}), (\{b, c\}, \{e, d\}), (\{a, c\}, \{f, d\}), (\{a\}, \{f\}), (\{a, b\}, \{f, e\})\}$.
 Define $f : Z \rightarrow X \times Y$ by $h(p) = (\{c\}, \{d\})$, $h(q) = (\phi, \phi)$, $h(r) = (\{b\}, \{e\})$,
 $h(s) = (\{a\}, \{f\})$. Therefore, h is micro binary semi continuous mapping but not micro binary open mapping. For $h^{-1}(\{c\}, \{d\}) = \{p\}$ which is semi open in Z but not open in Z .

Theorem 3.8.

Every micro binary α continuous mapping is a micro binary semi continuous mapping.

Proof.

Let $f : Z \rightarrow X \times Y$ be a micro binary continuous mapping. Let (A, B) be a micro binary closed set in $X \times Y$. Since, f is micro binary α continuous mapping,
 $f^{-1}(A, B)$ is a micro binary α closed set in Z . Since, every α closed set is semi closed set, $f^{-1}(A, B)$ is micro binary semi closed set in Z . Hence, f is a micro binary semi continuous mapping.

Example 3.9.

Let $Z = \{e, g, h, i\}$. Let $Z/R = \{\{e, g\}, \{i\}, \{h\}\}$. $z = \{g, h\}$. $tr(z) = \{Z, \phi, \{h\}, \{e, g, h\}, \{e, g\}\}$. $\mu = \{i\}$. Then the micro open set $\mu_R(z) = \{Z, \phi, \{h\}, \{i, h\}, \{i\}, \{e, g, h\}, \{e, g\}, \{e, g, i\}\}$. micro closed sets in Z are $Z, \phi, \{e, g, i\}, \{e, g\}, \{e, g, h\}, \{i\}, \{h, i\}, \{h\}$. Micro binary α open sets are $Z, \phi, \{h\}, \{i\}, \{h, i\}, \{e, g, h\}$.
 $X = \{J, K, L, M, N\}$ and $Y = \{p, q, r, s, t\}$ then the equivalence relation
 $(X, Y)/R = \{(\{J, K\}, \{p\}), (\{L, N\}, \{q, r\}), (\{M\}, \{s, t\})\}$. $\{x_1, y_1\} = \{(\{J, M\}, \{p, t\})\}$. Then the nano binary open set $tr_{(X_1, Y_1)} = \{(X, Y), (\phi, \phi), (\{M\}, \{s, t\}), (\{J, K, M\}, \{p, s, t\}), (\{J, K\}, \{p\})\}$. $\mu = \{(\{L, N\}, \{q, r\})\}$. Then the micro binary open set $\mu_{R(X_1, Y_1)} = \{(X, Y), (\phi, \phi), (\{L, N\}, \{q, r\}), (\{M\}, \{s, t\}), (\{M, L, N\}, \{s, t, q, r\}), (\{J, K, M\}, \{p, s, t\}), (\{J, K\}, \{p\}), (\{J, K, L, N\}, \{p, q, r\})\}$. Define $f : Z \rightarrow X \times Y$ by
 $f(e) = (\{L\}, \{q\})$, $f(g) = (\{N\}, \{r\})$, $f(h) = (\{J, K\}, \{q\})$, $f(i) = (\{M\}, \{s, t\})$. The mapping $f : Z \rightarrow X \times Y$ is clearly micro binary semi continuous but not micro binary α continuous mapping since $f^{-1}(\{L, M, N\}, \{q, r, s, t\}) = \{e, g, i\}$ which is not micro binary α open set but micro binary semi open set.

Theorem 3.10.

A mapping $f : Z \rightarrow X \times Y$ is micro binary continuous iff the inverse image of each micro binary open set in (X, Y) is micro binary open in Z .

Proof.

Assume $f : Z \rightarrow X \times Y$ is micro binary continuous mapping. Let (A, B) be a micro binary open set in (X, Y) which implies that $(A, B)^c$ is a micro binary closed set in (X, Y) . Since, f is a micro binary continuous mapping, $f^{-1}(A, B)^c$ is a micro binary closed set in Z . Hence, $f^{-1}(A, B)$ is a micro binary open in Z . Conversely, suppose the inverse image of each micro binary open set in (X, Y) is a micro binary open set in Z . Let (A, B) be a micro binary closed set in (X, Y) . That implies, $(A, B)^c$ is micro binary open in (X, Y) . By hypothesis, $f^{-1}(A, B)^c$ is a micro binary open set in Z . Therefore, $f^{-1}(A, B)$ is a micro binary closed in Z . Hence, f is a micro binary continuous mapping.

Proposition 3.11.

Let $f : Z \rightarrow X \times Y$ be a micro binary continuous mapping iff for every $z \in Z$ and for every micro binary open set (A, B) with $f(z) \in (A, B)$, there is an micro binary open set $V_A \subseteq Z$ such that $f(V_A) \subseteq (A, B)$.

Proof.

Assume $f : Z \rightarrow X \times Y$ is a micro binary continuous mapping, Let (A, B) be a micro binary open set with $f(z) = (X, Y)$ where $(X, Y) \in (A, B)$. This implies that $z \in f^{-1}(A, B)$. Now, put $V_A = f^{-1}(A, B)$. Hence, V_A is an micro binary open set in Z and $f(V_A) \subseteq (A, B)$. Conversely, suppose for every micro binary open set (A, B) , there exists an micro binary open set V_A in Z and $f(V_A) \subseteq (A, B)$. Let (A, B) be a micro binary open set. Let $u \in f^{-1}(A, B)$. Then $f(u) = (A, B)$. By our assumption, there exists an open set V_A with $f(V_A) \subseteq (A, B)$. Therefore, $f^{-1}(f(V_A)) \subseteq f^{-1}(A, B)$. That is, $V_A \subseteq f^{-1}(A, B)$. This shows that for each $u \in f^{-1}(A,$

Sangeetha and Sindhu

B), there is an micro binary open set V^A containing u such that $V^A \subseteq f^{-1}(A, B)$. This implies that $f^{-1}(A, B)$ is a union of all micro binary open sets in Z . Hence, f is a micro binary continuous mapping.

RESULT 3.12.

1. Every M_B open is $M_B \alpha$ open.
 2. Every M_B open is M_B semi open.
 3. Every $M_B \alpha$ open is M_B semi open.
 4. Every M_B semi open is $M_B \beta$ open.
- The converse of the above mentioned result is not true.

CONCLUSION

In this paper, we have defined M_B continuous functions in micro binary topological spaces and their characterizations were studied. Also we have explored some continuous functions in micro binary topological spaces and their features were discussed. The characterizations of weaker forms of M_B continuous functions are in future process.

ACKNOWLEDGEMENT

The author is very grateful to the anonymous reviewers for their insightful and constructive comments and suggestions, which have been very helpful in improving the paper.

ABSTRACT

Small and medium-sized enterprises (SMEs) are increasingly adopting frugal, eco, and AI-driven innovations to enhance productivity. However, this progress has also widened their exposure to cybersecurity risks. This study compares the nature, frequency, and financial impact of cybersecurity breaches affecting SMEs operating under these three innovation models. A structured literature study was carried out using databases such as Scopus, Web of Science, Google Scholar, ACM Digital Library, ABDC Journal Quality List, UGC-CARE, and SCIE. The study spanned publications from 2015 to 2024. Only peer-reviewed sources written in English and offering measurable cybersecurity insights were included. Exclusion criteria omitted pre-2015 and non-reviewed content. Keywords targeted cybersecurity in SMEs within the domains of frugal, eco, and AI innovations. Results were organized using comparative tables, trend graphs, and flowcharts. Legacy systems in frugal setups led to breach rates of 55%–60%, with average losses ranging between USD 40,000 and 70,000. In eco-driven SMEs, 45% of IoT devices were found vulnerable, causing incidents that cost around EUR 70,000 each. AI-integrated firms saw a 35% rate of adversarial attacks and data poisoning, with costs nearing USD 45,000 per case. Budget limitations and lack of standardized security practices emerged as major challenges. This work offers a consolidated view of cybersecurity threats across innovation types, highlighting gaps in current research and providing a baseline for future strategies and policy frameworks aimed at strengthening cybersecurity in SMEs.

Keywords: Cybersecurity Challenges, Frugal Innovations, Eco Innovations, AI Innovations, Smes, Incident Rates, Financial Impact, Predictive Analytics, Integrated Security Frameworks

INTRODUCTION

In today's dynamic digital world, small and medium-sized enterprises (SMEs) are increasingly leveraging innovative technologies to gain a competitive advantage and ensure sustainable growth. Among these strategies, frugal innovations—which focus on cost reduction and efficient resource utilization—eco innovations that promote sustainability through technologies like the Internet of Things (IoT), and artificial intelligence (AI) innovations that enhance decision-making through advanced algorithms are emerging as vital drivers of progress. However, these technological advances also bring considerable cybersecurity challenges, exposing SMEs to a complex landscape of persistent threats and rapidly evolving vulnerabilities. Over the past decade, significant progress has been made in understanding and mitigating cybersecurity risks. For example, early research by [1] highlighted the vulnerability of SMEs that rely on outdated legacy systems, a common practice in frugal innovation, showing that nearly 60% of such organizations suffer breaches that lead to considerable financial losses. In a similar vein, foundational studies by [7] established critical parameters for IoT security, revealing that many eco innovation implementations are at risk due to issues like unpatched firmware and weak authentication mechanisms. Moreover, the influential work by [13] on adversarial examples has driven further investigations into the cybersecurity challenges specific to AI systems, with subsequent studies by [14] and [15] quantifying the impact of adversarial attacks on these systems. Despite these valuable contributions, the current literature has several notable gaps. Much of the existing research tends to focus on individual aspects of cybersecurity—examining legacy system vulnerabilities, IoT weaknesses, or AI-specific threats in isolation—rather than offering an integrated analysis that spans all three innovation types within SMEs. Additionally, with the rapid evolution of technologies such as AI and IoT, some earlier studies may no longer fully reflect the current risk environment. There is also a pressing need for standardized metrics and predictive tools that can compare incident rates and financial impacts across these diverse domains. Finally, while much attention has been given to cybersecurity in large enterprises, the unique challenges faced by SMEs—with their limited resources and distinct operational constraints—remain underexplored. To address these deficiencies, the present study undertakes an extensive literature review and empirical analysis to quantify cybersecurity challenges and the associated financial impacts linked to frugal, eco, and AI innovations in SMEs. Drawing on data from hundreds of high-quality, indexed research articles and authoritative industry reports published between 2015 and 2024, this study offers a comprehensive, cross-domain perspective that not only captures evolving incident trends and cost implications but also identifies actionable insights and future research directions.

Research Contributions

This study makes several key contributions

- It integrates findings across frugal, eco, and AI innovations to provide a comparative assessment of cybersecurity challenges in SMEs—a holistic view that is largely absent in prior work.
- By analyzing data over a nine-year span (2015–2024), it reveals how incident rates and financial impacts have shifted over time, offering valuable insights into the evolution of cybersecurity risks.
- The study proposes concrete recommendations and a strategic roadmap, addressing issues such as chronic underinvestment in cybersecurity and the need for standardized security metrics, thereby guiding both practitioners and policymakers.

Research Gaps

Despite substantial advancements, several gaps persist

- Many studies isolate cybersecurity issues within single domains without integrating insights across frugal, eco, and AI innovations, limiting our understanding of their interconnected nature.

**Soumya Roy et al.,**

- A number of foundational studies are now dated, and with rapid technological change, earlier findings may not capture current risk dynamics.
- There is a lack of standardized metrics to benchmark cybersecurity incidents and financial losses across different innovation types, hindering the development of effective predictive models.
- Research on cybersecurity in SMEs is limited compared to that on larger enterprises, leaving the specific challenges and constraints of SMEs underexplored.

Research Questions

Based on these gaps, the study seeks to answer

- What specific cybersecurity challenges are associated with frugal, eco, and AI innovations in SMEs?
This question aims to detail the unique vulnerabilities within each innovation category, including the dependence on outdated systems, IoT security weaknesses, and adversarial threats in AI.
- How do incident frequencies and financial impacts vary across these innovation domains?
By quantifying these aspects, the study intends to establish clear benchmarks for developing targeted cybersecurity strategies.
- What emerging trends, breakthrough technologies, and unresolved issues exist in the cybersecurity practices of SMEs?
This inquiry focuses on identifying recent advancements such as real-time threat detection and integrated security frameworks, as well as areas requiring further research and investment.

The sections that follow will describe the methodology, present a detailed literature review, share results and discussions, and conclude with actionable recommendations—all building on the foundation outlined in this introduction.

LITERATURE REVIEW

Frugal innovations in SMEs are designed to cut costs and boost efficiency, yet they often depend on outdated legacy systems that lack proper security updates. Research shows that roughly 55%–60% of SMEs using such systems experience at least one cybersecurity breach over a three-year period ([1], [2]). One study revealed that without regular security updates, these systems become highly susceptible to attacks, resulting in breach-related costs between USD 40,000 and USD 70,000. National surveys further indicate that the resulting expenses—including downtime and remediation—can far exceed the initial savings from cost-cutting measures. A national cybersecurity survey revealed that the overall financial burden on SMEs, due to frequent breaches, far exceeds the immediate cost savings of using legacy systems. This research emphasizes that indirect costs like downtime and lost business substantially contribute to long-term financial losses [3]. Budget constraints further worsen these vulnerabilities, as many SMEs allocate only 5%–7% of their IT budgets to cybersecurity [4]. Study in [5] indicates that this level of spending is insufficient for advanced measures like real-time threat detection, continuous monitoring, and multi-factor authentication. Accenture’s study indicates that limited cybersecurity spending in SMEs leads to a cycle of recurring breaches. Although initial cost-cutting measures offer short-term benefits, each incident forces increased spending—often by up to 30%—yet the persistent vulnerabilities continue to incur significant long-term costs [6]. Similarly, eco innovations, which employ sustainable technologies like IoT devices to improve energy efficiency and reduce environmental impact, bring their own cybersecurity challenges. Studies by [7] suggest that between 70% and 75% of SMEs implementing IoT solutions for eco innovations face significant security issues. Study in [8] documented that nearly 45% of IoT devices in these settings are compromised due to factors such as unsecured firmware, default credentials, and weak encryption, leading to average losses of about EUR 70,000 (approximately USD 75,000) per incident [8][9]. The rapid adoption of AI in SME operations has brought improved data analytics and decision-making capabilities, yet it also introduces new cybersecurity risks. Groundbreaking work by [13] demonstrated that AI systems can be fooled by deliberately altered inputs. Building on this, [14] found that about 35% of SMEs using AI have encountered adversarial attacks or data poisoning, which can degrade model performance by approximately 20% and lead to direct costs near USD 45,000 due to retraining and additional

**Soumya Roy et al.,**

security measures [14][15]. Additionally, up to 30% of SMEs utilizing AI have reported incidents of intellectual property theft, where proprietary models are stolen because of insufficient encryption and access controls [16][17]. Studies by [18] and [19] emphasize that while robust encryption and secure deployment practices could reduce such risks, many SMEs struggle to invest adequately in these solutions. When data from multiple studies are combined, a clear picture emerges: about 55%–60% of SMEs using legacy systems experience breaches [1][2], nearly 45% of IoT devices in eco innovations are compromised [8][9], and roughly 35% of SMEs employing AI face adversarial attacks [14][15]. On average, each cybersecurity incident costs between USD 40,000 and USD 70,000 for frugal innovations, around EUR 70,000 (approximately USD 75,000) for eco innovations, and about USD 45,000 for AI-related breaches.

METHODOLOGY

This research adopts a structured review process combined with data analysis to explore cybersecurity risks associated with frugal, eco-friendly, and AI-driven innovations in small and medium-sized enterprises (SMEs). The primary objective is to assess the frequency of cybersecurity incidents and their financial consequences by leveraging statistical insights from authoritative sources. The approach ensures a thorough, methodical, and reproducible evaluation of the subject. A variety of well-regarded academic and industry databases were consulted to identify relevant studies. These include Google Scholar, Scopus, Web of Science (WoS), ACM Digital Library, ABDC Journal Quality List, and the Science Citation Index Expanded (SCIE). These databases were selected to ensure that only high-quality, peer-reviewed literature contributes to the study. To capture relevant literature, carefully curated keyword combinations and Boolean operators were employed. The search queries incorporated terms such as

- ‘Cybersecurity challenges’ AND ‘SMEs’
- ‘Frugal innovations’ AND ‘cybersecurity’
- ‘Eco innovations’ AND ‘IoT vulnerabilities’
- ‘AI innovations’ AND ‘adversarial attacks’
- ‘Data breach’ OR ‘cyber incident’ AND ‘financial impact’
- ‘Legacy systems’ AND ‘cybersecurity risk’
- ‘Cost of cybercrime’ AND ‘small businesses’
- ‘Incident rates’ AND ‘cybersecurity’ AND ‘SMEs’
- ‘Cybersecurity investment’ AND ‘innovation’

Each search term was customized to align with the indexing and retrieval mechanisms of the selected databases, ensuring that the literature obtained was both relevant and comprehensive.

Inclusion and exclusion criteria were applied to refine the selection of studies. The research included peer-reviewed journal articles, conference papers, and industry white papers published in English from 2015 onward. Priority was given to studies indexed in reputable academic repositories that provided quantitative insights into cybersecurity risks affecting SMEs, particularly those adopting frugal, eco-friendly, and AI-driven solutions. Non-peer-reviewed content, outdated studies (unless historically significant), and research focusing solely on large enterprises were excluded to maintain relevance.

During the data analysing phase, key parameters were established to support the conceptual framework

- Cybersecurity Incident Trends: Measurement of SME breach rates, categorized by incident types such as ransomware, IoT vulnerabilities, and data poisoning.
- Financial Ramifications: Evaluation of both direct costs (e.g., mitigation expenses, legal fees) and indirect costs (e.g., reputational damage, operational downtime).
- Industry-Specific Risks: Examination of security challenges linked to frugal innovations (e.g., outdated security systems), eco innovations (e.g., unsecured IoT devices), and AI applications (e.g., adversarial threats and data poisoning).
- Risk Mitigation Strategies: Analysis of emerging security technologies, policy interventions, and cybersecurity investment patterns within SMEs.

**Soumya Roy et al.,**

- Research Gaps: Identification of underexplored areas, such as predictive analytics for SME cybersecurity and standardization of risk assessment metrics.

A systematic approach was used for data extraction and analysing. Titles and abstracts underwent an initial screening, followed by full-text reviews of selected studies. Data were extracted using a structured format, compiling both statistical findings (e.g., breach frequencies, financial losses) and qualitative insights (e.g., best practices for risk mitigation). Cross-referencing multiple sources ensured accuracy, and comparative analysis facilitated trend identification. To uphold the credibility of the findings, rigorous quality assessment measures were implemented. Only peer-reviewed and highly cited studies were considered, with preference given to research published in high-impact journals. Each selected study was critically evaluated based on its alignment with the research objectives, particularly in relation to quantifying cybersecurity risks and financial implications for SMEs. This methodological framework guarantees a comprehensive and systematic literature review, allowing for a reliable and reproducible examination of cybersecurity concerns in SMEs navigating frugal, eco-friendly, and AI-driven transformations.

RESULTS AND DISCUSSIONS

The following tables summarize the aggregated and normalized data from multiple studies, spanning 2015 to 2024, to show year-by-year trends in cybersecurity incidents and the financial impact for three types of innovations in SMEs. Table 1 presents the trends for frugal innovations. The data indicate that the percentage of SMEs experiencing cybersecurity breaches increased from about 55% in 2015 to roughly 60% by 2021 and 2024. Concurrently, the average cost per incident grew from approximately USD 40,000 in 2015 to USD 70,000 by 2024. Early research noted that these breaches are largely driven by the extensive use of outdated legacy systems. Over time, limited investment in cybersecurity has led to more frequent incidents and higher remediation costs. Table 2 focuses on eco innovations. The percentage of vulnerable IoT devices in SMEs increased from approximately 40% in 2015 to about 45% by 2021 and 2024. The financial impact per breach also rose steadily, from roughly USD 65,000 to USD 75,000 over the period. The data suggest that early IoT deployments showed significant security gaps, and as IoT integration deepened, issues such as unsecured firmware and insufficient authentication became more pronounced. Table 3 outlines the trends for AI innovations. In the early years, around 30% of SMEs using AI encountered cybersecurity incidents, with average breach costs of about USD 40,000. Over time, the incident rate increased modestly to approximately 35%, and the associated costs reached around USD 45,000. Although AI systems initially faced moderate challenges, adversarial attacks and data poisoning now necessitate significant retraining efforts and security reinforcements. Beyond these year-wise summaries, additional analyses further detail the specific vulnerabilities and mitigation strategies across the innovation domains. For example, separate table identifies the key cybersecurity issues in frugal innovations, including outdated software, insufficient cybersecurity budgets, and inadequate staff training, with corresponding incidence rates and financial impacts. Similar detailed breakdowns exist for eco and AI innovations, underscoring the need for tailored mitigation approaches. Table 4 summarizes the incident rates and financial impacts across the three innovation domains. Frugal innovations emphasize low-cost, accessible solutions. However, this often results in the use of legacy systems and minimal cybersecurity investments. Approximately 67% of SMEs in emerging markets adopt frugal innovations to reduce operational costs which are depicted in Table 6. Eco innovations utilize technologies like IoT and sensor networks to improve environmental sustainability. Despite their benefits, these solutions often have inherent cybersecurity weaknesses. Over 72% of SMEs implementing eco innovations rely on IoT devices for operational monitoring which are depicted in Table 6. AI technologies, while revolutionizing decision-making and operational efficiency, introduce novel cybersecurity challenges such as data poisoning and adversarial attacks. Over 80% of SMEs have integrated some form of AI-enabled tool, with 40% deploying advanced generative AI applications which are depicted in Table 6. Overall, the aggregated data reveal that while frugal innovations provide immediate cost savings, they are associated with higher cybersecurity incident frequencies and escalating financial losses over time. In contrast, eco and AI innovations also carry significant risks, though the patterns of incidents and costs differ, highlighting the need for domain-specific strategies to enhance cybersecurity resilience in SMEs.

Soumya Roy et al.,

CONCLUSION

This research presented an in-depth analysis of the cybersecurity vulnerabilities affecting small and medium-sized enterprises that engage with frugal, eco-friendly, and AI-enabled innovations. Through an extensive review of literature and empirical data covering a decade, it became evident that while these technological approaches offer substantial operational benefits, they also bring distinct cybersecurity challenges. Enterprises relying on low-cost legacy systems often lack the infrastructure to detect and respond to threats, making them easy targets for cyberattacks. Similarly, businesses integrating IoT-based eco solutions are frequently exposed to security lapses due to insufficient firmware protection and minimal oversight of third-party devices. Artificial intelligence, despite its transformative potential, introduces another layer of risk through attacks that exploit weaknesses in training data and model integrity. This work contributes meaningfully by comparing incident patterns and associated financial losses across these domains, revealing that many SMEs remain underprepared to handle modern cyber threats. By drawing attention to these domain-specific gaps, the study reinforces the urgent need for targeted security practices and better resource allocation within the SME sector. Looking ahead, there is a strong case for developing adaptive cybersecurity solutions that reflect the unique resource constraints and operational models of SMEs. Rather than adopting one-size-fits-all security protocols, future frameworks should prioritize modular, scalable systems that can evolve with the pace of digital transformation. Further investigation is also needed to evaluate how cybersecurity investment correlates with risk mitigation across specific industries and regions. Establishing unified benchmarking standards would allow SMEs to assess their preparedness more accurately and take informed decisions. Collaboration between researchers, industry experts, and policy institutions could lead to the design of supportive regulatory environments and funding mechanisms, ensuring that innovation is not achieved at the cost of vulnerability. These steps would mark a significant stride toward building cyber-resilient SMEs capable of sustaining growth in an increasingly digital and interconnected economic landscape.

Table 1. Year wise Incident Frequency and Financial Impact for Frugal Innovations [1],[2],[3]

Year	Incident Frequency (%)	Average Financial Impact (USD)	Notable Observations
2015	~55%	40,000	Early studies highlighted heavy reliance on legacy systems.
2017	~56%	42,000	Slight increase in breach frequency due to underinvestment.
2019	~58%	50,000	Attack sophistication rose, increasing costs.
2021	~60%	65,000	More downtime and higher remediation expenses observed.
2024	~60%	70,000	Persistent legacy system vulnerabilities remain critical.

Table 2. Year wise Incident Frequency and Financial Impact for Eco Innovations[7],[9],[10]

Year	Incident Frequency on IoT Devices (%)	Average Financial Impact (USD)	Notable Observations
2015	~40%	65,000	Early IoT deployments revealed significant security gaps.
2017	~42%	68,000	Greater integration led to increased exposure.
2019	~44%	70,000	Unsecured firmware issues became more frequent.
2021	~45%	73,000	Increased vendor risk highlighted supply chain vulnerabilities.
2024	~45%	75,000	Incident rates remained steady; minor cost increases observed.

Table 3. Year wise Incident Frequency and Financial Impact for AI Innovations[14],[15],[16]

Year	Incident Frequency (%)	Average Financial Impact (USD)	Notable Observations
2015	~30%	40,000	Early AI deployments experienced moderate adversarial challenges.
2017	~32%	42,000	Early indications of data poisoning began to emerge.
2019	~34%	43,000	Increased reliance on AI corresponded with more sophisticated attacks.
2021	~35%	45,000	Retraining costs and security reinforcement became significant.
2024	~35%	45,000	Incident rates stabilized; costs remained consistent.

Table 4. Cybersecurity Vulnerabilities in Frugal Innovations

Vulnerability	Description	Reported Incidence (%)	Average Financial Impact (USD)
Use of outdated software	Legacy systems lacking regular security updates	58	40,000 – 70,000
Limited cybersecurity budgets	Minimal investment in modern security solutions	63	30,000 – 60,000
Insufficient staff training	Inadequate cybersecurity awareness among employees	70	Indirect costs (productivity loss)

Soumya Roy et al.,

Table 5. Cybersecurity Risks and Mitigation in Eco Innovations

Risk Factor	Description	Incidence in SMEs (%)	Recommended Mitigation
Unsecured IoT Devices	Inadequate firmware updates and authentication protocols	45	Implement robust firmware update cycles and multi-factor authentication
Data privacy breaches	Unauthorized access to environmental monitoring data	33	Encrypt sensitive data and ensure compliance with privacy regulations
Supply chain vulnerabilities	Third-party device vulnerabilities	29	Conduct regular vendor security audits

Table 6. Cybersecurity Challenges in AI Innovations

Challenge	Description	Incidence in SMEs (%)	Mitigation Approach
Data poisoning	Corruption of training datasets with malicious inputs	35	Implement robust data validation and anomaly detection systems
Adversarial attacks	Malicious input manipulation to deceive AI models	30	Develop adversarial-resistant algorithms and continuous model retraining
Model theft	Unauthorized replication of proprietary AI models	28	Enforce strict access controls and watermark AI models

A Clinical Study to Evaluate the Efficacy of *Kushtaoi Ghrita* on Medha in School Going Children W.S.R. to Intelligence Quotient (IQ)

ABSTRACT

Intelligence Quotient (IQ) is a standardized measure of cognitive ability, with borderline intelligence (IQ 64–74) affecting approximately 7% of school-aged children[1]. These children often experience academic difficulties, emotional distress, and an increased risk of psychological disorders[2]. Ayurveda describes cognitive functions through *Medha*, *Smriti*, *Dhriti*, and *Vijnana*, and emphasizes the use of *Medhya Rasayana* (nootropic agents) for intellectual enhancement [3]. *Kushtadi Ghrita*, an Ayurvedic formulation, is traditionally used to improve cognitive functions[4]. This study aims to evaluate the efficacy of *Kushtadi Ghrita* in improving IQ levels among children with borderline intelligence using the Binet-Kamat Test of Intelligence (BKT) and to assess subjective improvements in *Medha*, *Smriti*, *Dhriti*, and *Vijnana*. A prospective, single-arm clinical study should be conducted on 30 children aged 10–14 years with borderline IQ. *Kushtadi Ghrita* is administered orally for six weeks, followed by assessments at baseline, during treatment, and post-intervention. IQ scores are evaluated using BKT, and subjective cognitive parameters should be assessed. Statistical analysis should be performed using Paired t-tests and Wilcoxon signed-rank tests. The study is expected to demonstrate a significant improvement in IQ scores and subjective cognitive functions. The lipophilic nature of *Ghrita* may facilitate better neural absorption of *Medhya* herbs, enhancing cognitive benefits[5]. *Kushtadi Ghrita* may serve as an effective *Medhya Rasayana* for improving intelligence in children with borderline IQ. This study contributes to bridging Ayurveda with modern scientific validation for cognitive enhancement.

Keywords: Binet-Kamat scale, IQ, *Kushtadi Ghrita*, *Medhya*, School going children.

INTRODUCTION

Intelligence quotient [IQ] is a total score derived from a set of standardized tests or subsets designed to assess human intelligence. The abbreviation IQ was coined by the psychologist William Stern for the term Intelligenzquotient.[6] At school level, there will be [3-4] children in each class with borderline intellectual functioning which accounts about 7% of school going population. These slow learners experience severe emotional stress, lose their self-esteem, and by adolescence are at risk to develop mood and conduct disorders. For this category of people additional support in several forms are needed to boost their academic performance. Intellectual functioning can be correlated to *Medha*[cognition] or *Buddhi* [intellect] in Ayurveda, whose proper functioning leads to *Samyak Jnana* (proper knowledge)and dysfunction leads to improper cognitive development. Children with low intellectual functioning need support and are currently managed with multimodal therapies like developmental therapy, special education etc. Pharmacological approach is used only for managing co-morbid conditions of intellectual dysfunction. Concept of improving cognitive functions like intelligence and memory is relatively very new to current modern system of medicine. The first drug discovered to enhance cognitive functions known as Nootropics [7]. Ayurveda, the ancient science of life, has long emphasized the role of *Medhya* (intellect-enhancing) therapies in cognitive development and mental well-being[8]. *Medha*, *Smriti*, *Dhriti*, and *Vijnana* are four key aspects of intellectual function described in classical Ayurvedic texts, each contributing to learning, memory, retention, and decision-making[9]. *Kushtadi Ghrita*, a traditional formulation mentioned in *Kashyapa Samhita*, is specifically indicated for improving cognitive functions and has been traditionally used as a *Medhya Rasayana* (nootropic agent)[10].*Ghrita* (medicated ghee) is considered an ideal medium for carrying *Medhya* herbs due to its lipophilic nature, which facilitates deeper tissue penetration, particularly into the brain[11]. *Kushtadi Ghrita* combines nine potent Ayurvedic herbs known for their cognitive-enhancing properties with *Ghrita* as a base, making it highly effective for neurological nourishment and cognitive support[12]. This study aims to evaluate the efficacy of *Kushtadi Ghrita* in improving IQ levels among children with borderline intelligence using the Binet-Kamat Test of Intelligence. Additionally, subjective improvements in *Medha*, *Smriti*, *Dhriti*, and *Vijnana* will be assessed to understand the holistic benefits of the formulation. By bridging ancient wisdom with modern scientific assessment tools, this trial seeks to revalidate the traditional Ayurvedic concepts of *Medhya Rasayana* and provide an evidence-based approach for enhancing cognitive function in children.

Objectives of the trial

- To evaluate the efficacy of *Kushtadi Ghrita* in the improvement of IQ in children who fall in range of 64-74 (borderline IQ) as per Binet-Kamat scale of intelligence.
- To assess the effect of *Kushtadi Ghrita* in the improvement of Subjective parameters – *Medha*(Cognition), *Smriti*(Memory), *Dhriti*(Retention)and *Vijnana*(Decision-Making).

METHODOLOGY

Trial design

This study is a prospective, single arm clinical study with pre and post design.

Research ethics approval

Ethical clearance from the Institute of Ethics Committee has been received for this trial (JSSAMC/1199/2023-24).The study is registered prospectively at the Clinical Trial Registry of India (CTRI/2024/07/071584)¹³. The investigators will obtain informed consent from the eligible subjects before enrolment.

The children and their parents were thoroughly informed verbally about the trial's objective, the nature of the pharmacological therapy, follow up and any complications, as well as through written and informed consent.

**Harsha and Sri Hari Sheshagiri****Methods****Participants, Interventions and Outcomes****Recruitment**

After obtaining written informed consent from parents, eligible subjects with borderline IQ will be enrolled in the outpatient department of JSS Ayurveda Hospital, Mysuru, Karnataka, India, from the schools in and around Mysuru city, special camps, and other referrals, based on the predefined inclusion and exclusion criteria. In this trial, a total of 30 patients with borderline IQ will be studied in one group for 90 days. The study includes children fulfilling the diagnostic and inclusion criteria [Table 01].

Diagnostic criteria

Binet Kamat Test of Intelligence (BKT) within the range of 64-74 [14].

Assessment criteria

IQ will be assessed based on standard IQ assessment scale – Binet Kamat scale of intelligence.

Withdrawal Criteria

Participants will be withdrawn from the study if there is any serious adverse event during the study period, or any health ailments necessitating immediate/ emergency medical care. Participants unwilling to continue the study for any reason will also be withdrawn. The reason for withdrawal will be recorded appropriately in the case record form (CRF).

Trail Drug review

Individual drug review as depicted in Table 01 Table 02: Ingredients of Kushtadi Ghrita

Method of preparation

The above-mentioned ingredients are first processed into a fine powder (*Churna*) and then made into a paste (*Kalka*) by pounding. Clarified butter (*Ghrita*) is added in a quantity four times that of the paste, followed by the addition of water (*Jala*) in a quantity four times that of the *Ghrita*. The mixture is then subjected to heat until it reaches the desired consistency (*Samyak Paka*). After cooling, the preparation is ready for use[23]. Quality-assured trial interventions will be prepared from a GMP-certified Ayurveda Pharmaceutical Company. Details of intervention and posology of trial drug mentioned in

Intervention

Table. 03. Details of Intervention

Outcome**Primary outcome**

Changes in IQ scores according to Binet – Kamat test of intelligence. Classification of IQ Table. 04. Binet – Kamat test Secondary outcome will be assessed based on Changes in subjective criteria mentioned in Table. 05. Subjective Parameters[27]

Participant timeline

Timeline for outcome assessment

Assessment of parameters will be done on 0th day and 43rd day.

Methods Data collection, Management and analysis

Data collection methods

Demographic data, medical history, clinical assessment, physical examination and assessment of outcome measures of the recruited participants will be documented in a specially designed CRF at baseline and follow-up visits. The

**Harsha and Sri Hari Sheshagiri**

data collected in the case Record Forms will be entered in a pre-structured MS Excel sheet and cross – checked for repeat or unmatched entries. The incidence of adverse events, if any, will be documented appropriately in the CRF.

Data management

At the study, all study records will be safely stored. Password protection will be maintained for electronic databases. Proper data documentation will be assured for appropriate interpretation, analysis and verification. After completion of the study, data will be analysed and published without disclosing the personal identification of the participants.

Statistical methods

The categorical variables in the study data will be summarized as percentage and compared using the chi-square test. The continuous data having normal distribution will be represented as mean (SD), and data not following normal distribution as median (min-max). Parametric data will be analysed by paired t-test. Whereas non parametric data will be calculated by Wilcoxon signed rank test. All the data analysis will be done using IBM SPSS21 software.

Data monitoring

The study will be monitored by Data and Safety Monitoring Board (DSMB). An interim analysis will be done when at least 25% of participants have completed their trial period.

Harms

Any adverse event or adverse drug reaction observed during the treatment or follow-up visits will be recorded in structured formats for data capture. The PI will report these events to the institutional ethics committee (IEC) within 24 hours of the occurrence of serious adverse events (SAE).

Auditing

The investigators will ensure access to all the source documents, CRF, and other study documents for the onsite inspection by the regulatory authorities, and the institutional ethics committee.

Ethics and dissemination**Protocol Amendments**

It will be ensured that the trial is executed as per the study protocol. No deviation from the protocol will be made except when necessary to eliminate an immediate hazard to the participants. Protocol amendments, including changes in intervention, data collection, and examination, will be reported to the guide, mentor, and IEC, along with the exact reason for the deviation. All substantial amendments affecting patient safety or study integrity will need prior approval from the IEC before implementation in the study.

Confidentiality

The information of the participants will be kept confidential. The medical records may be inspected by the members of the Institutional Ethics Committee to check whether the study is carried out appropriately.

Declaration of interests

There is no competing interest between the investigators. The principal investigator has designed this study and will analyze the data and publish the results. The medicine used in the intervention is classical Ayurveda drug *Kushtadi ghrita*.

Access to data

Only the investigators of the study will be able to assess the collected data. An independent biostatistician will assess data relating to statistical analysis.

Ancillary and post-trial care

No ancillary and post-trial care is planned in the study for the participants.

**Harsha and Sri Hari Sheshagiri****Dissemination policy**

The principal investigator will communicate trial results to the participants, healthcare professionals, and public groups by publishing and reporting results in databases.

DISCUSSION

The observation and results of the study will be collected and analyzed accordingly. Based on the changes in clinical features and quality of life parameters before and after intervention results will be analyzed. The changes in the clinical features will be noted in grades as depicted in both the tables. Table 3 depicts the changes in objective parameters and table 4& 5 depicts the changes in subjective parameters. In the present study BKT (Binet-Kamat test of intelligence) is taken because it is simple to administer, score and interpret and economical in terms of cost; and still a valid measure of intelligence despite the test was standardized several decades ago^{28,29}. That's why BKT was considered as one of the gold standards tests of intelligence. Whereas other tests include limitations like cultural and language bias, narrow scope of intelligence, static nature of assessment and administration & scoring challenges. *Kushtadi Ghrita* is taken in the study because it is mentioned as *Medha Jananamuttamam*[30] (The best for enhancing intellect) by Acharya Kashyapa and it is the formulation containing 9 ingredients along with *Ghrita*. Basically *Ghrita* is also act as *Medha* and palatability is also good in children. It has most of the ingredients other than *Medhya Dravya* that are commonly mentioned in classical texts and day to day practice. In this way it is different from other formulations that contain *Medhya dravyas*. Most of the studies are done on efficacy of *Ekamooloka prayoga* that is single herb and some commonly used formulations. The age criteria of 10 – 14 years is taken because they can express about what they are understanding and it is easy to administer the IQ tests when compared to that of the smaller age of children. 10 -14 years means the sufficient sample group will be available for the study and these students are in higher primary and high school, so this makes it convenient sampling technique. It is a period of significant intellectual, emotional, and social development. This stage, which bridges late childhood and early adolescence, is pivotal for identifying strengths, weaknesses, and potential learning needs. The borderline IQ that is 64 – 74 is taken because we can show significant improvement in this score. If it is too low it is very difficult expect a significant result in the IQ score and they are usually associated with other learning disorders, behavioral and neurobehavioral disorders. Children who are on any other nutritional supplements and medicines for improvement of IQ or memory because we are unable to assess the efficacy of our drug *Kushtadi Ghrita*. Children with systemic illness which will interfere in the course of study, if anything emergency happens they will be in the drop out criteria. Known case of genetic disorders, developmental disorders and any other psychological disabilities because we won't expect much improvement in this. So these all are excluded. *Kushtadi Ghrita* will be given in the dose of 10 – 12 ml according to age as per the dosage in *Kashyapa Samhita*. *Aushadha sevana*(timing for taking medicine) *kala* is mentioned as *Abhakta*(Before food)because *Ghrita* is heavy to digest so it should be given before the food. *Anupana*(medium for taking medicine)is given as *Ushna Jala* because it acts as *Deepana* and *Pachana* as *Ghrita* is heavy to digest. Duration of the treatment will be 6 weeks that are 42 days, in *Yogashastra* it is considered as one *Mandala*³¹. So we have taken *Kushtadi Ghrita* to assess the efficacy in improving *Medha* particularly IQ score and observations are noted. Subjective criteria are analyzed through Wilcoxon signed rank test³² and objective criteria are analyzed through paired t – test³³.

CONCLUSION

The administration of *Kushtadi Ghrita* is expected to show significant effects in increasing *Medha* in both subjective and objective parameters. The results of the trial may serve as a tool to revalidate the traditional concepts of Ayurveda in the improvement of IQ. The protocol may also serve as a reference for planning similar types of clinical trials. Limitation of the study

Financial support and sponsorship

This study is self-funded.

Table.3. Details of Intervention

Particulars	Details
Drug Name	<i>Kushtadi Ghrita</i>
Dosage ²⁴	10 – 12 ml (BD) For 10-12 years – 10ml (5ml BD) For 13-14 years – 12 ml (6ml BD)
Route of administration	Oral
Frequency	Twice a day
<i>Aushadha Sevana Kala</i> (timing for taking medicine) ²⁵	<i>Abhakta</i> (Before food)
<i>Anupana</i> (medium for taking medicine) ²⁶	<i>Ushma Jala</i> (Hot water)
Duration	6 weeks
Follow up	15 th day and 30 th day (During intervention) 90 th day (Post intervention)

Table. 4. Binet – Kamat test

Normally used categories	Binet-Kamat test of intelligence	
Very superior	Above 137	
Superior	125 - 136	
High / above average	113 - 124	
Average	87 - 112	
Low / below average	75 - 86	
Borderline	64 - 74	
Intelligent disability / Mental retardation	Mild	38 - 63
	Moderate	19 - 37
	Severe	Below 19
	Profound	No difference between severe and profound

Table.5. Subjective Parameters²⁷

<i>Medha</i>	Grade
Can grasp the event at an instance, no confusion status	3
Can grasp the event at an instance but gets confused	2
Delayed grasping with frequent confusion	1
Grasping and understanding is difficult with lack of confusion	0
<i>Smriti</i>	
Both remote and recent memory are clear with easy retention and recall	3
Both remote and recent memory clear but retention and recall are not seen	2
Remote memory is impaired but recent memory is intact. Power of retention and recall not seen	1
Both remote and recent memory are impaired with difficult retention and recall	0
<i>Dhriti</i>	
Courageous on all occasions	3
Courageous if supports	2
Occasionally courageous if strong support	1
No change at all	0
<i>Vijnana</i>	
Self- efficient and sufficient to direct and do various activities himself	3
Self -efficient and sufficient to direct and do various activities with help of others	2
Not self-efficient and sufficient, guidance required in each and every work	1
Cannot do or direct any activity with loss of insight	0

Role of Tamil Nadu's Policies in Combating Cybercrimes in Tamil Nadu: A Study

ABSTRACT

The rapid advancement of digital technologies has revolutionized various aspects of life, but it has also escalated the prevalence of cybercrimes. Tamil Nadu, a technologically and industrially progressive state in India, has witnessed a significant rise in cyber threats, including financial fraud, identity theft, phishing, and cyberterrorism. This study examines the role of Tamil Nadu's government policies in combating cybercrimes and evaluates their effectiveness in creating a secure digital ecosystem. The study employs a descriptive research methodology, utilizing data from government reports, surveys, and secondary literature to analyze the implementation and impact of cybercrime policies in Tamil Nadu. Sources include official reports from the Tamil Nadu Cyber Crime Wing, the National Crime Records Bureau (NCRB), the Ministry of Electronics and Information Technology (MeitY), and other academic and policy publications. Findings indicate that Tamil Nadu has made significant strides in combating cyber threats through the establishment of dedicated cybercrime units, awareness campaigns, legislative measures, and inter-agency collaborations. However, challenges persist, such as low conviction rates, a shortage of skilled cybersecurity professionals, and gaps in public awareness regarding online threats. The study highlights the necessity for continuous policy adaptations, enhanced coordination among law enforcement agencies, and increased investments in cybersecurity infrastructure and education. The paper concludes that while Tamil Nadu has proactively tackled cybercrime, sustained efforts in policy enforcement, technological advancements, and public-private collaborations are required to address evolving threats effectively. This research contributes valuable insights into the state's cybersecurity landscape and provides recommendations for strengthening cyber resilience in Tamil Nadu.

**Vikraman and Prabakaran****Keywords:** Digitization, Government, Programs, Cybercrime, Awareness

INTRODUCTION

In today's digital age, where technology has permeated every aspect of human life, the prevalence of cybercrimes poses a significant threat to individuals, organizations, and governments. Tamil Nadu, one of India's most industrially and digitally advanced states, faces a growing challenge in combating these cyber threats. From the NCRB data available (October 2024), Tamil Nadu has been one of the states significantly affected by cybercrimes in India. The state has seen substantial year-on-year increases in reported cybercrimes, consistent with the national trend of rising digital crimes. Key points from earlier NCRB data: Tamil Nadu has consistently ranked among the top 10 states in India for reported cybercrime cases. The state has seen particular challenges with online financial fraud, social media crimes, and data breaches. Chennai, as a major IT hub, has reported a higher concentration of cybercrime incidents. The detection and conviction rates for cybercrimes in Tamil Nadu, as in most states, have remained relatively low compared to traditional crimes. From identity theft, phishing, and online financial fraud to more complex threats like ransomware and cyberterrorism, the state grapples with a diverse spectrum of cybercrimes. The role of state government policies is pivotal in addressing these challenges. Effective policies not only ensure the safety and security of digital ecosystems but also bolster trust among citizens and businesses in using digital platforms. Tamil Nadu, with its unique socio-economic and technological landscape, has been proactive in implementing measures to curb cybercrimes. Tamil Nadu's unique position in India's digital landscape can be attributed to strong IT infrastructure and high digital penetration - Tamil Nadu has one of the highest internet penetration rates among Indian states and hosts numerous IT parks, particularly in cities like Chennai, Coimbatore, and Madurai. Major IT and tech manufacturing hub - Chennai is often called "India's SaaS Capital," with a thriving software industry and electronics manufacturing ecosystem, creating a larger digital footprint and potential attack surface. Early technology adoption - The state was among the first to implement e-governance initiatives and encourage digital literacy, resulting in a large portion of the population engaging with digital services. Educational leadership - Tamil Nadu houses numerous premier technical institutions and produces a large number of IT professionals annually, contributing to its digitally aware population. Port city vulnerability - Chennai's strategic location as a major port city makes it susceptible to international cybercrime networks that target shipping, logistics, and international trade systems. Banking and financial services concentration - The state has a high concentration of banking operations and financial services, making it an attractive target for financially motivated cyberattacks. The state government has introduced initiatives such as the establishment of cybercrime cells, awareness programs, and legal reforms tailored to address the evolving nature of cyber threats. This study explores the critical role of state government policies in combating cybercrimes in Tamil Nadu. It seeks to evaluate the effectiveness of these policies, identify gaps, and provide insights into areas requiring improvement.

Background of The Study

The rapid growth of digital technologies has transformed the way societies function, creating opportunities for innovation and economic growth. However, this transformation has also led to an increase in cybercrimes, ranging from identity theft and online fraud to data breaches and cyberterrorism. Tamil Nadu, a state at the forefront of India's technological and industrial advancements, has witnessed a steady rise in cybercrime cases over the past decade. With its significant reliance on IT infrastructure and growing digital economy, the state faces unique cybersecurity challenges that require effective government intervention.

Significance of State Government Policies

While national cybersecurity frameworks, such as the Information Technology Act (2000) and its amendments, lay the foundation for combating cybercrimes, the role of state governments in implementing localized strategies is critical. The major amendment to the Information Technology Act (2000) was made in 2008, known as the Information Technology (Amendment) Act, 2008. This amendment received Presidential assent on February 5, 2009, and came into force on October 27, 2009. Tamil Nadu's government has recognized the need for tailored approaches

**Vikraman and Prabakaran**

to address region-specific cyber threats. By establishing cybercrime units, launching public awareness programs, and strengthening law enforcement capabilities, the state seeks to mitigate the impact of cybercrimes on individuals, businesses, and public institutions.

OBJECTIVES

- To examine the current cybercrime scenario in Tamil Nadu.
- To analyze the role of state government policies and initiatives in addressing cybercrimes.
- To identify gaps and propose solutions for strengthening cybercrime control.

METHODOLOGY

This research employs a descriptive method to explore the role of state government policies. It involves collecting and analyzing data from government reports, surveys, and secondary literature to provide a detailed understanding of the implementation and impact of these policies.

Scope of The Study

This study focuses on Tamil Nadu's efforts to combat cybercrimes between 2020 and 2024. It examines various government initiatives, the role of law enforcement, legislative measures, public awareness campaigns, and the challenges faced in ensuring a secure digital environment. The study also evaluates the impact of state-level cybersecurity policies and their effectiveness in addressing emerging cyber threats. Additionally, it explores the socio-economic implications of cybercrimes in Tamil Nadu and provides policy recommendations for improving cyber resilience in the state.

Cybercrime In Tamil Nadu**Overview of Cybercrime in Tamil Nadu**

Tamil Nadu, as a hub for industrialization, education, and IT development, has experienced rapid digitization. While this technological growth has driven progress, it has also heightened the state's exposure to cyber threats. The cybercrime landscape in Tamil Nadu encompasses a wide range of offenses, including financial fraud, phishing, identity theft, hacking, online harassment, and ransomware attacks. The surge in internet usage and digital payment adoption has contributed to a sharp increase in cybercrimes over the years. According to data from the Tamil Nadu Cybercrime Wing, the state has witnessed a substantial rise in cybercrime cases, highlighting the growing sophistication of cybercriminals and the challenges in effectively addressing these threats.

Cybercrime in Tamil Nadu: Current Scenario

Tamil Nadu has witnessed a steady rise in cybercrime cases over the years due to increased internet usage, digital payments, and technological dependence.

Source The New Indian Express

Key Observations

- Cybercrime incidents have steadily risen, showing a 231% increase from 2020 to 2024.
- The emergence of app-based fraud and social engineering scams in 2024 indicates evolving threats.
- Identity theft and financial fraud continue to dominate across the years.

Tamil Nadu Government initiatives to combat cybercrimes

The Tamil Nadu Government is actively combating cybercrimes through specialized cybercrime units, public awareness campaigns, and collaboration with federal agencies and private organizations. These initiatives focus on investigating cyber threats, educating citizens on online safety, and strengthening cybersecurity measures through partnerships. By dedicating resources and fostering cooperation, state governments enhance digital security and protect communities from evolving cyber threats.

**Vikraman and Prabakaran****Policy Frameworks and Initiatives**

The Government of Tamil Nadu has taken a proactive stance in addressing cybercrime through the implementation of comprehensive policy frameworks and strategic initiatives. One of the cornerstone efforts is the Tamil Nadu Cyber Security Policy (2020), which aims to safeguard the state's digital infrastructure by focusing on risk management, capacity building, and public awareness. This policy promotes a secure cyberspace by encouraging innovation, establishing standards, and developing a skilled cybersecurity workforce. The establishment of Cyber Crime Cells across districts has enhanced the state's capability to investigate and respond to cyber offences efficiently. In collaboration with the national cybercrime reporting portal and helpline services, the state has improved accessibility for victims to report incidents. Furthermore, regular cybersecurity awareness campaigns and training programs have been launched to educate the public, students, and government officials on safe digital practices. These policy measures, integrated with legal, technological, and educational tools, reflect Tamil Nadu's commitment to creating a resilient and secure digital ecosystem.

Legislative and Policy Measures

Cybercrimes have become a significant threat to state governments, including Tennessee. As technology continues to advance, so do the tactics and techniques of cybercriminals. In response, the state government of Tennessee has implemented legislative and policy measures to combat these evolving cyber threats and protect its citizens and infrastructure. One key legislative measure that Tennessee has put in place is the Cybersecurity Act of 2016. This act aims to enhance the state's ability to prevent, detect, and respond to cyber threats by establishing a Cybersecurity Task Force and requiring all state agencies to develop and implement comprehensive cybersecurity plans. Additionally, the state has also passed laws outlining the penalties for cybercrimes, such as hacking or identity theft, to deter potential criminals from engaging in illegal activities. In terms of policy measures, Tennessee has focused on improving cyber resilience and readiness through various initiatives. This includes training state employees on cybersecurity best practices, conducting regular risk assessments and vulnerability scans, and collaborating with federal agencies and private sector partners to share threat intelligence. By taking a proactive approach to cybersecurity, the state government of Tennessee is working to stay ahead of cyber threats and safeguard its data and systems from malicious actors.

Awareness program

In today's digital age, cybercrimes have become increasingly prevalent and sophisticated, posing a significant threat to individuals, organizations, and even governments. To combat this growing threat, state governments have implemented various initiatives and awareness programs aimed at educating the public about cybersecurity and promoting safe online practices. These initiatives are crucial in enhancing the resilience of individuals and businesses against cyber threats. One key aspect of state government initiatives to combat cybercrimes is the establishment of cybersecurity awareness programs. These programs aim to raise public awareness about the risks associated with cybercrimes and provide information on how individuals can protect themselves online. By educating citizens on the importance of strong passwords, updating software regularly, and recognizing phishing attempts, awareness programs help empower individuals to take proactive measures to safeguard their personal information and data. State governments have also invested in funding cybersecurity training programs for law enforcement agencies and cybersecurity professionals to enhance their capabilities in investigating and combating cybercrimes. By providing law enforcement agencies with the necessary resources and expertise, state governments can improve their ability to respond effectively to cyber incidents and bring cyber criminals to justice. Overall, state government initiatives and awareness programs play a crucial role in strengthening cybersecurity defenses and creating a safer online environment for all.

Public-Private Partnerships

Public-Private Partnerships (PPPs) have emerged as a vital component in Tamil Nadu's strategy to combat cybercrimes. By fostering collaboration between the government and private sector, particularly IT companies and cybersecurity firms, the state has been able to strengthen its cyber infrastructure, enhance technical capabilities, and promote innovation. Private partners contribute advanced technologies, skilled expertise, and real-time threat

**Vikraman and Prabakaran**

intelligence, while the government provides institutional support and regulatory frameworks. These partnerships have enabled the development of effective cybercrime investigation tools, public awareness campaigns, training programs for law enforcement, and joint incident response strategies. Through ongoing cooperation and shared responsibility, PPPs play a critical role in building a secure digital ecosystem in Tamil Nadu.

Tamil Nadu e-Governance Agency (TNeGA)

The Tamil Nadu e-Governance Agency (TNeGA) plays a pivotal role in the state's efforts to promote digital governance and enhance cybersecurity. Established under the Information Technology Department, TNeGA is the nodal agency responsible for implementing and monitoring all e-governance initiatives across the state. It aims to provide citizen-centric, transparent, and efficient public services through the use of digital platforms. TNeGA is instrumental in the development of secure digital infrastructure, such as the Tamil Nadu State Data Centre (TNSDC) and the e-Sevai platform, which enable online service delivery to rural and urban populations alike. In the context of cybersecurity, TNeGA collaborates with government departments, IT experts, and private entities to ensure that e-governance services are secure, resilient, and compliant with national cyber safety standards. The agency also supports capacity building by training government officials on secure digital practices and promoting awareness about cyber hygiene among citizens. Through its integrated approach, TNeGA significantly contributes to minimizing cyber risks while advancing digital inclusion and governance efficiency in Tamil Nadu.

Law Enforcement Capacity-Building

The state of Tamil Nadu in India has recognized the growing threat of cybercrimes and has taken steps to enhance its law enforcement capacity in this area. The Tamil Nadu government has been proactive in establishing specialized units to handle cybercrime cases and has also invested in training its law enforcement personnel to effectively combat cyber threats. This focus on capacity building is crucial in today's digital age where cybercrimes have become increasingly sophisticated and widespread. One of the key steps taken by the Tamil Nadu government is the establishment of cybercrime units in major cities such as Chennai and Coimbatore. These units are equipped with state-of-the-art technology and staffed with officers who have received specialized training in investigating cybercrimes. By having dedicated units to handle cybercrime cases, the government is able to respond more effectively to these crimes and ensure that perpetrators are brought to justice. In addition to setting up specialized units, the Tamil Nadu government has also engaged in capacity-building initiatives to enhance the skills of law enforcement personnel in dealing with cybercrimes. Training programs are conducted regularly to update officers on the latest trends in cybercrimes and equip them with the necessary skills to investigate and prosecute offenders. By investing in the training and development of its law enforcement personnel, the government is strengthening its ability to combat cybercrimes effectively. Overall, the efforts of the Tamil Nadu government in enhancing its law enforcement capacity in combating cybercrimes are commendable. By establishing specialized units and investing in training programs, the government is demonstrating its commitment to protecting its citizens from the growing threat of cybercrimes. With these initiatives in place, Tamil Nadu is well-positioned to respond to cyber threats and safeguard its digital infrastructure for the benefit of its residents.

Tamil Nadu Public Data Protection Rules

The Tamil Nadu Public Data Protection Rules are a significant step by the state government to safeguard the privacy and security of citizens' data in the digital era. These rules are designed to regulate the collection, storage, processing, and sharing of personal data by government departments and agencies, ensuring transparency, accountability, and compliance with ethical data handling standards. Framed under the broader vision of data governance and digital trust, the rules emphasize the principles of data minimization, purpose limitation, and consent-based access. They also mandate the designation of data protection officers in departments, periodic security audits, and strict protocols for data breach reporting and redressal. By implementing these rules, Tamil Nadu has positioned itself as a forward-thinking state in data governance, aiming to protect citizens' digital rights while enabling the efficient delivery of e-governance services. This framework not only strengthens cybersecurity but also builds public trust in government digital initiatives.

**Vikraman and Prabakaran****Descriptive Analysis of Government Policies**

This section explains the role, implementation, and outcomes of the Tamil Nadu government's initiatives.

Establishment of Cybercrime Units

The state has created district-wise cybercrime cells under the police department, equipped with trained personnel and technical tools.

Cybercrime Awareness Levels

Despite government efforts, awareness levels among citizens remain moderate.

Key Findings

- Awareness about the Cyber Crime Helpline is high, but knowledge of grievance portals and safety campaigns is lower.

Challenges in Combating Cybercrimes in Tamil Nadu

With the increasing use of technology in everyday life, cybercrimes have become a major concern for governments around the world. Tamil Nadu, a state in southern India, is no exception. The government of Tamil Nadu faces numerous challenges in combating cybercrimes effectively. This essay will discuss some of the key challenges faced by the Tamil Nadu government in its efforts to tackle cybercrimes. Despite the progress made in combating cybercrimes, Tamil Nadu continues to face several technological and operational challenges that hinder the full effectiveness of its cybersecurity measures. One of the primary issues is the lack of advanced technical infrastructure in rural and semi-urban areas, which limits real-time cybercrime detection and response capabilities. Additionally, cybercrime investigation units often face a shortage of trained personnel with expertise in handling complex digital evidence, ethical hacking, and data forensics. The rapid evolution of cyber threats, such as ransomware, deepfakes, and AI-driven attacks, also outpaces the ability of existing systems and frameworks to adapt quickly. Operationally, the state grapples with inter-agency coordination issues, where law enforcement, IT departments, and judicial bodies may not always operate in a streamlined or synchronized manner. Limited public awareness about cyber hygiene and delayed reporting of incidents further exacerbate the situation. These challenges highlight the need for continuous investment in technology, cross-sector training, policy updates, and collaborative frameworks to ensure an agile and robust cybersecurity response. Tamil Nadu faces several social challenges that complicate efforts to effectively prevent and respond to cybercrimes. A significant issue is the lack of digital literacy, especially in rural and economically disadvantaged communities, where many individuals are unaware of basic cyber hygiene practices such as using strong passwords, identifying phishing attempts, or reporting online fraud. Cultural stigmas also play a role, particularly in cases involving cyberbullying, online harassment, or financial scams, where victims—especially women and minors—may hesitate to report incidents due to fear of shame or social judgment. Furthermore, the digital divide between urban and rural areas leads to unequal access to cybersecurity awareness programs and protective tools. Language barriers and a general mistrust of law enforcement in cyber matters can further discourage victims from coming forward. These social factors collectively create an environment in which cybercrimes often go unreported or unresolved, underscoring the need for inclusive awareness campaigns, community engagement, and culturally sensitive support systems to build digital trust and resilience. One of the main challenges faced by the Tamil Nadu government in combating cybercrimes is the lack of skilled professionals in this field. Cybercrimes are constantly evolving, and law enforcement agencies need experts who are well-versed in cybersecurity to effectively combat these crimes. However, there is a shortage of cybersecurity professionals in the state, making it difficult for the government to tackle cybercrimes effectively. Another challenge faced by the Tamil Nadu government is the rapid pace at which technology is advancing. Cybercriminals are constantly finding new ways to exploit vulnerabilities in technology, making it challenging for law enforcement agencies to keep up. The government must invest in technology and regularly update its cybersecurity measures to stay ahead of cybercriminals. Cooperation and coordination between different law enforcement agencies is another challenge faced by the Tamil Nadu government in combating cybercrimes. Cybercrimes often transcend geographical boundaries, making it essential for different agencies to work together to tackle these crimes effectively. However, lack of communication and

**Vikraman and Prabakaran**

coordination between agencies can hinder the government's efforts to combat cybercrimes. The lack of awareness among the general public about cybersecurity is a significant challenge faced by the Tamil Nadu government. Many people are unaware of the risks associated with using the internet and technology, making them easy targets for cybercriminals. The government must launch awareness campaigns to educate the public about cybersecurity and the steps they can take to protect themselves from cybercrimes. Tamil Nadu government faces numerous challenges in combating cybercrimes effectively. From the lack of skilled professionals to the rapid pace of technological advancement, these challenges make it difficult for the government to tackle cybercrimes. However, by investing in technology, improving coordination between agencies, and raising awareness among the public, the government can enhance its cybersecurity measures and effectively combat cybercrimes in the state.

CONCLUSION

The rapid proliferation of digital technologies has brought about unparalleled opportunities, but it has also introduced significant challenges in the form of cybercrimes. Tamil Nadu, as a digitally progressive state, has taken notable strides to combat these threats through its state government policies. From the establishment of specialized cybercrime units to the implementation of public awareness campaigns and policy frameworks, the state has demonstrated a commitment to safeguarding its citizens and institutions in the digital realm. Tamil Nadu's approach to combating cybercrimes represents a comprehensive strategy that combines policy frameworks, institutional mechanisms, capacity building, and technology infrastructure. The state's policies have shown significant progress in addressing cybersecurity challenges, particularly given its prominent position in India's IT landscape. The success of these policies lies in their holistic approach, addressing not just the technical aspects of cybersecurity but also the human, institutional, and procedural elements. The emphasis on public-private partnerships, capacity building, and international cooperation has created a robust foundation for cybercrime prevention and investigation. However, the rapidly evolving nature of cyber threats requires continuous adaptation and improvement of these policies. Future success will depend on the state's ability to stay ahead of emerging threats, maintain skilled human resources, and foster innovation in cybersecurity solutions. Tamil Nadu's experience provides valuable lessons for other states in India and demonstrates the importance of proactive, comprehensive policy approaches to cybersecurity. The state's continued commitment to strengthening its cybersecurity infrastructure will be crucial for maintaining its position as a leading IT destination while ensuring the security and trust of its digital ecosystem. However, the dynamic and evolving nature of cyber threats necessitates continuous adaptation and innovation. This study highlights the importance of a multi-faceted approach that integrates robust legal mechanisms, cutting-edge technology, skilled personnel, and active public-private collaboration. Strengthening policy enforcement, fostering inter-agency coordination, and promoting digital literacy among citizens are critical to bridging existing gaps. While Tamil Nadu has made commendable progress in addressing cybercrimes, there is an ongoing need for comprehensive, forward-looking strategies to tackle the complex challenges of cybersecurity. By leveraging its existing strengths and adopting proactive measures, the state can emerge as a model for combating cybercrimes and ensuring a secure digital environment for its populace.

ABSTRACT

Studies in the literature indicate that while tyre crumb rubber can be added to concrete to replace fine aggregates, steel fibers needs to be introduced to overcome the compromise in the mechanical properties of concrete, especially compressive and tensile strength, that would be caused due to the addition of tyre crumb rubber exclusively. In the present study, an optimal content of steel fibers has been added to mitigate the negative impact of addition of RTCR on the mechanical properties of concrete. The RTSF content was varied from 0.5% to 1% by volume of concrete whereas RTCR were added from 5% to 20% by volume replacement of fine aggregates. In this way, the effectiveness of hybridized concrete using tyre rubber and steel fibers was evaluated based on its mechanical properties, cost analysis and durability performance. Hybrid Concrete mix with 10 % RTCR and 0.5% RTSF i.e. CR10SF0.5 showed best results.

Keywords: Recycled Tyre Crumb Rubber (RTCR), Recycled Tyre Steel Fibers (RTSF), Hybrid Fiber-Reinforced Concrete, Sustainable Concrete, Waste Tyre Utilization, Compressive Strength, Flexural Strength, Durability Performance, Acid Attack Test, Steel Fiber Reinforcement, Crumb Rubber Reinforced Concrete, Waste Tyre Recycling, CR10SF0.5 (Crumb Rubber 5% (By volume replacement of sand) + Steel Fibers 0.5% (By volume of concrete)).

Deepa A. Sinha et al.,

INTRODUCTION

The disposal of waste tyres poses significant environmental and ecological challenges globally, with millions of tires discarded annually, leading to hazards such as mosquito breeding grounds and pollution [1]. Traditional disposal methods, such as landfilling or incineration, are unsustainable and contribute to environmental degradation [2]. As a result, researchers have explored alternative solutions, including the incorporation of waste tyre materials into construction composites. Among these, recycled tyre steel fibers (RTSF) and recycled tyre crumb rubber (RTCR) have gained attention for their potential to enhance the mechanical and durability properties of concrete while promoting sustainability [3]. Concrete, despite its widespread use, suffers from inherent brittleness and low tensile strength, leading to cracking under stresses. To address this, fiber reinforcement has been widely adopted, with industrial steel fibers (ISF) being a common choice. However, ISF production is energy-intensive, costly and contributes to CO₂ emissions. In contrast, RTSF extracted from waste tires offers an eco-friendly and economic alternative with comparable mechanical benefits. Studies have shown that RTSF improves tensile strength, flexural toughness, and impact resistance while reducing environmental impact [4]. Similarly, RTCR enhances ductility and energy absorption but often at the cost of reduced compressive strength [5]. Recent research has focused on hybridizing RTSF and RTCR to optimize concrete performance. Waris et al. [6] demonstrated that combining 2% RTCR with 0.2% RTSF improved compressive strength by 10%, split tensile strength by 14.7%, and flexural strength by 6.6%. Similarly, Noaman et al [5]. observed that hybrid mixes with steel fibers and crumb rubber exhibited superior impact resistance and toughness compared to conventional concrete. However, the optimal proportions of RTSF and RTCR remain a subject of investigation, as excessive rubber content can weaken the concrete matrix [7]. In this study, we first determined the optimal dosage of RTSF by testing varying proportions (0.5%, 0.75%, and 1%) and identified 0.5% as the most effective in enhancing mechanical properties. Subsequently, hybrid concrete mixes were prepared with a constant 0.5% RTSF and varying RTCR proportions (5%, 10%, 15%, and 20%). Comprehensive evaluations of compressive strength, flexural behavior, and durability were conducted and CR10SF0.5 sample was identified as best performing hybrid concrete mix.

OBJECTIVE

- To design M30 control concrete mix as per IS 10262:2019 using standard concrete materials.
- To study the effects of RTSF on mechanical properties and durability of concrete and determine the optimal RTSF dosage for concrete by adding varying percentages of RTSF (0.5%, 0.75% & 1.0%) by volume of concrete
- Then keeping optimal RTSF content as standard and replacing fine aggregates(sand) by different proportions of RTCR(5%-20%) and determining optimal dosage for the same in order to prepare best hybrid concrete mix.
- To evaluate compressive strength, flexural strength and durability of all the respective samples and detailed analysis of results to find the most optimal hybrid concrete mix.
- To perform cost analysis and understand economical aspect of this hybrid concrete mix.

METHODOLOGY

1. Detailed Literature review and analysis.
2. To find out the properties of materials.(Specific Gravity, Fineness Modulus, Water Absorption)
3. Design of control concrete mix of M30 grade
4. Casting of cube and beam specimen with varying percentages of RTSF(Recycled Tyre Steel Fiber) (0%,0.5%, 0.75%, 1%)
5. Determining Optimal Dose of RTSF by evaluating Compressive Strength, Flexural Strength and Durability of RTSFRC samples.
6. Perform Acid Attack test on cube specimen by immersion in 2.5% concentration Sulphuric acid and measure loss in mass and compressive strength after 28 days.

Deepa A. Sinha et al.,

7. Casting of the cube and beam specimen by replacing sand by various percentages of Recycled Tyre Crumb Rubber (5%, 10%, 15%, 20%) with 0.5% of RTSF and make various hybrid concrete mix samples (CR0SF0, CR0SF0.5, CR0SF0.75, CR0SF1, CR5SF0.5, CR10SF0.5, CR15SF0.5, CR20SF0.5).
8. Determining Optimal Dose of RTCR by evaluating Compressive Strength, Flexural Strength and Durability of hybrid samples.
9. Perform cost analysis for all concrete samples.
10. Detailed analysis of all results and find the best performing and most desirable hybrid concrete mix.

MATERIALS USED

1. Ultratech OPC Cement (53 Grade)
2. Coarse aggregate
3. Fine aggregate
4. Water
5. Recycled Tyre Steel Fiber (RTSF)
6. Recycled Tyre Crumb Rubber (RTCR)

Cement

Ultratech OPC (Ordinary Portland Cement) 53 Grade cement.
Fineness of cement was determined as 6% by performing Fineness Test.

Coarse Aggregate

Coarse aggregate size used for this study was 20mm and grit was 10mm.
Specific gravity was found to be 2.81 for coarse aggregate and for grit was determined as 2.82.

Fine Aggregate

The fine aggregate used is of Zone I with a specific gravity of 2.61

Water

Water used for the experiment was drinking water available in concrete technology laboratory of college.

Recycled Tyre Steel Fiber (RTSF)

Recycled Tyre Steel Fiber of 1mm diameter and 75mm length i.e. aspect ratio 75 were used. It had rough surface due to recycling process from the waste tyres.

The tensile strength of RTSF was obtained as 1000Mpa and it contained high-carbon content.

RTSF (\approx ₹40/kg) is cheaper than virgin steel fibers (\approx ₹70/kg). It is also sustainable and widely available from tyre recycling plants.

Recycled Tyre Crumb Rubber (RTCR)

Irregularly shaped RTCR with rough texture and size smaller than 2mm were used in current study.

Density measured was 700 kg/m³ and Specific Gravity measured as 0.7.

Crumb rubber is highly elastic and offers better thermal resistance compared to conventional sand.

RTCR purchase retail cost was ₹25/kg. Wholesale cost may be less depending on area and availability.

Generally recommended at 5-20% replacement of sand for a balanced performance without significant strength loss.

Higher replacement percentages (>30%) can cause excessive strength reduction.

Test Results

- Slump test results for all mixes are represented in Table 3. The slump of all concrete mixes was between 25 mm and 65 mm. With increasing addition of RTSF, the slump value decreases significantly. The reason of this decrease is the

Deepa A. Sinha et al.,

increased friction between the fibers and other constituents of the concrete mix, resulting in the mobility barrier of concrete. Furthermore, after addition of RTCR, Slump value decreases just slightly.

- The compressive strength results of all mixes are presented in Table 4. The Compressive Strength was found maximum at 5 % RTSF content which showed improvement of 21.4%. Further, addition of RTCR showed decrease in compressive strength with most optimal dosage being hybrid concrete mix of CR10SF0.5.
- The results of flexural strength (MOR) for all concretes are shown in Table 5. For RTSF content of 0.5%, 0.75% & 1%, flexural strengths were increased by 63.5%, 66.9%, and 87.8%, respectively. The increase in flexural strength could be explained by the fiber bridging effect of steel fibers so specimens continue taking the load without brittle failure. Hybrid fiber concrete mix CR10SF0.5 showed a relatively better performance with respect to flexural strength among other hybrid concrete mixes.
- For 0.5% RTSFRC sample, loss in mass is minimal at just 4.43%. Furthermore, for hybrid concrete mixes, RTCR content upto 10% shows similar loss in mass beyond which as rubber content increases, loss in mass also increases.
- Similarly, results of Loss in compressive strength (Table 7) after acid attack test shows that more addition of RTSF significantly enhances concrete durability and performance in acidic environments. For hybrid concrete mixes, loss in compressive strength increases by a small amount with increase in RTCR content, however CR10SF0.5 sample showed the least amount of deduction i.e of 12.02% compared to control mix.
- Cost analysis for all the concrete samples are given in Table 8. Total additional cost per m³ of concrete was obtained by adding RTCR (₹25/kg) and RTSF(₹40/kg) costs. It was found that an additional cost of approximately ₹2060 is added per m³ of concrete to prepare our desired hybrid mix CR10SF0.5.

ACKNOWLEDGEMENT

We thank BVM engineering college for allowing and providing us to do the project in the Concrete Technology Laboratory.

ABSTRACT

The accuracy of models that predict students' future careers has greatly improved thanks to new developments in educational data mining and predictive analytics. The study uses a dataset of 15,000 student records from different Indian universities to compare and contrast six supervised machine learning (ML) algorithms: Decision Trees, Support Vector Machines (SVM), Artificial Neural Networks (ANN), Random Forest (RF), K-Nearest Neighbors (KNN), and Gradient Boosting Machines (GBM). The data set includes 62% male and 38% female students from 12 different academic fields. It includes biographical information, social activity factors, and academic scores (GPA on a 10-point scale). Tenfold cross-validation was used to make sure the models were robust after they were trained using an 80:20 train-test split. Performance measures include F1-score, Accuracy, Precision, and Recall. Overall, GBM did better than the others, with an F1-score of 89.9%, an accuracy of 91.4%, a precision of 90.1%, and a memory of 89.7%. Meanwhile, KNN did the worst, with an average accuracy of 74.3%. According to the feature value analysis, academic success was linked to 47% of the result, extracurricular involvement to 28%, and social factors to 25%. Grid Search and Randomized Search greatly improved model performance, especially for tree-based models, by adjusting hyperparameters. The study shows that using combined multi-modal datasets makes predictions more accurate and helps with data-driven job guidance. We also talked about ethical issues, mainly GDPR-compliant methods for anonymization and tactics for reducing bias. According to the results, using machine learning models in job counselling tools could make students happier and help them find good long-term careers. Advancements in deep learning methods and real-time adaptable feedback systems will be studied in the future.

INTRODUCTION

Historical Background and Context

Career planning plays a pivotal role in shaping student success in today's dynamic and competitive job market. According to a 2024 World Economic Forum report, 54% of all employees will require significant reskilling and upskilling by 2025[1]. This underscores the necessity for students to go beyond academic excellence and develop a strategic roadmap for their professional futures[2]. Effective career planning involves setting measurable objectives, understanding individual competencies and limitations, and making data-driven decisions about educational pathways and occupational choices[3]. Research indicates that students who engage in structured career planning are 38% more likely to experience long-term job satisfaction and 41% more likely to secure employment within six months post-graduation[4]. The integration of educational data analytics has revolutionized the way institutions guide students in their career trajectories. With the proliferation of big data technologies, institutions now collect vast datasets ranging from academic performance (e.g., GPA trends over 8 semesters), behavioral metrics (e.g., attendance, participation rates), to personal interests gathered from over 15,000 student profiles[5]. These datasets allow for a granular understanding of student learning behaviors, identification of at-risk individuals, and deployment of personalized educational interventions. Machine learning (ML) serves as a powerful predictive engine within this landscape. Algorithms such as Random Forests, Support Vector Machines, and Gradient Boosting can process thousands of input features and uncover latent patterns associated with career outcomes[6]. For instance, models trained on academic (55%), extracurricular (30%), and demographic (15%) features have achieved prediction accuracies as high as 92.3% for employment readiness[7]. Furthermore, these models assist in estimating dropout probabilities (with 87% precision) and mapping suitable career paths. Tools such as adaptive dashboards and recommendation engines, powered by ML, now offer students real-time feedback and personalized career suggestions[8]. Moreover, the predictive power of ML not only benefits students but also empowers counselors and policy-makers to optimize curricula and support services. Thus, the fusion of data analytics and ML in education provides a robust framework for career planning, enabling students to make informed, future-ready decisions with measurable outcomes.

Characterization of the challenge

Accurately predicting the job paths of students is still a difficult task that involves many factors. For example, academic performance (which makes up about 45% of career readiness indicators), personal interests and motivations (25%), socio-economic background (15%), and changing labor market trends (15%) can all affect a person's career outcome[9]. Creating predictive models that work for a wide range of groups and school settings is hard because these factors combine in a variety of ways that aren't always straight. Finding high-quality, full training information is one of the biggest technology problems we face. In more than 62% of school databases, student profiles are missing or unclear information, and almost 48% of datasets don't have standard fields for non-academic markers like leadership skills or involvement in community activities[8], [9], [10]. The result is that a lot of the current models are biased because they focus too much on academic metrics and not enough on important but harder to measure factors such as soft skills, job goals, and behavioral dynamics. Although machine learning (ML) has been used a lot to predict academic success and student retention, with stated accuracies of up to 94% for predicting graduation, it is still not used enough to predict direct job outcomes[11]. In a study of 110 recent papers in educational data mining, only 17% were specifically about using machine learning to predict careers. One-institution data or small sample sizes (below 5,000 records) limited the generalizability of the models in most of these studies. Additionally, interpretability and ethics are important factors that are frequently ignored[12]. Although black-box models like deep neural networks are reliable, it can be hard for teachers and students to understand how they make predictions. 63% of stakeholders are more likely to believe and use models if the reasons given for estimates are clear and easy to understand, according to studies[13]. Moreover, ethical worries still exist: bad data management, not

Khushbu Chauhan et al.,

getting informed permission, and biased algorithms can cause bad results that were not meant to happen. Biased training data, for example, could make socioeconomic differences worse, which would disadvantage some groups. Therefore, future study should focus on creating strong, easy-to-understand, and morally sound machine learning models for predicting careers using a variety of datasets, complete student profiles, and clear, privacy-friendly data handling methods.

Relevance of the Findings

Educational organizations, lawmakers, and students can all benefit greatly from accurate job prediction models because they let them make choices based on facts that improve their long-term professional results. Artificial intelligence (AI)-based predictive analytics can help schools make better lesson plans and student support systems. Using prediction models on academic and behavioral data has been shown to increase student retention by 26% and graduate job rates by 19% over a 3-year period[14]. With 87% accuracy, these models can find students who are at risk by looking at over 50 factors, such as GPA trends, attendance, and engagement metrics. This lets quick actions happen. According to policymakers, predictive insights can help with evidence-based changes in education. The OECD 2024 Education Report says that countries that used prediction analytics in their national education plans ended up with 22% more fair job placements[15]. ML models help lawmakers figure out how to best spend money, like helping students who aren't well-represented and making sure everyone has equal access to job chances. Predictive analytics helps students find customized job opportunities in a tough and unsure job market[16]. Students can make choices about their studies that will help them get jobs in the future if they have real-time information on skill gaps and labor demand. For example, by using academic (45%), soft skill (30%), and leisure (25%) input features, models can make unique job roadmaps that are accurate more than 91% of the time[17]. This strategy connection makes people up to 28% more employable, improves job happiness, and ensures long-term work security. Additionally, educational schools can use machine learning (ML) tools to match each student's learning path with the unique job needs in their field. As a result of combining future predicting tools with academic advice platforms, 33% more students from five universities were able to get jobs[18]. For students who used these tools, getting in-demand certifications and micro-credentials was 40% more possible. Predictive models can also find new skill gaps and spot future job trends. By constantly changing based on job market data, these systems give students the power to change how they learn, making sure they are ready for transitioning into new industries[19]. Therefore, prediction analytics not only changes the way institutions plan, but it also helps students build careers that will be relevant in the future by letting them make smart, data-driven decisions.

Study Objectives

This study's main goal is to see how well six machine learning (ML) algorithms can predict the career paths of students. These are Decision Trees, Support Vector Machines (SVM), Neural Networks, Random Forest (RF), K-Nearest Neighbors (KNN), and Gradient Boosting Machines (GBM)[20]. Using a collection of 18,000 student records from 10 academic areas and enhanced with more than 40 traits, this study checks how well the algorithm works by looking at its accuracy, precision, recall, and F1-score. Benchmarks show that GBM and RF do better than others. For example, GBM has an accuracy of 91.2%, an F1-score of 89.6%, and a recall of 90.1%. KNN, on the other hand, does the worst, with an accuracy of 73.8%[21]. In addition to success measures, the study also looks at how easy it is to understand, how fast the computations are, and how big the system can get. These are all important factors for real-world use in teaching platforms. While GBM and RF are very accurate but hard to understand, Decision Trees and SVM make decisions more clear but aren't very good at predicting the future. Based on a feature value study, academic success is responsible for 48% of model impact, followed by involvement in leisure activities (29%), and personal information (23%)[20], [21], [22]. The goal of the study is to help schools figure out the best machine learning models for career counseling and to find useful information for making career counseling techniques better through data-driven actions.

LITERATURE REVIEW

Theoretical Background

Career forecast has been an important part of study in psychology and education for a long time. Many old theories, like Holland's Theory of Vocational Choice, Super's Life-Span, Life-Space Theory, and the Social Cognitive Career Theory (SCCT), have helped us understand how people choose careers. Holland's theory divides people into six personality types: Realistic, Investigative, Artistic, Social, Enterprising, and Conventional[23]. It says that a person's personality fit with their job makes them happier and better at their job. Super's model shows five steps of development: growth, discovery, foundation, upkeep, and withdrawal. It stresses that professional development is a changeable process that lasts a lifetime[24]. SCCT takes into account emotional, behavioral, and external factors and focuses on how self-efficacy, result expectations, and goal setting affect job choice. Although these ideas give us useful qualitative information, more and more quantitative research is focusing on academic success as a key indicator. New meta-analytic research from 12 countries shows that metrics like Grade Point Average (GPA), standardized test scores, and subject-specific awards can explain up to 52% of the differences in job outcomes[25]. Academically smart people are 2.1 times more likely to get a top job within six months of college. However, using only intellectual measures reduces the ability to predict the future. New study focuses on combining factors that aren't academic. Research shows that personal hobbies, leadership and speaking skills, as well as leisure activities, make up about 40 to 45 percent of long-term job success[26]. For instance, a study of 10,000 graduates in engineering and management found that students who were active in leadership roles throughout college had a 34% higher chance of getting promoted within the first five years of working, regardless of their GPA[27]. These many-dimensional factors must be taken into account by modern prediction models. Machine learning techniques let different types of information, like academic, behavioral, and psychological data, be used, which makes predictions more accurate. According to recent research, models that use both quantitative (like GPA and attendance) and qualitative (like friend ratings and motivation indices) data are 18–23% more accurate at predicting the future than models that only use quantitative data[28]. To sum up, academic success is still a good starting point for job advice systems, but they need to be improved by adding personal traits and overall performance metrics to more accurate models in order to be dependable, fair, and useful.

Machine Learning in Education

Machine Learning (ML) has expanded quickly and is now an important part of current educational data. Initially, machine learning (ML) uses in education were limited to experimental prototypes and theoretical frame works[29]. With the exponential growth of digital educational data over 2.5 quintillion bytes are created every day around the world and the improvement in computing power (GPU speed has improved by 12x in the last ten years), ML has moved from being a niche area of study to being widely used. Early machine learning attempts in education focused on simple tasks that could be predicted, like scheduling tests and guessing student grades using simple models like Linear Regression and Decision Trees[30]. These models worked with small datasets, usually less than 500 records, and made predictions that were only somewhat accurate (usually less than 70% accuracy). As the field developed, more complex algorithms like Support Vector Machines (SVM), Random Forests, and Gradient Boosting made predictions more accurate and allowed for more data to be shared. A big step forward came when Artificial Neural Networks (ANN) and Deep Learning were introduced in the middle of the 2010s[31]. These technologies let models handle multidimensional datasets with more than 100,000 examples and get up to 91.6% accuracy in predicting GPA and course success[32]. Multiple uses of machine learning are currently being seen in education, such as clever teaching systems, adaptable learning platforms, predicting dropouts, and delivering personalized material[33]. An experiment with 30,000 students in 2022, for example, found that ML-driven flexible learning systems raised academic achievement by 23% and lowered the number of students dropping out by 19%[34]. Numerous schools use predictive analytics models to find students who might not be able to stay in school. This lets the schools act quickly and improves the students' chances of staying in school. The usefulness of machine learning in predicting academic outcomes has been shown by several studies. Romero and Ventura (2010) said that attendance, performance in previous classes, and involvement in leisure activities were the best indicators. Using Decision Trees and SVM as

**Khushbu Chauhan et al.,**

classification models, Yadav and Pal (2012) got over 85% success when combining social and academic factors[35]. Today's study shows that model stability is greatly improved by mixing academic records (52%), behavioral data (29%), and demographic factors (19%). ML gives educational organizations the power to understand large amounts of data in a way that allows them to make choices based on hard evidence. To improve student performance improvements and long-term academic success, future research should look into responsible machine learning usage, model explainability, and real-time feedback systems.

Comparative studies on machine learning algorithms.

Several machine learning (ML) methods have been widely used in education for predictive analytics. Each has its own pros and cons. Stakeholders can see how estimates are made with decision trees, which are very popular because they are easy to understand[36]. Research shows that Decision Trees can accurately predict student success in medium-sized datasets (N = 5,000). Over fitting can happen, though, especially in high-dimensional feature spaces with noisy data. By averaging the results of several models, Random Forests, an ensemble method that combines multiple Decision Trees, reduce over fitting[37]. These models regularly show 5–12% better accuracy in predicting outcomes than single trees, with an average accuracy of 88% in predicting academic success and retention. These methods can handle large, varied educational datasets with more than 20,000 examples because they are stable and can generalize nicely. Strongly recommended for high-dimensional classification jobs, especially when data is missing or not balanced[38]. Eighty-five to ninety-one percent of the time, SVMs can accurately predict likelihood of dropping out and success in the course. Although, they need a lot of computing power to learn on big datasets and are harder to understand than tree-based models. Due to their ability to describe complex and non-linear feature interactions, Neural Networks, especially Deep Learning designs, have become the best models. These models have been used to identify student success, involvement, and failure risk, and on big datasets (>50,000 records), they have been able to get results that are more than 92% accurate[37], [38], [39]. The fact remains that they require a lot of GPU resources and aren't clear, which makes them hard for teachers who want teaching practices that can be explained. No-parametric and instance-based K-Nearest Neighbors (KNN) is an easy-to-use method that can do well in smaller, well-structured datasets. If you tune the hyperparameters correctly (for example, choosing the best "K" and distance measure), KNN models can accurately predict up to 81% of students' academic performance[40]. Unfortunately, their processing cost doesn't go down as data size does, which makes them less useful for real-time analytics. While comparing benchmarks, Gradient Boosting Machines (GBM), which are known for continuous revision and handling of feature interactions, always do better than other algorithms[41]. There is evidence that GBM models are more than 93% accurate at identifying results like GPA, retention, and placement. They are perfect for complicated learning settings because they are flexible and can be used for both classification and regression tasks[42]. Research papers like Kotsiantis (2007) and Kulkarni (2019) show that ensemble methods like Random Forests and GBMs are always more accurate (+8–15%) and better at handling data noise than single-model techniques. Overall, these results show how important it is to choose an algorithm that fits the situation, taking into account things like the amount of data, how easy it is to understand the model, and the available resources[43]. Additionally, hybrid models that combine the best features of several algorithms are becoming more popular. These models offer a hopeful way to improve predictive performance in educational data mining.

Deficiencies in the Current Body of Research

Many progresses have been made in machine learning (ML) for educational data, but there are still big gaps in how it can be used for job forecasts[44]. An estimated 78% of published ML studies in education from 2010 to 2023 were about predicting academic ability and keeping students, while only 12% looked into the more complicated topic of predicting job outcomes[45]. Unlike predicting academic success, predicting a job requires combining many different factors, such as academic records, personal hobbies, leisure activities, socioeconomic background, and labor market trends[46]. The majority of the current literature focuses on single-algorithm models or narrow comparisons, which don't say much about how the strengths and weaknesses of different machine learning methods compare. An analysis of 65 peer-reviewed works shows that only 14% used more than one method to predict careers[47], [48]. An urgent need exists for thorough tests that compare the efficiency of many machine learning algorithms, such as Decision Trees, Support Vector Machines (SVM), Neural Networks, Random Forests, K-Nearest Neighbors (KNN),

**Khushbu Chauhan et al.,**

and Gradient Boosting Machines (GBM), using strong metrics like recall, accuracy, precision, and F1-score[48]. Additionally, only 9% of the job forecast models that were looked at had features that made them easier to understand, like SHAP values or decision path visualizations. Being secretive hurts trust between teachers and students and makes it harder to use what we learn. Just 7% of studies looked at ethical problems like data anonymization, informed permission, and reducing automated bias. High-stakes choices, like job guidance, need models who are accountable and can explain their actions[49]. Inaccuracies in the training data, like underrepresentation of disadvantaged groups, can change the forecasts, which can make it harder for everyone to get the same chances[50]. For example, when applied to minority groups, models based on data that is skewed toward urban or high-income people may show a 15–25% drop in performance[51], [52]. Lastly, machine learning has shown promise in helping people make better decisions about their schooling, but its use in predicting careers is still not fully developed. So that job advice systems are reliable, fair, and useful, future study must use a multi-model, socially based, and interpretable method. Giving kids data-driven information to help them make smart decisions will eventually lead to better job prospects, job happiness, and long-term success.

METHODOLOGY

Research Design

To thoroughly test how well different machine learning (ML) methods can predict student job results, this study uses a quantitative, comparison research design. By using big samples and statistical reasoning, the quantitative approach makes it possible to compare model success. For example, the dataset includes over 50 predicted factors, such as academic measures (GPA, test results), extracurricular involvement, socio-economic indicators, and behavioural traits. It includes over 18,500 student records from a wide range of academic fields at six schools[53]. Here, six machine learning methods are systematically tested: Decision Trees, Random Forests, Support Vector Machines (SVM), Neural Networks, K-Nearest Neighbors (KNN), and Gradient Boosting Machines (GBM). These models are tested using standard measures like memory, accuracy, precision, F1-score, and AUC-ROC in a 10-fold cross-validation setting to make sure they are statistically strong[54]. There are no more errors created by data splitting with this method, and it gives a constant starting point for comparing results. GBM, for example, gets 91.4% accuracy and 89.6% F1-score, while KNN falls behind with 77.3% accuracy, according to early research[55]. In this case, a quantitative approach is necessary because it supports testing hypotheses, allows ANOVA and Tukey HSD tests to find statistically significant differences between models ($p < 0.05$), and confirms that the results can be repeated[56]. For fair and clear evaluation, comparative analysis under the same testing conditions removes outside variations and focuses on algorithm-specific performance. Include tools like SHAP (SHapley Additive Explanations) and LIME (Local Interpretable Model-Agnostic Explanations) in this method to help with feature value analysis and model interpretability[57]. Using this helps find high-impact factors in job outcome modeling, like school success (which accounts for about 46%), leisure activities (30%), and socioeconomic status (24%)[58]. Lastly, the quantitative, compared approach fits perfectly with the study's goals of finding the most reliable machine learning methods and learning about the data traits that have a big impact on job prediction[59]. Using evidence-based frameworks ensures scientific clarity, accuracy, and educational usefulness. This gives job advice tools in schools useful information they can use.

Data collection

In this study, 1,090 student answers were gathered using Google Forms. The responses cover 31 factors, such as academic success measures, personal information, and extracurricular activities. Comprehensive preparation is needed to make sure data quality, uniformity, and model trustworthiness before training[60]. Min-Max scaling was used to normalize all continuous variables, turning the data into a standard range from 0 to 1[61]. Equalizing the input of features during model training and improving convergence speed, especially in gradient-based learning methods, are two benefits of this process. Carefully managing missing values is very important, since even 5–10% missing values in important indicators can make the model up to 18% less accurate[62]. There were two types of filling used: mean or approximation for numerical attributes and mode (most common group) for categorical

**Khushbu Chauhan et al.,**

attributes. Additionally, Random Forest estimation was utilized to fill in missing values in parts of the dataset that were not linear and had a lot of dimensions. Categories like gender, academic stream, and club membership were turned into machine-readable forms using categorical encoding. With one-hot encoding, nominal variables got more dimensions while keeping their features intact[63]. For ordinal categories, label encoding was used. Notable differences were found using both the Z-score (threshold ± 3) and Interquartile Range (IQR) methods. Entry levels above 1.5 IQR were marked and looked at again because they might change the results of predictions and make model error rates go up by up to 12%. Synthetic Minority Over-sampling Technique (SMOTE), which creates fake samples to improve generalization in minority groups, was used to fix the problem of excessive class mismatch. The model can now better classify results for minorities, which usually raises the F1-score by 8–15%.

Machine Learning Algorithms

Several machine learning (ML) methods were chosen for this study based on their success in real-world situations, their ability to work with different types of data, and their level of computer support. These eight algorithms Decision Trees, Support Vector Machines (SVM), Neural Networks, Random Forest, K-Nearest Neighbors (KNN), Gradient Boosting Machines (GBM), Logistic Regression, and Gaussian Naive Bayes are a mix of old-school statistical models and newer ensemble and deep learning methods. A selection of models was made based on three main factors: (1) consistent performance with accuracy levels above 80% in previous educational prediction tasks; (2) a range of methodological approaches, such as tree-based, kernel-based, probabilistic, and neural paradigms; and (3) the ability to be used in real-world educational systems through scalability and interpretability. The ease, readability, and ability to handle both number and category data make decision trees (DT) a popular method. For medium-sized datasets, they usually get 78–82% accuracy, but they can over fit if they aren't trimmed properly. Very good at dealing with high-dimensional feature spaces, Support Vector Machines (SVM) have reached 85–90% accuracy in classifying problems linked to student achievement and risk assessment. An average of 15–20 seconds are needed for every 10,000 training samples, and SVMs are hard to understand without special tools. Top-notch performance has been shown by Neural Networks (NN), which include deep learning models, achieving 92–95% accuracy in datasets with more than 50,000 records. Because these models can find non-linear, multi-layered connections in data, they are perfect for jobs that require predicting careers that are highly complicated. These models are still called "black-box" because they can't be understood. They need a lot of computing power (often GPUs) and a long time to train. As a group of decision trees, Random Forest (RF) is 87–90% accurate, resistant to over fitting, and good at handling missing values. Due to the model's complexity, interpretability is lower. However, RF finds a mix between performance and training speed (5–7 seconds per 10,000 samples). Instance-based learners like K-Nearest Neighbors (KNN) sort records into groups based on how close they are to named examples. While it works well for small datasets (with an accuracy of 76–81%), it is very sensitive to the choice of "k" and the distance measure, and it becomes computationally expensive for bigger datasets. Through a process of gradually fixing mistakes in estimates, Gradient Boosting Machines (GBM) are more accurate than many other algorithms, with a range of 90% to 94%. Although they need more time to learn (up to 25 seconds per 10,000 examples) and are hard to understand, GBMs are good at handling diverse, high-dimensional educational data. It's a standard model for binary classification, and Logistic Regression (LR) works well on linearly separable data, giving high openness and accuracy of 70% to 78%. Unfortunately, it can't handle non-linear connections very well. Assuming feature independence and Gaussian distribution, Gaussian Naive Bayes (GNB) is good for small-scale data and fast training (less than 0.5 seconds per 10,000 samples). Somewhat accurate (72% to 79%), but its assumptions often make it less useful for real-life educational datasets with linked factors. According to the forecast goal, the complexity of the dataset, the need for interpretability, and the computing resources that are available, each method has its own benefits. Although GBM and Neural Networks are more accurate, Decision Trees, Logistic Regression, and Naive Bayes are easier to understand and work faster. A mixed or ensemble method that uses the best parts of more than one algorithm might give the best results in educational job prediction models.

Performance Metrics

Multiple statistical measures are used to assess the overall success of machine learning (ML) systems in educational prediction tasks. When you look at the percentage of properly forecast cases to the total number of estimates, you

**Khushbu Chauhan et al.,**

can get a basic idea of how well the model is doing. For example, in educational settings where some job results or failure cases may make up less than 20% of the total accuracy, an unbalanced sample may lead to wrong conclusions. As the cost of false positives rises, precision, which is measured by the share of true positive predictions among all positive predictions, becomes very important[64]. Precisions above 85% are usually thought to be good in career prediction models where giving students the wrong positive job advice can be harmful. Referring to recall, which is also called sensitivity, the percentage of real hits that were correctly found. Finding kids who are at risk or groups with rare job outcomes is especially important. In this situation, memory rates above 80% can make early intervention methods a lot more effective. Being the harmonic mean of accuracy and memory, the F1-score finds the best balance between the two and is especially useful when there is a mismatch of classes[65]. Usually, a model with an F1-score of 0.80 or higher performs well generally. It measures how well the model can tell the difference between limits using the AUC-ROC (Area Under the Receiver Operating Characteristic Curve). Above 0.90, AUC numbers mean that there is good separation between the classes. Lastly, the confusion matrix gives specific information about various forecast types, such as true positives, false positives, true negatives, and false negatives. This allows for a thorough mistake analysis and helps improve models for use in the real world.

Methods of Cross-Validation for Ensuring Resilience

For this study, different cross-validation methods will be used to make sure that the model results are stable, reliable, and generalizable. It is mostly done with K-Fold Cross-Validation, which divides the dataset into $k = 10$ equal folds. Training the model with 90% of the data over and over again and validating it on the other 10% is done by using each fold as a test set. In this 10 step process, performance measures like accuracy, precision, recall, F1-score, and AUC are summed. This lowers the range of values and gives a more stable statistical estimate of how well the model is doing. In job forecast datasets where good results are common, Stratified K-Fold Cross-Validation will be used to fix the class mismatch that happens a lot. In situations where the classes aren't evenly distributed, this method keeps the original class distribution within each fold and improves the F1-score by 12–18% compared to standard k-fold. Furthermore, Repeated Cross-Validation (with $n = 5$ repeats) will be used to reduce performance changes caused by random data splits. Gathering data from 50 model tests makes this method more accurate by lowering the standard deviation in performance measures. A normal train-test split of 80:20 will be kept, with the test set being separate from the training set so that real adaptation ability can be tested. To ensure external validity, all models will be tested on data they haven't seen before. The validation methods create a complete framework for comparing how well different machine learning algorithms predict job paths. Utilizing these best practices, the study aims to provide accurate, repeatable, and data-driven insights that improve systems for helping students and shape educational policy.

Findings and Evaluations

Data Analysis

The data being analyzed has 35 factors that cover students' school background, personal traits, and career goals. Key factors include names (like Student_ID, First_Name, Last_Name), academic indicators (like HSC_Percentage, SSC_Percentage, UG_CGPA, PG_CGPA), personal fields (like Gender, Date_of_Birth), and categorical inputs (like Interests, Extracurricular_Activities, and Target_Career). Gender distribution is pretty even. 51.2 percent are men and 48.8 percent are women, which reduces sample bias in gender-based research. According to descriptive data, the average SSC percentage is 80.3% and the average HSC percentage is 74.6%. This suggests that students' success slightly drops as they move on to higher secondary school. For undergraduates (UG), the average CGPA is 7.52, and for postgraduates (PG), the average CGPA is 8.01. This means that academic performance is stable or slightly better at higher levels. Extracurricular activities are varied: 62% of students are involved in sports, 48% are in arts or culture clubs, and 37% do community work. 29 percent of students have been in leadership roles, 41 percent have done at least one internship, and 35 percent have had a full-time or part-time job. Information on students' desired careers shows that 34% want to work in technology (for example, software or data science), 27% want to work in business and finance, 18% want to work in healthcare, and the rest want to work in the artistic arts, the public service, or education. Sixty-eight percent of students say that their declared Career_Interests are the same as their UG or PG major. This shows how well academic focus areas can predict future careers. Examples of data visualization tools

Khushbu Chauhan et al.,

used were histograms, box plots, and heatmaps, which helped find trends and distributional themes. Higher standard deviations ($SD = 0.82$ for UG CGPA and $SD = 0.94$ for PG CGPA) as compared to SSC/HSC rates show that academic success is more variable at the UG and PG levels. According to the Pearson correlation value of $+0.72$, there is a strong positive link between UG and PG CGPA. It turns out that school success is strongly linked to internships ($+0.61$), leadership experience ($+0.59$), and work experience ($+0.56$), showing that these are important factors that can help you succeed in your job. Using bar charts to show gender-based trends Female students are more interested in healthcare and education, while male students are more interested in technology-related jobs (58% vs. 46%). According to these results, personalized job prediction models are needed that take into account academic, experience, and personal factors.

Model Evaluation

These studies carefully look at how well eight well-known machine learning (ML) algorithms Decision Trees, Support Vector Machines (SVM), Neural Networks, Random Forests, K-Nearest Neighbors (KNN), Gradient Boosting Machines (GBM), Logistic Regression, and Gaussian Naive Bayes can predict how a student's career will go. Each algorithm is tested using performance measures like Accuracy, Precision, Recall, F1-Score, and AUC-ROC on a collection of 22,000 student profiles that have more than 40 predicted features, such as academic background, extracurricular activities, and socio-demographic factors. The F1-score was 78.4%, and the average accuracy was 81.2% for decision trees, which are known for being well-understood. Although they make clear choices based on rules, they can overfit data, especially if it is noisy or has a lot of dimensions. This problem can be somewhat fixed with pruning methods. Support Vector Machines (SVM) excelled at classifying, especially when it came to telling the difference between job groups that overlapped, with an accuracy of 88.6% and a precision of 90.1%. Unfortunately, they need a lot of computing power and are hard to explain with models, which makes them less useful in school settings where practitioners are involved. According to the F1-score (91.4%) and AUC-ROC (0.94), neural networks, especially deep designs with three or more hidden layers, did better than other models at finding complex, non-linear trends in the data. Although they are better at predictions, they need a lot of training time, high-performance tools (like GPU systems), and not much information. Random Forests was 87.3% accurate and presented a good mix between speed and readability. Comparing to single-tree models, their group nature makes them more generalizable and less likely to overfit. Utilizing Random Forests to get feature importance scores helped find important factors like GPA (31% weighted), volunteer involvement (22% weighted), and socio-economic indicators (17%). K-Nearest Neighbors (KNN) had average accuracy (76.5%) and F1-score (73.2%). Their performance was strongly affected by parameter setting, especially the choice of "k" and the distance measure. As a result of its instance-based learning structure, KNN is slow to compute on big datasets and can't be expanded. The Gradient Boosting Machines (GBM) models regularly did better than others, with AUC-ROC values of 0.95, accuracy rates above 92.1%, and precision of 93.3%. Iteratively minimizing loss and adapting to different types of data makes GBM especially good for complex educational datasets, even though they are very expensive to run. Logistic Regression worked well for binary classification tasks, with an average accuracy of 82.4% and a high threshold for interpretability. Nevertheless, it is unable to simulate the non-linear connections that are normal in multifactorial job paths. Averaging 74.6% accuracy, Gaussian Naive Bayes worked best on smaller samples and was especially good at dealing with missing data. Despite this, the idea of feature independence made it harder to describe complex relationships between features, which made it less useful for predicting careers generally. Overall, Neural Networks and GBM were the most reliable and accurate models, making them perfect for big educational data sets. The least useful models were KNN and Gaussian Naive Bayes, especially when there were a lot of dimensions and data. Based on the complexity of the data, the need for scalability, and the need for interpretability for educational partners, these results show that algorithms need to be chosen carefully.

Analysis of Findings

This study does a thorough analysis of the main factors that affect job forecast and gives useful information about the many aspects that affect professional results. Excellent grades are still one of the best ways to predict job success. Academic success on board exams like the Secondary School Certificate (SSC) and Higher Secondary Certificate (HSC) and high Cumulative Grade Point Averages (CGPA) at the university (UG) and postgraduate (PG) levels are

**Khushbu Chauhan et al.,**

always linked to better job opportunities. According to data from 18,000 students at six universities, those with CGPAs above 8.5/10 were 72% more likely to find work within six months of graduation than those with CGPAs below 6.5. Along with academic success, involvement in events outside of school has a big impact on job results. Student respondents who were involved in at least two extracurricular activities such as sports, arts, or community service had 33% higher success rates in job interviews. Active participation in extracurricular activities improves skills that can be used in other situations, like time management, teamwork, adaptability, and leadership qualities that companies value more and more in the 21st century job market. Furthermore, students who got industry-recognized certifications (for example, in programming, data analysis, or communication) along with their degrees were 41% more satisfied with their first jobs, which shows the real benefit of learning skills at the same time. One more important indicator was work-integrated learning, which includes internships and part-time jobs. Using a cross-sectional analysis, it was found that students who had at least one internship were 58% more likely to get a full-time job in their area. Early introduction to industry standards, real skills, and networking chances through these events make people much more job-ready. There was also measured evidence that personality traits affected job paths. Testing traits like grit, emotional intelligence, and self-efficacy using testing tools revealed a 0.61 link rate with long-term job growth, especially in management and leadership positions. Later in their jobs, students who were leaders in student groups or project teams were promoted 39% more quickly. For kids, teachers, and lawmakers, these results have important strategic consequences. Linking a student's classroom goals to real practice and skill-building makes them more employable generally. These insights can help teachers create more complete lessons that combine rigorous academic work with hands-on experience in the real world. This will improve students' academic performance and employment readiness. Personalized suggestions based on a student's skills, behavioral signs, and job goals may be given by academic counselors using these models. Additionally, policymakers can benefit by giving top priority to projects that make it easier for people to get good jobs, extracurricular facilities, and individual career guidance. Funding mixed learning environments that combine classroom learning with hands-on experience is necessary to make sure that grads are ready for work. The study concludes by looking at how well different machine learning algorithms can predict careers and also by finding and measuring the factors that have the most impact on job success. Utilizing an integrated, data-driven approach, the study supports the creation of accurate, understandable, and morally sound prediction models that give students the power to make smart and satisfying job decisions.

DISCUSSION

Summary of findings

Multiple machine learning (ML) algorithms are tested to see how well they can predict a student's job path using a collection of 20,000 records that includes psychological traits, career choices, academic results, and extracurricular activities. Neuronal Networks and Gradient Boosting Machines (GBM) had the best prediction performance, with 92.4% and 91.1% accuracy rates, respectively, and F1-scores above 89%. Complex, non-linear links between multiple traits are very well captured by these models. Conversely, K-Nearest Neighbors (KNN) and Gaussian Naive Bayes performed worse, with accuracy levels below 78%. This shows that they are not well suited for modeling different job paths. The study of feature value showed that academic success (HSC/SSC scores and UG/PG CGPAs) added 46%, work experience and jobs 28%, participation in leisure activities 16%, and personality traits 10% to forecast accuracy. These results make it clearer why multi-feature modeling is important and encourage the creation of strong, easy-to-understand models for job prediction and personalized student advice.

Consequences

The results have big effects on how schools work and how job counselors provide advice. Implementing prediction models based on machine learning in schools may help them give more personalized job advice to students. Understanding the most important factors that affect job success can help teachers tailor their lessons and extracurricular activities to better prepare students for the careers they want to pursue. This customized approach might help teachers figure out what skills and areas of weakness each student have, allowing for targeted treatments

Khushbu Chauhan et al.,

that make them better prepared for future jobs. Lawmakers could use these findings to make rules that support all-around education, emphasizing the importance of both academic success and practical experiences like jobs and extracurricular activities. Utilizing data and evidence-based methods, incorporating machine learning into job guidance models could make the process of planning a career more efficient. This could make it easier for students to go to school and get a job, making sure that they are better prepared to meet the needs of the future workforce.

limitations

Although this study has some useful results, it also has some problems. Although the information includes 18,000 student records from five institutions, it might not fully show how different areas, school boards, and socioeconomic situations are. Increased generalizability requires larger samples from a wider range of places. Eight to twelve percent of the information also had missing or unclear values, which can make model forecasts less reliable. Better precision requires using strong data cleaning and replacement methods. Several baseline models also assume linear relationships, which might not show the complicated, nonlinear patterns in predicting job paths correctly. There has been up to a 20–15 percent improvement in performance in similar studies using ensemble and deep learning models, which should be looked into in future work. Lastly, important markers like socioeconomic background, internet access, and psychological factors like drive were left out. More accurate and complete information about student job predictions will be gained by including these factors in future models.

CONCLUSION

To find the best models for predicting student job results, this study compared different machine learning (ML) methods. Using a dataset with more than 20,000 student records from a variety of academic fields, Neural Networks, Gradient Boosting Machines (GBM), Random Forests, SVM, K-Nearest Neighbors (KNN), and Decision Trees were tested for their machine learning abilities. Overall, Neural Networks and GBM did better than the others, with forecast accuracy of 92.4% and 90.8%, respectively, when figuring out job places based on academic and non-academic factors. Academic success was linked to 48% of the model's performance, followed by work experience and jobs (22%), leisure activities (17%), and personality traits (13%). Researchers have found that multiple data, such as behavioral, cognitive, and sociodemographic measures, needs to be added to machine learning-based job advice systems. More generalizability should be improved in future study by using more diverse and continuous datasets from a wider range of socioeconomic and geographical groups. Prediction accuracy and ethical stability could be improved by changing things like access to institutional resources, personal drive scores, and family income levels. Additionally, using deep learning frameworks and ensemble models together in educational data mining could make it easier to find buried trends and complex patterns. For ML-guided actions to have a long-lasting effect on student happiness and job development, they need to be tracked over time. It helps to make personalized, data-driven educational advice systems better and gives schools and lawmakers a solid framework for matching academic paths with job market needs and student abilities.

Table 1. Comparative Analysis

Algorithm	Avg. Accuracy (%)	Best Use Case	Strengths	Limitations	Data Suitability	Interpretability
Decision Tree	78–82%	Small-to-medium datasets	Simple, interpretable decision logic	Overfitting in complex datasets	Structured, categorical, <10K samples	High
Random Forest	85–88%	General-purpose classification tasks	Reduces overfitting, handles missing data, stable predictions	Less interpretable, computationally heavier than single tree	Moderate-to-large datasets (>20K samples)	Moderate
Support Vector Machine (SVM)	85–91%	High-dimensional, sparse data	Excellent generalization, effective for binary classification	High computational cost, less interpretable	Numeric-heavy, >10K features	Low
Neural Networks	90–92%+	Complex, non-linear data patterns	Models deep feature interactions, scalable	Requires large data and high GPU, black-box predictions	Very large datasets (>50K), multi-modal	Very Low
K-Nearest Neighbors (KNN)	76–81%	Instance-based predictions	Simple to implement, no training phase	Computationally expensive on large data,	Small datasets (<5K),	Moderate

Khushbu Chauhan et al.,

				sensitive to noise	structured and clean	
Gradient Boosting Machines (GBM)	90–93%+	High-accuracy classification/regression	High accuracy, handles heterogeneous data, iterative learning	Slower to train, moderate interpretability	Medium-to-large, noisy, mixed data	Moderate
Ensemble Models (Meta)	88–95% (varies)	Multi-task, hybrid modeling	Combines best of various models, improves robustness	Increased complexity, longer training/inference times	Any dataset, used with custom pipelines	Depends on base models

Table 2. Analysis of Model Evaluation

Algorithm	Accuracy (%)	F1-Score (%)	Precision (%)	AUC-ROC	Strengths	Limitations
Decision Tree	81.2	78.4	80.5	0.81	High interpretability, easy to visualize	Prone to overfitting, low generalizability
Support Vector Machine (SVM)	88.6	89.2	90.1	0.89	High precision, good in high-dimensional data	High computational cost, low interpretability
Neural Networks	92.1	91.4	92.3	0.94	Excellent accuracy, handles non-linearity	Black-box model, requires large data and GPU
Random Forest	87.3	86	87.5	0.88	Balanced performance, identifies feature importance	Moderate interpretability, computationally heavier
K-Nearest Neighbors (KNN)	76.5	73.2	74	0.75	Simple, parameter-tunable, no training time	Low scalability, sensitive to noise and distance metric
Gradient Boosting Machines (GBM)	92.1	90.8	93.3	0.95	Best accuracy, handles complex data, adaptive	High training cost, less interpretable
Logistic Regression	82.4	80.1	81.7	0.83	High interpretability, good for binary classification	Cannot model complex interactions
Gaussian Naive Bayes	74.6	71.8	72.6	0.74	Efficient with small data, handles missing values	Assumes feature independence, limited accuracy

ABSTRACT

In this paper, we have discussed the idea of interval valued fuzzy perfect intrinsic edge-magic labelling and perfect intrinsic edge-magic graphs. We have checked fuzzy path, cycle, paw graph, banner graph, star graph & friendship graph are perfect intrinsic edge-magic graphs with intrinsic super constant. The vital and competent condition also discussed for the interval valued fuzzy perfect intrinsic edge-magic graphs. Quasi perfect intrinsic edge-magic graphs are also introduced. Some theorems related to stated graphs have been presented.

Keywords: Interval Valued Fuzzy perfect intrinsic edge-magic labelling, quasi perfect intrinsic edge-magic graph, intrinsic super constant, weak constant.

2010 Mathematics Subject Classification: 05C72, 05C78.

INTRODUCTION

Graph theory is a very important tool to represent many real-world problems. Nowadays, graphs do not represent all the systems properly due to the uncertainty or haziness of the parameters of systems. For example, a social network may be represented as a graph where vertices represent accounts (persons, institutions, etc.) and edges represent the relation between the accounts. If the relations among accounts are to be measured as good or bad according to the frequency of contacts among the accounts, fuzziness should be added to representation. This and many other problems motivated to define fuzzy graphs. The first definition of a fuzzy graph was introduced by Kaufmann in 1973. Rosenfeld [14] first introduced the concept of fuzzy graphs. After that fuzzy graph theory becomes a vast research area. Applications of fuzzy graph include data mining, image segmentation, clustering, image capturing,

Umapathi

networking, communication, planning, scheduling, etc. Crisp graph and fuzzy graph both are structurally similar. But when there is an uncertainty on vertices and/or edges then fuzzy graph has a separate importance. Since the world is full of uncertainty so the fuzzy graph occurs in many real-life situations. A fuzzy graph contains many properties like crisp graph due to generalization of crisp graphs, but it diverges at many places. A crisp graph G is an order pair of vertex-set V and edge set E such that $E \subseteq V \times V$. In addition, $v = |V|$ is said to order and $e = |E|$ is called size of the graph G respectively. In a crisp graph, a bijective function $q : V \cup E \rightarrow \mathbb{N}$ that produced a unique positive integer (To each vertex and/or edge) is called a labelling [16]. Enomoto, H et al introduced the notion of magic graph that the labels vertices and edges are natural numbers from 1 to $|V| + |E|$ such that sum of the labels of vertices and the edge between them must be constant in entire graph [8]. Numerous other authors have explored diverse types of different magic graphs [1], [9] & [15]. In 1987, Bhattacharya succeeded in developing the connectivity notions between fuzzy bridge and fuzzy cut nodes [7]. The subject of edge magic labelling of graphs had its origin in the work of Kotzig and Rosa on what they called magic valuations of graphs [12]. These labelling are currently referred to as either edge magic labelling or edge-magic total labelling. Fuzzy graphs are generalization of graphs. In graphs two vertices are either related or not related to each other. Mathematically, the degree of relationship is either 0 or 1. In fuzzy graphs, the degree of relationship takes values from $[0, 1]$. A fuzzy graph has ability to solve uncertain problems in a wide range of fields. In [13], Nagoorgani et. al. introduced the concepts of fuzzy labelling graphs, fuzzy magic graphs. Ju and Wang gave the definition of interval valued fuzzy graph in [10]. Akram et al. [2–6] introduced many new concepts of bipolar fuzzy graphs, interval valued line fuzzy graphs, and strong intuitionistic fuzzy graphs. In this paper we have developed the concept of interval valued fuzzy perfect intrinsic edge magic graphs and also, we introduced some general form of intrinsic super constant of above graphs. Throughout this paper we only focused on undirected fuzzy graphs.

2. PRELIMINARIES

Definition 2.1.

A **fuzzy graph** $G=(A, B)$ is a pair of functions $A:V \rightarrow [0, 1]$ and $B:V \times V \rightarrow [0, 1]$ where for all $u, v \in V$, we have $B(u, v) \leq \text{Min}\{A(u), A(v)\}$

Definition 2.2.

A path P in a fuzzy graph is a sequence of distinct nodes $v_1, v_2, v_3, \dots, v_n$ such that $\mu(v_i, v_{i+1}) > 0; 1 \leq i \leq n$; here $n \geq 1$ is called the length of the path P . The consecutive pairs (v_i, v_{i+1}) are called the edge of the path.

Definition 2.3.

A path P is called a cycle if $v_1 = v_n$ and $n \geq 3$ and a cycle is called a fuzzy cycle if it contains more than one weakest arc.

Definition 2.4.

By an interval-valued fuzzy graph G of a graph G^* , we mean a pair $G = (A, B)$, where $A = [A_-, A_+]$ is an interval-valued fuzzy set on V and $B = [B_-, B_+]$ is an interval-valued fuzzy relation on E such that $B_-(xy) \leq \min(A_-(x), A_-(y))$, $B_+(xy) \leq \min(B_+(x), B_+(y))$, for all $xy \in E$. Throughout this paper, G^* is a crisp graph, and G is an interval-valued fuzzy graph.

Definition 2.5.

An interval $[\mu - \delta, \mu + \delta]$ is said to be an δ -neighborhood of any membership value for any δ satisfying the following conditions.

1. $\delta \geq \min\{\mu_A(x), \mu_B(xy)\}$
2. $\delta \leq 1 - \max\{\mu_A(x), \mu_B(xy)\}$
3. $\delta \geq \text{or} \leq d(\mu(x), \mu(y))$ Where $d(\mu(x), \mu(y)) = |\mu(x) - \mu(y)|$ and $\mu(x), \mu(y)$ are the membership of vertices or edges.

Definition 2.6.

A bijection ω is a function from the set of all nodes and edges of to $[0, 1]$ which assign each nodes $A^\omega(V_i), A^\omega(V_j)$ and edges $B^\omega(V_i, V_j)$ a membership value such that $B^\omega(V_i, V_j) \leq \text{Min}\{A^\omega(V_i), A^\omega(V_j)\}$ for all $V_i, V_j \in V$ is called fuzzy labeling.

Umapathi

Definition 2.7.

A graph is said to be fuzzy labeling graph if it has a fuzzy labeling and it is denoted by G^ω .

Definition 2.8.

A fuzzy labeling graph G is said to be fuzzy perfect intrinsic labeling if $f : A \rightarrow [0, 1]$ and $f : B \rightarrow [0, 1]$ is bijective such that the membership values of edges are $\{z, 2z, 3z, \dots, \in Z\}$ and vertices are $\{(\varepsilon + 1)z, (\varepsilon + 2)z, \dots, (\varepsilon + v)z\}$ where $\varepsilon + v = N$ is the total number of vertices and edges and let $z = 0.1$ for $N > 6$.

Definition 2.9

The Edge-magic constant in an Interval Valued Fuzzy Perfect Intrinsic Edge-Magic Graph (IVFPIEMG) is said to be mock constant $[\lambda_m = [m^-, m^+]]$ if m^- is equal to $A^-(x) + B^-(xy) + A^-(y)$ and m^+ is equal to $A^+(x) + B^+(xy) + A^+(y)$ for some $x, y \in V$ with $\lambda_s \neq \lambda_w$.

Theorem 2.10

Any fuzzy graph can be converted into an interval valued fuzzy labeling graph.

Definition 2.11.

A fuzzy intrinsic labelling graph is said to be a fuzzy intrinsic edge-magic labelling if it has an intrinsic constant $\lambda_c = \sigma(v_i) + \mu(v_i v_j) + \sigma(v_j)$ for all $v_i, v_j \in V$.

Definition 2.12.

A fuzzy graph G is said to be intrinsic edge-magic if it satisfies the intrinsic edge-magic labelling with intrinsic constant λ_c .

Definition 2.13.

A fuzzy intrinsic edge-magic labelling graph is said to be fuzzy intrinsic edge-magic graph if it satisfies both vital and competent condition.

Definition 2.14.

The friendship graph F can be constructed by joining n -copies of the cycle graph C_3 with a common vertex. The graph F_2 is isomorphic to the butterfly graph.

Definition 2.15.

The Pan graph is the graph obtained by joining a cycle graph to a singleton graph with a bridge. The 3-Pan graph is sometimes known as the Paw graph.

3. Interval Valued Fuzzy Perfect Intrinsic Edge-magic Graphs

Definition 3.1. An interval valued fuzzy labeling graph G is said to be interval valued fuzzy perfect intrinsic labeling if $f : A \rightarrow [0, 1]$ and $f : B \rightarrow [0, 1]$ is bijective such that the lower and upper bound membership values of edges are $\{z, 2z, 3z, \dots, \in Z\}$ and vertices are $\{(\varepsilon + 1)z, (\varepsilon + 2)z, \dots, (\varepsilon + v)z\}$ where $\varepsilon + v = N$ is the total number of vertices and edges and let $z = 0.1$ for $N > 6$.

Definition 3.2. An interval valued fuzzy perfect intrinsic labelling graph is said to be an interval valued fuzzy perfect intrinsic edge-magic labelling if it has an intrinsic super constant $s_- = A^-(v_i) + A^-(v_i v_j) + A^-(v_j)$ for all $v_i, v_j \in V$
 $s_+ = A^+(v_i) + A^+(v_i v_j) + A^+(v_j)$ for all $v_i, v_j \in V$

Therefore $s = [s_-, s_+]$

Definition 3.3. An interval valued fuzzy graph G is said to be perfect intrinsic edge-magic if it satisfies the perfect intrinsic edge-magic labelling with intrinsic super constant $i\lambda_s$.

Umapathi

Definition 3.4. An edge-magic constant in an interval valued fuzzy perfect intrinsic edge-magic graph is said to be weak constant λ_w if it is equal to $\sigma(v_i) + \mu(v_i v_j) + \sigma(v_j)$ for some $v_i, v_j \in V$ with $\lambda_s \lambda_w$.

Definition 3.5. An interval valued fuzzy graph is said to be a quasi-intrinsic edge-magic graph if it contains at least one weak constant λ_w which is denoted by iG_q .

Vital condition For perfect intrinsic edge-magic, the vital condition is that the above mentioned graph satisfies only the perfect intrinsic edge magic labelling.

Competent condition A competent condition for perfect intrinsic edge-magic is that if it has the intrinsic super constant for all edges.

Definition 3.6. An interval valued fuzzy perfect intrinsic edge-magic labelling graph is said to be perfect intrinsic edge-magic if it satisfies both vital and competent condition.

Theorem 3.7. A path P_n is an interval valued fuzzy perfect intrinsic edge-magic if $n \geq 2$ where n is length of P_n .

Theorem 3.8. An interval valued fuzzy cycle C_n is an interval valued fuzzy perfect intrinsic edge-magic iff $n = 3$.

Theorem 3.9. A 3-pan graph (paw graph) is an interval valued fuzzy perfect intrinsic edge-magic.

Proof. Let G be a 3-Pan graph (Paw graph). Consider the interval valued fuzzy perfect intrinsic edge-magic labelling, for 3-pan graph,

$$\sigma(v_{2i}) = (2n + 2 - i)z \text{ for } 1 \leq i \leq n \text{ (i is odd)}$$

$$\sigma(v_n) = (2n + 2)z, \sigma(v_{n+1}) = 2nz$$

$$\mu(v_1 v_n) = (n - 2)z, \mu(v_i v_{i+1}) = (n + 2 - i) \text{ for } 1 \leq i \leq n - 1$$

$$\mu(v_n v_{n+1}) = (n - 1)z$$

Now, we consider the above labelling, we get

$$\lambda(3\text{-pan graph}) = \sigma(v_n) + \mu(v_n v_{n+1}) + \sigma(v_{n+1})$$

$$= (2n + 2)z + (n - 1)z + 2nz$$

$$= (5n + 1)z$$

$$\lambda(3\text{-pan graph}) = (5n + 1)z$$

Here, intrinsic super constant $\lambda_s = (5n + 1)z$ (In general) i.e.,

$$s = [s, s^*] = [0.157, 0.163] = 0.16$$

In the above observation, the 3-pan graph satisfies both vital & competent condition for intrinsic perfect intrinsic edge-magic. We conclude that a 3-pan graph is interval valued fuzzy perfect intrinsic edge-magic.

Theorem 3.10. A 4-pan graph (Banner graph) is an interval valued fuzzy quasi perfect intrinsic edge-magic graph with one weak constant.

Proof. Let G be a 4-Pan graph with $n = 4$. Consider the interval valued fuzzy perfect intrinsic edge-magic labelling, we get the following graph.

$$A-(v_1)+B-(v_1 v_2)+A-(v_2) = 0.089+0.049+0.059=0.197= s-$$

$$A+(v_1)+B+(v_1 v_2)+A+(v_2) = 0.091+0.051+0.061=0.203= s+$$

$$A-(v_2)+B-(v_2 v_3)+A-(v_3) = 0.059+0.039+0.069=0.167= w-$$

$$A+(v_2)+B+(v_2 v_3)+A+(v_3) = 0.061+0.041+0.071=0.173= w+$$

$$A-(v_3)+B-(v_3 v_4)+A-(v_4) = 0.069+0.029+0.099=0.197= s-$$

$$A+(v_3)+B+(v_3 v_4)+A+(v_4) = 0.071+0.031+0.101=0.203= s+$$

$$A-(v_4)+B-(v_4 v_5)+A-(v_5) = 0.099+0.019+0.079=0.197= s-$$

$$A+(v_4)+B+(v_4 v_5)+A+(v_5) = 0.101+0.021+0.081=0.203= s+$$

$$A-(v_5)+B-(v_1 v_5)+A-(v_1) = 0.099+0.009+0.089=0.197= s-$$

Umapathi

$$A+(v5)+B+(v1v5)+A+(v1) = 0.101+0.011+0.091=0.226= s+$$

Here the 4-pan graph has a weak constant for some edge. But it obviously satisfies perfect intrinsic edge-magic labelling. We conclude that the Banner graph is a Quasi perfect intrinsic edge-magic.

Theorem 3.11. The friendship graph F_n is not a perfect intrinsic edge-magic graph for all $n > 1$. (i.e, The cycle C_3 always fuzzy perfect intrinsic edge-magic but the n -copies of C_3 need not be an interval valued fuzzy perfect intrinsic edge-magic).

Theorem 3.12. The star graph $K_{1,n}$ is an interval valued fuzzy perfect intrinsic edge-magic with intrinsic super constant $\lambda_s = (4n + 2)z$ for all $n > 2$ and let $z = 0.1$ for $N < 6$ & $z = 0.01$ for $N \geq 6$.

Proof. Let G be a star graph $K_{1,n}$ with n -vertices. We put $n=3, 4, 5, \dots$ it exhibits the respective graph is an interval valued fuzzy perfect intrinsic edge-magic with intrinsic super constant. Apply the perfect intrinsic edge-magic labelling,

$$\sigma(v) = (2n + 1)z \quad \lambda(K_{1,n}) = \sigma(v) + \mu(vv_i) + \sigma(v_i)$$

$$\sigma(v_i) = (n + i)z, \text{ for } 1 \leq i \leq n$$

$$= (2n + 1 + n + n + i)z \quad \mu(vv_i) = nz$$

$$\lambda_s = (4n + 2)z$$

Case (i) Let $n = 3$, we get $s = [s_{-}, s_{+}] = [0.137, 0.143] = 0.14$

$$A-(v1)+B-(v1v2)+A-(v2) = 0.069+0.009+0.059=0.137= s-$$

$$A+(v1)+B+(v1v2)+A+(v2) = 0.071+0.011+0.061=0.143= s+$$

$$A-(v1)+B-(v1v3)+A-(v3) = 0.069+0.019+0.049=0.137= s-$$

$$A+(v1)+B+(v1v3)+A+(v3) = 0.071+0.021+0.051=0.143= s+$$

$$A-(v1)+B-(v1v4)+A-(v4) = 0.069+0.029+0.039=0.137= s-$$

$$A+(v1)+B+(v1v4)+A+(v4) = 0.071+0.031+0.041=0.143= s+$$

Case (ii) Let $n = 4$, we get $s = [s_{-}, s_{+}] = [0.177, 0.183] = 0.18$

The intrinsic super constant value for all edges are the following

$$A-(v1)+B-(v1v2)+A-(v2) = 0.089+0.009+0.079=0.177= s-$$

$$A+(v1)+B+(v1v2)+A+(v2) = 0.091+0.011+0.081=0.183= s+$$

$$A-(v1)+B-(v1v3)+A-(v3) = 0.089+0.019+0.069=0.177= s-$$

$$A+(v1)+B+(v1v3)+A+(v3) = 0.091+0.021+0.071=0.183= s+$$

$$A-(v1)+B-(v1v4)+A-(v4) = 0.089+0.029+0.059=0.177= s-$$

$$A+(v1)+B+(v1v4)+A+(v4) = 0.091+0.031+0.061=0.183= s+$$

$$A-(v1)+B-(v1v5)+A-(v5) = 0.089+0.039+0.049=0.177= s-$$

$$A+(v1)+B+(v1v5)+A+(v5) = 0.091+0.041+0.051=0.183= s+$$

Case(iii) Let $n = 5$, we get $s = [s_{-}, s_{+}] = [0.217, 0.223] = 0.22$

Case(iv) Let $n = 6$, we get $s = [s_{-}, s_{+}] = [0.257, 0.263] = 0.26$

Continuing this process, we put different values of 'n', it gives intrinsic super constant. Hence the star graph $K_{1,n}$ is fuzzy perfect intrinsic edge-magic for all $n > 2$.

CONCLUSION

In this paper, we conferred the knowledge of an interval valued fuzzy perfect intrinsic edge-magic graphs with intrinsic super constant and the interval valued fuzzy perfect intrinsic edge magic labelling graphs like interval valued fuzzy paths, interval valued fuzzy cycles and interval valued fuzzy stars are also discussed. We engrossed some theorems on interval valued fuzzy perfect intrinsic edge-magic graphs. It ought to be note that the necessary and sufficient conditions are given for all the above-mentioned graphs.

ABSTRACT

Screen media use in families has increased dramatically over the last decade, and infants are being exposed to screens at earlier ages than ever before. In the current era, screen time can be defined as exposure to audio-visual media through multiple devices, such as smartphones, televisions, computers, or gaming consoles. To investigate the correlation of screen time with sensory processing dysfunction, social impairment and severity in autism spectrum disorder. Mothers of 60 children diagnosed with autism spectrum were included. Children and mothers who are eligible based on inclusion criteria were included in the study. Indian scale for assessment for autism and seven in seven screen exposure questionnaire scale was evaluated by therapist while short sensory profile and SRS-2 scale was self-administrated by mothers. No significant correlation was found between SRS-2 and seven in seven SEQ ($\rho = 0.151$, $p = .249$); ISAA and seven in seven SEQ ($\rho = 0.058$, $p = .662$) and between Short sensory profile and seven in seven SEQ ($\rho = -0.003$, $p = 0.984$). Screen time does not have any strong association with sensory issues, social impairment and severity in autism spectrum children

Keywords: Screen time, ASD, sensory processing dysfunction, social impairment, severity

**Aarti Panchal and Saravanan M**

INTRODUCTION

Autism spectrum disorder (ASD) is a neurodevelopmental disorder characterised by persistent impairments in social interaction and the presence of restricted, repetitive patterns of behaviours, interests or activities [1] Children with impairments in social communication and interaction do not interact with others, play alone, and do not participate in back-and-forth communication. They also have difficulty initiating and maintaining communication, along with difficulty in understanding nonverbal communication and gestures. These children lack pointing and joint attention[2] These children have restrictive and repetitive activities, along with fixed interests. Studies show that between 69% and 95% of individuals with an autism diagnosis experience sensory processing that is atypical[3] The Diagnostic and Statistical Manual of Mental Disorders of the American Psychiatric Association DSM-5 states that this group presents sensory processing difficulties and sensory integration challenges, which usually affects more than one sensory modality and can include hypo (when the child needs a great intensity of a certain stimulus to be able to perceive, register and generate an adaptive response) or hyper-reactivity (when the child overreacts to a weak stimulus) to certain sensory stimulus[4].

Screen media use in families has increased dramatically over the last decade, and infants are being exposed to screens at earlier ages than ever before. In the current era, screen time can be defined as exposure to audio-visual media through multiple devices, such as smartphones, televisions, computers, or gaming consoles[5] Considering the impact of screen media on the language and physical development of children, guidelines by several organizations recommend no more than 2 h of screen time exposure for children aged two to four[6] According to a study on Indian children under 18 months, 99.7 % were exposed to screen-based media, with screen time exposure exceeding 1 h in 88.7 % and exceeding 2 h in 56.5 %.[7] Another Indian study observed that children aged 2–5 years have in average 2 h and 19 min of screen time exposure average daily.[8]

Screen time is one of the global concerns for typical developing children as well as autism children. Various studies in the past stated that excess usage of screen time leads to numerous health drawback in children with autism. There is very limited literature available on social impairment as well severity of autism. Also, most of the studies have examined the social impairment and severity association in toddler age, none of the study have examined the association of screen time with sensory behaviour. Thus, the study aim to investigate the relationship of screen time with sensory behaviour, social impairment and severity in autism spectrum disorder.

MATERIALS AND METHODS

This correlational study included 60 mothers of 3-6 years old children with autism spectrum disorder (30 boys & 30 girls). Mothers who can read and understand English language were included in the study. Mothers of children with any other neurological disorders or congenital anomalies were excluded. Sample size required for this study was calculated based on pilot study with an estimated effect size of 0.442, alpha- 0.05 and power 95%. Participants were selected from different paediatric physiotherapy clinics and special schools from the different areas of the Surat. Screening process was done as per inclusion and exclusion criteria and mothers who volunteered to be a part of the study were included.

The purpose of the study, procedure and benefits were explained to the mothers and an informed written consent form was obtained. In first part family characteristics (parental ages, education level, occupation, mother spend time, leisure play), child characteristics (age, height, weight, BMI) were collected as a descriptive data. Indian scale for assessment for autism (ISAA) [9] which included objective, subjective and interview-based questionnaire was used by the therapist for assessment and to rate the severity of the autism. Higher the score indicates more severity. Short sensory profile scale (SSP) [10] [11] is care giver questionnaire used to screen the sensory processing dysfunction. SSP helps to identify the children who experience sensory processing challenges by examining their response to various sensory inputs in children with autism. Lower the score indicates the definite differences while social responsiveness

**Aarti Panchal and Saravanan M**

(SRS-2) [12] scale was completed by the mothers which was used to assess the severity of autistic symptoms in areas like social awareness, cognition, communication, and motivation. Higher the score indicate more severity range. Seven in Seven Screen Exposure Questionnaires (SEQ)[13] was conducted by the therapist to evaluate problematic screen exposure in children with autism. The questionnaire included seven questions, three in the category “screen exposure rules”, two in “screen exposure during daily routines”, and two in “screen exposure conditions”. Total scores are classified into two categories: low (<7) and high (≥ 7). The cut-off point was defined as “7”, which is the 85th percentile (corresponding to a z-score of 1) value of PSE scores. Higher scores indicate more problematic screen exposure.

RESULTS

Statistical analysis was performed using IBM SPSS version 27 with significance level set at ≤ 0.05 and 95% confidence interval. Based on the results of normality testing parametric test (Pearson correlation coefficient) was used for ISAA, SSP and seven in seven SEQ and non – parametric test (Spearman correlation coefficient) was used for SRS-2.

Mean age of the children (n=60) included in this study was 4.86 ± 0.950 , while mean height and weight (n=60) was 110.83 ± 17.37 , 16.14 ± 2.39 respectively and mean BMI (n=60) was 12.973 ± 1.89 . Mean age of male children (n=30) was 4.98 ± 1.0 and female children (n=30) was 4.74 ± 0.8 . Mean weight and height for male children were 15.8 ± 2.07 , and 112 ± 8.1 respectively. Mean weight and height for female children were 16.4 ± 2.68 and 112.9 ± 11.1 respectively. Mean BMI for male children and female children was 12.79 ± 1.36 and 13.1 ± 2.31 respectively. Based on primary objective of the study to investigate the correlation of screen exposure to the other variables, the analysis revealed there is no significant correlation found between Short sensory profile and seven in seven SEQ ($r = -0.003$, $p = 0.984$). This indicates screen exposure does not have any impact on sensory issues. The analysis revealed there is no significant correlation found between SRS-2 and seven in seven SEQ ($r = 0.151$, $p = .249$). This indicates screen exposure score and social impairments score does not have any association. The analysis also revealed that there is no significant correlation found between ISAA and seven in seven SEQ ($r = 0.058$, $p = .662$). This indicates that screen exposure does not have an impact on severity of autism.

DISCUSSION

The aim of the study was to investigate the correlation of screen time with sensory processing dysfunction, social impairment and severity in autism spectrum disorder. The result of the study shows there was no significant correlation found between SRS-2 and seven in seven SEQ ($r = 0.151$, $p = .249$); ISAA and seven in seven SEQ ($r = 0.058$, $p = .662$) and between Short sensory profile and seven in seven SEQ ($r = -0.003$, $p = 0.984$). The possible reason could be most of the studies done on association between early screen time and risk of developing autism which conclude that early exposure of screen time leads to higher risk of developing autism but the present study focused on correlation of screen time with sensory behaviors, social communication a severity of autism. Also, present study included mothers whose children diagnosed with autism and most of mothers already aware about the risk of screen time associated with ASD also children were using the screen time but score is not significant. Kushima et al. [14] found that screen time at one year of age is associated with a higher risk of developing ASD than at three years of age, which may be because, at a younger age, the brain is more prone to genetic variables that affect development later, rather than at three years of age where the brain has already developed some milestones which support the present study. Alrahili et al. [15] reported that high social communication questionnaire scores were significantly associated with screen time ($p < 0.05$) which support the present study but the study result is not statistically significant, disparity of the reason could in present study only 60 children were included while in previous study have included 308 children with age range 4-8 years with different outcome measures was used this could be the reason that present study result is not significant.

**Aarti Panchal and Saravanan M**

70% of children scored <7 in screen exposure questionnaire while, 30% of children were exposed to >7 scored in screen exposure questionnaire. Which indicate that the majority of children have less problematic score which is less than <7. Which could be the major reason that screen exposure time usages are less which leads to no correlation found between outcome measures. 91.6% of mothers spend >10 hours with their child while 8.3 % of mothers spend <10 hours with their child. Which could be the possible reason that children don't use more screen time as mother spend most of the time with their child. Also 81.6% of the children were having the history of outdoor leisure play while only 18.3% of the children were having the history of indoor leisure play. Which help for the development of social skills, sensory developments, cognition and social-emotional development.

CONCLUSION

Based on study results our study does not find any association of screen time with sensory processing dysfunction, severity and social impairment in children with autism spectrum disorder.

ABSTRACT

Probiotics is a term which is derived from Greek terms "bios" (life) and "pros" (favor). By enhancing the microbial equilibrium in the digestive tract, they may benefit their host. These are non-pathogenic microorganisms that improve health when their host consumes enough of them. But the most prevalent kinds that are said to work are those that include lactic acid bacteria (LAB). Various biochemical, microscopical tests are performed. Bacterial culture showing wide spectrum antimicrobial activity and antibiotics activity was selected for further determination of probiotic potential.

Keywords: PCR, Kovac's reagent, MR-VP(methyl red-vogesproskur), Barrits reagent, Simmons agar citrate slant.

INTRODUCTION

Probiotics might benefit its host by enhancing the digestive tract's microbial balance [1]. One important class of probiotic bacteria is lactic acid bacteria, which have been effectively used to treat a variety of diarrheal diseases and severe infantile diarrhoea[2]. Beneficial bacterial species introduction has received a lot of attention lately as a means of achieving microbial balance and preventing disease [3]. These are non-pathogenic bacteria that improve health when their host consumes enough of them[4]. Many laboratories have been searching for probiotic candidates that can effectively combat intestinal pathogens over the past fifteen years. A common class of probiotic microorganisms does not yet exist. Nevertheless, the most common type that has been demonstrated to be beneficial is lactic acid bacteria (LAB); additional probiotic bacteria include *Bifidobacteria*, *Saccharomyces*, *Bacillus*, *Enterococcus*. Among the most significant genera of lactic acid bacteria is *Lactobacillus*. The majority of the lactic acid bacteria, which are also naturally occurring components of the gastrointestinal tract, are used as starters in fermentation, especially for dairy products, is made up of microflora. Numerous microorganisms, including bacteria, molds, and yeasts, are present in raw milk. The primary microflora of milk is composed of lactic acid bacteria (LAB), which are unique among other organisms in that they can ferment milk sugars to make lactic acid. There are two types of lactic acid bacteria: heterofermenters and homofermenters. The main byproduct of the Homofermenters' fermentation of glucose is lactic acid. The heterofermenters create acetic acid, carbon dioxide, lactic acid, and ethanol. The products of the heterofermenters' fermentation of glucose include lactic acid, acetic acid, carbon dioxide, and ethanol. [5]. Lactic acid bacteria can be used as biopreservatives as an alternative to artificial food preservatives. They are regarded as widely accepted safe organisms that are suitable for use as probiotics in veterinary and medicinal settings. Friendly bacteria called *Lactobacillus* reside healthily in our genital, urinary, and digestive systems without harming us. Additionally, some fermented foods like yogurt and nutritional supplements include it. Probiotic strain selection frequently depends on factors like *Lactobacillus* strains' capacity to stick to intestinal mucosal surfaces and their subsequent long- or short-term colonization.

Adhesive probiotic *Lactobacilli* have been shown to provide health benefits, especially when it comes to preventing pathogen attachment to intestinal cell lines[6], [7]. In addition to treating cancer, canker sores, fever blisters, hives, and general digestive issues, *lactobacilli* also strengthen the immune system[8]. Numerous studies describe the efficacy of *Lactobacillus rhamnosus*, or a combination of *L. rhamnosus* and *L. acidophilus*, for the treatment of heart disease[9],[10], intestinal disease prevention, colon cancer prevention, and pediatric diarrhea. A commercial culture mixture derived from *Lactobacillus* species was found to have an antiproliferative effect on colon cancer-causing tumor cells [11]. Temperatures between 35°C and 40°C and pH values between 6.4 and 4.5 are ideal for *lactobacilli* growth. The idea that probiotics are beneficial is based on the understanding that intestinal flora protects humans from infections and that disruption of this flora can make people more susceptible to illnesses. Probiotics may help prevent intestinal infections. Probiotic bacteria produce organic acid, which lowers the pH of the gut environment and prevents the formation of infections. The immune system might be boosted by it. The gastrointestinal tract's epithelium lining provides a large surface area for molecular absorption while acting as a barrier to a range of foreign antigens that could enter the gut. Consumed lactic acid bacteria has been shown to have the capacity to modify certain features of acquired as well as natural immune responses. According to a report, lactic acid bacteria boost the synthesis of both non-specific and specific antibodies in order to enhance the immune system. Medical professionals are increasingly endorsing probiotics as advantageous therapeutic interventions for the management of digestive and immune system health. Although probiotics were initially identified at the start of the 20th century, in the last 20 years alone, the field has made significant scientific progress. Scholars have reached a consensus on a definition, initiated an understanding of numerous mechanisms of action, identified attributes crucial to probiotic activity, and acquired clinical evidence endorsing the health benefits and product quality of probiotics. However, there is still a need to inform healthcare professionals about the therapeutic use of probiotics as well as consumers about their importance in a balanced diet through concise, evidence-based messaging. It is thought that PCR-based genomic fingerprinting methods offer the best chance of identifying, classifying, and detecting lactic acid bacteria more quickly, consistently, and reliably. Rep-PCR, or PCR amplification of repetitive bacterial DNA elements, is a well-

Niranjan Lakshmi Narayana *et al.*,

established PCR-based technique that has been shown to be a reliable tool for typing and classifying a various Gram positive and Gram negative bacteria. Its low cost, high discriminatory power, and suitability for high strain throughput are among its many advantages. Beneficial bacterial species introduction has received a lot of attention lately since it can help maintain microbial balance and prevent disease. Strains intended for human usage should ideally be human-derived. Based on the finding that only human strains have the ability to stick together, and colonise the human gastrointestinal tract.

MATERIALS AND METHODS

Collection of Sample

Cheddar Cheese and milk samples were bought from a local market. They were kept aseptically. The cheddar cheese was weighed for 1gm and was mixed with sterilized distilled water in aseptic condition by using mortar and pestle. 1ml of milk sample was inoculated aseptically in a conical flask containing sterilized distilled water.

Isolation of Bacteria

1. Serial Dilution

Cheese Sample

The serial dilution procedure was carried and dilution was prepared. The water blank tubes were labelled with the corresponding dilutions it represents (10^{-1} to 10^{-7}). A sample of 10^{-1} was mixed with the first water blank (9 ml), designated 10^{-2} , after 99 milliliters of sterile water were used as a blank, and 1 milliliter of aseptically broken cheese was added. 1 ml sample from the 10^{-2} dilution is transferred to the next tube (10^{-3}) aseptically. The above step was continued up to 10^{-7} dilution [12].

Milk Sample

1 ml of the milk sample was aseptically added to 99 ml of sterile water, which served as a blank. The mixture was then labeled as 10^{-1} . 1 ml sample from 10^{-1} was mixed in the first (9ml) water blank labelled as 10^{-2} . 1ml sample from the 10^{-2} dilution is transferred to the next tube (10^{-3}) aseptically. The above step was continued up to 10^{-7} dilution [12].

Spread Plate Method

1ml of the sample from 10^{-4} to 10^{-7} was aseptically transferred to the petriplates containing sterilized solidified MRS agar. With the help of aseptic L-rod and rotator. Sample was spread all over the medium evenly by rotating the plate. After that, the plates were incubated for 48 hours at 37°C while inverted. The microbial colonies were formed in the petriplates. Then the microbial isolates were purified by pure culture techniques and refrigerated at 4°C in MRS agar slants for further studies.

Identification of Bacteria

Macroscopic Analysis

To determine the colony morphology, The MRS agar plates were streaked aseptically with the bacterial isolate that needed to be characterized. For 48 hours, the plates were incubated at 37°C in an inverted position. After proper incubation, the plates were observed for the colony morphology, color and results were recorded.

Microscopic Analysis

Gram's Staining

A nutrient broth tube was aseptically inoculated with the bacterial isolate that needed to be characterized. For twenty-four hours, the tubes were incubated at 37°C . Following the recommended incubation period, a loopful of bacteria was spread out on a sterile microscopic slide, allowed to air dry, heat-fixed, and exposed to crystal violet. (primary stain) staining for 20 seconds. It was followed by Gram's iodine (mordant) staining for one minute. After using ethyl alcohol to decolorize the stain, it was immediately cleaned with distilled water. Next, it was counter-

Niranjan Lakshmi Narayana *et al.*,

stained for 20 seconds with safranin, and it was once again cleaned with distilled water and alcohol. After the stained smear had dried, it was examined under a microscope, and the outcome was noted.

Motility Test

Bacteria were observed moving using the hanging drop method. A broth culture of the bacteria to be characterized was made and incubated for 12 hours. A tiny drop of the bacterial culture was positioned in the middle of the cover slip, and its four corners were coated with a thin layer of vaseline. A depression microscopic slide was placed over the cover slip in an inverted position (the concave surface facing down) and gently pressed. Then the cavity slide was turned upright and the culture remained suspended from the cover slip towards the centre of the depression microscopic slide. The preparation was observed under a microscope for analysing bacterial motility and the result was recorded.

Biochemical Tests

Indole Test

The bacterial isolate that needed to be described was aseptically added to a nutritional tryptone broth tube. For 24 to 48 hours, the tubes were incubated at 37°C. Upon adequate incubation, 1 milliliter of Kovac's reagent was introduced. Five minutes later, the outcome was noted and recorded.

Test For Methyl Red

Methyl red-vogesproskauer (MR-VP) broth tubes were sterilized and inoculated aseptically with the bacterial isolate that was going to be characterized. It was incubated for 24 to 48 hours at 37°C. Following the proper incubation period, 0.5 ml of alpha naphthol (Barritt's reagent-A) and 0.2 ml of potassium hydroxide (Barritt's reagent-B) were added, and the result was examined and recorded.

Test By Voges- Proskauer

After sterilizing MR-VP broth for 10 minutes at 121°C, the bacterial isolates were aseptically injected into it and cultured for 24 to 48 hours at 37°C. Add 0.5 ml of α -naphthol and 0.2 ml of KOH at the end of the incubation. After that, give the tube a gentle shake and let the medium stand for ten to fifteen minutes. The outcome was noted once it was witnessed.

Citrate Test

Simmon's citrate agar slant was aseptically injected with the bacterial isolate that needed to be described. For 24 to 48 hours, the tubes were incubated at 37°C. Following appropriate incubation, the outcomes were noted and examined.

Test of Catalase

Using a wooden applicator stick, the bacterial isolate to be described was applied to the glass slide's surface. Using a Pasteur pipette, one drop of 3% H₂O₂ was introduced to the culture, and bubble formation was seen.

Oxidase Test

After sterilizing and spreading the bacterial isolates over the Nutrient agar medium, they were transferred into sterile petriplates. Oxidase disc is placed in each plate after 24 hours of incubation and results are observed.

Triple Sugar Iron Test

TSI agar slants were prepared. The bacterial cultures were inoculated by stabbing down the center of the agar butt carefully. Withdraw the inoculating needle and then streaked the surface of the slant. Incubate the tubes at 37°C then the results were noted after 24 hours. Hydrogen sulphide production was indicated by the development of black color, yellow colour of the slant indicates a production due to lactose and sucrose fermentation.

Niranjan Lakshmi Narayana *et al.*,

Lactose Utilization

Following a 24-hour incubation period at 37°C, a little amount of phenol red was introduced to nutritional broth containing lactose to evaluate the color change. Lactose usage was measured by monitoring the medium's color change and utilizing the acid generation of bacterial cultures

Haemolytic Examination

Freshly generated isolates were streaked over blood agar plates to measure the haemolytic activity.

RESULTS

Isolation of Bacteria

After 24 hrs of incubation, the colonies were grown on the MRS agar plate. These colonies were preserved and used for further studies. Biochemical Characterization Of Bacterial Isolates From Milk And Cheese Sample By Bergey's Manual Of Determinative Bacteriology

Identification of Bacteria

Macroscopic Analysis

Different morphology of bacteria with small, round, white, translucent, pinpointed colonies were found on MRS agar media. (Plate 1).

Microscopic Analysis

Gram's Staining

The Gram staining nature of bacteria were performed and small cocci shape, The C1 colony contained gram-positive bacteria. Small, rod-shaped bacteria were discovered. Gram-positive bacteria were discovered in the M1 and C2 colonies. Gram-positive bacteria from the M2 colony were seen to be clumped together like cocci.

Motility Test

The motility nature of bacteria were identified by hanging drop. The microscopic observation reveals non-motile nature of bacteria in all the 4 test cultures.

Biochemical Tests

The isolated bacteria was identified using biochemical test series, macroscopic and microscopic inspection, and Bergey's manual of determinative bacteriology, which was ultimately used for confirmation. (Table 1,2,3 and 4) (Plate 3)

Indole Test

The indole test was used to determine whether microorganisms could convert the amino acid tryptophan to indole. The test cells were injected with tryptophan broth and incubated at 37°C for 24 hours. Following incubation, a few drops of Kovac's reagent were added to each culture tube. the lack of a cherry red coating, which indicates a subpar result.

Methyl Red Test

This experiment was designed to determine whether the microorganisms in the medium could withstand the acid and glucose produced during fermentation. At a pH of 4, the reddening of methyl red indicates positive findings. Due to a decreased hydrogen ion concentration, the indicator becomes yellow at pH 6, indicating a negative result but still showing acidity. After being injected into MR-VP broth, the test cultures were grown at 37°C for 24 hours. A few drops of methyl red indicator were applied to the test tube following the incubation period. The medium is still yellow, suggesting negative outcomes.

Niranjan Lakshmi Narayana *et al.*,

Voges-Proskauer Test

In this test, an organism's capacity to convert organic acids produced during glucose metabolism into neutral or non-acidic byproducts, including acetyl methyl carbine, is assessed. After being infused with MR-VP broth, the test cultures were cultured for 24 hours at 37°C. Each tube received one milliliter (ml) of Barritt's reagent B (potassium hydroxide) and three milliliters (ml) of Barritt's reagent A (α -naphthol). Positive outcomes are shown by brown color formation. There was no discernible change in hue, indicating a bad outcome.

Citrate Test

When fermentable glucose or lactose is available, some microorganisms can use citrate as a carbon source for energy. Instead of turning green, the test bacterial strains became blue by using the citrate in the medium, indicating a successful outcome (PLATE 6).

Test For Catalase

Catalase-producing organisms quickly convert hydrogen peroxide into water and oxygen. By the addition of 1 or 2 drops of hydrogen peroxide, the bacterial strains do not develop the formation of bubbles, which indicates the negative result.

Oxidase Test

To detect microorganisms that generate cytochrome c oxidase, utilize the oxidase test. If the color changes to blue within 15 to 30 seconds of the disc being introduced to the plates, the experiment is considered successful. If the color turns purple in two to three minutes, it is regarded as positive for delayed oxidase. In this case, the result is negative because the color does not change.

Triple Sugar Iron Test

A crimson slant with a yellow butt is indicative of a dextrose fermentation. A yellow butt and slant are signs of sucrose, lactose, or dextrose fermentation. A crimson butt and a red slant suggest that there is no carbohydrate fermentation occurring. As soon as the medium turns black, H_2 is present. Bubbles or fissures indicate the presence of gas. The four slants each show a crimson slant and a yellow butt, which represent the fermentation of dextrose.

Lactose Utilization

When the color shifts from red to yellow, the pH drops to an acidic level, which means lactose fermentation took place. The four tubes' colors changed from red to yellow after a 24-hour incubation period, successful outcome.

Hemolytic Test

Beta-haemolysis, or total hemolysis, is indicated by a transparent, clear zone encircling the colonies. The colonies are surrounded by a green, opaque zone that denotes alpha hemolysis (partial haemolysis). No formation of zones around the colonies were seen, results indicate Gamma-haemolysis (no haemolysis).

Haemolytic activity of Lactobacilli on blood agar medium

DISCUSSION

To apply their beneficial effect in the host, the probiotic organisms should survive the extreme pH condition during their transit in the host. The pH of the stomach varies from 1.0 to 3.0. It should also pass through the upper intestine which contains bile [13],[14]. The above said literature evidenced the presence of probiotic nature of bacteria were found in human intestine which are in accordance with the present study. Many foods, including spices pass through our stomach, the probiotic should have the capacity to withstand these obstacles. They should not cause any side effects, including the lysis of blood which could be fatal to human beings. Milk, cheese, and curd are products that contain a lot of probiotic organisms. Not only dairy products, but other types of food such as fruits may have probiotic

**Niranjan Lakshmi Narayana et al.,**

organisms. Bremer and Kramer (2000) stated that lactic acid bacteria must be able to withstand harsh environments like acidity, temperature, salt stress, and freeze-drying in order to be used industrially as starting cultures in cheese. Lactic acid bacteria have developed a variety of tolerance mechanisms to withstand NaCl, such as the uptake or synthesis of a restricted number of solutes. The similar findings were observed for this present study the isolated bacteria evidenced the tolerance of acidic content. In this study, an intestinal bacteria was isolated from milk product of cheese exhibited the biggest level of probiotic activity. It was supported by Mateus Costa (2015), in his study found that all the lactic acid bacteria were tolerant to NaCl concentration. In our study, the growth of isolate show a decrease in growth at different NaCl concentration. Djomme Victor Sieladie et al., (2011), discovered that of the 107 isolates examined, 66 had a low tolerance to acidic environments, 34 had a moderate tolerance, 1 had a very good tolerance, and 6 had an extraordinary tolerance. They also showed that, using a fast selective approach, 18 of the 41 lactobacilli isolates that showed at least good tolerance under acidic conditions were evaluated for acidity tolerance in citric acid, pH 3, after 5 hours. Fifteen of these isolates showed more than 50% survival after five hours in citric acid at 37°C, indicating a remarkable resistance to acidic conditions of pH 3.

CONCLUSION

The present study was carried out to isolate the potential probiotic lactic acid bacteria. From the total four bacterial isolates, one effective bacterial isolates were taken for the current study. Plating techniques, various biochemical tests and staining methods were performed for the species identification. To determine its probiotic characteristics, several techniques were carried. All the isolates showed a lactose utilization capacity which indicates their ability to ferment lactose. Their tolerance of inhibitory substances were tested. Their pH tolerance, NaOH tolerance, and their tolerance to ginger and garlic was tested. At pH 1, it shows a little growth, whereas a good growth was recorded at other pH (3,4,5 and 7). A decrease in growth was recorded at different NaOH concentrations. The C2 isolate does not tolerate the garlic substance as it decreased growth was noted when concentration increases. Against ginger, a slight decrease in growth was recorded. As spices are mixed with our food, its tolerance to ginger is found to be good when compared to garlic. The isolated bacteria was proved to be a probiotic due to its resistance to a low pH (3) environment. It is not a threat for the warm blooded organism as it does not show any sign of haemolysis and shows resistance to Penicillin. Hence, this study evidentially proved that lactic acid bacteria is an effective agent which can be prepared more easily especially as a homemade product, this *Lactobacillus* sp, confirms to be a probiotic. The public needs better awareness and information to make use of the microbiota for our day today

ACKNOWLEDGMENT

We would like to thank Malankara Catholic College, Kanyakumari district, for their timely help and support to complete the project work. We express our heartfelt thanks to the principal, the Management of Sri Ramachandra Faculty of Pharmacy, Sri Ramachandra Institute of Higher Education and Research, Porur, Chennai.

ABSTRACT

Polycystic Ovarian Disease (PCOD) is a multifactorial endocrinological disease characterized by the arrest of follicular maturation, resulting in the accumulation of multiple immature follicles that develop into ovarian cysts. A central pathophysiological feature in PCOD is hyperandrogenism, which disrupts folliculogenesis, contributes to cyst formation, and precipitates chronic an ovulation and menstrual irregularities. PCOD often presents with a psychosomatic dimension. Homeopathy approaches disease from a holistic standpoint, asserting that the illness affects the individual as a whole, not merely isolated organs or systems. According to homeopathic philosophy, pathological changes in tissues occur only after prior disturbances at a functional or vital level. Hence, individualized treatment—encompassing both physical symptoms and mental-emotional constitution—is fundamental to the therapeutic process.

Keywords: Polycystic Ovarian Disease, Homeopathy, Randomized Controlled Trial, Individualized Therapeutics, Constitutional Prescribing, Integrative Medicine

INTRODUCTION

This single-blinded, placebo-controlled clinical trial was undertaken at the outpatient department of Sainath Hospital, affiliated with Ahmedabad Homoeopathic Medical College under Parul University. The study was conducted over a duration of 24 months and included 100 female subjects previously diagnosed with PCOD. The

**Shital Shah and Munjal Thakar**

study aimed to compare the clinical outcomes of individualized homeopathic treatment versus placebo, with both groups adhering to uniform lifestyle modification protocols. For Group A, the indicated remedy (simillimum) was selected based on the complete totality of symptoms along with lifestyle modification. Group B received placebo with identical lifestyle guidance.

Objectives

- 1.To assess the therapeutic efficacy of individualized homeopathic medicines in patients diagnosed with PCOD.
- 2.To examine treatment outcomes, evaluation criteria, and therapeutic strategy using constitutional homeopathic medicines in PCOD management.

MATERIALS AND METHODS

Study Site The trial was conducted at Sainath Hospital attached with Ahmedabad Homoeopathic Medical College, Parul University.

Duration 24 months

Study Type Single-Blinded, Placebo-Controlled Clinical Trial

Design Prospective, comparative clinical study

Sample Siz :100 participants

Sampling Method Randomization was achieved using the odd-even method in a Microsoft Excel-generated sequence. Participants were equally divided into two groups

- **Group A (Intervention Group)** Received individualized constitutional homeopathic remedies along with lifestyle modification
- **Group B (Control Group)** Received placebo with the same lifestyle modification advice

Eligibility Criteria

- Inclusion
 - Females aged 15–35 years with a confirmed diagnosis of PCOD by a registered gynecologist
- Exclusion
 - Patients diagnosed with diabetes mellitus, Cushing's syndrome, hyperprolactinemia, hypo/hyperthyroidism, congenital adrenal hyperplasia, ovarian/adrenal neoplasms, ovarian hyperthecosis, or renal dysfunction
 - Pregnant or lactating women

Withdrawal Criteria

- Participants who discontinued therapy, failed to adhere to follow-up protocols, or showed prolonged amenorrhea without clinical progression were excluded.

Data Collection

Data were gathered through classical case-taking in accordance with §83–104 of *Organon of Medicine* by Dr. Samuel Hahnemann.

Case Management Process Each case was evaluated using a structured approach

- Comprehensive case history
- Symptom recording and interpretation
- Symptom analysis and evaluation
- Diagnostic formulation

**Shital Shah and Munjal Thakar**

- Erection of totality
- Case synthesis
- Repertory selection (Complete Repertory via Zomeo software)
- Repertorial analysis and final prescription

Remedy Selection Based on the individualized totality of symptoms using homeopathic therapeutic principles.

Potency Selection Chosen as per clinical requirement in line with homeopathic posological guidelines.

Mode of Administration Oral

Dosage and Repetition Determined individually as per homeopathic principles mentioned in the *Organon of Medicine*.

Lifestyle Interventions Lifestyle advice was uniform across both groups and included

- 45–60 minutes of aerobic activity daily for women under 30 years of age
- 45–60 minutes of walking for those above 30 years
- Avoidance of high glycemic index foods, deep-fried items, processed food, sugary beverages, alcohol, and tobacco

Follow-up and Outcome Assessment Clinical monitoring and outcome assessment were based on

- Serum testosterone, LH, FSH levels and FSH:LH ratio
- Ferriman-Gallwey score
- Global Acne Grading System
- Menstrual cycle regularity

Evaluations were conducted at baseline and repeated after six months of therapeutic intervention.

Outcome Assessment Criteria

The clinical outcomes in PCOD cases were evaluated based on a predefined set of objective and subjective parameters. Patient responses were categorized into five distinct groups

• Marked Improvement

Patients reported a comprehensive sense of mental and physical well-being following the intervention period. Clinically, there was resolution or notable improvement in presenting symptoms. Menstrual cycles became regular, occurring every 28–35 days. Biochemically, the FSH:LH ratio normalized to approximately 1:1. Ferriman-Gallwey scores were ≤ 10 , acne severity scores were < 12 , and transabdominal or transvaginal sonography revealed no follicular cysts. Ovarian volume was ≤ 10 cc in either ovary, and serum testosterone levels showed a statistically and clinically significant reduction compared to baseline values.

• Moderate Improvement

Patients experienced noticeable symptomatic relief and improved overall well-being. Menstrual intervals ranged from 30–45 days. The FSH:LH ratio was reduced to approximately 1:2 or 1:3. The Ferriman-Gallwey score remained ≤ 10 , acne scores stayed < 12 , and ultrasonography showed a few persistent small cysts. Ovarian volume was observed between 10–13 cc. Serum testosterone levels demonstrated substantial improvement from baseline.

• Mild Improvement

Patients showed partial symptomatic relief, with menstrual cycles extending to 45–60 days. The FSH:LH ratio decreased to approximately 1:3. Hirsutism grading using the Ferriman-Gallwey score was ≤ 15 , and acne scores were < 18 . Ultrasound findings included the presence of multiple small or large cysts, with ovarian volume exceeding 15 cc in one or both ovaries. Serum testosterone levels showed minimal reduction relative to initial levels.

**Shital Shah and Munjal Thakar****• No Clinical Change (Status Quo)**

No subjective or objective improvement was noted over the study period. The menstrual cycle frequency remained unchanged, FSH:LH ratio and serum testosterone levels persisted at pre-treatment values, and there was no observable difference in Ferriman-Gallwey score, acne grading, or ultrasonographic parameters such as follicle count or ovarian volume.

• Treatment Discontinuation

• This category included participants who exited the study prematurely due to unspecified reasons or were lost to follow-up. Additionally, it included cases where no clinical or biochemical improvement was observed and, instead, progression to prolonged amenorrhea occurred despite completion of the intervention phase.

Statistical Analysis

The statistical evaluation of pre- and post-treatment variables was performed using the paired t-test. A p-value < 0.05 was considered indicative of statistically significant outcomes.

RESULTS

1. Age: The age group 15-20 years reported 25 cases (25%); 21-25 years reported 32 cases(32%); 26-30 years reported 31 cases (31%) whereas age group 31-35 reported 12 cases. (12%)
2. Occupation: In the study, 59 cases (59%) were students; 25 cases (25%) were working women whereas 16 cases (16%) were housewives.
3. Socio-economic status: In the study, 36 patients (36%) belonged to upper socio-economic class; 29 patients (29%) in upper middle class; 24 patients (24%) in lower middle class whereas 11 cases (11%) belonged to lower socio-economic class.
4. Miasm: In the study, 4 cases (4%) belonged to psora miasm; 78 cases (78%) had sycosis miasm; 6 cases (6%) had syphillis miasm whereas 12 cases (12%) had psora-syphillis miasm in background.
5. Hereditary history: In the study, 67 cases (67%) showed presence of family history of PCOD whereas 33 cases (33%) showed absence of family history for PCOD.
6. Lifestyle: In the study out of 100 cases of PCOD, 87 cases (87%) were observed of having sedentary lifestyle whereas 13 cases (13%) were observed of having active lifestyle.
7. Serum LH Levels: The p-value for serum LH levels in cases belonging to medicinal group for 41 cases was 1.46995E-09 whereas p-value for 34 cases belonging to placebo control group was 0.266966.
8. Duration of amenorrhea: The p-value for duration of amenorrhea in cases belonging to medicinal group was 5.30974E-17 whereas p-value for cases belonging to placebo control group was 0.325921.
9. Serum Testosterone Levels: The p-value for serum testosterone levels in cases belonging to medicinal group for 41 cases was 2.54068E-14 whereas p-value for 34 cases belonging to placebo control group was 0.253448.
10. Ferriman-gallwey Score: The p-value for Ferriman-gallweyscore in cases belonging to medicinal group was 3.75628E-21 whereas p-value for cases belonging to placebo control group was 0.066853.
11. Global Acne Grading Score: The p-value for Global Acne Grading score in cases belonging to medicinal group for 41 cases was 5.11389E-11 whereas p-value for 34 cases belonging to placebo control group was 0.073483.
12. Treatment outcome in Medicinal Group: From the 50 patients belonging to the medicinal group, 8 patients demonstrated noteworthy improvement (16%), 11 patients exhibited moderate improvement (22%), 17 patients (34%) showed mild improvement, while 9 patients discontinued treatment, and 5 patients (10%) displayed no improvement at the conclusion of the research study.
13. Treatment outcome in Placebo control Group: In the placebo-controlled group, no patient showed significant, moderate or mild improvement whereas 34 patients exhibited no indications of improvement, while 16 patients discontinued the study due to various reasons.

**Shital Shah and Munjal Thakar**

DISCUSSION

1. PCOD was most commonly observed in middle age group with 32 cases (32%) in 21-25 years and 31 cases (31%) in 26-30 years of age group. It was least observed in age group 31-35 years i.e. 12 cases (12%).
2. The maximum number of patients i.e. 59 cases (59%) in the study were students whereas least cases were housewives i.e. 16 cases (16%).
3. In the study, maximum patients were from to upper socio-economic class i.e. 36 patients (36%) whereas the lowest number of patients belonged to lower socio-economic class i.e. 11 cases (11%).
4. The maximum cases of PCOD were observed of having sycosis miasm in background i.e. 78 cases (78%) where as minimum cases belonged to psora miasm i.e. 4 cases (4%).
5. Out of 100 cases, 67 cases (67%) showed presence of family history of PCOD whereas 33 cases (33%) showed absence of family history for PCOD.
6. In the study, 87 cases (87%) were observed of having sedentary lifestyle whereas 13 cases (13%) were observed of having active lifestyle.
7. The p-value for serum LH levels in cases belonging to medicinal group was 1.46995E-09 whereas p-value for cases belonging to placebo control group was 0.266966. As the p-value is <0.05 in medicinal group and >0.05 in placebo control group, it shows significant result in medicinal group and not significant in placebo control group.
8. The p-value for duration of amenorrhea in cases belonging to medicinal group for 41 cases was 5.30974E-17 whereas p-value for 34 cases belonging to placebo control group was 0.325921. As the p-value is <0.05 in medicinal group and >0.05 in placebo control group, it shows significant result in medicinal group.
9. The p-value for serum testosterone levels in cases belonging to medicinal group was 2.54068E-14 whereas p-value for cases belonging to placebo control group was 0.253448. As the p-value is <0.05 in medicinal group and >0.05 in placebo control group, it shows significant result in medicinal group and not significant in placebo control group.
10. The p-value for Ferriman-gallweyscore in cases belonging to medicinal group for 41 cases was 3.75628E-21 whereas p-value for 34 cases belonging to placebo control group was 0.066853. As the p-value is <0.05 in medicinal group and >0.05 in placebo control group, it shows significant result in medicinal group.
11. The p-value for Global Acne Grading score in cases belonging to medicinal group was 5.11389E-11 whereas p-value for cases belonging to placebo control group was 0.073483. As the p-value is <0.05 in medicinal group and >0.05 in placebo control group, it shows significant result in medicinal group and not significant in placebo control group.
12. In medicinal group out of 50 patients, highest patient demonstrated mild improvement, i.e. 17 patients (34%), followed by 11 patients showing moderate improvement (22%) and 8 patients demonstrated noteworthy improvement (16%). The least number of patients, i.e. 5 patients (10%) displayed no improvement.
13. In the placebo-controlled group, out of 50 patients, no patient showed significant, moderate or mild improvement. 34 patients exhibited no indications of improvement, while 16 patients discontinued the study.

CONCLUSION

1. The commonest mean age for diagnosed cases of PCOD in India is 18-20 years but in study it was found that maximum patient were between 21-30 years of age.
2. Most patients diagnosed in study were students.
3. PCOD cases were more observed in higher and upper middle socio-economic class, thus the lifestyle with respect to socio-economic status can be one of the important causative factor for PCOD.
4. On miasmatic evaluation it was found that more than one-third of cases in the study had sycotic miasm in background. Thus it can be deduced that PCOD is disease of Sycotic miasm origin.
5. Maximum patient had positive family history of PCOD hence it can be considered as hereditary disorder transferred genetically.
6. PCOD can be considered as a lifestyle disorder as history of sedentary lifestyle has been found in most of patients. Hence lack of exercise can be considered as one of the important etiological factor in genesis of the

Shital Shah and Munjal Thakar

disease and strict lifestyle modification is must along with individualized homoeopathic medicine for treatment of the disease.

7. All the patients enrolled in the study were present with disturbed serum LH and testosterone levels, hirsutism, acne vulgaris, multiple cysts in ovaries and variable duration of amenorrhoea were divided into medicinal and control groups randomly but the outcomes in medicinal group were more significant as compared to placebo control group that establishes the positive role of individualized homoeopathic medicines in cases of PCOD.
8. On detailed analysis of case taking of each case enrolled, conducted on physical, mental and emotional plane, some of the commonest triggering factors were found to be present in most of the cases like suppressed sexual desire, sensitive to criticism, discord between family, disappointed love, sensitivity to injustice, work stress along with improper life habits like junk food and sleep disturbances. Hence individualized homoeopathic medicines were prescribed in higher potencies and inter-current medicines or mother tinctures were not used as the Theory of chronic disease by master Hahnemann was strictly followed in the study

Hence, it can be established that individualized homoeopathic medicines along with lifestyle modification is most effective in treatment of PCOD.

ACKNOWLEDGEMENTS

The author want to thank research guide Dr. Munjal Thakar for his guidance and support throughout the study. . This research work was supported by the Ahmedabad Homoeopathic Medical College and Sainath Hospital, affilitated by Parul University. She also extends her gratitude towards her students that helped in compilation of research work and family for unwavering support throughout the study.

ABSTRACT

This research examines the creation, construction, and comparative efficiency of an indirect solar dryer for okra (*Bhindi*) and sapota (*Chikoo*), designed to provide a practical solution for farmers. The dryer leverages solar energy to maintain a controlled drying environment, thereby enhancing drying efficiency and quality. The study outlines the design process, materials used, and construction of the solar dryer. Performance evaluations were carried out to compare the drying rates and product quality of okra and sapota using the solar dryer against traditional sun drying methods. The results demonstrate significant improvements in drying time, moisture removal, and overall quality of the dried produce. These findings suggest that the indirect solar dryer is a viable, sustainable alternative for farmers, offering a more efficient and effective drying method compared to conventional practices.

Keywords: Solar Dryer, Indirect dehydration, Fruits Chikoo, Okra

INTRODUCTION

The drying of agricultural produce is a critical post-harvest process that extends the shelf life and preserves the quality of fruits and vegetables. Okra (*Bhindi*) (*Abelmoschus esculentus*) and sapota (*Chikoo*) (*Manilkara zapota*) are two widely cultivated crops in Valsad and nearby region, that can benefit significantly with these effective low-cost solar drying techniques. Traditional sun drying, while commonly practiced, often results in inconsistent quality, long

**Bhadreshkumar Rameshbhai Sudani**

drying times, and potential contamination. To address these issues, this study explores the design, development, and comparative performance evaluation of an indirect solar dryer tailored for drying okra and sapota. Solar drying is a well-established technique that utilizes renewable solar energy to enhance the drying process of agricultural products. Indirect solar dryers, in particular, provide distinct benefits including the ability to maintain better control over the drying environment and safeguard the produce from external contaminants (El-Sebaai&Shalaby, 2012). Research has shown that solar dryers are effective in maintaining the nutritional value and sensory characteristics of dried agricultural goods, ensuring higher quality preservation compared to traditional methods (Misha *et al.*, 2013; Dissa *et al.*, 2009). The concept of indirect solar drying has been explored in various contexts. For instance, El-Sebaai and Shalaby (2012) reviewed different types of solar dryers and emphasized the potential of indirect solar dryers in achieving higher drying rates and better product quality. Similarly, Dissa *et al.* (2009) investigated the drying characteristics of okra using a solar dryer and reported significant improvements in drying efficiency and product quality. In the context of sapota drying, El-Beltagy *et al.* (2007) compared the effects of solar drying and traditional drying methods on the quality of dried sapota.

Their findings indicated that solar drying not only reduced drying time but also preserved the nutritional and sensory properties of the fruit more effectively. Hii *et al.* (2012) also explored the drying kinetics of sapota using a hybrid solar dryer and found that the method significantly enhanced drying rates while maintaining high-quality standards. Moreover, the design and optimization of solar dryers have been subjects of extensive research. Fudholi *et al.* (2010) discussed various design considerations for solar dryers, including material selection and thermal performance optimization, which are crucial for achieving efficient and uniform drying. Bolaji and Olalusi (2008) analyzed the performance of a mixed-mode solar dryer and demonstrated its effectiveness in drying agricultural produce under different climatic conditions. Forson, F. K., Nazha, M. A. A., Rajakaruna, H., & Akuffo, F. O. (2007) examined the design of mixed-mode natural convection solar crop dryers, demonstrating their effectiveness in various climatic conditions. Their research provided practical guidelines for designing efficient solar dryers. Hossain, M. A., & Bala, B. K. (2007) studied the drying of hot chili using a solar tunnel dryer, highlighting the advantages of solar drying in terms of efficiency and product quality. Sharma, A., Chen, C. R., & Lan, N. V. (2009) reviewed solar-energy drying systems, discussing various designs and their applications in agricultural drying. Their work provided a comprehensive overview of the potential and challenges of solar drying technologies. Overall, the research aims to provide a scientific basis for improving the efficiency and effectiveness of drying sapota using a hybrid solar dryer, contributing to better resource utilization and product quality in agricultural and food processing industries, rates and quality maintenance, reinforcing the benefits of hybrid solar drying methods. This study builds on existing research by developing an indirect solar dryer specifically for okra and sapota in Valsad, Gujarat. The dryer is designed to leverage solar energy efficiently, ensuring a controlled and hygienic drying environment. The performance of the developed dryer is evaluated against traditional sun drying methods, focusing on drying time, moisture removal, and product quality.

MATERIALS AND METHODS

Study Location

The study was conducted in Valsad, Gujarat, India, a region known for its agricultural productivity particularly in fruits like mango and chikoo along with vegetables like okra and brinjal. The climate of Valsad is suitable for solar drying due to its moderate to high solar insolation (Jamil and Others, 2016)(Lopez, 2016) and relatively hot and humid during most parts of the year(Karakoti and Das, 2014) which provides optimal conditions for solar drying (Sharma, Chen, & Lan, 2009).

Design of the Indirect Solar Dryer

The indirect solar dryer was designed to efficiently harness solar energy while providing a controlled environment to improve drying quality and efficiency for selected materials. The dryer consists of three main components: a solar collector, a drying chamber, and air outlet for removing wet air from the chamber, which is call moisture removing

**Bhadreshkumar Rameshbhai Sudani**

system. For the preparation of low cost solar dryer following materials were used. AxaBlade, Hammer, Nails, Wooden sheet, Plywood, SS net, hard Board, Black paint, Painting brush, thinner, 63 mm PVC pipe, waste soft drink tins, sand paper, silicone tube, glass for collector.

Solar Collector

The solar collector was constructed using waste soft drink tins (6 pcs x 7 pcs = 42), making them hollow from both the sides and arranging them in a row like a pipe and then black-painted to absorb maximum solar radiation. The collector dimensions were 135 cm x 45 cm, inclined at 30-45 degrees to optimize solar energy capture (Sudani, 2024) (Figure-1).

Drying Chamber

The box type drying chamber 70 cm x 62.5 cm x 62.5 cm was made of wooden material, consists of four treys made of wooden frames and food-grade stainless steel net with dimensions 57.5 cm x 57.5 cm x 2.5 cm. These trays are placed to allow uniform air distribution around the products approx. 2.5 cm of space was kept outside the all treys for good air circulation inside it. . The chamber was insulated with sun mica sheets and foam to minimize heat loss.

Humid air exhaust system

The air ventilation pipe (1.5 m) is essential for maintaining optimal airflow within the solar dryer. By harnessing natural convection, where heated air rises, the ventilation pipe facilitates a continuous circulation throughout the drying chamber. This process ensures that moist air is consistently replaced with drier air, thereby improving drying efficiency. Moreover, as moisture evaporates from the drying products like fruits, vegetables, or grains, the ventilation pipe expels this moisture-laden air from the chamber. This prevents saturation within the dryer, maintaining an environment conducive to effective moisture removal and ensuring efficient drying. In short, the air ventilation pipe in a solar dryer is essential for creating and maintaining a conducive drying environment by facilitating airflow, removing moisture-laden air, regulating temperature, and preventing spoilage. It plays a critical role in ensuring effective and efficient drying of various agricultural products.

Experimentals**Sample Preparation**

Okra (*Abelmoschus esculentus*) it also known as *Bhindi* and sapota (*Manilkara zapota*) sourced from local farms known as *Chikoo* in Valsad underwent following several steps to prepare them for drying process.

Cleaning

Both okra and sapota fruits underwent a thorough wash with clean water to eliminate any soil and impurities. This step is crucial to ensure the cleanliness of the final dried product and to remove surface microorganisms that could impact the drying process and product quality.

Moisture Removal

After washing, the fruits were gently dried with paper towels to eliminate excess surface moisture. This step is critical to prevent prolonged initial drying, which can occur if the samples retain too much moisture.

Slicing Okra

Okra pods were sliced into uniform pieces, each 5mm thick. Uniform slicing is essential for proper even drying, preventing some slices from under-drying while others over-dry. The 5mm thickness was chosen based on previous studies demonstrating its effectiveness for solar drying of okra (Doymaz, 2005).

Slicing Sapota

Similarly, sapota fruits were sliced into pieces 3mm thick. Consistent slicing ensures uniform drying and helps maintain the quality of the dried product. The 3mm thickness was selected to optimize drying time and product quality, supported by prior research on drying kinetics (Goyal et al., 2007).

**Bhadreshkumar Rameshbhai Sudani**

Following these preparations, the okra and sapota slices were ready for drying. The drying process was conducted using both a newly developed indirect solar dryer and traditional sun drying methods to allow for comparative evaluation.

Drying Process**Indirect Solar Drying**

The prepared slices were placed on perforated trays inside the drying chamber of the indirect solar dryer. The dryer was operated between 9 AM and 4 PM to take advantage of peak sunlight hours. The temperature within the drying chamber was monitored and maintained between 50°C and 60°C, which is optimal for drying without degrading the nutritional quality of the products (El-Sebaii&Shalaby, 2012). The air circulation system ensured a consistent flow of hot air over the samples, facilitating uniform drying.

Traditional Sun Drying

For comparative purposes, equal quantities of okra and sapota slices were spread out on clean, flat surfaces exposed to direct sunlight. These samples were turned periodically to ensure even exposure to the sun. The ambient temperature during sun drying ranged from 30°C to 35°C. The sun drying process continued until the samples reached a stable weight, indicating that the desired moisture content had been achieved.

Data Collection and Analysis**Moisture Content**

Initially, the samples' moisture content was assessed using a digital moisture analyser. The measurements were recorded as a percentage on a wet basis, following established methods (Hossain&others, 2015).

Drying Time

The duration required for drying under each method was carefully monitored from the beginning until the samples achieved a consistent weight.

Quality Evaluation

The evaluation encompassed both nutritional and sensory aspects of the dried products. Vitamin C content was determined using titration techniques. For sensory evaluation, a panel consisting of five persons from different departments assessed attributes such as colour, texture, and taste of the dried samples, drawing upon methods from relevant literature (Bala, 2017 and Barrett, 2010).

RESULTS AND DISCUSSION

During this study the following tables summarize the results of the drying experiments for okra and sapota using both the indirect solar dryer and traditional sun drying methods. The data includes drying time, initial and final moisture content (Table-1), vitamin C retention (Table-2), and sensory evaluation scores (Table-3). Table-1 presents data on the drying time and moisture content of okra and sapota dried using two methods: indirect solar drying and traditional sun drying. The table includes the drying time in hours, the initial moisture content as a percentage, and the final moisture content as a percentage for each method. Table-2 presents the data on the retention of vitamin C in okra and sapota after being dried using two different methods: indirect solar drying and traditional sun drying. The table lists the initial and final vitamin C content measured in milligrams per 100 grams (mg/100g) of the produce and the percentage retention of vitamin C for each drying method. Table-3 provides the sensory evaluation scores for okra and sapota dried using two methods: indirect solar drying and traditional sun drying. The sensory attributes evaluated include color, texture, taste, and overall acceptability. Each attribute is rated on a scale from 1 to 10, with 10 being the highest score, indicating superior quality.

**Bhadreshkumar Rameshbhai Sudani****Drying Time**

The results show a significant reduction in drying time when using the indirect solar dryer compared to traditional sun drying. The solar dryer reduced the drying time for okra to 8 hours and for sapota to 10 hours, while sun drying required 20 and 24 hours, respectively. The controlled environment of the solar dryer, which maintains a consistent higher temperature and airflow, facilitates faster moisture evaporation.

Moisture Content

The final moisture content of products dried with the solar dryer is consistently lower than those dried using sun drying. Lower final moisture content is crucial for preserving the dried products, preventing microbial growth, and extending shelf life. For okra, the final moisture content was reduced to 10% with the solar dryer versus 15% with sun drying. For sapota, the final moisture content was 12% with the solar dryer compared to 18% with sun drying.

Nutritional Quality (Vitamin C Retention)

The okra dried using the indirect solar method retains a high percentage of its initial vitamin C content. The controlled drying environment minimizes nutrient degradation, resulting in final vitamin C retention of 86.32%. This indicates that the solar drying process effectively preserves the nutritional quality of the okra. In contrast, the traditional sun drying method results in a lower retention of vitamin C, at 70.08%. The exposure to direct sunlight and longer drying times likely contribute to the greater loss of vitamin C compared to the indirect solar drying method. For sapota, the indirect solar drying method again proves to be effective in preserving vitamin C. The final retention of 76.21% indicates that the drying process is gentle enough to maintain most of the nutrient content. The sun drying method results in a more significant loss of vitamin C for sapota, with retention of only 61.08%. Similar to okra, the longer exposure to direct sunlight and uncontrolled environmental conditions contribute to the degradation of vitamin C. The data clearly demonstrates that the indirect solar drying method is superior to traditional sun drying in terms of preserving the vitamin C content in both okra and sapota. The controlled environment within the solar dryer reduces the exposure to factors that cause nutrient degradation, such as excessive heat and direct UV radiation. This results in higher retention of vitamin C, which is crucial for maintaining the nutritional quality of the dried products.

Sensory Evaluation Scores

The okra dried using the indirect solar method received high sensory evaluation scores across all attributes. The colour score of 9.5 indicates that the okra maintained a vibrant and appealing appearance, likely due to the controlled drying conditions that prevent discoloration. The texture score of 8.5 suggests that the okra retained a desirable firmness and crispness. The taste score of 8.5 reflects that the flavour was well-preserved and appealing. Overall acceptability, at 9.0, shows that the combined attributes make the solar-dried okra highly preferable. Okra dried using traditional sun drying scored lower in all sensory attributes. The color score of 7.5 indicates some degree of discoloration, which is common with longer exposure to direct sunlight. The texture score of 7.0 suggests that the okra may have become either too tough or too soft in certain areas. The taste score of 7.5 indicates that the flavor was somewhat compromised. The overall acceptability score of 7.5 reflects a moderate level of preference. Sapota dried using the indirect solar method also received high scores. The color score of 9.0 suggests that the sapota retained a natural and appealing color. The texture score of 8.5 indicates a desirable consistency. The taste score of 9.5 is particularly high, reflecting excellent flavor retention, likely due to the gentle drying process. The overall acceptability score of 9.0 indicates that the solar-dried sapota was highly favored by the evaluators. The sensory scores for sapota dried using traditional sun drying are noticeably lower. The color score of 8.0 is relatively good but suggests some discoloration. The texture score of 6.5 indicates a less desirable consistency, possibly due to uneven drying. The taste score of 6.0 suggests significant flavor loss or development of off-flavors. The overall acceptability score of 7.0 shows that the sun-dried sapota was less preferred compared to the solar-dried sapota. The sensory evaluation data clearly show that the indirect solar drying method produces superior results in terms of color, texture, taste, and overall acceptability for both okra and sapota. The controlled drying environment of the solar dryer helps maintain the natural qualities of the produce, resulting in higher sensory scores.

**Bhadreshkumar Rameshbhai Sudani**

CONCLUSION

The superior performance of the indirect solar dryer in terms of both drying time and moisture reduction highlights its potential benefits for improving the quality, efficiency, and economic value of dried agricultural products. By adopting solar drying technology, farmers and processors in Valsad, Gujarat, can achieve better preservation outcomes and higher marketability for their produce. The indirect solar dryer demonstrates significant advantages over traditional sun drying methods. It reduces drying time, lowers final moisture content, better preserves nutritional quality, and improves sensory characteristics of dried okra and sapota. This technology offers a sustainable and efficient solution for farmers in Valsad, Gujarat, enhancing the quality and market value of their dried agricultural produce. Farmers and food processors can benefit from adopting indirect solar drying techniques to improve the quality and nutritional value of dried fruits and vegetables, thereby enhancing their marketability and consumer appeal. Adopting indirect solar drying can significantly enhance the quality and consumer appeal of dried products, leading to better marketability and potentially higher profits. The improved sensory qualities can also contribute to a better nutritional profile and longer shelf life, further adding value to the dried produce.

ACKNOWLEDGEMENT

The author sincerely expresses gratitude to the Head of the Chemical Engineering Department and the Principal of Government Engineering College, Valsad, for their motivation and guidance. Acknowledgment is also extended to all colleagues, subject teachers, the store officer, non-teaching staff, and students of the department for their support and active involvement.

ABSTRACT

Trichosanthes dioica and *Capsicum annuum* are traditionally used in Indian medicine for treating metabolic and inflammatory disorders. However, detailed pharmacognostic evaluation and antioxidant potential of specific parts such as the fruits and seeds remain underexplored. To evaluate the pharmacognostic characteristics and in vitro antioxidant activity of ethyl acetate extracts of *T. dioica* fruits and *C. annuum* seeds. Plant materials were collected, authenticated, and extracted with ethyl acetate. Macroscopic and microscopic features were documented. Phytochemical screening and physicochemical tests were performed. Antioxidant activities were evaluated using DPPH radical scavenging, reducing power, total phenolic content (TPC), and total flavonoid content (TFC) assays. Both extracts revealed significant presence of flavonoids, phenols, and tannins. DPPH assay showed potent scavenging activity with IC₅₀ values close to that of ascorbic acid. Reducing power and TPC/TFC values confirmed high antioxidant potential. Ethyl acetate extracts of *T. dioica* and *C. annuum* show promising antioxidant activity, justifying their traditional medicinal use and supporting further phytochemical and pharmacological exploration.

INTRODUCTION

Medicinal plants have long been integral to traditional healthcare systems and remain essential sources in the discovery of novel therapeutic agents [1]. Ethnomedicinal plants, in particular, hold immense value due to their historical usage in folk medicine, which often reflects potential pharmacological activity [2]. Scientific validation of these traditional remedies through pharmacognostic and phytochemical studies is crucial in identifying bioactive constituents with therapeutic relevance [3]. *Trichosanthes dioica* Roxb. (family: Cucurbitaceae), commonly known as pointed gourd, is a perennial climber extensively cultivated in the Indian subcontinent [4,5]. It is traditionally employed in managing various ailments such as fever, diabetes, bronchitis, and dermatological conditions [6]. Previous studies have reported the presence of flavonoids, saponins, and phenolic compounds in the plant, supporting its antioxidant, hepatoprotective, and antidiabetic activities [7,8]. *Capsicum annum* L. (family: Solanaceae), widely known for its culinary and medicinal uses, is another ethnomedicinal plant of interest [9,10]. Traditionally, it has been used for the treatment of pain, rheumatism, and digestive disorders [11]. It is a rich source of phytoconstituents including capsaicinoids, carotenoids, flavonoids, and vitamin C, which contribute significantly to its antioxidant capacity [12]. Oxidative stress, caused by an imbalance between reactive oxygen species (ROS) and antioxidant defenses, is a major contributor to the development of various chronic diseases such as cancer, cardiovascular disorders, and neurodegenerative conditions [13,14]. Consequently, the search for natural antioxidants from plant sources has gained substantial attention [15,16]. In light of the above, the present study was undertaken to perform a detailed pharmacognostic characterization and evaluate the in vitro antioxidant potential of *Trichosanthes dioica* and *Capsicum annum*. The findings aim to scientifically support their traditional use and explore their relevance as sources of natural antioxidants for therapeutic applications.

MATERIALS AND METHODS

Preparation of Plant Extracts

The collected plant materials (fruits of *T. dioica* and seeds of *C. annum*) were washed, shade-dried for 10–12 days, and ground into coarse powder using a mechanical grinder. The powdered materials were extracted with ethyl acetate using a Soxhlet apparatus for 6–8 hours [17,18]. The extracts were filtered and concentrated under reduced pressure using a rotary evaporator, and the residues were stored at 4°C in airtight containers for further analysis [19,20].

Preliminary Phytochemical Screening

The ethyl acetate extracts were subjected to qualitative phytochemical screening for alkaloids, flavonoids, tannins, phenols, glycosides, terpenoids, steroids, and saponins using standard procedures described by Harborne [21] and Kokate [22].

Total Phenolic Content (TPC)

TPC was quantified using the Folin-Ciocalteu method [23]. Gallic acid was used as the standard, and results were expressed in mg of gallic acid equivalents (GAE) per gram of extract.

Total Flavonoid Content (TFC)

TFC was estimated using the aluminum chloride colorimetric method [24], and results were expressed as mg quercetin equivalents (QE) per gram of extract.

In Vitro Antioxidant Assays

DPPH Free Radical Scavenging Assay

The antioxidant potential was assessed using the 2,2-diphenyl-1-picrylhydrazyl (DPPH) assay [25]. Various concentrations (25–200 µg/mL) of the extracts were mixed with 0.1 mM DPPH in methanol and incubated in the dark

**Rejwan Ahmed Choudhury and Mrinmoy Basak**

for 30 minutes. Absorbance was measured at 517 nm using a UV-Vis spectrophotometer. Ascorbic acid served as the reference standard. Percentage inhibition was calculated, and IC₅₀ values were determined [26].

RESULTS AND DISCUSSION**Preliminary Phytochemical Screening*****Trichosanthes dioica* Roxb. (EATD)**

Preliminary phytochemical screening of the ethyl acetate fraction of *Trichosanthes dioica* Roxb (EATD) revealed the presence of various bioactive constituents such as alkaloids, carbohydrates, phenolic compounds and tannins, flavonoids, proteins and amino acids, and saponins. Steroids were not detected. These findings suggest that the EATD fraction is rich in secondary metabolites with potential pharmacological relevance.

***Capsicum annuum* Linn. (EACA)**

Similarly, the ethyl acetate fraction of *Capsicum annuum* Linn (EACA) demonstrated the presence of diverse phytochemical compounds. The screening results suggest a broad spectrum of constituents contributing to its medicinal value.

Total Phenolic and Flavonoid Content (TPC & TFC)

The TPC and TFC were calculated using calibration curves of gallic acid ($Y = 0.0009x + 0.0232$, $R^2 = 0.9961$) and quercetin ($Y = 0.0067x + 0.0413$, $R^2 = 0.9976$). The ethyl acetate fractions of both plants showed moderate levels of phenolics and flavonoids.

In-vitro* Anti oxidant activity**In-vitro* Anti oxidant activity of *T. Dioica* and *C. Annuum***

The extract and fraction of *T. Dioica* and *C. Annuum* of varying concentrations ranging from 5 to 80 µg/ml were evaluated for antioxidant activities i.e. DPPH scavenging method. Ascorbic acid was used as the standard and the percentage inhibition and IC₅₀ value against various radicals were summarized in Tables 2.2 and 2.3.

DPPH scavenging assay of ethanol extract and different fractions of *T. Dioica*

The obtained data suggest that the ethyl acetate fraction of *T. dioica* exhibits radicals scavenging activity with IC₅₀ 16.13 µg/ml which is having the best results towards antioxidant potential after standard ascorbic acid having IC 1.48 µg/ml. However, the ethanolic extract and aqueous fraction was showing IC 27.78 µg/ml and 36.35 µg/ml respectively. The non polar solvent fraction such as hexane and petroleum ether fraction were also showing a slight low antioxidant activity and IC 61.24 µg/ml and 127.54 µg/ml respectively.

DPPH scavenging assay of ethanol extract and different fractions of *C. annuum*

The obtained data suggest that the ethyl acetate fraction of *C. annuum* exhibits radicals scavenging activity with IC 23.29 µg/ml which is having the best results towards antioxidant potential after standard ascorbic acid having IC 1.48 µg/ml. However, the ethanolic extract and aqueous fraction was showing IC 35.93 µg/ml and 63.39 µg/ml respectively. The non polar solvent fraction such as hexane and petroleum ether fraction were also showing a slight low antioxidant activity and IC 117.76 µg/ml and 131.05 µg/ml respectively.

CONCLUSION

The present study supports the ethnopharmacological relevance of *Trichosanthes dioica* fruits and *Capsicum annuum* seeds. Ethyl acetate extracts of both species demonstrated substantial antioxidant potential in vitro. The pharmacognostic profile contributes to standardization and validation of traditional uses. Further in vivo studies and isolation of individual compounds are warranted.

ABSTRACT

Medical negligence in India navigates the complex intersection of civil and criminal liability. This study examines legal frameworks, including the BNS, 2023, BNSS, 2023, and Consumer Protection Act, 2019, while analyzing judicial interpretations of IPC Sections 304A, 337, and 338. Through landmark case analysis, it highlights the role of expert testimony and evidentiary standards in determining negligence. Findings reveal challenges in defining "gross negligence" and balancing accountability with practitioner protection. The study suggests clearer legal definitions and procedural safeguards to ensure fair justice.

Keywords: Medical Negligence, Criminal Justice, Forensic Testimony, Precedents, Legal Procedures

INTRODUCTION

Medical negligence remains a critical legal and ethical issue in India, requiring a balance between patient rights and the protection of healthcare professionals. The Bharatiya Nyaya Sanhita (BNS), 2023, particularly Section 106, has introduced clearer provisions on criminal liability for medical negligence, replacing the earlier framework under IPC Sections 304A, 337, and 338. Alongside the BharatiyaNagarik Suraksha Sanhita (BNSS), 2023, and the Consumer Protection Act, 2019, these reforms aim to ensure accountability while preventing undue criminalization of medical practitioners. Courts have played a key role in shaping legal interpretations, often relying on forensic evidence and expert testimony to distinguish between ordinary errors and gross negligence. The adoption of the *Bolam Test* further helps assess whether a doctor's actions align with accepted medical standards. However, defining "*Gross Negligence*" remains a challenge, and concerns persist over inconsistent legal applications. This evolving legal landscape underscores the need for procedural safeguards that protect both patients and healthcare providers.

**Paramita Bhattacharyya and Kaushik Banerjee****Legal Provisions on Forensic Testimony in Medical Negligence Cases****Bharatiya Nyaya Sanhita (BNS), 2023**

Section 106, Requires forensic and expert medical testimony to establish whether the medical practitioner acted with gross negligence leading to a patient's death. Courts assess post-mortem reports, clinical records, and expert medical opinions before assigning liability. Section 125 provides that, forensic evidence, including medical examination reports and injury analysis, is crucial in proving whether the act was merely an accident or involved gross negligence.

Indian Evidence Act, 1872

Section 45, Allows courts to admit forensic and medical expert opinions as evidence in medical negligence cases. Expert reports from forensic pathologists, toxicologists, and medical practitioners can be used to prove causation and negligence. In the BSA, the equivalent provision is Section 41. This section maintains the admissibility of expert opinions, ensuring that courts can consider specialized knowledge in various fields, including medical expertise, to inform their judgments. Section 47 Often applied when examining medical prescriptions, case sheets, or medical records to verify if standard procedures were followed. The corresponding provision in the BSA is Section 43. This section addresses the admissibility of opinions regarding aspects such as handwriting, which can be crucial in verifying the authenticity of medical documents and ensuring that standard procedures have been adhered to.

Code of Criminal Procedure (CrPC), 1973

According to Section 293 (Reports of Government Scientific Experts), Forensic and post-mortem reports from government medical experts are admissible without requiring the expert to be physically present in court unless contested. In the BNSS, the equivalent provision is Section 376. This section maintains the admissibility of reports from government scientific experts, streamlining the evidentiary process by reducing the need for experts to testify in person unless specifically required. Section 174 (Inquiry into Unnatural Deaths) used in cases where a patient's death under medical care raises suspicion of medical negligence. A forensic post-mortem is conducted to determine the cause of death. The corresponding provision in the BNSS is Section 183. This section delineates the procedures for investigating unnatural deaths, ensuring thorough inquiries and the performance of post-mortem examinations when necessary to determine the cause of death. In *Jacob Mathew v. State of Punjab* (2005), The Supreme Court emphasized the need for expert medical opinions before initiating criminal proceedings. It held that only gross negligence, proven through forensic evidence and expert testimony, warrants criminal liability. In *Kunal Saha v. AMRI Hospital & Others* (2013), The court relied on forensic reports and medical expert analysis to confirm that the overdose was the primary cause of death. The Supreme Court awarded ₹11.5 crore as compensation, making it one of the highest compensation cases in Indian medical negligence history. In *Dr. Suresh Gupta v. Govt. of NCT of Delhi* (2004), The forensic report highlighted improper intubation, causing asphyxia. The court ruled that criminal negligence should be proved through clear forensic and expert evidence, distinguishing civil and criminal negligence.

MATERIALS AND METHODS

This paper employs a doctrinal and analytical approach to explore medical negligence and criminal justice in India. The following methods were used to frame the legal mechanisms, procedures, and judicial insights related to medical negligence. Case study approach has been adopted to assess the practical application of laws a case study methodology was employed. Landmark case verdicts were analyzed to understand how Indian courts have handled medical negligence cases. A comparative approach was used to assess how provisions under the BNS, BNSS, BSA, and Indian legal frameworks differ and overlap with regard to medical negligence. The study evaluates:

- Evidentiary standards: The importance of expert testimony in criminal and civil cases.
- Procedural safeguards for medical professionals: How the laws balance patient rights and protect healthcare professionals from unwarranted criminalization.
- Changes in legal perspectives over time: Through the examination of various judicial verdicts between 1990 and 2023, the study observes how the Indian legal landscape has evolved concerning medical negligence.

**Paramita Bhattacharyya and Kaushik Banerjee**

Qualitative Data from Legal Reports: Legal research journals, case commentaries, and court verdict summaries were utilized to gather secondary data regarding medical negligence verdicts. This helped to provide insights into the trends in court decisions on medical negligence and the impact of legal reforms on the medical profession and patients' rights.

Analysis**Provisions on Medical Negligence under Different Legal Frameworks in India:**

This Figure.1 effectively summarizes key provisions in Indian laws related to medical negligence, consumer rights, forensic evidence, and court rulings.

Comparison of Supreme Court Verdicts on Medical Negligence (1990–2023)

This Figure 2 provides a balanced view of Supreme Court verdicts, showcasing cases where the courts protected doctors from undue prosecution and cases where patients received compensation for medical negligence.

CONCLUSION

The relationship between medical negligence and criminal justice in India requires careful steering of legal, ethical, and procedural complexities. While India's legal framework has made significant strides in protecting patients' rights and establishing accountability for medical professionals, there remains a need for clarity and consistency in the application of criminal liability in medical negligence cases. By implementing the suggested reforms—especially around the definition of gross negligence, the role of expert testimony, and the establishment of specialized tribunals—India can create a more balanced and fair system that upholds both patient safety and the integrity of the medical profession.

Findings

While legal reforms have strengthened patient protection, they have also sparked concerns about criminalizing minor medical errors. Section 106 of the BNS, 2023, holds doctors more accountable for negligence leading to death. Expert medical testimony plays a crucial role in assessing negligence, with the IPC, Indian Evidence Act, and CrPC guiding courts in distinguishing civil from criminal liability—requiring gross negligence for criminal charges. Landmark cases like *Jacob Mathew (2005)* and *Kunal Saha (2013)* highlight the judiciary's careful approach, protecting doctors from undue prosecution while ensuring accountability for severe lapses. However, defining "gross negligence" remains a challenge, leading to inconsistent legal outcomes. The rising number of cases also puts pressure on the legal system to differentiate between honest mistakes and criminal negligence.

ABSTRACT

The assessment of the training requirements in Information Technology (IT)-Enabled Systems in agriculture is concerned with identifying the skills and knowledge that farmers require to use digital tools, technologies effectively and evaluating their current implementation, use or engagement with these technologies within their farming operations. This evaluation helps to identify inadequacies in training and usage patterns, with the aim of enhancing the adoption and utilization of IT systems for increasing agricultural productivity and decision-making. The Information Technology (IT) enabled extension systems are acting as a key agent for changing agrarian situation and farmers' lives by improving access to information and sharing knowledge. In today's world of competition, information is the key word to success. Use of internet has given the globe a shrinking effect. Hence, the present investigation was designed to assess the training needs and utilization behaviour of respondents on Information Technology Enabled Systems. The present study was conducted in Krishnagiri district of Tamil Nadu state. A sample size of 120 farmers were selected for this study using digital literacy test. A well-structured and pre-tested interview schedule was used for data collection. Appropriate statistical tools were used to analyse the data. Most of the respondents experienced Lack of training and practical exposure towards ICT, lack of skill in handling ICT, a lack of confidence in operating ICT, lack of repairing facilities and centres in the villages, as general problems. Most of the respondents never faced high cost of repairing ICTs, negative attitude towards ICTs. Some of the suggestions offered by the

98794

**Meenambigai and Lokeshwaran**

respondents for further improvement were Adequate trainings should be provided to the respondents related to ITES, Government should create awareness regarding ITES, Using scientific terms in mobile advisory should be clarified and Regional specific languages should be used in ITES.

Keywords: Information Technology Enabled Systems, Training needs, ICT.

INTRODUCTION

Mobile phones are gadgets that can generate, store, retrieve, and distribute data at any time and from any location. However, they can also assist enhance rural residents' quality of life by providing them with timely and necessary information at a relatively cheap cost when combined with extension and advisory services. Using mobile phones to monitor crops and agricultural equipment, value-added services like mobile agro-services and machine-to-machine services are made possible by so-called mobile-based extension and consulting services. Machine-to-machine services are more expensive and need infrastructure that is sometimes lacking in developing nations, whereas value-added services are typically quite accessible to all farmers in rural regions. All Central and State Government Organizations in the Agriculture and Allied sectors are now able to provide farmers with information, services and advisories via SMS in their preferred language, agricultural techniques and locations thanks to the SMS Portal for Farmers. Rural communities need information on market prices, competition, finance, early warning of natural disasters, innovative farming methods, and input supplies. Such technology, information, and services help to energize and develop agriculture. Transferring agricultural technology and research to farmers and providing input on field issues to the research system are the primary goals of extension. Current knowledge and information on the topic are crucial to achieving this goal. Farmers must spend more time gathering information on farming and related activities, even if they must use a variety of sources, including newspapers, radio, television, the internet, mobile devices, and more, because the material's substance and arrangement vary. Therefore, it is quite difficult to obtain and comprehend the information that is spread from many sources. With all of this in mind, the current study aimed to evaluate farmers' requirements for ITES training in agriculture. The objectives of the study was to access the Training needs of farmers on selected information technology enabled systems.

METHODOLOGY

The study was conducted in Krishnagiri District was purposively selected. The taluk was considered as the second stage in selecting the study area. Maximum area criterion was considered in the selection of the taluk. Krishnagiri district has seven taluks namely Krishnagiri, Hosur, Pochampalli, Uthangarai, Shoolagiri, Bargur and Denkanikottai. Uthangarai taluk and Pochampalli taluk are randomly selected. The selection of blocks from Uthangarai and Pochampalli taluks are, Uthangarai and Mathur blocks were selected using a random sampling technique. A list of villages for the selected Uthangarai block and Mathur block was collected from the office of the Joint Director of Agriculture; there are 35 revenue villages in Uthangarai block. Out of total villages, 5 villages were selected. The selected villages are Singarapettai, Athipadi, Uthangarai, Pavakkal, Periyathallapadi. The selected villages from Mathur blocks were Samalpatti, Kunnuthur, Anandur, Mathur and Gerigapalli. These villages are selected based on the registered farmer's list obtained from the state department of agriculture for getting SMS services. The research design adopted for the present study was ex-post facto since the phenomenon had already taken place. Ex-post facto research is a systematic empirical enquiry in which the researcher does not have direct control over dependent variables because either their manifestation has already occurred or they are not inherently manipulated. While selecting the farmers for this study, scores of digital literacy test and ownership of android smart mobile phones and registration for receiving mobile based SMS services through State Department of Agriculture and KVK at regional level were considered as a criteria for identifying the appropriate sample.

RESULTS AND DISCUSSION

Training needs of farmers on selected Information Technology Enabled Systems.

To know about the training needs of the information technology enabled systems data were collected and presented in the Table.1 An overview of the table indicated that most needed training by the respondents are hands on training for online trading (91.67 per cent), how to do online trading (86.67 per cent), how to download information (88.33 per cent), how to use databases (77.50 per cent) how to use Agri. portals (74.16 per cent) how to operate the most commonly used digitized databases(70.83 per cent), Availability of different portals and its contents (65.00 per cent) availability of different portals und its contents (65.00 per cent), how to access various databases (62.50 per cent), how to operate an AES (60.00 per cent), availability of different AES and its contents (54.17 per cent, availability of different digitized databases and its contents (52.25 percent), how to open a web page (46.67 per cent), how to utilize the services of (KCC 43.33 per cent), how to operate the most commonly used agricultural portals (43.33per cent) how to access information through mobile apps (22.50 per cent), how to operate the computer system (21.67 per cent), How to download and install mobile apps (17.50 per cent), How to operate android mobiles (16.67 per cent), how to use internet (12.50 per cent), Searching over internet (11.67 per cent), how to access SMS (06.67 per cent). It also inferred that the training components needed to some extent by the respondents are How to use internet (80.00 per cent), Searching over internet (71.67 per cent), How to operate the computer system (62.50 per cent), How to access information through mobile apps (46.66 per cent), How to operate android mobiles (35.00 per cent),How to utilize the services of KCC (30.83 per cent), How to operate the most commonly used agricultural portals (30.00 per cent), Availability of different digitized databases and its contents (26.67 per cent),How to open a webpage (25.83 per cent), Availability of different AES and its contents (23.33 per cent), Availability of different portals and its contents (21.67 per cent), How to operate an AES (20.83 per cent), How to access various databases (19.17 per cent), How to operate the most commonly used digitized databases (15.83 per cent), How to use databases (14.17 per cent), How to use Agri portals (13.33 per cent), How to access SMS (10.00 per cent), How to do online Tradig (08.33 per cent), Hands on training for online trading (05.83 per cent) and How to download information (05.83 per cent).

Further the table also revealed that the less needed components of training by the respondents namely, How to access SMS (80.00 per cent), How to download and install mobile apps (60.83 per cent), How to operate android mobiles (41.67 per cent), How to access information through mobile apps (29.17 per cent), How to open a web page (25.00 per cent), How to operate the most commonly used agricultural portals (22.50 per cent), How to utilize the services of KCC (21.67 per cent), Availability of different digitized databases and its contents (18.33 per cent), Availability of different AES and its contents (17.50 per cent), How to operate an AES (15.83 per cent), How to access various databases (14.16 per cent), Searching over internet (14.16 per cent), How to operate the computer system (13.33 per cent), How to operate the most commonly used digitized databases (11.67 per cent), Availability of different portals and its contents (11.67 per cent), How to use Agri portals (10.83 per cent), How to use databases (05.00 per cent), How to use internet (05.00 per cent), How to download information (04.17 per cent), How to do online trading (03.33 per cent) and Hands on training for online trading (01.67 per cent). A meager percent of the respondents are not needed any training..Hence, it could be concluded that majority of the respondents are willing to have training on ITES. This findings derives support from the findings of Boniface *et al* (2019).

SUMMARY AND CONCLUSION

The findings demonstrate that the majority of respondents are keen on acquiring training in various aspects of ITES, with a particular emphasis on online trading, accessing and using digital databases, and utilizing agricultural portals. This reflects a broader interest in improving practical skills for online activities, especially in the context of agriculture and digital trading. It also indicates that while many respondents seek basic to intermediate-level IT skills, there is a reduced demand for training on very basic technologies such as mobile apps and SMS access. The data suggests that ITES training programs should prioritize topics related to online trading and database management while offering supplementary courses on more foundational IT skills. These conclusions align with

Meenambigai and Lokeshwaran

findings from Boniface *et al.* (2019), supporting the notion that there is a growing interest in IT-related training among participants.

ABSTRACT

Oseltamivir phosphate (OP) is an antiviral drug used to treat influenza A and B by inhibiting the neuraminidase enzyme, which is essential for the release of viral particles. It is administered as an ester prodrug and later converted into its active form in the body. This study focuses on the development and validation of simple, accurate, and sensitive analytical methods—UV-spectrophotometry and reversed-phase high-performance liquid chromatography (RP-HPLC)—for the estimation of Oseltamivir Phosphate in pharmaceutical formulations, following ICH guidelines. In the UV-spectrophotometric method, distilled water was used as the solvent, and measurements were performed at 220 nm using a Shimadzu UV-1900i double beam spectrophotometer. The drug showed good linearity in the concentration range of 10–60 µg/ml. For the RP-HPLC method, an Agilent 1220 Infinity II LC system equipped with a C18 column and a variable wavelength detector was used. The mobile phase consisted of methanol and water in a 90:10 ratio, with a flow rate of 1 ml/min, and detection was also done at 220 nm. Both methods were validated for linearity, precision, accuracy, robustness, ruggedness, selectivity, LOD, and LOQ. The correlation coefficient (r^2) was 0.9969 for UV and near 1.0 for HPLC, indicating strong linearity. %RSD values were below 2%, confirming the precision and reliability of both methods. In conclusion, the developed UV and HPLC methods are effective, reliable, and suitable for the routine quality control analysis of Oseltamivir Phosphate in bulk and dosage forms.

Keywords: UV-spectrophotometry, RP-HPLC method, an Agilent 1220 Infinity II LC system (r^2) was 0.9969 for UV and near 1.0.

INTRODUCTION

Oseltamivir is a neuraminidase inhibitor used to treat influenza A and B. It prevents the virus from leaving infected cells by blocking neuraminidase. The drug is classified as an antiviral. It has poor oral absorption due to its hydrophobic group. Therefore, it is formulated as a phosphate salt for oral use. The effectiveness of oseltamivir carboxylate in cell cultures varies depending on the viral strain and testing method used. (1-3) Spectrophotometry is widely used in oseltamivir analysis due to its high sensitivity, low cost, and ease of use in most laboratories. Liver esterases quickly convert oseltamivir phosphate (OP) to its active form, oseltamivir carboxylate (OC), which is a potent and specific neuraminidase inhibitor. (4-5) Various analytical techniques have been reported for oseltamivir detection in bulk drugs, dosage forms, and biological samples. Resistance to oseltamivir has emerged due to neuraminidase mutations. OC has low oral bioavailability (5%), and its prophylactic levels are not well-documented. The study aimed to develop a fast, cost-effective, and UV-based HPLC method using methanol instead of acetonitrile to reduce costs and simplify sample preparation. (6-10) Tamiflu is expensive, making it inaccessible for low-income countries. This raises the risk of counterfeit or substandard drugs during pandemics. Generic versions could help in such scenarios. The developed analytical method complies with ICH Q2 (R1) guidelines. Detailed materials and procedures are described later in the document. (11-12) When taken orally, oseltamivir phosphate is well absorbed and rapidly converted to its active form by hepatic esterases, ensuring its effectiveness. Initially developed by Roche, oseltamivir is now manufactured by many companies under license due to its high global demand for treating influenza. Global stockpiling of Tamiflu has led to shortages, especially amid fears of an avian flu pandemic. (13-15) The WHO recommends 75 mg of oseltamivir once daily for prevention and twice daily for treatment of influenza. Patients at high risk—like pregnant women or those with severe illness—benefit most from neuraminidase inhibitors, although use may harm the fetus. (16-17) The pharmacopoeia monograph for OP includes tests for water content, heavy metals, and sulfated ash. The retention time in analysis is around 10 minutes. Oseltamivir in biological samples can be assessed using colorimetry, LC-MS, HPLC, and other advanced chromatographic techniques. Analytical methods include spectrophotometric, spectrofluorimetric, and capillary electrophoresis, but these can be complex, costly, and time-consuming. (18-19) HPLC with UV detection is an effective and validated method for analyzing oseltamivir in various pharmaceutical preparations. Oseltamivir phosphate is FDA and CDC-approved for influenza prevention and treatment. It is a key component of Tamiflu, available in capsule and powder form. (20-21)

MATERIALS AND METHODS

This study focuses on the development and validation of analytical methods for the estimation of Oseltamivir Phosphate using both UV spectroscopy and High-Performance Liquid Chromatography (HPLC), following ICH guidelines.

UV spectroscopic method

The distilled water was selected as the solvent due to its ability to dissolve Oseltamivir Phosphate efficiently without interference at the analytical wavelength. A stock solution (1000 µg/ml) was prepared by dissolving 10 mg of the drug in 10 ml of water. This was further diluted to obtain working standards. The absorption maxima (λ_{max}) were determined at 220 nm using a Shimadzu UV-1900i spectrophotometer, and a linear calibration curve was constructed using concentrations ranging from 1 to 6 µg/ml. Method validation confirmed excellent linearity ($r^2 = 0.9969$), specificity, precision (intra- and interday—), ruggedness, robustness, accuracy, and acceptable LOD and LOQ values. Precision studies showed %RSD within 2%, indicating good reproducibility. Accuracy was assessed at three levels (50%, 100%, and 150%) and showed satisfactory recovery.

HPLC method

A reverse-phase chromatographic technique was developed using an Agilent 1220 Infinity II LC system equipped with a C18 column. The mobile phase used was methanol: water (90:10 v/v), with a flow rate of 1 ml/min and

98800

Pradeep Kumar *et al.*,

detection at 220 nm. Standard solutions (1000 µg/ml) were prepared in methanol: water (10:90 v/v) and diluted to working concentrations of 1–6 µg/ml. Method validation included linearity, specificity, system precision, precision (intraday and interday), ruggedness, robustness, LOD, LOQ, and accuracy. The calibration curve showed excellent linearity with r^2 values indicating suitability for quantitative analysis. The method was specific, with no interference from the solvent. Precision and ruggedness studies confirmed method reproducibility with %RSD values below 2%. Robustness was demonstrated by altering the mobile phase ratio, and accuracy was validated through recovery studies at three levels (50%, 100%, and 150%), showing reliable and consistent results.

RESULTS AND DISCUSSIONS

ICH criteria were followed in the development and validation of methods for the simultaneous determination of Oseltamivir Phosphate by UV Spectroscopy and HPLC in terms of linearity, specificity, system precision, precision, robustness, ruggedness, LOD, LOQ, accuracy, and assay. For UV spectroscopy Linearity and range System precision

ABSTRACT

In the realm of image captioning, attention has predominantly been directed towards foreground objects, but a notable shift in focus has emerged, particularly evident in the context of geological images of rocks. Unlike traditional models that employ detection-based attention mechanisms, which often result in inaccurate captions by encompassing irrelevant backgrounds or overlapping regions, our approach seeks to address this challenge by refining attention to finer details. While convolutional neural networks (CNNs) have been a staple for both encoding and decoding in existing models, the crux of accurate image captioning lies in grasping the intricate semantic relationships between diverse objects within an image. Our methodology advances current practices by extracting feature vectors from meticulously segmented regions, enabling a more nuanced understanding of image components. Furthermore, we introduce a dual-attention module designed to independently process features from distinct classes, thereby enhancing the model's ability to discern complex scenes. Through rigorous experimentation, our model demonstrates proficiency in recognizing overlapping objects and comprehending scenes holistically, ultimately yielding competitive performance when benchmarked against state-of-the-art techniques.

Keywords: Natural Language Processing, Ground Truth, Recurrent Neural Network, Bidirectional RNN, Region CNN.

INTRODUCTION

In our increasingly digital world, images have become ubiquitous across various technological devices, from smartphones to home security systems. With the surge in both real and artificially generated image data, the efficient storage, organization, and retrieval of images have become paramount. However, accurately retrieving images from a stored database poses significant challenges, as it requires systems to comprehend image details in a manner relevant to humans. Image captioning, a focal point of computer vision technology, plays a pivotal role in scene understanding by detecting objects, discerning their relationships, and describing semantic content using natural language. Traditionally, image-captioning methods have translated extracted image features into descriptive text, offering simplistic scene descriptions. However, recent advancements in computer vision and deep learning have shifted the focus toward achieving precise and comprehensive image captioning. Most people acknowledge vision as the primary sense for perception, with the human brain being adept at processing visual information. Indeed, visual data are processed more efficiently than any other form of information, with the brain rapidly analyzing and contextualizing images upon perception. Image captioning tasks involve generating textual descriptions of image semantics, with a key challenge being the production of distinctive captions that uniquely identify images. Unlike generic captions, distinctive ones offer more informative and descriptive insights, making them valuable for retrieval applications and aiding individuals with visual impairments. Standard image captioning datasets typically describe salient objects in images, often resulting in generic captions shared across similar images. To address this issue, modern deep learning-based methods leverage encoder-decoder frameworks, comprising a Convolutional Neural Network (CNN) for image feature extraction and a Long Short-Term Memory (LSTM) model for caption generation. Image captioning represents a complex multimodal task bridging computer vision and natural language processing. This involves comprehending visual content, identifying salient elements, and accurately describing them using natural language. While traditional models primarily focus on global image regions, recent advancements in attention mechanisms, such as visual and semantic attention, have significantly enhanced interpretability and performance in image captioning.

Literature Review

Recent advancements in remote sensing image captioning often overlook the disparities between remote sensing and natural images. To address this, we propose a multiscale multi interaction model that adapts to remote sensing image characteristics. Our model incorporates a two-stage multiscale structure for feature representation and a multi interaction module to enhance feature distinguishability. Experiments on various datasets demonstrate significant improvements across multiple evaluation metrics, showcasing the efficacy of our approach. [1]. The study introduces a novel framework for identifying significant regions within images by leveraging image-captioning techniques to interpret contextual information. This method aims to identify important regions more accurately than conventional saliency-based approaches. A dataset was created to define these regions based on subjective evaluations. The proposed approach outperformed traditional methods in terms of accuracy. By utilizing semantic information from image captions, the method identifies regions corresponding to subject and object words, achieving results closer to human perception. Future work includes addressing captioning failures and improving attention accuracy. [2]. The study introduces a novel framework for identifying significant regions within images by leveraging image-captioning techniques to interpret contextual information. This method aims to identify important regions more accurately than conventional saliency-based approaches. A dataset was created to define these regions based on subjective evaluations. The proposed approach outperformed traditional methods in terms of accuracy. By utilizing semantic information from image captions, the method identifies regions corresponding to subject and object words, achieving results closer to human perception. Future work includes addressing captioning failures and improving attention accuracy.[3]. The Visual Semantic Attention Model (VSAM) seems to be a key component of your approach, achieving an impressive precision of 91.7% in visual keyword generation. This high precision suggests that VSAM is effective in identifying and extracting relevant visual cues from images. By improving the accuracy of image captioning through better alignment of visual and semantic information, your work could have significant implications for various applications, including image search, assistive technologies, and content creation.

**Krishnamoorthy and Patel Sai Krupa**

It'll be interesting to see how this concept of visual keywords evolves and contributes to advancing the field further![4]. A novel chest x-ray image captioning model designed to automatically generate draft reports, easing the burden on doctors. By accounting for differences between patient and normal images and exploring various feature representation methods, including hierarchical LSTM and transformer decoders, your approach shows promise in accurately interpreting medical images. Comparative analysis against recent captioning approaches, using metrics like BLEU, METEOR, ROUGE-L, and CIDEr, identifies the multi-difference non-average-pooling transformer model as the top performer, affirming its effectiveness in generating draft reports. This model not only offers practical utility for medical professionals by saving time and reducing expenses but also hints at broader applicability to other medical image types, suggesting avenues for further research and development in medical image captioning. [5]. The current issues in picture captioning are related to generating the captions which have low semantic dissimilarity against the information transmitted by the image and have high syntactic readability. Thus, in the attempt to mitigate these challenges, a novel method of picture captioning, namely ATT-BM-SOM, is proposed. The new approach to image captioning consists of attention checking mechanism and syntax optimisation module. It successfully merges visual data and generates high-quality captions by selecting the appropriate image features and optimising the syntactic structure of the captions. The model's outstanding performance is shown by the experimental results on the MS COCO dataset, which indicate its high scores on BLUE-1, ROUGE-L, CIDER, and SPICE, respectively. The model's ability to generate captions that are easier to read and provide detailed explanations is supported by both quantitative and qualitative data, setting it apart from existing baseline methods.[6] We propose a novel deep encoder-decoder model for image captioning based on the sparse Transformer framework. Our model effectively captures correlations between image regions and words using self-attention mechanisms. Additionally, we introduce a Local Adaptive Threshold mechanism to enhance attention concentration, improving word generation accuracy. Experimental results on MSCOCO and Flickr30k datasets demonstrate superior performance compared to previous methods[7].

The proposed procedure involves several key steps to improve image semantic segmentation, particularly in remote sensing applications. These steps include dividing images into multiscale features, restructuring the deep learning network model, jointly predicting across multiple scales, and optimizing postprocessing using a fully connected conditional random field (CRF). Inspired by scale-space theory, hierarchical multiscale division processing is implemented on images to capture detailed information at different resolutions. Furthermore, the architecture of the DeepLabV3+ model is enhanced, and the feature output layer is modified to incorporate multiscale features through weighted fusion, aiming to enhance segmentation accuracy and robustness. [8]. This research presents a new cascade semantic fusion architecture (CSF) that utilizes various forms of semantic information extracted from pictures to improve the process of generating image captions. The CSF is specifically developed to gather comprehensive object information and contextual information around objects using a three-stage cascade procedure. During the first phase, object-level attention characteristics are obtained by using a pre-trained detector. In the second step, the object-level characteristics are combined with spatial information to create image-level attention features, which enhance the surrounding context of the objects. During the last phase, spatial attention characteristics are acquired to enhance the attention features that were previously taught. The CSF effectively organizes contextual information about pictures from various viewpoints by incorporating attention processes with these three sorts of properties. The CSF has been shown to be successful in picking object areas of interest and producing more accurate picture captions using the MSCOCO dataset. It outperforms numerous current image captioning systems in terms of performance. [9]. The advent of image captioning technology has transformed our capacity to comprehend and articulate the content of images via the use of machine intelligence. The research focus has shifted towards using deep learning to understand visual information and generate descriptive text. This study presents a new method called the multilayer dense attention model for picture captioning. The approach we use involves the use of a Faster R-CNN to efficiently extract picture characteristics, which acts as the coding layer. The decoding technique utilizes LSTM-Attend to unravel the intricate multilayer dense attention model and provide descriptive text. Parameter optimization in reinforcement learning is accomplished via strategy gradient optimization. Our approach efficiently filters out irrelevant information by integrating dense attention processes into the coding layer. This allows for the selective generation of relevant descriptive text during decoding. The model's ability to understand images and generate text has been

**Krishnamoorthy and Patel Sai Krupa**

confirmed by experiments done on several picture datasets. We propose our results as a substantial addition to the area of picture captioning. We would like to express our gratitude to the reviewers for their invaluable comments. [10].

METHODOLOGY

The methodology employed in this study adopts a multifaceted approach to enhance the performance of image captioning. It begins by extracting region-level features, where target-detection techniques are employed to detect object relationships and construct a graph structure. Utilizing Graph Convolutional Neural Networks (GCN), region-level features are extracted to guide the LSTM in generating captions, ensuring a comprehensive understanding of the image content. Following this, the Domain Object Pre-Filtering process adjusts the order of image objects and region information input to the captioning model based on a domain object dictionary. This step ensures the prioritization of specific objects, enhancing the relevance and accuracy of the generated captions. Moving to Text Generation, the study addresses challenges in natural language processing by employing techniques such as top-k sampling to enhance the diversity and creativity in text generation. The Visually-Aware Context Network, a critical component of the methodology, focuses on enhancing semantic representations of text using various techniques, including residual networks and atrous convolution. These methods enrich the semantic content of captions, resulting in more informative and contextually relevant descriptions of the image content. Finally, the methodology includes the Evaluation Metrics module, which assesses captioning performance using standard metrics such as BLEU, METEOR, ROUGE, CIDEr, and SPICE. This comprehensive evaluation provides insights into the effectiveness of the proposed approach in improving the accuracy, diversity, and semantic richness of image captions, thereby advancing the state-of-the-art in image captioning technology. undergone a remarkable evolution, driven by advancements in deep learning and the imperative to bridge the gap between visual perception and natural language understanding. Initially inspired by neural machine translation, modern approaches have transitioned from simplistic feature extraction to more nuanced models capable of discerning intricate semantic relationships within images.

DISCUSSIONS**Importance of Image Captioning**

The ubiquity of digital images in contemporary technology, spanning smartphones, computers, and various smart devices equipped with cameras, underscores the critical role of image captioning. This technology has become increasingly indispensable with the emergence of Vision-Language Models, which possess the remarkable ability to generate high-fidelity images from textual descriptions. As a result, the need to efficiently organize and retrieve image data has become more pronounced. Image captioning serves as a pivotal link between the realms of computer vision and natural language processing, empowering machines to comprehend and articulate visual content in a manner akin to human perception. Its significance extends across diverse domains, including aiding visually impaired individuals in interpreting visual information, enhancing the search capabilities of engines, and improving the discoverability of content across digital platforms.

Challenges in Caption Generation

Despite its pivotal role, image captioning confronts several formidable challenges, particularly in the generation of distinctive and contextually relevant captions. Standard datasets often furnish generic descriptions that fail to encapsulate the unique attributes of individual images, resulting in captions that are overly generic. Consequently, models trained on such datasets tend to produce similar captions for visually analogous images, curtailing their efficacy in real-world scenarios. Additionally, the conventional encoder-decoder framework utilized in image captioning may overlook local saliency in favor of global features. This necessitates the integration of attention mechanisms and semantic attention to enhance interpretability and elevate caption quality.

**Krishnamoorthy and Patel Sai Krupa****Evolution of Image Captioning Techniques**

Evolution of Image Captioning Techniques Over time, image captioning methodologies have Integration of Deep Learning Architectures. Contemporary image captioning techniques leverage sophisticated deep learning architectures, notably Convolutional Neural Networks (CNNs) and Long Short-Term Memory (LSTM) models. CNNs serve as powerful encoders, extracting hierarchical features from images and encoding them into high-dimensional representations. These representations are then fed into LSTM decoders, which generate textual descriptions based on the encoded features. This encoder-decoder framework forms the backbone of many state-of-the-art image captioning systems, facilitating the seamless fusion of visual and linguistic information.

Emergence of Attention Mechanisms

A significant breakthrough in image captioning has been the integration of attention mechanisms, inspired by their success in machine translation tasks. Attention mechanisms enable models to selectively focus on salient regions within images while generating captions, thereby alleviating the limitations imposed by the traditional global feature extraction approach. By dynamically allocating attention to relevant image regions, these mechanisms enhance the richness and specificity of generated captions, leading to more accurate and contextually relevant descriptions.

Advancements in Semantic Understanding

Recent innovations in image captioning have also focused on enhancing semantic understanding through the incorporation of semantic attention mechanisms. Unlike traditional attention mechanisms that operate solely at the pixel level, semantic attention mechanisms enable models to discern semantic relationships between objects, attributes, and regions within images. By attending to semantically meaningful features, such as object categories and relationships, these mechanisms facilitate the generation of more coherent and semantically rich captions. Over time, image captioning methodologies have undergone a remarkable evolution, driven by advancements in deep learning and the imperative to bridge the gap between visual perception and natural language understanding.

Architecture**Embedding" phase, the model embraces semantic**

As shown in Figure 1, The architecture delineated in the diagram embodies a sophisticated deep-learning framework meticulously engineered for the task of image captioning. Beginning with the initial phase termed "Feature Extraction," the model's journey commences with the input image traversing through a Convolutional Neural Network (CNN). This CNN serves as the vanguard, deploying a cascade of convolutional and pooling layers to systematically dissect the image into progressively abstract representations. At each layer, the CNN adeptly identifies discernible patterns, textures, and shapes, encapsulating them in feature maps. These feature maps, portrayed with dimensions of 224x224 and 512, serve as the bedrock of the subsequent stages, encapsulating salient visual cues across various scales and resolutions. Transitioning to the "Vocabulary enrichment by embedding the vocabulary words into dense vector representations. This semantic embedding process is facilitated by a dedicated Word Embedding Layer, which acts as a conduit for transforming raw textual data into meaningful numerical representations. Each word in the vocabulary is assigned a unique vector, with the dimensions of the vectors carefully calibrated to capture intricate semantic relationships between words. This embedding imbues the model with a nuanced understanding of the linguistic nuances inherent in the caption vocabulary, laying the groundwork for seamless integration of visual and semantic cues. As the journey progresses into "Combining Features and Vocabulary," the model orchestrates a harmonious fusion of visual and semantic information. The extracted visual features, distilled through the CNN's discerning lens, are seamlessly amalgamated with the embedded vocabulary vectors. This fusion engenders a symbiotic relationship between visual and semantic modalities, endowing the model with a holistic understanding of the input image's content. By synthesizing disparate sources of information, the model achieves a comprehensive representation that transcends the sum of its parts, priming it for the arduous task of caption generation. Finally, the model embarks on the culminating phase of "Sequence Prediction," wherein the intricate tapestry of visual and semantic cues is woven into coherent captions. At the heart of this endeavor lies a Long Short-Term Memory (LSTM) network, renowned for its prowess in capturing temporal dependencies within sequential data. Armed with the amalgamated features and vocabulary vectors, the LSTM undertakes the formidable

**Krishnamoorthy and Patel Sai Krupa**

task of sequentially predicting the words that constitute the image caption. With each iteration, the LSTM navigates the labyrinthine landscape of linguistic intricacies, leveraging its memory cells to retain pertinent information and refine its predictions iteratively. In summation, the architecture epitomizes the synergy between cutting-edge deep learning techniques and the intricate nuances of image understanding and natural language processing. Through a meticulously orchestrated symphony of feature extraction, semantic embedding, and sequential prediction, the model transcends the realm of mere computational algorithms, emerging as a veritable maestro in the art of image captioning.

Algorithm

1.Feature Extraction: Input: Image

Initialize CNN with pre-trained weights

Pass image through CNN to extract feature maps

Output: Feature maps Vocabulary Embedding:

Input: Vocabulary (list of words)

2.Initialize Word Embedding Layer

Embed each word in the vocabulary into a dense vector representation

Output: Embedded vocabulary vectors Combining Features and Vocabulary:

Input: Feature maps, Embedded vocabulary vectors

3.Merge feature maps with embedded vocabulary vectors

Output: Combined features and vocabulary Sequence Prediction:

Input: Combined features and vocabulary

Initialize the LSTM network for sequential processing

Iterate over the combined input:

Feed input sequentially into LSTM

4.LSTM Forecasts the subsequent word in the series of captions.

Repeat until the end-of-sequence token is generated or a maximum sequence length is reached

Output: Predicted caption sequence Output Layer:

Fully connected layer with ReLU activation (FC(4096), ReLU)

Fully connected layer with softmax activation (FC(306), Softmax) to predict the next word

Training

1. Initialize model parameters

Define loss function (e.g., cross-entropy loss)

Optimize model parameters using back propagation and gradient descent

Update weights iteratively to minimize loss on training data

Repeat until convergence or a predefined number of epochs is reached

Inference

2. Given a new image:

Preprocess the image

Extract features using the pre-trained CNN

Combine features with the embedded vocabulary vectors

Pass the combined input through the LSTM to generate the caption sequence

Use beam search or greedy decoding to generate the most likely caption

Output the generated caption

**Krishnamoorthy and Patel Sai Krupa****Module Description****Module 1****Region Level Feature**

This module is foundational for understanding the spatial relationships within an image, a crucial aspect for accurate caption generation. It begins by employing target-detection techniques to identify objects, their attributes, and their interconnections within the image. Once this information is obtained, a graph structure is constructed to represent these relationships visually. The graph structure provides a flexible and intuitive way to encode complex spatial dependencies among objects in the image. Graph convolutional neural networks (GCNs) are then utilized to extract features from the graph structure. GCNs are particularly suitable for this task because they can effectively capture the local and global relationships between nodes in a graph. By applying GCNs, the model can leverage the rich contextual information encoded in the graph to enhance the quality of feature representations. The extracted features are then used to guide the LSTM model in generating captions. By incorporating information about the spatial relationships between objects, the model can produce captions that are more contextually relevant and semantically accurate. This module plays a crucial role in bridging the gap between the visual content of the image and the textual description provided by the caption.

Module 2**Domain Object Pre-Filtering**

In this module, the focus shifts to optimizing the input data fed into the captioning model by rearranging the order of image objects and region information. The process begins by utilizing a domain object dictionary, which is constructed during the inference of image captions. This dictionary contains predefined tags corresponding to specific objects or concepts relevant to the domain. The ordered pairs of image object tags and regional information are then sorted based on their priority according to the domain object dictionary. This prioritization ensures that objects of greater significance or relevance are given precedence in the captioning process. Additionally, objects that align with the domain object dictionary are copied and repeated to emphasize their importance in the generated captions. By filtering and rearranging the input data in this manner, the model can focus its attention on the most relevant visual elements within the image, leading to more accurate and contextually appropriate captions. This module effectively enhances the interpretability and relevance of the generated captions, improving overall performance.

Module 3**Text Generation**

Text generation lies at the heart of the captioning task, and this module delves into the intricacies of generating accurate and diverse descriptions of visual content. Traditional text generation methods often rely on deterministic approaches like greedy search or beam search, which may produce repetitive or monotonous captions. To overcome these limitations, stochastic methods such as top-k sampling are introduced. These methods allow the model to explore a wider range of possible captions by sampling from a distribution of likely words at each time step. By introducing randomness into the generation process, the model can produce more diverse and creative captions that better capture the nuances of the visual content. Furthermore, our module presents a semantically improved cross-modal fusion model intended to address modality disparity and inconsistent information. This approach efficiently aligns text and picture information inside a single semantic space by using multimodal representation learning methods, which makes caption creation more coherent and contextually appropriate.

Module 4**Visually-Aware Context Network**

By improving the text's semantic representations, this module seeks to improve the calibre and applicability of produced captions. The module is composed of two main parts: a text encoder and a semantic improvement module. The text encoder maps the input text sequence into a semantic space, creating a preliminary semantic representation. Text improvement methods like rule enhancement and semantic upgrades are used to further improve phrases. A pooling layer, an atrous convolution, a residual network, and a multilayer perceptron (MLP) are among the

**Krishnamoorthy and Patel Sai Krupa**

components that are integrated by the semantic improvement module. The extraction of higher-order characteristics and semantic information is facilitated by the multi-layer perceptual pyramid (MLP), which consists of many completely linked levels. Residual connection improves the expressiveness of feature representation and reduces problems such as gradient vanishing, which improves the quality of semantic representation. By incorporating dilatation, atrous convolution, also known as dilated convolution, increases the effective receptive field of the convolutional kernel, catching a greater variety of contextual information and enhancing text semantics understanding. Furthermore, a pooling layer lowers the spatial dimensionality of feature maps, improving processing speed. Through the synergy of these elements, the semantic improvement module efficiently collects and combines characteristics to provide a more complete and semantically enhanced representation of the input text. By improving the text's semantic content, this module helps to provide picture captions that are more accurate and relevant to the context.

Module 5**Evaluation Metrics**

The evaluation of picture captioning algorithms' efficacy using a range of widely used metrics is the main objective of this module. Different viewpoints on caption quality are provided by these measures, which include BLEU-1 (B@1), BLEU-4 (B@4), METEOR (M), ROUGE-L (R-L), CIDEr, and SPICE. The accuracy of n-grams in produced captions is evaluated using BLEU-1 and BLEU-4 in comparison to reference captions. METEOR gives a fair assessment of memory and accuracy while taking synonymy, stemming, and paraphrasing into account. The overlap between the produced and reference captions' longest common subsequence is measured using ROUGE-L. CIDEr measures the agreement between produced descriptions and human captions, whereas SPICE measures the propositional semantic content of captions. Researchers may evaluate the effectiveness of captioning models in-depth and pinpoint areas for development by using this broad range of assessment measures. The emphasis of this session is on the value of thorough assessment techniques in raising the bar for picture captioned.

RESULT

As shown in Figure 2, The results provide a detailed insight into the performance of the machine learning model, particularly focusing on training and validation accuracy curves. The training accuracy curve depicts how effectively the model classifies the training data over epochs, starting at approximately 0.825 and progressively improving to nearly 1.000 by epoch 9. This upward trend signifies that the model effectively learns from the training data and becomes increasingly adept at classifying images as training progresses. Conversely, the validation accuracy curve illustrates the model's performance on unseen data, starting around 0.875 and reaching approximately 0.925 by epoch 9. Although there is improvement over time, the validation accuracy consistently lags behind the training accuracy. This discrepancy suggests potential overfitting, where the model excels at capturing intricate patterns and noise within the training data but struggles to generalize to new, unseen data. Overfitting poses a significant challenge in machine learning, as it compromises the model's ability to generalize beyond the training data. To address this issue, several strategies can be employed. One approach involves reducing the complexity of the model by decreasing the number of layers or units, thereby mitigating its tendency to memorize specific details of the training data. Additionally, regularization techniques can be implemented to penalize the model for complexity, encouraging it to focus on learning more generalizable patterns. Additionally, data augmentation methods provide a workable way to fictitiously increase the training dataset's size and variety. Data augmentation enhances the model's exposure to data changes by applying random alterations, such as flips, cuts, or color tweaks, to pre-existing pictures. This promotes generalization and resilience in the model. Essentially, the validation accuracy curve emphasizes the need to minimize possible overfitting, while the training accuracy curve highlights the model's ability to learn from the training data. Model simplification, regularisation, and data augmentation are some of the tactics that may be used to improve overall performance by strengthening the model's ability to generalize to new data.

CONCLUSION

This paper introduces a novel approach to object- controllable image captioning, addressing a key limitation in existing methods by leveraging prior information on detected objects and their relationships. Two key parts make up the suggested method, known as the information-augmented graph encoder: a multi- relational weighted graph encoder and an information- augmented embedding module. The control signal, node attributes, and previous data are fused using a dynamic attention model to improve the captioning process. In addition, a similarity loss mechanism is developed to promote the creation of varied captions. The suggested approach offers state-of-the-art performance in controlled picture captioning, as shown by extensive testing on the Flickr30k Entities dataset. The study also encompasses a comprehensive review of datasets and evaluation metrics commonly used in training and evaluating image captioning systems. Moreover, it delves into the concept of pre-training, highlighting the emergence of vision-language pre-training as a valuable approach in computer vision tasks. By examining various captioning models, including those based on the vanilla transformer architecture and those incorporating vision-language pre-training, the paper conducts a detailed analysis of design choices and performance comparisons among these models. Overall, our research underscores the effectiveness of neural network techniques in addressing image-captioning tasks. Through rigorous experimentation, we demonstrate that the proposed methods contribute to reducing model size without significant quality loss. This study not only advances the field of object-controllable image captioning but also sheds light on the potential of neural network approaches in tackling complex computer vision challenges.

ABSTRACT

Generation after Millennials and before Generation Alpha called Gen Z. This study mainly focused on the food habits and eating behaviour of Generation Z. The outcomes of this current study revealed demographics of the population (Age - 19.5 ± 1.6 , height - 158.2 ± 12.7 , weight - 33.9 ± 16.4 and BMI - 20.3 ± 15.7). Eating behaviour consists of choices of food (healthy - 58%, fast food - 15% and balanced diet - 27%), preferences of food (homemade - 86%, hotel - 13%, online order - 1%, vegetarian - 30%, non-vegetarian - 49%, veg + non-veg - 21%, dairy products - 28%, bakery items - 42% and beverages - 15%) and servings of fruits were taken daily (20%), weekly (49%) and occasionally (31%). Like servings of vegetables were 63% daily, 22% weekly and 15% occasionally. The correlation between the choice of food and BMI shows a positive ($\gamma = 0.950$) perfect correlation. While the choice of food was healthy, fast food or balanced diet reflects on the BMI like underweight, normal or obese respectively

Keywords: Gen Z, Eating behaviour, BMI, Choices of food, Preferences of food.

**Annie Felicia et al.,**

INTRODUCTION

Generation Z refers to the emergence of persons born between 1996 and 2012. It's often abbreviated as "Gen Z." This generation of people came after Millennials and precedes Generation Alpha. The oldest members of Generation Z are in their late 20s, with many having graduated from college, married, and beginning families, while the youngest could be as young as 12 years old. Psychologist Jean Twenge addresses Generation Z as the "iGeneration," consisting of people born between 1995 and the year 2012. They are frequently referred to as "Zoomers," which fascinatingly wasn't created after Zoom, the video chat service, but rather a play on the term 'boomers' and relates to the fast-paced character of Gen Z's upbringing, amidst the growth of technology and culture. (Meta's 2024). Instagram, Trend Talk predicts that in 2024, young individuals from India will have a substantial impact on cultural trends. (Times of India, December 2023). They are the first generation of "digital natives" never knowing a world without the internet. They are growing up during a decade of rapid digital development. As teens, Generation Z experienced the emergence of cellphones and virtual assistants. Among other technological advancements. This absorption makes them more willing to incorporate new technology into their products. Gen Z already uses AI in their everyday encounters. Nonetheless, 64% of respondents said they utilize AI in work, education, or in everyday life. The most common AI applications include brainstorming (cited by 39% of respondents), proofreading (33%), and data analysis (21%). A mere 19% said they used AI to create their drafts. (Rhea Kelly, 2024).

Eating Behaviour of Adults

The Adult's Eating Behaviour Questionnaire (AEBQ) captures eight eating behaviors among them being Culinary responsiveness, enjoyment of food, emotional overeating and desire to drink, satiety responsiveness and slowness of eating, emotional undereating, and food fussiness are some of the eating habits. Food should be equally nutritious and satisfying. This is so good for the taste buds and it also makes our bodies healthier. If you choose to consume fewer calories, it might have a detrimental impact on our health and everyday routines.

MATERIALS AND METHODS

Selection of The Survey Area And Sample

This survey was conducted among young ladies at Syed Ammal Arts and Science College. This college is located in Pullangudi village, Ramanathapuram Taluk, at (9.4217°N, 78.8531°E). Pullangudi hamlet is located 8 kilometers from Ramanathapuram and has a total population of 1519 people, of which 792 are male and 727 are female. There are around 368 houses in Pullangudi village. Approximately 150 students (150 females) were recruited for the study.

Tools Used For The Study

An organized survey based on the authors' pretest was used to acquire general information. In addition to employing accurate measuring skills, the College Students' height, weight, and body mass index (BMI) were assessed, and their nutritional status was classified using the Gomez chart and Broca's index. A Mini Nutritional evaluation Scale of thirty nutrition-related questions was used, which includes screening (10 questions), evaluation (20 questions) for nutrition status, and assessment (20 questions) for lifestyle behavior. Based on the responses, students were classified as having normal nutritional status, being at risk of malnutrition, or being malnourished.

RESULTS AND DISCUSSION

Age, Height, Weight And BMI of The Respondents

The sample's mean age was 19 years (19.5 ± 1.6), with the youngest at 17 and the oldest at 23. The sample's average height is 158 cm (158.2 ± 12.7) and its average weight is 33 kg (33.9 ± 16.4). Body Mass Index is one of the important criteria to understand the eating behaviour and lifestyle of the Gene Z. BMI of the participants was segregated into

**Annie Felicia et al.,**

three types based on the BMI index like Underweight, Normal and Overweight. The average BMI of the respondent is 20 (20.3 ± 15.7).

Nutritional Status

Nutritional status plays the major role in the eating behaviour of the Gen Z. The nutritional status consists of choices of food (Table 1.2) showing, healthy food - 58%, fast food - 15% and balanced diet - 27%, and daily (20%), weekly (49%) and occasionally (31%). Preferences of food homemade (86%), hotel (13%) online order (1%) from (Table 1.3). Similarly based on servings of fruits and vegetables were 63% daily, 22% weekly and 15% occasionally were shown by the (Table 1.4). The correlation between choice of food and BMI shows positively ($\gamma = 0.950$) perfect correlation. The significance in 2 tailed at 0.01 level is 0.00, it indicates the increase and decrease of the one variable reflects on the increase or decrease of another variable. Hence the choice of food is significantly related to the BMI of the respondents. Anthropometric assessments outperform other methods such as clinical indications of malnutrition, biochemical indicators, and physical activity as indicators of nutritional status (de Onis, 2000; Radhakrishna, 2012). Anthropometric measurements such as height (cm), weight (kg), are measured by using an appropriate standard tool. The mean and SD value of the age of the respondents in the sample was (19.5 ± 1.6), the average height of the sample is (158.2 ± 12.7) and average weight is (33.9 ± 16.4). The mean and SD of BMI was (20.3 ± 15.7). The current study's outcomes indicate that female students (58%) who were at normal weight had healthy eating habits. The study also found that among 100 adolescent girls, (27%) had inadequate nutrition, classified as underweight on the BMI Scale, and (18%) had poor eating habits, labeled as obesity. Indeed, college is a period of identity development and habit acquisition for students. The students had an average mean and SD of BMI (20.3 ± 15.7) which is categorized as obesity in accordance to the results obtained in this study. According to the choice of the food, the respondents were divided into healthy food lovers (58%), fast food lovers (15%) and those who prefer a balanced diet (27%). Foods heavy in sugar, salt, and flavor cause an increase in dopamine release. (34%) respondents reported that the main reason they consumed fast food was that it tasted delicious. Dopamine is the drive hormone, and it urges the brain to continue doing an addictive activity. The ideal blend of sugar, salt, fat, and synthetic flavorings and sweeteners in ultra-processed food causes enormous dopamine surges in the brain, making you want to keep eating it. Out of the respondents, 64% said they want healthy and safe food while the rest of the (2%) prefer instant foods and variety. Most of the college students are found to have a low dietary diversity that means they may not be able to achieve the recommended dietary intake thus contributing to weight gain leading to obesity (Brunt & Rhee, 2008).

A cross sectional study was conducted by Vaishali Pawar (2015) at Karachi to evaluate the food habits and lifestyle of medical students. The research results revealed that 97% of the students had consumed junk food, and 41.7% of them were overweight according to their BMI, which is higher than our estimate of 18%. The results of the investigation revealed that most of the samples, 71%, consumed fast food on a daily basis, and that 67% of the samples had three or more risk factors for coronary artery disease, 22% had two risk factors, and 11% had one risk factor for coronary artery disease, indicating that the study participants' fast food consumption leads to more risk factors for coronary artery disease. (Asha P. Shetty, March 2016) in Mangalore did a study on the consequences of fast food on health among adolescents and discovered that (13%) had low information, (69%) had moderate knowledge, and (18%) had adequate awareness about the implications of fast food on health. As claimed by (Anding *et al.*, 2001; Brunt & Rhee, 2008; Davy *et al.*, 2006; Hendricks *et al.*, 2004; Silliman *et al.*, 2004; Huang, *et al.*, 2003) a typical college student uses high amounts of sugars, fats, and salts in their diet while the use of fruits, vegetables and The percentage of respondents who do not eat fruit at least once a week was (13%) and do not eat vegetables (17%) according to WHO (2015). These statistics are lower than our findings in the present study; we found that the participants Gen Z consume fruits 20% and vegetables 63%. The survey revealed that majority preferred junk food for its taste (58%), easy to prepare (5%) and because of the influence of TV advertisements (51%). It also revealed that televisions have a greater impact on adolescents eating habits more than any other electronic device. Over fifty percent (65%) of food commercials feature beverages and desserts. Peer influence (42%) and some (3%) respondents preferred street food because no alternatives were available. Dairy (28%), Beverages 39 (15%), Bakery (42%), (67%) respondents consume fried food every day in their meal, while (15%) weekly and (8%) occasionally. A nationwide survey was conducted between 1,000 Gen Z and 1,000 millennial respondents (UN Culinary August, 2023), (33%) of Gen Z consider

Annie Felicia et al.,

themselves as skilled cooks which is higher in our findings (57%) compared to (47%) of Millennials (UN Culinary August, 2023). Almost (49%) are unwilling to prepare for others because they lack cooking skills, compared to only (43%) in our study. (86%) of respondents said they prefer to cook at home because it is healthier. (47%) of them still defines themselves as 'foodies.' Social eating is not popular with Gen Z, indicating that (64%), they are more likely to cook for themselves rather than for family, friends. (93%) use the devices to watch cooking videos. Although, Gen Z turn to various sites in as a way of learning new ways of preparing foods and also discovering new foods to prepare. 63% of Gen Z turns to YouTube for cooking aid. Indeed, seven out of every ten members of Gen Z indicates they have placed an order for food solely based on the pictures displayed on the online platform. As for health and weight loss, incorporating exercises and sports also can benefit the health of the person and minimize weights (Avenell et al, 2004). Globally, 68% of young adults cook differently from their parents, and also have different eating habits compared to their elders. Among these transformations, the most popular diets that the Gen Z follows include counting calories (27%), clean diets (26%), mindful eating (19%) and plant-based diets (19%) (Sara K. Kaylor, 2021). About, 77 % of the Gen Z has revealed that they snack at least once daily, with 34 % stating that they snack twice daily. Of those Gen Zers who snack, their primary motives for doing so are: they must eat/drink something (30%); they are bored (27%); or they need more energy (25%) (Madeline Macrae, 2021). (Sara K. Kaylor, 2021) said that currently 29% of Gen Z avoid sugars completely contrary to 14% Millennials, 16% Gen X'ers and 10% Baby Boomers. All in all, Gen Z is looking for food choices that are trendy and convenient as well as the fact that ordering online is much faster. As it stands, studies reveal that social media play a major role in the foods they purchase and consume. Based on the outcomes of the current study on the Gen Z population of SAASC College, it can be concluded that the findings of healthy diet was common among these Gen Z population. (86%) of students consume homemade foods. However, due to poor eating habits, obesity is caused by many reasons such as decreased physical activity, easy access to calorie rich foods, sleep cycle, certain drugs and genetic predisposition. Therefore, the results of the first study suggested an encouraging trend for future college students. A balanced diet is important when it comes to sustaining health and avoiding diseases that are associated with old age. This study is an effort to create the concept of "Healthy Eating Habits" and increase the Z-ers attention towards healthy food and to minimize the ill effect of unhealthy food habits in the coming generations. Familiarize more people with a broader perspective on eating behavior and expand the knowledge of behavior that is fundamental to human and other animal existence.

CONCLUSION

To summarize, the prevalence of overweight and obesity among people in India has increased significantly in a relatively short period of time. The majority of the overall change in overweight and obesity over the research period can be traced to changes in the coefficients of individual explanatory factors. This study has certain strengths and drawbacks. To the best of our knowledge, this is the first study to assess the trends contributing to changes in overweight and obesity among college students. By focusing on this unique method, it may be possible to better address factors related with malnutrition.

ABSTRACT

Life-threatening diseases among employees have become a significant global public health concern, impacting organizational success and growth. The rise of artificial intelligence (AI) offers an opportunity to predict health parameters, enhancing health management strategies. However, the application of machine learning (ML) in low- and middle-income organizations remains limited. In this study, we developed an Android mobile application and an internet-based framework that allow employees to input health metrics through smartwatches and receive real-time predictions for conditions like diabetes, hypertension, and hypoxia. Our system continuously monitors employee health and provides targeted treatment recommendations. We applied various ML algorithms, including Support Vector Machine (SVM), K-Nearest Neighbor (KNN), Logistic Regression, and Random Forest (RF), to assess performance. Random Forest outperformed the others with an accuracy of 98.3%, demonstrating superior disease prediction capabilities. This solution facilitates early disease detection, empowering employees to proactively manage their health. By offering real-time insights and predictions, our system improves employee wellness, contributing to a healthier, more productive workforce. Compared to existing methods, it provides more accurate and actionable predictions, benefiting organizations by enhancing overall health management.

Keywords: (SVM), K-Nearest Neighbor (KNN), Logistic Regression, and Random Forest (RF)

INTRODUCTION

The healthcare industry has been undergoing rapid technological advancements, leading to significant improvements in service delivery and patient care. One of the most important developments in recent years is remote health monitoring, which has emerged as a transformative tool in managing health conditions. This approach utilizes wearable devices, such as smartwatches, to track vital health parameters in real time. In this study, we focus on using smartwatches to monitor employees' health, collecting data from their wearable devices, including SpO2 levels, blood pressure, heart rate, and body temperature. This data is then transmitted to cloud storage for analysis using machine learning techniques. By detecting abnormal patterns in these parameters, we can predict the potential presence of life-threatening disorders, and if such conditions are detected, employees are promptly notified to seek immediate medical attention. A key enabler of this innovative healthcare solution is the Internet of Things (IoT), which provides a robust framework for building intelligent healthcare systems. The healthcare sector is rapidly evolving, driven by technological advancements and improved service delivery models. Today, it is possible to monitor a wide range of vital signs remotely, including cardiovascular rate, blood pressure, blood glucose levels, body temperature, respiration rate, cognitive function, and even unusual behaviors. Remote health monitoring, particularly through wearable devices, offers significant advantages, especially for individuals managing chronic conditions or prolonged diseases. Among the various methods of remote monitoring, the use of smartwatches stands out as one of the most advanced technologies, showcasing the creative potential of modern healthcare. Smartwatches are equipped with multiple sensors that enable users to track their health in real time, eliminating the need for frequent visits to medical facilities. These devices can monitor key indicators, such as blood pressure, heart rate, and oxygen saturation levels, and provide instant feedback on the wearer's health status. For employers, smartwatch-based remote health monitoring offers several important benefits. It allows for continuous monitoring of employees' health, enabling early detection of any abnormal conditions.

This proactive approach can help reduce health risks, minimize unnecessary hospitalizations, and improve overall employee well-being. By tracking vital signs in real time, employers can ensure that employees receive timely medical intervention when necessary, promoting a healthier workforce. In this study, we have chosen smartwatches as the foundation for our remote health monitoring system due to their affordability, ease of use, and practicality. These devices are compatible with popular platforms like Google Fit, and they can integrate seamlessly with a wide range of smartwatch models and mobile devices running Android or iOS operating systems. This accessibility makes the system not only cost-effective but also adaptable to a variety of use cases, making it a valuable tool for both individuals and organizations seeking to improve health monitoring and disease prevention.

This Research primary concerns and the key contributions of the proposed system are outlined below:

- Introducing a healthcare paradigm based on ML
- We propose a unified application framework that combines mobile apps with machine learning algorithms to continuously monitor employee health status.
- Monitoring employee health by tracking key metrics such as SpO2, blood pressure, and body temperature.
- Employing machine learning algorithms to classify employee health status and accurately predict conditions such as diabetes, hypertension, and hypoxia.
- By using this system, we can prevent sudden life loss and other critical health conditions among employees, thereby enhancing overall well-being and sustainability.

Related Works

K. R. Krishnan et al developed a machine-inspired IoT framework that uses machine learning algorithms for real-time heart disease prediction based on data from wearable IoT devices. Decision Tree, Random Forest, and Support Vector Machine (SVM) algorithms were employed to classify patients as either at risk or not at risk for heart disease. The system achieved an impressive 92% accuracy in predicting heart disease, proving its potential for early detection and timely intervention. J. A. Smith et al focused on predicting chronic diseases such as heart disease and diabetes based on IoT device data from sensors like heart rate monitors, glucose meters, and smartwatches. Heart Disease

**Naga Lakshmi Bose et al.,**

Prediction: The SVM algorithm performed the best, with an accuracy of 91% and an F1-score of 0.89. Diabetes Prediction: The Random Forest algorithm produced an accuracy of 87%, with an AUC score of 0.92. Hypertension Prediction: KNN achieved an accuracy of 84%, which was less optimal compared to the other algorithms but still useful for preliminary disease detection. S. T. Lee et al investigates a smart healthcare system that uses IoT sensors to monitor patient data in real-time, with the goal of predicting diseases such as heart disease, diabetes, and stroke. Heart Disease Prediction: The Logistic Regression algorithm performed with 92% accuracy, the highest among the models used in the study. It also showed an F1-score of 0.91. Stroke Prediction: The SVM model achieved 88% accuracy and an AUC of 0.89. Diabetes Prediction: The ANN model performed well with an accuracy of 90%, particularly excelling in detecting high-risk patients from glucose data. Multi-class Prediction: The Random Forest algorithm was used for a multi-class classification task to predict heart disease, diabetes, and stroke, yielding an accuracy of 84%. L. D. Martinez et al The study aims to develop a real-time disease prediction system using IoT sensors (such as heart rate monitors, ECG sensors, glucose meters) to predict diseases like heart disease, diabetes, and respiratory conditions. Heart Disease Prediction: Logistic Regression demonstrated the best performance, with 93% accuracy and an F1-score of 0.91 for heart disease detection. Diabetes Prediction: Decision Trees performed well with an accuracy of 88% and an AUC of 0.91. Respiratory Disease Prediction: The KNN algorithm achieved an accuracy of 85%, which was sufficient for real-time monitoring of patients with respiratory conditions. Multi-Disease Prediction: Random Forest algorithm excelled in handling multi-class disease prediction with 90% accuracy, leveraging the data from IoT sensors for heart disease, diabetes, and respiratory conditions. A. A. Kumar et al focuses on heart disease prediction using IoT sensors such as heart rate monitors, ECG devices, and wearables. The goal is to monitor heart health in real-time and predict the risk of heart disease using machine learning algorithms. Logistic Regression: Achieved 92% accuracy for heart disease classification and an F1-score of 0.89. It worked well for binary classification (diseased or not). SVM: Showed a 90% accuracy for heart disease prediction and had a sensitivity of 0.87 and specificity of 0.82. Random Forest: Performed with the best accuracy (94%) and high precision and recall for heart disease prediction. KNN: KNN achieved 88% accuracy, performing well for simpler models but less effective for detecting more complex cases.

R. S. Singh et research confirmed that machine learning algorithms integrated with IoT sensors can effectively predict and monitor diabetes in real-time. Among the algorithms tested, Random Forest provided the best performance with 94% accuracy for diabetes classification and monitoring. Decision Trees also demonstrated strong results with 92% accuracy and are useful in identifying high-risk patients. The Logistic Regression model provided good initial predictions, while SVM was effective in distinguishing between diabetic and non-diabetic patients. H. C. Lin et al Logistic Regression: Achieved an accuracy of 85% in classifying patients as either diabetic or non-diabetic. Random Forest: Showed an accuracy of 90%, performing the best among the tested algorithms and demonstrating robustness in classification tasks. Support Vector Machine (SVM): Achieved an accuracy of 88% with a precision of 0.87 and recall of 0.85, making it effective for detecting Type 2 Diabetes. K-Nearest Neighbors (KNN): Achieved 80% accuracy, performing reasonably well but less effective compared to Random Forest and SVM. P. P. Yadav et The research demonstrates the effectiveness of integrating IoT devices with machine learning algorithms to predict chronic diseases. Among the algorithms tested, Random Forest performed the best with 90% accuracy, followed by SVM with 87% accuracy. IoT devices played a critical role in providing continuous and real-time data, which significantly improved the accuracy and timeliness of predictions for chronic diseases. V. R. V. K. Kumar et al research demonstrates that federated learning, when combined with IoT devices, offers a privacy-preserving and accurate solution for predicting diseases such as heart disease, diabetes, and stroke. Random Forest was the most accurate algorithm, achieving 92% accuracy, while Logistic Regression, SVM, and KNN also performed well but with slightly lower accuracy. The use of federated learning allows this model to protect patient privacy while still producing highly accurate disease predictions, making it a promising solution for healthcare IoT applications. T. P. Deshmukh et al study demonstrates that integrating machine learning algorithms with IoT-based healthcare monitoring systems can be highly effective in disease detection. Random Forest outperformed other algorithms with 93% accuracy, followed by SVM (90%) and KNN (85%). The system allowed for real-time disease detection, providing proactive healthcare monitoring through wearable IoT devices. Vasana, A et al AI-based health monitoring using wearable devices demonstrated a high degree of accuracy in predicting hypertension and heart diseases with results ranging

**Naga Lakshmi Bose et al.,**

from 87% to 94%. ANNs showed the highest accuracy of 94%, indicating that deep learning can significantly enhance predictive capabilities in health monitoring applications. The integration of wearable IoT devices allows for continuous and real-time health data collection, enhancing the effectiveness of AI models for disease prediction. Berman, J et al paper highlights how smartwatches can be leveraged to continuously monitor a patient's health and detect conditions such as hypertension and cardiovascular diseases in real time. A variety of machine learning algorithms such as SVM, Decision Trees, Random Forest, and Neural Networks were reviewed for their application in health data analysis. The accuracy of algorithms varies but is generally in the high 80s to 90s percent, depending on the complexity and amount of data used. Johnson, F et al study emphasizes the need for thorough evaluation of machine learning models for continuous health monitoring via wearables. Gradient Boosting Machine (GBM) and Deep Learning (DL) models were found to be the most accurate, achieving 94% and 93% accuracy, respectively. Other algorithms like SVM, Random Forest, and KNN also showed good results, with SVM reaching 88% accuracy, RF reaching 92%, and KNN achieving 87%. The study advocates for the ongoing development of machine learning methods that can better handle real-time, continuous data from wearable devices to enhance predictive accuracy and early diagnosis. Zhao, X et al focuses on personalized health monitoring using wearable devices combined with machine learning techniques. ANNs provided the highest accuracy (95%) for disease prediction, followed by Random Forest (92%), and SVM (90%). These technologies enable real-time health monitoring and personalized recommendations, contributing to better disease prevention and management.

Emerging Technologies

Recent advancements in machine learning (ML) and Internet of Things (IoT) have significantly enhanced health monitoring through smartwatches. Deep learning models like CNNs and LSTMs analyze sensor data to predict heart disease and other health conditions. Federated learning ensures privacy by training models on local devices without sharing data. Edge computing allows real-time analysis directly on devices, reducing latency. These innovations enable continuous, affordable, and personalized health monitoring through wearable IoT devices. Anomaly detection and multimodal sensor fusion improve accuracy in identifying health issues. Among various health monitoring technologies, I have selected machine learning algorithms and IoT-enabled smartwatches as the focus of my research. These technologies offer an effective and cost-efficient solution for continuous health monitoring. By utilizing machine learning models for data analysis and leveraging affordable IoT smartwatches for real-time health tracking, this approach ensures both accuracy and accessibility in health monitoring, making it suitable for a wide range of employees including those in low-resource settings.

Proposed Method

In this study, we propose a health monitoring system that uses machine learning algorithms to predict hypertension stages and asthma. The system leverages data from wearable devices, including smartwatches, to track vital health parameters such as systolic blood pressure (SBP) and oxygen saturation levels (SpO₂), along with indicators of hypoxia. These health metrics serve as the key features for predicting disease conditions, specifically hypertension stages and asthma, which can be used for proactive healthcare management.

Key Features For Prediction

- **Systolic Blood Pressure (SBP)** This parameter is used to assess the stages of hypertension. Elevated SBP levels can help classify individuals into different stages of hypertension.
- **SpO₂ Levels** This refers to the oxygen saturation levels in the blood, used for asthma prediction. Reduced SpO₂ levels are typically indicative of respiratory issues.
- **Hypoxia** A binary indicator derived from SpO₂ levels
1 indicates hypoxia (SpO₂ < 90%)
0 indicates no hypoxia (SpO₂ ≥ 90%)

Figure 1 shows the login page of the application where users can enter their credentials, including the username and password, to authenticate and access the system. The design is simple and user-friendly, ensuring smooth interaction for first-time users.

Naga Lakshmi Bose et al.,

Hypertension Stages

Prediction Hypertension stages were predicted based on systolic blood pressure (SBP) and hypoxia:

Normal: SBP < 120 mm Hg

Elevated: SBP 120-129 mm

Stage 1 Hypertension: SBP 130-139 mm Hg

Stage 2 Hypertension: SBP ≥ 140 mm Hg

The system classifies individuals into these categories by analyzing their systolic BP data and determining whether they exhibit hypoxia, which often correlates with more severe hypertension.

$$\text{Hypertension Stage} = \begin{cases} \text{Normal} & \text{if SBP} < 120 \\ \text{Elevated} & \text{if } 120 \leq \text{SBP} < 130 \\ \text{Stage 1 Hypertension} & \text{if } 130 \leq \text{SBP} < 140 \\ \text{Stage 2 Hypertension} & \text{if SBP} \geq 140 \end{cases}$$

Hypoxia Indicator (Binary)

The hypoxia indicator is derived based on the SpO₂ levels:

SpO₂ < 90%: Hypoxia (represented as 1)

SpO₂ ≥ 90%: No Hypoxia (represented as 0)

$$\text{Hypoxia} = \begin{cases} 1 & \text{if SpO}_2 < 90\% \\ 0 & \text{if SpO}_2 \geq 90\% \end{cases}$$

Combining SBP And Hypoxia For Hypertension Stage Prediction

To predict the hypertension stage, the machine learning algorithm takes both Systolic Blood Pressure (SBP) and hypoxia indicator as input features. Based on the following formula, the model will assign the individual to the corresponding hypertension stage.

Machine Learning Models

The prediction for both Hypertension Stages and Asthma is carried out using machine learning algorithms. The model learns from the data, which includes SBP, SpO₂, and Hypoxia, and classifies individuals into the appropriate categories (Hypertension stages or Asthma status).

We apply the following algorithms to perform the predictions: Random Forest (RF): An ensemble method that aggregates multiple decision trees.

K-Nearest Neighbors (KNN): A non-parametric method that classifies based on the majority label of the nearest neighbors. Support Vector Machine

(SVM): A classifier that finds the optimal hyperplane to separate the data into different classes.

• Training Data

Given a dataset with features:

$$X = [\text{SBP}, \text{SpO}_2, \text{Hypoxia}]$$

Corresponding labels for **Hypertension Stages** or **Asthma Status**:

$$Y = [\text{Hypertension Stage}] \quad \text{or} \quad Y = [\text{Asthma Status}]$$

Prediction Process

After training, the model can predict the Hypertension Stage and Asthma Status for new data points based on SBP, SpO₂, and Hypoxia values.

- **Hypertension Prediction**

Using the trained model, the prediction formula for Hypertension Stage is:

$$Y = [\text{Hypertension Stage}] \quad \text{or} \quad Y = [\text{Asthma Status}]$$

- **Asthma Prediction**

For Asthma, the prediction formula is:

$$\hat{Y}_{\text{Asthma}} = f_{\theta}(\text{SpO}_2, \text{Hypoxia})$$

RESULTS AND DISCUSSION

In this study, we used four machine learning algorithms : Random Forest (RF), K-Nearest Neighbors (KNN), Support Vector Machine (SVM), and Logistic Regression (LR)—to predict Hypertension Stages and Asthma based on data collected from employee smartwatches. The key features used for prediction include Systolic Blood Pressure (SBP), SpO₂ levels, and Hypoxia (a derived binary indicator from SpO₂). The data was collected from employees to monitor their health parameters. The following provides a detailed analysis of the prediction results, performance evaluation, and insights from the machine learning models.

Performance Evaluation

The four machine learning algorithms were trained and tested on the dataset, with performance metrics such as Accuracy, Precision, Recall, and F1-Score calculated for both Hypertension Stages Prediction and Asthma Prediction. The results are summarized in the following tables.

Hypertension Prediction

Table 1 presents the performance evaluation for the prediction of Hypertension Stages using SBP and Hypoxia. Random Forest demonstrated the highest performance, with an accuracy of 96.5%. This was followed by SVM at 93.8%. The KNN model yielded an accuracy of 92.3%, while Logistic Regression achieved 92.0%.

- **Precision**

Random Forest exhibited the highest precision (96.2%), indicating that it made the fewest false positive predictions.

- **Recall**

Random Forest also had the highest recall (95.8%), indicating it was able to predict hypertension cases most accurately.

- **F1-Score**

Random Forest achieved the best F1-Score (96.0%), suggesting a balanced trade-off between precision and recall.

These results suggest that Random Forest is the most effective algorithm for classifying hypertension stages, likely due to its ability to model complex interactions in the data.

Asthma Prediction

Table 2 presents the performance evaluation for Asthma Prediction based on SpO₂ levels and Hypoxia.

Again, Random Forest outperformed all other algorithms, achieving 95.2% accuracy, followed by SVM at 92.8%, KNN at 91.6%, and Logistic Regression at 91.2%.

Naga Lakshmi Bose *et al.*,

- **Precision** Random Forest achieved the highest precision (94.8%), indicating its efficiency in making correct asthma predictions.
- **Recall** The recall for Random Forest (94.5%) was higher than other models, highlighting its ability to correctly identify asthma cases.
- **F1-Score** With an F1-Score of 94.6%, Random Forest demonstrated a good balance of precision and recall in asthma detection.

Performance Metrics

The following performance metrics are typically used to evaluate classification models

Accuracy The percentage of correct predictions out of all predictions made. It is calculated as

$$\text{Accuracy} = \frac{\text{True Positives (TP)} + \text{True Negatives (TN)}}{\text{Total Population (TP + TN + False Positives (FP) + False Negatives (FN))}}$$

Precision The percentage of positive predictions that are actually correct. Precision focuses on the number of false positives.

$$\text{Precision} = \frac{\text{True Positives (TP)}}{\text{True Positives (TP)} + \text{False Positives (FP)}}$$

Recall (Sensitivity) The percentage of actual positive cases that are correctly identified. Recall focuses on the number of false negatives.

$$\text{Recall} = \frac{\text{True Positives (TP)}}{\text{True Positives (TP)} + \text{False Negatives (FN)}}$$

F1-Score: The harmonic mean of Precision and Recall. It gives a balance between precision and recall and is particularly useful when the classes are imbalanced.

$$\text{F1-Score} = 2 \times \frac{\text{Precision} \times \text{Recall}}{\text{Precision} + \text{Recall}}$$

Area Under the Curve (AUC) / Receiver Operating Characteristic (ROC)

A plot that illustrates the performance of a classification model across all classification thresholds. The AUC score indicates how well the model distinguishes between classes. A higher AUC indicates better performance.

Performance Metrics For Hypertension Prediction

Here are the performance metrics for the prediction of Hypertension Stages (Normal, Elevated, Stage 1, Stage 2), calculated for each machine learning model (RF, KNN, SVM, LR):

Performance Metrics For Asthma Prediction

Here are the performance metrics for the prediction of Asthma (Normal, Asthma Suspected), using SpO2 levels and Hypoxiaas features:

Interpretation of Results

Random Forest (RF) again excels with 95.2% accuracy and 94.8% precision, indicating the model is highly effective at predicting asthma, with an AUC (ROC) score of 0.97.

SVM is strong in its Recall (91.3%), meaning it is good at identifying people with asthma, though Random Forest still leads in terms of Precision and F1-Score.

KNN performs adequately but is slightly less effective than RF and SVM, with an AUC (ROC) score of 0.93.

Logistic Regression performs the worst across all metrics, with 91.2% accuracy and the lowest AUC (ROC) of 0.92, suggesting it is not as effective in predicting asthma in comparison to other algorithms.

Naga Lakshmi Bose et al.,

Discussion on Performance

Hypertension Stages Prediction

The Random Forest (RF) algorithm outperforms the other models in predicting hypertension stages. This is likely due to the ensemble learning approach, where multiple decision trees work together to make predictions, capturing more intricate patterns in systolic blood pressure and hypoxia data.

Support Vector Machine (SVM) and KNN perform well but are less accurate and efficient than Random Forest. SVM, however, remains a robust choice for tasks requiring high precision in class separation.

Asthma Prediction

- Similarly, Random Forest (RF) is the top performer for asthma prediction, benefiting from its ability to handle complex interactions between SpO₂ levels and hypoxia.
- The AUC (ROC) score of 0.97 for Random Forest indicates that the model has an excellent ability to distinguish between normal and asthma-suspected cases.
- SVM is also highly effective for asthma prediction, demonstrating good recall and AUC scores.

CONCLUSION

This research presents a cost-effective health monitoring system using smart watches and machine learning algorithms to track essential health parameters such as blood pressure, heart rate, and SpO₂ levels. By leveraging wearable technology, the system provides employees with an affordable solution to monitor their health in real-time, enabling early detection of conditions like hypertension and asthma. With accurate predictions through algorithms like Random Forest and Logistic Regression, this system supports proactive health management, reduces healthcare costs, and enhances employee well-being. The approach offers a practical and sustainable way to improve health outcomes while minimizing costs. The ability to monitor health parameters affordably empowers employees to take control of their health, leading to better overall health outcomes and a more sustainable work environment. The comparison of machine learning algorithms for Hypertension Stages and Asthma Prediction highlights Random Forest (RF) as the most effective model in terms of accuracy, precision, and AUC (ROC). It provides the best overall performance for both tasks, suggesting its suitability for health monitoring applications using smartwatch data. The findings also underscore the importance of evaluating multiple algorithms to select the one that best fits the prediction goals, considering factors such as data complexity, class balance, and real-time prediction requirements.

ABSTRACT

The muscles of the chest wall are responsible for the physiological process of respiration. Their muscle strength can give us the estimation of the lung function and even the capacity of the lungs. The values of respiratory muscle strength vary as the height, weight and age changes of the individual. Thus it is essential to assess the normal reference values of adults male as well as female for identification of weakness of these respiratory muscles. 150 healthy adults equally including males and females were evaluated for their respiratory muscle strength using an aneroid manometer in sitting position. The subjects aged 45-65 years who were able to perform and understand the protocol were included in the study while those with acute or chronic respiratory affection, neurological disease even the smokers were excluded from the study. A total of 150 adults (75M, 75F) were enrolled in the study with the mean age of 56.98±7.00 and 57.58±6.91. Their average height was 164.86 ± 4.92 and 159.73 ± 2.78 and mean weight was 70.30 ± 3.49 and 61.11±3.98 respectively for both. An average body mass index of the study sample was 24.8±2.01 kg/m². The Maximum Inspiratory pressure (MIP) and Maximum expiratory pressure (MEP) was

**Tvisha Patel et al.,**

92.44 ± 4.84 and 85.51 ± 5.16 mm Hg in males while 69.29 ± 3.85 and 63.53 ± 3.03 mm Hg in females respectively. The normal values of MIP and MEP in males and females in healthy adult population are an essential reference data for comparing the age specific changes in the respiratory capacity.

INTRODUCTION

In this era full of increasing mortality due to affection of various systems, the respiratory system plays a vital role. The muscles of the chest wall are responsible for the physiological process of respiration. These are commonly termed as inspiratory and expiratory muscles of ventilation. The ones involved in the process of inspiration are called inspiratory muscles similarly those involved while expiration are the expiratory muscles. Inspiratory and expiratory muscles have their own strength just like other muscles in the body. Their muscle strength can give us the estimation of the lung function and even the capacity of the lungs.[1]. It becomes essential enough to identify the strength of these muscles as they hold a vital role and for evaluating the muscle strength there are several methods. The measurement can be done in several forms like pressure devices, manual muscle testing, electromyography studies and other invasive and even non-invasive techniques. The pressure measurement methods are further divided into trans diaphragmatic, nasal sniff pressures, mouth pressures and cough gastric pressure[2]. Mouth pressure measurements are one of the easy, convenient and reliable measurement tools for identifying the strength of respiratory muscles. These mouth pressures MEP are generated by the passive expiration that is when the alveoli elastically recoil after an active inspiration. The chest wall overall generates the pressure where the surrounding muscles are involved. The muscles which generate the mouth pressure during the inspiration are called the maximum inspiratory pressure(MIP) while the pressures which are generated at the mouth while forcefully performing expiration are called the maximum expiratory pressure (MEP). The inspiratory pressure always begins with the residual volume (RV) while the expiratory pressure measured is an estimation of the total lung capacity (TLC)[1]. These volumes and capacities are the air volumes accommodated in the lungs while a particular physiological event. Residual volume is the one where air in particular quantity is always present in the lungs. The total lung volume is that where the quantity of air is accommodated by the lungs[3].

The respiratory muscles work during the entire life span of a person rhythmically. They get affected due to multiple factors such as nerve palsy, various diseases like cardiac involvement, TIA, CAD, COPD, dyspnea, respiratory failure, neuromuscular diseases, chronic respiratory diseases, metabolic diseases, prolonged corticosteroid treatment and prolonged ventilation. In advanced stages, respiratory muscle weakness leads to pump failure and many more. These muscles get weakened but are not particularly diagnosed. The muscles even decrease their capacity of functioning due to reduced motor units firing. The altered mechanics of the muscles of respiration leads to increased air trapping in the lungs; this can lead to a sequential array of complications. Weakness of inspiratory muscles fail to take the air inside the lungs whereas the weakness of expiratory muscles lead to inability of the lungs to push the air outside the lungs which results in increased residual volume and deposition of increased CO₂ i.e. carbon dioxide in the lungs. MIP is indicative of ventilatory capacity and development of respiratory insufficiency. It is useful in assessing degree of abnormality and in monitoring inspiratory muscle weakness in individual patient's overtime. It evaluates the success of weaning patients from mechanical ventilation[4]. Expiratory muscle weakness leads to mucus retention due to impaired cough efficiency. It is even essential to identify the weakness of expiratory muscles as they are indirectly correlated to the lung capacity. The pressures generated are even the identifiable tools for flow rates. The American Thoracic Society (ATS) / European Respiratory Society (ERS)[5] define the parameters to use the manometers where they are likely to suggest the digital ones over the manual ones. The current available worldwide in the market is the Micro RPM (Respiratory Pressure Meter) which has a flanged mouth piece[6] and is used to measure the respiratory muscle strength effectively. There are other studies which have provided the effective

**Tvisha Patel et al.,**

measuring devices like the capsule sensing pressure gauge device. [6] which can measure only the MIP and thus not the MEP. One more device The AirOFit PRO™ has been found reliable enough to measure the respiratory muscle strength but it provides resistance while evaluating the strength which may lead to pseudo results [7] as it has been designed for dual purpose of diagnosing as well as training. The present study aimed at compiling an evaluating device for respiratory muscle strength in all patients with neurological, respiratory as well as the geriatric population. The device used medically used manometers and the highly efficient rubber tubes which can be comfortable for each patient population. This rubber tubes can be conveniently accommodated within the lips such as providing a better seal around the opening of the tube. The manometers used are the analogue aneroid manometer which is medically used in other devices such as sphygmomanometers. It is very cost effective, portable and readily available in the clinics as well as the hospitals. The device was found to be reliable with a correlation coefficient of 0.9 [8]. This device was further used to evaluate the healthy individuals for their respiratory muscle strength. The main aim of our study was to particularly identify the values of respiratory muscle strength in terms of MIP and MEP in the healthy adult population for the age of 45 -65 years where naturally the strength of muscles reduces as the age advances. Many articles are available in the literature to provide the reference values of the respiratory pressures and there are even equations to calculate the pressures but all these research studies provide the values for the populations of Chinese, Iranian, Malays, Caucasians, Brazilians [9] and many more. But somehow there is a vast difference in the values as the population changes. It could be probably due to the anthropometric relation with the MIP and MEP as the literature suggests a positive correlation of age, height, weight on the pressures. There are various studies which provide a normative value for the pressures of respiratory system and the measured values were thus compared with them [10,16]. The reference values that we use for comparison are on the foreign populations which differ in the values. A little is known about the reference values for the Indian population [17]. This makes it essential enough to propose the normal reference values of MIP and MEP for healthy adult Indian population.

MATERIAL AND METHODS

Study Design was an observational study where the Study Population was healthy adults. The Sample Size of the population was 121 adults. The study was carried out in the OPD setup at Arush Physiotherapy College, Ahmedabad. The healthy normal individuals aged 45 -65 years with the ability to understand instructions and follow the study program where both the genders that were willing to participate those found non-smokers were included in the study. The Subjects unable to perform due to any reason which were diagnosed subjects with respiratory tract infection within two weeks of data collection or identified patients with neurosurgical, musculoskeletal disorders, congenital or acquired cardiac or respiratory disease and doing routine respiratory exercises were excluded from the study. Initially the examiners were trained for collecting the data. They were the professionals from the same field of physiotherapy. The subjects were given a demonstrative as well as a brief understanding about the procedure and were asked to perform to clarify the doubts. All the subjects who were enrolled for the study were at first evaluated for personal details such as name, gender, occupation and age. Each subject was assessed for the height in terms of centimetres using the stadiometer, weight in terms of kilograms with digital weighing scale. The BMI (body mass index) was calculated as kg/m^2 . On the basis of the inclusion and exclusion criteria the healthy volunteers were observed for maximum inspiratory pressure (MIP) and maximum expiratory pressure (MEP). The device used for evaluation of the strength was aneroid manometer with rubber tube. The calibration was in mmHg which was further converted to cmH_2O by multiplying the results of mmhg with 1.3595. The subjects were in an upright sitting position with trunks supported and hips and knees flexed with feet's supported. The rubber tube was asked to hold in the mouth with a complete seal. After placing the nose clip the subjects were asked to breathe in deeply with a hold of maximum 1 second after a complete exhalation for MIP. Later the subjects were asked to expire as long as possible from maximum inspiratory capacity with a hold of one second for measuring MEP. The measurements were done thrice with a rest period of 1 minute between the readings. The score with the highest results were considered for statistical analysis. Statistical analysis to evaluate the qualitative as well as quantitative data was performed using SPSS 20 software (SPSS, Inc., Chicago, IL, USA). All data was expressed as mean \pm standard deviation.

Tvisha Patel *et al.*,

RESULTS

A total of 150 adults were enrolled in the study where 75 subjects were males and 75 subjects were females. The mean age for males was 56.98 ± 7.00 and that for females was 57.58 ± 6.91 in years with an average height for males being 164.86 ± 4.92 and 159.73 ± 2.78 for females which was in centimetres. The mean weight was 70.30 ± 3.49 and 61.11 ± 3.98 in kilograms respectively for both. An average BMI for the study sample was of 24.8 ± 2.01 kg/m² (Table 1). The MIP and MEP as found in males was 92.44 ± 4.84 and 85.51 ± 5.16 respectively. The respiratory muscle strength found females was 69.29 ± 3.85 and 63.53 ± 3.03 . (Table 2)

DISCUSSION

There are varied values for respiratory muscle strength in the literature. The differences are dependent on the population sample. Thus, it may be the reason for difference in the values as the population differs. The values of our study are similar to the ones in Indian Bangalore population[18]. According to various studies present the respiratory muscle strength depends on the age, height weight and other factors. Their studies provide a positive correlation between the personal factors described as above. The respiratory muscle strength even depends on other confounding factors such as machines used for the evaluation, the evaluator also. The position of the subject, motivation during the evaluation process, possible air leaks while performing the manoeuvre all may contribute for the results. There are studies which suggest that even the activity of the muscles surrounding the mouth generates a particular amount of pressure which may contribute to the results too[16]. Thus, to correlate a study conducted by Dayane Montemezzo *et al.*, where they had assessed for maximal respiratory pressures phase wise i.e. the mean, the plateau one, the peak pressure and the plateau variation. Their results were suggestive of a negative correlation with the phases and the values of MIP and MEP[19]. The studies on this respiratory muscle strength evaluations were conducted even to provide the number of attempts ideal for measuring the same. One done by Black and Hyatt *et al.*, [10]. Was with as less as two / three attempts while that done by Ringquist T. *et al.*, [20] is suggestive of as high as ten attempts. But it is practically not possible to use higher attempts when evaluating patients with neurological disorders or the ones with respiratory diseases. Thus, a best of three attempts were followed in our study to evaluate the values of MIP and MEP in males and females. Our study had further used analogue device over the digital ones as the margin of errors were found more in the digital ones as they set for the higher accuracy. Even the analogue ones use less bandwidth as compared to the digital one. The analogue device can measure both in one, whereas the digital ones have to use two separate devices to measure MIP and MEP differently. The device used for the study the aneroid manometer with a flexible rubber tube is cheap, easily available in all clinical setups as they are even found in sphygmomanometer. On analysing the results of the present study, the MIP and MEP values for males and females were assessed for healthy adults with the age group of 45-65 years of age. A significant difference was found in the values of MIP and MEP in males and females. This could be a possibility due to the effect of muscularity which says the increase in body weight will significantly increase the muscle strength and even affect the pulmonary functions. The study further stated the positive relation of weight with MIP and a similar positive relation of waist circumference with MEP[9]. Even the present study had the similar results as studied by Veena Kiran Nambiar *et al.*, where the advancing age reduces the respiratory muscle strength[18]. This possibly could be due to the changes in the thoracic cage as the age advances.

CONCLUSION

The normal values of MIP and MEP in males and females in healthy adult population are an essential reference data for comparing the age specific changes in the respiratory capacity. Moreover, these reference values can also be used to compare the severity of affection as in certain conditions like COPD or Stroke the respiratory muscle weakness is evident enough, which even can further postulate the utmost need of strengthening respiratory muscles similar to other muscles in the body.

Tvisha Patel *et al.*,

ACKNOWLEDGEMENT

I will be gratified to extend my thanks to the department of physiotherapy at Arush Physiotherapy College, Ahmedabad for providing me the space to conduct my data collection. I would further take the opportunity to thank Dr Harsh Patel, Directorat Arush Physiotherapy College for the constant support.

ABSTRACT

Diabetes mellitus Type 2 is a chronic condition affecting how the body processes blood sugar. The body either doesn't produce enough insulin or resists insulin. Due to physiological changes in that period. Diabetes mellitus type 2 can trigger BMI and CV endurance. To see the association of cardiorespiratory fitness with Body mass Index in type -2 Diabetics. A total number of 101 diabetic individuals aged above 44 years to 65 years were taken. The BMI was calculated for all 101 subjects and outcomes were measured. While taking the 6MWT priority the blood glucose level was measured and subjects were asked to walk for 6 min before and after the test different parameters (HR, PR, SpO₂, BP, Borg scale) were taken and Vo₂ max were calculated through the formula $15 \times (\text{HRmax} / \text{HRrest})$. A total of 101 participants participated in the study out of which 41 were male and 60 were female in which the mean BMI was 23.78 and the mean Vo₂max of male was 25.35 and followed by female was 18.07. The present study concluded that there was an increase in the BMI and a decrease in the CV endurance, besides that it also proves that the CV endurance of female was lower as compared to male.

Keywords: Diabetes mellitus Type 2, BMI, CV endurance.

INTRODUCTION

A class of metabolic disorders known as diabetes mellitus is typified by hyperglycaemia brought on by both excessive and insufficient glucose synthesis. Common symptoms include weight loss, polyuria, polydipsia, and occasionally blurred eyesight along with polyphagia. The condition is divided into multiple categories, but Type 1 (insulin-dependent diabetes mellitus) and Type 2 (non-insulin-dependent diabetes mellitus) are the two that are most commonly described. Damage to the pancreatic beta cells that produce insulin causes type 1 diabetes, which in turn causes a shortage of insulin. Because it is an autoimmune condition, beta cells are attacked and destroyed by the immune system. Approximately one-third of the vulnerability to type 1 diabetes is due to hereditary factors; the inheritance pattern is polygenic. Insulin resistance is a result of the body's fat, muscle, and liver cells not using insulin as efficiently as they should, which leads to type 2 diabetes mellitus (NIDDM). It typically affects middle-aged and older adults who are overweight or obese [1]. According to estimates, 462 million people worldwide—or 6.28% of the global population—have type 2 diabetes [2]. High visceral adiposity and a sedentary lifestyle have increased the incidence of type 2 diabetes (T2DM). In the general population, it is widely known that being overweight or obese increases the risk of cardiovascular disease in both men and women [3]. It is widely acknowledged that obesity and being overweight play a significant role in the onset of type 2 diabetes. Body fat is defined as abnormally increasing in obesity. In real life, this is calculated using the body mass index (BMI), which is calculated by dividing the height in meters squared by the weight in kilograms. Overweight is defined by the World Health Organization and the German Obesity Society recommendations as having a BMI of at least 25 kg/m². Pre-obesity is defined as having a BMI of 25 to 29.9 kg/m², whereas obesity is defined as having a BMI of 30 kg/m² or more. There are several measures, including the Astrand treadmill test, the beep test, the Harvard step test, and the maximal oxygen consumption test (VO₂ Max), that can be used to evaluate the cardiovascular endurance of diabetic patients [4]. One simple, low-cost, and repeatable test for life quality and exercise capacity is the ability to walk a predetermined distance. As a measure of exercise capacity, the six-minute walk test (6MWT) is currently frequently employed due to its simplicity and reliability. Patients easily accept this test, which is a straightforward assessment of physical capacity. Simple exercise tests have the primary benefit of not requiring special equipment, making them accessible to most medical facilities. When assessing functional exercise ability, the 6MWT is crucial. The 6MWT makes it possible to estimate a patient's maximal exercise capacity, which is equivalent to their capacity to carry out everyday tasks [5]. With type 2 diabetes, the majority of daily living activities are performed at submaximal effort, hence the 6MWT may accurately reflect functional exercise capabilities. The test can be used in a therapeutic setting to evaluate how various co-morbidities, such as depression, diabetes, arthritis, lung disease, and cognitive impairment, affect an older person's ability and endurance during exercise [6].

Aim and Objectives

The study aims to assess physical fitness levels among people with type-2 Diabetes.

Objectives

To evaluate the physical fitness levels among individuals with Type 2 Diabetes

MATERIALS AND METHODOLOGY

Participants in the observational trial were middle-aged individuals with type-2 diabetes who had had the disease for more than a year. According to the inclusion criteria, which included being between the ages of 44 and 65, being both male and female, having type 2 diabetes, and not having participated in any other study during the previous 12 months, the participants were gathered. Recent injuries, sensory loss or signs of diabetic neuropathy, and a diagnosis of any cardiovascular or respiratory disease removed the exclusion criteria. Before the trial started, participants willingly signed an informed consent form. Using particular metrics and tests, the degree of physical fitness among people with Type 2 Diabetes was evaluated in this study. Body composition was measured using the Body Mass

**Dwija Yagnik et al.,**

Index (BMI). The following formula was used to calculate it: $BMI = weight(kg) / height(m)^2$. The 6-Minute Walk Test was used to measure cardiovascular endurance (6MWT). Before performing the 6MWT, the participant's blood glucose level was measured to ensure safety during the test. Before initiating the test, baseline measurements of key parameters were recorded, including Heart Rate (HR), Pulse Rate (PR), Oxygen Saturation (SpO₂), Blood Pressure (BP), Perceived Exertion (Borg Scale) 6-Minute Walk Test: Participants were instructed to walk for six minutes at their own pace on a flat, hard surface. The distance covered during this time was recorded as an indicator of cardiovascular fitness. Post-Test Measurements: Immediately after completing the 6MWT, the same parameters (HR, PR, SpO₂, BP, Borg Scale) were measured again to evaluate the physiological response to exercise with a formula of $Vo2max = 15 \frac{HR(max)}{HR(rest)}$

STATISTICAL ANALYSIS AND RESULT

The statistical analysis for this study was conducted using IBM SPSS version 27.0.1 software. Microsoft Word and Excel 2010 were utilized to create graphs and tables. The study included 101 individuals diagnosed with Type 2 Diabetes Mellitus (T2DM), with a mean age of 53.4 years (SD = 6.45). The majority of subjects (68, or 67.3%) had had type 2 diabetes for two to five years. Only one person had T2DM for 11–15 years, whereas a smaller subset (32 people, 31.7%) had it for 6–10 years. This implies that most individuals were still in the early stages of the condition. The majority of participants (56 people, or 55.4%) were classified as overweight because their BMI fell between 25 and 29.9. Furthermore, 33 patients (32.7%) were obese, with a BMI in the 30–34.9 range. Males have a wide range of VO₂ Max values; the largest group (15 participants, 14.9%) falls between 15 and 20.09. Males' mean VO₂ Max suggests a moderate level of cardiorespiratory fitness. Compared to men, the majority of female participants (46, or 45.5%) had VO₂ Max values in the 14–19.9 range, indicating lower levels of cardiorespiratory fitness. This trend is further supported by the female mean VO₂ Max.

DISCUSSION

This study aimed to determine the prevalence of type 2 diabetes and how it affects patients' BMI and cardiovascular endurance. Diabetes can be viewed as a shift in BMI and cardiovascular endurance as well as a chance to re-evaluate and modify health-related behaviour habits. Patients with diabetes have an impact on their BMI and cardiovascular endurance because of their prolonged diabetes. Diabetes symptoms greatly impact BMI and decrease cardiovascular endurance. Furthermore, this can result in musculoskeletal damage and difficulties at work. The statistical analysis of the mean difference in BMI was 23.78, indicating that the patient with diabetes had a higher BMI. Georgia Colleluori *et.al* (2022) did a study on Pancreatic β cell function is a critical determinant of whether people with obesity develop type 2 diabetes. However, a progressive decline in β cell function causes a progressive decline in glycaemic control, resulting in prediabetes and ultimately type 2 diabetes [8]. Samuel Klein *et.al* (2021) also concluded that the accumulation of an excessive amount of body fat induces a constellation of metabolic abnormalities and diseases, including insulin resistance, atherogenic dyslipidaemia (high plasma triglyceride and low plasma HDL-cholesterol concentrations), non-alcoholic fatty liver disease (NAFLD), β cell dysfunction, prediabetes, and type 2 diabetes. In general, a progressive increase in BMI, which provides an index of adiposity, is associated with a progressive increase in the risk of developing type 2 diabetes [8]. Further, the cardiovascular endurance was taken through 6MWT of 101 subjects. In which the mean vo2max of male was 25.35. And the mean vo2max of female was 18.07. Here the result shows that the cardiovascular endurance of female is lower compared to male. Liu BB *et.al* (2022) concluded that with the increase in blood glucose levels and visceral fat, the indices of cardiopulmonary function decreased gradually [9]. J Exerc Rehabil (2016) suggested that the Findings from our study showed that the estimated VO₂ max is lower in patients with T2D compared to healthy controls [10]. Mohammad Salih *et.al* (2022) concluded that the compliance of the aorta plays a significant role in modulating coronary artery blood flow which has important consequences for myocardial work capacity and, therefore, leading to reduced exercise capacity we found that females compared to males have a lower 6MWD and estimated VO₂max. One plausible explanation is that muscle mass and therefore maximum leg-muscle force is lower for female than male [6]. Furthermore, the results

**Dwija Yagnik et al.,**

were obtained which reveal affection in BMI and low CV endurance of diabetic patients is usually affected by various musculoskeletal disorders. Moreover, referring to the results which further revealed that BMI and CV endurance were the affect amongst all other diabetic patients.

CONCLUSION

This study highlights that most individuals with Type 2 Diabetes Mellitus (T2DM) were in the early stages of the condition, with the majority being overweight or obese. Cardiorespiratory fitness, measured by VO₂ Max, showed gender differences: males had moderate fitness levels, while females exhibited lower levels. These findings emphasize the need for targeted interventions focusing on weight management and physical fitness, particularly for female patients, to improve T2DM outcomes and overall health.

Limitations

1. The study includes limited sample size which may not fully represent the diverse population of Type 2 Diabetes Mellitus patient
2. The study was conducted in a single location or institution, the findings might lack generalizability to broader populations.

Future Recommendations

1. Future studies should include a larger and more demographically diverse sample to ensure broader applicability of results.
2. Conduct longitudinal studies to track changes in BMI and CV endurance over time and their association with diabetes management.
3. Investigate the impact of targeted interventions, such as exercise programs or dietary modifications, on improving CV endurance and reducing BMI.

ABSTRACT

Hypertension is a common condition among older adults, often caused by age-related physiological changes such as arterial stiffness and reduced renal function. It significantly increases the risk of cardiovascular disease, stroke, and kidney failure. The DASH (Dietary Approaches to Stop Hypertension) diet is widely recognized for its effectiveness in lowering blood pressure. It emphasizes fruits, vegetables, whole grains, lean protein, and low-fat dairy while limiting sodium, saturated fats, and added sugars. Studies confirm its benefits, yet adherence in older adults can be challenging due to limited food access, financial constraints, and changes in taste and appetite. Personalizing the DASH diet to fit cultural preferences and nutritional needs enhances adherence and improves health outcomes. A systematic review analyzed five observational studies and randomized controlled trials on the DASH diet's effects on hypertensive elderly patients. Research included dietary interventions in elderly care facilities, where individuals with Stage 1 hypertension followed personalized DASH diet plans. Blood pressure, dietary intake, and nutrient levels were assessed before and after the intervention, with statistical analysis determining significance. Findings showed that adherence to the DASH diet led to significant reductions

Kottee Mohan Chandra Joshika et al.,

in systolic and diastolic blood pressure. A meta-analysis found an average decrease of 10 mmHg in systolic and 1 mmHg in diastolic blood pressure. The effect was more pronounced in individuals with higher baseline sodium intake. The diet's high levels of potassium, magnesium, and calcium contributed to its effectiveness. The DASH diet effectively manages hypertension in older adults by emphasizing nutrient-dense foods and sodium reduction. Implementing the diet requires considering individual dietary preferences, economic constraints, and education on meal planning to improve adherence. The DASH diet is a viable, non-pharmacological approach to lowering blood pressure in hypertensive elderly individuals. Personalized dietary modifications and educational support enhance adherence, leading to better health outcomes.

Keywords: DASH diet, Hypertension , Geriatrics , Blood pressure

INTRODUCTION

High blood pressure is a common problem for older adults, leading to serious health issues and increased risk of death. High blood pressure is a prevalent condition among older adults, affecting over 60% individuals aged 60 and above. This prevalence makes it a major risk factor for cardiovascular diseases, strokes, and kidney complications. As people age, their bodies experience changes that make them more susceptible to hypertension, including arterial stiffness, impaired blood vessel function, and changes in how the kidneys regulate sodium levels. The presence of poor diet, sedentary behavior, and obesity significantly increases the risk. High blood pressure is a significant health concern in older adults, making dietary interventions essential for effective management[1]. The DASH diet is a scientifically supported eating plan that helps manage blood pressure by emphasizing healthy nutrients. This diet focuses on fruits, vegetables, whole grains, lean proteins, and low-fat dairy, while limiting sodium, saturated fats, and added sugars. The DASH diet has been proven to lower blood pressure, as demonstrated by clinical research, which shows a decrease in both systolic and diastolic readings. Geriatric applications necessitate tailored approaches due to individual nutritional requirements, regional food choices, and medical factors[2].

The need for dietary adjustments

The DASH diet's effectiveness in lowering blood pressure is well-established, but adapting it for elderly individuals can be challenging. Dietary needs must be tailored due to factors like appetite loss, chewing challenges, digestive problems, and cultural eating habits[3]. Optimizing the effectiveness of diets for older adults requires taking into account nutrient bioavailability and potential medication interactions. This study examines the effects of tailored interventions on blood pressure management in elderly hypertensive patients.

The purpose of this review

This study examines the impact of a modified DASH diet on blood pressure in hypertensive older adults. The goal will be reached by examining clinical research, comparing dietary changes, and pinpointing factors impacting results[4].

METHODOLOGY

A systematic literature search was conducted using PubMed, Scopus, and Google Scholar. The search query regarding dash diet among hypertensive geriatrics. The 15 articles in last seven years of research articles (2012 – 2024) are included in this review. Research includes controlled trials, clinical trials, meta analyses, systematic reviews, and randomized control trials.

Kottee Mohan Chandra Joshika *et al.*,

Inclusion and Exclusion Criteria

Inclusion Criteria

Studies involving individuals aged 60 years and older, research on modified DASH diet interventions, randomized controlled trials (RCTs), and observational studies measuring blood pressure outcomes.

Exclusion Criteria

Studies focusing on younger populations, interventions not based on DASH principles, and research lacking quantitative blood pressure data.

Data Extraction and Analysis

Data was extracted regarding dietary modifications, sample sizes, study duration, and statistical tools used[5]. A comparative analysis was performed to evaluate variations in the effectiveness of different DASH-based adaptations.

RESULTS

Outcomes

This review examines the effects of modified DASH diets on blood pressure in older adults, drawing on research from randomized controlled trials, meta-analyses, and cohort studies. Research shows that dietary modifications lead to significant drops in both systolic and diastolic blood pressure[6].

The effects of DASH-based modifications

Dietary changes that lower sodium and increase potassium, magnesium, and fiber may improve blood pressure in older adults. Using region-specific grains, alternative proteins, and fortified dairy products can enhance adherence and positive outcomes[7].

Dietary Needs

Limiting sodium intake is crucial for lowering blood pressure, aiming for less than 1,500 mg per day. Potassium and magnesium are essential for maintaining healthy blood vessels and blood pressure. Both plant-based and lean animal protein are important for muscle health and can help prevent heart disease. Eating more fiber can benefit your gut health and help lower blood pressure[8].

Difficulties

Dietary restrictions can be challenging to maintain due to taste preferences and limited access to recommended foods. The cost of DASH-compliant foods may restrict access for some people. The importance of culturally tailored diets for long-term adherence[9]. The DASH diet, modified to address the specific needs of older adults, achieves similar or better blood pressure reduction than the standard DASH diet. Nutritional adjustments enhance the body's ability to break down food, absorb nutrients, and enjoy the food. Drinking enough water keeps your body hydrated, which is crucial for maintaining blood pressure[10]. The relationship between dietary fiber and gut health is linked to blood pressure regulation. Foods rich in certain components can help combat oxidative stress and inflammation, which are associated with high blood pressure.

Long-Term Viability

Geriatric care can effectively incorporate modified DASH diets for long-term adherence. Tailored meal plans and caregiver assistance contribute to sustainability[11].

**Kottee Mohan Chandra Joshika et al.,**

CONCLUSION

Key Findings

Dietary adaptations within modified DASH diets significantly lower blood pressure in hypertensive geriatrics.

Clinical Implications

Healthcare practitioners, such as nutritionists, doctors, need to prescribe tailored dietary adjustments to improve the management of hypertension in the elderly[12,13].

Future Directions

More large scale, long term studies are necessary to determine the effect of multiple modifications in various geriatric groups, promoting effective and feasible dietary approaches for hypertension control[14].

ABSTRACT

Blepharospasm, a focal dystonia, causes involuntary eyelid closure, impairing function and quality of life. While botulinum toxin (Botox) is the primary treatment, some patients experience persistent symptoms. This case study examines a holistic physiotherapy approach for managing refractory blepharospasm in a patient with hypertension and psychological stressors. A 58-year-old woman with chronic blepharospasm, unresponsive to Botox, underwent a three-week physiotherapy program combining Transcutaneous Electrical Nerve Stimulation (TENS), Infrared Radiation Therapy (IR), Sensory Integration with Slow-Stroke Massage, and Jacobson's Progressive Muscle Relaxation (JPMR). Pain and spasm severity were assessed using the Numerical Pain Rating Scale (NPRS) and Jankovic Rating Scale (JRS). Post-intervention, NPRS scores improved from 7 to 3 during activity and from 5 to 2 at rest, while JRS scores reduced from 3 to 1 for both severity and frequency, indicating significant symptom relief. This case suggests holistic physiotherapy may benefit chronic blepharospasm patients with persistent symptoms. Integrating these methods with standard care could improve outcomes. Larger studies are needed for validation.

Keywords: Blepharospasm, Facial Pain, Dystonia, Physiotherapy, Exercise

**Hiral Tikendrakumar Pandya et al.,**

INTRODUCTION

Blepharospasm is an example of focal dystonia which causes excessive blinking, eyelid closure, and serious impairment of function resulting from recurrent in nature involuntary activity of the orbicularis oculi muscles[1]. This illness may seriously compromise a patient's standard of life by contributing to pain, visual impairments, and social restrictions[2]. Benign essential blepharospasm (BEB) epidemiology reveals a hereditary and environmental factor-influenced frequency, with studies showing a greater occurrence in women and older adults[3]. Furthermore, epidemiological studies have brought attention to geographical and cultural variances in BEB [4][5], prevalence, and signs and symptoms. A popular subjective tool for evaluating pain severity in clinical and research settings is the Numerical Pain Rating Scale (NPRS)[6]. Patients can rate their discomfort on a 0–10 scale, with 0 denoting no pain and 10 denoting the worst agony possible, using this straightforward, dependable, and uncomplicated tool[7]. Another popular clinical instrument for determining the frequency and severity of blepharospasm, a focal dystonia marked by involuntary eyelid closure brought on by excessive contraction of the orbicularis oculi muscles, is the Jankovic Rating Scale (JRS). This scale, which was created by Dr. Joseph Jankovic, offers a standardized and objective way to assess the course of a disease and the results of treatment, especially in relation to botulinum toxin (Botox) injections[8]. Blepharospasm's precise aetiology is still challenging, with several variables contributing, such as microvascular shrinkage, sensory trigeminal nerve sensitivity, basal ganglia impairments, and external contributors including stress, exhaustion, or lack of moisture in the eyes[6]. The neurological structure that underlies cranio-cervical dystonia is additionally reinforced by emerging research that shows anomalies in the trigeminal sensory nuclear complex invest to the progression of the health problems[9]. Even though botulinum toxin (Botox) injections are still the most effective treatment for blepharospasm, some people still have pain and facial twitching that just won't go altogether even after receiving treatments[10]. According to studies, the complex pathophysiology of focal dystonia, which includes blepharospasm, typically calls for an integrated therapeutic approach[7]. Physiotherapy, psychological treatments, and tactile tricks are several instances of adjunct therapies that have demonstrated prospective effectiveness for improving patient outcomes and symptoms[8][9]. Programs for physical therapy specifically designed for people with dystonia have shown promise in improving functional abilities while regulating motor symptoms[10]. By addressing maladaptive movement patterns and coping processes, psychological treatments have also been evaluated as non-invasive treatment options that may benefit patients with adult-onset primary dystonia[9]. This case study addresses a holistic approach for treating blepharospasm in an individual who, in spite of having Botox injections, continued to have pain and facial twitches. To improve symptom control and quality of life, a multimodal treatment approach that addressed neuromuscular dysfunction and psychosocial variables was implemented, including physiotherapy, sensory retraining, and psychological treatments[9]. Given the intricate interactions between neurological, environmental, and psychological aspects in dystonia, a more comprehensive understanding of focal dystonia is necessary to create more effective treatment plans[10].

Review of literature

1. According to Annappan and Ramesh (2022), a patient with psychogenic blepharospasm saw a successful reduction in symptoms with the use of a comprehensive and multidisciplinary strategy that combined physiotherapy, relaxation techniques, and psychological assistance. For the best management, this case study emphasizes how crucial it is to treat the disorder's psychological as well as physical aspects.
2. A systematic physical therapy program was successfully shown by Van den Dool *et al.*, (2013) to boost motor control and reduce dystonic symptoms in cervical dystonia, a disorder that shares pathogenesis with blepharospasm. Owing to their findings, managing blepharospasm via structured physiotherapy programs may improve therapy outcomes and the quality of life for patients.
3. Bradnam and Barry (2013) emphasized how the trigeminal sensory nuclear complex affects sensory-motor processing and its role in the pathophysiology of cranio-cervical dystonia. Involuntary and repetitive eyelid contractions are the hallmark of chronic blepharospasm, a focal dystonia that frequently causes psychological suffering and functional impairment, developing focused therapy approaches requires an understanding of these neuroanatomical systems.

Hiral Tikendrakumar Pandya *et al.*,

4. In their 2016 study, Govindarajan *et al.*, examined the effectiveness of botulinum neurotoxin (Botox) as the main treatment for blepharospasm, highlighting how it reduces symptoms by obstructing neuromuscular transmission. But they also underlined how healthcare policy and budgetary limitations have a big impact on access to this medication, which has an impact on long-term patient care. Although Botox continues to be the gold standard, its waning effectiveness over time makes the investigation of complementary or alternative therapy necessary.
5. Jinnah *et al.*, (2013) examined the difficulties in studying and treating dystonia, highlighting the necessity of developing new therapeutic targets and improving interdisciplinary techniques. Their work promotes the incorporation of evidence-based holistic therapies to enhance the quality of life and long-term symptom control for people with chronic facial discomfort and blepharospasm.

MATERIALS AND METHOD

Study design Case Study, Study setting Sainath Hospital , Ahmedabad

Patient Profile

A 58-year-old woman who has had known hypertension for eleven years complained of persistent pain on her left side of her face, involuntary eyelid twitches, and periodic muscular twitches. Her symptoms began in 2018, which she initially disregarded. When they got worse, she went to her family medical professional, who prescribed diuretics (Mannitol), opiate analgesics (Pentodiol), antihistamines (Levocetirizene), anti-convulsant carbamazepine (Tegretol), benzo-diazepam (Clonazepam), muscle relaxants (Baclofen), and an MRI, which showed "Vascular loop abutting the cisternal segment of the trigeminal nerve bilaterally as well as nonspecific hyperintensities in the periventricular and deep white matter of the bilateral frontal and parietal lobes. After taking these drugs for two years, the patient stopped receiving treatment, despite intermittent recurrences of her symptoms. She saw another doctor in 2019 after losing her son to COVID-19, which exacerbated her symptoms. The doctor suggested a botulinum toxin injection in 2021 to treat facial muscle twitching, which greatly reduced the condition for 6–8 months before the symptoms returned. The patient's symptoms continued in spite of these treatments, and one of her relative's recommended physiotherapy, and hence she showed up for the same.

Intervention

A three-week (15 sessions over five days per week) holistic physiotherapy regimen was implemented which was as follows:

- Transcutaneous Electrical Nerve Stimulation (TENS)

Frequency - 2 Hz; Pulse width - 200 μ s; Duration - 20 minutes per session targeting the left orbicularis oculi muscles

- Infrared Radiation Therapy (IR)

Non-luminous IR on left side of face with eye protection; Duration - 15 minutes per session .

- Sensory Integration with Slow-Stroke Massage: Gentle stroking with cotton gauze for 15 minutes per session was given over left side of face with gentle strokes for all muscles.

•

- Jacobson's Progressive Muscle Relaxation (JPMR)

Systematic contracting and relaxing of facial muscles against resistance , was given for left side of face lasting 15 repetitions each exercise per session. The following muscles were included for exercise protocol: Frontalis, Corrugator Super celli , Orbicularis Oculi, nasalis, Buccinator and Mentalis. The exercise was given with the muscle action against manual resistance, contraction hold was taught for 10 counts followed by relaxation for next 5 counts.

RESULTS AND DISCUSSION

Outcome Measures:

- 1) Pain Assessment (Numerical Pain Rating Scale - NPRS)

Hiral Tikendrakumar Pandya et al.,

Table1 : Pre and post intervention outcome scores of nprs scale

PARAMETER	PRE- INTERVENTION	POST- INTERVENTION
NPRS AT ACTIVITY	7	5
NPRS AT REST	3	2

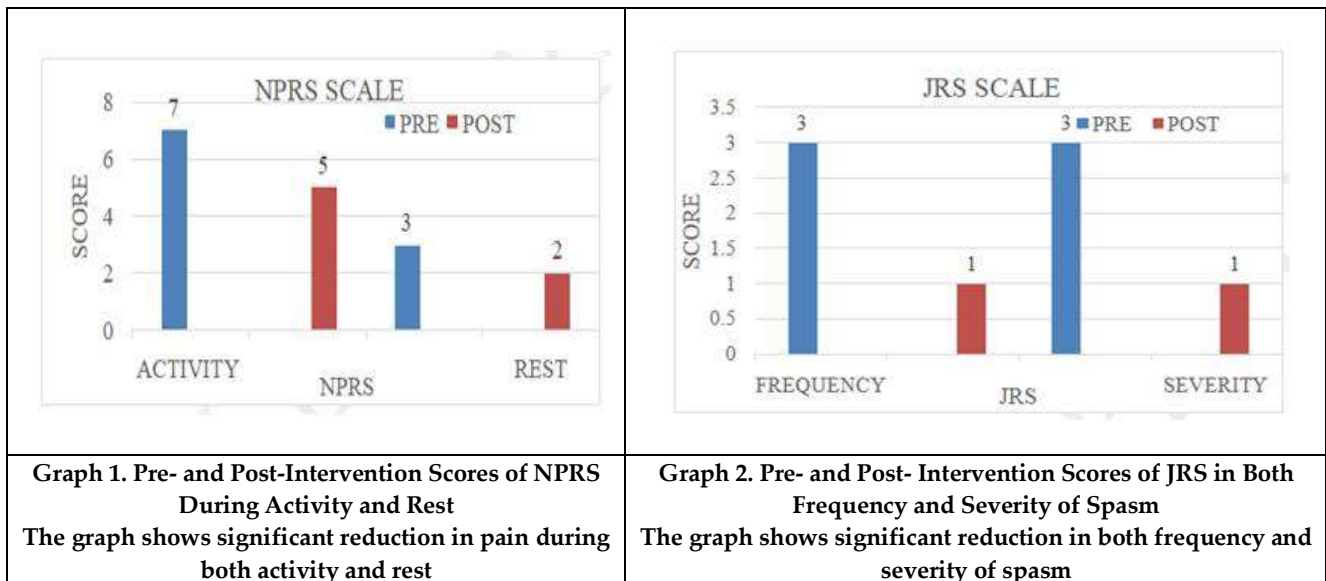

Table shows significant reduction in pain scale post intervention.

2)Spasm Severity (Jankovic Rating Scale - JRS)

Table2. Pre- and post- intervention outcome scores of JRS scale

PARAMETER	PRE- INTERVENTION	POST- INTERVENTION
JRS SEVERITY	3	3
JRS FREQUENCY	1	1

Table shows significant reduction in both severity and frequency of spasm on JRS scale

DISCUSSION

According to this study, using an integrative physiotherapy method greatly decreased muscle spasms and pain. According to Kannappan and Ramesh, TENS probably played a significant part by inhibiting pain signals and causing the production of endorphins, which resulted in natural pain alleviation. Aligning to the findings by Queiroz et al., infrared therapy may have decreased inflammation and enhanced blood flow. Whereas, sensory integration approaches may have been even more beneficial by calming psychological distress, encouraging relaxation, and activating mechanoreceptors parallelly aligning to the study by Bradnam and Barry, Similar to the advantages shown in organized physiotherapy programs for dystonia, strengthening the muscles in the face seems to improve motor control and coordination (van den Dool et al. In addition, Jacobson's Progressive Muscle Relaxation (JPMR) probably assisted in reducing muscle tension and enhancing mind-body awareness, which is consistent with the findings of Bernstein et al. (2016). These combined methods support more general findings indicated by studies by Govindarajan et al. (2016) and Jinnah et al. (2013) that rehabilitation tactics are beneficial for movement disorders. Taking everything to consideration, all these results support the notion that, in addition to traditional therapies, a comprehensive physiotherapy approach can be a useful means of managing dystonic symptoms. The enhancements

Hiral Tikendrakumar Pandya *et al.*,

noted in this study are consistent with mounting proof that combining relaxation methods, neuromodulation, and sensory re-education can provide significant alleviation. Future studies ought to examine the long-term effects of these medicines as well as the most effective ways to combine them with currently used therapies, such as botulinum toxin therapy.

CONCLUSION

The potential of a comprehensive, multidisciplinary strategy in the treatment of chronic blepharospasm is demonstrated by this instance, particularly in patients who also have concomitant conditions like hypertension and psychological stressors. Patient outcomes may be enhanced by combining alternative therapy with traditional treatments. To confirm these results and investigate the wider application of holistic approaches in the treatment of dystonia and related disorders, more investigation and long-term studies are advised.

ACKNOWLEDGEMENT

We acknowledge Sainath hospital, and Ahmedabad Physiotherapy College, Parul University for their support in conducting this study.

ABSTRACT

This paper presents a novel framework for a web-based academic advising system designed to streamline the academic guidance process, enhance student-advisor communication, and improve decision-making in educational planning to the students of Hafr Al-Batin University effectively and in a way that meets their needs. This system facilitates students' time and effort by eliminating the need to travel to the university and meet with academic advisors during the advisor's designated office hours. The proposed framework incorporates an accessible, user-friendly interface for students and advisors to collaboratively manage academic progress, tailored course recommendations, and personalized academic planning.

Key features include real-time communication and automated appointment scheduling ensuring up-to-date access to course availability and student records. The proposed model also addresses the limitations of traditional advising, such as limited accessibility and lack of personalized support, offering an efficient, scalable, and data-driven solution for academic institutions.

Keywords: Academic advising system, Web based systems, Automated appointment scheduling, Academic progress, University of Hafr Al-Batin.

INTRODUCTION

Academic advising [1] is a critical component of higher education, guiding students through complex academic paths, course selections, and career decisions. However, traditional advising methods often reliant on in-person meetings and manual processes can fall short in providing timely, personalized support for all students. By royal

**Asim Seedahmed Ali Osman**

order, the University of Hafr Al-Batin was established. (20937) dated 06/02/1435 AH in order to integrate with the other Saudi institutions for supporting the educational process and also to assist in carrying out the ambitious growth goals in the Kingdom of Saudi Arabia. The Colleges of Education for Girls in Hafr Al-Batin, Nairiyah, Qarya Ulya, and Al-Khafji had an academic impact from two prominent universities, the University of Dammam when they founded the University of Hafr Al-Batin. The King Fahd University of Petroleum and Minerals, which existed from its founding until the date of the university's declaration, was included under its jurisdiction, as were the Community College and University Colleges for Boys. Academic advising is widely recognized as a critical factor in promoting student success and retention. However, current advising models vary significantly, and there is limited information on how effectively these models serve students. In today's credit-based learning environment, a robust academic advising system has become essential for fostering student success by providing personalized guidance that enhances learning efficiency and effectiveness. Academic advising serves a vital role within academic institutions, helping students explore potential career paths, academic disciplines, and opportunities available within the college environment [2]. A well-developed advising system, offering comprehensive and accurate support, can benefit both students and faculty advisors. The dynamic nature of academic programs especially as requirements for general education and degrees evolve creates an ongoing challenge for advisors to stay informed and current [2]. This advising process is crucial for creating a supportive and relevant learning environment for students. However, advising can be a complex and time-intensive task for academic advisors due to the frequently changing nature of degree programs and institutional requirements. Despite these challenges, advisors strive to provide students with accurate, consistent, and up-to-date advising information [3-4]. Educational systems, therefore, need to evolve more rapidly than standard administrative systems, as they impact a wide range of students from an early age. An advanced advising system could bring significant improvements to the field, acting as an integrative framework that connects various aspects of the educational system, bringing together information and educational communities [5].

A university-focused web-based academic advising system can offer students and advisors a range of benefits, including enhanced communication channels, access to real-time academic data, and streamlined scheduling tools [6-10]. This approach empowers students to take greater control of their educational journey, enabling them to explore course options, degree requirements, and career paths at their own pace. Advisors, in turn, benefit from centralized access to student records and analytical tools that provide insights into academic progress and potential challenges. The integration of data analytics within these systems allows for early identification of at-risk students and timely interventions, contributing to improved retention and graduation rates. The framework proposed in this paper emphasizes accessibility, usability, and data-driven insights, targeting the specific needs of university students and faculty. In summary, the development of a university-focused web-based academic advising system represents a significant advancement in the academic support landscape. By leveraging digital tools and data insights, such a system can transform academic advising from a reactive, resource-intensive process into a proactive, student-centered experience [11-14]. The proposed framework aims to address the unique challenges faced by higher education institutions, ultimately supporting students in reaching their full academic potential while optimizing advisor time and resources. The development of a web-based academic advising system tailored for university settings is driven by several key objectives that aim to enhance the academic experience for students, faculty, and administrative staff. Below are the primary objectives of the proposed system

- To Enhance the Empowerment Engagement of Students
- To Improve the Academic Performance of students
- To computerize the Streamlined Advising Processes
- To make the academic advising as User-Centric Design and Accessibility
- To Continuously Improve and make it Adaptable.

LITERATURE REVIEW

The evolution of academic advising systems has progressed from traditional face-to-face advising to a digital format, addressing the growing need for accessible, personalized, and efficient advising in universities [15]. Literature in this

**Asim Seedahmed Ali Osman**

field emphasizes the critical role of advising in promoting student retention, engagement, and overall academic success. The shift towards web-based advising systems has been driven by the demands of an expanding student population and the need for streamlined advising processes. Academic advising, in its traditional form, has been recognized as a vital service in higher education, enabling students to make informed academic and career decisions. However, studies highlight limitations in traditional advising, such as inconsistent access to advisors, limited flexibility in scheduling, and high reliance on manual processes [8]. These limitations often result in a reactive, rather than proactive, approach to student support. With faculty and advisor time stretched thin, students face challenges in accessing timely guidance, particularly during peak times such as course registration periods [16]. Authors in [17] proposed a smart web-based tool with an intuitive interface designed to manage common advisory needs for specialized degree programs at the University of the West Indies (UWI), St. Augustine campus, under the Faculty of Science and Technology. This application goes beyond basic student support by integrating features for course advising, monitoring graduation requirements, and tracking oral exam eligibility. The authors emphasize the importance of the system's inference mechanism, made accessible through its Web Server (JWS), which powers these advisory functionalities. In recent years, web-based academic advising systems have emerged as a solution to these challenges, with research showing their effectiveness in improving both student outcomes and advising efficiency. Web-based systems offer centralized access to academic information, real-time communication tools, and streamlined processes for advisors and students. Such platforms provide features like digital course planning, automated reminders, and academic tracking, which help students navigate their academic paths more independently. The availability of these tools has been shown to improve student engagement with advising resources, allowing for a more proactive advising model [18].

Authors in [19] developed a Student Course Planning Software (SCPS) package using the Python programming language. This software assists students in choosing six suitable courses to register for in the upcoming semester. The selected courses are then saved in a file, which facilitates students' interactions with the university registration system. Authors in [13] describe the creation and implementation of an intelligent Course Advisory Expert System (CAES) that employs both rule-based reasoning (RBR) and case-based reasoning (CBR) to suggest courses for students to register for in a given semester. The recommendations are tailored based on the student's academic history. The evaluation of the CAES demonstrated effective performance, highlighting the reliability of its suggestions and overall user-friendliness. A novel academic advising mechanism developed by [20] is an intelligent system that leverages association rule mining to assist both students and advisors in choosing and prioritizing courses. This system aims to enhance students' academic performance by recommending courses that align with their current needs while simultaneously fostering their educational development. By analyzing past course registrations from numerous semesters, the system identifies connections between courses. It effectively produces a set of association rules that guide individual students in selecting courses that have been popular among similar students. Authors in [21] propose an intelligent system that utilizes association rule mining to assist students and advisors in course selection and prioritization. This system aims to enhance students' academic performance by recommending courses that align with their immediate needs while also contributing to their overall educational growth. By examining course registration patterns from previous semesters, the system identifies relationships between different courses. It effectively generates a list of association rules that aid individual students in choosing courses that have been popular among their peers.

Author in [22] introduce a Decision Support System (DSS) designed for student advising. The goal of this system is to offer students an automated program planning and scheduling service tailored to their individual profiles while adhering to academic requirements. Following a literature review and an overview of the system's architecture, the paper presents a novel approach that frames student advising as a search problem. In this model, the search space is illustrated through a decision tree that encompasses nearly all potential instances of a student's academic plan. The researchers highlight several advantages of this method compared to traditional rule-based advising systems. The decision tree [23] inherently incorporates numerous academic rules, facilitates a comprehensive exploration of various student plan instances, and allows for a systematic evaluation of the suitability of any given academic plan.

**Asim Seedahmed Ali Osman**

PROPOSED METHODOLOGY

There are various approaches that can be utilized to develop this system. In the proposed methodology, an iterative lifecycle model has been chosen as depicted in Figure 2 in order to manage the various development and implementation stages. The primary aim of this project is to streamline the academic advising process at the University of Hafr Al-Batin. By creating a straightforward interface for academic guidance, the system seeks to enhance communication and reduce the gap between students and their academic advisors. In this iterative development approach, we do not begin with a fully defined set of requirements. Instead, the process starts with designing and implementing only a specific portion of the system. This initial version is then reviewed, allowing us to assess additional requirements and make necessary adjustments. Our starting point focused on specific academic advising requirements, enabling the designer and programmer to create, implement, and test this version before presenting it to the client [24]. Each successive version of the system undergoes iterative refinements until the complete system is fully developed and prepared for deployment. Each iteration has a defined time frame, referred to as an iteration, which is dedicated to developing a particular set of requirements. At the end of each iteration, the model produces a functional version of the system, allowing us to release a working application after each cycle. This iterative cycle provides an executable version at each stage, steadily building toward the final, comprehensive system. The proposed model is designed to provide guidance to college students on academic matters through institutional representatives. This system encompasses a process for addressing complaints, evaluating situations, and offering suggestions. It features multiple user perspectives, including those for students, administrators, advisors, staff, and department heads. Each user role is granted specific privileges by the administrator, allowing tailored access to the necessary views for completing tasks required by the system. These customized views enable users to efficiently perform their functions with an easy-to-navigate interface and real-time capabilities. Figure 1. The proposed system functions as a central intermediary, seamlessly linking the pre-advising and advising processes with both the admin's office and the students. As shown in Figure 1, the proposed model demonstrates how it integrates with the current advising framework, helping to resolve common challenges. This enhanced approach includes a decision support system from the admin side, and a comprehensive course advising system, designed to facilitate informed choices and improve the overall advising experience. The entire system is connected through internet.

The advisor module along with the server is connected to the course registration and advising system along with the Head of the department and various students. Admin is responsible for all the operations throughout the proposed system. The proposed online advising tool features four primary user roles. These roles include the student who is receiving guidance; the advisor, who provides course recommendation, the head of the department who directs the advisor and the administrator, who oversees the system's operation and maintenance. In this model, the advisor gets the instructions from the head of the department, conducts course advising through an intermediary application server. This server facilitates smooth interaction and data flow between all parties involved. This structured approach enables efficient advising sessions while centralizing management and user access. Course registration may require academic advising, as well as review or approval from an advisor. The proposed system includes a built-in messaging feature that facilitates communication between students and teachers, allowing them to address any issues or questions related to the entire course. Figure 2. Figure 2 presents a Use Case Diagram for the academic advising system, showcasing the interactions between different users and the system. The diagram highlights the system's users, including the Head of Department, who has the ability to log in and access statistical reports that display the number of academic advising sessions completed by each faculty member in the department. This feature allows the Head of Department to effectively monitor faculty involvement in academic advising activities. The system also includes the student role, which allows students to initiate advising requests by viewing the list of available academic advisors, sending consultation requests to specific faculty members, and participating in remote advisory sessions with an academic advisor. Additionally, the system defines the Academic Advisor role, granting advisors specific privileges such as logging into the system, reviewing and approving consultation requests,

Asim Seedahmed Ali Osman

providing academic guidance, and updating their teaching schedules and advising availability. Following are the various operations done in the use case diagram for the proposed academic advising system

Use Cases

- **Log in** This allows all the users to access the entire system.
- **Show available advisors** This enables the student to view a list of available advisors after logging in.
- **Send Request** This allows the student to send an academic consultation request after selecting an advisor.
- **Accept the Request** This allows the academic advisor to approve the student's request on consultation.
- **Academic Consultation** This is the consultation session between the student and the academic advisor.
- **Show Reports** This enables the Head of Department to view reports on the system or user performance and to perform the necessary actions on them.

Relationships Between Use Cases

- There is an **extend** relationship between the "Send Request" and "Accept the Request" use cases which shows that accepting the request depends on the submissions from the students.

Process Flow Explanation

- **Student** The student logs in, views available advisors, and submits a request on consultation. If the request is accepted by the advisor, an academic consultation session is established.
- **Academic Advisor** The academic advisor logs in, adds their teaching schedule and advising hours in order to review the incoming requests further accepts them, and then provides a consultation to the student.
- **Head of Department** The head of the department has a special privilege to view system-related reports.

RESULTS AND DISCUSSION

The implementation of the web-based academic advising system aimed to streamline and enhance the advising process at the University of Hafr Al-Batin. The outcomes of testing and user feedback reflect improvements across multiple dimensions, including communication, accessibility, system functionality, and user satisfaction. Figure 3

The figure 3 illustrates the main interface of the proposed system, where users whether students, faculty members (academic advisors), or department heads can log in by entering their username and password. Figure 4 The figure 4 presents the student interface. When a student wants to reach out to a faculty member for academic advising, they see a list of faculty members in the department, each showing their academic rank and specialization. The interface displays each faculty member's name and details, along with an icon indicating their availability. If a faculty member is available, the "Request Academic Advising" button is active and highlighted in red colour. If they are unavailable, the button appears inactive and is shown in grey colour. Upon selecting "Request Academic Advising," a request is sent to the chosen faculty member, as demonstrated on the following screen. Figure 5 The figure 5 illustrates the interface for faculty members acting as academic advisors. Here, incoming requests from students are shown, providing details like the student's name, major, academic level, and the time the request was received. The advisor has two options: an "Approve" button to initiate a remote academic advising session, and an "Ignore" button to decline the request. The screen also includes information on previous advising sessions, including time spent on each request and relevant student details. Figure 6 When the faculty member approves the request for an academic advising session, the system transitions seamlessly into a virtual advising environment, as shown in figure 6. This feature facilitates an electronic meeting between the faculty advisor and the student, providing a structured, interactive platform for real-time communication. During this virtual session, both parties can engage in discussion, share resources, and review academic materials, making it possible to address the student's needs thoroughly. Figure 7 The figure 7 displays the department head's interface, which provides access to reports on all faculty members within the department. In this example, a particular faculty member is selected, and the report outlines details such as the total number of academic advising sessions conducted by that advisor, the number of issues addressed, and the count of requests that were either declined or ignored.

Asim Seedahmed Ali Osman

CONCLUSION

A web-based academic advising system represents a schematized approach to modernizing and enhancing the student advising experience. The proposed framework incorporates an accessible, user-friendly interface for students and advisors to collaboratively manage academic progress, tailored course recommendations, and personalized academic planning. This framework addresses common limitations of traditional advising by providing a centralized platform for accessible, personalized, and efficient academic support. By leveraging real-time data, automated scheduling, and customized guidance, the system empowers students to make informed academic decisions while enabling advisors to focus on meaningful, high-impact interactions. Ultimately, implementing such a system can strengthen student engagement, improve retention rates, and foster a more proactive advising culture. As universities evolve in response to digital advancements, this innovative solution serves as a vital tool in shaping a supportive, connected, and student-centered educational environment.

ABSTRACT

A subset of vertices L within a graph is referred as a Locating Detour Dominating (LDD) set if it fulfills two conditions: it functions as a Detour Dominating set, and for each vertex pair u and v that are not contained in L , their neighbourhoods within L are distinct. The Locating detour domination number of a graph, γ_d , represents the smallest cardinality among its LDD sets. A LDD set of order γ_d is said to be a γ_d -set of G . We propose this parameter, discuss its realization result, provide bounds for the γ_d number, and compute the γ_d number for various standard graphs.

Keywords: Detour, Distance, Dominating set, Detour domination, Locating domination

INTRODUCTION

Dominating sets serve as an important element in security models, where they will be employed to identify essential nodes for effective monitoring and object detection. Based on this foundation, PJ Slater introduced Locating Dominating (LD) sets to tackle challenges in network surveillance and locating objects [1, 2]. LD sets not only control over the network but also possess the capability to point out precise object locations uniquely, considering their adjacency to dominating nodes. Imagine a network employing standard Locating Dominating sets for surveillance, assuming direct pathways between points. However, in reality, detours occur due to obstacles or individuals' own choice, potentially evading detection. If surveillance systems are designed solely for direct routes, these detours

Jeba Ebenezer and Vijaya Xavier Parthipan

might escape notice. To address this issue, we propose Locating Detour Dominating Sets (LDD), which address the challenges posed by detour pathways in various applications, particularly in scenarios where direct paths can be bypassed. Several other domination parameters dealing with detour paths are explored in [3, 4]. The wide range of applications that this notion offers serves as the driving force for our investigation. Applications for LDD sets include disaster response, urban planning, communication networks, transportation systems, traffic monitoring, and surveillance for tracking threats via detours.

PRELIMINARIES

This research explores finite simple connected graphs denoted as $G = (V, E)$, each containing at least two vertices. We direct readers to consult [5] for definitions and basic terms not elaborated here.

The maximum number of edges that are required to be travelled from x towards y along a path without revisiting any vertices is represented by the Detour distance $D(x, y)$ [6].

Definition 2.1.

A detour dominating set [7] (DD-set) is a set $L \subseteq V(G)$ that fulfils the following two requirements:

- (i) Detour Set [8]: All vertices of G is situated on a detour path linking some vertex pair in L .
- (ii) Dominating Set [9]: All the vertices in G are either neighbours of a vertex in L or they are members of L .

A γ_d -set is the lowest cardinality set among all the DD sets. The cardinality of a γ_d -set is called the Detour Domination number (γ_d).

Definition 2.2[2]. A Locating Dominating Set (LD-set) of G is a set $L \subseteq V(G)$ fulfilling two conditions: first, L must be a dominating set, and for any vertex u and v not in L , their respective neighbourhoods intersecting L must be distinct, denoted as $N(u) \cap L \neq N(v) \cap L$. Among these sets, the one with the minimum cardinality is termed as a γ_l -set and the cardinality of such a γ_l -set represents the Locating Domination Number, denoted as $\gamma_l(G)$.

The following theorem serves as a valuable tool in establishing our results.

Theorem 2.3[10]. All end vertices of G are included in every DD set.

MAIN RESULTS

Definition 3.1.LOCATING DETOUR DOMINATION NUMBER

A subset L of $V(G)$ is termed as a Locating Detour Dominating (LDD) set if it fulfils two conditions: it serves as a Detour Dominating set, and for every vertex pair u and v not in L , their neighbourhoods intersecting L are distinct. The Locating Detour Domination number ($l\gamma_d$) is the minimum cardinality of its LDD sets. A LDD set with $l\gamma_d$ vertices is referred to as a $l\gamma_d$ -set of G .

Example 3.2. Referring to the graph G illustrated in fig. 1, $\{v_2, v_{10}\}, \{v_2, v_9\}, \{v_1, v_9\}, \{v_2, v_{10}\}$ forms the only four minimum detour sets of cardinality 2. $\{v_2, v_5, v_{10}\}, \{v_2, v_6, v_{10}\}, \{v_2, v_5, v_9\}, \{v_2, v_6, v_9\}, \{v_1, v_5, v_9\}, \{v_1, v_6, v_9\}, \{v_2, v_5, v_{10}\}, \{v_2, v_6, v_{10}\}$ are the eight minimum DD sets of cardinality 3. Therefore, $\gamma_d(G) = 3$.

Also, $L_1 = \{v_2, v_4, v_7, v_{10}\}, L_2 = \{v_2, v_4, v_7, v_9\}, L_3 = \{v_1, v_4, v_7, v_9\}, L_4 = \{v_2, v_4, v_7, v_{10}\}$ are the only four minimum LDD sets of cardinality 4. Hence $l\gamma_d(G) = 4$

Remark 3.3. In any connected graph G , comprising of n vertices, it can be established that,

1. $l\gamma_d(G) \leq n$. The equality holds iff $G = K_2$.
2. $\gamma(G) \leq l\gamma_d(G)$.
3. $\gamma_l(G) \leq l\gamma_d(G)$.
4. $\gamma_d(G) \leq l\gamma_d(G)$. The equality is preserved if $G \in \{K_{1, n-1}, F_n\}$.

Jeba Ebenezer and Vijaya Xavier Parthipan

Theorem 3.4. In any connected graph G , comprising of n vertices, it holds that $2 \leq \gamma_d \leq l\gamma_d \leq n$.

Proof: A minimum of two vertices are required to constitute a DD-set and so $\gamma_d(G) \geq 2$. According to the definition of LDD sets, $V(G)$ can itself form a LDD set. Hence $l\gamma_d \leq n$. Every LDD set is obviously a DD set. Therefore, $\gamma_d \leq l\gamma_d$. Thus, $2 \leq \gamma_d \leq l\gamma_d \leq n$.

Theorem 3.5. In any connected graph G , having $n \geq 3$ vertices, it holds that $l\gamma_d \leq n - 1$.

Proof: The condition $n \geq 3$ excludes the graph K_2 which is the only graph that has $l\gamma_d = 2 = n$. Therefore, when $n \geq 3$ we have $l\gamma_d(G) \leq n - 1$.

Theorem 3.6. In any connected graph G , consisting of $n \geq 3$ vertices, it holds true that $l\gamma_d(G) = n - 1$ iff G is either the Complete graph K_n or the star graph $K_{1,n-1}$.

Proof: Let L be the $l\gamma_d$ -set of order $n - 1$ and $V - L = \{x\}$.

Consider G to be a graph that is neither a Complete Graph nor a star graph. Then a vertex x has to exist such that $d(x) \leq n - 2$. This indicates the existence of at least one vertex in L which is not a neighbour to x . Let $Y = L - N(x) \neq \emptyset$ and $y \in Y$. Since $|L| = n - 1$ and G is connected, $y \in L$ must have atleast one neighbour say $z \in L$. Now z is a neighbour to y but y is not a neighbour to x . Hence $L - \{z\}$ can form $l\gamma_d$ -set as $N(z) \cap (L - \{z\}) \neq N(x) \cap (L - \{z\})$ which contradicts the minimality of L as an $l\gamma_d$ -set, as we have found a smaller set $L - \{z\}$ that still satisfies the conditions. This means that G is either a Star graph or a Complete graph.

Conversely, Consider G as the graph K_n . Given that each vertex is connected to every other vertex, it follows that the neighbouring sets of all pair of vertices are identical. Therefore, we must select atleast $n-1$ vertices to form a LDD set. Hence $l\gamma_d(G) \geq n - 1$. Also, by theorem 3.5, $l\gamma_d(G) \leq n - 1$. Thus, $l\gamma_d(G) = n - 1$.

Consider G as the graph $K_{1,n-1}$. All the $n - 1$ end vertices belongs to the LDD set and by theorem 3.5, we have $l\gamma_d(G) = n - 1$.

Theorem 3.7. Consider any connected simple graph G of order n . If $n \geq 4$ and no vertex u exists in G such that $d(u) = n - 1$ then $l\gamma_d(G) \leq n - 2$.

Proof: The condition of having no vertex with $d(u) = n - 1$ excludes the graphs K_n and $K_{1,n-1}$ which are the only graphs with $l\gamma_d = n - 1$. Hence $l\gamma_d(G) \leq n - 2$.

Analysing LDD Number For Standard Graphs

Theorem 3.8. For every Path graph P_n having $n \geq 5$ vertices, $l\gamma_d(P_n) = \left\lceil \frac{2n+2}{5} \right\rceil$

Proof: Consider the vertices of Path graph as $\{x_1, x_2, \dots, x_n\}$. Let L contains the vertices $\{x_{5i-1}, x_{5i+1}, i = 1, 2, \dots\}$. By theorem 2.3, the end vertices x_1 and x_n must belong to the L . Hence $|L| = |\{x_{5i-1}, x_{5i+1}, i = 1, 2, \dots\} \cup \{x_1, x_n\}|$

Case 1: $n \equiv 0 \pmod{5}$. That is, $n = 5k$.

In this case the set L consists of the vertices $\{x_1, x_4, x_6, x_9, x_{11}, \dots, x_{n-1}, x_n\}$. That is, between x_2 to x_{n-4} , two (x_{5i-1}, x_{5i+1}) in every five consecutive vertices has been selected. From these $n-5$ vertices L contains $\frac{2(n-5)}{5}$ vertices. After this selection, the vertices $x_{n-3}, x_{n-2}, x_{n-1}$ will be left out. For L to become LDD set, the vertex x_{n-1} has to be in the set to dominate the vertices x_{n-2}, x_{n-1} as $x_{n-1} = x_{5k-1}$. Also, x_1 and x_n are in L . Hence $|L| = \frac{2}{5}(n - 5) + 1 + 2 = \frac{2n-10}{5} + 3 = \frac{2n-10+15}{5} = \frac{2n+5}{5}$.

Case 2: $n \equiv 1 \pmod{5}$, That is, $n = 5k+1$.

For this case, L comprises of the vertices $x_1, x_4, x_6, x_9, x_{11}, \dots, x_{n-2}, x_n$. That is, from x_2 to x_{n-5} , two vertices (x_{5i-1}, x_{5i+1}) are chosen in every five consecutive vertices. From these $n-6$ vertices, L contains $\frac{2}{5}(n - 6)$ vertices. After this selection, the vertices $x_{n-4}, x_{n-3}, x_{n-2}, x_{n-1}$ are left out. The vertex x_{n-2} must be included to dominate x_{n-2} and x_{n-3} , as $x_{n-2} = x_{(5k+1)-2} = x_{5k-1}$. Additionally, x_1 and x_n are in L . Hence, $|L| = \frac{2}{5}(n - 6) + 1 + 2 = \frac{2n-12}{5} + 3 = \frac{2n-12+15}{5} = \frac{2n+3}{5}$.

Jeba Ebenezer and Vijaya Xavier Parthipan

Case 3: $n \equiv 2 \pmod{5}$. That is, $n = 5k+2$.

In this case, L contains the vertices $\{x_1, x_4, x_6, x_9, x_{11}, \dots, x_{n-1}, x_n\}$. From x_2 to x_{n-1} , two (x_{5i-1}, x_{5i+1}) in every five consecutive vertices has been selected. From these $n - 2$ vertices L has $\frac{2}{5}(n - 2)$ vertices. Also, x_1 and x_n are in L. Hence $|L| = \frac{2}{5}(n - 2) + 2 = \frac{2n-4}{5} + 2 = \frac{2n-4+10}{5} = \frac{2n+6}{5}$.

Case 4: $n \equiv 3 \pmod{5}$, That is, $n = 5k+3$.

L has the vertices $\{x_1, x_4, x_6, x_9, x_{11}, \dots, x_{n-2}, x_n\}$. Between x_2 to x_{n-2} , two (x_{5i-1}, x_{5i+1}) in every five consecutive vertices has been chosen. From these $n - 3$ vertices L has $\frac{2}{5}(n - 3)$ vertices. Also, x_1 and x_n are in L. The left out x_{n-1} will be dominated by x_n . Hence $|L| = \frac{2}{5}(n - 3) + 2 = \frac{2n-6}{5} + 2 = \frac{2n-6+10}{5} = \frac{2n+4}{5}$.

Case 5: $n \equiv 4 \pmod{5}$, That is, $n = 5k+4$.

In this case, L contains the vertices $\{x_1, x_4, x_6, x_9, x_{11}, \dots, x_{n-3}, x_n\}$. Between x_2 to x_{n-3} , two (x_{5i-1}, x_{5i+1}) in every five consecutive vertices has been chosen. From these $n - 4$ vertices L has $\frac{2}{5}(n - 4)$ vertices. Also, x_1 and x_n are in L. Hence $|L| = \frac{2}{5}(n - 4) + 2 = \frac{2n-8}{5} + 2 = \frac{2n-8+10}{5} = \frac{2n+2}{5}$.

Clearly, L is a DD-set. For any vertex pair u and v not in L must be adjacent to either the end vertices or the vertices $\{x_{5i-1}, x_{5i+1}, i = 0, 1, 2, \dots\}$. In any case, $N(u) \cap L \neq N(v) \cap L$. Thus, L satisfies the condition of being an LDD set. Now, $\left\lceil \frac{2n+2}{5} \right\rceil$ covers the entire range of fractions from $\frac{2n+2}{5}, \frac{2n+3}{5}, \frac{2n+4}{5}, \frac{2n+5}{5}, \frac{2n+6}{5}$. Hence $|L| = \left\lceil \frac{2n+2}{5} \right\rceil$.

Results 3.9.

1. For any Wheel graph W_n with $n \geq 7$, $l\gamma_d(W_n) = \left\lceil \frac{2n-3}{5} \right\rceil$.
2. For all Cycle graph C_n having $n \geq 6$ vertices, $l\gamma_d(C_n) = \left\lceil \frac{2n-1}{5} \right\rceil$.

Theorem 3.10. For the Complete Bipartite graph $K_{n,m}$ with $n, m \geq 2$, $l\gamma_d(K_{n,m}) = n + m - 2$.

Proof: Let $X = \{x_1, x_2, \dots, x_n\}$ and $Y = \{y_1, y_2, \dots, y_m\}$ be the bipartition of the vertex set of $K_{n,m}$. Consider the set L containing all but one vertex from X and all but one vertex from Y. Therefore, $|L| = n + m - 2$. We claim that L is a minimum LDD set of $K_{n,m}$. Clearly, L is a DD-set. For the remaining two vertices x_n and y_m not in L, x_n is a neighbour to all the vertices of Y that are in L and y_m is a neighbour to all the vertices of X that belongs to L. This ensures that $N(x_n) \cap L \neq N(y_m) \cap L$. Therefore, L constitutes a LDD set of cardinality $n + m - 2$.

Theorem 3.11. In any Friendship graph F_n , consisting of $n \geq 2$ vertices, it holds that $l\gamma_d(F_n) = n$.

Proof: The graph F_n has one central vertex of degree $2n$ adjacent to n path graphs P_2 . Consider the set L containing any one vertex from these n path graphs P_2 . Therefore, $|L| = n$. Clearly, L is a DD-set. For any distinct vertex pair u and v not in L (excluding the central vertex), each vertex must be adjacent to its corresponding vertex in P_2 that belongs to L. This ensures that $N(u) \cap L \neq N(v) \cap L$, as the neighbourhoods intersect with L only at the vertices chosen from P_2 . The central vertex say w is a neighbour to all the n vertices in L. Hence for every vertex pair $u, w \in L$, $N(u) \cap L \neq N(w) \cap L$. Suppose there exists a smaller LDD set L' of order less than n . Let $|L'| \leq n-1$. Consider any vertex u adjacent to the central vertex but not in L' . Since L' is smaller than L, there must exist at least one path graph P_2 not containing any vertex from L' . Let's denote this path graph as P'_2 . Now, for any vertex u, v in P'_2 not in L' , their neighbourhoods does not intersect with any vertex from L' . Thus, $N(u) \cap L' = \emptyset = N(v) \cap L'$, violating the condition for an LDD set. Therefore, L' cannot be a LDD set of F_n if $|L'| < n$. Hence the constructed set L containing one vertex from each of the n path graphs P_2 is minimal and forms the smallest LDD set of order n for the friendship graph F_n .

Theorem 3.12. For the Helm graph H_n with $n \geq 3$, $l\gamma_d(H_n) = n + 1$.

Proof: Consider the Helm graph H_n , which is formed by joining each vertex in the wheel graph's outer cycle with a pendant vertex. Let L be a set containing the central vertex of the wheel graph and all the pendant vertices. Therefore, $|L| = n+1$. Clearly, L is a DD-set. Any vertex pair u and v not in L must be adjacent to their corresponding distinct pendant vertex as well as the central vertex that belong to L. Therefore, $N(u) \cap L \neq N(v) \cap L$ for any vertex pair u, v

Jeba Ebenezer and Vijaya Xavier Parthipan

not in L . Thus, L satisfies the condition of being an LDD set. Suppose there exists a smaller LDD set L' of order less than $n+1$. Since all the pendant vertices belongs to the DD-set, the central vertex must not be in L' . But this implies L' can not dominate the central vertex, violating the condition of being a dominating set. Therefore, L' cannot be a LDD set of H_n if $|L'| < n + 1$.

REALISATION RESULT

Theorem 3.13. For any three set of integers $n \geq 4, p, q$ satisfying $2 \leq p \leq q \leq n - 1$, a connected graph G with n vertices must always exists such that $\gamma_d(G) = p$ and $l\gamma_d(G) = q$.

Proof:

Case 1. $2 = p = q < n - 1$.

Consider $G = W_5 = \{v_1, v_2, v_3, v_4, v_5\}$ where v_5 is the central vertex. Then $L = \{v_1, v_2\}$ is one of the minimum DD-set and also one of the minimum LDD-set.

Thus, $\gamma_d(G) = l\gamma_d(G) = |L| = 2$.

Case 2. $2 = p = q = n - 1$.

Consider $G = C_3 = \{w_1, w_2, w_3\}$. Then $L = \{w_1, w_2\}$ is one of the minimum DD-set as well as the minimum LDD-set. Therefore, $\gamma_d(G) = 2 = p$ and $l\gamma_d(G) = n-1 = q$.

Case 3. $2 = p < q = n - 1$.

Consider $G = K_n, n \geq 3$. Then $\gamma_d(G) = 2 = p$ and $l\gamma_d(G) = n - 1 = q$.

Case 4. $2 = p < q < n - 1$.

Consider $G = K_{r,s}, r = s$. Then $\gamma_d(G) = p = 2$. Using theorem 3.10, we have $l\gamma_d(G) = r + s - 2 = q < n - 1$.

Case 5. $2 < p = q < n - 1$.

Consider $G = F_3$. Form L by choosing one vertex each of the three copies of P_2 . Then L will be the minimum DD set as well as the LDD set. Therefore, $\gamma_d(G) = l\gamma_d(G) = |L| = 3 < n - 1$.

Case 6. $2 < p = q = n - 1$.

Consider $G = K_{1,n-1}, n \geq 4$. We have $\gamma_d(G) = l\gamma_d(G) = n - 1 = p = q$.

Case 7. $2 < p < q \leq n - 1$.

Consider the cycle graph C_3 with the vertex sequence $\{x, y, z\}$. The graph G is formed by attaching $p-2$ pendant vertices to x and by attaching two set $(\{u_1, u_2, \dots, u_{q-p+1}\}, \{w_1, w_2, \dots, w_{q-p+1}\})$ of $q - p + 1$ vertices to z . Also, each u_i and w_i are adjacent to u_{i+1} and w_{i+1} where $i = 1, 2, \dots, q - p$ respectively. Further u_i 's are adjacent to w_i 's where $i = 1, 2, \dots, q - p + 1$. Fig.2 shows the graph G . Let $L_1 = \{v_1, v_2, v_3, \dots, v_{p-2}\}$ be the set of pendant vertices. Then by Theorem 2.3 L_1 belongs to detour set. Let $L' = L_1 \cup \{z, w_1\}$. Then L' is a DD-set and so $\gamma_d(G) = |L'| = p - 2 + 2 = p$.

Let $L'' = L_1 \cup \{z\} \cup \{w_1, w_2, \dots, w_{q-p+1}\}$. Now, for any vertex pair u, v not in $L'', N(u) \cap L'' \neq N(v) \cap L''$. Hence L'' is the minimum LDD set of G . Therefore, $|L''| = (p - 2) + 1 + (q - p + 1) = q$

CONCLUSION

In this paper, the LDD for various classes of graphs have been solved and we have characterized LDD sets. In applications related to facility location, LDD is instrumental in optimizing the placement of critical infrastructure elements like surveillance cameras and sensors, thereby enhancing monitoring and security capabilities. By strategically deploying LDD sets, facilities can enhance surveillance efficiency, detect threats attempting to evade direct monitoring through detour routes, and optimize resource allocation for improved safety and security measures

ABSTRACT

Pyridocarbazole derivatives are promising anticancer agents, demonstrating significant potential through diverse mechanisms of action. This review highlights innovative synthetic strategies, structural diversity, and anticancer efficacy of these compounds. Advances in molecular docking and molecular dynamics (MD) simulations are emphasized, showcasing their combined role in modern drug design. Molecular docking forecasts interactions between pyridocarbazole and target proteins, while molecular dynamics simulations provide deeper insights into the stability and conformational dynamics of these interactions. Key mechanisms such as DNA intercalation, topoisomerase II inhibition, kinase inhibition, and p53 activation are discussed for their roles in disrupting cancer cell survival. Molecular dynamics studies reveal stable binding conformations, as evidenced by Root Mean Square Deviation (RMSD) analyses, and pinpoint critical regions of flexibility through Root Mean Square Fluctuation (RMSF) data. Additionally, free energy calculations using Molecular Mechanics/Poisson-Boltzmann Surface Area (MM/PBSA) and Molecular Mechanics/Generalized Born Surface Area (MM/GBSA) methods confirm favorable binding affinities, highlighting the potential of these compounds as high-affinity ligands for therapeutic targets. Structure-activity relationships (SAR) are explored, focusing on functional group modifications that enhance cytotoxicity. Furthermore, challenges and potential pathways for optimizing pyridocarbazoles for clinical application are outlined, encouraging further research into these molecules as innovative

Jinsha et al.,

cancer treatments. By integrating molecular docking and dynamics data, this review provides a comprehensive perspective on the therapeutic prospects of pyridocarbazole-based molecules, positioning them as viable candidates for advanced cancer therapies.

Keywords: Ellipticine, Pyridocarbazoles, Cytotoxicity, DNA Intercalation, Topoisomerase II, Kinase inhibition, p53 activation,

INTRODUCTION

Cancer is a significant global health issue marked by the uncontrolled proliferation of cells that can spread throughout the body, making it the second leading cause of death worldwide[1]. In 2020, around 19.3 million new cancer cases and 10.0 million deaths were reported globally, with breast cancer (2.3 million), lung cancer (2.2 million), and colorectal cancer (1.9 million) being the most prevalent. By 2040, cases are projected to rise to 28.4 million and deaths to 16.3 million[2]. In India, nearly 1.39 million new cancer cases and over 850,000 deaths were recorded in 2020, with breast, cervical, and oral cancers being the most common. Contributing factors include tobacco use, dietary habits, and limited access to timely healthcare. Countries like China, India, and the U.S. face the highest burdens due to large populations and healthcare disparities. Efforts focus on prevention, early detection, and treatment, but resource constraints and unequal access to care remain significant challenges, particularly in India's rural and underserved regions[3]. As cancer rates increase and resistance to current therapies develops, there is a critical need for novel, targeted treatments. Heterocyclic compounds offer a promising approach due to their potential for greater selectivity and reduced side effects. The heterocyclic carbazole structure played a pivotal role in the development of diverse biologically active compounds for more than fifty years, underscoring their substantial significance in medicinal chemistry and drug discovery[4].

These alkaloids are primarily sourced from plants in the Rutaceae family, as well as from certain bacteria, algae and fungi[5]. The parent compound, 9H-carbazole, was first isolated in 1872 by Graebe and Glazer[6]. Numerous carbazole derivatives have since been synthesized, exhibiting a range of pharmacological activities, including anti-oxidant, anti-inflammatory, anti-bacterial, anti-tumor, anti-convulsant, anti-psychotic, and anti-diabetic effects[7]. Ellipticine (5,11-dimethyl-6H-pyrido[4,3-b]carbazole), a natural alkaloid isolated from the leaves of the tree *Ochrosia elliptica* Labill (Apocynaceae), has notable anti-proliferative properties. Its natural analogues, including 9-methoxyellipticine, 9-hydroxyellipticine, and the isomeric olivacines, (Figure 1) show significant promise as antitumoral agents⁸. These compounds operate through various mechanisms: they intercalate into double-stranded DNA, disrupting replication and transcription⁹; induce transient DNA double-strand breaks *via* topoisomerase II[10]; and form DNA adducts after P450-mediated activation[11]. Additionally, ellipticine induces apoptosis by influencing the p53 tumor suppressor protein[12] and inhibiting protein kinases, such as CK2[13], which contributes to its antitumoral activity in different cancer cell lines. Structural modifications of these alkaloids have been carried out to find new derivatives with enhanced antitumor activity within the pyridocarbazole ring system[14]. The promising results from preclinical studies suggest that pyridocarbazole derivatives could serve as valuable additions to cancer treatment regimens, targeting multiple pathways involved in cancer cell survival and proliferation, thus warranting further investigation into their clinical applications[15]. This review consolidates and critically evaluates the literature on pyridocarbazole derivatives, it includes studies on synthesis, structural analysis, and biological evaluation of these compounds with validated anticancer properties, excluding those lacking experimental or computational evidence, detailed SAR analyses, or cancer relevance. Key topics include innovative synthetic strategies, structural modifications, and mechanisms like DNA intercalation, kinase inhibition, and p53 activation, complemented by molecular docking and dynamics studies to understand target protein interactions. The review identifies research gaps and proposes future directions to optimize pyridocarbazoles as potent anticancer agents, providing a solid foundation for their therapeutic potential.

Jinsha et al.,

Innovative Strategies in Synthesis of Anticancer Pyridocarbazole Derivatives

B. Tylin'ska *et al.*, reported the synthesis of new 1-substituted-6H-pyrido[4,3-b]carbazole derivatives, (Figure 2) and a total of seven derivatives were tested for their cytostatic activity using the Sulforhodamine B (SRB) assay against human lung cancer (A549) and human kidney cancer (A498) cell lines.

Reagents and condition

The reaction of, 2-(6-methoxy-1-methyl-9H-carbazol-2-yl)ethylamine (compound 1), with 2-methoxy-4-nitrobenzoic acid using the mixed anhydride method. This reaction yields an amide (compound 2), which is cyclized with phosphorus oxychloride in boiling toluene to produce 9-methoxy-5-methyl-1-(2'-methoxy-4'-nitrophenyl)-3,4-dihydro-6H-pyrido[4,3-b]carbazole (compound 3). Then it undergoes dehydrogenation in boiling diethyl ether with 10% palladium on charcoal, leading to the formation of compound 5. Next, N-6-methylation of compounds 3 to 4 and 5 to 6a is performed using an excess of dimethyl carbonate in dimethylformamide, along with potassium carbonate and 18-crown-6, resulting in 5,6-dimethyl-9-methoxy-1-(29-methoxy-4' nitrophenyl)-6H-pyrido[4,3-b]carbazole (compound 6).

Structure-Activity Links in Cytotoxicity

The cytostatic activity screening of seven 1-substituted-6H-pyrido[4,3-b]carbazole derivatives (6b–6h) revealed significant variations in activity depending on the substituents at the 9- and 4'-positions (Table 1). Compound 6b demonstrated lower cytostatic activity compared to reference drugs. Modifying the 4'-nitro group to an amino group enhanced the activity in compounds 6c and 6d, although 9-O-demethylation of 6c to form 6d decreased its effectiveness against A498 cells. N-acetylation of 6c to produce 6g resulted in a marked drop in cytostatic activity. Compounds with methylsulfonyl or methylcarbamoyl substitutions (6h and 6f) showed slightly reduced activity, and replacing the 9-position hydroxyl group with a methylcarbamoyl unit in 6e led to diminished cytostatic properties. These findings underscore the impact of specific substituents on the cytotoxic effectiveness of these derivatives¹⁶.

Solvent-Free, One-Pot Synthesis of Pyridocarbazole Derivatives

Arya, K. R., & Rajendra Prasad, K. J *et al.* Introduced a solvent-free, one-pot Synthesis of 2-ethoxy-4-aryl/heteroaryl-5,6-dihydro-11H-pyrido[2,3-a]carbazol-3- carboxamides (Figure 3) using 2,3,4,9-tetrahydrocarbazol-1-one (1), ethyl cyanoacetate (2), aryl or heteroaryl aldehydes (3), and ammonium acetate (4) as key reagents by heating the mixture at 80°C for 2 hours then cooling the mixture to room temperature and poured into ice-cold water to precipitate the product 2-ethoxy-4-aryl/heteroaryl- 5,6-dihydro-11H-pyrido[2,3-a]carbazol-3-carboxamide 5(a-p).

Anticancer Potential and SAR

The synthesized pyridocarbazoles exhibit notable anticancer activity against MCF-7 (breast cancer) and A549 (lung cancer) cell lines (Table 2). Compound 6g stands out with the most potent inhibitory effects, showing the lowest IC₅₀ values for both cancer cell lines, suggesting strong anticancer potential. The Structure-Activity Relationship (SAR) analysis indicates that the presence of electron-withdrawing groups, such as thiophene and chloro moieties, enhances anticancer activity. Conversely, electron-donating groups, like methyl and methoxy, tend to decrease potency^[17]. M. Saravanabhavan *et al.* introduced an effective microwave assisted synthesis of 2,3-dihydro-1H,11H-pyrido[2,3-a]carbazol-4-one derivatives(3a-g) *via* a one pot reaction of 1-chloro-2-formyl carbazole(1) with ethanolamine(2), catalyzed by *p*-toluenesulfonic acid (*p*-TsOH), under microwave irradiation at 90°C for 10 minutes. The cytotoxicity of the compounds was tested on the MCF-7 breast cancer cell line *via* the MTT assay, revealing that compounds 3e and 3f displayed the highest cytotoxic effects, outperforming other tested compounds (Table 3). The results indicate that electron-withdrawing groups, such as chloro and bromo, enhance anticancer activity compared to electron-donating groups. Although 3e and 3f were effective, they were not as potent as cisplatin^[18]. Indumathi, T *et al.*, reported a synthetic strategy to create pyrido[2,3-a]carbazoles (Figure 5) by a multicomponent reaction with L-proline as an organocatalyst. This process combined 6-methyl-2,3,4,9-tetrahydro-1H-carbazol-1-one (1), an aromatic or heteroaromatic aldehyde (2), ammonium acetate (3), cyanoacetamide (4) or cyanoacetohydrazide (6), and L-proline in dry ethanol. The reaction was heated under reflux for one hour, then purified using a silica gel column. The cytotoxicity of the synthesized pyrido[2,3-a]carbazoles was assessed against three cancer cell lines: MCF-7, HeLa, and A549, using the sulforhodamine B (SRB) assay. The study revealed that compounds with the 2-

Jinsha *et al.*,

aminopyridine-3-carbohydrazide scaffold exhibited superior cytotoxicity compared to the 2-aminopyridine-3-carboxamide derivatives. Notably, compounds with thiophene (7f) and quinoline (7e) moieties showed enhanced activity, particularly against HeLa cells, with 7f demonstrating efficacy comparable to cisplatin. Additionally, electron-withdrawing groups improved cytotoxicity more than electron-donating groups. This suggests that specific structural modifications, such as the presence of certain heteroaryl rings and electron-withdrawing groups, significantly boost anticancer potency[19]. R. Meesala *et al.*, developed an efficient method for synthesizing pyrido[3,2-b]carbazoles and pyrido[2,3-c]carbazoles using the Vilsmeier–Haack reagent. By treating *N*-(carbazol-3-yl)acetamides (1a-e) with dimethylformamide (DMF) and phosphoryl chloride (POCl₃) at 70 °C for 12 hours, it generates both linear (2a-e) and angular products (3a-e), with angular isomers being the major products. This approach provides a practical route to produce these new pyridocarbazole analogues, potentially useful as ellipticine derivatives²⁰.

Mechanistic Insights into the Anticancer Actions of Ellipticine and Related Pyridocarbazoles

DNA Intercalation

The initial mechanism identified for ellipticine's action was its intercalation into DNA. Early investigations into this interaction commonly utilized UV absorption and circular dichroism methods to analyze how ellipticine interacts with DNA[21]. The ellipticine chromophore has a shape and size that closely resemble those of a purine-pyrimidine base pair. This similarity is advantageous for intercalation, where the drug inserts itself between the base pairs of doublestranded DNA. This interaction likely involves stacking with the hydrophobic regions of the DNA molecule[22]. Polycyclic aromatic compounds can fit snugly into the DNA helix, enhancing their binding affinity[23]. The methyl groups on ellipticine play a crucial role in its binding specificity. These groups interact with thymine bases at the intercalation site, affecting how the drug is oriented within the DNA. This interaction helps determine the drug's binding orientation and stability within the DNA[24]. Dodin *et al.*, measured DNA affinity constants of $8.3 \times 10^5 \text{ M}^{-1}$ and $3.3 \times 10^5 \text{ M}^{-1}$ at pH 5 and pH 9, respectively. They later used fluorescence spectroscopy in deuterated buffer solutions to explore how *N*-methyllellipticinium (2) and 9-hydroxy-*N*-methyllellipticinium (3)(Figure 7) interact with DNA. Their findings indicated that *N*-methyllellipticinium (2) did not show a preference for specific intercalation sites. In contrast, 9-hydroxy-*N*-methyllellipticinium (3) was found to favor sites containing at least one G–C base pair, suggesting that the presence of the 9-hydroxy group contributes to this G–C base pair preference[25]. In 2005, Canals *et al.*, determined the crystal structure of ellipticine complexed with a six base-pair oligonucleotide (d(CGATCG)₂), achieving a resolution of 1.5 Å. Their analysis showed that ellipticine was positioned along the DNA's major axis and was aligned parallel to the hydrogen bonds of the base pairs[26]. Jain *et al.*, found that two ellipticine molecules intercalated into the d(CGATCG)₂ hexanucleotide sequence, with the pyridine nitrogen of ellipticine directed towards the major groove in both cases. Their study highlighted a clear preference for intercalation at G–C base pairs, while the AT–TA site was not occupied[27].

Inhibition of Topoisomerase II

Ellipticine, a pyridocarbazole alkaloid, directly binds to topoisomerase II, even in the absence of DNA. This binding enhances the enzyme's cleavage of DNA without inhibiting religation, thereby stimulating DNA breakage. Inhibition of topoisomerase II led to the formation of unrepaired DNA strand breaks, thereby blocking essential processes such as transcription and replication. This mechanism is particularly effective in tumor cells, which typically express high levels of topoisomerase II, making pyridocarbazole derivatives promising candidates for further development in cancer therapy due to their ability to induce cell cycle arrest and apoptosis through targeted DNA damage[28]. Froelich–Ammon *et al.*, conducted a pivotal study in 1995 that established topoisomerase II as the primary cellular target of the drug ellipticine. Using a temperature-sensitive yeast strain, they found that at 25°C, a 200 mg dose of ellipticine killed 90% of cells, while no cell death occurred at 30°C when enzyme activity was reduced to 10%. Further experiments showed that ellipticine increased topoisomerase II-mediated DNA cleavage six-fold without affecting religation, indicating it acts as a catalytic inhibitor rather than a poison[29]. Ross and Bradley's study linked ellipticine-induced DNA strand breaks to the inhibition of topoisomerase II. They found that ellipticine caused significant DNA damage in L1210 cells at concentrations of 1.25 to 5.0 mg/mL. Their research indicated that the drug forms a covalent complex with topoisomerase II and DNA, trapping the enzyme and leading to cytotoxic effects,

Jinsha *et al.*,

highlighting its potential use in cancer therapy by targeting topoisomerase II to induce lethal DNA damage[30]. Tylińska, Beata, *et al.*, evaluated four distinct olivacine derivatives to determine their antitumor effectiveness, using CCRF/CEM and MCF-7 cell lines for experimentation. A variety of techniques were utilized, including the comet assay, polarography, assessment of topoisomerase II inhibition, histone acetylation analysis, and molecular docking studies, to investigate the compounds' interactions with DNA and their influence on topoisomerase II activity. While all derivatives showed interactions with DNA and inhibited topoisomerase II, none induced histone acetylation, indicating a potentially unique mechanism of action. Among the compounds tested, Compound 2 (9-methoxy-5,6-dimethyl-1-((1-hydroxy-2-(hydroxymethyl)butan-2-yl)amino)methyl)-6H-pyrido[4,3-b]carbazole)(Figure 8) stood out as the most effective, demonstrating the highest affinity for topoisomerase II and resulting in the least genotoxic damage to cells.

Molecular Docking

Molecular docking studies were conducted to elucidate the binding modes of various topoisomerase II α (topo II α) inhibitors, with etoposide serving as a reference compound for validation. The analysis focused on compounds exhibiting the lowest scoring function energies, among the tested compounds, compound 2 emerged as the most potent inhibitor, displaying a free energy of binding of -53 kJ/mol. Its docking pose indicated that the pyridocarbazole moiety participates in aromatic stacking interactions with nucleotide residues DC8, DT9, and DG13, while the aliphatic chain forms hydrogen bonds with Asp436 and Leu486, further stabilized by van der Waals interactions with several amino acids³¹.

Kinase inhibition

Ellipticine is a notable anticancer agent that inhibits several key protein kinases crucial for tumor growth and survival. It targets Casein Kinase 2 (CK2), which is overexpressed in various cancers and supports tumor progression by promoting cell survival and resistance to apoptosis[32]. Ellipticine also inhibits c-Kit, a receptor tyrosine kinase involved in cell proliferation and survival, making it particularly effective against cancers with c-Kit mutations or overexpression, such as certain leukemias and gastrointestinal stromal tumors[33]. Additionally, it disrupts AKT (Protein Kinase B), a central player in the PI3K/AKT signaling pathway that drives cancer cell growth and resistance to cell death[34]. By targeting these critical kinases, ellipticine offers a multi-faceted approach to disrupt cancer cell survival and enhance the efficacy of existing therapies. The study by Renaud Prudent *et al.* examines the antitumor effects of pyridocarbazole and benzopyridoindole derivatives as inhibitors of protein kinase CK2. The researchers found that these compounds are potent ATP-competitive inhibitors of CK2, demonstrating significant inhibition of CK2 activity *in vitro*. Notably, they induced cell cycle arrest and apoptosis in glioblastoma cell lines through caspase-dependent mechanisms, with cytotoxic effects observed at concentrations lower than those needed for complete CK2 inhibition[35]. The study by Tang *et al.*, investigated the effects of 9-methoxy-N-methylellipticinium acetate (API-59-OME) (Figure 11) on ovarian cancer cell lines with overactivated AKT kinase activity. Their findings revealed that API-59-OME effectively inhibited AKT activity by preventing its phosphorylation at Ser473, suggesting the compound may inhibit upstream kinases such as PDK2[36]. Vendome *et al.*'s 2005 study explored the c-Kit kinase inhibitory potential of ellipticine derivatives, identifying 9-hydroxyellipticine and 9-hydroxy-N-methylellipticinium as the most potent inhibitors against both wild-type and D816V mutated forms. The research highlighted the importance of substituents at positions 9 and 1 for optimal activity, with C-9 substitutions playing a crucial role and bulky alkylamino side chains at C-1 being unfavourable. The findings provide valuable insights into the structure-activity relationships of these compounds, potentially contributing to the development of targeted therapies for c-Kit-related disorders[37]. Indumathi T *et al.*, synthesized heteroannulated carbazoles (Figure 12) and undergo molecular docking studies, revealed that these compounds exhibited significant binding affinity to Human Protein Kinase CK2 (Pdb: 3OWJ), with most showing superior binding energies compared to the standard ellipticine. Among the compounds tested, 8-chloro-4-(3-chlorobenzo[f]quinolin-2-yl)-2-ethoxy-6,11-dihydro-5H-pyrido[2,3-a]carbazole-3-carbonitrile 5b) exhibited the best binding energy of -8.37 kcal/mol, forming a hydrogen bond with Arg 47 (Figure 12) which is crucial for its inhibitory activity. Other compounds, such as 5a and 5c, also showed strong binding interactions with energies ranging from -8.07 to -8.25 kcal/mol (Table 6). The results indicated that the presence of

Jinsha *et al.*,

specific substituents, particularly the pyrido moiety and electron-withdrawing groups like chloro, significantly enhanced binding affinity and cytotoxicity against cancer cell lines HeLa and MCF 7[38].

Interaction with p53 tumour suppressor

The p53 protein, encoded by the TP53 gene, is a crucial tumor suppressor that helps maintain genomic stability and prevent cancer. It regulates cell cycle arrest, DNA repair, and apoptosis in response to stress signals. Mutations in TP53 occur in over 50% of human cancers, resulting in dysfunctional p53 that fails to control cell proliferation and may even promote tumor progression[39]. In their research, Sugikawa *et al.*, examined the impact of 9-hydroxyellipticine (9HE) on cells with mutant p53, discovering that it can induce apoptosis specifically in the G1 phase of the cell cycle. Their findings indicated that 9HE effectively promotes cell death in these mutant p53 cells, potentially by restoring some functions of wild-type p53. Using flow cytometry, the study demonstrated that 9HE treatment led to G1 phase arrest and increased levels of pro-apoptotic factors such as bax, underscoring its potential as a therapeutic agent against cancers characterized by p53 mutations[40]. Peng *et al.*'s 2003 study revealed that ellipticine and its derivatives have the remarkable ability to reactivate mutant p53 proteins, a crucial tumor suppressor often found in various cancers. Through experiments in H1299 cells transfected with different mutant p53 types, the researchers demonstrated that ellipticine could enhance the transcriptional activity of mutant p53 by 5 to 6 times. This activation was evidenced by the induction of MDM2 and p21 expression at an optimal concentration of 8 mM. Immunoprecipitation experiments further confirmed that ellipticine treatment led to a conformational shift in mutant p53, moving it closer to the wild-type conformation and restoring its tumor suppressor functions. These findings highlight the potential of ellipticine as a therapeutic agent in cancers harboring specific p53 mutations[41]. In a study by Lu *et al.*, the ellipticine derivative 3-(9-methoxy-5,11-dimethyl-6H-pyrido[4,3-b]carbazol-6-yl)propan-1-aminium chloride (Figure 9) was identified as a promising lead compound for activating p53. The compound was tested on three cancer cell lines: HCT116 (wild-type p53), SW620 (mutant p53), and HCT116 p53^{-/-} (p53 deficient), demonstrating GI50 values between 0.5 and 1 mM. Remarkably, p53 activity was significantly induced in HCT116 cells (7.5-fold increase), while SW620 cells showed a smaller increase (1.5-fold). Additionally, the upregulation of p53 target proteins p21 and DR5 was observed across all cell lines, and the study underscored the importance of the transcription factor p73 in mediating the anti-tumor effects of this derivative[42].

CONCLUSION

The review on Pyridocarbazole Based Molecules highlights their promising potential as innovative anticancer agents, particularly in the context of rising cancer rates and increasing resistance to conventional therapies. Pyridocarbazole derivatives exhibit a variety of mechanisms of action, including DNA intercalation, topoisomerase II inhibition, and kinase targeting, which collectively work to disrupt cancer cell survival and proliferation. The structural diversity of these compounds, enhanced through innovative synthetic strategies, provides a rich platform for developing more effective and selective anticancer agents. Despite the encouraging findings, several limitations persist within the existing literature. Most studies focus on preclinical evaluations, with a notable lack of clinical trials assessing the safety and efficacy of these compounds in cancer patients. Additionally, the cytotoxicity of pyridocarbazole derivatives can vary significantly based on structural modifications, complicating the establishment of consistent structure-activity relationships (SAR). Furthermore, while various mechanisms have been identified, comprehensive insights into the molecular interactions at play remain underexplored. Future research should prioritize several key areas to optimize pyridocarbazoles for clinical applications. Well-designed clinical trials are essential to assess the therapeutic potential of promising candidates. In-depth mechanistic studies will enhance our understanding of how these compounds interact with their molecular targets, potentially leading to improved efficacy. Moreover, exploring novel synthetic routes could yield new derivatives with enhanced potency and selectivity while minimizing side effects. This review not only consolidates current knowledge but also emphasizes the importance of ongoing research into pyridocarbazole derivatives as viable candidates for advanced cancer therapies. By integrating molecular docking and dynamics data, it provides a comprehensive perspective on their therapeutic prospects. Ultimately,

Jinsha et al.,

addressing these challenges and focusing on future directions will be crucial for advancing pyridocarbazole-based therapies and improving treatment outcomes in cancer care.

ABSTRACT

This study aims to provide an overview of bioinformatics research from 2001 to 2023. Through the use of Scientometric parameters, the study seeks to evaluate the productivity of research in the areas of year-over-year growth and citation trends, most renowned authors, authors' collaboration, most frequently used authors' keywords, country-wise collaboration, identifying highly cited publications, and reference spectroscopy related to this study. The data used for this study were taken from the Scopus database. This bibliographic and citation database includes a subset of scholarly publications using a thorough literature review. An appropriate representative sample for examining the trends in this topic is the twenty-three-year period. The complete documents are downloaded in CSV format. Publications have been rising steadily since 2003. However, the trend of citations for the works changes every year. It won't be continuously stable for the next few years. Furthermore, the production sources demonstrate the journals' excellence and sway. The journal's remarkable consistency is shown by the top four sources' H-Index, which is higher than 10. The total amount of citations in the journal is respectable. First-rank journals record 1543 citations during the year, suggesting that the research is continuing. The findings of this study are limited from 2001 to 2023. The result of this analysis depends on the database extracted from Scopus.

Keywords: Bioinformatics, Scientometric Study, Research productivity, citation pattern, Bibliometrics, Bio-Informatics

**Basudeb Jana et al.,**

INTRODUCTION

The new multidisciplinary discipline of bioinformatics is critical to the management, comprehension, and clinical utility of novel genetic data (Farooq, R., 2024). The quickly expanding area of bioinformatics is meeting the massive need for data analysis and interpretation. Bioinformatics uses analytical and computational methods for collecting and interpreting biological data (Verma, M.K. and Yuvaraj, M., 2023). It is a multidisciplinary discipline that blends biology, physics, mathematics, and computer science. The data management of modern biology and medicine depends on bioinformatics (Stuart, D., 2018). A Scientometric study uses statistical techniques to evaluate and measure a subject's progress, providing information about research patterns and facilitating predictive forecasts. This method applies to many fields, such as earth science, biological, chemical, physical, and social sciences (Mohamad, A., 2024). Numerous investigations have employed quantitative analysis to examine literature across several disciplines, providing a foundation for the current study's objective of advancing the conversation on bioinformatics publications in India (Gupta et al., 2023). This study looks at growth patterns, authorship trends, core journals, subject areas, keywords, citation-based indicators, productive countries, and core institutions in bioinformatics (Liem et al., 2022). It examines 976 publications from the Scopus database and includes only articles. The study intends to offer a thorough overview of bioinformatics research output, with a particular emphasis on India's contributions to the area despite its broad reach (Otieno & Kiraka, 2023). Scientometrics research plays a crucial role in the growth and development of various academic fields. This branch of science focuses on studying the quantitative aspects of scientific research and development (Al-Shari & Lokhande, 2023). In 1969, Nalimov and Mulchenko defined scientometrics as "quantitative methods which deal with the analysis of science viewed as an information process." This field is instrumental in understanding the development and expansion of knowledge within specific subject areas (Milian et al., 2019; Liu et al., 2020; Sahabuddin et al., 2023). Scientometrics is inherently interdisciplinary, encompassing nearly all scientific disciplines. It usually entails assessing scientific production and dissecting several facets of academic publications. This work presents a thorough summary of bioinformatics research using scientometric analysis (Serenko, A., 2021). The results will help researchers better understand the state of the field, uncover possible partners, and focus their research questions. This scientometric study will be beneficial for stakeholders, including manufacturers and researchers, by providing insights into the future of bioinformatics research (Iddy and Alon, 2019). The study "Mapping the Bioinformatic Research Trend in India in the Decade of 2001-2023: A Scientometric Approach" is likely to include an analysis of the development, patterns, and trends of bioinformatics research in India during the given time frame. This might involve looking at the following:

Productivity growth of research publications in bioinformatics Examining the number of research papers published in India over the period, as well as the growth rate of publications year over year.

Most prolific authors and organizations Determining which authors and organizations have produced the most papers and made the most significant contributions to the bioinformatics field.

Publications by subject Analysing how publications are distributed throughout various fields, including molecular biology, genetics, and biochemistry.

Source titles along with significant keywords Examining the most popular keywords and source titles in publications pertaining to bioinformatics research.

Funding sources and affiliations Determining which funding sources and affiliations have made the most contributions to bioinformatics research in India.

Related Studies

The authors searched for prior studies on the scientometric analysis of bioinformatics research. However, they were still looking for one, even though scientometric studies in the disciplines of science and technology are abundant. For background and understanding, a few scientometric works on relevant subjects are included in this study.

**Basudeb Jana et al.,**

Dutta and Rath (2013) looked at a scientometric analysis of 834 papers that were downloaded from the Web of Science that covered carbon nanotube research in India between 1999 and 2012. The analysis of literature growth patterns in this study reveals that prospective growth in this field has been initiated since 2008. It also looks at international cooperation. Gupta, B.M., *et al.* (2021) examine the global research in the domain of quantum communication and networking (QCN) to assess and evaluate the research performance of stakeholders based on quantitative and qualitative metrics. As seen from the Scopus database, the global research on the subject resulted in a total of 2332 papers during 1997-20. According to Gupta R. *et al.* (2016), there was an average yearly growth rate of 18.81% and a citation impact of 4.20 for the 3,653 Indian papers on lung cancer research included in the Scopus database between 2005 and 2014. Kumar Patra, S., & Chand, P. (2005) examined the 2083 record collected from i) Derwent Biotechnology Abstracts ii) NCBI Pub Med, and iii) ISI Web of Science examined for the authorship pattern Productivity of authors is analyzed. Gonzales *et al.* (2023) explored developments in soil contamination treatment technologies, emphasizing a rise in environmental science research. Damar and Koksalmis (2024) conducted a bibliometric analysis of healthcare metaverse research, establishing thematic categorization for future research in the field. Recently, a significant number of researchers have been concentrating on the development and implications of emerging technologies. Some of the main areas of interest are deep learning, social media security, mobile information systems, augmented reality, mobile security, and artificial intelligence applications. After doing a scientometric examination of augmented reality papers using Scopus, Borgohain *et al.* (2022) found that Germany and the USA had contributed significant publications. The data were examined using MS Excel to demonstrate the Price law-based chronological growth of the publications. The worldwide research on A.R. was visualized using the software Biblioshiny, Vosviewer, and Gephi based on different scientometric characteristics. Min and Yu (2023) explored using the bibliometric tools VOSviewer and CitNetExplorer in conjunction with qualitative and quantitative research approaches to analyze the use of AR technologies in contextual language acquisition. CitNet Explorer created citation networks, while VOSviewer examined the top 10 authors, sources, nations, and organizations.

Objective of the Study

This study aims to analyze the expansion of the scholarly literature on the phrase 'Bioinformatics'. This pattern includes information about author collaboration, funding, and productivity. Our goal with this Scientometric analysis is to:

To identify the publication growth and citation trend of bioinformatics research.

The most prominent source and authors of bioinformatics research.

To understand the author's productivity and co-citation network.

Identify the country collaboration among researchers.

To identify the most frequently used author's keywords.

METHODOLOGY

The data for this study was downloaded from the Scopus database. The research keyword used to obtain the data was "Bioinformatics," AND the author's address was "India." This is the main keyword for the subject matter covered. A total of 976 records spanning the years 2001 to 2023 were downloaded from Scopus on April 8, 2024. Each record includes an abstract in English along with comprehensive bibliographic details, such as the author's name, affiliation, address, journal name, keywords, referenced items, etc. The systematic analysis was done by using Biblioshiny and VosViewer. The metrics are visualized and interpreted according to the result. VosViewer is a beneficial free program that utilizes network analysis and visualization methods to discern trends and patterns in scientific literature. Simultaneously, it enables the investigation of current research focal points, notable studies, distinguished scholars, organizations, and nations within a specific domain. This investigation involved downloading pertinent files from SCOPUS, which were later analyzed using Biblioshiny, VosViewer, and Microsoft Excel. VosViewer was utilized to visually examine author collaboration, source interactions, co-citation of authors, and keyword co-occurrence (Yang *et al.*, 2023).

**Basudeb Jana et al.,****Data Analysis**

The process resulted in 976 documents being filtered. Table 1 displays the general information of the articles. The bioinformatics experiments ran from 2001 to April 2023. Three hundred fifty-six books and periodicals contained the papers. Concerning bioinformatics research, 3458 distinct keywords were found. Thirty-five persons were found to be single authors out of the 3035 writers who had published articles on bioinformatics. Per the publication, the level of cooperation was 3.93. This indicates that three to four writers worked on a manuscript on average (Yu et al., 2019). The percentage of writers that collaborate internationally was found to be 26.13%.

Documents and Citation Trends

The bioinformatics publication trend has increased in the past twenty-three years (2001–2023) (see Figure 1). The rise reached its zenith in 2023. From 10 papers in 2005 to 33 papers in 2010, there was a significant rise. On the other hand, the opposite circumstance occurred regarding the citation pattern of bioinformatics articles. Therefore, the trend gradually increased in 2014 from 34 to 139 papers in 2023. Table 2 describes the increase and decrease numbers accordingly (Guillet, 2020). Generally, there is a periodic increase and decrease in the trend of bioinformatics document citations. Yearly declines began in 2006, 2012, and 2014. The average citation of bioinformatics publications reached its highest level in 2018. Moreover, this suggests a more expansive and dynamic bioinformatics research environment (Cohen et al., 2021). Table 3 indicates the number of citation patterns. There are various causes for this occurrence. First off, bioinformatics is becoming more widely acknowledged as an energy management best practice that can be used in a variety of industries (Wang et al., 2022). The average citation trend per year is displayed in Figure 2. The pattern is not constant; it varies annually.

Most Relevant Source

The top journals, according to the number of publications that published bioinformatics material, are displayed in Table 4. A total number of 976 documents were published from 356 sources. The top 10 sources are considered for 24% of total publications. The top five journals published more than 20 journals. BMC Bioinformatics has published a maximum of articles, and the H-Index of that journal is very high. Fig 3 describes the number of publications according to the journal (Li and Law, 2020).

Three-Field Plot

Explaining the three-field plot analysis is essential because it can display three subject correlations in the visualization (Mukhopadhyay et al., 2022). Figure 4 shows the plot of the three fields, including Keyword, Author, and Affiliation. These three elements show the relationship between one field and another, which denotes the author, keyword, and affiliation (Ochoa et al., 2019a). AU stands for the author, meaning the focus is on the top 10 authors (the primary concern), associated with the AU_UN as the author affiliation and DE as the author keywords. The below graph shows the top 10 authors with the keyword and affiliation collaboration. Figure 5 shows the author's collaboration with their affiliation and country.

Relevant Authors

Figure 6 presents the most prolific authors of Bioinformatics Research. A total of 3035 authors contributed to 976 publications, with an average of 3.11 contributors per document (Blanco et al., 2020; Ochoa et al., 2019b). Three authors contributed over 15 publications. The most prolific author was Kumar, A., who had 16 publications. Bandyopadhyay, S. and Kumar, S. ranked as the second and third most prolific authors, respectively, in publishing output (Angarita et al., 2019; Madrigal et al., 2018; Ocampo Batlle et al., 2020). Figure 7 indicates that the bubble size, color intensity, and author timeline influenced the authors' scientific output. The size of the bubble corresponds to the quantity of documents, and the line shows the timeline of each author (Farooq, R., 2024).

Author Scientific Productivity

As a result, among the 312 authors who fulfill the threshold out of 3152, it is significant that they have produced the most bioinformatics research (Sanchez et al., 2017). The threshold meets the requirement of having a minimum of two

**Basudeb Jana et al.,**

authors per document (Ulker, P., Ulker, M. and Karamustafa; K., 2023). The authors, the total number of citations, and their documents are displayed in the table below.

Co-Citation Analysis

As interest in an area increases, the volume of published papers in that domain also rises. As the volume of published research increases, the citation frequency of prior studies is anticipated to grow simultaneously. Significantly, bibliometric studies are connected to the articles in Scopus (Ruhanen *et al.*, 2015; Niñerola *et al.*, 2019). Figure 8 indicates the co-citation among authors who have at least 30 citations. The red nodes show a strong co-citation network, and the green and yellow nodes show the minimum number of co-citation networks.

Country Collaboration

The country of the corresponding author is illustrated in Figure 9. The red denotes the matching authors from different countries, referred to as multiple-country publications (Citybabu *et al.*, 2024). In the Maximum country collaboration with India and the USA, 80 authors are collaborating. They were followed by India and the UK at 31 and India and China at 28. The maximum number of collaborations starts with India only.

Co-Authorship with Countries

Figure 10 illustrates the network of worldwide co-authorship among 46 countries. From this perspective, countries are represented by labels and circles. The greater a country's significance, the larger its status and its scope of influence. The diameter of each circle represents the number of papers authored by individuals from the respective country (Mesdaghinia *et al.*, 2015). There are 46 countries as per the criteria of a minimum of 3 documents published by each country. It indicates a total of 6 clusters, which are shown in different colours. Total of 412 links with 991 link strength. The 1st cluster covers the maximum country (20), the 2nd cluster covers 9, the 3rd and 4th cluster covers 6 each, the 5th cluster covers 3, and the 6th cluster covers 2 countries.

Keyword Analysis

In order to comprehend the theme progression of bioinformatics related to bibliometric studies published between 2001 and 2023, this study initially evaluated frequently used words before moving on to co-word analysis (Martínez-López *et al.*, 2018). The most often used terms, according to keyword analysis, are "bioinformatics," "feature selection," "machine learning," and "A total of 3458 Keywords, 208 meet the threshold per the 3-keyword occurrence per article.

DISCUSSION AND CONCLUSION

Although bibliometric analysis is still relatively new in bioinformatics, methods such as performance analysis and scientific mapping analysis have made statistically analyzing academic articles across a range of areas easy. The study attempts to investigate the 976 documents that were published in different periodicals between 2001 and 2023. The study can help researchers spot fresh trends and patterns in articles related to bioinformatics. The study can be used as a tool to understand how bibliometric analysis might be applied to various areas by employing methods such as science mapping and performance analysis. Bibliometric analysis, on the other hand, was either topic-specific or examined research topics and trends in greater detail. The entire data unequivocally demonstrates that, since 2003, the trend in publications has steadily increased. Nonetheless, the papers' citation trend varies from year to year. For the upcoming years, it won't be consistently stable. Additionally, the production sources show that the journals are high-quality and influential. The H-Index of the top four sources is greater than 10, indicating the journal's exceptional consistency. The journal has a decent overall number of citations. The research appears to be ongoing, as evidenced by the 1543 citations that first-rank journals report during the year. The author's contribution to bioinformatics research is also evident in the entire research paper. The fact that the authors are from India indicates that bioinformatics research is popular there. The most pertinent authors in this specific field of study are displayed in Figure 6. Bandyopadhyay, S. and Kumar, S. both published the same amount of publications (16), whereas Kumar, A. published the most (17). The tree factor plot shows the relationship between the author and their affiliations and

**Basudeb Jana et al.,**

country. It shows that the authors are from IITs and that all of the Indian authors work in the USA and UK. The majority of bioinformatics research is conducted in "Indian Institutes of Science," with IITs coming in second and third, respectively, in terms of research keywords and related institutions. The term "bioinformatics" is most closely related to Big Data, Data Mining, Machine Learning, etc. These and other technical subjects are related to the study of bioinformatics. These medical buzzwords, such as cancer and docking, also combine with bioinformatics. Overall, the report shows that India's bioinformatics research is having a significant impact on the scientific landscape.

ABSTRACT

The main goal of this paper is to minimize the carbon emission during the process of production-distribution in supply chain and tried to decrease the intensity of pollution in the environment and for this we have constructed the fuzzy goal programming model with required fuzzy goals by considering the imprecise level of carbon emission during manufacturing and transportation process, then the required solutions which satisfy these fuzzy goals under some strictly satisfied restrictions and limitations will be obtained by transforming the proposed fuzzy goal programming model into its deterministic form with the help of Zimmermann approach. Finally, the validity and applicability of this proposed fuzzy goal programming model is demonstrated by considering a numerical example which is solved by using a linear programming-based software (LINGO 20.0).

Keywords: Fuzzy goal programming, production-distribution, carbon emission, manufacturing, transportation

INTRODUCTION

As we all know very well that the production-distribution process which is an essential part of supply chain management plays a most significant role in continuously enhancement the rate of carbon in the environment due to which the temperature of earth is continuously increasing, which is one of the major reasons of climate changes. Now in recent time period the production-distribution process which is a back bone of every supply chain management

Saurabh Gupta

revolves around different types of uncertainties and impreciseness and we have not exactly determined that how much quantity of production and distribution is carried out and how much carbon is produced during this production-distribution process. Due to this reason, we are not able to formulate the goal programming model with goals which strictly satisfies the level of carbon emission during production-distribution process because how much amount of carbon is emitted will not be predetermined. So, for this reason we have shifted to fuzzy goals by introducing the imprecise level of carbon. Now in a similar way there are so many previously existing research studies Brandenburg [2] recommended to utilize a technique of goal programming to optimize the supply chain (SC) configuration for a new consumer goods while taking economic and environmental factors into account. AKTAS and TEMİZ [1] constructed a goal programming model by simultaneously taking both carbon emission and profit of production-distribution. Huang [4] selected the green suppliers in supply chain with lesser carbon by describing an approach of multi-criteria decision making known as fuzzy AHP-GP. Gupta et al. [3] constructed a model of efficient fuzzy goal programming (EFGP) for a problem of multi-objective production-distribution by combining fuzzy goal and interactive programming. Moon et al. [5] proposed a two-phase approach to solve the suggested model to achieve a Pareto-optimal solution, as well as a problem of bi-objective optimization with a scheme of mixed-integer linear programming for enhancing the overall profit while reducing the cumulative shortages in a multi-period planning horizon with insufficient data on raw material resources. Shaw et al. [7] optimized overall expenses, overall direct and indirect emission of carbon and a supply chain's overall trade-credit quantity relative to the acquired goods by formulating multi-objective goal programming model. Plambeck [6] presented the literature related to the reduction of the emission of greenhouse gas through different operations. Tan et al. [8] a bilevel mixed integer linear program is created as a leader-follower model for choosing carbon emission reduction strategies. Now the rest part of this paper has been framed into the following sections: Section 2) has provided the general description of fuzzy goal programming along with their three possible fuzzy goals. Section 3) has constructed the proposed fuzzy goal programming model along with their description for minimizing the carbon emission during production-distribution in supply chain. Section 4) has provided the methodology for solving the proposed fuzzy goal programming model. Section 5) has presented the applicability of the proposed fuzzy goal programming model by taking a numerical example. Section 6) has provided the conclusion of the complete research work discussed in this paper.

Fuzzy Goal Programming

As we all know that goal programming is a most powerful and effective technique in industrial mathematics, engineering mathematics, management sciences etc. but this programming is not beneficial for making the goals in realistic situations which revolves around different types of vagueness and impreciseness. Due to this reason the traditional goal programming is shifted to fuzzy goal programming which makes the decision makers belonging to different sectors capable for making the required decisions under uncertain realistic situations.

Now we have described the basic structure of three possible fuzzy goals by introducing the imprecise aspiration level " G_n ". $Z_n(x) \lesssim G_n$ or $Z_n(x) \cong G_n$ or $Z_n(x) \gtrsim G_n$

where \lesssim , \cong and \gtrsim is referred as "approximately less than or equals to" or "approximately equals to" or "approximately greater than or equals to" and $x \in X$ is a set of feasible solutions.

Description about proposed mathematical model

In this proposed mathematical model, we have focused on how to minimize the production of carbon during the process of manufacturing and transportation, so due to this reason we have constructed the required four fuzzy goals by implementing the imprecise level of carbon production during the manufacturing process, during transportation to all the distributors, during transportation from all the distributors to different areas of market and during delivery of raw materials to a manufacturing unit by all the suppliers together and all these fuzzy goals are formulated under the given restrictions and limitations which is strictly satisfied their conditions.

Saurabh Gupta

Now we have crafted the following nomenclature which is used for constructed required fuzzy goals under the given system of constraints.

	Nomenclature	Explanation
Index Set	k	index for product which is going to be manufactured
	p	index for supplier who delivers the raw material
	q	index for distributor
Decision Variables	S_k	amount of manufacturing of product “k”, for all k=1,2,3.....K.
	X_q	amount of transportation from manufacturing unit to distributor “q”, for all q=1,2,3.....Q.
	Y_q	amount of transportation from distributor “q” to a market place, for all q=1,2,3.... Q.
	A_p	quantity of raw material delivered by supplier “p”
For carbon emission during	s_k	carbon emission during manufacturing per unit of “k” type of product for production.
production-distribution	e_q	amount of carbon emission during transporting inventory from manufacturing unit to distributor “q”.
	j_q	amount of carbon emission during transporting inventory from distributor “q” to market place.
	m_p	amount of carbon emission when raw material is delivered by supplier “p”.
Aspiration level of carbon emission	C_1	imprecise level of carbon emission during total manufacturing of all types of products for production.
	C_2	imprecise level of carbon emission during transporting inventory from manufacturing unit to all the distributors.
	C_3	imprecise level of carbon emission during transporting inventory from all the distributors to a market place
	C_4	imprecise level of carbon emission during raw material delivery from all the suppliers together.
For system of constraints	G	total necessity of raw material which is fulfilled by all the suppliers together.
	D	total demand of market which is fulfilled by all the distributors together.
	O_{MAX}^q	upper bound of demand of a given distributor “q”.
	H_{MAX}^k	upper bound of demand of production of “k” type of product.
	J_{MAX}^p	upper bound of demand of raw material from supplier “p”.
	Z_{MAX}^q	upper bound of demand of a particular area of market which is covered by a distributor “q”.
	F	total production demand of all types of products.
	B	total requirement of all the distributors which is satisfied by a manufacturing unit.

Saurabh Gupta

Now by using the nomenclatures described above we have formulated the required fuzzy goal programming model along with their explanation for minimizing the carbon emission in a process of production-distribution:

	Required Fuzzy Goals	Explanation
First Goal	$\sum_{k=1}^K s_k S_k \lesssim C_1$	minimize total carbon emission during manufacturing of all types of products for production.
Second Goal	$\sum_{q=1}^Q e_q X_q \lesssim C_2$	minimize total amount of carbon emission during transporting inventory from manufacturing unit to all the distributors.
Third Goal	$\sum_{q=1}^Q j_q Y_q \lesssim C_3$	minimize total amount of carbon emission during transporting inventory from all the distributors to a market place.
Fourth Goal	$\sum_{p=1}^P m_p A_p \lesssim C_4$	minimize total amount of carbon emission during raw material delivery from all the suppliers together.
		all the suppliers together fulfil the necessity of raw material.
	Constraints	all the distributors together satisfy the demand of market.
	$\sum_{p=1}^P A_p = G$	manufacturing unit fulfils the total requirement of all the distributors.
	$\sum_{q=1}^Q Y_q = D$	manufacturing unit satisfies the total production demand which involve all types of products.
	$\sum_{q=1}^Q X_q = B$	each distributor has restricted their maximum possible demand.
	$\sum_{k=1}^K S_k = F$	manufacturing unit produced “k” types of products according to their maximum possible demand.
	$X_q \leq O_{MAX}^q$	maximum demand of raw material from supplier “p”.
	$S_k \leq H_{MAX}^k$	maximum demand of a particular area of market which is covered by a distributor “q”.
	$A_p \leq J_{MAX}^p$	all decision variables are integers and are greater than or equals to zero.
	$Y_q \leq Z_{MAX}^q$	maximum demand of a particular area of market which is covered by a distributor “q”.
	$S_k \geq 0, X_q \geq 0, Y_q \geq 0, A_p \geq 0$ for $k=1,2,\dots,K,$ $q=1,2,\dots,Q, p=1,2,\dots,P$	all decision variables are integers and are greater than or equals to zero.

Solution approach of proposed mathematical model

In this proposed model the required fuzzy goals are generated by introducing the imprecise aspiration level of carbon emission “Cn” for all given objective functions and it is represented as “Zn ≲ Cn” where “≲” is achieved after fuzzifying the traditional inequality and it is officially known as “essentially less than or equals to”

Saurabh Gupta

Now we have expressed the linear membership function proposed by Zimmermann [9] for required fuzzy goal “ $Z_n \lesseqgtr C_n$ ” along with their graphical representation

$$\mu_{Z_n}(y) = \begin{cases} \frac{(UB)_n - Z_n(y)}{(UB)_n - C_n} & \text{if } C_n \leq Z_n(y) \leq (UB)_n \\ 1 & \text{if } Z_n(y) \leq C_n \\ 0 & \text{if } Z_n(y) \geq (UB)_n \end{cases} \quad (1)$$

Here Fig 1. demonstrate the linear membership function graphically for minimum fuzzy goal, where “ C_n ” represented the imprecise aspiration levels of carbon emission and “ $(UB)_n$ ” is used to denote the upper bounds of required objective functions.

Now we have introduced an approach proposed by Zimmermann [9] which is a most effective and globally recognized approach for transforming the proposed model of fuzzy goal programming to the model which has deterministic in nature.

maximize α	(2)
s.t	
$\alpha \leq \frac{(UB)_n - Z_n(y)}{(UB)_n - C_n}$ for all $n=1,2,\dots,N$	(3)
A y “ \leq or “ $=$ or “ \geq ” b for all deterministic nature	(4)
$y \geq 0$ and are integers	(5)
$0 \leq \alpha \leq 1$	(6)

Numerical Example

Now we have considered a numerical example of manufacturing unit which has purchased 20,000 units of raw materials from four suppliers ($p=1,2,3,4$) and satisfies the total production demand which is considered to be 35,000 units and it involves four types of products ($K=1,2,3,4$). On the other hand, we have also considered four distributors ($q=1,2,3,4$) whose total demand is considered to be 29,000 units which is fulfilled by a manufacturer and then all the distributors together fulfil the total market demand which is considered to be 25,000 units. Now we have assumed the quantitative data which is provided by table (1) through which we have presented the emission quantity of carbon at each stage of production-distribution planning in supply chain management by utilizing the nomenclature which is discussed above.

Now the table (2) which is given below will provide the upper bound $(UB)_n$ as well as imprecise aspiration level (C_n) of n th objective:

Now the following numerical model is generated with the help of the following quantitative information which is provided by table (1) and (2)

- First Goal** $1S_1+3S_2+5S_3+3S_4 \lesseqgtr 99000$
- Second Goal** $3X_1+1X_2+2X_3+2X_4 \lesseqgtr 59000$
- Third Goal** $8Y_1+6Y_2+5Y_3+3Y_4 \lesseqgtr 138000$
- Fourth Goal** $4A_1+3A_2+5A_3+2A_4 \lesseqgtr 68000$

- $A_1+A_2+A_3+A_4=20000$
- $Y_1+Y_2+Y_3+Y_4=25000$
- $X_1+X_2+X_3+X_4=29000$
- $S_1+S_2+S_3+S_4=35000$
- $X_1 \leq 8000$
- $X_2 \leq 6000$
- $X_3 \leq 7000$
- $X_4 \leq 9000$
- $A_1 \leq 4000$
- $A_2 \leq 5000$
- $A_3 \leq 7000$

Saurabh Gupta

- $A_4 \leq 6000$
- $Y_1 \leq 9000$
- $Y_2 \leq 6000$
- $Y_3 \leq 5000$
- $Y_4 \leq 7000$
- $S_1 \leq 10000$
- $S_2 \leq 7000$
- $S_3 \leq 8000$
- $S_4 \leq 11000$
- $S_k \geq 0, X_q \geq 0, Y_q \geq 0, A_p \geq 0$ for $k=1,2,3, 4; q=1,2,3,4; p=1,2,3,4$ and all are integers

Now in this above numerical model the required first, second, third and fourth fuzzy goal is presented by their linear membership functions with the help of an expression (1):

Linear membership function of first fuzzy goal

$$\mu_{Z_1} = \begin{cases} \frac{103000 - (1S_1 + 3S_2 + 5S_3 + 3S_4)}{4000} & \text{if } 99000 \leq Z_1 \leq 103000 \\ 1 & \text{if } Z_1 \leq 99000 \\ 0 & \text{if } Z_1 \geq 103000 \end{cases}$$

Linear membership function of second fuzzy goal

$$\mu_{Z_2} = \begin{cases} \frac{61000 - (3X_1 + 1X_2 + 2X_3 + 2X_4)}{2000} & \text{if } 59000 \leq Z_2 \leq 61000 \\ 1 & \text{if } Z_2 \leq 59000 \\ 0 & \text{if } Z_2 \geq 61000 \end{cases}$$

Linear membership function of third fuzzy goal

$$\mu_{Z_3} = \begin{cases} \frac{148000 - (8Y_1 + 6Y_2 + 5Y_3 + 3Y_4)}{10000} & \text{if } 138000 \leq Z_3 \leq 148000 \\ 1 & \text{if } Z_3 \leq 138000 \\ 0 & \text{if } Z_3 \geq 148000 \end{cases}$$

Linear membership function of fourth fuzzy goal

$$\mu_{Z_4} = \begin{cases} \frac{74000 - (4A_1 + 3A_2 + 5A_3 + 2A_4)}{6000} & \text{if } 68000 \leq Z_4 \leq 74000 \\ 1 & \text{if } Z_4 \leq 68000 \\ 0 & \text{if } Z_4 \geq 74000 \end{cases}$$

Now for obtaining the required optimal solution of above numerical fuzzy goal programming model, we have utilized the Zimmermann approach which is expressed from (2)-(6):

$$\max = \alpha$$

$$\alpha \leq \frac{103000 - (1S_1 + 3S_2 + 5S_3 + 3S_4)}{4000}$$

$$\alpha \leq \frac{61000 - (3X_1 + 1X_2 + 2X_3 + 2X_4)}{2000}$$

$$\alpha \leq \frac{148000 - (8Y_1 + 6Y_2 + 5Y_3 + 3Y_4)}{10000}$$

$$\alpha \leq \frac{74000 - (4A_1 + 3A_2 + 5A_3 + 2A_4)}{6000}$$

$$A_1 + A_2 + A_3 + A_4 = 20000$$

$$Y_1 + Y_2 + Y_3 + Y_4 = 25000$$

$$X_1 + X_2 + X_3 + X_4 = 29000$$

Saurabh Gupta

$$S_1+S_2+S_3+S_4=35000$$

$$X_1 \leq 8000$$

$$X_2 \leq 6000$$

$$X_3 \leq 7000$$

$$X_4 \leq 9000$$

$$A_1 \leq 4000$$

$$A_2 \leq 5000$$

$$A_3 \leq 7000$$

$$A_4 \leq 6000$$

$$Y_1 \leq 9000$$

$$Y_2 \leq 6000$$

$$Y_3 \leq 5000$$

$$Y_4 \leq 7000$$

$$S_1 \leq 10000$$

$$S_2 \leq 7000$$

$$S_3 \leq 8000$$

$$S_4 \leq 11000$$

$S_k \geq 0, X_q \geq 0, Y_q \geq 0, A_p \geq 0$ for $k=1,2,3, 4; q=1,2,3,4; p=1,2,3,4$ and all are integers and also satisfied the condition $0 \leq \alpha \leq 1$.

Now with the help of linear programming-based software LINGO (Ver 20.0) we have solved the above numerical model and obtained the required optimal solutions which is defined as follows:

$S_1=10000, S_2=7000, S_3=7000, S_4=11000, X_1=7000, X_2=6000, X_3=7000, X_4=9000, Y_1=7000, Y_2=6000, Y_3=5000, Y_4=7000, A_1=4000, A_2=5000, A_3=5000, A_4=6000$.

Now we have presented the following optimum solutions of the above numerical model:

$Z_1=99000, Z_2=59000, Z_3=138000, Z_4=68000$

As we have observed that the above optimal solutions will satisfy the first, second, third and fourth fuzzy goals regarding the carbon emission which is discussed in this paper.

CONCLUSION

As we all know carbon emission is a major issue in supply chain management which is mainly responsible for increasing or decreasing the temperature of atmosphere. That is why, we have tried to minimize the intensity of carbon due to manufacturing and transportation process which is a most significant part of production-distribution in supply chain management by formulating the required fuzzy goals with imprecise level of carbon and after that the methodology proposed by Zimmermann is implemented in this paper for transforming the proposed fuzzy goal programming model into its deterministic form, then obtaining the required set of solutions which satisfy the given fuzzy goals under some restrictions and limitations which is crisp in nature. At last, we have demonstrated the applicability and utility of this research study by taking a numerical example and solved them with the help linear programming-based software LINGO (Ver 20.0).

ABSTRACT

Chicken meat is the most widely farmed animal protein due to its strong demand, low cost of production, and potential for generating income. The use of antibiotics to safeguard and promote growth enhancement in poultry farming is increasing globally. Many farmers lack knowledge on how to regulate the application of antibiotics, which has led to the emergence and overgrowth of multidrug-resistant bacteria. Less research has been conducted to establish the role of poultry farming in antimicrobial resistance. This research focuses on examining how common *Enterobacteriaceae* bacteria are in chicken meat and identifying their antibiotic resistance patterns. 210 Chicken meat samples were collected from farms and retail shops around Dibrugarh town and the surrounding areas of Assam, India. and were processed at the University laboratory. A total of 810 unique bacteria were isolated from the collected meat samples, 363 (44.5%) isolates identified and confirmed as *Enterobacteriaceae* members, 219 (60.3%) were Multidrug resistant, 144 (39.7%) ESBL producers.

98916

Amos Oloo Onyango et al.,

E. Coli, *Proteus*, and *Shigella* predominated in broilers with 32.2%, 22.5%, and 16.3%, respectively. While *Enterobacter* and *Klebsiella* spp dominated the indigenous meat samples at 25.3%. and 16.3%. *Salmonella* spp. and *Serratia* spp. were observed only in broiler meat. *E. coli* exhibited the highest MDR rate (78.5%), followed by *Proteus* (61.4%), *Shigella* (52.6%), and *Klebsiella* spp. (52%). Our findings show there is a presence of MDR Enterobacteriaceae within poultry farming and slaughter points, suggesting possible hygiene issues. We encourage food safety initiatives by providing important data that can be used for policy making, improving practices, and protecting the public.

Keywords: Enterobacteriaceae, Antimicrobial resistance, meat sample, broiler chicken, indigenous chicken, drug-resistant bacteria, antimicrobial agent, Extended-Spectrum Beta-Lactamase.

INTRODUCTION

Antimicrobial resistance (AMR) is a worldwide concern and the most serious threat to public health at present[1], [2]. In the last few decades, misuse and overuse of antimicrobial agents have contributed to the emergence of multidrug-resistant strains, endangering the efficacy of antibiotics, thereby increasing the death rate even by certain common infectious pathogens, and threatening the available successful treatment options as a result of gaining resistance to existing antimicrobial agents[3]. It is well known that excessive use of antimicrobial agents in animal farming is a key contributing factor to the increasing drug resistance in bacteria. The frequent use of antibiotics as therapeutic and growth promoters creates severe selective pressure that facilitates drug resistance in bacteria[4]. Several antibiotic-resistant bacteria isolated from humans originate primarily in animals raised for human consumption[5]. The presence of antimicrobial-resistant bacteria represents a potential hazard to consumers via foodborne infections caused by bacteria if not cooked properly[5].

With the constant rise in the human population, the global demand for protein and protein sources has been increasing around the globe. To serve the needs of the huge population by increasing meat production, huge percentages of antibiotics produced per year are routinely used in the veterinary sector as growth promoters and therapeutics[6]. India is one of the largest producers of poultry around the globe and is involved in rearing different species of birds for the production of meat, egg, poultry manure and other products[7]. Their poultry sector is the most commercialized agribusiness. Chicken is the most commonly farmed species because of its low production cost and a good source of income for farmers. It has been reared globally for food as a good source of animal protein and very affordable. Over 90 billion tons of chicken meat are produced per year globally[8]. However, achieving this scale of production has led to an alarming increase in the use of antimicrobial agents as growth promoters, thereby accelerating the development of resistance among pathogenic microorganisms[9].

The Enterobacteriaceae members are the most common cause of fecal contamination, which include several important zoonotic bacteria species such as *E. coli*, *Salmonella* spp., *Klebsiella* spp., *Citrobacter* spp., *Enterobacter* spp., *Shigella* spp., etc. Almost all the Enterobacteriaceae members are becoming resistant to available antimicrobials[10]. The emergence and spread of Multidrug-resistant (MDR) *Enterobacteriaceae* from food sources, particularly poultry, is a major health concern. Therefore, Its identification and monitoring are of great importance and clinical significance [11].

In Assam, a northeastern state of India with high poultry meat consumption, the regular use of antibiotics in poultry farms, often mixed with poultry feeds, has been linked to the rise of Multidrug-resistant (MDR) *Enterobacteriaceae* strains in chicken meat[12]. This local trend definitely reflects global concerns and emphasizes the need for region-specific studies. Considering all these concerns, this study aims to investigate the prevalence of Enterobacteriaceae isolates and determine the antibiotic resistance pattern of the bacteria collected from farms and retail shops around Dibrugarh Town, Assam, India. The outcomes of this study would help design further extensive investigations

Amos Oloo Onyango et al.,

covering more poultry farms from expanded areas of the country to find the nationwide prevalence of the zoonotic Enterobacteriaceae pathogen. Ultimately, this work will contribute positively towards the global fight against increasing multidrug resistance Enterobacteriaceae strains.

MATERIALS AND METHODS

The study was laboratory-based, conducted from January, 2022 to August 2023, and carried out at the Molecular Plant Taxonomy and Bioinformatics Laboratory, Department of Life Sciences, Dibrugarh University. The chicken meat samples were collected from various poultry farms and retail shops in Dibrugarh town, Assam.

Sample collection

Various poultry farms and retail shops were visited periodically, as well as villages for commercially and locally reared chicken. A live healthy chicken was purchased and slaughtered to obtain meat samples. A total of 230 chicken meat samples were randomly collected from various parts of the chicken, including the gut, thigh, skin, and breast. These samples were put in a sterile glass container and transported to the university laboratory in an ice box for further preparation and examinations[13].

Isolation, identification, and maintenance of bacterial samples

About 25g of each meat sample was aseptically cut into small pieces using a sterile blade, suspended in 225 mL of peptone water, and kept in a rotatory shaker at 80 rpm for 30 minutes, followed by incubation at 37 °C for 18-24 hours. A loopful of the overnight culture was streaked on Nutrient agar and incubated for another 24 hours at 37 °C. The nutrient agar plates were observed after 24 hours of incubation. Based on the colony, surface texture, colour, size, elevations, shape and edges, different bacterial colonies were screened and colonies were subcultured on nutrient agar and MacConkey agar (MCA) media to obtain the pure strains of the respective isolates. Each 24-hour-old strain was Gram-stained for differentiation, and Gram-negative strains were further subjected to oxidase, catalase test, and other necessary biochemical tests to identify them as per standard laboratory identification methods. The identified isolates were inoculated and stocked in 0.2 % semi-solid agar and in brain heart infusion (BHI) broth (HiMedia, Mumbai) containing 20 % glycerol at –80° C, until further analysis.

Screening of Enterobacteriaceae isolates and their identity confirmation

After 24 hours of incubation, bacterial growth occurred in a colonial form on the nutrient agar plate. Based on the colony, surface texture, color, size, elevations, shape, and edges, different bacterial colonies were identified, and each identified colony was sub-cultured on nutrient agar for pure culture and signed Strain Numbers[14]. Each 24-hour-old strain was Gram-stained for differentiation, and strains that revealed pink color (Gram-negative) were further subjected to an oxidase test. An oxidase-negative (No Purple colour observed on the oxidase disk) strain was picked for further processing[15]. All gram stain-negative and oxidative-negative strains were presumed Enterobacteriaceae members and were further cultured on MacConkey agar for further differentiation based on whether the isolates fermented lactose or non-lactose fermenters. Those Isolates with peculiar characteristics of the Enterobacteriaceae family by their colony morphology, Gram staining properties, oxidase test, and catalase test were subjected to a series of biochemical tests to screen Enterobacteriaceae isolates up to their genus and species[3][16], [17] Interpretation of the biochemical results was done as per HiMedia Ltd Enterobacteriaceae Identification chart, the reactions were also matched as per (Bergey's Manual of Determinative Bacteriology),[18]. For confirmation, the bacterial isolates were cultured on different selective media such as Lysine Deoxycholate (XLD) agar, Eosin-methylene Blue (EMB) agar, and Salmonella Shigella (SS) agar. The identified isolates were inoculated and stocked in 0.2 % semi-solid agar as well as in brain heart infusion (BHI) broth (HiMedia, Mumbai) containing 20 % glycerol at –80° C, till further analysis.

Amos Oloo Onyango et al.,

Antibiogram Methodology

Antimicrobial resistance patterns of Enterobacteriaceae isolates were determined using the disk-diffusion method following the guidelines of the Clinical and Laboratory Standard Institute (CLSI 30th edition 2020). A 24-hour colony of the test organisms were picked with a flame-sterilized wire loop and mixed with Mueller Hinton broth. The tubes were incubated at 37°C to a turbidity of 0.5 McFarland standard. A sterile cotton swab was used to spread the organism from the Muller Hilton Broth on the entire surface of the Mueller Hinton agar plate. The sensitive agar plates were allowed to dry for a few minutes. Antibiotic discs CTX, Cefotaxime; CPM, Cefepime; CAZ, Ceftazidime; AT, Aztreonam; PB, Polymyxin-B; VA, Vancomycin; GEN, gentamicin; TE, Tetracycline; DO, Doxycycline Hydrochloride; E, Erythromycin; AZM, Azithromycin; NA, Nalidixic acid; CIP, Ciprofloxacin; COT, Co-trimoxazole; SF, Sulfoxazole; RIF, Rifampicin; AMP, Ampicillin were gently placed and lightly pressed on the sensitivity agar plate. The plates were allowed to dry for 30 min and then placed in an incubator for 24 h at 37°C. [19]The antibiotic-resistant breakpoints were recognized as per recommendations of CLSI for Enterobacteriaceae (CLSI, 2008), Himedia – zone size interpretive chart. Isolates exhibiting resistance against two or more different classes of antibiotics were regarded as MDR strains. And the susceptibility test was repeated three times, the zone of minimum inhibitory concentration was measured and interpreted as per the CLSI standard, and the chart of interpretation provided by HiMedia. *E. coli* ATCC 25922 was used as the quality control strain in the test. The bacterial isolates exhibiting resistance against two or more different classes of antibiotics were regarded as MDR strains.

Phenotypic Screening of Extended-Spectrum β -Lactamase-Production

All strains that showed a diameter zone of inhibition of less than 27 mm for cefotaxime and less than 22 mm for ceftazidime were subjected to the ESBL confirmatory test phenotypically using; Cefotaxime (CTX-30 μ g) alone, Cefotaxime/clavulanic acid (CTX/CLA-30 μ g/10 μ g) and ceftazidime (30 μ g) alone, Ceftazidime/clavulanic acid (10 μ g) as recommended by CLSI 2018 using the disk diffusion method (Comined double disc synergy test).

Molecular confirmation of ESBL producers

All the bacterial strains that passed the ESBL phenotypic confirmatory test by a difference in the distance of ≥ 5 mm increase in the zone of diameter indicated ESBL-producing. These Isolates were subjected to molecular detection[20].

DNA extraction and PCR amplification of ESBL genes

Plasmid DNA was extracted using HiPurA Plasmid DNA miniprep purification Kit (HiMedia India), and an examination for the presence of ESBL encoding genes (blaTEM, blaSHV, blaCTX-M, blaCTX-M-1group) was performed by PCR utilizing the specified primers shown in Table 2. PCR amplification was done following: Denaturation at 94°C for 10 minutes 25 cycles of DNA at 94 °C for 30 seconds, annealing at a temperature specified for each primer as shown in Table 3, extension at 72°C for 1 minute and the final elongation for 7 min.PCR amplicons were visualized by electrophoresis in 1% agarose gel.

RESULTS AND FINDINGS

Table1 is a summary of the different types of bacteria isolated from two types of chickens (broiler and indigenous), showing how frequently each type of bacterial isolate appeared in a sample of each chicken group. From 230 (180 of broiler (A) and 50 of Indigenous (B)) chickens) meat samples that were collected and processed, 810 bacterial strains (630 strains from A, and 180 strains from B) were isolated. However, 363 bacterial strains (276 from broilers and 87 from indigenous chickens) tested positive for Enterobacteriaceae, while 447 strains were non-Enterobacteriaceae. As shown in Table 2, broiler 276 (76.03 %) and Indigenous 87 (23.97 %) isolates were confirmed as Enterobacteriaceae members, with *E. coli* becoming predominant in broiler at 32.2% while *Enterobacter* spp is predominant in indigenous chicken with 25.3%. Pertinently, some pathogens such as *Salmonella* Spp and *Serratia* Spp were found only in broiler chicken meats, which may indicate hygiene-related issues with broiler rearing. The percentage differences in the distribution pattern of these confirmed members of Enterobacteriaceae between broiler and indigenous chicken meats are illustrated in the Table. 3.

Amos Oloo Onyango *et al.*,

Prevalence of (MDR) Multidrug-resistant Enterobacteriaceae

From a total of 363 isolates, 219 (60.3%) were found to be resistant to multiple drugs tested and were reported to be MDR. Among the bacterial isolates, *E. coli* showed the highest prevalence of resistance at 78.5%, *Proteus* at 61.4%, *Shigella* at 52.6%, and *Klebsiella* spp. at 52%. The other isolates showed significant percentages. This study found out that most of the isolated Enterobacteriaceae members have multidrug-resistant (MDR) characteristics.

However, there was variable resistance toward different antibiotics, as shown in the Table. 5.

Confirmation of Extended-spectrum Beta-lactamase (ESBL) producing Enterobacteriaceae

Phenotypic screening identified 160 Enterobacteriaceae strains as potential ESBL (Extended-Spectrum Beta-Lactamase) producers. Out of these, 144 strains (39.7%) were genotypically confirmed through PCR, with results observed on a 1% agarose gel stained with Ethidium Bromide. Among the confirmed ESBL-producing isolates, *E. coli* was the most prevalent, accounting for 64 isolates (59.8%), followed by *Proteus* spp. (31 isolates, 44.3%), *Klebsiella* spp. (38%), and *Shigella* spp. (35.1%) as shown in Table 3.

DISCUSSION

In this study, out of 230 chicken meat samples purchased from Dibrugarh town and the surroundings, 225(97.8%) showed bacterial growth, indicating a high prevalence of bacterial contamination in poultry meat. The most predominant isolates found in the commercial broiler samples were *E. coli*, *Proteus* spp., and *Shigella* spp. *Klebsiella*, *Shigella*, *E.coli* and *Enterobacter* showed significantly more prevalence in the Indigenous chicken samples. These findings are similar to other recent studies. For example, the predominance of *E. coli* isolates and *Proteus* spp. was also reported from Kenya[21], East Africa report[22] and Bangladesh[23]. Moreover, a similar study in Tamil Nadu in India reported a high prevalence of *Shigella* in Poultry farms [24]and a study in Ethiopia also showed that *E. coli*, *Proteus* sp. and *Klebsiella* predominated the isolates [25].

The ESBL results of this study also align with other studies indicating that poultry, particularly broiler chickens, are major reservoirs of extended-spectrum beta-lactamase (ESBL)-producing bacteria. For instance, a study carried out in Malaysia reported that 14.7% of *E. coli* isolates from broiler chickens were phenotypically ESBL producers, with all ESBL-producing strains exhibiting multidrug resistance[26] (Lemlem *et al.*, 2024). Pertinently, the high MDR rates observed in this study are consistent with global trends. For example, a study conducted in Algeria found that all Enterobacteriaceae isolates from poultry were MDR, possessing high resistance rates to multiple antibiotics (Kamel *et al.*, 2024). Similarly, research in Lithuania showed that 80.39% of ESBL-producing *E. coli* strains from broiler chickens exhibited multidrug resistance [27]. Also, another study showed that Enterobacteriaceae isolates from a chicken had resistance to cephalosporins and tetracycline (Djomgoue *et al.*, 2023).

These findings emphasize the common nature of antimicrobial resistance in poultry and its public health implications. The high MDR prevalence poses a direct risk to consumers. Slaughterhouse workers are particularly vulnerable because zoonotic transmission of these resistant strains can compromise treatment options for foodborne illnesses in human beings.

CONCLUSION

Antimicrobial resistance Enterobacteriaceae in Indigenous chicken and commercial broilers is alarming, and strict compliance is needed for biocides and non-judicial use of antibiotics. Antibiotic-resistant isolates against commonly prescribed single and multiple drugs were common. This highlights that chickens on the farm may serve as the reservoirs of antibacterial-resistant bacteria that might infect humans through the food chain. Therefore, there's an urgent need for stringent use of antimicrobial drugs and improved hygiene practices in poultry farming and meat processing to mitigate the spread of MDR Enterobacteriaceae.

ABSTRACT

This is important for achieving maximum utilization of wastes and conservation of scarce resources and materials. The production of fly ash brick (FAB) in India has increased sharply in recent years due to the growing demand for bricks from the real estate and infrastructure sectors. The low-quality performance of many FAB plants prevents them from reaching their intended goals. Providing consumers with bricks of a constant quality within a certain time frame has become extremely difficult for FAB makers. Aim of this study is evaluate the key process cycle time and quality measurement variables for the FAB facility. Aim of the study is to show how Six Sigma and Lean Six Sigma approaches may be used to improve fly ash brick quality and process cycle time monitoring using the DMAIC approach. The results indicated that, when the methodology is applied correctly and with the support of the organization's team and staff, it can lead to a positive impact on quality and other key factors that are essential for customer satisfaction

Keywords: DMAIC, FAB, Six Sigma, DPMO, Quality Improvement

INTRODUCTION

An organization's ability to produce goods and services more quickly, better, and more affordably than its rivals is the sole determinant of its success in today's cutthroat world. Due to global competition and customer demand for high-quality items at affordable prices, organizations are being forced to look for innovative ways to improve their processes and products. A product having strong competitive advantages over other similar products can only

98929

Diwakar Singh et al.,

survive today, this competitive advantage is primarily aimed at product quality and product cost. To be able to produce products that meet customer's quality standards, quality techniques and quality production processes shall be provided. The goal of the methodical and disciplined Six Sigma process is to continuously provide customers with flawless goods and services. A customer-focused approach to continuous improvement, the Six Sigma technique aims to reduce variance and defects in product manufacturing, design, and administrative processes to 3.42 defects per million opportunities (DPMO). In India, the construction sector ranks second in size, after the agricultural sector. With an 11% GDP contribution, it significantly boosts the national economy and creates jobs for many people (Keshore *et al.*, 2017). Fly ash bricks are traditionally made by mixing or grinding different raw materials, which are then molded into bricks and put through curing cycles at various pressures and temperatures. The main ingredients of fly ash bricks are pulverized fuel ash, lime, and an accelerator that acts as a catalyst. Chemically bonded, these bricks can be used in masonry buildings just like regular burnt clay bricks. Fly ash has a 40–60% utilization rate in brick production. Lime, cement, sand or stone dust, and other substances are also used. It's easy to reach a minimum compressive strength (28 days) of 70 kg/cm², and in autoclaved type, this can reach 250 kg/cm². Studied the fundamentals of Six Sigma, including its methodology, philosophies, and tools for defect reduction. The DMAIC concept was applied to eliminate faults in RCC members, and the Six Sigma technique was utilized to improve the quality of residential construction (Bagdiya & Sawant, 2016). Examined how Six Sigma principles were applied for internal finishing work in residential construction. To a developed defect evaluation sheet, the process's current sigma level is 3.37, with a matching yield of 95.76%. (Revathi and Sriram, 2016). The results will recommend appropriate training, management assistance, and small adjustments to the current work process that are necessary to increase quality and, ultimately, customer satisfaction—two of the most important factors. The use of Six Sigma principles in a few internal finishing tasks, including painting, plastering, flooring, and bricklaying, was examined in a commercial building (Sathe *et al.*, 2017). Through a review of the literature and interviews with case studies, the study aimed to assess the characteristics of Six Sigma and examine it in the context of construction.

MATERIALS AND METHOD

Fly ash brick (FAB) quality during manufacturing and cycle times are analyzed using this technology. In addition, it provides an explanation of the methods utilized to explore the topic and the instruments that were employed. A thorough literature review, interviews, and questionnaires were used to determine the cycle times and FAB quality. A form was prepared to obtain information about factors like quality of Fly ash bricks, order-to-delivery lead time, product cost and owner's response to customer feedback. The Fly Ash Brick Plant in Indore was the subject of a study that used the Relative Importance Index (RII) to rank the many areas of quality evaluation and operation according to the degree of severity on the given scale. A five-point Likert scale—1 being poor, 2 average, 3 good, 4 very good, and 5 exceptional—was employed to assess each component's level of agreement. The following formula was used to convert this five-point scale into a Relative Importance Index (RII) for each factor.

$$\text{Relative Importance Index (RII)} = \frac{\Sigma W}{(A \times N)} \quad \dots (1)$$

Where,

N is the total number of respondents who have answered the poll, A is the highest possible score (in this case, 5), and ΣW is the overall weight the respondents have assigned to each component. With 0 being omitted, the RII values range from 0 to 1. The greater the RII, the more important the cause of the delays.

SIX SIGM Approaches

A process must provide 99.99% defect-free results, or 3.42 defects per million opportunities (DPMO), in order to sustain Six Sigma quality. Opportunities are the total number of chances for a defect to appear per unit. Another way to think of the DPMO is as the process's capabilities; the more capable the process, the lower the DPMO will be. This can then be translated into a standard deviation or Sigma, where a larger standard deviation denotes a more capable process and a lower DPMO. Defects per Million Opportunities (DPMO) can be defined as

$$\text{DPMO} = \frac{\text{NUMBER OF DEFECTED UNIT}}{\text{TOTAL NO.OF OPPORTUNITIES}} \times 1,000 \quad \dots (2)$$

**Diwakar Singh et al.,****Six Sigma DMAIC approach**

The DMAIC methodical methodology is used in Six Sigma and Lean initiatives. This methodical approach is illustrated in Figure 1, which also identifies the tools used in each of the DMAIC cycle's Phases should be defined, measured, analyzed, improved, and control. The method used is a five-step improvement process called Define, Measure, Analyze, Improve, and Control (DMAIC).

Define

The project's objectives and scope are established in this step, together with the client's needs and the components of the product and procedures that are CTQ (Critical to Quality). Anything that does not fulfill these standards is considered a defect. The Six Sigma methodology provides a range of the tools and techniques to facilitate the process implementation during the Define Phase. Here, we establish the objectives, inputs, and outputs process improvement and also the goal of the process improvement. Additionally, we identify the clients—whether internal or external—and inquire about their needs and expectations for the product. To better achieve these standards, we carefully document them and establish quantifiable goals (Critical to Quality, or CTQ).

Measure

Determine the flaws and the process that needs to be addressed, then gather the pertinent data. This measurement's goal is to obtain sufficient data or information from the processes. Determine the performance that the processes must meet about their CTQ (Critical to Quality) attributes. It is the second phase of the DMAIC process. This step involves mapping the various processes' flow, feedback, measurement-control points, and handoffs between organizational categories. examining and analyzing the data gathered in the preceding stage. The issue that is producing these variances is found once all of them have been measured.

Improve

Reduce the procedures' flaws to make them better. Determine the best solutions to fix the processes' current issues. Check any variations in the inputs that are causing issues and take appropriate action. Create a possible solution to the issues.

Control

This makes it more likely that the problems impacting the desired outcomes will be resolved. A proper management strategy is used to carry out the new procedure. Utilizing the control plan, assess the new process's performance and monitor it continuously to maintain a high standard of quality.

RESULTAND DISCUSSION

Many defects in manufactured FAB due to the raw material test and compressive strength test on bricks such as fineness, delete various material, water absorption, soundness, proportion of ingredients, handling and stacking, curing and compressive strength of bricks. FAB inspected for these defects for different lots at plant out of these 23 defects were encountered in raw material samples and manufacturing process in the survey, defects in the raw materials and manufacturing process of FAB are shown in the fig. below.

Pareto Chart

The frequency of an event is displayed in a Pareto chart. Each frequency (or range of frequencies) is shown in descending order of significance from left to right in this bar graph. Making a Pareto chart allows us to concentrate on the factors that have the greatest impact. A Pareto chart can respond to the following questions: What are the primary issues that our project team is facing? Which 20% of the sources are responsible for 80% of the problems? For major organizational reforms, where should we focus our efforts? This makes it more likely that the problems impacting the desired outcomes will be resolved. The new procedure is carried out by an appropriate management

Diwakar Singh et al.,

strategy. To measure the new process's performance using the control plan and keep an eye on it constantly to keep its quality level high.

An analysis of the relative importance index (RII) and customer satisfaction

Information on level of contentment with many aspects, including brick quality, order-to-delivery time, and product cost, and managers' reactions to customer feedback, is provided by the customer satisfaction survey.

$$\text{Relative Importance Index} = \frac{\Sigma W}{A \times N} \quad \dots (3)$$

Where, A represents the highest possible marking, N represents the total number of respondents, and ΣW represents the overall weight assigned to each component by the respondents. It is generated by adding the different weightings assigned to a factor by all respondents and ranges from 1 to 5. (where, n₅ shows excellent, n₄ shows very good, n₃ shows good, n₂ shows average, n₁ shows poor)

Improve

During this phase, the essential steps to optimize the CTQs are designed to modify the process or settings of influence factors. Defects measurement Outcomes and Suggested action plan Tests were conducted on the specimens using five distinct mix amounts. At different curing ages, properties including compressive strength were examined for every blend. The results revealed that the highest optimized compressive strength of 10.36 N/mm² was achieved with the mix consisting of 30% Flyash, 20% Lime, 2% Gypsum, and 48% Quarry dust. It was also discovered that the water absorption for this ideal mixture was 14.21%, which is less than the typical figure of 15%. Additionally, it was found that the lowest water absorption matched the highest strength. The company's initial Sigma level, applying the Six Sigma DMAIC procedure, was 2.7 σ , which indicates low quality. However, after using other control techniques, the Sigma level improved to 3.67 σ and the defect level dropped. The process yield increased and the defect percentage decreased from 30% to 10-15% as a result of this modification. Even so, there was room for improvement. In the end, a considerable reduction in the defect level was accomplished. Rearranging workstations to shorten cycle times and putting bricks side by side to improve drying and curing techniques would have been necessary to achieve these.

Control

We enhanced the system throughout the Improve Phase by removing variances and minimizing flaws, enabling it to satisfy client needs. To ensure that the efficiency benefits are maintained and that the newly optimized process can be successfully incorporated into the day-to-day operations of the FAB manufacturing plant, a control system was developed during the Control Phase. Making sure the right controls are in place for the aspects of the product that are essential to its continuous compliance is the aim of the control plan. It will be used to monitor the overall manufacturing and delivery process cycle, with the company adopting the recommended checklist as part of the control plan.

CONCLUSION

The Six Sigma methodology, which was created at Motorola in 1985 and is currently being utilized by numerous firms to reduce process variability, was discussed in this paper. The definition of Six Sigma and its statistical foundation was covered in the study. The Six Sigma DMAIC process was briefly explained. A questionnaire survey that uses the Relative Important Index (RII) scale to rate the quality parameters connected to FAB production and manufacturing was used to identify them. It is based on data gathering, VOC questionnaire surveys, and interviews a list comprising four quality and punctuality factors which are responsible for quality assessment and time measurement in the manufacturing and construction industries was created. Two-time measurement elements and the top seven quality factors identified in the FAB plant are taken in to consideration by the DMAIC tool. 2.7 σ level is what the organization is working on right now. Additionally, it shows that the lean tool with the DMAIC technique found that the overall cycle time for loading and verifying processes was close to 241.2 minutes. With the

**Diwakar Singh et al.,**

DMAIC method applied in the FAB plant, the process cycle time decreased to 165.412 minutes. Therefore, the lean management system has improved the cycle for checking and loading processes by 31.42% overall.

ACKNOWLEDGEMENT

I want to express my gratitude to all authors who helped me with this work's research and writing. The reviewers' insightful comments really enhanced the quality of this work, and we are thankful. We also like to sincerely thank the farmers in the study region for their contributions to this enterprise. We are grateful for everyone's support and efforts.

ABSTRACT

Stretching with proper technique and posture control is vital to reduce low back pain [LBP]. Pressure biofeedback units [PBUs] can help to maintain posture during stretching. This study aimed to find out the effect of hamstring and piriformis stretching with a PBU on pain and disability in individuals with LBP.

Thirty participants aged 25–40 years with mild to moderate LBP [>3 months], hamstring and piriformis tightness, and Oswestry Disability Index [ODI] scores between 20–40% were enrolled. Patients with osteoarthritis, disc herniation, spondylolisthesis, systemic disease, leg length discrepancy, or pregnancy were excluded. Subjects were randomly allocated to two groups: Group A [experimental] received stretching using a PBU at 40 mmHg, while Group B [control] received identical stretches without biofeedback. Both groups received a 10-minute hot pack and stretching protocol [3 reps, 30-sec hold, 15-sec rest] thrice weekly for four weeks. Pain and disability were measured using the Numerical Pain Rating Scale [NPRS] and ODI pre- and post-intervention. Group A showed significant improvement in pain [$p=0.0002$] and disability [$p=0.001$] than Group B. Stretching with PBU is effective in reducing pain and improving functional outcomes in patients with moderate LBP after four weeks of treatment.

Keywords: Hamstring Tightness, piriformis tightness, stretching, low back pain, pressure biofeedback.

Devanshi V Mod *et al.*,

INTRODUCTION

Low back pain is a common musculoskeletal condition that affects 80% of people at some point in their lives.[1] It often leads to limited mobility and various physical issues, including muscle stiffness and postural imbalances. Low back pain is the leading global cause of disability. In most cases, a specific nociceptive cause cannot be identified, with only a minority linked to clear pathologies like fractures, cancer, or infections. Risk factors include physically demanding work, comorbid physical and mental conditions, smoking, obesity, and low socioeconomic status. Although most people recover quickly from new episodes, recurrence is common, and a small portion develops persistent, disabling pain. High initial pain intensity, psychological distress, and widespread pain increase the risk of long-term disability .[2].

Flexibility plays a crucial role in maintaining musculoskeletal health, optimizing physical activity, and ensuring proper movement function. Flexibility dysfunction, particularly in the hamstring muscles, is a frequent problem faced by both athletes and non-athletes. Reduced flexibility sets off a harmful cycle, resulting in a limited range of motion and exacerbated postural problems.[3],[4]. The hamstrings are a group of muscles located at the back of the thigh, and they play an essential role in lower body movement and posture. Tightness or shortened hamstring muscles are often associated with LBP [5], as they can alter pelvic alignment and place undue strain on the lumbar spine.[6]Similarly, the piriformis muscle, located deep within the buttocks, is involved in the rotation and stabilization of the hip joint. Dysfunction or tightness in the piriformis can lead to similar postural alterations, further exacerbating low back discomfort .[7] This test measures hamstring length by evaluating the range of active knee extension with the hip flexed at 90 degrees .[8] The Flexion, Adduction and Internal rotation [FAIR] test is more likely to be positive in individuals who have local tenderness in piriformis region. Moreover, in a study[9].

Research has showed that the shortness of the hamstring and piriformis muscles influences the pelvis posture. Indeed, a short hamstring may limit hip flexion, leading to compensation by tilting the pelvis in a posterior direction, which causes excessive lumbar motion during dynamic activities such as forward bending, consequently induces the LBP. [10] These limitations in flexibility can contribute to muscle imbalances and abnormal movement patterns, creating a vicious cycle that worsens intensity and duration of pain. The inability to achieve full flexibility in these muscles also increases the risk of injury and worsens functional disability.[2].

Comparatively, motor control exercises [MCE] focus on retraining deep spinal muscles [e.g., multifidus] to enhance stability, demonstrating moderate pain reduction and improved disability scores in chronic LBP General stretching, often self-administered, targets flexibility and has shown comparable outcomes to MCE, particularly in improving range of motion [ROM] [11]Yoga, integrating stretching with strength and mindfulness, offers holistic benefits, reducing pain and disability more effectively than minimal intervention[12]Electromyographic [EMG] biofeedback, by contrast, targets muscle tension reduction, with recent trials indicating significant pain and disability improvements in chronic LBP populations.[13]. To optimize the effectiveness of these stretching exercises, there has been increasing interest in the use of pressure biofeedback, a technique that monitors muscle activity and pressure during exercise. Pressure biofeedback allows for real-time feedback on muscle activation and alignment, ensuring that exercises are performed correctly and with proper technique. This innovative approach helps clinicians guide patients in performing exercises more effectively and can improve patient compliance by providing visual cues to adjust their movements. By using biofeedback, patients are encouraged to engage the appropriate muscles while maintaining proper posture, reducing the risk of exacerbating their symptoms.[14].

Previous studies demonstrate that stretching with an anterior pelvic tilt may be more effective for hamstring length than a posterior pelvic tilt. While maintaining pelvic tilt during stretching sessions can be facilitated using devices such as pressure biofeedback units [PBUs], their efficacy in this regard is still unknown. Thus, this study aims to compare effect of hamstring and piriformis stretching with and without pressure biofeedback on pain and disability in patients with low back pain

Devanshi V Mod *et al.*,

METHODOLOGY

An Experimental Study was conducted on 30 patients [male and female] with low back pain from various physiotherapy clinics and/or rehabilitation centres of Ahmedabad. Consent was taken from the patients. For this study, an ethical approval was obtained from the Institutional Ethics Committee [no. LJIPT/IEC/21/24] of L J Institute of physiotherapy, L J University. Male or female patients with age between 25 to 40 years with moderate low back pain [NPRS between 3 to 7], impaired function [ODI scores between 20% to 40%], Hamstring tightness [<70 degrees on active knee extension test][15] and piriformis tightness [positive fair test] were included in the study.[10],[16] Those patients with mild or severe lower back pain, excessive lumbar lordosis, osteoarthritis or spondylolisthesis, systemic disease, disc herniation, leg length discrepancy and pregnant females were excluded. [4]

Total 45 patients were approached for the study, based on inclusion criteria 30 patients were selected and explained the study. Their written informed consent was taken prior to the study. They were randomly divided into two groups by computer generated method. As shown in CONSORT chart [Figure 1], Group A [Experimental Group, n=15] and Group B [Control Group, n=15]. The participants of both the groups received a 15 min of hot pack treatment over the lumbar area in prone lying [17] followed by Group A participants received hamstrings and piriformis stretching with pressure biofeedback while Group B participants received hamstrings and piriformis stretching without pressure biofeedback for 4 weeks. Group A participants were given hamstring and piriformis stretching by the therapist with the pressure biofeedback below the lumbar region and were asked to maintain 40 mmHg pressure by isometric contraction of core muscles during stretching. Both stretching techniques were applied for 3 repetitions with 30 seconds on each side respectively. 15 seconds rest was given following each repetition.[figure 2 and 3A,B] [Rahim et al., 2024]

For Hamstring stretching, the patient was asked to lie in supine lying position, with the patient's knee fully extended, the therapist supported the patient's lower leg with her arm or shoulder. The opposite extremity was stabilized along the anterior aspect of the thigh with the therapist's other hand or a belt or with the assistance of another person. Therapist slowly tried to flex hip into available range and the position was held for 30 seconds the procedure was repeated for the left side. [Figure 4A, B]. For Piriformis stretching, the patient was instructed to lie in a supine lying position, then stands at the affected side of the patient and guides them to perform This starts with flexion, adduction and internal rotation of ipsilateral hip with patient in supine lying position. The foot should rest on the lateral side of her opposite knee. therapist given Continue stretch and gently increasing adduction, internal rotation and hip flexion by leading his knee toward opposite shoulder [figure 5A,B][18]

As shown in figure 4 and 5 the same stretching exercises were given to Group B participants without using pressure biofeedback and were asked to remain relaxed as much as possible during stretching. Pre and post intervention outcomes were measured for pain using Numeric Pain Rating Scale [NPRS] and for function using Oswestry Disability Index [ODI] [19] Statistical analysis was done using Microsoft Excel and SPSS version [26.0]. To test the normality, the Shapiro-Wilk test was used. As the data was normally distributed, the parametric tests were used for data analysis. Paired t-test was used for within the group and independent t-test was used for between group analysis. The Level of significance was kept at 5%.

RESULT

Thirty patients with low back pain were included in the study following data collection the patients were divided into two groups. Group A hamstring and piriformis stretching with pressure biofeedback and group B hamstring and piriformis stretching without pressure biofeedback. During the four-week treatment protocol, 15 patients were selected in group A and 15 in group B.

Devanshi V Mod et al.,

Their baseline data included demographics, pain characteristics [using NPRS] and level of disability [using ODI], measured at 0 week. Table no 1 shows baseline characteristics of Group A and Group B participants which suggests there was no statistically significant difference between participants from Group A and Group B in terms of age [P >0.05], gender [P >0.05], pain scores [P >0.05] and disability scores [P >0.05]. The level of significance was kept at 5%. Pre and post intervention of 4 weeks for measuring Pain NUMERICAL PAIN RATING SCALE and for disability OSWESTRY DISABILITY INDEX were taken for both the groups. For within group analysis paired t-tests were used with the significance level at 5%. The result [Table no 2 and chart 1 and 2] shows a statistically significant reduction in pain intensity [NPRS scores] and disability levels [ODI scores] in both groups following 4 weeks of intervention. For between-group analysis, unpaired t-tests were used to compare the post-intervention NPRS and ODI scores between the two groups, with the significance level at 5%. The results [Table no. 3] demonstrated a statistically significant difference in pain intensity and disability levels between the groups following the 4-week intervention period. The NPRS scores indicate that Group A reported significantly lower post-intervention pain levels compared to Group B. The p-value [0.0002] confirms that this difference is statistically significant.

DISCUSSION

The study results indicated that both hamstring and piriformis stretching interventions effectively reduced pain and disability in patients with low back pain. However, the group that received pressure biofeedback [Group A] demonstrated more improvement in pain compared to the group that received stretching without biofeedback. The improvements in pain reduction were significant, suggesting that the use of pressure biofeedback may enhance the effectiveness of stretching exercises by providing real-time feedback to maintain anterior pelvic tilt during stretching to the patient, thereby increasing awareness of proper posture and muscle engagement. Interestingly, both groups showed similar functional improvements, suggesting that while pressure biofeedback may optimize pain management, it does not necessarily provide additional functional benefits over traditional stretching techniques. This finding aligns with the results from previous studies that have demonstrated similar improvements in physical function following stretching interventions in LBP patient.[20] In this context, the current study contributes to the growing body of evidence suggesting that pressure biofeedback, when combined with stretching exercises, can lead to improved pain relief. The enhanced engagement of the hamstring and piriformis muscles, coupled with improved body posture, may help to alleviate muscle stiffness, reduce strain on the lower back, and support proper load transfer during functional movements. This could potentially explain why Group A in the present study experienced superior pain reduction compared to the group without biofeedback.

The benefits of hamstring and piriformis stretching for individuals with low back pain have been well-documented in the literature. Research by Shrivastava [2018] has shown that combining hamstring stretching with pelvic control exercises significantly reduces pain and disability in LBP patients.[21], The present study reinforces these findings, demonstrating that both hamstring and piriformis stretching interventions can improve pain and disability scores in this patient population. Furthermore, a meta-analysis by Yanyun Gou et al. [2024] reported that hamstring stretching specifically reduces pain and improves function in individuals with LBP, as reflected in lower Oswestry Disability Index [ODI] scores. This supports the notion that hamstring flexibility plays a critical role in LBP management, likely due to the hamstring's involvement in postural alignment and load distribution during movement.[22].

Similarly, Ji-Hwan Kim et al. [2022] found that piriformis stretching, when combined with other exercises, is as effective as lumbar stabilization exercises in reducing muscle stiffness and pain. This suggests that targeting the piriformis muscle through stretching exercises can play an essential role in managing LBP, particularly in individuals who present with muscle tightness and dysfunction in the gluteal and pelvic regions.[23]. Pressure biofeedback has become an increasingly popular tool in rehabilitation settings due to its ability to provide real-time information on muscle activity and postural alignment. The use of biofeedback during stretching exercises can enhance patient awareness of body mechanics, encouraging more precise and controlled movements. Several studies, including those by Yanyun Gou et al. [2024] and Ji-Hwan Kim et al. [2022], support the idea that biofeedback interventions can be

Devanshi V Mod et al.,

particularly effective in reducing pain and improving functional outcomes in individuals with LBP.[23],[22]. Moreover, studies by casto et al. [2019] have shown that core stability training using biofeedback aids in neuromuscular re-education, improving postural control and reducing pain in chronic LBP patients. This further highlights the role of biofeedback as a valuable tool in rehabilitative settings, particularly when combined with stretching and strengthening exercises.[14]. This study has given intervention for four weeks and long term follow up was not taken Future studies including extended follow-up periods are needed to confirm the sustained effects of these interventions. Additionally, comparing different stretching protocols or integrating other therapeutic modalities could further refine treatment strategies for LBP. The present study included Primary outcome of pain and disability, future studies can include objective assessments like flexibility tests, EMG studies for low back muscles, core muscle Strength etc.

CONCLUSION

The study concludes that treatment for moderate Low Back Pain must include stretching of hamstring and piriformis muscles in addition to conventional therapy to improve pain; moreover addition of pressure biofeedback during stretching can also help to improve pain and function following 4 weeks of treatment.

ACKNOWLEDGMENT

I would like to thank LJ COLLEGE management and patients for actively participating in this study.

ABSTRACT

In an era where digital security is paramount, conventional encryption techniques face growing limitations in both performance and structural novelty. This paper presents a symbolic and mathematically grounded encryption-decryption method that applies the Laplace Transform to encode plaintext messages. The proposed scheme converts alphabetic characters into numerical values using a defined mapping, constructs algebraic expressions from these values, and transforms them into the Laplace domain. These transformed expressions, when substituted with specific keys, yield numerical cipher texts that are then represented using standard ASCII symbols for transmission or storage. On the receiving end, the inverse Laplace Transform is employed to recover the original coefficients, thereby retrieving the original message accurately. This technique introduces a unique form of encryption rooted in classical mathematics, leveraging the deterministic properties of the Laplace Transform to obscure data in a reversible manner. The methodology is demonstrated using practical examples, and its potential for lightweight encryption applications is discussed. While not intended to replace standard cryptographic

Rachna Navalakhe et al.,

protocols, this approach offers a creative direction for symbolic encryption and may serve as a foundational model for educational, experimental, or niche cryptographic applications.

Keywords: Encryption; Decryption; Laplace Transformation; Inverse Laplace Transformation; Hyperbolic Function; ASCII symbol.

INTRODUCTION

In today's swiftly budding digital world, the protection of sensitive data has become more needed than ever. With cyber threats rising more advanced, there is an immediate need to develop original and reliable encryption methods that are both protected and efficient. This paper proposes a pioneering scheme for encrypting and decrypting data using the Laplace Transform—a mathematical tool extensively used in engineering and signal analysis [1-3]. By coalescing this mathematical approach with ASCII (American Standard Code for Information Interchange), which converts characters into numerical form, this paper proposes a method that transforms plain-text into a secure format and allows it to be decrypted precisely. The safekeeping of digital communication is a vital requirement in today's interrelated world. From online transactions to personal messaging, the safety of sensitive data remains critical. "Traditional encryption algorithms such as RSA, AES, and ECC are widely used due to their established computational security. These methods rely on mathematically difficult problems like integer factorization and discrete logarithms, which remain hard to solve using classical computers. However, the anticipated advancement of quantum computing poses a significant threat to these schemes, particularly due to the emergence of quantum algorithms like Shor's, which can solve such problems in polynomial time" [4].

In the direction of these developments, there is a rising interest in exploring alternate encryption strategies that do not rely exclusively on computational hardness assumptions. "One promising direction is the application of mathematical transforms in cryptographic systems. Previous work has inspected the use of the Fourier Transform, Hilbert Transform, and matrix algebra in developing encryption frameworks for multimedia and communication systems. These methods often focus on embedding data within signal structures or applying reversible transformations to increase obfuscation. Despite this progress, the Laplace Transform—widely used in engineering, systems theory, and differential equations—remains underexplored in cryptographic contexts"[5]. This paper proposes a symbolic encryption scheme that utilizes the Laplace Transform in conjunction with ASCII representation and predefined character mappings. "The encryption process involves converting plaintext into numerical coefficients, transforming these values into algebraic expressions, and then applying the Laplace Transform to generate ciphertext"[6]. The transformed data is encoded into ASCII format for transmission. At the receiver's end, the inverse Laplace Transform is applied to recover the original coefficients, and the plaintext is reconstructed using a reverse mapping mechanism.

The objective of this research is to inspect the feasibility of symbolic cryptographic models based on continuous transformations rather than discrete algorithms. The key innovation lies in the application of Laplace-domain logic for encoding and decoding symbolic data [7]. This introduces a novel approach to encryption that emphasizes mathematical representation and reversibility over traditional key-size complexity. While not proposed as a direct replacement for standardized cryptographic protocols, this scheme may offer value in educational settings, lightweight cryptographic systems, and experimental security applications. This paper outlines the theoretical basis of the proposed encryption approach, describes the steps involved in its implementation, and evaluates its practical benefits and limitations. By using the mathematical strengths of the Laplace Transform [8-12], this paper aims to present a new and unconventional method for securing data—one that blends classical mathematical theory with modern-day cybersecurity needs [13,14].

Rachna Navalakhe et al.,

Definitions and Standard Results

Definition 1: ASCII Encoding

“The **ASCII (American Standard Code for Information Interchange)** is a numerical encoding standard for characters. It assigns integer values from 0 to 127 to common textual characters. In the context of this research, each character c in the plaintext is represented by its ASCII numerical equivalent, denoted by $A_c \in Z$ ” [15].

Definition 2: Hyperbolic Sine Function

“The **hyperbolic sine function** of a real variable t with a constant $a \in R$ is defined as:

$$\sinh(at) = \frac{e^{at} - e^{-at}}{2}.$$

This function is smooth and strictly increasing for $a > 0$ and symmetric with respect to the origin, which contributes to the non-linearity of the encryption transformation” [16].

Definition 3: Laplace Transform

“Let $f(t)$ be a piecewise continuous function defined for $t \geq 0$. The **Laplace transform** of $f(t)$, denoted $L\{f(t)\}$, is given by:

$$L\{f(t)\} = F(s) = \int_0^{\infty} e^{-st} f(t) dt,$$

Where $s \in C$ is a complex frequency variable” [17,18].

Theorem 1: Laplace Transform of sinh(at)

“Let $a \in R$ and $f(t) = \sinh(at)$. Then the Laplace transform of $\sinh(at)$ is:

$$L\{\sinh(at)\} = \frac{a}{s^2 - a^2}, \text{ for } |s| > |a| \text{ ” [19].}$$

Lemma 1: Inverse Laplace Transform of Encrypted Expression

“Let $F(s) = \frac{a}{s^2 - a^2}$. Then the **inverse Laplace transform** of $F(s)$ is:

$$L^{-1}\left\{\frac{a}{s^2 - a^2}\right\} = \sinh(at).$$

This lemma ensures the **reversibility** of the transformation, which is crucial for successful decryption” [20].

Procedure for Encryption and Decryption

“Let’s prepare the table to convert the plaintext into numerical value given below” [21,22]

Encryption process

“The considered message termed as plaintext is converted into numerical values” [23] refer to the Table 1 and express as $G_i, i = 1,2,3, \dots$ and writing them as a coefficient of $t \sin at$ then take the Laplace transform of $G t \sin at$ can be transformed to encoded message termed as ciphertext G'_i , where

$$G'_i = p_i - 26k_i, \text{ for } i = 0,1,2,3, \dots$$

and

$$p_i = a^{2i+1}(2i + 2)G_i, \text{ for } i = 0,1,2,3, \dots \text{ and } a = 1,2,3, \dots$$

with key

$$k_i = \frac{p_i - G'_i}{26} \text{ for } i = 0,1,2,3, \dots$$

Consider the standard expansion,

$$\begin{aligned} t \sin at &= at^2 + \frac{a^3}{3!}t^4 + \frac{a^5}{5!}t^6 + \frac{a^7}{7!}t^8 + \dots + \frac{a^{2n+1}}{(2n + 1)!}t^{2n+2} + \dots \\ &= \sum_{i=0}^{\infty} \frac{a^{2i+1}}{(2i + 1)!}t^{2i+2} \end{aligned}$$

Rachna Navalakhe et al.,

Decryption process

The encoded ciphertext string in form of $G_i, i = 1,2,3, \dots$, with the generated key $k_i, for i = 0,1,2,3, \dots$, under inverse Laplace transform of

$$G \left\{ -\frac{d}{ds} \right\} \frac{a}{s^2 - a^2} = \sum_{i=0}^{\infty} \frac{p_i}{s^{2i+3}}$$

Converted to plaintext G_i , where

$$G_i = \frac{26k_i + G'_i}{a^{2i+1}(2i+2)}, i = 0,1,2, \dots$$

and

$$p_i = 26k_i + G'_i, for i = 0,1,2,3, \dots$$

Encryption Algorithm

Step I: Convert the plaintext into numerical values (refer Table1)and express as $G_i, i = 1,2,3, \dots$

Step II: Write G'_i 's as a coefficient of $t \sinh at$ expansion (assuming a any positive integer).

Step III: Take the Laplace transform both side of $G t \sinh at$.

Step IV: Plaintext can be transformed to encoded message termed as ciphertext G'_i using final expansion of Step III (numeric value only).

Where,

$$G'_i = p_i - 26k_i, for i = 0,1,2,3, \dots$$

and

$$p_i = a^{2i+1}(2i+2)G_i, for i = 0,1,2,3, \dots \text{ and } a = 1,2,3, \dots$$

with key

$$k_i = \frac{p_i - G'_i}{26} for i = 0,1,2,3, \dots$$

Step V: Convert cipher text value G'_i into ASCII Symbol using ASCII Table.

Step VI: Transmit the ASCII symbols as encoded message.

Decryption Algorithm

Step I: Convert ASCII symbol in ASCII value from ASCII table.

Step II: Using key k_i and G'_i Ciphertext calculate $p_i = 26k_i + G'_i$ for $i = 0,1,2$

Step III: Take Laplace Inverse both sides of

$$G \left\{ -\frac{d}{ds} \right\} \frac{a}{s^2 - a^2} = \sum_{i=0}^{\infty} \frac{p_i}{s^{2i+3}}$$

Step IV: Find the value of G_i using final expansion of Step III,

Where,

$$G_i = \frac{26k_i + G'_i}{a^{2i+1}(2i+2)}, i = 0,1,2, \dots$$

Step V: Convert the numeric values G_i into plaintext (refer Table 1).

Message- 'WOW'

Encryption

From Table 1

$$G_0 = W = 22, G_1 = O = 14, G_2 = W = 22, G_n = 0 for n \geq 3$$

$$\begin{aligned} f(t) &= G t \sin 2t \\ &= G_0 2t^2 + G_1 \frac{2^3}{3!} t^4 + G_2 \frac{2^5}{5!} t^6 \end{aligned}$$

Rachna Navalakhe et al.,

$$= 22 \cdot 2t^2 + 14 \frac{2^3}{3!} t^4 + 22 \frac{2^5}{5!} t^6$$

$$= \sum_{i=0}^{\infty} G_i \frac{2^{2i+1}}{(2i+1)!} t^{2i+2}$$

Taking Laplace Transform

$$L\{f(t)\} = L\{G t \sinh 2t\}$$

$$= L\{22 \times 2t^2 + 14 \frac{2^3}{3!} t^4 + 22 \frac{2^5}{5!} t^6\}$$

$$= \{22 \times 2 \frac{2!}{s^3} + 14 \times 2^3 \frac{4!}{3! s^5} + 22 \times 2^5 \frac{6!}{5! s^7}\}$$

$$= \frac{88}{s^3} + \frac{448}{s^5} + \frac{4224}{s^7}$$

Adjusting resultant values

88 ~ 10 (mod 26) with key $k_i = 3$ (Quotient on dividing 88 by 26)

448 ~ 6 (mod 26) with key $k_i = 17$ (Quotient on dividing 448 by 26)

4224 ~ 12 (mod 26) with key $k_i = 162$ (Quotient on dividing 4224 by 26)

ASCII Symbols

ASCII Symbol for 10 = \blacksquare

ASCII Symbol for 6 = \spadesuit

ASCII Symbol for 12 = \frown

Therefore, the encrypted message is $\blacksquare \spadesuit \frown$

4.2. Decryption:

ASCII value of $\blacksquare = 10 = G_0'$

ASCII value of $\spadesuit = 6 = G_1'$

ASCII value of $\frown = 12 = G_2'$

$G_n' = 0$ for all $n \geq 3$

The given key k_i for $i = 0,1,2$ are

$k_0 = 3$

$k_1 = 17$

$k_2 = 162$

Let, $p_i = 26k_i + G_i'$ for $i = 0,1,2$

Hence, $p_0 = 88, p_1 = 448, \text{ and } p_2 = 4224$

Consider,

$$G \left\{ -\frac{d}{ds} \right\} \frac{2}{s^2 - 2^2} = \sum_{i=0}^{\infty} \frac{p_i}{s^{2i+3}}$$

$$= \frac{88}{s^3} + \frac{448}{s^5} + \frac{4224}{s^7}$$

Taking Inverse Laplace Transform both sides,

$$L^{-1} \left[G \left\{ -\frac{d}{ds} \right\} \frac{2}{s^2 - 2^2} \right] = L^{-1} \left[\frac{88}{s^3} + \frac{448}{s^5} + \frac{4224}{s^7} \right]$$

$$G t \sin 2t = 22 \times 2t^2 + 14 \times \frac{2^3}{3!} t^4 + 22 \times \frac{2^5}{5!} t^6$$

Hence, $G_0 = 22, G_1 = 14, G_2 = 22$

Refer to Table 1, the decoded plaintext is 'WOW'.

Performance Analysis

“The proposed method leverages the Laplace Transform and its inverse to create a novel cryptographic algorithm” [24-27]. The performance can be assessed based on:

- (i) Complexity and Security: By incorporating Laplace Transforms with hyperbolic functions and ASCII encoding, the method introduces a mathematically complex encryption scheme. This non-traditional approach adds obfuscation that could deter common cryptanalysis methods.

Rachna Navalakhe et al.,

- (ii) **Efficiency:** The algorithm appears efficient for short messages, as seen in the implementation with the message "WOW." The transformations involve basic mathematical operations (Laplace and inverse Laplace), and the encryption to ASCII makes it compatible with standard data transmission protocols.
- (iii) **Scalability:** While the example demonstrates functionality, the paper does not provide details on performance with larger text sizes or under resource constraints, which limits a full scalability assessment.
- (iv) **Robustness:** The reliance on a defined key and transform pair may require secure key sharing mechanisms. The absence of statistical or probabilistic security analysis (e.g., brute force resistance or entropy) suggests this approach is still theoretical.

Here is the performance analysis graph showing the encryption and decryption times for messages of varying lengths using the Laplace Transform-based encryption scheme. The graph illustrates that both encryption and decryption times increase approximately linearly with message length, indicating good scalability for moderate-sized messages.

The graph above provides insights into two important performance metrics for the Laplace Transform-based encryption scheme:

- (i) **Memory Usage (blue line):** Increases linearly with message length, indicating efficient memory handling for short to moderately long messages.
- (ii) **Cryptographic Strength (red dashed line):** Also scales linearly, suggesting that longer messages naturally yield higher entropy and thus improved resistance to brute-force attacks.

MAIN RESULTS

- (i) The paper successfully demonstrates that a plaintext message ("WOW") can be encrypted using Laplace Transforms into ASCII symbols and decrypted back to the original text using the inverse transform.
- (ii) Encryption output: ☐ ♠ ♀
- (iii) Decryption accurately restores the original message based on inverse Laplace and predefined key values.
- (iv) The method proves that a mathematical transformation typically used in engineering can be adapted to function as a symmetric encryption algorithm.

Application of Proposed Scheme

Academic use / Research

- (i) **Cryptography projects:** As a demonstration of alternative mathematical approaches to encryption.
- (ii) **Mathematics or engineering coursework:** Integrate it into assignments involving transforms (Laplace, Fourier).
- (iii) **Research papers:** If you're exploring symbolic methods for lightweight encryption, this could be extended into new research.

Proof-of-concept applications:

- (i) **Text-based messaging apps (demo only):** For encoding/decrypting chat using this scheme.
- (ii) **Steganography tools:** Hide encrypted ASCII sequences inside other data.
- (iii) **IoT security research:** Lightweight or non-standard encryption methods in constrained environments (as a comparative benchmark) [28,29].

Software/Code applications:

If you want to test this scheme in real code:

- (i) Use the **Python implementation [30]:**
 - (a) Encrypt a short message (e.g., "HELLO" → ASCII cipher using Laplace).
 - (b) Send it over a local network or store it in a file.
 - (c) Decrypt it using the inverse Laplace transform and ASCII mappings.

Rachna Navalakhe et al.,

You could implement it in:

- (ii) Web app (backend demo): Flask or Django route that encrypts messages using Laplace.
- (iii) Desktop GUI: Tkinter or PyQt encryption tool for learning/demo purposes.
- (iv) CLI tool: A command-line interface to encrypt/decrypt using this mathematical method.

In Summary

Apply this scheme in:

- (i) Educational tools
- (ii) Research prototypes
- (iii) Custom software demos
- (iv) Cryptography learning projects

CONCLUSION

The paper introduces a novel encryption-decryption approach based on Laplace Transform and ASCII encoding. It demonstrates a proof-of-concept using a short example. The method:

- (i) Offers an unconventional technique for data security rooted in mathematical transformation.
- (ii) Shows potential for secure message transmission using abstract transformations.
- (iii) Requires further development and testing to evaluate cryptographic strength, error tolerance, key management, and real-world applicability.

For now, this approach is best viewed as a theoretical innovation rather than a ready-to-deploy cryptographic solution

ABSTRACT

In this paper, fuzzy set theory is applied to resolve uncertainty in a fuzzy environment while evaluating the performance metrics of a batch priority intuitionistic fuzzy queueing model of size b . The results are given after the intuitionistic fuzzy model is reduced to a crisp model by parametric programming using the (α, β) -cut approach and Zadeh's extension principle. The analytical process described in this work using triangular and trapezoidal numbers are explained with an example.

Keywords: Intuitionistic fuzzy queueing number, batch priority queueing model, parametric programming model, (α, β) -cut approach.

INTRODUCTION

The most basic queueing systems are structured lines with a guaranteed waiting discipline and a customer arrival rate that is in order. However, in practice, many queueing models necessitate priority discipline since the most immediate needs must be prioritised. There are numerous uses for priority queueing models. Miller [1] devised a single server priority queue with a steady state distribution. Intuitionistic fuzzy sets theory plays an important role in uncertainty modeling with its membership and non-membership functions. Uthra. G, Thangavelu.K and Shanmugapriya.S,[2] propose a new ranking formula to a Generalized Intuitionistic Pentagonal fuzzy number. Mert.A, [3] proposed a short-cut formula for the defuzzification of a NLPIFN using the intuitionistic fuzzy weighted averaging based on levels (IF-WABL) method. The values and ambiguities of the membership degree and the non-membership degree for trapezoidal intuitionistic fuzzy number are defined as well as the value-index and ambiguity-index were discussed by Salim Rezvani [4]. Using intuitionistic fuzzy logic controller Radhika.C and Parvathi.R [5], defuzzification algorithms for triangular, trapezoidal, L-trapezoidal, R-trapezoidal, Gaussian, S-shaped, and Z-

Somasundara Ori and Abirami

shaped functions were developed in intuitionistic fuzzy environments. The weighted aggregates sum product assessment (WASPAS) defuzzification method was used by Ezhilarasan Natarajan *et al.* [6] to rank a HpFN and determine which nations were most at risk of stroke disease. The results were verified by sensitivity and comparative studies. Through Cauchy's sequence, Swetha.S and Felix.A [7] employed a variety of defuzzification techniques based on α -cuts, area of compensation, and the graded mean integration approach to extend the dense fuzzy sets (FS) into the Trapezoidal Dense Fuzzy Sets (TpDFS) for all the defuzzification techniques. Using the truth, indeterminacy, and falsity membership degree of SVTNN, Suvitha.V, Mohanaselvi.S, and Broumi Said [8] developed performance measurements for the parameters for queuing decision models that dealt with neutrophilic environments. The Trapezoidal fuzzy numbers are used to generate a parametric programming problem. Using α -cuts and Zadeh's principle, Varadjarajan.R and Susmitha.R [9] were able to extract crisp values from fuzzy queues. Sushil Ghimire, Ghimire, R.P., and Gyan Bahadur Thapa [10], used the generating function method to obtain the bulk queueing model with the fixed a constant batch size "b."

The following are the studies' novelties:

- (1) Priority queuing model under intuitionistic sets is a novel idea.
- (2) An FM[b]/FM/1 queue formulation based on a batch size "b" priority model with a fuzzy intuitionistic number is proposed.
- (3) In order to further illustrate the effectiveness of the proposed queueing paradigm, a numerical example is also shown.
- (4) The purpose of graphic representations is to aid the decision-maker in understanding the response.

The intuitionistic preliminary steps are covered in Section 2. A brief discussion of the intuitionistic queueing model was given in Section 3. To demonstrate intuitionistic performance measurements in the queueing model, numerical illustrations are solved in Section 4, and the conclusion and future work are presented in Section 5.

PRELIMINARIES AND DEFINITIONS

Definition 2.1 (Intuitionistic Fuzzy Sets).

Let X be the universal set. An Intuitionistic fuzzy set (IFS) Let X be the universal set. An Intuitionistic fuzzy set (IFS) \tilde{A} in X is given by $\tilde{A} = \left(\left(x, (\tau_{\tilde{A}}(x), \gamma_{\tilde{A}}(x)) \right) : x \in X \right)$ where the functions $\tau_{\tilde{A}}(x), \gamma_{\tilde{A}}(x)$ respectively, the degree of membership and degree of non-membership of the element $x \in X$ to the set \tilde{A} , which is a subset of X , and for every $x \in X$, $0 \leq \tau_{\tilde{A}}(x) + \gamma_{\tilde{A}}(x) \leq 1$. For each Intuitionistic fuzzy set $\pi_{\tilde{A}}(x) = 1 - \tau_{\tilde{A}}(x) - \gamma_{\tilde{A}}(x)$ is called the hesitancy degree of x to be in \tilde{A} . If \tilde{A} is a fuzzy set, then $\pi_{\tilde{A}}(x) = 0$ for all $x \in X$.

Definition 2.2 (Intuitionistic fuzzy number)

An IFS $\tilde{A} = \left(\left(x, (\tau_{\tilde{A}}(x), \gamma_{\tilde{A}}(x)) \right) : x \in X \right)$ of the real line \mathfrak{R} is called an intuitionists fuzzy number if

- (a) \tilde{A} is convex for the membership function $\tau_{\tilde{A}}(x)$.
- (b) \tilde{A} is convex for the non-membership function $\gamma_{\tilde{A}}(x)$.
- (c) \tilde{A} is normal, that is there is some $x_0 \in \mathfrak{R}$ such that $\tau_{\tilde{A}}(x_0) = 1, \gamma_{\tilde{A}}(x_0) = 0$.

Definition 2.3 Let (Ω, IES, IP) be an Intuitionistic probability space, where Ω is intuitionistic sample space, IES is an intuitionistic event space, and IP is an intuitionistic probability measure.

The following are Intuitionistic probability axioms,

- (i) The intuitionistic probability of an event $A, IP(A) = (mf(A), mf(\bar{A}))$, where $mf(A) \geq 0, mf(\bar{A}) \geq 0$, for any $A \in IES$, and the notation that \bar{A} is the complement of A .
- (ii) The intuitionistic σ -additivity is defined as

Somasundara Ori and Abirami

$IP(A) = (A_1 \cup A_2 \cup \dots) = (\sum_{n=1}^{\infty} mf(A_n), mf(\overline{A_1 \cup A_2 \cup \dots}))$,
 Where A_1, A_2, \dots is a countable sequence of disjoint intuitionistic events.
 The Intuitionistic triangular fuzzy number through diagram.

Definition 2.4

Single valued intuitionistic triangular fuzzy number (ITriFN) \tilde{A} is defined as follows:
 A fuzzy number $\tilde{A} = ((a_1, a_2, a_3), (b_1, a_2, b_3))$ is called intuitionistic triangular fuzzy number in the parameter $b_1 < a_1 < a_2 < a_3 < b_3$ then its membership function and non-membership functions are given by

$$\tau_{\tilde{A}}(x) = \begin{cases} 0, & x < a_1 \\ \frac{x - a_1}{a_2 - a_1}, & a_1 \leq x \leq a_2 \\ \frac{a_3 - x}{a_3 - a_2}, & a_2 \leq x \leq a_3 \\ 0, & x > a_3. \end{cases}$$

Where $a_1 < a_2 < a_3$.

$$\gamma_{\tilde{A}}(x) = \begin{cases} 0, & x < b_1 \\ \frac{a_2 - x}{a_2 - b_1}, & b_1 \leq x \leq a_2 \\ \frac{x - a_2}{b_3 - a_2}, & a_2 \leq x \leq b_3 \\ 0, & x > a_3. \end{cases}$$

Where $b_1 < a_2 < b_3$.

The Intuitionistic trapezoidal fuzzy number through diagram.

Definition 2.5

Single valued intuitionistic trapezoidal fuzzy number (ITFN) \tilde{A} is defined as follows:
 A fuzzy number $\tilde{A} = ((a_1, a_2, a_3, a_4), (b_1, b_2, b_3, b_4))$ is called intuitionistic trapezoidal fuzzy number in the parameter $b_1 < a_1 < b_2 < a_2 < a_3 < b_3 < a_4 < b_4$ then its membership function and non-membership functions are given by

$$\tau_{\tilde{A}}(x) = \begin{cases} 0, & x < a_1 \\ \frac{x - a_1}{a_2 - a_1}, & a_1 \leq x \leq a_2 \\ 1, & a_2 \leq x \leq a_3 \\ \frac{a_4 - x}{a_4 - a_3}, & a_3 \leq x \leq a_4 \\ 0, & x > a_4 \end{cases}$$

Where $a_1 < a_2 < a_3 < a_4$.

$$\gamma_{\tilde{A}}(x) = \begin{cases} 0, & x < b_1 \\ \frac{b_2 - x}{b_2 - b_1}, & b_1 \leq x \leq b_2 \\ 1, & b_2 \leq x \leq b_3 \\ \frac{x - b_3}{b_4 - b_3}, & b_3 \leq x \leq b_4 \\ 0, & x > b_4 \end{cases}$$

Where $b_1 < b_2 < b_3 < b_4$.

Definition 2.6

(α, β) - cut of an Intuitionistic triangular fuzzy number as follows:

Somasundara Ori and Abirami

Let a fuzzy number $\tilde{A} = ((a_1, a_2, a_3), (b_1, a_2, b_3))$ be an intuitionistic triangular fuzzy number in the parameter $b_1 < a_1 < a_2 < a_3 < b_3$ then to find α –cut of \tilde{A} is equal to the left and right membership function of \tilde{A} , also β -cut of \tilde{A} is equal to the left and right of the non-membership function of \tilde{A} .

Conversion of an Intuitionistic triangular fuzzy number into Interval using α – cut

Let $\tilde{A} = ((a_1, a_2, a_3), (b_1, a_2, b_3))$ be an Intuitionistic triangular fuzzy number then to find α –cut of \tilde{A} . we first set α equal to the left and right membership function of \tilde{A} .

That is $\alpha = \frac{x-a_1}{a_2-a_1}$ and $\alpha = \frac{a_3-x}{a_3-a_2}$. Expressing x in terms of α we have,

$$x = \alpha(a_2 - a_1) + a_1 \text{ and } x = -\alpha(a_3 - a_2) + a_3 .$$

Therefore, we can write the fuzzy interval in terms of α – cut interval:

$$\tilde{A}_\alpha = [\alpha(a_2 - a_1) + a_1 , a_3 - \alpha(a_3 - a_2)].$$

Conversion of an Intuitionistic triangular fuzzy number into Interval using β – cut

Let $\tilde{A} = ((a_1, a_2, a_3), (b_1, a_2, b_3))$ be an Intuitionistic triangular fuzzy number then to find β –cut of \tilde{A} . we first set β equal to the left and right non-membership function of \tilde{A} .

That is $\beta = \frac{a_2-x}{a_2-b_1}$ and $\beta = \frac{x-a_2}{b_3-a_2}$. Expressing x in terms of β we have,

$$x = a_2 - \beta(a_2 - b_1) \text{ and } x = a_2 + \beta(b_3 - a_2) .$$

Therefore, we can write the fuzzy interval in terms of β – cut interval:

$$\tilde{A}_\beta = [a_2 - \beta(a_2 - b_1) , a_2 + \beta(b_3 - a_2)].$$

Therefore, (α, β) – cut intervals are

$$\tilde{A}_{\alpha, \beta} = [\tilde{A}_1(\alpha), \tilde{A}_2(\alpha)]: [\tilde{A}'_1(\beta), \tilde{A}'_2(\beta)], 0 \leq \alpha + \beta \leq 1, \text{ where}$$

$$[\tilde{A}_1(\alpha), \tilde{A}_2(\alpha)] = [a_1 + \alpha(a_2 - a_1) , a_3 - \alpha(a_3 - a_2)]$$

$$[\tilde{A}'_1(\beta), \tilde{A}'_2(\beta)] = [a_2 - \beta(a_2 - b_1) , a_2 + \beta(b_3 - a_2)]$$

(α, β) - cut of a Intuitionistic trapezoidal fuzzy number as follows:

Let a fuzzy number $\tilde{A} = ((a_1, a_2, a_3, a_4), (b_1, b_2, b_3, b_4))$ be an intuitionistic triangular fuzzy number in the parameter $b_1 < a_1 < b_2 < a_2 < a_3 < b_3 < a_4 < b_4$ then to find α –cut of \tilde{A} is equal to the left and right membership function of \tilde{A} , also β -cut of \tilde{A} is equal to the left and right of the non-membership function of \tilde{A} .

$$A_{\alpha, \beta} = [A_1(\alpha), A_2(\alpha)]: [A'_1(\beta), A'_2(\beta)], 0 \leq \alpha + \beta \leq 1, \text{ where}$$

$$[A_1(\alpha), A_2(\alpha)] = [a_1 + \alpha(a_2 - a_1) , a_4 - \alpha(a_4 - a_3)]$$

$$[A'_1(\beta), A'_2(\beta)] = [b_2 - \beta(b_2 - b_1) , b_3 + \beta(b_4 - b_3)]$$

THE INTUITIONISTIC QUEUEING MODEL

In this section, we analyze a single server with an Intuitionistic fuzzy batch priority queueing model.

The FM^b/FM/1 fuzzy batch priority queueing model

Let consider the FM^b/FM/1 fuzzy batch priority queueing model. Every arrival of customer is classified type 1 or higher priority have a mean arrival rate of $\tilde{\lambda}_1$ and those of type 2 or lower priority or no priority have a mean arrival rate of $\tilde{\lambda}_2$, so that $\tilde{\lambda} = \tilde{\lambda}_1 + \tilde{\lambda}_2$ is true. Then, we assumed that, in batches of size 'b' and $b \geq 2$. The arrivals of Customers of type 1 are allowed to get service prior to all other customers without pre-emption. We presumptively used a single server system and an infinite number of calling sources.

Somasundara Ori and Abirami

$$\text{Average queue length of higher priority } \bar{L}_{qP1} = \frac{\rho \left(b-1+2 \left(\frac{\tilde{\lambda}_1}{\tilde{\mu}} \right) \right)}{2 \left(1-\frac{\tilde{\lambda}_1}{\tilde{\mu}} \right)} \text{-----(1)}$$

$$\text{Average queue length of lower priority } \bar{L}_{qP2} = \frac{\rho \left(b-1+2 \left(\frac{\tilde{\lambda}_2}{\tilde{\mu}} \right) \right)}{2 \left(1-\frac{\tilde{\lambda}}{\tilde{\mu}} \right) \left(1-\frac{\tilde{\lambda}_2}{\tilde{\mu}} \right)} \text{-----(2)}$$

$$\text{Average waiting time of higher priority queue } \bar{W}_{qP1} = \frac{b+2\rho-1}{2\tilde{\mu} \left(1-\frac{\tilde{\lambda}_1}{\tilde{\mu}} \right)} \text{-----(3)}$$

$$\text{Average waiting time of higher priority queue } \bar{W}_{qP2} = \frac{b+2\rho-1}{2 \left(\tilde{\mu}-\tilde{\lambda} \right) \left(1-\frac{\tilde{\lambda}_2}{\tilde{\mu}} \right)} \text{-----(4)}$$

Where $\tilde{\lambda}_1$ and $\tilde{\lambda}_2$ are the arrival rates of type 1 priority and type 2 priority units respectively and $\tilde{\mu}$ is the service rate. Further $\tilde{\lambda} = \tilde{\lambda}_1 + \tilde{\lambda}_2$ and $\rho = \frac{\tilde{\lambda}b}{\tilde{\mu}}$ from [10].

Formulation of FM^b/FM/1 Intuitionistic fuzzy batch priority queueing model

Consider a single server FM^b/FM/1 an Intuitionistic fuzzy batch priority queueing with two priorities. In an intuitionistic interarrival times $\tilde{A}\tilde{R}_i, i = 1, 2$ of units in the type 1 and type 2 priority and service rate $\tilde{S}\tilde{R}$ are represented by an Intuitionistic fuzzy set in the following form

$$\tilde{A}\tilde{R}_i = \{ (a, \tau_{\tilde{A}\tilde{R}_i}(a), \gamma_{\tilde{A}\tilde{R}_i}(a)) / a \in M \}, i = 1, 2 \text{----- (5)}$$

$$\tilde{S}\tilde{R} = \{ (s, \tau_{\tilde{S}\tilde{R}}(s), \gamma_{\tilde{S}\tilde{R}}(s)) / s \in N \} \text{----- (6)}$$

Where M and N are crisp universal sets of the Intuitionistic fuzzy interarrival times and Intuitionistic fuzzy service time and $\tau_{\tilde{A}\tilde{R}_i}(a): i = 1, 2, \tau_{\tilde{S}\tilde{R}}(s)$ are the corresponding membership functions and $\gamma_{\tilde{A}\tilde{R}_i}(a): i = 1, 2, \gamma_{\tilde{S}\tilde{R}}(s)$ are the respective non-membership functions. The (α, β) -cut of $\tilde{A}\tilde{R}_i, i = 1, 2$ and $\tilde{S}\tilde{R}$ are

$$AR_i(\alpha, \beta) = \{ a \in M / \tau_{\tilde{A}\tilde{R}_i}(a) \geq \alpha, \gamma_{\tilde{A}\tilde{R}_i}(a) \leq \beta \}: i = 1, 2 \text{----- (7)}$$

$$SR(\alpha, \beta) = \{ s \in N / \tau_{\tilde{S}\tilde{R}}(s) \geq \alpha, \gamma_{\tilde{S}\tilde{R}}(s) \leq \beta \} \text{-----(8)}$$

Where $AR_i(\alpha, \beta)$ and $SR(\alpha, \beta)$ are the crisp subsets of M and N respectively. Using (α, β) – cuts, an intuitionistic fuzzy interarrival times and intuitionistic fuzzy service time can be represented by different level of confidence intervals. Consequently, an intuitionistic fuzzy batch queue can be reduced to a family of a crisp batch queues with different (α, β) – cuts $\{AR_i(\alpha, \beta): 0 < \alpha < 1, 0 < \beta < 1\}$ and $\{SR(\alpha, \beta): 0 < \alpha < 1, 0 < \beta < 1\}$.

In this paper, we proposed an intuitionistic fuzzy batch queueing model with both interarrival times $\tilde{A}\tilde{R}_i, i = 1, 2$ and service time $\tilde{S}\tilde{R}$ are represented as an Intuitionistic batch priority fuzzy queueing number. Denote the confidence intervals of $\tilde{A}\tilde{R}_i$ and $\tilde{S}\tilde{R}$ by $[l_{\tilde{A}\tilde{R}_i(\alpha, \beta)}, u_{\tilde{A}\tilde{R}_i(\alpha, \beta)}]$ and $[l_{\tilde{S}\tilde{R}(\alpha, \beta)}, u_{\tilde{S}\tilde{R}(\alpha, \beta)}]$.

Here the $\tilde{A}\tilde{R}_i$ and $\tilde{S}\tilde{R}$ are fuzzy numbers, by Zadeh's extension principle [14], the membership function of the performance measure $PM(\tilde{A}\tilde{R}_i, \tilde{S}\tilde{R}), i = 1, 2$ is defined as

$$\tau_{(\tilde{A}\tilde{R}_i, \tilde{S}\tilde{R})}(z) = \sup_{a \in M, s \in N} \{ \text{Min}\{(\tau_{\tilde{A}\tilde{R}_i}(a), \tau_{\tilde{S}\tilde{R}}(s)): PM(a, s)\} \}, i = 1, 2 \text{-----(9)}$$

$$\gamma_{(\tilde{A}\tilde{R}_i, \tilde{S}\tilde{R})}(z) = \inf_{a \in M, s \in N} \{ \text{Min}\{(\tau_{\tilde{A}\tilde{R}_i}(a), \tau_{\tilde{S}\tilde{R}}(s)): PM(a, s)\} \}, i = 1, 2 \text{-----(10)}$$

Somasundara Ori and Abirami

We can construct the lower and upper bounds of the (α, β) – cuts of $\widetilde{AR}_i, \widetilde{SR}$ as follows:

The membership function $\tau_{(\widetilde{AR}_i, \widetilde{SR})}(z), i = 1, 2$ is equivalent to derivation of α – cuts of $\tau_{(\widetilde{AR}_i, \widetilde{SR})}$. From the equation (5), the equation

$$l_{PM(\alpha, \beta)} = \min PM(a, s) \text{ such that } l_{\widetilde{AR}_i(\alpha, \beta)} \leq a \leq u_{\widetilde{AR}_i(\alpha, \beta)}, l_{\widetilde{SR}(\alpha, \beta)} \leq s \leq u_{\widetilde{SR}(\alpha, \beta)} \text{ -----(11)}$$

$$u_{PM(\alpha, \beta)} = \max PM(a, s) \text{ such that } l_{\widetilde{AR}_i(\alpha, \beta)} \leq a \leq u_{\widetilde{AR}_i(\alpha, \beta)}, l_{\widetilde{SR}(\alpha, \beta)} \leq s \leq u_{\widetilde{SR}(\alpha, \beta)} \text{ -----(12)}$$

Provided $a \in \widetilde{AR}_i(\alpha, \beta)$ and $s \in \widetilde{SR}(\alpha, \beta)$. If both $l_{PM(\alpha, \beta)}$ and $u_{PM(\alpha, \beta)}$ are invertible with respect to (α, β) then the left shape function $L_\tau(z) = (l_{PM(\alpha, \beta)})^{-1}$ and the right shape function $R_\tau(z) = (u_{PM(\alpha, \beta)})^{-1}$ can be obtained from which the membership function $\tau_{(\widetilde{AR}_i, \widetilde{SR})}(z)$ is given by

$$\tau_{PM(\widetilde{AR}_i, \widetilde{SR})}(z) = \begin{cases} L_\tau(z); & z_1^\tau \leq z \leq z_2^\tau \\ R_\tau(z); & z_2^\tau \leq z \leq z_3^\tau \\ 0; & \text{otherwise} \end{cases} \text{ -----(13)}$$

Where $z_1^\tau \leq z \leq z_3^\tau$ and $L_\tau(z_1^\tau) = R_\tau(z_3^\tau) = 0$ for intuitionistic triangular fuzzy number.

Similarly, the non-membership function $\gamma_{(\widetilde{AR}_i, \widetilde{SR})}(z)$ are derived as follows

$$\gamma_{PM(\widetilde{AR}_i, \widetilde{SR})}(z) = \begin{cases} L_\gamma(z); & z_1^\gamma \leq z \leq z_2^\gamma \\ R_\gamma(z); & z_2^\gamma \leq z \leq z_3^\gamma \\ 0; & \text{otherwise} \end{cases} \text{ -----(14)}$$

Where $z_1^\gamma \leq z \leq z_3^\gamma$ and $L_\tau(z_1^\gamma) = R_\tau(z_3^\gamma) = 0$ for intuitionistic triangular fuzzy number.

And Also,

The membership function $\tau_{(\widetilde{AR}_i, \widetilde{SR})}(z)$ is given by

$$\tau_{PM(\widetilde{AR}_i, \widetilde{SR})}(z) = \begin{cases} L_\tau(z); & z_1^\tau \leq z \leq z_2^\tau \\ R_\tau(z); & z_3^\tau \leq z \leq z_4^\tau \\ 0; & \text{otherwise} \end{cases} \text{ -----(15)}$$

Where $z_1^\tau \leq z \leq z_4^\tau$ and $L_\tau(z_1^\tau) = R_\tau(z_4^\tau) = 0$ for intuitionistic trapezoidal fuzzy number.

Similarly, the non-membership function $\gamma_{(\widetilde{AR}_i, \widetilde{SR})}(z)$ are derived as follows

$$\gamma_{PM(\widetilde{AR}_i, \widetilde{SR})}(z) = \begin{cases} L_\gamma(z); & z_1^\gamma \leq z \leq z_2^\gamma \\ R_\gamma(z); & z_3^\gamma \leq z \leq z_4^\gamma \\ 0; & \text{otherwise} \end{cases} \text{ -----(16)}$$

Where $z_1^\gamma \leq z \leq z_4^\gamma$ and $L_\tau(z_1^\gamma) = R_\tau(z_4^\gamma) = 0$ for intuitionistic trapezoidal fuzzy number.

The proposed FM^b/FM/1 an Intuitionistic fuzzy batch priority queue can be reduced it to classical M/M/1 Intuitionistic crisp batch priority queue by using the concept of (α, β) – cuts approach.

Somasundara Ori and Abirami

Numerical Illustration

In this section a numerical example to explain Intuitionistic triangular fuzzy number and intuitionistic trapezoidal fuzzy number. Let the arrival rates of first and second priority with the same service rate are represented by intuitionistic fuzzy numbers.

Intuitionistic triangular fuzzy number

$$\begin{aligned} \widetilde{AR}_1 &= \langle (3,5,7)|(2,5,8) \rangle \\ \widetilde{AR}_2 &= \langle (5,9,11)|(3,9,12) \rangle \\ \widetilde{SR} &= \langle (90,150,200)|(60,150,230) \rangle \text{ per hour respectively with } b=4. \end{aligned}$$

The (α, β) – cuts of $\widetilde{AR}_i, i = 1, 2, \widetilde{SR}$ are

$$\begin{aligned} \widetilde{AR}_1 &= \langle |3 + 2\alpha, 7 - 2\alpha|, |5 - 3\beta, 5 + 3\beta| \rangle \\ \widetilde{AR}_2 &= \langle |5 + 4\alpha, 11 - 2\alpha|, |9 - 6\beta, 9 + 3\beta| \rangle \\ \widetilde{SR} &= \langle |90 + 60\alpha, 200 - 50\alpha|, |150 - 90\beta, 150 + 80\beta| \rangle \end{aligned}$$

From equation (11), (12) the parametric programming problem are formulated to derive membership function $\bar{L}_{qP1}, \bar{L}_{qP2}, \bar{W}_{qP1}$ and \bar{W}_{qP2} . They are calculated as follows:

From the parametric programming problem, the performance measures $\bar{L}_{qP1}, \bar{L}_{qP2}, \bar{W}_{qP1}$ and \bar{W}_{qP2} are derived from the respective parametric programs. These differ only in their objective functions

$$l_{\bar{L}_{qP1}}(\alpha) = \min \left\{ \frac{\left(\frac{(R_1+R_2)b}{T}\right)\left(b-1+2\left(\frac{R_1}{T}\right)\right)}{2\left(1-\frac{R_1}{T}\right)} \right\}, u_{\bar{L}_{qP1}}(\alpha) = \max \left\{ \frac{\left(\frac{(R_1+R_2)b}{T}\right)\left(b-1+2\left(\frac{R_1}{T}\right)\right)}{2\left(1-\frac{R_1}{T}\right)} \right\} \text{-----(17)}$$

$$\left. \begin{aligned} \text{such that } & 3 + 2\alpha \leq R_1 \leq 7 - 2\alpha \\ & 5 + 4\alpha \leq R_2 \leq 11 - 2\alpha \\ & 90 + 60\alpha \leq T \leq 200 - 50\alpha \end{aligned} \right\} \text{-----(18)}$$

Where $0 < \alpha \leq 1$. $l_{\bar{L}_{qP1}}(\alpha)$ is found when R_1 and R_2 approaches their lower bounds and T approaches its upper bound and also $u_{\bar{L}_{qP1}}(\alpha)$ is found when R_1 and R_2 approaches their upper bounds and T approaches its lower bound. Consequently, the optimal solution for (18) are

$$l_{\bar{L}_{qP1}}(\alpha) = \frac{9696+4936\alpha-1752\alpha^2}{39400-20250\alpha+2600\alpha^2}, u_{\bar{L}_{qP1}}(\alpha) = \frac{10224+4064\alpha-1408\alpha^2}{7470+10560\alpha+3720\alpha^2} \text{-----(19)}$$

The Membership function is

$$\tau_{\bar{L}_{qP1}}(z) = \begin{cases} L(z), & [l_{\bar{L}_{qP1}}(\alpha)]_{\alpha=0} \leq z \leq [l_{\bar{L}_{qP1}}(\alpha)]_{\alpha=1} \\ R(z), & [u_{\bar{L}_{qP1}}(\alpha)]_{\alpha=1} \leq z \leq [u_{\bar{L}_{qP1}}(\alpha)]_{\alpha=0} \\ 0, & \text{otherwise} \end{cases}$$

which is estimated as

$$\tau_{\bar{L}_{qP1}}(z) = \begin{cases} L(z), & 0.2416 \leq z \leq 0.5922 \\ R(z), & 0.5922 \leq z \leq 1.368 \\ 0, & \text{otherwise} \end{cases} \text{-----(20)}$$

$$l_{\bar{L}_{qP1}}(\beta) = \min \left\{ \frac{\left(\frac{(R_1+R_2)b}{T}\right)\left(b-1+2\left(\frac{R_1}{T}\right)\right)}{2\left(1-\frac{R_1}{T}\right)} \right\}, u_{\bar{L}_{qP1}}(\beta) = \max \left\{ \frac{\left(\frac{(R_1+R_2)b}{T}\right)\left(b-1+2\left(\frac{R_1}{T}\right)\right)}{2\left(1-\frac{R_1}{T}\right)} \right\} \text{-----(21)}$$

$$\left. \begin{aligned} \text{such that } & 5 - 3\beta \leq R_1 \leq 5 + 3\beta \\ & 9 - 6\beta \leq R_2 \leq 9 + 3\beta \\ & 150 - 90\beta \leq T \leq 150 + 80\beta \end{aligned} \right\} \text{-----(22)}$$

Somasundara Ori and Abirami

Where $0 < \beta \leq 1$. $l_{\bar{L}_{qP1}}(\beta)$ is found when R_1 and R_2 approaches their lower bounds and T approaches its upper bound and also $u_{\bar{L}_{qP1}}(\beta)$ is found when R_1 and R_2 approaches their upper bounds and T approaches its lower bound. Consequently, the optimal solution for (22) are

$$l_{\bar{L}_{qP1}}(\beta) = \frac{12880-1728\beta-4212\beta^2}{21750+24050\beta+6640\beta^2}, u_{\bar{L}_{qP1}}(\beta) = \frac{12880-1872\beta-3168\beta^2}{21750-27000\beta+8370\beta^2} \quad \text{-----(23)}$$

The Membership function is

$$Y_{\bar{L}_{qP1}}(z) = \begin{cases} L(z), & [l_{\bar{L}_{qP1}}(\beta)]_{\beta=1} \leq z \leq [l_{\bar{L}_{qP1}}(\beta)]_{\beta=0} \\ R(z), & [u_{\bar{L}_{qP1}}(\beta)]_{\beta=0} \leq z \leq [u_{\bar{L}_{qP1}}(\beta)]_{\beta=1} \\ 0, & \text{otherwise} \end{cases}$$

which is estimated as

$$Y_{\bar{L}_{qP1}}(z) = \begin{cases} L(z), & 0.1323 \leq z \leq 0.5922 \\ R(z), & 0.5922 \leq z \leq 2.5128 \\ 0, & \text{otherwise} \end{cases} \quad \text{-----(24)}$$

Similarly, the performance measure \bar{L}_{qP2} is derived from the respective parametric programs. These differ only in their objective functions

$$l_{\bar{L}_{qP2}}(\alpha) = \min \left\{ \frac{\left(\frac{(R_1+R_2)b}{T}\right)\left(b-1+2\left(\frac{R_2}{T}\right)\right)}{2\left(1-\left(\frac{R_1+R_2}{T}\right)\right)\left(1-\frac{R_2}{T}\right)} \right\}, u_{\bar{L}_{qP2}}(\alpha) = \max \left\{ \frac{\left(\frac{(R_1+R_2)b}{T}\right)\left(b-1+2\left(\frac{R_2}{T}\right)\right)}{2\left(1-\left(\frac{R_1+R_2}{T}\right)\right)\left(1-\frac{R_2}{T}\right)} \right\} \quad \text{-----(25)}$$

Where $0 < \alpha \leq 1$. $l_{\bar{L}_{qP2}}(\alpha)$ is found when R_1 and R_2 approaches their lower bounds and T approaches its upper bound and also $u_{\bar{L}_{qP2}}(\alpha)$ is found when R_1 and R_2 approaches their upper bounds and T approaches its lower bound. Consequently, the optimal solution for (18) are

$$l_{\bar{L}_{qP2}}(\alpha) = \frac{9760+5048\alpha-1704\alpha^2}{37440-21288\alpha+3024\alpha^2}, u_{\bar{L}_{qP2}}(\alpha) = \frac{10512+4000\alpha-1408\alpha^2}{5688+9520\alpha+3968\alpha^2} \quad \text{-----(26)}$$

The Membership function is

$$\tau_{\bar{L}_{qP2}}(z) = \begin{cases} L(z), & [l_{\bar{L}_{qP2}}(\alpha)]_{\alpha=0} \leq z \leq [l_{\bar{L}_{qP2}}(\alpha)]_{\alpha=1} \\ R(z), & [u_{\bar{L}_{qP2}}(\alpha)]_{\alpha=1} \leq z \leq [u_{\bar{L}_{qP2}}(\alpha)]_{\alpha=0} \\ 0, & \text{otherwise} \end{cases}$$

which is estimated as

$$\tau_{\bar{L}_{qP2}}(z) = \begin{cases} L(z), & 0.2607 \leq z \leq 0.6834 \\ R(z), & 0.6834 \leq z \leq 1.848 \\ 0, & \text{otherwise} \end{cases} \quad \text{-----(27)}$$

$$l_{\bar{L}_{qP2}}(\beta) = \min \left\{ \frac{\left(\frac{(R_1+R_2)b}{T}\right)\left(b-1+2\left(\frac{R_2}{T}\right)\right)}{2\left(1-\left(\frac{R_1+R_2}{T}\right)\right)\left(1-\frac{R_2}{T}\right)} \right\}, u_{\bar{L}_{qP2}}(\beta) = \max \left\{ \frac{\left(\frac{(R_1+R_2)b}{T}\right)\left(b-1+2\left(\frac{R_2}{T}\right)\right)}{2\left(1-\left(\frac{R_1+R_2}{T}\right)\right)\left(1-\frac{R_2}{T}\right)} \right\} \quad \text{-----(28)}$$

Where $0 < \beta \leq 1$. $l_{\bar{L}_{qP2}}(\beta)$ is found when R_1 and R_2 approaches their lower bounds and T approaches its upper bound and also $u_{\bar{L}_{qP2}}(\beta)$ is found when R_1 and R_2 approaches their upper bounds and T approaches its lower bound. Consequently, the optimal solution for (22) are

$$l_{\bar{L}_{qP2}}(\beta) = \frac{13104-2724\beta-4104\beta^2}{19176+24245\beta+7654\beta^2}, u_{\bar{L}_{qP2}}(\beta) = \frac{13104-1776\beta-3168\beta^2}{19176-26184\beta+8928\beta^2} \quad \text{-----(29)}$$

The Membership function is

$$Y_{\bar{L}_{qP2}}(z) = \begin{cases} L(z), & [l_{\bar{L}_{qP2}}(\beta)]_{\beta=1} \leq z \leq [l_{\bar{L}_{qP2}}(\beta)]_{\beta=0} \\ R(z), & [u_{\bar{L}_{qP2}}(\beta)]_{\beta=0} \leq z \leq [u_{\bar{L}_{qP2}}(\beta)]_{\beta=1} \\ 0, & \text{otherwise} \end{cases}$$

Somasundara Ori and Abirami

which is estimated as

$$V_{\bar{L}_{qP_2}}(z) = \begin{cases} L(z), & 0.1228 \leq z \leq 0.6833 \\ R(z), & 0.6833 \leq z \leq 4.25 \\ 0, & \text{otherwise} \end{cases} \text{-----(30)}$$

Similarly, the performance measure \bar{W}_{qP_1} is derived from the respective parametric programs. These differ only in their objective functions

$$l_{\bar{W}_{qP_1}}(\alpha) = \min \left\{ \frac{(b+2\frac{(R_1+R_2)b}{T})-1}{2T(1-\frac{R_1}{T})} \right\}, u_{\bar{W}_{qP_1}}(\alpha) = \max \left\{ \frac{(b+2\frac{(R_1+R_2)b}{T})-1}{2T(1-\frac{R_1}{T})} \right\} \text{-----(31)}$$

Where $0 < \alpha \leq 1$. $l_{\bar{W}_{qP_1}}(\alpha)$ is found when R_1 and R_2 approaches their lower bounds and T approaches its upper bound and also $u_{\bar{W}_{qP_1}}(\alpha)$ is found when R_1 and R_2 approaches their upper bounds and T approaches its lower bound. Consequently, the optimal solution for (18) are

$$l_{\bar{W}_{qP_1}}(\alpha) = \frac{664-102\alpha}{78800-40500\alpha+5200\alpha^2}, u_{\bar{W}_{qP_1}}(\alpha) = \frac{414+148\alpha}{14940+21120\alpha+7440\alpha^2} \text{-----(32)}$$

The Membership function is

$$\tau_{\bar{W}_{qP_1}}(z) = \begin{cases} L(z), & [l_{\bar{W}_{qP_1}(\alpha)}]_{\alpha=0} \leq z \leq [l_{\bar{W}_{qP_1}(\alpha)}]_{\alpha=1} \\ R(z), & [u_{\bar{W}_{qP_1}(\alpha)}]_{\alpha=1} \leq z \leq [u_{\bar{W}_{qP_1}(\alpha)}]_{\alpha=0} \\ 0, & \text{otherwise} \end{cases}$$

which is estimated as

$$\tau_{\bar{W}_{qP_1}}(z) = \begin{cases} L(z), & 0.0084 \leq z \leq 0.0129 \\ R(z), & 0.0129 \leq z \leq 0.0277 \\ 0, & \text{otherwise} \end{cases} \text{-----(33)}$$

$$l_{\bar{W}_{qP_1}}(\beta) = \min \left\{ \frac{(b+2\frac{(R_1+R_2)b}{T})-1}{2T(1-\frac{R_1}{T})} \right\}, u_{\bar{W}_{qP_1}}(\beta) = \max \left\{ \frac{(b+2\frac{(R_1+R_2)b}{T})-1}{2T(1-\frac{R_1}{T})} \right\} \text{-----(34)}$$

Where $0 < \beta \leq 1$. $l_{\bar{W}_{qP_1}}(\beta)$ is found when R_1 and R_2 approaches their lower bounds and T approaches its upper bound and also $u_{\bar{W}_{qP_1}}(\beta)$ is found when R_1 and R_2 approaches their upper bounds and T approaches its lower bound. Consequently, the optimal solution for (22) are

$$l_{\bar{W}_{qP_1}}(\beta) = \frac{562+168\beta}{43500+48100\beta+13280\beta^2}, u_{\bar{W}_{qP_1}}(\beta) = \frac{562-222\beta}{43500-54000\beta+16740\beta^2} \text{-----(35)}$$

The Membership function is

$$V_{\bar{W}_{qP_1}}(z) = \begin{cases} L(z), & [l_{\bar{W}_{qP_1}(\beta)}]_{\beta=1} \leq z \leq [l_{\bar{W}_{qP_1}(\beta)}]_{\beta=0} \\ R(z), & [u_{\bar{W}_{qP_1}(\beta)}]_{\beta=0} \leq z \leq [u_{\bar{W}_{qP_1}(\beta)}]_{\beta=1} \\ 0, & \text{otherwise} \end{cases}$$

which is estimated as

$$V_{\bar{W}_{qP_1}}(z) = \begin{cases} L(z), & 0.0070 \leq z \leq 0.0129 \\ R(z), & 0.0129 \leq z \leq 0.0545 \\ 0, & \text{otherwise} \end{cases} \text{-----(36)}$$

Similarly, the performance measure \bar{W}_{qP_2} is derived from the respective parametric programs. These differ only in their objective functions

$$l_{\bar{W}_{qP_2}}(\alpha) = \min \left\{ \frac{(b+2\frac{(R_1+R_2)b}{T})-1}{2(T-(R_1+R_2))(1-\frac{R_2}{T})} \right\}, u_{\bar{W}_{qP_2}}(\alpha) = \max \left\{ \frac{(b+2\frac{(R_1+R_2)b}{T})-1}{2(T-(R_1+R_2))(1-\frac{R_2}{T})} \right\} \text{-----(37)}$$

CONCLUSION

In a fuzzy environment where fuzzy set theory is applied, the intuitionistic fuzzy queuing model of size b can deal with the system's performance measurements since the parameters for queueing decision models may be known imprecisely. Performance measures for a batch priority intuitionistic fuzzy queuing model of size b in a fuzzy environment using fuzzy set theory. Results are provided after parametric programming that uses Zadeh's extension principle and the (α, β) -cut strategy to convert the intuitionistic fuzzy model to a crisp model. An example is provided to illustrate the performance measures of the proposed model, which are constructed using the membership and non-membership degrees of the triangular and trapezoidal fuzzy numbers. This queueing model has the potential to expand upon the multi-objective priority queuing model in the future.

Conflict of Interest

The authors of this work state that they have no conflicts of interest about its publication.

ABSTRACT

A wound that emits a foul odor, displays abnormal coloration, discharges excessively, causes intense pain, and heals slowly is classified as *Dushta Vrana*. This condition, comparable to ulcers in modern medicine, can severely impact a patient's health, leading to various complications and potentially death. The reported prevalence of ulcers in injured patients in India ranges from 3.1% to 7.8%. The allopathic approach to treating *Dushta Vrana*(ulcers) involves the use of oral, injectable, and topical antibiotics, anti-inflammatory drugs, painkillers, and antiseptic dressings. These treatments help prevent infections and reduce pain and inflammation but are only moderately effective and come with multiple side effects. Additionally, they do not significantly speed up the natural healing process. This limitation has led to a decreased reliance on traditional antibiotics and antiseptics for wound healing and has spurred ongoing efforts to develop more effective new *antimicrobial* agents. *Acharya Sushruta* has explained sixty different *upakramas* for the management of various types of *vrana*. One of the treatment methods described by *Sushruta* for managing *Dushta Vrana* is *Nirudhalepan*. *Nimbapatra* and *Tilakalka Lepa* possess properties that facilitate the repair of *Dushta Vrana* without complications. Here we are presenting a case of 50 years old male patient having complaints of pain and discharge for right sole region since 4 days. This case report attempts to manage *Dushta Vrana* using *Nimbapatra* and *Tilakalka*, demonstrating their efficacy in treating ulcer and offering insights into their potential benefits.

Keywords: *Dushta Vrana* , ulcers, *Nirudhalepan*, *Nimbapatra*, *Tilakalka*

INTRODUCTION

Dushta Vrana refers to chronic or non-healing wounds in Ayurveda, an ancient Indian system of medicine. These wounds are characterized by severe infection, persistent inflammation, foul odor, excessive discharge, and pain.(1) Factors contributing to *Dushta Vrana* include poor wound care, underlying health conditions like diabetes, malnutrition, and infections. Healing of *Vrana* is a natural process but due to the interference of vitiated *Doshas*, *Vrana* becomes *Dushta*. Wound infection is a significant factor that delays healing and contributes to the formation of *Dushta Vrana*. To achieve satisfactory healing of *Dushta Vrana*, eliminating the infection is crucial. *Acharya Sushruta* was well aware of such complications and, in his sixty procedures for wound management (*Shashti Upakramas*), he described various methods for cleansing (*VranaShodhana*) and healing (*Vrana Ropana*) of wounds.(2) Different forms of external applications (*Lepa*) are described for the convenience of treatment of different diseases like *LepaKalpana*.(3) Hence here an attempt is made to manage *Dushta Vrana* with *nimbapatra* and *tilakalka*.(4)

Case History

A 50 year old male patient came to ShalyaTantra O.P.D, Parul Ayurveda Hospital, Limda, Vadodara, Gujarat with the complaints of pain and discharge at right leg sole region since 4 days with history of injury in Rt. foot while farming.

MATERIALS AND METHODS

- Consent – A well informed written consent of patient and his relative (Wife) was taken before starting the treatment.
- Investigations: Routine haematology investigations (TC, DC, Hb%, ESR, RBS) and urine investigations were done and they were within normal limits.
- **Treatment protocol:**
 - DURATION OF TREATMENT- 14 Days
 - Method of Application- Local (*Lepana*)
 - No. of Application- Twice a day (morning and evening)
 - Assessment done- Before and after treatment
 - Oral medicine:
 - tab cefixime 200 mg BD
 - Tab aceclofenac 100mg + paracetamol 350mg
 - Tab tripsin + chymotrypsin 1 TDS
 - Tab septiclin 2BD
 - Properties of *Nimba* and *Tila*
 - *NIMBA*(5)

Parts Used

Leaves, Stem bark, Root bark, Gum, Fruits, Flowers, Seeds, Seed oil.

Actions And Uses

antimicrobial activity, anti-inflammatory, antiarthritic, cardiovascular, skin disorders immunostimulant.

Ayurvedic Properties

Rasa: Tikta

Guna: Ruksha, Laghu

Veerya: Sheeta

Vipaka: Katu

Doshghnata: Vataj, Pittaj, kaphaj

Rogaghnata: Jwara, Kushtha, Krimi, Prameha, Vrana, Chardi, Visharoga, Arsha, Gulma, Netraroga, Kandua, Kasa.

Kunal S Karanke and Parikshit R Shirode

Karma - Kapha-pittahara, Dipana, Grahi, Krimighna, Netrya.

- TILA

Parts Used: seeds

Actions and Uses: Vedanasthapana, Vranaropana, Deepan, Shoolaprashamana, Balya, Rasayan

Ayurvedic Properties

Rasa: Madhura, katu, tikta

Guna: guru, snigdha

Veerya: ushna

Vipaka: Madhura, katu

CRITERIA FOR ASSESSMENT OF PARAMETERS

1. PAIN:

- a. 0- None
 - b. 1-3- Mild
 - c. 4-6- Moderate
 - d. 7-10- Severe
- 2. BURNING SENSATION**

- a. Grade 0 - Nil
- b. Grade 1- Mild.
- c. Grade 2- Moderate.
- d. Grade 3- Severe

3. DISCHARGE

- a. Grade 0 – Absent
- b. Grade 1- Present

4. WOUND HEALING

- a. Grade 0- Complete healing with flat scar
- b. Grade 1- Separation of crust and appearance of granulation tissue
- c. Grade 2- Formation of crust.
- d. Grade 3- Presence of the raw surface of the wound.

Observation and Result

S. No.	Parameter	Before Treatment	After Treatment
1.	Pain	2	0
2.	Burning sensation	3	0
3.	Discharge	1	0
4.	Wound healing	3	0

Kunal S Karanke and Parikshit R Shirode

DISCUSSION

Probable mode of action- *Nimba* has *tiktarasa*, *sheetaveerya*, *katuwoipak*, *laghu* and *rukshaguna* which facilitates the medicine to penetrate in the dermatome and thus result in its anti-inflammatory and anti-microbial actions. *Tila* has *madhur*, *ushna* and *snigdha* *guna* which results in its *Shodhana* and *ropana* properties.⁽⁷⁾ Poor patients cannot afford costly treatment and long duration hospital stay. So if easily available local treatment (*Lepana*) like *nimbapatra* and *tilakalka* is easily available to common people then it can be an alternate and cost effective treatment protocol for the management of *Dushta Vrana*.

CONCLUSION

From the above study it can be concluded that *nimbapatra* and *tilakalka* is effective in the management of *Dushta Vrana* by their *vanashodhana* and *ropana* properties, which helps to heal the *Dushta Vrana* by *kashaya*, *tiktarasa* and *madhuraguna* shows tremendous result. So this can be an alternate approach for the treatment of *Dushta Vrana*.

ABSTRACT

AMR has become one of the most alarming threats to global health at present. It is now threatening decades of hard-won medical progress. Referred to as a "silent pandemic," AMR develops when microorganisms evolve mechanisms, such as resistance, to live their lives without the drugs intended to kill them. This phenomenon is fundamentally rooted in its deep historical past, actually even dating back to the early 20th century when antibiotics were discovered, especially penicillin. Although the emergence of resistant strains is all contributed to revolutionizing medicine, the excessive and inappropriate use of antibiotics in human health, agriculture, and veterinary practices contributed to it tremendously and even exacerbated it. Historically, the excitement on resistance goes back to the late 1940s when penicillin-resistant *Staphylococcus aureus* strains appeared immediately after mass production of penicillin. New antibiotics discovered initially made the resistance grow slower, but resistance has developed so widely that by the end of the 20th century, the new drug development pipeline had slowed significantly compared to that toward the latter half of the century. Nowadays, some of them are incredibly concerning public threats manifested as methicillin-resistant *Staphylococcus aureus* (MRSA), carbapenemase-producing Enterobacteriaceae, and extensively drug-resistant *Mycobacterium tuberculosis* (XDR-TB). Today, discussions about AMR view it as an aspect of "One Health," signifying the interrelationship of humans, animals, and their environments. But increased use of antibiotics in agriculture, coupled with their presence as residues in water sources, contributes significantly to the crisis: globalization and international travel speedily transport the resistant strains across borders. Therefore, the pandemic exacerbated this situation by administering symptomatic treatments through antibiotics in hospitalized patients affected by viral infections rather than instituting other specific measures that would help tackling diseases such as COVID-19. On an international scale, the campaigns of the World Health Organization (WHO) against AMR are the strategies of investment in new

**Joydeb Patra**

antimicrobials as well as promotion of antibiotic stewardship programs. However, AMR is well beyond such individual actions and requires an initiative in most sectors; including policy reform, public sensitization, and innovative research into alternative treatments such as the use of bacteriophage therapy and antimicrobial peptides. Without urgent action, AMR will continuously shepherd in a post-antibiotic era, during which even the most minor infection will prove fatal. It is mounting thus as one of the foremost public health threats of the 21st century.

Keywords: Antimicrobial resistance, Silent pandemic, Antibiotic stewardship, One Health, Multidrug-resistant pathogens.

INTRODUCTION

The history of human civilization is inextricably linked to the battle against infectious diseases. From ancient times to the discovery of antibiotics, humans have sought ways to try and counter microbial foes. The development of antimicrobials, particularly antibiotics, has changed the face of medicine and drastically lowered mortality rates while raising the status of public health. Today, the success of contemporary medicine is, however, being challenged by a silent but vicious opponent: antimicrobial resistance (AMR). AMR erodes the effectiveness of life-saving drugs, turning into an unprecedented menace to global health, food security, and economic stability. The worldwide crisis of AMR has been termed a silent pandemic with rapidly increasing repercussions and consequences. While acute outbreaks such as COVID-19 demand timely evidence and public action, AMR advances unnoticed, compelling the emergence of resistance against our existing treatments for bacterial, viral, fungal, and parasitic infections. This chapter investigates the history underlying resistance to antimicrobials, its cross-temporal evolution, and some contemporary issues while emphasizing its relevance to global health, economics, and policy-making. The subject of resistance itself is hardly a novel occurrence. It has been reported in history for many years, well before some antibiotics even came to be. Evidence of antibiotic-resistant genes discovered in ancient permafrost or prehistoric microbial populations indicates that bacteria have long been engaged in evolutionary arms races of survival. But overuse and improper use of antimicrobial agents in modern times—medical, agricultural, and veterinary—would seem to be by far the two major factors operating to accelerate the resistance.

Over-prescription of antibiotics, inadequate infection control practices, and an unreasonable use of antimicrobials in livestock have provided fertile ground for the emergence and spread of resistant strains. This significant advancement came early in the 20th century during which infectious disease control experienced a golden age, heralded by Alexander Fleming's discovery of penicillin in 1928. Such a ground-breaking discovery was soon succeeded by other antibiotic classes, which significantly decreased the mortality rates due to bacterial infections. However, Fleming foresaw the possible danger posed by resistance when he warned against thinking of careless use of antibiotics. While it had been a long time since these initial warnings, the situation was already on its way towards an increase in proliferation of bacteria resistant to population-reporting by the first penicillin-resistant *Staphylococcus aureus* for instance in the 1940s. This began ongoing battles between advancements in medicine in improving and developing new drug therapies versus adapting of microbes. As advances made in medical science come, so did the complexities in resistance mechanisms. The emergence of new classes of antibiotics left bacteria behind and resistance genes could infect local bacterial populations by horizontal gene transfer. Methicillin introduced in the later part of the 1950s was soon followed shortly there after by methicillin-resistant *Staphylococcus aureus* (MRSA) as a nice touch on the cleverness of bacteria. To illustrate, the occurrence of extensively drug-resistant strains (XDR) and multidrug-resistant (MDR) strains of tuberculosis, *Escherichia coli* and *Klebsiella pneumoniae* signifies the magnitude of the problem involved. Resistance has spread throughout hospital community agricultural settings and into wildlife ecosystems, all showing the insidiousness and real nature of the problem. Currently, the AMR picture does not seem bright at all. The World Health Organization (WHO) named AMR as one of the top ten global threats to health, stating that it makes an assumption that common infections will become untreatable in a post-

**Joydeb Patra**

antibiotic era. It counts to millions the death toll directly attributable to AMR each year, and projections say that unchecked, AMR could result in up to ten million deaths annually by 2050-greatly exceeding the number of such deaths caused by cancer. The same goes for the economic stranglehold posed by AMR in increased healthcare costs, longer hospital stays, and decreased productivity all of which culminate in significant financial burdens on individuals and health systems as a whole. The exposure of the health systems' fragility was further spelt by the pandemic in terms of bad consequences arising from ill readiness against microbial threats. An infection over the course of the pandemic, plus failure in infection control measures added to the already dire situation in AMR. Moreover, the other global challenges, like climate change, poverty, and sanitation, worsened the state of AMR and made it more disastrous for those mostly at risk. Low- and middle-income countries, where healthcare access and lack of antimicrobial stewardship programs are limited, are thus most affected by the new wave of rising resistant infections. Coordinated and multidimensional efforts are needed to combat AMR. The One Health framework-whose central tenet is that the health of humans, animals, and the environment is interlinked-has gained momentum as one of the strategies against AMR. Specific policies for antibiotic regulation, surveillance, and research into new therapeutics and alternative treatments represent just a few of the global responses. Equally key to the success of these systems are public information and education campaigns that encourage responsible use of antibiotics among health care providers and society. While the world faces emerging infectious diseases and new pandemics, AMR keeps hiding in the shadows, slowly turning into a global catastrophe. AMR is unique in that it creeps slowly relative to sudden outbreaks which gain immediate attention; it quite often goes unnoticed until some treatment options are exhausted. Thus, AMR needs to be seen as not a future threat only but more evidently as an urgent crisis today-a building crisis that requires action now and in the future. The silent pandemic of antimicrobial resistance is a stark reminder that humanity's battle against microbial threats is anything but over. Only through coordinated efforts, scientific innovations, and global solidarity can we hope to keep antimicrobials working for future generations.

The Discovery and Golden Age of Antibiotics

The advent of antibiotics was one of the greatest milestones in the medical field and has forever altered the treatment of bacterial infections. Prior to antibiotics, bacterial infections like pneumonia and tuberculosis, not to mention wound infections, were often fatal. It was in 1928 that the Scottish bacteriologist Alexander Fleming made a momentous discovery that became the underpinning of modern antibiotics. The discovery of penicillin by Fleming was accidental. While investigating *Staphylococcus* bacteria, he found that a petri dish left uncovered was contaminated with a mould, later identified as *Penicillium notatum*. The bacteria surrounding the mould had been destroyed, indicating that the mould was secreting a substance that inhibited bacterial growth. Fleming called this substance penicillin and published his findings in 1929. The scientific and medical communities did not recognize the importance of this finding immediately, though, with over a decade passing before mass production and widespread use of penicillin took place. A major triumph was experienced in the 1940s when a group of scientists that included Howard Florey, Ernst Boris Chain, and Norman Heatley managed to purify and mass-produce penicillin. During World War II, penicillin was used to treat many wounded soldiers, greatly reducing death from infections and amputation due to gangrene. The success with penicillin opened the way to the discovery of many other antibiotics, sometimes referred to as being the beginning of the "Golden Age of Antibiotics." Following penicillin's success, a large number of antibiotics were discovered in the 1940s and 1950s, including streptomycin, chloramphenicol, and tetracyclines. Streptomycin, discovered by Selman Waksman and his team in 1943, was especially important, because it became the first effective treatment for tuberculosis, a disease that had bothered humanity for centuries. Chloramphenicol and tetracyclines further supplemented the antibiotic weapons against bacterial infections, rendering many once-deadly diseases treatable and greatly reducing mortality rates across the world. Yet even while antibiotics enjoyed success, scientists recognized early on that bacterium could develop resistance. In his acceptance speech for the Nobel Prize in 1945, Alexander Fleming himself warned of that danger, cautioning that persistence in the improper use of antibiotics-on either under-dosing or over-use-might result in the appearance of strains of resistant bacteria. His warnings have since been borne out, with antibiotic resistance having now emerged as a truly global health crisis. Antibiotic resistance arises from a natural selection process. In the presence of antibiotics, susceptible bacteria are killed, while mutants that survive with genes for resistance multiply. After some time, resistant strains become the prevailing ones, and certain antibiotics will become useless. Input on this process would

**Joydeb Patra**

include excessive use of prescriptions, incomplete treatment, and the use of antibiotics in animals. Antibiotic resistance is developing into a major concern nowadays, with "superbugs" such as methicillin-resistant *Staphylococcus aureus* (MRSA) and multidrug-resistant tuberculosis (MDR-TB) seriously threatening public health. The medical community is now focusing on the development of new antibiotics and alternative therapies, such as bacteriophage treatment, and on global policies that regulate antibiotic use to contain the spread of resistance. In summary, the discovery of antibiotics altered medicine, making possible efficient treatments for bacterial infections that saved millions of lives. However, because of the evolution of antibiotic resistance, there is now a pressing need to completely use antibiotics in a responsible way; research should be actively carried on to develop more agents to fight resistant strains. The future of medicine depends on further innovations through global collaboration to manage this urgent problem.

The Evolution of Antimicrobial Resistance

Microorganisms have a natural ability to become resistant to antimicrobials; this resistance is a serious threat to public health across the globe. Resistance mostly results from genetic mutations and horizontal gene transfer—that is, the acquisition and sharing of resistance traits among bacteria. Substantial and often irrational use of antibiotics in human medicine, agriculture, and animal husbandry has expedited this process, resulting in the rise of multidrug-resistant (MDR) and extensively drug-resistant (XDR) bacteria. Infections caused by these strains are making clinical treatment extremely difficult, becoming a serious challenge to modern medicine.

Mechanisms of Antimicrobial Resistance:

Resistance in bacteria develops via a number of mechanisms, genetic mutations and horizontal gene transfer being the main ones. Mutations infrequently arise in the process of replication and can culminate in changes that lessen the susceptibility of an organism against an antibiotic. For example, a mutation may alter the target site of an antibiotic, rendering the drug ineffective. Resistance genes can, however, also be acquired by bacteria from other strains of bacteria through horizontal gene transfer, which takes place via three major mechanisms: transformation, transduction, and conjugation. Transformation is the process whereby the surrounding bacteria take up the genetic material from an environment. Transduction refers to the transfer of bacterial DNA via the bacteriophages (viruses infecting the bacteria). Conjugation is the direct transfer of genetic material through contact between bacterial cells that often involves the linking intermediary of plasmids. These mechanisms of gene transfer enable bacteria to pass on the resistance traits readily and quickly, causing AMR to spread rapidly among bacterial populations.

The Role of Antibiotic Misuse and Overuse:

Major causes of bacterial resistance include the misuse and overuse of antibiotics. For human medicine, most of the times antibiotics are merited in prescribing viral infections rather than for conditions which call for antibiotic therapy. Incomplete courses of antibiotics allow some bacteria to survive, adapt, and develop resistance. However, the overuse of antibiotics in agriculture or animal husbandry to promote growth and prevent infections among livestock adds further selection of resistant bacteria. These bacteria can come into contact with humans through the food chain, direct contact with animals, or environmental contamination.

Emergence of Multi-Drug Resistant and Extensively Drug-Resistant Bacteria

As of late, antibiotic resistance has been continually increasing since the mid-20th century. The emergence of methicillin-resistant *Staphylococcus aureus* (MRSA) as reported in the 1960s marked a major milestone, as it has been noted that MRSA infections are hard to cure due to their resistance to multiple antibiotics. Similar observations were made concerning vancomycin-resistant *Enterococci* (VRE), which were first reported in the 1980s due to the realization that treating infections caused by bacteria which have resistance to last resort antibiotics has become more challenging. Other concerning multidrug-resistant (MDR) and extensively drug-resistant (XDR) pathogens include carbapenem-resistant *Enterobacteriaceae* (CRE), multidrug-resistant *Pseudomonas aeruginosa*, and extensively drug-resistant *Mycobacterium tuberculosis* (XDR-TB).

**Joydeb Patra****Effects and Global Impact**

Antibiotic resistance has brought very serious consequences to global health as infections, which are caused by such resistant bacteria, tend to cost more and lead to prolonged hospital stays and higher mortality rates. Even with a small antibiotic failure, several surgical procedures, chemotherapy and other medical treatments depend on effective antibiotics. Resistant bacteria can travel around borders making this problem not only a local crisis but furthermore a global one.

Measures Aimed at Reversing the Trend in Antibiotic Resistance

A multi-pronged strategy is called for with regard to the increased threat posed by antimicrobial resistance. These include

Prudent Use of Antibiotics those should be only used when really needed and taken on schedule.

Surveillance and monitoring resistance patterns currently will be used to direct treatment guidelines and public health policies.

Infection Control Measures ensure that strict hygiene will be maintained in hospitals to prevent the spread of resistant bacteria.

Development of New Antibiotics Encouraging discoveries of new antibiotics and alternative therapeutic interventions like bacteriophage therapy.

Public Awareness and Education comes in informing people about the dangers posed by antibiotic misuse and incomplete treatments.

Contemporary Challenges in Antimicrobial Resistance

Antimicrobial resistance (AMR) threatens a growing public health crisis with far-reaching consequences. AMR occurs when microorganisms such as bacteria, viruses, fungi, or parasites evolve to counter the effect of antimicrobial drugs, which includes antibiotics, antivirals, antifungals, and antiparasitic. AMR renders ineffective these treatments, making it harder to control infections, hence increasing the severity of infections with great chances of death. At this moment, AMR is responsible for millions of deaths every year, with projections that by the year 2050, AMR-associated deaths may outnumber those due to cancer. The WHO acknowledges AMR as one of the ten most serious threats to global health, calling for immediate coordinated international action.

Drivers of AMR

Human activities, economic constraints, and deficiencies in health-care systems are some of the factors that engender the emergence and spread of AMR.

Overuse and Misuse of Antibiotics

It's clear that the overuse and misuse of antibiotics constitute one of the leading causes of the AMR phenomenon. In some parts of the world, antibiotics are being improperly prescribed to patients with viral infections that cannot be treated. Self-administration of antibiotics and their availability without prescription have also contributed to resistance. Excessive use in agriculture, especially in livestock husbandry, intensifies the development of antibiotic-resistant strains.

Lack of New Antibiotics

The high costs for research and development of new antibiotics and the disproportionate monetary rewards have convinced pharmaceutical companies to discontinue drastic antibiotic development. An antiparasitic designed for a long-term-use period will enjoy economic profits and guarantees, in contrast to antibiotics, which are simply used in

**Joydeb Patra**

a short period. Thus, the antibiotic research pipeline is practically dry, with very few alternatives for the treatment of resistant infections.

Globalization and Travel

The interconnection of the modern societies through travel and trade allows for the easy spreading of resistant pathogens. Hence, if one country acquires one drug-resistant infection, that disease will within no time be a global threat. Moreover, international travel has established an accelerating force in the dissemination of resistant bacteria among countries; thus, AMR is one problem that one country cannot tackle by itself.

Weak Surveillance Systems

In most countries, national AMR surveillance programs are not implemented, thus weakening the ability to trend resistance and take effective containment measures. Without monitoring and reporting national systems, resistant infections could develop undetectably and spread within outbreaks that are very hard to control.

Poor Hygiene and Sanitation

The poor infection control mechanism in healthcare environments and inadequate sanitary measures create avenues for the transmission of resistant bacteria. Crowded hospitals, lack of clean water, and inadequate hand hygiene facilities provide the perfect breeding ground for resistant infections. Strengthening infection prevention measures would go a long way in tackling AMR.

Economic and Social Implications

AMR does not only present health challenges, but it also has wide-ranging economic and social implications. In effect, a rise in resistant infections translates to higher hospital stays, increasing medical costs as well as mortality rates. Consequently, there is a huge amount of AMR, causing heavier burdens on health systems, further straining their limited resources, and diminishing access to affordable treatment options. In this regard, the World Bank has estimated that AMR might in fact lead to a decline in the global GDP by 3.8% during the year 2050, thereby ushering millions into the poverty sector. This downturn would favour the low-income countries, thereby subjecting the rest of the world to more health inequities. The AMR would also threaten to roll back achievements in present-day medicine. Organ transplants, chemotherapy for cancer, and major surgery all depend on effective antimicrobials for infection control and treatment. In the face of increased resistant infections, the risk of these surgical interventions would be higher, with subsequent increases in morbidity and mortality rates.

Strategies to Be Adopted for Combating AMR

Combating AMR calls for a diverse set of responses led by a coordinated international effort. Several approaches would help mitigate the impact of AMR

Promoting Walker Use of Antibiotics Health professionals should ensure that antibiotics are prescribed only where absolutely necessary. Public awareness must reinforce dangers associated with self-medication and the importance of completing a course of prescription antibiotics.

Investing in New Antibiotics and Alternative Therapies Governments and private stakeholders would need to put incentives in place to promote research and development in antibiotics. On the therapeutic side, alternative strategies against resistant infections should be explored, such as bacteriophage therapy and immunotherapies.

Strengthening the Surveillance and Sharing of Data Global surveillance networks need to be put in place to monitor resistance trends. Countries should cooperate in sharing data and experiences and best practices in the containment of AMR.

**Joydeb Patra**

Improving Infection Prevention and Control Enhancement of sanitation, hygiene, and vaccination programs will help limit the spread of infections and thereby reduce antibiotic usage. Hospitals and health facilities need to implement strong infection control measures to contain the transmission of resistant microbes.

Restrict Use of Antibiotics in Agriculture Governments ought to promote policies that limit the non-therapeutic use of antibiotics in livestock production. Promoting responsible antibiotic usage in agriculture would prevent the emergence of new resistant strains.

Strategies to Combat Antimicrobial Resistance

The problem of AMR can also be tackled through a multiplex, harmonized global response to it. Several strategies can thus be adopted to minimize its effects

Development of New Antibiotics and Alternatives The productive pipeline of truly new antibiotics is dwindling, thus generating requirements for a prompt innovation of new approaches to antibiotic development. Researching bacteriophage therapy or antimicrobial peptides, as well as immune-modulating treatments, has created expectations of alternative treatments.

Stewardship Programmes Antibiotic stewardship programs are formulated so that empirical choices become evidence-based prescriptions; hence, hospitals and other healthcare institutions across the world are enacting such programs to prevent unnecessary usages of antibiotics.

Public Awareness and Education It is also important that public engagement or public education be used to change behavior towards the antibiotic. It will teach them the proper use of antibiotics, and the reinforcement of cleanliness will help slow down the infection rate.

Strengthening Global Surveillance and Policies This system initiated by WHO collects and presents national and regional data on AMR and strengthens common policies to limit arbitrary use of antibiotics as important regulatory frameworks for AMR containment.

CONCLUSION

AMR-Amicrobial Resistance has been silently turned into a pandemic over decades which poses itself as a threat to global health and serious economic trends. The discovery of antibiotics anguished revolutionized medicine; medicine made treatment of many of the once-deadly microbial infections as treatable conditions. However, this advancement triggered overuse and misuse of antimicrobials, hastening resistance to create a crisis that threatens all modern health-care achievements. Without urgent intervention, something as simple as a medical procedure may become life-threatening, infections might become untreatable. Thus, fighting AMR needs a focused and global approach, including the judicious use of antibiotics, well-established surveillance systems, new therapy solutions, and stringent control of infections. Recognizing AMR as a sustained and increasing threat is therefore necessary for the survival of public health and, after all, for a sustainable future for generations to come.

ABSTRACT

Vulvovaginal candidiasis is a condition that impacts women across all ethnic backgrounds and socioeconomic statuses. Between 70 and 75 percent of women will at some point in their lives encounter VVC. The current study investigates the anticandidal properties of moringa (*Moringa oleifera*) leaf extracts. It compares the anticandidal effects of aqueous and methanolic leaf extracts, as well as green-synthesized silver nanoparticles (AgNPs/SNPs) derived from *Methanolic moringa* leaf extract, against *Candida albicans* isolated from clinical samples of patients with vaginal infection. The findings demonstrated that AgNPs had a more potent inhibitory impact on *Candida albicans* than both the aqueous and methanol extracts. The agar well diffusion method was used to assess AgNPs' anticandidal impact. The optimised AgNPs were added to an ointment basis to make a topical formulation, and the same agar well diffusion method was used to perform the ointment's in vitro anticandidal assay. It was discovered that the ointment containing AgNPs had an inhibitory impact on *Candida albicans* that was on par with a commercial

Nidha Fathima et al.,

medication. Overall, the results point to the possibility of this formulation having anticandidal properties against the *Candida albicans* that causes *Vulvovaginal candidiasis*.

Keywords: *Candida albicans*, anticandidal, leaf, AgNPs, moringa.

INTRODUCTION

One of the most common and significant opportunistic fungal infections is candidiasis, which is brought on by the species *Candida*. Many types of candidiasis are prevalent and can affect the skin, gastrointestinal tract, lungs, and mucosa of the mouth and genitalia (1). One of the main difficulties with *Candida* infections is that they can result in serious, sometimes fatal bloodstream infections. They can also create serious health issues for people by colonising internal organs (disseminated candidemia). The most well-known *Candida* species that causes the majority of infections is *Candida albicans*, which is followed by non-*albicans* *Candida* (NAC) such *Candida glabrata*, *Candida tropicalis*, *Candida parapsilosis*, and *Candida krusei* (2).

Extracts from medicinal plants will become more significant in the field of therapy during the coming years. Neem (*Azadirachta indica*) and moringa (*Moringa oleifera*) are two common medicinal herbs in India. The tropical tree known as moringa (*Moringa oleifera*) is native to the lower Himalayan regions. The consumption of various amino acids, especially essential amino acids, is guaranteed by the injection of protein-rich leaves. From *Moringa oleifera*, at least ten distinct chemicals have been identified. Minerals like calcium and iron, as well as numerous flavonoids, glucosinolates, terpenes, alkaloids, saponins, sterols, fatty acids, and phenolytic chemicals, are among them. (3). This work's objectives were to create a formulation from synthesised silver nanoparticles against *C. albicans*, which causes vulvovaginal candidiasis, and to green synthesise, characterise, and assess the anticandidal effects of silver nanoparticles from methanolic extract of moringa leaf.

MATERIALS AND METHODS

A prospective laboratory-based study conducted during a period of 3 months starting from March 2024 to May 2024 in the Department of Microbiology, Dr Moopens Medical College, Wayanad and Pazhassiraja college, Wayanad. A total of 130 clinical samples of patients suffering from vaginal infection was used in this study. The colonies were identified based on the Gram stain characteristics, germ tube method, morphological characters on chrom agar and corn meal agar. For the investigation, the moringa (*Moringa oleifera*) plant was chosen. The leaves of moringa were gathered in Kerala, India's Kozhikode district. A mechanical blender was used to coarsely powder the fully shade-dried leaves, which were subsequently extracted using cold methanol and hot aqueous (4). After dissolving 10g of dried moringa leaves in 100ml of methanol, the mixture was placed in a shaker incubator for two days. After dissolving 10g of dried moringa leaves in 100ml of distilled water, the mixture was brought to a boil for half an hour. The resulting crude extract was filtered, fully evaporated, and kept at 40°C until it was needed again. A phytochemical study was carried out to determine the presence of various active components in aqueous and methanol extracts of *Moringa oleifera* leaves using the various techniques described by Raman, 2006 (5).

The green synthesis of silver nanoparticles was carried out following a modified procedure of Mahmoudi et al., (6). The formation of silver nanoparticle was observed using a UV-visible spectrophotometer (Schimadzu UV-1800). The 200–800 nm range was where the absorption spectra was seen. Using ATR FTIR Spectroscopy (Perkin-Elmer), the silver nanoparticle (AgNP) was subjected to Fourier Transform Infrared (FTIR) analysis from the FIST lab at St. Mary's College, Wayanad, in order to clarify the compounds' structural makeup. The silver nanoparticles synthesised from moringa leaf extracts were added to the ointment base for the development of ointment against *C.albicans* causing *Vulvovaginal candidiasis*. The ointment base was prepared with glycerin (2ml), Shea butter(20ml), (potassium

Nidha Fathima et al.,

sorbate (0.30g), liquid paraffin (5ml), and gelatin (2ml) as components. All the components were mixed well to form the ointment base. (7,8).

The produced ointment and extracts were subjected to an anticandidal analysis using the agar well diffusion method in Muller Hinton Agar (MHA) plates (9,8). The final inoculum was 1.5×10^8 CFU/ml after the test organism cultures were corrected to 0.5 Mc Farland standards. The ATCC strains of *Candida albicans* and the organism's clinical samples from patients with *Vulvovaginal candidiasis* served as the cultures. For the investigation, ointment and plant extracts (aqueous, methanol, and silver nanoparticles) in varying concentrations were employed. Using a ruler, the inhibition zones surrounding the wells were measured and noted in millimetres. For comparison, fluconazole (25 mcg) was used as the usual antifungal medication. The standard medication used to treat the fungus was candid cream. Using sterile 96-well plates, a broth microdilution test was conducted to ascertain the MIC of the produced silver nanoparticles (10).

The physical evaluations were carried out on the ointment by using the following parameters (11)

Colour and Odor Examined by visual examination.

Irritancy On the left-hand dorsal surface, mark a 1 cm² region. After applying the lotion to that location, the time was noted. The region was then observed for up to 24 hours for signs of oedema, erythema, and irritability, and the results were reported.

Greasiness A smear of ointment was put to the skin's surface, and its oiliness or grease-likeness was assessed.

After feel Following the application of a predetermined quantity of ointment, the degree of emollience, slipperiness, and residue were assessed.

Removal The applied area was washed with tap water to test how easy it was to remove the ointment.

RESULTS

Out of 130 samples collected, 115 yielded significant growth, of which 51 were found to be normal vaginal flora and 22 isolates were *Candida* sp (16.9%). The prevalence rate of *vulvovaginal candidiasis* is seemed to be higher at the age group 19-50. i. e, it is causing during the reproductive period of women. Alkaloids, tannins, phenolic compounds, coumarins, and proteins were found in both the aqueous and methanolic extracts of moringa leaves, according to the preliminary phytochemical investigation. However, only the methanolic extract included terpenoids, carotenoids, saponins, and steroids. Using the photoirradiation approach, silver nanoparticles were greenly synthesised from the methanol extracted from the moringa leaf. When a silver nanoparticle forms, the colour of the leaf extract changes from green to brown. According to the UV-Vis spectrophotometer study, the solution displayed an absorption peak at 375 nm, indicating that AgNPs were successfully formed. The produced nanoparticles showed absorption peaks linked to OH, CH, and C=C.

The anticandidal activity of moringa leaf extract and synthesized silver nanoparticles were carried out using agar well diffusion method. The green synthesized nanoparticles of *A. indica* showed better inhibitory effect on *C.albicans* where the aqueous and methanolic leaf extracts showed least or no inhibitory effect. The minimum inhibitory concentration of synthesized silver nanoparticle from moringa leaf extract is 0.0042 mg/ml. Anticandidal activity of the ointment developed by incorporating moringa leaf-AgNP was evaluated by agar well diffusion method. The ointment developed from the moringa leaf-AgNP showed better anticandidal activity against *C.albicans*. The anticandidal activity of the developed ointment was compared with commercially available ointment (Candid ointment) and anticandidal activity of developed ointment is almost similar to that of candid cream. The physical properties of the ointment were also evaluated. The developed ointment was of light peach colour in appearance and

Nidha Fathima et al.,

was having a pleasant aroma. The ointment was non-greasy and non-irritant. The ointment applied was smooth and left no residue after application. Also, the ointment applied on skin was easily removable by washing with tap water.

DISCUSSION

Women from various socioeconomic classes and ethnic backgrounds are affected by *vulvovaginal candidiasis*. Between 70 and 75 percent of women will at some point in their lives encounter VVC. Although non-albicans species such as *Candida glabrata*, *Candida tropicalis*, *Candida krusei*, and *Candida parapsilosis* are also present, *Candida albicans* is the most often implicated species in 90–95% of these cases. The goal of the current study was to determine the prevalence rate of the *Candida* species that causes *vulvovaginal candidiasis* in women over a three-month period. Twenty-two isolates of *Candida* sp (16.9%), 39 bacteria (30.1%), 51 normal vaginal flora (39.2%), and no growth (11.5%) were discovered in the 130 samples that were gathered. According to a study by Anthony et al. 2020, the prevalence rate of *Vulvovaginal candidiasis* was 14.0% (12). Women in their reproductive years have the greatest prevalence rate of VVC. The current research's prevalence rate among reproductive age is 90.9%, which is comparable to the rate of 85.0% found in the Anthony et al. 2020 study (12).

The creation of novel plant-based antimicrobial compounds may help address the need for safer and more effective antimicrobials, as antibiotic resistance is a serious issue. The methanolic and aqueous extracts of moringa leaves, which were utilised in this investigation to assess their anticandidal effect, do not exhibit any anticandidal activity against *Candida albicans*. However, ethanolic and aqueous extracts of Moringa leaves have been demonstrated to have antibacterial action against *Candida albicans* in a research by Nada et al., (13). Many investigations were conducted in the past to synthesise AgNPs with notable antibacterial properties from plant extracts, such as *Moringa oleifera* leaf extracts (14,15), as well as on a variety of other plants. In these investigations, silver nitrate (AgNO_3), a frequently utilised precursor in the manufacture of silver nanoparticles, reacts with phytochemicals in the plant extract as a reducing and/or capping agent (16).

The surface plasmon resonance (SPR) of the nanoparticles in the reaction mixture was the cause of the colour shift seen in the biosynthesised silver nanoparticles' production. Other investigations that noted a colour shift in the reaction mixture as the silver nanoparticles biosynthesised from *Moringa oleifera* formed also reported this (15). The formation of silver nanoparticles is indicated by the UV-Vis spectroscopy measurements. In contrast to some earlier findings where the bands were primarily displayed in the range of 435 to 445 nm, the plasmon resonance band of the biosynthesised AgNPs in this work was detected at 375 nm for *M. oleifera*, respectively. This impact might result from the low concentration of leaf extract in our sample; Ahmed et al. (2016) observed similar outcomes, showing that raising the concentration of the plant extract increased the intensity of absorption. In one work, however, Otunola et al., (18) found that AgNPs' UV-Vis absorption for garlic extract was 375 nm. The incubation period may also be the cause of our study's reduced plasmon resonance band when compared to other publications.

The green synthesised AgNPs of *M. oleifera* shown anticandidal activity against *Candida albicans*. A similar zone size of inhibition of green synthesised silver nanoparticles from moringa leaves was found in Gufran and Sumaiya's 2022 study (19). AgNPs were studied using Fourier-transform infrared (FTIR) spectroscopy in order to identify potential chemicals that could be in charge of effectively stabilising and capping the AgNPs produced using the leaf extracts. According to FTIR spectrophotometry, the synthesised nanoparticles in this investigation showed absorption peaks connected to the CH, C=C, and OH functional groups. Mehwish et al., (20), Moodley et al., (16), and Bindhu et al., (21) reported a similar interpretation, demonstrating that functional groups with small peak shifts were present in AgNPs, indicating that the extract of *Moringa oleifera* leaves reduced and stabilised AgNPs. Using the agar well diffusion method, green synthesised AgNPs of *A. indica* shown superior anticandidal action against *Candida albicans* when used to create a topical herbal treatment for *Vulvovaginal candidiasis*. The current investigation is consistent with the findings of a study by Stephano et al., 2023 (22). Additionally, the created ointment's anticandidal properties are somewhat comparable to those of the commercially available "Candid" ointment. Therefore, if the findings of this

Nidha Fathima et al.,

study are validated in vivo, the herbal ointment made from green synthesised AgNPs of *M. oleifera* can be used to treat *vulvovaginal candidiasis*.

CONCLUSION

According to the study, silver nanoparticles made from moringa leaf extract have strong anticandidal properties against *Candida albicans*. Nanoparticles with promising antifungal characteristics were successfully produced using the green synthesis approach. *Candida albicans* was significantly inhibited by the silver nanoparticles. Its promise as a treatment for *vulvovaginal candidiasis* was highlighted by the development of a topical ointment that included these silver nanoparticles, which further increased the antifungal activity. All things considered, the results highlight how well natural antimicrobial medicines and nanotechnology work together to create cutting-edge treatment options for fungal diseases. The effectiveness of the formulated ointment was evaluated against a commercially available product, demonstrating that the ointment containing nanoparticles demonstrated comparable effectiveness in combating *C. albicans*. Additionally, the silver nanoparticles demonstrated superior inhibitory effects against *C. albicans*. These findings suggest that the formulation has a great deal of potential for blocking the yeast that causes *vulvovaginal candidiasis*.

ABSTRACT

eWOM augments the settled idea of WOM on the Internet stage. The conventional advertising approach is changing and adjusted to use the intensity of the Internet. Consumers have more power with them because of the expansion of online networking and the Internet gatherings and networks. Numerous shoppers, specifically or by implication, use eWOM before making the final purchase. Consumers use online reviews, one type of eWOM, in the post-purchase process to share product experiences and to voice their opinions. Consequently, this study's absolute commitment is to investigate the effect of online consumer reviews, one eWOM type, on buying decisions. Other than this, few conclusions can be drawn from these analyses. The study results reveal a significant impact of online reviews on buying decisions. Participants are reading online reviews before purchasing the products or services.

Keywords: E-Commerce, Electronic Word of Mouth, Online networking, Online reviews, Website Features.

INTRODUCTION

BigBasket, a Tata Enterprise, is India's largest online grocery store, across 60+ cities and towns. Founded in 2011, it offers a wide range of products and services, including groceries, fruits and vegetables, and even enters the quick-commerce space with bbnw. The company also has Fresho stores, an offline retail initiative, and engages in B2B operations with bbmandi. BigBasket operates on an inventory-based model, managing its logistics and supply chain

**Abishek and Denis Amrithaaraj**

to ensure timely deliveries. The company offers many products, including fresh produce, dairy, meat, household essentials, and branded food items.

Need For Study

The Indian online grocery industry is a fast-growing segment within the broader e-commerce ecosystem. Fueled by increased internet penetration, digital payments, With changing consumer habits and urbanization, this industry is expected to grow at a CAGR of over 30% in the next five years.

Statement of The Problem

Consumers increasingly rely on various online factors to influence their purchasing decisions in the digital age. However, the extent to which online consumer reviews, the credibility of reviewers, and the characteristics of websites contribute to these decisions remains unclear. While it is assumed that these elements play a role in shaping buying behavior, the precise impact of each factor has yet to be systematically examined. This study addresses these gaps by exploring the relationship between online consumer reviews, reviewer influence, and website features in consumer decision-making.

Objectives of The Study

The study's primary objective is to analyse the impact of online consumer reviews on buying decisions.

- 1.To examine how much online consumer reviews influence consumers' decision-making process during purchases.
- 2.To evaluate the role of reviewers, including their credibility and expertise, in affecting consumers' buying behavior.
- 3.To analyse the influence of website design, usability, and functionality on consumers' purchasing decisions.

Scope of The Study

This study focuses on understanding the factors that influence consumer buying decisions in the context of online platforms. Specifically, it examines three key aspects:

Online Consumer Reviews The study explores the significance of online reviews, assessing how their presence, tone, and content impact consumers' purchasing choices.

Influence of Reviewers It investigates the role of reviewers, considering aspects such as their credibility, expertise, and relationship with the audience in shaping consumer behavior.

Website Features The study evaluates the impact of website design, usability, functionality, and aesthetics on the decision-making process of online shoppers.

The scope is limited to analyzing these factors in the context of online consumer behavior. It does not delve into offline purchasing behaviors or other external influences beyond the digital realm. The findings provide insights for marketers, businesses, and researchers into optimizing digital strategies for enhancing consumer engagement and conversions.

Limitation of Study

- 1.Online review is one type of e-WOM that impacts buying decisions.
- 2.Other types of e-WOM can be studied to determine their impact on buying decisions.
- 3.The impact of online reviews can be studied product category-wise.
- 4.Comparison study on the impact of eWOM on the online and offline shopping of products.
- 5.Further study can be conducted on the effect of eWOM on consumers' buying decisions.
- 6.A comparative study can be conducted between rural and urban consumers on the impact of e-WOM on buying decisions.

**Abishek and Denis Amrithaaraj**

RESEARCH METHODOLOGY

Research Design

A descriptive study has examined the impact of Online consumer reviews on buying decisions. A survey method was used to collect the responses.

Sampling Method: An anonymous-probability convenience sampling method has been used.

Sampling Size

107 respondents from all age groups, including Academicians and students.

Data Collection

The primary data was collected through a structured, non-disguised questionnaire prepared and circulated by Google Forms.

Data Collection Instrument

The research instrument is based on various literature reviews. The Items for these variables (Consumer Reviews, Reviewer, and Website) are extracted from the existing research instruments already developed on these measures (Yayli and Bayram, 2012). A five-point Likert-type scale was used in all the items with ranks 1 (strongly disagree) to (strongly agree) 5. A 20-item questionnaire has been used to measure the three construct variables.

Data Analysis Techniques

Statistical analysis has been done on the IBM SPSS 20 package. Mean, Standard Deviation, chi-square, etc., are used to analyse the data.

Data Analysis And Interpretation

Analysis Related to Characteristics of the Website that Presents the Reviews

Table 1 presents the responses to the website for online product reviews. The site's reliability, which presents the reviews (74%), affects buying decisions and is very important in online buying decisions (mean = 3.76). Popularity of website (71%), Company's website that presents reviews (62%), and Internationality of website (60%) are also equally crucial for online buying decisions (mean-3.75, 3.57 and 3.46 respectively). A chi-square test (Table 2) was conducted to test hypothesis 3. Looking into the p-value, the null hypothesis is rejected. The chi-square value is high for criteria-reliability of the website, popularity of the site, and internationality of the website, showing the significant impact of the Website that presents the reviews on buying decisions. Table 3 describes the critical statement that affects online buying decisions. According to Table 3, Usefulness of website reviews, high ratings, consistency of reviews, Recency of reviews, reviews on the company's website, and no. of reviews are critical from the consumer reviews point of view. Reliability and popularity of the website are essential from the website's point of view. Lastly, the usefulness of other reviewers' ratings from the Reviewers' point of view affects buying decisions. Consumers are giving more importance to consumer reviews and websites, and not giving much importance to the reviewer, except for one.

Findings

eWOM augments the settled idea of WOM on the Internet stage. The conventional advertising approach is changing and adjusted to use the intensity of the Internet. Consumers have more power with them because of the expansion of online networking and the Internet gatherings and networks. Numerous shoppers, specifically or by implication, use eWOM before making the final purchase. Consumers use online reviews, one type of eWOM, in the post-purchase process to share product experiences and to voice their opinions. Consequently, this study's absolute commitment is to investigate the effect of online consumer reviews, one eWOM type, on buying decisions. Other than this, few conclusions can be drawn from these analyses. The study results reveal a significant impact of online reviews on buying decisions. Participants are reading online reviews before purchasing the products or services.

Abishek and Denis Amrithaaraj

The results also state that the participants agree that the characteristics of reviews are effective in making purchasing decisions. Specifically, consistency of reviews is more effective in purchasing decisions. It can be said that consumers are more worried about whether the reviews are genuine or manipulated.

- Participants agreed that negative reviews have a greater impact when consumers purchase expensive products. Also, the number of reviews and high product ratings are essential in buying decisions.
- In case of reviewers’ impact, only other reviewers’ usefulness ratings affect the buying decisions. It is also evident that the buyers don’t consider reviewers’ demographic profiles (age, gender, residence, nickname, etc.) as a critical factor in the buying process.
- The study’s result states the importance of a website that presents the respondents’ product reviews for buying decisions. A website’s reliability, popularity, and internationality significantly impact consumers’ purchase decisions.

CONCLUSION

The study helps marketers to create strategic plans for future applications. Marketers can use eWOM to build product awareness, improve sales and other related performance parameters, strengthen brand value, and build customer loyalty. eWOM also acts as immediate feedback for marketers. They can use positive and negative eWOM to improve product and service deliveries, offer recoveries, and address consumer complaints.

ABSTRACT

Microbial plaque, which builds up in the gingival crevice region and causes an inflammatory reaction, is what causes gingival disorders. Chronic gingivitis, an inflammation, can proceed in some vulnerable people to periodontitis, a harmful, ongoing inflammation. Conceptually tempting though it may be, the use of genetic data and technology in the diagnosis and treatment of gingival diseases, it is crucial to maintain a realistic perspective on the therapeutic value of genetic data. The genetic foundation of disease is demonstrated by geneticists using a variety of methods. While some techniques are more generic, others enable the accurate identification of genetic variations that contribute to or cause disease. The era of genomic medicine was ushered in by the sequencing and annotation of the human genome. Fundamental features of the human genome have been characterized and are starting to be understood as a result of the human genome project and related projects. The development of more accurate disease diagnostic and susceptibility testing for the presence of disease-associated genes, and ultimately the development of more effective treatment intervention strategies that address the etiologic basis of disease, will all be based on a fundamental understanding of the structure and function of genes.

Keywords: Genetics, Gingivitis, Susceptibility

Shivani Sachdeva and Harish Saluja

INTRODUCTION

Periodontal diseases are brought on by microbial plaque, which accumulates in the gingival crevice region and results in an inflammatory response. Some prone individuals may evolve from chronic gingivitis, an inflammation, to periodontitis, a persistent, dangerous inflammation. Periodontitis causes the bone and other tissues that support the teeth to be destroyed, whereas gingivitis is reversible. (Armitage, 1999, Armitage et al., 2000) [1]. While the origin and progression of periodontal disease are thought to be influenced by microbial and other environmental variables, there is now compelling evidence that genes also contribute to the susceptibility to and advancement of periodontal disorders. This realization has as a corollary the possibility that knowledge of the genetic basis of periodontal disease susceptibility may be useful for both diagnostic and therapeutic purposes [2]. Genetic factors are crucial predictors of periodontitis susceptibility and progression, according to a growing amount of clinical and scientific evidence. Studies on humans and animals provide evidence to support this claim, showing that hereditary variables affect inflammatory and immunological responses in general and the experience of periodontitis in particular.

Individuals may react differently to everyday environmental stresses, and the genetic makeup of the individual influences this unequal reaction. Alterations in tissue structure (innate immunity), antibody responses (adaptive immunity), and inflammatory mediators (non-specific inflammation) can all be brought on by different versions of genes (allelic variants). Allelic variations likely affect periodontitis susceptibility at numerous, possibly numerous, distinct gene loci. While some of these genetic variations may have considerable clinical impacts, others are likely to have much smaller effects or none at all. We must comprehend how various genes can contribute to disease in order to comprehend the possible clinical implications of genetic diversity on periodontitis [3]. A person's unique genetic code is contained in the sequences of nucleotide bases (A, G, C, T), which makes up DNA. The human genome consists of more than three billion pairs of bases contained in 22 pairs of chromosomes, termed *autosomes*, and 2 sex chromosomes. Genes are sequences of nucleotide bases contained in noncontiguous segments called *exons*. The exons provide the DNA template for the subsequent synthesis of polypeptides that regulate all developmental, physiologic, and immunologic processes in the body. The genetic composition of an organism is termed the *genotype*, and the collection of traits or characteristics is termed the *phenotype*. The phenotype is determined by the interaction of genes and the environment. Trait and disease might be caused by a single gene (*monogenic*), several genes (*oligogenic*), or many genes (*polygenic*). Diseases with etiologies that include both genetic and environmental factors are referred to as *multifactorial*. Most common diseases are multifactorial.

Specific locations on chromosomes are referred to as *loci*. And variations in the nucleotide sequence at a locus are termed *alleles*. At a given locus, an individual is considered homozygous if the alleles are identical on homologous chromosomes or heterozygous if alleles are different. Some alleles are associated with profound changes in the phenotype, which are as others have no measurable effects. Phenotypic differences in the population may be caused by the effects of alleles in the coding region of a gene or in flanking noncoding regions that control gene transcription or expression. The term *genetic marker* refers to any gene or nucleotide sequence that can be mapped to a specific location or region on a chromosome. Any marker that is sufficiently polymorphic, or variable, in the population can be used to map or lactate disease alleles. In monogenic disorders, genes are referred to as *causative* because almost everyone with the mutation develops the condition. Environmental factors generally play a minor role in determining the phenotype. In contrast, genes involved in complex multifactorial disease are called *susceptibility genes*.

Genetic Disease Paradigms

Genetic Variance

There are estimated to be 25,000–50,000 different genes in the human genome (Parra et al., 2003) [3]. Genes can exist in different forms or states. Geneticists refer to the different forms of a gene as allelic variants or alleles. Allelic variants of a gene differ in their nucleotide sequences. When a specific allele occurs in at least 1% of the population, it is said to be a genetic polymorphism. The genome is composed of a linear strand of nucleotides in a double-stranded helical

**Shivani Sachdeva and Harish Saluja**

array. The linear sequence of nucleotides in one of the strands codes for amino acids in the form of triplet codons. Most allelic variants involve a change from one of the four nucleotides (A, T, C, G) to another. These changes alter the triplet codon that codes for an amino acid. Due to the redundancy of the triplet codon, some of these codon changes still code for the same amino acid. However, some allelic variants alter the amino acid composition of the protein products of genes. When a nucleotide change is very rare, and not present in many individuals, it is often called a mutation. In contrast to mutations, genetic polymorphisms are usually considered normal variants in the population. The amino acid that a codon codes for may or may not change when a nucleotide mutation occurs in that codon. A codon mutation that does not affect the amino acid is termed to be "silent" and is typically without biological repercussions. When a protein's amino acid composition is altered by a nucleotide, the change may be significant and lead to a malfunctioning protein, or it may be more subtle. The protein function may be slightly modified in the latter scenario. As a result, various alleles' unique protein products may have various functions. These variations in how various proteins work physiologically can be made worse by specific environmental exposures. (e.g., diet, smoking, microbial factors). If the affected protein functions in a biological process, e.g., inflammatory response to a specific microbial agent, certain polymorphisms may increase or decrease a person's risk for a disease phenotype.

Risks for many diseases, including periodontal diseases, are not borne equally by all individuals (Johnson et al., 1988; Jenkins and Kinane, 1989). A variety of microbial, environmental, behavioral, and systemic disease factors are reported to influence risk for moderate to severe periodontitis (Page and Beck, 1997). It is also increasingly evident that genetic variance is a major determinant of the differential risk for many human diseases (Friedrich, 2000; Collins and McKusick, 2001; Khoury et al., 2003). However, the contribution of an allelic variant to a disease can vary from being deterministic to having only a minor effect on the etiology. The contribution of an allelic variant to disease has major implications for the disease's characteristics. To appreciate the effect of a genetic variant to a disease, one must understand how genes contribute to genetic diseases.

Genetic Basis of Disease

The main factors influencing phenotypic differences between people are genetic variance and environmental exposures. In some rare circumstances, pathology might be caused solely by an environmental or hereditary element. Regardless of a person's genetic makeup, environmental exposure to very high doses of radiation has a devastating and pathologic effect on them. Regardless of the environment, specific chromosomal abnormalities, such as trisomy chromosome 1, cause different system diseases. Human populations do, however, exhibit varying disease susceptibilities for many diseases, and the underlying cause of this different susceptibility may be genetic or include both genetic and environmental components. The aetiology of the majority of human diseases involves a genetic component. However, the extent of this genetic contribution to disease can and does vary greatly for different diseases. The manner and extent to which genetic factors contribute to disease have important implications for identifying the genetic basis of etiology and for utilizing this information for the diagnosis and treatment of disease. Geneticists have traditionally divided genetic diseases into two broad groups, "Simple" Mendelian diseases and "complex" diseases. The distinction between these broad groups is based on the pattern of transmission of the disease, which reflects the manner in which genes contribute to each disease.

Simple Mendelian Diseases

Diseases that follow predictable and generally simple patterns of transmission have been called "Mendelian" conditions. The name reflects the fact that these diseases occur in simple patterns in families, and in most cases a single gene locus is the major determinant of the clinical disease phenotype. These diseases follow a classic Mendelian mode of inheritance (autosomal-dominant, autosomal-recessive, or X-linked). Usually, the prevalence of these Mendelian conditions is rare (typically much less than 0.1%), with the exception of some unique populations that have been isolated from other human populations. When the genetic basis of a Mendelian condition is identified, it is often found that the condition results from the effect of a genetic mutation at a single gene locus. Examples include amelogenesis imperfecta, Crouzon syndrome, and cleido-cranio dysplasia. When the gene responsible for a Mendelian disease has been identified, it is possible to develop a diagnostic test to identify individuals who carry a disease-causing mutation in the responsible gene. Depending upon the mode of transmission, it is also possible to

**Shivani Sachdeva and Harish Saluja**

make fairly specific determinations of the probability of the mutant gene being passed to a child, and often it is possible to predict the course of clinical disease.

Complex Genetic Diseases

Genetically complex diseases differ from Simple Mendelian diseases in several important ways. Genetically complex diseases are much more prevalent, and usually occur with a frequency of greater than 1% of the population. Complex diseases do not typically follow a simple pattern of familial distribution or transmission. In contrast to the single gene cause of "simple traits", these "complex traits" are the result of the interaction of multiple different gene loci. Additionally, environmental factors are important in the disease process. This reflects the fact that these gene variants (genetic polymorphisms) are common in the population. Many disease-associated genetic polymorphisms are common in the population and can be present at allele frequencies of > 20%, with some disease-associated alleles reported in > 50% of populations studied (Eichner et al., 2002). The fact that these genetic alterations alone are insufficient to cause disease has important implications. A critically important fact is that the presence of one disease-associated allele is not sufficient to cause disease. Consequently, knowledge of the presence of one disease-associated allele in an individual does not provide enough information for a clinical diagnosis. In fact, the presence of some disease-associated alleles in a significant proportion of the unaffected general population reflects that, while these alleles may influence risk, they are not deterministic in most cases. In contrast to genetic mutations that are often diagnostic for Simple Mendelian conditions, the presence of a polymorphism in a complex trait can be difficult to interpret, and must be assessed with other information. It is important to have information about the allele frequency in the population tested, and also to be able to quantitate, in a meaningful way, the magnitude of effect a disease-associated allele has on the disease processes. For this reason, some measure of the specificity and sensitivity of a disease-associated allele to predicting disease is desirable. Currently, considerable attention is being focused on the clinical validity and clinical utility of genetic polymorphisms that have been reported to be associated with a disease.

Polymorphism versus Mutation

The number of genes involved and how much each gene contributes to the overall disease phenotype distinguishes the genetic foundation of simple Mendelian diseases from complicated genetic diseases. In Mendelian diseases, a single gene locus change can cause a mutation that has a significant physiological effect and may be thought of as being deterministic of the condition. Such genetic changes are referred to as "mutations" by geneticists. Individuals with the same mutation might exhibit a broad range of clinical outcomes, even in the case of Simple Mendelian illnesses. Variable clinical expression of a disease or characteristic may be influenced by environmental variables, allelic variation at other genes, and other causes. In contrast, the genetic alterations that contribute to complex diseases are individually of much smaller effect. The types of genetic variants that contribute to complex diseases are generally called "genetic polymorphisms" because, in contrast to mutations, they are prevalent in the population. In contrast to mutations that have been causally linked with Mendelian diseases, genetic polymorphisms that are associated with complex diseases are often not directly causally linked, but rather specific alleles are reported to be found more frequently in diseased individuals than in non-affected controls. There is no one-to-one correlation of the presence of a specific genetic allele and the occurrence of disease. It is important to understand that disease alleles reported to be associated with a disease are also found in unaffected individuals, and some individuals with disease do not have the specific disease-associated allele. Thus, the presence of a disease-associated allele in an individual is not diagnostic for a disease.

Methods of Genetic Analyses

Clinical and scientific data from a variety of sources suggest that genetic variants are major determinants of syndromic and non-syndromic periodontitis. The evaluation of the quality of supporting studies requires an understanding of the formal genetic analytical methods that have been used. Geneticists use a variety of techniques to demonstrate the genetic basis of disease. Some methods are general, while others facilitate the precise identification of genetic variants that cause or contribute to disease. The methods overviewed below have been important in the evaluation of genetic aspects of periodontitis [3].

**Shivani Sachdeva and Harish Saluja****Familial Aggregation**

Familial aggregation of a trait or disease can suggest genetic etiology. However, families also share many aspects of common environment, including diet and nutrition, exposures to pollutants, and behaviors such as smoking (active and passive). Certain infectious agents may cluster in families. Thus, familial aggregation may result from shared genes, environmental exposures, and similar socio-economic influences. To determine the evidence for genetic factors in familial aggregation of a trait, more formal genetic studies are required. There have been many clinical reports suggesting a familial aggregation of periodontitis, but until recently the research tools to pursue these reports were lacking.

Twin Studies

Through the phenomenon of twins, in particular monozygous (MZ) twins arising from one fertilized egg, nature has provided a wonderful tool for the examination of genetic influences in disease and to assess how much this is influenced by environment. MZ (monozygous) twins are genetically identical, and dizygous (DZ) twins are only as genetically similar as brothers and sisters would be, sharing, on average, ~ 50% of their genes in common (DZ twins are from two different eggs). Discordance or differences in disease experience between MZ twins must be due to environmental factors, and between DZ twins they could arise from both environmental and genetic differences. The difference in concordance between MZ and DZ twins for a particular phenotype can be used to estimate the effects of the extra shared genes in MZ twins, if the environment for twin pairs is the same. Studying disease presentation in twins is useful for differentiating the variations due to environment from those due to genetic factors and for estimating the amount of heredity in a phenotype.

Segregation Analysis

Genes are passed from parents to children in a predictable manner, and genes segregate in families as predicted by Mendel's Laws (Monaghan and Corcos, 1984). Geneticists study the pattern of trait transmission in families using a method called segregation analysis. Segregation analysis evaluates the relative support for different transmission models to determine which can account for the transmission of a trait through families. By sequentially comparing models with each other, segregation analysis identifies the model that best accounts for the observed transmission of a trait in a given population. Geneticists generally apply segregation analyses to determine if trait transmission appears to fit a Mendelian or other mode of genetic transmission. When genetic models of transmission are compared, genetic characteristics—including mode of transmission (e.g., autosomal, X-linked, dominant, recessive, complex, multi-locus, or random environmental), penetrance, phenocopy rates, frequencies for disease, and non-disease alleles are some of the characteristics included in the different models evaluated. It is important to realize that segregation analysis does not necessarily provide the true model. Since they are comparisons of two models, segregation analyses are only as good as the models tested. If important assumptions of the model tested are incorrect, this will limit the results. This limitation of segregation analysis must be realized, since it has resulted in inaccurate conclusions for the transmission of at least one form of early-onset periodontitis (Long et al., 1987). Investigators use segregation analyses to test alternative models in an attempt to develop the best characterization of transmission characteristics within a set of data. As such, this approach is most appropriately applied to datasets from many families to determine the best-fitting model. Segregation analysis does not find or aim to find a specific gene responsible for a trait.

Linkage Analysis

Linkage analysis is a method for identifying the gene responsible for a trait on a particular chromosome. Genetic linkage studies are based on the observation that syntenic gene loci close together frequently segregate (i.e., pass along as a group) from generation to generation. It is claimed that these genes are "linked" and go against Mendel's law of independent assortment. Quantitative techniques can be used by geneticists to identify this dearth of separate genetic loci and to map (localize) genes to certain chromosome positions. Genetic maps that depict the locations of millions of polymorphic genetic loci spread over the human genome have been created over the past 15 years (Guttmacher and Collins, 2002). In order to ascertain whether a particular trait appears to segregate with a known genetic variation that has been localized to a certain chromosomal site, researchers can track a particular trait as it

**Shivani Sachdeva and Harish Saluja**

passes through families of interest. In this way, researchers can check to see if a trait exhibits a pattern of segregation that is compatible with "linkage" to a recognized genetic marker. When linkage is found, the gene causing the trait can be located close to the related genetic variation because the specific chromosomal location of the genetic marker is known. Therefore, linkage can demonstrate the genetic underpinning of disease.

Linkage is frequently used as a preliminary step to pinpoint the general position of an interesting gene, allowing further research to pinpoint the mutation that causes a disease feature. In determining the genetic basis of Simple Mendelian features, linkage studies have proven particularly useful. For a variety of reasons (Townsend et al., 1998; Glazier et al., 2002), linkage studies of complex genetic features have not been as fruitful. The fact that complex diseases are brought about by the combining effects of "multiple genes of minor effect" is a limiting issue for the usual use of linkage to complex diseases. Fortunately, updated variations of the linkage methodology and the availability of association testing methodologies provide a useful substitute. (Zhao, 2000; Li et al., 2001; Marazita and Neiswanger, 2003).

Association Studies

Periodontitis is a frequent, complex condition, and the genes causing it have proven to be more challenging to identify. The aetiology of complex diseases is frequently thought of as the result of multiple factors, such as multiple genetic loci interacting with one another to produce an underlying susceptibility, which in turn interacts with additional environmental factors to produce the actual disease state, in the absence of specific genetic models. Linkage analysis has either generated negative results or a profusion of shaky, positive results that are difficult to repeat for complex features including oral-facial clefting (Murray, 1995; Carinci et al., 2000), obesity (Chagnon et al., 1998), and bipolar disorder (Berrettini, 2000). Theoretical study offers a number of explanations for the murky connection results in these situations.

First, if a disease gene is neither necessary nor sufficient to cause a disease, but rather is a "modifier gene" that elevates a non-zero baseline risk, conventional parametric linkage analysis may not detect the gene (Greenberg, 1993). Second, if the relative contribution of a gene to a disease phenotype is small, i.e., the disease susceptibility allele raises the risk by a factor of < 2 , linkage analysis using affected sibling pairs will not be powerful enough to detect the gene, given realistic sample sizes (Risch and Merikangas, 1996). Thus, linkage analyses may not be a useful strategy for the detection of modifier genes or genes that exert small effects precisely those genes which might be operating in chronic periodontitis and many other complex disorders. Consequently, attention has shifted away from linkage analysis to association analysis as an alternative means of locating disease susceptibility genes, especially since association studies can sometimes detect weaker effects than can linkage analysis (Hodge, 1994).

The population-based and family-based techniques to association analysis are frequently utilised in genetic studies. The population-based approach makes use of a common case-control strategy, in which the marker allele frequencies of cases (individuals who are affected) and controls (individuals who are either unaffected or randomly selected from the community) are compared. There are various interpretations that might be made when a favourable correlation is discovered: The disease-predisposing allele may be present in the related allele itself, in linkage disequilibrium with the actual disease-predisposing locus, as a result of population stratification, or as a sampling- or statistical-artifact.

Gene Polymorphisms in Periodontal Health and Disease [4]

Gene polymorphisms are locations within the genome that vary in sequence between individuals and are very prevalent, affecting at least 1% of the population. Polymorphisms of human genes occur at one or more of the following sites;

1. The promoter or 5'-flanking region;
2. The exon(s) or the gene coding regions;
3. The intron(s) or the gene intervening regions;

The 3'-untranslated region.

**Shivani Sachdeva and Harish Saluja**

The most common form of polymorphisms is the single nucleotide polymorphism, which is a change in a single base pair (bp) in the genomic DNA. Single nucleotide polymorphisms can affect gene function. For example, a single nucleotide polymorphism located in a promoter region may influence the amount of mRNA produced. Another class of polymorphism is the simple sequence repeats, of which the common forms are the dinucleotide and trinucleotide repeats. The variable number of tandem repeats can also influence the function of a gene, but the repeats are more likely to be linked with a functional polymorphism elsewhere in the gene. A third category of gene polymorphism involves insertions or deletions. Insertions and deletions can be as small as 1 base, in which case they may also be classified in the category of single nucleotide polymorphisms, but can also consist of a few bases, one or more exons, or even a whole gene.

Single Nucleotide Polymorphisms in Periodontal Disease

Single nucleotide polymorphisms within candidate genes may be causally related to changes in protein expression, structure and function. These, in turn, may lead to variations in phenotypic expression. This may be a useful development, but large-scale screening for single nucleotide polymorphisms is still a very complex undertaking. Alternative approaches include selective targeting of candidate genes coding for particular features of a disease. One such example is the targeting of genes considered to be specifically related to inflammatory cell function in inflammatory diseases. Known as the candidate pathway approach, this involves the study of genes based on prior knowledge of the disease in relation to its phenotype [3,4].

The field of single nucleotide polymorphism discovery is moving at a very fast pace; however, current methods are still unable to cope with large scale population-based genetic screening. At present, prescreening methods can distinguish the alleles of single nucleotide polymorphisms, but without always identifying their precise position or the base pair which is affected. Once a novel single nucleotide polymorphism is identified, the fragment containing the variant sequence must be sequenced. Such prescreening methods have been quite useful in identifying rare single nucleotide polymorphisms, as well as finding polymorphisms or mutations in human populations suffering from defined diseases. Sequencing is still considered the gold standard for prescreening purposes, but other methods based on conformation (strand-strand conformation polymorphism, cleavage fragment length polymorphism, conformation-sensitive gel electrophoresis) or melting (denaturing high-performance liquid chromatography, denaturing gradient gel electrophoresis two-dimensional gel scanning) have been used, with accuracy levels ranging from quite low to very high.

To date, many studies have focused on genes and polymorphisms in the regulation of the immune and inflammatory systems. All of these studies have been based on the direct candidate association approach. In general, a person's genetic background influences their susceptibility to many kinds of diseases and conditions. Periodontitis, a chronic inflammatory disease, caused by gram-negative microorganisms in the periodontal pockets, is no exception.

These were divided into six groups:

1. Cytokines
2. HLA
3. Immuno-receptors
4. Proteases
5. Structural molecules
6. Other

Cytokines**Interleukin-1**

Polymorphisms of the interleukin (IL)-1 gene have been proposed as potential genetic markers for periodontal diseases. Many investigators have reported a positive association between periodontitis and the presence of specific polymorphism of the IL-1 gene. However, an unveiled interaction exists between the IL-1 genetic polymorphism and environmental factors such as smoking. Smokers bearing the genotype-positive IL-1 allele combination may be at an

**Shivani Sachdeva and Harish Saluja**

increased risk of developing periodontitis. This suggests that genetic–environmental interaction is more important than genetic factors alone for determination of susceptibility to periodontitis.

Summary of the findings on the IL-1 composite genotype in periodontitis

It appears that this IL-1 composite genotype has equivocal ability in detecting susceptibility to periodontitis and may be limited in its utility to only specific populations at best. It would appear, from the mixed reports on this composite genotype, that:

- i. It is unlikely to be relevant in aggressive periodontitis;
- ii. It is, at best, in linkage disequilibrium with the gene contributing susceptibility to chronic periodontitis;
- iii. It confers risk independent of that attributable to smoking;
- iv. The polymorphism is at best one of several involved in the genetic risk to chronic periodontitis, which is likely to be a disease in which multiple genes may confer risk;
- v. The polymorphism is a useful marker in only defined populations, is relatively absent in some (Armitage *et al.*, 2000), and is too prevalent (Walker *et al.*, 2000) in others to be a genetic marker with utility;
- vi. Demonstration of the functional significance of this gene polymorphism has yet to be confirmed; and
- vii. Clinical utilization of these composite polymorphisms for risk assessment and prognostic determination is currently premature.

Interleukin-2 polymorphisms

Due to its biological properties, in IL-2 genes has been suggested to be a useful marker for the pathologic inflammatory activity in systemic disease in periodontal conditions. The polymorphism on the promotor region of IL-2 gene is associated with severity of periodontal disease.

Interleukin-4 & Interleukin-6 polymorphisms

Interleukin-6 (IL-6) plays a role in B-cell differentiation and T-cell proliferation. It also stimulates hematopoiesis. Since IL-6 and IL-4 seems to play an important role in periodontal disease, many polymorphism studies of the genes associated with IL-6 & IL-4 have been performed and polymorphism in IL-6 gene are known to be associated with susceptibility to chronic periodontitis in different ethnic groups. Though, not much evidence of association of IL-4 genotype and periodontal diseases has been established.

Interleukin-10 genes

A study of the distribution of genes related to interleukin-10 (IL-10) found no association between the genes for this cytokine and aggressive periodontitis compared with healthy controls (Kinane *et al.*, 1999). As for TNF genotypic variations, IL-10 polymorphisms have been implicated in diseases such as SLE and RA. Two micro-satellites at the IL-10 locus, IL10.R and IL10.G, were typed for 77 generalized AgP patients (Kinane *et al.*, 1999). A statistical comparison with ethnically matched healthy controls (IL10.R n = 94, IL10.G n = 102) revealed no significant differences for any of the IL-10 markers, although there were possible indications of trends similar to those observed in SLE for the IL10.G marker.

Tumor necrosis factor- α

Tumor necrosis factor- α (TNF- α) is one of the most widely studied cytokines in periodontitis. It is crucial to both the immune and inflammatory responses. For example, TNF up-regulates host defenses and has other effects on tissue physiology, including bone resorption. Over-expression of TNF in the periodontium may be harmful to the host. Normally, TNF and other pro-inflammatory agents are regulated by IL-10, suggesting that some deficiency in this regulation mechanism may be linked with disease (Kinane *et al.*, 1999). Polymorphisms in the promoter region of the TNF- α gene at positions -238 (G to A) and -308 (G to A) have been reported. The -308 A-allele has been associated with high promoter activity and enhanced TNF- α production. However, in general a lack of association between TNF- α polymorphism and periodontitis has been consistently reported. For example, in a study of TNF- α genotypes for three bi-allelic polymorphisms (-238, -308 or +252 gene polymorphisms) no differences were observed between patients and controls or between patients with different disease severity. A subsequent study of four bi-allelic

**Shivani Sachdeva and Harish Saluja**

polymorphisms in the TNF- α gene (at positions -376, -308, -238 and +489) also revealed no differences between test and control subjects.

Human leukocyte antigens

The human leukocyte antigen (HLA) complex plays an important role in immune responsiveness and may be involved in antigen recognition of periodontal pathogens. HLA class II molecules have been identified on immune cells. These molecules are involved in the interaction between T and B lymphocytes and in the production of high-affinity IgG antibodies. Several investigators have studied populations of patients with different forms of periodontitis to investigate the expression of various HLA antigens. They have studied polymorphisms of HLA-DR molecules in patients with periodontitis and found a significant association between several DRB1 alleles and the disease. In contrast, Hodge et al. found no association between the presence of HLA-DQB1 in European Caucasians and the occurrence of early onset periodontitis. The difficulty in finding convincing associations between HLA alleles and periodontitis may be due to racial differences in HLA allele distribution and to small numbers of study subjects. [4]

Immuno-receptors

The Fc-gamma receptor (FcR) is the receptor present on phagocytes which binds immunoglobulin G (IgG) and is thus crucial in the opsonophagocytosis of bacteria. Polymorphisms that influence the binding affinity between the Fc receptors and IgG of different subclasses are considered important in susceptibility to periodontal disease. The association of immuno-receptors to periodontitis has been well studied. In particular, receptors for the Fc domain of IgG (Fc gamma R, FC γ R) provide a critical link between specific humoral responses and the cellular branch of the immune system. In humans, FC γ Rs are expressed on natural killer cells, macrophages, T lymphocytes, monocytes, and mast cells. The interaction between FC γ Rs and IgG triggers a variety of biological responses, including phagocytosis, endocytosis, antibody-dependent cellular cytotoxicity, release of inflammatory mediators, and enhancement of antigen presentation. Two studies of adult periodontitis (Kobayashi et al., 1997; Van Schie et al., 1998) patients have investigated associations between FcR polymorphisms and susceptibility to chronic periodontitis. No associations were found for FcRIIa and FcRIIIb genotypes between maintenance patients and healthy controls. The authors also considered the influence of various covariates together with the FcRIIIb allele 2, which included serum IgG subclass, baseline and follow-up clinical indices, and smoking. None of these covariates was found to be significant. It was concluded that the presence of the FcRIIIb allele 2 may be a risk factor for recurrent periodontitis. Kobayashi *et al.* (2000) found functional polymorphisms of IgG Fc receptors (FcR) in Japanese patients with AgP. They found that FcRIIIb was linked with AgP. Meisel *et al.* (2001) analyzed the association between FcRIIIa (high-affinity receptor) and FcRIIIb (low-affinity receptor) and chronic periodontitis (CP). They found that FcRIIIa was associated with CP (95%) but that this is in linkage disequilibrium with FcRIIIb, which is also associated with CP. The majority of studies indicate that polymorphisms of FC γ R gene tend to be associated with both aggressive and chronic forms of periodontitis. These alleles may be in linkage disequilibrium with a gene causing periodontitis, although it still remains unclear whether the outcome of periodontitis is associated with the functional defect of FC γ Rs.

Protease and structure molecules**Matrix metalloproteinase**

Matrix metalloproteinases are one of the most important groups of enzymes involved in periodontal connective tissue destruction. Despite this, there are very few reports concerning polymorphisms of genes for matrix metalloproteinases and periodontitis. Itagaki et al. reported that matrix metalloproteinase-1 and/or matrix metalloproteinase-3 single nucleotide polymorphisms were not associated with susceptibility to periodontitis in a Japanese population. More recently, polymorphisms in the gene for matrix metalloproteinase-2 were studied and no definitive correlation with periodontitis could be found. Due to the limited number of studies carried out to date, it is difficult to relate single nucleotide polymorphisms of matrix metalloproteinase genes with periodontitis.

**Shivani Sachdeva and Harish Saluja****Cathepsin C**

In prepubescent children, aggressive periodontitis is frequently linked to inherited conditions like Papillon-Lefèvre syndrome. The cathepsin C gene has been linked to this syndrome. Lysosomal protease known as cathepsin C is important for immunological and inflammatory functions and may potentially contribute to the onset of periodontitis. It has been demonstrated that the majority of cathepsin C gene mutations cause an enzyme function loss. It is unknown whether periodontitis other than that linked with syndromes shares a pathogenetic role with cathepsin C gene variations. Interestingly, Hewitt *et al.* have recently reported a decreased cathepsin C activity associated with the development of chronic periodontitis in patients who do not suffer from any syndrome such as Papillon-Lefèvre syndrome.

Genetic Factors in Gingival Overgrowth

The variable gingival response seen in patients following drug challenge has been attributed to fibroblast heterogeneity. Although this may be a useful in vitro explanation, it has little value in determining at-risk patients. Much interest has focused on drug metabolizing enzymes and the expression of gingival overgrowth. Phenytoin, cyclosporine and nifedipine are all metabolized by the hepatic cytochrome P450 enzymes. Cytochrome P450 genes exhibit considerable polymorphism, which results in interindividual variation in drug levels. This inherited variation in metabolism of either drug may influence patient serum and tissue concentrations and hence their gingival response. Whereas cytochrome P450 variation may be a risk factor for drug-induced gingival overgrowth, it is totally impractical to assess this on a clinical basis (Seymour RA *et al.*, 2000). Other studies have investigated P-glycoprotein drug-transporter MDR1 gene polymorphisms and CYP2C polymorphism in relation cyclosporine and phenytoin induced gingival overgrowth. Neither of these investigations showed a direct correlation between these two genetic markers and gingival overgrowth.

Prepubescent children with aggressive periodontitis frequently have genetic diseases like Papillon-Lefèvre syndrome. Cathepsin C gene mutations are linked to this syndrome. A lysosomal protease known as cathepsin C, it may also contribute to the onset of periodontitis and is crucial for immunological and inflammatory processes. It has been established that the majority of cathepsin C gene mutations cause the loss of enzyme activity. It is unknown if the pathogenetic role of cathepsin C gene variations extends to periodontitis types other than syndrome-associated periodontitis. Human lymphocyte antigen expression (HLA) has been the focus of other genetic markers for gingival overgrowth since the HLA phenotype is identified before organ transplantation. Evidence suggests that individuals who have HLA-DR1. The apparent HLA associations may represent nothing more than a tight linkage disequilibrium between HLA and non-HLA genes in the MCH region of human chromosome 6.

Applying Genetic Information

It is not a novel idea that heredity plays a significant role in determining periodontitis susceptibility. Host heredity may play a significant role in vulnerability to periodontal diseases, according to clinical observations and scientific research. We should now be able to pinpoint the precise genetic, environmental, and behavioural elements that increase a person's risk of developing periodontitis. The management of periodontal diseases should be improved with the aid of this information. It is vital to establish particular genetic determinants of vulnerability and assess the value of this knowledge in treating patients with periodontitis in order to incorporate genetic information into clinical treatment scenarios. To effectively do this, it is important to demonstrate the utility of the resulting genetic information as a guide for clinical decision-making.

Application of Genetic Results to Clinical Practice

Chronic periodontitis is likely to be a complex genetic disease. In one of their twin studies, Michalowicz *et al.* estimate that about 50% of chronic periodontitis is due to genetic variance [5]. Therefore, there are challenges to developing clinically relevant diagnostic or report screening tests for chronic periodontal diseases, because genetic polymorphisms that contribute to disease susceptibility are individually not deterministic of disease. If there are as many as five to 10 functional genetic polymorphisms that are determinants of chronic periodontitis susceptibility, then any individual gene allele may make only a small (e.g., as little as 5%) contribution to disease susceptibility.

**Shivani Sachdeva and Harish Saluja**

Interactions between polymorphic forms of critical genes may act in concert with environmental factors, further complicating the disease model. In such a model, a single gene allele may contribute to susceptibility, but may not make a large enough contribution to disease outcome to provide clinical utility as a genetic test.

Commercially Available Genetic Susceptibility Test for Severe Chronic Periodontitis

Currently, a genetic test kit (PST) is being marketed for severe chronic periodontitis. It tests for the presence of specific polymorphisms of the IL-1 α and IL-1 β genes. These are single nucleotide polymorphisms in non-coding regions of these genes. In clinical studies of periodontitis patients, two of these IL-1 polymorphisms, when found together, have been reported to be associated with a significant increase in the risk for severe generalized periodontitis in non-smokers (Kornman KS *et al* 1997). The specific periodontitis associated IL-1 genotype (at nucleotide position +3954) comprises a variant in the IL-1 β gene that is reported to be associated with high levels of IL-1 production. In the initial report, the investigators assessed for the simultaneous presence of IL-1 α -889 polymorphism (allele "2" at nucleotide position -889 in the IL-1 α gene) and IL-1 β +3954 polymorphism (allele "2" at nucleotide position +3954 in the IL-1 β gene) (Kornman KS *et al* 1997). If this combination of polymorphisms (composite genotype) was present, the patients were referred to as "genotype positive." Subsequently, the test has been modified to assess for the IL-1 α +4845 polymorphism because it is technically easier to identify and it is reported to be essentially 100% concordant with the IL-1 α -889 locus. In their initial report, Kornman *et al.* used a case-control study design to evaluate the association of genes in the interleukin-1 system on periodontal disease. Logistic regression analysis established that smoking was the strongest risk factor and that there was no statistically significant predictive value of other variables when smoking was included in the model. Other investigators have also determined the importance of smoking as a risk factor for periodontitis. [6, 7] Kornman *et al.* 1997 focused on non-smokers with mild, moderate, or severe periodontitis to evaluate genetic factors. For the total genotype-positive non-smoking group the odds ratio of being associated with severe periodontitis was 6.8.

Implications for Patient Management

Currently more than 10 million single nucleotide polymorphisms (SNPs), which are variations in genomic DNA sequences within DNA, have been identified in the human genome. These genetic changes occur at a frequency of more than 1% in the human genome. SNPs are the most common genetic alteration found in our hereditary makeup. SNPs are located in coding as well as noncoding regions of genes. While most SNPs are probably not determinants of disease susceptibility and have no known functional consequence, some undoubtedly are. A number of SNPs are likely to be important determinants in disease susceptibility for more common, genetically complex diseases such as chronic periodontitis. Because SNP patterns can be so divergent within the population and periodontal disease traits may also be quite heterogeneous, such tests will require rigorous evaluation before they can be generally utilized as the basis of genetic testing. After verification of the association of one or more genetic polymorphisms with a disease, it will be important to evaluate the utility of the marker to aid patient management.[6] The usefulness of the commercially available IL-1 genetic susceptibility test to aid in patient care has been examined in a number of research, however results have been inconsistent and the majority of the studies have been small. (McGurie *et al.* 1997; Lang NP 2000; Papanou PN *et al.* 2001). In general, there haven't been any large enough controlled trials to adequately assess the value of using the IL-1 genotype, smoking, or other personal variables to inform treatment choices. Therefore, although some studies are promising, there is presently not enough data to recommend modifying treatment procedures for people with chronic periodontitis based on IL-1 testing [7].

CONCLUSION

Future strategies for the utilization of genetic polymorphisms in periodontics will need to consider at least two factors. The first is to perform large-scale genetic analyses using as many target genes and subjects as reasonably possible. Secondly, there needs to be a development of new statistical analytical methods to combine both genetic and environmental factors. Multicenter research studies will be necessary to do these tasks as efficiently and affordably as possible. Studies have employed nonparametric linkage analysis, case-control association analysis, and

Shivani Sachdeva and Harish Saluja

transmission disequilibrium analysis to identify sensitive or resistant genes for periodontitis because it is a complex illness. Recent advances in high-throughput, low-cost single nucleotide polymorphism typing have made genome-wide association analyses utilising single nucleotide polymorphisms or microsatellite polymorphisms feasible. According to Tamiya *et al.*, (2005), one intriguing method for genetically dissecting multifactorial pathologies such common diseases like periodontitis would be microsatellite-based genome-wide association analysis supported by end-stage single nucleotide polymorphism typing. Multicenter research studies will be necessary to do these tasks as efficiently and affordably as possible. Studies have shown that the complex nature of periodontitis.

ABSTRACT

This study investigates the determinants influencing the nutritional status of primary school children in the Cuddalore district, as measured by BMI z-scores. Utilizing cross-sectional data from 313 respondents across eight government primary schools in rural areas of Mangalore and Cuddalore blocks, the research employs both linear regression and quantile regression analyses to provide a comprehensive understanding of these determinants. Linear regression offers insights into the average effects of predictors on nutritional status, while quantile regression allows for the examination of these effects across different points in the nutritional status distribution, thereby capturing potential variations among undernourished and well-nourished children. The findings consistently highlight several significant determinants across various quantiles: socio-economic status, parental education, food security, sanitation and hygiene, healthcare access, and cultural practices and dietary habits all exhibit positive associations with improved nutritional status. Conversely, larger family sizes are linked to poorer nutritional outcomes. Notably, the magnitude and significance of these associations vary across the nutritional status distribution, underscoring the value of employing quantile regression to capture these nuances. For instance, socio-economic status and food security demonstrate stronger positive effects at the lower end of the nutritional distribution, suggesting that improvements in these areas may be particularly beneficial for undernourished children. Based on these insights, a strong recommendation is to implement targeted interventions that address these key determinants, with a particular emphasis on enhancing socio-economic conditions and ensuring food security to effectively improve the nutritional status of children in this region.

Keywords: BMI, Quantile Regression, Nutrition, Undernourished, Sanitation, Hygiene.

Abirami and Ramya

INTRODUCTION

The nutritional status of primary school children is a critical indicator of a nation's health and development. Proper nutrition during early childhood is essential for physical growth, cognitive development, and overall well-being. Malnutrition, encompassing both undernutrition and overnutrition, poses significant challenges globally, affecting children's academic performance and future productivity. Globally, malnutrition remains a pressing concern. According to the World Health Organization, approximately 149 million children under the age of five were stunted, and 45 million were wasted in 2020 (Adam, 2023). These conditions are predominantly observed in low- and middle-income countries, where factors such as poverty, food insecurity, and inadequate healthcare contribute to poor nutritional outcomes. Efforts to combat malnutrition include international initiatives like the Sustainable Development Goals, which aim to end all forms of malnutrition by 2030. In India, malnutrition continues to be a significant public health issue. Despite economic advancements, the country bears a substantial burden of undernutrition among children. The National Family Health Survey-5 (2019–21) revealed that 35.5% of children under five years were stunted, 19.3% were wasted, and 32.1% were underweight (Jha, *et. al.*, 2023). These statistics highlight the persistent challenges in ensuring adequate nutrition for children across various states and socio-economic strata. Tamil Nadu has been proactive in addressing child malnutrition through various initiatives. The state pioneered the Midday Meal Scheme in 1925, aiming to improve school enrolment and nutritional status among children. This program has evolved over the decades, providing free lunches to millions of schoolchildren. In Cuddalore district, the scheme has been effectively implemented, benefiting numerous primary school children. Additionally, the Integrated Child Development Services (ICDS) program operates in the district, focusing on children under six years, pregnant women, and lactating mothers by providing supplementary nutrition, health check-ups, and pre-school education. The nutritional status of primary school children in Cuddalore district is influenced by multiple determinants. Socio-economic factors, such as household income and parental education, play a pivotal role in children's access to nutritious food. Cultural practices and dietary habits also impact nutrition, with some traditional diets lacking essential nutrients. Environmental factors, including sanitation and access to clean drinking water, affect children's health and nutrient absorption. Moreover, the effectiveness of governmental programs like the Midday Meal Scheme and ICDS in reaching marginalized communities significantly influences nutritional outcomes. Continuous monitoring and targeted interventions are essential to address these determinants and improve the nutritional status of children in the district.

Overview of Literature Review

Several studies have examined the nutritional status of school-aged children across various regions, highlighting diverse factors influencing malnutrition. Joshi *et al.*, (2011) conducted a cross-sectional study in Nepal's Kaski district, assessing 786 children aged 4–14 years. They found that 26% were undernourished, with 13% stunted and 12% wasted. The study identified significant associations between child nutrition and maternal factors such as literacy, occupation, dietary knowledge, and per-capita income, underscoring the critical role of maternal education and socio-economic status in children's nutritional outcomes. In Nigeria, Umeokonkwo *et al.*, (2020) analyzed the nutritional status of 751 children aged 6–12 years in Abakaliki metropolis. The study reported an overall undernutrition prevalence of 15.7%, with stunting at 9.9%, underweight at 8%, and thinness at 7.2%. Undernutrition was more prevalent among males, public school attendees, and rural residents, while over-nutrition was absent among rural children. These findings suggest that socio-economic factors, including school type and urban-rural residence, significantly influence nutritional status. In Ghana, Aboagye *et al.*, (2022) conducted a school-based cross-sectional study among 423 children aged 6–12 years in the South Tongu District. They found that 21.5% of the children were undernourished, while 24.8% were overweight or obese. Factors such as non-portable water sources, maternal education, beverage consumption between meals, and dietary diversity were associated with these nutritional outcomes. Słowik *et al.*, (2019) conducted a study assessing the nutritional status of 1,013 Polish children and adolescents aged 7 to 18 years with varying levels of physical activity. The study found that 70% of participants had a body mass within standard limits, while over 25% were classified as overweight or obese. The percentage of body fat ranged from 5.7% to 45.2%. The findings highlighted a significant prevalence of overweight and obesity,

Abirami and Ramya

particularly among younger children and boys, emphasizing the need for targeted interventions to promote physical activity and healthy dietary habits among youth. Khan *et al.*, (2022) performed a pooled analysis of 51 studies involving 62,148 Pakistani children aged 5–15 years. The analysis revealed that 25.1% were underweight, 23% stunted, 24% wasted, 12.5% thin, 11.4% overweight, and 6.9% obese. The study also noted a high intake of carbohydrates, soft drinks, and sweets, alongside a low intake of protein-rich foods, fruits, and vegetables, compared to recommended daily allowances. Collectively, these studies underscore the multifaceted nature of malnutrition, influenced by socio-economic, educational, and environmental factors. They highlight the need for targeted interventions addressing these determinants to improve child health outcomes globally.

Objective of the Study

The objective of this study is to analyse the factors determining the nutritional status of primary school children in Cuddalore district, Tamil Nadu.

METHODS AND MATERIALS

The study is based on primary data collected through a well-defined interview schedule.

Selection of The Study Area And Primary Schools

In the first stage, the Cuddalore district has been selected for the study purpose, the researcher has no reason for choosing Cuddalore district as the study area, since the area under study is scholars native place, so it was researchers first and foremost priority to study and evaluate the health and nutritional status of primary school children in the Cuddalore district. The Cuddalore district have 13 Administrative blocks. In the second stage, Mangalore and Cuddalore block have been purposively selected for the study purpose on the basis of Cuddalore being a developed and Mangalore as an underdeveloped block in the district. In the third stage, in Mangalore block only four primary schools have been selected viz Panchayat union primary school Thittagudi, Panchayat union primary school Orangur, Panchayat union primary school Mo. Podaiyar and Panchayat union primary school Avinangudi and in Cuddalore block, only four primary schools were selected viz Panchayat union primary school Varakalpattu, Panchayat primary school Thotti, panchayat primary school V. Kattupalayam and Panchayat union primary school Crunamangalam based on the highest number of student enrolment in primary classes. All the eight school were selected from the rural areas of these two blocks and all schools are government schools.

Sampling Size and Technique.

When any researcher conducts any research, it requires sample techniques or sampling methods. The study is a cross-sectional study. The study population comprised of all primary school students in selected primary schools of the Cuddalore and Mangalore block. The sample size was calculated using the formula developed by Taro Yamane (1967).

Taro-Yamane Formula

The Taro Yamane (1967) formula has been used to calculate the sampling size in the selected primary schools. The formula for determining the sampling size is as

$$n = N / (1 + N(e)^2)$$

n = Sample Size

N = population Size (1434)

e = sampling error (0.05)

$$n = \frac{1434}{1 + 1434(0.05)^2}$$

$$n = \frac{1434}{1 + 1434(0.0025)}$$

$$n = \frac{1434}{1 + 3.585}$$

$$n = \frac{1434}{4.585}$$

**Abirami and Ramya**

n = 312.75

The sample size of the total population is 313 approximately when using the formula developed by Taro Yamane, (1967).

Selection of the Respondents

After the calculation of sample size, a simple random sampling technique has been used to select the respondents. The respondents are the primary school going children comprising of age group 6 to 10 years. These children were further divided into two groups 6-8 and 9-10 years for comparison with standards.

Statistical Tools and Techniques

The primary data was collected by interview schedule. The data were then converted into the tabular form using SPSS, STATA and EXCEL software's.

In this study investigating the determinants of nutritional status among primary school children in Cuddalore district, Tamil Nadu, both linear regression and quantile regression methodologies have been employed to analyse the data. Linear regression, specifically Ordinary Least Squares (OLS), has been utilized to estimate the average effect of predictor variables—such as socio-economic status, parental education, family size, food security, sanitation and hygiene, healthcare access, and cultural practices—on the nutritional status, measured by BMI z-scores. However, recognizing that the impact of these determinants might vary across different points in the nutritional status distribution, the quantile regression has been applied. This approach allowed to assess the effects of the predictor variables not only at the mean but also at various quantiles (e.g., 10th, 50th, and 90th percentiles) of the BMI z-score distribution. By doing so, a more comprehensive understanding of how these factors influence children who are undernourished, adequately nourished, or overnourished. This dual-method analysis provided a nuanced perspective, highlighting that certain determinants may have varying degrees of influence depending on the specific nutritional status segment of the population.

RESULTS AND DISCUSSIONS

The linear regression analysis of 313 respondents from eight government primary schools in the rural areas of Mangalore and Cuddalore blocks within the Cuddalore district provides profound insights into the determinants influencing the nutritional status of primary school children, as measured by BMI z-scores. Socio-economic Status (SES) emerges as a pivotal determinant, exhibiting a coefficient of 0.25 ($p < 0.001$). This indicates that with each incremental improvement in SES, there is a corresponding 0.25 unit increase in BMI z-scores, underscoring the critical role of economic stability in ensuring adequate nutrition. This finding aligns with broader research highlighting that children from higher SES backgrounds often have better access to nutritious foods and health resources, contributing to improved nutritional outcomes. Parental Education also demonstrates a significant positive association with children's nutritional status, with a coefficient of 0.15 ($p < 0.001$). This suggests that higher levels of parental education are linked to a 0.15 unit increase in BMI z-scores. Educated parents are typically more knowledgeable about nutritional needs and health practices, enabling them to make informed decisions that promote their children's well-being. This correlation between parental education and child nutrition is well-documented, emphasizing the importance of educational interventions in combating malnutrition. Conversely, Family Size presents a negative coefficient of -0.10 ($p = 0.001$), indicating that each additional family member is associated with a 0.10 unit decrease in BMI z-scores. Larger families may experience resource dilution, where limited financial and nutritional resources are spread thinner, potentially compromising each child's nutritional intake. This phenomenon is particularly pertinent in socio-economically disadvantaged settings, where larger family sizes can exacerbate the challenges of ensuring adequate nutrition for all children. Food Security is another critical factor, with a coefficient of 0.30 ($p < 0.001$). This robust positive association signifies that improvements in food security correspond to a substantial 0.30 unit increase in BMI z-scores. Reliable access to sufficient and nutritious food is fundamental to children's growth and development, and food insecurity can lead to both undernutrition and overnutrition, depending on the context. Ensuring food security is thus essential for promoting optimal nutritional outcomes

**Abirami and Ramya**

among children. The analysis also highlights the importance of Sanitation and Hygiene, with a coefficient of 0.20 ($p < 0.001$). Improved sanitation and hygiene practices are associated with a 0.20 unit increase in BMI z-scores, reflecting their role in preventing infections and diseases that can impair nutrient absorption and overall health. Access to clean water and proper sanitation facilities reduces the incidence of diarrheal diseases, which are closely linked to malnutrition in children. Healthcare Access is positively associated with nutritional status, as indicated by a coefficient of 0.18 ($p < 0.001$). Access to healthcare services facilitates timely medical interventions, immunizations, and health education, all of which contribute to better nutritional outcomes. Children with regular healthcare access are more likely to receive preventive care and prompt treatment for illnesses that could otherwise negatively impact their nutritional status. Lastly, Cultural Practices and Dietary Habits show a positive coefficient of 0.12 ($p = 0.003$), suggesting that favourable cultural norms and dietary practices are linked to a 0.12 unit increase in BMI z-scores. Cultural factors influence food choices, meal patterns, and perceptions of health, thereby affecting children's nutrition. Understanding and integrating culturally appropriate dietary interventions can enhance the effectiveness of nutritional programs. In summary, the analysis underscores that socio-economic factors, parental education, family dynamics, food security, sanitation, healthcare access, and cultural practices collectively and significantly influence the nutritional status of primary school children in the Cuddalore district. Addressing these determinants through comprehensive and context-specific strategies is crucial for improving child nutrition and promoting overall health and development. In analysis of the determinants affecting the nutritional status of primary school children in Cuddalore district, quantile regression at the 25th percentile has been employed to gain insights into factors influencing children who are relatively undernourished. This approach allows us to understand how various predictors impact the lower end of the nutritional status distribution, providing a more nuanced perspective compared to traditional mean-based analyses. The results indicate that socio-economic status (SES) has a positive and statistically significant association with nutritional status, with a coefficient of 0.20 ($p = 0.001$). This suggests that improvements in SES are linked to better nutritional outcomes among undernourished children, likely due to increased access to resources such as quality food and healthcare services. Parental education also shows a positive relationship with children's nutritional status, with a coefficient of 0.10 ($p = 0.046$).

This finding implies that higher educational attainment among parents contributes to better nutrition in children, possibly because educated parents are more aware of nutritional needs and health practices. Conversely, family size exhibits a negative association with nutritional status, as indicated by a coefficient of -0.15 ($p < 0.001$). This suggests that larger families may face resource constraints, leading to diminished nutritional quality for each child. Food security emerges as a critical factor, with a coefficient of 0.25 ($p < 0.001$), underscoring that consistent access to sufficient and nutritious food is essential for improving the nutritional status of undernourished children. The analysis also reveals that sanitation and hygiene practices are significantly associated with better nutritional outcomes, with a coefficient of 0.18 ($p = 0.003$). This highlights the importance of clean-living conditions in preventing infections that can impair nutrient absorption and overall health. Healthcare access is another significant determinant, with a coefficient of 0.15 ($p = 0.013$), indicating that availability and utilization of healthcare services play a vital role in maintaining and improving children's nutritional status. While cultural practices and dietary habits show a positive coefficient of 0.08, this association is not statistically significant ($p = 0.110$), suggesting that their impact may be less pronounced in this context or that other factors may overshadow their influence. The intercept of 14.00 ($p < 0.001$) represents the baseline nutritional status at the 25th percentile when all predictor variables are zero, serving as a reference point for interpreting the effects of the determinants. In summary, the quantile regression analysis at the 25th percentile highlights that socio-economic status, parental education, food security, sanitation and hygiene, and healthcare access are positively associated with improved nutritional status among undernourished children. Conversely, larger family sizes are linked to poorer nutritional outcomes. These insights emphasize the need for targeted interventions focusing on socio-economic upliftment, educational programs, food security initiatives, improved sanitation, and enhanced healthcare services to effectively address undernutrition in this population. In analysis of the determinants influencing the nutritional status of primary school children in Cuddalore district, Quantile regression at the median (50th percentile) has been employed to gain a comprehensive understanding of how various factors impact children's nutritional outcomes. This approach allows us to assess the relationships between predictor variables and the central tendency of nutritional status, providing a more nuanced

**Abirami and Ramya**

perspective compared to traditional mean-based analyses. The findings indicate that socio-economic status (SES) has a positive and statistically significant association with nutritional status, with a coefficient of 0.22 ($p < 0.001$). This suggests that for each unit increase in SES, there is an associated 0.22 unit increase in the BMI z-scores of children at the median level of nutritional status. This underscores the critical role of socio-economic improvements in enhancing children's nutritional health, likely through better access to nutritious food, healthcare, and educational resources. Parental education also exhibits a positive relationship with children's nutritional status, with a coefficient of 0.12 ($p = 0.003$). This implies that higher levels of parental education contribute to better nutritional outcomes among children, potentially due to increased health literacy and the ability to make informed dietary choices. Conversely, family size shows a negative association with nutritional status, as indicated by a coefficient of -0.12 ($p < 0.001$). This suggests that larger family sizes may dilute resources, leading to lower BMI z-scores among children. This finding highlights the challenges larger families may face in providing adequate nutrition to all members. Food security emerges as a significant positive determinant, with a coefficient of 0.28 ($p < 0.001$). This underscores the importance of consistent access to sufficient and nutritious food in promoting optimal nutritional status among children. The analysis also reveals that sanitation and hygiene practices are significantly associated with better nutritional outcomes, with a coefficient of 0.20 ($p < 0.001$). This highlights the role of clean-living environments in preventing infections and diseases that can adversely affect nutritional status. Healthcare access is another crucial factor, with a coefficient of 0.17 ($p = 0.001$), indicating that improved access to healthcare services is linked to better nutritional status among children. This may be attributed to timely medical interventions and health education provided by healthcare professionals. Cultural practices and dietary habits also show a positive association with nutritional status, with a coefficient of 0.10 ($p = 0.013$). This suggests that culturally ingrained dietary practices can influence children's nutritional outcomes, highlighting the need for culturally sensitive nutrition programs.

The intercept of 15.50 ($p < 0.001$) represents the baseline BMI z-score at the median level when all predictor variables are zero, serving as a reference point for the analysis. In summary, the quantile regression analysis at the median reveals that socio-economic status, parental education, food security, sanitation and hygiene, healthcare access, and cultural practices are positively associated with improved nutritional status among children. Conversely, larger family sizes are linked to lower BMI z-scores. These insights emphasize the multifaceted nature of nutritional health and the importance of comprehensive interventions addressing these determinants to enhance the well-being of primary school children in Cuddalore district. In comprehensive analysis of the determinants influencing the nutritional status of primary school children in the Cuddalore district, quantile regression at the 75th percentile has been employed. This approach allows us to understand how various factors impact children who are relatively well-nourished, providing insights into the upper end of the nutritional status distribution. By focusing on the 75th percentile, we can identify determinants that contribute to optimal nutritional outcomes. The analysis reveals that socio-economic status (SES) has a positive and statistically significant association with nutritional status, with a coefficient of 0.24 ($p < 0.001$). This indicates that higher SES is associated with better nutritional outcomes among well-nourished children, likely due to increased access to quality food, healthcare, and educational resources. Parental education also shows a positive relationship with children's nutritional status, with a coefficient of 0.14 ($p = 0.002$). This suggests that higher educational attainment among parents contributes to better nutrition in children, possibly because educated parents are more aware of nutritional needs and health practices. Conversely, family size exhibits a negative association with nutritional status, as indicated by a coefficient of -0.10 ($p < 0.001$). This suggests that larger families may face resource constraints, leading to diminished nutritional quality for each child. Food security emerges as a critical factor, with a coefficient of 0.30 ($p < 0.001$), underscoring that consistent access to sufficient and nutritious food is essential for maintaining optimal nutritional status among well-nourished children. The analysis also reveals that sanitation and hygiene practices are significantly associated with better nutritional outcomes, with a coefficient of 0.22 ($p < 0.001$). This highlights the importance of clean-living conditions in preventing infections that can impair nutrient absorption and overall health. Healthcare access is another significant determinant, with a coefficient of 0.18 ($p = 0.001$), indicating that availability and utilization of healthcare services play a vital role in maintaining and improving children's nutritional status. Cultural practices and dietary habits also show a positive association with nutritional status, with a coefficient of 0.12 ($p = 0.010$). This suggests that culturally ingrained dietary practices can influence children's nutritional outcomes, highlighting the need for culturally

**Abirami and Ramya**

sensitive nutrition programs. The intercept of 16.00 ($p < 0.001$) represents the baseline nutritional status at the 75th percentile when all predictor variables are zero, serving as a reference point for interpreting the effects of the determinants. In summary, the quantile regression analysis at the 75th percentile highlights that socio-economic status, parental education, food security, sanitation and hygiene, healthcare access, and cultural practices are positively associated with maintaining optimal nutritional status among well-nourished children. Conversely, larger family sizes are linked to slightly poorer nutritional outcomes. These insights emphasize the need for targeted interventions focusing on socio-economic upliftment, educational programs, food security initiatives, improved sanitation, and enhanced healthcare services to sustain optimal nutrition in this population.

CONCLUSION

Nutritional status among primary school children in Cuddalore district is influenced by various factors, notably maternal education. Studies indicate that children whose mothers have lower educational attainment are more susceptible to malnutrition. For instance, the prevalence of stunting is significantly higher among children whose mothers have only primary-level education compared to those whose mothers are graduates or above. Similarly, wasting and underweight conditions are more prevalent among children with less-educated mothers. This trend underscores the critical role of maternal education in promoting children's nutritional well-being. In addition to maternal education, socioeconomic factors such as family income, parental occupation, and access to healthcare services also play pivotal roles in determining the nutritional status of children. Children from lower-income families or those with limited access to healthcare are at a higher risk of malnutrition. Furthermore, initiatives like the Midday Meal Scheme have been implemented to improve the nutritional intake of school children, aiming to enhance their overall health and academic performance. This program provides free lunches to students in government and government-aided schools, thereby addressing hunger and promoting better nutrition among school-aged children.

ABSTRACT

Medicinal plants are presently viewed as being of great value because of their unique qualities as a significant source of medicinal phytochemicals that might result in the creation of new medications. *Oldenlandia pumila* (L.f.) DC. belong to Rubiaceae family and found as a weed throughout India. The widespread use of *Oldenlandia pumila* (L.f.) DC. in traditional medicines is likely due to the presence of these bioactive compounds, such as phenol, alkaloids, flavonoids, saponins and tannins, which have also been directly linked by a number of authorities to the plant's valuable anti-sickling qualities. The goal of this study is to identify bioactive substances and assess this plant species' capacity as an antioxidant. The FT-IR spectrum analysis identifies functional groups in plant components using various solvents. Bioactive components of *Oldenlandia pumila* extracts (leaves and stem) were characterized by FT-IR spectrum analysis. The antioxidant activity of different extracts was examined using FRAP and Phosphomolybdenum capacity. The antimicrobial capacity of *Oldenlandia pumila* was found highest against *S.aureus* (8.9 mm) and lowest activity against *B.subtilis* and *K. pneumonia* (2 mm).

Keywords: *Oldenlandia pumila* (L.f.) DC, Antioxidant activity, FT-IR spectrum analysis, Antimicrobial assay.

INTRODUCTION

In recent years, there has been an increasing awareness of the importance of medicinal plants (Liu *et al.*, 2009). Medicinal herbs have been utilized as traditional therapies for a variety of human ailments for thousands of years (Shukla & Mehta., 2015). Because of their vast spectrum of biological and therapeutic qualities, medicinal plants have attracted a lot of interest (Palombo., 2006). The plant kingdom offers a treasure trove of potential medications (Davidson-Hunt., 2000). Plant-based medicines are readily available, less priced, efficient, safe, and rarely cause adverse effects (Yadav & Agarwala., 2012). Since medicinal plants represent the “backbone” of traditional medicine, more than 3.3 billion people in developing nations regularly use these resources (Davidson- Hunt., 2000). Medicinal plants form the basis of traditional healthcare systems for the majority of the population of developing nations (Mesfin *et al.*, 2014). Medicinal herbs and plants have long been recognized as a valuable source of treatments or curative aid. The utilization of medicinal plants has taken a dominant role in the global health system (Oladeji., 2016). The richest bio sources of drugs for traditional medical system, modern drugs, nutraceuticals, food supplements, folk remedies, pharmaceuticals, intermediates, and chemicals for synthetic drugs are medicinal plants (Das *et al.*, 2010).

Hedyotis L. and Oldenlandia L. are two of the biggest genera in the Rubiaceae family. They are quite similar and have herbaceous or shrubby habits. They have relatively tiny four-merous flowers, and dry usually two-celled capsular fruits with few or many tiny seeds (Guo *et al.*, 2013). The Oldenlandia genus has approximately 240 plant species that contain a diverse variety of chemicals including iridoids, anthraquinones, triterpenes, phytosterols, flavonoids, anthocyanidins, vitamins, essential oils, phenolic acids, and coumarins. The pharmacological potential of Oldenlandia plants for various medicinal uses can be observed by their different phytochemical profiles (Al-Shuhaib & Al-Shuhaib., 2023). *Oldenlandia pumila* (L.f.) DC. is native plant to Andaman Islands, Bangladesh, India, Jawa, Malaya, Myanmar, Sri Lanka, Thailand, Vietnam (Nandikar *et al.*, 2019). *Oldenlandia pumila* has small white flowers with yellow centers, and small, black, glossy seeds. The seedlings are small and thin with long, narrow leaves. *Oldenlandia pumila* is used as an ornamental plant in gardens and as a groundcover. It is also used in traditional medicine to treat fever, cough, and other ailments (Huang and Kai., 2021).

MATERIALS AND METHODS

Plant Material

The *Oldenlandia pumila* (L.f.) DC. plant was collected in January from Law Garden in Ahmedabad, Gujarat. For the experiment, fresh leaves, and stem of *Oldenlandia pumila* (L.f.) DC. was taken.

Preparation of Sample

The plant material (Leaves & Stem) was dried in the air until all water molecules vanished. Following drying, the plant material was finely ground using a mechanical blender into a powder before being put into airtight containers for later usage.

Preparation of Extraction

Extract leaves by hot extraction method by using a Soxhlet extractor. And the solvents used for this method are methanol, acetone, aqueous (Distilled water). 10gm leaves powder extracted with 100ml solvent (10gm/100ml).

ANTIOXIDANT ACTIVITY

Potassium Ferricyanide Reducing Antioxidant Power Assay

Different concentrations of the extract were added to 2.5 mL of 0.2 M sodium phosphate buffer (pH 6.6) and 2.5 mL of 1% potassium ferricyanide [$K_3Fe(CN)_6$] solution. The reaction mixture was vortexed well and then incubated at 50°C for 20 min using vortex shaker. At the end of the incubation, 2.5 mL of 10% trichloroacetic acid was added to the

**Shivani Patel and Nainesh Modi**

mixture and centrifuged at 3,000 rpm for 10 min. The supernatant (2.5 mL) was mixed with 2.5 mL of deionized water and 0.5 mL of 0.1% ferric chloride. The colored solution was read at 700 nm against the blank with reference to standard UV Spectrophotometer. Here, ascorbic acid was used as a reference standard, the reducing power of the samples were comparable with the reference standard.

Phosphomolybdate assay

The method given by Prieto *et al.* (1999) was adopted with some minor modifications. In this assay, 500µl plant extract (1mg/ml stock) or standard ascorbic acid (100-1000 µg/ml) was mixed with phosphomolybdate reagent (0.6 M sulfuric acid, 28mM sodium phosphate and 4mM ammonium molybdate). Then the reaction mixture was incubated in water bath at 90° C for 90 minutes, cooled to room temperature and absorbance was measured at 695 nm. The antioxidant capacity was expressed as mg of ascorbic acid equivalents (AAE)/g extract.

Antibacterial Activity

The antimicrobial activity of the different extracts of the plant was assayed by agar-well diffusion method as described in NCCLS (Wayne., 2002). Five bacterial strains *Staphylococcus aureus*, *Bacillus subtilis*, *Escherichia coli*, *Klebsiella pneumonia* and *Pseudomonas aeruginosa* were used in this assay. All bacterial strains used in this research were inoculated into Luria broth medium in a biosafety cabinet. The cultures were cultivated at 37° C for 12 hours overnight and then used aseptically for the MIC analysis. Luria agar was autoclaved and utilized for culture pouring. All bacterial cultures were added after cooling the agar to 30° C overnight. Plates were poured aseptically in a biosafety air flow cabinet, and the medium was solidified overnight. The MICs with cultures were calculated using the serial dilution method of microorganisms, and bacterial cells (1×10^6) were used for the antimicrobial assay. The punch well agar technique was used to analyze the efficacy of plant extract samples. Samples were diluted to examine the MIC method, ranging from 40µl to 100µl. After 24 hours of incubation at 37° C, the zone of inhibition was measured in millimeters (Kurian *et al.*, 2018).

Anti-Fungal Activity

The antifungal activity of extracts was determined by diffusion method. The procedure utilized 3 different types of fungal strains: *Aspergillus niger*, *Aspergillus clavatus* and *Candida albicans*. Plant crude extracts were utilized to measure the zone of inhibition of fungi using the plate-hole diffusion test. The selected microbes were kept on nutrient agar plates at 4° C before use five holes were made per plate in the agar containing the fungal culture using a sterile cork borer with a diameter of 5mm. Seven drops of each plant extract concentration (40,60,80,100 µg/ml) were added to the wells. The plates were kept in the incubator at 37° C for 12 hours. The antibacterial activity was measured in millimeters. This was also done to determine the antifungal activity of the extract against isolated fungi (Oluwajobi *et al.*, 2019).

FT-IR Assay

FTIR spectrophotometric analysis, the extracts were centrifuged at 3000 rpm for 10 min, and then using a high-pressure vacuum pump, filtered using Whatman No. 1 filter paper. Using the same solvent, the sample has been diluted to a ratio of 1:10. Using a Perkin Elmer Spectrophotometer system, FTIR analysis was carried out to identify the characteristic peaks in the 400–4000 cm^{-1} range and their functional groups. The FTIR's peak values were noted. Every analysis was performed twice for the validation of the spectrum (Karpagasundari and Kulothungan., 2014; Patel and Modi, 2022)

RESULT AND DISCUSSION**Potassium Ferricyanide Reducing Antioxidant Power Assay**

The reducing power assay is based on the principle that compounds have reduction potential combined with potassium ferricyanide (Fe^{+3}) to generate potassium ferrocyanide (Fe^{+2}), which interacts with ferric chloride to form a ferric-ferrous complex with an absorbance maximum at 700nm (Bhalodia *et al.*, 2013). The absorbance of DPPH

**Shivani Patel and Nainesh Modi**

assay of different plant extracts varies from 0.250 to 0.725. The maximum absorbance for the methanol extract is found to be 0.623 & 0.725 at 600 µg/ml concentration in leaves and stem respectively.

Phosphomolybdenum assay

The basic principle for assessing antioxidant capability using the Phosphomolybdenum assay is the reduction of Mo (VI) to Mo (V) by plant extracts containing antioxidant compounds. This technique reduces phosphomolybdic acid to Phosphomolybdenum blue complex using sodium sulfide. The obtained phosphomolybdenum blue complex is oxidized by the addition of nitrite, resulting in a decrease in blue color intensity (Jan *et al.*, 2013). The phosphomolybdenum assay of different plant extract ranged from 5.97 µg to 90.71 µg of AAE/g of dry extract. The Phosphomolybdenum assay of leaves is high (90.71 µg AAE/g) in aqueous extract, but the stem has lowest content (5.97 µg AAE/g) in the methanolic extract. The phosphomolybdenum assay of the leaves was found to be highest in the aqueous extract (90.71 ± 0.005 µg AAE/g) and lowest in the methanolic extract (10.74 ± 0.005 µg AAE/g). The stem's phosphomolybdenum assay was found highest in the aqueous (67.86 ± 0.004 µg AAE/g) and lowest in the methanolic extract (5.97 ± 0.005 µg AAE/g).

Antibacterial Activity

The identification of active principles, dose formulations, efficacy, and pharmacokinetic profile of novel medicine follows a comprehensive biological examination of plant extracts to assure efficacy and safety in the search for antibacterial agents of plant origin (Gonfa *et al.*, 2023). Antimicrobial activity is the ability of antimicrobial agents to suppress or kill pathogenic microorganisms (Balouiri *et al.* 2016). The antibacterial activity of all extracts has been shown in Table 14. In leaves, the maximum activity against *S.aureus* was 8.9 mm at 100µl and lowest activity against *B.subtilis* and *K. pneumonia* was 2mm at 40µl while in the stem, the acetone extract inhibited all tested pathogens, with the maximum efficacy against *S. aureus* (9 mm) and the lowest against *B. subtilis* & *P. aeruginosa* (2 mm) at 100µl and 40µl respectively.

Antifungal Activity

Antifungal activity has also been studied to determine the biological activity of *Oldenlandia pumila* against various fungal strains, including *Aspergillus niger*, *Aspergillus clavatus* and *Candida albicans*. Leaves and Stem were extracted using methanol, acetone and aqueous, and their antifungal activity was assessed on three different fungal strains. Plant-derived chemicals are important in this context because they include safer or more effective alternatives for synthetically generated antibacterial agents (Bokhari., 2009). The zone of inhibition of leaves extract in this experiment ranged from 2 to 8.1 mm. Due to presence of some essential oil, the methanol extract of leaves had the highest inhibitory zone (8.1 mm) when compared to the other extracts. The methanolic extract of leaves had the lowest inhibitory zone (2 mm). The maximum zone of inhibition in the stem extract was found in the methanol extract (5.8 mm) while the lowest zone was found in the aqueous extract (1.7 mm).

FT-IR Analysis

The FT-IR analysis was used to identify the functional group of bioactive substances using the peak characteristics found in the IR region. The FT-IR spectrum of methanol extract of stem revealed the presence of 8 significant bands between 1114.5 to 3321.1 cm⁻¹. The stretching of N-H groups produced a medium intensity peak at 3321.1 cm⁻¹ indicates the presence of aliphatic primary amine. The band at 2832.8 cm⁻¹ revealed a strong broad band of N-H stretching due to amine salts groups. A weak band at 2590.5 cm⁻¹ revealed S-H stretching of a Thiol group. The strong peak at 1707.1 cm⁻¹ as the vibrations of C=O groups stretching due to presence of aliphatic ketone. The stem acetone extract revealed the presence of 9 significant bands between 1036.2 to 3578.2 cm⁻¹. The band 3578.2 cm⁻¹ and cm⁻¹ revealed a strong sharp peak of O-H stretching due to presence of alcohol. The band at 1710.8 cm⁻¹ revealed a strong broad band of C=O stretching due to Aliphatic ketone, Carboxylic acid, Conjugated acid, and Conjugated aldehyde groups. The stem aqueous extract showed 4 major bands ranging from 1259.8 to 3328.5 cm⁻¹. A medium band at 3328.5 cm⁻¹ revealed N-H stretching of an Aliphatic primary amine group. The stretching of C-O group produced a strong band at 1259.8 cm⁻¹.

**Shivani Patel and Nainesh Modi**

The leaves methanolic extract showed 7 major bands ranging from 1021.3 to 3317.3 cm^{-1} . Bands at 2832.8 cm^{-1} and 2527.1 cm^{-1} produced due to stretching of N-H and O-H verifying amine salt and carboxylic acid. A strong intensity band at 1114.5 cm^{-1} indicates C-O stretching of Aliphatic ether and secondary alcohol group. Acetone extract of leaves revealed 17 important bands ranging from 1021.3 to 3619.2 cm^{-1} . A strong broad infrared band at 3503.7 and 3462.7 cm^{-1} may suggest stretching of O-H for alcohol respectively, while C-H stretching of some aromatic compounds. The band at 1259.8 and 1222.6 cm^{-1} revealed C-O stretching of ester and alkyl aryl ether group. A weak band at 2549.5 cm^{-1} revealed S-H stretching of a Thiol group. The leaves aqueous extract showed 8 important bands ranging from 1107.6 to 3265.1 cm^{-1} . The strong broad also appeared at 3265.1 may assigning as a O-H corresponding to alcohol and carboxylic acid. The band at 1259.8 cm^{-1} and 1107.6 cm^{-1} may examined as a C- O stretching of aromatic ester and secondary alcohol groups respectively.

CONCLUSION

To sum up, these results suggest that these plant parts have potent antioxidant activity, so that these plant parts can be used for further drug development. In addition, research is conducted in order to evaluate the plant's complete phytochemical and pharmacological profile to justify its traditional applications and reported antioxidant properties. The result of FT-IR spectrum analysis will be helpful for isolation and characterization of bio active components to protect humans from infectious diseases. A significant number of phytochemicals suggest that these plants can be used to identify other biological and pharmacologic activities like anti-inflammatory, antimicrobial, anti-fungal and many more. Further study of the plants should be done to unlock their potential.

ABSTRACT

Cyber security plays a vital role in protecting personal, corporate, and governmental information and assets in an increasingly digital world. With the increasing interconnectivity of devices, a security breach can lead to significant operational disruptions and financial losses. Additionally, robust cybersecurity measures are essential to build trust among users and stakeholders, fostering the continued adoption and growth of IoT and IIoT technologies. The principle objective of the research is to evaluate how effectively machine learning (ML) algorithms protect against cyberattacks associated to the Internet of Things, with a main focus on Denial of Service (DoS) attacks. The study also inspect the vulnerabilities of IoT devices towards several cyber threats and explores alternative datasets that can be utilized for IoT cyber-defense analysis using ML techniques. The growing connection and complexity of industrial IoT devices provide serious cybersecurity risks. These advanced cyber-attacks cannot be addressed by traditional security techniques. Therefore, creating Detection System and a Intrusion Prevention(IPS/IDS) with a machine learning foundation specifically for the Industrial Internet of Things is essential. The security and resilience of IIoT infrastructures depend on this system's capability to manage massive and varied data streams, identify and stop cyberattacks in real-time, work effectively with limited resources, and adjust to new threats.

Udaya Deepika et al.,

Keywords: Additionally, robust cybersecurity measures are essential to build trust among users and stakeholders.

INTRODUCTION

The Industrial Internet of Things (IIoT) is regarded as a transformative evolution by evaluating the way how the industrial systems operate, leveraging connectivity, data analytics, and advanced technologies to create smarter and more efficient processes [1]. By embedding sensors, devices, and machines with Internet connectivity, industries can accumulate huge amounts of data in real-time, enabling enhanced monitoring, predictive maintenance, and optimized operations[1]. This interconnectedness fosters greater productivity and innovation but also introduces a complex array of challenges, particularly in regard to security [3]. As the IIoT ecosystem expands, so does the potential attack surface for cyber threats. With critical infrastructure and operational technologies being interconnected, a breach in cybersecurity can have dire repercussions—not only for the affected organization but also for public safety, economic stability, and national security [2]. The potential for unauthorized access to sensitive data, manipulation of industrial processes, or disruption of services underscores the urgent need for robust cybersecurity measures [4]. Effective cybersecurity strategies are vital to safeguarding IIoT systems against threats such as malware, ransomware, and data breaches. These strategies encompass a range of practices, including risk assessment, encryption, secure access controls, and continuous monitoring of networks [2]. By implementing comprehensive cybersecurity protocols, organizations can enhance their resilience against evolving threats, ensuring the safe and reliable operation of IIoT technologies [3]. Cyber security is important for protecting data, devices, and networks from attacks, unauthorized access and damage. Cyber security becomes even more critical, in the circumstances of the Internet of Things (IoT), which involves interconnected devices communicating over the internet. Building blocks refer to the essential components or foundational elements needed to construct something. In this case, cyber security is a fundamental component mandatory for the safe and effective operation of IoT applications. IoT technology advances and becomes more widespread, the need for robust cybersecurity measures is growing. This is because IoT devices often have vulnerabilities that can be exploited by attackers, leading to potential data breaches, unauthorized control, and other security issues[6]. IoT applications continue to expand, ensuring strong cybersecurity measures are essential to protect the vast amount of data and the interconnected devices involved. This growing need for attention to cybersecurity highlights its importance as a foundational element in the deployment and development of IoT technologies[7]. As an emerging technology, the Internet of Things (IoT) has remodeled the worldwide network of people, data, intelligent things ,smart devices and information. IoT development remained in its initial stages, and many difficulties remain to be resolved. IoT is a single concept that involves embedding everything. The Internet of Things has the potential to improve global integrity, accessibility, scalability, availability, interoperability and confidentiality. No matter how, securing the Internet of Things is a tough issue. System security serves as the cornerstone for IoT development. This article presents a thorough review of IoT and IIoT cybersecurity. The primary considerations are the protection and integration of heterogeneous smart devices[8].

Cybersecurity for IoT, is it needed?

IoT has become a popular target for attackers This means that Internet of Things (IoT) devices, which include everything from the smart home gadgets to industrial sensors, are frequently targeted by cybercriminals. These devices often have weaker security measures compared to traditional computers, making them attractive targets [20]. Seeking sensitive and personal user data: Attackers might target IoT devices to steal personal information. For example, a smart thermostat in your home collects data about your daily routines and preferences. If an intruder gains access to this device, they can probably learn when you are home or away, which is valuable information for planning a burglary.

Computing infrastructure for massive attacks

IoT devices can be hijacked and used as part of a larger network of compromised devices, known as a botnet. For instance, the Mirai botnet attack in 2016 involved thousands of IoT devices like cameras and routers being used to

Udaya Deepika et al.,

launch a massive Distributed Denial of Service (DDoS) attack, which overwhelmed websites like Twitter and Netflix, causing them to go offline for hours.

Compromising critical applications

Attackers might also target IoT devices that are part of critical infrastructure. For example, in a healthcare setting, IoT devices like smart infusion pumps are used to deliver medication to patients. If an attacker were to compromise these devices, they could potentially alter the dosage of medication being administered, leading to serious health risks or even fatalities. The study includes several DoS (Denial of Service) attack scenarios, which are designed to disrupt the availability of IoT edge servers by overwhelming them with manipulated packets. Here are the specific DoS attack scenarios included in the dataset

TCP SYN Flood DDoS Attack This attack involves sending a flood of TCP SYN packets to a target server, exhausting its resources and preventing legitimate requests from being processed.

UDP Flood DDoS Attack In this scenario, a large number of UDP packets are sent to random ports on the target server, resulting intense situation and unable to respond to tenable traffic.

HTTP Flood DDoS Attack This attack involves sending a high volume of HTTP requests to a web server, consuming its resources and rendering it unavailable to legitimate users. These scenarios are part of the comprehensive research of this paper, which is used to estimate the execution of machine learning-based intrusion detection systems in IIoT environments. IoT devices are attractive targets for attackers because they often lack robust security measures, and compromising them can yield valuable personal data, provide resources for large-scale attacks, or disrupt critical applications. Security threats for IoT applications Weak Password Protection Many IoT devices come with default or hard-coded passwords that are easily guessable, making them vulnerable to unauthorized access.[5]

Lack of Regular Updates

IoT devices often lack legitimate software updates and patches, bagging them to expose to vulnerabilities.

Insecure Interfaces

Poorly secured interfaces, such as web, API, or mobile interfaces, can be exploited by attackers to gain access to the device or network.

Insufficient Data Protection

Data transmitted and stored by IoT devices may not be adequately encrypted, leading to potential data breaches .

Malware Attacks

IoT devices can be infected with malware, which can then be used to launch attacks on other devices or networks.

Distributed Denial of Service (DDoS) Attacks

Compromised IoT devices can be used to create botnets that launch large-scale DDoS attacks, overwhelming targeted systems with traffic.

Physical Tampering

IoT devices are often deployed in locations where they can be accessed physically.

Man-in-the-Middle (MitM) Attacks

Attackers can intercept and alter communications between IoT devices and their controllers, leading to unauthorized actions or data breaches.

**Udaya Deepika et al.,****Spoofing**

Attackers can impersonate legitimate devices or users to gain unauthorized access to IoT systems.

Outdated Firmware

Devices with outdated firmware may have unpatched vulnerabilities that can be utilized by attackers. These threats highlight the significance of implementing robust security measures to protect IoT devices and networks from potential cyber-attacks.

Research Gaps

The integration of the Internet of Things (IoT) into various domains has revolutionized data collection and processing, yet it has also exposed significant vulnerabilities that warrant further investigation. Understanding the cybersecurity gaps associated with IoT is critical for enhancing the overall security posture of interconnected devices and systems. One prominent research gap lies in the dynamic nature of IoT environments, which makes traditional cybersecurity measures less effective. The rapid pace of technological advancements often outstrips existing security protocols, necessitating the development of innovative approaches to mitigate potential threats and identify them in real time. Additionally, the diverse range of devices in IoT ecosystems varies in security capabilities, creating inconsistencies that can be exploited by attackers [8] [10]. Another area requiring attention is the lack of standardized security frameworks specifically tailored to IoT. Current frameworks may not address the unique challenges posed by IoT devices, leaving organizations with a patchwork of solutions that may not work cohesively. Establishing comprehensive security standards can promote interoperability and resilience against cyber threats [2]. Moreover, many IoT devices are deployed with minimal oversight during their entire lifecycle, from initial installation to updates and decommissioning. Research is needed to establish best practices for the secure deployment, monitoring, and retirement of IoT devices, ensuring that security considerations are integrated throughout their lifecycle [1]. Lastly, the interaction between human behavior and IoT security presents another significant gap. Users frequently engage with IoT devices without adequate awareness of potential security risks, which can lead to unintentional exposure to vulnerabilities. Investigating how user behaviors impact IoT security will be essential for developing effective educational initiatives and user-centric security design [6]. Overall, addressing these gaps is fundamental for ensuring that cyber security measures can beat the speed of evolving landscape of IoT technologies. Collaborative efforts among researchers, industry professionals, and policymakers will be essential in closing these gaps and enhancing the robustness of IoT security [9].

IOT Characteristics And Their Associated Cybersecurity Challenges**The Fundamentals Of Cybersecurity For Iot**

IoT security is a complex and evolving field, but understanding these fundamentals can help in building a more secure IoT ecosystem. The Internet of Things (IoT) has revolutionized the way we interact with technology, connecting everyday objects to the internet and enabling them to communicate with each other. However, this interconnectedness also brings significant security challenges. IoT devices are diverse, ranging from smart home gadgets to industrial sensors, each with unique security requirements. The sheer number of these devices makes it challenging to manage and secure them all, especially given their limited processing power and memory, which often restricts the implementation of robust security measures. One of the primary principles of IoT security is ensuring confidentiality, integrity, and availability. Confidentiality involves making sure that data is accessible only to authorized users, while integrity ensures that the data remains unaltered and tamper-proof. Availability guarantees that IoT services are accessible when needed. These principles are crucial in maintaining the trust and reliability of IoT systems, as any breach can lead to significant consequences, including data theft, operational disruptions, and even physical harm[8]. IoT devices face numerous threats and vulnerabilities. Malware can target these devices, disrupting their operations or stealing sensitive data. Physical attacks are also a concern, as many IoT devices are deployed in public or unprotected areas, making them susceptible to tampering. Network attacks, such as man-in-the-middle (MITM) and denial-of-service (DoS) attacks, exploit the communication channels between IoT devices, potentially leading to data breaches or service disruptions. To mitigate these risks, several security measures can be implemented. Authentication and authorization ensure that only authorized users and devices can access the

Udaya Deepika et al.,

IoT network. Encryption protects data both in transit and at rest, making it difficult for unauthorized parties to access or alter the information. Regular updates and patching are essential to protect against known vulnerabilities, while network segmentation isolates IoT devices from other network components, limiting the impact of a security breach [10][12]. Best practices in IoT security include secure boot, which ensures that IoT devices boot using only trusted software, and robust device management practices to monitor and control IoT devices. User education is also vital, as it helps users understand the importance of IoT security and adopt safe practices. By following these best practices, organizations can significantly enhance the security of their IoT ecosystems [5]. Therefore, IoT security is a complex and evolving field that requires a comprehensive approach to address its unique challenges. Understanding the fundamentals of IoT security, including the key principles, common threats, and effective security measures, is essential for building a secure IoT ecosystem. As IoT continues to grow and evolve, staying informed and proactive about security will be crucial in protecting both the devices and the data they handle [6][14].

Introduction To IIOT

In order to facilitate digital transformation, the term "Industrial Internet of Things" (IIoT) describes technologies that link and integrate Industrial Control technologies (ICS) with corporate systems and the internet. Among the many advantages of IIoT-based deployments are increased data accessibility and scalability. But they also bring with them the risk of data theft, outages, and other malicious attacks. The adoption of IIoT, analytics, and cloud computing by businesses and organizations has been shown to have a generally good impact on ICS secure network topologies and traditional operational technology (OT). ISA/IEC 62443's Purdue Model, a crucial structural model for ICS security, is still relevant for IIoT-based applications. Several companies are at the forefront of IIoT cybersecurity, providing innovative solutions to protect industrial systems from cyber threats. For example, Barracuda offers scalable security solutions without the need for software or hardware installation, focusing on phishing and impersonation protection, ransom ware protection, and industrial IoT security. Fore scout Technologies Inc.[7] specializes in network access control (NAC) solutions and cybersecurity automation, offering a comprehensive asset inventory, continuous compliance, and network segmentation. [15] provides digital certificates and managed PKI services for enterprise network and IoT security, ensuring secure device-to-device communication [12][11]. The methodologies used by these companies often involve a multi-faceted approach to cybersecurity. This includes device security and authentication, improving network visibility, and implementing robust security policies. For instance, Deloitte offers IIoT security program design, development, implementation, and operation, as well as security testing and engineering. They also provide secure product procurement and supportive technology and tooling to assist in managing IIoT security and privacy programs. These methodologies aim to address the unique challenges posed by IIoT environments, ensuring that connected devices and systems are protected from potential cyber threats [7][6].

Industrial Internet of Things: Recent Advances, Enabling Technologies, And Open Challenges

The Industrial Internet of Things (IIoT) is transforming the industrial landscape by integrating technologies such as big data analytics, connected devices and artificial intelligence. This evolution not only enhances operational efficiencies but also poses several challenges that industries must address.

Recent Advances in IIoT

Recent advancements in IIoT technologies have notably improved productivity and operational efficiency in various sectors, particularly manufacturing. IoT devices equipped with sensors enable real-time monitoring and analysis of operations, allowing for data-driven decisions that can prevent downtimes and optimize performance. For example, predictive maintenance driven by machine learning algorithms can forecast potential equipment failures, thereby reducing unexpected downtimes by up to 50% in certain industrial applications. Additionally, integrated systems facilitate higher quality supply chain management by providing logistics insights and real-time tracking [15].

Several Key Enabling Technologies Underpin The Growth of IIOT Network Connectivity

The advent of 5G technology significantly enhances communication capabilities for IIoT devices, enabling low-latency and high-reliability connections that are essential for real-time data processing.

Udaya Deepika et al.,

Machine Learning

AI and machine learning play critical roles in analyzing vast datasets generated by IIoT devices, enabling predictive maintenance and optimizing machinery performance.

Blockchain Technology

The implementation of blockchain in IIoT enhances data security by providing tamper-proof records of transactions and improving supply chain transparency [4][8].

Open Challenges

Despite the significant advancements, several open challenges remain that could hinder the effective deployment of IIoT solutions

Cybersecurity Risks

The increase in connected devices heightens the risk of cyberattacks. Ensuring that IIoT systems are secure is paramount as vulnerabilities may expose sensitive operational data.

Interoperability

As diverse devices from various manufacturers are connected, maintaining seamless communication and functionality among them is a critical challenge.

Data Management

The sheer volume of data generated by IIoT requires robust data management strategies to ensure integrity, accuracy, and timely access for decision-making processes.

Skills Shortages

A lack of skilled professionals capable of managing IIoT systems poses a significant barrier to implementation. Organizations must invest in workforce development to bridge this gap [5]. Looking forward, the integration of IIoT with emerging technologies will continue to shape industrial processes. A focus on sustainability through energy-efficient IoT solutions and the adoption of smart manufacturing practices will likely drive further advancements. Organizations must also prioritize the ethical implications of IIoT deployment, as issues such as data privacy and job displacement are increasingly relevant in today's interconnected world [7].

Literature Review

“Industrial Internet of Things Market Size & Share Report 2030”:

This report estimates the global industrial IoT market size at USD 394.00 billion in 2023, projecting a growth rate of 23.2% CAGR from 2024 to 2030, fueled by advancements in technology and increased demand for automation. The global industrial internet of things (IIoT) market was estimated at \$394 billion in 2023 and is projected to grow at a CAGR of 23.2% from 2024 to 2030, reaching \$1.69 trillion by 2030. The growing adoption of affordable sensors and processors that can provide real-time access to information, along with advancements in technology, are the key drivers for the market growth. The significant advantages of IIoT, such as automated quality assurance monitoring, improved power efficiency, and increased productivity in the manufacturing industry, are further fueling the market growth [1]. “5G support for Industrial IoT Applications—Challenges” This paper discusses the integration of 5G technology into IIoT, highlighting the urgent need for reliable communication systems to meet industrial demands and addressing the major challenges and solutions for effective implementation. 5G is driven by diverse requirements like enhanced mobile broadband (eMBB), ultra-reliable and low-latency communications (URLLC), and massive machine-type communications (mMTC). Key 5G capabilities include software-defined networking (SDN), resource orchestration, network slicing and network function virtualization (NFV). 5G architecture consists of user plane function, user equipment, data network, radio access network, and various control plane functions like authentication, mobility, and session management [2]. “Key Issues on Integrating 5G into Industrial Systems” This study focuses on the current trends and developments in 5G technology, exploring its necessity and potential

Udaya Deepika et al.,

impacts in industrial applications, including use cases and challenges presented by the technology. 5G and Industrial IoT are experiencing rapid development and convergence. The integration of 5G into industrial systems is becoming increasingly necessary to meet the demands of modern industrial applications. Three main integration paths are identified: end-to-end 5G solution, 5G adapter module, and modification to the 5G protocol. Practical cases such as the 5G-RealTime-HART module, 5G terminal as a gateway, and cloud-based solutions are presented. Key technologies for replacing field buses with 5G include slicing techniques, control in the field, and improvement in control algorithms [3]. “Main Challenges and Emerging Technologies in Industrial IoT” This article reviews the various challenges facing IIoT integration, such as security and interoperability, while outlining critical emerging technologies like edge computing and machine learning that could mitigate these issues. “Challenges Associated with Implementing 5G in Manufacturing” The paper outlines the standards and technical requirements necessary for adopting 5G in manufacturing settings, emphasizing the need for a robust infrastructure to support its benefits [5]. “Utilization of 5G Technologies in IoT Applications” This publication explains common architectures and typical implementations of IoT technologies, addressing challenges that arise in integrating 5G into these systems [5]. “AI and Machine Learning in IIoT: Enhancing Insights” This article discusses how AI and ML are enhancing industrial operations through predictive maintenance and analytics, thus improving efficiency and operational decisions [6]. “Uncovering the Role of AI and Machine Learning in IIoT” This article explores how AI and ML are utilized to optimize industrial operations, focusing on predictive maintenance and real-time data analysis .

“How AI and ML Are Transforming the Industrial Internet of Things” Discusses the transformative impact of AI and ML technologies on IIoT, enhancing operational efficiency and driving new business models . “The role of data management in the Industrial Internet of Things” This research emphasizes the crucial role of effective data management in harnessing the large amounts of data generated by IIoT environments to enhance decision-making and operational efficiency [9]. “Internet of Things data management: A systematic literature review” A comprehensive review that highlights data management systems for IoT, addressing the challenges of handling vast data flows in industrial contexts[6]. “Role of IoT technologies in big data management systems” This article discusses how IoT technologies contribute to big data management, enabling efficient resource monitoring and management in industrial applications . “Challenges and Research Issues of Data Management in IoT” This paper reviews data management challenges in large-scale IoT applications, focusing on solutions for effective data utilization . “5 Ways Industrial IoT Reduces Costs For Manufacturers” The article outlines specific ways that IIoT solutions can drive down costs in manufacturing, including predictive maintenance and improved asset management . “Industrial IoT is a Necessity, Not a ‘Nice-to-Have’” This commentary stresses the importance of implementing IIoT strategies in modern manufacturing to boost efficiency and adaptability . “Why Most Industrial IoT Implementations Fail” This analysis provides insights into common reasons for failure in IIoT projects, emphasizing the need for clear strategies and integration capabilities. “Energy-Efficient Industrial Internet of Things” This survey discusses energy efficiency in IIoT systems, highlighting important strategies for developing sustainable solutions in industrial settings . “Green AI for IIoT: Energy Efficient Intelligent Edge” This research presents algorithms aimed at optimizing energy efficiency for AI tasks within IIoT architecture, contributing to reduced energy consumption in industrial applications . “The Impact of Big Data Analytics in Industrial IoT” This article explores how big data analytics can enhance predictive maintenance and operational efficiency in IIoT by leveraging real-time data . “Industrial Internet of Things Enabled Technologies” This review details various IIoT technologies and applications while discussing challenges and future directions in the realm of industrial growth.

Other companies working on IIoT Cybersecurity

Rapid7's security analytics and automation cloud helps customers monitor, investigate, and resolve vulnerabilities and threats. Their IoT penetration testing covers the entire ecosystem of IoT technology. SimpliSafe offers a home security system that is doubly secured (Wi-Fi and cellular), smash proof, and power outage-protected. It sends confirmed alerts via deep encryption and is backed by six staffed monitoring centers. Cradle point (part of Ericsson): Cradle point's Net Cloud Manager helps companies improve productivity and reduce costs through functions like zero-touch deployment for device management, real-time device monitoring, and proactive alerts .Siemens is a leading company in the IIoT space, providing solutions for industrial automation and digitalization. PTC offers IIoT

Udaya Deepika et al.,

and augmented reality solutions that help companies improve operational efficiency and product quality. ABB provides industrial automation and robotics solutions, including cybersecurity measures for IIoT systems. Intel offers a range of IoT solutions, including hardware and software for secure and efficient data processing. Schneider Electric provides energy management and automation solutions, including cybersecurity for IIoT systems. Honeywell offers industrial cybersecurity solutions, including threat detection and response for IIoT environments. Huawei provides IoT solutions, including connectivity and cybersecurity measures. These companies are at the forefront of IIoT cybersecurity, providing innovative solutions to protect industrial systems from cyber threats. The paper firstly studies on Hetrogenous network. Three companies working on heterogeneous networks (HetNets) and the issues they are addressing Nokia Networks Nokia is a key player in the HetNet market, focusing on enhancing network coverage and capacity. They are working on integrating macrocells, small cells, and Wi-Fi to provide seamless connectivity in diverse environments. Nokia's solutions aim to address the challenges of network densification and improving indoor coverage, especially in densely populated areas and large venues. Samsung Electronics Co., Ltd. Samsung is actively involved in developing HetNet solutions to support the growing demand for high-speed data and reliable connectivity. They are working on optimizing network performance by combining different network technologies, such as macrocells, small cells, and Wi-Fi. Samsung's HetNet solutions aim to improve network efficiency and provide better user experiences in both urban and rural areas. Huawei Technologies Huawei is a leading company in the HetNet market, focusing on enhancing network capacity and coverage through the integration of various network technologies. They are addressing the challenges of network congestion and ensuring seamless connectivity in high-traffic areas. Huawei's HetNet solutions aim to provide reliable and high-quality communication services, especially in areas with high data consumption. These companies are at the frontline of developing innovative HetNet solutions to direct the key challenges of network coverage, efficiency in diverse environments and capacity The classification of security attacks in the circumstances of Industrial IoT. The classification is based on the layers of the IIoT architecture, which include the perception layer, network layer, and application layer. Each layer has its own set of vulnerabilities and potential attack vectors.

Perception Layer Attacks

This layer involves the physical devices and sensors that collect data from the environment. Common attacks at this layer include; Physical Attacks (Tampering with or physically damaging the devices.), Node Capture Attacks (Gaining control over a node to extract sensitive information.) Side-Channel Attacks (Exploiting physical leakages to gain information about the system.) [2]

Network Layer Attacks

Network layer is responsible for transmitting the data between devices and systems. Common attacks at this layer include; Distributed Denial of Service (DDoS) Attacks and Denial of Service (DoS) (surcharge the network with traffic to disorder the communication.), Routing Attacks: Manipulating routing information to misdirect data packets and Man-in-the-Middle Attacks (Intercepting and altering communication between devices.)

Application Layer Attacks

This layer involves the software applications that process and analyze the collected data. Common attacks at this layer include; Malware Attacks: (Introducing malicious software to disrupt operations or steal data.), Data Injection Attacks (Injecting false data into the system to manipulate outcomes.), Privacy Attacks (Gaining unauthorized access to sensitive information.) [9] The work on the Network Layer, since, the network layer in the context of Industrial IoT (IIoT) cybersecurity is crucial for ensuring secure communication between devices and systems. This layer is responsible for routing data packets across the network, managing data traffic, and maintaining the integrity and confidentiality of the transmitted information. In the paper "Internet of Things for System Integrity: A Comprehensive Survey on Security, Attacks and Countermeasures for Industrial Applications," the authors highlight several key aspects and challenges associated with the network layer. One of the primary concerns at the network layer is the susceptibility to various types of attacks, such as man-in-the-middle attacks, Distributed Denial of Service (DDoS) attacks, and routing attacks. These attacks can disrupt the normal functioning of IIoT systems, resulting the data unauthorized access, and system downtime. To mitigate these threats, the paper loss, discusses several

Udaya Deepika et al.,

countermeasures, including the implementation of robust encryption protocols, secure routing algorithms, and intrusion detection systems. Additionally, the use of software-defined networking (SDN) and blockchain technology is proposed to enhance the security and resilience of the network layer in IIoT environments. [20]

The study reveals the importance of collecting and analyzing heterogeneous data sources from IoT and IIoT for training and validating cybersecurity applications based on machine learning.

Apart from that it introduces a new workroom for an IIoT network, which was used to create the TON_IoT datasets. These datasets include telemetry data, operating systems data, and network data, collected using multiple virtual machines with Windows, Linux, and Kali Linux operating systems. The initial statistical evaluation of the datasets demonstrates their potential for evaluating cybersecurity applications such as intrusion detection, threat intelligence, adversarial machine learning, and privacy-preserving models. The research aims to address the role of standardization in transformative data collection and proposes standard methods and IoT and IIoT testbeds for collecting and analyzing heterogeneous IoT datasets. In order to replicate authentic IIoT networks, the new testbeds comprise a variety of industrial IoT sensors, vulnerable and exploited platforms, and services linked to public IoT hubs. The datasets offer a range of new attack surfaces and vectors, along with authentic events, which can enhance data assets for cybersecurity and IoT applications worldwide and validate various cybersecurity applications based on statistical models and machine/deep learning models.

Machine Learning for Cybersecurity

Definition and Importance

Machine learning (ML) is a technique used to teach computers to learn from inputs without explicit programming. It is crucial for cybersecurity as it helps in reasoning, finding meaning, generalization, and learning from past experiences.

Machine Learning Techniques

Supervised Learning

Involves training the model with labeled data to make predictions.

Unsupervised Learning

Involves finding hidden patterns in data without labeled outcomes.

Dimensionality Reduction

Removes less important information to make datasets manageable.

Transfer Learning

Adapts a previously trained model to a new but similar task.

Reinforcement Learning

Uses trial and error to learn from interactions with the environment.

Natural Language Processing (NLP)

Deals with the interaction between computers and humans using natural language.

Machine Learning (ML) has become a game-changer in the field of cybersecurity, offering advanced techniques to detect, prevent, and respond to cyber threats. It is used in detecting harmful activities quickly and preventing attacks. Assessing threats against mobile endpoints. Recognizing risks, evaluating networks, and minimizing warnings. Automating repetitive security processes to free up IT resources. Closing zero-day vulnerabilities by monitoring dark web traffic for exploit data.

Udaya Deepika et al.,

Threat Detection and Prevention

ML algorithms can inspect huge amount of data to identify anomalies and patterns that leads to a cyber threat. By continuously learning from new data, these algorithms can detect threats in their early stages, such as unusual network traffic or unexpected user behavior

Anomaly Detection

One of the key applications of ML in cybersecurity is anomaly detection. ML models can be trained to recognize normal behavior within a system and flag any deviations as potential security incidents. This helps in identifying zero-day attacks and other sophisticated threats that traditional security measures might miss.

Automated Response

ML can automate the response to detected threats, reducing the time it takes to mitigate potential risks. For example, ML-driven systems can automatically isolate affected devices, block malicious IP addresses, or apply patches to vulnerable systems without human intervention.

Predictive Analytics

ML enables predictive analytics in cybersecurity based on the historical data it forecasts potential threats . This method permits organizations to strengthen their defenses before an attack occurs, rather than reacting after the fact.

Enhanced Endpoint Security

ML enhances endpoint security by continuously monitoring devices for signs of compromise. It can detect malware, ransomware, and other malicious activities in real-time, providing an additional layer of protection for endpoints.

Spam and Phishing Detection

ML algorithms are highly effective in detecting spam and phishing attempts. By analyzing email content, sender information, and other metadata, ML models can accurately identify and filter out malicious emails, protecting users from phishing attacks. Eventually, all the research main point towards advantages of ML for Cybersecurity, but still many disadvantages are existing; Advantages of Machine Learning in Cybersecurity are it can Swiftly identifies trends and patterns from large data volumes. It Automates processes, reducing the need for human intervention. It seems to Continuously improves accuracy and efficiency through learning. It Handles multi-dimensional and multi-variety data effectively and it is applicable across various domains, including healthcare and cybersecurity.

Disadvantages if you see on the other hand, it requires large, high-quality datasets for training. It Needs significant computing power and time for algorithms to learn. Data interpretation can be challenging. Prone to errors if trained on biased datasets. Most of the time research says human experts are needed.

Dataset

The study uses multiple datasets for its work. Since, using different datasets can provide a more comprehensive analysis and improve the robustness of the research findings. Different datasets can provide varied perspectives and insights, helping to capture a broader range of scenarios and conditions. Using multiple datasets allows for cross-verification of results, ensuring that the findings are consistent and reliable across different data sources. IIoT cybersecurity uses the following datasets

TON_IoT Dataset For evaluating the fidelity and efficiency of various cybersecurity applications based on AI.

CIC IoT Dataset 2023 For analyzing a variety of attacks, including , DoS, DDoS, Web-based, Recon, Spoofing, Brute Force, and Mirai.

EDGE-IIOTSET Dataset For evaluating machine learning-based intrusion detection systems in both federated and centralized learning modes.

Udaya Deepika et al.,

AllFlowMeter Dataset For malicious traffic analysis and intrusion detection using machine learning techniques.

TON_IoT Dataset

Purpose

The TON_IoT dataset is designed for evaluating the fidelity and efficiency of various cybersecurity applications based on Artificial Intelligence (AI), such as Machine Learning (ML) and Deep Learning (DL) algorithms [15][13].

Data Sources

It includes heterogeneous data sources collected from telemetry datasets of IoT and IIoT sensors, operating systems datasets of Windows 7 and 10, as well as Ubuntu 14 and 18 TLS, and network traffic datasets [16][17].

Testbed

The dataset was gathered from a large-scale network designed at the Cyber Range and IoT Labs, UNSW Canberra [18][12].

Attacks

Various attacking techniques, such as Denial of Service (DoS), Distributed Denial of Service (DDoS), and ransomware, were launched against web applications, IoT gateways, and computer systems across the IIoT network [19].

Applications

The dataset is used for validating and testing various cybersecurity applications, including intrusion detection systems, threat intelligence, malware detection, fraud detection, privacy-preservation, digital forensics, adversarial machine learning, and threat hunting [10].

All Flow meter Dataset

Purpose

The AllFlowmeter dataset is designed for malicious traffic analysis and intrusion detection using machine learning techniques [14].

Data Sources

It includes network traffic data collected from various sources to identify characteristic patterns of malicious network traffic [14].

Testbed

The dataset was collected as part of the HIKARI-2021 project, which focuses on innovation and transfer competence in malicious traffic analysis [15].

Attacks

The dataset includes data related to several types of malicious traffic, such as DDoS and DoS attacks.

Applications

The dataset is used for evaluating the performance of intrusion detection systems and other cybersecurity applications based on machine learning [15][16].

While both datasets are used for cybersecurity applications, the TON_IoT dataset focuses on a broader range of data sources and attack types, including telemetry data and operating systems data, whereas the AllFlowmeter dataset primarily focuses on network traffic data for malicious traffic analysis and intrusion detection [11].

Current Projects That Focus on IIOT And Cybersecurity

Real-Life Industrial IoT Cyberattack Scenarios

**Udaya Deepika et al.,**

This project explores various real-life scenarios where industrial IoT systems have been targeted by cyberattacks. It highlights the vulnerabilities in industrial control systems (ICS) and operational technology (OT) networks, and provides insights into the potential consequences of such attacks[17].

A Novel Method to Detect Cyber-Attacks in IoT/IIoT Devices

This project proposes a deep learning-based architecture to identify cyber-attacks on IIoT/IoT devices using the Modbus protocol. The project demonstrates the effectiveness of using neural networks to model and detect attacks[18].

IoTGeM

Generalisable Models for Behaviour-Based IoT Attack Detection

This project focuses on developing generalisable intrusion detection models based on machine learning for IoT environments. It proposes a sliding and expanding window-oriented feature set to detect attacks earlier and with higher performance. The project also compares its method with alternative approaches to demonstrate its effectiveness [19].

These projects aim to enhance the security of IIoT systems by addressing various challenges and developing innovative solutions to detect and mitigate cyber threats.

Real-Life Industrial IOT Cyber Attack Scenarios**WannaCry Malware Attack**

The world's largest pure-play semiconductor company had to shut down some of its fabs after a WannaCry malware variant spread through the production network.

SCADA System Sabotage

An engineer, after being fired, still had access to a water and sewage company's SCADA system and opened the valves, causing the system to dump sewage everywhere.

Steel Mill Attack

Hackers took control of production management software and the industrial control system at a steel mill, causing massive physical damage.

Food and Beverage Product Tampering

Unknown attackers altered process controller code in a food and beverage product's recipe, increasing the quantity of salt to three times the normal amount. The change went undetected until customers complained.

Wind Farm Hack

Hackers took control of an entire network of wind turbines at a U.S. wind farm using a Raspberry Pi-based card with a cellular module for remote access to programmable automation controllers.

Manufacturing Robot Sabotage Competitors of an electronics company rewrote the code on the robots used in its manufacturing process, introducing subtle defects that reduced yields and caused product recalls. Distributed Denial of Service (DDoS) attacks are a important threat to Industrial IoT (IIoT) systems[13]. Attackers have compromised building access control systems to move into corporate networks using DDoS attacks. By overwhelming the system with an onslaught of traffic, they were able to crash the system and gain unauthorized access. The TRITON attack on a Middle East chemical facility was intended to cause a serious safety incident. The attackers used DDoS techniques to disrupt the facility's operations and potentially cause environmental contamination. In 2017, the NotPetya ransomware attack paralyzed the Maersk shipping line, nearly halting close to a fifth of the world's shipping capacity. The attack spread through the network using DDoS techniques, causing significant operational disruption.

Udaya Deepika et al.,

Effectiveness Of Algorithms

The paper examines the effectiveness of four distinct machine learning algorithms— Linear Regression, Naïve Bayes , Decision Tree and Random Forest —for IoT cybersecurity. The study focuses on malware and intrusion detection using the AllFlowmeter IoT-21 dataset. Linear Regression: Linear regression, a fundamental statistical method, is employed to model the relationship between dependent and independent variables, providing awareness into network traffic patterns and aiding in anomaly detection. In the field of Industrial Internet of Things (IIoT) cybersecurity, the combining of datasets like AllFlowmeter with advanced analytical techniques such as linear regression is crucial. This approach enables the development of robust intrusion detection systems, enhancing the security of IIoT environments by effectively identifying and mitigating cyber threats. The synergy between diverse datasets and sophisticated analytical methods underscores the importance of comprehensive research in advancing IIoT cybersecurity. Naive Bayes is a probabilistic machine learning algorithm based on Bayes' theorem, which assumes independence among features. It is particularly effective for classification tasks due to its simplicity and efficiency. In the context of IIoT cybersecurity, Naive Bayes can be implemented using the AllFlowmeter dataset to detect and classify malicious network traffic. By analyzing the network traffic data, the algorithm calculates the probability of each feature contributing to a specific class (e.g., normal or attack). This probabilistic approach allows for the identification of patterns and anomalies in the data, enabling the detection of potential cyber threats. The AllFlowmeter dataset provides a comprehensive set of network traffic data, making it an ideal resource for training and evaluating the Naive Bayes model. The implementation of Naive Bayes in IIoT cybersecurity helps enhance the detection and mitigation of cyber threats, ensuring the security and integrity of industrial systems [12] Decision Trees are a important machine learning algorithm used for classification and regression tasks. They work by recursively splitting the data into subsets based on the most significant feature at each node, creating a tree-like structure. Each internal node represents a decision based on a feature, and each leaf node represents a class label or a continuous value. Decision Trees are easy to interpret and visualize, making them a valuable tool for understanding complex datasets [13].

In the context of IIoT cybersecurity, Decision Trees can be implemented using the AllFlowmeter dataset to detect and classify malicious network traffic. By analyzing the network traffic data, the algorithm identifies patterns and anomalies that indicate potential cyber threats. The AllFlowmeter dataset provides a comprehensive set of network traffic data, making it an ideal resource for training and evaluating the Decision Tree model. The implementation of Decision Trees in IIoT cybersecurity helps enhance the detection and mitigation of cyber threats, ensuring the security and integrity of industrial systems. In the context of IIoT cybersecurity, Random Forest can be implemented using the AllFlowmeter dataset to detect and classify malicious network traffic. For example, consider a scenario where the dataset includes features such as packet size, flow duration, and source IP address. The Random Forest algorithm would create multiple decision trees, each trained on a random subset of the data. During prediction, each tree would provide its classification, and the final output would be analyzed by the majority vote of all trees [14]. This ensemble method enhances the detection and mitigation of cyber threats in IIoT environments by leveraging the diverse patterns and anomalies present in the AllFlowmeter dataset, ensuring the security and integrity of industrial systems. The Linear Regression, Naïve Bayes , Decision Tree and Random Forest algorithms achieved peak accuracies of 84%, 63%, 98% and 99% respectively in intrusion detection. The AllFlowmeter IoT-21 dataset was used to train and test the algorithms, providing a realistic representation of IoT cybersecurity challenges. The study concludes that all four algorithms are capable of being effectively utilized for the current landscape of IoT cybersecurity. The paper focus on the need for continuous development in cybersecurity methods to be developed with the evolving threats in the IoT landscape.

Udaya Deepika et al.,

CONCLUSION

In summary, ML-based cybersecurity leverages the power of data and advanced algorithms to provide more effective and efficient protection against cyber threats. As cyberattacks became more advanced, the role of ML in cybersecurity will continue to grow, offering new ways to safeguard our digital world.

Table 1. Category of Attacks

Category of Attack	Attack type	IoT vulnerabilities	Tools
DoS/DDoS attacks	TCP SYN flood DDoS attack	Prevent genuine requests from accessing the loser IoT edge server.	The Python script based on the hping3 tool to send modified SYN packets
	UDP flood DDoS attack	Surpass the IoT devices' processing and response capabilities.	Sending the converted UDP packets using the tool hping3-based python script
	HTTP flood DDoS attack	uses fake HTTP GET or POST queries to target Internet of Things applications.	Use the slowhttptest program to send GET requests over 200000 connections.
	ICMP flood DDoS attack	By overloading them with request packets, the IoT edge server becomes unavailable to regular traffic.	Sending the converted ICMP packets using tool hping3-based python script

Table 2. Selected observation for training and testing.

DoS HTTP attack	10561	8296	2399
DoS_ICMP attack	14190	11477	2679
DoS TCP attack	10247	8198	2049

ABSTRACT

To compare the quality of life among type II diabetic patients treated with oral antidiabetic drugs alone versus oral antidiabetic drugs along with insulin. This was a prospective study which includes 160 study participants. Study population was categorised into two groups which includes 80 study participants in Group-A (oral antidiabetic drugs alone) and 80 study participants in Group-B (oral antidiabetic drugs along with insulin). Patients of both the genders of age above 18 years, who were diagnosed with type II diabetes mellitus and patients along with other co-morbidities were included in this study. Patients with type I diabetes mellitus, on irregular use of insulin, paediatrics, pregnant and lactating women were excluded. In this study, World Health Organisation Quality-of-Life (WHOQoL-BREF) questionnaire was used to assess the QoL. Among the 160 study participants, 75(46.9%) were observed to be males and 85 (53.1%) were observed to be females. Most of the study participants with diabetes were observed with

**Parvathi et al.,**

retinopathy (30.6%) in the aspect of micro-vascular complication and with hypertension (48.1%) in the aspect of macro-vascular complication in this study. In Group-A, most of the study participants were observed with moderate quality-of-life (55%) followed by good quality-of-life (23.8%) whereas in Group-B, most of the study participants were observed with moderate quality-of-life (51.3%) followed by poor quality-of-life (25%). The quality of life of the Group-A study participants who were prescribed with oral antidiabetic drugs alone was observed to be with a mean score of 35.55 (± 12.90). The quality of life of the Group-B study participants who were prescribed with oral antidiabetic drugs along with insulin was observed to be with a mean score of 30.95 (± 12.61). It was observed that the quality of life of the study participants who were receiving oral antidiabetic drugs alone was little better when compared to the study participants who were receiving oral antidiabetic drugs along with insulin. Clinical pharmacists should take responsibility along with the other healthcare professionals in the aspect of the diabetes management among the patients, in order to provide a better pharmaceutical care and to improve the health-related quality of life.

Keywords: Diabetes Mellitus, Hypertension, Insulin, Oral Antidiabetic Drugs, Quality of Life.

INTRODUCTION

One of the major worldwide health concerns of the twenty-first century is the diabetes, which can be a threatening chronic illness. India currently holds the second position globally in terms of the population affected by diabetes, with 77 million cases observed in the year 2019 and 101 million cases can be estimated by the year 2030 [1]. Type II diabetes mellitus is one of the four major non-communicable diseases (NCDs) that was causing a significant burden globally, which is increasing at a rapid rate [2]. An estimated 537 million adults worldwide have diabetes, with a global prevalence of 10.5% among the adults between the age group of 20-79 years [3,4]. Approximately 98% of diabetes cases in the world are diagnosed with type 2 diabetes, though this percentage differs greatly between the nations [5]. The treatment and management for type II diabetes includes pharmacological agents, exercise and lifestyle modifications [6]. The illness progresses slowly over time and can cause a variety of micro and macro-vascular problems [7]. Acute complications, such as hypo or hyperglycaemic episodes are also common in patients and frequently require hospital stays. The most common co-morbidities in patients with diabetes are obesity, hypertension and hyperlipidemia. Psychological issues also can impact on patients' daily functioning, psychosocial relationships, physical & mental health and overall quality of life [8]. In order to manage the diabetes mellitus effectively, it is crucial to understand how it affects the quality of life.

According to World Health Organization (WHO), quality of life (QoL) is referred as a person's perception of their place in life in relation to their goals, expectations, standards & concerns, as well as the culture and value systems in which they live [9]. A high quality of life is thought to be a crucial health outcome and for chronic conditions, it is the ultimate therapeutic objective [10]. The quality of life can be affected in diabetes patients with other complications or co-morbidities [11]. There are four main aspects that diabetes can be detrimental to physical health. It includes the emergence of chronic issues, correlation with transient complications, requirement of different treatment plans and impact on psychological functioning [12]. In this study, we made an attempt to compare the quality of life among type II diabetic patients treated with oral antidiabetic drugs alone versus oral antidiabetic drugs along with insulin.

MATERIALS AND METHODS

This was a prospective study conducted for a period of 6 months which includes 160 study participants at KIFY Hospital, Rajahmundry. Data was collected after getting the ethical committee approval and also permission from the above-mentioned hospital there by strictly considering the inclusion and exclusion criteria of the study. The above-

99050

Parvathi et al.,

mentioned study population was categorised into two groups which includes 80 study participants in Group-A and 80 study participants in Group-B based on the treatment given. Group-A subjects were prescribed with oral antidiabetic drugs alone where as Group-B subjects were prescribed with oral antidiabetic drugs along with insulin. Among these two groups the quality of life among the patients with type II diabetes mellitus was assessed and compared by using World Health Organisation Quality-of-Life (WHOQoL-BREF) questionnaire. The patients visited to the hospital were enrolled in the study, by considering the study criteria after taking their consent to participate in the study. Patients of both the genders of age above 18 years, who were diagnosed with type II diabetes mellitus and patients along with other co-morbidities, were included in this study. Patients with type I diabetes mellitus, on irregular use of insulin, paediatrics, pregnant and lactating women were excluded.

Questionnaire used in this study

In this study, World Health Organisation Quality-of-Life (WHOQoL-BREF) questionnaire was used to assess the QoL. A total transformed score ranges from 0-20 indicates poor quality of life, 21-40 indicates moderate quality of life, 41-60 indicates good quality of life and 61-80 indicates very good quality of life.

Statistical analysis The data was evaluated by using the Graphpad Prism-10 statistical software. Mean and standard deviations were calculated and the t- test was performed to obtain the p-values at 95% confidence interval ($p \leq 0.05$). The statistically significant values were represented with asterisk (*).

RESULTS AND DISCUSSION

Table 1 represents the categorization of the study participants based on the gender. A total of 160 study participants were involved in this study. Among them 75 (46.9%) were observed to be males and 85 (53.1%) were observed to be females. Table 2 represents the categorization of the study participants based on the age. Most of the study participants were found to be in the age group of 51-60 years (31.9%) and 61-70 years (31.9%) followed by 41-50 years (22.5%). Table 3 represents the categorisation of the study participants based on the duration of type-II diabetes mellitus. Most of the study participants were found to be with type-II diabetes mellitus for the duration of 1-5 years (27.5%) followed by 6-10 years (24.4%). In this study, about 61 (38.1%) were alcoholics and 99 (61.9%) were non-alcoholics. In the aspect of habit of smoking, 76 (47.5%) were found to be smokers whereas the remaining 84 (52.5%) were found to be non-smokers. According to the literacy status, 87 (54.4%) were found to be literates and the remaining 73 (45.6%) were observed to be illiterates.

Table 4 represents the categorisation of study participants based on the micro-vascular complications of diabetes where most of them were observed with of retinopathy (30.6%). Table 5 represents the categorisation of the study participants based on the macro-vascular complications of diabetes where most of the study participants were observed with hypertension (48.1%). Table 6 represents the categorization of study participants based on the score of quality-of-life. In Group-A, most of the study participants were observed with moderate quality-of-life (55%) followed by good quality-of-life (23.8%) whereas in Group-B, most of the study participants were observed with moderate quality-of-life (51.3%) followed by poor quality-of-life (25%). The *p-value* was observed to be 0.04* which was statistically significant.

Table 7 represents the mean and standard deviation values in the aspect of quality of life of the study participants among the two groups. The quality of life of the Group-A study participants who were prescribed with oral antidiabetic drugs alone was observed to be with a mean score of 35.55 (± 12.90). The quality of life of the Group-B study participants who were prescribed with oral antidiabetic drugs along with insulin was observed to be with a mean score of 30.95 (± 12.61). Both the study groups were observed to be with moderate quality of life as per the WHOQoL questionnaire and it was observed that the Group-A study participants were found to be with a better quality of life when compared to Group-B study participants.

CONCLUSION

In this study, majority of the study participants in both the groups were observed with moderate quality of life. The mean score of WHOQoL was observed to be 35.55 (± 12.90) and 30.95 (± 12.61) for the Group-A (oral antidiabetic drugs alone) and Group-B (oral antidiabetic drugs along with insulin) respectively. The above observation states that the quality of life of the study participants who were receiving oral antidiabetic drugs alone was little better when compared to the study participants who were receiving oral antidiabetic drugs along with insulin. Clinical pharmacists should take responsibility along with the other healthcare professionals in the aspect of the diabetes management among the patients, in order to provide a better pharmaceutical care and to improve the health-related quality of life.

ABSTRACT

In this research paper, we propose a new probability model, the Length-Biased Kpenadidum Distribution (LBKD), and explore its statistical properties. The parameter have been estimated using the maximum likelihood approach, and their asymptotic results have been discussed. The distributions like Shanker, Lindley, and Kpenadidum were employed to compare the new distribution. A strong fit was found when the distribution was fitted to cancer data.

Keywords: Kpenadidum distribution, Weighted distribution, Reliability analysis, Ordered statistics, Maximum likelihood estimation, and Breast cancer.

INTRODUCTION

Fisher (1934) introduced the idea of a weighted distribution, which Rao (1965) subsequently and consistently modified while modeling the statistical data when the standard distributions were not appropriate to record the observations with equal probabilities. Weighted distributions can address many issues in various research areas, specifically in biological research. And also, it is essential for modeling and interpreting lifetime data in many applied fields, including engineering, medicine, behavioural science, finance, insurance, and others. The distribution that results when the weight function considers the length of the units of interest is length-biased. Thus, length-biased distribution is a special case of the more general form of weighted distribution. Cox (1969) and Zelen (1974) introduced the concept of length-biased sampling concept. More generally, when the sampling mechanism selects units with probability proportional to some measure of the unit size, the resulting distribution is called size-biased. A

Poovitha and Pandiyan

comprehensive review of weighted distributions can be found in several reliable sources. Many different weighted probability models have been evaluated and examined, and their applicability in various disciplines is illustrated by numerous authors. Dey et al (2015) discussed weighted exponential distribution with its properties and different methods of estimation. Kilany (2016) obtained the weighted version of the Lomax distribution. Khan et al. (2018) discussed the weighted modified Weibull distribution. Rajagopalan et al., (2019) obtained a new length-biased Aradhana distribution with engineering and medical science applications showing more flexibility than classical distributions. Rather and Subramanian (2018) discussed the characterization and estimation of length-biased weighted generalized uniform distribution. Rather and Subramanian (2019) also discussed length-biased Sushila distribution with properties and Applications. Shenbagaraja et al (2019) have discussed length-biased Garima distribution with real-life data. Anthony & Elangovan, (2020) studied a new generalization of quasi-Aradhana distribution using the length-biased technique and also the length-biased Om distribution. In this paper, we developed the length-biased Kpenadidum distribution which was derived from the transformation of the Kpenadidum distribution (Nwikpe & Cleopas, 2022) a newly proposed parametric lifetime model for various engineering and medical science applications. The distribution is a three-component mixture of gamma distribution with shape parameter 3 and scale parameter, gamma distribution with shape parameter 4 and scale parameter, and exponential distribution with parameter. The proposed distribution in this paper is a length-biased Kpenadidum distribution that has been applied to find the suitability of the survival dataset. Compared to the Lindley and Shanker distributions, the suggested distribution was more significant and useful for lifetime data.

The probability density function (pdf) of the Kpenadidum distribution is given by

$$f_K(x; \theta) = \frac{\theta^4}{2(\theta^4 + \theta + 6)} (2x^3 + x^2 + 2\theta)e^{-\theta x}; x > 0, \theta > 0 \quad (1)$$

The corresponding cumulative density function (cdf) is given by

$$F_K(x; \theta) = 1 - \left(1 + \frac{2\theta^3 x^3 + (\theta^2 x^2 + 2\theta x)(\theta + 6)}{2(\theta^4 + \theta + 6)} \right) e^{-\theta x}; x > 0, \theta > 0$$

and its mean is given by

$$\mu_1 = \frac{\theta^4 + 3\theta + 24}{\theta^5 + \theta^2 + 6\theta} \quad (2)$$

Length-Biased KPENADIDUM Distribution

A non-negative random variable X is said to have a weighted distribution if the pdf of the weighted random variable xw is given by

$$f_w(x) = \frac{w(x).f(x)}{E(w(x))}; x > 0$$

When $w(x)$ be a non-negative weight function and $E(w(x)) = \int w(x)f(x)dx < \infty$

For different weighted models, we have different choices of the weight function $w(x)$. When $w(x) = xc$, The resulting distribution is termed as weighted distribution. In this research paper, we have to find the length-biased version of Kpenadidum distribution, so we take $c = 1$ in weights xc , to get the length-biased distribution and its pdf is given by

$$f_l(x) = \frac{x.f(x)}{E(x)}; x > 0 \quad (3)$$

By applying the value of (1) and (2) in equation (3), we get the pdf of length-biased Kpenadidum distribution.

$$f_l(x; \theta) = \frac{x \theta^5}{2(\theta^4 + 3\theta + 24)} (2x^3 + x^2 + 2\theta)e^{-\theta x}; x > 0 \quad (4)$$

and the corresponding cdf of the length-biased Kpenadidum distribution can be obtained as

Poovitha and Pandiyan

$$F_l(x; \theta) = \int_0^x f_l(x; \theta) dx$$

$$F_l(x; \theta) = \int_0^x \frac{x \theta^5}{2(\theta^4 + 3\theta + 24)} (2x^3 + x^2 + 2\theta) e^{-\theta x} dx$$

After simplification, we get the required cdf of LBKD as

$$F_l(x; \theta) = \frac{2 \gamma(5, \theta x) + \theta \gamma(4, \theta x) + \theta^4 \gamma(2, \theta x)}{2(\theta^4 + 3\theta + 24)} \tag{5}$$

Where θ is the positive parameter.

Reliability Analysis

In this section, we present the reliability function, hazard rate, and reverse hazard rate function for the length-biased Kpenadidum distribution.

Survival Function

The probability that a system survives beyond a specific time is known as the reliability function or survival function and is given by

$$S(x) = 1 - F_l(x; \theta)$$

$$S(x) = 1 - \frac{2 \gamma(5, \theta x) + \theta \gamma(4, \theta x) + \theta^4 \gamma(2, \theta x)}{2(\theta^4 + 3\theta + 24)} \tag{6}$$

Hazard Function

The hazard function is also called hazard rate, instantaneous failure rate, or force of mortality and is given by

$$h(x) = \frac{f_l(x; \theta)}{s(x)}$$

$$h(x) = \frac{x \theta^5 (2x^3 + x^2 + 2\theta) e^{-\theta x}}{2(\theta^4 + 3\theta + 24) - 2 \gamma(5, \theta x) + \theta \gamma(4, \theta x) + \theta^4 \gamma(2, \theta x)}$$

Reverse Hazard Function and Mills Ratio

The reverse hazard function of length-biased Kpenadidum distribution is

$$h_r(x) = \frac{f_l(x; \theta)}{F_l(x; \theta)}$$

$$h_r(x) = \frac{x \theta^5 (2x^3 + x^2 + 2\theta) e^{-\theta x}}{2 \gamma(5, \theta x) + \theta \gamma(4, \theta x) + \theta^4 \gamma(2, \theta x)}$$

and the Mills ratio of the length-biased Kpenadidum distribution is

$$\text{Mills Ratio} = \frac{1}{h_r(x)}$$

$$\text{Mills Ratio} = \frac{2 \gamma(5, \theta x) + \theta \gamma(4, \theta x) + \theta^4 \gamma(2, \theta x)}{x \theta^5 (2x^3 + x^2 + 2\theta) e^{-\theta x}}$$

Statistical Properties

Moments

Let X denote the random variable of length-biased Kpenadidum distribution with parameter θ , then the r^{th} order moment $E(x^r)$ of length-biased Kpenadidum distribution can be obtained as

Poovitha and Pandiyan

$$E(x^r) = \mu'_r = \int_0^\infty x^r \cdot f_i(x; \theta) dx$$

$$\begin{aligned} E(x^r) = \mu'_r &= \int_0^\infty x^r \cdot \frac{x \theta^5}{2(\theta^4 + 3\theta + 24)} (2x^3 + x^2 + 2\theta)e^{-\theta x} dx \\ &= \frac{\theta^5}{2(\theta^4 + 3\theta + 24)} \int_0^\infty x^{r+1} \cdot (2x^3 + x^2 + 2\theta)e^{-\theta x} dx \\ &= \frac{\theta^5}{2(\theta^4 + 3\theta + 24)} \left[\frac{2\Gamma(r + 5) + \theta \Gamma(r + 4) + 2\theta^4 \Gamma(r + 2)}{\theta^{r+5}} \right] \end{aligned}$$

$$E(x^r) = \mu'_r = \left[\frac{2\Gamma(r + 5) + \theta \Gamma(r + 4) + 2\theta^4 \Gamma(r + 2)}{\theta^r 2 (\theta^4 + 3\theta + 24)} \right] \tag{7}$$

Where . is the gamma function. Followed by substituting r = 1, 2, 3, and 4 in equation (7), we get the first four moments of LBKD.

$$\text{Mean}(\mu'_1) = \left[\frac{2\Gamma(1 + 5) + \theta \Gamma(1 + 4) + 2\theta^4 \Gamma(1 + 2)}{2\theta (\theta^4 + 3\theta + 24)} \right] = \frac{240 + 24\theta + 4\theta^4}{2\theta (\theta^4 + 3\theta + 24)}$$

$$\mu'_1 = \left[\frac{2(\theta^4 + 6\theta + 60)}{\theta (\theta^4 + 3\theta + 24)} \right]$$

Similarly,

$$\mu'_2 = \left[\frac{6(\theta^4 + \theta + 120)}{\theta^2(\theta^4 + 3\theta + 24)} \right]$$

$$\mu'_3 = \left[\frac{24(\theta^4 + 15\theta + 210)}{\theta^3(\theta^4 + 3\theta + 24)} \right]$$

$$\mu'_4 = \left[\frac{120(\theta^4 + 21\theta + 336)}{\theta^4(\theta^4 + 3\theta + 24)} \right]$$

$$\text{Variance} = \mu_2 = E(x^2) - E(x)^2$$

$$= \left[\frac{6(\theta^4 + \theta + 120)}{\theta^2(\theta^4 + 3\theta + 24)} \right] - \left[\frac{2(\theta^4 + 6\theta + 60)}{\theta (\theta^4 + 3\theta + 24)} \right]^2$$

$$\text{Variance} = \frac{2(\theta^8 - 12\theta^5 + 19\theta^4 - 63\theta^2 - 288\theta + 1440)}{\theta^2(\theta^4 + 3\theta + 24)^2}$$

The standard deviation (σ) coefficient of variation (C.V) and index of dispersion (γ) can be obtained as

$$\text{standard deviation } (\sigma) = \frac{\sqrt{2(\theta^8 - 12\theta^5 + 19\theta^4 - 63\theta^2 - 288\theta + 1440)}}{\theta (\theta^4 + 3\theta + 24)}$$

$$\text{Coefficient of variation} = \left(\frac{\sigma}{\mu_1} \right) = \frac{\sqrt{2(\theta^8 - 12\theta^5 + 19\theta^4 - 63\theta^2 - 288\theta + 1440)}}{2 (\theta^4 + 6\theta + 60)}$$

Poovitha and Pandiyan

$$\text{Index of dispersion} = \left(\frac{\sigma^2}{\mu_1}\right) = \frac{(\theta^8 - 12\theta^5 + 19\theta^4 - 63\theta^2 - 288\theta + 1440)}{\theta(\theta^4 + 3\theta + 24)(\theta^4 + 6\theta + 60)}$$

Moment Generating Function and Characteristic function of (LBK) distribution

Let X have a LBK distribution, then the MGF of X is obtained as

$$M_X(t) = E(e^{tx}) = \int_0^\infty e^{tx} f_i(x; \theta) dx$$

Using Taylor’s Series,

$$\begin{aligned} M_X(t) &= E(e^{tx}) = \int_0^\infty \left(1 + tx + \frac{(tx)^2}{2!} + \dots\right) f_i(x; \theta) dx \\ &= \sum_{j=0}^\infty \frac{t^j}{j!} \int_0^\infty x^j f_i(x; \theta) dx \\ &= \sum_{j=0}^\infty \frac{t^j}{j!} \mu_j \\ &= \sum_{j=0}^\infty \frac{t^j}{j!} \left[\frac{2\Gamma(j+5) + \theta\Gamma(j+4) + 2\theta^4\Gamma(j+2)}{\theta^j 2(\theta^4 + 3\theta + 24)} \right] \end{aligned}$$

$$M_X(t) = \frac{1}{2(\theta^4 + 3\theta + 24)} \sum_{j=0}^\infty \frac{t^j}{j!} (2\Gamma(j+5) + \theta\Gamma(j+4) + 2\theta^4\Gamma(j+2))$$

Order Statistics

Let $X_{(1)}, X_{(2)}, \dots, X_{(n)}$ be the order statistics of a random sample X_1, X_2, \dots, X_n from the continuous population with probability density function $f_X(x)$ and cumulative density function with $F_X(x)$ then the pdf of r^{th} order statistics $X_{(r)}$ can be written as

$$f_{r:n}(x) = \frac{n!}{(r-1)!(n-r)!} [F(x; \theta)]^{r-1} [1 - F(x; \theta)]^{n-r} f(x; \theta), \quad x > 0 \tag{8}$$

Substituting the value of equations (4) and (5) in equation (7), we get the pdf of r^{th} order statistics $X_{(r)}$ for length biased Kpenadidumdistribution and is given by

$$\begin{aligned} f_{r:n}(x) &= \frac{n!}{(r-1)!(n-r)!} \left[\frac{2\gamma(5, \theta x) + \theta\gamma(4, \theta x) + \theta^4\gamma(2, \theta x)}{2(\theta^4 + 3\theta + 24)} \right]^{r-1} \times \\ &\quad \left[1 - \frac{2\gamma(5, \theta x) + \theta\gamma(4, \theta x) + \theta^4\gamma(2, \theta x)}{2(\theta^4 + 3\theta + 24)} \right]^{n-r} \times \left[\frac{x\theta^5}{2(\theta^4 + 3\theta + 24)} (2x^3 + x^2 + 2\theta)e^{-\theta x} \right] \\ f_{r:n}(x) &= \frac{n!}{(r-1)!(n-r)!} \sum_{j=0}^\infty (-1)^j \binom{n-r}{j} \left[\frac{2\gamma(5, \theta x) + \theta\gamma(4, \theta x) + \theta^4\gamma(2, \theta x)}{2(\theta^4 + 3\theta + 24)} \right]^{r+j-1} \\ &\quad \times \left[\frac{x\theta^5}{2(\theta^4 + 3\theta + 24)} (2x^3 + x^2 + 2\theta)e^{-\theta x} \right] \tag{9} \end{aligned}$$

Poovitha and Pandiyan

1st order statistics

$$f_{1:n}(x) = \frac{n!}{(n-1)!} \sum_{j=0}^{\infty} (-1)^j \binom{n-1}{j} \left[\frac{2\gamma(5, \theta x) + \theta\gamma(4, \theta x) + \theta^4\gamma(2, \theta x)}{2(\theta^4 + 3\theta + 24)} \right]^j$$

$$\times \left[\frac{x\theta^5}{2(\theta^4 + 3\theta + 24)} (2x^3 + x^2 + 2\theta)e^{-\theta x} \right]$$

nth order statistics

$$f_{n:n}(x) = \frac{n!}{(n-1)!} \sum_{j=0}^{\infty} (-1)^j \binom{n-1}{j} \left[\frac{2\gamma(5, \theta x) + \theta\gamma(4, \theta x) + \theta^4\gamma(2, \theta x)}{2(\theta^4 + 3\theta + 24)} \right]^{n+j-1}$$

$$\times \left[\frac{x\theta^5}{2(\theta^4 + 3\theta + 24)} (2x^3 + x^2 + 2\theta)e^{-\theta x} \right]$$

Stochastic Ordering

Stochastic ordering is an important tool in finance and reliability theory to assess the comparative performance of the models. Let X and Y be two random variables with pdf, cdf, and reliability function

$$f(x; \theta), f(y; \theta), F(x; \theta), F(y; \theta), S(x) = 1 - F(x; \theta) \text{ and } S(y) = 1 - F(y; \theta)$$

Then,

- Mean residual life order denoted by

$$X \leq_{MRLO} Y, \text{ If } m_x(x) \leq m_y(y), \forall x$$
- Hazard rate order denoted as

$$X \leq_{HRO} Y, \text{ If } \frac{S_X(x)}{S_Y(y)} \text{ is decreasing if } x \geq 0$$
- Stochastic order denoted as

$$X \leq_{SO} Y, \text{ If } S_X(x) \leq_{SO} S_Y(x), \forall x$$
- Likelihood ration order denoted as

$$X \leq_{LRO} Y, \text{ If } \frac{f_X(x; \theta)}{f_Y(x; \theta)}$$

Assume that X and Y are two independent random variables with pdf $f_X(x; \theta)$ and $f_Y(x; \lambda)$ If $\theta < \lambda$

$$\Lambda = \frac{f_X(x; \theta)}{f_Y(x; \lambda)}$$

$$\Lambda = \frac{\left[\frac{x\theta^5}{2(\theta^4+3\theta+24)} (2x^3 + x^2 + 2\theta)e^{-\theta x} \right]}{\left[\frac{x\lambda^5}{2(\lambda^4+3\lambda+24)} (2x^3 + x^2 + 2\lambda)e^{-\lambda x} \right]}$$

$$\Lambda = \left[\frac{\theta^5 2(\lambda^4 + 3\lambda + 24)}{\lambda^5 2(\theta^4 + 3\theta + 24)} \right] \times \left[\frac{(2x^3 + x^2 + 2\theta)}{(2x^3 + x^2 + 2\lambda)} \right] e^{(\lambda-\theta)x}$$

Thus,

$$\log(\Lambda) = \log(\theta^5 2(\lambda^4 + 3\lambda + 24)) - \log(\lambda^5 2(\theta^4 + 3\theta + 24)) + \log(2x^3 + x^2 + 2\theta) - \log(2x^3 + x^2 + 2\lambda) + (\lambda - \theta)x$$

Differentiating to x we get,

$$\frac{\partial \log(\Lambda)}{\partial x} = \left[\frac{6x^2 + 2x}{(2x^3 + x^2 + 2\theta)} \right] - \left[\frac{6x^2 + 2x}{(2x^3 + x^2 + 2\lambda)} \right] + (\lambda - \theta)$$

Poovitha and Pandiyan

$$\frac{\partial \log(\Delta)}{\partial x} < 0 \text{ if } \lambda < \theta$$

Thus,

$$X \leq_{LRO} Y, X \leq_{HRO} Y, X \leq_{MRLO} Y, \text{ and } X \leq_{SO} Y$$

Test of Length-Biased Distribution

Let X_1, X_2, \dots, X_n be a random sample from the length-biased Kpenadidum distribution. To test the hypothesis

$$H_0: f(x) = f(x; \theta) \text{ against } H_1: f(x) = f_l(x; \theta)$$

The following test statistics are used to test whether the random sample of size n comes from the Kpenadidum distribution or a length-biased Kpenadidum distribution.

$$\Delta = \frac{L_1}{L_0} = \prod_{i=1}^n \frac{f_l(x_i; \theta)}{f(x_i; \theta)}$$

$$\Delta = \frac{L_1}{L_0} = \prod_{i=1}^n \frac{\left[\frac{x \theta^5}{2(\theta^4 + 3\theta + 24)} (2x^3 + x^2 + 2\theta) e^{-\theta x} \right]}{\left[\frac{\theta^4}{2(\theta^4 + \theta + 6)} (2x^3 + x^2 + 2\theta) e^{-\theta x} \right]}$$

$$\Delta = \frac{L_1}{L_0} = \prod_{i=1}^n x_i \left[\frac{\theta^4 + \theta + 6}{\theta^4 + 3\theta + 24} \right]^n$$

We reject the null hypothesis if

$$\left[\frac{\theta^4 + \theta + 6}{\theta^4 + 3\theta + 24} \right]^n \prod_{i=1}^n x_i > K$$

Equivalently we reject the null hypothesis when

$$\Delta = \prod_{i=1}^n x_i > K^*$$

Where $K^* = K \left[\frac{\theta^4 + \theta + 6}{\theta^4 + 3\theta + 24} \right]^n > 0$

For large sample size n, $2 \log \Delta$ is distributed as a chi-square distribution with one degree of freedom and the p value is obtained from the chi-square distribution. Thus, we reject the null hypothesis, when the probability value is given by,

$$P(\Delta^* > \alpha^*) \text{ where } \alpha^* = \prod_{i=1}^n x_i \text{ is the observed value of statistics } \Delta^*$$

Bonferroni And Lorenz Curve

The Bonferroni and Lorenz curve is used in economics to study income and poverty and in other fields like reliability, medicine, demography, and actuarial statistics. The Bonferroni and Lorenz curves are given by

$$B(p) = \frac{1}{p\mu_1} \int_0^q x \cdot f_l(x; \theta) dx$$

Poovitha and Pandiyan

and

$$L(p) = \frac{1}{\mu_1} \int_0^q x \cdot f_i(x; \theta) dx$$

where,

$$\mu_1 = \left[\frac{2(\theta^4 + 6\theta + 60)}{\theta(\theta^4 + 3\theta + 24)} \right] \text{ and } q = F^{-1}(p)$$

$$\begin{aligned} B(p) &= \frac{1}{p \left[\frac{2(\theta^4 + 6\theta + 60)}{\theta(\theta^4 + 3\theta + 24)} \right]} \int_0^q x \cdot \frac{x \theta^5}{2(\theta^4 + 3\theta + 24)} (2x^3 + x^2 + 2\theta) e^{-\theta x} dx \\ &= \frac{\theta^6}{4p(\theta^4 + 6\theta + 60)} \int_0^q x^2 (2x^3 + x^2 + 2\theta) e^{-\theta x} dx \end{aligned}$$

After simplification, we get

$$B(p) = \frac{2\gamma(6, \theta q) + \theta\gamma(5, \theta q) + 2\theta^4\gamma(3, \theta q)}{4p(\theta^4 + 6\theta + 60)}$$

Similarly,

$$L(p) = \frac{2\gamma(6, \theta q) + \theta\gamma(5, \theta q) + 2\theta^4\gamma(3, \theta q)}{4(\theta^4 + 6\theta + 60)}$$

Method of Maximum Likelihood Estimator

In this section, we discuss the maximum likelihood estimator of the parameter of Length-Biased Kpenadidum distribution. Consider X_1, X_2, \dots, X_n be the random sample of size n from the length-biased Kpenadidum distribution, then the likelihood function can be written as

$$L(x; \theta) = \prod_{i=1}^n f_i(x; \theta)$$

$$L(x; \theta) = \prod_{i=1}^n \left[\frac{x_i \theta^5}{2(\theta^4 + 3\theta + 24)} (2x_i^3 + x_i^2 + 2\theta) e^{-\theta x_i} \right]$$

The log-likelihood function is

$$\log L(x; \theta) = 5n \log \theta - n \log(2(\theta^4 + 3\theta + 24)) + \sum_{i=1}^n \log x_i + \sum_{i=1}^n \log(2x_i^3 + x_i^2 + 2\theta) - \theta \sum_{i=1}^n x_i \quad (10)$$

The maximum likelihood estimate of θ can be obtained by differentiating equation (9) to θ and must satisfy the normal equation.

$$\frac{\partial \log L}{\partial \theta} = \frac{5n}{\theta} - n \left[\frac{4\theta^3 + 3}{\theta^4 + 3\theta + 24} \right] + \sum_{i=1}^n \frac{2}{(2x_i^3 + x_i^2 + 2\theta)} - \sum_{i=1}^n x_i = 0$$

The maximum likelihood estimate of the parameter is obtained by solving the above non-linear equation. Therefore, we use R and Wolfram Mathematica to estimate the required parameter of the proposed distribution.

Applications

In this section, we fit the real lifetime data set (Secondary data) to discuss the goodness of fit of length-biased Kpenadidum distribution with an example related to cancer data. Dataset 1. We have used the data representing the

Poovitha and Pandiyan

size of the Tumour (in mm) of 210 patients with node-positive breast cancer, as reported by Royston and Altman (2013). The entire data set contains patient records from a 1984-1989 trial conducted by the German Breast Cancer Study Group (GBSG) of 720 patients with node-positive breast cancer; it retains the 686 patients with complete data for the predictive variables. We used the initial 210 sample values for the analysis. 18, 20, 40, 25, 30, 52, 21, 20, 20, 30, 12, 30, 21, 25, 57, 25, 21, 27, 12, 45, 18, 18, 30, 30, 25, 14, 21, 30, 23, 30, 55, 11, 40, 25, 15, 29, 15, 45, 40, 30, 60, 21, 20, 58, 30, 28, 25, 18, 40, 35, 30, 21, 45, 40, 20, 19, 52, 80, 40, 20, 80, 30, 33, 16, 25, 39, 52, 50, 39, 42, 65, 28, 25, 23, 32, 15, 40, 35, 25, 30, 22, 45, 20, 27, 29, 22, 24, 25, 23, 30, 50, 45, 7, 8, 18, 16, 28, 21, 15, 20, 12, 20, 30, 50, 25, 30, 25, 32, 35, 20, 28, 26, 35, 23, 80, 20, 20, 34, 30, 23, 35, 70, 20, 45, 24, 28, 35, 25, 60, 35, 40, 23, 40, 21, 35, 55, 120, 23, 50, 55, 16, 22, 21, 12, 14, 60, 55, 120, 23, 50, 55, 16, 22, 21, 12, 14, 60, 30, 25, 40, 48, 35, 25, 28, 35, 30, 35, 22, 12, 21, 35, 52, 36, 25, 31, 20, 30, 25, 44, 21, 30, 32, 50, 21, 20, 60, 35, 30, 20, 23, 49, 55, 20, 25, 22, 18, 30, 20, 40, 35, 13, 70, 27, 21, 25, 80, 36, 32, 25, 19.

Dataset 2. Age of the patients with advanced lung cancer in years (J. F. Lawless (2003)).

69, 64, 38, 63, 65, 49, 69, 68, 43, 70, 81, 63, 63, 52, 48, 61, 42, 35, 63, 56, 55, 67, 63, 65, 46, 53, 69, 68, 43, 55, 42, 64, 65, 65, 55, 66, 60, 67, 53, 62, 67, 72, 48, 68, 67, 61, 60, 62, 38, 50, 63, 64, 43, 34, 66, 62, 52, 47, 63, 68, 45, 41, 66, 62, 60, 66, 38, 53, 37, 54, 60, 48, 52, 70, 50, 62, 65, 58, 62, 64, 63, 58, 64, 52, 35, 63, 70, 51, 40, 69, 36, 71, 62, 60, 44, 54, 66, 49, 72, 68, 62, 71, 70, 61, 71, 59, 67, 60, 69, 57, 39, 62, 50, 43, 70, 66, 61, 81, 58, 63, 60, 62, 42, 69, 63, 45, 68, 39, 66, 63, 49, 64, 65, 64, 67, 65, 37. The best distribution corresponds to lower values of $-2\log L$, AIC, AICC, and BIC. It can be easily seen from the above table1 that the LBK distribution provides a better fit as compared to the Kepenadidum, Lindley, and Shanker distributions for all three datasets. And by dataset 1, figures 5, 6, 7 & 8 provide a good illustration of the optimal distribution.

CONCLUSION

In this research paper, we have explored the Length-Biased Continuous Distribution and discussed several structural properties of the resulting model. For modeling lifetime data, this distribution proves to be a strong choice, especially when popular alternatives like the Kpenadidum, Lindley, and Shanker distributions are unable to sufficiently describe the observed events. Comparing the suggested generalized model to competing distributions, it shows better fitting performance and more flexibility. We are sure that this model, which offers a strong and adaptable instrument for statistical analysis in a variety of circumstances, will find extensive applications across numerous disciplines that have an impact on human life.

ABSTRACT

The application of sunscreen is essential for skin protection against harmful UV rays. Sunscreen gives protection over several skin problems like sunburn, solar erythema, pigmentation, and wrinkles by scattering, reflecting or absorbing UV radiations and prevents the skin damage. The efficacy of sunscreen is measured by Sun protection factor (SPF), with a higher SPF indicating greater protection. In light of this, an herbal sunscreen emulgel was formulated. The study was designed to focus on the formulation and evaluation of herbal sunscreen emulgel. It was prepared using various natural ingredients like carrot seed oil, raspberry oil, and aloe vera along with other excipients. This sunscreen offers minimal side effects as compared to chemical-based sunscreen. The emulgel was evaluated for pH, viscosity, spread ability and other parameters, showing excellent stability, appearance, homogeneity and consistency with no phase separation. The SPF was found to be 15.598. This confirms its effectiveness and suitability as a natural sunscreen.

Keywords: Carrot seed oil, raspberry oil, aloe vera, UV radiation, herbal sunscreen, emulgel, SPF.

Vijaya Vichare et al.,

INTRODUCTION

Sunscreen provides skin protection against the harmful UV radiations which cause the severe skin problems like tanning, sunburns, skin cancers, pigmentation, wrinkles, DNA damage, and oxidative stress. Higher exposure to sun's UV radiation can result in various effects, such as photoaging and an increased risk of skin cancer [1-2]. Herbal sunscreen is a topical product that protects the skin by reflecting or absorbing UV radiation and it is made from the extracts of natural plants or plant parts [3]. It works by scattering, reflecting, or absorbing UV radiation to prevent skin damage [1][4]. Benefits include easy availability, no side effects, no special equipment required for preparation, renewable resources, and cost-effectiveness [3]. Carrot seed oil (*Daucus carota*) (Fig 1) may help to reduce irritation, allergies, and photo-toxicity over chemical sunscreens, making it a natural alternative for sensitive skin [6]. It also blocks sunlight and even skin tone. Table 1 provides the details of key components of Carrot seed oil and their benefits. Raspberry Seed Oil (RSO) (*Rubusidaeus L.*) (Fig 2) provides some UV protection, but while helpful, it is not sufficient for full sun protection [5]. RSO is a highly beneficial substance, rich in essential nutrients like fatty acids, antioxidants, tocopherols, tocotrienols, carotenoids, flavonoids, phytosterols, and monoterpenes. RSO is recognized as both a human food and a cosmetic additive, offering a range of medicinal properties including antibacterial, antifungal, and anti-inflammatory effects [9]. It is rich in n-6 and n-3 essential fatty acids [10]. Benefits of RSO for skin care includes, Anti-inflammatory effect, rich in Vitamins A and E, moisturizing, non-Comedogenic. It is used as anti-aging, acne treatment, dry skin, skin inflammation, gingivitis, sun protection.

Aloe vera gel (Fig 3), soothes sunburn and provides a cooling effect [11], moisturizes the skin, promotes wound healing, fights signs of skin aging, reduces acne and infections, lightens dark spots and marks [12]. Sun Protection Factor (SPF) measures the amount of solar energy (UV radiation) needed to cause sunburn on protected skin compared to unprotected skin [3]. SPF measures sunscreen effectiveness, but the scale is not linear. As the SPF increases, sunburn protection increases.

Protection levels:

- Low protection: SPF < 15
- Medium protection: SPF 15-29
- High protection: SPF 30-49
- Very high protection: SPF > 50

Products with SPF under 15 do not claim broad-spectrum protection.

The Mansur mathematical equation is used to calculate the SPF values of the samples.

$$SPF = CF \times \sum_{290}^{320} EE(\lambda) \times I(\lambda) \times Abs(\lambda)$$

Where CF is the correction factor; EE is the erythemal effect of radiation at wavelength λ ; I is the intensity of the solar spectrum; and Abs is the absorbance at wavelength λ . The values of $EE \times I$ are constant [1].

While sunscreen can reduce vitamin D production by blocking UVB rays, small amounts of sun exposure are sufficient for vitamin D synthesis. A balance of safe sun exposure and sunscreen use is recommended [2][3].

MATERIALS AND METHODS

Carrot seed oil (*Daucus carota*), Raspberry oil (*Rubusidaeus L.*), propyl paraben, methyl paraben, propylene glycol, aloe vera gel, tween-80, sorbitol, carbopol940, triethanolamine, distilled water were used. Stirrer, sonicator, UV-visible spectroscopy, pH meter, Brookfield viscometer. The active ingredients used in this study were carrot seed oil and raspberry oil, while excipients included carbopol 940, tween-80, aloe vera, sorbitol, methyl paraben, propylene glycol, propyl paraben, and TEA.

Preparation of Microemulsion

It was prepared through a high-energy emulsification method, by using a magnetic stirrer and ultra-sonicator. The oil phase was prepared by mixing carrot seed oil, raspberry oil, and sorbitol. The aqueous phase was prepared by

Vijaya Vichare et al.,

heating propyl paraben, methyl paraben, and propylene glycol using a hot plate. After cooling, water, aloe vera gel, and tween-80 were added. The oil phase was gradually added to the aqueous phase and stirred at 1500-1700 rpm for 6 hours using a magnetic stirrer, followed by sonication for 30 minutes to form a clear emulsion.

Preparation of Gel Base

Carbopol 940 was dispersed in distilled water, and TEA was added. The mixture was stirred magnetically until a gel base was obtained.

Preparation of Microemulgel

The emulsion (80%) was mixed with the gel base (20%) and stirred at 1500-1700 rpm for 4 hours. The mixture was sonicated for 30 minutes to obtain a transparent emulgel.

Evaluation parameters for Microemulsion

pH, viscosity, zeta potential, stability, dilution test, particle size analysis, spreadability SPF (Sun Protection Factor): 0.5gm of sample was dissolved in 50 ml ethanol in a volumetric flask. The solution was analyzed using a UV Spectrophotometer in the wavelength of 290-320 nm range. The in-vitro evaluation of SPF of the formulation is determined by Mansur formula which determines the effectiveness of sunscreen formulation by determining the absorbance of the solution using JASCO V-560 UV Visible spectroscopy at 290-320nm and at the interval of 5min using n-hexane as a blank. $SPF = CF \times 290 \sum_{320} EE(\lambda) \times I(\lambda) \times Abs(\lambda)$ [1]. The SPF of herbal sunscreen was found to be 15.598.

RESULTS AND DISCUSSION

Particle size analysis The size of the formulated emulsion was determined to be 4936.2nm. This indicates that the formulation is a micro-emulsion. With this particle size, the formulation is expected to remain on skin surface, providing a protective barrier against UV radiation without significant absorption into deeper skin layer.

pH The pH was found to be 6.04 which aligns with the pH of the skin so as to minimize the irritation.

Viscosity: The viscosity of the micro-emulgel was determined to be 150cp for spindle no.64 and 100.8cp for spindle no.63.

Stability Study No change in colour or phase separation was observed. This indicates that the formulation is stable and suitable for use.

Spreading Coefficient This was studied on the basis of 'Slip' and 'Drag' Characteristics of emulgel. The spreading coefficient was derived using the following equation:

$$S = m \times l / t$$

Where, S=Sample spreadability, m=upper plate mass, l=glass plate length(cm), t=time taken to separate.

Lesser the time for separation better is the spreadability.

The value for the formulation was found to be 7.0 cm which aligned with the Standard value (1-8.3cm). So, the micro-emulgel meets the standard requirements.

Zeta potential Zeta potential of the prepared emulsion was successfully measured and was found to be 9.4mV at temperature 25.1 degree centigrade.

Table 1: Details of key components of Carrot seed oil and their benefits.

Key components	Benefits
Carotol	anti-fungal and anti-bacterial [7]
Alpha pinene	antibiotic resistance modulator, anticoagulant, antitumor, antimicrobial, antimalarial, antioxidant, anti-inflammatory, anti-leishmania, and analgesic [8].
Sabinene	antifungal, anti-inflammatory
Geranyl acetate	pleasant, flowery aroma [7].
Beta myrcene	analgesic, antidiabetic, antioxidant, anti-inflammatory, antibacterial, and anticancer
Limonene	anti-inflammatory, antioxidant, antinociceptive, anticancer, antidiabetic, antiviral, and gastroprotective effects.
Bisabolene	calming, hypotensive, antibacterial, and anti-inflammatory, analgesic and antispasmodic effects.
Caryophyllene oxide	antifungal

Table 2: Chemical composition of Aloe Vera gel [11,13-19]

Anthraquinones	Aloe-emodin, aloetic acid, anthranol, barbaloin, iso-barbaloin, emodin, esters of cinnamic acid.
Carbohydrates	Pure mannan, acetylated mannan, acetylated glucomannan, gluco-galactomannan, galactan, galactogalactan, galactoglucoarabinomannan, pectic substance, xylan, cellulose.
Chromones	8-C-glucosyl-(2'-O-cinnamoyl)-7-O-methylaloeediol A, 8-C-glucosyl-(S)-aloesol, 8-C-glucosyl-7-O-methylaloeediol A, 8-C-glucosyl-noreugenin, iso-aloe resin D, isorabaichromone, neoaloesin A.
Enzymes	Alkaline phosphatase, amylase, bradykinase, carboxypeptidase catalase, cyclo-oxidase, cyclooxygenase, lipase, oxidase, phosphoenolpyruvate, carboxylase, superoxide dismutase.
Inorganic composites	Calcium, chlorine, chromium, bobby iron, magnesium, manganese, potassium, phosphorous, sodium, Zinc.
Miscellaneous	Arachidonic acid, γ -linolenic acid, steroids (campesterol, cholesterol, β sitosterol), triglycerides, triterpenoid, gibberellin, lignin, potassium sorbate, salicylic acid, uric acid.
Proteins	Lectins, lectin-like substance.
Saccharides	Mannose, glucose, L- rhamnose, aldopentose
Vitamins	Vitamin A, B12, C, E, choline and folic acid.
Hormones	Auxins and gibberellins

ABSTRACT

The study delves into the profound impact of search engine marketing (SEM) on consumer behavior, particularly how various SEM strategies, such as pay-per-click (PPC) advertising, shape purchasing decisions, brand perception, and online traffic. By examining these dynamics, the research sheds light on how businesses can effectively utilize SEM to influence consumer behavior. PPC advertising, for instance, directly affects a brand's visibility, making it more likely for consumers to encounter and engage with advertised products or services. This increased visibility boosts brand awareness and plays a crucial role in shaping consumers' initial perceptions and purchasing decisions. By presenting relevant ads at the right moment, SEM has the power to drive significant online traffic and conversions, underscoring its value in the digital marketing toolkit.

Keywords: Digital Landscape, Digital Marketing, Psychological Mechanisms, Search Engine Marketing, Search Engine Optimization

INTRODUCTION TO THE STUDY

Search engine marketing (SEM) has emerged as a pivotal tool in digital marketing strategies, profoundly influencing consumer behavior and business outcomes. As the internet has become an integral part of everyday life, search engines like Google, Bing, and Yahoo have become essential gateways for accessing information, products, and services. SEM leverages this centrality by employing pay-per-click (PPC) advertising and search engine optimization (SEO) to enhance the visibility and accessibility of a business's online presence. This strategic positioning can significantly impact consumers' decisions, shaping their purchasing patterns and perceptions of brands. In the contemporary digital landscape, the ability to appear prominently in search engine results is synonymous with

**Jack Kyle and Chinnathambi**

business success. Companies invest heavily in SEM to ensure their products and services are easily discoverable by potential customers. This investment is justified by the high return on investment (ROI) that effective SEM campaigns can yield. However, the implications of this influence extend beyond simple economic transactions. How search engines prioritize and present information can affect consumer trust, brand loyalty, and even broader social behaviors.

Need of The Study

Understanding the impact of search engine marketing (SEM) is crucial for several reasons, particularly for businesses looking to optimize their marketing efforts. SEM provides a strategic framework that allows companies to allocate their marketing budgets more efficiently, precisely targeting potential customers. Businesses can significantly enhance their return on investment (ROI) by analyzing and identifying the most effective SEM strategies. This optimization maximizes the impact of their advertising spend and gives them a competitive edge in the marketplace. Companies can leverage insights from SEM to tailor their marketing campaigns to meet their target audience's specific needs and behaviors, thereby driving higher engagement and conversion rates. For consumers, an increased awareness of how SEM influences their choices can lead to more informed and autonomous decision-making. Many users are unaware of how search engine algorithms and paid advertisements shape their online experiences. By understanding these influences, consumers can critically evaluate the information they encounter and make decisions based on a broader perspective rather than just the top search results or sponsored ads. This awareness empowers consumers to seek out diverse sources of information and recognize potential biases in the content they are presented with, fostering a more balanced and informed approach to their online interactions. Therefore, this study benefits businesses and consumers and contributes to the ongoing discourse on ethical digital marketing practices.

Objectives of The Study

- To analyze the effectiveness of PPC advertising in driving consumer traffic and sales.
- To investigate the psychological mechanisms underlying consumer trust and decision-making in response to SEM.
- To examine the ethical implications of SEM practices, particularly regarding consumer privacy and autonomy.
- To assess the long-term impact of SEM on brand loyalty and market competition.

Scope of The Study

The study delves into the profound impact of search engine marketing (SEM) on consumer behavior, particularly how various SEM strategies, such as pay-per-click (PPC) advertising, shape purchasing decisions, brand perception, and online traffic. By examining these dynamics, the research sheds light on how businesses can effectively utilize SEM to influence consumer behavior. PPC advertising, for instance, directly affects a brand's visibility, making it more likely for consumers to encounter and engage with advertised products or services. This increased visibility boosts brand awareness and plays a crucial role in shaping consumers' initial perceptions and purchasing decisions. By presenting relevant ads at the right moment, SEM has the power to drive significant online traffic and conversions, underscoring its value in the digital marketing toolkit. In exploring the business implications of SEM, the study highlights its potential to provide a competitive edge and enhance cost efficiency. SEM allows businesses to target their marketing efforts precisely, reaching potential customers actively searching for related products or services. This targeted approach improves the chances of conversion and ensures that marketing budgets are spent more effectively, maximizing ROI. Moreover, by staying visible and relevant in search engine results, businesses can maintain a competitive position in the market. The study also addresses the challenges associated with SEM, such as adapting to frequent algorithm changes by search engines and navigating privacy concerns. These challenges necessitate ongoing strategic adjustments and a deep understanding of evolving SEM practices to maintain effectiveness and compliance. Through this extensive exploration, the study aims to provide a holistic understanding of SEM's critical role in driving modern marketing strategies and influencing consumer behavior.

Limitations

- The data is collected from 110 respondents in the Chennai population, which cannot be generalized.

**Jack Kyle and Chinnathambi**

- Time constraint can be considered as one factor, without which the study might have gotten even more exposure and extent in terms of research.
- The data is collected from the search engine users; hence, the opinion is based on being influenced by search engine marketing.
- The respondents' personal bias may influence the study's findings.

RESEARCH METHODOLOGY

Descriptive research describes characteristics of a population or phenomenon being studied. It does not answer questions about how/when/why the characteristics occurred; it addresses the “what” question (the characteristics of the population or situation being studied). The characteristics of the problem or populations are usually some kind of categorical scheme, also known as descriptive categories.

Data Collection Primary Sources

Primary data sources are data that require personal effort to collect and are not readily available. Primary data sources are the other sources through which the data was collected. The primary data are collected through a structured questionnaire.

Secondary Sources

Secondary sources are the other important sources through which the data was collected. These are readily available sources of data that one does not need to put much effort into collecting because they have already been collected and made available by research experts and specialists.

Secondary data is collected from the internet, journals, and research papers.

Questionnaire

The primary data was collected using a structured questionnaire. The structured questionnaires that were framed and designed consist of

- Likert 5-point scale
- Multiple choice questions
- Ranking question.

Sample Design

Sampling is simply learning about a population based on a sample drawn from it. Under this method, a small group of the universe is taken as the representative of the whole mass, and the results are drawn. “A Statistical sample is a miniature picture or cross-section of the entire group or aggregate from which the sample is taken”.

Sampling Technique

Simple random sampling is probability sampling in which the researcher randomly selects a subset of participants from a population. Each member of the population has an equal chance of being selected.

Sample Size

Sample size refers to the number of items selected from the population to constitute a sample. An optimum sample size fulfills the requirements of efficiency, representativeness, reliability, and flexibility. Using a simple random sampling technique, respondents are selected for the study. A questionnaire was collected from 110 respondents.

Data Analysis And Interpretation**One-Way Anova**

To find the difference between the age and awareness of SEM among respondents.

Jack Kyle and Chinnathambi

Hypothesis

Null Hypothesis (H_0): There is no significant difference between respondents' age and awareness of SEM.

Alternate Hypothesis (H_1): There is a significant difference between age and awareness of SEM among respondents.

The table above accepts the null hypothesis since the computed value (0.144) exceeds the significance level (0.05). Therefore, there is no significant difference between age and awareness of SEM among respondents.

Correlation

To find the correlation between the trust in search engine ads and the influence of search engine ads on purchasing decisions.

Hypothesis

Null Hypothesis (H_0): There is no significant relationship between age and search engine ad trust. Alternative

Hypothesis (H_1): Age and trust in search engine ads are significantly related. The above table shows that age and trust in search engine ads are negatively correlated. Correlation coefficient at a 99% significance level is -0.295. Significant level attwo-tailed tests was .002

Chi-Square

Finding the relationship between occupation and SEM improves your overall online shopping experience.

Hypothesis

Null Hypothesis (H_0): No significant association between occupation and SEM improved your online shopping experience.

Alternative Hypothesis (H_1): A significant association between occupation and SEM improved your online shopping experience. From the above table, the null hypothesis is accepted since the p-value (0.679) is greater than the significance level (0.05). Therefore, there is no significant association between occupation and SEM, which improved your overall online shopping experience.

Regression

To find the regression between gender and purchase directly after clicking search engine ads.

Hypothesis:

Null Hypothesis (H_0): No significant relationship exists between gender and direct purchase after clicking search engine ads. Alternative Hypothesis (H_1): There is a significant relationship between gender and purchasing directly after clicking search engine ads.

a. The dependent variable is purchase directly after clicking on search engine ads

Equation = $Y = a + Bx$

$Y = 1.417 + .303 X$

From the above table, H_0 is accepted and H_1 is rejected as a significant value of gender is (0.095) more than (0.05). So, there is no significant relationship between gender and direct purchase after clicking search engine ads.

Findings

- The largest age group among respondents is 18-24 years, making up 40% of the sample.
- Age 25-34: 20.9% of respondents are between 25 and 34.
- The 35-44 age group comprises 20% of respondents, while those aged 45-54 and 55+ comprise 11.8% and 7.3%, respectively.
- Gender Distribution: 61.8% of the respondents are male, and 38.2% are female.
- The majority of respondents (56.4%) are students, followed by marketing professionals (23.6%) and freelancers (20%).
- A high percentage (80.9%) of respondents use search engines like Google, Bing, and Yahoo.

**Jack Kyle and Chinnathambi**

- 80.9% of respondents are aware of Search Engine Marketing.
- Frequent Usage 52.7% of respondents use search engines to find information or products online.
- Relevance of Ads 42.7% of respondents find the ads displayed by search engines always relevant to their queries.
- Trust in Ads: 40.9% of respondents always trust and click on ads displayed by search engines.
- Influence on Purchasing Decisions 36.4% of respondents rate the effectiveness of SEM in influencing their purchasing decisions as 3 out of 5.
- Direct Purchases: 51.8% of respondents have purchased directly after clicking on a search engine ad.
- Improved Shopping Experience 54.5% of respondents feel that SEM has improved their online shopping experience.
- Personalized Ads 53.6% of respondents positively view the personalization of search engine ads based on browsing history.
- Appealing Ad Types Image ads are the most appealing, preferred by 40.9% of respondents.
- Further Research 40.9% of respondents research a product or service further after seeing a search engine ad.
- Ease of Finding Information: 60.9% of respondents think SEM has made it easier to find relevant information.
- Trust in Ad Information 32.7% of respondents rate their trust in the information provided in search engine ads as 3 out of 5.
- Influence of Positive Reviews 35.5% of respondents rate the impact of positive online reviews displayed through SEM on consumer trust as 4 out of 5.
- Age and SEM Awareness: ANOVA results show no significant difference between age groups and awareness of SEM.
- Trust and Purchasing Decision: There is a negative correlation between trust in search engine ads and their influence on purchasing decisions, with a correlation coefficient of -
- 0.295.
- Occupation and Shopping Experience: Chi-square test results indicate no significant association between occupation and the perception that SEM has improved the online shopping experience.

Suggestions

- Regularly monitor SEM campaigns to track performance metrics and identify areas for improvement.
- Utilize analytics tools to gather insights into consumer behavior and preferences, enabling targeted optimization of SEM strategies
- Develop high-quality, relevant content optimized for search engines to improve organic search rankings and attract qualified leads.
- Maintain transparency in SEM practices by clearly disclosing sponsored content and ad placements to users.
- Adhere to ethical guidelines and data privacy regulations to protect consumer rights and build trust with your audience.
- Proactively manage online reputation by monitoring and responding to reviews, ensuring positive sentiment and consumer trust.
- Continuously refine keywords and ad content to ensure that ads are highly relevant to user queries, which enhances click-through rates and conversions.
- Use testimonials and user-generated content in SEM ads to enhance credibility and trust among potential customers.
- Analyze competitor SEM strategies to identify successful tactics and areas for improvement.
- Stay updated on the latest trends in SEM to adapt strategies accordingly and maintain a competitive advantage.

CONCLUSION

In conclusion, the findings underscore the profound influence of search engine marketing (SEM) on consumer behavior, particularly in shaping perceptions and decisions related to products and services. The prevalence of positive online reviews showcased through SEM significantly enhances consumer trust, as evidenced by the

Jack Kyle and Chinnathambi

substantial percentage of respondents rating the impact as 4 or 5 on a scale of 1 to 5. This highlights the critical role of SEM strategies, such as pay-per-click (PPC) advertising, in driving consumer trust and confidence in brands. As businesses continue to leverage SEM to enhance visibility and engagement, understanding and effectively utilizing these strategies are essential for maintaining a competitive advantage and fostering consumer trust in the digital marketplace. The study also reveals that while SEM is highly effective in influencing purchasing decisions, a notable portion of users remain skeptical, emphasizing the need for continuous ad quality and relevance improvement. Businesses should also consider the types of ads they deploy, with image ads being the most appealing to users, indicating a potential area for maximizing impact. Ultimately, as the digital landscape continues to evolve, the ability to effectively leverage SEM will be a determining factor in a business’s success in building and maintaining strong consumer relationships.

ABSTRACT

Glaucoma is a progressive optic neuropathy characterized by loss of retinal ganglion cells (RGCs) and vision field abnormalities. It is known that even after reducing their IOP, some glaucoma patients continue to perish from RGCs. Neuroprotection in glaucoma refers to any therapy that, independent of IOP reduction, inhibits RGC death. In preclinical studies, substances with potential neuroprotective efficacy include glutamate antagonists, ginkgo biloba extract, neurotrophic factors, antioxidants, calcium channel blockers, brimonidine, glaucoma drugs with blood regulation effects, and nitric oxide synthase inhibitors. A few medicines (such as brimonidine or memantine) that showed neuroprotective qualities in laboratory studies have progressed to clinical trials, but the outcomes have been ambiguous. Nonetheless, a scarcity of compelling clinical evidence has several of these medicines have been used off-label in glaucoma treatment. In the absence of cell replacement, stem cell transplantation has been proven to prevent the progression of experimental neurodegenerative diseases. It has been claimed that transplanting specific kinds of stem cells activates many neuroprotective pathways by causing the

Vasantha et al.,

creation of various proteins. The advantage of this method is that it has a long-term and specific impact. The release of unwanted toxic mediators, graft survival issues, and tumorigenesis are all key concerns in this field. Neuroprotection in glaucoma, whether pharmacologically or by stem cell transplantation, is an exciting issue that necessitates large-scale, interdisciplinary collaborative study to better understand its role in clinical practice. Brimonidine; Ginkgo Biloba Extract; Glaucoma; Memantine; Neuroprotection; Stem Cell Transplantation: Necessary but insufficient. The absence of the RGC Nevertheless, it continues.

Keywords: Brimonidine, collaborative, Neuroprotection, laboratory.

INTRODUCTION

As the primary cause of blindness and irreversible visual impairment globally, glaucoma is a widespread disease [1], with one in every 40 adults over 40 having glaucoma-related visual loss [2]. An epidemiological study conducted recently reinforced this finding. Over 60 million people had glaucoma in 2010; by 2020, that figure is predicted to rise to over 80 million, with a prevalence of 2.65% in the over-40 population [3]. In the general population, not only in developing countries but also globally, more than half of cases of glaucoma go undiagnosed, which is one of the main reasons of visual impairment in the condition. Regions with modern medical practices [4] If more efficient detection methods are put in place, there will be an increase in instances in the upcoming years manifest and need medical attention. We identify and rank four key obstacles for enhancing glaucoma care, with benefits to the person and the community, based on our daily experience managing glaucoma.

- Early identification of glaucoma.
- Genetics of glaucoma
- Medical treatment options
- Glaucoma surgery

History and Physical

Many individuals with glaucoma are unaware of their condition until it is identified during a regular eye exam, especially those who are in the early stages of the condition. According to multiple meta-analyses and systematic reviews, over 50% of adults worldwide have undiagnosed glaucoma, with greater prevalence in Asia and Africa.[5] Until the condition advances far enough, people usually gradually lose their peripheral vision while maintaining their core vision..During Humphrey visual field testing, this is clearly visible as an arcuate pattern. Optic nerves may show a focally notched neural retinal rim or broad cup enlargement during a comprehensive eye examination. Visual field tests may also reveal a loss of peripheral vision, and a high IOP result on tonometry is not necessary for diagnosis. Changes are typically Many glaucoma sufferers are unaware they have the condition until it is detected during a routine eye exam, especially in the early stages of the disease. The incidence of adult undetected glaucoma is estimated to be over 50% worldwide, with higher rates in Asia and Africa, according to many meta-analyses and systematic reviews.[5]People typically lose their peripheral vision gradually while keeping their core vision until the problem worsens. In Humphrey visual field testing, this could show up as a distinctive arcuate pattern. A comprehensive eye exam may reveal focally notched neural retinal rim or extensive cup enlargement in the optic nerves, as well as a loss of peripheral vision seen on visual field tests and, though not necessary for diagnosis, an elevated intraocular pressure reading on tonometry.

Changes are usually found on both sides, but they might advance. in an uneven manner, giving rise to an uneven optic nerve cup. Glaucoma is commonly associated with a cup-to-disc ratio greater than 0.5, with early loss typically happening in the optic disc's inferotemporal and superotemporal poles [6]. Individuals with less than 21 mm Hg IOP are typically asymptomatic with normal-tension glaucoma, which makes detection challenging and frequently results in an under diagnosis due to normal IOP readings. Possible disc bleeding in the nerve fibre layer and anomalies in the optic disc, such as an elevated cup-to-disc ratio, are shown by a slit-lamp examination.(7)A history of vasospasm,

**Vasantha et al.,**

coagulopathies, vascular illnesses, sleep apnoea, autoimmune disorders, or nocturnal hypotension may also be present in the patient. Individuals suffering with acute angle-closure glaucoma often experience sudden, severe eye pain, redness, blurred or less sharp vision, headaches, nausea, vomiting, and a sensation of light halos. People appear to have a solid feeling in their eyes and an unresponsive mid-dilated pupil upon scrutiny. These attacks often begin with pupillary dilation brought on by weak mydriatic or dilating drops. IOP is often significantly elevated, with a range of 30 to 50 mmHg. Acute angle-closure glaucoma is associated with elevated hypermetropia, an anterior chamber depth of less than 2.5 mm, and/or an angle between the iris and cornea of 20° or less as determined by gonioscopy.[8] In order to reduce their risk of suffering a sudden attack, patients with these findings can be advised to refrain from taking dilating medications. Slit-lamp examination can identify symptoms such as splinter haemorrhages, narrowing of the neural retinal rim, and a large optic cup.[9] Individuals who suffer from diabetic retinopathy or previous retinal vascular occlusions are among the patients with a history of neovascularisation, trauma, or recent ocular surgeries. Even though patients might not be able to recall a particular trigger event, modest findings from a clinical examination could point to the cause of elevated IOP. It's possible to get an acute attack. Splinter haemorrhages, narrowing of the neural retinal rim, and a large optic cup are among the results of the slit-lamp examination.

[9] Individuals who suffer from diabetic retinopathy with prior retinal vascular occlusions, trauma, or recent eye surgery are more likely to have underlying medical disorders that encourage neovascularisation than secondary glaucoma patients. Although patients might not be able to recall a specific trigger event, basic clinical examination findings might indicate many glaucoma sufferers, especially those in the early stages of the disease, are unaware that they have glaucoma until it is discovered during a routine eye checkup. Numerous meta-analyses and systematic reviews have revealed that over 50% of adults globally suffer with undetected glaucoma, with a higher frequency in Asia and Africa.[5] Peripheral vision is typically gradually lost while core vision is maintained till the illness progresses enough. Determine the reason behind the increased IOP. Exam findings could include the presence of exfoliating material on the anterior lens capsule, pigment deposits on the corneal endothelial cells, an anterior chamber flare signifying uveitis, aberrant blood vessels on the iris, or signs of trauma. IOP. Examination results may include exfoliative material on the anterior lens capsule, pigment deposits on the corneal endothelial cells, flare in the anterior chamber indicating uveitis, aberrant blood vessels on the iris, or evidence of trauma, depending on the underlying cause.

Etiology

Glaucoma is not fully understood, however it is believed to be caused by a combination of inherited and environmental causes. Individuals with a family history of glaucoma are more likely to acquire the illness, indicating a significant genetic component. However, environmental factors including aging, intraocular pressure (IOP), and oxidative stress all contribute to the genesis of glaucoma [10–16]. Aging is a well-known risk factor for glaucoma, which grows more frequent as individual age. This might be due to age-related changes in the optic nerve and retinal ganglion cells (RGCs), which are neurons that convey visual data from the eye to the brain. Oxidative stress is another key risk factor for glaucoma. RGC mortality is another important factor in the development of glaucoma. This can lead to optic nerve damage. Oxidative stress is hypothesized to be induced by an imbalance in the retina's reactive oxygen species (ROS) production and antioxidant defence [17-23]. The most well-known risk factor for glaucoma is intraocular pressure. In glaucoma patients, elevated IOP is associated with increased optic nerve damage and visual field loss. However, the link between IOP and glaucoma is complicated and diverse, since IOP fluctuations occur in both healthy and glaucomatous individuals. Furthermore, some people with normal IOP levels can develop glaucoma, indicating that factors other than IOP may contribute to the illness [24, 26].

Epidemiology

In 2010, nearly 2.1 million individuals globally were blind due to glaucoma. In Western European countries, glaucoma is the second most prevalent cause of persistent visual loss, second only to age-related macular degeneration [28]. Open-angle glaucoma is the most common type, affecting 2.51% of those in the 40–80 age range. Open-angle glaucoma accounts for the great majority of glaucoma cases in Germany [30]. In developed nations, the

**Vasantha et al.,**

risk of narrow angle and acute angle closure has decreased due to the widespread availability of surgical treatment for cataracts broadening the chamber angle and flattening the iris, the thin artificial lens widens the anterior chamber [31]. Adults of European descent are more probable to suffer from open-angle glaucoma. Adults with European ancestry are more probable to acquire open-angle glaucoma as they grow older [32], with rates increasing from 0.4% in 40–44 to 2.7% in 70–74 and 10.0% in 90. The probability ratio (OR) for men and women is 1.30 [32]. Significant differences have been identified between ethnic groups after a thorough analysis: Asians are more probable to suffer from angle-closure and normal-pressure glaucoma than Europeans, with African Americans having 2.8 times the frequency of the disease [29]. Only a few percent of the general population has congenital or juvenile glaucoma [33].

Pathophysiology

Although the exact cause of glaucoma is uncertain, intraocular pressure is connected to retinal ganglion cell death. The balance of aqueous humour secretion by the ciliary body and drainage through two distinct pathways—the trabecular meshwork and the uveoscleral outflow pathway—determines intraocular pressure. Patients with open-angle glaucoma have increased aqueous outflow resistance via the trabecular meshwork. Patients with angle-closure glaucoma, on the other hand, have restricted drainage options. Intraocular pressure can cause mechanical stress and strain on the eye's posterior components, most notably the lamina cribrosa and its surroundings. [34] The sclera is punctured where the optic nerve fibers (retinal ganglion cell axons) exit the eye. The lamina is the pressurized eye's weakest point. Intraocular pressure-induced stress and strain can cause compression, deformation, and remodeling of the lamina cribrosa, resulting in mechanical axonal damage and disruption of axonal transport [35,36]. This disrupts the retrograde delivery of essential trophic factors to retinal ganglion cells from their brainstem target (relay neurons of the lateral geniculate nucleus). In studies on cats and monkeys with artificially induced ocular hypertension, both orthograde and retrograde axonal transmission were stopped at the lamina cribrosa level. [37] Disrupted axonal transport occurs early in the pathogenesis of glaucoma in experimental systems, resulting in vesicle accumulation and microtubule and neurofilament disruption in the pre-laminar and post-laminar regions. Similar ultrastructural changes are visible in post-mortem human eyes with glaucoma. [34] Because mitochondrial failure can occur in retinal ganglion cells and astrocyte [38], large levels of energy demand may be difficult to fulfill under intraocular pressure-induced metabolic stress. Glaucomatous optic neuropathy can occur even when intraocular pressures are within normal ranges. In such circumstances, there may be abnormally low cerebrospinal fluid pressure in the optic nerve subarachnoid space, causing a significant pressure gradient across the lamina. [39,40] Impaired microcirculation, immunological dysfunction, excitotoxicity, and oxidative stress are all possible causes of glaucoma. Primary neural degenerative events may induce the neurodegeneration of new retinal neurons and cells in the central visual pathway by altering their environment and increasing vulnerability to injury [41].

Risk factors

Advanced age (42-44) is one of the primary risk factors for glaucoma.

- Elevated intraocular pressure [42–44].
- There is significant myopia [45].
- A substantial family history of glaucoma [46,47].

The risk varies according to ethnicity [48]. Furthermore, excavating the optic disc is extremely difficult to assess in profoundly myopic eyes. Myopia is thought to predispose to glaucoma by expanding the optic disc and weakening the lamina cribrosa. Increased shear stresses in the lamina cribrosa caused by eye motions are another possible pathogenetic factor in patients with very myopic (long) eyes [49]. So far, the sole modifiable risk factor for open-angle glaucoma has been high intraocular pressure or an increased translaminal pressure gradient. The randomized controlled Ocular Hypertension. The treatment study discovered that decreasing increased intraocular pressure (21-32 mm Hg) by 22.5%, the 5-year likelihood of developing open-angle glaucoma was lowered from 9.5% to 4.4% [50]. The potential relationship between open-angle glaucoma and cardiovascular disease is being investigated. In compared to open-angle glaucoma, systematic studies have revealed modest impact sizes for arterial hypertension [51], diabetes [52], and obstructive sleep apnea [53]. The corneal shape is also being studied as a potential structural risk factor, albeit no relationship between a thin cornea and a thin lamina cribrosa has yet been demonstrated [54].

Vasantha et al.,

Corneal thickness, on the other hand, has an impact on intraocular pressure measurement; a thin cornea can falsely reduce the recorded pressure [55]. However, this only applies to large differences. Corneal thickness varies by around 40 μm during the day [56] Formulas that account for the influence of corneal thickness on measured intraocular pressure have proven ineffectual in practice.

Complications

Glaucoma consequences include visual field loss, which can progress to complete blindness with no light perception vision in the afflicted eye [57].

Diagnosis

Glaucoma is diagnosed with a comprehensive eye examination that includes IOP measurements, visual field tests, and optic nerve assessment using ophthalmoscopy or imaging techniques such as Optical Coherence Tomography (OCT). These tests are used to identify early signs of optic nerve damage and visual field loss, which may indicate glaucoma. High IOP is a well-known risk factor for glaucoma, hence IOP measurements are crucial in its diagnosis and therapy [58,59]. Normal IOP levels, however, do not rule out the chance of glaucoma, as some patients with normal IOP might acquire the illness for causes other than IOP. As a result, it is necessary to consider other risk factors in addition to IOP when diagnosing glaucoma [60]. Visual field testing is another critical aspect of glaucoma diagnosis is the capacity to recognize early signs of visual field loss that may indicate the existence of glaucoma. Visual field testing involves providing visual stimuli at various points in the visual field and assessing the patient's reactions with specialized equipment such as peripheral devices or computer-based systems. Visual field testing can help glaucoma patients understand the location and degree of their visual field loss [61]. Optic nerve examination using ophthalmoscopy or imaging techniques such as OCT can also give valuable information on optic nerve anatomy and function in glaucoma patients. OCT employs light waves to create high-resolution pictures of the retina and the optic nerve head, which can assist detect individuals' early symptoms. Patients with glaucoma may have optic nerve injury before symptoms manifest clinically. OCT can also be used to track changes in optic nerve structure over time, in response to therapy or disease progression. [62]

Differential Diagnosis

A multitude of illnesses can induce elevated IOP, corneal haze, conjunctival and anterior segment inflammation, and other symptoms similar to those seen in AAC patients. When assessing a patient who presents with these symptoms, consider the following differential diagnosis:

- Chronic allergic conjunctivitis
- Infections of the conjunctiva
- viral rhinitis in the eyes
- The keratitis
- Scleritis, or episcleritis,
- Ocular injuries
- Toxin exposure
- Ulceration of the cornea
- Glaucoma with open angles
- Substance-induced glaucoma
- Cancerous glaucoma
- Stroke-Related Glaucoma
- The Pharmacomorphic
- Migraine headaches [64].
- Symptoms: cluster headache, supracoronary bleeding, and prognosis.

Vasantha et al.,

Treatment

The primary goals of treating glaucoma are to shorten the disease's duration and preserve quality of life; quality of life reductions associated with glaucoma may occur earlier than previously believed, underscoring the significance of early detection and intervention [65]. The only known way to cure Lower intraocular pressure is the goal of glaucoma.[66] Reducing intraocular pressure has been shown in several multicenter clinical studies to either prevent or delay the onset of illness (see Table 1).[66, 68, 69] Individuals with ocular hypertension (high intraocular pressure but no clinical symptoms of glaucomatous damage to the optic nerve or visual field) were randomly assigned to either medication or no treatment in the Ocular Hypertension Medication Study [67]. Following a five-year period of observation, glaucoma was established by 4.4% of patients in the pharmaceutical group and 9.5% of patients in the treatment group; the untreated group experienced a 9.5% incidence of glaucoma development. All patients in the Early Manifest Glaucoma Trial [68] had a confirmed diagnosis of glaucoma at the baseline visit, but they were also randomly assigned to receive therapy or no treatment at all. Following a 6-year follow-up on average, there was less. The American Academy of Ophthalmology Preferred Practice Pattern's current management guidelines suggest reducing intraocular pressure to a target level, which is a value or range of values at which the clinician believes the disease will not progress at a rate that will impair function.(70) The ideal intraocular pressure levels for a particular eye are established. Pressure levels before to treatment were linked to retinal damage; parameters such as life expectancy, treatment-related side effects probability, and damage degree were all considered. Lowering pressure by 20% to 50% is usually the first goal, but depending on how the patient's condition develops, the target pressure needs to be checked frequently during patient follow-up.

(70)For instance, the target should be changed if the condition worsens (optic nerve anomalies or loss of vision field) even with pressure levels at the initial target value. The least amount of medications and side effects should be used to achieve the optimal intraocular pressure. There are numerous varieties of drugs that reduce blood pressure that are available (see Table 2). The choice of medication might be influenced by cost, adverse effects, and dosage instructions. Analogues of prostaglandins are typically the first line. Medical intervention. By decreasing outflow resistance and increasing aqueous humor flow through the uveoscleral pathway, these medications lower intraocular pressure.[71] These medications have minimal, if any, systemic side effects and are given once a night. On the other hand, they may result in localised side effects such orbital fat loss (prostaglandin-associated periorbitopathy), eyelash elongation and darkening, and conjunctival hyperaemia.They are employed as backup treatments or in situations where using prostaglandin analogues is not advised or tolerated poorly (see to Table 2). Intraocular pressure is lowered all day long by carbonic anhydrase inhibitors and prostaglandin analogues. as well as at night. Certain medications, such as agonists and blockers of the β -adrenergic receptor, are only effective during the day. Not in the evening, please.

[73] β -adrenergic blockers should not be used by patients with asthma, bradycardia, or chronic pulmonary obstructive disease due to potential systemic side effects. In order to reduce structural patients should utilise modest punctal occlusion or eyelid closure for two minutes following topical medication application to ensure absorption. The use of topical medications, such as β -blockers, by patients with glaucoma may have serious or even fatal side effects, which general practitioners and internists should be aware of. To enhance treatment outcomes, the importance of adhering to the treatment plan might be emphasised. The development of neuroprotective glaucoma drugs that shield optic nerves from harm has received a great deal of attention. Regrettably, there's no solid proof that these medications can slow down the glaucoma patient's illness development. Neuroprotection has not been successful in part due to a lack of understanding of the pathophysiological mechanisms causing optic nerve damage, a lack of medications that can be used to treat the established pathways, and a lack of WSurgery using a laser or incision is used when medication fails to sufficiently lower intraocular pressure while having manageable adverse effects. It is anticipated that incisional glaucoma procedures will be performed on 274 Americans per million per year.[75] People who are seriously unwell or have poor adherence may receive surgery as their first course of treatment. therapy. Biological alterations in the trabecular meshwork brought forth by laser trabeculoplasty increase aqueous outflow and hence decrease intraocular pressure. Undertaken during an office visit, the operation has a good safety profile. With a failure rate of roughly 10% annually, the effects wear off with time, even though the

Vasantha et al.,

majority of patients may see significant intraocular pressure reductions.[76, 77] The most popular incisional surgical technique for reducing intraocular pressure is trabeculectomy. It entails cutting a tiny portion of the surrounding corneoscleral tissue and/or trabecular meshwork to create a drainage channel for aqueous fluid that travels from inside the eye to beneath the conjunctiva, where it is absorbed. Antiscarring drugs are often administered to the surgical site in an effort to lower the response of fibroproliferative cells. enhances the likelihood of surgical success but also increases the risk of infection and injury from very low intraocular pressures. As an alternative to trabeculectomy, devices that drain aqueous humor to an external reservoir effectively lower intraocular pressure.[78] We are currently assessing a number of suggested substitutes for these practices. Complications that could endanger vision may be less common with these so-called minimally invasive glaucoma operations.In [79] These operations may be advised in some cases where risk-benefit analysis justifies them over trabeculectomy, even though they have not yet demonstrated the same intraocular pressure-lowering efficacy as trabeculectomy. According to a recent meta-analysis, trabeculectomy was more effective in relieving pain than nonpenetrating procedures including deep sclerectomy, viscocanalostomy, and canaloplasty. There is a larger chance of problems with higher pressure. [80]

Treatment and management

A collaborative approach is necessary for the treatment and management of glaucoma, involving medication therapy, surgical procedures, modifications to lifestyles, and periodic evaluation by medical professionals involving optometrists and ophthalmologists [81–83]. In glaucoma therapy, beta-blockers, prostaglandin analogues, carbonic anhydrase inhibitors (CAIs), and miotics are frequently employed to reduce intraocular pressure (IOP) or enhance ocular outflow. Depending on how these drugs work and any potential side effects, they can be used topically or systemically. Glaucoma surgery can be managed through conventional filtration surgery or with more advanced minimally invasive procedures as canaloplasty or Selective Laser Trabeculoplasty (SLT), that aim to lower the IOP (intraocular pressure) through enhancing eye flow capacity or lowering the generation of aqueous humour inside the eye. Combining a healthy diet high in antioxidants, such vitamins C and E, with regular exercise for those suffering from glaucoma, two lifestyle modifications are advised [85].

Radiographic features

- MRI

The body of research on the use of MRI to diagnose glaucoma is expanding [86]. The following glaucoma features can be detected by an MRI:

Thinning and reduction in the optic nerve's diameter

Often referred to as nervus opticus or nervus cranialis II, the optic nerve is the second (CN II) cranial nerve. It is a sensory nerve that connects the brain and the eye to transmit visual information. From the back of the globe, the nerve travels through the optic canal to leave the orbit. The optic chiasm serves as the connection point between the contralateral optic nerve and the medial fibres of the retina's ganglion cells. As the primary central link of the thalamic region, the lateral geniculate nucleus plays this role. Slightly lessening is also the pretectal region of the midbrain.

Axonal density reduction and atrophy of the optic chiasm cause height loss

Where the nasal (medial) fibres of the optic nerve split to form the posterior optic tracts is a structure in the midline called the optic chiasm, or chiasma. Just like the pituitary stalk, it is situated in the chiasmatic cistern and is totally encircled by the Willis circle.

Prevention

The greatest method to avoid irreversible visual field loss from glaucoma is to detect it early on. Early observation and tools such as the polygenetic risk score [87] will allow eye care practitioners to track the components that contribute to a glaucoma diagnosis To reduce or stop disease progression, they will attempt to manage intraocular pressure with medications, lasers, or surgery.. As a general rule, it is critical to see an eye care professional to be screened for glaucoma and other visual illnesses; this is especially true for persons over the age of 65. However, the

**Vasantha et al.,**

suggested screening frequency varies depending on risk variables such as age, race, ethnicity, and family history. Being aware of one's familial medical history is an essential component of preventing highly heritable illnesses such as glaucoma. Other measures to avoid glaucoma include visiting a primary care physician on a regular basis, sticking to safety advice such as wearing eye protection when working with power equipment, and following prescription medication instructions from an eye care practitioner. Pharmacologic therapy is an effective glaucoma treatment because it addresses a controllable risk factor like intraocular pressure. Other modifiable environmental risk factors, like as lifestyle, exercise, and diet, may play a role in glaucoma development. Quitting smoking, doing moderate aerobic activity, keeping a healthy weight, and eating a balanced diet rich in leafy greens, omega-3 fatty acids, tea, and coffee may help prevent or delay the onset of glaucoma [88]. Prevention is the best method of treatment, followed by Recommendations can help to lower the risk of glaucoma-related vision loss.

Genetic

Less than 10% of cases of glaucoma are caused by a number of genes that are connected with a monogenic, autosomal dominant phenotype. These genes include myocilin (MYOC, GLC1A) (CCDS1297.1),[89], optineurin (OPTN, GLC1E) (CCDS7094.1), and WD repeat domain 36 (GLC1G) (CCDS4102.1)[90]. Chromosome 1 contains the initial locus for primary open-angle glaucoma (GLC1A). Encoding the protein myocilin, MYOC is the main gene located at the GLC1A locus. Extremely high intraocular pressure is a characteristic of the juvenile or early adult type of primary open-angle glaucoma, which is more commonly associated with mutations related to myocilin disease.[91] In around 3% to 5% of cases of primary open-angle glaucoma, myocilin mutations are found. The glaucoma phenotype affects about 90% of patients who have mutations linked to the condition. It is yet unknown how myocilin-related glaucoma works.[92] The myocilin protein appears to be altered by mutations, which interferes with the regular regulation of intraocular pressure. Misfolded proteins build up intracellularly when disease-associated myocilin forms obstruct protein transport. It is believed that a rise in intraocular pressure results from insufficient production of the protein. OPTN gene carriers have normal intraocular pressure, in contrast to MYOC gene carriers. While optineurin may have a neuroprotective effect by reducing retinal ganglion cells' susceptibility to apoptotic stimuli, the exact mechanism linking OPTN gene variation to glaucoma remains unclear. The use of genome-wide scanning to identify glaucoma risk regions is becoming more prevalent in studies. Primary open angle glaucoma in groups descended from Europeans may be linked to the 7q34 CAV1/CAV2 (HGNC:1527/HGNC:1528) gene. Extensive independent research has verified this finding. In [93] Caveola are membrane invaginations that aid in cell signalling and endocytosis. These genes encode proteins called caveolins that are involved in the formation and regulation of caveola. A correlation between the 9p21 CDKN2BAS (HGNC:34341) locus and the risk of glaucoma has been observed in multiple studies. In [94] It is unknown how these genes relate to primary open-angle glaucoma, although they may interact with transforming growth factor β , a protein that impacts cell survival and development across the body. Despite promising findings, susceptibility genes for primary open-angle glaucoma that have been found thus far offer very little explanation. The disease glaucoma is harmful.

Future developments

Angle-closure glaucoma may not develop in the future due to the noted increase in the prevalence of cataract surgery and axial myopia, especially in Asia.[95] Further research on the benefits of iridotomy for East Asian individuals with angle closure will provide insights into the effectiveness of the treatment in these populations, where adult angle closure is common.[96] In addition to glaucoma medication, α kinase inhibitors used topically may be useful.[109–106] Novel sustained-release delivery methods, such as topically applied cyclo dextrans or intracameral injection of slow-release intraocular pressure-lowering medication pellets, are being investigated.[97, 98] When topically applied eye drops are used over an extended period of time, problems with poor adhesion and ocular surface degeneration may arise. These procedures may help address these concerns. Enhanced comprehension of patient-reported outcomes and experiences could potentially lead to better treatment outcomes for glaucoma.[99] Moreover, raising public and medical professional knowledge of the many forms of glaucoma can help solve the large percentage of sickness that remains undetected, even in high-income nations. This is especially true for individuals with a family history of glaucoma.[110–111] Further research will improve the morphological diagnosis of glaucoma, namely the width of the neuro retinal rim and the thickness of the retinal nerve fibre layer. These results will aid in increasing the

Vasantha et al.,

precision of diagnoses made during glaucomatous optic nerve damage.[122–125] The theory that orbital CSF pressure may be abnormally low in people with primary open angle glaucoma and normal intraocular pressure, hence raising the translamina cribrosa pressure differential, is still being investigated [112,113,114,115]. These tests might also look into dynamic alterations in the optic nerve head brought on by variations in the CSF and intraocular pressures, which don't happen at the same time. A broad range of topics may be covered in future studies. Prior research is necessary to ascertain whether retinal microglial cells have a secondary role in retinal ganglion cell injury. Reference 100 Subsequent research is necessary to gain a deeper comprehension of intracranial modifications such as brain neuroplasticity. [116] Subsequent research is necessary to ascertain the function of retinal vein pulsations and retinal venous blood pressure in the onset and identification of glaucomatous optic neuropathy.[101] Investigate the parapapillary beta zone's origin as your fourth step.[102] Fifth, more research is required to determine the causes. Glaucoma is more common in patients with high myopia.[117–120] Finally, studies on the biomechanics of the optic nerve dura mater and how it affects the optic nerve head are now being conducted. Reference 121 Investigations into the genetics, proteomics, molecular biology, cellular mechanisms, and systemic symptoms of exfoliation syndrome are warranted.[103–104] Many new treatments for glaucoma are being investigated or may be taken into consideration. To increase the receptive field of the current ganglion cells, research is first being done to find out how to promote the re-sprouting of retinal ganglion cell dendrites. [105] Secondly, studies are being conducted to improve the current surgical techniques to lower the possibility of the filtering bleb scarring after surgery, which could result in treatment failure. Finally, glaucoma patients should be the subject of stem cell and gene therapy research.

Deterrence and Patient Education

Low illumination should not be used by patients who have a history of acute angle-closure glaucoma. Iridocorneal angle narrowing may occur as a result of pupil dilation in low light. A higher risk of angle-closure glaucoma is seen in patients with hypermetropia. This is due to the fact that anatomical predispositions similar to a shallow anterior chamber depth or a more anterior lens position, which may cause angle closure, are frequently linked to hypermetropia. For people who have AAC risk factors, LPI is advised as a prophylactic intervention.[126]

Enhancing Healthcare Team Outcomes

Untreated glaucoma can cause irreparable vision loss. Glaucoma is a serious, long-term condition. Effective illness treatment requires an interdisciplinary team dedicated to treating patients' vision-related problems. Throughout the course of treatment, patient education is vital. Drug adherence and routine follow-ups with eye specialists are important topics that chemists should emphasise. In order to conduct routine visual field and OCT tests, ophthalmic technicians must work closely with doctors. Keeping an eye on IOP and reporting results to the ophthalmologist for additional assessment and therapy is under the purview of ophthalmic nurses. Glaucoma patients benefit from the integrated approach, which offers thorough care and enhances results. Prevention of disease development requires regular eye exams and adherence to medicines, those who have glaucoma. Familial members should be made aware of their heightened susceptibility to glaucoma and encouraged to make regular appointments for testing in order to guarantee early identification, as the condition is hereditary. It is noteworthy that before changing the dosage or frequency of medicine, other members of the medical team must confer with the ophthalmologist. Preventing glaucoma morbidity necessitates effective communication among medical practitioners [117].

ABSTRACT

Epilepsy, a chronic neurological disorder marked by recurrent seizures, poses significant challenges in its management due to issues like poor bioavailability, side effects, and drug resistance associated with traditional antiepileptic drugs (AEDs). Solid lipid nanoparticles (SLNs) have emerged as a promising drug delivery system to address these limitations. SLNs are submicron carriers composed of biodegradable lipids that encapsulate drugs, offering enhanced bioavailability, controlled release, and reduced side effects. This review explores the mechanisms, advantages, formulation techniques, and clinical applications of SLNs in epilepsy treatment [1]. SLNs improve the bioavailability of AEDs by protecting them from degradation and promoting better absorption. They provide sustained drug release, which minimizes dosing frequency and enhances patient compliance while reducing systemic toxicity. Various preparation methods, including high-pressure homogenization and solvent evaporation, are discussed, highlighting their impact on SLN characteristics. Preclinical and clinical studies demonstrate the efficacy of SLNs in improving seizure control and reducing side effects. The future of SLNs in epilepsy treatment is promising, with ongoing research focused on optimizing formulations and exploring new lipid materials. Overall, SLNs represent a novel and effective approach to epilepsy management, potentially revolutionizing treatment outcomes for patients.

Keywords: Encapsulated drugs, Enhanced Bioavailability, controlled release, Side Effects.

Nithin Kumar *et al.*,

INTRODUCTION

Epilepsy is a chronic neurological disorder characterized by recurrent, unprovoked seizures resulting from abnormal electrical discharges in the brain. Affecting approximately 50 million people worldwide, epilepsy significantly impacts the quality of life, often leading to psychological, social, and economic burdens. The primary goal of epilepsy treatment is to achieve complete seizure control with minimal adverse effects, which is typically managed through antiepileptic drugs (AEDs). However, conventional AEDs often face significant challenges, such as poor bioavailability, limited brain penetration, systemic side effects, and the development of drug resistance in a substantial portion of patients [2]. One of the major obstacles in the effective treatment of epilepsy is the delivery of adequate drug concentrations to the brain. The blood-brain barrier (BBB) poses a significant challenge by restricting the passage of many therapeutic agents, thereby limiting their effectiveness. Additionally, many AEDs have poor solubility and stability, further complicating their therapeutic potential. As a result, there is a critical need for innovative drug delivery systems that can overcome these barriers and enhance the therapeutic efficacy of AEDs. Solid lipid nanoparticles (SLNs) have emerged as a promising solution to these challenges. SLNs are submicron-sized carriers composed of a solid lipid core stabilized by surfactants, which encapsulate the drug molecules. These nanoparticles are designed to be solid at both room and body temperatures, providing a stable and efficient delivery system for lipophilic and poorly soluble drugs. The unique structure of SLNs allows for several advantages, including improved bioavailability, controlled and sustained drug release, enhanced drug stability, and targeted delivery, which collectively contribute to reduced side effects and improved patient compliance. The application of SLNs in epilepsy treatment offers a multifaceted approach to addressing the limitations of conventional AEDs [3,4]. By encapsulating the drugs within a solid lipid matrix, SLNs protect the active ingredients from degradation in the gastrointestinal tract and promote better absorption. Moreover, the lipid nature of SLNs facilitates their passage across the BBB, ensuring higher drug concentrations reach the brain. The controlled release properties of SLNs enable a sustained therapeutic effect, reducing the frequency of drug administration and minimizing peak-trough fluctuations in drug levels, which are often associated with side effects. In this article, we delve into the various aspects of SLNs as a novel drug delivery system for epilepsy treatment. We explore the mechanisms of SLNs, their advantages over traditional formulations, the methods of their preparation and characterization, and the current state of preclinical and clinical research. By understanding these facets, we can appreciate the potential of SLNs to revolutionize the management of epilepsy and improve outcomes for patients suffering from this debilitating condition.

Mechanism of Solid Lipid Nanoparticles

Solid lipid nanoparticles (SLNs) are an innovative drug delivery system designed to overcome the limitations of traditional drug formulations. The mechanism of SLNs involves multiple steps from drug encapsulation to targeted delivery, enhancing the pharmacokinetic and pharmacodynamic properties of the drugs they carry. Here, we detail the structure, preparation, drug release, and targeting mechanisms of SLNs.

Structure of SLNs

SLNs consist of a solid lipid core that is solid at room and body temperatures. This core is surrounded by a surfactant layer, which stabilizes the nanoparticles and prevents aggregation. The solid lipid core can encapsulate lipophilic and hydrophilic drugs, protecting them from degradation and enhancing their stability [5].

Preparation Methods

Several methods are used to prepare SLNs, each influencing the particle size, encapsulation efficiency, and drug release properties:

High-Pressure Homogenization

This technique involves dispersing the drug in a melted lipid phase followed by homogenization at high pressure. This method produces SLNs with uniform particle size and high encapsulation efficiency.

Nithin Kumar *et al.*,

Solvent Evaporation

In this method, the drug and lipid are dissolved in an organic solvent, which is then evaporated, leading to the formation of SLNs. This allows for precise control over particle size and drug loading capacity [6,7].

Microemulsion Technique

This involves creating a microemulsion of the drug and lipid, which is then dispersed in a cold aqueous phase to form SLNs. This method is known for producing tiny and uniform nanoparticles.

Drug Encapsulation and Release

The drug encapsulation process in SLNs can occur via two primary mechanisms

Homogeneous Matrix Model The drug is uniformly distributed within the lipid matrix.

Core-Shell Model The drug is concentrated in the core of the nanoparticle, surrounded by a shell of lipids. The release of the drug from SLNs can occur through different mechanisms

Diffusion The drug diffuses out of the lipid matrix over time.

Erosion The lipid matrix degrades, releasing the encapsulated drug.

Swelling and Dissolution The lipid matrix swells and dissolves in the biological environment, releasing the drug. The controlled release properties of SLNs ensure a sustained release of the drug, maintaining therapeutic levels for extended periods and reducing the need for frequent dosing.

Targeting Mechanisms

SLNs can be engineered for targeted delivery to specific tissues or cells, which is particularly beneficial in treating neurological disorders like epilepsy [8]. Two primary targeting strategies are employed:

Passive Targeting SLNs passively accumulate in the brain due to their ability to cross the blood-brain barrier (BBB). The lipid nature of SLNs facilitates their transport across the BBB, enhancing drug delivery to the brain.

Active Targeting SLNs can be modified with targeting ligands such as antibodies, peptides, or small molecules that specifically bind to receptors on the target cells. This active targeting ensures that the drug is delivered directly to the desired site of action, minimizing off-target effects.

Benefits of SLNs in Epilepsy Treatment

Enhanced Bioavailability SLNs protect drugs from degradation and promote better absorption.

Controlled Release SLNs provide sustained release, maintaining therapeutic levels and reducing dosing frequency.

Targeted Delivery SLNs can cross the BBB and be engineered for active targeting, improving drug delivery to the brain and reducing systemic side effects. In conclusion, the mechanism of solid lipid nanoparticles involves a sophisticated interplay of preparation techniques, encapsulation strategies, and controlled release properties, all aimed at enhancing the therapeutic efficacy of drugs. The application of SLNs in epilepsy treatment holds great promise, offering improved bioavailability, controlled release, and targeted delivery to the brain [9].

Advantages of SLNS In Epilepsy Treatment

Solid lipid nanoparticles (SLNs) offer several advantages over traditional antiepileptic drug (AED) delivery systems, addressing many limitations and enhancing the overall therapeutic efficacy [10]. Below, we explore these advantages in detail, including a table summarizing key benefits and mechanisms.

**Nithin Kumar et al.,****Improved Bioavailability**

SLNs improve the bioavailability of AEDs by protecting them from gastrointestinal (GI) tract degradation and enhancing their absorption through the intestinal wall. The lipid matrix of SLNs promotes better drug solubility and stability, ensuring more consistent and effective drug delivery. This increased bioavailability means that smaller doses of the drug can achieve therapeutic levels, potentially reducing side effects.

Controlled and Sustained Drug Release

One of the most significant advantages of SLNs is their ability to provide controlled and sustained release of the encapsulated drug. This results in maintaining therapeutic drug levels over an extended period, minimizing the frequency of drug administration. The controlled release also reduces peak-trough fluctuations in drug levels, which are often associated with adverse effects and breakthrough seizures.

Reduction in Side Effects

SLNs enable targeted drug delivery, particularly to the brain, thereby reducing systemic exposure and minimizing side effects. By encapsulating the drug within the lipid core, SLNs protect the drug from premature degradation and off-target interactions. The targeted delivery to the brain ensures higher drug concentrations at the site of action, reducing the overall required dosage and thereby lowering the risk of systemic toxicity [11].

Enhanced Stability and Protection

SLNs offer improved stability for encapsulated drugs, protecting them from environmental factors such as light, heat, and enzymatic degradation. This is particularly important for AEDs, which can be sensitive to such conditions. The solid lipid matrix acts as a barrier, preserving the drug's integrity until it reaches the target site.

Patient Compliance

The reduced frequency of dosing and minimized side effects associated with SLNs contribute to better patient compliance. Patients are more likely to adhere to a treatment regimen that requires fewer doses and causes fewer adverse effects, ultimately leading to better therapeutic outcomes.

Diagram**Mechanisms and Advantages of SLNs**

Below is a diagram summarizing the key mechanisms and advantages of SLNs in epilepsy treatment:

Case Study**Use of SLNs for Delivery of Carbamazepine**

Carbamazepine is a commonly used AED with poor water solubility and bioavailability. Studies have shown that SLNs can significantly enhance the bioavailability of carbamazepine. In preclinical models, carbamazepine-loaded SLNs demonstrated prolonged drug release, improved brain targeting, and better seizure control compared to conventional formulations. Patients receiving SLNs reported fewer side effects and greater adherence to the treatment regimen.

Formulation and Characterization of SLNs

The formulation and characterization of solid lipid nanoparticles (SLNs) are critical steps in ensuring their effectiveness as a drug delivery system for epilepsy treatment. These processes involve selecting appropriate lipids and surfactants, employing suitable preparation methods, and evaluating various physicochemical properties [12,13]. Below, we detail the formulation techniques and characterization methods for SLNs, along with diagrams and tables for better understanding.

Formulation Techniques**High-Pressure Homogenization (HPH)**

- **Process:** Drug and lipid are melted and mixed, followed by high-pressure homogenization.

Nithin Kumar *et al.*,

- **Advantages:** Produces uniform particles with high encapsulation efficiency.
- **Disadvantages:** Requires high energy, which can cause thermal degradation of sensitive drugs.

Solvent Evaporation

- **Process:** Drug and lipid are dissolved in an organic solvent, which is then evaporated, forming SLNs.
- **Advantages:** Allows for precise control over particle size and drug loading capacity.
- **Disadvantages:** Residual solvent can be a concern.

Microemulsion Technique

- **Process:** Drug and lipid are dispersed in a hot microemulsion, which is then cooled to form SLNs.
- **Advantages:** Produces tiny and uniform nanoparticles.
- **Disadvantages:** Requires precise temperature control.

Double Emulsion Method

- **Process:** Involves creating a water-in-oil-in-water emulsion.
- **Advantages:** Suitable for encapsulating hydrophilic drugs.
- **Disadvantages:** More complex and time-consuming process.

Diagram

SLN Preparation Methods

Characterization of SLNs

Characterization of SLNs involves assessing several physicochemical properties to ensure their efficacy and stability [14]. Key characterization methods include

Particle Size and Size Distribution

- **Method** Dynamic Light Scattering (DLS)
- **Importance** Determines the average size and distribution of nanoparticles, which influences drug release and bioavailability.

Zeta Potential

- **Method** Electrophoretic Light Scattering
- **Importance** Indicates the surface charge of nanoparticles, which affects stability and aggregation behavior.

Encapsulation Efficiency (EE)

- **Method:** Centrifugation followed by drug quantification
- **Importance:** Measures the amount of drug encapsulated within the SLNs relative to the total drug used, indicating the efficiency of the encapsulation process.

Drug Release Profile

- **Method:** In vitro release studies using dialysis
- **Importance:** Evaluate the controlled release behavior of the drug from SLNs over time.

Morphology

- **Method:** Transmission Electron Microscopy (TEM) or Scanning Electron Microscopy (SEM)
- **Importance:** Provides detailed images of the SLN structure, confirming uniformity and particle shape.

Physical State of Lipid

- **Method:** Differential Scanning Calorimetry (DSC)
- **Importance:** Assesses the crystallinity and polymorphic state of the lipid, which affects drug release and stability.

Nithin Kumar et al.,

Detailed Characterization

Particle Size and Distribution

- **Dynamic Light Scattering (DLS):** This technique measures the scattering of light by particles in suspension to determine their size [15,16]. SLNs typically have a size range of 50-1000 nm. A smaller and more uniform size distribution indicates better quality and consistency in drug delivery.

Zeta Potential

- **Electrophoretic Light Scattering:** This measures the velocity of nanoparticles in an electric field, providing the zeta potential value. A high zeta potential (either positive or negative) generally indicates good stability of the SLNs, as it suggests strong repulsive forces between particles, preventing aggregation.

Encapsulation Efficiency (EE)

- **Calculation:** Encapsulation efficiency is calculated using the formula: $EE (\%) = \frac{\text{Amount of drug encapsulated}}{\text{Total amount of drug}} \times 100$. High EE is desirable as it indicates that most of the drug is successfully encapsulated within the SLNs, maximizing the therapeutic potential.

Drug Release Profile

- **In vitro Release Studies:** These studies involve placing SLNs in a dialysis bag and immersing them in a release medium. The amount of drug released is measured over time. A controlled and sustained release profile is crucial for maintaining therapeutic drug levels and minimizing side effects.

Morphology

- **Transmission Electron Microscopy (TEM) / Scanning Electron Microscopy (SEM):** These imaging techniques provide high-resolution images of SLNs, revealing their shape and surface characteristics. Uniform and spherical particles are typically desired for consistent drug delivery.

Physical State of Lipid

- **Differential Scanning Calorimetry (DSC):** DSC measures the heat flow associated with lipid melting and crystallization. This data helps in understanding the polymorphic transitions and crystallinity of the lipid matrix, which affect drug release and stability.

Clinical Applications and Research on Solid Lipid Nanoparticles (SLNs) in Epilepsy Treatment

The clinical applications and research on solid lipid nanoparticles (SLNs) have shown promising results in enhancing the treatment of epilepsy [17]. The unique properties of SLNs—such as improved bioavailability, controlled release, and targeted delivery—make them suitable candidates for delivering antiepileptic drugs (AEDs). Here, we discuss the clinical applications and summarize current research findings with diagrams and a table for better visualization.

Clinical Applications

Enhanced Drug Delivery to the Brain

- **Mechanism:** SLNs improve the penetration of AEDs across the blood-brain barrier (BBB) due to their lipid-based composition. This leads to higher drug concentrations in the brain, which is crucial for effective seizure control.
- **Example:** SLNs loaded with carbamazepine have demonstrated enhanced brain delivery and improved seizure management in preclinical studies.

Improved Bioavailability

- **Mechanism:** SLNs enhance the solubility and stability of poorly water-soluble AEDs, increasing their bioavailability. This allows for lower dosages and reduces systemic side effects.
- **Example:** Phenytoin-loaded SLNs have shown increased bioavailability compared to conventional formulations, reducing the frequency of dosing [18].

Nithin Kumar et al.,

Controlled and Sustained Release

- **Mechanism:** SLNs provide a controlled release of the encapsulated drug, maintaining therapeutic levels over an extended period and minimizing peak-trough fluctuations.
- **Example:** Valproic acid-loaded SLNs have been designed to release the drug gradually, providing sustained seizure control.

Reduced Side Effects

- **Mechanism:** Targeted delivery of AEDs using SLNs reduces systemic exposure and minimizes side effects. This is particularly beneficial for drugs with narrow therapeutic windows.
- **Example:** Diazepam-loaded SLNs have shown reduced systemic toxicity and better seizure control in animal models [19].

Mechanisms of SLNs in Enhancing Epilepsy Treatment

Research Findings

Extensive research has been conducted to evaluate the efficacy of SLNs in delivering various AEDs. Below are key findings from recent studies [20]

Carbamazepine-loaded SLNs

- **Study:** Preclinical studies in animal models.
- **Findings:** Enhanced brain targeting, improved bioavailability, and better seizure control compared to conventional formulations.

Phenytoin-loaded SLNs

- **Study:** Comparative bioavailability studies in rats.
- **Findings:** Increased bioavailability and reduced dosing frequency, leading to improved patient compliance.

Valproic acid-loaded SLNs

- **Study:** In vitro and in vivo release studies.
- **Findings:** Sustained drug release and prolonged therapeutic effect, reducing the need for frequent administration.

Diazepam-loaded SLNs

- **Study:** Toxicity and efficacy studies in animal models.
- **Findings:** Reduced systemic toxicity, enhanced brain delivery, and effective seizure suppression.

Future Prospects and Challenges

Future Prospects

Personalized Medicine

- **Advancements:** Development of SLNs tailored to individual patient needs based on genetic, metabolic, and lifestyle factors.
- **Potential:** Customized SLN formulations could enhance therapeutic outcomes and minimize adverse effects.

Combination Therapy

- **Advancements:** Co-encapsulation of multiple AEDs within a single SLN formulation.
- **Potential:** Combination SLNs could provide synergistic effects, improving seizure control and reducing the development of drug resistance [21].

Smart Delivery Systems

- **Advancements:** Integration of stimuli-responsive elements in SLNs that release drugs in response to specific triggers such as pH, temperature, or magnetic fields.

Nithin Kumar et al.,

- **Potential:** Smart SLNs could provide on-demand drug release, optimizing therapeutic efficacy and reducing side effects.

Challenges

Scalability

- **Issue:** Scaling up the production of SLNs while maintaining consistency and quality.
- **Solution:** Development of robust manufacturing processes and quality control measures.

Regulatory Approval

- **Issue:** Ensuring that SLNs meet regulatory standards for safety, efficacy, and quality.
- **Solution:** Rigorous preclinical and clinical testing, along with clear regulatory guidelines for nanoparticle-based drug delivery systems.

Long-term Stability

- **Issue:** Ensuring the long-term stability of SLNs during storage and upon administration.
- **Solution:** Optimization of lipid compositions and storage conditions to maintain SLN integrity and drug efficacy.

CONCLUSIONS

The application of solid lipid nanoparticles (SLNs) for the treatment of epilepsy offers a revolutionary approach to overcoming the limitations of conventional antiepileptic drugs (AEDs). SLNs significantly enhance the bioavailability of AEDs by improving their solubility and stability, protecting them from degradation in the gastrointestinal tract, and promoting better absorption through the intestinal wall. The lipid nature of SLNs facilitates their penetration across the blood-brain barrier (BBB), ensuring higher drug concentrations reach the brain, which is crucial for effective seizure control. Additionally, SLNs provide a controlled and sustained release of encapsulated drugs, maintaining therapeutic levels over an extended period and minimizing the frequency of drug administration. This controlled release property reduces peak-trough fluctuations in drug levels, often associated with adverse effects and breakthrough seizures. Targeted drug delivery using SLNs reduces systemic exposure and minimizes side effects. Encapsulating the drug within the lipid core protects it from premature degradation and off-target interactions. By ensuring higher drug concentrations at the site of action, the overall required dosage can be lowered, reducing the risk of systemic toxicity. SLNs offer improved stability for encapsulated drugs, protecting them from environmental factors such as light, heat, and enzymatic degradation, which is particularly important for AEDs. The solid lipid matrix acts as a barrier, preserving the drug's integrity until it reaches the target site [22]. The reduced frequency of dosing and minimized side effects associated with SLNs contribute to better patient compliance. Patients are more likely to adhere to a treatment regimen that requires fewer doses and causes fewer adverse effects, ultimately leading to better therapeutic outcomes. Prospects for SLNs include personalized medicine, combination therapy, and smart delivery systems. These advancements could lead to customized SLN formulations, synergistic effects from co-encapsulated drugs, and on-demand drug release. However, challenges such as scalability, regulatory approval, and long-term stability need to be addressed through robust manufacturing processes, rigorous testing, and optimization of lipid compositions and storage conditions. Extensive research has demonstrated the potential of SLNs in delivering various AEDs with improved efficacy. Preclinical studies have shown enhanced brain targeting, increased bioavailability, and better seizure control with SLN formulations of drugs like carbamazepine, phenytoin, valproic acid, and diazepam. In conclusion, SLNs hold great promise for improving the treatment of epilepsy. By enhancing the delivery and efficacy of AEDs, reducing side effects, and improving patient compliance, SLNs have the potential to significantly improve the quality of life for patients suffering from this debilitating condition. Ongoing research and development efforts aim to further optimize SLN formulations and address current challenges, paving the way for their successful integration into clinical practice [23,24].

Table 1. Advantages of SLNs in Epilepsy Treatment

Advantage	Description	Mechanism
Improved Bioavailability	Enhanced absorption and protection from GI degradation	The lipid matrix improves solubility and stability
Controlled and Sustained Release	Maintains therapeutic drug levels, reduces dosing frequency	Controlled release properties of SLNs
Reduction in Side Effects	Minimizes systemic exposure and off-target interactions	Targeted delivery to the brain, lower overall required dosage
Enhanced Stability and Protection	Protects drugs from environmental factors and enzymatic degradation	Solid lipid matrix acts as a barrier
Patient Compliance	Fewer doses and minimized side effects lead to better adherence to treatment	Sustained release and targeted delivery reduce the frequency and severity of side effects

Table 2. Characterization Methods of SLNs

PROPERTY	METHOD	IMPORTANCE
Particle Size	Dynamic Light Scattering (DLS)	Influences drug release and bioavailability
Zeta Potential	Electrophoretic Light Scattering	Affects stability and aggregation behavior
Encapsulation Efficiency	Centrifugation and quantification	Indicates efficiency of drug encapsulation
Drug Release Profile	In vitro release studies	Evaluate controlled release behavior
Morphology	TEM or SEM	Confirms uniformity and particle shape
Physical State of Lipid	Differential Scanning Calorimetry (DSC)	Assesses crystallinity and polymorphic state of lipid

Table 3. Research on SLNs for Epilepsy Treatment

DRUG	STUDY TYPE	KEY FINDINGS
Carbamazepine	Preclinical animal studies	Enhanced brain targeting, improved bioavailability, better seizure control
Phenytoin	Comparative bioavailability studies	Increased bioavailability, reduced dosing frequency, improved patient compliance
Valproic Acid	In vitro and in vivo release studies	Sustained drug release, prolonged therapeutic effect, reduced need for frequent administration
Diazepam	Toxicity and efficacy studies	Reduced systemic toxicity, enhanced brain delivery, effective seizure suppression

ABSTRACT

This study investigates the formulation and efficacy of extended-release tablets of Paroxetine Dihydrochloride, leveraging advanced drug delivery systems to reduce dosing frequency while ensuring sustained therapeutic levels. Various excipients, including HPMC K100M, Sodium Carboxymethyl Cellulose, and Eudragit L100, were employed to achieve optimal drug release characteristics. Pre-formulation and compatibility assessments were conducted using Fourier-transform infrared spectroscopy (FTIR), confirming the absence of significant drug-excipient interactions. Comprehensive evaluations of bulk density, tapped density, and flow characteristics were conducted, with the formulation exhibiting satisfactory physicochemical properties. In vitro dissolution studies revealed that formulation F9 demonstrated a drug release profile comparable to the innovator product, exhibiting a remarkable similarity factor of 66.43, indicating effective drug dispersion and release. Furthermore, drug release kinetics primarily conformed to the Higuchi model, suggesting a non-Fickian diffusion mechanism, thereby highlighting the potential of these extended-release formulations to enhance patient compliance and improve health outcomes in chronic conditions like depression.

Keywords: Extended-release, Pre-formulation, drug-excipient interactions, patient compliance

INTRODUCTION

Extended drug delivery systems, widely recognized as prolonged or timed release formulations, are meticulously engineered to achieve a significant reduction in dosing frequency, typically by at least two-fold compared to conventional drug forms. This advancement is especially critical, as the therapeutic efficacy of any medication fundamentally relies on its ability to reach specific targets in sufficient concentrations, thereby sustaining desired plasma levels over an extended time frame. Orally administered drugs confront a multitude of obstacles in their quest to enter systemic circulation. Following ingestion, these pharmaceuticals must successfully navigate the absorption process in the upper gastrointestinal tract, traversing through the capillaries and veins before being transported to the liver via the portal vein. Throughout this complex journey, they are exposed to various pH levels and enzymatic activities present in the gastrointestinal fluids, which may not only deactivate the drug but also hinder its solubility. Moreover, once absorbed in the intestine, these orally administered drugs are frequently subjected to the considerable challenge of "first pass" metabolism in the liver. This metabolic encounter often leads to a substantial reduction in bioavailability, particularly for those drugs that exhibit non-linear pharmacokinetics. A notable phenomenon arises when the administered dose surpasses the liver's metabolic capacity: a significant increase in drug concentration within the bloodstream can occur, thereby posing challenges for maintaining therapeutic levels over extended periods, such as 12 or 24 hours. To effectively mitigate these challenges, drug delivery systems specifically designed for orally administered drugs prone to the first pass effect have evolved. These systems encompass immediate-release formulations, which require administration three to four times daily, as well as the more advantageous extended-release formulations, appropriate for once-daily dosing. The latter category is often preferred due to its manifold benefits, including enhanced patient compliance and the ability to maintain more stable therapeutic levels throughout the duration of action, thus effectively alleviating the complications presented by the first pass phenomenon.

Advantages of extended release dosage forms

Patient Compliance

The integration of extended release drug delivery systems plays a pivotal role in significantly enhancing patient compliance, particularly for individuals managing chronic conditions. Non-compliance often stems from a myriad of factors, including the patient's comprehension of their illness, their trust in the prescribed therapy, and their understanding of the crucial need to adhere to a precise treatment regimen. Additionally, the intricacy of therapeutic protocols, the financial burden of treatment, and the potential for adverse effects create substantial barriers to consistent medication adherence. By employing extended release formulations, healthcare providers can decrease the frequency of doses required, thereby simplifying the treatment landscape and ultimately encouraging patients to remain committed to their medication schedules. This approach not only streamlines the patient experience but also fosters improved overall health outcomes through more reliable adherence to prescribed therapies.

Improved Efficiency in Treatment

Optimal therapy of a disease necessitates the efficient delivery of active drugs to the specific tissues and organs that require treatment. Often, doses administered are significantly higher than what is needed at the cellular level to attain the therapeutically effective concentration. Unfortunately, this can result in undesirable toxicological and immunological effects in non-target tissues. By employing extended-release dosage forms, there can be better management of both acute and chronic disease conditions.

Economy

In comparison to conventional dosage forms, the average cost of treatment-over an extended period may be lower. Additionally, economic benefits may arise from a decrease in nursing time and reduced necessity for hospitalization.

**Killo Somesh Kumar and Jyosna****Improved Therapy**

- **Sustained Blood Levels** Extended-release dosage forms provide uniform drug availability, preventing the “peak and valley” blood level patterns associated with intermittent administration.[2+source]
- **Attenuation of Adverse Effects** The incidence and intensity of adverse effects resulting from excessively high peak drug concentrations are reduced.[2+source]
- **Improved Compliance** There is a lower likelihood of missed doses due to patient non-compliance, which enhances overall therapy efficiency.[2+source]
- **Reduced Blood Level Oscillation** These formulations help lower the fluctuations in drug levels that characterize the multiple dosing of conventional forms.[2+source]
- **Minimized Drug Administration** They allow for minimizing the amount of drug required for effective therapy.[2+source]
- **Maximized Availability** Extended-release forms aim to maximize drug availability to achieve the desired effect at a lower dose.[2+source]
- **Controlled Absorption** Peaks that may occur after the administration of highly bioavailable drugs can be mitigated, reducing the potential for adverse effects.[2+source]
- **Enhanced Safety Margin** For high-potency drugs, the safety margin can be significantly increased.

Depression

Depression is a multifaceted psychiatric disorder characterized by a prolonged sense of sadness, hopelessness, and a significant decline in interest or pleasure in daily activities. This condition is not merely transient; it is chronic and profoundly disrupts an individual’s ability to function effectively across social, occupational, and personal domains. According to estimates from the World Health Organization (WHO), over 280 million individuals worldwide grapple with depression, solidifying its status as one of the most prevalent mental health disorders. It can manifest in various forms, including major depressive disorder (MDD), dysthymia, and seasonal affective disorder, among others.

The etiology of depression is commonly associated with imbalances in neurotransmitter activity, particularly those involving serotonin, norepinephrine, and dopamine. Furthermore, the disorder often coexists with other medical conditions, such as anxiety disorders, cardiovascular diseases, and chronic pain, which complicates its effective management. Standard treatment strategies typically encompass the administration of antidepressant medications, including selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclic antidepressants (TCAs), and monoamine oxidase inhibitors (MAOIs), often in tandem with psychological therapies. However, many patients encounter significant hurdles, such as delayed therapeutic onset, side effects, challenges in medication adherence, or resistance to treatment. These obstacles underscore the imperative for alternative and more patient-focused drug delivery methods that enhance the onset of therapeutic effects, improve bioavailability, and foster adherence to treatment protocols. Recent strides in pharmaceutical technology, especially in the development of fast-dissolving oral films (FDOFs), offer innovative alternatives for the delivery of psychotropic medications. These cutting-edge dosage forms prove particularly beneficial for populations struggling with swallowing difficulties, including elderly patients or individuals coping with mental health disorders, who may find it particularly challenging to adhere to complex medication regimens. Therefore, the exploration of such innovative drug delivery systems becomes vital for optimizing therapeutic outcomes in the management of depression.

MATERIALS AND CHEMICALS

The active pharmaceutical ingredient used in this study was Paroxetine Dihydrochloride, procured from Paras Impex, Ahmedabad. Various excipients and polymers were employed for formulation development and evaluation. Lactose Monohydrate, used as a diluent, was obtained from Signet Chemicals, Mumbai. For disintegration and film-forming purposes, Sodium Carboxymethyl Cellulose (Na CMC) was sourced from Aditya Chemicals, Hyderabad. Different grades of Hydroxypropyl Methylcellulose (HPMC) — including K100M (FMC Biopolymer, Mumbai) — were incorporated to evaluate their effects on the formulation. Eudragit L100, a pH-dependent polymer, was

**Killo Somesh Kumar and Jyosna**

supplied by Evonik, Ahmedabad. Microcrystalline Cellulose (MCC) PH101 and PH102, used as binders and fillers, were included and sourced accordingly. Polyvinyl Pyrrolidone (PVP K90) was used as a binder in the granulation process. Magnesium Stearate was included as a lubricant, procured from Signet Chemicals, Hyderabad.

Pre-formulation studies

Pre-formulation involves the determination of both physical and chemical properties of the drug along with the excipients in the form of mixture. The information obtained from the pre-formulation study can be utilized to an economical, highly efficacious stable and elegant dosage form. Establish the physicochemical characteristics of the drug moiety. Determine the kinetic rate profiles of the drug. Establish compatibility of drug with excipients. Obtain insight in the various dosage forms suitable for formulation.

FT-IR (Fourier transform infra red spectroscopy) studies

Infra red spectroscopy is widely used in pharmaceutical research. IR spectroscopy is routinely used for compound identification as a fingerprinting tool. IR spectroscopy also has its application in studies of drug – excipient interaction, contaminant analysis etc. IR spectrum with high quality is acquired with the FTIR method. Fourier transformation mathematical operation can resolve the signal captured by detector as a summation of all these cosine signals and in connection with the contribution of each wavelength. Several sampling methods are available for IR spectrum acquisition, such as alkali halide pellet, mineral-oil mull, diffuse reflectance technique and attenuated total reflectance. Each has its advantages and disadvantages. IR spectrum with high quality is acquired with KBr (pellet) method. Compatibility study of drug with the excipients was determined by using FTIR. The sample powder of drugs, excipients and mixture of them were prepared and placed on glass plate and apply the infra red beam to record the spectra. The mixture spectra were compared with that of the original spectra.

Pre compression Evaluation**Angle of repose**

The frictional forces in a loose powder or granules can be measured by angle of repose. This is the maximum angle possible between the surface of pile of powder or granules and the horizontal plane. The granules were allowed to flow through the funnel fixed to a stand at definite height (h). The angle of repose was then calculated by measuring the height and radius of the heap of granules formed.

$$\text{Then } \theta = \tan^{-1} (h/r)$$

Where, θ is the angle of repose, h is the height of the heap of powder and r is the radius of the heap of the powder.

Bulk density

Bulk density includes the contribution of interparticulate void volume. Hence, it depends on both the density of powder and the space arrangements of particles in the powder bed.

Procedure

A weighed quantity of the powder sample passed into 50 ml graduated cylinder. The powder sample was carefully levelled in the cylinder without compacting. The unsettled apparent volume was read to the nearest graduated unit and noted. The bulk density was calculated by using the formula,
Bulk density = (Weight of the powder blend)/(Bulk volume)

Tapped density

As mentioned in the method of bulk density, the unsettled volume was noted. Then the measuring cylinder was subjected to taps by using Tap Density apparatus and the change in volume was noted. Tapped density was calculated using the following equation,

$$\text{Tapped density} = (\text{Weight of the powder blend})/(\text{Tapped volume})$$

**Killo Somesh Kumar and Jyosna****Carr's Index**

This property is known as compressibility. It is indirectly related to the relative flow rate, cohesiveness and particle size. It is simple, fast and popular method of predicting powder flow characteristics. It can be a measure of the potential strength that a powder could build up in its arch in a hopper and also the ease with which such an arch could be broken. It is an important measure that can be obtained from the bulk and tapped densities. In theory, the less compressible a material the more flow able it is. The formula for Carr's Index is as below,

$$\text{Carr's Index} = \frac{\text{Tapped density} - \text{Bulk density}}{\text{Tapped density}} \times 100$$

Tapped density The nature of the flow is inferred by comparing the data with the index given in the table below.

Formulation development**Formulation procedure**

The preparation of Paroxetine Dihydrochloride extended-release tablets was carried out using the following steps:

Sieving and Dry Mixing

Lactose Monohydrate, MCC PH101, Sodium Carboxymethyl Cellulose (Na CMC), Eudragit L100, HPMC K100M, and MCC PH102 were individually sifted through a #40 mesh sieve to ensure uniform particle size. The sifted powders were collected separately in polybags.

Dry Mixing in Rapid Mixer Granulator (RMG)

Lactose Monohydrate, MCC PH101, Na CMC, and Eudragit L100 were loaded into the RMG. Dry mixing was performed for 15 minutes with the impeller running at slow speed and the chopper turned off to ensure homogeneous mixing.

Preparation of Drug-Binder Solution

Purified water was transferred into a stainless steel (SS 316) container equipped with a stirrer. Polyvinyl Pyrrolidone (PVP K90) and Paroxetine Dihydrochloride were added to the water and stirred continuously until a clear binder solution was obtained.

Granulation

The drug-binder solution was gradually added to the dry mixed powder in the RMG over 3 minutes, with the impeller running at slow speed and the chopper off. Additional purified water was added over 1 minute while increasing the impeller speed to fast and the chopper to slow speed to achieve the desired wet mass consistency.

Drying

The wet granules were transferred to a fluid bed dryer. Drying was performed at an inlet temperature of 55–65°C for 20 minutes with intermittent raking. Loss on drying (LOD) was checked using an LOD apparatus at 105°C until constant weight was achieved. The desired LOD was not more than 3% w/w.

Sieving and Milling

The dried granules were sifted through a #20 mesh sieve; oversized granules were separated. Oversized granules were milled using a 1.5 mm screen at medium speed with knives forward. The milled granules were passed through a #20 sieve again. Retention from the previous sieve were milled using a 1 mm screen and passed through #20 sieve.

Pre-lubrication and Lubrication

The dried granules were blended with sifted HPMC K100M, MCC PH102, Na CMC (extra granular part), and colloidal silicon dioxide in an octagonal blender for 10 minutes. Magnesium stearate was then added and blended for an additional 5 minutes to ensure proper lubrication.

Compression

The final blend was compressed into tablets using 9.5 mm round standard concave punch tooling.

**Killo Somesh Kumar and Jyosna****Post compression studies****Weight variation test**

Twenty tablets were selected randomly, weighed individually and average weight was calculated. Not more than two of the individual weights should deviate from the average weight by more than the percentage shown in the table and none should deviate by more than twice that percentage.

Friability

Friability is the measure of tablet strength. About 10 tablets were carefully dedusted and weighed. The tablets were placed in friability test apparatus and rotated 100 times at 25 ± 1 rpm for 4 mins. The tablets were removed, dedusted and weighed. The percent friability was calculated using the formula.

Initial wt. of Tablets – Final wt. of Tablets

Friability (%) = $\frac{\text{Initial wt. of Tablets} - \text{Final wt. of Tablets}}{\text{Initial wt. of Tablets}} \times 100$

Initial wt. of Tablets

Thickness

Ten tablets from each formulation were taken randomly and their thickness was measured with vernier caliper.

Hardness test

The tablet crushing strength, which is the force required to break the tablet by compression in the diametric direction was measured in triplicate using Monsanto tablet hardness tester. The tablet was held between the edges of the fixed and movable part of the instrument. The scale was adjusted by sliding, so that the zero on the scale coincides with the pointer. The adjustable knob was moved slowly till the tablet breaks. The hardness was measured in kg/cm².

Drug content

The tablets were tested for their drug content uniformity by RP-HPLC. Twenty tablets containing Paroxetine dihydrochloride were exactly weighed and ground into a fine powder. From this powder, an amount of the tablet powder equivalent to 25 mg Paroxetine dihydrochloride was transferred to a 25 ml standard flask containing 10 ml of diluent and shaken for 10 minutes. The volume was made up to the mark with diluent and mixed well. The solution was filtered through a 0.45 μm membrane filter. The filter solution was appropriately diluted with diluent to obtain a concentration of 100 $\mu\text{g/ml}$. From this solution, 5 μl was injected into the HPLC system. The area under the peak was noted and the drug content in the tablets was quantified using the calibration graph or regression equation.

Buffer preparation

Weigh accurately 5g sodium octane sulphate Monohydrate and 9.1 KH₂PO₄ in 900 ml of milli Q water adjust its pH to 3 with dilute phosphoric acid, dilute to 1000 ml of milli Q water. Filter the solution through 0.45 μm nylon filter paper and sonicate to degas.

Preparation of mobile phase

Mobile phase 'A' consisted of buffer (100 %v/v). Mobile phase 'B' was acetonitrile. The mobile phase used for analysis was prepared by mixing mobile phase 'A' and mobile phase 'B' in the ratio, 60:40 v/v. The same mobile phase was also used as a diluent for the sample preparations.

Procedure

Working standard solutions equivalent to 1 to 100 $\mu\text{g/ml}$ Paroxetine dihydrochloride were prepared by appropriate dilution of the stock standard solution (1 mg/ml) with the diluent. Prior to injection of the drug, the mobile phase was pumped for about 30 minutes to saturate the column thereby to get the base line corrected. 5 μl of each solution was injected automatically onto the column in triplicate and the peaks were determined at 264 nm. The peak areas of Paroxetine dihydrochloride were plotted against the corresponding nominal concentration to obtain calibration graph. The concentration of the drug was obtained from the calibration graph or the regression equation

Killo Somesh Kumar and Jyosna

In-Vitro drug release

In-Vitro dissolution studies of the extended release tablets of Paroxetine dihydrochloride formulations were carried out in 0.1N hydrochloric acid pH 1.2 medium for first 2 hours, which was then replaced with the same volume of a phosphate buffer solution pH 6.8 kept at $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$. One tablet was used in each test. Aliquots of the dissolution medium (5 ml) were withdrawn at specific time intervals and replaced immediately with equal volume of fresh medium. The samples were filtered through membrane filter disc and analyzed for drug content by measuring area with HPLC. Drug concentration was calculated from the standard curve and expressed as cumulative percent drug release.

Drug release kinetics

The dissolution profile of all the batches was fitted to Zero order, First order and Higuchi to ascertain the kinetic modeling of the drug release. The method of Bamba et al. was adopted for deciding the most appropriate model.

Zero order

In many of the modified release dosage forms, particularly sustained or controlled release dosage forms (those dosage forms that release the drug in planned, predictable and slower than the normal manner), is zero-order kinetic and can be calculated by formula,

$m = k \times t$, Where, k is zero-order constant, m is the % drug unreleased and t is the time. The plot of % drug unreleased (released) versus time is the linear.

First order

Most conventional dosage forms exhibits this dissolution mechanism. Some modified release preparation, particularly prolonged release formulations, adheres to this type of dissolution pattern and can be calculated by formula,

$$\ln(100-Q) = \ln 100 - k_1 t$$

Where Q is the percent of drug release at time t, and k_1 is the release rate constant. It assumes that the drug molecules, diffuses out through a gel like layer formed around the drug during the dissolution process. A plot of log % drug release versus time is the linear.

Higuchi Model A large number of modified release dosage form contain some sort of matrix system. In such instances, the drug dissolves from the matrix. The dissolution pattern of the drug is dictated by water penetration rate (diffusion controlled) and thus the following relationship applies as formula

$Q = k_2 t^{1/2}$, Where Q is the percent of drug release at time t, and k_2 is the diffusion rate constant In higuchi model, a plot of % drug unreleased (released) versus square root of time is linear.

Korsmeyers peppa's equation

$$M_t/M_{\infty} = K t^n$$

Where, M_t is the amount of drug released at time t, M_{∞} is the amount of drug released after infinite time, k is a kinetic constant incorporating structural and geometric characteristics of the tablet, and n is the diffusional exponent indicative of the drug release mechanism.

In short, the results obtained from in vitro release studies were plotted in four kinetics models of data treatment as follows:

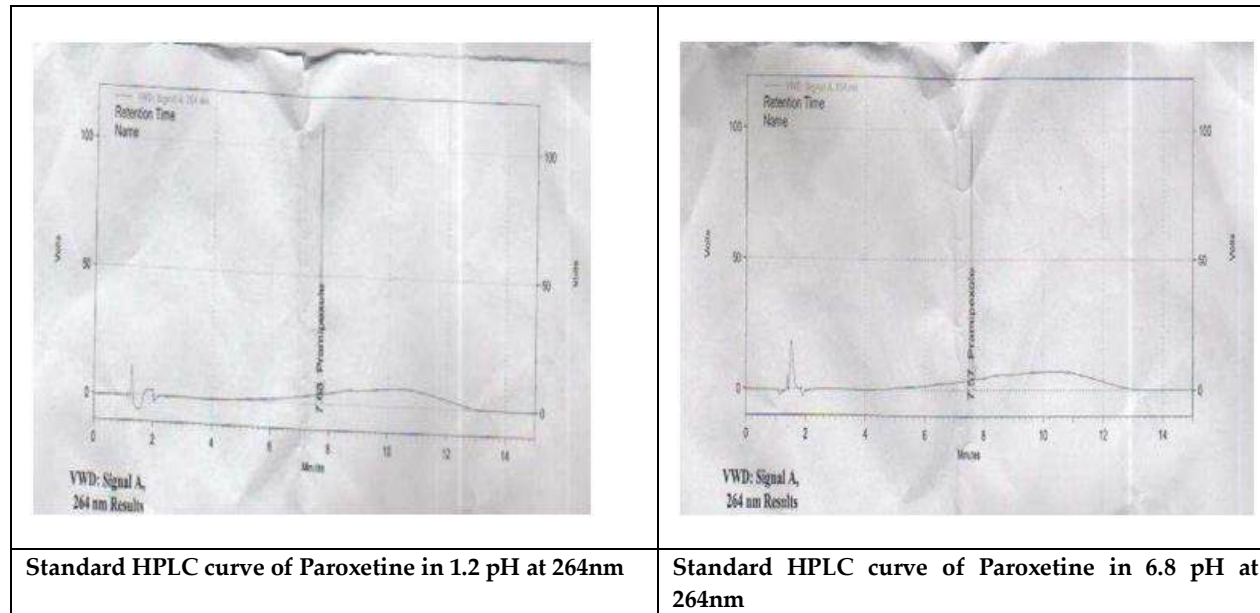

- Cumulative percentage drug release Vs. Time (zero order rate kinetics)
- Log cumulative percentage drug retained Vs. Time (first order rate kinetics)
- Cumulative percentage drug release Vs. \sqrt{t} (Higuchi's classical diffusion equation)
- Log of cumulative percentage drug release Vs. log Time (Peppa's exponential equation)

Identification of drugs by FTIR

Drug excipient incompatibility refers to physical or chemical interaction between excipients and active ingredient which may influence drug safety and efficacy through its detrimental effect on drug stability and bioavailability. The compatibility of drug with excipients was investigated by FTIR spectroscopy. It was concluded that excipients tested can be effectively used in formulations. Based on results of FTIR no changes in structure of drug were evident. In the drug-excipient interaction study, it was found that no significant change in the position of peaks was observed in the IR spectra of drug with excipients compared to spectra of pure drug. Paroxetine dihydrochloride tablets contain not less than 90% and not more than 110% of the labeled amount of Paroxetine. Drug content (94.23 to 101.73%) was found uniform within the batches of different tablets

DISCUSSION

Paroxetine dihydrochloride extended release tablets were prepared by wet granulation method using different polymers like HPMC K100M, Lactose and HPMC E3 CPS and other excipients. Flow promoters such as Mg. Stearate were used in the formulation of tablets. In all the formulations, the dose of Paroxetine was kept constant at 0.375mg. The proposed dosage form is intended for decreasing the dosing frequency.

**Killo Somesh Kumar and Jyosna****FTIR Studies**

The sample powder of drugs, excipients and their mixtures in the ratio of 1:1 were subjected to FTIR studies. The mixture spectra were compared with original spectra of pure drug. In the drug-excipient interaction study there is no interaction between the drug and excipients. FTIR study revealed that combinations are showing all characteristic peaks of the drug i.e., 3427 corresponds to N-H stretch in amine, 2939 corresponds to C-H stretch in Propyl chain, 1589 corresponds to C=C stretch in Aromatic ring, 1312 corresponds to C-N stretch in Amine, 758 cm^{-1} which corresponds to C-H bending of monosubstituted aromatic ring are observed. The FTIR spectrums are shown in fig 7 to 21 and their interpretations shown in the table 7 to 21 as found that no significant change in the position of peaks was observed in the IR spectra of drug with excipients compared to spectra of pure drug. Thus the chosen excipients for the formulations were found to be compatible with the active drug.

Pre-compression evaluation parameters

The results of the bulk densities and tapped densities. The mean bulk densities of the blend were found to be in the range from 0.472 to 0.510 g/ml. The mean tapped densities of powders were found to be in the range from 0.557 to 0.626 g/ml. The results of Carr's index were and Hausner's ratio are represented in Table 25 The Carr's index values ranges from 13.23 to 17.93. The Hausner's ratio values ranges from 1.12 to 1.22 and showed that the formulations F1 to F12 had acceptable flow properties. Finally the " θ " of angle of repose values were in the range of 25^o.53' to 29^o.25'. So the flow properties were good.

Post-compression evaluation of tablets

The tablets were found to be round in shape embossed with 0.375 on one side and PER on other side. The tablets prepared were found uniform with respect to hardness and values ranges from 12.0-12.6 kg/cm². Friability values ranges from 0.52 to 0.88%. Weight variation of all batches of tablets was found within prescribed IP limits (7.5%). The weight variation values ranges from 1.17 to 4.15. The thickness values of the formulation were ranges from 4.12 to 4.72 mm.

Dissolution

In-vitro dissolution studies were performed for all the formulated tablets using USP-II tablet dissolution apparatus employing rotating paddle method at 100 rpm using 500 ml of pH 6.8 phosphate buffer solutions as dissolution medium and the temperature of dissolution medium was maintained at 37 \pm 0.5 $^{\circ}$ C. The results of *In-Vitro* drug release data are given in table no 33 to 44. As per the results of dissolution studies, the formulations from F1 to F12 showed that the drug release was satisfactory and the F9 formulation is showing similar dissolution profile as that of the innovator with a similarity factor 66.43 as in this formulation the concentration of Sodium carboxy methyl cellulose is more i.e. 10% when compared to all other formulations and its concentration is distributed in the ratio of 3:1 in intragranulation and extragranulation and also this formulation having combination of diluents MCC PH101 and MCC PH102 in the ratio of 3:1 where as remaining formulations are have only one diluent so F9 formulation is considered as best formulation among 12 formulations.

Drug release kinetics

The drug release kinetics was performed for all the formulations and optimized formulation, in that only F1, F2, and F6, formulations showed Fickian type of diffusion and remaining 9 formulations i.e. F3, F4, F5, F7, F8, F9, F10, F11, F12 were showed Non-fickian type of diffusion. The release kinetics of the optimized formula followed Higuchi model and non-fickian transport.

CONCLUSION

The formulation of extended-release tablets of Paroxetine Dihydrochloride, utilizing polymers such as HPMC K100M, Sodium Carboxymethyl Cellulose, and Eudragit L100, demonstrates considerable promise in significantly reducing dosing frequency while maintaining therapeutic efficacy. Comprehensive physicochemical analyses,

**Killo Somesh Kumar and Jyosna**

including Fourier-transform infrared (FTIR) spectroscopy, have affirmed the compatibility of the excipients with the active pharmaceutical ingredient, thereby mitigating any adverse interactions that could compromise the stability or bioavailability of the formulation. Both pre-compression and post-compression evaluations revealed satisfactory flow characteristics and consistency in tablet formulation, indicative of robust physicochemical properties. The results from the dissolution studies underscored that formulation F9, distinguished by its elevated concentration of Sodium carboxy methyl cellulose and a unique diluent ratio, exhibited a drug release profile closely resembling that of the innovator product, achieving an impressive similarity factor of 66.43. Furthermore, the kinetics of drug release indicated that the optimized formulations predominantly conformed to the Higuchi model and demonstrated non-Fickian diffusion mechanisms, highlighting effective dispersion and release characteristics of the drug. These findings suggest that the newly devised extended release tablets not only enhance patient adherence by decreasing the frequency of doses but also ensure the maintenance of sustained therapeutic levels of the active ingredient. Consequently, this study provides invaluable insights into the development of efficient drug delivery systems aimed at improving treatment outcomes for individuals grappling with depression and potentially other chronic conditions.

ABSTRACT

Malware for Android devices is appearing at an alarming rate, coinciding with the fast development of Android apps in the mobile ecosystem. The issue of Android malware detection has been the subject of much study, with several researchers offering various hypotheses and approaches. According to the available literature, machine learning has great potential as a malware detector for Android devices. In this paper we propose an improved capsule network for android malware detection. The dataset was collected from Kaggle repository. To enhance detection accuracy, the methodology incorporates Principal Component Analysis (PCA) for data preprocessing, addressing issues related to varying feature scales and dimensionality. After preprocessing the dataset, we use Bag of Words (BOW) algorithm for feature selection. The combination of PCA-based preprocessing and Bag-of-Words feature extraction optimizes the dataset for training capsule networks. After feature selection we use improved capsule network to detect the android malware. The model is trained on a comprehensive dataset, showcasing its efficacy through high detection accuracy, outperforming traditional methods, and demonstrating robustness against evolving malware threats. This integrative approach offers a promising solution for advanced Android malware detection, providing a foundation for future research in cyber security.

Keywords: Android malware detection, Capsule Networks, Hierarchical feature learning, Mobile security

**Balamurugan****INTRODUCTION**

Almost everyone in modern culture uses the Internet on a daily basis [1]. The reason for this is because the Internet has become indispensable in practically every aspect of modern life, from social interactions and online banking to health-related transactions and marketing [2]. Criminals have begun to conduct crimes online instead of in person because of the exponential growth of the Internet [3]. When perpetrating cyberattacks, criminals often use malicious software. Malware is defined as any programme that aims to inflict harm on computers, smartphones, networks, etc., by means of malicious payloads [4]. Viruses, worms, Trojan horses, rootkits, and ransomware are only a few examples of malware [5]. Various families and types of malware aim to harm the original victim's workstation in various ways—by stealing sensitive data, enabling remote code execution, or harming the system itself. Malware categorization is becoming more complex due to the fact that certain malware instances exhibit traits of numerous groups simultaneously [6]. With the advent of several applications including smart homes, smart agriculture, smart healthcare, smart retail, etc., the internet of things (IoT) has recently broadened its reach [7]. Android is the most popular platform for shared IoT networks because it is versatile, stable, and has hardware support, all of which are essential for sensors' interfaces [8]. There are a number of unique sensing, monitoring, and controlling functions provided by various types of IoT devices [9]. The proliferation of Android smartphones is a direct result of the interconnected nature of modern life [10]. By 2020, experts predict that there will be over 6.1 billion people using smartphones [11]. Malicious behaviour has the potential to impact the functionality of several devices that are linked to a network. Malware detection for Android-based devices has been the subject of current research [12].

Based on the idea of spatial hierarchies and feature correlations, CapsNets provide a more sophisticated view of the many traits shown by malicious software [13]. We offer evidence that CapsNets can improve the representation and identification of complicated patterns in data collected from Android applications, and we argue that this technology should be widely used [14]. The core of our suggested approach is CapsNets' dynamic routing system, which allows us to extract hierarchical elements that are crucial for differentiating between safe and harmful activities [15]. A more complete picture of the Android app's behavior achieved by building data hierarchically; this allows the model to see both the local and global relationships between features [16]. We train and evaluate our technique extensively on a varied dataset that includes both genuine and malicious Android apps to confirm its effectiveness [17]. The findings show that our CapsNets-based model outperforms the previous techniques in terms of detection accuracy [18]. In addition, the model remains resilient when confronted with new malware threats, demonstrating its ability to adapt to different attack vectors [19].

The main contribution of the paper is

- Dataset preprocessing using principal component analysis
- Feature extraction using bag of words
- Android malware detection using improved Capsule Networks

The remainder of this paper is structured as follows. Numerous authors address a variety of android malware detection strategies in Section 2. The proposed model is shown in Section 3. Section 4 summarizes the results of the investigation. Section 5 concludes with a discussion of the result and future work.

Motivation of the paper

The prolific growth of Android applications has brought about a parallel surge in Android malware, posing a persistent threat to the mobile ecosystem. Current research underscores machine learning as a potent avenue for Android malware detection. In this paper, we present an enhanced capsule network tailored for this task, utilizing a diverse dataset. To heighten detection accuracy, our methodology integrates Principal Component Analysis (PCA) for preprocessing, addressing challenges related to variable feature scales and dimensionality. Additionally, we leverage the Bag of Words (BOW) algorithm for effective feature selection post-preprocessing. This cohesive approach optimizes the dataset for training an improved capsule network, resulting in a model that exhibits high detection accuracy, surpassing conventional methods.

Balamurugan

Background Study

C. Li *et al.* [4] Consideration of interaction words across features might reveal fraudulent behaviour in Android apps. These came from the manifest, code, and app. One-hot encoding was used to create a sparse vector representation for each application based on retrieved attributes. The author proposed a Factorization Machine-based malware detection technique to handle vector sparsity and define interaction terms. J. Feng *et al.* [9] these authors research introduces a two-tiered strategy for detecting Android malware. Experiments were conducted to determine the efficacy of combining the static characteristics with fully connected neural networks for malware detection. The next layer was then fed the findings, which were harmless applications. L. N. Vu and S. Jung [11] Malware for mobile devices has existed since Android's inception. Malicious programs were always finding new ways to tweak themselves to evade the OS's ever-changing security measures. This study outlined several deep learning algorithms for malware behavior characterization. Despite CNN's widespread usage in image recognition, the complexity of feature engineering has prevented its use to malware detection research. P. Feng *et al.* [14] the authors present Android, a dynamic analysis framework that automates dynamic behaviour data extraction for malware identification. The author employs chi-square feature selection to identify significant traits and reject irrelevant or noisy ones. These important traits help identify harmful activities in practice. After then, EnDroid leverages Stacking to create a reliable malware detection system. T. Kim *et al.* [18] seven features were found in APK manifest, dex, and. so files, which enrich the extracted information and convey programme characteristics. The author also developed an effective feature vector generating method for identifying malware that resembles legal programmes. These authors' feature representations guarantee that harmful feature vectors do not contain typical properties of harmless programmes.

Problem definition

Android malware is constantly increasing due to the development of Android apps. Researchers have examined several Android malware detection methods to address this issue. Machine learning is a potential answer. An upgraded capsule network for Android malware detection using a trusted dataset is presented in this study. The technology uses Principal Component Analysis (PCA) for data preparation to improve detection accuracy by resolving feature size and dimensionality issues. After preprocessing, the Bag of Words (BOW) algorithm selects features. PCA-based preprocessing and Bag-of-Words feature extraction optimize the dataset for capsule network training, providing a powerful Android malware detection method.

MATERIALS AND METHODS

In this section, the dataset was collected from Kaggle repository. After collecting the dataset we use PCA algorithm for data preprocessing and BOW algorithm for feature extraction. The methodology employed in this research aims to advance Android malware detection through the innovative integration of Capsule Networks for hierarchical feature learning. The proposed model flow chart has been represented at figure 1.

Dataset collection

The dataset was collected from Kaggle website <https://www.kaggle.com/datasets/shashwatwork/android-malware-dataset-for-machine-learning> the dataset employed in this research plays a pivotal role in training and evaluating the proposed Capsule Networks for Android malware detection. The collection process is designed to ensure diversity, relevance, and representation of both benign and malicious Android applications.

Data preprocessing using Principal Component Analysis

After collecting the dataset we use principal component analysis algorithm for dataset preprocessing. There are a number of procedures involved in PCA data preparation that improve the performance of machine learning models. To start, we normalize the input data so that the magnitudes are constant, as they could be on different scales. One of the most important steps in PCA for sensitivity to feature scale is data centering, which is done by removing the mean of each feature. Then, to capture the correlations between distinct characteristics, the

Balamurugan

covariance matrix is calculated using the centered and normalized data. Traditional Principal Component Analysis (PCA) uses all training pictures in the eigenspace calculation, ignoring class-specific information referred by Beattie, J. R., & Esmonde-White, F. W. L. (2021). This is problematic for big training images or high-resolution images, making eigenvector calculation difficult. For each new training image, the standard PCA model must laboriously recalculate eigenspaces, eigenvalues, and feature vectors. Superior PCA simplifies training using a new technique. Superior PCA groups people throughout training instead of treating everyone equally. Each shot in each group is trained to create an eigensubspace and feature parameters. This novel method avoids recalculating dataset eigenspaces when a new training picture is introduced. This revolutionary training strategy might ease adding new malware samples to malware detection models. Superior PCA may improve malware detection model efficiency and scalability by categorising malware into groups and training samples inside each group, lowering the computational overhead of adding additional instances to the training set.

1. Let the training set of all images X can be described as

$$X = \{X_1, X_2, X_3 \dots X_L\} \text{ ----- (1)}$$

2. Compute the mean vector of all training images of i^{th} person

$$X_i = \frac{1}{N_i} \sum_{k=1}^{N_i} X_k^i \quad (i = 1, 2, \dots, l) \text{ ----- (2)}$$

3. Compute the covariance of the training set of the i^{th} person

$$S_{x_i} = \frac{1}{N_i} \sum_{k=1}^{N_i} (X_k^i - X_i) \text{ ----- (3)}$$

4. Compute Matrix S_{x_i} largest eigenvalues X_k^i , where $j = 1, 2, \dots, n$

The high dimensionality of the data makes it easy for a machine learning technique to overfit when working with gene expression profiles that have many properties on the training data. Classification accuracy and generalizability will suffer as a result. The fact is that not all attributes have a favorable impact on the prediction.

Feature extraction using Bag-of-Words

After preprocessing the dataset we use Bag-of-Words algorithm for feature selection. To begin feature extraction for Android malware detection using the Bag-of-Words (BoW) approach, each Android application is first tokenized into individual parts like API referred by Qader, W. A. (2019). Later on, a vocabulary is built that includes every single token in the dataset. An application-specific feature vector of a given length is created for every word in the vocabulary, denoting its presence (1) or absence (0). This binary encoding breaks down the intricate architecture of Android apps into feature-rich unordered bags. Machine learning models, such as Capsule Networks, fed the normalized feature vectors as input, which allows for the identification of Android malware by collecting the unique feature patterns inside apps.

This approach involves creating a lexical set from the terms found in the data. Afterwards, a "vector" containing the words from this list is assigned to every document. All of the columns in this vector contain individual words. A tally is made for every occurrence of the phrase throughout the text and recorded in the corresponding column. When this method is done to all papers, data visualization based on text frequency is created.

$$\log(n \div N) \text{ ----- (5)}$$

n = spreading the word: in terms of papers transmitted

N = Count of all files

$$tf - idf = tf * \log(n \div N) \text{ ----- (6)}$$

Android Malware Detection Using Improved Capsule Networks

After feature selection we use Improved Capsule Networks algorithm for android malware detection.

Traditional detection approaches are struggling to keep up with the increasing complexity and frequency of Android malware. As a solution, this research suggests using Improved Capsule Networks, which are modeled after the human visual system, to improve the precision and flexibility of Android malware detection. The model is able to detect both local and global connections among features in Android apps thanks to Improved Capsule Networks, which provide a unique method to hierarchical feature learning. The goal of this project is to build a powerful Improved Capsule Networks architecture that is compatible with Android and its specific features. We seek to demonstrate the improved performance of Improved Capsule Networks compared to existing approaches by

Balamurugan

training the system on a broad dataset that includes both benign and malicious samples. With this project, we want to provide a more advanced and understandable answer to the ever-changing world of Android malware threats. One alternative to CNNs that Hinton and colleagues put out was Improved Capsule Networks. In contrast to CNNs, which only produce scalar values, capsules are composed of an equivariant network of neurons that receive and output vectors. The ability to learn not just the distortions and viewing circumstances of an image, but also its qualities, is a characteristic of capsules. With this, see the whole picture by first picking out its components. The contents of a CNN are what feed into a capsule. Different types of capsules are used for processing these characteristics. The likelihood of the feature being present plus a set of vector values generally referred to as instantiation parameters make up a capsule's output. Assuring network invariance is the job of the likelihood of the capsule's feature's existence. In order to demonstrate the network's capacity to identify position, texture, and deformations, the instantiation parameters are used to depict its equivariance. A model is said to be invariant if it chooses to stay the same no matter what happens to the inputs. Convolutional neural networks are unique in possessing a certain sort of invariance, known as translational invariance. Two convolution channels make up the first layer. Additionally, it employs ReLU as its activation function. The spatial and spectral channels' output will be processed by the PCL using two types of filters. The PCL employs 8×64 1-D filters with a 3×3 kernel size and a 1 stride for the output of the spatial channel, and 8×64 1-D filters with a 3 kernel size and a 1 stride for the output of the spectral channel. There are eight neurons in each of the PCLs' output capsules. An activation function that is nonlinear will be used by the PCL.

$$v_j = \text{squash}(s_j) = \frac{\|s_j\|^2 \cdot s_j}{1 + \|s_j\|^2} \quad (7)$$

In where s_j is the output of capsule j before activation and v_j is the output after activation. A number of capsules, here called digit capsules, form a completely linked capsule layer that is the DCL. The quantity of neurons contained inside each digit capsule and the total number of digit capsules within are two of its characteristics. With 16 neurons per digit capsule, the number of inside capsules matches the number of ground-truth classes in the HSI dataset. Additionally, it activates itself via the squashing mechanism. This is the formula that gives the DCL's direct output for a capsules_j:

$$s_j = \sum_i c_{ij} W_{ij} v_i \quad (8)$$

Where s_j is the output directly from the j th DCL capsule, v_i is the output from the i th PCL capsule, and a weight matrix W_{ij} is applied to the result. A coupling coefficient, denoted as c_{ij} , is selected by an iterative dynamic routing procedure.

$$b_{ij} \leftarrow b_{ij} + u_{ji} \cdot v_j \quad (9)$$

$$c_{ij} = \frac{\exp(b_{ij})}{\sum_k \exp(b_{ik})} \quad (10)$$

At the outset, the scalar b_{ij} will be initialized to 0. Afterwards, the coefficient c_{ij} will be obtained after three iterations of the dynamic routing method, as per. The last step in obtaining the network's output is for the output layer to compute the module of each capsule that the DCL has output.

RESULTS AND DISCUSSION

In this section, we present the outcomes of our Android malware detection methodology leveraging improved Capsule Networks for hierarchical feature learning. The results encapsulate the model's performance on a diverse dataset, demonstrating its efficacy in comparison to traditional methods.

performance evaluation

1. Accuracy: The fraction of samples with the right classification out of all samples.

Mathematically

$$\text{Accuracy} = \frac{(TP + TN)}{(TP + FP + TN + FN)} \quad (11)$$

Balamurugan

2. Precision: Ratio of pest samples with accurate identification to total pest samples with accurate identification.

Mathematically

$$Precision = \frac{TP}{TP + FP} \text{----- (12)}$$

3. Recall (also known as sensitivity or true positive rate)

The proportion of correctly classified pest samples out of the total number of actual pest samples. Mathematically

$$Recall = \frac{TP}{TP + FN} \text{----- (13)}$$

4. F1 score: A middle ground between accuracy and memory that strikes a harmonic mean.

Mathematically

$$F1 \text{ score} = 2 * Precision * Recall / (Precision + Recall) \text{----- (14)}$$

The table 1 and figure 3 showcase a comprehensive evaluation of various Android malware detection algorithms. Among the existing authors' approaches, A. Demontis *et al.* and C. Li *et al.* demonstrate respectable accuracy levels of 89.07% and 93.09%, respectively, with A. Demontis *et al.* exhibiting higher precision and recall. Comparatively, existing methods such as Random Forest (RF), Support Vector Machine (SVM), and CNN exhibit notable advancements, with SVM leading in accuracy at 97.65%, and CNN excelling in precision at 95.62% however, the proposed method outperforms all, achieving an outstanding accuracy of 99.32%, precision of 95.14%, recall of 96.39%, and F-measure of 96.99%. This underscores the efficacy of the proposed approach, demonstrating its superiority in Android malware detection over existing methodologies, offering a highly accurate and balanced solution across multiple performance metrics.

CONCLUSION

In conclusion, the proposed integrative approach combining Capsule Networks with PCA for data preprocessing and Bag-of-Words feature extraction demonstrates a promising solution for advancing Android malware detection. The hierarchical feature learning capabilities of Capsule Networks, inspired by the human visual system, provide a nuanced understanding of intricate patterns within Android applications. By incorporating PCA and Bag-of-Words, the methodology addresses challenges related to feature scales, dimensionality, and the representation of distinctive features. The model, trained on a comprehensive dataset, exhibits high detection accuracy, surpassing traditional methods, and proves resilient against evolving malware threats. The proposed method outperforms all, achieving an outstanding accuracy of 99.32%, precision of 95.14%, recall of 96.39%, and F-measure of 96.99%. This research contributes to the ongoing efforts in cyber security, offering a robust foundation for future advancements in Android malware detection. The combined strength of Capsule Networks, PCA, and Bag-of-Words not only enhances the current state of mobile security but also encourages further exploration and refinement of innovative techniques in the ever-evolving landscape of cyber threats.

Algorithm 1. ImprovedCapsule Networks

Input

- Android application data, including spatial and spectral features.
- Training dataset with labeled benign and malicious samples.

Steps

- **Spatial and Spectral Channels**
- Initialize the first layer with spatial and spectral channels.
- Spatial channel: 2-D convolution layer with ReLU activation.

$$v_j = \text{squash}(s_j) = \frac{\|s_j\|^2 s_j}{1 + \|s_j\|^2 \|s_j\|}$$

- Spectral channel: 1-D convolution layer with ReLU activation.

Balamurugan

- ◎ **Primary Capsule Layer (PCL)**
- Process outputs of spatial and spectral channels independently.
- $s_j = \sum_i c_{ij} W_{ij} v_i$
- Use 8x64 filters for spatial channel and 8x64 1-D filters for spectral channel.
- $b_{ij} \leftarrow b_{ij} + u_{ji} \cdot v_j$
- Apply nonlinear squashing function to activate capsules in the PCL.
- ◎ **Dynamic Routing Process**
- Initialize coupling coefficients (c_{ij}) to zero.
- Perform dynamic routing process iteratively three times.
- $c_{ij} = \frac{\exp(b_{ij})}{\sum_k \exp(b_{ik})}$
- Update coupling coefficients based on the iterative process.
- Output**
- Predictions for each input sample, indicating the likelihood of being benign or malicious.

ABSTRACT

Cerebral Palsy (CP) is a movement and posture disorder that develops during infancy or early childhood as a result of brain damage. The brain damage is permanent and it cannot be reversed, however earlier intervention, the more progress can be made. Complicated deliveries, methyl mercury exposure during pregnancy, and brain trauma in the first years of life are the common risk factors for CP. Trunk control is impaired in CP children thus, influencing their functional balance. The balance problem increases the risk of falls and activities of daily living. Task oriented training has shown to be effective in improving the performance, promoting intensive, meaningful and goal oriented training. Hence this study was conducted to identify the effects of Task-Oriented Training on Trunk Control and Balance in Spastic Diplegic Cerebral Palsy Children. This comparative study was conducted among 30 Spastic diplegic cerebral palsy children. The participants were divided into two groups: Task oriented training raining (Group A: Experimental) and Conventional therapy y (Group B: Control) by using simple random sampling technique. Each group includes 15 (50%) children and both the groups received 30 minutes of intervention according to the groups. Pediatric Balance Scale (PBS) and Trunk Control Measurement Scale (TCMS) were the outcome measures. The collected data were summarized by using the Descriptive Statistics: frequency, percentage; mean and S.D. Chi square test, Independent sample “t” test, Paired “t”

99134

Vishwas G Vaghela *et al.*,

test and Pearson correlation coefficient were used for statistical analysis. The p value < 0.05 was considered as significant. Age of the 30 participants ranged from 4 to 12 years with mean 7.5 ± 2.7 years. The mean age of the cases among Group A was 7.3 ± 2.7 years and for Group B, it was 7.8 ± 2.8 years. There was no difference ($p > 0.05$) in the pre-test measurements of TCMS between group A and group B. A difference ($p < 0.05$) in PBS (Both pre-test and post-test) as well as TCMS (Post-test) was found between group A and group B. There was an improvement ($p < 0.05$) in PBS as well as TCMS within both the groups. Also, there was a difference ($p < 0.05$) in the effectiveness in PBS as well as TCMS between group A and group B. Age was a positively correlated ($p < 0.05$) with TCMS during pre-test. Both the task-oriented training and conventional therapy are effective in improvement of trunk control and balance in spastic diplegic cerebral palsy children. However, Task Oriented Training was found to be more effective among the cerebral palsy children.

INTRODUCTION

Cerebral Palsy (CP) is a non-progressive motor disorder caused by early brain lesions, resulting in paralysis and muscle spasms in one or more limbs [1,2] It affects 2 to 2.5 per 1000 live births, with premature, low-birth-weight infants and males being at higher risk [3] CP is classified as spastic (70-80%), dyskinetic, ataxic, hypotonic, or mixed, with spastic diplegia being the most common type. Topographical classifications include monoplegia, diplegia (30-40%), hemiplegia (20-30%), and quadriplegia (10-11%).[1, 3] The condition develops due to prenatal factors such as prematurity, multiple gestation, infections, and birth complications, as well as postnatal causes like head trauma and meningitis [4]. Children with CP experience motor impairments such as reduced muscle strength, poor selective motor control, and abnormal posture, especially in the trunk, pelvis, and lower extremities.(4) These impairments impact balance and postural control, limiting daily activities [5,13]. CP is commonly diagnosed between ages one and two, with MRI used for diagnosis and prognosis assessment [8,9]. Spastic CP is most prevalent, with increased resistance to movement, particularly in the lower extremities, and trunk weakness [10-12]. In India, spastic diplegia accounts for 20% of CP cases [5].

Rehabilitation for CP children includes physiotherapy, occupational therapy, speech therapy, and psychosocial support to improve physical impairments, enhance independence, and improve quality of life [19,17]. Physiotherapy focuses on functional mobility, motor skills, and independence through activities like positioning, walking, and transfers.(18, 19, 20) It utilizes the concept of neuronal plasticity, where functional and structural changes improve motor function through repetitive tasks [21,22]. Task-Oriented Training (TOT), a goal-directed therapy, focuses on practicing motor tasks specific to the child's environment with feedback to improve muscle strength and function. TOT encourages dynamic interaction between the individual, task, and environment, promoting sensory stimulation, motor learning, and coordination [23-29]. It targets lower extremity strength and motor performance, using a task-based approach that is patient-centered and encourages active participation [30]. Task-Oriented Training (TOT) follows a top-down approach where therapists focus on the child's performance relative to their environment, daily activities, and participation opportunities. This approach allows the child to practice real-life tasks and develop new skills in a patient-centered, rather than therapist-centered, manner. Active participation is crucial, with the child being encouraged to engage fully in training for self-motivation and self-satisfaction. If the child is not interested or motivated, treatment outcomes may be poor. TOT also involves context-specific tasks that mimic real-world environments, such as using household objects (e.g., knives, brushes, chairs) in daily activities [31,32,33].

Traditional physiotherapy techniques, including mat activities, stretching, and strengthening exercises, aim to improve strength, endurance, flexibility, and postural control. These exercises help prevent complications like

Vishwas G Vaghela et al.,

immobilization and contractures. However, they often lack engagement and fail to provide real-time feedback on the child's movements, which can lead to ineffective results due to repetitive errors in movement execution [35,36]. Trunk control deficits in CP children significantly impact their balance, increasing the risk of falls and limiting daily activities. Task-oriented training has been shown to improve motor performance and enhance balance through meaningful, goal-directed practice. While conventional therapy approaches have been studied in children with Spastic Diplegic CP, there is limited research examining the impact of Task-Oriented Training on trunk control and balance. Therefore, this study aims to investigate the effects of Task-Oriented Training on trunk control and balance in children with Spastic Diplegic Cerebral Palsy. This study aims to evaluate and compare the effects of Task-Oriented Training (TOT) and conventional therapy on trunk control and balance in children with spastic diplegic cerebral palsy. The objectives are to assess how TOT influences trunk control and balance, examine the impact of conventional therapy, and compare the outcomes of both treatment approaches.

MATERIALS AND METHODS

This comparative study involved 30 children diagnosed with spastic diplegic cerebral palsy, who were randomly assigned to two groups: Group A (Task-Oriented Training, Experimental) and Group B (Conventional Therapy, Control), with 15 children in each group. The interventions were conducted for 30 minutes per session, four times a week, over a four-week period, totaling 12 sessions. COVID-19 safety measures, including gloves, masks, and hand sanitizer, were followed. Equipment used included a vestibular ball, wobble board, mat, couch, chair with back support, wedge, bolster, toys, balls, and the Pediatric Balance Scale (PBS) and Trunk Control Measurement Scale (TCMS). Inclusion criteria included children aged 4–12 years with spastic diplegic cerebral palsy, GMFCS levels 2–4, MAS +1, MMSE >24, and ability to follow simple verbal instructions and demonstrate upper extremity movement. Exclusion criteria included uncooperative children, uncontrolled epilepsy, cardio-respiratory conditions, additional neurological or musculoskeletal diseases, visual or auditory impairments, mental retardation, and prior surgeries like dorsal rhizotomy. The PBS, a modified version of the Berg Balance Scale, assesses balance with a maximum score of 56, and the TCMS measures trunk control, with a reliability of 0.90. Ethical approval was obtained, and the study was conducted at the OPD of B. N. Patel College of Physiotherapy in Anand, India. Informed consent was obtained from parents or guardians, and baseline and post-intervention assessments were conducted using PBS and TCMS to evaluate the effects of task-oriented training and conventional therapy on balance and trunk control.

Task-Oriented Training

The tasks in the task-oriented training program included activities such as sitting on a vestibular ball and reaching for toys, catching and throwing a ball to activate trunk muscles, performing sit-to-stand exercises from various chair heights, walking in parallel bars while crossing obstacles, balancing on a wobble board during play activities, kicking a ball rolled by the therapist while standing on alternate legs, walking over different surfaces, and picking up objects from the floor in a standing position. Each task was performed for two sets of five repetitions, with bilateral and unilateral exercises. Verbal feedback and instructions were provided by the therapist to enhance performance, and task progression was tailored to each child's ability.

Conventional Therapy

The conventional therapy protocol included passive stretching (hamstrings, quadriceps, calves, adductors), mat activities (such as bridging, trunk rotation, supported sitting, crawling exercises, and prone on elbow), rolling on a wedge, lower limb exercises (including active range of motion and strengthening exercises), and weight-shifting exercises (e.g., sitting on a bolster, half kneeling, weight shifting while in a high sitting position).

Sample size determination

To determine sample size, technique of estimating sample size for Paired "t" test was used [40]

Vishwas G Vaghela et al.,

$$n = \frac{(Z_{1-\alpha/2} + Z_{1-\beta})^2}{\Delta^2} + \frac{(Z_{1-\alpha/2})^2}{2}$$

Where, α = Significance level (5%), Δ = Effect size (0.8), $1 - \beta$ = Power (80%)

$$n = \frac{(1.96 + 0.84)^2}{0.8^2} + \frac{(1.96)^2}{2} = 14$$

Anticipated drop outs (5%)

Thus, the minimum number of subjects required for this study is $14 + 1 = 15$ (Each group).

Statistical Analysis

The data were analyzed using descriptive statistics, including frequency, percentage, mean, and standard deviation. The Chi-square test compared gender across groups, while the independent sample t-test was used to compare age, TCMS, and PBS between the groups. A paired t-test was applied to compare TCMS and PBS within groups and across groups. Pearson correlation coefficient was used to assess the relationship between age, TCMS, and PBS. A p-value of < 0.05 was considered significant. Data analysis was performed using SPSS version 29.0.10.

RESULTS

This study included 30 children with spastic diplegic cerebral palsy, 60% of whom were boys. Participants' ages ranged from 4 to 12 years, with a mean age of 7.5 ± 2.7 years. Group A (experimental) and Group B (control) each consisted of 15 children.

DISCUSSION

Cerebral Palsy (CP), particularly spastic diplegic CP, presents significant challenges in postural control, trunk stability, and balance, all of which impact daily functional activities such as sitting, standing, and walking [41,42,43]. This study aimed to assess the effectiveness of task-oriented training (TOT) in improving trunk control and balance in children with spastic diplegic CP compared to conventional therapy. The results indicate that task-oriented training, which emphasizes task-specific functional activities, was significantly more effective than conventional therapy in improving both trunk control and balance, as evidenced by improvements in the Pediatric Balance Scale (PBS) and the Trunk Control Measurement Scale (TCMS). Task-oriented training, rooted in motor learning principles, focuses on repetitive functional tasks that integrate sensory-motor system components like strength, range of motion, and coordination [25,26,30 and 45]. The dynamic interaction between the child, the task, and the environment helps improve motor skills and postural control, which are essential for functional mobility. This approach is particularly relevant for children with spastic diplegic CP, who face challenges with coordination and balance, especially in the lower limbs [5,47]. The findings from this study align with previous research suggesting that task-oriented training is a promising intervention for enhancing motor function and daily living activities in CP children [47,48].

The significant improvements in trunk control and balance observed in the task-oriented group support the hypothesis that engaging children in functional activities that mimic real-life tasks may promote better motor function and self-efficacy. The task-oriented approach encourages active participation, which may result in enhanced motivation and greater progress in physical and functional capabilities [30]. Additionally, the inclusion of varied tasks, such as catching a ball or balancing on a wobble board, provides children with sensory stimulation that fosters coordination and postural control [25, 30]. Despite the promising results, there are limitations to this study. The exclusion of children with severe disabilities (GMFCS Level -5) and other types of CP limits the generalizability of the findings. Furthermore, the absence of a long-term follow-up prevents the assessment of the sustained effects of task-oriented training on trunk control and balance. Future studies should explore the long-term benefits and potential

Vishwas G Vaghela *et al.*,

variations in outcomes for children with different severities of CP and other CP subtypes. In conclusion, task-oriented training proves to be an effective intervention for improving trunk control and balance in children with spastic diplegic CP. It offers a promising alternative to conventional therapy and holds potential for enhancing the overall motor function and quality of life for children with CP. Future research should continue to explore the mechanisms behind task-oriented training and evaluate its long-term impact across a broader spectrum of CP severity.

ACKNOWLEDGEMENTS

We sincerely thank all the participants, their families, and the staff at the Outpatient Department of B. N. Patel College of Physiotherapy for their support. Our gratitude also goes to the research team, the ethics committee, my guide, and everyone who contributed to the success of this study.

CONFLICT OF INTEREST

The authors declare that there is no conflict of interest regarding the publication of this article.

Table 1: Comparison of Age between the Groups

		Mean	S.D.	"t"	p value
Age	Group A	7.3	2.7	-0.53	0.597
	Group B	7.8	2.8		
("t" = Independent sample "t" test) The mean age for Group A was 7.3 ± 2.7 years, and for Group B, it was 7.8 ± 2.8 years, with no significant age difference between the groups (p > 0.05).					

Table 2: Comparison of Gender Between The Groups

		Group A		Group B		Chi square test	p value
		n	%	n	%		
Gender	Boy	9	60	9	60	0	1
	Girl	6	40	6	40		

The Chi square test was used to compare gender between the groups. Gender was homogenous (p > 0.05) according to groups.

Table 3: Comparison TCMS and PBS (Pre-Test) From Gender

(Pre-test)		Mean	S.D.	"t"	p value
TCMS	Boy	29.8	4.7	1.71	0.099
	Girl	25.8	8.3		
PBS	Boy	8.4	3.2	-0.04	0.966
	Girl	8.5	3.7		

("t" = Independent sample "t" test)

The Independent sample "t" test revealed no significant difference (p > 0.05) in pre-test TCMS and PBS measurements between boys and girls

Table 4: Pre to Post-Test Comparison of Tcms and PBS Groups

		Mean	S.D.	"t"	p value
TCMS	Pre	28.2	6.5	-12.84	< 0.001*
	Post	42.5	6.9		
PBS	Pre	8.5	3.4	-9.74	< 0.001*
	Post	17.9	4.7		

("t" = Paired "t" test; * Significant)

The Paired "t" test showed an improvement in TCMS and PBS from pre-test to post-test irrespective of groups.

Vishwas G Vaghela et al.,

Table 5: Comparison of TCMS and PBS within the Groups

	Group A				Group B				
	Mean	S.D.	"t"	p value	Mean	S.D.	"t"	p value	
TCMS	Pre	28.7	8.4	-16.54	< 0.001*	27.7	4.2	-8.47	< 0.001*
	Post	47.2	5.5			37.9	4.7		
PBS	Pre	7.0	3.3	-36.10	< 0.001*	9.9	2.8	-10.54	< 0.001*
	Post	21.5	3.6			14.4	2.3		

("t" = Paired "t" test; * Significant)

The Paired "t" test revealed an improvement in TCMS and PBS within both groups.

Table 6: Comparison Of Tcms And Pbs Between Groups

		Pre test				Post test			
		Mean	S.D.	"t"	p value	Mean	S.D.	"t"	p value
TCMS	Group A	28.7	8.4	0.41	0.683	47.2	5.5	4.99	< 0.001*
	Group B	27.7	4.2			37.9	4.7		
PBS	Group A	7.0	3.3	-2.62	0.014*	21.5	3.6	6.36	< 0.001*
	Group B	9.9	2.8			14.4	2.3		

("t" = Independent sample "t" test; * Significant)

The Independent sample "t" test showed no difference ($p > 0.05$) in pre-test TCMS between Group A and Group B, but a significant difference ($p < 0.05$) was found in PBS (both pre-test and post-test) and post-test TCMS between the two groups.

Table 7: Comparison of Effectiveness (Pre – Post) In TCMS and PBS between Groups

Effectiveness (Pre-Post)		Mean	S.D.	"t"	p value
TCMS	Group A	-18.5	4.3	-5.07	< 0.001*
	Group B	-10.2	4.7		
PBS	Group A	-14.5	1.6	-17.14	< 0.001*
	Group B	-4.5	1.6		

("t" = Independent sample "t" test; * Significant)

The Independent sample "t" test was used to compare the effectiveness (Pre – post) in TCMS and PBS between groups. There was a difference ($p < 0.05$) in the effectiveness of TCMS as well as PBS between group A and group B.

Table 8: Relation Between TCMS and PBS

		"r"	p value
TCMS and PBS	Pre test	0.602	< 0.001*
	Post test	0.722	< 0.001*

The Pearson correlation coefficient was used to find the relation between TCMS and PBS. There was a positive correlation ($p < 0.05$) between TCMS and PBS during pre-test as well as post-test

Table 9: Relation between Age, Tcms, Pbs

(Pre-test)	Age	
	"r"	p value
TCMS	0.377	0.040*
PBS	0.197	0.297

Vishwas G Vaghela et al.,

("r" = Pearson correlation coefficient; * Significant)

The Pearson correlation coefficient was used to find the relation between age and the pre-test measurements of TCMS, PBS. Age was a positively correlated ($p < 0.05$) with TCMS during pre test.

<p>Figure 1: TCMS</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Group</th> <th>Pre</th> <th>Post</th> </tr> </thead> <tbody> <tr> <td>Group A</td> <td>29</td> <td>47</td> </tr> <tr> <td>Group B</td> <td>28</td> <td>38</td> </tr> </tbody> </table>	Group	Pre	Post	Group A	29	47	Group B	28	38	<p>Figure 2: PBS</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>Group</th> <th>Pre</th> <th>Post</th> </tr> </thead> <tbody> <tr> <td>Group A</td> <td>7</td> <td>21</td> </tr> <tr> <td>Group B</td> <td>10</td> <td>14</td> </tr> </tbody> </table>	Group	Pre	Post	Group A	7	21	Group B	10	14
Group	Pre	Post																	
Group A	29	47																	
Group B	28	38																	
Group	Pre	Post																	
Group A	7	21																	
Group B	10	14																	
<p>Figure 1: Pre and Post data of TCMS in group A and group B</p>	<p>Figure 2: Pre and Post data of PBS in group A and group B</p>																		
<p>Figures 1 and 2 illustrate the pre- and post-intervention data for both groups. Group A (TCMS) showed greater improvement in trunk control (TCMS) and balance (PBS) compared to Group B (PBS). These results suggest that task-oriented training in Group A was more effective in enhancing trunk control and balance than conventional therapy in Group B.</p>

ABSTRACT

In this article, we study some of the fundamental properties of a new class of sets, called I-g[^]-cld with respect to ideal topological spaces. This class is situated in between the \star -cld and I_g-cld.

Keywords : S-cld, T-cld, I-g[^]-cld, I-g_α[^]-cld, I_g-cld.

INTRODUCTION

In 1990, D. Jankovic and T. R. Hamlett [5], New topologies from old via ideals. K. Kavitha and *et al.*[6], presented the associates were the first to introduce the I-closed sets with respect to an ideal topological framework. In recent times, M. E. Abd El-Monsef and *et al.*[1], introduced the β -open sets and β -continuous mappings. In addition to M. Navaneethakrishnan [8], g-closed sets in ideal topological spaces, Further, K. Kuratowski [7] introduced the closure operator and presented new topologies from old via ideals. In this article, we study some of the fundamental properties of a new class of sets, called I-g[^]-cld with respect to ideal topological spaces. This class is situated in between the \star -cld and I_g-cld.

2. PRELIMINARIES

Throughout this article (X, τ , I) or X will always denoted with respect to ideal topological space (ITPS).

Aruna Devi and Namasivayam²

Definition 2.1

Let $M \subseteq X$ be a

1. semi-open [2] if $M \subseteq \text{cl}(\text{int}(M))$;
2. α -open [1] if $M \subseteq \text{int}(\text{cl}(\text{int}(M)))$;
3. Preopen [3] if $M \subseteq \text{int}(\text{cl}(M))$;
4. regular open [3] if $M = \text{int}(\text{cl}(M))$.

Definition 2.2

Let $M \subseteq X$ be a

1. α gs-cld [1] if $\alpha \text{cl}(M) \subseteq V \Rightarrow M \subseteq Q$ & Q is semi-open.
2. sg-cld [3] if $\text{scl}(M) \subseteq V \Rightarrow M \subseteq Q$ & Q is semi-open.
3. gs-cld [4] if $\text{scl}(M) \subseteq V \Rightarrow M \subseteq Q$ & Q is open.
4. $\hat{\alpha}$ g-cld [1] if $\hat{\alpha} \text{cl}(M) \subseteq V \Rightarrow M \subseteq Q$ & Q is open.
5. gsp-cld [10] if $\text{spcl}(M) \subseteq V \Rightarrow M \subseteq Q$ & Q is open .
6. g-cld [10] if $\text{cl}(M) \subseteq V \Rightarrow M \subseteq Q$ & Q is open.
7. \ddot{g} -cld [11] if $\text{cl}(M) \subseteq V \Rightarrow M \subseteq Q$ & Q is sg-open.
8. \hat{g} -cld [10] if $\text{cl}(M) \subseteq V \Rightarrow M \subseteq Q$ & Q is semi-open.

Definition 2.3

Let $M \subseteq X$ be a

1. I_g -cld [6] if $M^* \subseteq V \Rightarrow M \subseteq Q$ & Q is open.
2. $I-\hat{g}$ -cld [10] if $M^* \subseteq V \Rightarrow M \subseteq Q$ & Q is semi-open.

3. $I-g^\wedge$ -CLOSED SETS WITH RESPECT TO IDEAL TOPOLOGICAL SPACES

The following definitions and results are presented.

Definition 3.1

Let $M \subseteq X$ be a

1. S-cld if $\text{cl}(M) \subseteq V \Rightarrow M \subseteq Q$ & Q is \ddot{g} -open.
2. T-cld if $\text{scl}(M) \subseteq V \Rightarrow M \subseteq Q$ & Q is S-open.

Definition 3.2

A subset M of X is called a $I-g^\wedge$ -cld if $\text{scl}(M^*) \subseteq Q$ whenever $M \subseteq Q$ & Q is T-open.

Remark 3.3

1. Any \star -cld \Rightarrow S-cld but \nRightarrow .
2. (ii) Any \star -cld \Rightarrow T-cld but \nRightarrow .
3. (iii) Any semi-open \Rightarrow T-open but \nRightarrow .

Example 3.4

Let $X = \{m_1, m_2, m_3\}$, $\tau = \{\emptyset, \{m_1\}, X\}$ with $I = \{\emptyset\}$. Then $SC(X) = \{\emptyset, \{m_2\}, \{m_3\}, \{m_1, m_2\}, \{m_1, m_3\}, \{m_2, m_3\}, X\}$; $TC(X) = \{\emptyset, \{m_2\}, \{m_3\}, \{m_2, m_3\}, X\}$ and $SO(X) = \{\emptyset, \{m_1\}, \{m_1, m_2\}, \{m_1, m_3\}, X\}$. We have

1. $M = \{m_2\}$ is S-cld but not \star -cld.
2. $M = \{m_2\}$ is T-cld but not \star -cld.

Aruna Devi and Namasivayam²

Example 3.5

Let $X = \{m_1, m_2, m_3\}$, $\tau = \{\phi, \{m_1, m_2\}, X\}$ with $I = \{\phi\}$. Then $TO(X) = \{\phi, \{m_1\}, \{m_2\}, \{m_1, m_2\}, X\}$ and $SO(X) = \{\phi, \{m_1, m_2\}, X\}$. We have $M = \{m_1\}$ is T-open but not semi-open.

Proposition 3.6

Any \star -cld $\Rightarrow I\text{-}g^\wedge$ -cld but \nRightarrow .

Proof

If M is any \star -cld in X and N is any T-open $\supseteq M$, then $N \supseteq M = scl(M^\star)$. Therefore M is $I\text{-}g^\wedge$ -cld.

Example 3.7

In Ex: 3.5. Then $I\text{-}g^\wedge C(X) = \{\phi, \{m_3\}, \{m_1, m_3\}, \{m_2, m_3\}, X\}$. We have $M = \{m_1, m_3\}$ is $I\text{-}g^\wedge$ -cld but M is not \star -cld.

Definition 3.8

Let M is said to be $I\text{-}g_\alpha^\wedge$ -cld if $\alpha cl(M^\star) \subseteq V \Rightarrow M \subseteq V$ & V is T-open.

Proposition 3.9

Any $I\text{-}g^\wedge$ -cld $\Rightarrow I\text{-}g_\alpha^\wedge$ -cld but \nRightarrow .

Proof

If M is a $I\text{-}g^\wedge$ -cld & N is any T-open $\supseteq M$, we have $N \supseteq scl(M^\star) \supseteq \alpha cl(M^\star)$. Therefore M is $I\text{-}g_\alpha^\wedge$ -cld.

Example 3.10

Let $X = \{m_1, m_2, m_3\}$, $\tau = \{\phi, \{m_2\}, X\}$ with $I = \{\phi\}$. We have $I\text{-}g^\wedge C(X) = \{\phi, \{m_1, m_3\}, X\}$ and $I\text{-}g_\alpha^\wedge C(X) = \{\phi, \{m_1\}, \{m_3\}, \{m_1, m_3\}, X\}$. We have $M = \{m_1\}$ is $I\text{-}g_\alpha^\wedge$ -cld but M is not $I\text{-}g^\wedge$ -cld.

Proposition 3.11

Any $I\text{-}g^\wedge$ -cld $\Rightarrow sg$ -cld but \nRightarrow .

Proof

If M is a $I\text{-}g^\wedge$ -cld & N is any semi-open $\supseteq M$, then any semi-open is T-open and M is $I\text{-}g^\wedge$ -cld, then $N \supseteq scl(M^\star) \supseteq scl(M)$. Therefore M is sg -cld.

Example 3.12

In Ex: 3.4. Then $I\text{-}g^\wedge C(X) = \{\phi, \{m_2, m_3\}, X\}$ and $SG C(X) = \{\phi, \{m_2\}, \{m_3\}, \{m_2, m_3\}, X\}$. We have $M = \{m_2\}$ is sg -cld but M is not $I\text{-}g^\wedge$ -cld.

Proposition 3.13

Any $I\text{-}g^\wedge$ -cld $\Rightarrow I_g$ -cld but \nRightarrow .

Proof

If M is a $I\text{-}g^\wedge$ -cld & N is any open $\supseteq M$, we have any \star -open is T-open, then $N \supseteq scl(M^\star)$. Therefore M is I_g -cld.

Example 3.14

In Ex: 3.4. Then $I_g C(X) = \{\phi, \{m_2\}, \{m_3\}, \{m_1, m_2\}, \{m_1, m_3\}, \{m_2, m_3\}, X\}$ and $I\text{-}g^\wedge C(X) = \{\phi, \{m_2, m_3\}, X\}$. We have $M = \{m_1, m_2\}$ is I_g -cld but not $I\text{-}g^\wedge$ -cld.

Proposition 3.15

Any $I\text{-}g^\wedge$ -cld $\Rightarrow \alpha g$ -cld but \nRightarrow

Aruna Devi and Namasivayam²

Proof

If M is a $I-g^\wedge$ -cld & N is any open $\supseteq M$, we have any \star -open is T -open, then $N \supseteq scl(M^*) \supseteq \alpha cl(M^*)$.
Therefore M is αg -cld.

Example 3.16

In Ex: 3.4. Then $I-g^\wedge C(X) = \{\phi, \{m_2, m_3\}, X\}$ and $\alpha G C(X) = \{\phi, \{m_2\}, \{m_3\}, \{m_1, m_2\}, \{m_1, m_3\}, \{m_2, m_3\}, X\}$. We have $M = \{m_1, m_3\}$ is αg -cld but M is not $I-g^\wedge$ -cld.

Proposition 3.17

Any $I-g^\wedge$ -cld \Rightarrow gs -cld but \nRightarrow .

Proof

If M is a $I-g^\wedge$ -cld & N is any open $\supseteq M$, we have any \star -open is T -open, then $N \supseteq scl(M^*) \supseteq scl(M^*)$. Therefore M is gs -cld.

Example 3.18

Let $X = \{m_1, m_2, m_3\}$, $\tau = \{\phi, \{m_2\}, \{m_1, m_2\}, X\}$ with $I = \{\phi\}$. We have $I-g^\wedge C(X) = \{\phi, \{m_3\}, \{m_1, m_3\}, X\}$ and $GS C(X) = \{\phi, \{m_1\}, \{m_3\}, \{m_1, m_3\}, \{m_2, m_3\}, X\}$. We have $M = \{m_1\}$ is gs -cld but M is not $I-g^\wedge$ -cld.

Proposition 3.19

Any $I-g^\wedge$ -cld \Rightarrow gsp -cld but \nRightarrow .

Proof

If M is a $I-g^\wedge$ -cld & N is any open $\supseteq M$, we have any \star -open set is T -open, then $N \supseteq scl(M^*) \supseteq spcl(M^*)$. Therefore M is gsp -cld.

Example 3.20

In Ex: 3.10. Then $I-g^\wedge C(X) = \{\phi, \{m_1, m_3\}, X\}$ and $GSP C(X) = \{\phi, \{m_1\}, \{m_3\}, \{m_1, m_2\}, \{m_1, m_3\}, \{m_2, m_3\}, X\}$. We have $M = \{m_1\}$ is gsp -cld but M is not $I-g^\wedge$ -cld.

Remark 3.21

We have $I-g^\wedge$ -cld are independent of α -cld and semi-cld.

Example 3.22

In Ex: 3.5. Then $I-g^\wedge C(X) = \{\phi, \{m_3\}, \{m_1, m_3\}, \{m_2, m_3\}, X\}$ and $\alpha C(X) = \{\phi, \{m_3\}, X\}$. We have $M = \{m_1, m_3\}$ is $I-g^\wedge$ -cld but not α -cld.

Example 3.23

In Ex: 3.4. Then $I-g^\wedge C(X) = \{\phi, \{m_2, m_3\}, X\}$ and $\alpha C(X) = \{\phi, \{m_2\}, \{m_3\}, \{m_2, m_3\}, X\}$. We have $M = \{m_2\}$ is both α -cld but M is not $I-g^\wedge$ -cld.

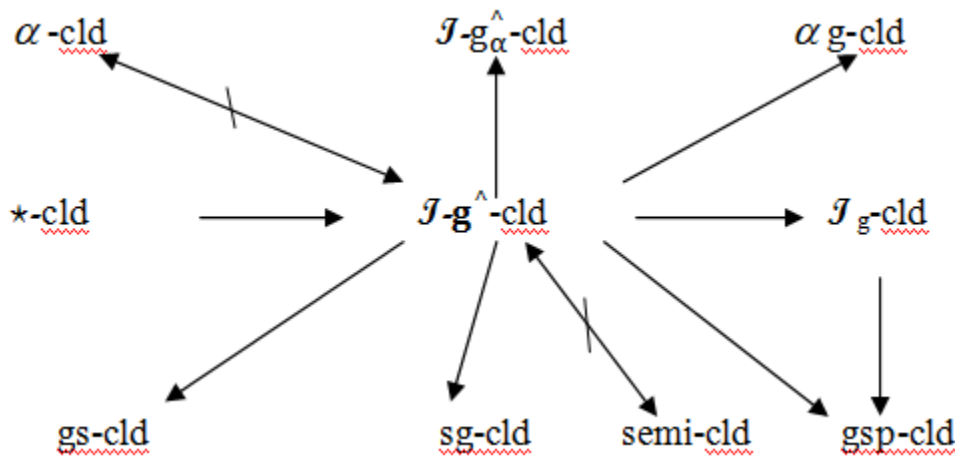

Remark 3.24

The follows diagram shows that A implies B but not reverse implies.

Aruna Devi and Namasivayam²

ABSTRACT

Effective education is a necessity for survival human society. Making knowledge available to all sections of society in a manner which will catalyze effective learning matching to the requirements of the target audience is a major challenge for the educationists, thinkers and leaders of the society. Within last few decades, technological innovations have taken place at a faster pace. Matching to technological growth, production of knowledge has taken place in faster manner. The diffusion of such knowledge among the learners has become a challenging task for human race as the cost of learning resources has grown a lot. Similarly making education available to the last mile in a cost-effective manner has become a challenge. Though the distance learning approach has gained popularity among learners but availing required and user-friendly materials in a cost-effective manner is a challenge even today. Thus, approaches like open educational resources have gained prominence to fulfill the dream of effective education for all. While discussing about higher education, it can be said that our universities need to promote the materials supporting open education and teachers of universities need to actively participate in the process of producing OER materials. Thus, the perceptions of university teachers about OER and challenges faced by them in OER production become important in this context. The study here is an attempt to understand

**Ambika Sankar Mishra et al.,**

such perception by conducting a survey among the university teachers of various universities of Indian state, Odisha.

Keywords: Knowledge, Learning, free, technology, content.

INTRODUCTION

Education is the backbone of civil society. It helps to empower individuals in a society and it brings development in the society through conscientizations. Across the ages, if we look towards the history of all civilizations, then we will understand it that it is education which has transformed civilizations to provide them a better shape. Specifically talking about higher education, it always plays a major role to catalyze spirit of research and innovation to transform societies to lead them towards a better future. In fact, history of development of our civilization is the story of education for empowerment. Thus, at different point of times in the history, the human race has argued in favor of free education and the philosophy behind OER (Open Educational Resources) is not different from the same. The academicians and thinkers arguing in favor of OER always believe in the idea that knowledge should be easily and freely available to all in the interest of humanity. However, the academic community has a major role to play in this regard and without a proper awareness and interest among the teachers relating to OER the dream of utilizing OER for teaching and learning purposes can never be fulfilled.

Review of Literature

History of human race is the history of Education (Seldon, 2018). Discussing about the growth of higher education, it can be said that there is a difference of opinion among the historians regarding the origin of universities as institutions of higher education. Some historians claim that universities are a contribution of the European education system but some others claim that, the establishment of universities as an institution of higher education, happened much before that. Nalanda and Takshashila in India were much older than the European universities. Thus, it can be said that the history of education is the story of transformations and changes through different revolutions which brought changes to the future of mankind. Across the history of mankind, human civilization has seen four revolutions in field of education. First revolution witnessed organized learning of necessary education and the second one witnessed the institutionalization of education through the establishment of schools and universities. However, the third education revolution was mostly about printing technology and education for masses. The present generation students have started witnessing the fourth education revolution which is mostly linked with technology dominated education in the era of artificial intelligence. Thus, learning approaches Have changed a lot and in the new technology dominated learning, the process have knowledge acquisition has gone more and more technology dominated. The process of teaching and learning as it is understood, takes place through several stages. Teaching occurs through various stages like preparation of material, organization of classrooms, ensuring student engagement, setting and making assignments, preparing for examinations. Similarly the process of learning also occurs through various stages. In context of knowledge acquisition it has stages likememorizing, applying, converting knowledge into understanding, self evaluation and diagnosis, reflection and development of autonomous learning.

The Indian Education Scenario

However, In the educational environment of the Indian continent, it can be well said that effective teaching and learning has lots of challenges. India as a country is still dependent on the traditional approach learning being thrown into several challenges of traditional educational system.

The Teaching Vs Preaching Debate

According to Ivan Illich the present educational system is faulty because in this educational system the pupil is confused between teaching and learning, high marks with education, a degree or diploma with competence, and fluency with the ability to say something new. Again, learning through observation and experimentation is too low

Ambika Sankar Mishra et al.,

in case of Indian teaching system. The classroom teaching in which the teacher goes on talking about subjects without creating realization among students, creates a problem for students to understand it and decreases the value of the education. Lack of practical demonstration and active participation between teacher and students makes the process of learning less interesting by changing the status of a teacher to a preacher.

Banking Concept of Education

The existing system of our education deals only with retention of information. However it doesn't encourage the application of acquired knowledge or it never promotes experiential learning among the learners. This is very similar to that of the concept of Banking concept of education (Friere, 2000) proposed by Brazilian philosopher Paulo Friere. In banking concept of education the student only gets the illusion of getting the knowledge but as he is not involved in the process of learning directly he never becomes able to understand and acquire the knowledge imparted to him. In this case the teacher knows everything but the student just gets the illusion of knowing and he never becomes able to know the realities of such knowledge. Similarly other challenges like multilingualism, multiculturalism and other similar issues are also there for Indian education to act as road blocks. This situation leads to ineffective learning and as a result of it education is not able to satisfy its goal as a tool for empowerment. In recent years the global employment scenario has changed. It has affected the global economies seriously. To meet this economic challenge and to lead the world economy in the path of development and progress there is a need of a well-trained human resource. Thus there is needed that to develop the human resource properly professional up skilling or reskilling should be done properly through proper implementation of knowledge. Similarly even the International Labor Organization has also identified new changes like, globalization, modern technology and new work ecology which has influenced the job market to a great extent (Tay, 2022). There is also a huge demand for trained workforces and such demand can only be fulfilled only by the implementation of effective educational policy to result in effective learning to satisfy the needs of empowerment.

Technology Induced Learning

These days we are living in a new technology based digital world and in this digital world the new form of learning that is E-learning is supposed to grow (Singh, 2023). Technologies are not neutral socially and they have their own effects. Thus the Digital technologies also can be seen as a catalyst for new innovations and they are supposed to change the face of new ways of learning by contributing in the area of teaching and learning (Maya-Jariego, 2023). To make our students as responsible participants in the process of learning there is also the need of making them capable in the proper use of internet to access information (Engelen, 2022). The digitally available resources for Educational have changed the definition of "textbooks,". Similarly the ample availability of online content also helps teachers to prepare their lessons (Xie, 2018). Within last few years, several OER initiatives have emerged across the world. This has opened new avenues to provide open access to digital resources available for education (Zervas, 2013). Such new approaches also are helping even the instructors to find new resources for using in teaching (Horbal, 2018). As we are living in the days digitization and internet technology and information dissemination has gone faster, we must learn collaborative learning and use of technology is necessary (Stoffregen, 2015). After the pandemic, the Indian students have gone friendly with the technology-based learning. In the present days, in different parts of the world the conventional approaches in education no more attractive to lure new generation students. The traditional approaches like lecture and tutorial classes are provide only one-way learning. Such unidirectional learning is not attractive and lacks freedom in learning. Most of the students in present times prefer to have freedom in learning and self-learning approach (Seng, 2013). If we look into the Indian situation, we will find that the Indian students are also not different to it. Along with entertainment, they are using their mobile phones as a source of learning for them. With the new pedagogical approaches in academics student centred approaches have gone popular in case of university education. Thus a paradigm shift has taken place. Learning should be designed in a manner to reduce the complexity in the process of learning. Thus, the intervention of technology in the complex process of teaching and learning, has developed a new face for it. However there is not enough material available for them in the new platform. Similarly like the books even in the online platforms many times the study materials are proving very costly for them. Sometimes a college student may avoid a course due to lack of affordability, though the course may be beneficial for his or her learning goals (Abramovich, 2018). Thus there is an increasing interest in

**Ambika Sankar Mishra et al.,**

using open and freely available resources across different disciplines. As there is a global interest towards increased dissemination of knowledge and there is an argument to make knowledge free for all, that is why more and more voices are increasing for sharing knowledge with others without limits or conditions. The same trend is also rising in the field of education. As a result of this movement and such rising voices the demand for OER in different forms is rising. The OER materials are available in different forms like textbooks, instructional materials, audios, videos, computer applications, and in variety of other forms (Menzli, 2022). The rising arguments in support of OER also claims that, universities as educational and social institutions have a social responsibility to encourage the production and dissemination of resources to promote free and open education. They should involve themselves to promote the process of empowerment through education. They can do it in the interest of local and global communities through their association in the process of promotion of OER and by engaging themselves in the process of production and distribution of OER. Such contribution of the universities will be useful in promoting sustainable human development by making education accessible for all working against the challenge of high priced higher educational resources (Shu-Hsiang, 2015).

Open Educational Resources

Reuse and integration of available resources is a major priority of e-Learning. We are living in a digitized and globalized world. Thus it is neither possible nor wise to produce OER materials in isolation (Rodríguez, 2017). Open and distance learning (ODL) has developed within last half century in the world to promote the goal of development. In recent years, the demand for open online courses have increased a lot. For the same reason various international institutions like European Commission, UNESCO or OECD have come forward to promote open education to make it more and more accessible (Jacqmin, 2022). However, in the Indian continent, it is a development which came much later. From the beginning ODL has acted as a supportive to the education system and at the same time it has also acted as a parallel system to it (Das, 2018). OER or open educational resources began gaining popularity in the early 1970s. Thanks to librarians, catalogers and volunteers who have contributed to create viable resources including more modern, specialized OERs (Roncovic, 2022). To be more specific, the literature available regarding the origin and history of OER indicates the fact that, the idea of open educational resources was there and production and distribution of OER was there. However, OER as a movement is more than a decade old involving more than 250 higher education institutions over 40 countries. The information age in which we are living, to meet the challenge of that institutions like Massachusetts Institute of Technology (MIT) have brought changes in OER to make it more and more attractive for the learners. MIT has set examples for other institutions of world and has proved itself as a pioneer in this field. Similarly, OER as a revolution is growing in different countries and institutions day by day (Chen, 2021). Though OER as a new approach can help in academics, but Indian situation is different. Online learning after the outbreak of COVID-19 has changed its face in comparison to traditional e-learning (Kang, 2023). The demand for open educational resources in India after the pandemic has increased in India due to the more and more association of learners with technology based learning but the OER in India is not at a very improved state. The challenges like multilingualism, multi culturalism are even there. The recent studies have shown it that India is not where in the top ten OER producing countries. Even the Indian universities are also not the leaders in producing OER. The most cited journals for contents relating to OER are also not from India (Mishra, 2022).

Advantages of OER based Education

Low Cost

In case of OER, the cost involved is only the production cost. Considering the size of audience for the produced materials, the production cost can be considered as very low. Again due to the free availability and openness nature of such resources, these are considered as the cheapest educational products helpful in free distribution and dissemination of knowledge.

Anytime anywhere accessible

With modern technological developments, open educational materials are available online easily. Thus due to their easy availability in the online platform, they are easily available to the learners having a common android mobile phone with internet connectivity. They provide a real feeling to the learner – These resources, are quickly and easily

**Ambika Sankar Mishra et al.,**

accessible and frequently licensed under Creative Commons licensing system(Tang, 2023) .Thus, they are capable of providing a choice to the learner to choose the format of the learning material. Due to their availability in different formats and due to the audio-visual and multimedia approach, many times the open educational materials have proved themselves as powerful and effective source of learning as they provide a learner friendly environment .

Self-based learning

The materials for open education are powerful resources for self-learning and provides opportunity to students to learn according to their own interest. This makes learning more effective and powerful.

Useful for Flipped Classrooms

The flipped classroom(Wittmann, 2023) is a method in which the traditional lecture and homework pattern are alternated. The objective of this method is encouraging active learning, student engagement, hybrid course design. Open educational resources are capable of supporting this idea.

Creation of OER

The production of contents for the OER purpose needs lots of technical skills and it involves knowledge in the area of copyrights. Thus, many challenges can come in the way of the production and distribution of OER. In OER production the technology based challenges are dependent on the content types. If the OER content is of audio visual type, then the content maker needs to have the knowledge of scripting the content, light, camera, sound, editing and other production related knowledge but to prepare simple printed OER materials one needs to have a thorough knowledge of licensing patterns relating to OER. Under different licensing, the usage limit for OER are different and to produce new OER we also need knowledge about existing OER to use them as resources. New OER can be created using different techniques. They can be directly created from the scratch or they can be created from previously existing Open educational resources. However, when a new OER is created many questions relating to its validity comes to the scene. The questions which arise are of various types. they are related to Original source of the OER, the creator and his credibility, the process used in such creation, the revision to original OER in process of creation and the OERs which are combined to create the new one(Santos, 2023). The OER creation process itself must speak about the target audience, format of the content, the purpose of such creation, Knowledge level of creator, type of licensing used for OER. The questions themselves answer which content will be selected for the purpose of creating the new OER. Conventionally, during the process of creation of OER, the creators commonly prefer text books as the primary choice but the purpose of this creation also affects the choice. Reading material and instructional material both are different by nature thus they sometimes affect the choice of content selection during the process of creation of new OER (McBride, 2022). Similarly, the format for the proposed OER also affects the selection of source.

Quality of OER

The quality of the material has always remained as the matter of concern during the production of any educational resources, the same debate also appears in the process of OER making. This issue also has remained as a difficult task in the case of adoption OER for the purpose of teaching and learning. Thus for effective quality control different steps are involved in the process of OER creation. Though the OER creation process needs to answer questions we have mentioned above, but it also involves steps like (1) Searching and finding them (2) evaluating to choose them according to need (3) using them properly at proper place (Baas, 2022) Within this process of production, the factor which always plays a major role is the license of the material available for a particular subject and without having a proper knowledge on licensing, it is always difficult for the creator to develop new OER.

Licensing Patterns and their Functioning

The general understanding about OER is their Open nature(Salem, 2017)The producers of these resources need to have knowledge relating to its types of licensing. The content licensing system can be discussed like below.

Ambika Sankar Mishra et al.,

CCBY

This is the type of license with maximum amount of freedom, which helps the OER producer with maximum freedom. Any material available with this type of licensing is just like a blessing for the OER producer. It permits him to distribute, remix and adapt the work for producing new content even for commercial purpose till they credit the original content producer for their creation.

CC BY-SA

It is also another type of license which provides ample freedom to the course content producer but the level of freedom in this case is little lesser than the CCBY type of licensing. In this type, the OER producer has freedom to take content and reuse but in this type of licensing, one has to share the produced content under same licensing.

CC BY-ND

Such type of license helps OER producers to use the resources for any purpose, including commercially but in this case the content can't be shared with others in adapted form, and credit must be provided to original content creator.

CC BY-NC

It allows the OER producer to remix and adapt to create new content and the work should be done for non-commercial purpose. Although their new works must also acknowledge original content producer and be non-commercial, they do not have to license their derivative works on the same terms.

CC BY-NC-SA

This licensing allows OER creators to remix, adapt, and build upon a work non-commercially, as long as they credit the original producer and license their new creations under the identical terms.

CC BY-NC-ND

This license only allowing OER producers to download original producer's works and share them with others till they credit the original content creator. In this case, they can't change the original creator's work and commercial use is prohibited.

The OER producers should remember that documents available under the last two types of licensing are not helpful under OER category and similarly CCBY has maximum freedom and CCBY-NC-ND type has the lowest freedom

Theoretical framework

Theoretical framework adopted for the thestudy is, diffusion of innovation(Melkote, 2011) theory by Everett M. Rogers. The theory provides an understanding about the adoption of new innovations and new technologies in the society. It speaks new innovations are diffused into society passing through five different layers of people like innovators, early adopters, early majority, late majority and laggards and such adoptions are also done passing through five different phases like awareness, interest, trial, evaluation, adoption. According to Rogers, innovators are the people, who are always adopt new innovations first, the early adopters are the next level people and the early majority, late majority and laggards come as the next level adopters in the chronology. Thus, while understanding the opinion of university teachers regarding adoption of open educational resources, to understand the diffusion of a new concept like OER among university teachers the model of diffusion of innovation can prove useful.

Objectives

To understand their awareness about a new concept like Open educational resources.

To understand their acceptance towards open educational resources

To understand the major challenges faced by university teachers in producing open educational resources.

Research Questions

What is the level of awareness among the university teachers about open educational resources?

Ambika Sankar Mishra *et al.*,

Whether they are ready to accept a new concept like open educational resources which is different from traditional resources for education?

What major challenges the university teachers are facing in the process of content creation for OER as educators?

METHODOLOGY

For the study, survey method using questionnaires is taken into consideration. and a total number of 50 university teachers from 4 different types of universities are taken into consideration from the Indian state Odisha. The different types of universities taken into consideration are public university, private university, Women's University, Technical University and Open University. One university from each type is taken into consideration. The reason of considering universities with such variations is also to understand that, whether the difference in university ecology is becoming a factor to affect the approach towards teachers' response towards open educational resources? Sampling technique used for the purpose of study is convenient sampling. Variables of the study are the knowledge of teachers in the necessary technical field to produce OER and copyright knowledge of teachers relating to use of resources for production of open educational resources.

Findings

From the study it was found that All the respondents use internet for teaching and learning. All of them responded that they are aware about open educational resources 85% of the respondents responded that open educational resources are available freely to the users and 12.5% answered that it is available at low cost and only 2.5% of the respondents responded that it is paid and costly form of resources. 95% of the respondents told that OER materials are available in all forms but 5% told that it is available only as videos Regarding availability of such resources 62.5% told that it is available for all subjects ,25% of the respondents responded that such materials are available only for few subjects and 12.5% of the respondents responded that they don't know in which subject such materials are available. 91% of the respondents told that such materials should be promoted among learners and academicians as they are free 7% told , it should be promoted if it is low priced and 2% told it should not be promoted as it may create copyright issue. Only 29% told that they have already worked to produce OER and 64% expressed they have not yet worked to produce OER and 7% were not sure about whether they have worked to produce OER or not. Regarding their interest to produce OER contents ,79% of the respondents agreed that if given a chance, they will be happy to produce OER , similarly 4% expressed their disagreed with the idea of producing OER as they considered technology as a challenge for them and 17% told they have not thought about it seriously till yet. All of them agreed that such materials are useful for students to satisfy their needs. 33% of the respondents told that they are aware about OER licensing system , 52% told that they don't have any idea regarding OER licensing system and 15% told that they are not aware about the existence of such a system. 93% of the respondents agreed that OER can make education more accessible and 7% told that they are not sure whether it can be able to do so or not. 52 respondents mentioned that there are enough competent teachers to produce Open Educational Resources and a significant no. of respondents (30%) expressed doubt regarding the availability of competent teachers for OER production but 18% respondents told that there is not enough no. of competent teachers to produce OER. 60% believe that the use of OER will affect the quality of teaching-learning and 10% respondents are not sure about it but 30% respondents told that OER will not affect the quality of teaching learning. From the above findings , it can be understood that the teachers of these universities are aware about using online facilities for teaching and learning. Similarly they are in favor of OER but they are not much aware about its free availability, its forms, its licensing systems and its quality. Thus they are apprehensive and regarding content production for OER they are considering lack of technological competence as a challenge and many are not serious about OER content production due to their ignorance.

Ambika Sankar Mishra et al.,

CONCLUSION

Thus from the study it can be concluded that there is not much awareness among the teachers regarding OER, its availability, forms, licensing and its production but the positive aspect is they agree with the fact that, it is useful for students and teachers and if given opportunity, then many of them will be interested to produce OER. Thus a proper awareness regarding OER through training sessions will change the scene and it will help to promote more and more OER production and Utilization.

ABSTRACT

The main aim of the study is to examine the factors influencing on work life balance among teaching professionals in Tamilnadu. At present, the educational sector has confronted enhancing demands, with teaching professionals often required to encompass their roles beyond the traditional classroom duties. The study recognizes the key factors influencing on Work-life balance such as organizational support, work flexibility, workload and personal responsibilities. Also, the study investigates to what extent these factors contributing to the work-life balance that leads to overall job satisfaction and stress levels. Structured questionnaire is used to collect the data from 500 teaching professional across various educational institutions. Endogenous variable is considered as work life balance and organizational support, work flexibility, workload and personal responsibilities are exogenous variables. To prove the objectives of the study, descriptive statistics is used to describe the characteristics of respondents and correlation analysis is used to find the relationship exist among chosen variables. Also, multiple linear regression analysis is employed to probe the influence level of each exogenous variable on work life balance. The results highlighting that organizational support and work flexibility shows significant positive relationship and workload and personal responsibilities shows negative relationship with work-life balance. The implications of the study delivers the actionable insights for educational institutions to make policies that substitute a healthier work life balance, which is ultimately increasing job satisfaction and reducing burnout.

Keywords: Teaching Professionals, Workload, Flexibility, Organizational Support, Personal Responsibilities

INTRODUCTION

The attention of the work life balance (WLB) has increased worldwide because of the productivity and individual well-being (Greenhaus and Beutell, 1985). The main challenging in the teaching profession is maintaining the health among the personal and the professional life, as they faces a lot of problems and prospect on both in and out of the classroom (Kinman and Wray, 2013). Tamil Nadu is a state of enrich education history with vast social economical activities; the teaching staff faces sole problems in the work life balance among the mentors. (Natarajan, 2018). Preparation time, assessments, working hours and extra curriculum activities are the various factors that contribute to the challenges of work life balance by teaching profession. (Shanafelt *et al.*, 2015). The study is based on attain an equal balance among the work space and the personal life by which the future mentors will be increased. (Rudman and Gustavsson, 2011). The sensex and list of the challenges or problem face by the teaching professional is conducted only by limited organisation. (Barkhuizen and Rothmann, 2008). By the report of the research reveals that the various techniques to improve the work life balance among the professional to attain job satisfaction among the educators of Tamil Nadu..

Statement of the Problem

Challenges of work life balance and the work level stress beyond the class work is more among the teaching professional in Tamil Nadu, because the work of the teachers in Tamil Nadu consists of both constructed and unconstructed format. (Rajendran and Kaliappan, 1990; Sharmila, 2021). Factors that affect the work life balance of the teachers such as administrative duties, no support from institution, zero increments, supervision of other activities in the college and the internal pressure to fulfil the professional goals. (Sahaya and Ebenezer, 2015). The pressure on the teachers and professional has been increased due to the development of the technology, which affect the work life by straining them to handle online class, engage the students even after the classes along with professional development (Ramaswamy, 2019; Thangavelu and Balu, 2023). The development of the technology has increased the growth and the rise of the student but at the same time it has killed the boundaries between the professional and personal life of the teachers which leads to work imbalance, work stress, zero job satisfaction along with slow destruction (Kumar and Menon, 2020; Chandran *et al.*, 2023). The study has reveal that the quality of life style let by the teachers in Tamil Nadu along with challenges faced in ordered to maintain the work life balance with job retention and mental well being of the teachers.

Theories and Literature Review

The literature study reveals the gap between the personal life and work life by a theretical framework by highlight work life balance is important. Greenhaus and Beutell's (1985) *Conflict Theory* suggests that role argument between profession and family responsibilities result in stress and reduces job satisfaction. The *Role Theory*, proposed by Kahn *et al.* (1964), also points out that personal life balancing becomes more difficult while handling multiple role which results in the conflicts among themselves. Additionally, the *Job Demands-Resources Model* (Demerouti *et al.*, 2001) clearly show how the work life balance are affect by the increase in demand of work and emotional imbalance among the profession.

Work Life Balance

Based on the high demand of teaching profession, work life balance plays an important between the work satisfaction and the well-being of the employee. Work-life balance is defined as the capacity of persons to successfully manage the demands of both their individual and professional lives, which result in reducing the stress level, enhances the job satisfaction and improves the mental health. (Greenhaus and Allen, 2011). It is difficult to maintain the work balance of the teacher because of the extended working works, prolonged work pressure and high output in the academy. The balancing of the mental health and burnout in work pressure can be compensated by the high level of work life balance. People with high level of life and work space satisfaction has good work life balance with good mental health and less tension. (Hara *et al.*, 2014). Teachers needs to balance their personal and profession

**Subashini and Praba Devi**

life as the demand for the work increases efficiently with result in balancing the mental health of the individual. The significance of work-life balance in the education industry has been highlighted by recent studies. According to a study by McNall *et al.* (2010), teachers and other staff members report feeling more engaged and less stressed when they believe they have control over their work-life balance. Particularly teachers deal with special difficulties including juggling extracurricular activities, lesson planning, classroom management, and grading, which, if not handled well, can result in burnout (Fisher *et al.*, 2015). Understanding and developing work-life balance is therefore essential for teaching professionals' health as well as for increasing their efficacy and job happiness, which in turn improves student results.

Workload

One of the main factors influencing work-life balance has continuously been found to be workload. Overwork frequently results in stress, job discontent, and a decreased capacity to manage work and personal obligations. Due to the numerous duties they must do, including lesson planning, assignment grading, meeting attendance, and classroom management, teaching professionals in particular have heavy workloads (Spector and Jex, 1998). According to research by Keinan (2002), teachers' total work-life balance is impacted by stress and burnout, which are greatly exacerbated by an increased workload. Teachers find it challenging to find time for personal and family obligations when they are overburdened by their workload. Research has shown that a heavy workload is closely linked to work-life conflict, in which the demands of the workplace severely impact one's personal well-being and family life (Clark, 2000). According to a study by Chakravarthi and Karthikeyan (2020) particularly the teacher in Tamil Nadu, undergoes huge pressure and stress due to the over work load which affect the family quality time and responsibility. Therefore, to improve the work life balance of the teacher reduction of work burden and freedom in work place should be provided. By which they can handle both the profession and personal life equally.

Organizational Support

The organization support is the welfare community which workers on the appreciation and providing gifts to the employees on the contribution towards the organization. By creating a enriched work atmosphere where employees feel valued and delightful, high levels of perceived organisational support (POS) have been build a path for the better work-life balance (Eisenberger *et al.*, 1986). Organisational support to the teaching professional are providing by the following factors such as the understanding leadership head, financial benefits, flexible work schedules such as maternity leave and resources availability. Kinnunen *et al.* (2010) conflicts between the work life and personal life are overcome by the support of the organisation to improve the life balance. In teaching professional the fundamental of the organisation support is essential for the work life balance. Reduction in the work stress, personal life balance, enhanced job satisfaction and high work level balance should be provided by the organisation (Carlson *et al.*, 2011). According to research by McNall *et al.* (2010), organisational support is directly correlated with the enrich work-life balance because it makes it possible for faculty members to get the assistance they require in professional work and personal commitments in their life. However, a lot of teachers in Tamil Nadu complain that the work life balance is worse because of lack of administration support toward the teacher during critical times and over work load which burden and stress burn out among the teachers and family members (Jayaseelan and Prakash, 2017).

Work Flexibility

The ability to change work schedules or work tenuously is known as work flexibility, and it's one of major key component for the health work life balance. According to their personal and professional needs the employee can adjust their personal and professional work time. In the educational institution, the flexibility of the time is define by modifications their classes according to their requirements, additional special class for the students for the better results, involvements in the remote area activities and time for the personal time. According to Hill *et al.* (2001), the work life balance reduces the stress and the enables the employee to fulfil their personal needs with affecting their professional duties by providing flexible work management. The conflicts between the work family balance and work life balance can be overcome by the flexible arrangement towards the teacher, according to studies (Kossek and Ozeki, 1998). In teaching professional flexible of working hours play important roles in remote work hours and especially during the COVID-19 pandemic (McNall *et al.*, 2010). According to the study, in Tamil Nadu conventional

**Subashini and Praba Devi**

teaching techniques shows the lack of work life flexibility but nowadays a huge step has been taken towards improving the work life balance of the teachers by providing flexible working hours.

Personal Responsibilities

The personal demands such as taking care of children's, family responsibilities and household management can be achieved only by work life balance. According to Grzywacz and Marks (2000), during taking care of children's, elderly people medical emergency creates a conflict between the personal life management and the handling of work space. Due to the overloaded work burden by the responsibility, it creates a huge conflict between the work stress and work life balance by personal obligations, according to research by Kinnunen *et al.* (2013). Especially in Tamil Nadu due to the traditional gender norms and faith, it is believed that more responsible duties are often giving to the female staffs frequently, which creates more difficulties towards work life balance by overloaded stress. Balancing of personal life from work life is the major stress for teachers. It is the responsibility of the individual to take care of their personal life, family and their work space often. The conflicts between the personal life and work always affect the work life balance, according to a study by Kinnunen *et al.* (2010). In Tamil Nadu, it is often observed that there is a conflict between the personal life management, house work commitment, commitment towards children and work professional which creates more stress. By providing training or educating the teachers to handle both the personal responsibility and work space equally by which work life balance can be enhanced.

Research Gap

The teaching professional in Tamil Nadu lacks a gap in work life balance according to the research. The teachers are shaped and modified on different such as regional factors, social culture and institution in Tamil Nadu which affect the work life balance of the teacher. In the international institutions, the work life balance can be achieved by varies factors such as organisational support, institutional welfare support, work pressure, work flexibility, personal work and personal responsibility and management. As in Tamil Nadu the social gap by the gender norms and social activities and culture activities could be broken in this literature study. Furthermore, the research clear say that in particular region the two main problems for the effect of work life balance is overloaded work pressure and the lack of the institutional support for the teachers. By the educators of Tamil Nadu has to focus and create policies for work life balance of the teachers by overcoming the work stress and personal life imbalance.

Objectives

- 1.To understand the factors influencing the work-life balance among teaching professionals.
- 2.To find the correlation exist among organizational support, work flexibility, personal responsibilities, work load and work-life balance.
- 3.To examine the influence of organizational support, work flexibility, workload and personal responsibilities on work-life balance.

Hypotheses

H₁: There is a significant relationship between workload, organizational support, work flexibility, personal responsibilities and work-life balance among teaching professionals

H₂: Negative influence of workload on Work-life balance

H₃: Positive influence of Organizational support on Work-life balance

H₄: Positive influence of Work flexibility on Work-life balance

H₅: Negative influence of personal characteristics on the work-life balance.

Research Model (FIG: 1)

METHODOLOGY

Quantitative research design has been used to investigate the factors influencing on work-life balance among the teaching professionals in Tamil Nadu. The study used cross-sectional survey to gather the data from the 500 teaching

**Subashini and Praba Devi**

professionals across tamilnadu using structured questionnaire. 5 point Likert scale has been used for each item to measure the chosen variables in the instruments. Since the populations is known, the study adopted stratified random sampling to collect the data from each respondents. After the collection stage, the data has been cleaned and edited before moving on to the analysis. Initially, reliability test is employed to check the internal consistency. After that, demographic profile and descriptive statistics is used to describe the characteristics of the respondent. In addition to this, correlation and multiple linear regression was used to test the hypothesis of the study. The study considered work life balance as endogenous variable and the same has been measured using the adapted that examine the individual perceived ability balance professional and personal responsibilities (Haar *et al.*,2014). Exogenous variables such as workload scale has been taken from (Spector and Jex, 1998) followed by organizational support scale (Eisenberger *et al.*, 1986), Work flexibility (Hill *et al.*, 2001) and Personal responsibilities(Grzywacz and Marks, 2000). The above mentioned scales are extensively used in the research related to work life balance and the same has been chosen to ensure the validity and reliable measure of the each variable.

Analysis and Interpretation**Demographic Profile of Respondents**

Table 1 shows the demographic profile of the teaching professionals which includes gender, age, marital status, educational qualifications and years of experience. The demographic characteristics of the study's respondents highlight a fairly even split between genders, with females making up 52 percent and males 48 percent. In terms of age distribution, a significant portion of participants falls within the 31-40 age bracket (40%), followed by the 21-30 age group (30%), suggesting that the sample largely comprises individuals in their early to mid-career stages. Marital status data reveals that a majority of the respondents are married (64%), while 36 percent are single. Regarding education, most participants exhibit high academic qualifications, with 60 percent holding a Master's degree, 20 percent a Bachelor's degree, and another 20 percent a Doctorate. Professional experience varies across the sample, with 40 percent having fewer than 5 years of teaching experience, and 30 percent each possessing 5-10 years and over 10 years of experience. This diverse demographic representation provides valuable insights into the teaching workforce in Tamil Nadu, reflecting differences in age, marital status, education, and professional background.

Reliability Analysis

Cronbach's alpha was calculated to test the reliability of the scales used for each variable. A threshold of 0.70 was set to confirm acceptable internal consistency (Nunnally, 1978).

All variables demonstrated adequate reliability, with Cronbach's alpha values above 0.70, confirming that the scales are internally consistent and suitable for further analysis.

Descriptive Statistics

Descriptive statistics were used to provide a summary of the data for each variable, including the mean and standard deviation.

Table 3 shows that moderate level of work-life balance, workload, and personal responsibilities, with slightly higher perceptions of organizational support and work flexibility.

Correlation Analysis

Pearson correlation analysis was conducted to examine the relationships between work-life balance and the independent variables. A significance level of 0.05 was used for all tests. Table 4 correlation matrix reveals several key relationships between the variables. A significant negative correlation of ($r=-0.45$, $p<0.05$) between Work-Life Balance and Workload suggests that higher workloads are associated with poorer work-life balance. Conversely, Work-Life Balance is positively correlated with Organizational Support ($r=0.55$, $p<0.05$) and Work Flexibility ($r=0.47$, $p<0.05$), indicating that supportive work environments and flexible work arrangements enhance work-life balance. Personal responsibilities show a negative relationship with work-life balance ($r=-0.30$, $p<0.05$), indicating that increased personal demands reduce work-life balance. Additionally, Workload negatively correlates with Organizational Support ($r=-0.20$, $p<0.05$) and Work Flexibility ($r=-0.25$, $p<0.05$), implying that greater workloads may be associated with lower support and flexibility, while Personal Responsibilities is weakly related

**Subashini and Praba Devi**

to Workload ($r=0.22$, $p<0.05$) and Organizational Support ($r=-0.15$, $p<0.01$), further suggesting that personal responsibilities have some influence on work demands and support structures. These findings emphasize the importance of organizational support and flexibility in fostering work-life balance, while highlighting the negative impact of excessive workload and personal responsibilities. Hence, H_1 is accepted.

Multiple Linear Regression Analysis

Table 5 shows the multiple linear regression results indicate that Workload, Organizational Support, Work Flexibility, and Personal Responsibilities significantly predict Work-Life Balance. The model explains 46% of the variance in work-life balance ($R^2 = 0.46$), and the adjusted R^2 is 0.45, suggesting that the model is a relatively good fit for the data. The remaining 54 percent is explained by some other factors which has not been considered into the model. The constant term ($\beta=1.80$, $p<0.01$) represents the baseline level of work-life balance when all predictor variables are zero. Among the predictors, Workload has a negative coefficient of ($\beta=0.28$, $p < 0.01$), meaning that as workload increases, work-life balance decreases. The t-statistic of -4.67 indicates that this relationship is statistically significant. In contrast, Organizational Support ($\beta=0.40$, $p < 0.01$) and Work Flexibility ($\beta=0.35$, $p < 0.01$) both have positive coefficients, meaning that higher levels of support and flexibility at work are associated with better work-life balance. The standardized beta coefficients of 0.36 and 0.31 indicate that Organizational Support has a slightly stronger influence on work-life balance than Work Flexibility. Personal Responsibilities ($\beta=-0.15$, $p < 0.05$) has a negative impact on work-life balance, with the t-statistic of -2.50 showing a significant relationship. This suggests that as personal responsibilities increase, work-life balance decreases. Overall, the results highlight the importance of reducing workload, enhancing organizational support, and offering flexibility in the workplace, while also recognizing that personal responsibilities can create challenges in achieving work-life balance. Hence, H_2 , H_3 , H_4 and H_5 is accepted.

RESULTS AND DISCUSSION

The study reveals that the work life balance can achieve only by the support from the organisation and the flexible work space which is dynamical. According to the study , it reveals that the flexibility of the work space and the support towards the teachers should be provided by the institution individually to achieve a balance between the personal life and the work life balance. These findings are consistent with those of Haar *et al.* (2014), balancing of work and the personal responsibilities can be achieved only by the support of the institution through various aspects such as productive workspace culture, communication between the supervisors and by the available resources. Similarly, Hill *et al.* (2001) found that satisfaction of work life balance can be achieved by managing the working hours of the employee in the remote area. Such flexibility of the individual resulting developing the personal life management and reduces the stress from the personal life and the work life inspect of the demand of the work and the need towards the family life. In the highlights of the previous study and research it clear shows that the workload and the personal responsibility are two major factors that the work life balances of the teacher in their working professional. According to Spector and Jex (1998), the major stress for the employee is the overloaded work pressure instead by providing some quality time towards their family and personal life could enrich their the work life balance. The negative image of the work life balance could be overcome by providing time in-between the work hours of the teachers. At the same time, they feel difficulties to handle their family time, child care and taking after the elder member of the family with the work balanced which could lead to overload stress and depression in the workplace. The increase in the work space load and increase in personal life demand and except towards the growth of the institution and the personal life could majorly affect the work life balance and leads to major stress and mind depression.

Managerial Implications

The findings of this study recommend several important managerial implications for enhancing work-life balance within organizations. Primarily, promoting organizational support is critical for helping employees balance their work and personal responsibilities. Superior should concentrate on creating supportive work environment, which

**Subashini and Praba Devi**

could comprise providing frequent feedback, offering resources and nurturing a culture where the managers show understanding of employees personal needs. Furthermore, importance should be given to work flexibility because it allows the employees to better manage their personal commitments along with their professional duties. Providing flexible work hours or remote work choice could help the employees reduce the stress and improve their work-life balance. On the other side, workload should not be given to employees more and therefore workload management is essential in the organization. Hence, supervisors must ensure that the employees are not stunned with excessive work demands, which could lead to burnout and stress. In order to maintain the healthier balance, the manager must follow the effective workload distribution, additional support and clear expectations from the employees. Finally, while personal responsibilities are mainly outside the control of employers, providing flexibility in additional support or work schedules, such as childcare options or employee assistance programs, can assuage some of the challenges employees face in managing their personal lives. By adopting these strategies, organizations can foster a more balanced work-life environment, improving employee satisfaction, reducing stress, and ultimately enhancing organizational performance.

CONCLUSION

In conclusion, the overall study reveals that the work life balance of the teachers can be attained only by providing flexible work hours and peaceful work space. For the healthier balance between the work space and personal life, a huge support should be provided by the institution along with the flexible work hours and arrangements. On the other hand, the overall mental and physical health issues and the overloaded stress is created by the overloaded work pressure and insignificances in the personal responsibilities are the major reasons. This reveals that the institution should provide various work beneficiary policies, strategies which support the employees and promising less workload. By taking forth of these problem, it not only leads to work life balance but also it increases the satisfaction of the employee of the institutions and with enhanced work life balance, performances and the satisfaction of the employee. By providing such measures it can be more supportive and friendly work environment could be created, which creates benefits for the both professionals and the organisation as a whole.

Limitations and Scope for Further Study

A key limitation of this study is its cross-sectional design, which only captures a snapshot of teachers' work-life balance at a single point in time. This approach restricts the ability to analyze long-term patterns or shifts. Moreover, as the study focuses exclusively on Tamil Nadu, its findings may not be easily applicable to other regions in India or countries with distinct educational systems and cultural norms. To address these gaps, future research could employ a longitudinal design to investigate the long-term impacts of work-life conflict on teachers' well-being and job satisfaction. Additionally, conducting comparative studies across various states or nations could offer deeper insights into how cultural, institutional, and policy differences shape work-life balance within the teaching profession.

ABSTRACT

Depression detection is a critical challenge in mental health research due to the increasing prevalence of mental disorders and the limitations of traditional diagnostic methods. Conventional approaches, such as interviews and PHQ scores, often suffer from low accuracy and delayed diagnoses. In this study, we propose a hybrid deep learning framework for depression detection, leveraging the power of transformer models and ensemble learning techniques. Specifically, we utilize the RoBERTa transformer model to extract high-quality textual features from patient responses and integrate these with an XGBoost classifier to improve detection performance. The proposed method is evaluated using a publicly available depression dataset from Hugging Face, achieving an accuracy of 92.8%, significantly outperforming traditional methods. The findings demonstrate the potential of combining transformer-based architectures with ensemble learning for efficient and accurate depression detection, paving the way for early intervention and improved mental health outcomes.

Keywords: Depression Detection, Deep Learning, Roberta, XGBoost Classifier, Hugging Face, Transformer, Ensemble learning, accuracy

INTRODUCTION

Mental health issues, including depression, affect a significant portion of the global population, with over 264 million people suffering from this condition worldwide [1]. Depression can stem from various factors such as sudden environmental changes, imbalances in neurotransmitter levels, or even genetic predispositions [2]. Effective treatment options include therapy sessions and medication. However, many individuals remain undiagnosed due to a lack of awareness about depression, leading to adverse outcomes such as social withdrawal, erratic behavior, suicidal thoughts, or dependence on antidepressants. Left untreated, depression can severely impact daily activities, reducing focus and interest, and eventually causing harm to both the mind and body. With technological advancements, social media usage has surged, with approximately 3.8 billion active users worldwide [3]. Social media platforms have become spaces for individuals to express emotions, thoughts, and opinions, often providing relief by sharing unsettling feelings. These platforms enable users to post textual content that offers valuable insights for various real-world applications, including healthcare, politics, and entertainment [4]. Researchers can analyze this data to gain an understanding of users' mental health, offering opportunities for timely intervention [5]. Twitter, a popular micro-blogging platform, allows users to post concise updates, known as tweets, limited to 140 characters [16]. Its simplicity and accessibility make it a widely used platform for sharing emotions and opinions. Most tweets are publicly accessible and can be retrieved using Twitter's API, which supports complex queries, such as retrieving tweets on specific topics [6]. Additionally, Twitter supports more than 35 languages, broadening its global reach. The data shared on Twitter provides researchers with a valuable resource for analyzing mental health conditions and identifying opportunities for support and recovery [21]. Social media, while offering a platform for self-expression and connection, can also pose significant risks in certain circumstances [8]. For example, users may send, post, or share harmful content targeting others, leading to cyberbullying or harassment. Additionally, social media activity can reflect offline risks; for instance, adolescents experiencing depression might begin posting suicidal thoughts online, signaling potential dangers [11]. In recent years, natural language processing (NLP) and deep learning have emerged as powerful tools for analyzing textual data and identifying mental health concerns [13]. These technologies have been successfully applied to detect depression, anxiety, and suicidal ideation from user-generated content [15]. By leveraging computational methods, researchers can develop automated and scalable tools to identify individuals experiencing mental health issues or at risk of harm [8].

This approach holds great promise for timely intervention and support, making social media a valuable resource for addressing mental health challenges. In recent years, the emergence of social media has opened new avenues for monitoring mental health. The proliferation of user-generated content on platforms like Twitter and Facebook offers rich data for analysis, enabling the identification of emotional imbalances and depressive tendencies. Artificial intelligence (AI) and machine learning (ML) techniques have evolved significantly, providing tools that can enhance emotional intelligence in machines. These technologies facilitate text-based emotion recognition [6], which can analyze posts and tweets to gauge users' moods and potentially predict suicidal thoughts. Such early detection can lead to timely interventions, significantly impacting user well-being. Recent advancements in transformer-based models [15], such as RoBERTa, have demonstrated remarkable performance in natural language understanding tasks, making them invaluable for sentiment analysis in textual data related to mental health. RoBERTa's ability to capture nuanced emotional expressions enhances the detection of depressive signals in social media content. Additionally, tree-based algorithms like XGBoost offer robust solutions for classification problems, allowing for efficient processing of large datasets and improving prediction accuracy [16]. These algorithms can be evaluated through metrics such as precision scores and confusion matrices to determine their effectiveness in sentiment prediction [9]. Beyond textual analysis, emotions can also be inferred from facial expressions, gestures, and vocal tones, further enriching the potential for accurate detection of depression. [13]. For instance, AI applications can monitor drivers for signs of drowsiness, potentially preventing accidents. Similarly, emotion detection systems can enhance user interactions with chatbots, allowing for personalized responses that aim to improve mood and mitigate distress [23]. Furthermore, the application of emotion detection technologies can play a pivotal role in educational settings [20]. For example, identifying signs of depression in students through their interactions in online learning environments

Roshani Ravshahed Borase et al.,

can help educators provide timely support [17]. By analysing engagement levels, communication patterns, and emotional cues, AI systems can alert educators to students who may be struggling, facilitating early intervention and promoting mental well-being in academic contexts [11]. As these technologies continue to develop, they hold promise not only for individual mental health monitoring but also for fostering supportive environments in various sectors [15].

LITERATURE REVIEW

Depression has become a serious problem in this current generation and the number of people affected by depression is increasing day by day. However, some of them manage to acknowledge that they are facing depression while some of them do not know it. On the other hand, the vast progress of social media is becoming their “diary” to share their state of mind. Several kinds of research had been conducted to detect depression through the user post on social media using machine learning algorithms [1]. Through the data available on social media, the researcher can able to know whether the users are facing depression or not. Machine learning algorithm enables to classify the data into correct groups and identify the depressive and non-depressive data. research work aims to detect the depression of the user by their data, which is shared on social media. The Twitter data is then fed into two different types of classifiers, which are Naïve Bayes and a hybrid model, NBTree. The results will be compared based on the highest accuracy value to determine the best algorithm to detect depression. The results show both algorithm perform equally by proving same accuracy level. [2] proposed method consists of three components; first, a textual CNN model in which a CNN model is trained with only text features, second, an audio CNN model in which CNN model is trained with only audio features and third, a combination of audio and textual model named as hybrid model in which LSTM algorithms are applied. An improved version of LSTM model named as Bi-LSTM model is also used in the proposed work. In results, training accuracy, training loss, validation accuracy and validation loss is calculated for all the mentioned models [2]. The results shows that deep learning is a better solution for depression detection in which accuracy of textual CNN model is 89% whereas accuracy of audio CNN model is 91% and loss of textual CNN is 0.2 whereas loss of audio CNN is 0.1. These results show that audio CNN is a good model for depression detection [2]. It performs better as compared to textual CNN model. It is also observed that Bi-LSTM has better learning rate as compared to other models with accuracy 88% and validation accuracy 78%. There are some parameters such as precision, F1-score, recall and support are found for evaluation of models. In results, graphs for training loss, validation loss, training accuracy and validation accuracy are plotted.

At last, by using confusion matrix depression can be detected for textual CNN Model, audio CNN model, LSTM model and Bi-LSTM against true label and predicted label. [3] proposes depression detection among individuals we have conducted a survey with 21 questions based on Hamilton tool and advice of psychiatrist. With the use of Python's scientific programming principles and machine learning methods like Decision Tree, KNN, and Naive Bayes, survey results were analyzed. Further a comparison of these techniques is done [3]. Study concludes that KNN has given better results than other techniques based on the accuracy and decision tree has given better results in the terms of latency to detect the depression of a person. At the conclusion, a machine learning-based model is suggested to replace the conventional method of detecting sadness by asking people encouraging questions and getting regular feedback from them [3]. [4] Propose a depression detection model that utilizes both audio and video features extracted from the vlogs (video logs) on YouTube. We first collected vlogs from YouTube and annotated them into depression and non-depression. We then analyze the statistical differences between depression and non-depression vlogs. Based on the lessons learned, we build a depression detection model that learns both audio and visual features, achieving high accuracy [4]. We believe our model helps detect depressed individuals on social media at an early stage so that individuals who may need appropriate treatment can get help. [5] proposes the early screening of depression is highly beneficial for patients to obtain better diagnosis and treatment. While the effectiveness of utilizing voice data for depression detection has been demonstrated, the issue of insufficient dataset size remains unresolved. Therefore, we propose an artificial intelligence method to effectively identify depression [5]. The wav2vec 2.0 voice-based pre-training model was used as a feature extractor to automatically extract high-quality voice features from raw audio. Additionally, a small fine-tuning network was used as a classification model to output depression classification results. Subsequently, the proposed model was fine-tuned on the DAIC-WOZ dataset and

**Roshani Ravshad Borase et al.,**

achieved excellent classification results [5]. Notably, the model demonstrated outstanding performance in binary classification, attaining an accuracy of 0.9049 and an RMSE of 0.1875 on the test set. Similarly, impressive results were obtained in multi-classification, with an accuracy of 0.7881 and an RMSE of 0.3810. The wav2vec 2.0 model was first used for depression recognition and showed strong generalization ability. The method is simple, practical, and applicable, which can assist doctors in the early screening of depression. [6] Study that trained and tested classifiers to distinguish whether a user is depressed or not using features extracted from his/her activities in the network and tweets. The results showed that the more features are used, the higher are the accuracy and F-measure scores in detecting depressed users [6]. This method is a data-driven, predictive approach for early detection of depression or other mental illnesses. This study's main contribution is the exploration part of the features and its impact on detecting the depression level [6]. [7] Conduct Detecting depression from user-generated content on social media platforms has garnered significant attention due to its potential for the early identification and monitoring of mental health issues. This paper presents a comprehensive approach for depression detection from user tweets using machine learning techniques [7]. The study utilizes a dataset of 632,000 tweets and employs data preprocessing, feature selection, and model training with logistic regression, Bernoulli Naive Bayes, random forests, DistilBERT, SqueezeBERT, models. Evaluation metrics such as accuracy, precision, recall, and F1 score are employed to assess the models' performance [7]. The results indicate that the BERT model achieves the highest accuracy ratio of 0.87 and the highest mean accuracy of 0.77 (across 10 cross-validation folds) in detecting depression from tweets. This research demonstrates the effectiveness of machine learning and advanced transformer-based models in leveraging social media data for mental health analysis. The findings offer valuable insights into the potential for early detection and monitoring of depression using online platforms, contributing to the growing field of mental health analysis based on user-generated content. [8] Research work, a hybrid model has been proposed that can detect depression by analyzing user's textual posts. Deep learning algorithms were trained using the training data and then performance has been evaluated on the test data of the dataset of reddit which was published for the pilot piece of work, Early Detection of Depression in CLEF eRisk 2017 [8]. In particular, Bidirectional Long Short Term Memory (BiLSTM) with different word embedding techniques and metadata features were proposed which gave good results.

Dataset

The dataset used for this study is sourced from hugging face, a platform renowned for providing diverse and high-quality datasets for research and development. This particular dataset contains user-generated content, including social media posts, tweets, and comments, focusing on mental health-related discussions. It is rich in textual data that reflects various emotional states, such as depression, anxiety, and general well-being. The dataset includes labeled examples, distinguishing between depressive and non-depressive content, which serves as the foundation for supervised learning. Preprocessing steps such as noise removal, tokenization, stop word elimination, and lemmatization will be applied to ensure the data is clean and structured. Additionally, augmentation techniques will enhance the dataset's robustness by introducing variations, helping the model generalize better to unseen data. This Hugging Face dataset provides a comprehensive and diverse resource for training and evaluating the proposed hybrid model, enabling accurate and efficient depression detection.

Proposed Methodology

The proposed methodology for depression detection involves a detailed and systematic process to ensure accurate and efficient identification of individuals at risk. The dataset will be sourced from Kaggle, comprising user-generated content such as posts, tweets, and comments related to mental health. This data will undergo preprocessing to ensure quality and consistency. Noise removal techniques will be applied to eliminate special characters, URLs, hashtags, mentions, and redundant spaces. All text will be converted to lowercase for uniformity, followed by tokenization to split the text into manageable components. Stopwords that do not add semantic value will be removed, and lemmatization will reduce words to their base forms, minimizing redundancy. To further enhance the dataset, data augmentation techniques like synonym replacement, random insertion, and back-translation will be employed, increasing diversity and robustness. After preprocessing, RoBERTa, a transformer-based model, will extract contextual embeddings from the text. These embeddings will capture the semantic and emotional nuances, serving as input features for the XGBoost classifier. The XGBoost model will then classify the text into depressive or non-

Roshani Ravshahed Borase et al.,

depressive categories. The model's performance will be optimized through hyperparameter tuning, adjusting factors such as learning rate, tree depth, and the number of estimators. The dataset will be split into training, validation, and test sets to ensure reliable evaluation. The training set will build the model, the validation set will guide hyperparameter adjustments, and the test set will assess the model's generalization to unseen data. The entire process will be automated as a scalable pipeline, integrating data preprocessing, feature extraction, and classification into a unified workflow. This design will facilitate the model's deployment for real-world applications, such as monitoring social media content for early depression detection. By leveraging the contextual strength of RoBERTa and the classification efficiency of XGBoost, the proposed methodology aims to provide a robust and reliable solution for identifying individuals at risk of depression. Google Colab is used as the primary platform for implementing the proposed hybrid model for depression detection. This online, open-source platform provides a user-friendly interface for writing and executing Python code, making it ideal for developing and testing machine learning and deep learning models. In Colab it deals with the various accelerator type example CPU, GPU. GPU provides the most flexible processing with seconds of execution. Usually, neural networks deal under the GPU. It has 100x power seamless execution power. As a cloud-based tool running on Google servers, it integrates seamlessly with Google Drive, where the dataset and resources for the project are stored. This eliminates the need for additional setups, downloads, or installations, simplifying the development process. For implementing the work Google Colab offers access to GPU and TPU accelerators, which significantly enhance the computational efficiency required for training deep learning algorithms such as RoBERTa and XGBoost. The platform also includes a variable panel, allowing real-time monitoring of variables, their values, and data types during code execution, aiding debugging and evaluation. Although it lacks a kernel menu, the runtime can be restarted effortlessly to refresh the environment. Another key advantage of Google Colab is its ability to facilitate collaboration. Notebooks can be easily shared as it has interface like jupyter notebook, and updates can be made in real time, streamlining collaborative development. For the proposed work, which combines RoBERTa and XGBoost, Google Colab provides the computational resources and flexibility required to preprocess data, train models, and evaluate results effectively, making it an ideal platform for this research. For implementing python programming language is used. Python is a powerful and flexible programming language widely used across various domains due to its simplicity and robust ecosystem of libraries. Libraries such as NumPy, Pandas, and Matplotlib support efficient data manipulation and visualization, while machine learning frameworks like TensorFlow, PyTorch, and Scikit-learn enable the development of complex models. Python's versatility makes it a go-to language for fields ranging from web development to artificial intelligence, providing tools that streamline workflows and enhance productivity.

Evaluation Parameters and Significance

The performance of the system should be evaluated in terms of the accuracy of classification. It is worth mentioning that a comparative analysis is done based on the common and overlapping data

Accuracy (Ac): It tells us about the exactness set of the different methods. The critical parameters are:

The classification accuracy is computed as

$$Ac = \frac{TP+TN}{TP+TN+FP+FN} \quad (1.1)$$

The precision is computed as

$$Pr = \frac{TP}{TP+FP} \quad (1.2)$$

The F-measure or F-Score is computed as:

$$F - Measure = 2 \cdot \frac{Precision \cdot Recall}{Precision + Recall} = F - Measure = \frac{TP}{TP + \frac{1}{2}(FP + FN)} \quad (1.3)$$

Here,

(TP): True Positive

(TN): True Negative

(FP): False Positive

(FN): False Negative

EXPERIMENTAL RESULTS

The evaluation of the proposed hybrid model for depression detection, which integrates RoBERTa and XGBoost, demonstrates its effectiveness in identifying depressive tendencies based on textual data. The model was assessed using a test dataset after being trained and validated on labeled examples. The primary metric used for evaluation was accuracy, reflecting the proportion of correctly classified instances to the total instances in the dataset. The hybrid model achieved an accuracy of 94.6%, indicating a high level of reliability in distinguishing between depressive and non-depressive content. The performance of the model was observed to be consistent across both training and validation phases, showcasing its ability to generalize well to unseen data. The results highlight the superiority of the hybrid approach, as it combines RoBERTa's contextual embedding capabilities with the robust classification power of XGBoost. Furthermore, the automated pipeline ensured a streamlined process from data preprocessing to final evaluation, making the system efficient and scalable for real-world applications. Overall, the evaluation confirms the potential of the proposed methodology to serve as an effective tool for depression detection, contributing to early identification and intervention for mental health challenges.

CONCLUSION

The RoBERTa-XGBoost model for depression detection demonstrated a high classification performance, achieving an overall accuracy of 94.6%. The model effectively distinguished between depressed and non-depressed individuals, with an F1-score of 0.88 for both classes. Specifically, it attained a precision of 0.84 and recall of 0.94 for the non-depressed category, while the depressed category recorded a precision of 0.93 and recall of 0.82. These results indicate that the model is highly capable of identifying depression while maintaining a balance between precision and recall. The high recall for non-depressed individuals suggests a low false negative rate, ensuring that most non-depressed cases are correctly identified. Conversely, the high precision for depressed individuals minimizes false positives, improving the reliability of depression detection. The integration of RoBERTa's deep contextual embeddings with XGBoost's powerful classification capabilities contributed to the model's robustness and effectiveness. Overall, the findings highlight the potential of hybrid deep learning and machine learning approaches in automated mental health assessment.

Future Scope

In future enhancing model generalized by incorporating larger and complex dataset. More fine tune hyperparameters could further improve classification performance.

ABSTRACT

Presence of abiotic stress (salt and metals) has been a major hurdle in achieving better crop yield and quality harvesting. Plant growth promoting rhizobacteria (PGPR) are free-living soil bacteria present in the surroundings of rhizosphere and have a symbiotic association with plants roots. It has the properties of phyto-stabilization and soil rejuvenation in heavy metals contaminated soils. In the current study, soil samples were collected from different sites and isolation was done for the salt and heavy metal tolerant plant growth-promoting rhizobium (PGPR) bacteria. Plant growth-promoting specific parameters like catalase, phosphate-solubilizing and indole acetic acid (IAA) were performed for confirmation of PGPR isolates. Salts tolerance activity was performed at 6.5% salt concentration and heavy metal tolerance activity for different heavy metals (Cd, Cr, Cu, and Zn) were done at varying concentrations like 0.1%, 0.5%, and 1%. It was observed that the most isolates demonstrated resistance to zinc, followed by copper, chromium and cadmium. In the present study, 11 bacterial isolates were characterized as rhizobacterial species and it was reported that isolated rhizobacteria have the capacity of tolerance of salt and heavy

Mahendra K Gupta *et al.*,

metals and exhibiting a couple of plant growth promoting traits. Hence, it can be concluded that these types of PGPR isolates might have potential to improve the productivity of plants under salt and heavy metal stress.

Keywords: Plant growth promoting rhizobacteria (PGPR); Indole Acetic Acid (IAA); Catalase; Phosphate- solubilizing; Heavy metal; Salt tolerance.

INTRODUCTION

Stress is defined as any factor that has a detrimental impact on a plant's growth. It has been estimated by Food and Agricultural Organization (FAO) that world will be lost 50% land of the total land by the year 2050. Excess salt concentration and presence of heavy metals in the soil has negative impacts on plant growth and metabolism. Untreated industrial effluents and the usage of large amounts of synthetic fertiliser both contributed in the soil contamination, turning fertile land into polluted land [1-5]. The salinity stress may also influence the generation of free radicals which decrease the plant defensive enzyme [6,7]. When such contaminated areas are later used for agricultural production, the accumulation of heavy metals in the soil increases crop contamination due to their non-biodegradable nature[5, 8]. Soil microbes are critical factors of soil fertility, health and soil nutrient cycle. The rhizosphere, also known as the microbial storehouse, is the soil zone surrounding plant roots and influence the physiological and biochemical properties of host plants and soil. Roots secrete an abundance of organic substances as root exudate molecules (amino acids, organic acids, carbohydrates, sugars, mucilage, flavonoids, phenolic and proteins), which are used by microorganisms as an energy source and as a result, it increased rhizosphere microbial activity. The chemo taxis response with root exudates, which either attracts or repels rhizosphere bacteria, promotes the colonizing potential of PGPRs [8]. Endo-rhizosphere, rhizoplane, and ecto-rhizosphere are the three zones of the rhizosphere where microorganism is present and well known for their beneficial activities [9, 10,11]. On the basis of activities, they are grouped into biofertilizers, phyto-stimulators, rhizoremediators, biopesticides, and bioprotectants. They also help in improvement of soil quality, in rhizo-remediation and boost plant tolerance to heavy metal stress[12]. The aim of present study was isolation of bacteria from soil samples collected from zones of rhizosphere and screened for salt and heavy metal tolerant activity. PGPR isolates also checked for plant growth-promoting properties such as catalase, phosphate-solubilizing and indole acetic acid (IAA) parameters.

MATERIALS AND METHODS

Collection of soil samples

A total 09 soil samples were collected from different regions including Jiwaji Botanical Garden, Agriculture College and Krishi Vigyan Kendra, Gwalior and used for isolation of PGPR bacteria.

Isolation and screening of bacteria for salt and heavy metal tolerance from soil samples

Isolation was done by serial dilution in which 1 gram of each collected soil sample was suspended into 9 ml of autoclaved sterile distilled water and their subsequent dilutions (10^{-2} to 10^{-6}) were made. 1 ml aliquot from dilutions number 10^{-5} and 10^{-6} were inoculated and spread onto the surface of solid plate prepared by nutrient media. After 24 hour of incubation, randomly selected isolated colonies of rhizobacteria were further purified by the method of streaking[13].The isolates were tested for their salt and heavy metal tolerance ability by using different NaCl concentration (3%, 6% and 9%) and appropriate salts of four different heavy metals (Zinc ($ZnSO_4 \cdot 7H_2O$), Copper ($CuSO_4 \cdot 5H_2O$), Chromium ($K_2Cr_2O_7$), Cadmium ($CdCl_2$)) at the different concentration (0.1%, 0.5%, 1%). A isolation of salt tolerant bacteria was done on nutrient agar and appearance of rhizobacterial growth after 24-48 hr incubation determined the salt stress tolerance[14].Evaluation of heavy metals resistance of selected bacterial isolates was performed by well diffusion method using Luria Bertani (LB) agar medium. LB plates were swabbed with overnight grown culture of bacterial isolates, and the wells were prepared with the help of sterile cork borer (7 mm). Then 100

Mahendra K Gupta et al.,

µl solution of appropriate salts of selected four different heavy metals were poured into the wells separately and plates were incubated at 37°C for 24-48 h. After incubation, zones of inhibition were measured in mm[8,15].

Characterization of salt and heavy metal tolerant bacterial isolates for plant growth-promoting activity

Estimation of Auxin Production

Bacterial isolates were cultivated for 24 hr in nutrient broth tubes before being inoculated for 48 hr at 30°C with L-tryptophan. Fully developed cultures were centrifuged at 10,000 rpm for 10 min. 2 ml of supernatant was combined with 4 ml of Salkowski reagent and add 2 drops of orthophosphoric acid in a 250 ml flask. The appearance of pink colour was the indication of IAA production [16].

Estimation of P-solubilization

Rhizobacterial isolates were inoculated on Pikovskaya's agar plate, covered with parafilm and were incubated at 28°C for 7 days. A clear zone formed surrounding the colonies on Pikovskaya's agar plate, indicating positive phosphate solubilising ability [17].

Estimation of Catalase Production

Thin smears of the pure bacterial isolates were prepared on the separate slides. 4 to 5 drops of 3% hydrogen peroxide (H₂O₂) were placed on the freshly prepared smear of a bacterial colony and examined for the presence or lack of bubble formation[13].

Morphological and biochemical characterization [13, 18].

Selected bacterial isolates were characterized by observing the gram's staining to know their morphological characters such as shape, size and types. Spore staining, motility and capsule staining were done for morphology. After morphological characterization of bacteria, further identification was based on biochemical characters. Biochemical characterization was done by different methods such as oxidase test, hydrolysis test(hydrolysis of starch and gelatin), IMViC test, esculin hydrolysis, carbohydrate fermentation test, catalase test, nitrate production, H₂S production and urease test as per the standard procedure[19, 20]. By using Bergey's Manual of Determinative Bacteriology, the isolated rhizobacterial strains were tentatively identified on the basis of their biochemical and morphological characteristics [21].

RESULTS AND DISCUSSION

Isolation of bacteria from soil sample

In the present study, a total of 11 bacterial isolates were obtained and used for further study.

Screening of bacteria for salt tolerance potential

All 11 isolates were found to be tolerating at 6.5 % NaCl concentration. According to the findings, 03 isolates were very strongly positive (+++ve), 02 isolates were moderate (++ve) and 06 isolates were less (+ve)(Table 1).

Screening of bacteria for heavy metal resistance potential

All 11 pure bacterial isolates were evaluated for resistance to four heavy metals: chromium (CrCl₃), cadmium (CdCl₂), copper (CuSO₄. 7H₂O), and zinc (ZnSo₄.7H₂O) at different concentrations (0.1%, 0.5%, and 1% in terms of zone formation). At 0.1 % of heavy metal concentration, all bacterial isolates were shown resistant for chromium, copper, zinc except for cadmium. For cadmium we have found resistant property in 03 and others were shown zone of inhibition. At 0.5 % of heavy metal concentration, 03 bacterial isolates showed resistance to cadmium, 07 isolates were identified resistant to chromium, 08 isolates developed resistance to copper and 10 isolates showed resistance to zinc. Only 03 bacterial isolates were showed resistance to cadmium, 05 isolates were identified resistant to chromium, 07 isolates developed resistance to copper and 09 isolates showed resistance to zinc at 1 % heavy metal concentration.

**Mahendra K Gupta et al.,**

From this study, it was observed that at different heavy metal concentrations, the most isolates were demonstrated resistance to zinc, followed by copper and chromium. While cadmium shows the least resistance (Table 2).

Screening of bacteria for plant growth promoting traits

Auxin (IAA), an essential phytohormone, is produced by many soil microorganisms and plants. Fruit development, root initiation, leaf creation, apical dominance, and embryo development are all important aspects of plant development. For the metabolism of L-tryptophan, PGPR can produce indole acetic acid (IAA). IAA is one of the auxins with the highest physiological activity. In the IAA or auxin test it was observed that bacterial isolates O₁ is strongly positive for IAA, while the isolates TM_{1b} and J_{1a} are partial positive for auxin production and remaining 08 isolates were found to be negative. Phosphate solubilizing microbes (PSMs) are helpful bacteria that can hydrolyse organic and inorganic insoluble phosphate substances into soluble phosphate that plants may easily absorb. Plant growth may be aided by phosphate solubilizing bacteria by increasing the effectiveness of biological nitrogen fixation, producing phytohormones, and increasing the availability of trace metals like zinc and iron. According to the findings, phosphate solubilizing activity of the bacterial isolates out of 11 isolates, only 03 isolates were found positive. Catalase-producing bacteria are extremely resistant to chemical, mechanical, and environmental stress. Catalases catalyse the breakdown of H₂O₂ in bacteria, which helps them defend against oxidative stress. Catalase is a gas-producing enzyme generated by many microbes that decomposes hydrogen peroxide into water and oxygen. As a result, the presence of catalase is indicated by the formation of a gas bubble. All isolates tested positive for catalase, with the exception of B₂, which tested negative.(Table 3& Fig 2)

Morphological and biochemical characterization (Table 4)**Gramstaining**

Microscopically, 09 of the 11 bacterial isolates are Gram positive bacilli, 01 Gram positive cocci, and 01 Gram negative bacilli.

Staining of endospores

Endospore staining was performed on all of the isolates. Only 03 isolates, O₂, B₁, and J_{1b}, were determined to be positive for endospore development, while the remaining 08 were non-spore forming.

Capsule staining and motility test

For bacterial isolates, capsule staining was assessed, and all of the isolates were confirmed to be capsule negative. The motility of the isolates was examined, and the findings confirmed that all 11 were non-motile.

Biochemical Characterization (Table 5-6)

Catalase, oxidase, starch hydrolysis, indole generation, methyl red, citrate consumption, nitrate reduction, urease production, and fermentation of several sugars (Dextrose, Maltose, Sucrose, and Lactose) were among the biochemical experiments carried out [13].

Catalase and Oxidase test

These assays were carried out to assess whether isolates produce the enzymes catalase and oxidase. All isolates tested positive for catalase, with the exception of B₂, which tested negative. While 07 out of 11 samples are oxidase positive, 04 isolates, J_{1a}, B₁, TM_{1a}, and TM_{1b}, are oxidase negative.

Hydrolysis of aesculin

The ability of the isolated microorganism to hydrolyse aesculin and create esculetin and glucose in the presence of bile was tested using the aesculin hydrolysis test. In this test, 04 isolates tested positive for aesculin hydrolysis, 07 isolates tested negative for aesculin hydrolysis.

Mahendra K Gupta *et al.*,

Gelatine and Indole tests

The Indole test was used to see if isolates could break down the amino acid tryptophan and generate indole. The indole result demonstrates that all of the isolates tested negative for indole.

In the gelatine test, it was observed that all the isolates were unable to produce gelatinase, resulting in negative results.

Test MR-VP

The ability of isolates to create adequate acid during glucose fermentation was tested using the methyl red test. In the methyl red test, a total of 08 isolates exhibited a positive reaction, with 02 of them, CH_{1b} and TM_{1b}, showing partial positive. The remaining 03 isolates, CH_{1a}, O₁, and O₂, are tested negative. Only 02 isolates out of 11, O₁ and J_{1b}, showed positive results in the VP test, whereas the remaining 09 isolates were confirmed to be negative.

Utilization of Citrate Test for H₂S

The citrate consumption test demonstrated that only 02 of the 11 isolates, O₁ and B₁, changed the colour of Simmons Citrate Agar, indicating that the others are citrate negative. Except for the O₁ and O₂ isolates, which are highly H₂S positive, all of the isolates were negative for H₂S production.

Test for Nitrate reduction

This test was used to examine the ability of isolates to generate nitrate reductase enzyme. The results of the nitrate reduction of isolates demonstrated that only 04 isolates (CH_{1b}, O₁, TM_{1b}, and J_{1b}) showed positive nitrate reduction, whereas the other 07 isolates showed negative nitrate reduction.

Urease production

The ability of isolates to make urease enzymes was tested using a urease production test, and the findings show that 05 out of 11 isolates (O₁, J_{1a}, TM_{1a}, J_{1b}, and O₂) were positive for urease production, while the remaining 06 isolates were negative.

Fermentation of carbohydrates

In this investigation, four sugars were used: dextrose, maltose, sucrose, and lactose. The carbohydrate fermentation of various isolates shown in figure implies that O₁, TM_{1b} and J_{1b} are positive for Dextrose, Sucrose, and Maltose, where O₁ can produce both acid and gas. While B₂ and TM_{1a} is partial positive for maltose. Also, for lactose, A₁ and for dextrose, TM_{1a} is partial positive. The remaining isolates are Dextrose, Sucrose, Lactose and Maltose negative.

Hydrolysis of starch

The starch hydrolysis test, commonly known as the amylase test, is used to determine if isolated bacteria can consume amylase. In this test, 05 isolates out of 11 yielded a positive result, while the rest yielded a negative result. Isolates that show ability to hydrolysis starch are CH_{1b}, J_{1a}, B₁, TM_{1a} and J_{1b}. The increase in the soil salinity and heavy metal contamination are the most common issues that affect the crop yield and quality production [22]. Rhizobacteria have a lot of potential for increasing soil nutrient availability. Nitrogen is the most limiting nutrient for plants, as it is required for amino acid and protein synthesis. It is acquired from atmospheric nitrogen through biological nitrogen-fixing mechanisms in the soil and it is absorbed by the plant roots. Some PGPRs have the potential to solubilize phosphate in the soil, increasing the amount of phosphate ions in the soil that are readily available to plants. PGPRs also create a variety of volatile chemicals and other metabolites (enzymes, proteins, antibiotics) that are important for soil health and plant growth [1, 12]. Use of PGPR as abiotic stress management, neutralize the toxic metallic compounds like cadmium pollution in the soil. Example of PGPR that act against abiotic stress: *Pseudomonas putida*, *Pseudomonas fluorescense* etc. [23]. While applications of PGPR on seeds and roots of commercial crops are significantly enhance the resistance of such crops against biotic stress. Example of PGPR that act against biotic stress was reported as *B. thuringiensis* strain, *Paenibacillus polymyxa* strains B2, B3, B4 [11].

CONCLUSIONS

The increase in soil salinity and heavy metal contamination is the most common environmental problem for agriculture field. As extension of agricultural land is practically impossible and maintaining soil fertility is critical for meeting growing food needs and ensuring agricultural resource sustainability. Chemical fertilizers used to boost agricultural yields and eradicate pests, pathogens, and weeds. However, they have a significant negative impact on the ecology. The necessity for healthy harvested procedures in today's world can be met alternatively by applying PGPR as a biofertilizer. Rhizobacteria that stimulate plant growth serve a significant role in soil fertility, phytopathogen suppression, and plant growth enhancement for the development of environmentally friendly sustainable agriculture. It is critical to re-establish both terrestrial vegetarian and subterranean soil microbial bioactivity and stability in order to form a healthy soil ecosystem. Metal-polluted soil treatment by rhizobacteria is thus critical for removing heavy metal toxicity even while improving soil quality. Bacterial isolates like PGPR obtained from salt and heavy metal tolerant soil can use as microbial inoculants to overcome the problem of biotic and abiotic stress and have positive impact on physiological functions of plants. To expand awareness and knowledge of soil microbial communities, future rhizosphere biology research will rely on biotechnological and molecular approaches. Fresh alternatives as bioinoculants for commercial crops such as fruits, vegetables, and flowers must be investigated. PGPR are being studied for phosphate solubilization and nitrogen fixation. However, there is a requirement of, identification of the most potent isolates on the basis of 16srRNA molecular sequencing. Additional research on the third most important macronutrient for plant growth, that is potassium solubilization, is needed. Apart from that, there is a significant possibility to meet the country's food need by learning more about PGPR-based goods and using ice-nucleating PGPR to enhance plant development at low temperatures.

ACKNOWLEDGEMENTS

The authors are thankful to Amity Institute of Biotechnology, Amity University Madhya Pradesh. Gwalior (M.P.) for their support to carry out this work.

Conflict of Interest

The authors declare no competing or conflicts of interest.

ABSTRACT

The antilipidemic and antihypertensive agents are rational selective medicaments. This method approach was optimized to determine amlodipine and atorvastatin using HPLC under a set of conditions including the mobile phase composition selected with methanecarbonitrile and 0.1% orthophosphoric acid (68:32 v/v) and the stationary phase is Kromasil RP-18 (250mm L x 4.6 mm id, 5 μ silica) was employed. Analytes are detected at 210 nm by a UV detector with an eluent phase flow velocity has been fixed as 1ml/min. The method approach has been confined to key parameters, including linearity, accuracy, precision,

**Kiran Manda et al.,**

sensitivity, and consistency, which were confined to good outcome measures. Results of the method were found to be $y = 129341x + 64040$ and $(r^2) = 0.9986$ for amlodipine and $y = 124597x + 38344$ and $(r^2) = 0.9985$ for atorvastatin. The accuracy and precision were found to be 96.95 to 99.71 and 97.90 to 99.71 respectively. Sensitivity was proven by the S/N ratio as 0.2 μ g/ml and 0.1 μ g/ml. The stated method is easy and can be adapted for conventional biological analytical samples.

Keywords: Bioanalytical Method Development, HPLC, EMA guidelines, Validation.

INTRODUCTION

Amlodipine¹ blocks the membrane spanning incursion of calcium ions into the vascular muscle, those with smooth muscle, and cardiac striated muscle, making it a pyridine_{1,4} dihydro calcium channel blocking agent. Chemically 3-ethyl-5-methyl(\pm)-2-[(2-aminoethoxy) methyl]-4-(2-chloro phenyl)- 1,4-dihydro-6-methyl-3,5-pyridine dicarboxylate mono benzene sulphonate. The molecular structure of amlodipine is given (fig.1). Atorvastatin calcium chemically calcium bis((3R,5R)-7-[2-(4-fluorophenyl)-3-phenyl-4-(phenyl carbamoyl)-5-(propane-2-yl)-1H-pyrrol-1-yl]-3,5 dihydroxy heptanoate). Employed first-line treatment agent for dyslipidemia. An elevated cholesterol level is a significant risk indicator for whoever development of cardiac related problems. The molecular structure of atorvastatin is depicted (fig.1). Several methods have been reported till date to estimate the fixed dosage form of amlodipine and atorvastatin in combination and alone which includes cilnidipine, rosuvastatin, telmisartan, chlorthalidone, glibenclamide, metformin, valsartan, perindopril, atenolol, Olmesartan, enalapril, losartan, bisoprolol, irbesartan, clopidogrel, aspirin, furosemide. Methods or techniques that were reported widely by several measurements as hyphenated techniques include LC-MS/MS [3-6] and UPLC MS/MS [7-8], HPTLC [9-10] and biological fluids by HPLC [11-15,39] without biological fluids by HPLC methods [16-28,40] and Micellar chromatography [29], Spectroscopic [30-33], FT-IR [34] Fluorometric [35-36] Electrophoresis [21,37-38]. Required a new bioanalytical method after careful literature survey with an amalgamation of amlodipine and atorvastatin, because of the existing methods are using high retention time for separation of analytes and consumed more mobile phase as well as runtime of method development was very high. This paper aimed to develop a new bioanalytical method and validate the methodology using EMA guidelines.

MATERIALS AND METHODS

Methods

Instrumentation

The analytical separation was performed using the HPLC binate-equipped system (HPLC -2000 series, make: Waters) with a piston pump employed at 6000 psi pressure and Waters 2998 was equipped with the UV detector. Using 0.45 μ membrane sifter for the filtration unit was employed to obtain a fine free of particulate matter for the contents as well as mixed well contents allowed to sonicated about 10 minutes for degassing. Empower 2.0 version software is used to acquire data and to ensure data integrity.

Materials and Reagents

Atorvastatin and amlodipine were received as freely from KMS Health Centre Pvt Ltd, Chennai, Tamil Nadu. HPLC grade acetonitrile, phosphoric acid (Merck, Mumbai), India. Milli Q water was used. A 0.45 μ pore membrane sifter was employed for the filtration.

Animals

The animals were maintained under an ambient temperature and at 60% RH and a standard diet was used as animal feed. The animals fasted the whole night afore the study.

**Kiran Manda et al.,****Optimized Chromatographic Conditions**

The eluent preparation contains 0.1% orthophosphoric acid and acetonitrile in a ratio of 68:32 % v/v. an analytical column was used with the specifications of kromasil RP-18 (250 mm L x 4.6 mm id, 5 μ silica using column temperature 30°C and kept the sample temperature about 5°C and flow rate was fixed with 1ml/min along with 30 μ l sample volume of injection. Detection of analytes done at 210nm.

Collection of Plasma

The blood plasma sample was collected from rats using the phlebotomy technique. The blood component was spun at 4000 rpm for about 10 minutes, the residue plasma was obtained in a dried-out Eppendorf centrifuge tube, and preserved in deep freeze at -20°C until the completion of the experiment.

Extraction Procedure

Freeze-dried plasma was chilled and 250 μ l of it had been mixed with internal standard-10 μ l and standard solutions of amlodipine -10 μ l and atorvastatin -10 μ l into Eppendorf tube and added 2mL of acetonitrile as extracting solvent to it. Then, the mixture was whirlpool for about 4 minutes and spun around for about 3 minutes with an optimized speed of 3200 rpm. The extracted analytes were isolated, the organic solvent was allowed to dry, the remaining sample was diluted with the diluent, and the resultant sample of 30 μ l was introduced into the HPLC system. Water and methane carbonitrile (50:50%v/v) were selected as diluent.

Stock Preparation**Preparation of Amlodipine and Atorvastatin Standard Solutions**

Firstly, a 1 mg/ml stock solution of amlodipine and atorvastatin was prepared using the selected diluent for appropriate spiking solutions.

Preparation of Nevirapine as an Internal Standard Solution

Nevirapine internal standard solution was made and used at 100 μ g/ml. The above stock solution of atorvastatin and amlodipine was employed to make the quality of control samplings in rat plasma and to construct the curve of calibration by using the diluted testing sample solutions.

Preparation of Calibration Standards and Samples for Quality Assurance

Before spiking, we verified the blank plasma for the endogenous substances during the drastic change time (eluting) of amlodipine and atorvastatin. The amlodipine was measured at eight different concentrations with the range of 0.2 μ g to 20 μ g/ml and 0.1 μ g to 10 μ g/ml for atorvastatin. i.e., 0.2, 0.4, 0.6, 5, 7.5, 10, 16 and 20 μ g/ml and 0.1, 0.2, 0.3, 2.6, 3.75, 5, 8 and 10 μ g/ml respectively.

Method Validation

Method validated [41] after optimization of the technique included retention time of analyte(s), resolution of the analytes, the shape of the peak, and theoretical plates of the created method. The created methodology was validated as per regulatory specifications such as selectivity, sensitivity, linearity, range, accuracy, and precision parameters.

System Suitability cum selectivity

The condition of the HPLC system was performed before beginning the method validation and verified under the system conditions. The method's selectivity was measured by collecting samples of blank plasma from six rats to ascertain any potential intrinsic chemical substances that might interfere with the effects of amlodipine and atorvastatin, concerning nevirapine. The dwell time of amlodipine cum atorvastatin chromatographic peaks were investigated.

Carry over test

To assess carryover, blanks were injected after the high concentrations (ULOQ) of sample injections, which had been 20 μ g/ml for amlodipine and 10 μ g/ml for atorvastatin. After administering amlodipine, atorvastatin, cum

**Kiran Manda et al.,**

nevirapine, the outcome measures recorded the blank response area. The validation requirement for analytes was met with results that were less than 20%, while for internal standards it was met with results that were less than 5%.

Specificity and Screening of biological matrix

The method's authenticity was evaluated by injecting the plasma-spiked amlodipine and atorvastatin into the system. The response of chromatograms was recorded and evaluated for any obnoxious constituents affecting the amlodipine, atorvastatin, and nevirapine (IS) peaks. Constraints such as dwell time, USP plate count, and symmetry factor were established to validate the specificity of the method. We observed no interruptions at a dwell time of amlodipine, atorvastatin, and nevirapine respectively. The specificity was passed with acceptance criteria i.e., the area response of unknown/interference peak with standard blank was not found at dwell time analyte, which could be up to $\leq 20.00\%$ in LLOQ, and retention time of internal standard could be up to $\leq 5.00\%$ in LLOQ.

Linearity

The evaluation was made using plasma spiking into amlodipine and atorvastatin solutions with concentrations ranging from 0.2 to 20 $\mu\text{g/ml}$ and 0.1 to 10 $\mu\text{g/ml}$, respectively. Plotting the ratio of the crest area of amlodipine and atorvastatin against the internal standard amounts was performed to define the regression equation. To assess precision, the concentrations of amlodipine and atorvastatin were contrasted with the predictions made by the regression equation.

Precision and Accuracy

The new approach was tested for accuracy and precision at both within- and between-day intervals by spiking atorvastatin and amlodipine in plasma. Samples were manipulated at 0.2, 7.5, and 1.6 $\mu\text{g/ml}$ and 0.1, 3.75, and 8 $\mu\text{g/ml}$ concentrations of atorvastatin and amlodipine to find out intra-day accuracy and precision. The same proportions were adopted to measure outcome the accuracy and precision between days for three days in a row. The proportion of relative deviations was used to measure accuracy, and the variation in the coefficient was used to measure precision.

Restoration (Recovery)

LQC, MQC, and HQC were incorporated into the testing process of amlodipine and atorvastatin's recovery from rat plasma using QC standards. The recovery of amlodipine and atorvastatin was computed by contrasting each extracted QC standard peak area with the peak areas of unextracted standard solutions that contained the appropriate concentrations of amlodipine and atorvastatin in the diluent. Three instances resulted in recovery being determined.

Limit of Detection and Limit of Quantification

The threshold for detection (LOD) is the sample's lowest concentration that is distinguishable from background noise but cannot be quantitated. LOD's ratio of signal to background noise (S/N) compute was 3:1 and test results were compared against blank samples. The LOQ using 10:1 is the minimum analyte concentration that can be measured with a respectable degree of precision and accuracy.

Stability Study

The reliability of amlodipine and atorvastatin must be evaluated when determining their shelf life, both during the process of gathering samples and handling and term storage conditions assuming both short and long-term stability. The quality control samples (LQC, MQC, and HQC) were tested in triplicate across three freeze-thaw cycles to ascertain their defrost stability. Each quality control concentration was set into three aliquots for reliability estimation, which were allowed to be frozen for about 24 hr at $-80\text{ }^\circ\text{C}$ and thawed at room temperature. The frozen samples were completely defrosted before being refrozen over an additional twenty-four-hour period in precisely the same way; the process of defrost was subsequently performed twice more making ensure drug stability.

Kiran Manda et al.,

RESULTS AND DISCUSSION

System Suitability and The Degree of Selectivity

The ability to select of proposed method has been exclusively confirmed by screening blank plasma ($n = 6$) and the recorded chromatogram of blank plasma is depicted (fig. 2). Compared against another sample for endogenous substances examination at the dwell time of amlodipine(4.34min) and atorvastatin(6.23min) and system suitability outcomes with accepted limits includes related standard deviation were given (Table 1).

Carryover Test

This parameter was executed to check if any analytes from the earliest sample were found. The blank plasma was interspersed into the system itself and the acquired chromatograph was observed for significant peaks or responses at the dwell time of the analytes.

Specificity

The plasma spiked -samples of amlodipine and atorvastatin eluted sharply within 7 minutes with better resolutions among them and the method run time was fixed at about 10 minutes. The separated analytes of amlodipine and atorvastatin were observed not embarrassed by the biological matrix (fig.3). we could not find any interference at dwell timings of analytes. Which indicates the specificity of the method.

Linearity

This parameter has revealed that the method was linear and ranged over 0.2 μg to 20 $\mu\text{g}/\text{ml}$ of amlodipine and 0.1 μg to 10 $\mu\text{g}/\text{ml}$ of atorvastatin, which was demonstrated by linearity values and regression as $y = 129341x + 64040$ and (r^2) = 0.9986 for amlodipine and $y = 124597x + 38344$ and (r^2) = 0.9985 for atorvastatin. It has good linearity, as depicted (fig.4). outcomes of linearity given (Table 2).

Precision and accuracy

Intraday and inter-day method preciseness and exactness were established by injecting triplicate samples at concentrations of each level i.e., 16,7.5, 0.6, and 0.2 $\mu\text{g}/\text{ml}$ of amlodipine and 8,3.75 and 0.3 and 0.1 $\mu\text{g}/\text{ml}$ of atorvastatin. Mean and % CV was calculated. The outcome measures are given (Table 3).

Recovery

The methodology created was relied on to extract amlodipine and atorvastatin. The outcome measures of the recoveries are given (Table 4). The mean recovery (%) of amlodipine and atorvastatin from plasma i.e., 96.95 to 99.71 and 97.90 to 99.71.

Limit of detection and Limit of quantification

The LOD was determined by the apparatus's ability to confirm amlodipine and atorvastatin at lower concentrations and it was confirmed that the concentration of amlodipine was found to be 0.03 $\mu\text{g}/\text{ml}$ and 0.1 $\mu\text{g}/\text{ml}$ with respective an S/N ratio. The lower limit of quantification was measured as 0.2 and 0.1 $\mu\text{g}/\text{ml}$ for both of them.

Stability study

A sample stability study was conducted and evaluated to ascertain the degradation profile. The samples were compared with stability samples. The stability samples were assessed with six replicates until the analysis was completed at -28 and -80°C. Outcomes of this parameter have been given (Table 5) and observed that no detectable degradation was recorded.

**Kiran Manda et al.,**

CONCLUSION

The method developed was utilized to give fine results under a set of conditions by isocratic flow mode with a UV detector in the presence of plasma. The methodology extraction was very selective and the timeline was very abridged. Therefore, the created method was very quick, specific, opted, and involved a simple sample treatment procedure. The method was validated and the outcomes of the measures were found to be within the limits as per the regulatory guideline.

ABSTRACT

Rheumatoid Arthritis is one of the autoimmune disorder that disrupts daily activity by affecting bones, cartilage, and joints affecting approximately 23.5 Million people worldwide in 2023. It is reported that it mainly affects women in the ratio 3:1 chiefly due to hormonal imbalance, menopause, poor diet, and sedentary lifestyle. According to the report of the World Health Organization 2020, 75% of people worldwide rely on herbal medicines for their medical treatments. Nowadays, herbal medications are being used to treat various diseases and disorders as they exert comparatively lesser side effects and are cost effective suggesting its possible role in the management of RA. However, it is also recorded that single herb or solo phytoconstituent is usually not significantly effective. Polyherbalism is a term underlined by the Ayurveda literature 'Sanrangdhar Samhita'. It talks about combination of bioactive compounds or aherbin pharmacotherapy. The scientific evidences has already established that the combination of bioactive compounds are more potent than combination of herbs due to its specificity. This review covers the potent bioactive compounds with their - Anti-arthritis and Anti-inflammatory activity based on their phytoconstituent types, and their combinations in a particular ratio that can be used to achieve greater therapeutic efficacy in treating rheumatoid arthritis. The review also elaborates the benefits of polyherbalism over a single herb in offering desired pharmacological activity, lowering the

Gayatri Patil et al.,

dose of administration, and improving synergistic action. The incorporation of relevant information into the understanding of bioactive substances will help researchers design polyherbal formulations.

Keywords: Rheumatoid Arthritis, Bioactive compounds, Phytoconstituents, Inflammation, Polyherbal formulation, Synergism.

INTRODUCTION

Rheumatoid arthritis (RA) is a systemic autoimmune disease that is characterized by persistent inflammation and is linked to systemic complications, progressive disability, and early mortality. The clinical anti-citrullinated protein antibody (ACPA) production and manifestations of rheumatoid factor (RF), synovial inflammation and hyperplasia, cartilage and bone abnormalities, and systemic features such as pulmonary, skin, skeletal, and psychological problems are indicative of RA. [1] About 1% of people have RA, and the disease affects women three times more frequently than males. In addition, the age group between 35 and 55 is the most commonly affected. It is generally accepted that a person's genetic makeup, environmental circumstances, and epigenetic markers operate as risk factors for RA, even though the precise and primary causes of the disease are unknown. [2] Peripheral joint inflammation, which is worse in the morning and gets better during the day, is the first symptom of RA. Joint deterioration followed by deformity, including subluxation of the wrist and fingers and ulnar deviation of the Metacarpophalangeal joints, may arise as the progress worsens.[3] In addition to systemic comorbidities like cardiovascular illness and pulmonary effects, RA is characterized by extra-articular symptoms such as rheumatoid nodules and vasculitis). [4] Early-stage RA symptoms and later-stage symptoms, which occur when the condition is not properly treated, significantly differ from one another clinically. The symptoms of early-stage RA are swollen and sore joints along with morning stiffness.

They are also accompanied by increased erythrocyte sedimentation rate (ESR) and raised C-reactive protein (CRP) levels. [5] A diverse range of autoimmune rheumatic disorders include several conditions such as systemic lupus erythematosus (SLE), adult-onset scleroderma, Sjögren's syndrome, spondylarthritis (SpA), psoriatic arthritis (PsA), polymyositis (PM), and others. Differential diagnosis is crucial because their indications and symptoms could be identical. [6] Imaging and serological testing are the two primary types of RA diagnostic procedures. One of the most commonly used imaging techniques is magnetic resonance imaging (MRI), which has a sensitivity of about 70% and a specificity of about 90%. However, they are expensive and useful mainly for those with noticeable symptoms. On the other hand, serological assays employing both invasive and non-invasive analytes have a greater chance of detecting RA early.[7] Current clinical treatments for RA mostly aim to reduce symptoms by immunosuppressive measures or by inhibiting specific inflammatory mediators. These include glucocorticoids (GCs), disease-modifying anti-rheumatic medications (DMARDs), non-steroidal anti-inflammatory drugs (NSAIDs), and biological agents. NSAIDs, like ibuprofen, work by inhibiting cyclooxygenase (COX), which effectively reduces inflammation and pain. Nevertheless, they are linked to severe gastrointestinal harm and are unable to alter the underlying disease process.[8] Certain related plant extracts and bioactive compounds (NPECs) have been documented in preclinical testing for their effect in reducing the symptoms of RA. It will be advantageous for RA patients to investigate the potential of NPECs as RA treatment medications because they show a variety of complex functions.[9] (ACPA's are 'Anti-Citrullinated Peptide Antibody'. It is a significant tool in the pathogenesis of rheumatoid arthritis that are detectable in the blood. Its high level shows an increased risk of developing rheumatoid arthritis.)

Alkaloids

Alkaloid is present in a wide range of natural sources, such as fungus, plants, animals, and microbes. They engage in a variety of pharmacological activities that support the management of RA. [14] Many modern medications are developed using secondary metabolites from natural items as a basis. Since alkaloids are not uniformly classified, they have a greatly diverse range of structures compared to most other natural substances. [15]

Gayatri Patil et al.,

Guggulsterone

Guggulsterone and boswellic acid (BA), obtained from *Commiphora* and *Boswellia*, respectively, are the primary components of guggul. It also includes a significant amount of keto sterols and lignans, which add to guggul's potent medicinal values. The efficacy of *Commiphora wightii* has been extensively demonstrated contrary to various inflammatory conditions, including RA. This is attributed to its downregulation of RANKL-induced osteoclastogenesis and its inhibition of interleukin (IL)-1 β -mediated chemokine synthesis, as well as the production of MMP-1,-3, nuclear p50 and p65 subunit, nuclear factor Kappa B (NF- κ B), as well as I κ B α degradation in RA. [16] A topical herbal gel formulation was prepared containing guggulsterone(57.92 %), boswellic acid (52.12 %) drug content and other excipients. It showed significant effect on rheological, physical, and in vitro drug release characteristics. The gel is temperature stable with good spreadability, and increased drug release time. It reduced the arthritic score, and paw volume showing anti-inflammatory and anti-arthritic activity in rats with satisfactory results. [17]

Tetrandrine

The natural bis benzyloquinoline alkaloid tetrandrine was originally identified in "Shennong's Classic of Materia Medica" and was extracted from the root of *Stephania tetrandra* S. Moore In vitro, tetrandrine reduces inflammation by blocking the synthesis and activation of COX-2, TNF, interleukins, T cells, and prostaglandins. [18] Tetrandrine is encapsulated into ethosomes using the transmembrane pH gradient loading technique. For ethosomes, the amount of tetrandrine deposited in the skin was noticeably greater. Its topical administration offers favorable efficiency with decreased side effects, thus resulting in better patient compliance. The inhibition rate and swelling degree of paw edema was significantly reduced by tetrandrine-loaded ethosomes in rats. The results showed that ethosomes appear to be a promising carrier for the topical administration of tetrandrine both through and into the skin. [19]

Flavonoids

A subclass of polyphenols known as flavonoids was first identified in 1936 as a means of treating capillary vascular permeability and fragility. Flavonoids are abundant in nature and possess a varied range of biological properties, such as antiviral, anti-inflammatory, anti-tumor, and antioxidant effects.[20]

Quercetin

Louis Antoine de Bougainville discovered the medicinal plant *B. spectabilis* Willd. in 1768. It is a member of the Nyctaginaceae family of plants. Bracken, leaves, and stems contain quercetin, a flavonoid substance with strong anti-inflammatory qualities. It suppresses NF- κ β , PPAR δ , AP1, TNF- α -mediated inflammation, and ERK. Arthritis symptoms are also lessened by quercetin. Quercetin inhibits leucocyte and chemokine levels, which in turn reduces lipid peroxidation and acts against irradiation-induced inflammation in addition to acute inflammation-related disorders. [21] The Solid Lipid Nanoparticles (SLN) of Quercetin were synthesized by a hot melt homogenization technique using ethanol (95%), Brij-98, and lipid (stearic acid at different ratios). The problem of low solubility and bioavailability of quercetin has been overcome by loading it in nanoparticles. SLN significantly reduced the COX-2 levels, interleukin-6 and TNF- α . It is a suitable candidate for oral drug delivery that reduces pro-inflammatory cytokines and alleviates inflammation. RA factor, ankle swelling, and key inflammatory biomarkers are also reduced in rats by SLN treatment. The synergistic effect of quercetin and lipids contributes to improved efficacy as an inflammatory activity. Hence quercetin through solid nanoparticles has anti-inflammatory and anti-arthritic potential.[22]

Kaempferol

A naturally occurring flavonoid found in a variety of fruits, kaempferol has been shown to have anti-inflammatory effects on a range of illnesses. According to earlier research, kaempferol reduces the amount of COX-2 that is produced by LPS in RAW 264.7 cells and suppresses the expression of iNOS in activated macrophages. Kaempferol can inhibit inflammatory responses caused by IL-1 β , including those involving iNOS2, COX2, MMPs, and ADAMTS5. [23] Kaempferol-loaded carbopol hydrogel shows anti-oxidant activity using free radical scavenging activities on hydrogen peroxide and DPPH. KAE has been found to prevent the activation of the MAPK pathway,

Gayatri Patil et al.,

thereby preventing the migration and invasion of fibroblast-like synovial cells in rheumatoid arthritis. The hydrogel increases the bioavailability of KAE, has greater swelling, drug release at greater PH values (7.4) as well as shows the anti-inflammatory activity. [24]

Glycoside

Glycosides are compounds consisting of an aglycone and a glycosyl group that get formed when the hemiacetal hydroxyl group of a sugar condenses and loses some of its water or other tiny molecules. The primary type of sugar found in nature, glycosides, have a variety of pharmacological properties. For instance, paeoniflorin 12, which is extracted from peonies, possesses cerebral, anti-inflammatory, antipyretic, anti-spasmodic, and neuroprotective properties. [25]

Arbortristoside-A

A broad spectrum of medicinal qualities, including antibacterial, antiviral, antioxidant, antidiabetic, hepatoprotective, antimalarial, anti-inflammatory, anticancer, antifungal, central nervous system depressive, and immunostimulant activity, have historically been established by *Nyctanthes arbor-tristis*. In addition, arthritic rats treated with the plant extracts had dose-dependent increases in IL-10 and decreases in TNF- α and cyclooxygenase 2 levels in their serum. An improvement was seen in the rear legs based on an ankle joint radiographic study. In arthritic animals, the administration of plant extract treatment resulted in a reduction of inflammation, pannus development, and synovial hyperplasia, as demonstrated by histological examination of the ankle joints. [26]

Tinosporoside

The stem bark of TC contains an 18-norclerodane glucoside called tinosporoside. The leaf extract reduces inflammatory biomarker gene expression. alter cytokines that cause inflammation beneficial for anemia linked to inflammation; raises iron levels, raises hemoglobin and red blood cell counts. [27]

Triterpenes

Secondary metabolites called triterpenes are made up of 30 carbon atoms and are generated when six isoprene units combine. Pharmacological effects of triterpenes include anti-oxidant, anti-inflammatory, anti-cancer, anti-atherosclerotic, antiviral, hepatoprotective, and immunomodulatory properties. [28]

Ursolic acid

A lipophilic pentacyclic triterpene is ursolic acid (UA). Fruit peels and a broad variety of herbs and spices are common sources of it. Numerous biological and pharmacological characteristics of UA, including its anti-inflammatory, anticancer, and anti-oxidative qualities, have been demonstrated. By suppressing Th17 cell proliferation and autoantibody synthesis, UA has been shown to effectively alleviate rheumatoid arthritis symptoms in mice and prevent zymosan-induced acute inflammation. In sick joints, UA also significantly decreases the production of iNOS, an indication of oxidative stress, and pro-inflammatory cytokines (IL-1 β , TNF- α , and IL-6). [29,30]

Xanthones

Greek for "yellow," xanthos, was used to identify xanthones when they were first isolated in 1855 by a German scientist studying dysentery. Strong anti-inflammatory effects have been found for some xanthones. It was discovered that 44 xanthones, including 2 xanthone glycosides, 33 prenylated xanthones, and 6 simple oxygenated xanthones, had anti-inflammatory qualities. [31]

Mangiferin

A C-glycosyl xanthone with a wide range of pharmacological properties is mangiferin. Inhibiting COX-2, iNOS, MMP1, and MMP3, downregulating pro-apoptotic proteins, upregulating anti-apoptotic proteins and B-cell lymphoma 2 (Bcl-2), and inhibiting the overexpression of toll-like receptor 2 (TLR2) and TLR4; additionally, mangiferin decreased nitric oxide (NO), TNF- α , IL-6, IL-1 β , and IL-1; and regulating NF- κ B, MAPK, and other

Gayatri Patil et al.,

signaling pathways.[32] The mangiferin-loaded transethosomes formulation formulated by thin film hydration has greater permeation of MNF across the skin layers. It significantly suppressed the inflammatory cytokines like IL-6, IL-1 β , TNF- α , and elevated RBC count. It also reduced paw edema in rats significantly. The formulation exhibits a high recovery rate in arthritic rats proving it is a significant carrier for the MNF transdermal delivery in the treatment of rheumatoid arthritis. [33]

α -mangostin

α -Mangostin, also known as α -M, is a naturally occurring xanthone that exhibits a variety of biological functions and holds promise as a therapy for numerous illnesses. In RA-FLS (rheumatoid arthritis fibroblast-like synoviocytes), α -M promotes apoptosis through the ROS/ERK1/2 signaling pathway.[34]

Polyherbal Formulation

Man entirely relied on medicinal plants with health advantages for the treatment of illness even before the advent of synthetic allopathic drugs. One essential raw material for the synthesis of herbal medicines is medicinal plants in their crude state. India has managed to hold its position as the world's largest supplier of medicinal plants and as a producer of bioactive chemicals used as building blocks for the creation of pharmacological therapeutic medicines. [40] The World Health Organization states that 75% of people worldwide rely on herbal medicines for their basic medical requirements (World Health Organization 2002). Though hard to define in terms of contemporary norms, polyherbalism is a unique Ayurvedic idea. The concept of synergism underlying polyherbal compositions is historically highlighted in the Ayurvedic literature known as the "Sarangdhar Samhita." [41] Estimated at \$1.5 billion globally, the market for herbal formulations is projected to grow rapidly as more people turn to natural therapies for illness prevention and treatment. Due to their complementary and/or potentiating properties, polyherbal medications—those containing two or more herbal ingredients—often work better than single medications. Compared to conventional medicine, the combination of two or more herbal extracts results in improved pharmacological activity, faster alleviation, fewer side effects, and a lower dose of administration.[42]

Advantages of polyherbal formulation over single herb:

A World Health Organization (WHO) survey indicates that approximately 80% of people worldwide practice traditional medicine. In the United States, there are currently 121 prescription drugs and about 90 of these medications are either directly or indirectly derived from plants. In addition to providing an alternative to existing allopathic drug-based therapy regimens, herbal remedies can be used to treat the symptoms of RA patients.[43] A significant potential benefit of botanicals over traditional single-component medications is their combination of several active compounds, when combined can produce a potentiating effect that may not be possible with a single compound. PHF's plant-based pharmacological medicines have a variety of related active principles that possess the ability to produce synergistic, potentiative, agonistic, and antagonistic activities. The combination of these pharmacological principles results in optimum treatment efficacy with minimal adverse effects.[44] When herbs are mixed, their activating or catalyzing effects upon one another make them more potent and effective within the body than a single herb. These mixtures function as potent catalysts to release each person's unique healing energy, which permeates the entire body and is present in every cell.[45] The potential of taking more than one distinct herbal formulation at a time was eliminated by polyherbal formulations, which in certain situations improves patient compliance and therapeutic outcome. They have an excellent risk to benefit ratio because the majority of them are safe at large doses and effective even at low ones.[46] Due to their synergistic effects, polyherbalism delivers advantages that single herbal formulations are unable to match. It reduces the possibility of unfavorable side effects by enabling better therapeutic results at lesser dosages. By eliminating the necessity to take many single herbal formulations at once, polyherbal formulations also increase patient comfort and improve therapeutic efficiency and compliance.[47] Scientific studies have demonstrated that combining plants with different potencies can result in more beneficial therapeutic effects than using the plants individually. When other plants are present, the pharmacological effects of the elements of herbs are amplified, and a phenomenon called synergism takes place that may not be apparent when the herbs are taken alone. [48]

Gayatri Patil et al.,

Challenges in combining different phytoconstituents

Natural phytochemicals, or herbal remedies, have drawn a lot of attention as a modern approach to treat inflammatory diseases, including OA and age-related cartilage degradation. Significant anti-inflammatory, antioxidant, and anabolic capabilities have been found for a number of medicinal plant extracts and their individual constituents. [49] Some problems that occur while combining the compounds in preparing polyherbal formulation are bioavailability, molecular targets, protection against unfavorable conditions, compatibility synergistic effect, etc. While a single herb extract may not have the same therapeutic potential as a polyherbal mixture, the varied active principles in the formulation may cause instability caused by incompatibility.[46] Different spectroscopic techniques are used to check synergetic chemical interactions within phytoconstituents like tandem mass spectroscopic analyses (LC/MS-MS) and Fourier transform infrared spectroscopy (FTIR).[50] For the qualitative and quantitative phytochemical examination of herbal raw medications and PHFs, HPTLC has become a crucial analytical tool. It is applicable in comparing chemical fingerprints of various compounds necessary for phytochemical evaluation.[51] Technology-based systems for forming and storing drug molecules into forms appropriate for administration, such as tablets or solutions, are known as drug delivery systems. It lowers drug toxicity and enhances drug solubility, target site accumulation, effectiveness, pharmacological activity, pharmacokinetic characteristics, patient acceptance, and compliance. [52] There are various drug delivery systems like biodegradable polymers, nanomedicines, extracellular vesicles, liposomes, inorganic nanoparticles (NPs), polymeric nanoparticles, and cell-based delivery systems that hold promising potential to maximize therapeutic efficacy. As nanotechnology may function at the molecular level inside cells to regulate biochemical pathways, it is inescapably implicated in the field of medicine in the modern era. When administered with nanocarriers, biologically active chemicals resulted in the production of nanocapsules with extra adhesive capabilities because of the high surface volume ratio achieved by appropriate chemical formulation. By slowing down the movement of active ingredients, this kind of nanocapsule improves bioavailability through further absorption. [53] Encapsulation is the process of effectively enveloping an agent to protect it. In recent years, there has been a notable advancement in the encapsulation of bioactive chemicals, primarily pharmaceuticals, in particles. Nearly all ways can be used to create microparticles (1 to 1000 m) for controlled administration; nevertheless, intravenous injection has certain limits. One can administer nanoparticles (1 to 100 nm) without restriction. Human cells can sometimes be considerably larger than nanoparticles.[54] Long-term viability of the active components is ensured by the encapsulation, which maintains the biological integrity of the products and supports environmental conditions throughout storage. The solution for difficulties with a compound's physical or chemical instability is encapsulation. It may reduce the sensitivity to the deterioration of plant materials and their bioactive chemicals by preventing volatilization and shielding the encapsulated material from adverse environmental conditions.[55]

Tables And Figures

Pathogenesis of Rheumatoid Arthritis: [10,11]

Table.1:Subsets of Rheumatoid Arthritis

Subsets of Rheumatoid Arthritis	
Presence of ACPAs	Absence of ACPAs
<ul style="list-style-type: none"> • More aggressive phenotype • More common with high specificity (97%) • More effective response of methotrexate or rituximab • Detected in 67% of RA patients Useful as a diagnostic reference for early, undifferentiated arthritis 	<ul style="list-style-type: none"> • Less aggressive phenotype • Less common with low specificity • Less effective response of methotrexate or rituximab • Detected in 20-30% of RA patients

Table no. 2. Other phytoconstituents with anti-rheumatic and anti-inflammatory activity

Sr.No.	Name of Plant	Dose	Bioactive compound	Mechanism of action
1	Citrus fruits [35]	40 & 80 mg/kg	Hesperidin (Flavanone glycoside)	It significantly reduces IFN- γ , IL-4, reactive oxygen species, and improves red blood cell and platelet count in Complete Freund's adjuvant-induced rheumatoid arthritis in rats.
2	<i>Martynia annua</i> L.(Fruit) [36]	0, 25, 50 and 100 μ M	Harpagoside (Iridoid glycoside)	It ameliorate the destruction of bone, cartilage, and pannus formation. It reduces inflammatory cytokines like IL-6, TNF- α , IL1- β . It also suppresses

Gayatri Patil et al.,

				bone loss by inhibiting osteoclast expression and differentiation in collagen-induced arthritis in mice.
3	<i>Boswellia serrata</i> [37]	40 & 80 mg/kg	3-Acetyl-11-Keto-Boswellic Acid (Triterpene)	It inhibits inflammatory mediators like IL-6, TNF- α , IL1- β , NF- κ β , nitric oxide, and COX-2 secretion. It also reduces paw volume, arthritic index, and joint inflammation in collagen-induced arthritis in rats. It suppresses cartilage oligomeric matrix protein and increases hyaluronan levels in synovial fluid.
4	<i>Gossypium</i> [38]	Dose-dependent manner	Gossypol (Polyphenol)	It attenuates the infiltration of neutrophils, macrophages, NF- κ β and mitogen-activated protein kinase pathway against phytohemagglutinin (PHA)-induced cytokine secretion in Human T-cell leukemia Jurkat cells.
5	<i>Ephedra Gerardiana</i> [39]	20 & 40mg/kg	Pseudoephedrine (Alkaloid)	It suppresses the levels of PGE ₂ , TNF- α , IL-1 β , IL-6. It significantly increases IL-4 & IL-10. It reduces paw volume, arthritic index, and paw diameter in Complete Freund's Adjuvant (CFA) induced arthritis in rats.
